1823.
PARTHIA, a celebrated empire of antiquity, bounded on the west by Media, on the north by Hyrcania, on the east by Aria, and on the south by Carmania the desert; surrounded on every side by mountains, which still serve as a boundary, though its name is now changed, having obtained that of Eyrac or Arac; and, to distinguish it from Chaldea, that of Eyrac Agamem. By Ptolemy it is divided into five districts, viz. Camanissine or Camisene, Partheyne, Choromo, Atticene, and Tabiene. The ancient geographers enumerate a great many cities in this country. Ptolemy in particular reckons 25 large cities; and it certainly must have been very populous, since we have accounts of 2000 villages, besides a number of cities, which were destroyed by earthquakes. Its capital was named Ecatopoeia, from the circumstance of its having 100 gates. It was a noble and magnificent place; and, according to some, it still remains under the name of Isfahan, the capital of the present Persian empire.

Parthia is by some supposed to have been first peopled by the Phetri or Pathri, often mentioned in Scripture, and that the Parthians are descended from Pathrusim the son of Misram. But however true this may be with regard to the ancient inhabitants, yet it is certain, that those Parthians who were so famous in history, descended from the Scythians, though from what tribe we are not certainly informed. The history of the ancient Parthians is totally lost. All that we know about them is, that they were first subject to the Medes, afterwards to the Persians, and lastly to Alexander the Great. After his death the province fell to Seleucus Nicator, and was held by him and his successors till the reign of Antiochus Theus, about the year 250 before Christ. At this time the Parthians revolted, and chose one Arsace for their king. The immediate cause of this revolt was the lewdness of Agathocles, to whom Antiochus had committed the care of all the provinces beyond the Euphrates. This man made an infamous attempt on Tigrades, a youth of great beauty; which so enraged his brother Arsaces, that he excited his countrymen to revolt; and before Antiochus had leisure to attend to the rebellion, it became too powerful to be crushed. Seleucus Callinicus, the successor of Antiochus Theus, attempted to reduce Arsaces; but the latter having had so much time to strengthen himself, defeated and drove his antagonist out of the country. Seleucus, however, in a short time, undertook another expedition against Arsaces; but was still more unfortunate than he had been in the former, being not only defeated in a great battle, but taken prisoner, and died in captivity.

Arsaces I. was succeeded by his son Arsaces II. who, entering Media, made himself master of that country, while Antiochus the Great was engaged in war with Ptolemy Euergetes king of Egypt. Antiochus, however, was no sooner disengaged from that war, than he marched with all his forces against Arsaces, and at first drove him quite out of Media. But he soon returned with an army of 100,000 foot and 20,000 horse, with which he put a stop to the further progress of Antiochus; and a treaty was soon after concluded, in which it was agreed, that Arsaces should remain master of Parthia and Hyrcania, upon condition of his assisting him in his wars with other nations.

Arsaces II. was succeeded by his son Priapates, who Conquests reigned 15 years, and left three sons, Phrahatres, Mithridates, and Artabanus. Phrahatres, the elder, succeeded to the throne, and reduced under his subjection the Mardri, who had never been conquered by any but Alexander the Great. After him, his brother Mithridates was invested with the regal dignity. He reduced the Bactrians, Medes, Persians, and Elymans, and overran in a manner all the east, penetrating beyond the boundaries of Alexander's conquests. Demetrius Nicator, who then reigned in Syria, endeavoured to recover those provinces; but his army was entirely destroyed, and himself taken prisoner, in which state he remained till his death; after which victory Mithridates made himself master of Babylonia and Mesopotamia, so that all the provinces between the Euphrates and the Ganges were now subject to his power.

Mithridates died in the 37th year of his reign, and Antiochus left the throne to his son Phrahatres II. who was scarce Sidetes des- settled in his kingdom when Antiochus Sidetes marched against him at the head of a numerous army, under pretence of delivering his brother Demetrius, who was still in captivity. Phrahatres was defeated in three pitched
PAR

Parthia. pitched battles; in consequence of which he lost all the countries conquered by his father, and was reduced within the limits of the ancient Parthian kingdom. Antiochus did not, however, long enjoy his good fortune; for his army, on account of their number, amounting to no fewer than 400,000, being obliged to separate to such distances as prevented them, in case of any sudden attack, from joining together, the inhabitants, whom they had most cruelly oppressed, taking advantage of this separation, conspired with the Parthians to destroy them. This was accordingly executed; and the vast army of Antiochus, with the monarch himself, were slaughtered in one day, scarcely a single person escaping to carry the news to Syria. Phraates, elated with this success, proposed to invade Syria; but in the mean time, happening to quarrel with the Scythians, he was by them cut off with his whole army, and was succeeded by his uncle Artabanus.

The new king enjoyed his dignity but a very short time, being, a few days after his accession, killed in another battle with the Scythians. He was succeeded by Pacorus I, who entered into an alliance with the Romans; and he by Phraates III. This monarch took under his protection Tigranes the son of Tiridates the Great, king of Armenia, gave him his daughter in marriage, and invaded the kingdom with a design to place the son on the throne of Armenia; but on the approach of Pompey he thought proper to retire, and soon after solemnly renewed the treaty with the Romans.

Phraates was murdered by his children Mithridates and Orodes; and soon after the former was put to death by his brother, who thus became sole master of the Parthian empire. In his reign happened the memorable war with the Romans under Crassus. This was occasioned not by any breach of treaty on the side of the Parthians, but through the shameful avarice of Crassus. The whole Roman empire at that time had been divided between Caesar, Pompey, and Crassus; and by virtue of that partition, the eastern provinces had fallen to the lot of Crassus. No sooner was he invested with this dignity, than he resolved to carry the war into Parthia, in order to enrich himself with the spoils of that people, who were then looked upon to be very wealthy. Some of the tribunes opposed him, as the Parthians had religiously observed the treaty; but Crassus having, by the assistance of Pompey, carried every thing before him, left Rome in the year 55 B.C. and pursued the march to Brundusium, where he immediately embarked his troops, though the wind blew very high; and after a difficult passage, where he lost many of his ships, he reached the ports of Galatia.

From Galatia Crassus hastened to Syria, and passing through Judea, plundered the temple at Jerusalem in his way. He then marched with as great expedition as he could to the river Euphrates, which he crossed on a bridge of boats; and, entering the Parthian dominions, began hostilities. As the enemy had not expected an invasion, they were quite unprepared for resistance; and therefore Crassus overran all Mesopotamia; and if he had taken advantage of the consternation which the Parthians were in, might have also reduced Babylonia. But instead of this, early in the autumn, he re-passed the Euphrates, leaving only 7,000 foot and 1,000 horse to garrison the places he had reduced; and putting his army into winter quarters in Syria, gave himself wholly up to his favourite passion of amusing himself.

Early in the spring, the Roman general drew his forces out of their winter quarters, in order to pursue the war with vigour, but, during the winter, Orodes had collected a very numerous army, and was well prepared to oppose him. Before he entered upon action, however, the Parthian monarch sent ambassador to Crassus, in order to expostulate with him on his injustice in attacking an ally of the Roman empire; but Crassus, without attending to what they said, only returned for answer, that they should have his answer at Seleucia.

Orodes, finding that a war was unavoidable, divided his army into two bodies. One he commanded in person, and marched toward Armenia, in order to oppose the king of that country, who had raised a considerable army to assist the Romans. The other he sent into Mesopotamia, under the command of Surenas or Surenas, a most experienced general, by whom conduct all the cities which Crassus had reduced were quickly retaken. On this some Roman soldiers who had made their escape, and fled to the camp of Crassus, filled the mind of his army with terror at the accounts of the number, power, and strength, of the enemy. They told their fellow soldiers, that the Parthians were very numerous, brave, and well disciplined; that it was impossible to overtake them when they fled, or escape them when they pursued; that their defensive weapons were proof against the Roman darts, and their offensive weapons so sharp, that no buckler could resist them, &c. Crassus looked upon all this only as the effect of cowardice: but the common soldiers, and even many of the chief officers, were so disheartened, that Cassius, the same who afterwards conspired against Caesar, and most of the legionary tribunes, advised Crassus to suspend his march, and consider better of the enterprise before he be proceeded farther in it. But Crassus obstinately persisted in his former resolution, being encouraged by the arrival of Artabanus king of Armenia, who brought with him 6,000 horse, and promised to send 10,000 cuirassiers and 30,000 foot, whenever he should stand in need of them. At the same time, he advised him by no means to march his army through the plains of Mesopotamia, but to take his route over the mountains of Armenia. He told him, that as Armenia was a mountainous country, the enemy's cavalry, in which their main strength consisted, would there be entirely useless; and besides, his army would there be plentifully supplied with all manner of necessaries: whereas, if he marched by the way of Mesopotamia, he would be perpetually harassed by the Parthian horse, and frequently be obliged to lead his army through sandy deserts, where he would be distressed for want of water and all other provisions. This salutary advice, however, was rejected, and Crassus entered Mesopotamia with an army of about 40,000 men.

The Romans had no sooner crossed the Euphrates, than Cassius advised his general to advance to some of those towns in which the garrisons yet remained, in order to halt and refresh his troops: or if he did not choose to follow this advice, he said that his best way would be to march along the banks of the Euphrates to Seleucia;
commanded in the centre, his son in the left wing, and Cassius in the right.

In this order they advanced to the banks of a small river called the Balisius, the sight of which was very pleasing to the soldiers, who were much harassed with drought and excessive heat. Most of the officers were for encamping on the banks of this river, or rather rivulet, to give the troops time to refresh themselves after the fatigues of so long and painful a march; and, in the mean time to procure certain intelligence of the number and disposition of the Partian army; but Crassus, suffering himself to be hurried on by the inconsiderate ardour of his son, and the horse he commanded, only allowed the legions to take a meal standing; and before this could be done by all, he ordered them to advance, not slowly, and halting now and then, after the Roman manner, but as fast as they could move, till they came in sight of the enemy, who, contrary to their expectation, did not appear either so numerous or so terrible as they had been represented; but this was a stratagem of Surenas, who had concealed his men in convenient places, ordering them to cover their arms, lest their brightness should betray them, and, starting up at the first signal, to attack the enemy on all sides. The stratagem had the desired effect; for Surenas no sooner gave the signal, than the Partians, rising as it were out of the ground, with dreadful cries, and a most frightful noise, advanced against the Romans, who were greatly surprised and dismayed at the sight; and much more so, when the Partians, throwing off the covering of their arms, appeared in shining cuirasses, and helmets of burnished steel, finely mounted on horses covered all over with armour of the same metal. At their head appeared young Surenas in a rich dress, who was the first who charged the enemy, endeavouring, with his pikemen, to break through the first ranks of the Roman army; but finding it too close and impenetrable, the cohorts supporting each other, he fell back, and retired in a seeming confusion; but the Romans were much surprised when they saw themselves suddenly surrounded on all sides, and galled with continual showers of arrows. Crassus ordered his light-armed foot and archers to advance, and charge the enemy; but they were soon repulsed, and forced to cover themselves behind the heavy-armed foot. Then the Partian horse, advanced near the Romans, discharged showers of arrows upon them, every one of which did execution, the legionaries being drawn up in such close order, that it was impossible for the enemy to miss their aim. As their arrows were of an extraordinary weight, and discharged with incredible force and impetuosity, nothing was proof against them. The two wings advanced in good order to repulse them, but to no effect; for the Partians shot their arrows with as great dexterity when their backs were turned, as when they faced the enemy; so that the Romans, whether they kept their ground, or pursued the flying enemy, were equally annoyed with their fatal arrows.

The Romans, as long as they had any hopes that the Partians, after having spent their arrows, would either betake themselves to flight, or engage them hand to hand, stood their ground with great resolution and intrepidity; but when they observed that there were a great many camels in their rear loaded with arrows, and that those who emptied their quivers wheeled about to fill...
Parthia, they anew, they began to lose courage, and loudly to complain of their general for suffering them thus to stand still, and serve only as a butt to the enemy's arrows, which, they well saw, would not be exhausted till they were all killed to a man. Hereupon Crassus ordered his son to advance, at all adventures, and attack the enemy with 1,300 horse, 500 archers, and 8 cohorts. But the Parthians no sooner saw this choice body (for it was the flower of the army) marching up against them, than they wheeled about, and betook themselves, according to their custom to flight. Hereupon young Crassus, crying out as loud as he could, *They fly before us*, pushed on full speed after them, not doubting but he should gain a complete victory; but when he was at a great distance from the main body of the Roman army, he perceived his mistake; for those who before had fled, facing about, charged him with incredible fury. Young Crassus ordered his troops to halt, hoping that the enemy, upon seeing their small number, would not be afraid to come to a close fight; but herein he was likewise greatly disappointed; for the Parthians, conceiving themselves to oppose his front with their heavy-armed horse, surrounded him on all sides; and, keeping at a distance, discharged incessant showers of arrows upon the unfortunate Romans, thus surrounded and pent up. The Parthian army, in wheeling about, raised so thick a dust, that the Romans could scarce see one another, much less the enemy: nevertheless, they found themselves wounded with arrows, though they could not perceive whence they came. In a short time the place where they stood was all strown with dead bodies.

Some of the unhappy Romans finding their entrails torn, and many overcome by the exquisite torments they suffered, rolled themselves in the sand with the arrows in their bodies, and expired in that manner. Others endeavouring to tear out by force the bearded points of the arrows, only made the wounds the larger, and increased their pain. Most of them died in this manner; and those who outlived their companions were no more in a condition to act; for when young Crassus exhorted them to march up to the enemy, some showed him their wounded bodies, others their hands nailed to their bucklers, and some their feet pierced through and pinned to the ground; so that it was equally impossible for them either to attack the enemy or defend themselves. The young commander, therefore, leaving his infantry to the mercy of the enemy, advanced at the head of the cavalry against their heavy-armed horse. The thousand Gauls whom he had brought with him from the west, charged the enemy with incredible boldness and vigour; but their lances did little execution on men armed with cuirasses, and horses covered with tried armour: however, they behaved with great resolution; for some of them taking hold of the enemy's spears, and closing with them, threw them off their horses on the ground, where they lay, without being able to stir, by reason of the great weight of their armour; others, dismounting, crept under the enemy's horses, and thrusting their swords into their bellies, made them throw their riders. Thus the brave Gauls fought, though greatly harassed with heat and thirst, which they were not accustomed to bear, till most of their horses were killed, and their commander dangerously wounded. They then thought it advisable to retire to their infantry, which they no sooner joined, than the Parthians invested them anew, making a most dreadful havoc of them with their arrows. In this desperate condition, Crassus, spying a rising ground at a small distance, led the remains of his detachment thither, with a design to defend himself in the best manner he could, till succours should be sent him from his father. The Parthians pursued him; and having surrounded him in his new post, continued showering arrows upon his men, till most of them were either killed or disabled, without being able to make use of their arms, or give the enemy proofs of their valour.

Young Crassus had two Greeks with him, who had settled in the city of Carrhae. These, touched with compassion, at seeing so brave a man reduced to such straits, pressed him to retire with them to the neighbouring city of Ischmics, which had declared for the Romans; but the young Roman rejected their proposal with indignation, telling them, that he would rather die a thousand times than abandon so many valiant men, who sacrificed their lives for his sake. Having returned this answer to his two Greek friends, he embraced and dismissed them, giving them leave to retire and shift for themselves in the best manner they could. As for himself, having now lost all hopes of being relieved, and seeing most of his men and friends killed round him, he gave way to his grief; and, not being able to make use of his arm, which was shot of young Crassus through with a large barbed arrow, he presented his side to one of his attendants, and ordered him to put an end to his unhappy life. His example was followed by Censorinus a senator, by Megabacchus an experienced and brave officer, and by most of the nobility who served under him. Five hundred common soldiers were taken prisoners, and the rest cut in pieces.

The Parthians, having thus cut off or taken the whole detachment commanded by young Crassus, marched without delay against his father, who, upon the first advice that the enemy fled before his son, and were closely pursued by him, had taken heart, the more because those who had remained to make head against him seemed to abate much of their ardour, the greatest part of them having marched with the rest against his son. Wherefore, having encouraged his troops, he had retired to a small hill in his rear, to wait there till his son returned from the pursuit. Young Crassus had despatched frequent express to his father, to acquaint him with the danger he was in; but they had fallen into the enemy's hands, and been by them put to the sword: only the last, who had escaped with great difficulty, arrived safe, and informed him that his son was lost if he did not send him an immediate and powerful reinforcement. This news threw Crassus into the utmost consternation; a thousand affecting thoughts rose in his mind, and disturbed his reason to such a degree, that he scarcely knew what he was doing. However, the desire he had of saving his son, and so many brave Romans who were under his command, made him immediately decamp, and march to their assistance; but he was not gone far before he was met by the Parthians, who, with loud shouts, and songs of victory, gave, at a distance, the unhappy father notice of his misfortune. They had cut off young Crassus's head, and, having fixed it on the point of a lance, were advancing full speed to fall on the father. As they drew
Parthia. Crassus was struck with that dismal and affecting sight; but on this occasion, behaved like a hero: for though he was under the deepest concern, he had the presence of mind to stifle his grief, for fear of discouraging the army, and to cry out to the dismayed troops, "This misfortune is entirely my own: the loss of one man cannot affect the victory: Let us charge, let us fight like Romans: if you have any compassion for a father who has just now lost a son whose valour you admired, let it appear in your rage and resentment against these insulting barbarians." Thus Crassus strove to reanimate his troops; but his efforts were unsuccessful: their courage was quite sunk, as appeared from the faint and languishing shout which they raised, according to custom, before the action. When the signal was given, the Parthians, keeping to their old way of fighting, discharged clouds of arrows on the legionsaries, without drawing near them; which did such dreadful execution, that many of the Romans, to avoid the arrows, which occasioned a loud and painful death, threw themselves, like men in despair, on the enemy's heavy-armed-horse, seeking from their spears a more quick and easy kind of death. Thus the Parthians continued plying them incessantly with their arrows till night, when they left the field of battle, crying out, that they would allow the father one night to lament the death of his son.

This was a melancholy night for the Romans. Crassus kept himself concealed from the soldiery, lying not in the general's tent, but in the open air, and on the bare ground, with his head wrapped up in his paludamentum or military cloak; and was, in that forlorn condition, says Plutarch, a great example to the vulgar, of the instability of fortune; to the wise, a still greater of the pernicious effects of avarice, temerity, and ambition. Octavius, one of his lieutenants, and Cassius, approached him, and endeavoured to raise him up and console him: but, seeing him quite sunk under the weight of his affliction, and deaf to all comfort, they summoned a council of war, composed of all the chief officers; wherein it was unanimously resolved, that they should decamp before break of day, and retire, without sound of trumpet, to the neighbouring city of Carrhae, which was held by a Roman garrison. Agreeable to this resolution, they began their march as soon as the council broke up; which produced dreadful outcries among the sick and wounded, who, perceiving that they were to be abandoned to the mercy of the enemy, filled the camp with their complaints and lamentations: but their cries and tears, though very affecting, did not stop the march of the others, which, indeed, was very slow, to give the stragglers time to come up. There were only 300 light horse, under the command of one Agmatius, who pursued their march without stopping. They arrived at Carrhae about midnight, Agmatius, calling to the centurions on the walls, desired them to acquaint Coponius, the governor of the place, that Crassus had fought a great battle with the Parthians; and, without saying a word more, or letting him know who he was, continued his march with all possible expedition to the bridge of Zeugma; which he passed, and by that means saved his troops, but was much blamed for thus abandoning his general.

The message which he sent to Coponius was of some temporary service to Crassus. For that commander, wisely conjecturing, from the manner in which the unknown person had given him the intelligence, that some misfortune had befallen Crassus, immediately ordered his garrison to stand to their arms; and, marching out, met Crassus, and conducted him and his army into the city: for the Parthians, though informed of his flight, did not offer to pursue him, observing therein the superstitious custom which obtained among them and the Persians, not to fight in the night; but when it was day, they entered the Roman camp, and having put all the wounded, to the number of 4000, to the sword, dispersed their cavalry all over the plain, in pursuit of the fugitives. One of Crassus's lieutenants, named Vargunteius, having separated in the night from the main body of the army, with four cohorts, missed his way, and was overtaken by the enemy; at whose approach he withdrew to a neighbouring hill, where he defended himself, with great valour, till all his men were killed, except 20, who made their way through the enemy, sword in hand, and got safe to Carthage: but Vargunteius himself lost his life on the occasion.

In the mean time Surenas, not knowing whether Surenas Cassius and Cassius had retired to Carthage, or chosen a different route; in order to be informed of the truth, he sent Cnemon to confer with Caesarianus, and take his measures accordingly, despatched a messenger, who spoke the Roman language, to the city of Carthage, enjoining him to approach the walls, and acquaint Cassius himself, or Cassius, that the Parthian general was inclined to enter into a treaty with them, and demanded a conference. Both the proconsul and his questor Cassius spoke from the walls with the messenger; and, accepting the proposal with great joy, desired that the time and place for an interview might be immediately agreed upon. The messenger withdrew, promising to return quickly with an answer from Surenas: but that general no sooner understood that Cassius and Cassius were in Carthage, than he marched thither with his whole army; and, having invested the place, acquainted the Romans, that if they expected any favourable terms, they must deliver up Cassius and Cassius to him in chains. Hereupon a council of the chief officers being summoned, it was thought expedient to retire from Carthage that very night, and seek for another asylum. It was of the utmost importance that none of the inhabitants of Carthage should be acquainted with their design till the time of its execution; but Cassius, whose whole conduct evidently shows that he was blinded, as Dio Cassius observes, by some divinity, imparted the whole matter in confidence to one Andromachus, choosing him for his guide, and relying injudiciously on the fidelity of a man whom he scarce knew. Andromachus immediately acquainted Surenas with the design of the Romans; promising at the same time, as the Parthians did not engage in the night, to manage matters so, that they should not get out of his reach before daybreak. Pursuant to his promise, he led them through many windings and turnings, till he brought them into deep marshy grounds where the infantry were up to the knees in mire. Then Cassius, suspecting that their guide had led them into these bogs with no good design, refused to follow him any longer; and returning to Carthage, took his route towards Syria, which he reached with 500 horse. Octavius, with 5000 men under his command, being conducted by trusty guides,
Parthia gained the mountains called by Plutarch and Appian Sarmiac, and there intrenched himself before break of day.

As for Crassus, he was still entangled in the marshes, when Surenas, at the rising of the sun, overtook him, and invested him with his cavalry. The proconsul had with him four cohorts, and a small body of horse; and with these he gained, in spite of all opposition, the summit of another hill within 12 furlongs of Octavius; who seeing the danger that threatened his general, flew to his assistance, first with a small number of his men, but was soon followed by all the rest, who, being ashamed of their cowardice, quitted their post, though very safe, and charging the Parthians with great fury, disengaged Crassus, and obliged the enemy to abandon the hill. Upon the retreat of the enemy, they formed themselves into a hollow square; and placing Crassus in the middle, made a kind of rampart round him with their bucklers, resolutely protesting, that none of the enemy’s arrows should touch their general’s body, till they were all killed fighting in his defence. Surenas, loth to let so fine a prey escape, surrounded the hill, as if he designed to make a new attack: but, finding his Parthians very backward, and not doubting but the Romans, when night came on, would pursue their march, and get out of his reach, he had recourse again to artifice; and declared before some prisoners, whom he soon after set at liberty, that he was inclined to treat with the proconsul of a peace; and that it was better to come to a reconciliation with Rome, than to sow the seeds of an eternal war, by shedding the blood of one of her generals.

Agreeable to this declaration, Surenas, as soon as the prisoners were released, advanced towards the hill where the Romans were posted, attended only by some of his officers, and, with his bow unstrung, and open arms, invited Crassus to an interview. So sudden a change seemed very suspicious to the proconsul; who therefore declined the interview, till he was forced, by his own soldiers, to intrust his life with an enemy whose treachery they had all experienced; for the legionaries flocking round him, not only abused him in an outrageous manner, but even menaced him if he did not accept of the proposals made him by the Parthian general. Seeing, therefore, that his troops were ready to mutiny, he began to advance, without arms or guards, towards the enemy, after having called the gods and his officers to witness the violence his troops offered him; and intreated all who were present, but especially Octavius and Petronius, two of the chief commanders, for the honour of Rome their common mother, not to mention, after his death, the shamefuil behaviour of the Roman legionaries. Octavius and Petronius could not resolve to let him go alone; but attended him down the hill, as did likewise some legionaries, keeping at a distance. Crassus was met at the foot of the hill by two Greeks who, dismounting from their horses, saluted him with great respect; and desired him in the Greek tongue, to send some of his attendants, who might satisfy him that Surenas, and those who were with him, came without arms. Hereupon Crassus sent two brothers, of the Roscian family; but Surenas having caused them to be seized, advanced to the foot of the hill, mounted on a fine horse, and attended by the chief officers of his army. Crassus, who waited for the return of his two messengers, was surprised to see himself prevented by Surenas in person, when he least expected it. The Parthian general, perceiving, as he approached Crassus, that he was on foot, cried out, in a seeming surprise, “What do I see? a Roman general on foot, and we on horseback! Let a horse be brought for him immediately.” “You need not be surprised (replied Crassus): we are come only to an interview, each after the custom of his country.” “Very well (answered Surenas), there shall be henceforth a lasting peace between King Orodes and the people of Rome: but we must sign the articles of it on the banks of the Euphrates; for you Romans do not always remember your conventions.” Crassus would have sent for a horse; but a very stately one with a golden bit, and richly caparisoned, was brought to him by a Parthian; which Surenas presenting to him, “Accept this horse from my hands (said he), which I give you in the name of my master King Orodes.” He had scarce uttered these words, when some of the king’s officers, taking Crassus by the middle, set him upon the horse, which they began to whip with great violence before them in order to make him quicker his pace. Octavius, offended at this insult, took the horse by the bridle; Petronius and the few Romans who were present, seconded him, and flocking all round Crassus, stopped his horse. The Parthians endeavoured to repulse them, and clear the way for the proconsul; whereupon they began to justle and push one another with great tumult and disorder. At last, Octavius, drawing his sword, killed one of the king’s grumes; but, at the same time, another coming behind Octavius, with one blow laid him dead at his feet. Both parties fought with great resolution, the Parthians striving to carry off Crassus, and the Romans to rescue him out of their hands. In this scuffle most of the Romans who came to the conference were killed; and amongst the rest Crassus himself; but whether by a Roman or a Parthian is uncertain.

Upon his death, the rest of the army either surrendered to the enemy, or dispersing in the night, were pursued, and put to the sword. The Romans lost in this campaign at least 30,000 men; of which 20,000 were killed, and 10,000 taken prisoners.

When the battle of Carrhae was fought, King Orodes was in Armenia, where he had made peace with Artabazus. While the two kings were solemnizing their new alliance with expensive and public feasts, Styliaces or Syllaces, a Parthian officer, whom Surenas had sent with the news of his late victory, and the head of Crassus as a proof of it, arrived in the capital of Armenia. The transports of joy which Orodes felt at this sight, and these news, are not to be expressed; and the lords of both kingdoms, who attended their sovereigns, raised loud and repeated songs of joy. Styliaces was ordered to give a more particular and distinct account of that memorable action; when which he had done, Orodes commanded melted gold to be poured into Crassus’s mouth; reproaching him thereby with avarice, which had been always his predominant passion.

Surenas did not long enjoy the pleasure of his victory; for Orodes, jealous of his power and authority among to death by the Parthians, soon after caused him to be put to death, Orodes.

Pacorus, the king’s favourite son was put at the head of the army; and, agreeably to his father’s directions, invaded Syria: but he was driven out from thence with great loss by Cicero and Cassius, the only general who survived the defeat of Crassus. After this we find no mention
against his countrymen. But Phraates justly dreading the consequences of such a person’s defection, sent a solemn embassy to invite him home on such terms as he should think fit to accept; which greatly provoked Anto-
yon; though he did not hinder him from returning, lest others should thereby be discouraged from coming over to him. He therefore dismissed him with great civility, sending ambassadors at the same time to Phraates to treat of a peace. Thus he hoped to divert the Parthian monarch’s attention from making the necessary prepara-
tions for war, and that they should be able to fall upon him in the spring when he was in no condition to make resistance. But herein he was greatly disappointed; for on his arrival at the Euphrates, which he intended to pass, and enter the Parthian dominions on that side, he found all the passes so well guarded, that he thought proper to enter Media with a design first to reduce that country, and then to enter Parthia.

This plan had been suggested to him by Artabazus king of Armenia, who in the end betrayed him; for instead of conducting the army the straight way from Zeugma on the Euphrates, to the Araxes which part ed Media from Armenia, and which was about 300 miles distant from the place whence he first set out, Artabazus led them over the rocks and mountains so far about, that the army had marched above 1000 miles before they reached the borders of Media, where they intended to begin the war. Thus they were not only greatly fatigued but had not sufficient time, the year being far spent, to put in execution the design on which they had come. However, as Antony was impatient to get back to Cleopatra, he left behind him most of the baggage of the army, and 300 wagons loaded with battering rams and other military engines for sieges; appointing Statianus, one of his lieutenants, with a body of 10,000 men, to guard them, and to bring them, by slow marches, after the army. With the rest of the forces he marched more than 300 miles before the rest, without allowing his men any respite till he arrived at Praaspa or Phrabata, the capital of Media, which he immediately invested. But the Parthians, well knowing that he could not make any progress without his military machines, passed by his army, in order to attack Statianus; which they did with success, by the body commanded by him were all to a man cut off, Ten thousand and all their military engines taken, among which was a battering ram 80 feet long.

Antony, notwithstanding this disaster, continued the siege of Praaspa; but was daily harassed by sallies of the garrison from within, and the enemy’s army without. At last he began to think of a retreat when his provisions were almost exhausted, finding it impossible to become master of the city. But as he was to march 300 miles through the enemy’s country, he thought proper first to send ambassadors to the Parthian monarch, acquainting him that the Roman people were willing to allow him a peace, provided he would restore the standards and prisoners taken at Carrhae. Phraates received the ambassadors, sitting on a golden throne; and, after having bitterly inveighed against the avarice and unbounded ambition of the Romans, told them that he would not part with the standards and prisoners; but that if Antony would immediately raise the siege of Praaspa, he would suffer him to retire unmolested.

Antony, who was reduced to great straits, no sooner received
Parthia. received this answer than he broke up the siege, and marched towards Armenia. However, Phraates was not so good as his word; for the Romans were attacked by the enemy no fewer than 18 times on their march, and were thrice in the utmost danger of being cut off. A famine also raged in the Roman army; upon which they began to desert to the enemy; and indeed Antony would probably have been left by himself, had not the Parthians, in a very cruel as well as impolitic manner, murdered all those who fled to them in sight of the rest. At last, after having lost 32,000 men, and being reduced to such despair that he was with difficulty prevented from laying violent hands on himself, he reached the river Araxes; when his men, finding themselves out of the reach of the enemy, fell down on the ground, and kissed it with tears of joy.

Antony was no sooner gone, than the kings of Media and Parthia quarrelled about the booty they had taken; and after various contests Phraates reduced all Media and Armenia. After this, being exalted by his conquests, he oppressed his subjects in such cruel and tyrannical manner, that a civil war took place, in which the competitors were alternately driven out and restored, till the year 50, when one Vologeses, the son of Gortazes, a former king, became peaceable possessor of the throne. He carried on some wars against the Romans, but with very indifferent success, and at last gladly consented to a renewal of the ancient treaties with that powerful people.

From this time the Parthian history affords nothing remarkable till the reign of the emperor Trajan; when the Parthian king, by name Cosrodes, infringed the treaty with Rome, by driving out, the king of Armenia. Upon this Trajan, who was glad of any pretence to quarrel with the Parthians, immediately hastened into Armenia. His arrival there was so sudden and unexpected, that he reduced almost the whole country without opposition; and took prisoner Parthamaspis, the king whom the Parthians had set up. After this he entered Mesopotamia, took the city of Nisibis, and reduced to a Roman province the whole of that wealthy country.

Early in the spring of the following year, Trajan, who had kept his winter quarters in Syria, took the field again; but was warmly opposed by Cosrodes. He selected him encamped on the banks of the Euphrates, with that design to dispute his passage; which he did with much vigour, that the emperor, after having several times attempted to ford that river, and been always repulsed with great slaughter, was obliged to cause boats to be built on the neighbouring mountains, which he privately conveyed from thence on carriages to the water side; and having in the night time formed a bridge with them, he passed his army the next day; but not without great loss and danger, the Parthians harassing his men the whole time with incessant showers of arrows, which did great execution. Having gained the opposite bank, he advanced boldly into Assyria, the Parthians flying everywhere before him, and made himself master of Arbelia. Thence he pursued his march; subduing, with incredible rapidity, countries where the Roman standard had never been before displayed. Babylonia, or the province of Babylon, voluntarily submitted to him. The city itself was, after a vigorous resistance, taken by storm; by which means he became master of all Chaldea and Assyria, the two richest provinces of the Parthian empire. From Babylon he marched to Ctesiphon, the metropolis of the Parthian monarchy; which he besieged, and at last reduced. But as to the particulars of these great conquests, we are quite in the dark; this expedition, however glorious to the Roman name, being rather hinted at than described, by the writers of those times. While Trajan was thus making war in the heart of the enemy's country, Cosrodes, having recruited his army, marched into Mesopotamia, with a design to recover that country, and cut off all communication between the Roman army and Syria. On his arrival in that province, the inhabitants flocked to him from all parts; and most of the cities, driving out the garrisons left by Trajan, opened their gates to him. Hereupon the emperor detached Lucius and Maximus, two of his chief commanders, into Mesopotamia, to keep such cities in awe as had not revolted, and to open a communication with Syria. Maximus was met by Cosrodes; and having ventured a battle, his army was entirely defeated, and himself killed. But Lucius being joined by Eucruisis and Clarus, two other commanders sent by Trajan with fresh supplies, gained considerable advantages over the enemy, and retook the cities of Nisibis and Seleucia, which had revolted.

And now Trajan, seeing himself possessed of all the best and most fruitful provinces of the Parthian empire, but at the same time being well aprized that he could not, without a vast expense, maintain his conquests, nor keep in subjection so fierce and warlike a people at such a distance from Italy; resolved to set over them a king of his own choosing, who should hold the crown of him and his successors, and acknowledge them as his lords and sovereigns. With this view he repaired to Ctesiphon; and having there assembled the chief men of the nation, he crowned one of the royal family, by name Parthanaspatas, king of Parthia, obliging all who were present to pay him their allegiance: He chose Parthanaspatas as king by the Roman emperor, but not after the king in the Roman empire, but not after the king had joined him at his first entering the Parthian dominions, conducted him with great fidelity, and shown on all occasions an extraordinary attachment to the Romans. Thus the Parthians were at last subdued, and their kingdom made tributary to Rome. But they did not long continue in this state of subjection: for they no sooner heard of Trajan's death, which happened shortly after, than, taking up arms, they drove Parthanaspatas from the throne; and recalling Cosrodes, who had retired into the country of the Hycranians, openly revolted from Rome. Adrian, who was then commander in chief of all the forces in the east, and soon after acknowledged emperor by the army, did not wish, though he was at that time in Syria with a very numerous army, to engage in a new war with the Parthians; but contented himself with preserving the ancient limits of the empire, without any ambitious prospects of further conquests. Therefore, in the beginning of his reign, he abandoned those provinces beyond the Euphrates which Trajan had conquered; withdrew the Roman garrisons from Mesopotamia; and, for the greater safety of other places, made the Euphrates the boundary of, and barrier in, those parts, posting his legions along the banks of that river.

Cosrodes died after a long reign, and was succeeded by his eldest son Vologeses: in whose reign the Albs, breaking into Media, then subject to the Parthians, committed
against the only nation that was then formidable to Partibus.

Home. But he had no sooner crossed the Euphrates

than Vologeses recovered all the provinces except

Mesopotamia, which he had reduced. These expeditions

were chargeable to the Romans, and cost them much

blood, without reaping any advantages from them; for

as they had not sufficient forces to keep in awe the pro-

vinces they had subdued, the inhabitants, greatly attach-

ed to the family of Arsaces, never failed to return to

their ancient obedience as soon as the Roman armies

were withdrawn. Vologeses was soon after engaged in

a war still more troublesome and destructive, with

his brother Artabanus, who, encouraged by some of the

discontented nobles, attempted to rob him of the

crown, and place it on his own head. Vologeses gained

several victories over his brother and rebellious

subjects; but died before he could restore the empire to its former

tranquillity.

Artabanus, who had a numerous army at his devo-

tion, did not meet with any opposition in seizing the

throne, vacant by the death of his brother, though

Tiridates had a better title to it, as being his elder

brother. He had scarce settled the affairs of his king-

dom, when the emperor Caracalla, desirous to signa-

lize himself as some of his predecessors had done,

by some memorable exploit against the Parthians, sent

a solemn embassy to him, desiring his daughter in

marriage. Artabanus, overjoyed at this proposal, which

he thought would be attended with a lasting peace

between the two empires, received the ambassadors

with all possible marks of favour, and readily

complied with their request. Soon after, Caracalla

sent a second embassy to acquaint the king that he

treached the throne was coming to solemnize the nuptials; whereupon Arta-

abanus went to meet him, attended with the chief of the

nobility and his best troops, all unarmed, and in

most pommous habits: but this peaceable train no sooner

approached the Roman army, than the soldiers, on a signal

given them, falling upon the king's retinue, made a

terrible slaughter of the unarmed multitude, Ar-

tabanus himself escaping with great difficulty. The

treacheryous Caracalla, having gained by this exploit

booby, yet, as he thought, no less glory, wrote a

long and boasting letter to the senate, assuming the title of

Particus for this piece of treachery; as he had be-

fore that of Germanicus, for murdering, in like manner,

some of the German nobility.

Artabanus, resolving to make the Romans pay dear

for their inhuman and barbarous treachery, raised the

most numerous army that had ever been known in Par-

thia, crossed the Euphrates, and entered Syria, put-

ting all to fire and sword. But Caracalla being mur-

dered before this invasion, Macrinus, who had suc-

ceeded him, met the Parthians at the head of a mighty

army, composed of many legions, and all the auxilia-

ries of the states of Asia. The two armies no soon-

er came in sight of each other, but they engaged with

the utmost fury. The battle continued two days; but

both Romans and Parthians fighting so obstinately,

that only parted them, without any apparent

advantage on either side; though both retired when

night had put an end to the contest, crying victory.

The field of battle was covered with two dead bod-

ies, there being already above 40,000 killed, in-

cluding both Romans and Parthians: nevertheless,

Artabanus,
PARTIALITY. See Self-partiality and Pre-
judice.

PARTICIPLE, in Grammar, an adjective formed
of a verb; so called because it participates partly of
the properties of a noun, and partly of those of a verb. See
Grammar.

PARTICLE, in Physics, the minute part of a
body, an assemblage of which constitutes all natural
bodies.

In the new philosophy, particle is often used in
the same sense with atom in the ancient Epicurean
philosophy, and corpuscle in the later. Some writers,
however, distinguish them; making particle an assem-
blage or composition of two or more primitive and
physically indivisible corpuscles or atoms; and cor-
puscle, or little body, an assemblage or mass of several
particles or secondary corpuscles. The distinction,
however, is of little moment; and, as to most purposes
of physics, particle may be understood as synonymous
with corpuscle. Particles are then the elements of
bodies: it is the various arrangement and texture of
these, with the difference of the cohesion, &c., that
constitute the various kinds of bodies, hard, soft, liq-
uid, dry, heavy, light, &c. The smallest particles or
corpuscles cohere, with the strongest attractions, and
always compose larger particles of weaker cohesion;
and many of these cohering compose larger particles,
whose vigour is still weaker; and so on for divers suc-
cessions, till the progression end in the largest par-
ticles, on which the operations in chemistry, and the
colours of natural bodies, depend, and which, by coher-
ing, compose bodies of sensible bulks.

The cohesion of the particles of matter, according
to the Epicureans, was effected by hooked atoms; the
Aristotelians thought it managed by rest, that is, by
nothing at all. But Sir Isaac Newton shows it is by
means of a certain power whereby the particles mutually
attract or tend toward each other, which is still per-
haps giving a fact without a cause. By this attraction
of the particles he shows that most of the phenomena
of the lesser bodies are effected, as those of the heavenly
bodies are by the attraction of gravity. See Attraction
and Cohesion.

PARTICLE, a term in Theology, used in the Latin
curch for the crumbs or little pieces of consecrated
bread, called in the Greek church μεσον. The Greeks
have a particular ceremony, called το μεσον, of the
particles, wherein certain crumbs of bread, not con-
secrated, are offered up in honour of the Virgin, St John
Baptist, and several other saints. They also give them
the name of προσφορα, oblation. Gabriel archbishop of
Philadelphia wrote a little treatise express το μεσον,
wherein he endeavours to show the antiquity of this
ceremony, in that it is mentioned in the litur-
gies of St Chrysostom and Basil. There has been
much controversy on this head between the reformed
and catholic divines. Aubertin and Blondel explain
a passage in the theory of Germanus patriarch of Con-
stantinople, where he mentions the ceremony of the
particles as in use in his time, in favour of the former;
Messieurs de Port Royal contest the explanation; but
M. Simon, in his notes on Gabriel of Philadelphia,
endeavours to show that the passage itself is an inter-
polation, not being found in the ancient copies of Ger-
manus,
Particle, consequently that the dispute is very ill grounded.

**Organic Particles.** are those small moving bodies which are imperceptible without the help of glasses; for besides those animals which are perceptible to the sight, some naturalists reckon this exceedingly small species as a separate class, if not of animals properly so called, at least of moving bodies, which are found in the semen of animals, and which cannot be seen without the help of the microscope. In consequence of these observations, different systems of generation have been proposed concerning the spermatic worms of the male and the eggs of the female. In the second volume of Buffon's *Natural History,* several experiments are related, tending to show that those moving bodies which we discover by the help of glasses in the male semen are not real animals, but organic, lively, active, and indestructible molecules, which possess the property of becoming a new organized body similar to that in which they were extracted. Buffon found such bodies, he female as well as in the male semen; and he supposes that the moving bodies which are observed with the microscope in infusions of the germs of plants are likewise vegetable organic molecules. Neecham, Wirgrib, Spalanzani, and several other writers on the animal economy, have pursued the same track with M. de Buffon.

Some suppose that these organic molecules in the semen answer no purpose but to excite the venereal desire: but such an opinion cannot be well founded; for eunuchs, who have no seminal liquor, are nevertheless subject to venereal desire. With respect to the beautiful experiments which have been made with the microscope on organic molecules, M. Bonnet, that learned and excellent observer of nature, remarks that they seem to carry us to the farthest verge of the sensible creation, did not reason teach us that the smallest visible globule of seminal liquor is the commencement of another universe, which, from its infinite smallness, is beyond the reach of our best microscopes.—**Animacule.** Properly so called, must not be confounded with the wonderful organic particles of Buffon. See Animacule.

**Particle,** in Grammar, a denomination for all those small words that tie or unite others, or that express the modes or manners of words. See Grammar.

**Parting,** in Chemistry and Metallurgy; an operation by which gold and silver are separated from each other. See Chemistry, and Ore, Reduction of.

**Partisan,** in the art of war, a person-dexterous in commanding a party; who, knowing the country well, is employed in getting intelligence, or surprising the enemy's convoys, &c. The word also means an officer sent out upon a party, with the command of a body of light troops, generally under the appellation of the partisan's corps. It is also necessary that this corps should be composed of infantry, light horse, and dragoons.

**Partnership,** is a contract among two or more persons, to carry on certain business, at their joint expense, and share the gain or loss which arises from it. Of this there are four kinds.

1. Occasional joint trade, where two or more merchants agree to employ a certain sum in trade, and divide the gain or loss, so soon as the adventure is brought to an issue. This kind of contract being generally private, the parties concerned are not liable for each other. If one of them purchase goods on trust, the furnishor, who grants the credit through confidence in him alone, has no recourse, in case of his insolvency, against the other partners. They are only answerable for the share of the adventure that belongs to the insolvent partner.

If it be proposed to carry the adventure farther than originally agreed on, any partner may withdraw his interest; and if it cannot be separated from the others, may insist that the whole shall be brought to an issue.

II. Standing companies, which are generally established by written contract between the parties, where the stock, the firm, duration, the division of the gain or loss, and other circumstances, are inserted.

All the partners are generally authorized to sign by the firm of the company, though this privilege may be confined to some of them by particular agreement. The firm ought only to be subscribed at the place where the copartnery is established. If a partner has occasion, when absent, to write a letter relating to their affairs, he subscribes his own name on account of the company. When the same partners carry on business at different places, they generally choose different firms for each. The signature of each partner is generally sent to new correspondents; and when a partner is admitted, although there be no alteration in the firm, his signature is transmitted, with an intimation of the change in the copartnery to all their correspondents. Houses that have been long established, often retain the old firm, though all the original partners be dead or withdrawn.

The powers of each partner are, in general discretionary; but they ought not to act, in matters of importance, without consulting together, when there is an opportunity. No partner is liable to make good the loss arising from his judging wrong in a case where he had authority to act. If he exceeds his power, and the event prove unsuccessful, he must bear the loss; but if it prove successful, the gain belongs to the company: yet if he acquaints the company immediately of what he has done, they must either acquiesce therein, or leave him the chance of gain, as well as the risk of loss.

All debts contracted under the firm of the company are binding on the whole partners, though the money was borrowed by one of them for his private use, without the consent of the rest. And if a partner exceeds his power, the others are nevertheless obliged to implement his engagements; though they may render him responsible for his misbehaviour.

Although the sums to be advanced by the partners be limited by the contract, if there be a necessity for raising more money to answer emergencies or pay the debts of the company, the partners must furnish what is necessary, in proportion to their shares.

A debt to a company is not cancelled by the private debts of the partner: and when a partner becomes insolvent, the company is not bound for his debts beyond the extent of his share.

The debts of the company are preferable, on the company's effects, to the private debts of the partners.

Partnership is generally dissolved by the death of a
PARTNERSHIP.

When partnership is dissolved, there are often outstanding debts that cannot be recovered for a long time, and effects that cannot easily be disposed of. The partnership, though dissolved in other respects, still subsists for the management of its outstanding affairs: and the money arising from them is divided among the partners, or their representatives, when it is recovered. But as this may postpone the final settlement of the company's affairs to a very inconvenient length, other methods are sometimes used to bring them to a conclusion, either in consequence of the original contract, or by agreement at the time of dissolution. Sometimes the debts and effects are sold by auction; sometimes they are divided among the partners; and when there are two partners, one divides them into shares, as equal as possible, and the other chooses either share he thinks best.

If a partner withdraws, he continues responsible for his former partners till it be publicly known that he hath done so. A deed of separation, registered at a public office, is sufficient presumption of such notoriety.

IV. Companies, where the business is conducted by officers. There are many companies of this kind in Britain, chiefly established for purposes which require a larger capital than private merchants can command. The laws with respect to these companies, when not confirmed by public authority, are the same as the former, but the articles of their agreement usually very different. The capital is condoned in on; and divided into a certain number of shares, whereof each partner may hold one or more, but is generally restricted to a certain number. Any partner may transfer his share; and the company must admit his assignee as a partner. The death of the partners has no effect on the company. No partner can act personally in the affairs of the company; but the execution of their business is intrusted to officers, for whom they are responsible; and, when the partners are numerous, the superintendence of the officers is committed to directors chosen annually, or at other appointed times, by the partners.

IV. Companies incorporated by authority. A royal charter is necessary to enable a company to hold lands, to have a common seal, and enjoy the other privileges of a corporation. A charter is sometimes procured, in order to limit the risk of the partners: for, in every private company, the partners are liable for the debts, without limitation; in incorporated societies, they are only liable for their shares in the stock of the society. The incorporation of societies is sometimes authorized by act of parliament: but this high authority is not necessary, unless for conferring exclusive privileges.

Mr. Paley says, "I know of nothing upon the subject of partnership that requires explanation, but how the profits are to be divided where one partner contributes money and the other labour, which is a common case.

"Rule. From the stock of the partnership deduct the sum advanced, and divide the remainder between the moneys of the labour, and the moneys of the labour. Let the interest of the money to the wages of the labour, allowing such a rate of interest as money might be borrowed for upon the same security, and such wages as a journeyman would require for the same labour and trust.

"Example. A advances 1000l. but knows nothing of the business; B produces no money, but has been brought up to the business, and undertakes to conduct it. At the end of the year the stock and effects of the partnership amount to 1300l. Consequently there are 200l. to be divided. Now nobody would lend money upon the event of the business succeeding, which is A's security, under 6 per cent. Therefore A must be allowed 60l. for the interest of his money. B, before he engaged in the partnership, earned 30l. a-year in the same employment: his labour, therefore, ought to be valued at 30l. and the 200l. must be divided between the partners in the proportion of 60 to 30; that is, A must receive 133l. 6s. 8d. and B 66l. 13s. 4d. If there be nothing gained, A loses his interest, and B his labour, which is right. If the original stock be diminished, by this rule B loses only his labour as before; whereas A loses his interest and part of the principal; for which eventual disadvantage A is compensated, by having the interest of his money computed at 6 per cent. in the division of the profits when there is any. It is true, that the division of the profit is seldom forgotten in the constitution of the partnership; and is therefore commonly settled by express agreement; but these agreements, to be equitable, should pursue the principle of the rule here laid down. All the partners are bound by what any one of them does in the course of the business; for quoad hoc, each partner is considered as an authorized agent for the rest.

PARTRIDGE, a species of bird. See Tetrao.

ORNITHOLOGY Index.

The partridge is so valuable at the table, that a great many ways of taking it have been invented by sportsmen, all of which suceed from the natural folly and timidity of the animal.

They partridges delight in most are corn fields, especially whilst the corn grows, for under that cover they shelter and breed: neither are those places unfrequented by them when the corn is cut down, by reason of the grain they find there, especially in wheat, staddle, the height of which they delight in, being to them as a covert or shelter. When the wheat staddle is much trodden by men or beasts, they then betake themselves to the barley staddle, provided it be fresh and untrodden; and they will, in the furrows, amongst the clots, branches, and long grass, hide both themselves and covesies, which are sometimes 20 in number, nay, 30 in a covey.

When the winter season is arrived, and the staddle fields are ploughed up, or over-soiled with cattle, partridges resort into the upland meadows, and lodge in the dead grass, or fog, under hedges, amongst mole holes, or under the roots of trees; sometimes they resort to
Partridge to coppices and underwoods, especially if any corn
fields are adjacent, or where there is grown broom,
brakes, fern, &c.

In the harvest time, when every field is full of men and
cattle, in the day time they are found in the fallow
fields which are next adjoining to the corn fields, where
they lie lurking till evening or morning, and then they
seek among the sheaves of corn.

When their haunts are known, according to the situation
of the country and season of the year, the next
care must be to find them out in their haunts, which is
done several ways. Some do it by the eye only; and
this art can never be taught, but learned by frequent
experience, the colour of the birds being so like that of
the earth at a distance, that no eye but a very conversant
one could distinguish them. When they are once
seen, the business is to keep the eye upon them, and
then to keep in continual motion. They are a very
lazy bird, and by this means will let a person almost
tread upon them; though if the person stands still to
eye them, they will rise immediately though they be
at a considerable distance.

Another method of discovering them is, by going
to their haunts very early in the morning, or at the
close of the evening, which is called the jucking time.
The noise of the cock partridge is to be attended to
at this time, and is very loud and earnest. The hen
will soon come up to the cock after her: making the
noise, which she does by way of answer; and when
they are got together, their chattering will discover
them. Thus they may always be found at these times.
But there is yet a better method of finding this bird,
which is by the call. The business, in order to have
success in this way, is carefully to learn the notes of
the partridge, and be able to imitate all the several
sounds. When perfect in this, the person is to go to
the haunts morning and evening, and placing himself
in some place where he can see the birds without being
seen by them, he is to listen to their calling; and when
they are heard, he is to answer in the same notes,
doubting again as they do: by continuing this, they
may be brought so near, that the person lying down
on his back may count their whole number. Having
in this manner found where the birds are, the next case
is to catch them.

They are so foolish, that it is extremely easy to take
them in nets. In order to this, there needs no more
that the going out, provided with two or three nets,
with meshes somewhat smaller than those of the pleas
sant nets, and walking round about the covert, a net
is to be fixed so as to draw over them, on pulling a
line at a distance. All this may be easily done; for
so long as the sportsman continues moving about, and
does not fix his eye too intensely upon them, they will
let him come near enough to fix the net without mov
ing. If they lie so straggling, that one net will not
cover them, then two or three must be fixed in the same
manner. The sportsman may then draw the nets over
them, and they will often lie still with the nets upon
them till he comes up to fright them; then they will
rise and be entangled in the net.

A second method of taking them is with bird time:
this is done by means of wheat-straws. These must
be large, and cut off between knot and knot; they
must be well lined with the best and strongest bird
lime, and the sportsman must carry a great number out
with him. Having found a field where there are par
tridges, he is to call; and if they answer, he is then to
stick up the linned straws in rows across two or three
lands, and going backward, call again to them, lead
ning them on in the road where the straws are: they will
follow one another like a flock of chickens, and come
out to the call; and will in their way run upon the
straws, and lining themselves they will daub one anoth
er by crowding together, so that very few of them
will be able to escape.

But there is yet a pleasanter way of taking them
than this, that is, by driving of them. In order to this,
an engine is to be made of canvas stuffed with straw,
to represent a horse; this horse and nets are to be taken
to the haunts of the partridges, and the nets being
placed slanting or slopwise in the lower part of the field,
the sportsman is to take the wind in his back and get
above them, driving them downwards; his face is to
be covered with something green or blue, and placing
the horse before him, he is to go towards them slowly
and gently; and by this means they will be raised on
their legs, but not on their wings, and will run before
the horse into the nets. If in the way they go into a
wrong path, the horse is to be moved to face them;
and they will be thus driven back again, and driven
every way the sportsman pleases.

The partridges of Abyssinia, we are told, are very
large, being as big as cockerels.

In Jeremiah xviii. 11. we have the following curious
passage: "As the partridge sitteth on eggs, and hatcheth
them not; so he that getteth riches, and not by
right, shall leave them in the midst of his days, and at
his end shall be a fool;" which is explained by Mr. Poole
as follows: It is no wonder if we cannot be certain as
to the sense of these words, so far as they concern
natural history, when we are not certain what bird it
is to which this doth relate. We translate it partridge:
others have it to be a cockerel; but certain it is,
that it is the same word which we translate partridge,
(1 Sam. xxvi. 20.); and cockeoos use not to be much
hunted after. How the partridge is said to sit on eggs
and hatch them not, is yet a greater question. It may
be occasioned by many ways, viz., either sitting upon
worn eggs; or being killed before the eggs are hatch
ed; or having its eggs destroyed by the male partridge,
or by some dog or other vermin; or, its nest being
found, having her eggs taken from her, that it is hard
to determine which the prophet means. Of all others,
I least approve of that which Jerome makes the sense,
though the thing be true (if we may believe Cassiodorus
and several natural historians, Aldrovandus, &c.),
that partridges have such a love and desire to hatch
young ones, that having lost their own eggs, they will
steal the eggs of other partridges, and hatch them;
which being hatched, the young ones knowing the cry
of their proper dams, hearing them call, leave the par
tridge that hatched them (which is one thing quoted
by Aldrovandus, to show the sagacity of that bird); but
if this were the sense, the words would be, 'as the par
tridge sitteth on eggs, and hatcheth them, but enjoyeth
them not;' whereas they are, 'hatcheth them not:'
that is, having lost them, either by some man that hath
taken them from her, or by some vermin or wild beast.'
The words in the original are, רָי אָבֶל יִירֵר, which the Septuagint translate ἀργαί ἐνυδρία, &c. "The partridge cried; it gathered together what it had not produced;" and some translate the Hebrew, "The partridge lays many eggs, but does not hatch them all." Le Clerc, upon the authority of Bocchare, understands the Hebrew word קֹרֶה here to signify a woodcock. Le Clerc's translation is as follows: Rosicuta seu colletti, sed non partit; factit sibi dicatum, sed sine jure, meditit suis dicibus eas valde qui, atque ad extremum statua cat.

PARTURITION, the state of bringing forth or being delivered of young. See MIDWIFERY.

PARTY, in a military sense, a small number of men, horse or foot, sent upon any kind of duty; as into an enemy's country to pillage, to take prisoners, and to oblige the country to come under contribution. Parties are often sent out to view the roads and ways, get intelligence, seek forage; to reconnoitre, or amuse the enemy upon a march: they are also frequently sent upon the flanks of any army or regiment, to discover the enemy if near, and prevent surprise or ambush.

PARVICH, an island near Dalmatia, and one of the best peopled and most considerable of those which are under the jurisdiction of Sibenico. It contains a great number of fishermen, and a considerable number of persons employed in agriculture. It contains many Roman antiquities, which evidently show that it was a Roman station. It seems to be among the number of those islands which Pliny calls Coluttes, which is supposed to be an inversion of ortens, which means ill-sounding or noisy. Parvich is not of large extent, but it is extremely fertile. Every product succeeds in perfection there: we mean those products of which a very shallow ground is susceptible; such as wine, oil, mulberry-trees, and fruit. The aspect of this island is also very pleasant at a distance, whereas that of the others adjacent disgusts the eye, by their too high, rocky, and bare hills. The name of Parvich seems to have been given it because it is the first one meets with on going out of the harbour of Sibenico; for the Illyric word parvi signifies first.

PARULIDES, or SONGBIRD, a genus of birds belonging to the order of passerines. See ORNITHOLOGY INDEX.

PASCAL, BLAISE, one of the greatest geniuses and best writers France has produced, was born at Clermont in Auvergne, in the year 1623. His father, Stephen Pascal, born in 1585, and of an ancient family, was president of the court of aide in his province: he was a very learned man, an able mathematician, and a friend of Descartes. Having an extraordinary tenderness for this child, his only son, he quitted his office in his province, and went and settled at Paris in 1631, that he might be quite at leisure for the instruction of him; and Blaise never had any master but his father. From his infancy he gave proofs of a very extraordinary capacity: for he desired to know the reason of every thing; and when good reasons were not given him, he would seek for better; nor would he ever yield his assent but upon such as appeared to him well grounded. There was room to fear, that with such a cast of mind he would fall into free thinking, or at least into heterodoxy; yet he was always very far from any thing of this nature.

What is told of his manner of learning the mathematics, as well as the progress he quickly made in that science, seems almost miraculous. His father, perceiving in him an extraordinary inclination to reasoning, was afraid lest the knowledge of the mathematics would hinder his learning the languages. He kept him therefore as much as he could from all notions of geometry, locked up all his books of that kind, and restrained even from speaking of it in his presence. He could not, however, make his son refrain from nosing upon proportions; and one day surprized him at work with charcoal upon his chamber-floor, and in the midst of figures. He asked him what he was doing? I am searching, says Pascal, for such a thing; which was just the 32d proposition of the first book of Euclid. He asked him then how he came to think of this? It was, says Pascal, because I have found out such another thing; and so going backward, and using the names of bar and round, he came at length to the definitions and axioms he had formed to himself. Does it not seem miraculous that a boy should work his way into the heart of a mathematical book, without ever having seen that or any other book upon the subject, or knowing any thing of the terms? Yet we are assured of the truth of this by Madame Perrier, and several other writers. the credit of whose testimony cannot reasonably be questioned. He had, from henceforward, full liberty to indulge his genius in mathematical pursuits. He understood Euclid's Elements as soon as he cast his eyes upon them: and this was not strange; for, as we have seen, he understood them before. At 16 years of age he wrote a treatise of conic sections, which was accounted by the most learned a mighty effort of genius; and therefore it is no wonder that Descartes, who had been in Holland a long time, should, upon reading it, choose to believe that Mr Pascal the father was the real author of it. At 49, he contrived an admirable arithmetical machine, which was esteemed a very wonderful thing, and would have done credit as an invention to any man versed in science, and much more to such a youth. About this time his health became impaired, and he was in consequence obliged to suspend his labour; nor did he recover a condition to resume them till four years after. About that period, having seen Torricelli's experiment respecting a vacuum and the weight of the air, he turned his thoughts towards these objects; and in a conference with Mr Petit, intendant of fortifications, proposed to make further researches. In consequence of this idea, he undertook several new experiments, one of which was as follows: Having provided a glass tube, 46 feet in length, open at one end, and sealed hermetically at the other, he filled it with red wine, that he might distinguish the liquor from the tube. He then elevated it in this condition; and having placed it perpendicularly to the horizon, stopped up the bottom, and plunged it into a vessel full of water, to the depth of a foot; after which he opened the extremity of the tube, and the wine descended to the distance of about 33 feet from the surface of the vessel, leaving a considerable vacuum at the upper extremity. He next inclined the tube, and remarked that the wine rose higher: and having inclined it till the top was within 32 feet of the ground,
Pascal, ground, making the wine thus run out, he found that the water rose in it, so that it was partly filled with that fluid, and partly with wine. He made also a great many experiments with siphons, syringes, bellows, and all kinds of tubes, making use of different liquors, such as quicksilver, water, wine, oil, &c.; and having published them in 1647, dispersed his work throughout all France, and transmitted it also to foreign countries. All these experiments, however, ascended effects, without demonstrating the causes. Pascal knew that Torricelli conjectured that those phenomena which he had observed were occasioned by the weight of the air (1); and, in order to discover the truth of this theory, he made an experiment at the top and bottom of a mountain in Auvergne, called Le Puy de Dome, the result of which gave him reason to conclude that air was weighty. Of this experiment he published an account, and sent copies of it to most of the learned men in Europe. He likewise renewed it at the top of several high towers, such as those of Notre Dame at Paris, St Jacques de la Boucherie, &c.; and always remarked the same difference in the weight of the air, at different elevations. This convinced him of the weight of the atmosphere; and from this discovery he drew many useful and important inferences. He composed also a large treatise, in which he thoroughly explained this subject, and replied to all the objections that had been started against it. As he thought this work rather too prolix, and as he was fond of brevity and precision, he divided it into two small treatises, one of which he entitled, A Dissertation on the Equilibrium of Liquors; and the other, An Essay on the Weight of the atmosphere. These labours procured Pascal so much reputation, that the greatest mathematicians and philosophers of the age proposed various questions to him, and consulted him respecting such difficulties as they could not solve.—Some years after, while tormented with a violent fit of the toothache, he discovered the solution of a problem proposed by Father Mersenne, which had baffled the penetration of all those who had attempted it. This problem was to determine the curve described in the air by the nail of a coach-wheel, while the machine is in motion. Pascal offered a reward of 40 pistoles to any one who should give a satisfactory answer to it. No one, however, having succeeded, he published his own at Paris; but as he began now to be disgusted with the sciences, he would not put his real name to it, but sent it abroad under that of A. d’Ettenville.—This was the last work which he published in the mathematics; his infirmities now increasing so much, that he was under the necessity of renouncing severe study, and of living so recluse, that he scarcely admitted any person to see him.

After he had thus laboured abundantly in mathematical and philosophical disquisitions, he forsook those studies and all human learning at once; and determined to know nothing, as it were, for the future, but Jesus Christ and him crucified. He was not 24 years of age, when the reading some pious books had put him upon taking this holy resolution; and he became as great a devotee as any age has produced. Mr Pascal now gave himself up entirely to a state of prayer and mortification. He had always in his thoughts these great maxims, of renouncing all pleasure and all superfluity; and this he practised with rigour even in his illnesses, to which he was frequently subject, being of a very invalid habit of body: for instance, when his sickness obliged him to feed somewhat delicately, he took great care not to relish or taste what he ate. He had no violent affection for those he loved; he thought it sinful, since a man possesses a heart which belongs only to God. He found fault with some discourses of his sister, which she thought very innocent; as if she had said upon occasion, that she had seen a beautiful woman, she would be angry, and tell her, that she might raise bad thoughts in footmen and young people. He frequently wore an iron girdle full of points next to his skin; and when any vain thought came into his head, or when he took particular pleasure in any thing, he gave himself some blows with his elbow, to redouble the prickings, and to recall himself to his duty.

Though Mr Pascal had thus abstracted himself from the world, yet he could not forbear paying some attention to what was being done in it; and he even interested himself in the contest between the Jesuits and the Jansenists. The Jesuits, though they had the popes and kings on their side, were yet decried by the people, who brought up after them against them the assassination of Henry the Great, and all the old stories that were likely to make them odious. Pascal went farther; and by his Lettres Provinciales (a), published in 1656, under the name of Louis de Montaigu, made them the

(a) Before this period, all those effects which are now known to be produced by the weight of the atmosphere were attributed to Nature’s abscence of a vacuum.

(b) The origin of these letters was this: for the sake of unbending his mind, Pascal used often to go to Port Royal des Champs, where one of his sisters had taken the veil, and where he had an opportunity of seeing the celebrated Mr Arnaud, and several of his friends. This gentleman’s dispute with the doctors of the Sorbonne, who were endeavouring to condemn his opinions, was of course frequently brought upon the carpet. Mr Arnaud, solicited to write a defence, had composed a treatise, which, however, did not meet with approbation, and which he himself considered as a very indifferent work. Pascal being one day in company, some of those present, who were sensible of his abilities, having said to him, “You who are a young man ought to do something!” he took the hint, and composed a letter, which he showed to his friends, and which was so much admired, that they insisted on its being printed. The object of this letter is an explanation of the terms, next power, sufficient grace, and actual grace; and the author here shows, as well as in two others which followed it, that a regard for the faith was not the motive which induced the doctors of the Sorbonne to enter into dispute with Mr Arnaud, but a desire of oppressing him by ridiculous questions. Pascal, therefore, in other letters which he published afterwards, attacks the Jesuits, whom he believed to be the authors of this quarrel, and in the most elegant style, seasoned with wit and satire, endeavours to render them not only odious but ridiculous.
Pascal. The subject of ridicule. "These letters (says Voltaire) may be considered as a model of eloquence and humour. The best comedies of Molière have not more wit than the first part of these letters; and the sublimity of the latter part of them is equal to any thing in Bossuet. It is true, indeed, that the whole book was built upon a false foundation; for the extravagant notions of a few Spanish and Flemish Jesuits were artfully ascribed to the whole society. Many absurdities might likewise have been discovered among the Dominican and Franciscan casuists; but this would not have answered the purpose; for the whole raitery was to be levelled only at the Jesuits. These letters were intended to prove, that the Jesuits had formed a design to corrupt mankind; a design which no sect or society ever had, or can have." Voltaire calls Pascal the first of their satirists; for Despreaux, says he, must be considered as only the second. In another place, speaking of this work of Pascal, he says, that "examples of all the various species of eloquence are to be found in it. Though it has been now written almost 100 years, yet not a single word occurs in it, savouring of that vices of which living languages are so subject. Here then we are to fix the epocha when our language may be said to have assumed a settled form. The bishop of Lucon, son of the celebrated Busay, told me, that asking one day the bishop of Meaux what work he would covet most to be the author of, supposing his own performances set aside, Bossuet replied, "The Provincial Letters." These letters have been translated into all languages, and printed over and over again. Some have said, that there were decrees of formal condemnation against them; and also that Pascal himself, in his last illness, detested them, and repented of having been a Jansenist: but both these particulars are false and without foundation. Father Daniel was supposed to be the anonymous author of a piece against them, entitled, The Dialogues of Cleander and Eudoxus.

Pascal was only about the age of 30 when these letters were published, yet he was extremely infirm, and his disorders increasing soon after, so much that he conceived his end fast approaching, he gave up all farther thoughts of literary composition. He resolved to spend the remainder of his days in retirement and pious meditation; and with this view he broke off all his former connection, changed his habitation, and spoke to no one, not even to his own domestics. He made his own bed, fetched his dinner from the kitchen, carried it to his apartment, and brought back the plates and dishes in the evening; so that he employed his servants only to cook for him, to go to town, and to do such other things as he could not absolutely do himself. In his chamber nothing was to be seen but two or three chairs, a table, a bed, and a few books. It had no kind of ornament whatever; he had neither a carpet on the floor nor curtains to his bed; but this did not prevent him from sometimes receiving visits; and when his friends appeared surprised to see him thus without furniture, he replied, that he had what was necessary, and that any thing else would be a superfluity, unworthy of a wise man. He employed his time in prayer, and in reading the Holy Scriptures; and he wrote down such thoughts as this exercise inspired. Though his continual infirmities obliged him to use very delicate food, and though his servants employed the utmost care to provide only what was excellent, he never relished what he ate, and seemed quite indifferent whether what they brought him was good or bad. When any thing new and in season was presented to him, and when he was asked, after he had finished his repast, how he liked it, he replied, "You ought to have informed me beforehand, I should have then taken notice of it." His indifference in this respect was so great, that though his taste was not vitiated, he forbade any sauce or ragout to be made for him which might excite his appetite. He took without the least repugnance all the medicines that were prescribed him for the re-establishment of his health; and when Madame Perrier, his sister, seemed astonished at it, he replied ironically, that he could not comprehend how people could ever shew a dislike to a medicine, after being apprised that it was a disagreeable one, when they took it voluntarily; for violence or surprise ought only to produce that effect.

Though Pascal had now given up intense study, and though he lived in the most temperate manner, his health continued to decline rapidly; and his disorders had so enfeebled his organs, that his reason became in some measure affected. He always imagined that he saw a deep abyss on his left side, and he never would sit down till a chair was placed there, to secure him from the danger

this purpose he employs the form of dialogue, and introduces an ignorant person, as men of the world generally are, who requests information respecting the questions in dispute from these doctors, whom he consults by proposing his doubts; and his answers to their replies are so perspicuous, pertinent, and just, that the subject is illustrated in the clearest manner possible. He afterwards exposes the morality of the Jesuits, in some conversations between him and one of their casuists, in which he still represents a man of the world, who seeks for instruction, and who, hearing maxims altogether new to him, seems astonished, but still listens with moderation. The casuist believes that he is sincere, and relishes these maxims; and under this persuasion he discovers every thing to him with the greatest readiness. The other is still surprised; and as this instructor attributes this surprise only to the novelty of his maxims, he still continues to explain himself with the same confidence and freedom. This instructor is a simple kind of man, who is not overburdened with acuteness, and who insensibly engages himself in details which always become more particular. The person who listens, wishing neither to contradict him nor to subscribe to his doctrine, receives it with an ambigous kind of raitery; which, however, sufficiently shows what opinion he entertains of it. The Jesuits reproached the author with having employed only raitery against them, and with having misrepresented several passages of their authors; which induced Pascal to write eight more in vindication of himself. All these letters, in number 18, written in a style altogether new in France, appeared in 4to, one after another, from the month of January 1656, to the month of March of the year following.
danger which he apprehended. His friends did every
thing in their power to banish this melancholy idea from
his thoughts; and to eure him of his error, but without
the desired effect; for though he would become calm
and composed for a little, the phantom would in a few
moments again make its appearance and torment him.
The cause of his seeing this singular vision for the first
time, is said to have been as follows: His physicians,
alarmed on account of the exhausted state to which he
was reduced, had advised him to substitute easy and
agreeable exercise for the fatiguing labours of the closet.
One day, in the month of October 1654, having gone
according to custom to take an airing on the Pont de
Neuilly, in a coach and four, the two first horses sud-
denly took fright, opposite to a place where there was
no parapet, and threw themselves violently into the
Seine; but the traces luckily giving way, the carriage
remained on the brink of the precipice. The shock
which Pascal, in his languishing situation, must have re-
received from this dreadful accident, may easily be im-
gined. It threw him into a fit, which continued for
some time, and it was with great difficulty that he could
be restored to his senses. After this period his brain
became so deranged, that he was continually haunted
by the remembrance of his danger, especially when his
disorders prevented him from enjoying sleep. To the
same cause was attributed a kind of vision or ecstacy that
he had some time after: a memorandum of which he
preserved during the remainder of his life in a bit of pa-
paper, put between the cloth and the lining of his coat,
and which he always carried about him. Some of the
Jesuits had the baseness and inhumanity to reproach this
great genius with the derangement of his organs. In
the Dictionary of Jansenist Books, he is called a hypo-
chondriac, and a man of a strong head and a bad heart.
But, as a celebrated writer has observed, Pascal's dis-
order had in it nothing more surprising or disgraceful
than a fever or the vertigo. During the last years of
his life, in which he exhibited a melancholy example of
the humilitating reverses which take place in this tran-
sitory scene, and which, if properly considered, might
teach mankind not to be too proud of those abilities
which a moment may take from them, he attended
all the salutations (c), visited every church in which
relics were exposed, and had always a spiritual alman-
ack, which gave an account of all those places where
particular acts of devotion were performed. On this
occasion it has been said, that "Religion renders great
minds capable of little things, and little minds capable
of great."

In company, Pascal was distinguished by the amiable-
ness of his behaviour; by his easy, agreeable, and in-
structive kind of conversation, and by great modesty. He
possessed a natural kind of eloquence, which was in a man-
ner irresistible. The arguments he employed for the
most part produced the effect which he proposed; and
though his abilities entitled him to assume an air of su-
periority, he never displayed that haughty and imperio-
sive tone which may often be observed in men of shining
talents. The philosophy of this great man consisted in
renouncing all pleasure, and every superfluity. He not
only denied himself the most common gratificat
but he took also without reluctance, and even with plea-
sure, either as nourishment or as remedies, whatever
was disagreeable to the senses; and he every day re-
trenched some part of his dress, food, or other things,
which he considered as not absolutely necessary. Tow-
ards the close of his life, he employed himself wholly
in pious and moral reflections, writing down those which
he judged worthy of being preserved. The first piece
of paper he could find was employed for this purpose;
and he commonly put down only a few words of each
sentence, as he wrote them merely for his own use. The
bits of paper upon which he had written these thoughts,
were found after his death piled upon different pieces of
string, without any order or connection; and being co-
pied exactly as they were written, they were afterwards
arranged and published.

The celebrated Bayle, speaking of this great man,
says, A hundred volumes of sermons are not of so much
avail as a simple account of the life of Pascal. His hu-
mility and his devotion mortified the libertines more
than if they had been attacked by a dozen of mission-
aries. In a word, Bayle had so high an idea of this
philosopher, that he calls him a paradis in the human
species. "When we consider his character (says he),
we are almost inclined to doubt that he was born of a
woman, like the man mentioned by Lucretius:

"Ut vis humana videatur stirpe creatus."

Mr Pascal died at Paris the 19th of August 1662,
aged 59 years. He had been some time about a work
against atheists and infidels, but did not live long enough
to digest the materials he had collected. What was
found among his papers was published under the title of
Pensees, &c. or Thoughts upon religion and other sub-
jects, and has been much admired. After his death
appeared also two other little tracts; one of which is
intitled, The equilibrium of fluids; and the other, The
weight of the mass of air.

The works of Pascal were collected in five volumes
8vo, and published at the Hague by De Tucne, and at
Paris by Nyhon senior, in 1779. This edition of Pas-
cal's works may be considered as the first published; at
least the greater part of them were not before collected
into one body; and some of them had remained only in
manuscript. For this collection, the public were indebted
to the abbé Boussu, and Pascal deserved to have such
an editor. "This extraordinary man (says he) inher-
ited from nature all the powers of genius. He was a
geometer of the first rank, a profound reasoner, and
a sublime and elegant writer. If we reflect, that in a
very short life, oppressed by continual infirmities, he in-
vented a curious arithmetical machine, the elements of
the calculation of chances, and a method of resolving
various problems respecting the cycloid; that he fixed
in an irrevocable manner the wavering opinions of the
learned respecting the weight of the air; that he wrote
one of the completest works which exist in the French
language; and that in his Thoughts there are passages,

(c) Certain solemn prayers, which are repeated at certain hours, and on certain days, in the Popish
churches.
the depth and beauty of which are incomparable—we shall be induced to believe, that a greater genius never existed in any age or nation. All those who had occasion to frequent his company acknowledged his superiority. His conversation instructed, without making those who heard him sensible of their own inferiority; and he was remarkably indulgent towards the faults of others.

It may be easily seen by his Provincial Letters, and by some of his other works, that he was born with a great fund of humour, which his infirmities could never entirely destroy. In company, he readily indulged in that harmless and delicate raillery which never gives offence, and which greatly tends to enliven conversation; but its principal object generally was of a moral nature. For example, ridiculing those authors who say, My Book, my Commentary, my History; they would do better (added he) to say, Our Book, our Commentary, our History; since there are in them much more of other people's than of their own. An elegant Latin epitaph was inscribed on his tomb. See remarks on his philosophical character, in the First Dissertation, vol. 3d. Supplement. p. 125.

PASchal, something belonging to the passover, or Easter. See Easter and Easter.

PAS-EP-A, the chief of the Lamas, particularly eminent for having invented characters for the Mogula. He was much esteemed by the Chinese, though the literature exclaimed against the manner in which the people demonstrated their affection. There is still at Pekin a myau or temple, built in honour of Pas-ep-a in the time of the Mogul emperors. He died in 1279.

PASIGRAPHY (from κατα, omnis, and γραφει, scribo), the art of writing on any subject whatever, so as to be universally understood by all nations upon earth. The idea of establishing such a language is deemed by many extremely fanciful and absurd, while the practicability of it is as strenuously contended for by others. Hints respecting such a system of writing as might be understood by all mankind, are to be met with in the writings of many eminent philosophers; but such an attempt failed in the hands of Leibnitz, Kircher, a Beccari, a Wilkins, and some others. It is at least to be presumed, that the execution of a pasigraphy, or universal language, will always be found to bear a striking analogy to the chimerical sentiments which were formerly entertained respecting the doctrines of the quadrature of the circle, the multiplication of the cube, the philosopher's stone, or perpetual motion, all of which have been finely ridiculed by Dean Swift in his idea of a circular shot. Kant is clearly of opinion, however, that such a pasigraphy falls within the limits of possibility;—say, he even asserts, that it will actually be established at some future period. And, while none of its admirers venture to bid us believe that it will ever be universally spoken, or understood, they confidently think, that, by means of it, the valuable labours of erudition and human genius will be effectually prevented from ever falling into oblivion. See a Memoir on this subject in Nicholson's Journal. ii. 342. 416.

PASIPHAE, in fabulous history, daughter of the Sun by Perseus, who married Minos king of Crete. She disgraced herself by an unnatural passion for a bull, which we are told she was enabled to gratify by means of the artist Daedalus. This celebrated bull had been given to Minos by Neptune, to be offered on his altars.

But as the monarch refused to sacrifice the animal on account of his beauty, the god revenged his disobedience by inspiring Pasiphaë with an unnatural love for him. This fable, which is universally believed by the poets, who observe, that the minotaur was the fruit of this infamous commerce, is refuted by some writers; who suppose that the infidelity of Pasiphaë to her husband was betrayed in her affection for an officer of the name of Taurus, and that Daedalus, by permitting his house to be the asylum of the two lovers, was looked upon as accessory to the gratification of Pasiphaë's lust. From this amour with Taurus, as it is further remarked, the queen became mother of twins; and the name of Minoteaurus arises from the resemblance of the children to the husband and the lover of Pasiphaë. Minos had four sons by Pasiphaë, Castor, Deucalion, Glaucus, and Androgeus; and three daughters, Hecate, Ariadne, and Phaedra.

PASQUIN, a mutilated statue at Rome, in a corner of the palace of the Urmiu. It takes its name from a cobbler of that city called Pasquin, famous for his shoes and gibs, and who diverted himself by passing his jokes and quips on all that went through that street. After his death, as they were digging up the pavement before his door, they found in the earth the statue of an ancient gladiator, well cut, but maimed and half-spoiled: this they set up in the place, where it was found, and by common consent named it Pasquin. Since that time all satires are attributed to that figure; and are either put into its mouth, or pasted upon it, as if they were written by Pasquin redivivus; and these are addressed by Pasquin to Marforio, another statue at Rome. When Marforio is attacked, Pasquin comes to his assistance; and, when Pasquin is attacked, Marforio assists him in his turn; that is, the people make the statues speak just what they please.

PASQUINADE, a satirical libel fastened to the statue of Pasquin: these are commonly short, witty, and pointed; and from hence the term has been applied to all lampoons of the same kind.

PASS, or PASSADE, in fencing, an advance or leap forward upon the enemy. Of these there are several kinds; as passes within, above, beneath, to the right, the left, and passes under the line, &c. The measure of the pass is when the swords are so near as that they may touch one another.

Pass, in a military sense, a strait and difficult passage, which shuts up the entrance into a country.

Pass Parole, in military affairs, a command given at the head of an army, and thence communicated to the rear, by passing it from mouth to mouth.

Passade, in the manage, is a turn or course of a horse backwards or forwards on the same spot of ground.

Hence there are several sorts of passades, according to the different ways of turning, in order to part or return upon the same tread, which is called closing the passade; as the passade of one time, the passade of five times, and the raised or high passes, into which the demivolts are made into curves. See Horsemanship.

North-west Passade. See North-West Passage.
North-east Passade. See North-East Passage, and Pole.

Right of Passage, in commerce, is an imposition or duty exacted by some princes, either by land or sea, in certain close and narrow places in their territories, on all
has been mentioned by every author who has treated of
them, and needs no explanation; but it is a question of
some importance in the philosophy of the human mind,
whether these different passions be each a degree of an
original and innate disposition, distinct from the disposi-
tions which are respectively the foundations of the other
passions, or only different modifications of one or two
general dispositions common to the whole race.

The former opinion is held by all who build their
system of metaphysics upon a number of distinct internal
senses; and the latter is the opinion of those who, with
Locke and Hartley, resolve what is commonly called
instinct into an early association of ideas. (See Instinct).
That without deliberation mankind instantly feel
the passion of fear upon the apprehension of danger,
and the passion of anger or resentment upon the recep-
tion of an injury, are truths which cannot be denied:
and hence it is inferred, that the seeds of these passions
are innate in the mind, and that they are not generated,
but only swell to magnitude on the prospect of their re-
spective objects. In support of this argument, it has
been observed that children, without any knowledge of
their danger, are instinctively afraid on being placed on
the brink of a precipice; and that this passion contrib-
utes to their safety long before they acquire, in any de-
gree equal to their necessities, the exercise of their ra-
tional powers. Deliberate anger, caused by a voluntary
injury, is acknowledged to be in part founded on reason
and reflection; but where anger impels one suddenly to
return a blow, even without thinking of doing mischief,
the passion is instinctive. In proof of this, it is obser-
ved, that instinctive anger is frequently raised by bodily
pains, occasioned even by a stock or a stone, which in-
stantly becomes an object of resentment, that we are
violently incited to rush to atoms. Such conduct is
certainly not rational, and therefore it is supposed to be
necessarily instinctive.

With respect to other passions, such as the lust of
power, of fame, or of knowledge, innumerable instances,
says Dr Reid, occur in life, of men who sacrifice to them
their ease, their pleasure, and their health. But it is
absurd to suppose that men should sacrifice the end to
what they desire only as means of promoting that end;
and therefore he seems to think that these passions must
be innate. To add strength to this reasoning he ob-
erves, that we may perceive some degree of these prin-
ciples even in brute animals of the most sagacious kind,
who are not thought to desire means for the sake of ends
which they have in view.

But it is in accounting for the passions which are dis-
interested that the advocates for innate principles seem
most completely to triumph. As it is impossible not to
feel the passion of pity upon the prospect of a fellow
creature in distress, they argue, that the basis of that
passion must be innate; because pity, being at all times
more or less painful to the person by whom it is felt,
and merely of no use to the person who is its object,
it cannot in such instances be the result of deliberation,
but merely the exertion of an original instinct. The
same kind of reasoning is employed to prove that grati-
tude is the exercise of an innate principle. That good
offices are, by the very constitution of our nature, apt
to produce good will towards the benefactor, in good
and bad men, in the savage and in the civilized, cannot
surely be denied by any one in the least acquainted with

human
Human nature. We are grateful not only to the benefactors of ourselves as individuals, but also to the benefactors of our country; and that, too, when we are conscious that from our gratitude neither they nor we can reap any advantage. Nay, we are impelled to be grateful even when we have reason to believe that the objects of our gratitude know not our existence. This passion cannot be the effect of reasoning, or of association founded on reasoning; for, in such cases as those mentioned, there are no principles from which reason can infer the propriety or usefulness of the feeling. That public spirit, or the affection which we bear to our country, or to any subordinate community of which we are members, is founded on instinct is deemed so certain, that the man destitute of this affection, if there be any such, has been pronounced as great a monster as he who has two heads.

All the disinterested passions are founded on what philosophers have termed benevolent affection. Instead therefore of inquiring into the origin of each passion separately, which would swell this article to no purpose, let us listen to one or two of the best writers of the age, treating of the origin of benevolent affection. "We may lay it down as a principle (says Dr Reid*), that all benevolent affections are in their nature agreeable; that it is essential to them to desire the good and happiness of their objects; and that their objects must therefore be beings capable of happiness. A thing may be desired either on its own account, or as the means in order to something else. That only can properly be called an object of desire which is desired upon its own account; and therefore I consider as benevolent those affections only which desire the good of their object ultimately, and not as means in order to something else. To say that we desire the good of others, only to procure some pleasure or good to ourselves, is to say that there is no benevolent affection in human nature. This indeed has been the opinion of some philosophers both in ancient and in later times. But it appears more reasonable to resolve all benevolent affections into self-love, as it would be to resolve hunger and thirst into self-love. These appetites are necessary for the preservation of the individual. Benevolent affections are no less necessary for the preservation of society among men; without which men would become an easy prey to the beasts of the field. The benevolent affections planted in human nature, appear therefore no less necessary for the preservation of the human species than the appetites of hunger and thirst. In a word, pity, gratitude, friendship, love, and patriotism, are founded on different benevolent affections; which our learned author holds to be original parts of the human constitution."

This reasoning has certainly great force; and if authority could have any weight in settling a question of this nature, we know not that name to which greater deference is due than the name of him from whom it is taken. Yet it must be confessed that the philosophers, who consider the affections and passions as early and deep rooted associations, support their opinion with very plausible arguments. On their principles we have endeavored elsewhere to account for the passions of fear and love, (see INSTINCT and LOVE); and we may here safely deny the truth of what has been stated respecting fear, which seems to militate against that account. We have attended with much solicitude to the actions of children; and have no reason to think that they feel terror on the brink of a precipice till they have been repeatedly warned of their danger in such situations by their parents or their keepers. Every person knows not only that the least, but the most original of the instinctive dread of fire, which is as dangerous to them as any other peril; but that it is extremely difficult to keep them from that destructive element till they are either capable of weighing the force of arguments, or have repeatedly experienced the pain of being burnt by it. With respect to sudden resentment, we cannot help considering the argument, which is brought in proof of its being instinctive, as proving the contrary in a very forcible manner. Instinct is some mysterious influence of God upon the mind exciting to actions of beneficial tendency: but can any benefit arise from wreaking our impotent vengeance on a stock or a stone? or is it supposable that a Being of infinite wisdom would exalt us to actions so extravagantly foolish? We learn from experience to defend ourselves against rational or sensible enemies by retaining the injury which they inflict upon us; and if we have been often injured in a particular manner, the idea of that injury becomes in time so closely associated with the means by which it has been constantly repelled, that we never receive such an injury—a blow for instance—without being prompted to make the usual retaliation, without reflecting whether the object be sensible or insensible. So far from being instinctive does resentment appear to us, that we think an attentive observer may easily perceive how the seeds of it are gradually infused into the youthful mind; when the child, from being at first a timid creature shrinking from every pain, learns by degrees to return blow for blow and threat for threat.

But instead of urging what appears to ourselves of most weight against the instinctive system, we shall lay before our readers a few extracts from a dissertation on the origin of the passions, by a writer whose elegance of language and ingenuity of investigation do honour to the school of Hartley.

"When an infant is born (says Dr Sayers†), there is every reason to suppose that he is born without ideas. These are rapidly communicated through the medium of the senses. The same senses are also the means of conveying to him pleasure and pain. These are the hinges on which the passions turn: and till the child is acquainted with these sensations, it would appear that no passion could be formed in his mind; for till he has felt pleasure and pain, how can he desire any object, or wish for its removal? How can he either love or hate? Let us observe then the manner in which love and hatred are formed; for on these passions depend all the rest. When a child endures pain, and is able to detect the cause of it, the idea of pain is connected in his mind with that of the thing which produced it; and if the object which occasioned pain be again presented to the child, the idea of pain associated with it arises also. This idea consequently urges the child to avoid or to remove the object; and thus arises the passion of dislike or hatred. In the same manner, the passion of liking or love is readily formed in the mind of a child from the association of pleasant ideas with certain objects which produced them."

* Passio. Ensay on the Active Powers of Man.

† Disquisitions metaphysiques et litteraires.
mind depending upon the good or bad prospects of gratifying love or hatred; and joy or sorrow arises from the final success or disappointment which attends the exertions produced by love or by hatred. Out of these passions, which have all a perceptible relation to our own good, and are universally acknowledged to be selfish, all our other passions are formed.

To account for the passions called disinterested, he observes, that in the history of the human mind we find many instances of our dropping an intermediate idea, which has been the means of our connecting two other ideas together; and that the association of these two remains after the link which originally united them has vanished. Of this fact the reader will find sufficient evidence in different articles of this work (see INNOCENT, N° 19, and METAPHYSICS, N° 101.) and to apply it to the disinterested passions, let us suppose, with Dr Sayer, that any individual has done to us many offices of kindness, and has consequently much contributed to our happiness; it is natural for us to seek with some anxiety for the continuance of those pleasures which he is able to communicate. But we soon discover, that the surest way of obtaining the continuance of his friendly offices is to make them, as much as possible, a source of pleasure to himself. We therefore do everything in our power to promote his happiness in return for the good he has conferred upon us, that thus we may attach him to us as much as we are able. Hitherto all is plainly selfish. We have been evidently endeavouring, for the sake of our own future gratification, to promote the happiness of this person; but observe the consequence. We have thus, by contemplating the advantage, to be derived to ourselves from promoting the prosperity of our friend, learned to associate a set of pleasant ideas with his happiness; but the link which has united them gradually escapes us, while the union itself remains. Continuing to associate pleasure with the well-being of our friend, we endeavour to promote it for the sake of his immediate gratification, without looking farther; and in this way his happiness, which was first attended to only as a means of future enjoyment, finally becomes an end. Thus then the passion which was originally selfish, is at length disinterested; its gratification being completed merely by its success in promoting the happiness of another.

In this way does our author account for the origin of gratitude; which at last becomes a habit, and flows spontaneously towards every man who has either been or intended to be our benefactor. According to him, it is easy to observe also, that from associating pleasure with the happiness of an individual when we procure it ourselves, it must of course soon follow, that we should experience pleasure from a view of his happiness any way produced; such happiness raising at all times pleasant ideas when it is presented to our minds. This is another feature of a disinterested affection, to feel delight from the mere increase of happiness in the object whom we love.

"It may be objected, perhaps, that parents seem to have an instinctive disinterested love of their offspring: but surely the love of a parent (A) for a new-born infant is not usually equal to that for a child of four or five years old. When a child is first born, the prospect and hopes of future pleasure from it are sufficient to make a parent anxious for its preservation. As the child grows up, the hope of future enjoyment from it must increase; hence would pleasure be associated with the well-being of the child, the love of which would of course become in due time disinterested."

Our author does not analyze pity, and trace it to its source in selfishness; but he might easily have done it, and it has been ably done by his master. Pity or compassion is the unselfishness which a man feels at the misery of another. It is generated in every mind during the years of childhood; and there are many circumstances in the constitution of children, and in the mode of their education, which make them particularly susceptible of this passion. The very appearance of any kind of misery which they have experienced, or of any signs of distress which they understand, excite in their minds painful feelings, from the remembrance of what they have suffered, and the apprehension of their suffering it again. We have seen a child a year old highly entertained with the noise and struggles made by its elder brother when plunged naked in a vessel filled with cold water. This continued to be the case for many days, till it was thought proper to plunge the younger as well as the elder; after which the daily entertainment was soon at an end. The little creature had not been itself plunged above twice till it ceased to find diversion by its brother's sufferings. On the third day it cried with all the symptoms of the bitterest anguish upon seeing its brother plunge, though no preparation was then made for plunging itself; but surely this was not disinterested sympathy, but a feeling wholly selfish, excited by the remembrance of what it had suffered itself, and was apprehensive of suffering again. In a short time, however, the painful feelings accompanying the sight of its brother's struggles, and the sound of his cries, were doubtless so associated with that sight and sound, that the appearance of the latter would have brought the former
it makes its way, it continues rising, till it emerges into light; and then suddenly expiring, leaves behind it the fairest issue,"—beneficent affection.

Self-love partook the path it first pursu'd,
And found the private in the public good.

Thus have we stated the two opposite theories respecting the origin of passions in the mind, and given our readers a short specimen of the reasonings by which they are supported by their respective patrons. Were we called upon to decide between them, we should be tempted to say, that they have both been carried to extremes by some of their advocates, and that the truth lies in the middle between them. "It is impossible but that "creatures capable of pleasant and painful sensations, should love and choose the one, and dislike and avoid the other. No being who knows what happiness and misery are, can be supposed indifferent to them, without a plain contradiction. Pain is not a possible object of desire, nor happiness of aversion." A lover prefers a greater good, though distant, to a less good that is near at hand; or to choose a present evil, in order to avoid a greater future evil—is indeed wise and rational conduct; but to choose evil ultimately, is absolutely impossible. Thus far then must be admitted, that every being possessed of sense and intellect, necessarily desires his own good as soon as he knows what it is; but if this knowledge be not innate, neither can the desire. Every human being comes into the world with a capability of knowledge, and of course with a capability of affections, desires, and passions; but it seems not to be conceivable how he can actually love, or hate, or dread any thing, till he know whether it be good, or ill, or dangerous. If, therefore, we have no innate ideas, we cannot possibly have innate desires or aversions. Those who contend that we have, seem to think, that without them reason would be insufficient, either for the preservation of the individual or the continuation of the species; and some writers have alleged, that if our affections and passions were the mere result of early associations, they would necessarily be more capricious than we ever find them. But this objection seems to arise from their not rightly understanding the theory of their antagonists. The disciples of Locke and Hartley do not suppose it possible for any man in society to prevent such associations from being formed in his mind as shall necessarily produce desires and aversions; far less do they think it possible to form associations of ideas utterly repugnant, so as to desire that as good which his senses and intellect have experienced to be evil. Associations are formed by the very same means, and at the very same time, that ideas and notions are impressed upon the mind; but as pain is never mistaken for pleasure by the senses, so an object which has given us only pain, is never associated with any thing that makes it desirable. We say an object that has given us only pain, because it is possible to form such an association between life and the loss of a limb, as to make us grateful to the surgeon by whom it was amputated. Associations being formed according to the same laws by which knowledge is acquired, it by no means follows that passions resulting from them should be more capricious than they are found to be; and they certainly are sufficiently capricious to make us suspect that the greater part of them has this origin, rather than that they are all infused in the mind by the immediate agency of the Creator.
If passions, whatever be their origin, operate instantaneously, and if they be formed according to fixed laws, it may be thought a question of very little importance whether they be instinctive or acquired,—This was long our own opinion; but we think, that upon mature reflection we have seen reason to change it. If passions be the result of early associations, it is of the utmost consequence that no improper associations be formed in the minds of children, and that none of their unreasonable desires be gratified. Upon this theory it seems indeed to depend almost wholly upon education, whether a child shall become a calm, benevolent, steady, and upright man; or a passionate, capricious, selfish miscreant. By teaching him to resent every petty injury, the seeds of inscrutability are sown in his mind, and take such root, that before the age of manhood he becomes intolerable to all with whom he must co-exist. By exciting numberless desires in his youthful mind, and instantly gratifying them, you make him capricious and impatient of disappointment; and by representing other children as in any degree inferior to him, you inspire him with the hateful passion of pride. According to the instinctive theory, education can only augment or diminish the strength of passions; according to the other theory, it is the source of far the greater part of them. On either supposition, parents should watch with solicitude over the actions of their children; but it will surely not be to their credit if, believing, that through their neglect their children may acquire hateful passions, to which, if properly educated, they might have remained strangers through their whole lives. And let it be remembered, that this solicitude should begin at an early period; because the mind is susceptible of deep associations much sooner than is sometimes imagined. Without this susceptibility, no language could be learned; and therefore a child by the time he learns to speak, may have planted in his mind the seeds of passions, on the just regulation and subordination of which depends in a great measure the happiness of mankind. See Moral Philosophy, Part I. chap. 3. & 2. Part III. No. 216.

Passions and Emotions, difference between them. See Emotions and Passions.

External Signs of Emotions and Passions. So intimately connected are the soul and body, that every agitation in the former produces a visible effect upon the latter. There is, at the same time, a wonderful uniformity in that operation; each class of emotions and passions being invariably attended with an external appearance peculiar to itself. These external appearances, or signs, may not improperly be considered as a natural language, expressing to all beholders emotions and passions as they rise in the heart. Hope, fear, joy, grief, are displayed externally: the character of a man can be read in his face; and beauty, which makes so deep an impression, is known to result, not so much from regular features and a fine complexion, as from good nature, good sense, sprightliness, sweetness, or other mental quality, expressed upon the countenance. Though perfect skill in that language be rare, yet what is generally known is sufficient for the ordinary purposes of life. But by what means we come to understand the language, is a point of some intricacy. It cannot be by sight merely; for upon the most attentive inspection of the human visage, all that can be discerned are, figure, colour, and motion, which, singly or combined, never can represent a passion nor a sentiment: the external sign is indeed visible; but to understand its meaning, we must be able to connect it with the passion that causes it; an operation far beyond the reach of eye-sight. Where then is the instructor to be found that can unveil this secret connexion? If we apply to experience, it is yielded, that from long and diligent observation, we may gather, in some measure, in what manner those we are acquainted with express their passions externally; but with respect to strangers, we are left in the dark; and yet we are not puzzled about the meaning of these external expressions in a stranger, more than in a bosom companion. Further, Had we no other means but experience for understanding the external signs of passion, we could not expect any uniformity, nor any degree of skill, in the bulk of individuals; yet matters are so much better ordered, that the external expressions of passion form a language understood by all, by the young as well as by the old, by the ignorant as well as by the learned: We talk of the plain and legible characters of that language: for undoubtedly we are much indebted to experience, in deciphering the dark and more delicate expressions. Where then shall we apply for a solution of this intricate problem, which seems to penetrate deep into human nature? Undoubtedly if the meaning of external signs be not derived to us from sight, nor from experience, there is no remaining source when it can be derived but from nature.

We may then venture to pronounce, with some degree of confidence, that man is provided by nature with a sense or faculty that lays open to him every passion by means of its external expressions. And we cannot entertain any reasonable doubt of this, when we reflect, that the meaning of external signs is not hid even from infants; an infant is remarkably affected with the passions of its nurse expressed on her countenance; a smile cheers it, a frown makes it afraid: but fear cannot be without apprehending danger; and what danger can the infant apprehend, unless it be sensible that its nurse is angry? We must therefore admit, that a child can read anger in its nurse's face; of which it must be sensible intuitively, for it has no other mean of knowledge. We do not affirm, that these particulars are clearly apprehended by the child; for to produce clear and distinct perceptions, reflection and experience are requisite: but that even an infant, when afraid, must have some notion of its being in danger, is evident.

That we should be conscious intuitively of a passion from its external expressions, is conformable to the analogy of nature: the knowledge of that language is of too great importance to be left upon experience; because
Passion, a foundation so uncertain and precarious, would prove a great obstacle to the formation of societies. Wisely therefore is it ordered, and agreeably to the system of Providence, that we should have nature for our instructor.

Such is the philosophy of Lord Kames, to which objections unanswerable may be made. It is part of the instinctive system of metaphysics, which his lordship has carried farther than all who wrote before him, and perhaps farther than all who have succeeded him in this department of science. That a child intuitively reads anger in its nurse’s face, is so far from being true, that for some short time after birth it is not terrified by the most menacing gestures. It is indeed absolutely incapable of fear till it has suffered pain, (see Instinct;) and could we constantly care for what is called an angry look, it would be cheered by that look, and frightened at a smile. It feels, however, the effects of anger, and is soon capable of observing the peculiarity of feature with which that passion is usually accompanied; and these two become in a short time so linked together in its tender mind, that the appearance of the one naturally suggests to it the reality of the other.

Should it be said that a loud and sudden noise startles a child immediately after birth, and that, therefore, the infant must be instinctively afraid, the fact may be admitted, without any necessity of admitting the inference. The nerves of an infant are commonly very irritable, and the strong impulse on the auditory nerves may agitate its whole frame, without inspiring it with the passion of fear. The loud noise is in all probability not the sign of approaching danger, but the immediate cause of real pain, from which the infant shrinks as it would from the prick of a pin or the scorching of a candle. But we have said enough in the article immediately preceding, and in others which are there quoted, to show how the passions may be formed by associations even in early infancy, and yet operate as if they were instinctive. This being the case, we shall through the remainder of this article suffer his lordship to speak his own language, without making any further remarks upon it. We are induced to do this for two reasons; of which the first is, that many of our readers will probably prefer his theory to ours; and the second is, that his conclusions respecting the signs and language of passion hold equally good from either theory.

We are in agreement with him, that manifold and admirable are the purposes to which the external signs of passion are made subservient by the Author of our nature.

1. The signs of internal agitation displayed externally to every spectator, tend to fix the signification of many words. The only effectual means to ascertain the meaning of any doubtful word, is an appeal to the thing it represents: and hence the ambiguity of words expressive of things that are not objects of external sense; for in that case an appeal is denied. Passion, strictly speaking, is not an object of external sense: but its external signs are: and by means of these signs, passions may be appealed to with tolerable accuracy; thus the words that denote our passions, next to those that denote external objects, have the most distinct meaning. Words signifying internal action and the more delicate feelings, are least distinct. This defect, with regard to internal action, is what chiefly occasions the intricacy of logic: the terms of that science are far from being sufficiently ascertained, even after much care and labour bestowed by an eminent writer; to whom, however, the world is greatly indebted, for removing a mountain of rubbish, and moulding the subject into a rational and correct form. The same defect is remarkable in criticism, which has for its object the more delicate feelings; the terms that denote these feelings being not more distinct than those of logic.

2. Society among individuals is greatly promoted by that universal language. Looks and gestures give direct access to the heart; and leads us to select, with tolerable accuracy, the persons who are worthy of our confidence. It is surprising how quickly, and for the most part how correctly, we judge of character from external appearance.

3. After social intercourse is commenced, these external signs, which diffuse through a whole assembly the feelings of each individual, contribute above all other means to improve the social affections. Language, no doubt, is the most comprehensive vehicle for communicating emotions: but in expedition, as well as in power of conviction, it falls short of the signs under consideration; the involuntary signs especially, which are incapable of deceit. Where the countenance, the tones, the gestures, the actions, join with the words in communicating emotions, these united have a force irresistible. Thus all the pleasant emotions of the human heart, with all the social and virtuous affections, are, by means of these external signs, not only perceived, but felt. By this admirable contrivance, conversation becomes that lively and animating amusement, without which life would at best be insipid: one joyful countenance spreads cheerfulness instantaneously through a multitude of spectators.

4. Disocial passions, being hurtful by prompting violence and mischief, are noted by the most conspicuous external signs, in order to put us upon our guard: thus anger and revenge, especially when sudden, display themselves on the countenance in legible characters. The external signs, again, of every passion that threatens danger, raise in us the passion of fear: which frequently operating without reason or reflection, moves us by a sudden impulse to avoid the impending danger.

5. These external signs are remarkably subservient to morality. A painful passion being accompanied with disagreeable external signs, must produce in every spectator a painful emotion: but then, if the passion be social, the emotion it produces is attractive, and connects the spectator with the person who suffers. Disocial passions only are productive of repulsive emotions, involving the spectator’s aversion, and frequently his indignation. This artful contrivance makes us cling to the virtuous, and abhor the wicked.

6. Of all the external signs of passion, those of affliction or distress are the most illustrious with respect to a final cause, and deservedly merit a place of distinction. They are illustrious by the singularity of their contrivance; and also by inspiring sympathy, a passion to which human society is indebted for its greatest blessing, that of providing relief for the distressed. A subject so interesting deserves a leisurely and attentive examination. The conformity of the nature of man to his external circumstances is in every particular wonderful: his nature makes him prone to society; and society is necessary to his wellbeing, because in a solitary state he is a helpless being,
Passion being destitute of support, and in his distresses destitute of relief: but mental support, the shining attribute of society, is of too great moment to be left dependent upon cool reason; it is ordered more wisely, and with greater conformity to the analogy of nature, that it should be enforced even instinctively by the passion of sympathy. Here sympathy makes a capital figure; and contributes, more than any other means, to make life easy and comfortable. But however essential the sympathy of others may be to our well-being, one beforehand would not readily conceive how it could be raised by external signs of distress; for considering the analogy of nature, if these signs be agreeable, they must give birth to a pleasant emotion, leading every beholder to be pleased with human woes: if disagreeable, as they undoubtedly are, ought they not naturally to repel the spectator from them, in order to be relieved from pain? Such would be the reasoning beforehand; and such would be the effect were man purely a selfish being. But the benevolence of our nature gives a very different direction to the painful passion of sympathy, and to the desire involved in it: instead of avoiding distress, we fly to it in order to afford relief; and our sympathy cannot be otherwise gratified but by giving all the succour in our power. Thus external signs of distress, though disagreeable, are attractive; and the sympathy they inspire is a powerful cause, impelling us to afford relief even to a stranger, as if he were our friend or relation.

It is a noted observation, that the deepest tragedies are the most crowded; which, in an overly view will be thought an unaccountable bias in human nature. Love of novelty, desire of occupation, beauty of action, make us fond of theatrical representations; and when once engaged, we must follow the story to the conclusion, whatever distress it may create. But we generally become wise by experience, and when we foresee what pain we shall suffer during the course of the representation, is it not surprising that persons of reflection do not avoid such spectacles altogether? And yet one who has scarce recollected from the distress of a deep tragedy, resolves cooled and deliberately to go to the very next, without the slightest obstruction from self-love. The whole mystery is explained by a single observation: That sympathy, though painful, is attractive; and attracts us to an object in distress, instead of prompting us to fly from it. And by this curious mechanism it is, that persons of any degree of sensibility are attracted by affliction still more than by joy.

To conclude: the external signs of passion are a strong indication, that man, by his very constitution, is framed to be open and sincere. A child, in all things obedient to the impulses of nature, hides none of its emotions; the savage and clown, who have no guide but pure nature, expose their hearts to view, by giving way to all the natural signs. And even when men learn to disguise their sentiments, and when behaviour degenerates into art, there still remain checks, that keep dissimulation within bounds, and prevent a great part of its mischievous effects: the total suppression of the voluntary signs during any vivid passion, begots the utmost uneasiness, which cannot be endured for any considerable time: this operation becomes indeed less painful by habit; but luckily the involuntary signs cannot, by any effort, be suppressed or even dissembled. An absolute hypocrisy, by which the character is concealed and a fictitious one assumed, is made impracticable; and nature has thereby prevented much harm to society. We may pronounce, therefore that Nature, herself sincere and candid, intends that mankind should preserve the same character, by cultivating simplicity and truth, and banishing every sort of dissimulation that tends to mischief.

Influence of Passion with respect to our Perceptions, Opinions, and Belief. So intimately are our perceptions, passions, and actions, connected, it would be wonderful if they should have no mutual influence. That our actions are too much influenced by passion, is a known truth; but it is not less certain, though not so well known, that passion hath also an influence upon our perceptions, opinions, and belief. For example, the opinions we form of men and things are generally directed by affection: An advice given by a man of figure has great weight; the same advice from one in a low condition is despised or neglected: a man of courage underwrites danger; and to the indolent the slightest obstacle appears unsurmountable. All this may be accounted for by the simple principle of association.

There is no truth more universally known, than that tranquillity and sedateness are the proper state of mind for accurate perception and cool deliberation; and for that reason, we never regard the opinion even of the wisest man, when we discover prejudice or passion behind the curtain. Passion hath such influence over us, as to give a false light to all its objects. Agreeable passions prepossess the mind in favour of their objects; and disagreeable passions, not less against their objects: A woman is all perfection in her lover's opinion, while in the eye of a rival beauty she is awkward and disagreeable: when the passion of love is gone, beauty vanishes with it—nothing is left of that genteel motion, that sprightly conversation, those numberless graces, which formerly, in the lover's opinion, charmed all hearts. To a zealot every one of his own sect is a saint, while the most upright of a different sect are to him children of perdition: the talent of speaking in a friend is more regarded than prudent conduct in any other. Nor will this surprise any one acquainted with the world; our opinions, the result frequently of various and complicated views, are commonly so slight and wavering, as readily to be susceptible of a bias from passion.

With that natural bias another circumstance concurs, to give passion an undue influence on our opinions and belief; and that is a strong tendency in our nature to justify our passions as well as our actions, not to others only, but even to ourselves. That tendency is peculiarly remarkable with respect to disagreeable passions; by its influence, objects are magnified or lessened, circumstances supplied or suppressed, every thing coloured and disguised to answer the end of justification. Hence the foundation of self-deceit, where a man imposes upon himself innocently, and even without suspicion of a bias.

We proceed to illustrate the foregoing observations by proper examples.

Gratitude, when warm, is often exerted upon the children of the benefactor; especially where he is removed out of reach by death or absence. The passion in this case being exerted for the sake of the benefactor, requires no peculiar excellence in his children: but the practice of doing good to these children produces affec-
P A S

[26]

When by great sensibility of heart, or other means, grief becomes immoderate, the mind, in order to justify itself, is prone to magnify the cause; and if the real cause admit not of being magnified, the mind seeks a cause for its grief in imagined future events:

Busby. Madam, your majesty is much too sad:
You promised, when you parted with the king,
To lay aside self-harming heaviness,
And entertain a cheerful disposition.

Queen. To please the king, I did; to please myself, I cannot do it. Yet I know no cause
Why I should welcome such a guest as grief;
Save holding farewell to so sweet a guest
As my sweet Richard: yet again, methinks,
Some unborn sorrow, ripe in Fortune's womb,
Is coming toward me; and my inward soul
With something trembles, yet at nothing grieves,
More than with parting from my lord the king.

Richard II. act ii. sc. 5.

Resentment at first is vented on the relations of the offender, in order to punish him; but as resentment, when so outrageous, is contrary to conscience, the mind, to justify its passion, is disposed to paint these relations in the blackest colours; and it comes at last to be convinced, that they ought to be punished for their own demerits.

Anger, raised by an accidental stroke upon a tender part of the body, is sometimes vented upon the undersigning cause. But as the passion in that case is absurd, and as there can be no solid gratification in punishing the innocent, the mind, prone to justify as well as to gratify its passion, deludes itself into a conviction of the action's being voluntary. The conviction, however, is but momentary; the first reflection shows it to be erroneous; and the passion vanishes almost instantaneously with the conviction. But anger, the most violent of all passions, has still greater influence: it sometimes forces the mind to personify a stock or a stone if it happen to occasion bodily pain, and even to believe it a voluntary agent, in order to be a proper object of resentment. And that we have really a momentary conviction of its being a voluntary agent, must be evident from considering, that without such conviction the passion can neither be justified nor gratified: the imagination can give no aid; for a stock or a stone imagined insensible, cannot be an object of punishment, if the mind be conscious that it is an imagination merely without any reality (A). Of such personification, involving a conviction of reality, there is one illustrious instance. When the first bridge of boats over the Hellespont was destroyed by a storm, Xerxes fell into a transport of rage, so excessive, that he commanded the sea to be punished with 300 stripes; and a pair of fetters to be thrown into it, enjoining the following words to be pronounced: "O thou salt and bitter water! thy master hath condemned thee to this punishment for offending him without cause; and is resolved

(A) We have already shown how a man may be instigated to wreak his vengeance on a stock or stone, without ever considering whether it be sensible or insensible: (See Passion). If the story of Xerxes be true, he may have considered the sea as sensible and animated, without dreaming that a stock or a stone is so. The sea was a god among many of the pagans, and was considered as such by Xerxes, otherwise he could not have applauded men for not sacrificing to it.
PAS

Passion.

resolved to pass over thee in spite of thy insolence:
with reason all men neglect to sacrifice to thee, because
thou art both disagreeable and treacherous."

Shakespeare exhibits beautiful examples of the irregular
influence of passion in making us believe things to
be otherwise than they are. King Lear, in his distress,
personifies the rain, wind, and thunder; and in order to
justify his resentment, believes them to be taking part
with his daughters:

Lear. Rumble thy bellyful, spit fire, spout rain!
Nor rain, wind, thunder, fire, are my daughters.
I tax not you, ye elements, with unkindness;
I never gave you kingdoms, call’d you children;
You owe me no subscription. Then let fall
Your horrible pleasure. — Here I stand, your brave;
A poor, infirm, weak, and despised old man!
But yet I call you servile ministers,
That have with two pernicious daughters join’d
Your high-engender’d battles ‘gainst a head
So old and white as this. Oh! oh! ‘tis foul!

Act iii. sc. 2.

King Richard, full of indignation against his favourite
horse for carrying Bolingbroke, is led into the conviction
of his being rational:

Groom. O, how it yearn’d my heart, when I beheld
In London streets, that coronation-day,
When Bolingbroke rode on Roan Barbary,
That horse that thou so often hast bestrid,
That horse that I so carefully have dressed.
K. Rich. Rod he on Barbary? tell me, gentle friend,
How went he under him?

Groom. So proudly as he had disdain’d the ground.
K. Rich. So proud that Bolingbroke was on his back!
That jade had eat bread from my royal hand.
This hand hath made him proud with clapping him.
Would he not stumble? would he not fall down,
(Since pride must have a fall), and break the neck
Of that proud man that did usurp his back?

Richard II. act v. sc. 11.

Hamlet, swelled with indignation at his mother’s second
marriage, was strongly inclined to lessen the time of her
widowhood, the shortness of the time being a violent
circumstance against her; and he deludes himself by
degrees into the opinion of an interval shorter than the
real one:

Hamlet. ———That it should come to this!
But two months dead! nay, not so much; not two—
So excellent a king, that was, to this,
Hyperion to a satyr, so loving to my mother,
That he permitted not the wind of heav’n
Visit her face too roughly. Heav’n and earth!
Must I remember—why, she would hang on him,
As if increase of appetite had grown
By what it fed on: yet, within a month—

Let me not think—Frailty, thy name is Woman!
A little month! or ere those shoes were old,
With which she follow’d my poor father’s body,
Like Niobe, all tears—why she, ev’n she—
(O heav’n! a beast, that wants discourse of reason,
Wou’d have morn’d looser) married with mine uncle,
My father’s brother; but so more like my father
Than I to Hercules. Within a month!—

Ere yet the salt of most unrighteous tears
Had left the flushing in her galled eyes,
She married—Oh, most wicked speed! to post
With such dexterity to incestuous sheets!
It is not, nor it cannot, come to good.
But break, my heart, for I must hold my tongue.

Act i. sc. 3.

The power of passion to falsify the computation of
time is remarkable in this instance; because time, hav-
ing an accurate measure, is less obsequious to our de-
sires and wishes, than objects which have no precise
standard of magnitude.

Good news are greedily swallowed upon very slender
evidence; our wishes magnify the probability of the
event, as well as the veracity of the relater; and we be-
lieve as certain what at best is doubtful:

Quel, che l’huom vede, amor li fa invisible
E l’ invisibil fa veder amore.
Questo credute fu, che l’ miser suole
Dar facile credenza a’ quel, che vuole.

Orland. Furios. cart. 1st. 36.

For the same reason, bad news gain also credit upon the
slightest evidence: fear, if once alarmed, has the same
effect with hope, to magnify every circumstance that
tends to conviction. Shakespeare, who shows more
knowledge of human nature than any of our philoso-
phers, hath in his Cymbeline represented this bias of the
mind; for he makes the person who alone was affected
with the bad news, yield to evidence that did not con-
vince any of his companions. And Othello is convinced
of his wife’s infidelity from circumstances too slight to
move any person less interested.

If the news interest us in so low a degree as to give
place to reason, the effect will not be altogether the
same: judging of the probability or improbability of
the story, the mind settles in a rational conviction ei-
ther that it is true or not. But even in that case, the
mind is not allowed to rest in that degree of convic-
tion which is produced by rational evidence: if the
news be in any degree favourable, our belief is raised
by hope to an improper height; and if unfavourable,
by fear.

This observation holds equally with respect to future
events: if a future event be either much wished or dread-
ed, the mind never fails to augment the probability be-

That easiness of belief, with respect to wonders and
prodigies, even the most absurd and ridiculous, is a
strange phenomenon; because nothing can be more
evident than the following proposition. That the more
singular any event is, the more evidence is required to
produce belief: a familiar event daily occurring, being
in itself extremely probable, finds ready credit, and
therefore is vouch’d by the slightest evidence; but to
overcome the improbability of a strange and rare event,
contrary to the course of nature, the very strongest evi-
dence is required. It is certain, however, that won-
ders and prodigies are swallowed by the vulgar, upon
evidence that would not be sufficient to ascertain the
most familiar occurrence. It has been reckoned diffi-
cult to explain that irregular bias of mind; but we are
now made acquainted with the influence of passion up-
on opinion and belief; a story of ghosts or fairies, told
with an air of gravity and truth, raiseth an emotion of wonder, and perhaps of dread; and these emotions imposing on a weak mind, impress upon it a thorough conviction contrary to reason.

Opinion and belief are influenced by propensity as well as by passion. An innate propensity is all we have to convince us that the operations of nature are uniform: influenced by that propensity, we often rashly think, that good or bad weather will never have an end; and in natural philosophy, writers, influenced by the same propensity, stretch commonly their analogical reasonings beyond just bounds. See Metaphysics, No. 133, 134.

Opinion and belief are influenced by affections as well as by propensity. The noted story of a fine lady and a curate viewing the moon through a telescope is a pleasant illustration: "I perceive (says the lady) two shadows inclining to each other; they are certainly two happy lovers!" "Not at all (replies the curate), they are two steepleys of a cathedral."

Language of Passion. Among the particulars that compose the social part of our nature, a propensity to communicate our opinions, our emotions, and every thing that affects us, is remarkable. Bad fortune and injustice affect us greatly; and of these we are so prone to complain, that if we have no friend or acquaintance to take part in our sufferings, we sometimes utter our complaints aloud, even when there are none to listen.

But this propensity operates not in every state of mind. A man immediately grieved, seeks to afflict himself, rejecting all consolation: immediate grief accordingly is mute; complaining is struggling for consolation.

It is the wretch's comfort still to have
Some small reserve of near and inward we,
Some unsuspected hoard of inward grief,
Which they unseen may wall, and weep, and mourn,
And glutton-like alone devour.

Mourning Bride, act i. sc. 1.

When grief subsides, it then, and no sooner, finds a tongue: we complain, because complaining is an effort to disburden the mind of its distress. This observation is finely illustrated by a story which Herodotus records, book iii. Cambyse, when he conquered Egypt, made Psammeticus the king prisoner; and for trying his constancy, ordered his daughter to be dressed in the habit of a slave, and to be employed in bringing water from the river; his son also was led to execution with a halter about his neck. The Egyptians vented their sorrow in tears and lamentations: Psammeticus only, with a downcast eye, remained silent. Afterward meeting one of his companions, a man advanced in years, who, being plundered of all, was begging alms, he wept bitterly, calling him by his name. Cambyse, struck with wonder, demanded an answer to the following question: "Psammeticus, thy master Cambyse is desirous to know, why, after thou hadst seen thy daughter so ignominiously treated, and thy son led to execution, without complaining or weeping, thou shouldst be so highly concerned for a poor man noway related to thee?" Psammeticus returned the following answer: "Son of Cyrus, the calamities of my family are too great to leave me the power of weeping; but the misfortunes of a compa-

nion, reduced in his old age to want of bread, is a fit subject for lamentation."

Surprise and terror are silent passions, for a different reason: they agitate the mind so violently, as for a time to suspend the exercise of its faculties, and among others the faculty of speech. Love and revenge, when immoderate, are not more loquacious than immoderate grief. But when these passions become moderate, they set the tongue free, and like moderate grief, become loquacious. Moderate love, when unsuccessful, is vented in complaints; when successful, is full of joy expressed by words and gestures.

As no passion hath any long uninterrupted existence, nor beats always with an equal pulse, the language suggested by passion is not only unequal but frequently interrupted; and even during an uninterrupted fit of passion, we only express in words the more capital sentiments. In familiar conversation, one who vents every single thought, is justly branded with the character of loquacity; because sensible people express no thoughts, but what make some figure: in the same manner, we are only disposed to express the strongest impulse of passion, especially when it returns with impetuosity after interruption.

It is elsewhere observed that the sentiments ought to be tuned to the passion, and the language to both. Elevated sentiments require elevated language: tender sentiments ought to be clothed in words that are soft and flowing: when the mind is depressed with any passion, the sentiments must be expressed in words that are humble, not low. Words being intimately connected with the ideas they represent, the greatest harmony is required between them: to express, for example, an humble sentiment in high-sounding words, is disagreeable by a discordant mixture of feelings; and the discord is not less when elevated sentiments are dressed in low words:

Versibus exponi tragicias res comica non vult.
Indignatur item privatis ac prope socco
Dignis carminibus narrari cena Thyeste.

Horat. Ars Poet. 1. 89.

This, however, excludes not figurative expression, which, within moderate bounds, communicates to the sentiment an agreeable elevation. We are sensible of an effect directly opposite, where figurative expression is indulged beyond a just measure; the opposition between the expression and the sentiment makes the discord appear greater than it is in reality.

At the same time, figures are not equally the language of every passion: pleasant emotions, which elevate or swell the mind, vent themselves in strong epithets and figurative expression; but humble and dispiriting passions affect to speak plain:

Et tragicus plebansque dolet sermonem pedestri.
Telephus et Pelcus, cum pauper et exul uteque,
Project ambitus et assequediala verba.
Si curat cor spectantis te eligisse quern.

Horat. Ars Poet. 95.

Figurative expression, being the work of an enlivened imagination, cannot be the language of anguish or distress. Otway, sensible of this, has painted a scene of distress in colours finely adapted to the subject: there is scarcely
And ye that live, and move, fair creatures! tell,
Tell, if ye saw, how came I thus, bow here.—

Paradise Lost, viii. 273.

Both have sinned! but thou
Against God only; I, 'gainst God and thee;
And to the place of judgment will return;
There with my cries importune Heav'n, that all
The sentence, from thy head remov'd, may light
On me, sole cause to thee of all this wo;
Me! me! only just object of his ire.

Paradise Lost, x. 930.

In general, the language of violent passion ought to be broken and interrupted. Soliloquies ought to be so in a peculiar manner: language is intended by nature for society; and a man when alone, though he always clothes his thoughts in words, seldom gives his words utterance, unless when prompted by some strong emotion; and even then by starts and intervals only. Shakespeare’s soliloquies may be justly established as a model; for it is not easy to conceive any model more perfect. Of his many incomparable soliloquies, the two following only shall be quoted, being different in their manner.

Hamlet. Oh, that this too, too solid flesh would melt,
Thaw, and resolve itself into a dew!
Or that the Everlasting had not fix’d
His canon ‘gainst self-slaughter! O God! O God!
How weary, stale, flat, and unprofitable,
Seem to me all the uses of this world!
Fie on’t! O fie! ‘tis an unweeded garden,
That grows to seed: things rank and gross in nature
Possess it merely.—That it should come to this!
But two months dead! nay, not so much; not two—
So excellent a king, that was, to this,
Hyperion to a satyr: so loving to my mother,
That he permitted not the winds of heaven
Visit her face too roughly. Heaven and earth!
Must I remember—why, she would hang on him,
As if increase of appetite had grown
By what it fed on: yet, within a month—
Let me not think—Frailty, thy name is Woman!
A little month! or ere those shoes were old,
With which she follow’d my poor father’s body,
Like Niobe, all tears—why she, even she—
(O heaven! a beast, that wants discourse of reason,
Would have mourn’d longer)—married with mine
uncle,
My father’s brother; but no more like my father
Than I to Hercules. Within a month!
Ere yet the salt of most unrighteous tears
Had left the flushing in her galled eyes,
She married—Oh, most wicked speed, to post
With such dexterity to insinuate sheets!
It is not, nor it cannot come to good.
But break, my heart, for I must hold my tongue.

Hamlet, Act i. sc. 3.

“Ford. Hum! ha! is this a vision? is this a dream?
“do I sleep? Mr Ford, awake! awake, Mr Ford;
“there’s a hole made in your best coat, Mr Ford! this
“‘tis to be married! this ‘tis to have huss and buck
“baskets! Well, I will proclaim myself what I am;
P A S

Passion. "I will now take the teacher; he is at my house;
not me. But how, if Honour pricks me off, when I come
"he cannot escape me; 'tis impossible he should; he
"on? how then? Can honour set a leg? No. Or an
"arm? No. Or take away the grief of an wound?
"No. Honour hath no skill in surgery then? No.
"What is Honour? A word.—What is that word ho-
"nour? Air; a trim reckoning.—Who hath it? He
"that dy'd a Wednesday. Doth he feel it? No.
"Dost he hear it? No. Is it insensible then? Yea,
..."

P A S

to the dead. But will it not live with the living?
"No. Why? Detraction will not suffer it. Therefore
"I'll none of it; honour is a mere scutcheon: and so
"ends my catechism."

First Part, Henry IV. act v. sc. 2.

And even without dialogue a continued discourse may
be justified, where a man reasons in a soliloquy upon an
important subject: for if in such a case it be at all ex-
cusable to think aloud, it is necessary, that the reasoning
be carried on in a chain; which justifies that admirable
soliloquy in Hamlet upon life and immortality, being a
serene meditation upon the most interesting of all sub-
jects. And the same consideration will justify the soli-
loquy that introduces the 4th act of Addison's Cato.

Language ought not to be elevated above the tone of
the sentiment.

Zara. Swift as occasion I
Myself will fly; and earlier than the morn
Wake thee to freedom. Now 'tis late; and yet
Some news few minutes past arriv'd, which seem'd
To shake the temper of the king—Who knows
What rack-and-paces disease a monarch's bed?
Or love, that late at night still lights his lamp,
And strikes his rays through dusk, and folded lids,
Forbidding rest, may stretch his eyes awake,
And force their balls abroad at this dead hour.
I'll try.

Mourning Bride, act iii. sc. 4.

The language here is undoubtedly too pompous and la-
boured for describing so simple a circumstance as ab-
scence of sleep. In the following passage, the tone of the lan-
guage, warm and plaintive, is well suited to the passion,
which is recent grief: but every one will be sensible,
that in the last couplet save one the tone is changed,
and the mind suddenly elevated to let fall as suddenly
in the last couplet:

Il déteste à jamais sa couable victoire,
Il renonce à la cour, aux humains, à la gloire
Et se fuyant lui-même, au milieu des déserts,
Il va cacher sa peine au bout de l'univers;
La, soit que le soleil rendit le jour au monde,
Soit qu'il finit sa course au vaste sein de l'onde,
Savoir faisoit redire aux échos attendris,
Le nom, le triste nom, de son malheureux fils.

Hemèride, chant. viii. 229.

Light and airy language is unsuitable to a severe
passion.

Imagery and figurative expression are discordant, in
the highest degree, with the agony of a mother, who
is deprived of two hopeful sons by a brutal murder.
Therefore the following passage is undoubtedly in a bad
taste:

Queen. Ah, my poor princes! ah, my tender babes!
My unblown flowers, new appearing sweets!
If yet your gentle souls fly in the air,
And be not fixt in doom perpetual,
Hover about me with your airy wings,
And hear your mother's lamentation.

Richard III. act iv. sc. 4.

Again:

K. Philip. You are as fond of grief as of your child.

Constance. Grief fills the room up of my absent child.

Lies
P A S

Lies in his bed, walks up and down with me,
Puts on his pretty looks, repeats his words,
Remembers me of all his gracious parts,
Stuffs out his vacant garment with his form;
Then have I reason to be fond of grief.

K. John, act iii. sc. 9.

Thoughts that turn upon the expression instead of
the subject, commonly called a play of words, being
low and childish, are unworthy of any composition,
whether gay or serious, that pretends to any degree
of elevation.

In the Amynta of Tasso, the lover falls into a mere
play of words, demanding how he who had lost himself,
could find a mistress. And for the same reason, the
following passage in Corneille has been generally con-
demned:

Chimene. Mon pere est mort, Elvire, et la premiere
epée
Dont s'est armée Rodrigue a sa trame coupée.
Pleurez, pleurez, mes yeux, et fondez-vous en eaux,
La moieté de ma vie a mis l'autre au tombeau.
Et m'oblige à venger, après ce coup funeste,
Celle que je n'ai plus, sur celle que me reste.

Cid, act iii. sc. 3.

To die is to be banish'd from myself:
And Sylvia is myself: banish'd from her,
Is self from self; a deadly banishment!

Two Gentlemen of Verona, act iii. sc. 3.

Countess. I pray thee, Lady, have a better cheer:
If thou engrossest all the griefs as thine,
Thou robb'st me of a moiety.

All's well that ends well, act iii. sc. 3.

K. Henry. O my poor kingdom, sick with civil
blows!
When that my care could not withhold thy riots,
What wilt thou do when riot is thy care?
O, thou wilt be a wilderness again,
Peopled with wolves, thy old inhabitants.

Second Part, Henry IV, act iv. sc. 11.

Crudes Amarilli, ohe col nome ancora
D'amor, ah lasso, amaramente insegni.

Pastor Fido, act i. sc. 2.

Antony, speaking of Julius Caesar:
O world! thou wast the forest of this hart;
And this, indeed, O world, the heart of thee.
How like a deer, strikten by many princes,
Dost thou here lie!

Julius Caesar, act iii. sc. 3.

Playing thus with the sound of words, which is still
worse than a pun, is the meanest of all conceits. But
Shakespeare, when he descends to a play of words
is not always in the wrong; for it is done sometimes to
denote a peculiar character, as in the following pas-
sage:

K. Philip. What say'st thou, boy? look in the lady's
face.

Loves. I do, my Lord; and in her eye I find
A wonder, or a wondrous miracle;
The shadow of myself form'd in her eye;
Which being but the shadow of your son,
Becomes a son, and makes your son a shadow.

P A S

I do protest, I never lov'd myself;
Till now infix'd I beheld myself
Drawn in the flatt'ring table of her eye.

Faulconbridge. Drawn in the flatt'ring table of her
eye!

Hang'd in the frowning wrinkle of her brow!
And quarter'd in her heart! he doth espy
Himself Love's traitor: this is pity now,
That hang'd and draw'd, and quarter'd there should be,
In such a love so vile a lust as he.

King John, act ii. sc. 5.

A jingle of words is the lowest species of that low
wit, which is scarcely sufferable in any case, and least
of all in an heroic poem: and yet Milton in some in-
stances has descended to that puerility:

And brought into the world a world of woe.

—Begirth th' Almighty throne
Beseeching or beseeching—
Which tempted our attempt—
At one slight bound high overlap'd all bound.

—With a shout.
Loud as from numbers without number.

One should think it unnecessary to enter a caveat
against an expression that has no meaning, or no distinct
meaning; and yet somewhat of that kind may be found
even among good writers.

Sebastian. I beg no pity for this mould'ring clay.
For if you give it burial, there it takes
Possession of your earth:
If burnt and scatter'd in the air; the winds
That strow my dust, diffuse my royalty,
And spread me o'er your clime; for where one atom
Of mine shall light, know there Sebastian reigns.

Dryden, Don Sebastian King of Portugal, act i.

Cleopatra. Now, what news, my Charmion?
Will he be kind; and will he not forsake me?
Am I to live or die? may, do I live?
Or am I dead? for when he gave his answer,
Fate took the word, and then I liv'd or dy'd.

Dryden, All for Love, act ii.

If she be coy, and scorn my noble fire,
If her chill heart I cannot move;
Why, I'll enjoy the very love,
And make a mistress of my own desire.

Cowley, poem inscribed "The Request."

His whole poem inscribed My Picture is a jargon of
the same kind.

—"Tis he, they cry, by whom.
Not men but war itself is overcome.

Indian Queen.

Such empty expressions are finely ridiculed in the Re-
hearsal.

Was't not unjust to ravish hence her breath,
And in life's need to leave us nought but death?

Passions, in Medicine, make one of the non-natu-
ral, and produce very sensible effects. Joy, anger, and
fear are the principal, in the two first, the spirits are
harried with too great vivacity; whereas, in fear or
dread,
Dread, they are as if they were curbed and concentrated; whence we may conclude, that they have a very bad effect upon health; and therefore it will be best to keep them within bounds as much as possible, and to preserve an inward serenity, calmness, and tranquillity.

Passions, in Painting, are the external expressions of the different dispositions and affections of the mind; but particularly their different effects upon the several features of the face: for though the arms, and indeed every part of the body, serve likewise, by their quick, languid, and variously diversified motions, to express the passions of the soul; yet, in painting, this difference is most conspicuous in the face. See Painting, and Drawing, § 8.

As we have given engravings of Le Brun's drawings of the passions, we shall here subjoin the account which he has given of each of these heads.

1. The effects of attention are, to make the eyebrows sink and approach the sides of the nose; to turn the eyelids toward the object that causes it; to open the mouth, and especially the upper part; to decline the head a little, and fix it without any other remarkable alteration.

2. Admiration causes but little agitation in the mind, and therefore alters but very little the parts of the face; nevertheless the eyebrow rises; the eye opens a little more than ordinary; the eyelid placed equally between the eyelids appears fixed on the object; the mouth half opens, and makes no sensible alteration in the cheeks.

3. The motions that accompany admiration with astonishment are hardly different from those of simple admiration, only they are more lively and stronger marked; the eyebrows more elevated; the eyes more open; the eyeball further from the lower eyelid, and more steadily fixed: the mouth is more open, and all the parts in a much stronger emotion.

4. Admiration begets esteem, and this produces veneration, which, when it has for its object something divine or beyond our comprehension, makes the face decline, and the eyebrows bend down; the eyes are almost shut and fixed: the mouth is shut. These motions are gentle, and produce but little alteration in the other parts.

5. Although rotepc has the same object as veneration, only considered in a different manner, its motions are not the same; the head inclines to the left side; the eyelids and eyebrows rise directly up; the mouth half opens, and the two corners are a little turned up: the other parts remain in their natural state.

6. The passion of desire brings the eyebrows close together and forwards toward the eyes, which are more open than ordinary: the eyeball is inflamed, and places itself in the middle of the eye; the nostrils rise up, and are contracted towards the eyes; the mouth half opens, and the spirits being in motion give a lively glowing colour.

7. Very little alteration is remarked in the face of those that feel within themselves the sweetness of joy, or joy with tranquillity. The forehead is serene; the eyebrow without motion, elevated in the middle; the eye pretty open and with a laughing air; the eyeball lively and shining; the corners of the mouth turn up a little; the complexion is lively; the cheeks and lips are red.

8. Laughter, which is produced by joy mixed with surprise, makes the eyebrow rise towards the middle of the eye, and bend towards the sides of the nose; the eyes are almost shut, and sometimes appear wet, or shed tears, which make no alteration in the face; the mouth half open, shows the teeth; the corners of the mouth drawn back, cause a wrinkle in the cheeks, which appear so swelled as to hide the eyes in some measure; the nostrils are open, and all the face is of a red colour.

9. Acute pain makes the eyebrows approach one another, and rise towards the middle; the eyeball is hid under the eyebrows; the nostrils rise and make a wrinkle in the cheeks; the mouth half opens and draws back: all the parts of the face are agitated in proportion to the violence of the pain.

10. Simple bodily pain produces proportionally the same motions as the last, but not so strong: The eyebrows do not approach and rise so much; the eye appears fixed on some object; the nostrils rise, but the wrinkles in the cheeks are less perceptible; the lips are further asunder towards the middle, and the mouth is half open.

11. The dejection that is produced by sadness makes the eyebrows rise towards the middle of the forehead more than towards the cheeks; the eyeball appears full of perturbation; the white of the eye is yellow; the eyelids are drawn down, and a little swelled; all about the eyes is livid; the nostrils are drawn downward; the mouth is half open, and the corners are drawn down; the head carelessly leaning on one of the shoulders: the face is of a lead colour; the lips pale.

12. The alterations that weeping occasions are strongly marked: The eyebrows sink down towards the middle of the forehead; the eyes are almost closed, wet, and drawn down towards the cheeks; the nostrils swelled; the muscles and veins of the forehead appear; the mouth is shut, and the sides of it are drawn down, making wrinkles on the cheeks; the under lip pushed out, presses the upper one; all the face is wrinkled and contracted; its colour is red, especially about the eyebrows, the eyes, the nose, and the cheeks.

13. The lively attention to the misfortunes of another, which is called compassion, causes the eyebrows to sink towards the middle of the forehead; the eyeball to be fixed upon the object; the sides of the nostrils next the nose to be a little elevated, making wrinkles in the cheeks; the mouth to be open; the upper lip to be lifted up and thrust forwards; the muscles and all the parts of the face sinking down and turning towards the object which excites the passion.

14. The motions of scorn are lively and strong: The forehead is wrinkled; the eyebrow is knit; the side of it next the nose sinks down, and the other side rises very much; the eye is very open, and the eyeball is in the middle; the nostrils rise, and draw towards the eyes, and make wrinkles in the cheeks; the mouth shuts, its sides sinking down, and the under-lip is pushed out beyond the upper one.

15. An object despised sometimes causes horror, and then the eyebrow knits, and sinks a great deal more. The eyeball, placed at the bottom of the eye, is half covered by the lower eyelid; the mouth is half open, but closer in the middle than the sides, which being drawn back,
PASSIONS.

Passion, back, makes wrinkles in the cheeks; the face grows pale, and the eyes become livid; the muscles and the veins are marked.

16. The violence of terror or fright, alters all the parts of the face; the eyebrow rises in the middle; its muscles are marked, swelled, pressed one against the other, and sunk towards the nose, which draws up as well as the nostrils; the eyes are very open; the upper eyelid is lid under the eyebrow; the white of the eye is encompassed with red; the eyeball fixes toward the lower part of the eye; the lower part of the eyelid swells and becomes livid; the muscles of the nose and cheeks swell; and these last terminate in a point toward the sides of the nostrils; the mouth is very open, and its corners very apparent; the muscles and veins of the neck stretched; the hair stands on end; the colour of the face, that is, the end of the nose, the lips, the ears, and round the eyes, is pale and livid; and all ought to be strongly marked.

17. The effects of anger show its nature. The eyes become red and inflamed; the eyeball is staring and sparkling; the eyebrows are sometimes elevated and sometimes sunk down equally; the forehead is very much wrinkled, with wrinkles between the eyes; the nostrils are open and enlarged; the lips pressing against one another, the under one rising over the upper one, leaves the corners of the mouth a little open, making a cruel and disdainful grin.

18. Haired and jealousy wrinkles the forehead; the eyebrows are sunk down and knit; the eyeball is half hid under the eyebrows, which turn towards the object; it should appear full of fire, as well as the white of the eye and the eyelid; the nostrils are pale, open, more marked than ordinary, and drawn backward so as to make wrinkles in the cheeks; the mouth is so shut as to show the teeth are closed; the corners of the mouth are drawn back and very much sunk; the muscles of the jaw appear sunk; the colour of the face is partly inflamed and partly yellowish; the lips pale or livid.

19. As despair is extreme, its motions are so likewise; the forehead wrinkles from the top to the bottom; the eyebrows bend down over the eyes, and press one another on the sides of the nose; the eye seems to be on fire, and full of blood; the eyeball is disturbed, hid under the eyebrow, sparkling and unfixed; the eyelid is swelled and livid; the nostrils are large, open, and lifted up; the end of the nose sinks down; the muscles, tendons, and veins, are swelled and stretched; the upper part of the cheeks is large, marked, and narrow towards the jaw; the mouth drawn backwards is more open at the sides than in the middle; the lower lip is large and turned out; they gnash their teeth; they foam; they bite their lips, which are pale; as in the rest of the face; the hair is straight and stands on end.

Passion Week. See Passiflora, Botany Index.

Passive, in general, denotes something that suffers the action of another, called an agent or active power.
P A S  [ 34 ]  P A S

Active and passive obedience; and that many who consider themselves as bound on no account whatever to resist the supreme power, would yet suffer death rather than do an immoral action in obedience to any law of earthly origin.

Passive Prayer, among the mystic divines, is a total suspension or ligature of the intellectual faculties; in virtue whereof, the soul remains of itself, and as to its own power, impotent with regard to the producing of any effects. The passive state, according to Fenelon, is only passive in the same sense as contemplation is, i.e., it does not exclude peaceable, disinterested acts, but only unquiet ones, or such as tend to our own interest.

In the passive state, the soul has not properly any activity, and sensation, of its own: it is a mere infinite flexibleness of the soul, to which the feeblest impulse of grace gives motion.

P A S O V E R, a solemn festival of the Jews, instituted in commemoration of their coming out of Egypt; because the night before their departure, the destroying angel, who put to death the first-born of the Egyptians, passed over the houses of the Hebrews without entering therein, because they were marked with the blood of the lamb which was killed the evening before, and which for this reason was called the paschal lamb. This feast was called pesah, passage, leap. The following is what God ordained concerning the passover of the Jews, (Exod. xii.).

The month of the coming forth from Egypt was looked upon from this time to be the first month of the sacred or ecclesiastical year, and the fourteenth day of this month, between the two vespers, that is, between the sun's decline and his setting: or rather, according to our manner of reckoning, between two o'clock in the afternoon and six o'clock in the evening at the equinox, they were to kill the paschal lamb, and to abstain from leavened bread. The day following being the fifteenth, counting from six o'clock of the foregoing evening, which concluded the fourteenth, was the grand feast of the passover, which continued seven days. But it was only the first and the seventh day that were solemn.

The lamb that was killed ought to be without any defect, a male, and yeamed that year. If no lamb could be found, they might take a kid. They killed a lamb or a kid in every family; and if the number of those that lived in the house was not sufficient to eat a lamb, they might join two houses together. With the blood of the paschal lamb they sprinkled the door-posts and lintel of every house, that the destroying angel, at the sight of the blood, might pass over them, and save the Hebrew children. They were to eat the lamb the same night that followed the sacrifice; they ate it roasted, with unleavened bread, and a salad of wild lettuce. The Hebrew says literally, with bitter things, as suppose mustard, or any thing of this nature to give a relish. It was forbid to eat any part of it raw, or boiled in water, nor were they to break a bone, (Exod. vii. 26. Numb. ix. 12. John xix. 36.) and if any thing remained to the day following, it was thrown into the fire. They that ate it were to be in the posture of travellers, having their reins girt, their shoes on their feet, their staves in their hands, and eating in a hurry. But this last part of the ceremony was but little observed, at least it was of no obligation, but only upon that night they came forth out of Egypt. For the whole eight days of the passover no leavened bread was to be used; and whoever should eat any, was threatened to be cut off from his people. With regard to the ceremonies which are observed in relation to the bread, see the article BREAD.

They keep the first and last day of the feast, yet so as that it was allowed to dress victuals, which was forbidden on the Sabbath-day. The obligation of keeping the passover was so strict, that whoever should neglect to do it, was condemned to death, (Numb. ix. 13.)

But those who had any lawful impediment, as a journey, sickness, or any uncleanness, voluntary or involuntary; for example, those that had been present at a funeral, or by any other accident had been defiled, were to defer the celebration of the passover till the second month of the ecclesiastical year, or to the fourteenth day of the month Tann, which answers to April and May. It was thus the Lord ordered Moses, upon the occasion of the inquiry of some Israelites, who had been obliged to pay their last offices to some of their relations, and who being thus polluted, were not capable of partaking of the paschal sacrifice, (2 Chr. xxx. 1, 2, &c.) The modern Jews observe in general the same ceremonies that were practised by their ancestors, in the celebration of the passover. On the fourteenth of Tann, the first-born fast in memory of God's smiting the first-born of the Egyptians. The morning prayers are the same with those said on other festivals. They take the roll of the pentateuch out of the chest, and read as far as the end of the twelfth chapter of Exodus, and what is contained in the eighteenth chapter of Numbers, relating to the passover. The matron of the family then spreads a table, and sets on it two unleavened cakes, and two pieces of the lamb, a shoulder boiled and another roasted, to put them in mind that God delivered them with a stretched-out arm. To this they add some small fishes, because of the leviathan; a hard egg, because of the ziz; some meal, because of the behemoth, (these three animals being appointed for the feast of the elect in the other life); and peace and nuts for the children, to provoke their curiosity to ask the reason of this ceremony. They likewise use a kind of mustard, which has the appearance of mortar, to represent their making bricks in Egypt. The father of the family sits down with his children and slaves, because on this day all are free. Being set down, he takes bitter herbs, and dips them in the mustard, then eats them, and distributes to the rest. Then they eat of the lamb, the history and institution of which is at that time recited by the master of the family. The whole repast is attended with hymns and prayers. They pray for the prince under whose dominion they live, according to the advice of Jeremiah (xxix. 7.), "Seek the peace of the city whither I have caused you to be carried away captive, and pray unto the Lord for it: for in the peace thereof shall ye have peace." See the article FEAST, &c. The same things are put in practice the two following days; and the festival is concluded by the ceremony habbala or distinction. This ceremony is performed at the closing of the Sabbath-day, at which time the master of the house pronounces certain benedictions, accompanied with certain formalities, requesting that every thing may succeed well the week following. After going out of the synagogue, they
they then eat leavened bread for the last time. (Leo of Modena, p. iii. c. 3. and the Rabbins). While the temple was standing, they brought their lambs thither, and sacrificed them, offering the blood to the priest, who poured it out at the foot of the altar. The passover was typically predictive of Christ our Christian passover, (1 Cor. v. 7.). As the destroying angel passed over the houses marked with the blood of the paschal lamb, so the wrath of God passes over them whose souls are sprinkled with the blood of Christ. The paschal lamb was killed before Israel was delivered, so it is necessary Christ should suffer before we could be redeemed. It was killed before Moses’s law or Aaron’s sacrifices were enjoined, to show that deliverance comes to mankind by none of them; but only the true passover, that Lamb of God alain from the foundation of the world, (Rom. iii. 25. Heb. ix. 14.). It was killed the first month of the year, which prefigured that Christ should suffer death in this month, (John xviii. 28.). It was killed in the evening, (Exod. xii. 6.). So Christ suffered in the last days, and at this time of the day, (Matt. xxvii. 46. Heb. i. 2. At even also the sun sets, which shows that it was the Sun of Righteousness who was to suffer and die, and at his passion universal darkness should be upon the whole earth, (Luke xxiii. 44.). The passover was roasted with fire, to denote the sharp and dreadful pains which Christ should suffer, not only from men, but from God also. It was to be eaten with bitter herbs, not only to put them in remembrance of their bitter bondage in Egypt, but also to typify our mortification to sin, and readiness to undergo afflictions for Christ, (Col. i. 24.).

Many erroneously imagine, that the passover was instituted in memory of the Israelites passing the Red Sea; though it is certain the feast was held, and had its name, before the Israelites took a step of their way out of Egypt, and consequently several days before their passing the Red Sea. Besides the passover celebrated on the fourteenth of the first month, there was a second passover held on the fourteenth of the second month after the equinox, instituted by God in favour of travellers and sick persons, who could not attend at the first, nor be at Jerusalem on the day. The Greeks, and even some of the catholic doctors, from the thirteenth, eighteenth, and nineteenth, chapters, of St John, take occasion to conclude, that Jesus anticipated the day marked for the passover in the law; but the authority of three evangelists seems to evince the contrary. See Whitby’s Dissertation on this subject, in an appendix to the fourteenth chapter of St Mark. F. Lamia supposes, that our Lord did not attend at the passover the last year of his life; which sentiment has drawn upon him abundance of opposers. F. Hardonin asserts, that the Galileans celebrated the passover on one day, and the Jews on another.

PASSOVER, or PASS, a licence or writing obtained from a prince or governor, granting permission and a safe conduct to pass through his territories without molestation: Also a permission granted by any state to navigate in some particular sea, without hindrance or molestation from it. It contains the name of the vessel, and that of the master, together with her tonnage and the number of her crew, certifying that she belongs to the subjects of a particular state, and requiring all persons at peace with that state to suffer her to proceed on her voyage without interruption.

The violation of safe-conducts or passports expressly granted by the king or by his ambassadors to the subjects of a foreign power in time of mutual war, or committing acts of hostility against such as are in amity, league, or truce with us, who are here under a general implied safe-conduct, are breaches of the public faith, without which there can be no intercourse or commerce between one nation and another; and such offences may, according to the writers upon the law of nations, be a proper ground of a national war. And it is enacted by the statute 31 Hen. VI. cap. 4. still in force, that if any of the king's subjects attempt to offend upon the sea, or in any port within the king's obedience, or against any stranger in amity, league, or truce, or under safe-conduct, and especially by attacking his person, or spoiling him, or robbing him of his goods; the lord-chancellor, with any of the justices of either the king's bench or common-pleas, may cause full restitution and amends to be made to the party injured. Passequier says that passport was introduced for passe par-louis. Balzac mentions a very honourable passport given by an emperor to a philosopher in these terms: "If there be any ocean of land or sea, hardly enough to molest Potamot, let him consider whether he be strong enough to wage war with Cesar."

PASSPORT is used likewise for a licence granted by a prince for the importing or exporting merchandises, moveables, &c. without paying the duties. Merchants procure such passports for certain kinds of commodities: and they are always given to ambassadors and ministers for their baggage, equipage, &c.

PASSPORT is also a licence obtained for the importing or exporting of merchandises deemed contraband, and declared such by tariffs, &c. as gold, silver, precious stones, ammunition of war, horses, corn, wool, &c. upon paying duties.

PASSUS, among the Romans, a measure of length, being about four feet ten inches, or the thousandth part of a Roman mile. The word properly signifies, the space between the feet of a man walking at an ordinary rate. See Measure.

PASTE, in Cookery, a soft composition of flour, wrought up with proper fluids, as water, milk, or the like, to serve for cases or coffins, therein to bake meats, fruits, &c. It is the basis or foundation of pyes, tarts, patties, pasties, and other works of pastry. It is also used in confectionary, &c. for a preparation of some fruit, made by beating the pulp thereof with some fluid or other admixture, into a soft pappy consistence, spreading it into a dish, and drying it with sugar, till it becomes as pliable as an ordinary paste. It is used occasionally also for making the crusts and bottoms of pyes, &c. Thus, with proper admixtures, are made almond pastes, apple pastes, apricot pastes, cherry, currant, lemon, plum, peach, and pear pastes.

PASTE is likewise used for a preparation of wheaten flour, boiled up and incorporated with water; used by various artificers, as upholsterers, saddlers, bookbinders, &c. instead of glue or size, to fasten or cement their cloths, leathers, papers, &c. When paste is used by bookbinders, or for paper-hangings to rooms, they mix a fourth, fifth, or sixth, of the weight of the flour of powdered resin; and where it is wanted still more tenacious, gum arabic or any kind of size may be added. Paste may be preserved, by dissolving a little sublimate, 

E 2
PAST, in the proportion of a dram to a quart, in the water employed for making it, which will prevent not only rats and mice, but any other kind of vermin and insects, from preying upon it.

PASTES, in the glass trade, or the imitation of cutters' work on glass, see GEM.

PASTEBOARD, a kind of thick paper, formed of several single sheets pasted one upon another. The chief use of pasteboard is for binding books, making letter-cases, &c., see PAPER.

PASTERN of a Horse, in the mange, is the distance between the joint next the foot and the coronet of the hoof. This part should be short, especially in middle-sized horses; because long pasterns are weak, and cannot so well endure travelling.

PASTERN-Joint, the joint next a horse's foot.

PASTIL, or PASTEL, among painters, a kind of paste made of different colours ground up with gum-water, in order to make CRAYONS.

PASTIL, in Pharmac., is a dry composition of sweet-smelling resins, aromatic woods, &c., sometimes burnt to clear and scent the air of a chamber.

PASTIME, a sport, amusement, or diversion. Pastimes of some kind seem to be absolutely necessary, and to the more than to the man of study; for the most vigorous mind cannot bear to be always bent. Constant application to one pursuit, if deeply engage the attention, is apt to unlight the mind, and to generate madness: of which the Don Quixote of Cervantes, and the astronomer of Johnson, are two admirably conceived instances. But though pastime is necessary to relieve the mind, it indicates great frivolity when made the business of life; and yet the rich and the great, who are not obliged to labour for the means of subsistence, too often rove from pastime to pastime with as constant assiduity as the mechanic toils for his family, or as the philosopher devotes himself to the cultivation of science. When those pastimes tend to give elasticity to the mind or strength to the body, such conduct is not only allowable, but praise-worthy; but when they produce effects the reverse of these, it is both hurtful and criminal. The gaming-table, the masquerade, the midnight assembly of any sort, most of inanity enfeebles both the body and the mind; and yet such are the fashionable amusements of the present day, to which many a belle and many a beau sacrifice their beauty, their health, their quiet, and their virtue.

For different were the pastimes of our wiser ancestors: Remote from vice and effeminacy, they were innocent, manly, and generous exercises. From the ancient records of this country, it appears, that the sports, amusements, pleasures, and recreations of our ancestors, as described by Fitz-Stephen (A), added strength and agility to the wheels of state mechanism, while they had a direct tendency towards utility. For most of these ancient recreations are resolvable into the public defence of the state against the attacks of a foreign enemy. The play at ball, derived from the Romans, is first introduced by this author as the common exercise of every school-boy. The performance was in a field, where the resort of the most substantial and considerable citizens, to give encouragement and countenance to this feat of agility, was splendid and numerous. The intention of this amusement at this period of time was to make the juvenile race active, nimble, and vigorous; which qualities were requisite whenever their assistance should be wanted in the protection of their country. The next species of pastime indeed does not seem to have this tendency; but it was only, as it seems, an annual custom: This was cock-fighting. The author tells us, that in the afternoon of Shrove-Tuesday, on which day this custom prevailed, they concluded the day in throwing the ball: which seemed to inanimate, that the cock-fighting was merely in conformity to ancient usage, and limited only to part of the day, to make way for a more laudable performance. We may reasonably suppose, although this author is entirely silent upon this head, that while cock-fighting was going on, cock-throwing was the sport of the lowest class of people, who could not afford the expense of the former (B). Another species of manly exercise was truly martial, and intended to qualify the adventurers for martial discipline. It is related by Fitz-Stephen thus: “Every Friday in Lent, a company of young men comes into the field on horseback, attended and conducted by the best horsemen: then march forth the sons of the citizens, and other young men, with disarmed lances and shield; and there practise feats of war. Many courtiers likewise, when the king is near the spot, and attendants upon noblemen, do repair to these exercises: and while the hope of victory does inflame their minds, they show by good proof how serviceable they would be in martial affairs.” This evidence is of Roman descent, and immediately brings to our recollection the Ludus Trojae, supposed to be the invention, as it was the common exercise, of Ascanius. The common people, in this age of masculine manners, made every amusement where strength was exerted the subject-matter of instruction and improvement.

(A) Otherwise called William Stephanides, a monk of Canterbury, who lived in the reign of King Stephen to the time of Richard I. He wrote a Latin treatise, in which he gives an account of the several pastimes which were countenanced in his time. Bale in his writings draws a pleasing portrait of him. He is likewise sketched in a strong and forcible outlines of praise and commendation by Leland. Bale says thus of him: “The time which other people usually misemployed in an idle and frivolous manner, he consecrated to inquiries which tended to increase the fame and dignity of his country: in doing which, he was not unworthy of being compared to Plato; for like him, he made the study of men and heaven his constant exercise.”

(B) There were places set apart for the battles of these animals, as at this day, where no one was admitted without money. These places, or pits commonly called, were schools, as at this day, in which people were instructed in the doctrines of chance, loss and gain, betting and wagers, and particularly in the liberal art of laying two to one. Cock-throwing has been laudably abolished; for it was a species of cruelty towards an innocent and useful animal; and such a cruelty as would have kindled compassion in the heart of the kindest barbarian.
instructed to exert their bodily strength in the maintenance of their country’s rights; and their minds improved by such exertion, into every manly and generous principle.

In the vacant intervals of industrious labour, commonly called the holy-days, idleness and inactivity, which at this day mark this portion of time, were found only in those whose lives were distempered with age or infirmity. The view which Fitz Stephen gives us of the Easter holidays is animated. In Easter holidays they fight battles upon the water. A shield is hanged upon a pole, fixed in the middle of the stream. A boat is prepared without oars, to be borne along by the violence of the water; and in the forepart thereof standeth a young man, ready to give charge upon the shield with his lance. If so be he strike his lance against the shield, and doth not fall, he is thought to have performed a worthy deed. If without breaking his lance he runs strongly against the shield, down he falleth into the water; for the boat is violently forced with the tide: but on each side of the shield ride two boats, furnished with young men, who recover him who falleth soon as they may. In the holidays all the summer the youths are exercised in leaping, dancing, shooting, wrestling, cast-ting the stone, and practising their shields; and the maidens trip with their tymbrels, and dance as long as they can well see. In winter, every holiday before dinner, the boars prepared for brawn are set to fight, or else bulls or bears are baited.

These were the laudable pur-suits to which leisure was devoted by our forefathers, so far back as the year 1350. Their immediate successors breathed the same generous spirit. In the year 1522, the sixth year of Henry III, we find, that certain masters in exercises of this kind made a public profession of their instructions and discipline, which they imparted to those who were desirous of attaining excellence and victory in these honourable achievements. About this period, the persons of better rank and family introduced the play of Tennis (c); and erected courts or oblong edifices for the performance of the exercise.

About the year 1525, in the 38th year of Henry III, the Quintan was a sport much in fashion in almost every part of the kingdom. This contrivance consisted of an upright post firmly fixed in the ground, upon the top of which was a cross-piece of wood, moveable upon a spindle; one end of which was broad like the flat part of a halberd, while at the other end was hung a bag of sand. The exercise was performed on horseback. The masterly performance was, when, upon the broad part being struck with a lance, which sometimes broke it, the assi-siant rode swiftly on, so as to avoid being struck on the back by the bag of sand, which turned round instantly upon the stroke given with a very swift motion. He who executed this feat in the most dexterous manner was declared victor, and the prize to which he became entitled was a peacock. But if, upon the aim taken, the contester mis-carried in striking at the broad-side, his impotency of skill became the ridicule and contempt of the spectators.

Dr. Plot, in his Natural History of Oxfordshire, tells us, that this pastime was in practice in his time at Deddington in this county. "They first (says this author) fixed a post perpendicularly in the ground, and then placed a small piece of timber upon the top of it, fastened on a spindle, with a board nailed to it on one end, and a bag of sand hanging at the other. Against this board they anciently rode with spears: now as I saw it at Deddington only with strong staves, which violently bringing about the bag of sand, if they make not good speed away, it strikes them in the neck or shoulders, and sometimes perhaps strikes them down from their horses; the great design of the sport being to try the agility both of man and horse, and to break the board; which, whoever did, was accounted conqueror: for whom hitherto there was some reward always appointed." (D)

Matthew Paris, speaking of this manly diversion, says, "The London youths made trial of their strength on horseback, by running at the Quintan; in doing which, whoever excelled all the rest was rewarded with a peacock." This sport is continued to this day in Wales; and being in use only upon marriages, it may be considered as a votive pastime, by which these heroic spirits seem to wish, that the male issue of such marriage may be as strong, vigorous, and active, as those who are at that time engaged in the celebration of this festive exertion of manhood. Virtuous exercises of this kind would

---

(c) The word Tennis seems to owe its original to the French language: if so, the game is of French production. Yet the word tenes will hardly be found to afford incontrovertible evidence upon this subject. For the holding or keeping possession of the ball is no part of the game, but rather a circumstance casually attending it: since, during the performance of it the ball is in continual motion, so there can be no tenes at this juncture. Perhaps a place in France called Tennis (as there is a town which differs only in a letter, called Sennais, in the district of Champagne) was the place where the balls were first made, and the game first introduced.

(D) This was originally an exercise derived from a military institution of the Romans, though the instrumental figure, will find there: were four principal gates or passages. Near the Questorium, or Questor’s apartment, was the Forum, or what is now calling a sitting house; and from being near the Questor’s station called Quaestorium forum. At this part was a fifth gate Quintanum, where the soldiers were instructed in the discipline of the Parias, which was to aim at and strike their javelins against an upright post fixed in the ground, as a kind of propulsion to a real engagement with an enemy. By the frequent practice of this exercise, sometimes called exercitium ad palam by Roman writers, the soldiers at length acquired not only a dexterity and address in the management of their arms, but a constant and regular exactness in the direction of them. Titus Livius Palatinus, cap. 2. Panvivialles Rerum Memorabil. lib. ii tit. 21. Veturius in Augustanis Monumentis, lib. li. p. 237.

Upon the irritation of the Istri into the Roman camps, which they plundered, says Livius, ad Questorium forum, quintanumque pervenurunt.
Pastime. would be too rude and barbarous for the attendants on pleasure in the present age. The hand would tremble at the weight of the javelin; and the heart would pant upon the apprehension of personal insecurity. While these exertions of triumphant prowess continued, the sordid degeneracy of disposition, the supple baseness of temper, were unknown: for the love of country, as the Roman orator has wisely observed, included all other virtues. But if we guard the palace of honour, like the brazen castle of Danaë, with every possible security, importunate corruption will be ever waiting at the gate, to seize an opportunity of intrusion. These feats of honourable contest were succeeded by the gilded banners of exhibition, and all the long train of dependants in the interest of indolence: for the writers of these times inform us, that the soft pleasures of the stage forced the passes to public favour in the year 1391, and likewise in the year 1409; so that utility, which before stood on the right hand of pleasure, was now ordered to withdraw for a season. The drama, it seems, was attempted by set of useless and insignificant persons called paroch-clerks, who, because they had the knowledge of the alphabet, ignorantly presumed that this included every other species of knowledge. The subject was truly serious, the creation of the world; but the performance must have been ludicrous. It was, however, honoured with the attendance of noble personages; and royalty itself deigned to cast a favourable eye upon it, for the king and queen were present. These interludes lasted no longer than the time requisite for the former condescency of utility and pleasure to resume its powers; as when the pliable bow by being too much bent is put out of shape, and by its elasticity recovers its former position. The lance, the shield, the ball, and the equestrian procession, came forward again, and put the dramatic usurper to flight. After this period, these objects of generous pleasure seem to have had their audience of leave, and one general object, indeed no less main than the former, to have filled their stations, which was archery. This had a continuation to the reign of Charles I.; for we find in many hospitals founded in that reign, among the articles of benefaction recorded upon their walls, this singular provision, arms for the boys, which signified bows and arrows.

There are many places at this day, formerly resorted to for the practice of this noble art, distinguished by appellations which indicate their ancient usage: such as Brentford Butts, Newington Butts, and many others of the like denomination. It appears from 33 Hen. VIII. that by the intrusion of other pertinacious games, archery had been for a long time disused; to revive which this statute was made. It seems that the bows of the best kind were made of yew; and that this wood more readily obtained for this purpose, yew-trees were in church-yards. The sons of those only who were sons of fortune and fashion, if under 17 years were permitted to use such bows. The words statute are singular, and ran thus: "No person seventeen years, except he, or his father or mother have lands or tenements to the yearly value of forty marks sterling, shall shoot with any bow of which shall be bought for him, after the feast of our Lord next coming, under the pain to lose and forfeit six shillings and eightpence." Two observations arise upon these words. One, that the yew-wood, not so common as other wood, might probably be soon deficient, as it was the best wood for making bows and restraining in the use of it to particular ages and sons, as young people wantonly destroy what is put in their hands for useful purposes. The other observation is, that the age of 17 is by this statute distinguishable the age of discretion, when young people are more tentative and considerate in things of public concern age in these times which few ever arrive at, and never. This statute makes provision of other kind wood for the common people in the following manner.

"To the intent that every person may have bow mean price, be it enacted, that every bowyer shall every bow that he maketh of yew, make four other bows meet to shoot with, of elm, witch hazel, ash, or oak wood apt for the same, under pain to lose and forfeit every such bow so lacking the sum of three shillings and fourpence." It seems there was a species of yew at time called elk, which wood was stronger and pliant than the common yew mentioned in this statute and the price of it fixed. Moreover, no bow shall sell or put to sale to any of the king's subjects any bow of yew of the tax called elk, above the price of three shillings and fourpence, under the pain to forfeit twenty shillings for every bow sold above said price.

From these several considerations which occur this statute, we can trace three resplendent qualities courage, strength, and agility, which three unite inspired to more, generosity and magnanimity. On the decline of this and other polished amusements, a savage deformity of manners sprung up, and spangled here and there with the opposite character of lazy opulence, which began now to erect her vef standard in defiance of chaste and regular manners. Towards the beginning of James I.'s reign, military prowess seems to have sounded a retreat. He, to gratify the importance of the common people, and

(2) How widely different the conceptions of politeness at this day from what they were in the most refined ages of Greece and Rome! These two states agreed in fixing the standard of this accomplishment upon the fitness and propriety of actions. We bend to an arbitrary imposture of language, trusting to the sense and meaning of our opposite Gallic neighbours, as if this island was at all times to be the foot-ball of that continent. To define politeness in its ancient and true sense, it is a manly exertion of conduct, founded upon every noble and virtuous principle. Gallic politeness is an effeminate impotence of demeanour, founded upon fallacy, evasion, and every insidious artifice. There can be no security, no happiness, no prosperity, awaiting this kingdom, so long as we fawn to fashions that disgrace humanity, and to manners which consist of more than Punic perfidy.

(9) It has been confidently asserted by some historians, that James was, during his whole life, struck with terror upon the sight of a drawn sword; which was the reason of his great unwillingness in bestowing the honour of knighthood.
the same time to obviate his own fears upon a refusal, published a book of sports, in which the people had been some time before usually indulged on Sunday evenings, but which had been lately prohibited. These sports consisted of dancing, singing, wrestling, church ales, and other profligations of that day.

Charles, his successor, wisely, in the very entrance of his reign, abolished these sports. The act of Charles states the several amusements in part; by which we may conjecture what was the remainder as stated in the book of sports by James. It is necessary to transcribe that part of the act relating to this subject.

"Forasmuch as there is nothing more acceptable to God, than the true and sincere worship of Him, and service according to His holy will, and that the holy keeping of the Lord's day is a principal part of the service of God, which in many places of this realm hath been, and now is, prophaned and neglected by a disorderly sort of people, in exercising and frequenting bear-baiting, bull-baiting, interludes, and common-plays, and other unlawful exercises and pastimes, neglecting divine service both in their own parishes and elsewhere: Be it enacted, that from and after forty days next after the end of this session of parliament, there shall be no meetings, assemblies, or concourse of people, out of their own parishes, on the Lord's day, within this realm of England, or any of the dominions thereof, for any sports or pastimes whatsoever: nor any bear-baiting, bull-baiting, interludes, common-plays, or other unlawful exercises or pastimes, used by any person or persons within their own parishes: and that every person and persons offending in any of the said premises, shall forfeit for every offence the sum of three shillings and fourpence; the same to be employed and converted to the use of the poor of the parish where such offence shall be committed." All this was perhaps proper, and showed the distinguished piety of this unfortunate monarch. But in this age likewise ended the main sports of Britons, and nothing was introduced that could compensate for the loss.

All these lusty arts, considered as vehicles of pleasure, from the variety of their inventions, represent pleasure as a fleeting phantasm: evincing at the same time the stability of happiness as springing from internal order. Even reflex acts, preoccupancies with future health and well-being, have more true feelings in expectancy than those which arise from the object in possession. Nay, pleasure is found frequently in the imagination only: for action's disappointment frequently awaits us when we advance to embrace this Juno of our desires.

Upon the whole, happiness, the only thing of intrinsic value, must arise in the heart, and be something more solid than what mere amusement can possibly supply. Amusements or pastimes ought to be considered only as necessary relaxations from severer and more useful employment; and in this point of view they may be solely pursued; but they become criminal when they occupy the place of the business of life.

PASTINACA, the PARSNIP, a genus of plants belonging to the pentadria class; and in the natural method ranking under the 45th order, Umbellatae. See BOTANY Index.

PASTOGRAPHI, among the ancients, were priests whose office it was to carry the images, along with the shrines of the gods, at solemn festivals, when they were to pray to them for rain, fair weather, or the like. The Greeks had a college of this order of priests in Sylia's time. The cells or apartments near the temples, where the pastophori lived, were called pastophoria. There were several lodging rooms for the priests of a similar kind in the temple of Jerusalem.

PASTORAL, in general, something that relates to shepherds: hence we say, pastoral life, manners, poetry, &c.

Pastoral life may be considered in three different Blair's views; each such as it now actually is; when the Lectures, state of shepherds is reduced to be a mean, servile, and vol. iii. laborious state; when their employments become P. 117. disagreeable, and their ideas gross and low; or such as we may suppose it once to have been, in the more early and simple ages, when it was a life of ease and abundance; when the wealth of men consisted chiefly in flocks and herds, and the shepherd, though unrefined in his manners, was respectable in his state; or lastly, such as it never was, and never can in reality be, when, to the ease, innocence, and simplicity of the early ages, we attempt to add the polished taste and cultivated manners of modern times. Of these three states, the first is too gross and mean, the last too refined and unnatural, to be made the groundwork of pastoral poetry. Either of these extremes is a rock upon which the poet will split, if he approach too near it. We will be disgusted if he give us too much of the servile employments and low ideas of actual peasants, as Theocritus is censured for having sometimes done; and if, like some of the French and Italian writers of pastorals, he make his shepherds discourse as if they were courtiers and scholars, he then retains the name only, but wants the spirit of pastoral poetry.

PASTORAL Poetry. See POETRY, Part II. sect. 4.

PASTRY, that branch of cookery which is chiefly taken up in making pies, pasties, cakes, &c. See PASTE. Dr. Cullen observes, that pastry is a very hard and indigestible without butter; and even with it, is apt to produce heartburn and acidity. Perhaps this is increased by the burned butter, from a certain sensibility in the stomach, which occasions all empyreumatic oils to be long retained, and so produce acidity.

PASTURE, or PASTURE Land, is that reserved for feeding cattle. See AGRICULTURE Index.

PATECI, in Mythology, images of gods which the Phœnicians carried on the prow of their galleys. Herodotus, lib. iv. calls them καλλωπια. The word is Phoenician, and derived from pethica, i. e. titulus. See Boccaccio's Chansonn, lib. ii. cap. 3. But Scaliger does not agree. More derives it from ἄραμα, monkey, this animal having been an object of worship among the Egyptians, and hence might have been honoured by their
their neighbours. Mr Elsner has observed, that He-
Patagonia rodutos does not call the Patunci gods; but that they
obtained this dignity from the liberality of Henschius
and Suidas, and other ancient lexicographers, who
place them at the stern of ships; whereas Herodotus
placed them at the prow. Scaliger, Bochart, and Se-
den, have taken some pains about this subject.—M.
Morin has also given us a learned dissertation on this
head, in the Memoires de l'Acad. des Inscript. et Belles
Lettres, tom. 1; but Mr Elsner thinks it defective in
point of evidence.

PATAGONIA, a country of South America, com-
prehending all that country extending from Chili and
Paraguay to the utmost extremity of South America;
that is, from 35° to 54° of latitude: being sur-
brounded by the countries just mentioned, the South and
North seas, and the straits of Magellan, which separate
it from the island called Terra del Fuego, and extend
about 150 leagues in length from sea to sea, but only
from half a league to three or four in breadth.

This country had the name of Terra Magellanica,
from Ferdinand Magellan, a Portuguese officer in the
service of the Catholic king, who is reported to have
sailed through the straits that also bear his name, from
the North to the South sea, in the year 1519.

The lofty mountains of the Andes, which are cover-
ed with snow a great part of the year, traversing the
country from north to south, the air is said to be much
colder than in the north under the same parallels of
latitude. Towards the north, it is said to be covered
with wood, and storied with inexhaustible fund of
large timber; whereas, to the southward, not so much
as a single tree fit for any mechanical purpose is to be
seen: yet there is good pasture, and incredible num-
biers of wild horned cattle and horses, which were first
brought hither by the Spaniards, and have increased
amazingly. Fresh water, we are told by some writers,
is very scarce; but if that were really the case, it is
difficult to conceive how the present inhabitants and
such multitudes of cattle could subsist. The east coast
is mostly low land, with few or no good harbours: one
of the best is Port St Julian.

Patagonia is inhabited by a variety of Indian tribes;
as the Patagonos, from which the country takes its
name, the Pampeos, the Chilenos, &c. of whom we
know very little. Only it appears, from the accounts
of former voyagers, lately confirmed by Commodore Byron
and his crew, and the testimonies of other navigators,
that some of them are of a gigantic stature, and clo-
thed with skins; but it would seem that there are
others who go almost quite naked, notwithstanding
the inclemency of the climate. Some of them also, that
live about the straits, if we may credit the navigators
who have passed that way into the South sea, are per-
fect savages: but those with whom Commodore Byron
and his people conversed, are represented as of a more
gentle, humane disposition: only, like other savages,
they live on fish and game, and the spontaneous pro-
ductions of the earth.

The Spaniards once built a fort upon the straits, and
left a garrison in it, to prevent any other European na-
passing that way into the South sea: but most of
the men perished by famine, whence the place obtained
the name of Port Famine: and no people have attempt-
ed to plant colonies here ever since.

About the middle of the strait is a promontory
Cape Pribiardo, which is the most southerly on-
tinent of South America.

On the coasts of Patagonia lie a great num-
ber of islands, or clusters of islands. On the west the
islands Madre de Dios, Santa Trinidad, Sant
the islands of the Chilenos and Huilans, the Serr
and many others; to the number of 80 in all, as
say. Of those on the south coast, the most ex-
able are Terra del Fuego, and Staten Land. Se
articles.

A vast deal has been said respecting the sta-
of the Patagonians, by people of different na-
tions, various occasions. We shall insert the follow-
ing, from Mr Charles Clarke, who was on board
ship in 1764, and gave this account to Dr Maty

"We had not got above 12 or 18 leagues in
straits of Magellan, from the Atlantic ocean,
we saw several people, some on horseback, some on
the north shore (continent), and with the
our glasses could perceive them beckoning to
come on shore, and at the same time observed to
other, that they seemed to be of an extraordinary
However, we continued to stand on, and should
pass without taking the least farther notice of
them, which we had proceeded; but our breeze dying
and the tide making against us, we were obliged
anchor; when the commodore ordered his boat
and another of six, to be hoisted out, manned
armed. In the first went the commodore, in the
Mr Cummins our first lieutenant, and myself.
leave the ship, their number did not exceed
but as we approached the shore, we perceived them
ning down from all quarters, some galloping, others
ring, all making use of their utmost expedi
were collected themselves into a body just at the plac
steered off for. When we had got within 30 12 or 14 y
of the beach, we found it a disagreeable flat shore,
very large stones, which we apprehended would in
the boats; so looked at two or three different place
find the most convenient for landing. They supp
we deferred coming on shore through apprehension
danger from them; upon which they all threw open
skins which were over their shoulders, which was
only clothing they had; and consequently the
thing they could secret any kind of arms with
many of them lay down close to the water's edge.
commodore made a motion for them to go a little
from the water, that we might have room to be
which they immediately complied with, and within
30 or 45 yards; we then landed, and formed each
with his musket, in case any violence should be off
As soon as we were formed, the commodore went to
us to them, then at about 20 yards distance; they see
vastly happy at his going among them, immedi
gathered round him, and made a rude kind of no
which I believe was their method of singing; as w
countenances bespoke it a species of jollity. The co
mmodore then made a motion to them to sit down, whi
they did in a circle, with him in the middle, when N
Byron took some beads and ribbons, which he b
brought for that purpose, and tied about the wome
necks, with which they seemed infinitely pleased. W
were struck with the greatest astonishment at the sig
of people of such a gigantic stature, in total abolishin
Patagonia. previous notice with glusses from the ship. Their body was increased, by the time we got in there, to the number of 400, men, women, and children. The men and women both rode in the same manner; the women had a kind of belt to close their skirts round the waist, which the men had not, as theirs were only flung over their shoulders, and tied with two little slips, cut from the skin, round the neck. At the time of the commodore’s motion for them to retire farther up the beach, they all dismounted, and turned their horses loose, which were gentle, and stood very quietly. The commodore having disposed of all his presents, and satisfied his curiosity, thought proper to retire; but they were vastly anxious to have him go up into the country to eat with them. That they wanted him to go with them to eat, we could very well understand by their motions, but their language was wholly unintelligible to us.—There was a very great smoke to which they pointed about a mile from us, where there must have been several fires; but some intervening hills prevented our seeing anything but the smoke. The commodore returned the compliment, by inviting them on board the ship; but they would not favour him with their company; so we embarked, and returned to the ship. We were with them near two hours at noon-day within a very few yards, though none had the honour of shaking hands but Mr. Byron and Mr. Commodore; however, we were near enough, and long enough with them, to convince our senses, so far as not to be cavilled into the very existence of those senses at that time, which some of our countrymen and friends would absolutely attempt to do. They are of a copper colour, with long black hair; and some of them are certainly nine feet, if they do not exceed it. The commodore, who is very near six feet, could but just reach the top of one of their heads, which he attempted on tip-toes, and there were several taller than the person on whom the experiment was tried. They are prodigious stout, and as well and as proportionally made as ever I saw people in my life. That they have some kind of arms among them, is, I think, indisputable, from their taking methods to convince us they had none at that time about them. The women, I think, bear much the same proportion to the men as our Europeans do; there was hardly a man there less than eight feet, most of them considerably more. The women, I believe, run from seven and a half to eight feet. Their horses were stout and bony, but not remarkably tall; they are, in my opinion, from 15 to 17½ hands. They had a great number of dogs, about the size of a middling pointer, with a fox nose. They continued on the beach till we got under way, which was two hours after we got on board. I believe they had some expectations of our returning again; but as soon as they saw us getting off, they betook themselves to the country.

The country of Patagonia is rather hilly, though not remarkably so. You have here and there a ridge of hills, but not very high ones. We lay some time at Port Desire, which is not a great way to the northward of the straits, where we traversed the country many miles round. We found fire-brands in different places, which convinced us there had been people, and suppose them to have been the Patagonians. The soil is sandy, produces nothing but a coarse harsh grass, and a few small shrubs, of which Sir John Narborough remarks...

The正文内容...
Patagonia is peaceable, but remarkably tractable; some trials might have been made of the weight they could have lifted, and how much they could exceed in that respect the strongest man in the ship. This, in a great measure, would have determined the point, which is yet left doubtful by the different relations that are given by the different voyagers who have seen these people, no two of them agreeing in the same description. All agree, however, that their hair is black, and harsh like bristles; that they are of a dark copper colour, and that their features are rather handsome than ugly; that they clothe themselves decently with the skins of guanicoes; that they paint themselves variously; and there is reason to suspect, that by that variety they distinguish their tribes. Those seen by Commodore Byron were painted round both eyes, no two of them alike; those seen by Captain Wallis had only a red circle round the left eye; and those seen by Bougainville had no circle round the eyes, but had their cheeks painted red. This may account for the different reports of voyagers concerning their stature: it is not impossible, nay, it is very probable, that they may vary in this particular, according to their tribes; as is seen in the Highlands of Scotland, where one clan of the Campbells is remarkably tall, and another of the Frasers remarkably short. Were it not for some such natural discrimination, there could not be so wide a difference in the descriptions of gentlemen, who, having no ends to serve, either in falsifying one another’s reports, or in imposing upon the public, cannot be supposed to mistake wilfully.

One remarkable observation made by our voyagers must not be omitted; and that is, that though our people could distinguish but one word of their language, which the English pronounce cewoww, and the French ahaou, yet the Patagonians could repeat whole sentences after our men more distinctly than almost any European foreigner of what nation soever. This appears the more singular, as, among the islanders between the tropics, it was hardly possible to make them articulate any of our words. Sydney Parkinson, in a specimen he has given us, says, that though the English remained at Otsheite three months, the nearest the natives could approach the sound of Cook was Twote; Banks, Opame; Solander, Tolono; Gore, Towara; Monkhouse, Mata; and so of the rest: whereas the Patagonians presently got by heart this sentence of invitation, Come ashore, Englishmen! which they showed they well understood, by repeating it afterwards whenever the ships came so near the shore as to be within call.

Another very remarkable particular is, that they had none of the characters of a ferocious people; there was no offensive weapon among them, except the scimitar already mentioned. The men, indeed, had a kind of sling, which they use in hunting, consisting of two round stones of about a pound weight each, connected together by a thong. These stones were fastened to the extremities of the thong; and, when they threw them, they held one stone in the hand, and swung the other about the head. “They are so expert in the management of this double-headed shot (says the writer of the voyage), that they will hit a mark not bigger than a shilling with both these stones at the distance of fifteen yards; but their method of availing themselves of their dexterity against the guanicoe and ostrich is, to sling the stones so as to entangle their legs, by which means they retarded their flight, and easily overtook. I ville speaks of these slings as common among o dian nations in South America; but we do not believe we have seen this assertion confirmed by an traveller. These people certainly dress differently as paint differently; for the dress described by B ville is very unlike the dress of those seen by the English voyagers. Captain Wallis invited some on board his ship: but, among all the words were shown them, none seemed to attract their so much as the looking-glasses; they looked and gazed again and laughed; in short, they were end to their Merriment when in possession of this of curiosity. They ate whatever was given to them; would drink nothing but water. In this they from all the tribes of Indians in North America are immoderately fond of spirituous liquors. They admired the European sheep, hogs, and poultry did not seem over-acquainted in that they expected clothes. When the marines were exercised in their arms, they appeared disconcerted; an old among them made signs, by striking his breast; tumbling down and lying as if he had been dead deck, that he knew the effect of their guns; and of them seemed easy till the firing was over. The captain had satisfied his own curiosity, and, imagined, theirs, he gave them to understand, th was going to sail, and that they must depart; they were very unwilling to do. However, he gave each of them a canvas bag, with some ready threaded, a knife, a pair of scissors, a few b and a comb, and a looking-glass, he dismissed them, great reluctance on their part, particularly on the old man’s, who by very significant signs expressed his desire to stay till sunset.

Patagonula, in Botany, a genus of plant belonging to the pentandra class. See Botany In Patan, a kingdom of Asia, in the East In and in the peninsula of Malacca, and on the east coast between the kingdoms of Siam and Paha. Inhabitants are partly Mahometans and partly Gent; but they are all very voluptuous. The air is wholesome, though very hot; and they have no seasons but winter and summer. The former is more properly rainy season; and contains the months of November, December, and January. The woods are full of plants and many wild animals. Some voyagers tell that this country is governed by a queen, who never marries, but may have as many gallants as she pleases. They have some trade with the Chinese; and the principal town is of the same name, which is one of strongest in these parts, having a well defended harbo. Patan, a town of Hindostan, in the valley of the Paul, about a mile and a half from Katmandoo, the capital. E. Long. 85° 40’. N. Lat. 27° 30’.

Patavinity, among critics, denotes a peculiarity of Livy’s dictum; derived from Patavium or Padua, the place of his nativity; but wherein this patavinity consists, they are by no means agreed.

Asinius Pollio, according to Quintilian, taxed Liv with patavinity. But what he meant by this census
PATAVIUS we believe no man can say. Morhof believes it to be a singular turn of expression, and some phrases peculiar to the Paduese. All we certainly know about it is, that it was a fault in the language of Livy, not in the sentiments or manners. In all probability, it is one of those delicacies that are lost in a dead language. Dan. Georg. Morhof published a treatise De Patavinitate Liviana, at Kiel, in 1685, where he explains, very learnedly, the urbanity and peregrinity of the Latin tongue.

PATARA, (Livy, Mela); the capital of Lycia, to the east of the mouth of the river Xanthus; famous for a temple and oracle of Apollo, thence called Patavemus, three syllables only; but Patarumus, (Horace). For the six winter months, Apollo gave answers at Patara; and for the six summer at Delos, (Virgil, Servius); these are the Lycia Sortes of Virgil. The town was situated in a peninsula, called Lidiumus Chersonesus, (Stephanus), Acts xxi. 1. St Paul in his passage from Philippi to Jerusalem, came to Miletus, hence to Coos, then to Rhodes, and from Rhodes to Patara; where having found a ship that was bound for Phcenicia, he went on board and arrived at Jerusalem, to be at the feast of Pentecost.

PATAVUM, (Tacitus, Strabo), a town of the Transpadana, situated on the left or north bank of the Medusus Minor; founded by Antenor the Trojan, (Mela, Virgil,Seneca); Patavinii, the people. (Livy); who himself was a native, and by Asinus Pollio charged with patavinity. Now Padua in the territory and to the west of Venice. E. Long. 12. 15. N. Lat. 45. 30.

PATAY, a town of France, in the province of Orleans, remarkable for the defeat of the English in 1429, and where Joan of Arc did wonders. E. Long. 1. 43. N. Lat. 48. 5.

PATEE, in Fortification, a kind of platform, resembling what is called an horse's shoe.

PATEE, or TATEE, in Heraldry, a cross, small in the centre, and widening to the extremities, which are very broad.

PATELLA, or KNEE-FAN, in Anatomy. See ANATOMY Index.

PATELLA, or LIMPET, a genus of shell-fish belonging to the order of vermes testaceae. See CONCHOLOGY Index.

PATELLA, in the History of Insects, a name given by Lister and other authors to a little husk or shell, found on the bark of the cherry, plum, rose, and other trees, containing an animal within, and useful in colouring. These patellae are of the form of globes, except where they adhere to the tree, and are for the most part of a shining chestnut colour. The husk itself strikes a very fine crimson colour on paper, and within it is found a white maggot which is of no value: this, in time, hatches into a very small but beautiful bee. The size of this bee is about half that of an ant. They have a sting like bees, and three spots placed in a triangle on the forehead, which are supposed to be eyes. They are of a black colour, and have a large round whitish or pale yellow spot on the back. The upper pair of wings are shaded and spotted, but the under pair are clear. It might be worth while to try the shells or husks in order to discover whether the colour they yield might not be useful. It is to be remarked, that the deepest coloured husks afford the finest and deepest purple: they must be used while the animal in them is in the maggot form; for when it is changed into the bee state the shell is dry and colourless. Lister, who first observed these patellae, went so far, on comparing them with the common keras, as to assert that they were of the same nature with that production: but his account of their being the workmanship of a bee, to preserve her young maggot in, is not agreeable to the true history of the keras; for that is an insect of a very peculiar kind. He has in other instances been too justly censured for his precipitancy of judging of things, and perhaps has fallen into an error by means of it here. It is very possible that these patellae may be the same sort of animals with the keras, but then it produces its young within the shell or husk, which is no other than the skin of the body of the mother animal; but as there are many flies whose worms or maggots are lodged in the bodies of other animals, it may be that this little bee may love to lay its egg in the body of the proper insect, and the maggot hatched from that egg may eat up the proper progeny, and, undergoing its own natural changes there, issue out at length in form of the bee. This may have been the case in some few which Dr. Lister examined; and he may have been misled by this to suppose it the natural change of the insect.

PATENT, in general, denotes something that stands open or expanded: thus a leaf is said to be patent, when it stands almost at right angles with the stalk.

PATENT, or LETTER Patent. See LETTER.

PATER NOSTER, the Lord's Prayer, so called from the two first words thereof in Latin.

PATER NOSTER, islands of Asia, in the East Indian sea, so called because of the great number of rocks, which sailors have likened to the beads with which the Papists tell their pater-noster. They abound in corn and fruits, and are very populous.

PATER PATRATUS, was the name of the first and principal person in the college of heralds called Perioles. Some say the Pater Patratus was a constant officer and perpetual chief of that body; and others suppose him to have been a temporary minister, elected upon account of making peace or denouncing war, which were both done by him. See FECALES.

PATERA, among antiquaries, a goblet or vessel used by the Romans in their sacrifices; wherein they offered their consecrated meats to the gods, and wherewith they made libations. See SACRIFICE and LIBATION.

The word is Latin, formed from pateo, "I am open;" quod patet, "because it has a great aperture;" in contradistinction to bottles, &c. which have only narrow necks, or whose aperture is less than the body of the vessel.

On medals the patera is seen in the hands of several deities; and frequently in the hands of princes, to mark the sacerdotal authority joined with the imperial, &c.

Hence F. Joubert observes, that besides the patera, there is frequently an altar upon which the patera seems to be pouring its contents.

The patera was of gold, silver, marble, brass, glass, or earth;
PAT

earth; and they used to incline it in urns with the ashes of the deceased, after it had served for the libations of the wine and liquors at the funeral.

The patera is an ornament in architecture, frequently seen in the Doric frieze, and the tympanae of arches; and they are sometimes used by themselves, to ornament a space; and in this case it is common to hang a string of husks or drapery over them: sometimes they are much enriched with foliage, and have a mask or a head in the centre.

PATERCULUS, CAIUS VELLECIUS, an ancient Roman historian, who flourished in the reign of Tiberius Caesar, was born in the year of Rome 735. His ancestors were illustrious for their merit and their offices. His grandfather espoused the party of Tiberius Nero, the emperor's father; but being old and infirm, and not able to accompany Nero when he retired from Naples, he ran himself through with his sword. His father was a soldier of rank, and so was Paterculus himself. He was a military tribune when Caius Tiberius, a grandson of Augustus, had an interview with the king of the Parthians, in an island of the river Euphrates, in the year 735. He commanded the cavalry in Germany under Tiberius; and accompanied that prince for nine years successively in all his expeditions. He received him with due respects from him; but we do not find that he was preferred to any higher dignity than the pretorship. The praises he bestows upon Sejanus give some probability to the conjecture, that he was looked upon as a friend of this favourite, and consequently that he was involved in his ruin. His death is placed by Mr Dodwell in the year of Rome 784, when he was in his 80th year.

He wrote an abridgment of the Roman History in two books, which is very curious. His purpose was only to deduce things from the foundation of Rome to the time wherein he lived; but he began his work with things previous to that memorable era; for, though the beginning of his first book is wanting, we yet find in what remains of it, an account of many cities more ancient than Rome. He promised a larger history; and no doubt would have executed it well; for during his military expeditions he had seen, as he tells us, the provinces of Thrace, Macedonia, Achaia, Asia Minor, and other more easterly regions; especially upon the shores of the Euxine sea, which had furnished his mind with much entertaining and useful knowledge. In the Abridgment which we have, many particulars are related that are nowhere else to be found; and this makes it the more valuable. The style of Paterculus, though miserably disguised through the carelessness of transcribers, and impossible to be restored to purity for want of manuscripts, is yet manifestly worthy of his age, which was the time of pure Latinity. The greatest excellence of this historian lies in his manner of commending and blaming those he speaks of; which he does in the finest terms and most delicate expressions. He is, however, condemned, and indeed with the greatest reason, for his partiality to the house of Augustus; and for making the most extravagant eulogies, not only upon Tiberius, but even upon his favourite Sejanus: whom, though a vile and cruel monster, Paterculus celebrates as one of the most excellent persons the Roman commonwealth had produced. Lipsius, though he praises him in other respects, yet censures him most severely for his insincerity and partiality. "Vellecius Paterculus (says he) raises my indignation: he represents Sejanus as endowed with all good qualities. The impudence of this historian! But we know that he was born, a died, to the destruction of mankind. After many commendations, he concludes, that Livia was a woman resembling the gods than men: and so to Tiberius, thinks it a crime to speak otherwise of him than as an immortal Jove. What sincere and honest mind could bear this? On the other hand, how artfully does everywhere conceal the great qualities of Caesar Germanicus! how obliquely does he ruin the reputation Agrippina and others, whom Tiberius was thought to hate! In short, he is nothing but a court-prostitut You will say, perhaps, it was unsafe to speak the truth as those times: I grant it; but if he could not whisper the truth, he ought not to have written lies: none called to account for silence." La Mothe le Vayer has made a very just remark upon this occasion: "The same fault (says he) may be observed in many other who have written the history of their own times, w. a design to be published while they lived."

It is strange, that a work so elegant and worthy be preserved, and of which, by reason of its shortness copies might be so easily taken, should have been near being lost. One manuscript only has had the lu to be found, as well of this author among the Latins as of Hesychius among the Greeks: in which, says a great critic of our own nation, "The faults of t scribes are found so numerous, and the defects so b yond all redress, that notwithstanding the pains of t learned and most acute critics for two whole centuries these books still are, and are like to continue, a me heap of errors." No ancient author but Priscian mak mention of Paterculus: the moderns have done him infinitely more justice, and have illustrated him with not and commentaries. He was first published from a manuscript of Moreau, by Rhenanus, at Basle in 1527; afterwards by Lipsius at Leyden in 1631; then Gerard Vossius in 1639; next by Boeclerus at Strasburg in 1642; then by Thyssius and others; and, lastly, Peter Burman at Leyden, 1719, in 8vo. To the Oxford edition in 1693, 8vo, were prefixed the Anna Feliciani of Mr Dodwell, which show deep learning a great knowledge of antiquity.

PATH, in general, denotes the course or track marked out or run over by a body in motion.

For the path of the moon, &c. see MOON, & ASTRONOMY INDEX.

PASTIFIC, whatever relates to the passions, that is proper to excite or awake them. The words comes from the Greek ἑθος, passion or emotion. § PASSION.

Pastific, in Music, something very moving, e pressive, or passionate; capable of exciting pity, or passion, anger, or other passions. Thus we speak the pastific style, a pastific figure, pastific song, &c. The chromatic genus, with its greater and lesser sonorities, either ascending or descending, is very proper for the pastific; as is also an awful management of discords, with a variety of motions, now brisk, no languishing, now swift, now slow.

Nieuwentyt speaks of a musician at Venice who excelled in the pastific, that he was able to play at of his auditors into distraction: he says also, that t gr:
PATHETIC great means he made use of was the variety of motions, &c.
PATHOLOGOMONIC, among Physicians, an appeal for a symptom, or concourse of symptoms, that are inseparable from a distemper, and are found in that only, and in no other.
PATHOLOGY, that part of medicine which explains the nature of diseases, their causes and symptoms. See MEDICINE.
PATHOS, a Greek term, literally signifying passion.
PATHROS, a city and canton of Egypt, of which the prophets Jeremiah and Ezekiel make mention; Jerem. liiv. 115. Ezek. xxix. 14. xxx. 14. We do not very well know its situation, though Piny and Ptolemy the geographer speak of it by the name of Phaturis; and it appears to have been in Upper Egypt. Isaiah (xii. 2.) calls it Pathros; and it is the country of the Pathrotes, the posterity of Mizrarn, of whom Moses speaks, Gen. x. 14. Ezekiel threatens them with an entire ruin. The Jews retired thither notwithstanding; and the ancestors of Jeremiah; and the Lord says by Isaiah, that he will bring them back from thence.
PATIENCE, that calm and unruffled temper with which a good man bears the evils of life, from a conviction that they are at least permitted, if not sent, by the best of Beings, who makes all things work together for good to those who love and fear him.

The evils by which life is embittered—may be reduced to these four: 1. Natural evils, or those to which we are by nature subject as men, and as perishable animals. The greatest of these are, the death of those whom we love, and of ourselves. 2. Those from which we might be exempted by a virtuous and prudent conduct, but which are the inseparable consequences of imprudence or vice, which we shall call punishments; as infamy proceeding from fraud, poverty from prodigality, debility and disease from intemperance. 3. Those by which the fortitude of the good are exercised; such as the persecutions raised against them by the wicked. To these may be added, 4. The opposition against which we must perpetually struggle, arising from the diversity of sentiments, manners, and characters of the persons among whom we live.

Under all these evils patience is not only necessary but useful: it is necessary, because the laws of nature have made it a duty, and to murmurs against natural events is to affront providence; it is useful, because it renders our sufferings lighter, shorter, and less dangerous.

Is your reputation sullied by invidious calumnies? rejoice that your character cannot suffer but by false imputations. You are arraigned in a court of judicature, and are unjustly condemned: passion has influenced both your prosecutor and your judge, and you cannot forbear repining that you suffer although innocent. But would it have been better that you should have suffered being guilty? Would the greatest misfortune that can befall a virtuous man be to you a consolation? The opulence of a villain, the elevated station to which he is raised, and the honours that are paid to him, excite your jealousy, and fill your breast with repinings and regret. What! say you, are riches, dignity, and power, reserved for such wretches as this? Patience.

Cease these groundless murmurs. If the possessions you regret were real benefits, they would be taken from the wicked and transferred to you. What would you say of a successful hero, who, having delivered his country, should complain that his services were ill requited, because a few sugar-plums were distributed to some children in his presence, of which they had not offered him a share? Ridiculous as this would appear, your complaints are no better founded. Has the Lord of all no reward to confer on you but perishable riches and empty precarious honour?

It is fancy, not the reason of things, that makes life so uneasy to us. It is not the place nor the condition, but the mind alone, that can make anybody happy or miserable.

He that values himself on conscience, not opinion, never needs reproaches. When we are evil spoken of, if we have not deserved it, we are never the worse; if we have, we should mend.

Tiberius the Roman emperor, at the beginning of his reign, acted in most things like a truly generous, good natured, and clement prince. All slanderous reports, libels, and lampoons upon him and his administration, he bore with extraordinary patience; saying, "That in a free state the thoughts and tongues of every man ought to be free;" and when the senate would have proceeded against some who had published libels against him, he would not consent to it; saying, "We have not time enough to attend to such trifles; if you once open a door to such informations, you will be able to do nothing else; for under that pretence every man will revenge himself upon his enemies by accusing them to you." Being informed that one had spoken detrimentally of him: "If he speak ill of me," says he, "I will give him as good an account of my words and actions as I can; and if that be not sufficient, I will satisfy myself with having as bad an opinion of him as he has of me." Thus far even Tiberius may be an example to others.

Men will have the same veneration for a person who suffers adversity without dejection, as for demolished temples, the very ruins of which are reverenced and adored.

A virtuous and well-disposed person, is like to good metal; the more he is fired, the more he is refined; the more he is opposed, the more he is approved; wrongs may well try him and touch him, but cannot imprint in him any false stamp.

The man therefore who possesses this virtue (patience), in this ample sense of it, stands upon an eminence, and is a human character below him: the tempest indeed may reach him; but he stands secure and collected against it upon the basis of conscious virtue, which the severest storms can seldom shake, and never overthrow.

Patience, however, is by no means incompatible with sensibility, which, with all its inconveniences, is to be cherished by those who understand and wish to maintain the dignity of their nature. To feel for others, disposes us to exercise the amiable virtue of charity, which our religion indispensably requires. It constitutes that enlarged benevolence which philosophy inculcates, and which is indeed comprehended in Christian charity. It is the privilege and the ornament of man; and the pain which
which it causes is abundantly recompensed by that sweet sensation which ever accompanies the exercise of beneficence.

To feel our own misery with full force is not to be deprecated. Affliction softens and improves the heart. Tears, to speak in the style of figure, fertilize the soil in which the virtues grow. And it is the remark of one who understood human nature, that the faculties of the mind, as well as the feelings of the heart, are mitigated by adversity.

But in order to promote these ends, our sufferings must not be permitted to overwhelm us. We must oppose them with the arms of reason and religion; and to express the idea in the language of the philosopher, as well as the poet, of Nature, every one, while he is compelled to feel his misfortunes like a man, should resolve also to bear them like a man.

Resign’d in ev’ry state,
With patience bear, with prudence push, your fate;
By suffering well our fortune, we subdue,
Fly when she frowns, and when she calls pursue.

PATIGUMO (a corruption of the words pate-de-guinause); the name of a sort of paste or cakes much used on the continent as an agreeable and useful remedy for catarhal defluxions, and supposed by Dr Percival to consist of gum-arabic combined with sugar and the whites of eggs (see the article Hunger). But we have been informed that the powdered substance of the marshmallow is the chief ingredient of the composition.

PATIN, Guy, professor of physics in the royal college of Paris, was born in 1632. He made his way into the world merely by the force of his genius, being at first corrector of a printing-house. He was a man of great wit and erudition: he spoke with the gravity of a Stoic, but his expressions were very satirical. He hated bigotry, superstition, and knavery; had an upright soul, and a well-disposed heart. He was a most tender father, courteous to every body, and polite in the highest degree. He died in 1672, and did not owe his reputation to any writings published in his lifetime upon physics; but his letters which appeared after his death have rendered his name famous. He left a son mentioned in the ensuing article.

PATIN, Charles, who made a great figure in the world, and excelled in the knowledge of medals. He was born in Paris in 1633; and made so surprising a progress, that he maintained theses in Greek and Latin on all parts of philosophy, in 1647. He studied the law in compliance to an uncle, and was admitted an advocate in the parliament of Paris; but could not lay aside that of physics, for which he always had an inclination. He therefore quitted the law, and devoted himself to physics; in which, after taking the doctor’s degree, he applied himself to practice with great success. He afterwards travelled into Germany, Holland, England, Switzerland, and Italy. In 1676, he was appointed professor of physics in Padua; and three years after was created a knight of St Mark. He died in that city in 1694. His works are many, and well known to the learned world. His wife too, and his daughters were authorises.

PATKUL, John Reinhold, was born of a noble family in Livonia, a northern province belonging to the crown of Sweden. The Livonians having been sti

Augustus possessed himself of Livonia in consequence of this proposal; and afterwards, when Charles XI entered the province to recover it, Patkul command in the Saxon army against him. Charles was victorious; and Patkul, some time afterwards, being disgraced at the haughty behaviour of General Fleming, Augustus’s favourite, entered into the service of the Czar, with whom Augustus was in strict alliance, and a little before Charles compelled Augustus to abdicate the throne of Poland, and his subjects to elect Stanislaus in his stead. The Czar sent Patkul, with the title his ambassador, into Saxony, to prevail with Augustus to meet him at Grodno, that they might confer on the state of their affairs. This conference took place; and immediately afterwards the Czar went from Grodno with a rebellion in Astrakan. As soon as the Czar was gone, Augustus, to the surprise of all Europe, ordered Patkul, who was then at Dresden, to be seized as a state criminal. By this injurious and unprecedented action Augustus at once violated the law of nations, and weakened his own interest; for Patkul was not only an ambassador, but an ambassador from the only power that could afford him protection. The cause, however, was this: Patkul had discovered that Augustus’s minister were to propose a peace to Charles upon any terms; and had therefore formed a design to be beforehand with them, and procure a separate peace between Charles and his new master the Czar. The design of Patkul was discovered; and, to prevent its success, Augustus ventured to seize his person, assuring the Czar that he was a traitor, and had betrayed them both.

Augustus was soon after reduced to beg a peace of Charles at any rate; and Charles granted it upon certain conditions, one of which was, that he should deliver up Patkul. This condition reduced Augustus to a very distressful dilemma: the Czar, at this very time, reclaimed Patkul as his ambassador; and Charles demanded, with threats, that he should be put into his hands. Augustus therefore contrived an expedient by which he hoped to satisfy both: he sent some guards to deliver Patkul, who was prisoner in the castle of Königstein, to the Swedish troops; but by secret or
...and the country of an ally would not have afforded him protection; but that he was in Saxony a wretched exile, not a counsellor or adviser; that before his arrival every thing was already planned, the alliance with Muscovy signed, and the measures with Denmark agreed upon.

My inclination, (said he, after a pause) were always to serve Sweden, though the contrary opinion has prevailed. The elector of Brandenburg owed his title of king of Prussia to the services I did him; and when, in recompense, he would have given me a considerable sum of money, I thanked him, and rejected the offer; adding, that the reward I most wished for was to regain the king of Sweden's favour by his intercession. This he promised, and tried every possible method to succeed, but without success. After this I laboured so much for the interest of the late emperor in his Spanish affairs, that I brought about what scarce any other man could have effected. The emperor as an acknowledgement gave me an assignment for 50,000 crowns, which I humbly laid at his feet, and only implored his imperial majesty's recommendation of me to my king's favour: this request he immediately granted, and gave his orders accordingly, but in vain. Yet, not to lose any opportunity, I went to Moscow while the Swedish ambassadors were at that court; but even the mediation of the Czar had no effect. After that I distributed among the Swedish prisoners at Moscow at least 100,000 crowns, to show the ardent desire I had, by all ways, to regain the favour of their sovereign. Would to heaven I had been equally in earnest to obtain the grace of God. — At these words another shower of tears fell from his eyes, and he remained for some moments silent, and overwhelmed with grief. I used my best endeavours to comfort him with the assurance that this grace would not be denied him, provided he spent the few hours still left in earnestly imploring it; for the door of heaven's mercy was never shut, though that of men might be cruelly so. (This (replied he), this is my consolation; for thou art God and not man, to be angry for ever.) He then inveighed bitterly against Augustus, and reproached himself for having any connexion with a wretch who was totally destitute of all faith and honour, an atheist, without piety, and without virtue. While he was at Warsaw (said he), and heard the king was advancing to attack him, he found himself extremely distressed. He was absolutely without money, and therefore obliged to dismiss some of his troops. He had recourse to my assistance, and intreated me, for the love of God, to borrow whatever sum I could. I procured him 400,000 crowns; 50,000 of which, the very next day, he squandered on trinkets and jewels, which he gave in presents to some of his women. I told him plainly my thoughts of the matter; and by my importunity prevailed, that the Jews should take back their toys, and return the money they had been paid for them. The ladies were enraged; and he swore that I should one time or other suffer for what I had done; there indeed he kept his word; would to God he had always done so with those he employed! I now left him for a short time, and at seven in the evening I returned; and the officer being retired, he accosted me with a smiling air, and an appearance of much tranquillity. "Welcome, dear sir, the weight that lay heavy on my heart is removed, and I already feel a sensible change wrought in my mind. I am ready..."
ready to die: death is more eligible than the solitude of a long imprisonment. Would to heaven only that the kind of it were less cruel. Can you, my dear sir, inform me in what manner I am to suffer? I answered, that it had not been communicated to me; but that I imagined it would pass over without noise, as only the colonel and myself had notice of it. That (replied he) I esteem as a favour; but have you seen the sentence? or must I die, without being either heard or condemned? My apprehensions are of being put to intolerable tortures. I comforted him in the kindest manner I could; but he was his own best comforter from the Word of God, with which he was particularly acquainted; quoting, among many other passages, the following in Greek, We must enter into the kingdom of heaven through many tribulations. He then called for pen and ink, and intreated me to write down what he should dictate. I did so, as follows:

'Testamentum, or my last will as to the disposition of my effects after my death.—I. His majesty King Augustus, having first examined my conscience thoroughly, will be so just as to pay back to my relations the sum he owes me; which being liquidated, will amount to 30,000 crowns; and as my relations are here in the service of Sweden, that monarch will probably obtain it for them.

At this he said, let us stop here a little; I will quickly return to finish this will; but now let us address ourselves to God by prayer. Prayers being ended, 'Now (cried he) I find myself yet better, yet in a quieter frame of mind: Oh! were my death less dreadful, with what pleasure would I expiate my guilt by embracing it!—Yes (cried he, after a pause), I have friends in different places, who will weep over my deplorable fate. What will the mother of the king of Prussia say? What will be the grief of the Countess Levolde, who attends on her? But what thoughts must arise in the bosom of her to whom my faith is pledged? Unhappy woman! the news of my death will be fatal to her peace of mind. My dear pastor, may I venture to beg one favour of you? I assured him he might command every service in my power. Have the goodness then (said he, pressing my hand), the moment I am no more, to write—And then will you set about it to letter to Madame Eisenelder, the lady I am promised to—Let her know that I die her's; inform her fully of my unhappy fate: Send her my last and eternal farewell! My death is in truth disgraceful; but my manner of meeting it will, I hope by heaven's and your assistance, render it holy and blessed. This news will be her only consolation. Add farther, dear Sir, that I thanked her with my latest breath for the sincere affection she bore me: May she live long and happy: This is my dying wish.—I gave him my hand in promise that I would faithfully perform all he desired.

"Afterwards he took up a book: 'This (said he) is of my own writing. Keep it in remembrance of me, and as a proof of my true regard for religion. I could wish it might have the good fortune to be presented to the king, that he may be convinced with what little force I, as he been accused of atheism. Taking it from his hand, I assured him that my colonel would not fail to present it as soon as opportunity offered.

"The rest of his time was employed in prayer, which he went through with a very fervent devotion. On the 30th of September I was again with him at four in the morning. The moment he heard me he rose, and render thanks to God, assured me he had not slept soundly for a long time. We went to prayers; and, truth his piety and devout frame of mind were were of admiration. About six he said he would begin confession, before the din and clamour of the people without could rise to disturb his thoughts. He then knelt down, and went through his confession in manner truly edifying. The sun beginning to appear above the horizon, he looked out of the window, saying Salve festa dies! 'This is my wedding-day. I look. alas! for another, but this is the happier; for to shall my soul be introduced by her heavenly bridegroom into the assembly of the blessed? He then asked whether I yet knew in what way he was to die? I answered, that I did not. He conjured me, by the sacred name of Jesus, not to forsake him; for that he should find in my company some consolation even in the midst of tortures. Casting his eye on the paper that lay on the table, 'This will (said he) can never be finished. I asked him, whether he would put his name to what was already written? 'No (replied he, with a sigh), I will write that hated name no more. My relations will find their account in another place; save them for me.' He then addressed himself again to God in prayer, and continued his devotions till the lieutenant entered to conduct him to the coach. He wrapped himself up in his cloak, and went forward a great pace guarded by 100 horsemen. Being arrived at the place of execution, we found it surrounded by 300 foot soldiers; but at the sight of the stakes and wheels, his horror is not to be described. Clasping me in his arms, 'Beg of God' (he exclaimed) that my soul may not thrown into despair amidst these tortures? I comforted him I adjured him to fix his thoughts on the death of Christ, who for our sins was nailed to a cross.

"Being now on the spot where he was to suffer, the executioner to do his duty well, and put into hands some money which he got ready for that purpose. He then stretched himself out upon the wheel; a while they were stripping him naked, he begged me to pray that God would have mercy on him, and bear him in his arms. I did; and turning to all the spectators, and to them, Brother., said with him in prayer for this unhappy man. 'Yes (cried he), ass me all of you with your supplications to heaven.' The executioner gave him the first stroke. His cries were terrible: 'O Jesus! Jesus! have mercy upon me.' The cruel scene was much lengthened out, and of the utmost horror; for at the headsman had no skill in his business the unhappy victim received upwards of 15 severe blows, with each of which were intermingled the most piteous groans and invocations of the name of God. The length, after two strokes given on the breast, his strength and voice failed him. In a faltering dying tone, was just heard to say, 'Cut off my head?' and the executioner still lingering, he himself placed his head to the scaffold: After four strokes with an hatchet, the head was separated from the body, and the body quartered. Such was the fate of the renowned Patkul.

Charles X. has been generally severely censured for not pardoning him, and we are not inclined to vindicate the sovereign. Yet it must be remembered that Patkul was guilty of a much greater crime than that which drew upon him the displeasure of Charles
XI. He incited foreign powers to attack his country when under the government of a boy, hoping, as he said himself, that it would in such circumstances become an easy conquest. He was therefore a rebel of the worst kind; and where is the absolute monarch that is ready to pardon such unnatural rebellion? Let it be remembered, too, that Charles, amongst whose faults no other instance of cruelty has been numbered, certainly thought that, in ordering the execution of Patkul, he was discharging his duty. That monarch, it is known, believed in the possibility of discovering the philosopher's stone. Patkul, when under sentence of death, contrived to impose so far upon the senate at Stockholm, as to persuade them that he had, in their presence, converted into gold a quantity of baser metal. An account of this experiment was transmitted to the king, accompanied with a petition to his majesty for the life of so valuable a subject; but Charles, blending magnanimity with his severity, replied with indignation, that he would not grant to interest what he had refused to the call of humanity and the intrigues of friendship.

PATMOS, in Ancient Geography, one of the Sporades (Dionysius); 30 miles in compass (Pliny); concerning which we read very little in authors. It was rendered famous by the exile of St John, and the revelation showed him there. The greatest part of interpreters think that St John wrote in the same place during the two years of his exile; but others think that he did not commit them to writing till after his return to Ephesus. The island of Patmos is between the island of Icaria and the promontory of Miletus. Nothing has done it more honour than to have been the place of the banishment of St John. It is now called Patimo, or Patino, or Patmon, or Palmoa. Its circuit is five and twenty or thirty miles. It has a city called Patmos, with a harbour, and some monasteries of Greek monks. It is at present in the hands of the Turks. It is considerable for its harbours; but the inhabitants derive little benefit from them, because the corsairs have obliged them to quit the town, and retire to a hill on which St John's convent stands. This convent is a citadel consisting of several irregular towers, and is a substantial building seated on a very steep rock. The whole island is very barren, and without wood; however, it abounds with partridges, rabbits, quails, turkeys, pigeons, and snipes. All their corn does not amount to 1000 barrels in a year. In the whole island there are scarcely 300 men; but there are above 20 women to one man, who expect that all strangers who land in the island should carry some of them away. To the memory of St John is an hermitage on the side of a mountain, where there is a chapel not above eight paces long and five broad. Over head they show a chink in the rock, through which they pretend that the Holy Ghost dictated to St John. E. Long. 85. 15. N. Lat. 35. 37.

PATMACK, a large river of Virginia, in North America, which rises in the Alleghany mountains, separates Virginia from Maryland, and falls into Chesaapeake bay. It is navigable for near 300 miles. Washington is situated on its north bank.

PATONCE, in Heraldry, is a cross, flory at the ends; from which it differs only in this, that the ends instead of turning down like a fleau-de-lis, are extended somewhat in the patee form. See Florx.

PATRAE, a city of Achaia. This place was visited by Dr Chandler, who gives the following account of it. "It has often been attacked by enemies, taken, and pillaged. It is a considerable town, at a distance from the sea, situated on the side of a hill, which has its summit crowned with a ruinous castle. This made a brave defence in 1447 against Sultan Morat, and held out until the peace was concluded, which first rendered the Morea tributary to the Turks. A dry flat before it was once the port, which has been choked with mud. It has now, as in the time of Strabo, only an indifferent road for vessels. The house of Nicholas Paul, Esq. the English consul, stood on part of the wall either of the theatre or the odeum. By a fountain was a fragment of a Latin inscription. We saw also a large marble bust much defaced; and the French consul showed us a collection of medals. We found nothing remarkable in the citadel. It is a place of some trade, and inhabited by Jews as well as by Turks and Greeks. The latter have several churches. One is dedicated to St Andrew the apostle, who suffered martyrdom there, and is of great sanctity. It had been recently repaired. The site by the sea is supposed that of the temple of Ceres. By it is a fountain. The air is bad, and the country round about overrun with the low shrub called glycyrrhiza or liquorice." Of its ancient state, the same author speaks thus: "Patre assisted the Ætolians when invaded by the Gauls under Brennus; but afterwards was unfortunate, reduced to extreme poverty, and almost abandoned. Augustus Caesar united the scattered citizens, and made it a Roman colony, settling a portion of the troops which obtained the victory of Actium, with other inhabitants from the adjacent places. Patre refurnished and enjoyed dominion over Naupactus, Oeniath, and several cities of Achaia. In the time of Pausanias, Patre was adorned with temples and porticoes, a theatre, and an odeum which was superior to any in Greece but that of Atticus Herodes at Athens. In the lower part of the city was a temple of Bacchus Æsymnetes, in which was an image preserved in a chest, and conveyed, it was said, from Troy by Euryppus; who, on opening it, became disordered in his senses. By the port were temples; and by the sea, one of Ceres, with a pleasant grove and a prophetic fountain of uttering veracity in determining the event of any illness. After supplicating the goddess with incense, the sick person appeared, dead or living, in a mirror suspended so as to touch the surface of the water. In the citadel of Patre was a temple of Dianæ Laphria, with her statue in the habit of a huntress, of ivory and gold, given by Augustus Caesar when he laid waste Calydon and the cities of Ætolia to people Nicopolis. The Patreans honoured her with a yearly festival, which is described by Pausanias who..."
was a spectator. They formed a circle round the altar with pieces of green wood, each 16 cubits long, and within barked dry fuel. The solemnity began with a most magnificent procession, which was closed by the virgin-priestess in a chariot drawn by stags. On the following day, the city and private persons offered at the altar fruits, and birds, and all kinds of victims, wild-boars, stags, deer, young wolves, and beasts full grown; after which the fire was kindled. He relates, that a bear and another animal forced a way through the fence, but were reconducted to the pile. It was not remembered that any wound had ever been received at this ceremony, though the spectacle and sacrifice were as dangerous as savage. The number of women at Patrae was double that of the men. They were employed chiefly in a manufacture of flax which grew in Ellis, weaving garments, and attire for the head."

**PATRANA, or PASTRANA, a town of New Castile in Spain, with the title of a duchy. It is seated between the rivers Tajo and Tajoja, in W. Long. 2. 45. N. Lat. 42. 26.**

**PATRAS, an ancient town of European Turkey, in the Morca, with a Greek archbishop's see. It contains about 440 families; and the Jews, who are one-third part of the inhabitants, have four synagogues. There are several handsome mosques and Greek churches. The Jews carry on a trade in silk, leather, honey, wax, and cheese. There are cypress trees of a prodigious height, and excellent pomegranates, citrons, and oranges. It stands at a little distance from the sea, and its port is now choked up with mud. It is in the hands of the Turks. E. Long. 21. 45. N. Lat. 38. 17.**

**PATRICA, a town in Italy, in the territory of the church, and in the Campagna of Rome, towards the sea-coast, and eight miles east of Ostia. About a mile from this place is a hill called Monte de Livano, which some have thought to be the ancient Lavinium founded by Æneas.**

**PATRES CONSCRIPTI. See CONSCRIPT and SENATE.**

**PATRIARCH, PATRIARCHA, one of those first fathers who lived towards the beginning of the world, and who became famous by their long lines of descendants. Abraham, Isaac, and Jacob, and his twelve sons, are the patriarchs of the Old Testament; Seth, Enoch, &c. were antediluvian patriarchs.**

The authority of patriarchal government existed in the fathers of families, and their first-born after them, exercising all kinds of ecclesiastical and civil authority in their respective households; and to this government, which lasted till the time of the Israelites dwelling in Egypt, some have ascribed an absolute and despotic power, extending even to the punishment by death. In proof of this, is produced the curse pronounced by Noah upon Canaan (Gen ix. 25); but it must be observed, that in this affair Noah seems to have acted rather as a prophet than a patriarch. Another instance of supposed despotic power is Abraham's turning Hagar and Ishmael out of his family (Gen. xxii. 19, &c.); but this can hardly be thought to furnish evidence of any singular authority vested in the patriarchs, as such, and peculiar to those ages. The third instance brought forward to the same purpose is that of Jacob's denouncing a curse upon Simeon and Levi (Gen. xlix. 7), which is maintained by others to be an instance of prophetic inspiration than of patriarchal power. The fourth instance is of Judah with regard to Tamar (Gen. xxxviii. 24); regard to which it is remarked, that Jacob, the father of Judah, was still living; that Tamar was not one of his own family; and that she had been guilty of adultery the punishment of which was death by burning; that Judah on this occasion might speak only as a protector.

On the whole, however, it is difficult to say who these opinions are most agreeable to truth. Men believe the origin of civil government, and the obligation to obedience, to arise from a supposed original tract, either real or implied, will be naturally to weaken the authority of the patriarchs: and again who esteem government to be a divine institution will be apt to raise that authority to the highest; that either reason or scripture will permit them. cannot be denied, that authority existed in fathers, descended to their first-born, in the first ages of the world; and it is neither unnatural nor improbable imagine, that the idea of hereditary power and hereditary honours was first taken from this circumstance. But whether authority has descended through family and son in this way to our times, is a circumstantial statement that cannot be the name is asserted, and can be needed in a thousand. The real source of the dignity and of the authority of modern times seems to have been, skill in the art of war, and success in the contest of conquests.

**Jewish PATRIARCH, a dignity, respecting the origin of which there are a variety of opinions. The learned authors of the Universal History think, that the appearance and institution of those patriarchs happened under Nerva the successor of Domitian. It seems probable that the patriarchs were of the Aaronic or Levitical race; the tribe of Judah being at that time much depressed, and too obnoxious to the Romans to be able to assume any external power. But of what tribe they were, their authority came to be very considerable. Their principal business was to instruct the people; and for this purpose they instituted schools several cities. And having gained great reputation their extraordinary learning, zeal, and piety, they might in time, not only bring a great concourse of other Jews from all parts, as from Egypt and other western provinces of their dispersion, but likewise prove the merit of their patriarchal authority's being acknowledged there. From them they ventured at length to levy kind of tribute, in order to defray the charges of the dignity, and of the officers, viz. the Apostoli or Legati under them, whose business it was to carry their orders and decisions through the other provinces of their dispersion, and to see them punctually executed by all, till some shadow of union at least might be kept up among the western Jews. They likewise nominated the doctors who were to preside over their schools, and to give them instruction in time, and the highest order of priests, and to possess both dignities once; an usurpation which caused not only great confusion amongst them, but oftentimes very violent bloody contests. However, as the Jewish Rabbis ha
PAT [ 51 ] PAT

trumped up a much older era for this patriarchal dignity, and have given us a succession of them down to the fifth century, in which it was abolished, it will not be amiss to give our readers the substance of what they have written of the rise and progress of this order of men; and at the same time to show the absurdity and falsehood of that pretended succession to this imaginary dignity.

According to them, the first patriarch was Hillel, surnamed the Babylonian, because he was sent from thence to Jerusalem about 100 years before the ruin of their capital, or 30 years before the birth of Christ, to decide a dispute about the keeping of Easter, which on that day fell out on the Sabbath-day; and it was on account of his wise decision that he was raised to that dignity, which continued in his family till the said fifth century. He was likewise looked upon as a second Moses, because he lived like him 40 years in obscurity, 40 more in great reputation for learning and sanctity, and 40 more in possession of this patriarchal dignity. They make him little inferior to that lawgiver in other of his excellencies, as well as in the great authority he gained over the whole Jewish nation. The wonder will be, how Herod the Great, who was so jealous of his own power, could suffer a stranger to be raised to such a height of it, barely for having decided a dispute which must in all likelihood have been adjudged by others long before that time.

However, Hillel was succeeded by his son Simeon, whom many Christians pretend to have been the venerable old person of that name, who received the divine infant in his arms. The Jews give him but a very obscure patriarchate; though the authors above quoted make him, moreover, chief of the sanhedrin; and Ephraimius says, that the priestly tribe hated him so much for giving so ample a testimony to the divine child, that they denied him common burial. But it is hardly credible that St Luke should have so carelessly passed over his twofold dignity, if he had been really possessed of them, and have given him no higher title than that of a just and devout man.

He was succeeded by Johanan, not in right of descent, but of his extraordinary merit, which the Rabbies, according to custom, have raised to so surprising a height, that, according to them, if the whole heavens were paper, all the trees in the world pens, and all the men writers, they would not suffice to pen down all his lessons. He enjoyed his dignity but two years, according to some, or five according to others: and was the person who, observing the gates of the temple to open of their own accord, cried out, "O temple, temple! why art thou thus moved? We know that thou art to be destroyed, seeing Zechariah hath foretold it, saying, "Open thy gates, O Lebanon, and let the flames consume thy cedars." Upon this he is further reported to have complimented Vespasian, or rather, as some have corrected the story, Titus, with the title of king, assuring him that it was a royal person who was to destroy that edifice; on which account they pretend that general gave him leave to remove the sanhedrin to Japhne.

The Jewish writers add, that he likewise erected an academy there, which subsisted till the death of Akiba; and was likewise the seat of the patriarch; and consisted of 300 schools, or classes of scholars. Another he erected at Lydda, not far from Japhne, and where the Christians have buried their famed St George. He lived 120 years, and being asked, what he had done to prolong his life? he gave this wise answer; I never made water nearer a house of prayer than four cubits; I never disguised my name: I have taken care to celebrate all festivals: and my mother hath even sold my head ornaments to buy wine enough to make me merry on such days; and left me at her death 300 hogheads of it, to sanctify the Sabbath. The doctors who flourished in his time were no less considerable, both for their number and character; particularly the famed Rabbi Chaima, of whom the Bath Col was heard to say, that the world was preserved for the sake of him; and R. Nicodemus, whom they pretend to have stopped the course of the sun, like another Joshua.

He was succeeded by Gamaliel, a man, according to them, of unsufferable pride; and yet of so universal authority over all the Jews, not only in the west, but over the whole world, that the very monarchs suffered his laws to be obeyed in their dominions, not one of them offering to obstruct the execution of them. In his days flourished Samuel the Less, who composed a prayer full of the bitterest curses against heretics, by which they mean the Christians; and which are still in use to this day. Gamaliel was no less an enemy to them; and yet both have been challenged, the former as the celebrated master of our great apostle, the other as his disciple in his unconverted state.

Simon II. his son and successor was the first martyr who died during the siege of Jerusalem. The people so regretted his death, that an order was given, instead of 10 bums of wine, which were usually drank at the funeral of a saint, to drink 13 at his, on account of his martyrdom. These bums were in time multiplied, they tell us, to such shameful height, that the sanhedrin was forced to make some new regulations to prevent that abuse.

These are the patriarchs which, the Rabbies tell us, preceded the destruction of the temple; and we need no further confutation of this pretended dignity, than the silence of the sacred historians, who not only make not the least mention of it, but assure us all along that they were the high-priests who presided in the sanhedrin; and before whom all cases relating to the Jewish religion were brought and decided. It was the high-priest who examined and condemned our Saviour; that condemned St Stephen; that forbade the apostles to preach in Christ's name; and who sat as judge on the great apostle at the head of that supreme court. The same may be urged from Josephus, who must needs have known and mentioned this pretended dignity, if any such there had been; and yet is so far from taking the least notice of it, that, like the evangelists, he places the pontiffs alone at the head of all the Jewish affairs; and names the high-priest Ananus as having the care and direction of the war against the Romans;—which is an evident proof that there were no such patriarchs in being.

To all this let us add, that if there had been any such remarkable succession, the Talmudists would have preserved it to future ages; whereas, neither they, nor any of the ancient authors of the Jewish church, make any mention of it; but only some of their doctors, who have written a considerable time after them; as of writers to whom little credit can be given in points of this nature;
Patriarchs, nature; especially as there are such unsurmountable contradictions between them, as no authors either Jewish or Christian have, with all their pains, been hitherto able to reconcile.

According to Ganta Tzemach David, who hath reduced them to 10, they are: 1. Hillel the Babylonian. 2. Simeon, the son of Hillel. 3. Rabbb Gamaliel Rebona. 4. R. Simeon, the son of Gamaliel. 5. Rabban Gamaliel his son. 6. R. Jehuda the prince. 7. Hillel, the prince, his son. 8. Rabban Gamaliel the Old. 9. Simeon III. 10. R. Judah, Nasri or prince.

On the whole, it cannot be doubted but that their first rise was in Nerva's time, however much Jewish pride may have prompted them to falsify, and to assert their origin to have been more ancient that it really was. Nor have the Jews been faithful in giving an account of the authority of these men. They have exaggerated their power beyond all bounds, for the purpose of repelling the arguments of Christians: for their power was certainly more showy than substantial. In time, however, they certainly imposed upon the people; and what power they did possess (which the Romans only allowed to be in religious matters, or in such as were connected with religion) they exercised with great rigour. Their pecuniary demands, in particular, became very exorbitant; and was the cause of their suppression in the year 429.

Patriarchs, among Christians, are ecclesiastical dignitaries, or bishops, so called from their paternal authority in the church. The power of patriarchs was not the same in all, but differed according to the different customs of countries, or the pleasures of kings and councils. Thus the patriarch of Constantinople grew to be a patriarch over the patriarchs of Ephesus and Cæsarea and was called the eccumenical and universal patria and the patriarch of Alexandria had some prerogatives which no other patriarch but himself enjoyed, such as the right of consecrating and approving every single bishop under his jurisdiction.

The patriarchate has ever esteemed the supreme dignity in the church: the bishop had only under the territory of the city of which he was bishop, metropolitan superintended a province, and had for fragans the bishops of his province; the primate the chief of what was then called a diocese (A), and several metropolitan under him; and the patriarch under him several dioceses, composing one exarch and the primates themselves were under him.

Usher, Pagi, De Marca, and Morinus, attribute establishment of the grand patriarchates to the apostles themselves; who, in their opinion, according to the scripture of the world then given by geographers, placed on the three principal cities in the three parts of known world; viz. Rome in Europe, Antioch in Asia and Alexandria in Africa; and thus formed a trinity of patriarchs. Others maintain that the name patriarch was unknown at the time of the council of Nice; that for a long time afterwards patriarchs and primates were confounded together, as being all equally chief dioceses, and equally superior to metropolitans, were only chiefs of provinces. Hence Socrates gives the title patriarch to all the chiefs of dioceses, and cons ten of them. Indeed, it does not appear that the city of patriarch was appropriated to the five grand of Rome, Constantinople, Alexandria, Antioch, and Jerusalem, till after the council of Chalcedon in 455, when the council of Nice regulated the limits and prerogatives of the three patriarchs of Rome, Antioch, Alexandria, it did not give them the title of patriarch; though it allowed them the pre-eminence and privilege thereof; thus when the council of Constantinople judged the second place to the bishop of Constantinople, who till then was only a suffragan of Heraclea, it is nothing of the patriarchate. Nor is the term patriarch found in the decrees of the council of Chalcedon whereby the fifth place is assigned to the bishop of Jerusalem; nor did these five patriarchs govern all churches.

(A) The word diocese was then of very different import from what it bears now. Under the article Episcopacy, it was observed, that the first founders of churches regulated their extent and the jurisdiction of their bishops by the divisions of the Roman empire into civil jurisdictions. One of these divisions was into provinces and dioceses. A province comprised the cities of a whole region subjected to the authority of one chief magister, who resided in the metropolis or chief city of the province. A diocese was a still larger district, comprehended within it several provinces, subject to the control of a chief magistrate, whose residence was in the metropolis of the diocese. The jurisdiction of the bishops of the Christian church was established upon this model. The authority of a private bishop extended only over the city in which he resided, together with the adjacent villages and surrounding towns of country. This district was called a regnum, though it comprehended many parishes; the modern sense of the word. Under Arcadius and Honorius the empire was divided into thirteen dioceses: 1. The Oriental diocese, containing fifteen provinces; 2. The diocese of Egypt, six provinces; 3. The Asiatic diocese, ten provinces; 4. The Pontic diocese, ten provinces; 5. The diocese of Thrace, six provinces; 6. The diocese of Macedonia, six provinces; 7. The diocese of Dacia, five provinces; 8. The Germanic diocese, seven provinces; 9. The diocese of Illyricum, six provinces; 10. The diocese of Africa, six provinces; 11. The Spanish diocese, seven provinces; 12. The Gallican diocese, seventeen provinces; 13. The Britannic diocese, five provinces. Each of these provinces comprehended many pagi, and each pagus many modern parishes. —Bingham’s Origenes Sacri, Book ii.
There were besides many independent chiefs of dioceses, who, far from owning the jurisdiction of the grand patriarch, called themselves patriarchs such as that of Aquila; nor was Carthage even subject to the patriarch of Alexandria. Mosheim * imagines that the bishops, who enjoyed a certain degree of pre-eminence over the rest of their order, were distinguished by the Jewish title of patriarchs in the fourth century. The authority of the patriarchs gradually increased, till about the close of the fifth century, all affairs of moment within the compass of their patriarchate came before them, either at first hand or by appeals from the metropolitans. They consecrated bishops; assembled yearly in council the clergy of their respective districts; pronounced a decisive judgment in those cases where accusations were brought against bishops; and appointed vicars or deputies, clothed with their authority, for the preservation of order and tranquillity in the remoter provinces. In short, nothing was done without consulting them; and their decrees were executed with the same regularity and respect as those of the princes.

It deserves to be remarked, however, that the authority of the patriarchs was not acknowledged throughout all the provinces without exception. Several districts, both in the eastern and western empire, were exempted from their jurisdiction. The Latin church had not a patriarch till the sixth century; and the churches of Gaul, Britain, &c. were never subject to the authority of the patriarch of Rome, whose authority only extended to the suburbanicary provinces. There was no primacy, no exarchate nor patriarchate, owned here; but the bishops with the metropolitans, governed the church in common. Indeed, after the name patriarch became frequent in the west, it was attributed to the bishops of Bourges and Lyons; but it was only in the first signification, viz. as heads of dioceses. Du Cange says, that there have been some abbots who have borne the title of patriarchs.

Patriarchal cross, in Heraldry, is that where the shaft is twice crossed; the lower arms being longer than the upper ones.

Patriarch, a title given, among the ancient Romans, to the descendants of the hundred, or, as some will have it, of the two hundred, first senators chosen by Romulus; and by him called patres, fathers. Romulus established this order after the example of the Athenians; who were divided into two classes, viz. the præsidii, patricians, and filii populi, patricians. Patricians, therefore, were originally the nobility; in opposition to the plebeians. They were the only persons whom Romulus allowed to aspire to the magistracy; and they exercised all the functions of the priesthood till the year of Rome 492. But the cognizance and character of these ancient families being almost lost and extinguished by a long course of years, and frequent changes in the empire, a new kind of patricians were afterwards set on foot, who had no pretensions from birth, but whose title depended entirely on the emperor's favour. This new patriciate, Zosimus tells us, was erected by Constantine, who conferred the quality on his counsellors, not because they were descended from the ancient fathers of the senate, but because they were the fathers of the republic or of the empire. This dignity in time became the highest of the empire. Justinian calls it summum dignitatem. In effect, the patricians seem to have had the precedence of the consuls, and to have taken place before them in the senate; though F. Faber asserts the contrary. What confounds the question is, that the two dignities often met in the same person; because the patriciate was only conferred on those who had gone through the first offices of the empire, or had been consuls. Pope Adrian made Charlemagne take the title of patrician before he assumed the quality of emperor; and other popes have given the title to other kings and princes by reason of its eminence.

Patrician is also a title of honour often conferred on men of the first quality in the time of our Anglo-Saxon kings. See Than.

Patrician Deities, Patricii Dii, in Mythology, were Janus, Saturn, the Genius, Pluto, Bacchus, the Sun, the Moon, and the Earth.

Patricians, in ecclesiastical writers, were ancient secretaries, who disturbed the peace of the church in the beginning of the third century: thus called from their founder Patricius, preceptor of a Marcionite called Symmachus. His distinguishing tenet was, that the substance of the flesh is not the work of God, but that of the devil: on which account his adherents bore an implacable hatred to their own flesh; which sometimes they crucified them so far as to kill themselves. They were also called Tattitamates, and made a branch of the Engrafted.

Patrick, St., the apostle of Ireland, and second bishop of that country. He was born April 9th A.D. 373, of a good family, at Kirk Patrick near Dumbarston, in what is now called Scotland, but then comprehended under the general name of Britain.—His baptismal name Sucaeth, signifies, in the British language, "valiant in war." On some impromptu of certain exiles from Ireland he was taken prisoner, and carried into that kingdom, where he continued six years in the service of Milcho, who had bought him of three others, when Patrick acquired the new name of Cathragh, or Ceathan-Tigh, i.e. a four families. In this time he made himself master of the Irish language, and at last he made his escape, and returned home on board a ship. About two years after he formed a design of converting the Irish, in consequence of a dream, or of vision; what he had observed during his acquaintance with them. The better to qualify himself for this undertaking, he travelled to the continent, where he continued 23 years, pursuing his studies under the direction of his mother's uncle St. Martin, bishop of Tours, who had ordained him deacon; and after his death, with St. German, bishop of Auxerre, who ordained him priest, and gave him his third name Mawn or Maginn.

An ancient author, Henricus Antisoderensis, who wrote a book concerning the miracles of St German, considers it as the highest honour of that prelate to have been the instructor of St Patrick: "As the glory of a father shines in the government of his sons; out of the many disciples in religion who are reported to have been his sons in Christ, suffice it briefly to mention one by far the most famous, as the series of his actions shows; Patrick the particular apostle of Ireland, who being under his holy discipline 18 years, derived no little knowledge in the inspired writings from such a source. The most godly divine pontiff, considering him alike distinguished in religion, eminent for virtue, and steadfast in doctrine; and thinking it absurd to let one of the best authors..."
bournes remain inactive in the Lord's vineyard, recom-

mended him to Celestine, pope of Rome, by his

presbytery Segisius, who was to carry to the apostolic

see a testimonial of ecclesiastical merit of this excel-

lent man. Approved by his judgment. supported by

his authority, and confirmed by his blessing, he set

out for Ireland; and being particularly destined to that

people as their apostle, instructed them at that time by

his doctrine and miracles; and now does and will for-

ever display the wonderful power of his apostleship.

Lastly, Pope Celestine consecrated him bishop and

gave him his most familiar name Patricius, expressive

of his honourable descent; and to give lustre and

weight to the commission which he now charged him

with to convert the Irish. Palladius had been here a

year before him on the same design, but with little

success: the saints Kieran, Ailbe, Declan, and Ibar,

were precursors both to Palladius and Patrick. But

the great office of apostle of Ireland was reserved for our

prelate, who landed in the country of the Evoli, or at

Wicklow, A.D. 441. His first convert was Sitnell,

eighth in descent from Cormac king of Leinster; but

not meeting with encouragement, he proceeded to Dub-

lin, and thence to Ulster, where he founded a church

(afterwards the famous abbey of Saul, in the county of

Down), remarkable for its position, being made out of

a barn, and its greatest length reaching from north to

south. After labouring seven years indefatigably in his

great work, he returned to Britain, which he delivered

from the heresies of Pelagius and Arius; engaged sev-

eral eminent persons to assist him; visited the isle of

Man, which he converted in 440, when the bishopric

was founded; and, A.D. 448, returned to the see of

Armagh (a), which he had founded three years before;

and in 13 years more completed the conversion of the

whole island (b). After giving an account of his com-

mission at Rome, he once more returned thither, and

spent the remainder of his life between the monasteries

of Armagh and Saul, superintending and enforcing the

great plan of doctrine and discipline which he had estab-

lished. After having established schools, or an aca-

demic here, he closed his life and ministry at Saul ab-

bey, in the 120th year of his age, March 17. A.D.

493, and was buried at Down afterwards, in the same

grave with St. Bridget and St. Columb, in the same

place. Respecting his burial-place, however, there

have been great disputes; and it has been as great a

subject of debate with the religious, as Homer's birth-

place was formerly among the cities of Greece. Those

of Down lay claim to it, on the authority of the follo-

wing verses:

These three in Down lie in tomb one,

Brgit, Patricius, and Columba pius.

Those of Glastenbury in England, from the old mo-

tems of their church: And some Scots affirm he

have been both born and buried among them at Gl-

gow. His genuine works were collected and printed

Sir James Ware, 1656. His immediate successor

this see was St. Binnen or Bignus.

Order of St. Patrick, an institution which took pl

in Ireland in the year 1782. On the fifth of Febru-

ary, in that year, the king ordered letters-patent

be passed under the great seal of the kingdom of I

land, for creating a society or brotherhood, to be call

knights of the illustrious order of St. Patrick, of which

majesty, his heirs and successors, shall perpetually

sovereigns, and his majesty's lieutenant-general a

general-governor of Ireland, &c. for the time being

shall officiate as grand-master; and also for appoin-

Prince Edward, and several of the prime nobility of I

land, knights companions of the said illustrious order.

Patrick, Simon, a very learned English bish

was born at Gainsborough in Lincolnshire in 1642.

In 1644 he was admitted into Queen's college, Cam-

bridge, and entered into holy orders. After being

some time chaplain to Sir Walter St. John, and vicar

the church at Battersea in Surrey, he was preferred

to the rectory of St. Paul's, Covent-garden, in Lon-

don, where he continued all the time of the plague in

1665 among his parishioners, to their great comfort.

In 1668 he published his Friendly Debate between a Con-

formist and a Nonconformist. This was answered by

the Dissenters, whom he had much exasperated by it

but by his moderation and candour toward them after-

wards, they were perfectly reconciled to him, and he

brought over many of them to the communion of the

established church. In 1678 he was made dean of

Peterborough, where he was much beloved. In 168

Dr Lewis de Moulin, who had been a history-profe-

sor at Oxford, and written many bitter books again

the church of England, sent for Dr Patrick upon his

sick bed, and made a solemn declaration of his regu-

lar that account, which he signed, and it was publis-

hed after his death. During the reign of King Jame

the dean's behaviour showed that he had nothing at

heart than the Protestant religion; for which he

ventured all that was dear to him, by preaching an

(a) At Armagh St Patrick founded, A.D. 445 or 447, a priory of Augustine canons, dedicated to St Pete

and St Paul, much enriched by the archbishops; restored by Imar O Hedegan in the 12th century. It was grant-

ed, A.D. 1611, to Sir Toby Caulfield, knight. St Patrick also founded there a house of canonesses of the same

order, under his sister Lupita, called Templeua firma, or the "house of miracles."

We are told, that Armagh was made a metropolitan see in honour of St Patrick; in consequence of which it

was held in the highest veneration not only by bishops and priests, but also by kings and bishops, as the venerable

Bede informs us.

(b) There is a cave in the county of Donegal or Tir-connel, near the source of the Liffey, which, it is pretend-

ed, was dug by Ulysses, in order to hold conversations with infernals. The present inhabitants call it Eilem n

Prodoity or the "island of Purgatory, and Patrick's Purgatory." They affirm, with a pious credulity, that the

St Patrick, the saint of Ireland, or some abbot of that name, obtained of God by his earnest prayers, that the

pains and torments which await the wicked after this life might be here set forth to view, in order the more easi-

ly to recover the Irish from their sinful state and heathenish errors.
writing against the errors of the church of Rome. In 1687 he published a prayer composed for that difficult time, when persecution was expected by all who stood firm to their religion. The year after the Revolution, the dean was appointed bishop of Chichester, and was employed with others of the new bishops to settle the affairs of the church in Ireland. In 1691 he was translated to the see of Ely, in the room of the deceased Bishop Turnill. He died in 1707, after having published various works; among which the most distinguished are his Paraphrases and Commentaries on the Holy Scriptures, three volumes folio. These, with Lowth on the Proverbs, Arnold on the Apocalypse, and Whitby on the New Testament, make a regular continued commentary in English on all the sacred books.

PATRIMONY, a right or estate inherited by a person from his ancestors. The term patrimony has been also given to church estates or revenues; in which sense authors still say, the patrimony of the church of Rimini, Milan, &c. The church of Rome hath patrimonies in France, Africa, Sicily, and many other countries. To create the greater respect to the estates belonging to the church, it was usual to give their patrimonies the names of the saints they held in the highest veneration: thus the estate of the church of Ravenna was called the patrimony of St Apollinaris; that of Milan, the patrimony of St Ambrose; and the estates of the Roman church were called the patrimony of St Peter in Abruesso, the patrimony of St Peter in Sicily, and the like.

What is now called St Peter’s patrimony is only the duchy of Castro, and the territory of Orvietto. See CASTRO, &c.

PATRIOTISM, a love of one’s country, which is one of the noblest passions that can warm and animate the human breast. It includes all the limited and particular affections to our parents, children, friends, neighbours, fellow-citizens, and countrymen. It ought to direct and limit their more confined and partial actions within their proper and natural bounds, and never let them encroach on those sacred and first regards we owe to the great public to which we belong. Were we solitary creatures, detached from the rest of mankind, and without any capacity of comprehending a public interest, or without affections leading us to desire and pursue it, it would not be our duty to mind it, nor criminal to neglect it. But as we are parts of the public system, and are not only capable of taking various views of its interests, but by the strongest affections connected with it, and prompted to take a share of its concerns, we are under the most sacred ties to prosecute its security and welfare with the utmost ardour, especially in times of public trial.

"Zea! for the public good (says Mr Addison) is the characteristic of a man of honour and a gentleman, and must take place of pleasures, profits, and all other private gratifications: that whoever wants this motive, is an opus enemy, or an inglorious neuter to mankind, in proportion to the misapplied advantages with which nature and fortune have blessed him." This love of our country does not import an attachment to any particular soil, climate, or spot of earth, where perhaps we first drew our breath, though those natural ideas are often associated with the moral ones; and, like external signs or symbols, help to ascertain and bind Patriotism.

Patriotism—wherever this love of our country prevails in its genuine vigour and extent, it swallows up all sordid and selfish regards; it conquers the love of ease, power, pleasure, and wealth; it may, when the amiable partialities of friendship, gratitude, private affection, or regards to a family, come in competition with it, it will teach us to sacrifice all, in order to maintain the rights, and promote and defend the honour and happiness of our country. To pursue, therefore, our private interests in subordination to the good of our country; to be examples in it of virtue, and obedient to the laws; to choose such representatives as we apprehend to be the best friends to its constitution and liberties; and if we have the power, to promote such laws as may improve and perfect it; readily to embrace every opportunity for advancing its prosperity; cheerfully to contribute to its defence and support; and, if need be, to die for it:—these are among the duties which every man, who has the happiness to be a member of our free and Protestant constitution, owes to his country.

The constitution of man is such, that the most selfish passions, if kept within their proper bounds, have a tendency to promote the public good. There is no passion of more general utility than patriotism; but its origin may unquestionably be termed selfish. The love of one’s relations and friends is the most natural expansion of self-love: this affection connects itself too with local circumstances, and sometimes cannot easily be separated from them. It often varies, as relationship or place varies; but acquires new power when the whole community becomes its object. It was therefore with singular propriety that the poet said, "Self-love and social are the same." Under the article Capaix we have already given the outlines of the transactions of its siege. Hist. Eng. by Edward III. during which the inhabitants displayed Edw. III. a degree of patriotism truly wonderful. History scarcely affords a more distinguished instance of true patriotic virtue than on this occasion. We shall therefore give a fuller account of this remarkable affair, as one of the best examples that can possibly be selected of the virtue we have been explaining. The inhabitants, under Count Vienne their gallant governor, made an admirable defence against a well disciplined and powerful army. Day after day the English effected many a breach, which they repeatedly expected to storm by morning; but, when morning appeared, they wondered to behold new ramparts raised nightly, erected out of the ruins which the day had made. France had now put the snickel into her second harvest since Edward with his victorious army sat down before the town. The eyes of all Europe were intent on the issue. The English made their approaches and attacks without remission; but the citizens were as obstinate in repelling all their efforts. At length, famine did more for Edward than arms. After the citizens had devoured the lean carcasses of their half-starved cattle, they tore up old foundations and rubbish in search of vermin: they fed on boiled leather, and the weeds of exhausted gardens; and a morsel of damaged corn was accounted matter of luxury.
PAT [ 56 ]

Friends, there is one expedient left; a gracious, an excellent, a god-like expedient! Is there any here whom virtue is dearer than life? Let him offer himself an oblation for the safety of his people! He shall not fail of a blessed approbation from that power, who offered up his only Son for the salvation of mankind. He spoke—but an univer-

al silence ensued. Each man looked round for the example of that virtue and man自己的 performances, which all wished to approve themselves, though they wanted the resolution. A length Saint Pierre resumed: "It had been base me, my fellow-citizens, to promote any matter of derangement to others, which I myself had not been willing to undergo in my own person. But I held it unnerous to deprive any man of that preference and estimation, which might attend a first offer on so sign an occasion: for I doubted not but there are many as ready, as my, more zealous for this martyrdom than can be, however modesty and the fear of self-protection may withhold them from being foremost in ex- hibiting their merits. Indeed the station to which the captivity of Count Vienne has unhappily raised me imports a right to be the first in giving my life for your sakes. I give it freely, I give it cheerfully. What comes next? Your son! exclaimed a youth, not yet come to maturity.—Ah, my child! cried Saint Pierre; am I then twice sacrificed. But no! I have rather been gotten thee a second time.—Thy years are few, but full my son; the victim of virtue has reached the utmost purpose and goal of mortality. Who next, my friends? This is the hour of heroes. Your kinsman, eric John de Aire! Your kinsman, cried James Wissant! Your kinsman, cried Peter Wissant!—"Ah! (exclai-

ed Sir Walter Mauny, bursting into tears), why was not a citizen of Calais?" The sixth victim was still wanting, but was quickly supplied by lot, from numer-

ous who were now emulous of so nobly attaining an example. The keys of the city were then delivered to Sir Walter. He took the six prisoners into his custody. He ordered the gates to be opened, and gave charge to his attendants to conduct the remaining citizens with their families through the camp of the English. Before they departed, however, they desired permission to take the last adieu of their deliverers.—What a parting! what a scene! they crowded with their wives and children about Saint Pierre and his fellow-prisoners. They embraced their clubbing arms, they fell prostrate before them. They groaned; they wept aloud; and the joint chime of their mourning passed the gates of the city and was heard throughout the camp. At length Saint Pierre and his fellow-victims appeared under the con-

tact of Sir Walter and his guard. All the tents of the English were instantly emptied. The soldiery poured from all parts, and arranged themselves in each side to behold, to contemplate, to admire the little band of patriots as they passed. They murmured their applause of that virtuous which they could not but reverence even in enemies; and they regarded those ropes which they had voluntarily assumed about their necks as emblems of greater dignity than that of the British Carter. As soon as they had reached the royal presence, "Mauny (says the King), are these the principal inhabitants of Calais?" "They are (say Mauny); they are not the principal men of Calais, they are the principal men of France, my lord
P A T

P A T

were two more such families in Rome," said they, "the

Patriotism.

"Were they delivered peaceably, (says Edward)?

"Not in the least, my lord. They are self-
delivered, self-devoted, and come to offer up
their unestimable heads as an ample equivalent for the ransom

The king, who was highly incensed at the length
and difficulty of the siege, ordered them to be carried
away to immediate execution; nor could all the
remonstrances and treatises of his courtiers divert him
from his cruel purpose. But what neither a regard to
his own interest and honour, what neither the dic-
tates of justice, nor the feelings of humanity, could
effect, was happily accomplished by the more powerful
influence of conjugal affection. The queen, who was
then big with child, being informed of the particulars
respecting the six victims, flew into her husband's pre-
sence, threw herself on her knees before him, and, with
ears in her ears, besought him not to stain his character
with such an infamy by committing such a horrid and barbarous deed.
Edward could refuse
nothing to a wife whom he so tenderly loved, and
especially in her condition; and the queen, not satisfied with
having saved the lives of the sixburghers, conducted
them to her tent, where she applauded their virtue,
rewarded them with a plentiful repast, and having made
them a present of money and clothes, sent them back
to their fellow citizens.

The love of their country, and of the public good,
seems to have been the predominant passion of the Spar-
tans. Pedaretus having missed the honour of being
chosen one of the three hundred who had a certain
rank of distinction in the city, went home extremely
pleased and satisfied; saying, "He was overjoyed there
were three hundred men in Sparta more honourable than
himself."

The patriotism of the Romans is well known, and has
been justly admired. We shall content ourselves at pres-
ent with the following example; a zeal and patriotic
devotion similar to which is perhaps scarcely equalled,
and certainly is not exceeded, in history.

Rome, under the consul Cneo Fabius and T. Vir-
ginius, had several wars to sustain, less dangerous than
troublesome, against the Eequi, Volsci, and Veientes.

To put a stop to the incursions of the last, it would
have been necessary to have established a good garrison
upon their frontiers to keep them in awe. But the
commonwealth, exhausted of money, and menaced by
abundance of other enemies, was not in a condition to
provide for so many different cares and expences. The
family of the Fabii showed a generosity and love of
their country that has been the admiration of all ages.
They applied to the senate, and by the mouth of the
consul demanded as a favour that they would be pleased
to transfer the care and expenses of the garrison
necessary to oppose the enterprises of the Veientes to
their house, which required an assiduous rather than a
numerous body, promising to support with dignity the
honour of the Roman name in that post. Every body
was charmed with so noble and unheard of an offer;
and it was accepted with great acknowledgment. The
news spread over the whole city, and nothing was talk-
ed of but the Fabii. Every body praised, every body
admired and extolled to the skies. "If there

Vol. XVI. Part I.
PATRIOTS fought with fresh courage, the enemy leaving them no time to breathe. As they were upon the higher ground, they defended themselves with advantage, notwithstanding their small number; and beating down the enemy, who spared no pains in the attack, they made a great slaughter of them. But the Veientes having gained the top of the mountain by taking a compass, fell suddenly upon them, and gained them exceedingly from above with a continual shower of darts. The Fabi defended themselves to their last breath, and were all killed to a man. The Roman people were highly affected with the loss of this illustrious band of patriots. The day of their defeat was ranked amongst the unfortunate days, called nefasti, on which the tribunals were shut up, and no public affair could be negotiated, or at least concluded. The memory of these public-spirited patriots, who had so generously sacrificed their lives and fortunes for the service of the state, could not be too much honoured.

PATRIASSIANS, PATRIASSIANI, in church history, a Christian sect, who appeared about the latter end of the second century; so called from their ascribing the passion to the Father; for they asserted the unity of God in such a manner as to destroy all distinctions of persons, and to make the Father and Son precisely the same; in which they were followed by the Sabellians and others. The author and head of the Patriassians was Praxeas, a philosopher of Phrygia in Asia. Swedenenbourg and his followers seem to hold the same faith.

PATROCLUS, a Grecian chief at the Trojan war. He was the son of Mencetus, by Sthenele, whom some call Philomela or Polymela. The murder of Clytemnestra, the son of Amphidamas, by accident, in the time of his youth, made him fly from Opus, where his father reigned. He went to the court of Peleus king of Phthia. He was cordially received, and contracted the most intimate friendship with Achilles the king's son. When the Greeks went to the Trojan war, Patroclus went with them at the express desire of his father, who had visited the court of Peleus; and he accordingly embarked with ten ships from Phthia. He was the constant companion of Achilles; lodged in the same tent; and, when he refused to appear in the field of battle, because he had been offended by Agamemnon, Patroclus imitated his example, and by his absence was the cause of much evil to the Greeks. At last, however, Nestor prevailed upon him to return to the war, and Achilles permitted him to appear in his armour. The bravery of Patroclus, together with the terror which the sight of the arms of Achilles inspired, soon routed the victorious armies of the Trojans, and obliged them to fly to the city for safety. He would have broken down the walls; but Apollo, who interested himself for the Trojans, opposed him; and Hector, at the instigation of that god, dismounted from his chariot to attack him as he attempted to strip one of the Trojans whom he had slain. This engagement was obstinate; but Patroclus was at length overpowered by the valour of Hector, and the interposition of Apollo. His arms became the property of the conqueror; and Hector would have severed his head from his body had not Ajax and Menelaus prevented it. His body was at last recovered, and carried to the Grecian camp, where Achilles received it with the loudest lamentations. His funeral were observed with the greatest solemnity. Achilles sacrificed near his burning pile twelve young Trojans, four of his horses, and two of his dogs; and the whole was concluded by the exhibition of funeral games, in which the conquerors were liberally rewarded by Achilles. The death of Patroclus, as described by Homer, gave rise to new events. Achilles forgot his resentment against Agamemnon, and entered the field to avenge the fall of his friend; and his anger was gratified by the slaughter of Hector, who had more powerfully kindled his wrath by appearing at the head of the Trojan armies in the armour which had been taken from the body of Patroclus. The patronymic of Actorius is often applied to Patroclus, because Actor was the son of Mencetus.

PATROI, in war, a round or march made by guards or watch in the night time, to observe passes in the streets, and to secure the peace and tranquility of a city or camp. The guard generally consists of a body of five or six men, detached from a body on guard, and commanded by a sergeant.

They go every hour of the night, from the beat of the tattoo until the reveille; they are to walk in streets in garrisons, and all over the camp in the field to prevent disorders, or any number of people from resembling together: they are to see the lights in the soldiers' barracks put out, and to take up all the soldiers they find out of their quarters. Sometimes patrols consist of an officer and 30 or 40 men, as well infantry as cavalry; but then the enemy is generally near at hand and consequently the danger the greater.

PATRON, among the Romans, was an appellation given to a master who had freed his slave. As soon as the relation of master expired, that of patron began for the Roman, in giving their slaves their freedom did not despoil themselves of all rights and privileges in them; the law still subjected them to consider all services and duties towards their patrons, the neglect of which was very severely punished.

Patron was also a name which the people of Rome gave to some great man, under whose protection they usually put themselves; paying him all kinds of honor and respect, and denominating themselves his clients while the patron, on his side, granted them his credit and protection. They were therefore mutually attached and mutually obliged to each other; and by these means, in consequence of reciprocal ties, all those sentiments, jealousies, and animosities, which are sometimes the effect of a difference of rank, were prudently avoided: for it was the duty of the patron to advise his clients in points of law, to manage their suits, to take care of them as his own children, and secure them peace and happiness. The clients were to assist the patrons with money on several occasions; to raise them or their children when taken in war; to contribute to the portions of their daughters; and to defray in part, the charges of their public employments. They were never to accuse each other, or take contrary sides and if either of them was convicted of having violated this law, the crime was equal to that of treason, and any one was allowed to kill the offender with impunity. This patronage was a tie as effectual as any consanguinity or alliance, and had a wonderful effect towards maintaining union and concord among the people.
the space of 600 years; during which time we find no disensions or jealousies between the patrons and their clients, even in the times of the republic, when the populace frequently mutinied against those who were most powerful in the city.

Patron, in the church of Rome, a saint whose name a person bears, or under whose protection he is put, and whom he takes particular care to invoke; or a saint in whose name a church or order is founded.

Patron, in the canon or church law, is a person who, having the advowson of a parsonage, vicarage, or the like spiritual promotion, belonging to his manor, hath on that account the gift and disposition of the benefice, and may present to it whenever it becomes vacant. The patron’s right of disposing of a benefice originally arises either from the patron or his ancestors, &c. being the founders or builders of the church; from their having given lands for the maintenance thereof; or from the church’s being built on their ground; and frequently from all three together.

Patronage, or Advowson, a sort of incorporeal hereditament, consisting in the right of presentation to a church or ecclesiastical benefice. Advowson, adovovasio, signifies in clientelam recipit, the taking into protection; and therefore is synonymous with patronage. Patronage (for it is called the patron of the church. For when lords of manors first built churches on their own demesnes, and appointed the titles of those manors to be paid to the officiating ministers, which before were given to the clergy in common (from whence arose the division of parishes), the lord who thus built a church, and endowed it with a glebe or land, had of common right a power annexed of nominating such minister as he pleased (provided he were canonically qualified) to officiate in that church, of which he was the founder, endower, maintainer, or, in one word, the patron.

Advowsons are either advowsons appendant, or advowsons in gross. Lords of manors being originally the only founders, and of course the only patrons, of churches, the right of patronage or presentation, so long as it continues annexed to the possession of the manor, as some have done from the foundation of the church to this day, is called an advowson appendant: and it will pass, or be conveyed, together with the manor, as incident and appendant thereto, by a grant of the manor only, without adding any other words. But where the property of the advowson has been once separated from the property of the manor by legal conveyance, it is called an advowson in gross, or at large, and never can be appendant any more; but it is for the future annexed to the person of its owner, and not to his manor or lands.

Advowsons are also either presentative, collative, or donative. An advowson presentative, is where the patron hath a right of presentation to the bishop or ordinary, and moreover to demand of him to institute his clerk if he finds him canonically qualified: and this is the most usual advowson. An advowson collative, is where the bishop and patron are one and the same person: in which case the bishop cannot present to himself; but he does, by the one act of collation, or conferring the benefice, the whole that is done in common cases, by both presentation and institution. An advowson donative, is when the king, or any subject by his licence, doth found a church or chapel, and ordains that it shall be merely in the gift or disposal of the patron; subject to his visitation only, and not to the patron; subject to his visitation only, and not to that of the ordinary; and vested absolutely in the clerk by the patron’s deed of donation, without presentation, institution, or induction. This is said to have been anciently the only way of conferring ecclesiastical benefices in England; the method of institution by the bishop not being established more early than the time of Archbishop Becket in the reign of Henry II. and therefore, though Pope Alexander III. in a letter to Becket, severely inveighs against the present common ways, as he calls it, of investiture conferred by the patron only, this however shows what was then the common usage. Others contend that the claim of the bishops to institution is as old as the first planting of Christianity in this island; and in proof of it they allege a letter from the English nobility to the pope in the reign of Henry the Third, recorded by Matthew Paris, which speaks of presentation to the bishop as a thing inmemorial. The truth seems to be, that, where the benefice was to be conferred on a mere layman, he was first presented to the bishop in order to receive ordination, who was at liberty to examine and refuse him; but where the clerk was already in orders, the living was usually vested in him by the sole donation of the patron; till about the middle of the 12th century, when the pope and his bishops endeavoured to introduce a kind of feudal dominion over ecclesiastical benefices, and, in consequence of that, began to claim and exercise the right of institution universally, as a species of spiritual investiture.

However this may be, if, as the law now stands, the true patron once waxes this privilege of donation, and presents to the bishop, and his clerk is admitted and instituted, the advowson is now become for every presentative, and shall never be donative any more. For these exceptions to general rules and common right are ever looked upon by the law in an unfavourable view, and construed as strictly as possible. If therefore the patron, in whom such peculiar right resides, does once give up that right, the law, which loves uniformity, will interpret it to be done with an intention of giving it up for ever; and will therefore reduce it to the standard of other ecclesiastical livings. See further, Law, Part III. Sect. v. No. 55. 10.

Arms of Patronage, in Heraldy, are those on the top of which are some marks of subjection and dependence: thus the city of Paris lately bore the fleur-de-lis in chief, to show her subjection to the king; and the cardinals, on the top of their arms, bear those of the pope, who gave them the hat, to show that they are his creatures.

Patronymic, among grammarians, is applied to such names of men or women as are derived from those of parents or ancestors.

Patronymics are derived, 1. From the father; as Pelides, i.e. Achilles the son of Peleus. 2. From the mother; as Phileides, i.e. Chiron the son of Philyra. 3. From the grandfather on the father’s side; as Hyacinths, i.e. Achilles the grandson of Eneas. 4. From the grandfather by the mother’s side; as Atlantides, i.e. Mercury the grandson of Atlas. 5. From the kings and founders of nations; as Romulides, i.e. the Roman people, from their founder King Romulus.

The terminations of Greek and Latin patronymics are
are chiefly four, viz. des, of which we have examples above; as, as Thaumaturgis, i.e. Iris the daughter of Thaumas; it, as Atlas, i.e. Electra the daughter of Atlas; and ne, as Neriha, the daughter of Nerus. Of these terminations des is masculine; and as, it, and ne, feminine; des and ne are of the first declension, as and it of the third.

The Russians, in their usual mode of address, never prefix any title or appellation of respect to their names; but persons of all ranks, even those of the first distinction, call each other by their Christian names, to which they add a patronymic. These patronymics are formed in some cases by adding Vitch (the same as our Fitz, as Fitzherbert, or the son of Herbert) to the Christian name of the father; in others by Of or Ef; the former is applied only to persons of condition, the latter to those of inferior rank. Thus,

Ivan Ivanovitch, Ivan Ivanof, is Ivan the son of Ivan: Peter Alexievitch, Peter Alexof, Peter the son of Alexey.

The female patronymic is Efna or Ofna, as Sophia Alexovna, Sophia the daughter of Alexey; Maria Ivanovna, Maria the daughter of Ivan.

Great families are also in general distinguished by a surname, as those of Romanof, Galitzin, Sberemotof, &c.

PATROS, mentioned by Jeremiah and Ezekiel, appears from the context to be meant of a part of Egypt. Bocchart thinks it denotes the Higher Egypt; the Septuagint translate it the country of Pathure; in Pliny we have the Namos Pathurites in the Thebaies; in Ptolemy, Pathris, probably the metropolis. From the Hebrew appellation Patros comes the gentilicium name Pathruaim, (Moses).

PATTANS, PATANS, or AFGHANS, a very warlike race of men, who had been subjects of the vast empire of Bocchar. They revolted under their governor Abstagi, in the 10th century, and laid the foundation of the empire of Ghiziri or Gazza. In the Dissertation prefixed to vol. iii. of Dow's History, we have this account of the Pattans.

"They are divided into distinct communities, each of which is governed by a prince, who is considered by his subjects as the chief of their blood, as well as their sovereign. They obey him without reluctance, as they derive credit to their family by his greatness. They attend him in his wars with the attachment which children have to a parent; and his government, though severe, partakes more of the rigid discipline of a general than the caprice of a despot. Rude, like the face of their country, and fierce and wild as the storms which cover their mountains, they are addicted to incursions and depredations, and delight in battle and in plunder. United firmly to their friends in war, to their enemies faithless and cruel, they place justice in force, and conceal treachery under the name of address."

The empire, which took its rise from the revolt of the Pattans, under a succession of warlike princes rose to a surprising magnitude. In the beginning of the 11th century, it extended from Isphahan to Bengal, and from the mouths of the Indus to the banks of the Jaxartes, which comprehends at least half of the continent of Asia. They had fled to the mountains on the borders of Persia, that they might escape the sword, or avoid submitting to the conquerors of India; and there they formed their state, which the Moguls were never able thoroughly to subdue. Indeed they sometimes exercised depositions on the adjacent countries; nor was it possible for the Moguls either to prevent or to extirpate them. They were sensible that the climate and soil of the fertile plains would only serve to rob them of that business they contracted in the hills to which they were fined; they, therefore, for a long time gave no indications of a desire to exchange them for more pleasant bodies, or a more accessible situation. This enabled them to brave the victorious army of Nadir Shah, whose troops they quietly suffered to penetrate into Hindostan, waited his return with the spoils of that country.—I then harassed his army in the straits and defiles of mountains, and proved themselves such absolute masters of the passes, that they forced him to purchase from the passage into Persia.

In the beginning of the 18th century, they spread themselves over the adjoining province of Kharvar and such was the imbecility of the Persian emperors at that time, that many other provinces and tributary states were also induced to revolt. When the king of Thatahmash, whose name was Husain, opposed growing power of this warlike people, he was totally routed, and Isphahan was besieged and obliged to surrender, after having suffered dreadful calamities, to an army consisting of only 30,000 men. In consequence of this, they brought about a revolution in Persia, and subjected it to themselves. This sovereignty, however, they only held for seven years and 21 days, having offered a sacrifice to the enterprising spirit of Koulie Khi or Nadir Shah. See PERSIA and AFGHANS.

PAU, a town of France, in the department of L.Pyrenee, having formerly a parliament, a mint, and a castle. "The city of Pau (says WRAXAL) will be for ever memorable in history, since it was the birthplace of Henry IV. That immortal prince was born in the castle, then the usual residence of the kings of Navarre. It stands on one of the most romantic and singular spots I have ever seen, at the west end of the town, upon the brow of a rock which terminates perpendicularly. Below runs the Gave, a river or rather a torrent which rises in the Pyrenees, and empties itself into the Adour. On the other side, about two miles off, is a ridge of hills covered with vineyards, which produce the famous Vin de Jorencion, so much admired in Italy and beyond all, at the distance of nine leagues, appears the Pyrenees themselves, covering the horizon from east to west, and bounding the prospect. The castle, though now in a state of decay, is still habitable; and the apartments are hung with tapestry, said to be the work of the queen of Navarre, and mother of Henry IV. Gaston, I.V. count de Foix, who married Leonora heiress to the crown of Navarre, began the edifice in 1465; but his successor Henry d'Albret completed and enlarged it about the year 1519, when he made choice of the city of Pau for his residence, and where, during the remainder of his reign, he held his little court. In a chamber which by its size was formerly a room of state, is a fine whole-length portrait of that Jane queen of Navarre whom I have just mentioned. Her dress is very splendid, and resembles those in which our Elizabeth is usually painted. Her head-dress is adorned with pearls around her neck she wears a ruff; and her arms, which are likewise covered with pearls, are concealed by her habit.
habit quite down to the wrist. At her waist hangs by a
chain a miniature portrait. The fingers of her right
hand play on the strings of a guitar; and in her left
she holds an embroidered handkerchief. The painter
has drawn her as young, yet not in the first bloom
of youth. Her features are regular, her countenance thin,
but rather inclining to long; the eyes hazel, and the eye-
brows finely arched. Her nose is well formed; though
large, and her mouth pretty. She was a great princess,
of high spirit, and undaunted magnanimity. Her
memory is not revered by the French historians, because
she was the protectress of the Huguenots and the friend
of Coligny; but the actions of her life evince her dis-
tinguished merit.

In one of the adjoining chambers, is another por-
trait of Henry IV. himself when a boy; and on the sec-
ond floor is the apartment in which he was born. The
particulars of his birth, are in themselves so curious, and
as relating to so great and good a prince, are so pe-
culiarly interesting, that I doubt not you will forgive
my enumerating them, even though you should have seen
them elsewhere.—His mother Jané had already lost two
sons, the duke de Beannmont and the count de Marle.
Henry d'Albret, her father, anxious to see an heir to
his dominions, enjoined her (when she accompanied her
husband Anthony of Bourbon to the wars of Picardy
against the Spaniards), if she proved with child, to re-
turn to Pau, and to lie in there, as he would himself su-
perintend the education of the infant from the moment
of its birth. He threatened to disinherit her if she fail-
ed to comply with this injunction. The princess, in
obedience to the king's command, being in the ninth
month of her pregnancy, quitted Compiègne in the end
of November, traversed all France in 15 days, and ar-
rived at Pau, where she was delivered of a son on the
13th December 1553. She had always been desirous to
see her father's will, which he kept in a golden box;
and he promised to show it to her, provided she admit-
ted of his being present at her delivery, and would, du-
ring the pains of her labour, sing a song in the Bearnois
language. Jane had courage enough to perform this
unusual request; and the king being called on the first
news of her illness, she immediately sung a Bearnois
song, beginning,  
Notre Dame du Bout du Post, aidez
moi en cette heure. — As she finished it, * Henry
was born. The king instantly performed his promise, by
giving her the box, together with a golden chain, which
he tied about her neck; and taking the infant into his
own apartment, began by making him swallow some
drops of wine, and rubbing his lips with a root of gar-
lic. They still show a tortoise-shell which served her
for a cradle, and is preserved on that account. Several
of the ancient sovereigns of Navarre resided and died in
the castle of Pau. François Phoebus, who ascended the
throne in 1479, died hero in 1493."

Pau is a handsome city, well built, and contained
8,68; inhabitants in 1800. It is a modern place, hav-
ing owed its existence entirely to the castle, and to the
residence of the kings of Navarre. W. Long. 0. 42.
N. Lat. 43. 15.

PAVAN, or PAVANE, a grave dance used among
the Spaniards, and borrowed from them; wherein the
performers made a kind of wheel or tail before each
other, like that of Pavo, "a peacock;" from whence the
name is derived. The pavana was formerly in great
repute; and was danced by gentlemen with cap and
sword; by those of the long robe in their gowns, by
princes with their mantles, and by the ladies with their
gowns tails trailing on the ground. It was called the
grand ball, from the solemnity with which it was per-
formed. To moderate its gravity, it was usual to intro-
duce several flourishes, passades, capers, &c. by way of
episodes. Its tablature or score is given at large by
Thoinot Arbeau in his Orchesgraphie.

PAVETTA, a genus of plants belonging to the
tranthria class; and in the natural method ranking under
the 47th order, Stellata. See BOTANY Index.

PAVIA, an ancient and celebrated town of Italy,
in the duchy of Milan, and capital of the Pavese, with
an university and bishop's see. It was anciently called
Ticinum, from its situation on that river. It lies 20 miles
to the southward of Milan, and contains about 30,000
inhabitants. It was formerly the capital of the Longe-
bardic kingdom, and is still remarkable for the broad-
ness of its streets, the beauty and richness of some of
its churches, for its university founded by Charlemagne,
and for several other literary institutions. The bishop's
see, which was once the richest in Italy, is now depen-
dent on the pope; and upon the whole the city is gone
to decay. The few objects within it worth the public
attention belong to the clergy or monks; and the church
and convent of the Carthusians are inexpressibly noble,
the court of the convent being one of the finest in the
world. It is defended by strong walls, large ditches,
good ramparts, excellent bastions, and a bridge over
the river Ticino. In the centre of the town is a strong
castle, where the duke of Milan was wont to reside. It
was taken by the duke of Savoy in 1706; by the French
in 1733; by the French and Spaniards in 1745; but
retaken by the Austrians in 1746. It fell into the
hands of the French in 1796, was recovered by the Aus-
trians in 1798, but surrendered again to the French in
1800; and formed a part of the kingdom of Italy, till
the peace of Paris in 1815 restored it to the Austrians.
E. Long. 9. 5. N. Lat. 45. 10.

PAVILION, in Architecture, signifies a kind of tur-
et, or building, usually insulated, and contained under
a single roof; sometimes square, and sometimes in form
of a dome: thus called from the resemblance of its roof
to a tent.

Pavilions are sometimes also projecting pieces, in
the front of a building, marking the middle thereof; some-
times the pavilion flanks a corner, in which case it is
called an angular pavilion. The Louvre is flanked with
four pavilions: the pavilions are usually higher than the
rest of the building. There are pavilions built in gardens,
commonly called summer-houses, pleasure-houses, &c.
Some castles or forts consist only of a single pavilion.

Pavilion, in military affairs, signifies a tent raised
on posts, to lodge under in the summer time.

Pavilion, is also sometimes applied to flags, colours,
ensigns, standards, banners, &c.

Pavilion, in Heraldry, denotes a covering in form
of a tent, which invests or wraps up the armories of di-
vers kings and sovereigns, depending only on God and
their sword.

The pavilion consists of two parts: the top, which is
the chapeau, or coronet; and the curtain, which makes
the mantle.

None but sovereign monarchs, according to the French
heralds,
PAV[62]PAV

1. Pebble-paving, which is done with stones collected from the sea-beach, mostly brought from the islands of Guernsey and Jersey; they are very durable, indeed the most so of any stone used for this purpose. They are used of various sizes, but those which are from six to nine inches deep, are esteemed the most serviceable. When they are about three inches deep, they are denominated bolders or boulées; these are used for paving court-yards, and other places not accustomed to receive carriages with heavy weights; when laid in geometrical figures, they have a very pleasing appearance.

2. Rag-paving was much used in London, but is very inferior to the pebbles; it is dug in the vicinity of Maidstone in Kent, from which it has the name of Kentish ragstone; there are squared stones of this material for paving coach tracks and footways.

3. Purbeck pitchens; square stones used in footways; they are brought from the island of Purbeck, and also frequently used in court-yards; they are in general from six to ten inches square, and about five inches deep.

4. Squared paving, for distinction by some called Scotch paving, because the first of the kind paved in the manner that has been and continues to be paved, came from Scotland; the first was a clear close stone, called blue whynm, which is now disused, because it has been found inferior to others since introduced in the order they are hereafter placed.

5. Granite, a hard material, brought also from land, of a reddish colour, very superior to the whynm quarry, and at present very commonly used in London.

6. Gurenay, which is the best, and very much in use, is the same stone with the pebble before spoken of, broken with iron hammers, and squared to any dimensions required of a prismatical figure, set with its largest base downwards. The whole of the foregoing should be bedded and paved in small gravel.

7. Purbeck paving, for footways, is in general considered as the best and hardest; it is of a half thick blue sort, and the best of this kind paving.

8. Yorkshire paving, an excellent stone, and of almost any dimensions of the same thickness as the Purbeck. This stone, not admitting the wet to pass through it, nor is it affected by frost.

9. Ryegate or freestone paving, is used for hearthstones, oven, and such places as are liable to frequent contact which does not affect the stone if kept dry.

10. Newton's stones are stones in about two feet square, and one inch and a half or two inches thick; they are very well for paving out-offices; they are not like the Yorkshire.

11. Portland paving, with stone from the island of Portland; this is sometimes ornamented with blue marble dots.

12. Sudeland paving, is a black slate dog in Leicestershire, and looks well for paving halls, or in part coloured paving.

13. Marble paving, is mostly variegated with different marbles, sometimes inlaid in mosaic.

14. Flat brick paving, done with brick laid in sand, mortar, or grout, as when liquid lime is poured in the joints.

15. Brick-on-edge paving, done with brick laid edgewise in the same manner.

16. Bricks are also laid flat or edgewise in herringbone.

17. Bricks are also sometimes set endwise in sand, mortar, or grout.

18. Paving is also performed with paving bricks.

19. With ten-inch tiles.

20. With foot tiles.

21. With clinkers for stables and outer offices.

22. With the bones of animals, for gardens, &c.

And, 23. We have-knob paving, with large gravel stones, for porticoes, garden-seats, &c.

Pavements of churches, &c. frequently consist of stone of several colours; chiefly black and white, and of several forms, but chiefly squares and lozenges, artfully disposed. Indeed, there needs no great variety of colour to make a surprising diversity of figures and arrangements. M. Truchet, in the Memoirs of the French Academy, has shown by the rules of combination, the two square stones, divided diagonally into two colours, may be joined together chequerwise 64 different ways, which appears surprising enough; since two letters of figures can only be combined in two ways.

The reason is, that letters only change their situation with regard to the first and second, the top and bottom remaining the same; but in the arrangement of these stones, each admits of four several situations, in each
PAU [63] PAU

whereof the other square may be changed 16 times, which gives 64 combinations.

Indeed, from a further examination of these 64 combinations, he found there were only 32 different figures, each figure being repeated twice in the same situation, though in a different combination; so that the two only differed from each other by the transposition of the dark and light parts.

PAUL, formerly named SAUL, was of the tribe of Benjamin, a native of Tarsus in Cilicia, a Pharisee by profession; first a persecutor of the church, and afterwards a disciple of Jesus Christ, and apostle of the Gentiles. It is thought he was born about two years before our Saviour, supposing that he lived 68 years, as we read in a homily which is in the 6th volume of St. Chrysostom's works. He was a Roman citizen (Acts xxii. 27, 28.), because Augustus had given the freedom of the city to all the freemen of Tarsus, in consideration of their firm adherence to his interests. His parents sent him early to Jerusalem, where he studied the law at the seat of Gamaliel a famous doctor (id. xxiii. 3.). He made very great progress in his studies, and his life was always blameless before men; being very zealous for the whole observance of the law of Moses (id. xxvi. 4, 5.). But his zeal carried him too far; he persecuted the church, and insulted Jesus Christ in his members (1 Tim. i. 13.); and when the proto-martyr St. Stephen was stoned, Saul was not only consenting to his death, but he even stood by and took care of the clothes of those that stoned him (Acts vii. 58, 59.). This happened in the 33d year of the common era, some time after our Saviour's death.

At the time of the persecution that was raised against the church, after the death of St Stephen, Saul was one of those that showed most violence in distressing the believers (Gal. i. 13. and Acts xxvi. 11.). He entered into their houses, and drew out by force both men and women, loaded them with chains, and sent them to prison (Acts viii. 3. and xxii. 4.). He even entered into the synagogues, where he caused those to be beaten with rods that believed in Jesus Christ, compelling them to blaspheme the name of the Lord. And having got credentials from the high-priest Caiaphas, and the elders of the Jews, to the chief Jews of Damascus, with power to bring to Jerusalem all the Christians he should find there, he went away full of threats, and breathing nothing but blood (Acts ix. 1, 2, 3, &c.). But as he was upon the road, and now drawing near to Damascus, all on a sudden about noon, he perceived a great light to come from heaven, which encompassed him and all those that were with him. This splendour threw them on the ground; and Saul heard a voice that said to him, "Saul, Saul, why persecutest thou me?" It was Jesus Christ that spoke to him. To whom Saul answered, "Who art thou, Lord?" And the Lord replied to him, "I am Jesus of Nazareth whom thou persecutest; it is hard for thee to kick against the pricks." Saul, all in consternation, asked, "Lord, what is it that thou wouldst have me do?" Jesus bid him rise and go to Damascus, where the will of the Lord should be revealed to him.

Saul then rose from the ground, and felt that he was deprived of sight; but his companions led him by the hand, and brought him to Damascus, where he continued three days blind, without taking any nourishment. He lodged at the house of a Jew named Judas. On the third day, the Lord commanded a disciple of his, named Ananias, to go and find out Saul, to lay his hands upon him, and to cure his blindness. And as Ananias made excuses, saying that this man was one of the most violent persecutors of the church, the Lord said to him, Go and find him, because this man is an instrument that I have chosen, to carry my name before the Gentiles, before kings, and before the children of Israel; for I will show him how many things he must suffer for my name. Ananias went therefore, and found Saul, laid his hand upon him, and restored him to his sight; then rising, he was baptized, and filled with the Holy Ghost. After this he continued some days with the disciples that were at Damascus, preaching in the synagogues, and proving that Jesus was the Messiah (a).

From Damascus he went into Arabia (Gal. i. 17.), probably

(a) The conversion of such a man, at such a time, and by such means, furnishes one of the most complete proofs that have ever been given of the divine origin of our holy religion. That Saul, from being a zealous persecutor of the disciples of Christ, became all at once a disciple himself, is a fact which cannot be controverted without overturning the credit of all history. He must therefore have been converted in the miraculous manner in which he himself said he was, and of course the Christian religion be a divine revelation; or he must have been either an impostor, an enthusiast, or a dupe to the fraud of others. There is not another alternative possible.

If he was an impostor, who declared what he knew to be false, he must have been induced to act that part by some motive: (See MIRACLE.) But the only conceivable motives for religious imposture are, the hopes of advancing one's temporal interest, credit, or power; or the prospect of gratifying some passion or appetite under the authority of the new religion. That none of these could be St Paul's motive for professing the faith of Christ crucified, is plain from the state of Judaism and Christianity at the period of his forsaking the former and embracing the latter faith. Those whom he left were the disposers of wealth, of dignity, of power, in Judea: those to whom he went were indigent men, oppressed, and kept from all means of improving their fortunes. The certain consequence therefore of his taking the part of Christianity was the loss not only of all that he possessed, but of all hopes of acquiring more; whereas, by continuing to persecute the Christians, he had hopes rising almost to a certainty of making his fortune by the favour of those who were at the head of the Jewish state, to whom nothing could so much recommend him as the zeal which he had shown in that persecution. As to credit or reputation, could the scholar of Gamaliel hope to gain either by becoming a teacher in a college of fishermen? Could be lather himself, that the doctrines which he taught would, either in or out of Judea, do him honour, when he had before that he were to the Jews a stumbling block, and to the Greeks foolishness? Was it then the love of power that induced him to make this great change? Power! over whom? over a flock of sheep whom he himself had assisted to de-
Paul, probably into the neighbourhood of Damascus, being then under the government of Aretas king of Arabia; and having remained there for a little while, he returned to Damascus, where he began again to preach the gospel. The Jews could not bear to see the progress that the gospel made here; and so resolved to put him to death: and they gained to their side the governor of Damascus, who was to apprehend him, and to deliver him to them. Of this Saul had early notice; and knowing that the gates of the city were guarded night and day to prevent him from making his escape, he was let down over the wall in a basket. And coming to Jerusalem to see Peter (Gal. i. 38.), the disciples were afraid to have any correspondence with him, not believing him to be a convert. But Barnabas having brought him to the apostles, Saul related to them the manner of his conversion, and all that had followed in consequence of it. Then he began to preach both to the Jews and Gentiles; and spoke to them with such strength of argument, that not being able to withstand him in reasoning, they resolved to kill him. For this reason, the brethren brought him to Caesarea of Palestine, from whence he came, probably by sea, into his own country, Cilicia.

There he continued about five or six years, from the year of Christ 37 to the year 43; when Barnabas coming to Antioch by the order of the apostles, and there having found many Christians, went to Tarsus to see Saul, and brought him with him to Antioch (Acts xi. 20, 25, 26.), where they continued together a whole year, preaching to and instructing the faithful. During this time, there happened a great famine in Judea (ib. ib. 27, 28, &c.), and the Christians of Antioch having made some collections to assist their brethren in Jerusalem, they made choice of Paul and Barnabas to go thither with their offering. They arrived there in the year of Christ 44; and having acquitted themselves of their commission, they returned again to Antioch. They had not been there long before God warned them by the prophets he had in this church, that he had pointed them to carry his word into other places. To the church betook themselves to fasting and prayer, and the prophets Simeon, Lucius, and Manaen, their hands on them, and sent them to preach whith the Holy Ghost should conduct them. And it was especially about this time, that is, about the year of Christ 44, that Paul being rapt up into the third heaven, there in ineffable things, and which were above the comprehension of man (2 Cor. xii. 2, 3, 4. and Acts iv. 5, 6, &c.)

Saul and Barnabas went first into Cyprus, where they began to preach in the synagogues of the Jews. While they had gone over the whole island, they there found a Jewish magician called Bar-Jesus, who was with a proconsul Sergius Paulus; and who resisted them, endeavoured to prevent the proconsul from embracing Christianity; whereupon St Paul struck him with blindness; by which miracle the proconsul, being an eye-witness of it, was converted to the Christian faith.

From this conversion, which happened at the city Paphos, in the year of Christ 45, many think, that the apostle first began to bear the name of Paul, which Luke always gives him afterwards, as is supposed memory of his converting Sergius Paulus. Some lie

stody, and whose very Shepherd had lately been murdered? Perhaps it was with the view of gratifying some
tentious passion, under the authority of the new religion, that he commenced a teacher of that religion! I cannot be alleged; for his writings breathe nothing but the strictest morality, obedience to magistrates, order and government, with the utmost abhorrence of all licentiousness, idleness, or loose behaviour, under the cloak of religion. We nowhere read in his works, that saints are above moral ordinances; that dominion is founded grace; that monarchy is despotism which ought to be abolished; that the fortunes of the rich ought to be divided among the poor; that there is no difference in moral actions; that any impulses of the mind are to direct against the light of our reason and the laws of nature; or any of those wicked tenets by which the peace of society has been often disturbed, and the rules of morality often broken, by men pretending to act under the sanction of divine revelation. He makes no distinctions like the impostor of Arabia in favour of himself; nor do any part of his life, either before or after his conversion to Christianity, bear any mark of a libertine disposition. As among the Jews, so among the Christians, his conversation and manners were blameless.—It has been sometimes objected to the other apostles, by those who were resolved not to credit their testimony, that having been deeply engaged with Jesus during his life, they were obliged, for the support of their own credit, and from having gone too far to return, to continue the same professions after his death; but this can by no means be said of St Paul. On the contrary, whatever force there may be in that way of reasoning, it all tends to convince us, that St Paul must naturally have continued a Jew, and an enemy to Christ Jesus. If they were engaged on one side, he was as strongly engaged on the other. If shame withheld them from changing sides, much more ought it to have stopped him; who, from his superior education, must have been vastly more sensible to that kind of shame than the mean and illiterate fishermen of Galilee. The only other difference was, that they, by quitting their Master after his death, might have preserved themselves; whereas he, by quitting the Jews, and taking up the cross of Christ, certainly brought on his own destruction.

As St Paul was not an impostor, so it is plain he was not an enthusiast. Heat of temper, melancholy, ignorance, and vanity, are the ingredients of which enthusiasm is composed; but from all these, except the first, the apostle appears to have been wholly free. That he had great fervor of zeal, both when a Jew and when a Christian, in maintaining what he thought to be right, cannot be denied; but he was at all times so much master of his temper, as, in matters of indifference, to "become all things to all men" with the most pliant condescension, boding his notions and manners to theirs, as far as his duty to God would permit; a conduct compatible neither with the stiffness of a bigot nor with the violent impulses of fanatical delusion. That he was not melancholy, I explain from his conduct in embracing every method which prudence could suggest to escape danger and shame persecution
Paul believe that he changed his name upon his own conversion; and Chrysostom will have this change to take place at his ordination, when he received his mission at Antioch; while others say, he took the name Paul only when he began to preach to the Gentiles: and, finally, several are of opinion, that he went by the name of both Saul and Paul, like many other Jews who had one Hebrew name and another Greek or Latin one.

From the isle of Cyprus, St Paul and his company went to Perga in Pamphylia, where John Mark left them, to return to Jerusalem: but making no stay at Perga, they came to Antioch in Pisidia, where going into the synagogue, and being desired to speak, St Paul made them a long discourse, by which he showed, that Jesus Christ was the Messiah foretold by the prophets, and declared by John the Baptist; that he had been unjustly put to death by the malice and jealousy of the Jews; and that he rose again the third day. They heard him very attentively; and he was desired to discourse again on the same subject the next Sabbath-day; and several, both Jews and Gentiles, followed them, to receive particular instructions more at leisure. On the Sabbath-day following, almost all the city met together to hear the word of God: but the Jews, seeing the concourse of people, were moved with envy at it; opposed, with blasphemies, what St Paul said; and not being able to bear the happy progress of the gospel in this country, they raised a persecution against the two apostles: whereupon Paul and Barnabas, shaking off the dust upon their feet against them, came from Antioch in Pisidia to Iconium. Being come thither, they preached in their synagogue, and converted a great number, both of Jews and Gentiles; and God confirmed their commission by a great number of miracles (Acts xiv. 1, 2, &c.). In the mean time, the unbelieving Jews, having incensed the Gentiles against Paul and Barnabas, and threatening to stone them, they were obliged to retire to Lystra and Derbe, cities of Lycia and Iconium, where they preached the gospel. At Lystra, there was a man who had been lame from his mother's womb. This man fixing his eyes on St Paul, the apostle bid him rise, and stand upon his feet: whereupon he presently rose up, and walked; the people, seeing this miracle, cried out, that the gods were descended among them in the shape of men. They called Barnabas Jupiter, and Paul Mercury, because of his eloquence, and being the chief speaker. The priest of Jupiter brought also garlands and bulls before the gate, to offer sacrifices to them: but Paul and Barnabas tearing their clothes, and casting themselves into the middle of the multitude, cried out to them, Friends, what do you do? we are men as yourselves: and we are preaching to you to turn away from these vain superstitions, and to worship only the true God, who has made heaven and earth. But whatever they could say, they had much ado to restrain them from offering sacrifices to them.

In the mean time, some Jews of Antioch in Pisidia and of Iconium coming to Lystra, animated the people against the apostles. They stoned Paul, and drew him out of the city, thinking him to be dead. But the disciples gathering together about him, he rose up among them, and went back again to Lystra, Iconium, and Antioch; enlarging his discourses, and confirming the souls of the disciples. For he spent there a long season in the region of Asia; and, being stretched on the ground at Iconium, the Gentiles called him Jupiter, and the Jews called him Mercury, because of his eloquence.

eution, when he could do it without betraying the duty of his office or the honour of his God. A melancholy enthusiast courts persecution; and when he cannot obtain it, afflicts himself with absurd penances: but the holiness of St Paul consisted only in the simplicity of a godly life, and in the unwearyed performance of his apostolical duties. That he was ignorant, no man will allege who is not grossly ignorant himself; for he appears to have been master not only of the Jewish learning, but also of the Greek philosophy, and to have been very conversant even with the Greek poets. That he was not credulous, is plain from his having resisted the evidence of all the miracles performed on earth by Christ, as well as those that were afterward worked by the apostles; to the fame of which, as he lived in Jerusalem, he could not possibly have been a stranger. And that he was as free from vanity as any man that ever lived, may be gathered from all that we see in his writings, or know of his life. He represents himself as the least of the apostles, and not meet to be called an apostle. He says that he is the chief of sinners; and he prefers, in the strongest terms, universal benevolence to faith, and prophecy, and miracles, and all the gifts and graces with which he could be endowed. Is this the language of vanity or enthusiasm? Did ever fanatic prefer virtue to his own religious opinions, to illuminations of the spirit, and even to the merit of martyrdom?

Having thus shown that St Paul was neither an impostor nor an enthusiast, it remains only to inquire, whether he was deceived by the fraud of others: but this inquiry needs not be long, for who was to deceive him? A few illiterate fishermen of Galilee? It was morally impossible for such men to conceive the thought of turning the most enlightened of their opponents, and the cruellest of their persecutors, into an apostle, and to do this by a fraud in the very instant of his greatest fury against them and their Lord. But could they have been so extravagant as to conceive such a thought, it was physically impossible for them to execute it in the manner in which we find his conversion to have been effected. Could they produce a light in the air, which at mid-day was brighter than the sun? Could they make Saul hear words from out of that light which were not heard by the rest of the company? Could they make him blind for three days after that vision, and then make scales fall off from his eyes, and restore him to sight by a word? Or, could they make him and those who travelled with him believe, that all these things had happened, if they had not happened? Most unquestionably no fraud was equal to all this.

Since then St Paul was neither an impostor, an enthusiast, nor deceived by the fraud of others, it follows, that his conversion was miraculous, and that the Christian religion is a divine revelation. See Lyttleton's "Observations on the Conversion of St Paul"; a treatise to which it has been truly said, that infidelity has never been able to fabricate a specious answer, and of which this note is a very short and imperfect abridgement.

VOL. XVI. Part I.
them, entered again into the city, and the day after
left it with Barnabas to go to Derbe. And having there
preached the gospel also, they returned to Lystra, to
Iconium, and to Antioch in Pisidia. Passing through-
out Pisidia, they came to Pamphylia, and having
preached the word of God at Perga, they went down
into Attalia. From hence they set sail for Antioch in
Syria, from whence they had departed a year before.
Being arrived there, they assembled the church together,
and told them the great things God had done by their
means, and how he had opened to the Gentiles a door
of salvation; and here they continued a good while with
the disciples.

St Luke does not inform us of the actions of St Paul
from the 45th year of Christ to the time of the council
at Jerusalem, which was held in the 50th year of Christ.
There is great likelihood that it was during this interval
that St Paul preached the gospel from Jerusalem to Illy-
ricum, as he informs us in his epistle to the Romans
(xx. 19); and this without making any stay in those
places where others had preached before him. He does
not acquaint us with the particulars of these journeys,
but with the success of his preaching; but he says in ge-
neral, that he had suffered more labours than any other,
and had endured more prisons. He was often very near
death itself, sometimes upon the water and sometimes
among thieves. He ran great dangers, sometimes from
the Jews and sometimes among false brethren and perse-
vere Christians; he was exposed to great hazards, as
well in the cities as in the deserts: he suffered hunger,
thirst, nakedness, cold, fastings, watchings (2 Cor. xi.
23.—27.), and the fatigues inseparable from long jour-
neys, which were undertaken without any prospect of
human succour; in this very different from the good
fortune of others who lived by the gospel, who received
subsidence from those to whom they preached it, and
who were accompanied always by religious women, who
ministered to them in their necessary occasions. He
made it a point of honour to preach gratis, working
with his hands that he might not be chargeable to any
one (1 Cor. ix. 1.—15.); for he had learned a trade,
as usual among the Jews, which trade was to make
tents of leather for the use of those that go to war.
(Acts xviii. 3.)

St Paul and St Barnabas were at Antioch when some
persons coming from Judea (Acts xiv. 1, 2, &c.) pre-
tended to teach, that there was no salvation without cir-
cumcision, and without the observation of the other le-
gal ceremonies. Epaphnius and Philaster say, that he
that maintained this was Cerinthus and his followers.
Paul and Barnabas withstood these new doctors; and it
was agreed to send a deputation to the apostles and el-
ders at Jerusalem about this question. Paul and Barna-
bas were deputed; and being arrived at Jerusalem, they
reported to the apostles the subject of their commission.
Some of the Pharisees that had embraced the faith, as-
serted, that the Gentiles that were converted ought to
receive circumcision, and to observe the rest of the law.
But the apostles and elders assembling to examine into
this matter, it was by them decreed, that the Gentiles,
who were converted to Christianity, should not be obli-
ged to submit to the yoke of the law, but only to avoid
idolatry, fornication, and the eating of things strangled,
and blood.

St Paul and St Barnabas were then sent back to An-
tioch with letters from the apostles, which contain
the decision of the question, and the resolution of au-
thority assembly. The apostles also deputed Jude
named Barnabas and Silas, who were principal breth-
ren to go to Antioch with Paul and Barnabas to
their territories. Jude had been decreed at Jera-
salem. Being arrived at Antioch, they assembled again,
faithful, read to them the apostles letter, and ac-
cquainted them, that it had been resolved to discharge
it from the yoke of the ceremonial law. Some time
this, St Peter coming to Antioch, and joining him
the converted Gentiles, he lived with them with
scruple; but some brethren happening to arrive from Jerusalem, he separated himself from the Gentiles,
and did no longer eat with them: for when St Paul publicly censured him (Gal. ii. 11—13)
St Paul (id. ii. 2, 3, &c.) in the same journey to Jer-
salem, declared openly to the faithful there the doct
he preached among the Gentiles; and besides, discor-
sed of it in private among the chief of them in presen-
t of Barnabas and Titus. St Peter, St James, and
John, with whom he had those conversations, could
nothing to be either added or amended in that paper
so sound a doctrine and demeanour. They saw with
the grace that God had given them; they acknowledged
that he had been appointed the apostle of the Gentiles
as St Peter had been of the circumcision. They con-
celuded that Paul and Barnabas should continue to pre-
ach the Gentiles; and only recommended to them
take care concerning the collections for the poor; it
is to say, exhort the converted Christians among
Gentiles, to assist the faithful brethren in Judea, v
were in necessity; whether it were because they had s
and distributed their goods, or because they had be
taken away from them (Heb. x. 34.).

After Paul and Barnabas had continued some days
Antioch, St Paul proposed to Barnabas to return a
visit the brethren through all the cities wherein they
had planted the gospel, to see in what condition they
there. Barnabas consented to the proposal; but insist
upon taking John Mark along with them. This was
opposed by Paul, which produced a separation between
them. Barnabas and John Mark went together to C
prus; and St Paul, making choice of Silas, crossed on
Syria and Cilicia, and came to Derbe, and afterward to
Lystra (Acts xvi. 1, 2, &c.). Here they found a
disciple, called Timothy, whom St Paul took with him
and circumcised him that he might not offend the Je
of that country. When, therefore, they had gone off
the provinces of Lycaonia, Phrygia, and Galatia, t
Holy Ghost would not allow them to preach the gos
in the proconsular Asia, which contained Ionia, Eol
and Lydia. They therefore went on to Myra, a
coming to Troas, St Paul had a vision in the night
man, habited like a Macedonian, presented himself b
fore him, and said, Pass into Macedonia and come su
ccess we. Immediately he set out on this journey, n
doubting but that God had called him into this coun-
try.

Embracing therefore at Troas, they sailed to Neap
lia. Thence they came to Philippi, where upon sabbath-day they went near the river side, where the
Jews had a place of devotion, and where they fou
some religious women, among whom was Lydia, w
was converted and baptized, and invited the apostle an
his company to lodge at her house. Another day, as they went to the same place of devotion, they happened to meet a maid servant possessed with a spirit of divination, who followed St Paul and his company, crying out, that these men were the servants of the most high God, who declared to the world the way of salvation. This she did for several days together; at last St Paul, turning himself towards her, said to the spirit, I command thee in the name of Jesus Christ to come out of the body of this woman: upon which it immediately left her. But the masters of this damsel, who made much money by her, drew Paul and Silas before the magistrates, and accused them of attempting to introduce a new religion into the city. For this the magistrates ordered them to be whipped with rods upon the back and shoulders, and afterwards sent them to prison.

Towards midnight, as Paul and Silas were singing hymns and praises to God, on a sudden there was a great earthquake, so that the foundations of the prison were shaken, and all the doors flew open at the same time, and the fetters of the prisoners burst asunder. The gaoler being awakened at this noise, and seeing all the doors open, he drew his sword with an intention to kill himself, imagining that all the prisoners had made their escape. But Paul cried out to him, that he should do himself no mischief, for they were all safe. Then the gaoler entering and finding all the prisoners there, he brought out Paul and Silas from this place, asking them what he must do to be saved? Paul and Silas instructing him and all his family, gave them baptism. After this the gaoler set before them something to eat; and when the morning was come, the magistrates sent him word that he might release his prisoners, and let them go about their business. But Paul returned this answer to the magistrates: Ye have publicly whipped us with rods, being Roman citizens; ye have thrown us into prison; and now ye would privately dismiss us: But it shall not be so, for you yourselves shall come to fetch us out. The magistrates hearing that they were Roman citizens, came to excuse themselves; and having brought them out of prison, they desired them to depart out of their city. Paul and Silas went first to the house of Lydia, where having visited and comforted the brethren, they departed from Philippi.

Then passing through Amphipolis and Apollonia, they came to Thessalonica the capital city of Macedonia, where the Jews had a synagogue (Acts xvii. 1, &c.). Paul entered therein, according to his custom, and there preached the gospel to them for three Sabbath-days successively. Some Jews and several proselytes believed in Jesus Christ, and united themselves to Paul and Silas: but the greatest part of the Jews being led away by a false zeal, raised a tumult in the city, and went to the house of Jason where St Paul lodged. But not finding him there, they took Jason and led him before the magistrates, where they accused him of harbouring in his house people that were disobedient to the ordinances of the emperor, and who affirmed that there was another king besides him, one Jesus whom they preached up. But Jason having given security to answer for the people who were accused, he was dismissed to his own house; and the night following the brethren conducted Paul and Silas out of the city, where they went to Berea, where they began to preach in the synagogue. The Jews of Berea heard them gladly, and many of them were converted; as also several of the Gentiles, and many women of distinction that were not Jewesses.

The Jews of Thessalonica being informed that Paul and Silas were at Berea, came thither and animated the mob against them; so that St Paul was forced to withdraw, leaving Silas and Timothy at Berea to finish the work he had so happily begun. Those who conducted St Paul embarked along with him, and brought him as far as Athens (Theod. in 1 Thessal.), where he arrived in the 32d year of Jesus Christ. As soon as he was got thither, he sent back those that had brought him, with orders to tell Silas and Timothy, that he desired them to follow him to Athens as soon as possible. In the mean time, he went into a synagogue of the Jews, and preached to them as often as he had opportunity; and disputing with the philosophers who were frequent in that place, they at last brought him before the Areopagus, accusing him of introducing a new religion. St Paul being come before the judges, pleaded in his own defence, that among other marks of superstition which he had found in that city, he had observed an altar inscribed, "To the unknown God." It was therefore this God whom they confessed that they knew not, that he came to make known to them. Afterwards he spoke to them of God the creator of heaven and earth, of the superintendence of a providence, of the last judgment, and of the resurrection of the dead. But after they had heard of the resurrection, some were smitten of him, and others desired to hear him another time. However some of them embraced the Christian faith, of which number was Dionysius a senator of the Areopagus, and a woman called Demæria, and several others with them.

St Timothy came from Berea to Athens according to the request of St Paul, and informed him of the persecution with which the Christians of Thessalonica were then affrighted. This obliged the apostle to send him into Macedonia, that he might comfort them and keep them steadfast (1 Thessal. iii. 1, 2, &c.). After this St Paul left Athens and went to Corinth, where he lodged with one Aquila a Jew, and by a trade a tent-maker (Acts xviii. 1, 2, &c.). With this Aquila the apostle worked, as being of the same trade himself. But, however, he did not neglect the preaching of the gospel, which he performed every day in the synagogue; showing both to the Jews and Gentiles that Jesus was the Messiah. There he made several converts: and he tells us himself (1 Cor. i. 13—17. and xvi. 15.) that he baptized Stephanus and his whole house, with Crispus and Gains. About the same time Silas and Timothy came to Corinth, and acquainted him with the good state of the faithful at Thessalonica; and soon after this, he wrote his first epistle to the Thessalonians, which is the first of all the epistles that he wrote; and not long after he wrote his second epistle to that church.

St Paul, now finding himself encouraged by the presence of Silas and Timothy, went on with the work of his ministry with new ardour, declaring and proving that Jesus Christ was the true Messiah. But the Jews opposing him with blasphemous and opprobrious words, he shook his clothes at them, and said, "Your blood be upon your own head; from henceforth I shall go to the Gentiles." He then quitted the house of Aquila, and went to lodge with one Titus Justus, who was originally
Soon after this, taking leave of the disciples, he departed for Macedonia (Acts xx. 1, 2, &c.). He embarked at Troas, took Timothy with him, and together passed into Macedonia (2 Cor. ii. 12. and vii. 5—15.). Titus came thither to him, and acquainted him with the good effects that his letter had produced among the Corinthians; and told him, that the collections that had been made by the church of Corinth for the faithful in Palestine were now ready; which engaged Paul to write a second letter to the Corinthians. St. Paul, having passed through Macedonia, came into Greece or Achaia, and there continued three months. He visited the faithful of Corinth; and having received their alms, as he was upon the point of returning into Macedonia, he wrote his epistle to the Romans.

At last he left Greece and came into Macedonia, in the year of Christ 58, intending to be at Jerusalem at the feast of Pentecost. He said some time at Philippi, and there celebrated the feast of the passover. From hence he embarked and came to Troas, where he continued a week. On the first day of the week the disciples being assembled to break bread, as St. Paul was to depart the day following, he made a discourse to them which held till midnight. During this time a young man called Eutychus, happening to sit in a window and fall asleep, fell down three stories high, and was killed by the fall. St. Paul came down to him, and embraced him, and restored him to life again. Then he went up again, broke bread and ate it, and continued his discourse till daybreak, at which time he departed. Those of his company took ship at Troas; but as for himself he went on foot as far as Athens, otherwise called Aigion, and then embarked along with them at Mitylene. From hence he came to Miletus, whither the elders of the church of Ephesus came to see him; for he had not time to go to them, because he was desirous of being at Jerusalem at the feast of Pentecost.

When these elders had arrived at Miletus, St. Paul discoursed with them, and told them that he was going to Jerusalem without certainly knowing what should happen to him; however he did not doubt but that he had much to suffer there, since in all cities the Holy Ghost had given him to understand, that chains and afflictions waited for him at Jerusalem. Nevertheless, he declared to them, that all this did not terrify him, provided he could but fulfill his ministry. After having exhorted them to patience, and having prayed along with them, he went on board, going straight to Coos, then to Rhodes, and thence to Patara (Acts xxvii. 1, 3, &c.), where finding a ship that was bound for Phoenicia, they went on board and arrived safe at Tyre. Here they made a stop for seven days, and then going on, they arrived at Ptolemais, and thence to Caesarea, where they found Philip the evangelist, who was one of the seven deacons. While St. Paul was there, the prophet Agabus arrived there also from Judea; and have taken St. Paul's girdle, he bound his own hands and feet with it, saying, "Thus shall the Jews of Jerusalem bind the man that owns this girdle, and shall deliver him up to the Gentiles." But St. Paul's constancy was not shaken by all these predictions, and he told them that he was ready, not only to suffer bonds, but death itself, for the name of Christ.

When he was come to Jerusalem, the brethren received
received him with joy; and the day following he went to see St James the Less, bishop of Jerusalem, at whose house all the elders assembled. Paul gave them an account of what God had done among the Gentiles by his ministry. Then St James informed him, that the converted Jews were strangely prejudiced against him, because they were informed he taught the Jews that lived among the Gentiles and out of Palestine, that they ought to renounce the law of Moses, and no longer circumcise their children. Therefore, continued St James, we must assemble them here together, where you may speak to them yourself, and undeceive them. Moreover do this, that your actions may verify your words: join yourself to four men that are here, and who have taken upon them a vow of Nazaritianship; and that you may share in the merit of their action, contribute to the charge of their purification, and purify yourself also, that you may offer with them the offerings and sacrifices ordained for the purification of a Nazarite. 

See Nazarite.

St Paul exactly followed this advice of St James, and on the next day went into the temple, where he declared to the priests, that in seven days these four Nazarites would complete their vow of Nazaritianship; and that he would contribute his share of the charges. But towards the end of these seven days, the Jews of Asia having seen him in the temple, moved all the people against him, laid hold of him, and cried out, "Help, ye Israelites, that is he that teaches every where against the law, and against the temple, and has brought Gentiles into the temple, and profaned this holy place." At the same time they laid hold on him, shut the gates of the temple, and would have killed him, had not Lysias the tribune of the Roman garrison there run to his rescue, taken him out of their hands, and brought him into the citadel. St Paul being upon the steps, desired the tribune to suffer him to speak to the people, who followed him thither in a great multitude. The tribune permitted him, and St Paul, making a sign with his hand, made a speech in Hebrew (Acts xxiii), and related to them the manner of his conversion, and his mission from God to go and preach to the Gentiles. At his mentioning the Gentiles, the Jews began to cry out, "Away with this wicked fellow out of the world, for he is not worthy to live." Immediately the tribune made him come into the castle, and ordered that he should be examined by whipping him, in order to make him confess the matter why the Jews were so incensed against him. Being now bound, he said to the tribune, "Is it lawful for you to whip a Roman citizen before you hear him?" The tribune hearing this, caused him to be unbound, and calling together the priests and the senate of the Jews, he brought Paul before them, that he might know the occasion of this tumult of the people. Then Paul began to speak to them to this purpose, (Acts xxiii.): "Brethren, I have lived in all good conscience before God until this day." At which words, Ananias, son of Nebedeus, who was the chief-priest, ordered the bystanders to give him a blow in the face. At which St Paul said to him, "God shall smite thee, thou whitened wall; for sittest thou to judge me after the law, and commandest me to be smitten contrary to the law?" Those that were present said to him, "Revilest thou God's high priest?" St Paul excused himself by saying, that he did not know he was the high priest. "For it is written, thou shalt not speak evil of the ruler of thy people." Then perceiving that part of the assembly were Sadducees, and part Pharisees, he cried out, "Brethren, I am a Pharisee, the son of a Pharisee; of the hope and resurrection of the dead I am called in question." Then the assembly being divided in interests and opinions, and the clamour increasing more and more, the tribune ordered the soldiers to fetch him away out of the assembly, and bring him into the castle. The following night the Lord appeared to Paul, and said to him, "Take courage, for as you have borne testimony of me at Jerusalem, so must you also at Rome." The day following more than 40 Jews engaged themselves by an oath, not to eat or drink till they had killed Paul. They came, therefore, and made known their design to the priests and chiefs of the people, saying to them, "To-morrow cause Paul to appear before you, as if you would inquire more accurately into this affair, and before he can come to you, we will lie in wait for him and kill him." But St Paul, being informed of this conspiracy by his sister's son, acquainted the tribune with it; who gave orders that the night following he should be sent to Cæsarea, to Felix the governor, who had his ordinary residence there. Felix having received letters from Lysias, and being informed that St Paul was of Cilicia, he told him he would hear him when his accusers should arrive.

Five days after, Ananias the high-priest and some of the senators came to Cæsarea, bringing with them Tertullus the orator, to plead against Paul. Tertullus accused him of being a seditionous person, a disturber of the public peace; one who had put himself at the head of a sect of Nazarines, and who made no scruple even to profane the temple, (id. xxiv.). But St Paul easily refuted these calumnies, and defied his accusers to prove any of the articles they had exhibited against him: he ended his discourse by saying, "That for the doctrine of the resurrection from the dead, his adversaries would have him condemned." Felix put off the further hearing of this cause till another time; and, some days afterwards, came himself with his wife Drusilla to hear Paul; and being in hopes that the apostle would purchase his freedom with a sum of money, he used him well, often sent for him, and had frequent conversations with him.

Two years having thus passed away, Felix made way for his successor Portius Festus; but being willing to oblige the Jews, he left Paul in prison. Festus being come to Jerusalem, the chief priests desired to send for Paul, with a design to fall upon him by the way. But Festus told them, they might come to Cæsarea, where he would do them justice. Either the Jews came, and accused Paul of several crimes, of which they were able to prove nothing (id. xxv.). Festus then proposed to the apostle to go to Jerusalem, and be tried there; but he answered, "That he was now at the emperor's tribunal, where he ought to be tried; and that he appealed to Cæsar:" whereupon Festus, having conferred with his council, told him, that therefore to Cæsar he should go.

Some days after, King Agrippa and his wife Bernice coming to Cæsarea, desired to hear Paul; who pleased,
pleaded his cause with such ability, that Agrippa explained, "Almost thou persuadest me to be a Christian." See AGrippa.

As soon, therefore, as it was resolved to send Paul into Italy, he was put on board a ship at Adramyttium, a city of Myasis; and having passed over the seas of Cilicia, and Pamphylia, they arrived at Myra, in Lycia, where, having found a ship that was bound for Italy, they went on board, (id. xxvii.) But the season being far advanced (for it was at least the latter end of September), and the wind proving contrary, they with much difficulty arrived at the Fair Haven, a port in the isle of Crete. St Paul advised them to winter there: however, others were of opinion they had better go to Phenice, another harbour of the same island; but as they were going thither, the wind drove them upon a little island called Cauda, where the mariners, fearing to strike upon some bank of sand, they lowered their mast, and surrendered themselves to the mercy of the waves. Three days after this, they threw overboard the tackling of the ship. Neither sun nor stars had appeared now for 14 days. In this extreme danger, an angel appeared to St Paul, and assured him that God had given him the lives of all that were in the ship with him; which were in all 276 souls. St Paul told them of his vision, exhorted them to take courage, and promised them that they should all come alive into an island; and that the vessel only should be lost. On the 14th night the seamen cast out the lead, and thought by their sounding that they approached near to some land. They were attempting to save themselves by going into the boat; but St Paul told the centurion and the soldiers, that except the sailors continued in the ship, their lives could not be saved. Then the soldiers cut the ropes of the boat, and let her break. About daybreak, St Paul persuaded them to take some nourishment, assuring them that not a hair of their heads should perish. After his example, they took some food, and when they had eaten, they lightened their vessel, by throwing the corn into the sea. Day being come, they perceived a shore, where they resolved, if possible, to bring the ship to. But the vessel having struck against a neck of land that run out into the sea, so that the head remained fixed, and the stern was exposed to the mercy of the waves; the soldiers, fearing lest any of the prisoners should make their escape by swimming, were for putting them all to the sword. But the centurion would not suffer them, being willing to save Paul; and he commanded those that could swim to throw themselves first out of the vessel; and the rest got planks, so that all of them came safe to shore. Then they found that the island was called Melita or Malta; the inhabitants of which received them with great humanity, (Acts xxvii. 1, 2, 3, &c.).

They being all very wet and cold, a great fire was lighted to dry them; and Paul having gathered up a handful of sticks, and put them upon the fire, a viper leaped out of the fire, and took hold of his hand. Then the barbarous people said one to another, "Without doubt this man is a murderer; and though he has been saved from the shipwreck, yet divine vengeance still pursues him and will not suffer him to live." But Paul, shaking the viper into the fire, received no injury from it. The people, seeing this, changed their opinion of him, and took him for a god; which opinion of theirs was more confirmed, by his curing the father of Publius, the chief man of the island, of a fever and bloody-flux. After this miracle, they all brought out their sick to him, and they were healed. See MELOTA.

At the end of three months they embarked again; and arrived, first at Syracuse, then at Rhegium, and lastly at Puteoli. Here St Paul found some Christians, who detained him for seven days; then he set out for Rome. The brethren of this city having been informed of St Paul's arrival, came to meet him as far as Appii forum, and the Three Taverns. And when he was come to Rome, he was allowed to dwell where he pleased, having a soldier to guard him, who was joined to him with a chain. Three days afterwards, St Paul desired the chief of the Jews there to come to him. He related to them in what manner he had been seized in the temple of Jerusalem, and the necessity he was under of appealing to Caesar. The Jews told him, that as yet they had received no information about his affair; and, as for Christianity, they knew nothing of it, but only that it was spoken against everywhere; however, that they should be very willing to have some account of that doctrine from him. A day was appointed for this purpose; when St Paul preached to them concerning the kingdom of God, endeavouring to convince them from Moses and the prophets, that Jesus was the Messiah. Some of them believed what he had said to them, while others disbelieved; so that they returned from him divided among themselves.

Paul dwelt for two whole years at Rome, from the year of Christ 61 to the year 63, in a lodging that he hired; where he received all that came to him, preaching the kingdom of God, and the religion of Jesus Christ, without any interruption.

Hitherto we have had the Acts of the Apostles for our guide, in compiling the history of St Paul; what we shall add hereafter, will be mostly taken from his own Epistles. His captivity did not a little contribute to the advancement of religion; for he converted several persons even of the emperor's court, (Philip. i. 12—18. and iv. 22.) The Christians of Philippi, in Macedonia, hearing that St Paul was a prisoner at Rome, sent Epaphroditus their bishop to him, to bring him money, and otherwise to assist him in their name, (Phil. ii. 25.) Epaphroditus fell sick at Rome; and when he went back to Macedonia, the apostle sent by him his Epistle to the Philippians.

It is not known by what means St Paul was delivered from his prison, and discharged from the accusation of the Jews. There is great probability that they durst not appear against him before the emperor, as not having sufficient proof of what they laid to his charge. However that may be, it is certain that he was set at liberty, after having been two years a prisoner at Rome. He wrote also, during this imprisonment, his Epistles to Philemon and the Colossians.

He was still in the city of Rome, or at least in Italy, when he wrote his Epistle to the Hebrews. St Paul, having got out of prison, went over Italy; and, according to some of the fathers, passed into Spain; then into Judea; went to Ephesus, and there left Timothy (Heb. xii. 24. and 1 Tim. i. 3.) preached in Crete, and there fixed Titus, to take care to cultivate the church
Paul he had planted in that place. Probably he might also visit the Philippians, according to the promise he had made them, (Phil. i. 23, 26, and ii. 24;) and it is believed, that it was from Macedonia that he wrote the First Epistle to Timothy. Some time after, he wrote to Titus, whom he had left in Crete; he desires him to come to Nicopolis, from whence, probably, he sent this letter. The year following, that is, the 67th year of the Christian era, the apostle went into Asia, and came to Troas, (2 Tim. iv. 13.) Thence he went to visit Timothy at Ephesus, and from that to Miletus, (2 Tim. iv. 20.) Lastly, he went to Rome; and St Chrysostom says, that it was reported, that having converted a cup-bearer and a concubine of Nero, this so provoked the emperor, that he caused St Paul to be apprehended, and clapped into prison. It was in this last place of confinement that he wrote his Second Epistle to Timothy, which Chrysostom looks upon as the apostle's last testament. See Timothy and Titus.

This great apostle at last consummated his martyrdom, the 29th of June, in the 56th year of Jesus Christ, by having his heart cut off, at a place called the Sebastea Water. He was buried on the way of Ostium, and a magnificent church was built over his tomb, which is in being to this day. (Calmet's Dict. &c.

Paul, St, Cave or Grotto of, in the island of Malta, where St Paul and his company took shelter from the rains, when the vipers fastened on his arm. Upon this spot there is a church built by the famed Alfor de Vignacourt, grand-master of the order, in the year 1608, a very handsome, though but a small, structure. On the altar-piece is a curious painting, representing the apostle's shaking off the viper, surrounded with men, women, and children, in attitudes of admiration and surprise, and in the old Maltese гарб; and the whole very well executed. On the top of the painting is the following inscription:

Vipera ignis acta calore frustra Pauli
Manum invadit; is insulce beneficis
Anguibus et herbis admitt omne virus.

M.D.C.V.

Paul, first bishop of Narbonne, or Sergius Paulus, the proconsul, converted and made bishop by St Paul, was descended from one of the best families of Rome. It is said the apostle called himself Paul, from his name. The Spaniards will have him to be their apostle, which is not improbable; and it is said he died a martyr at Narbonne.

Paul V. by birth a Roman, was first clerk of the chamber, and afterwards nuncio to Clement VIII. in Spain, who honoured him with a cardinal's hat. He was advanced to the papal chair the 16th of May 1605, after Leo XE. The ancient quarrel between the secular and ecclesiastical jurisdictions, which in former times had occasioned so much bloodshed, revived in the reign of this pontiff. The senate of Venice had condemned by two decrees, 1. The new foundations of monasteries made without their concurrence. 2. The alienation of the estates both ecclesiastical and secular. The first decree passed in 1603, and the second in 1605. About the same time a canon and abbot, accused of rape and murder, were arrested by order of the senate, and delivered over to the secular court; a circumstance which could not fail to give offence to the court of Rome. Clement VIII. thought it proper to dissemble or take no notice of the affair; but Paul V. who had managed the Genoese upon a similar occasion, flattered himself with the hopes that the Venetians would be equally placat. However, he was disappointed; for the senate maintained that they held their power to make laws of God only, and therefore they refused to revoke their decrees and deliver up the ecclesiastical prisoners into the hands of the nuncio, as the pope demanded. Paul, provoked by this behaviour, excommunicated the doge and senate; and threatened to put the whole state under an interdict, if satisfaction was not given him within the space of 14 hours. The senate did no more than protest against this menace, and forbid the publication of it throughout their dominions. A number of pamphlets, from both sides, soon announced the animosity of the two parties. The Capuchins, the Theatines, and Jesuits, were the only religious orders who observed the interdict. The senate shipped them all off for Rome, and the Jesuits were banished for ever. Meantime his holiness was preparing to make the Venetians submit to his spiritual tyranny by force of arms. He levied troops against the Venetians; but he soon found his design baulked, as the cause of the Venetians appeared to be the common cause of all princes. He had recourse, therefore, to Henry IV. to settle the differences: and this prince had all the honour of bringing about a reconciliation between the contending parties. His ambassadors at Rome and Venice began the negotiation, and Cardinal de Joyeuse finished it in 1607. It was agreed upon, that this cardinal should declare at his entry into the senate, that the censures of the church were to be taken off, or that he would remove them; and that the doge should at the same time surrender to him the deeds of revocation and protest. It was also stipulated, that all the religious who were banished, except the Jesuits, should be restored to their former privileges. In fine, the Venetians promised to send an ambassador extraordinary to Rome, in order to thank the pope for the favour he had done them; but they would not allow the legate to speak of his holiness granting them absolution. Paul was wise enough to overlook the whole matter, but endeavoured to put an end to another dispute, which had been long agitated in the congregations of auxiliis. He caused it to be intimated in form to the disputants and counsellors, that, as the congregations were now dissolved, it was his express order that the contending parties should no longer continue to censure one another. Some authors have affirmed that Paul V. had drawn out a bull against the doctrine of Molina, which only wanted to be promulgated; but for this fact there appears to be no other evidence than the draught of this bull, which we meet with in the end of the history of the above-mentioned congregations. Paul was strongly solicited, but in vain, to make the immaculate conception of the lady an article of faith. He contented himself with fairly forbidding the contrary doctrine to be publicly taught, that he might not offend the Dominicans, who, at that time, maintained that she was conceived, like other human creatures, in original sin. His holiness afterwards applied himself to the embellishing of Rome, and was at great pains to collect the works of the most eminent painters and engravers. Rome is indebted to him for its most beautiful fountains.
Paul. fountains, especially that where the water spouts out
from an antique vase taken from the therme or hot-
baths of Vesuvian, and that which they call aqua Paul-
ina, an ancient work of Augustus, restored by Paul V.
He brought water into it by an aqueduct 35 miles in
length, after the example of Sixtus V. He completed
the frontispiece of St Peter, and the magnificent palace
of Mount Cavallo. He applied himself in a particular
manner to the recovering and repairing ancient monu-
ments, which he made to advance, as much as the na-
ture of them would admit, the honour of Christianity;
as appears from an elegant inscription placed upon a
column of porphyry, taken from the temple of Peace,
and bearing a beautiful statue of the Virgin, at the side
of the church of St Mary the elder:

"Im pura falsi templum
Quondam numinis
Jubente moesta perferebam Caesar:
Nunc ieta veri
Perferens matrem Dei
Te, Paule, nullis obticebo acceuis." His pontificate was honoured with several illustrious embas-
sies. The kings of Japaes, Congo, and other Indian
princes, sent ambassadors to him. He took care to sup-
ply them with missionaries, and to found bishoprics in
these countries newly brought over to the faith. He
showed the same attention to the Maronites and other
eastern Christians. He sent legates to different ortho-
dox princes, both to testify his esteem for them, and to
confirm them in their zeal for religion. He died the
28th of January 1621, aged 69; after having confirmed
the French Oratory, the Ursulines, the Order of Char-
ty, and some other institutions. Bold in his claims, but
of narrow views, he distinguished himself more by his
piety and knowledge than by his politics. It has been
remarked, that he never passed a single day of his pope-
dom without celebrating mass. He enjoined all the re-
ligious in the prosecution of their studies to have regu-
lar professors for Latin, Greek, Hebrew, and Arabic;
if there were any among themselves properly qualified;
or if that was not the case, to take the assistance of
laymen for that purpose, until there were some of their
own order who had learning enough to instruct their
brethren. It was very difficult to carry this decree in-
to execution; and indeed it was always very imper-
fectly observed.

Paul, Father, whose name, before he entered into
the monastic life, was Peter Sarpi, was born at Venice,
August 14, 1552. His father followed merchandise,
but with so little success, that at his death he left his
family very ill provided for; but under the care of a
mother whose piety was likely to bring the blessing of
providence upon them, and whose wise conduct supplied
the want of fortune by advantages of greater value.

Happily for young Sarpi she had a brother, master of a
celebrated school, under whose direction he was placed
by her. Here he lost no time, but cultivated his abili-
ties, naturally of the first rate, with unwearied applica-
tion. He was born for study, having a natural averse-
sion to pleasure and gaiety, and a memory so tenacious
that he could repeat 30 verses upon once hearing them. Pro-
portional to his capacity was his progress in literature:
at 13, having made himself master of school learning,
he turned his studies to philosophy and the mathematic,
and entered upon logic under Capella of Cremona, w
though a celebrated master of that science, confess
himself in a very little time unable to give his pr
any farther instructions.

As Capella was of the order of the Servites, his sco
lar was induced by his acquaintance with him to eng
in the same profession, though his uncle and his mo
represented to him the hardships and austerities of
kind of life, and advised him with great zeal against
But he was steady in his resolutions, and in 15
took the habit of the order, being then only in
14th year, a time of life in most persons very impro
for such engagements, but in him attended with so
maturity of thought, and such a settled temper, that
never seemed to regret the choice he then made, w
which he confirmed by a solemn public profession
1572.

At a general chapter of the Servites held at Ma
tua, Paul (for so we shall now call him) being then
by 20 years old, distinguished himself so much in a
batic disputations by his genius and learning, that Willi
duke of Mantua, a great patron of letters, solicited
consent of his superiors to retain him at his court, n
not only made him public professor of divinity in the
edical, and reader of casuistical divinity and canon
in that city, but honoured him with many proofs of
estimate. But Father Paul finding a court life not a
able to his temper, quitted it two years afterwards, r
retired to his beloved favories, being then only q
quainted with the Latin, Greek, Hebrew, and Chal
languages, but with philosophy, the mathematics, ca
and civil law, all parts of natural philosophy, and c
mistry itself; for his application was unintermit
head clear, his apprehension quick, and his memory
utive.

Being made a priest at 22, he was distinguished
the illustrious Cardinal Borromeo with his confidence
employed by him on many occasions, not without t
the envy of persons of less merit, who were so far as
asperated as to lay a charge against him before the a
quisition, for denying that the Trinity could be pro
from the first chapter of Genesis; but the accusati
was too ridiculous to be taken notice of. After this
passed successively through the dignities of his order,
which he was chosen provincial for the province of
nice at 25 years of age; and discharged his post w
such honour, that in 1579 he was appointed, with t
others, to draw up new regulations and statutes for
order. Thus he executed with great success; and w
his office of provincial was expired, he retired for t
years to the study of natural and experimental philos
phy and anatomy, in which he is said to have made so
useful discoveries. In the intervals of his employm
he applied himself to his studies with so extensive a
pacity, as left no branch of knowledge untouched.

him Aequalpendente, the great anatomist, confesses t
he was informed how vision is performed; and there s
proofs that he was not a stranger to the circulation
the blood. He frequently conversed upon astronom
with mathematicians, upon anatomy with surgeons, up
medicine with physicians, and with chemists upon t
alysis of metals, not as a superficial inquirer, but as
plete master. He was then chosen procurator gen
ral of his order; and during his residence at Rome w
greatly esteemed by Pope Sixtus V. and contracted i
intimate friendship with Cardinal Bellarmine and other eminent persons.

But the hours of repose, which he employed so well, were interrupted by a new information in the Inquisition, where a former acquaintance produced a letter written by him in cyphers, in which he said, "that he detested the court of Rome, and that his preferment was obtained there but by dishonest means." This accusation, however dangerous, was passed over on account of his great reputation; but made such impressions on that court, that he was afterwards denied a bishopric by Clement VIII. After these difficulties were surmounted, F. Paul again retired to his solitude; where he appears, by some writings drawn up by him at that time, to have turned his attention more to improvement in piety than learning. Such was the case with which he read the scriptures, that, being his custom to draw a line under any passage which he intended more nicely to consider, there was not a single word in his New Testament but was underlined. The same marks of attention appeared in his Old Testament, Psalter, and Breviary.

But the most active scene of his life began about the year 1615, when Pope Paul V. exasperated by some decrees of the senate of Venice that interfered with the pretended rights of the church, laid the whole state under an interdict. The senate, filled with indignation at this treatment, forbade the bishops to receive or publish the pope's bull; and, convening the rectors of the churches, commanded them to celebrate divine service in the accustomed manner, with which most of them readily complied; but the Jesuits and some others refusing, were by a solemn edict expelled the state. Both parties having proceeded to extremities, employed their ablest writers to defend their measures. On the pope's side, among others, Cardinal Bellarmine entered the lists, and, with his confederate authors, defended the papal claims with great solemnity of expression, and very sophistical reasonings; which were confuted by the Venetian apologists in much more decent language, and with much greater solidity of argument. On this occasion F. Paul was most eminently distinguished by his Defence of the Rights of the supreme Magistrate, his Treatise of Excommunication, translated from Gerson, with an Apology, and other writings; for which he was cited before the Inquisition at Rome; but it may be easily imagined that he did not obey the summons.

The Venetian writers, whatever might be the abilities of their adversaries, were at least superior to them in the justice of their cause. The propositions maintained on the side of Rome were these: That the pope is invested with all the authority of heaven and earth: that all princes are his vassals, and that he may annul their laws at pleasure: that kings may appeal to him, as he is temporal monarch of the whole earth: that he can discharge subjects from their oaths of allegiance, and make it their duty to take up arms against their sovereign: that he may depose kings without any fault committed by them, if the good of the church requires it: that the clergy are exempt from all tribute to kings, and are not accountable to them even in cases of high-treason: that the pope cannot err: that his decisions are to be received and obeyed on pain of sin, though all the world should judge them to be false: that the pope is God upon earth: that his sentence and that of God are the same.

Vol. XVI. Part I.
Paul, an Armenian by birth, who lived under the reign of Justinian II. In the seventh century a zealous Constantine revived this drooping sect, which had suffered much from the violence of its adversaries, and was ready to expire under the severity of the imperial edicts and that zeal with which they were carried into execution. The Paulicians, however, by their number, and the countenance of the emperor Nicephorus, became formidable to all the East.

But the cruel rage of persecution, which had some years been suspended, broke forth with redoubled violence under the reigns of Michael Curoplates and Leo the Armenian, who inflicted capital punishments on such of the Paulicians as refused to return into the bosom of the church. The empress Theodora, tutor of the emperor Michael, in 845, would oblige them either to be converted or to quit the empire: upon which several of them were put to death, and more retired among the Saracens; but they were neither all exterminated nor banished.

Upon this they entered into a league with the Saracens; and choosing for their chief an officer of greatest resolution and valour, whose name was Carbe, they declared against the Greeks a war which was carried on for fifty years with the greatest vehemence and fury. During these commotions, some Paulicians, wards the conclusion of this century, spread abroad the doctrines among the Bulgarians; many of them, either from a principle of zeal for the propagation of their opinions, or from a natural desire of flying from the persecution which they suffered under the Grecian yoke, retired, about the close of the eleventh century, into Bulgaria and Thrace, and formed settlements in old countries. Their first migration was into Italy; where in process of time, they sent colonies into almost all the other provinces of Europe, and formed gradually a considerable number of religious assemblies, who adhered to their doctrine, and who were afterwards persecuted with the utmost vehemence by the Roman pontiffs. In Italy they were called Petarini, from a certain place called Pataria, being a part of the city of Milan, where they held their assemblies; and Gathari or Ghazari, from Gazan or the Lesser Tartary. In France they were called Albigeenses, though their faith differed widely from that of the Albigeenses, whom Protestant writers generally vindicate. (See Albigeenses). The first religious assembly the Paulicians had formed in Europe is said to have been discovered at Orleans in 1017, under the reign of Robert, when many of them were condemned to be burnt alive. The ancient Paulicians, according to Photius, expressed the utmost abhorrence of Manes and his doctrine. The Greek writers comprise their errors under the six following particulars: 1. They denied the inferior and visible world in the production of the Supreme Being, and they distinguish the Creator of the world and of human bodies from the most high G who dwells in the heavens: and hence some have been led to conceive that they were a branch of the Gnostics rather than of the Manicheans. 2. They treated the Virgin Mary as, or, according to the usual manner of speaking among the Greeks, they refused to adore and worship her. 3. They refused to celebrate the institution of the Lord's Supper. 4. They looked upon the cross of Christ with contempt and reproach, which we are only to understand, that they refused to acknowledge that he was born, the catholic and apostolic church anathematizes. Those who have any reverence for the council of Nice must appear a very severe, and perhaps not unjust, censure of some other modern sects as well as of the Socinians.

Paulicians, a branch of the ancient Manichees, so-called from their founder, one Paulus, an Armenian, in the seventh century: who, with his brother John, both of Samosata, formed this sect: though others are of opinion, that they were thus called from another
follow the absurd and superstitious practice of the Greeks, who paid to the pretended wood of the cross a certain sort of religious homage. 5. They rejected, after the example of the greatest part of the Gnostics, the books of the Old Testament; and looked upon the writers of that sacred history as inspired by the Creator of this world, and not by the supreme God. 6. They excluded presbyters and elders from all part in the administration of the church.

Paulina, a Roman lady, wife of Saturnius governor of Syria, in the reign of the emperor Tiberius. Her conduct was disturbed, and violence was offered to her virtue, by a young man named Mundus, who fell in love with her, and had caused her to come to the temple of Iasis by means of the priests of that goddess, who declared that Anubis wished to communicate to her something of moment. Saturnius complained to the emperor of the violence which had been offered to his wife; and the temple of Iasis was overturned, and Mundus banished, &c. — There was besides a Paulina, wife of the philosopher Seneca. She attempted to kill herself when Nero had ordered her husband to die. The emperor, however, prevented her; and she lived some years after in the greatest melancholy.

Paulina, a genus of plants belonging to the oc-tandria class, and in the natural method ranking under the 239 order, Trihidae. See Botany Index.

Paulinus, a bishop who flourished in the early part of the 7th century. He was the apostle of Yorkshire, having been the first archbishop of York. This dignity seems to have been conferred on him about the year 626. He built a church at Almonbury, and dedicated it to St Albans, where he preached to and converted the Brigantes. Camden mentions a cross at Dewsborough, which had been erected to him, with this inscription, Paulinus hie praeclarui et celeberrui. York was so small about this time, that there was not so much as a small church in it in which King Edwin could be baptized. Constantius is said to have made it a bishops. Pope Honorius made it a metropolitan see. We are told that Paulinus baptized in the river Swale, in one day, 10,000 men, besides women and children, on the first conversion of the Saxons to Christianity, besides many at Hylton. At Walston, in Northumberland, he baptized Segbert king of the East Saxons. Bede says, "Paulinus coming with the king and queen to the royal manor called Alduchrinf (now Yeversy), staid there 36 days with them, employed in the duties of catechizing and baptizing. In all this time he did nothing from morning to night but instruct the people, who flocked to him from all the villages and places, in the doctrine of Christ and salvation; and, after they were instructed, baptizing them in the neighbouring river Glen." According to the same Bede, "he preached the word in the province of Lindissi; and first converted the governor of the city of Lindocollina, whose name was Blecca, with all his family. In this city he built a stone church of exquisite workmanship, whose roof being ruined by long neglect or the violence of the enemy, only the walls are now standing." He is also said to have founded a collegiate church of prebends near Southwell, in Nottinghamshire, dedicated to the Virgin Mary. This church he is said to have built when he baptized the Coritani in the Trent.

Paulo, Marco, a celebrated traveller, was son to Nicholas Paulo, a Venetian, who went with his brother Matthew, about the year 1255, to Constantinople, in the reign of Baudoin II. Nicholas, at his departure, left his wife big with child; and she brought to the world the famous Marco Paulo, the subject of this memoir. The two Venetians, having taken leave of the emperor, crossed the Black sea, and travelled into Armenia; whence they passed over land to the court of Baka, one of the greatest lords of Tartary, who loaded them with honours. This prince having been defeated by one of his neighbours, Nicholas and Matthew made the best of their way through the deserts, and arrived at the city where Kuklai, grand khan of the Tartars, resided. Kuklai was entertained with the account which they gave him of the European manners and customs; and appointed them ambassadors to the pope, in order to demand of his holiness a hundred missionaries. They came accordingly to Italy, obtained from the Roman pontiff two Dominicans, the one an Italian, the other an Asiatic, and carried along with them young Marco, for whom Kuklai expressed a singular affection. This young man, having learned the different dialects of Tartary, was employed in embassies which gave him the opportunity of traversing Tartary, China, and other eastern countries. At length, after a residence of seventeen years at the court of the grand khan, the three Venetians returned to their own country, in the year 1295, with immense fortunes. A short time after his return, Marco serving his country at sea against the Genoese, his galley, in a great naval engagement, was sunk, and himself taken prisoner, and carried to Genoa. He remained there many years in confinement; and, as well to amuse his melancholy as to gratify those who desired it from him, he sent for his notes from Venice, and composed the history of his own and his father's voyages in Italian, under this title, Delle maraviglie del mondo da lui visute, &c.; the first edition of which appeared at Venice, in 8vo, 1496. His work was translated into different languages, and inserted in various collections. The editions most esteemed are the Latin one published by Andrew Muller at Cologne, in 1671; and that in French, to be found in the collection of voyages published by Bergeron at the Hague, 1735, in 2 vols 4to. In the writings of Marco Paulo, there are some things true and others highly incredible. It is indeed difficult to believe, that so soon as the grand khan was informed of the arrival of two Venetian merchants, who were come to sell theriac (or treacle) at his court, he sent before them an escort of 40,000 men, and afterwards dispatched these Venetian ambassadors to the Pope, to beseech his holiness to send him a hundred missionaries. It is equally difficult to believe that the Pope, who doubtless had an ardent zeal for the propagation of the faith, instead of a hundred, should have sent him only two missionaries. There are therefore some errors and exaggerations in Marco Paulo's narrative; but many other things which were afterwards verified, and which have been of service to succeeding travellers, prove that in several respects his relation is valuable. He not only gave better accounts of China than had been before received; but, likewise furnished a description of Japan, of many of the islands of the East Indies, of Madagascar, and the coasts of Africa; so that from his work it might be easily collected, that a direct passage by sea to the Indies was not only possible, but practicable. It may
in the second century, under the reign of Antoninus
Philosopher, was the disciple of Herodes Atticus.
He lived for a long time in Greece; and afterwards
he went to Rome, where he died at a great age. He
wrote excellent description of Greece, in ten books;
in which he gives us not only the situation of places, but the
antiquities of Greece, and every thing most curious and
useful of knowledge. Abbe Gedoin has given a Fr.
translation of it into two volumes.

PAUSE, a stop or cessation in speaking, singing,
playing, or the like. One of the points in a page
is to make proper pauses, in certain places. — There
is a pause in the middle of each verse. See POETRY
READING.

PAW, in the manege. A horse is said to paw
ground, when, his leg being either tired or painful,
does not rest it upon the ground, and fears to hurt
himself as he walks.

PAWN, a pledge or gage for surety or payment
of money lent. It is said to be derived from the Latin
word pugno, which means to hold.

likewise made use of as a kind of magazine for the spires that were brought by the Roman merchants out of Egypt and Arabia; so that many rich persons were reduced to beggary, all their valuable effects and treasures being consumed in one night, with the temple.

PEACH. See Amygdalus, Botany and Gardening Index.

PEACOCK. See Pavo, Ornithology Index.

PEAK of DERBYSHIRE. A chain of very high mountains in the county of Derby in England, famous for the mines they contain, and for their remarkable caverns. The most remarkable of these are Pool's-hole and Eilden-hole. The former is a cave at the foot of a high hill called Coramass, so narrow at the entrance that passengers are obliged to creep on all-fours; but it soon opens to a considerable height, extending to above a quarter of a mile, with a roof somewhat resembling that of an ancient cathedral. By the petrifaction of the stalactites and stalagmites continually dropping in many parts, the cave is formed a variety of curious figures and representations of the works both of nature and art. There is a column here as clear as alabaster, which is called The Queen of Scots' Pillar, because Queen Mary is said to have proceeded thus far when she visited the cavern. It seems the curiosity of that princess had led her thus far into this dark abode; and indeed there are few travellers who care to venture farther; but others, determined to see the end of all, have gone beyond it. After sliding down the rock a little way, is found the dreary cavity turned upwards: following its course, and climbing from crag to crag, the traveller arrives at a great height, till the rock, closing over his head on all sides, puts an end to any further subterraneous journey. Just at turning to descend, the attention is caught by a chasm, in which is seen a candle glimmering at a vast depth underneath. The guides say, that the light is at a place near Mary Queen of Scots' pillar, and no less than 80 yards below. It appears frightfully deep indeed to look down; but perhaps does not measure any thing like what it is said to do. If a pistol is fired by the Queen of Scots' pillar, it will make a report so loud as a cannon. Near the extremity there is a hollow in the roof, called the Needle's Eye; in which if a candle is placed, it will represent a star in the firmament to those who are below. At a little distance from this cave is a small clear stream consisting of hot and cold water, so near each other, that the finger and thumb of the same hand may be put the one into the hot water and the other into the cold.

Eilden-hole is a dreadful chasm in the side of a mountain; which, before the latter part of the last century, was thought to be altogether unfathomable. In the time of Queen Elizabeth, a poor man was led down into it for 200 yards; but he was drawn up in a frenzy, and soon after died. In 1682, it was examined by Captain Collins, and in 1699 by Captain Stumy, who published their accounts in the Philosophical Transactions. The latter descended by ropes fixed at the top of an old lead-one pit, four fathoms almost perpendicular, and from these three fathoms more obliquely, between two great rocks. At the bottom of this he found an entrance into a very spacious cavern, from whence he descended along with a miner for 25 fathoms perpendicular. At last they came to a great river or water, which he found to be 20 fathoms broad and eight fathoms deep. The miner who accompanied him, insisted that this water ebbed and flowed with the sea; but the Captain disproved this assertion, by remaining in the place from three hours flood to two hours ebb, during which time there was no alteration in the height of the water. As they walked by the side of this water, they observed a hollow in the rock some feet above them. The miner went into this place, which was the mouth of another cavern; and walked for about 70 pieces in it, till he just lost sight of the Captain. He then called to him, that he had found a rich mine; but immediately after came running out and crying, that he had seen an evil spirit; neither could any persuasions induce him to return. The floor of these caverns is a kind of white stone enamelled with lead ore, and the roofs are encrusted with shining spar. On his return from this subterraneous journey, Captain Stumbery was seized with a violent headache, which, after continuing four days, terminated in a fever, of which he died in a short time.

PEAN, in Heraldry, is when the field of a coat of arms is sable, and the powderings or.

PEARCE. See Pyrus, Botany and Gardening Index.

PEAR Glass. See Vitrea Lactyma.

PEARCE, Dr., Lord Bishop of Rochester, was the son of a distiller in High Holborn. He married Miss Adams, the daughter of a distiller in the same neighbourhood, with a considerable fortune, who lived with him 32 years in the highest degree of conunial happiness. He had his education in Westminster school, where he was distinguished by his merit, and elected one of the king's scholars. In 1710, when he was 20 years old, he was elected to Trinity College, Cambridge. During the first years of his residence at the university, he sometimes amused himself with lighter composition, some of which are inserted in the Guardian and Spectator. In 1715, he published his edition of Cicero de Oratore, and, at the desire of a friend, luckily dedicated it to Lord Chief Justice Parker (afterwards Earl of Macclesfield), to whom he was a stranger. This incident laid the foundation of his future fortune; for Lord Parker soon recommended him to Dr. Bentley, master of Trinity, to be made one of the fellows; and the doctor consented to it on this condition, that his lordship would promise to unmak him again as soon as it lay in his power to give him a living. In 1717, Mr. Pearce was ordained at the age of 27; having taken time enough, as he thought, to attain a sufficient knowledge of the sacred office. In 1718, Lord Parker was appointed chancellor, and invited Mr. Pearce to live with him in his house as chaplain. In 1719, he was instituted into the rectory of Stapleford Abbots, in Essex; and in 1720, into that of St. Bartholomew, behind the Royal Exchange, worth 400l. per annum. In 1723, the lord chancellor presented him to St. Martin's in the Fields. His Majesty, who was then at Hanover, was applied to in favour of St. Claget, who was then along with him; and the doctor actually kissed hands upon the occasion; but the chancellor, upon the king's return, disputed
saw no objection; and that Lord Northington, who had been doubtful, on further consideration thought that request might be complied with. Unfortunately for bishop, Lord Bath applied for Bishop Newton to succeed. This alarmed the ministry, who thought no dignities should be obtained but through their hands; they therefore opposed the resignation; and his majesty was informed that the bishops disliked the design. His majesty sent to him again; and at a third audience he told him, that he must think no more of resigning. The bishop replied, “Sire, I am all duty and submission and then retired.

In 1768 he obtained leave to resign the deanship; 1773, he lost his lady; and after some months of lingering decay, he died at Little Ealing, June 29, 1774.

This eminent prelate distinguished himself in every part of his life by the virtues proper to his station. His literary abilities, and application to sacred and philosophical learning, appear by his works; the principal of which are, A letter to the clergy of the church of England, on occasion of the bishop of Rochester's commitment to the Tower, 2d edit. 1722. Miracles of Jesus vindicated, 1727 and 1728. A review of the text of Milton, 1732. Two letters against Dr Middleton, censured by the doctor's letter to Waterland, on publication of his treatise, intitled, Scripture Vindicated, 3d edit. 1752.

And since his death, a commentary was notes on the four Evangelists and the acts of the Apostles, together with a new translation of St Paul's Epistle to the Corinthians, with a paraphrase and notes have been published, with a life prefixed, from original MSS. in 2 vols 4to.

The following character of this excellent bishop was written, as we are told, by a contemporary friend. “The world has not lost for many years a respectable member of society than the late Dr Pearce; nor the clergy a more pious and learned prelate. In younger days, before he became a graduate, he published that excellent edition of Longinus, still admired and quoted by the best critics. What is said of Longinus himself by our excellent English poet, is applicable to the editor: ‘He is himself the great sublime draught; for few of his order ever arrived at that perfection in eloquence, for which he was so justly celebrated. His diction was simple, nervous, and flowing, his sentiments were just and sublime; more sublime than the heathen critic, in proportion to the superior sublimity of the Christian revelation. Yet he was never puffed with the general applause of the world, but of an humble deportment, resembling the meek Jesus as far as weakness of human nature can resemble a character without virtue. His countenance was always placid, and displayed the benevolence of his heart, if his extensive charity had not proved it to a demonstrator. His thirst of knowledge prompted him to a very studious life, a that rendered both his complexion and constitution decrepit; yet it held out by the blessing of Providence to the 8th year of his age; which is the more extraordinary, considering the midnight lamp had cast paleness over his complexion; yet with all his learning and knowledge, his humility and modesty restrained him from many publications, which the world may hope from his executors; one particularly in divinity, which has been the object of his contemplation for many years.
past. With a view to complete that work, and to retire from the bristle of the word, he struggled so hard to resign his bishopric, &c. After possessing the esteem
and approbation of all who knew him for a long series of years, either as rector of a very large parish, or as a
dignitary of the church, he has left the world in tears;
and gone to receive the infinite reward of his piety and
virtue."

PEARCE. See PERCA. ICHTHYLOGY Index.

PEARCE-Glue, the name of a kind of glue, of remark-
able strength and purity, made from the skins of
parches.

PEARL, in Natural History, a hard, white, shining
body, usually rounded, found in a testaceous fish, a spe-
cies of Mya; which see, CONCHOLOGY Index.

Pearls, though esteemed of the number of gems, and
high valued in all ages, proceed only from a dis-
semen in the animal that produces them, analogous to
the bessaors and other stony concretions in other ani-
mals of other kinds. For an account of the mode of
formation of some of the pearls, see CONCHOLOGY, p. 476;
for the history of the pearl fisheries, the bayers of Pearl.
Concretions in Ceylon, see CEYLON, p. 363; see also Cordiner's
History of that island, 4to.

Mr Bruce mentions a muscle found in the salt springs
of the Nubian desert; in many of which he found those
excessences which might be called pearls, but all of them
ill formed, fouled, and of a bad colour, though of the
same consistence, and lodged in the same part of the
body as those in the sea. The muscle, too (says our
author), is in every respect similar, I think larger.
The outer skin or covering of it is of a vivid green.
Upon removing this, which is the epidermis, what next appears
is a beautiful pink without gloss, and seemingly of a cal-
careous nature. Below this, the mother-of-pearl, which is
undermost, is a white without lustre, partaking much
of the blue and very little of the red; and this is all the
difference I observed between it and the pearl-bearing
muscle of the Red sea.

In Scotland, especially to the northward, in all ri-
ers running from lakes, there are found muscles that
have pearls of more than ordinary merit, though seldom
of large size. They were formerly tolerably cheap, but
lately the wearing of real pearls coming into fashion,
those of Scotland have increased in price greatly beyond
their value, and superior often to the price of oriental
ones when bought in the east. The reason of this is a
demand from London, where they are actually employed
in work, and sold as oriental. But the excellency of all
glass or paste manufactory, it is likely, will keep the
price of this article, and the demand for it, within
bouquets, when every lady has it in her power to wear in
her ears, for the price of sixpence, a pearl as beautiful in
colour, more elegant in form, lighter and easier to carry,
and as much bigger as she please, than the famous ones
of Cleopatra and Servilia. In Scotland, as well as in
the east, the smooth and perfect shell rarely produces a
pearl; the crooked and distorted shell seldom wants one.

The mother-of-pearl manufactory is brought to the
greatest perfection at Jerusalem. The most beautiful
shell of this kind is that of the peniniram already men-
tioned; but it is too brittle to be employed in any large
pieces of workmanship; whence that kind named dora
is most usually employed; and great quantities of this
are daily brought from the Red sea to Jerusalem. Of
these, all the fine works, the crucifixes, the wafer-boxes,
and the beads, are made, which are sent to the Spanish
dominions in the New World, and produce a return in-
comparably greater than the staple of the greatest ma-
ufactory in the Old.

Very little is known of the natural history of the pearl
fish. Mr Bruce says, that, as far as he has observed, they
are all stuck upright in the mud by an extremity; the
muscle by one end, the pinna by the small sharp point,
and the third by the hinge or square part which projects
from the round. In shallow and clear streams (says
Mr Bruce), I have seen small furrows or tracks upon the
sandy bottom, by which you could trace the mus-
cle from its last station; and these not straight, but deviat-
ing into traverses and triangles, like the course of a ship
in a contrary wind laid down upon a map, probably in-
pursuit of food. The general belief is, that the muscle
is constantly stationary in a state of repose, and cannot
transfer itself from place to place. This is a vulgar pre-
judice, and one of those facts that are mistaken for want
of sufficient pains or opportunity to make more critical
observations. Others, finding the first opinion a false one,
and that they are endowed with power of changing place
like other animals, have, upon the same foundation, gone
into the contrary extreme, so far as to attribute swiftness
to them, a property surely inconsistent with their being
fixed to rocks. Pliny and Solinus say that the muscles
have leaders, and go in flocks; and that their leader is
endowed with great cunning to protect himself and his
flock from the fishes; and that, when he is taken, the
others fall an easy prey. This, however, we may justly
look upon to be a fab; some of the most accurate ob-
servers having discovered the motion of the muscle,
which indeed is wonderful, and that they lie in beds,
which is not at all so, have added the rest, to make their
history complete." Our author informs us, that the
muscles found in the salt springs of Nubia likewise tra-
vel far from home, and are sometimes surprised, by the
cessing of the rains, at a greater distance from their
beds than they have strength and moisture to carry them.
He assures us, that none of the pearl-fish are edible;
and that they are the only fish he saw in the Red sea
that cannot be eaten.

Artificial Pearls. Attempts have been made to
take out stains from pearls, and to render the foul
opaque-coloured ones equal in lustre to the oriental.
Numerous processes are given for this purpose in books
of secrets and travels; but they are very far from
answering what is expected from them. Pearls may be
cleaned indeed from any external foulness by washing
and rubbing them with a little Venice soap and warm
water, or with ground rice and salt, with starch and
powder blue, plaster of paris, coral, white vitriol and
tartar, cuttle-bone, pomum-stone, and other similar sub-
stances; but a stain that reaches deep into the sub-
stance of pearls is impossible to be taken out. Nor can
a number of small pearls be united into a mass similar
to an entire natural one, as some pretend.

There are, however, methods of making artificial
pearls, in such manner as to be with difficulty distin-
guished from the best oriental. The ingredient used
for this purpose was long kept a secret; but it is now dis-
covered to be a fine silver-like substance found upon
the under side of the scales of the bly or bleak fish. The
scales, taken off in the usual manner, are washed and
rubbed.
rubbed with fresh parcels of fair water, and the several
liquors suffered to settle: the water being then poured
off, the pearly matter remains at the bottom, of the con-
sistency of oil, called by the French essence d'orient:
A little of this is dropped into a hollow bead of glasse
and shaken about so as to line the internal surface; after
which the cavity is filled up with wax, to give solidity
and weight. Pearls made in this manner are distin-
guishable from the natural only by their having fewer
blemishes.

Mother-of-Pearl, the shell, not of the pearl oyster,
but of the murex marmoriferus. See Mytilus, Con-
chology Index.
Pearl- Ash, a fixed alkaline salt, prepared chiefly in
Germany, Russia, and Poland, by melting the salts out
of the ashes of burnt wood; and having reduced them
again to dryness, evaporating the moisture, and calcin-
ing them for a considerable time in a furnace moderately
hot. The goodness of pearl-ash must be distinguished by
a uniform and white appearance, they are neverthe-
less subject to a common adulteration, not easy to be
distinguished by the mere appearance: which is done by
the addition of common salt. In order to find out this
fraud, take a small quantity of the suspected salt; and
after it has been softened by lying in the air, put it over
the fire in a shovell: if it contains any common salt, a
crackling and slight explosion will take place as the salt
grows hot.

Pearl-ash is much used in the manufacture of glass,
and require no preparation, except where very great
transparency is required, as in the case of looking-glass,
and the best kind of window-glass. For this purpose
dissolve them in four times their weight of boiling wa-
ter: when they are dissolved, let the solution be put into
a clean tub, and suffered to remain there 24 hours or
more. Let the clear part of the fluid be then decanted
off from the sediment, and put back into the iron pot
in which the solution was made; in this let the water be
evaporated till the salts be left perfectly dry. Keep
those that are not designed for immediate use in stone
jars, well secured from moisture and air.

Mr Kirwan, who instituted a set of experiments on
the alkaline substances used in bleaching, &c. (see Irish
Transact. for 1789), tells us, that in 100 parts of the
Dantzick pearl-ash, the vegetable alkali amounted
to somewhat above 63. His pearl-ash he prepares by
calcinning a ley of vegetable ashes dried into a salt to
whiteness. In this operation, he says, “particular care
should be taken that it should not melt, as the extrac-
tive matter would not be thoroughly consumed, and
the alkali would form such a union with the earthy parts as
could not easily be dissolved.” He has “added this
caution, as Dr. Lewis and Mr. Domette have inadvertently
directed the contrary.” We apprehend, however, that
there is a little inaccuracy; and that it was not for pearl-
ash, but for the unrefined pot-ash, that these gentlemen
directed fusion. The fact is, that the American pot-
ashes, examined by them, had unquestionably suffered
fusion; which was effected in the same iron pot in which
the evaporation was finished, by rather increasing the fire
at the end of the process: by this management, one of
the most troublesome operations in the whole manufac-
ture, the separation of the hard salt from the vessels with
hammers and chisels, was avoided; and though the ex-
ttractive matter was not consumed, it was burnt to an in-
dissoluble coal; so that the salt, though black itself, pro-
duced a pale or colourless solution, and was uncommonly
strong. Mr Kirwan has also given tables of the qual-
tities of ashes and salt obtained from different vege-
tables; and he concludes from them, “That in ge-
neral weeds yield much more ashes, and their ashes much
more salt, than woods; and that consequently, as to
salts of the vegetable alkali kind, neither America,
Trieote, nor the northern countries, possess any advan-
tage over us. 2. That all of weeds, fumitory produces
most salt, and next to it wormwood; but if we attend
only to the quantity of salt in a given weight of ashes,
the ashes of wormwood contain most. Tripolium fli-
rium also produces more ashes and salt than fern.” Sea
Potash.

Pearson, John, a very learned English bishop in
the 17th century, was born at Smirig in 1613. After
his education at Eton and Cambridge, he entered into
holy orders in 1629, and was the same year elected to
the prebend of Neitherham in the church of Sarn.
In 1650 he was appointed chaplain to the lord-keeper
Finch, and by him presented to the living of Tarrington
in Suffolk. In 1650 he was made minister of St Clement’s,
East-Cheap, in London. In 1677, he and Mr Gunnigle
had a dispute with two Roman Catholics upon the sub-
ject of schism; a very unfair account of which was print-
ed at Paris in 1658. Some time after, he published at
London An Exposition of the Creed, in folio, dedicated
to his parishioners of St Clement’s East-Cheap, to whom
the substance of that excellent work had been preached
several years before, and by whom he had been desired
to make it public. The same year he likewise published
The Golden Remains of the ever memorable Mr John
Hales of Eton; to which he prefixed a preface, contain-
ing, of that great man, with whom he had been ac-
quainted for many years, a character drawn with great
elegance and force. Soon after the Restoration, he was
presented by Juxton, then bishop of London, to the re-
citory of St Christopher’s in that city; created doctor of
divinity at Cambridge, in pursuance of the king’s letters
mandatory; installed prebendary of Fly, archdeacon of
Sury; and made master of Jesus college in Cambridge;
all before the end of the year 1668. March 22th 1661,
he was appointed Margaret professor of divinity in that
university; and, the first day of the ensuing year, was
nominated one of the commissioners for the review of
the liturgy in the conference at the Savoy. April 14th
1662, he was admitted master of Trinity college in
Cambridge; and, in August, resigned his rectory of St
Christopher’s and prebend of Sarum.—In 1667 he was
admitted a Fellow of the Royal Society. In 1672 he
published at Cambridge, in 4to, Vinicia Epistolaram
S. Ignatii, in answer to M. Daille; to which is subjoined,
Isacii Pontii Epistolas duas adversus D. E. Bonelli-
dum. Upon the death of the celebrated Wilkins, Pear-
son was appointed his successor in the see of Chester, to
which he was consecrated February 6th 1672-3. In
1682, his Annales Cypriani, sive tredecim annorum,
quibus S. Cyprian, inter Christianos versatur ex, historia
chronologica, was published at Oxford, with Bell’s edi-
tion of that Father’s works. Pearson was disabled from
all public service by ill health a considerable time before
his death, which happened at Chester, July 16. 1698.

Peasant, a hind, one whose business is in rural
labour.
It is amongst this order of men, that a philosopher would look for innocent and ingenuous manners. The situation of the peasantry is such as excludes them from the devastations of luxury and licentiousness: for when the contagion has once reached the recesses of rural retirement, and corrupted the minds of habitual innocence, that nation has reached the summit of vice, and is hastening to that decay which has always been the effect of vicious indulgence. The peasantry of this country, still in a great measure, retain that simplicity of manners and rustic innocence which ought to be the characteristic of this order of society; and, in many parts, their condition is such as, were all its advantages sufficiently known, would create envy in the minds of those who have toiled through life, amidst the bustle of the world, in quest of that happiness which it could not easier.

O fortunator minus, sus si bona norint, Agricola.—Virgil.

In other countries the peasants do not enjoy the same liberty as they do in our own, and are consequently not so happy. In all feudal governments they are subject slaves, entirely at the disposal of some petty despot. This was the case in Poland, where the native peasants were subject to the most horrid slavery, though those descended of the Germans, who settled in Poland during the reign of Boleslaus the Chaste and Casimir the Great, enjoyed very distinguished privileges. Amongst the native slaves, too, those of the crown were in a better condition than those of individuals. See Poland.

The peasants of Russia (Mr. Coxe tells us) are a hardy race of men, and of great bodily strength. Their cottages are constructed with tolerable propriety, after the manner of those in Lithuania; but they are very poorly furnished. The peasants are greedy of money, and as the same author informs us, somewhat inclined to thieving. They afford horses to travellers, and act the part of conchomen and postilions. "In their common intercourse they are remarkably polite to each other: they take off their cap at meeting; bow ceremoniously and frequently, and usually exchange a salute. They accompany their ordinary discourse with much action, and innumerable gestures; and are exceedingly servile in their expressions of deference to their superiors: in accosting a person of consequence, they prostrate themselves, and even touch the ground with their heads. We were often struck at receiving this kind of eastern homage, not only from beggars, but frequently from children, and occasionally from some of the peasants themselves.

"The peasants are well clothed, comfortably lodged, and seem to enjoy plenty of wholesome food. Their rye-bread, whose blackness at first disquiets the eye, and whose sourness the taste, of a delicate traveller, agrees very well with the appetite: as I became reconciled to it from use, I found it at all times no unpleasant morsel, and, when seasoned with hunger, it was quite delicious."

The dress of these people is well calculated for the climate in which they live: they are particularly careful of their extremities. On their legs they wear one or two pair of thick worsted stockings; and they enshroud their legs with wrappers of coarse flannel, or cloth, several feet in length, and over these they frequently draw a pair of boots, so large as to receive their bulky contents with ease. The lower sort of people are grossly ignorant; of which we shall give a surprising instance in the words of Mr. Coxe: "In many families, the father marries his son while a boy of seven, eight, or nine years old, to a girl of a more advanced age; in order, as it is said, to procure an able-bodied woman for the domestic service: he cohabits with this person, now become his daughter-in-law, and frequently has several children by her. In my progress through Russia, I observed in some cottages, as it were, two mistresses of a family; one the peasant's real wife, who was old enough to be his mother; and the other, who was nominally the son's wife, but in reality the father's concubine. These incestuous marriages, sanctified by inveterate custom, and permitted by the parish-priests, were formerly more common than they are at present; but as the nation becomes more refined, and the priests somewhat more enlightened; and as they have lately been discountenanced by government, they are daily falling into disuse; and, it is to be hoped, will be no longer tolerated (A)."

(A) "The truth of this fact, which fell under my own observation, and which I authenticated by repeated inquiries from all ranks of people, is still further confirmed by the following passage in the Antidote to the Journey into Siberia, although the author gives another reason for those early marriages. "The peasants and common people..."
The peasants of Russia, like those of Poland, are divided into those of the crown and those of individuals; the first of which are in the best condition; but all of them undergo great hardships, being subject to the despotic will of some cruel overseer. They may obtain freedom, 1. By manumission on the death of their master, or otherwise: 2. By purchase; and, lastly, by serving in the army or navy. The empress has redressed some of the grievances of this class of her subjects. The hardship of the peasants arises in a great measure from their mode of education and way of life, and from the violent changes and great extremes of heat and cold to which they are exposed.

The peasants of Finland differ widely from the Russians in their look and dress: they have for the most part fair complexions, and many of them red hair: they shave their beards, wear their hair parted at the top, and hanging to a considerable length over their shoulders (b). We could not avoid remarking, that they were in general more civilized than the Russians; and that even in the smallest villages we were able to procure much better accommodations than we usually meet with in the largest towns which we had hitherto visited in this kingdom.

The peasants of Sweden (Mr. Coxe informs us) are more honest than those in Russia; in better condition, and possessing more of the conveniences of life, both with respect to food and furniture. "They are well clad in strong cloth of their own weaving. Their cottages, though built with wood, and only of one story, are comfortable and commodious. The room in which the family sleep is provided with ranges of beds in tiers (if I may so express myself), one above the other; upon the wooden testers of the beds in which the women lie, are placed others for the reception of the men, to which they ascend by means of ladders. To a person who has just quitted Germany, and been accustomed to tolerable inns, the Swedish cottages may perhaps appear miserable hovels; to me, who had been long used to places of far inferior accommodation, they seemed almost palaces. The traveller is able to procure many conveniences, and particularly a separate room from that inhabited by the family, which could seldom be obtained in the Polish and Russian villages. During my course through those two countries, a bed was a phenomenon which seldom occurred, excepting in the large towns, and even then not always completely equipped; but the poorest huts of Sweden were never deficient in this article of comfort: an evident proof that the Swedish peasants are more civilized than those of Poland and Russia.—After having witnessed the slavery of the peasants in those two countries, it was a pleasing satisfaction to find myself again among freemen, in a kingdom where there is a more equal division of property; where there is no vassalage; in the lowest order enjoy a security of their person and property; and where the advantages resulting from right are visible to the commonest observer."

The peasants of Holland and Switzerland are a very tolerable condition; not subject to the untended control of a hireling master, they are free and enjoy in their several stations the blessings of home. In Bohemia, Hungary, and a great part of Germany, they are legally slaves, and suffer all the miseries attending such a condition. In Spain, Savoy, and Italy they are little better. In France, their situation such as to warrant the first Revolution; but by contrary matters too far, they are now infinitely worse than were at any former period.

PFAT, a well known inflammable substance, in many parts of the world as fuel. There are several species:

1. A yellowish-brown or black peat, found in marshy grounds in Scotland, Holland, and Germany. When fresh, it is of a viscid consistence, but hard by exposure to the air. It consists, according to a well-known definition, of clay mixed with casia and earthy pyrites, sometimes also it contains common salt. While it is formed into oolong pieces for fuel, after the vitreous and stony matters are separated. By distillation it yields water, acid, oil, and volatile alkalies; the ashes containing a small proportion of fixed alkalies, being either white or red according to the proportion of pyrites contained in the substance.

2. The second species is found near Newbury in Berkshire. In the Philosophical Transactions for the year 1757, we have an account of this species; the substance of which is as follows:

Peat is the composition of the branches, twigs, leaf-stalks and roots of trees, with grass, straw, plants, and weeds, which having lain long in water, is formed into a mass so soft as to be cut through with a sharp blade. Its colour is a blackish brown, and it is used in many places for firing. There is a stratum of this peat on the Kennet, near Newbury in Berkshire, which is about a quarter to half a mile wide, and many miles long. The depth below the surface of the ground is from one foot to eight. Great numbers of entire

(b) The Russians have generally dark complexions and hair: they also wear their beards, and cut their hair short.

A. He was the author of many works, of which the first is a poem, entitled, "Sighs on the Death of Queen Anne," printed probably about the time of her death in 1714. Two years afterwards he printed "TO YOUTH," or an Exercise on the Creation, and an Hymn to the Creator of the World; written in the express words of the sacred Text, as an Attempt to show the Beauty and Sublimity of the Holy Scriptures, 1716, 8vo." In 1721, being then curate of King's Clifton in Northamptonshire, he issued proposals for printing the History and Antiquities of his native town, which was published in 1727, in folio, under the title of "Academis tertiae Anglicanae; or the Antiquarian Annals of Stamford in Lincoln, Rutland, and Northamptonshires; containing the History of the University, Monasteries, and Colleges, Churches, Chapels, Hospitals, and Schools there, &c." inscribed to John duke of Rutland. This work was hastened by "An Essay on the ancient and present State of Stamford, 1726, 4to," written by Francis Hargrave, who, in his preface, mentions the difference which had arisen between him and Mr. Peck, on account of the former's publication unfairly foreshadowing that intended by the latter. Mr. Peck is also therein very roughly treated, on account of a small work he had formerly printed, entitled, "The History of the English Bull-running." Mr. Peck had before this time obtained therectory of Godley near Melton in Leicestershire, the only preferment he ever enjoyed. In 1729, he printed on a single sheet, "Queries concerning the Natural History and Antiquities of Leicestershire and Rutland," which were afterwards reprinted in 1740; but although the progress he had made in the work was very considerable, yet it never made its appearance. In 1732 he published the first volume of "Desiderata Curiosa; or, a Collection of divers scarce and curious Pieces relating chiefly to Matters of English History," consisting of choice tracts, memoirs, letters, wills, epitaphs, &c. transcribed, many of them, from the originals themselves, and the rest from divers ancient MSS. copies, or the MSS. collations of sundry famous antiquaries and other eminent persons, both of the last and present age: the whole, as nearly as possible, digested into order of time, and illustrated with ample notes, contents, and additional discoveries of the same. Mr. Peck's index. This volume was dedicated to Lord William Haldimand, and was followed, in 1735, by a second volume, dedicated to Dr. Reynolds bishop of Lincoln. In 1735 Mr. Peck printed in a 4to pamphlet, "A complete catalogue of all the discourses written both for and against popery in the time of King James II. containing in the whole an account of 457 books and pamphlets, a great number of them not mentioned in the three former catalogues; with references after each title, for the more speedy finding a further account of the said discourses and their authors in sundry writers, and an alphabetical list of the writers on each side." In 1739 he was the editor of "Nineteen Letters of the truly reverend and learned Henry Hammond, D.D. (author of the Annotated on the New Testament, &c.) written to Mr Peter Stainnough and Dr Nathaniel Angelo, many of them on curious subjects, &c." These were printed from the originals, communicated by Mr Robert Marston archdeacon of Nottingham, and Mr John Worthington. The next year, 1740, produced two volumes in 4to, one of them entitled, "Memoirs of the Life and Actions
PECORA, in Zoology, the fifth order of the class mammalia, in the Linnean system. See Zoology.

PECQUET, John, was a physician in Dieppe, and died at Paris in 1674. He was physician in ordinary to the celebrated Fouquet, whom he entertained at his spare hours with some of the most amusing experiments in natural philosophy. He acquired immortal honour to himself by the discovery of a lacteal vein, which conveys the chyle to the heart; and which from his name is called le Reservoir de Pecquet. This discovery was a fresh proof of the truth of the circulation of the blood: though it met with opposition from many of the learned; particularly from the famous Riolau, who wrote a treatise against the author of it; with this title: Adversus Pecquetium et Pecquetionum. The only works which we have of Pecquet, are, 1. Experimentera nova Anatomica, published at Paris, 1654. 2. A Dissertation, De Thornicae Lacets, published at Amsterdam, 1661. He was a man of a lively and active genius; but his spriritiveness sometimes led him to adopt dangerous opinions. He recommended, as a remedy for all diseases, the use of brandy. This remedy, however, proved fatal to himself, and contributed to shorten his days, which he might have employed to the advantage of the public.

PECTEN, the Scallop; a species of shell-fish. See Ostrea, Conchology Index.

PECTORAL, a sacred or habit or vestiment, worn by the Jewish high-priest. The Jews called it Aboth; the Greeks,∣φόμια; the Latins,∣pectore; and in our version of the Bible it is called בַּדַּשְׁפָּלו. It consisted of embroidered stuff, about a'quin qua and was worn upon the breast, in which were the precious stones, ranged in four rows, and containing the names of the twelve tribes. It was fastened to the shoulder by two chains and hooks of gold. God himself prescribed the form of it. See Breastplate.

PECTORAL, a breastplate of thin brass, about 124 gers square, worn by the poorer soldiers in the Roman army, who were rated under 1000 drachmēs. See Riga.

PECTORALIS. See Anatomy, Table of Muscles.

PECULIATE, in Civil Law, the crime of embezzling the public money, by a person intrusted with a receipt, management, or custody thereof. This term is also used by civilians for a theft, whether the thing be public, fiscal, sacred, or religious.

PECULIAR, in the Common Law, signifies a particular right or interest in property within its limits, for granting privileges of wills and advowons, exempt from the ordinary or bishop's courts. The king's chapel is a royal peculiar, exempt from all spiritual jurisdiction, and reserved to the visitation and immediate government of the king himself. There is likewise the archbishop's peculiar; for it is an ancient privilege the see of Canterbury, that wherever any minor ad
dowons belong to it, they forthwith become ex
tempt from the ordinary, and are reputed peculiars; there are 57 such peculiars in the see of Canterbury. Besides these, there are some peculiars belonging to deaneries, chapters, and prebendaries, which are only exempt from the jurisdiction of the archdeacon: these are derived from the bishop, who may visit them, to whom there lies an appeal.

Court of Peculiars, is a branch of, and annexed to the court of ARCHES. It has a jurisdiction over all the parishes dispersed through the province of Canterbury in the midst of other dioceses, which are exempt from the ordinary's jurisdiction, and subject to the metropolitan only. All ecclesiastical causes, arising with these peculiar or exempt jurisdictions, are cognizable by this court: from which an appeal formerly to the pope, but now by the stat. 25 Hen. VIII. c. 19. to the king in chancery.

PECULIUM, the stock or estate which a person in the power of another, whether male or female, either as his or her slave, may acquire by his industry. Rome slaves frequently amassed considerable sums in this way. The word properly signifies the advanced price which a slave could get for his master's cattle, &c. above the price fixed upon them by his master, which was the slave's own property.

In the Roman church, peculium denotes the gift which each religious reserves and possesses to himself.
PEDAEIS, the largest phase of an organ, so called because played and stopped with the foot. The pedais are made square, and of wood; they are usually 13 in number. They are of modern invention, and serve to carry the sounds of an octave deeper than the rest. See ORGAN.

PEDAGOGUE, or PEDAGOGICUS, a tutor of masters, to whom is entrusted the discipline and instruction of a scholar, to be instructed in grammar and other arts. The word is formed from the Greek word παιδαγωγος, pedagogos, "leader of boys."

M. Cicero observes, that the Greeks gave the same pedagogus to slaves appointed to attend their children, lead them, and teach them to walk, etc. The Romans gave the same denomination to the slaves who were instructed with the care and instruction of their children.

PEDANT, a schoolmaster or pedagogue, who professes to instruct and govern youth, teach them the humanities, and the arts. See PEDAGOGUS.

Pedants are the very unlearned, unpolished men of letters, who make an impertinent use of the sciences, and abound in unreasonable criticisms and observations.

Dacier defines a pedant, a person who has more reading than good sense. See PEDANTRY.

Pedants are persons ever armed with quibbles and syllogisms, breathe nothing but disputations and dichotomies, and presume a proposition to the last limits of logic.

Malebranche describes a pedant as a man full of false erudition, who makes a parade of his knowledge, and is ever quoting some Greek or Latin author, or inventing his own etymology.

8: Everson says, that to paint the folly of a pedant, we must represent him as turning all conversation to some one science or subject he is best acquainted with.

There are pedants of all conditions, and all ages. Wicquemart says, an ambassador, always attentive to formalities and ceremonies, is nothing else but a political pedant.

PEDANTRY, or PEDANTEM, the quality or manner of a pedant. See PEDANT.

To swell up little and low things, to make a vain show of science, to heap up Greek and Latin, without judgment, to bear those to pieces who differ from us about a passage in Suetonius or other ancient authors, or in the etymology of a word, to stir up all the world against a man for not admiring Cicero enough, to be interested for the reputation of an ancient as if he were our next of kin, is what we properly call pedantry.

PEDARIAN, in Roman antiquity, those senators who signed their votes by their feet, not with their tongues; for, such as walked over to the side of those whose opinion they approved of, in divisions of the senate.

Dr. Middleton thus accounts for the origin of the word. He says, that though the magistrates of Rome had a right to place and vote in the senate both during their office and after it, and before they were put upon the roll by the censors, yet they had not probably a right to speak or debate there on any question, at least in the earlier ages of the republic. For this reason to have been the original division between them and the ancient senators, as it is plainly intimated in the formula of the consular edict, sent abroad to summon the senate, which was addressed to all senators, and to all those who had a right to vote in the senate. From this distinction, those who had only a right to vote were called in subiculo pedarum, because they signified their votes by their feet, not their tongues, and upon every division of the senate, went over to the side of those whose opinion they approved. It was in allusion to this old custom, which seems to have been wholly lost in the latter ages of the republic, that the lower part of the senate continued still to be called by the name of pedarii, as Cicero informs us, who gives an account to Atticus of a certain debate and decree of the senate upon it, says that it was made with the eagerness and general concurrence of the pedarii, though against the authority of the rest of the consuls.

PEDATURA, a term used in Roman antiquity, for a space or proportion of a certain number of feet set out. This word often occurs in writers on military affairs: as in Hyginus de Castramentatione, we meet with memorandam edixisse ad computationem cohortis ex equitata miliciae pedatam ad mile trecenas sexaginta duo debere; which is thus explained: The pedatura, or space allowed for a cohors equitata or provincial cohort, consisting of both horse and foot, could not be the same as the pedatura of an uniform body of infantry, of the same number, but must exceed it by 360 feet; for the proportion of the room of one horsesman to one foot soldier, he assigns as two and a half to one.

PEDERASTS, the same with SODOMITES.

PEDESTAL, in Architecture, the lowest part of an order of columns, being that part which sustains the column and serves it as a foot to stand. See COLUMN.

PELICAN, in Greek antiquity. The city of Athens was anciently divided into three different parts: one on the descent of a hill; another on the sea-shore; and a third in a plain between the other two. The inhabitants of the middle region were called Pelicans, Pelican, formed from ρελικανος, "plain," or "flat;" or as Aristotle will have it, Pelecanos: those of the hill, Diacrians; and those of the shore Paralians.

These quarters usually composed so many different factions. Pisistrates made use of the Pelicans against the Diacrians. In the time of Solon, when a form of government was to be chosen, the Diacrians chose it democratically; the Pelicans demanded an aristocracy; and the Paralians a mixed government.

PEDICLE, among botanists, that part of a stalk which immovably sustains the leaf of a flower or a fruit, and is commonly called a footstalk.

PEDICULUS, the Louse, a genus of insects belonging to the order of aptera. See Entomology.

PEDILUVIUM, or Bathing of the Feet. The uses of warm bathing in general, and of the pediluvium in particular, are so little understood, that they are often preposterously used, and sometimes injudiciously abstained from.

In the Edinburgh Medical Essays, we find an ingenious author's opinion of the warm pediluvium, notwithstanding that of Borelli, Boerhave, and Hoffman, to the contrary, to be, That the legs become warmer than before, the blood in them is warmed; this blood purifying, sustains the vessels; and in circulating imparts a great degree of warmth to the rest of the body; and as there is a portion of it constantly passing through the legs, and acquiring new heat there, which heat is in-
the course of circulation communicated to the rest of the
blood, the whole mass rarefying, occupies a larger space,
and of consequence circulates with greater force. The
volume of the blood being thus increased, every vessel
is distended, and every part of the body feels the effects
of it; the distant parts a little later than those first beat-
ed. The benefit obtained by a warm pediluvium is ge-
erally attributed to its making a derivation into the
parts immersed, and a resolation from those affected, be-
cause they are relieved; but the cure is performed by
the direct contrary method of operating, viz. by a great-
er force of circulation through the parts affected, remo-
ving what was stagnant or moving too sluggishly there.
Warm bathing is of no service where there is an irre-
soluble obstruction, though, by its taking off from an
apasm in general, it may seem to give a moment's ease;
nor does it draw from the distant parts, but often hurts
by pushing against matter that will not yield with a
stronger impetus of circulation than the stretched and
diseased vessel can bear: so that where there is any
suspicion of scirrhous, warm bathing of any sort should
never be used. On the other hand, where obstructions
are not of long standing, and the impacted matter is
not obstinate, warm baths may be of great use to resolve
them quickly. In recent colds, with slight humoral
peripneumonies, they are frequently an immediate cure.
This they effect by increasing the force of the cir-
culation, opening the skin, and driving freely through
the lungs that lentor which stagnated or moved slowly in
them. As thus conducting to the resolution of obstruc-
tions, they may be considered as short and safe fevers;
and in using them we imitate nature, which by a fever
often carries off an obstructing cause of a chronical ail-
ment. Borelli, Boerhaave, and Hoffman, are all of
opinion, that the warm pediluvium acts by driving a
larger quantity of blood into the parts immersed. But
arguments must give way to facts: the experiments re-
lated in the Medical Essays seem to prove to a demon-
stration, that the warm pediluvium acts by rarefying
the blood.
A warm pediluvium, when rightly tempered, may be
used as a safe cordial, by which circulation can be roused,
or a gentle fever raised; with this advantage over the
cordials and sodorifiques, that the effect of them may be
taken off at pleasure.
Pediluvia are sometimes used in the smallpox; but
Dr Stevenson thinks their frequent tumultuous opera-
tions render that suspected, and at best of very doubt-
f ul effect; and he therefore prefers Mons. Martin of
Lausanne's method of bating the skin, not only of the
legs, but of the whole body, with a soft cloth dipped in
warm water, every four hours, till the eruption; by
which means the pustules may become universally higher
and consequently more safe.

PEDIMENT. See Architecture.

PEDLAR, a travelling foot-trader. See Hawkers.

In Britain (and formerly in France) the pedlars are
despised; but it is otherwise in certain countries. In
Spanish America, the business is so profitable, that it
is thought by no means dishonourable; and there are
many gentlemen in Old Spain, who, when their cir-
cumstances are declining, send their sons to the Indies
to retrieve their fortunes in this way. Almost all the
commodities of Europe are distributed through the
southern continent of America by means of these ped-
laris. They come from Panama to Paita by sea; in the
road from the port last mentioned, they in Pera their first voyage to Lima. Some take the
through Caxamalca: others through Truxillo, a
shore from Lima. They take their passage bac
Panama by sea, and perhaps take with them a little

makes a small recompense.

In Poland, where there are few or no manufactu
almost all the merchandise is carried on by pedlars,
said to be generally Scotsmen, and who, in the re
of King Charles II. are said to have amounted to
fewer than 53,000.

PEDEMETER, or PODOMETER, formed from
pes, "foot," and mensura, "measure," a me-
chanical instrument, in form of a watch, consisting
various wheels with teeth, catching in one another,
disposable in the same plane; which by means of a ch
or string fastened to a man's foot, or to the wheel of
chariot, advance a notch each step, or each revolu-
tion of the wheel; so that the number being marked on
the edge of each wheel, one may number the paces, or me
sure exactly the distance from one place to another.
There are some of them which mark the time on a di
plate, and are in every respect much like a watch, a
are accordingly worn in the pocket like a watch. S
PERAMBULATOR.

PEDRO, Don, of Portugal, duke of Coimbra, w
the fourth child and second surviving son of King Jo
of Portugal, and was born March the 4th 1394. H
father gave him an excellent education, which, joined
to strong natural abilities and much application, rende
ed him one of the most accomplished princes of his tim
He was not only very learned himself, but a great love
of learning, and a great patron of learned men. He w
chiefly with a view to improve his knowledge that h
spent four years in travelling through different countr
in Europe, Asia, and Africa, with a train suitable t
his quality; of which travels there is a relation still ex
tant, but so loaded with fabulous circumstances, that i
wounds the reputation it was designed to raise. At h
return he espoused Isabella, daughter to the count o
Urgel, and grand-daughter to Don Pedro, the fourti
king of Portugal, which was esteemed a very great ad
vancement of his fortune. He was elected into the mos
noble order of the Garter, April 22, 1417, in the fifi
year of the reign of his cousin Henry V. a grandson o
John of Gaunt, by the father's side, as our duke o
Coimbra was by the mother. In 1440 he was declared
regent during the minority of his cousin Don Alonso V.
son of King Edward, who died by the plague. He f
found some difficulty at first in the discharge of his of
ce, both from the queen-mother and others. But, up
on the whole, his administration was so mild and so j
just, that the magistrates and people of Lisbon concurred in
demanding his leave to erect a statue to him. The re
Peebles [ 87 ]

The queen dowager wished to raise disturbances in Portugal by aiming to recover the regency to herself; but the steadiness of the regent's administration, the attachment of the best part of the nobility to him, and his enjoying, in so absolute a degree, the confidence of the people, not only secured the interior tranquillity of the state, but raised the credit likewise of the crown of Portugal to a very great height in the sentiments of its neighbours: for, in the course of his regency, he had made it his continual study to pursue the public good; to ease the people in general, and the inhabitants of Lisbon in particular, of several impositions; to maintain the laws in their full vigour; to give the king an excellent education; and if that had been at all practicable, to diffuse a perfect unanimity through the court, by assuaging the malice and envy of his enemies. The king when he came of age, and the cortes or parliament, expressed their entire satisfaction with the regent's administration; and all parties entirely approved of the king's marriage with Donna Isabella, the regent's daughter, which was celebrated in 1446. The enmity of his enemies, however, was not in the least abated by the regent's being out of office. They still persecuted him with their unjust calumnies, and unfortunately made the king hearken to their falsehoods. The unfortunate duke, when ordered to appear before the king, was advised to take with him an escort of horse and foot. In his passage he was proclaimed a rebel, and quickly after he was surrounded by the king's troops. Soon after he was attacked, and in the heat of action he was killed; nor was the envy of his enemies even then satiated; his body was forbid burial; and was at length taken away privately by the peasants. His virtue, however hated in courts, was adored by the uncouth part of his countrymen. At length, though, by an inspection of his papers, the king saw, when it was too late, the injustice that had been done the man who had behaved so well in so high and difficult an office; and whose papers only discovered signs of further benefit to the king and his dominions. In consequence of these discoveries, the duke's adherents were declared loyal subjects, all prosecutions were ordered to cease, and the king desired the body of Coimbra to be transported with great pomp from the castle of Abrantes to the monastery of Batalha; where it was interred in the tomb which he had caused to be erected for himself. The royal name of Don Pedro occurs often in the history of Portugal, and many who bore the name were singularly distinguished either for great abilities, or external splendour. See Portugal.

PENDLETON, in Botany. See Pedicle.

PEEBLES, a royal borough and county town of Peeblesshire or Tweeddale, is situated on the banks of the Tweed, 22 miles south from Edinburgh. Peebles was a royal residence in the time of James I. of Scotland; and here it is supposed, he composed the poem of "Peebles at the Play." Peebles has considerable woolen manufactures, and excellent beer. The population in 1801 was 2088, and in 1811, 2485.

PEEBLES-SHIRE, or Tweeddale, a county of Scotland, extending 36 miles in length and about 10 in breadth. It is bounded on the east by Ettrick Forest, on the south by Annandale, on the west by Clydesdale, and on the north by Mid-Lothian. Tweeddale is a hilly country, well watered with the Tweed, the Yarrow, and a great number of smaller streams that fertilize the valleys, which produce good harvests of oats and barley, with some proportion of wheat. All the rivers of any consequence abound with trout and salmon. The lake called West Water Loch swarms with a prodigious number of eels. In the month of August, when the west wind blows, they tumble into the river Yarrow in such shoals, that the people who wade in to catch them run the risk of being overturned. About the middle of this county is the hill or mountain of Braidalb, from the top of which the sea may be seen on each side of the island. Tweeddale abounds with limestone and freestone. The hills are generally as green as the downs in Sussex, and feed innumerable flocks of sheep, that yield great quantities of excellent wool. The earls of March were hereditary sheriffs of Tweeddale, which bestows the title of marquis on a branch of the ancient house of Hay, earls of Errol, and hereditary high constables of Scotland. The family of Tweedale is, by the female side, descended from the famous Simon de Fraser, proprietor of great part of this county, and who had a great share in obtaining the triple victory at Roslin. The chief town in Tweeddale, is Peebles, a royal borough, and seat of a presbytery, pleasantly situated on the banks of the Tweed, over which there is at this place a stately stone bridge of five arches. In the neighbourhood of Peebles, near the village of Romano, on the river Lyne, we see the vestiges of two Roman castella, or stationary forts; and a great many terraces on the neighbouring hills, which perhaps have served as itinerant encampments. In the shire of Tweeddale there are many ancient and honourable families. Douglas of Cavers, who was hereditary sheriff of the county, it is said still preserves the standard and the iron mace of the gallant Lord Douglas, who fell in the battle of Otterburn, just as his troops had defeated and taken Henry Percy, surnamed Hotspur. In the churchyard of Drumelzier, belonging to an ancient branch of the Hay family, the famous Merlyn is supposed to lie buried. There was an old traditional prophecy, that the two kingdoms should be united when the waters of the Tweed and the Pansel should meet at his grave. Accordingly, the country people observe that this meeting happened in consequence of an inundation at the accession of James VI. to the crown of England. The valued rent of the county is £1,937l 13s. 10d. Scots, and the real rent is estimated at 29,820l. sterling.

The population of this county, in 1801, amounted to 8717, and in 1811 to 9935. The following is the population at two different periods by parishes.

Lyne
PEEK, in the former government of the twelve great lords of that kingdom: of whom the bishops and six counts, and of these, six were dukes and six earls: thus the archbishop of St. John of Gaunt and Langres, were dukes, and the bishops of Chartres and Chartres, Noyon, Beauvais, were dukes, and counts. The dukeries of Normandy, and Aquitaine, were dukes; and the counts of Flanders, Clermont, and Toulouse, lay peers and counts. These peers were the hereditary and representative, in person, of the clergy, by which name each performed the function of archbishop, and the six bishops were appointed to the crown, except the Bishop of Flanders, six lords of the first quality, and the title of peer was bestowed on every lord. whose estate was exempt from peerage; the number of which, as it depended on the king, was uncertain.

PEERS, or House of Lords, in the thrones of the states of parliament. See LORDS.

In a judicial capacity, the house of peers, or house of lords, is the highest court of the kingdom, having at its disposal, jurisdiction over causes, but only upon appeal; to rectify any injustice or a law committed by the courts below. To them proceeded from the court of the Regia, for as the barons of parliament were members of that court, and the rest of it was dealt with by other tribunals, over whose officers those barons were delegated to preside, and to whom they were held accountable. The assembly of the nobility, on which all the decisions of the assembly of the nobility, are founded, is the supreme court of the kingdom.
A countess or baroness may not be arrested for debt or trespass; for though in respect of their sex, they cannot sit in parliament, they are nevertheless peers of the realm, and shall be tried by their peers, &c.

PEGWITT, a species of gull. See LARVS, ONTHOLOGY, Index.

PEGASUS, among the poets, a horse imagined to have wings; being that on which Bellerophon was failed to be mounted when he engaged the Chimera. See CHIMERA.

The opening of the fountain Hippocrene on Mount Helicon is ascribed to a blow of Pegasus's hoof. It was esteemed to have flown away to heaven, where it became a constellation. Hence

PEGASUS, in Astronomy, the name of a constellation of the northern hemisphere, in form of a flying horse. See ASTRONOMY.

PEGMARAS, a name by which certain gladiators were distinguished, who fought upon moveable scaffolds called pegmates, which were sometimes unexpectedly raised, and by this means surprised the people with gladiators in hot contention. They were sometimes so suddenly lifted up as to throw the combats into the air; and sometimes they were let down into dark and deep holes, and then set on fire, thus becoming the funeral pyres of those miserable wretches; and roasting them alive to divert the populace.

PEGU, a very considerable kingdom of Asia, beyond the Ganges. The country properly so called is but about 350 miles in length from north to south, and as much in breadth from east to west. It is situated on the eastern side of the bay of Bengal, nearly opposite to Arika, and to the north-east of the coast of Coromandel. It is bounded on the north by the kingdoms of Arrakam and Ava; on the east by the Upper and Lower Siam, on the south by part of Siam and the sea; and on the west by the sea and part of Arrakam.

The kingdom of Pegu is said to have been founded about 1100 years ago. Its first king was a seaman, concerning whom and his successors we know nothing till the discovery of the East Indies by the Portuguese in the beginning of the sixteenth century. In 1518 the throne of Pegu was occupied by one Bensaagagouk, with whom Antony Courea the Portuguese ambassador solemnly concluded a peace in 1519. This monarch was possessed of a very large and rich empire, nine kingdoms being in subjection to him, whose revenues amounted to three millions of gold. We hear no farther accounts of his transactions after the conclusion of the treaty with the Portuguese.

In 1559 he was murdered on the following occasion: Among other princes who were his tributaries was Pura Mandara, king of the Birman or Barma. These people inhabited the high lands called Pangawarum, to the northward of the kingdom of Pegu. Their prince, by one of the terms of his vassalage, was obliged to furnish the king of Pegu with 30,000 Birman soldiers to labour in his mines and other public works. As the king used frequently to go and see how his works went forward, and in these journeys took along with him none but his women, the Birman observing these while frequently repeated, formed a design of robbing the queen and all the concubines of their jewels; and pursuant to this design, the next time the king visited the works, they murdered him, and having stripped the ladies, fled to their own country.

By this enormity all Pegu was thrown into confusion: but, instead of revenging the death of their king, the people divided everywhere into factions; so that Dacha Rupi, the lawful heir to the crown, found himself unable to maintain his authority. Of these commotions, the king of the Birmans taking the advantage, not only shook off the yoke, but formed a design of conquering the kingdom of Pegu itself.—With this view he invaded the country with an army of more than a million of foot, and 5000 elephants; besides a great fleet which he sent down the river Ava towards Bagou or Pegu, the capital of the empire; while he himself marched thither by land. Just at this time Ferdinand de Mirales arrived at Pegu from Goa with a large galleon richly laden on account of the king of Portugal, as soon as Dacha Rupi heard of his coming, he sent to desire his assistance against the enemy. This he obtained by great presents and promises: and Mirales, setting out in a galiot, joined the king's ships. Had the numbers been any thing near an equality, the superior skill of Mirales would undoubtedly have gained the victory; but the fleet of the Birmans covered the whole river; and the ships of Dacha Rupi could scarcely be observed in comparison with them. Mirales did every thing that man could do, and even held out alone after the natives had deserted him; but at last, oppressed and overwhelmed with numbers, he was killed with all his men.

Thus Para Mandara became master of all Pegu; after which he attacked the tributary kingdoms. In 1544 he besieged Martavan, the capital of a kingdom of the same name, then very great and flourishing. The land forces which he brought against it consisted of 700,000 men, while by sea he attacked it with a fleet of 1700 sail; 100 of which were large galleys, and in them 700 Portuguese commanded by John Cayero, who had the reputation of being a valiant and experienced officer. The siege, however, continued seven months, during which time the Birmans lost 120,000 men; but at last the besieged king, finding himself straitened for want of provisions, and unable to withstand so great a power, offered terms of capitulation. This treaty was made of no terms, upon which the distressed king applied to the Portuguese in the service of his enemy; for by their assistance he doubted not to be able to drive away the Birmans. Accordingly, he sent one Seixas to Cayero, intimating him to receive himself, his family, and treasure, on board the four ships he had under his command; offering, on that condition, to give half his riches to the king of Portugal, to become his vassal, and pay such tribute as should be agreed upon. Cayero consulted the principal officers, and in their presence asked Seixas what he thought the treasure might amount to. Seixas answered, that out of what he had seen, for he had not seen all, two ships might be loaded with gold, and four or five with silver. This proposal was too advantageous to be slighted; but the rest of the officers enquiring the great fortune which Cayero would make, threatened to discover the whole to the king of Barma or Barma, if he did not reject it. The unhappy king of Martavan had now no other resource but to set fire to the city, make a sally, and die honourably with the few men he had with him: but even here he was disappointed; for by the desertion of 4000 of his troops the enemy were apprised of his design, and prevented it. Thus
betrayed, he capitulated with the Barma king for his own life and the lives of his wife and children, with leave to end his days in retirement. All this was readily granted, but the conqueror intended to perform no part of his promise. The city was plundered and burnt, by which above 60,000 persons perished, while at least an equal number were carried into slavery. Six thousand cannon were found in the place; 100,000 quintals of pepper, and an equal quantity of other spices. The day after this destruction, 21 gibbets were erected on a hill adjoining to the city; on which the queen, her children, and ladies, were executed, by hanging them up alive by the feet: however, the queen expired with anguish before she suffered such cruel indignity. The king, with 50 of his chief lords, was cast into the sea, with stones about their necks. This monstrous cruelty so provoked the tyrant's soldiers, that they mutinied, and he was in no small danger of suffering for it: however, he found means to pacify them; after which he proceeded to besiege Prome, the capital of another kingdom. Here he increased his army to 500,000 men. The queen by whom it was governed offered to submit to be his vassal; but nothing would satisfy the Barma monarch less than her surrender at discretion, and putting all her treasure into his hands. This she, who knew his perfidy, refused to do: on which the city was fiercely assaulted, but greatly to the disadvantage of the Barmas, who lost near 100,000 men. However, the city was at last betrayed to him, when Mandara behaved with his usual cruelty. Two thousand children were slain, and their bodies cut in pieces and thrown to the elephants; the queen was stripped naked, publicly whipped, and then tortured, till she died; the young king was tied to her dead body, and both together cast into a river, as were also 300 other people of quality.

While the tyrant was employed in fortifying the city, he was informed, that the prince of Ava had sailed down the river Queyor with 400 rowing vessels having 30,000 soldiers on board; but that, hearing of the queen's desert, he stopped at Meleaty, a strong fortress about 12 leagues north of Prome, where he waited to be joined by his father the king of Ava with 80,000 men. On this news the Barma king sent his foster-brother Chaumigrem along the river side with 200,000 men, while he himself followed with 100,000 more. The prince, in this emergency, burnt his barks, forming a vanguard of the mariners, and, putting his small army in the best position he could, expected the enemy. A most desperate engagement ensued, in which 800 only of the prince's army were left, and 11,500 out of 200,000 Barmas who opposed him were killed. The 800 Avaans retired into the fort: but Mandara coming up soon after, and being enraged at the terrible havoc made in his army, attacked the fortress most violently for seven days; at the end of which time, the 800, finding themselves unable to hold out any longer, rushed out in a dark and rainy night, in order to sell their lives at as dear a rate as possible. This last effort was so extremely violent, that they broke through the enemy's troops in several places, and even pressed so hard on the king himself that he was forced to jump into the river. However, they were at last all cut off, but not before they had destroyed 12,000 of their enemies.

Mandara having thus become master of the fort, commanded it to be immediately repaired; at the river to the port of Ava, about a league's distance, where he burnt between 2000 and 3000 men; and lost in the enterprise about 8000 men himself he did not think proper to invest, as newly fortified, was defended by a numerous army of 80,000 men was advancing. The king also, apprehensive of Mandara's designs to become a tributary condition that himself and his forces in recovering the city, To this the emperor readily assented; which alarmed the Barma monarch, so that he sent ambassadors to the Kalaminahm or sovereign of the territory adjacent, requesting him to divert his purpose. On these ambassadors return court, it appeared that the treaty had already been executed; but as the season was not yet arrived for Ava, Chaumigrem, the king's foster-brother with 150,000 men to reduce Senodi or Sauandal of a small kingdom about 130 leagues north of Pegu. The general, however, failed in his and afterwards endeavouring to revenge his town in the neighbourhood, he was surprised by the enemy and put to flight.

In the meantime, the empire of Siam fell into the hands of the king, together with the crown, were murdered by the queen, who had a love with an officer, whom she married after band's death. However, both of them were killed at an entertainment; and the crown was transferred to a natural brother of the late king, but a natural brother of the late king, but a cowardly tyrant. On this Mandara resolved to invade it, and, his principal courtiers concurring in the same scheme, he collected an army of 800,000 men, and after 20,000 elephants. In this army with Portuguese, commanded by one Jazural de Souza, already had a pension of 200,000 ducats a year, king of Pegu, with the title of his brother, and lord of the kingdom. With this formidable arm out in April 1458. His first achievement was the taking of the fortress on the borders of the enemy's troops before which, being several times repulsed, and lost 3000 of his men, he revenged himself by putting the women to the sword. He next besieged the fort itself; but though the siege was continued for months, during which time the most violent efforts were made upon it, the assailants were constantly attacked with great loss. However, it was still required to continue the siege; and a mount of earth was raised by which were placed 40 pieces of cannon, ready to fire it anew, when, in October, advice was received of an expedition having broke out in Pegu. The person who headed the rebels on the occasion was Shoripam Shyan, near akin to the monarch since 12 years before. He was a religious man of great understanding, and esteemed a saint; he was a famous preacher, he made a sermon, in which he set forth the tyranny of the Birmans in such a manner that he was immediately taken out of the pulpit proclaimed king by the people, who, as a token of sovereignty, gave him the title of Seinmindo. The act of sovereignty which he exerted was cutting 15,000 Birmans, and seizing the treasure; and peaceable was this change of government.
people, that in three weeks time all the strong holds of Pegu fell into his hands.

On this news the king immediately raised the siege in which he was engaged, and in 17 days got to Martavan. Here he was informed, that Shemindoo had posted 200,000 men in different places, in order to intercept his passage; at the same time that he had the mortification to find 30,000 of his best troops deserted. To prevent a greater desertion, after 14 days stay, he departed from Martavan, and soon met Shemindoo at the head of 600,000 men. A desperate engagement followed; in which Shemindoo was entirely defeated, with the loss of 300,000 men. Of the Burman troops were slain 60,000; among whom were 25 Portuguese.

The morning after this victory, the tyrant marched to the city: the inhabitants of which surrendered, on condition of having their lives and effects spared. The kingdom being thus again brought under his subjection, his next step was to punish the principal persons concerned in the rebellion: their heads he cut off, and confiscated their estates, which amounted to 10 less than ten millions of gold. Others say, that he put all without distinction to the sword, excepting only 1,000, who took shelter in James Suarez's house: that alone afforded an asylum from the general slaughter. The plunder was incredible, Suarez alone getting three millions. All these cruelties, however, were insufficient to secure the allegiance of the tyrant's subjects; for in less than three months news was brought that the city of Martavan had revolted; and that the governor had not only declared for Shemindoo, but murdered 200 Birmans. Mandara then summoned all the lords of the kingdom to meet him with their forces, within 15 days, at a place called Maouchau, not far from his capital, whither he himself went with 300 men, to wait their arrival. But in the meantime he received intelligence that the shemin or governor of Zatan, a city of some consequence, had submitted to Shemindoo, and also sent him a large sum of gold. The shemin was immediately sent for in order to be put to death: but he, suspecting Mandara's design, excused himself by pretending sickness; after which, having consulted with his friends, he drew together about 600 men; and having with these privately advanced to the place where the king was, he killed him, with the few attendants that were about him at the time. The guards in the court being alarmed with the noise, a skirmish ensued with the shemin's men, in which about 800 were slain on both sides, most of them Birmans. The shemin then retreated to a place called Pontel; whether the people of the country, hearing of the death of the king, who was universally hated, resorted to him. When he had assembled about 3000 men, he returned to seek the troops which the late king had with him; and finding them dispersed in several places, easily killed them all. With the Birmans were slain 80 out of 300 Portuguese. The remainder surrendered, with Suarez their leader; and were spared, on condition of their remaining in the service of the shemins.

The shemin, now finding his forces daily increase, assumed the title of king: and, to render himself the more popular, gave out that he would exterminate the Birmans so effectually, as not to leave one in all the kingdom. It happened, however, that one of those who were with the late king at the time he was murdered, escaped the general slaughter; and, swimming over the river, informed Chaumigrem of the king's death. He had with him 180,000 men, all of them natives of Pegu, excepting 30,000 Barmas. He knew very well, that if the natives had known that the king was dead, he and all his Barmas would have instantly been put to the sword. Pretending, therefore, that he had received orders to put garrisons into several places, Chaumigrem dispatched all the natives into different parts; and thus got rid of those whom he had so much cause to fear. As soon as they were marched, he turned back upon the capital, and seized the king's treasure, together with all the arms and ammunition. He then set fire to the magazines, arsenals, palace, some of whose apartments were filled with gold, and 2000 rowing vessels which were on the river. Then destroying all the artillery, he fled with the 30,000 Barmas to his own country, being pursued in vain by the natives of Pegu.

Thus the shemin of Zatan was left in quiet possession of the kingdom; but, by his repeated acts of tyranny and cruelty, he so disgusted his subjects, that many fled to foreign countries, while others went over to Shemindoo, who began now to gather strength again. In the mean time, James Suarez, the Portuguese whom we have often mentioned, lost his life by attempting to ravish a young woman of distinction; the shemin being unable to protect him, and obliged to give him up to the mob, who stoned him to death. The shemin himself did not long survive him; for, being grown intolerable by his oppressions, most of his followers abandoned him, and he was besieged in his capital by Shemindoo with an army of 200,000 men, and soon after slain in a sally; so that Shemindoo now seemed to be fully established on the throne. But in the mean time Chaumigrem, the foster-brother to the deceased king, hearing that Pegu was very ill provided with the means of defence, invaded the kingdom with an army of 200,000 men. Shemindoo met him with three times their number; but his men, being all natives of Pegu, were inferior in strength, notwithstanding their numbers, to the enemy. The consequence was, that Shemindoo was defeated with prodigious slaughter, and Chaumigrem caused himself to be proclaimed king of Pegu. Shortly after, Shemindoo himself was taken; and, after being treated with the utmost cruelty, was beheaded.

The history of Chaumigrem is very imperfect. However, we know that he was a very great conqueror, and not at all inferior in cruelty to his predecessors. He reduced the empire of Siam and Aracan, and died in 1383; being succeeded by his son named Pronginoko, then about 50 years of age. When this prince ascended the throne, the kingdom of Pegu was in its greatest height of grandeur; but by his tyranny and obstinacy lost all that his father had obtained. He died in 1399, and after his death the kingdom of Pegu became subject to Aracan. For some time past it has been tributary to the more powerful kingdom of Ava; the sovereigns of which country have hitherto been extremely cautious of permitting Europeans to obtain any settlement among them.

The air of Pegu is very healthy, and presently receives sick strangers. The soil also is very rich and fertile in corn, rice, fruit, and roots; being enriched by the inundations of the river Pegu, which are almost increasible.
two years preached the Sunday-evening's lecture meeting-house in Miles's Lane, London, and at Cambridge. In 1713 he was removed to Exeter, where he continued till the time when the Calvinists among the dissenters subscription to articles of faith be signed by dissenting ministers in the kingdom, several a proposition in John Halle's 'Apologia' to the minister at Exeter, in order that the subterfuge they both refused, imagining this proceeding, dissenting brethren to be an unworthy imposture to ligious liberty and private judgment; and it were ejected from their congregation. Upon a meeting was opened for them at Exeter, of Peirce continued minister till his death, in was a man of the strictest virtue, exemplary great learning. He wrote, 1. Exercitatio in de Homoeosmia Anaxagorea. 2. Thirteen pie Controversy between the Church of England Dissenters. 3. Ten pieces on the Controversy Ejection at Exeter. 4. Six pieces on the Gospels and the Trinity. 5. A Paraphrase and Notes on Colossians, Philippians, Ephesians. 6. An Essay in favour of giving the to Children. 7. Fourteen Sermons.

PEIRESC, NICOLAS CLAUDE FABRY, born was descended from an ancient and noble family originally at Pavia in Italy. At ten years of age he went to Avignon, where he spent five years in college, in the study of what in Scotland is called humanity. From Avignon in 1555, removed to Aix, and entered upon the philosophy. In the interim, he attended the masters for dancing, riding, and handling arms which, though he performed the lessons regularly with reluctance: for this being done only to please his uncle, whose heir he was to be, he never praction himself, esteeming all the time lost that was not in the pursuits of literature. During this period he being presented with a medal of the emperor, which was found at Bellegers. Peiresc began in favour of it; and, charmed with deciphering the characters in the exergue, and reading the emperor's name, he carried the medal with a transport of joy to his mother, who for his encouragement gave him two more, and he himself wrote some books upon the subject. This epoch of his application to antiques, for which he became afterwards so famous. In 1596, he was a finish of his course of philosophy under the Jesuits at Rome. There, where he turned his attention particularly to the geography and antiquities, etc., being necessary to the understand history, abating, however, nothing of his application to antiquities, in which he was assisted by Petrus Romanus, one of the professors, and a skilful medalist: nor would he omit the study of humanity in general, wherein he was the master and instructor of a brother who was with him. To do all this he was obliged to sit up late at night, and so much labour and attention, as he was noted for a tender constitution, increased the weakness of his stomach formerly contracted, and for which he had a kind of digestive powder. Being recalled by his uncle in 1597, he returned to Aix, and entered upon the study of the law; which he prosecuted, however, so as to find leisure to visit and converse frequently with the learned of the adjacent country, and greatly increased his reputation. He finally returned to Rome, to complete his studies in the humanities and philosophy. After his return to Rome, he was appointed as a physician to the papal court and became involved in political matters.

PEIRESC, JAMES, an eminent dissenting minister, was born at Wapping, in London, in the year 1674, and was educated at Utrecht and Leyden; after which he spent some time at Oxford, in order to enjoy the benefit of frequenting the Bodleian Library. He then for
PEI

Procured leave not to be presently entered into the list of senators. The heat of his inclination was not so much to business as to advance arts and sciences, and to assist all the pretenders of learning. For this purpose, he resolved to lead a single life; so that when his father had concluded a match for him with a respectable lady, he begged to be excused.

In 1605, he accompanied G. Varrius, first president of the senate at Aix, who was very fond of him, to Paris: whence, having visited every thing curious, he crossed the water, in company with the king's ambassador, 1606, to England. Here he was very graciously received by King James I.; and having seen Oxford, and visited Camden, Sir Robert Cotton, Sir Henry Savile, and other learned men, he passed over to Holland; and after visiting the several towns and universities, with the literati in each, he went through Antwerp to Brussels, and thence back to Paris, to see the ceremony of the Dauphin's baptism; which being solemnized August 24, he returned home in September, 1605, being expected for the ordering of the family affairs.

Presently after this, he purchased the barony of Rians; and at the solicitation of his uncle, having approved himself before that assembly, he was received a senator on the 1st of July 1607. January 1608 he lost his uncle; and the following year, falling himself into a dangerous fever, recovered by eating musk-melons before supper, for which he had conceived a longing. He was ordered by his physician to eat them before his meals without bread, and to drink a glass of pure wine upon them. He continued this method all his life afterwards: and grew so fond of them, that, though he could abstain from any other meat as he listed, yet towards them he protested he was unable to master himself. He frequently experienced, that in the musk-melon season he was never troubled with the gravel. In 1618, having procured a faithful copy of the Acts of the Monastery of Maren in Switzerland, he published a second edition of that work. As it was written in defence of the royal line of France against Tiberius Pieperius, who had attempted to prove the title of the Austrian family to the French crown by right of succession, he was, upon this publication, nominated the same year, by Louis XIII. abbot of Sancta Maria Aquistriniana. He stayed in France till 1633; when, upon a message from his father, now grown old and sickly, he left Paris, where he had spent seven years and some months. He arrived at Aix in October; and not long after presented to the court a patent from the king, permitting him to continue in the function of his ancient dignity, and to exercise the office of a secular or lay person, notwithstanding that, being an abbot, he had assumed the character of a churchman. To this the court of parliament not assenting, decreed unanimously, that, being already admitted into the first rank, he should abide perpetually therein; not returning, as the custom of the court was, to the inferior auditory, whereas trials are usually had of criminal cases. In 1625, he buried his father, who had been long afflicted with the gout. In 1627, he prevailed with the archbishop of Aix to establish a post thence to Lyons, and so to Paris and all Europe; by which the correspondence constantly held with the literati everywhere was much facilitated. In 1629, he began to be much tormented with the strangury.
strangury and hemorrhoides; and in 1631, having completed the marriage of his nephew Claudius with Margaret Alresia, a noblewoman of the county of Avignon, he bestowed upon him the barony of Bianty, together with a grant of his senatorial dignity, only reserving the function to himself for three years. But the parliament not waiting his surrender of it, he resented that affront so heinously, that he procured, in 1635, letters patent from the king to be restored, and to exercise the office for five years longer, which happened to be till his death: for being seized, June 1637, with a fever that brought on a stoppage of urine, this put an end to his life on the 24th of that month, in his 57th year.

The character of Peiresce may be summed up in a few words. His person was of a middle size, and of a thin habit: his forehead large, and his eyes gray; a little hawk nosed; his cheeks tempered with red; the hair of his head yellow, as also his beard, which used to grow on his chest, was of a remarkable length, and the marks of uncommon and rare courtesy and affability. In his diet he affected cleanliness, and in all things about him; but nothing superfluous or costly. His clothes were suitable to his dignity; yet he never wore silk. In like manner, the rest of his house was adorned according to his condition, and very well furnished; but he neglected his own chamber. Instead of tapestry, there hung the pictures of his chief friends and of famous men, besides innumerable bundles of commentaries, transcripts, notes, collections from books, epistles, and such like papers. His bed was exceedingly plain, and his table continually loaded and covered with papers, books, letters, and other things; as also all the seats round about, and the greatest part of the floor.

These were so many evidences of the turn of his mind; in respect to which, the writer of his eulogium compares him to the Roman Atticus; and Bayle, considering his universal correspondence and general assistance to all the literati in Europe, dashed it out luckily enough, when he called him "the attorney general of the literary republic." The works which he published are, "Histoia provinciae Galliae Narbonensis;" "Nobilissimum ejusdem provinciae familiarem Origines, et separatim Fabriciae;" "Commentarii rerum omnium memoria dignarum suae etatis gestarum;" "Liber de ludicris naturae operibus;" "Mathematica et astronomica varia;" "Observationes mathematicae;" "Epistole ad S. P. Urbanum VIII. cardinales Barberine, &c.;" "Authorum antiqui Graeci et Latini de ponderibus et mensuris;" "Elogia et epitaphia;" "Inscriptiones antiquae et novae;" "Genealogia domus Austriacae;" "Catalogus librorum biblioth. reg.;" "Poemata varia;" "Nummi Gallici, Saxonici, Britannici, &c.;" "Linguae orientales, Hebraea, Samaritana, Arabica, Egyptiaca, et Indices librorum harum linguarum;" "Observationes in varias auctores." It is remarkable, that though Peiresce bought more books than any man of his time, yet his collection left was not large. The reason was, that as fast as he purchased, he kept continually making presents of them to such learned men as he knew they would be useful to.

PEKIN, the capital city of the empire of China, in Asia, where the emperor generally resides. It is situated in a very fertile plain, 20 leagues distant from the great wall. This name, which signifies the northern court, is given to it, to distinguish it from a considerable city called Nanking, or the south. The emperor formerly resided in the latter Tartars, a restless and warlike people, of prince to remove his court to the northern that he might more effectually repel the intese barbarians, by opposing to them a num litia which he generally keeps around his palace, is an exact square, and divided into two parts that which contains the emperor's palace, with the new city, or, as it is called, the Tartar cause it is inhabited by Tartars ever since they ed this empire; the other, called the Old City, ted by the Chinese. The city is surrounded by wall rather less than thirty feet high, and a round a circumference of 14 English miles. Things within, according to Mr Barrow, are so never be completely hidden by the wall. They are strait on the model of a tent, being supported by slight wooden pillars, and concealed by a deep wall to the street; their roofs alone appear at enclosure, and being arranged in straight lines out the whole city, gives it very much the apper of a vast encampment. With the exception of great streets which lead to the gates, the res city consists of very narrow lanes, and every part is entirely without pavement, and filled with dust. There are no aqueducts, and the whole is generally nauseous. There are no drains; substances that may be used as manure, being in the house, the whole precincts are infected with offensive odours. The buildings are generally me except one or two temples. The population of Pek been estimated at 2,000,000, but Sir George Sta thinks it cannot be less than 3,000,000. The coup d'oeil of the great streets is singular and stri. "The multitude of moveable workshops," says Mr row, "of tinkers and barbers, cobblers and blacke the tents and booths where tea and fruit, rice and eatables, were exposed for sale, with the warm merchandise arrayed before the doors, had contr the spacious street to a narrow road in the middle wide enough for two of our little vehicles to other. The cavalcade of officers and soldiers that ceded the embassy; the processions of men in of ficed by their numerous retinues, bearing umbre and flags, and painted lanterns, and a variety of insignia of their rank and station; different trains were accompanying with lamentable cries corpse their graves, and with squalling music, brides to husbands; the troops of draymen laden with co from Tartary, the wheelbarrows and handcarts star with vegetables, occupied nearly the whole of thi saddle space in one continued line, leaving very the room for the cavalcade of the embassy to pass was in motion. The sides of the street were filled w immense concourse of people bartering their different commodities. The buzz of confused noises of this mixed multitude, proceed from the loud bawling of those who were crying the wares, the wrangling of others, with every now an then a strange twanging noise like the jarring of cracked Jew's harp, the barber's signal made by his trowsers, the mirth and laughter that prevailed in every group, could scarcely be exceeded by the broker.
in the Bank rotunda, or the Jews and old women in Rosemary lane. Pedlars with their packs, jugglers, and conjurers, fortune-tellers, mountebanks, quack-doctors, comedians and musicians, left no space unoccupied."

"People of distinction, says Grosier, oblige all their dependents to follow them. A mandarin of the first rank is always accompanied in his walks by his whole tribunal; and, to augment his equipage, each of the inferior mandarins in his suit is generally attended by several domestics. The nobility of the court, and princes of the blood, never appear in public without being surrounded by a large body of cavalry; and, as their presence is required at the palace every day, their train alone would be sufficient to create confusion in the city. It is very singular, that in all this prodigious concourse no women are ever seen; hence we may judge how great the population of China must be, since the number of females in this country, as well as everywhere else, is superior to that of the other sex.

"As there is a continual influx of the rich and merchandize of the whole empire into this city, the number of strangers that resort hither is immense. They are carried in chairs, or ride on horseback; the latter is more common: but they are always attended by a guide, acquainted with the streets, and who knows the houses of the nobility and principal people of the city. They are also provided with a book, containing an account of the different quarters, squares, remarkable places, and of the residence of those in public offices. In summer there are to be seen small temporary shops, where people are served with water cooled by means of ice; and one finds everywhere eating-houses, with refreshments of tea and fruits. Each kind of provision has a certain day and place appointed for its being exposed to sale.

"The governor of Pekin, who is a Manchew Tartar, is styled Governor of the Nine Gates. His jurisdiction extends not only over the soldiers, but also over the people in every thing that concerns the police. No police can be more active; and it is surprising to see, among an infinite number of Tartars and Chinese mixed together, the greatest tranquillity prevail. It is rare, in a number of years, to hear of houses being robbed, or people assassinated. All the principal streets have guard-rooms, and soldiers patrol night and day, each having a sabre hanging from his girdle, and a whip in his hand, to correct, without distinction, those who excite quarrels or cause disorder. The lanes are guarded in the same manner; and have latticed gates, which do not prevent those from being seen who walk in them: they are always kept shut during the night, and seldom opened even to those who are known; if they are, the person to whom this indulgence is granted, must carry a lantern, and give a sufficient reason for his going out. In the evening, as soon as the soldiers are wanted to their quarters by beat of drum, two centinels go and come from one guard-room to another, making a continual noise with a kind of castanet, to show that they are not asleep. They permit no one to walk abroad in the night-time. They even examine those whom the emperor despatches on business; and if their reply gives the least cause of suspicion, they have a right to convey them to the guard-room. The soldiers in each of the guard-rooms are obliged to answer every time the centinels on duty call out.

"It is by these wise regulations, observed with the greatest strictness, that peace, silence, and safety reign throughout the whole city. The governor is also obliged to go the round; and the officers stationed on the walls, and in the towers over the gates (in which are kept large kettle-drums that beat every time the guard is relieved), are continually dispatching substituters to examine the quarters belonging to the gates, where they are posted. The least neglect is punished next morning, and the officer who was on guard is cashiered. The support of this police costs the emperor a great deal; for part of the soldiers we have mentioned are maintained for this purpose only. They are all infantry, and their pay is generally very high.

The walls of the emperor’s palace, including that and the gardens, are about two miles in length. "Although (says Grosier) the Chinese architecture has no resemblance to that of Europe, the imperial palace of Pekin does not fail to strike beholders by its extent, grandeur, and the regular disposition of its apartments, and by the singular structure of its pavilion-roofs, ornamented at each corner with a carved plat-band, the lower extremity of which is turned upwards. These roofs are covered with varnished tiles of so beautiful a yellow colour, that at a distance, they make as splendid an appearance as if they were gilded. Below the upper roof there is another of equal brilliancy, which hangs sloping from the wall, supported by a great number of beams, daubed over with green varnish, and interspersed with gilt figures. The second roof, with the projection of the first, forms a kind of crown to the whole edifice. The palace is a small distance from the south gate of the Tartar city. The entrance to it is through a spacious court, to which there is a descent by a marble staircase, ornamented with two large copper lions, and a balustrade of white marble. This balustrade runs in the form of a horse-shoe, along the banks of the rivulet, that winds across the palace with a serpentine course, the bridges over which are of marble. At the bottom of this first court arises a façade with three doors: that in the middle is for the emperor only; the mandarins and nobles pass through those on each side. These doors conduct to a second court, which is the largest of the palace: it is about 300 feet in length, and 50 in breadth. An immense gallery runs round it, in which are magazines, containing rich effects, which belong to the emperor as his private property; for the public treasure is entrusted to a sovereign tribunal called..."
the Grand Union, is in this second court. It is built
upon a terrace about 18 feet in height, inclosed with
white marble, and ornamented with balustrades of ex-
cellent workmanship. Before this hall all the ma-
damirs range themselves, when they go, on certain
days, to renew their homage, and perform those ceremonies
that are appointed by the laws of the empire. This
hall is almost square, and about 130 feet in length.
The ceiling is carved, varnished green, and loaded
with gilt dragons. The pillars which support the roof within
are six feet in circumference towards the base, and are
coated with a kind of mastick varnished red; the floor
is partly covered with coarse carpets, after the Turkish
manner; but the walls have no kind of ornament, ne-
ither tapestry, lustres, nor paintings.

"The throne, which is in the middle of the hall,
consists of a pretty high alcove, exceedingly neat. It
has no inscription but the character αυλος, which the
authors of this relation have interpreted by the word
'auly': but it has not always this signification; for it
seems better sometimes to the Latin word auclusus,
or the English words excellent, perfect, most true. Upon
the platform opposite to this hall stand large vessels of
bronze, in which incense is burnt when any ceremony
is performing. There are also chandeliers shaped like
birds and painted different colours, as well as the wax-
candles that are lighted up in them. This platform
is extended towards the north, and has on it two lesser
halls; one of them is a rotunda that glitters with varnish,
and is lighted by a number of windows. It is here that
the emperor changes his dress before or after any cere-
mony. The other is a saloon, the door of which opens
to the north: through this door the emperor must pass,
when he goes from his apartment to receive on his
throne the homage of the nobility; he is then carried
in a chair, by officers dressed in long red robes bordered
with silk, and caps ornamented with plumes of feathers.
It would be difficult to give an exact description of the
interior apartments which properly form the palace of
the emperor, and are set apart for the use of his family.
Few are permitted to enter them but women and eun-
cuchas."

The temples and the towers of this city are so numero-
some, that it is difficult to count them. Provisions of
all kinds are very plentiful, they being, as well as the
merchandises, brought from other parts by means of
canals cut from the rivers, and always crowded with ves-
sels of different sizes, as well as from the adjacent coun-
try. An earthquake which happened here in 1732
burred above 100,000 persons in the ruins of the houses
which were thrown down. E. Long. 116° 41', N. Lat.
39° 54'. See CHINA, Supplement.

We have already, under the article OBSERVATORY,
mentioned the famous observatory in this city, of which
we shall give this further account from the Universal
History. "The Chinese had thought nothing in the
universe could equal in magnificence this famous place;
and one of the most celebrated mathematicians of
the royal academy of Paris hath made me seruple to
represent it as one of the greatest prodigies of art and
ingenuity, of beauty and magnificence; and yet, when

this celebrated structure came to be viewed by proper
and unbiased judges, it appears to have little worth as to its ancient machines, as to its situation; and that all that is now vast is owing to the improvements made by Father
a Flemish Jesuit, who caused a new set of it to be made, with extraordinary care, neatness

decision."

"This fabric stands in a court of a modern build-
ing and is built in the form of a square tower, to
the city wall on the inside, and raised twelve feet above its bulwark. The ascent
top is by a very narrow staircase; and on the
above were placed all the old instruments, while
but few, took up the whole room, till Father
introduced his new apparatus, which he dear
more convenient order. These are large,
and embellished; and there are the nuts of the
answerable to the work, and the telescopes for
them according to the new method, they

equal to those of Europe; but the Chinese
were, it seems, either too negligent, or irre-
following his directions. As to the old instruments
they were, by order of the emperor Kang-bi,
as useless, and laid in the hall near the tower
they may be seen through a cross-barred window
covered with rust, and buried in oblivion.

"In this famed observatory there are five re-
ticians employed night and day, each in a proper
eling on the top of the tower, to observe all
over their heads: Their observations are care-
ted in their journals, and an account of them
is every morning to the surveyor of the mathematicians
registered in his office. These mathematicians
love, are very ignorant. Mr. Barrow tells us that
compiled the national calendar from the Comte
de temps de Paris, and that their journal not having
in consequence of the war, they were in great per-
till one of the gentlemen belonging to the embassy
ished them with a set of nautical almanacs
800.

PELAGIUS, a Christian sect who appear
about the fifth or end of the fourth century.
maintained the following doctrines: 1. That Adam
by nature mortal, and whether he had sinned or
would certainly have died. 2. That the consequence
of Adam's sin was confined to his own person. 3.
New-born infants are in the same situation with
before the fall. 4. That the law qualified men for
kingdom of heaven, and was founded upon
promises with the gospel. 5. That the general rec-
tion of the dead does not follow in virtue of
Saviour's resurrection. 6. That the grace of God
given according to our merits. 7. That this grace
not granted for the performance of every moral
the liberty of the will, and information in point

duty, being sufficient, &c. The founder of this sect
PELAGIUS, a native of Great Britain; but
ther of England, Scotland, or Wales, it is uncertain
it is immaterial (A). He was born towards the end
of the fourth century, and educated in the monast

(A) Dr Henry thinks he was born in North Wales; that his real name was Morgan, of which Pea

Pelagius, of Banchor, in Wales, of which he became a monk, and afterwards abbot. In the early part of his life he went over to France, and thence to Rome, where he had the insolence to promulgate certain opinions somewhat different from those of the infallible church. His morals being irreproachable, he gained many disciples; and the dreadful heresy made so rapid a progress, that, for the salvation of souls, it became necessary for the pope to exert his power. Pelagius, to avoid the danger, in the year 409 passed over to Sicily, attended by his friend and pupil Celestius. In 411 they landed in Africa, continued some time at Hippo, and were present at the famous conference between the Catholics and Donatists which was held at Carthage in 412. From thence they travelled into Egypt; and from Egypt, in 415, to Palestine, where they were graciously received by John bishop of Jerusalem. In the same year Pelagius was cited to appear before a council of seventeen bishops, held at Diospolis. They were satisfied with his creed, and absolved him of heresy. The African bishops, however, being displeased with their proceedings, appealed to the Roman pontiff: he first approved, and afterwards condemned, the opinions of Pelagius, who, with his pupil Celestius, was publicly excommunicated; and all the bishops who refused to subscribe the condemnation of the Pelagian heresy were immediately deprived. What became of him after this period is entirely unknown; but it seems very probable that he retired to Banchor, and died abbot of that monastery. He wrote, 1. Expositionum in epist. Paulinis, lib. xiv. 2. Epistola ad Demetriadam de virginitate. 3. Explanatio simboli ad Damasum. 4. Epistola ad virum ducis. 5. De libero arbitrio. These and many other fragments are scattered among the works of St Jerome. They are also collected by Garnerius, and published in Appendix op. Mercatoris, p. 373. Cave.

Pelagosa, an island in the Adriatic, which, together with several rocks that appear above water near it, are the remains of an ancient volcano. "I will not trouble you (says Fortis) that it was thrown up out of the sea like several other islands in the Archipelago, though there is some ground to suspect this to have been the case; because we find no precise mention of it in the most ancient geographers. It should seem that it ought not to be confused with the Diomede, from which it is 30 miles distant; yet it is not impossible that they have reckoned it among them. The lava which forms the substance of this island, is perfectly like the ordinary lava of Vesuvius, as far as I could discover in passing near it. If a naturalist should land there, and visit on purpose the highest parts of the island, perhaps we might then know whether it has been thrown up by a submarine

is a translation; and that he was born on the 13th of November A.D. 354, the same day with his great antagonist St Augustin. The same learned historian gives us the following account of Pelagius and his great confidant Celestius. "He received a learned education in his own country, most probably in the great monastery of Banchor near Chester, to the government of which he was advanced A.D. 404. He was long esteemed and loved by St Jerome and St Augustin, who kept up a friendly correspondence with him by letters before they discovered the heretical pravity of his opinions; for Pelagius, being a cautious and artful man, for some time vented his peculiar notions as the sentiments of others, without discovering that they were his own. At length, however, he threw off the mask, and openly published and defended his doctrines at Rome about the beginning of the fifth century. This involved him in many troubles, and drew upon him the indignation of his former friends St Jerome and St Augustin, who wrote against him with great acrimony. He is acknowledged, even by his adversaries, to have been a man of good sense and great learning, and an acute disputant, though he loaded him with the most bitter reproaches for his abuse of these talents. His personal blemishes are painted in very strong colours; and he is represented by these good fathers, in the heat of their zeal, as a very ugly fellow, broad-shouldered, thick-necked, fat-headed, lame of a leg, and blind of an eye. Even the most northern parts of this island (Britain) produced some men of learning in this period. Celestius, the disciple and friend of Pelagius, was a Scotsman, who made a prodigious noise in the world by his writings and disputations about the beginning of the fifth century. He defended and propagated the peculiar opinions of his master Pelagius with so much learning, zeal, and success, that those who embraced these opinions were frequently called Celestins. Before he became acquainted with these doctrines he wrote several books, which were universally admired for their orthodoxy, learning, and virtuous tendency. After he had spent his youth in his own country in a studious privacy, he travelled for his further improvement to Rome, where he became acquainted with Rufinus and Pelagius, and was by them infected with their heresies. From that time he became the most indefatigable and undaunted champion of these heresies, and thereby brought upon himself the indignation of the orthodox fathers of these days, who gave him many very bad names in their writings. St Jerome, whose commentaries on the Ephesians he had presumed to criticize, calls him, an ignorant, stupid fool, having his belly swelled and distended with Scots potage; a great, corpulent, barking dog, who was fitter to kick with heels than to bite with his teeth; a Cerberus, with his master Pluto (Pelagius), deserved to be knocked on the head, that they might be put to eternal silence. Such were the flowers of rhetoric which these good fathers employed against the enemies of the orthodox faith! But candour obliges us to observe, that this was perhaps more the vice of the age in which they lived than of the men. Both Pelagius and Celestius were very great travellers; having visited many different countries of Asia and Africa, as well as Europe, with a view to elude the persecutions of their enemies, and to propagate their opinions. It is no inconsiderable evidence of their superior learning and abilities, that their opinions gained great ground in all the provinces both of the eastern and western empire, in spite of the writings of many learned fathers, and the decrees of many councils against them. "The Pelagian and Celestian heresy (says Photius) not only flourished in great vigour in the West, but was also propagated into the East."
PELAGOSA, a vine volcano, as the island near Santerini was in our age; or if we ought to believe it the top of some ancient volcanic mountain, of which the roots and sides have been covered by the waters, which divided Africa from Spain, forming the straits of Gibraltar; an invasion that no one can doubt of who has examined the bottoms and shores of our sea. The Lissian fishermen say, that Pelagosa is subject to frequent and violent earthquakes; and the aspect of the island proves at first sight, that it has suffered many revolutions; for it is rugged, ruinous, and subverted.

PELIAH, a Levite (Nehem. viii. 7. x. 10.). He was one of the principal Levites that returned from captivity, and was one of those who signed the covenant that Nehemiah renewed with the Lord.

PELIAH, son of Amazi and father of Jeroham, of the family of Pahur, son of Malchiah, of all whom mention has been made: he was of the race of the priests (Nehem. xi. 12.).

PELASGI. See PELOSITIOTIS.

PELASGIA (Pliny); the ancient name of Lebos; so called from the Pelasgi, its first inhabitants (Diodorus Siculus). It is also the ancient name of Peloponnesus, from Pelasgus, a native of the country (Nicolas Damascus, Ephorus).

PELASGCICUM (Pausianias, Pliny); the north wall of Athens; so called from the builders, the Pelasgi. There was an excration pronounced on any that should build houses under this wall, because the Pelasgi, while dwelling there, entered into a contest against the Athenians (Thucydides).

PELASGIOTIIS, a third part of Thessaly (Strabo); so called from a very ancient people, the Pelasgi, called Pellasitor (Ptolemy); who formerly, together with the Æolians, occupied Thessaly, and thence that part was called Pelassicum Argos; besides many other parts of Greece. Their name Pelasgi, or Pelargi, denoting storks, was given them from their wandering roving life (Strabo). The poets extend the appellation to Greeks in general. Pelasgus, the epithet. Some of the inhabitants of Crete were called Pelasgi (Homer); who thus also calls the neighbouring people to the Cilicians in Troas. The Pelasgi were originally of Arcadia (Hesiod); but Æschylus makes Argos, near Myceene, their country. The Pelasgiotis was situated between Pheria and Macedonia to the north and west, Thessaliotics to the south, and Magnesia to the east, (Strabo, Pliny).

PELATÆE, were free-born citizens, among the Athenians, who by poverty were reduced to the necessity of serving for wages. During their servitude they had no vote in the management of public affairs, as having no estate to qualify them; but this restriction was removed whenever they had released themselves from their servile situation, which they were allowed to do when able to support themselves. While they continued servants, they had also a right to change their masters. We find them sometimes distinguished by the name of Theter.

PELATIAH, son of Hananiah, and father of Ishi, of the tribe of Simeon. He subdued the Amalekites upon the mountain of Seir (1 Chron. iv. 42). The time of this action is unknown.

PELATHA, son of Beniah, a prince of the people, who lived in the time of Zedekiah king of Judah, and opposed the wholesome advice given by Jeremiah, to submit to King Nebuchadnezzar. Ezekiel (xi. 4.) being a captive in Mesopotamia, had a vision which he saw five and twenty men at the door of the temple of Jerusalem, among whom were Jezar the son of Azur, and Pelaiath the son of Ben; who were the most remarkable. Then the Lord to him, "Son of man, these are the men that think of iniquity, and who are forming pernicious designs against this city, saying, Have not the days of the city been built a long time? Jerusalem is the pot, and the flesh is the city. Thus saith the Lord: You have a great havock in this city, and have filled its streets with dead bodies. These men are the flesh, and the city is the pot. But as for you, I will make you come forth from the middle of this city, and I will make you perish by the hands of your enemies."

PELÆ, (Stephanus). There were two towns of name in Thessaly: the one subject to Euryynnus, another to Achilles; both extinct. Pelæus the generous name (id.).

PELEK, son of Eber, was born in the year of world 1737. The scripture says his father gave the name of Peleg, signifying division, because at the time the earth began to be divided (Gen. xi. 25); whether it was that Noah had begun to divide the earth among his descendants, some year before the building of Babel; or that Peleg came into the world the same year that Babel was begun, and as a division of languages; or that Eber by a spirit of prophecy gave his son the name of Peleg some years before the tower of Babel was begun, is not absolutely certain. That which here perplexes the interpreters is, first, Peleg came into the world not above 100 years after the deluge. But it should seem, that the number was not then sufficient for such an undertaking as of Babel. Secondly, Joktan the brother of Peleg had already thirteen sons at the time of this dispersion which happened after the confusion of Babel (Gen. xx. 27, 28, &c.). Peleg being born in the thirty-fourth year of Eber (Gen. xi. 16.), it is impossible his other Joktan should have such a number of children the birth of Peleg. It seems therefore that he was not born at the time of the dispersion. To this be answered, that Moses has there enumerated the names of the thirteen sons of Joktan (in Gen. x. 5), by way of anticipation, though they were not till a good while after the confusion at Babel; but they possessed a very large country, it was convenient to take notice of them, and to name them among other descendants of Noah, who divided the possession of the east among themselves. However this may have been, at the age of thirty years Peleg begat Reu; he died at the age of 229.

PELETHITES. The Pelethites and Chrietites were famous under the reign of King David. They were the most valiant men in the army of that prince, and had the guard of his person. See Ezekiel xxv. Zephaniah ii. 5. 1 Sam. xxx. 14. 2 Samuel xv. xx. 7. Patrick's Comm. Pool's Annot. and Dekker's Hist. of the Life of David.

PELETHRONI, a name or epithet given to Lapithces, either because they inhabited the town of Pelethronium at the foot of Mount Pelion in Æolus.
PELETHRONII, or because one of their number bore the name of
PELETHRONII. It is to them, we are told, that man-
kind are indebted for the invention of the bit with which they tamed their horses with so much dexte-
ritv.

PELETHRONIUM (Nicander and Scholiast); a
town of Thessaly, situated in a flowery part of Mount
Pelion; and hence the appellation _throna_, signifying
"flowers." Lucan says the Centaurs were natives of
that place; to whom Virgil assigns Mount Othrys.
Most authors, however, ascribe the breaking of horses
to the Centaurs. Some make the Lapithæ and Cen-
taurs the same; others a different people; allowed how-
ever to be both of Thessaly. Their story is greatly in-
volved in fable. See LAPITHUS.

PELEUS, in Fabulous History, a king of Thessaly,
son of AEacus and Eneus, the daughter of Chiron. He
married Thetis one of the Nereids, and was the only
mortal man who ever married an immortal. He was
concerned in the murder of his brother Phocus, and
was therefore obliged to leave his father's dominions.
He fled to the court of Eurytus the son of Actor, who
reigned at Phthia, or according to the opinion of Ovid,
the truth of which is questioned, to Ceyx king of
Trachinia. He was purified of his murder by Eurytus,
with the usual ceremonies, and the king gave him his
girl Antigone in marriage. After this, as Peleus
and Eurytus went to the chase of the Calydonian boar,
the father-in-law was accidentally killed by an arrow
which his son-in-law had aimed at the beast. This un-
fortunate action obliged him to banish himself from
the court of Phthia, and he went to Iolcos, where he
was also purified of the murder of Eurytus by Acatus
the king of the country. His residence at Iolcos was
short: Astydamia the wife of Acatus fell in love with
him; but when she found him insensible to her pas-
sionate declarations, she accused him of attempts upon
her virtue. The king her husband partly believed the
accusations of his wife; but not with the laws of hospi-
tality, by putting him instantly to death, he ordered his officers to conduct him to Mount
Pelion, on pretence of hunting, and there to tie him
to a tree and to leave him a prey to the wild beasts
of the place. The orders of Acatus were faithfully
obeyed: but Jupiter knowing the innocence of
his grandson Peleus, ordered Vulcan to set him at
liberty. As soon as he had been delivered from dan-
ger, Peleus assembled his friends in order to punish the
ill treatment, which he had received from Acatus.
He took Iolcos by force, drove the king from his
possessions, and put to death the wicked Astydamia.
On the death of Antigone, Peleus made love to Thet-
is, of whose superior charms Jupiter himself had been
enamoured. His pretensions were rejected; for as he
was but a mortal, the goddess fled from him with the
attmost abhorrence, and the more effectually to evade his inquiries, she generally assumed the shape of a bird,
or a tree, or of a tigress. Peleus's passion was fanned by refusal: he offered a sacrifice to the gods; and Pro-
teus informed him, that to obtain Thetis he must sur-
pise her while she was asleep in her grotto, near the
shores of Thessaly. This advice was immediately at-
tended to; and Thetis, unable to escape from the grasp
of Pelies, at last consented to marry him. Their nup-
tials were celebrated with the greatest solemnity, all the
gods attending and making them each the most valu-
able presents. The goddess of Discord was the only
one of the deities who was absent; and she punished
this seeming neglect by throwing an apple in the midst
of the assembly of the gods, with the inscription of
DETUR PULCHRIORI. The celebrated Achilles was the
fruit of this marriage, whose education was early en-
trusted to the Centaur Chiron, and afterwards to Pho-
nix, the son of Amyntor. Achilles, it is well known,
went to the Trojan war, at the head of his father's
troops; and Peleus gloried in having a son who was su-
perior to all the Greeks in valour and intrepidity.
His death, however, was the source of great grief to Peleus;
but Thetis, to comfort her husband, promised him im-
mortality, and ordered him to retire into the grottoes
of the island of Leuce, where he should see and converse
with the manes of his son. Peleus had a daughter called
POLYDORA, by Antigone.

PELEW ISLANDS, a cluster of small islands situated
between the latitudes of 5° and 7° north, and the longi-
itudes 134° and 136° east. Various conjectures have
been formed respecting the time of their first discovery
by Europeans. Mr Keate, the editor of the only voyage
in which we have any account of their climate, soil, and
produce, together with the manners of their inhabitants,
considers they were first noticed by the Spaniards from
the Philippines, and by them named _Pulos_ from the
number of trees growing in them resembling the masts
of ships. This conjecture has been vehemently opposed
by a critic, who affirms that the whole of Mr Keate's
introduction is erroneous, and that the islands in question
were first discovered by a French Jesuit named PERE
PAPIN. The Jesuit, he imagines, was directed to them
by one of the inhabitants, who had found his way to the
Moluccas, where he was baptized. They are said to
have been again noticed by _P. Centova_ in 1724, who,
saw at Agdane, the capital of the Merian islands, some
of the inhabitants; and from their account gives a de-
scription not very favourable of these harmless islanders.
Centova's description is to be found in the 11th volume,
and the relation of the discovery by P. Papin in the 11th
volume, of Lettres Edifiantes et Curieuses, published at
Paris 1781.

The latest and most authentic account of them, how-
ever, is given from the Journals of Captain Wilson of
the Antelope, a packet belonging to the East India
company, which was wrecked upon one of them in Au-
gust 1793. This ship was fitted out in England by the
court of directors in the summer 1792, as was then gen-
erally understood, for a secret expedition. Whatever
may have been her destination, as she was proceeding
from Macao in squally weather, the man, who, on the
night of the 10th of August, had the look-out, suddenly
called out _Breakers_! But the sound of the word had
scare reached the ear of the officer on deck, before
the ship struck and stuck fast; and in less than an hour
bulged and filled with water. Having secured the gun-
powder, small arms, bread, and such other provisions
as were liable to be spoiled with water, Captain Wilson,af-
ter many difficulties, effected a landing. The crew of
the Antelope consisted of 33 Europeans besides the cap-
tain, and 16 Chinese: and the only possible means by
which they could be delivered from an island, which at
first appeared to them uninhabited, was by building a
ship capable of transporting them to the nearest Euro-
american
and his people, that some of the crew should be sent to
the king of the place, in order to solicit his friendship,
and interest his permission to build a vessel that might
carry them back to their own country. This business
was allotted to the captain's brother; and during his
absence, Raas Koosk, the king's brother, and several
of the natives, remained with our people. This amiable
chief seemed to place an entire confidence in those he
was among; he endeavoured to accommodate himself
to their manners; would sit at table as they did, instead
of squatting on his haunches; and inquired particularly
into the principles and causes of every thing he observed
about him, lending his personal assistance in all that was
going forward, and even desiring the cook to let him
aid him in blowing the fire.

In order to conciliate their affections, Captain Wilson
had presented Arra Kooker, another of the king's bro-
thers, with a pair of trowers; but having conceived a
greater passion for a white shirt, one was immediately
given to him, which he also soon ordered on; he began
to dance and jump about with so much joy, that
every body was diverted by his singular gestures, and
the contrast which the linen formed with his skin. This
prince was about 40, of a short stature, but so plump
and fat that he was nearly as broad as he was long.
He possessed an abundant share of good humour, and a
wonderful turn for mimicry; and had besides a cou-
tenance so lively and expressive, that though our peo-
ple at this time were strangers to almost all he said, yet
his face and gestures made men accurately comprehend
whatever he was describing.

After three or four days, Abba Thulle the king ar-
rieved with a great retinue. He was received with ever
mark of respect by the ship's company, who were exer-
cised before him, and fired three volleys in different
positions. The surprise of the natives, their howling, ha-
looging, jumping, and chattering, produced a noise a
most equal to the discharge of the muskets; and who
one of the men shot a bird, which was done to displa-
esthe effect of their arms, the surprise it occasioned was
wonderful. Some of the natives ran for it, and carried
car it to the king, who examined it with great attention,
but was unable to comprehend how it could be wounde
not having seen any thing pass out of the gun.

Raas Koosk expressed great impatience to show the king
whatever had impressed his own mind; and taking his
brother by the hand, led him to a grindstone which was
fixed behind one of the tents. He immediately put
motion as he had frequently done before; at the
pity of which the king was greatly astonished, par-
cularly when he was informed that it would sharp
iron. Captain Wilson ordered a hatchet to be brough
ground, that they might more readily perceive op-
eration, when Raas Koosk eagerly seized the hand
and began turning it, appearing highly delighted to
his brother see how well he understood it. The wheel
appeared like something supernatural; but the circu-
stance which most bewildered their ideas was, how
sparks of fire could come, and how a stone so well w
wed could become so soon dry.

The king then visited the different tents, and inquir
about every thing he saw: all was novelty, and of cou
interested his attention. When he got to the tent wh
the Chinese men were, who had been brought with th
from Macao, Raas Koosk, whose retentive mind ne
PEL

Pelau Islands.

...lost a single trace of anything he had been informed of, acquainted the king that these were a people quite different from the English, and that he had learnt there were many other nations besides these interspersed through the world, some of which fought with guns and others with boarding-pikes, an instrument which he held very cheap in comparison with the former.

When the king heard his brother discoursing about a variety of nations, who all spoke differently, and had before him the example of the Chinese, whose language was not the same with the English, he appeared instantly thoughtful and serious, as if struck by conceptions which had never before crossed his mind. He remained a while pensive and bewildered; and this circumstance impressed on every one at the time an idea that there was every reason to imagine that there had never been a communication between those people and any other nation: and indeed it is evident, that if Pere Pauan did really visit them in 1710, they had before 1783 lost the remembrance of every trace of European manners. This indeed is not surprising, as they had no other record than knots similar to the quipes of Peru at the landing of the Spaniards.

Raa Kook would now show his brother the kitchen, which was in the hollow of a rock, a little above the cave. It was at the time when the cook was preparing dinner; and though the implements were exceedingly scanty, an iron pot, a tea kettle, a tin sauce-pan, with a poker, a pair of tongs, and a frying-pan, were here of sufficient consequence to excite admiration; nor were the bowls now forgotten by Raa Kook, who taking them up, as he explained their use to the king, seemed ambitious to let his brother see what an adept he was at blowing. The little bald cook, who was always close shaved, and never wore any thing on his head, was likewise pointed out to the king as an object of Merriment and curiosity.

Some time after this the king requested five of Captain Wilson's men to attend him in a war he was going to make against the inhabitants of a neighbouring island called Baroong, who, he said, had done him injury. But before this request was made known, he had long struggled with a delicacy of sentiment which no one would have expected to find in regions so disjoined from the rest of mankind. This was no other than that it might prove a temporary inconvenience to the unfortunate strangers who had sought his protection, and might be considered by them as an ungenerous proceeding. It was, however, no sooner made known, than Captain Wilson instantly complied; and every face, which had before been clouded with doubt and apprehension, became immediately brightened and gay.

In this enterprise little more was done than braving their enemies, stripping some cocoa-nut trees of their fruit, and carrying off a number of yams and other provisions; but in another, which was undertaken against the island of Artingall, they were more successful, and showed signs of the same sanguinary disposition which some demon has infused into the whole human race. Nine prisoners of war who had been taken upon this occasion were cruelly put to death; and notwithstanding the English strongly remonstrated against this proceeding, all the arguments they could use were of no avail. In justification of their conduct, they alleged the necessity of doing it for their own security, declaring that they had formerly only detained them as menial servants, but that they always found means to get back to their own country, and return with such a force as frequently made great depredations.

Having given this general account of the character and conduct of these hitherto unknown people, we now proceed to lay before our readers what we have learned of their government, customs, manners, and arts, together with a description of the face of their country. In this the editor of Captain Wilson’s voyage must be our guide; and if our narrative do not satisfy the man of science, it is to be observed, that the Antelope was not a ship sent out purposely to explore undiscovered regions, nor were there people on board properly qualified to examine with judgment every object which presented itself. Distress threw them upon these islands; and while they were there, all their thoughts were occupied on the means of liberating themselves from a situation of all others the most afflicting to the mind, that of being cut off for ever from the society of the rest of the world.

It, however, clearly appears, from their uniform testimony, that at Pelew the king was considered as the first person in the government.

"He was looked up to as the father of his people; and though invested of all external decorations of royalty, had every mark of distinction paid to his person. His rupacks or chiefs approached him with the greatest respect; and his common subjects whenever they passed near him, or had occasion to address him, put their hands behind them, and crouched towards the ground. Upon all occurrences of moment, he convened the rupacks and officers of state; their councils were always held in the open air, where the king first stated the business upon which he had assembled them, and submitted it to their consideration. Each rupack delivered his opinion, but without rising from his seat; and when the matter before him was settled, the king standing up put an end to the council.

"When any message was brought him, whether in council or elsewhere, if it came by one of the common people, it was delivered at some distance in a low voice to one of the inferior rupacks, who, bending in a humble manner at the king's side, delivered it in the same manner with his face turned aside. His commands appeared to be absolute, though he acted in no important business without the advice of his chiefs; and every day in the afternoon, whether he was at Pelew or with the English, he went to sit in public for the purpose of hearing any requests, or of adjusting any difference or dispute which might have arisen among his subjects."

But these, according to our editor, seldom happened; for as their real wants were but few, and they saw nothing to create artificial ones; every one was chiefly occupied with his own humble pursuits; and as far as the ship's crew, who remained among them about three months, could decide, they appeared to conduct themselves towards each other with the greatest civility and benevolence; never wrangling or entering into quarrelsome contentions, as is customary among those who call themselves a polished and enlightened people. Even when
when children showed a disposition of this kind, they strongly marked their displeasure, by stinting with rebuke their little animosities.

The character of the king is thus drawn by the editor: “The excellent man who reigned over these sons of nature, showed himself in every part of his conduct firm, noble, generous, and benevolent; there was a dignity in all his deportment, a gentleness in all his manners, and a warmth and sensibility about his heart, that won the love of all who approached him. Nature had bestowed on him a contemplative mind, which he had improved by those reflections that good sense dictated and observation confirmed. The happiness of his people seemed to be always in his thoughts. In order more effectually to stimulate them to useful labour, he had himself learnt all the few arts they possessed, and was looked on in some of them to be the best workman in his dominions. Placed as he was by Providence in its obscurer scenes, he lived beloved by his chiefs, and revered by his people; over whom, whilst he preserved a dignity which distinguished his superior station, he reigned more as the father than the sovereign. The eyes of his subjects beheld their naked prince with as much awe and respect as those are viewed with who govern polished nations, and are decorated with all the dazzling parade and ornaments of royalty; nor was the purple robe or the splendid diadem necessary to point out a character which the masterly hand of nature had rendered so perfect.

Next in power to the king was his brother Raa Kook, who was official general of all his forces. It was his duty to summon the rupacks to attend the king for whatever purpose they were wanted. He was also his presumptive heir; the succession of Pelew not going to the king’s children till it had passed through his brothers; so that after the demise of Abba Thulle, the sovereignty would have descended to Raa Kook; on his demise to Ara Kook; and on the death of this last it would have reverted to Qui Bill, the king’s eldest son, when Lee Boo, his second son, of whom we have much to say, would have become the hereditary general.

The office of first minister is described as follows: “The king was always attended by a particular chief or rupack, who did not appear to possess any hereditary office, but only a delegated authority. He was always near the king’s person, and the chief who was always first consulted; but whether his office was religious or civil, or both, our people could not learn with any certainty. He was not considered as a warrior, or ever bore arms, and had only one wife, whereas the other rupacks had two. The English were never invited to his house, or introduced into it, although they were conducted to those of almost every other chief.”

Of the rupacks it is observed, “That they could only be regarded as chiefs or nobles; they were not all of the same degree, as was plain by a difference in the bone (A) they wore; they generally attended the king, and were always ready at his command to accompany him on any expedition with a number of canoes properly manned, and armed with darts and spears, who were to remain with him till they had his permission to return home with their dependents. In this part of their government we may trace an outline of the feudal system; but from the few opportunities our people had of investigating points of internal government, it appeared that the titles of rupacks were personal badges of rank and distinction; nor did they apprehend they were hereditary honours, unless in the reigning family, who must of necessity be of this class.”

As to property, it was understood, “That the people possessed only such as arose from their own work and labour, but no absolute one in the soil, of which the king appeared to be general proprietor. A man’s house, furniture, or canoe, was considered as his private property, as was also the land allotted him, as long as he occupied and cultivated it; but whenever he removed with his family to another place, the ground he held reverted to the king, who gave it to whom he pleased, or to those who solicited to cultivate it.”

All that part of the island which they had an opportunity of seeing is said to have been well cultivated. It was covered with trees of various kinds and sizes, many of which must have been very large, as they made canoe of their trunks, some of which were capable of carrying twenty-eight or thirty men. Among the timber trees was noticed the ebony, and a tree which when pierced would yield a thick white liquor of the consistence of cream. “They had also a species of the manchineel-tree, in cutting down of which our people frequently got blistered and swelled; the inhabitants pointed out the cause, saying it was owing to being sprinkled by the sap. This they reckoned among the unlucky trees, and advised our people against the use of it.”

But the most singular tree noticed at Pelew, was one in its size and manner of branching not unlike an orange tree, but in its leaves resembling the myrtle. Its peculiarity was, that it had no bark, but only an outward coat of about the thickness of a card, which was darker than the inside, though equally close in texture. Its colour was nearly that of mahogany, and the wood was so extremely hard, that few of the tools with which the English had could work it. They also found large trees, the bark of which was covered with a fruit something resembled an almond. But yams, cocoa-nuts, being their principal articles of sustenance claimed their chief attention.

The island Coorooroa, of which Pelew is the capi likewise produced plantains, bananas, Seville oranges and lemons, but neither of them in any considerable quantity. None of the islands which the English visited had any kind of grain. As to birds, they had plenty of common cockens and hens, which, though not domesticated, kept running about near their houses and plantations; and what appears extremely singular is, that natives had never made any use of them, till our people told them they were excellent eating. Pigeons accounted a great delicacy; but none but those of the taint dignity were permitted to eat of them. The English left them two geese, which were the only remnant of their live stock.

(A) This was a mark of rank worn upon the wrist, with which Captain Wilson was invested by the king; what animal it came from our people could not learn.
From the description of the country it appears to be very mountainous; but some of the valleys are represented as extensive and beautiful, affording many delightful prospects. The soil being very rich produces great abundance of grass, which, as there are no cattle to eat it, grows very high, and was scorched and burnt up by the sun. Our people saw no river at Pellew; their supplies of fresh water being obtained from small streams and ponds, of which there are a great many.

From this account of the scanty produce of these islands, it is evident that no luxury reigned among their inhabitants, whose principal article of food appears to be fish; they had no salt, nor did they make use of sauce or any seasoning in anything they ate. Their drink was also as simple as their diet: it principally consisted of the milk of the cocoa nut; but upon particular occasions they used a kind of sweet drink and sherbet, which latter had the addition of some juice of orange.

The islands appeared to be populous, though to what extent could not be ascertained. Their houses were raised about three feet from the ground, upon stones which appeared as if hewn from the quarry. The interior part of them was without any division, the whole forming one great room, which rose in a ridge like our barns, the outside being thatched thick and close with bamboos or palm leaves. All their implements, utensils, weapons of war, and canoes, are much of the same kind with those which were found in the South sea islands.

In their marriages they allow a plurality of wives, thought not in general more than two. When a woman is pregnant, the utmost attention is paid to her; but upon other occasions no more respect is shown to one sex than the other. "One of our people endeavoured to make himself agreeable to a lady belonging to one of the rupacks, by what we should call a marked assiduity, Arra Kooker, with the greatest civility, gave him to understand that it was not right to do so."

They have places particularly appropriated to sepulture; their graves being made nearly the same as they are in our country churchyards. The corpse is attended only by women, who at the place of internment make a great lamentation. The men, however, assemble round the body before it is carried to the grave, on which occasion they preserve a solemn silence; "their minds, from principles of fortitude or philosophy, being armed to meet the events of mortality with manly submission, divested of the external testimony of human weakness."

On the article of religion our editor observes, "That among all the race of men whom navigation has brought to our knowledge, few appear to be without a sense of something like religion, however it may be mixed with idolatry or superstition. And yet our people, during their continuance with the natives of Pellew, never saw any particular ceremonies, or observed any thing that had the appearance of public worship. But though there was not found on any of the islands they visited any place appropriated to religious rites, it would perhaps be going too far to declare that the people of Pellew had absolutely no idea of religion. Independent of external testimony, there may be such a thing as the religion of the heart, by which the mind may in a wise silence be turned to contemplate the God of Nature; and though unblest by those lights which have pointed to the Christian world an unerring path to happiness and peace, yet they might, by the light of reason only, have discovered the efficacy of virtue, and the temporal advantages arising from moral rectitude."

"Superstition is a word of great latitude, and vaguely defined: though it hath in enlightened ages been called the offspring of ignorance, yet in no time hath it existed without having some connection with religion. Now the people of Pellew had beyond all doubt some portion of it, as appeared by the wish expressed by the king when he saw the ship building, that the English would take out of it some particular wood, which he perceived they had made use of, and which he observed was deemed an ill omen, or unpropitious."

"They had also an idea of an evil spirit, that often counteracted human affairs. A very particular instance of this was seen when Mr Barker, a most valuable member in the English society, fell backwards from the side of the vessel, whilst he was on the stocks: Raa Kook, who happened to be present, observed that it was owing to the unlucky wood our people had suffered to remain in the vessel, that the evil spirit had occasioned this mischief to Mr Barker."

They likewise appeared to entertain a strong idea of divination, as was evident from the ceremonies they practised before they undertook any enterprise of moment. A few occurrences, which are mentioned in the course of the narrative, would also lead us to believe that they could not be altogether unacquainted with the nature of religious worship: for when they were present at the public prayers of the English, they expressed no surprise at what was doing, but seemed desirous to join in them, and constantly preserved the most profound silence. The general even refused to receive a message from the king which arrived during divine service. And upon another occasion, when Captain Wilson told Lee Boo, that good men would live again above, he replied, with great earnestness, "All same Pellew; bad men stay in earth; good men go into sky; become very beautiful:" holding his hand up, and giving a fluttering motion to his fingers. Some later voyagers, however, have affirmed, that these people, notwithstanding their superstition, have no notion whatever of a Deity; a circumstance to which it is extremely difficult to give full credit.

The most wonderful circumstances in the history of this people, except that last mentioned, are the acuteness of their understanding, their hospitality, and the implicit confidence which they placed in utter strangers. That their manners were pleasing, and their society not disagreeable, is evident from the conduct of Madau Blanchard, one of the seamen, who, when the vessel was built and ready to take her departure with her captain and his companions, was left behind at his own particular request. That they had the fullest confidence in Captain Wilson and his crew, is put beyond a doubt by the behaviour of the king and Raa Kook when their guests were to leave them. Raa Kook solicited his brother's permission to accompany the English, but from prudential motives was refused. The sovereign, however, resolved to entrust his second son Lee Boo to Captain Wilson's care, that he might improve his mind, and learn such things as at his return would benefit his country.

The instructions which he gave the young man, and the fortitude which he showed upon this occasion, would
would have done honour to the most enlightened mind.

Upon delivering him to Captain Wilson, he used these expressions: "I would wish you to inform Lee Boo of all things which he ought to know, and make him an Englishman. The subject of parting with my son I have frequently revolved; I am well aware that the distant countries he must go through, differing much from his own, may expose him to dangers, as well as diseases, that are unknown to us here, in consequence of which he may die; I have prepared my thoughts to this: I know that death is to all men inevitable; and whether my son meets this event at Pelew or elsewhere is immaterial. I am satisfied, from what I have observed of the humanity of your character, that if he is sick you will be kind to him; and should that happen, which your utmost care cannot prevent, let it not hinder you, or your brother, or your son, or any of your countryman, returning here; I shall receive you, or any of your people, in friendship, and rejoice to see you again."

How noble! This is the language of a king, a father, and a philosopher, who would have been delighted to see his son with European accomplishments. But, alas! the subsequent history of this amiable youth must force a tear from the eye of every reader whose heart is not callous to the genuine feelings of nature and humanity. As soon as they arrived at Macao, the house into which he first entered, and the different articles of furniture, fixed him in silent admiration; but what struck his imagination most was the upright walls and flat ceilings of the rooms, being utterly unable to comprehend how they could be so formed. When he was introduced to the ladies of the family, his deportment was so easy and polite, that it could be exceeded by nothing but his abundant good nature; and at his departure, his behaviour left on the mind of every one present the impression, that, however great the surprise might be which the scenes of a new world had awakened in him, it could hardly be exceeded by that which his own amiable manners and native polish would excite in others.

They were now conducted to the house of an English gentleman, who introduced them into a large hall, which was lighted up, with a table in the middle, covered for supper, and a sideboard handsomely decorated. Here a new scene burst at once upon Lee Boo's mind; he was all eye, all admiration. The vessels of glass particularly rivetted his attention; but when he surveyed himself in a large pier glass at the upper end of the hall, he was in raptures with the deception. It was in truth, to him, a scene of magic, a fairy tale.

Soon after the people of the vessel came on shore, some of them went to purchase things they were in want of; in doing which they did not forget Lee Boo, who was a favourite with them all. Among the trinkets they brought him was a string of large glass beads, the first sight of which almost threw him into an ecstasy: he hugged them with a transport which could not have been exceeded by the interested possessor of a string of oriental pearls. His imagination suggested to him that he held in his hand all the wealth the world could afford him. He ran with eagerness to Captain Wilson to show him his riches, and begged he would get him a Chinese vessel to carry them to the king his father, that he might see what the English had done for him; adding, that if the people faithfully executed their charge, he would at their return present them with or two beads as a reward for their services.

Having no quadrupeds at Pelew, the sheep, go and other cattle, which he met with at Macao, viewed with wonder; but soon after, seeing a man on horseback, he was so much astounded that he wanted every one to go and look at the strange sight. After the matter, however, was explained to him, he was easily persuaded to get upon horse himself; and when he was informed what a noble, cile, and useful animal it was, he besought the captain to send one to his uncle Raa Kook, as he was sure would be of great service to him.

Omitting a number of other particulars of this kind which excited his curiosity and showed the excel disposition of his heart, we shall follow him to England, the country from which he was never to return. Here he had not been long before he was sent to an academy to be instructed in reading and writing, which was extremely eager to attain, and most assiduous in his learning. His temper was mild and compassionate to the highest degree; but it was at all times governed by discretion and judgment. If he saw the young ask relief, he would rebuke them with what little English he had, telling them it was a shame to beg when they were able to work; but the entreaties of old age could never withstand, saying, "Must give poor man, old man no able to work."

He always addressed Mr Wilson by the name of Captain, but never would call Mrs Wilson by any other name than mother, looking on that as a mark of greatest respect; and such was the gratitude of his heart for the kindness they showed him, that if any of the milly were ill, he always appeared unhappy, would softly up to the chamber, and sit silent by the bed for a long time together without moving, peeping gibly from time to time between the curtains, to see if it slept or lay still.

He was now proceeding with hasty strides in gaining the English language, writing, and accounts, when was overtaken by that fatal disease, the smallpox, with the greatest pains had been taken to guard him again and notwithstanding the utmost care and attention his physician, he fell a victim to this scourge of the man race.

Upon this trying occasion, his spirit was above explaining, his thoughts being all engrossed by the kindness of his benefactors and friends. He told his tenant, that his father and mother would grieve much, for they knew he was sick. This he repeated several times, and begged him to go to Pelew, tell Abba Thulle that Lee Boo take much drink make smallpox go away, but he die; that the cap and mother very kind; all English very good in much sorry he could not speak to the king the man of fine things the English had got." Then he recked up the presents which had been given him, desiring they might be properly distributed among the ch and requesting that particular care might be taken two glass pedestals, which he begged might be pres ed to his father.

We have given this short history of Lee Boo, beit exhibits in a strong light the manners of the nation of the Pelew islands, to which we know nothing sin in the history of man from the savage state to that civilizat
They appear to have had no communication with any other people, and were yet neither treacherous, cruel, nor cowardly. They are a striking instance of the weakness of all the philosophic theories by which mankind are usually traced from their origin through the several stages of savagism, barbarism, and civilization, down to the period of refinement, ending in effeminacy.

Since the publication of Captain Wilson's voyage we have some further accounts of these islands, all confirming what we were first told of the gentleineness of the people. Two armed ships were, by order of the court of directors, fitted out at Bombay, for the purpose of surveying the islands of Pelew, and furnishing the natives with domestic animals, and such other things as might add to the comforts of life. Among the presents to the king were swords and other European implements of war; of which it is at least possible that he and his people might have been equally happy had they remained for ever in total ignorance. The foundation of a fort was likewise laid on one of the islands, and possession of it taken in the name of the English; we trust with no remote view of enslaving the people, or of driving them from their native country. It has been likewise announced in a late publication, that Captain McClur, who commanded the armed ships, was so delighted with the manners of the king and his subjects, that he was resolved to pass the remainder of his days on those islands at the early age of 54. The following is the sequel of the adventure here alluded to. The two vessels called the Panther and Endeavour, under the command of Captain McClur, were fitted out for a voyage to the Pelew islands, to acquaint Abba Thulile the king with the death of his favourite son Lee Boo, who went to England with Captain Wilson in the Antelope in 1783, where he died. On the 24th of August 1790 Captain McClur sailed from Bombay, having on board Messrs White and Wedgeborough, who had been shipwrecked with Captain Wilson, and were much esteemed by the king of those islands, at which he arrived in January 1791. Abba Thulile, the king, received them with demonstrations of joy as Englishmen, of whom he had previously found reason to entertain a very favourable opinion. The present in which the company sent Abba Thulile was able to travel with all convenient speed. They consisted of a considerable quantity of live stock, such as cows, bulls, ewes, rams, goats, pigs, and poultry, together with arms, ammunition, and packages of hardware, comprising a number of articles which could not fail to be of singular advantage to the natives. The grateful king was astonished at the meaning of all this, and being informed that it was a small acknowledgement for his generous treatment of the crew of the Antelope, when wrecked on his coast, he expressed his regret that it was not in his power to have done more.

With the nature and situation of these islands, as well as the amiable and engaging manners of the natives, Captain McClur was so well pleased, that he considered them as a paradise, where he could spend with pleasure the remainder of his days. Soon after these transactions the Panther sailed in the month of February from the Pelew islands for China, the Endeavour remaining behind till her return, which happened on the 10th of June the same year. Having visited these islands a third time, after a survey of the coast of New Guinea,
Pellias, as recommended, was with equal warmth accepted by the young hero, and his intended expedition was made known all over Greece. While Jason was absent in the Argonautic expedition, Pellias murdered Eason and all his family, but, according to the more received opinion of Ovid, Eason was still living, when the Argonauts returned, and he was restored to the favor of youth by the magic of Medea. This change in the vigour and the constitution of Eason astonished all the inhabitants of Iolcos; and the daughters of Pellias, who have received the patronymic of Peliades, expressed their desire to see their father's infernal visage vanish by the same powerful magic. Medea, who wished to avenge the injuries which her husband Jason had received from Pelias, raised the desire of the Peliades, by cutting an old ram to pieces, and boiling the flesh in a cauldron, and then turning it into a fine young lamb. After they had seen this successful experiment, the Peliades cut their father's body to pieces, after they had drawn all the blood from his veins, on the assurance that Medea would replenish them by her wonderful power. The limbs were immediately put into a cauldron of boiling water; but Medea suffered the flesh to be totally consumed, and refused to give the promised assistance, and the bones of Pellias did not even receive a burial. The Peliades were four in number, Alcestis, Pindice, Pelophea, and Hippothoe, to whom Hyginus adds Medusa. Their mother's name was Anaxibia, the daughter of Bias or Philonachus, the daughter of Amphion. After this parturition, the Peliades fled to the court of Aedmetus, where Acatus, the son-in-law of Pelias, pursued them, and took their protector prisoner. The Peliades died, and were buried in Arcadia.

**PELICAN,** a genus of birds belonging to the order of anatidae. See Ornithology Index.

**PELICAN,** in Chemistry, is a glass alembic consisting of one piece, with a tubulated capital, from which two opposite and crooked beaks pass out, and enter again at the bottom of the cucurbit. This vessel was contrived by the older chemists for a continued distillation, but has gone into disuse.

**PELICANUS,** a genus of birds belonging to the order of anatidae. See Ornithology Index.

**PELION** (Diocorus Siculus, &c.), Pelias, mone understood, (Mela, Virgil, Horace, Seneca,) a mountain of Thessaly near Ossa, and hanging over the Sinus Pelagicus, or Pegasius; its top covered with pines, the sides with oaks, (Ovid.) Said also to abound in wild ash (Val. Flaccus.) From this mountain was cut the spear of Achilles, called pelteus, which none but himself could wield, (Hom.) Dicerachus, Aristotle's scholar, found this mountain 1520 paces higher than any other of Thessaly, (Plink.) Pelias, Cosmas; Pelitius, (Catallus), the epithet.

**PELLA,** in Ancient Geography, a town situated on the confines of Euboea, a district of Macedon, (Ptolemy;) and therefore Herodotus allots it to Bessiaca, a maritime district on the Sinus Thermaicus. It was the royal residence, situated on an eminence, verging to the south-west, encompassed with impassable marshes summer and winter; in which, next the town, a citadel like an island rises, placed on a bank or dam, a prodigious work, both supporting the wall and securing it from any hurt by access of the circumambient waters. At a distance, it seems close to the town, but is separated from it by the Leda, running by the walls, and joined to it by a bridge, (Livy;) distant from the sea 120 stadia, the Leda being so far navigable, (Strabo.) Mela calls the town Pellia, though most Greek authors write Pella. The birth-place of Philip, who enlarged it; and afterwards of Alexander, (Strabo, Mela.) Continued to be the royal residence down to Perseus, (Livy.) Called Pella Colonia, (Pliny;) Colonia Julia Augusta, (Coin.) It afterwards came to decline, with few and mean inhabitants, (Lucian.) It is now called Πασχαλία, the Little Palace, (Holtzianus.) Pelionus, both the gentilicium name and the epiteth, (Lucian, Juvenal, Martial.) —Another Pella, (Polybius, Pliny;) a town of the Decapolis, on the other side the Jordan; abounding in water, like its cognominal town in Macedonia; built by the Macedonians, (Strabo;) by Seleucus, (Eusebius;) anciently called Bura, (Stephanus;)干嘛, (Strabo;) situated 35 miles to the north-east of Gerassa, (Ptolemy.) Thither the Christians, just before the siege of Jerusalem by Titus, were directly conducted thither by (Eusebius.) It was the utmost boundary of the Persea, or Transjordan country, to the north, (Josephus.)

PELLETIER, Bertrand, a celebrated chemical philosopher, was born at Bayonne in 1751, and very soon discovered a strong predilection for the sciences, to cherish which he had every thing in his father's house that could be reasonably desired, and here he acquired the elements of that art for which he was afterwards so famous. His subsequent progress he made under Daret, who admitted him among the pupils attached to the chemical laboratory of France. Five years intense application under such a master, gave him a stock of knowledge very uncommon at his years. As a convincing proof of this, he published, when only 21, a number of valuable observations on arsenic acid, proving contrary to the opinion of Maclaurin, that sulphuric acid distilled from the arseniates of potash, dissolves the acid of arsenic.

Encouraged by the success which attended his first labours of a chemical nature, he communicated his remarks on the crystallisation of sulphur, cinnabar, and the deliquescent salts; the examination of zeolites, particularly the false zeolite of Fréyburg, which he discovered to be merely an ore of zinc. He also made observations on the oxygenated muriatic acid, in reference to the absorption of oxygen; on the formation of others, chiefly the muriatic and the aetic; and a number of memoirs on the operation of phosphorus made in the large way; its conversion into phosphoric acid, and its combination with sulphur and most metallic substances. It was by his operations on phosphorus that he burst himself so severely as nearly to endanger his life. Immediately on his recovery he began the analysis of different varieties of plumage from France, England, Germany, Spain, and America, and gave both novelty and interest to his work, even after the labours of Seneville on the same subject had made their appearance. The analysis of carpanotes of barytes led him to make experiments on animals, from which he discovered that this earth is a real poison, in whatever way administered. Strenuus was also analysed by this celebrated chemist, which was found to contain a new earth. Pelletier discovered a process for preparing verditer in the large way, equal, it is said, in beauty to that which
which is manufactured in England. He was also among the first who shewed the possibility of refining bell metal, and separating the tin. His first experiments were performed at Paris, after which he went to the foundry at Romilly, to prove their accuracy in the large works. This was soon after he was admitted a member of the Academy of Sciences at Paris, and afterwards accompanied Borda and General Daboville to La Fere, to assist in experiments on a new species of gunpowder. Being obliged to pass great part of the day in the open air during a cold and moist season, in order to render his experiments more decisive, his health, which was naturally delicate, was very much impaired. He partly recovered it, but again fell a victim to his thirst after knowledge, for he was at one time nearly destroyed by inspiring the oxygenated muriatic acid gas, which occasioned a consumptive asthma, which at times appeared to abate, but was found to be incurable. The assistance of art was insufficient to save him, and he died at Paris on the 21st of July 1797, of a pulmonary consumption, in the flower of his age, being only 36.

PELLET, in Heraldry, those roundles that are black, excepted also on argente, and gules, and by the French torteau de sable.

PELLICLE, among physicians, denotes a thin film or fragment of a membrane. Among chemists it signifies a thin surface of crystals uniformly spread over a saline liquor evaporated to a certain degree.

PELLISON, or PELLISON FONTANIER, PAUL, one of the finest geniuses of the 17th century, was the son of James Pellisson counsellor at Castres. He was born at Beziers in 1624, and educated in the Protestant religion. He studied with success the Latin, Greek, French, Spanish, and Italian tongues, and applied himself to the reading the best authors in these languages; after which he studied the law at Castres with reputation. In 1652 he purchased the post of secretary to the king, and five years after became first deputy to M. Fouquet. He suffered by the disgrace of that minister; and in 1661 was confined in the Bastile, from whence he was not discharged till four years after. During his confinement he applied himself to the study of controversy; and in 1670 abjured the Protestant religion. Louis XIV. bestowed upon him an annual pension of 2000 crowns; and he likewise enjoyed several posts. In 1676 he had the abbey of Gimen, and some years after the priory of St Orens at Auch. He died in 1693. His principal works are: 1. The History of the French Academy. 2. Reflections on religious Disputes, &c. in 4 vols. 12 mo. 3. The History of Louis XIV. 4. Historical Letters and Miscellaneous, in 3 vols. 12mo.

PELOPA. He was soon observed by the Eleaee after the death of Pelops. A ram was sacrificed on the occasion, which both priests and people were prohibited from partaking of, on pain of excommunication from Jupiter's temple: the neck only was allotted to the officer who provided wood for the sacrifice. This officer was called Ελας; and white poplar was the only wood made use of at solemnity.

PELOPONNESUS, (Diosyllus), a large peninsula to the south of the rest of Greece; called, as it were Pelopin necus, or insula, though properly not an island, but a peninsula; yet wanting but little to be one, viz. the isthmus of Corinth, ending in a point like the leaf of the piaante or plane tree. Anciently called Asia, and Pelasgia; a peninsula second to no other country for nobleness; situated between two seas, the Egean and Ionian, and resembling a platane-leaf, on account of its angular recesses or bays, (Pliny, Strabo, Melas, Strabo adds from Homer, that one of its ancient names was Argo, with the epithet Arcadian, to distinguish it from Thessaly, called Pelagonium. Divided into six parts; namely, Argolis, Laconica, Messenia, Elis, Achaea, and Arcadia, (Melas). Now called the Morea.

PELOPS, in fabulous history, the son of Tantalus, king of Phrygia, went into Elis, where he married Hippodamia the daughter of Oenomaus king of that country; and became so powerful, that all the territory which lies beyond the isthmus, and composes a considerable part of Greece, was called Peloponnesus, that is, the island of Pelops, from his name and the word Πελοποννήσος.

PELT, a small, light, manageable buckler, used by the ancients. It was worn by the Amazons. The pelta is said by some to have resembled an ivy leaf in form; by others it is compared to the leaf of an Indian fig-tree; and by Servius to the moon in her first quarter.

PELTARIA, a genus of plants belonging to the tetradynamia class, and in the natural method ranked under the 39th order, Stilognes. See BOTANY.

PELUSIUM, in Ancient Geography, a strong city of Egypt, without the Delta, distant 20 stadia from the sea; situated midst marshes; and hence its name and its strength. Called the key or inlet of Egypt (Diodorus, Hirtius); which being taken, the rest of Egypt lay quite open and exposed to an enemy. Called Sin (Ezekiel). Pelusiacus the epithet (Virgil, Diodorus). From its ruined arose Damietta. E. Long. 32°. N. Lat. 31°.

Mr Savary gives us the following account of this place: "The period of its foundation, as well as that of the other ancient cities of Egypt, is lost in obscurity of time. It flourished long before Herodotus. As it commanded the entrance of the country on the side of Asia, the Pharaohs rendered it a considerable fortress: one of them raised a rampart of 30 leagues in length from the walls of this town to Heliopolis. But we find from the history of nations that the long wall of China, those which the weakness of the Greek emperors led them to build round Constantinople, and many others, built at an immense expense, were but feeble barriers against a warlike people: the examples have taught us, that a state, to be in security against a foreign yoke, must form warriors within itself; and that men must be opposed to men. This rampart which covered Pelusium did not stop Cambyses, who attacked it with a formidable army. The formidable character of this son of Amasis, unable to prevent the descent of 200,000 Egyptians, who went to found a colony beyond the cataracts, had not force sufficient to oppose that torrent which broke in upon his country. Cambyses, after a bloody battle, wherein he cut his enemies to pieces, entered Pelusium in triumph. That memorable day, which saw the descent of one part of the Egyptian militia, and the ruin of the other, is the true epoch of the subjugation of that rich country. Since that period, it has passed under the yoke of the Persians, the Macedonians, the Romans, the Greeks, the Arabs, and the Turks. A
continued slavery of more than 2000 years seems to secure them an eternal bondage.

"Herodotus, who visited Pelusium some years after the conquest of Cambyses, relates an anecdote which I cannot omit: I surveyed (says he) the plain where the two armies had fought. It was covered with human bones collected in heaps. Those of the Persians were on one side, those of the Egyptians on the other, the inhabitants of the country having taken care to separate them after the battle. They made me take notice of a fact which would have appeared very astonishing to me without their explanation of it. The skulls of the Persians, which were slight and fragile, broke on being lightly struck with a stone; those of the Egyptians, thicker and more compact, resisted the blows of flint. This difference of solidity they attributed to the custom the Persians have of covering their heads from their infancy with the tiara, and to the Egyptian custom of leaving the heads of their children bare and shaved, exposed to the heat of the sun. This explanation appeared satisfactory to me." Mr Savary assured me that the same customs still subsist in Egypt, of which he frequently had ocular demonstration.

"Pelusium (continues he), after passing under the dominion of Persia, was taken by Alexander. The brave Antony, general of cavalry under Cambyses, took it from his successor, and Rome restored it to Ptolemy Auletes. Pompey, whose credit had established this young prince on the throne of Egypt, after the fatal battle of Pharsalia took refuge at Pelusium. He landed at the entrance of the harbour; and, on quitting his wife Cornelia and his son, he repeated the following verses of Sophocles, "The free man who seeks an asylum at the court of a king will meet with slavery and chains." He there found death. Scarcely had he landed on the shore, when Theodore the rhetorician, of the isle of Chio, Septimius the courtier, and Achillas the eunuch, who commanded his troops, wishing for a victim to present to his conqueror, stabbed him with their swords. At the sight of the assassins, Pompey covered his face with his mantle, and died like a Roman. They cut off his head, and embalmed it, to offer it to Caesar, and left his body naked on the shore. It was thus that this great man, whose warlike talents had procured the liberty of the seas for the Romans, and added whole kingdoms to their extended empire, was basely slain in setting foot on the territory of a king who owed to him his crown. Philip his freedman, collecting together, under favour of the night, the wreck of a boat, and stripping off his own cloak to cover the sad remains of his master, burnt them according to the custom. An old soldier, who had served under Pompey's colours, came to mingle his tears with those of Philip, and to assist him in performing the last offices to the remains of his general.—Pelusium was often taken and pillaged during the wars of the Romans, the Greeks, and the Arabs. But in spite of so many disasters, she preserved to the time of the Crusades her riches and her commerce. The Christian princes having taken it by storm, sacked it. It never again rose from its ruins; and the inhabitants went to Damietta." See Damietta.

PELVIS, in Anatomy. See Anatomy Index.

PEMBROKE, MARY, Countess of. See HERBERT.

PEMBROKE, in Pembroke-shire, in England, is the principal town in the county. It is situated upon a creek of Milford-Haven, and in the most pleasant part of Pembroke, being about 256 miles distant from London. It is the county-town, and has two handsome bridges over two small rivers which run into a creek, forming the west side of a promontory. It is well inhabited, has several good houses, and but one church. There is also a customhouse in it. There are several merchants in it, who, favoured by its situation, employ near 200 sail on their own account; so that, next to Caerarthen, it is the largest and richest town in South Wales. It has one long straight street, upon a narrow part of a rock; and the two rivers seem to be two arms of Milford-Haven, which ebbs and flows close up to the town. It was in former times fortified with walls, and a magnificent castle seated on a rock at the west end of the town. In this rock, under the chapel, is a natural cavern called Wogan, remarked for having a very fine echo: this is supposed to have been a store-room for the garrison, as there is a staircase leading into it from the castle. This structure being burnt a few years after it was erected, it was rebuilt. It is remarkable for being the birth-place of Henry VII. and for the brave defence made by the garrison for Charles I. The inhabitants in 1811 amounted to 2415.

PEMBROKE, in Pembroke-shire, a county of Wales, bounded on all sides by the Irish sea, except on the east, where it joins to Caerarthenshire, and on the north-east to Cardiganshire. It lies the nearest to Ireland of any county in Wales; and extends in length from north to south 35 miles, and from east to west 20, and is about 140 in circumference. It is divided into seven hundreds; contains about 420,000 acres, one city, eight market-towns, two forests, 145 parishes. In 1811 it contained 12,874 houses, and 60,617 inhabitants, of whom 15,557 lived in towns, and 45,058 in the country. It lies in the province of Canterbury, and diocese of St David's. It sends three members to parliament, viz. one for the county, one for Haverfordwest, and one for the town of Pembroke.

The air of Pembroke-shire, considering its situation, is good; but it is in general better the farther from the sea. There are but few woods; the soil is generally fruitful, especially on the sea-coasts; its mountains also maintain great numbers of sheep and goats. Its other commodities are corn, cattle, pit-coal, marl, fish, and fowl. Among these last are falcons, called here Peregrines. Amongst the birds common here are migratory sea-birds, that breed in the isle of Ramsey, and the adjoining rocks called The Bishop and his Clerks. About the beginning of April such flocks of sea-birds, of several kinds, resort to these rocks, as appear incredible to those who have not seen them.

The inhabitants of this county make a very pleasant durable fire of culm, which is the dust of coal made up into balls with a third part of mud. The county is well watered by the rivers Clewy, Douglady, Cleidoch, and Teive; which last parts it from Cardiganshire. There is a division of the county styled Rheid in the Welsh, by which is meant a large green plain. This is inhabited by the descendants of the Flemings, placed there by Henry I. to curb the Welch, who were never able to expel them, though they often attempted it. On the coasts of this county, as well as on those of Glamorganshire and the Severn sea, is found a kind of alga or laver, which is gathered in spring; and of which the
PEN

the inhabitants make a sort of food, called in Welch tanan, and in English black butter. Having washed it clean, they lay it to sweat between two flat stones, then abred it small, and knead it well, like dough for bread, and then make it up into great balls or rolls, which is by some eaten raw, and by others fried with oatmeal and butter. It is accounted excellent against many distempers. See Pembrokeshire, Supplement.

PEN, a town of Somersetshire, in England, on the north-east side of Wincanton, where Kenwald a West Saxon king so totally defeated the Britons, that they were never after able to make head against the Saxons; and where, many ages after this, Edmund Ironside gained a memorable victory over the Danes, who had before, i. e. in 1001, defeated the Saxons in such same place.

PEN, a little instrument, usually formed of a quill, serving to write withal.

Pens are also sometimes made of silver, brass, or iron.

Dutch Pens, are made of quills that have passed through hot ashes, to take off the grosser fat and moisture, and render them more transparent.

Fountain Pen, is a pen of silver, brass, &c. contrived to contain a considerable quantity of ink, and let it flow out by gentle degrees, so as to supply the writer a long time without being under the necessity of taking fresh ink.

The fountain pen is composed of several pieces. The middle piece, fig. 1. carries the pen, which is screwed into the inside of a little pipe, which again is soldered to another pipe of the same bigness as the lid, fig. 2.; in which lid is soldered a male screw, for screwing on the cover, as also for stopping a little hole at the place and hindering the ink from passing through it. At the other end of the piece, fig. 1. is a little pipe, on the outside of which the top-cover, fig. 3. may be screwed. In the cover there goes a port-crayon, which is to be screwed into the last-mentioned pipe, in order to stop the end of the pipe, into which the ink is to be poured by a funnel. To use the pen, the cover fig. 2. must be taken off, and the pen a little shaken, to make the ink run more freely.

There are, it is well known, some instruments used by practical mathematicians, which are called pens, and which are distinguished according to the use to which they are principally applied; as for example, the drawing pen, &c. an instrument too common to require a particular description in this place. But it may be proper to take some notice of the geometric pen, as it is not so well known, nor the principles on which it depends so obvious.

The geometric Pen is an instrument in which, by a circular motion, a right line, a circle, an ellipse, and other mathematical figures, may be described. It was first invented and explained by John Baptista Sacardi, in a work intitled Nuovo Instrumenti per la Descrizione di diverse Curve Antichi e Moderni, &c. Several writers had observed the curves arising from the compound motion of two circles, one moving round the other; but Sacardi first realized the principle, and first reduced it to practice. It has been lately introduced with success into the steam-engine by Watt and Bolton. The number of curves this instrument can describe is truly amazing; the author enumerates not less than 173, which (he says) can be described by it in the simple form. We shall give a short description of it from Adam's Geometrical and Graphical Essays.

Fig. 1 represents the geometric pen; A, B, C, the stand by which it is supported; the legs A, B, C, are contrived to fold one within the other for the convenience of packing. A strong axis D is fitted to the top of the frame; to the lower part of this axis any of the wheels (as r) may be adapted; when screwed to it they are immovable. EG is an arm contrived to turn round upon the main axis D; two sliding boxes are fitted to this arm; to these boxes any of the wheels belonging to the geometric pen may be fixed, and then slid so that the wheels may take into each other and the immovable wheel s; it is evident, that by making the arm EG revolve round the axis D, these wheels will be made to revolve also, and that the number of their revolutions will depend on the proportion between the teeth. F G is an arm carrying the pencil; this arm slides backwards and forwards in the box c d, in order that the distance of the pencil from the centre of the wheel h may be easily varied; the box c d is fitted to the axis of the wheel h, and turns round with it, carrying the arm f g along with it; it is evident, therefore, that the revolutions will be fewer or greater in proportion to the difference between the numbers of the teeth in the wheels h and s; this bar and socket are easily removed for changing the wheels. When two wheels only are used, the bar f g moves in the same direction with the bar EG; but if another wheel is introduced between them, they move in contrary directions.

The number of teeth in the wheels, and consequently the relative velocity of the epicycle or arm f g, may be varied in infinitum. The numbers we have used are 8, 16, 24, 32, 40, 48, 56, 64, 72, 80, 88, 96.

"The construction and application of this instrument is so evident from the figure, that nothing more need be pointed out than the combinations by which various figures may be produced. We shall take two as examples:

"The radius of EG (fig. 2.) must be to that of f g Fig. 2. as 10 to 5 nearly; their velocities, or the number of teeth in the wheels, to be equal; the motion to be in the same direction.

"If the length of f g be varied, the looped figure delineated at fig. 3. will be produced. A circle may be Fig. 3. described by equal wheels, and any radius but the bars must move in contrary directions.

"To describe by this circular motion a straight line and an ellipse. For a straight line, equal radii, the velocity as 1 to 2, the motion in a contrary direction; the same data will give a variety of ellipses, only the radii must be unequal; the ellipses may be described in any direction." See fig. 4.

PEN, or Penstock. See PENSTOCK.

Sea-Pen. See PENNATULA, HELMINTHOLOGY Index.

PENANCE, a punishment, either voluntary or imposed by authority, for the faults a person has committed. Penance is one of the seven sacraments of the Roman church. Besides fasting, alms, abstinence, and the like, which are the general conditions of penance, there are others of a more particular kind; as the pealing a certain number of Ave-marys, pater-nosters, and
and creeds, wearing a hair-shirt, and giving one's self a
certain number of stripes. In Italy and Spain it is usual
to see Christians almost naked, loaded with chains and
a cross, and lashing themselves at every step.

PENATES, in Roman antiquity, a kind of tutelar
deities, either of countries or particular houses; in which
last sense they differed in nothing from the laroes. See
LARIES.

The penates were properly the tutelar gods of the
Trojans, and were only adopted by the Romans, who
gave them the title of penates.

PENCIL, an instrument used by painters for laying
on their colours. Pensiles are of various kinds, and
made of various materials; the largest sorts are made of
boars' bristles, the thick ends of which are bound to a
stick, bigger, or less according to the uses they are de-
signed for; these, when large, are called brushes. The
finer sorts of pencils are made of camel's, badgers, and
squirrel's hair, and of the down of swans; these are tied
at the upper end with a piece of strong thread, and en-
closed in the barrel of a quill.

All good pencils, on being drawn between the lips,
come to a fine point.

PENCIL, is also an instrument used in writing, draw-
ning, &c. made of long pieces of black lead or red
chalk, placed in a groove cut in a slip of cedar; on
which other pieces of cedar being glued, the whole is
placed round, and one of the ends being cut to a point,
it is fit for use.

Black lead in fine powder, stirred into melted sal-
phur, unites with it so uniformly, and in such quantity,
in virtue perhaps of its subduing with salphur, that
though the compound remains fluid enough to be pour-
ed into moulds, it looks nearly like the coarser sorts of
black lead itself. Probably the way which Prince Re-
port is said to have bad, mentioned in the third volume
of Dr Birch's History of the Royal Society, of making
black lead run like a metal in a mould, so as to serve for
black lead again, consisted in mixing with it sulphur or
sulphurous bodies.

On this principle the German black lead pencils are
said to be made; and many of those which are hawked
about by certain persons among us are prepared in the
same manner: their miltmg or softening, when held to
a candle, or applied to a red-hot iron, and yielding a
bluish flame, with a strong smell like that of burning
brimstone, betrays their composition; for black lead it-
self yields no smell or fume, and suffers no apparent
alteration in that heat. Pencils made with such additions
are of a very bad kind; they are hard, brittle, and do
not cast or make a mark freely either on paper or wood,
rather cutting or scratching than leaving a coloured
stroke.

The true English pencils (which Vogel in his min-
eral system, and some other foreign writers, imagine to
be prepared also by melting the black lead with some
additional substances, and casting it into a mould) are
formed of black lead alone sawed into slips, which are
fitted into a groove made in a piece of wood, and an-
other slip of wood glued over them: the softest wood, as
cedar, is made clincher of, that the pencil may be the
casier cut; and a part at one end, too short to be convey-
ningly cast away, is left unglued with the black lead, that there may be
no waste of so valuable a commodity. These pencils
are greatly preferable to the others, though seldom so
perfect as could be wished, being accompanied with
some degree of the same inconveniences, and being ve-
er unequal in their quality, on account of different sorts
of the mineral being fraudulently joined together in one
pencil, the fore part being commonly pretty good, and
the rest an inferior kind. Some, to avoid these im-
perfections, take the finer pieces of black lead itself,
which they saw into slips, and fix for use in port cray-
ones: this is doubtless the surest way of obtaining black
lead crayons, whose goodness can be depended on.

PENDANT, an ornament hanging at the ear, fre-
quently composed of diamonds, pearls, and other jew-
els.

PENDANTS, in Heraldry, parts hanging down from
the label to the number of three, four, five, or six at
most, resembling the drop-in the Doric frieze. When
they are more than three, they must be specified in blaz-
ing.

PENDANTS of a Ship, are those streamers, or long
colours, which are split and divided into two parts, end-
ing in points, and hung at the head of masts, or at the
yard-arm ends.

PENDENNE, in Cornwall, in England, on the
north coast, by Morvath. There is here an unfathom-
able cave under the earth, into which the sea flows at
high water. The cliffs between this and St Ives shine
as if they had store of copper, of which indeed there is
abundance within land.

PENDENNIS, in Cornwall, at the mouth of Fal-
mouth haven, is a peninsula of a mile and a half in
compass. On this Henry VIII. erected a castle, oppo-
site to that of St Maw's, which he likewise built. It
was fortified by Queen Elizabeth, and served then for
the governor's house. It is one of the largest castles in
Britain, and is built on a high rock. It is stronger by
load than St Maw's, being regularly fortified, and hav-
ing good outworks.

PENDULOUS, a term applied to any thing that
bends or hangs downwards.

PENDULUM, a vibrating body suspended from a
fixed point. For the history of this invention, see the
article CLOCK.

The theory of the pendulum depends on that of the
inclined plane. Hence, in order to understand the na-
ture of the pendulum, it will be necessary to premia
some of the properties of this plane; referring, however,
to Inclined PLANES, and to the article MECHANICS, for
the demonstration.

I. Let $AC$ (fig. 1) be an inclined plane, $AB$ its
perpendicular height, and $D$ any heavy body; then
the force which impels the body $D$ to descend along
the inclined plane $AC$, is to the absolute force of gra-
avity as the height of the plane $AB$, to its length $AC$;
and the motion of the body will be uniformly acceler-
ated.

II. The velocity acquired in any given time by a
body descending on an inclined plane $AC$, is to the
velocity acquired in the same time by a body falling
freely and perpendicularly, as the height of the plane
$AB$ to its length $AC$; and the times of description as the spaces
described.

III. If a body descend along several contiguous
planes,
PEN [ III ]

Pendulums. Planes, AB, BC, CD, (fig. 2.) the final velocity, namely, that at the point D, will be equal to the final velocity in descending through the perpendicular AE, the perpendicular heights being equal. Hence, if these planes be supposed indefinitely short and numerous, they may be conceived to form a curve, and therefore the final velocity acquired by a body in descending through any curve AF, will be equal to the final velocity acquired in descending through the planes AB, BC, CD, or to that in descending through AE, the perpendicular heights being equal.

IV. If from the upper or lower extremity of the vertical diameter of a circle a cord be drawn, the time of descent along this cord will be equal to the time of descent through the vertical diameter; and therefore the times of descent through all cords in the same circle, drawn from the extremity of the vertical diameter, will be equal.

V. The times of descent of two bodies through two planes equally elevated will be in the subduplicate ratio of the lengths of the planes. If, instead of one plane, each be composed of several contiguous planes similarly placed, the times of descent along these planes will be in the same ratio. Hence, also, the times of describing similar arches of circles similarly placed will be in the subduplicate ratio of the lengths of the arches.

VI. The same things hold good with regard to bodies projected upward, whether they ascend upon inclined planes or along the arches of circles.

The point or axis of suspension of a pendulum is that point about which it performs its vibrations, or from which it is suspended.

The centre of oscillation is a point in which, if all the matter in a pendulum were collected, any force applied at this centre would generate the same angular velocity in a given time as the same force when applied at the centre of gravity.

The length of a pendulum is equal to the distance between the axis of suspension and centre of oscillation.

Let PN (fig. 3.) represent a pendulum suspended from the point P; if the lower part N of the pendulum be raised to A, and let fall, it will by its own gravity descend through the circular arch AN, and will have acquired the same velocity at the point N that a body would acquire in falling perpendicularly from C to F, and will endeavour to go off with that velocity in the tangent ND; but being prevented by the rod or cord, will move through the arch NB to B, where, losing all its velocity, it will by its gravity descend through the arch BN, and, having acquired the same velocity as before, will ascend to A. In this manner it will continue its motion forward and backward along the arch ANB, which is called an oscillatory or vibratory motion; and each swing is called a vibration.

Prop. I. If a pendulum vibrates in very small circular arcs, the times of vibration may be considered as equal, whatever be the proportion of the arcs.

Let PN (fig. 4.) be a pendulum; the time of describing the arch AB will be equal to the time of describing CD; these arches being supposed very small.

Join AN, CN; then since the times of descent along all cords in the same circle, drawn from one extremity of the vertical diameter, are equal; therefore the cords AN, CN, and consequently their doubles, will be described in the same time; but the arcs AN, CN being supposed very small, will therefore be nearly equal to their cords; hence the times of vibrations in those arcs will be nearly equal.

Prop. II. Pendulums which are of the same length vibrate in the same time, whatever be the proportion of their weights.

This follows from the property of gravity, which is always proportional to the quantity of matter, or to its inertia. When the vibrations of pendulums are compared, it is always understood that the pendulums describe either similar finite areas, or arcs of evanescent magnitude, unless the contrary is mentioned.

Prop. III. If a pendulum vibrates in the small arc of a circle, the time of one vibration is to the time of a body's falling perpendicularly through half the length of the pendulum, as the circumference of a circle is to its diameter.

Let PE (fig. 5.) be the pendulum which describes the arch ANC in the time of one vibration; let PN be perpendicular to the horizon, and draw the cords AC, AN; take the arc ER infinitely small, and draw EFG, cFg perpendicular to PN, or parallel to AC; describe the semicircle BGN, and draw er,g perpendicular to EG: now let t = time of describing the diameter 2PN, or through the cord AN; then the velocities gained by falling through 2PN, and by the pendulum's descending through the arch AE, will be as \( \sqrt{2PN} \) and \( \sqrt{BF} \); and the space described in the time \( t \), after the fall through 2PN, is 4PN. But the times are as the spaces divided by the velocities.

Therefore \( \frac{4PN}{\sqrt{2PN}} \) or \( \frac{2\sqrt{2PN}}{\sqrt{BF}} \), time of describing \( E = \frac{1}{2} \times E \). But in the similar triangles PEF, EFR, and KGF, GFG,

\[ \begin{align*}
\Delta PFE &= PE : EF : : EF : PE \times E
\\
\Delta KGF &= KG : FG : : FG : KG \times KG
\\
\Delta KGD &= KG : GD : : GD : KG \times KG
\\
\Delta PNX &= PN : XF : : XF : PN \times EX
\\
\Delta KGK &= KG : KG : : KG : KG \times KG.
\end{align*} \]

Hence \( E = \frac{1}{2} \times PN \times FG \times G \).

And by substituting this value of \( E \) in the former equation, we have the time of describing \( E = \)

\[ \begin{align*}
2BD \times EF \times \sqrt{BI} \times 2PN
\end{align*} \]

circle \( FGC = \sqrt{BF} \times FN \), and \( EF = \sqrt{PN} + PF + FN \).

Hence, by substitution, we obtain the time of describing

\[ \begin{align*}
2BD \times PN \times \sqrt{PF} \times FN \times \sqrt{BF} \times 2PN
\end{align*} \]

\[ \begin{align*}
2BD \times \sqrt{PN} + PF \times FN \times \sqrt{BF} \times 2PN
\end{align*} \]

\[ \begin{align*}
2BD \times \sqrt{PN} + PF \times \sqrt{BF} \times 2PN
\end{align*} \]

\[ \begin{align*}
2BD \times \sqrt{PN} + PF \times \sqrt{BF} \times 2PN
\end{align*} \]

But \( NF \), in its mean quantity for all the arcs \( Gg \), is nearly equal to \( NK \); for if the semicircle described on the diameter BN, which corresponds to the whole arch AN, be divided into,
the time of vibration of the pendulum PO in a subdu-
re-plicate ratio of PN to PO.

If the length of a pendulum vibrating seconds be
39.174 inches, then the length of a pendulum vibra-
ting half seconds will be 9.793 inches. For 1" : ½" ::
\[\sqrt{3.174} : \sqrt{x};\] and 1 : ½ :: 39.174 : x. Hence
\[x = 39.174 \times 9.793.

PROP. VI. The lengths of pendulums vibrating in
the same time, in different places, will be as the forces
of gravity.

For the velocity generated in any given time is
directly as the force of gravity, and inversely as the quan-
tity of matter. Now the matter being supposed the
same in both pendulums, the velocity is as the force of
gavity; and the space passed through in a given time
will be as the velocity; that is, as the gravity.

Cor. Since the lengths of pendulums vibrating in
the same time in small arcs are as the gravitating forces,
and as gravity increases with the latitude on account of
the spheroidal figure of the earth and its rotation about its
axis; hence the length of a pendulum vibrating in a
given time will be variable with the latitude, and the
same pendulum will vibrate slower the nearer it is car-
ried to the equator.

PROP. VII. The time of vibrations of pendulums
of the same length, acted upon by different forces of
gravity, are reciprocally as the square roots of the
forces.

For when the matter is given, the velocity is as the
force and time; and the space described by any given
force is as the force and square of the time. Hence the
lengths of pendulums are as the forces and the squares
of the times of falling through them. But these times
are in a given ratio to the times of vibration; whence
the lengths of pendulums are as the forces and the
squares of the times of vibration. Therefore, when the
lengths are given, the forces will be reciprocally as the
square of the times, and the times of vibration reciproc-
al as the square roots of the forces.

Cor. Let \(p = \text{length of pendulum}, \quad g = \text{force of}
\text{gravity}, \quad \text{and} \quad t = \text{time of vibration}. \) Then since \(p =
g \times \frac{t}{c}\). Hence \(g = p \times \frac{1}{c^2}; \) and \(t = \sqrt{p} \times \frac{1}{g}.

That is, the forces in different places are directly as the
lengths of the pendulums, and inversely as the square
roots of the times of vibration; and the times of vibra-
tion are directly as the square roots of the lengths of
the pendulums, and inversely as the square roots of the
gravitating forces.

PROP. VIII. A pendulum which vibrates in the
arch of a cycloid describes the greatest and least vibra-
tions in the same time.

This property is demonstrated only on a supposition
that the whole mass of the pendulum is concentrated at
a point; but this cannot take place in any really vibra-
ting body; and when the pendulum is of finite magni-
tude, there is no point given in position which deter-
mines the length of the pendulum; on the contrary the
centre of oscillation will not occupy the same place if
the given body, when describing different parts of the
tract it moves through, but will continually be moved in
respect of the pendulum itself during its vibration. I
may, however, be observed, that Huyghens, aware tha
Whence, if the clock be so adjusted as to keep time when the thermometer is at $55^\circ$, it will lose 10 seconds daily when the thermometer is at $65^\circ$, and gain as much when it is at $45^\circ$.

Hence the daily variation of the rate of the clock from summer to winter will be very considerable. It is true indeed that most pendulums have a nut or regulator at the lower end, by which the bob may be raised or lowered a determinate quantity; and therefore while the height of the thermometer is the same, the rate of the clock will be uniform. But since the state of the weather is ever variable, and as it is impossible to be raising or lowering the bob of the pendulum at every change of the thermometer, therefore the correction formerly mentioned is to be applied. This correction, however, is in some measure liable to a small degree of uncertainty; and in order to avoid it altogether, several contrivances have been proposed by constructing a pendulum of different materials, and so disposing them that their effects may be in opposite directions, and thereby counterbalance each other; and by this means the pendulum will continue of the same length.

Mercurial Pendulum. The first of these inventions is that by the celebrated Mr George Graham. In this, the rod of the pendulum is a hollow tube, into which a sufficient quantity of mercury is introduced. Mr Graham first used a glass tube, and the clock to which it was applied was placed in the most exposed part of the house. It was kept constantly going, without having the hands or pendulum altered, from the 9th of June 1722 to the 14th of October 1725, and its rate was determined by transits of fixed stars. Another clock made with extraordinary care, having a pendulum about 60 pounds weight, and not vibrating above one degree and a half from the perpendicular, was placed beside the former, in order the more readily to compare them with each other, and that they might both be equally exposed. The result of all the observations was this, that the irregularity of the clock with the quicksilver pendulum exceeded not more than one part of that of the other clock with the common pendulum, but for the greatest part of the year not above an eighth or ninth part; and even this quantity would have been lessened, had the column of mercury been a little shorter: for it differed a little the contrary way from the other clock, going faster with heat and slower with cold. To confirm this experiment more, about the beginning of July 1723 Mr Graham took off the heavy pendulum from the other clock, and made another with mercury, but with this difference, that instead of a glass tube he used a brass one, and varnished the inside to secure it from being injured by the mercury. This pendulum he used afterwards, and found it about the same degree of exactness as the other.

The Gridiron Pendulum is an ingenious contrivance for the same purpose. Instead of one rod, this pendulum is composed of any convenient number of rods, as five, seven, or nine; being so connected, that the effect of one set of them counteracts that of the other set; and therefore, being properly adjusted to each other, the centres of suspension and oscillation will always be equidistant. Fig. 7. represents a gridiron pendulum composed of nine rods, steel and brass alternately. The two outer rods AB, CD, which are of steel, are fastened to the cross pieces AC, BD by
The next two rods, EF, GH, are of brass, and are fastened to the lower bar BD, and to the second upper bar EG. The two following rods are of steel, and are fastened to the cross bars EG and IK. The two rods adjacent to the central rod being of brass, are fastened to the cross pieces IK and LM; and the central rod, to which the ball of the pendulum is attached, is suspended from the cross piece LM, and passes freely through a perforation in each of the cross bars IK, BD. From this disposition of the rods, it is evident that, by the expansion of the extreme rods, the cross piece BD, and the two rods attached to it, will descend: but since these rods are expanded by the same heat, the cross piece EG will consequently be raised, and therefore also the two next rods; but because these rods are also expanded, the cross bar IK will descend; and by the expansion of the two next rods, the piece LM will be raised a quantity sufficient to counteract the expansion of the central rod. Whence it is obvious, that the effect of the steel rods is to increase the length of the pendulum in hot weather, and to diminish it in cold weather, and that the brass rods have a contrary effect upon the pendulum. The effect of the brass rods must, however, be equivalent not only to that of the steel rods, but also to the part above the frame and spring, which connects it with the cock, and to that part between the lower part of the frame and the centre of the ball.

M. Thieout.

Another excellent contrivance for the same purpose is described in a French author on clock-making. It was used in the north of England by an ingenious artist about 40 years ago. This invention is as follows:

A bar of the same metal with the rod of the pendulum, and of the same dimensions, is placed against the back part of the clock case; from the top of this a part projects, to which the upper part of the pendulum is connected by two fine pliable chains or silk strings, which just below pass between two plates of brass, whose lower edges are always terminated in the length of the pendulum at the upper end. These plates are supported on a pedestal fixed to the back of the case. The bar rests upon an immovable base at the lower part of the case; and is inserted into a groove, by which means it is always retained in the same position. From this construction, it is evident that the extension or contraction of this bar, and of the rod of the pendulum, will be equal, and in contrary directions. For suppose the rod of the pendulum to be expanded any given quantity by heat; then, as the lower end of the bar rests upon a fixed point, the bar will be expanded upwards, and raise the upper end of the pendulum just as much as its length was increased; and hence its length below the plates will be the same as before.

Of this pendulum, somewhat improved by Mr. Crossthwaite watch and clock-maker, Dublin, we have the following description in the Transactions of the Royal Irish Academy, 1788—"A and B (fig. 8.) are two rods of steel forged out of the same bar, at the same time, of the same temper, and in every respect similar. On the top of B is formed a gibbet C; this rod is firmly supported by a steel bracket D, fixed on a large piece of marble E, firmly set into the wall F, and having liberty to move freely upwards between cross staples of brass, 1, 2, 3, 4, which touch only in a point in front and rear (the staple having been carefully formed for that purpose); to the other rod is firmly fixed by its centre the lens G, of 24 pounds weight, although it should in strictness be a little below it. This pendulum is suspended by a short steel spring on the gibbet at C; all which is entirely independent of the clock. To the back of the clock plate I are firmly screwed two checks nearly cycloidal at K, exactly in a line with the centre of the verge L. The maintaining power is applied by a cylindrical steel stud, in the manner of regulators; at M. Now, it is very evident, that any expansion or contraction that takes place in either of these exactly similar rods, is instantly counteracted by the other; whereas in all compensation pendulums composed of different materials, however just calculation may seem to be, that can never be the case, as not only different metals, but also different bars of the same metal, that are not manufactured at the same time, and exactly in the same manner, are found by a good pyrometer to differ materially in their degrees of expansion and contraction, a very small change affecting one and not the other."
such a manner as to form the evolute of the given parabola. Hence, let KH (fig. 9) be an axis perpendicular to the horizon, having a pinion at K moved by the last wheel in the train of the clock; and a hardened steel point at H moving in an agate pivot, to render the motion as free as possible. Now, let it be required that the pendulum shall perform each revolution in a second, then the paraboloid surface it moves in must be such whose latus rectum is double the length of the common half second pendulum. Let O be the focus of the parabola MEC, and MC the latus rectum; and make AE : MO = MC = the length of a common half second pendulum. At the point A of the verge, let a thin plate AB be fixed at one end, and at the other end B let it be fastened to a bar or arm BD perpendicular to DH, and to which it is fixed at the point D. The figure of the plate AB is that of the evolute of the given parabola MEC.

The equation of this evolute, being also that of the semicubical parabola, \( x^2 = \frac{27}{16} y^2 \). Let \( x = \frac{27}{16} P \); then \( P \cdot y = \frac{27}{16} P \). In this case \( x^2 = \frac{27}{16} P^2 \); hence \( x = \frac{27}{16} P \), and \( x = \frac{P}{\sqrt{3} - \frac{27}{16}} \), which is the distance of the focus from the vertex A. By assuming the value of \( x \), the ordinates of the curve may be found; and hence it may be easily drawn.

The string of the pendulum must be of such a length that when one end is fixed at B, it may lie over the plate AB, and then hang perpendicular from it, so that the centre of the bob may be at E when at rest. Now, the verge KH being put into motion, the ball of the pendulum will begin to gyrate, and thereby conceive a centrifugal force which will carry it out from the axis to some point F, where it will circulate seconds or half seconds, according as the line AE is 9.8 inches, or 2.4 inches, and AB answerable to it.

One advantage possessed by a clock having a pendulum of this construction is, that the second hand moves in a regular and uniform manner, without subject to those jerks or starts as in common clocks; and the pendulum is entirely silent.

Theory has pointed out several other pendulums, known by the names of Elliptical, Horizontal, Rotundary, &c. pendulums. These, however, have not as yet attained that degree of perfection as to supplant the common pendulum.

Observing that both the gridiron and mercurial pendulums are subject to many inconveniences and errors, Mr. Carter has attempted to construct one possessing such properties in respect of cheapness and accuracy as he thinks might justly give it the preference to any other. As wood possesses a less degree of expansibility by means of heat than any other substance; on this account, if it could be rendered quite impervious to moisture, it would be the best of all substances for the rod of a pendulum; and as it also appears that zine, above all other metals, possesses the greatest degree of expansibility by means of heat, he considered it the best substance which could be employed for a compensation. His next object was to institute a set of delicate experiments, in order to ascertain the precise degree of the expansibility of wood by the application of heat, and be discovered by the use of a pyrometer, that a rod of very dry, well seasoned white wood, four feet long, three-fourths of an inch broad, and one-fourth of an inch thick, when exposed in an oven to the temperature of 235°, had contracted. Being again put into the oven, where it was permitted to remain for a long time till it became a little discoloured, with a view to dissipate the whole of the moisture, it was placed in the pyrometer, and allowed to remain till it reached the temperature of the room, or 49°, when it was found to have contracted 0.0225 of an inch with 136° of Fahrenheit, from which we obtain by proportion 0.0049 of an inch for the expansion of one foot with 180° difference of temperature. Thus,

\[
\frac{0.0205 \times 180}{136} = \frac{0.0108}{4} = 0.0049.
\]

But for a general description of this pendulum, and a full account of the manner in which it is constructed, we must refer our readers to the inventor's own paper, Nichol. Jour. vol. xx. p. 214.

Besides the use of the pendulum in measuring time, it has also been suggested as a proper standard for measures of length. See Measure.

PENEPEA, a genus of plants belonging to the tetracytrid class, and in the natural method ranked with those of which the order is doubtful. See Botany Index.

PENELOPE, in fabulous history, the daughter of Icarus, married Ulysses, by whom she had Telemachus. During the absence of Ulysses, who was gone to the siege of Troy, and who staid 20 years from his dominions, several princes charmed with Penelope's beauty, told her that Ulysses was dead, offered to marry her, and pressed her to declare in their favour. She promised compliance on condition they would give her time to finish a piece of tapestry she was weaving; but at the same time she medi in the night what she had done in the day, and by this artifice eluded their importunity till Ulysses's return.

PENELOPE, a genus of birds of the order of gallinace. See Ornithology Index.

PENELOPE, (Antonine), a town of the Helvetii, situated between the lacus Lausonius and Salodurum; called Petenemia by Ptolemy. Thought now to be Bel (Chevres); the capital of a small territory in Switzerland.

PENEUS, (Strabo); a river running through the middle of Thessaly, from west to east, into the Iesus Thermicus, between Olympus and Ossa, near temple of Thessaly, rising in Mount Pirndus. (Ovid, Val. Flaccus).

PENETRABLE, a walled room or chapel in private houses, which was set apart for the worship of the household gods among the ancient Romans. In temples also there were penetralia, or apartments of distinguished sanctity, where the images of the gods were kept, and certain solemn ceremonies performed.

PENGUIN, or PENGUIN. See Penguin, Ornithology Index.

PENCILLIUS, among surgeons, is used for a tent to be put into wounds or ulcers.

PENIEL, or PENZEL, a city beyond Jordan, near the ford or brook Jabbok. This was the occasion of its name. Jacob, upon his return from Mesopotamia, (Gen. xiiii. 24, &c.) made a stop at the brook Jabbok: and very early the next morning, after he had sent all
the people before, he remained alone, and beheld an angel came, and wrestled with him till the day began to appear. Then the angel said to Jacob, Let me go, for the morning begins to appear. Jacob answered, I shall not let you go from me till you have given me your blessing. The angel blessed him then in the same place, which Jacob thence called Peniel, saying, I have seen God face to face, yet continue alive.

In following ages the Isrealites built a city in this place, which was given to the tribe of Gad. Gideon, returning from the pursuit of the Midianites, overthrew the tower of Peniel, (Judges viii. 17.) and put all the inhabitants of the city to death, for having refused subservience to him and his people, and having answered him in a very insulting manner. Jeroboam the son of Nebat rebuilt the city of Peniel, (1 Kings xii. 25.) Josephus says, that this prince there built himself a palace.

PENINNAH, the second wife of Elkanah, the father of Samuel. Peninnah had several children, (1 Sam. i. 2, 3, &c.) but Hannah, who afterwards was mother of Samuel, was for a great while barren; Peninnah, instead of giving the glory to God, the author of fruitfulness, was elevated with pride, and insulted her rival Hannah. But the Lord having visited Hannah, Peninnah was thereupon humbled: and some interpreters think, that God took away her children from her, or at least that she had no more after this time, according to the words of the song of Hannah, (1 Sam. ii. 5.) "The barren hath born seven, and she that hath many children is waxed feeble."

PENINSULA, in Geography, a portion or extent of land joining to the continent by a narrow neck or isthmus, the rest being encompassed with water.

PENIS, in Anatomy. See Anatomy Index.

PENITENCE, is sometimes used for a state of repentance, and sometimes for the act of repenting. See Repentance. It is also used for a discipline, or punishment attending repentance; more usually called penance.

It also gives title to several religious orders, consisting either of converted debauchees, and reformed prostitutes, or of persons who devote themselves to the office of reclaiming them. Of this latter kind is the Order of Penitence of St Magdalen, established about the year 1272 by one Bernard, a citizen of Mar-selles, who devoted himself to the work of converting the courtesans of that city. Bernard was succeeded by several others; who, forming a kind of society, were at length erected into a religious order by Pope Nicholas III. under the rule of St Augustine. F. Gesnays says, that they also made a religious order of the penitents, or women they converted, giving them the same rules and observances which they themselves kept.

Congregation of Penitence of St Magdalen at Paris, owed its rise to the preaching of F. Tisseran a Franciscan, who converted a vast number of courtzans about the year 1492. Louis duke of Orleans gave them his house for a monastery; or rather, as appears by their constitutions, Charles VIII. gave them the hotel called Boeaignes, whence they were removed to St George's chapel, in 1572. By virtue of a brief of Pope Alexander Sixtus, he gave them the rule of St Augustine. It was necessary, before a woman could be admitted, that she had first committed the sin of the flesh. None were admitted who were above 35 years of age.

Till the beginning of the last century, none but penitents were admitted; but since its reformation by Mary Alvequin, in 1616, none have been admitted but maids, who, however, still retain the ancient name of penitents.

PENITENTS, an appellation given to certain fraternities of penitents distinguished by the different shape and colour of their habits. These are secular societies, who have their rules, statutes, and churches, and make public processions under their particular crosses or bannners. Of these there are more than a hundred, the most considerable of which are as follow: the white penitents, of which there are several different sorts at Rome, the most ancient of which was constituted in 1264; the brethren of this fraternity every year give portions to a certain number of young girls, in order to their being married: their habit is a kind of white sackcloth, and on the shoulder is a circle, in the middle of which is a red and white cross. Black penitents, the most considerable of which are the brethren of mercy, instituted in 1488 by some Florentines, in order to assist criminals during their imprisonment, and at the time of their death: on the day of execution they walk in procession before them, singing the seven penitential psalms and the litanies; and after they are dead, they take them down from the gibbet and bury them; their habit is black sackcloth. There are others whose business it is to bury such persons as are found dead in the streets: these wear a death's head on one side of their habit. There are also blue, gray, red, green, and violet penitents; all of whom are remarkable for little else besides the different colours of their habits.

Mabillon tells us, that at Turin there are a set of penitents kept in pay to walk through the streets in procession, and cut their shoulders with whips, &c.

PENITENTS, or Converts of the name of Jesus, a congregation of religious at Seville in Spain, consisting of women who had led a licentious life, founded in 1550. This monastery is divided into three quarters: one for professed religious; another for novices; a third for those who are under correction. When these last give signs of a real repentance, they are removed into the quarter of the novices, where, if they do not behave themselves well, they are remanded to their correction. They observe the rule of St Augustine.

PENITENTS of Orvieto, are an order of nuns, instituted by Antony Simoncelli, a gentleman of Orvieto in Italy. The monastery he built was at first designed for the reception of poor girls, abandoned by their parents, and in danger of losing their virtue. In 1662 it was erected into a monastery, for the reception of such as having abandoned themselves to impurity, were willing to take up, and consecrate themselves to God by solemn vows. Their rule is that of the Carmelites.

These religious have this in peculiar, that they undergo no noviciate. All required is, that they continue a few months in the monastery in a secular habit; after which they are admitted to the vows.

PENITENTIAL, an ecclesiastical book, retained among the Romanists; in which is prescribed what relates to the imposition of penance and the reconciliation of penitents. See Penance.

There are various penitentials, as the Roman penitential, that of the venerable Bede, that of Pope Gregory III. &c.

PENITENTIARY, in the ancient Christian church,
Pen

[117]

Pen

a name given to certain presbyters or priests, appointed in every church to receive the private confessions of the people, in order to facilitate public discipline, by acquainting them what sins were to be expiated by public penance, and to appoint private penance for such private crimes as were not proper to be publicly censured.

Penitentiary, at the court of Rome, is an office in which are examined and delivered out the secret bulls, graces, or dispensations relating to cases of conscience, confessions, &c.

Penitentiary, is also an officer, in some cathedrals, vested with power from the bishop to absolve, in cases referred to him. The pope has at present his grand penitentiary, who is a cardinal and the chief of the other penitentiary priests established in the church of Rome, who consult him in all difficult cases. He presides in the penitentiary, dispatches dispensations, absolutions, &c. and has under him a regent and proctor.

Penitentiary, a prison or place of confinement for criminals, in which the prisoners are made to labour, and a system of discipline is employed for effecting their reformation. The building is so constructed that the overseer from a central station can observe the conduct of every individual. There is an establishment of this kind at Milbank, near London, but the building is not yet finished. It is intended for the reception of such criminals as have hitherto been transported to New South Wales, for a less period than during life.

Penman-Mawr, a mountain in Caernarvonshire, 1400 feet high. It hangs perpendicularly over the sea, at so vast a height, that few spectators are able to look down the dreadful steep. On the side which is next the sea, there is a road cut out of the side of the rock, about six or seven feet wide, which winds up a steep ascent.

Penn, William, an eminent writer among the Quakers, and the planter and legislator of Pennsylvania, was the son of Sir William Penn, and was born at London in 1644. In 1669, he was entered a gentleman of Christ-Church, in Oxford; but having before received an impression from the preaching of one Thomas Lees a Quaker, withdrew with some other students from the national worship, and held private meetings, where they preached and prayed amongst themselves. This giving great offence to the heads of the college, Mr. Penn, though but 16 years of age, was fined for non-conformity; and continuing his religious exercises, was at length expelled the college. Upon his return home, he was on the same account, treated with great severity by his father, who at last turned him out of doors; but his resentment afterwards abating, he sent him to France in company with some persons of quality; where he continued a considerable time, and returned not only well skilled in the French language, but a polite and accomplished gentleman. About the year 1666, his father committed to his care a considerable estate in Ireland. Being found in one of the Quakers meetings in Cork, he, with many others, was thrown into prison; but on his writing to the earl of Orrery, was soon discharged. However, his father being informed he still adhered to his opinions, sent for him to England, and finding him inflexible to all his arguments, turned him out of doors a second time. About the year 1668, he became a public preacher among the Quakers; and that year was committed close prisoner to the Tower, where he wrote several treaties. Being discharged after seven months imprisonment, he went to Ireland, where he also preached amongst the Quakers. Returning to England, he was in 1670 committed to Newgate, for preaching in Gracechurch-street meeting-house, London; but being tried at the sessions-house of the Old Bailey, he was acquitted. In September the same year, his father died; and being perfectly reconciled to him, left him both his paternal blessing and a good estate. But his persecutions were not yet at an end; for in 1671 he was committed to Newgate for preaching at a meeting in Wheeler-street, London; and during his imprisonment, which continued six months, he also wrote several treaties. After his discharge, he went to Holland and Germany; and in the beginning of the year 1672, married and settled with his family at Rickmansworth in Hertfordshire. The same year he published several pieces; and particularly one against Reeve and Muggleton. In 1677, he again travelled into Holland and Germany in order to propagate his opinions; and had frequent conversations with the princess Elizabeth, daughter to the queen of Bohemia, and sister to the princess Sophia, mother to King George I. In 1681, King Charles II. in consideration of the services of Mr. Penn's father, and several debts due to him from the crown at the time of his decease, granted Mr. Penn and his heirs the province lying on the west side of the river Delaware in North America, which from thence obtained the name of Pennsylvania. Upon this Mr. Penn published a brief account of that province, with the king's patent; and proposing an easy purchase of lands, and good terms of settlement for such as were inclined to remove thither, many went over. These having made and improved their plantations to good advantage, the governor, in order to secure the planters from the native Indians, appointed commissioners to purchase the land he had received from the king of the native Indians, and concluded a peace with them. The city of Philadelphia was planned and built; and he himself drew up the fundamental constitutions of Pennsylvania in 24 articles. In 1681, he was elected a member of the Royal Society; and the next year he embarked for Pennsylvania, where he continued about two years, and returned to England in August 1684. Upon the accession of King James to the throne, he was taken into a great degree of favour with his majesty, which exposed him to the imputation of being a Papist; but from which he fully vindicated himself. However, upon the Revolution, he was examined before the council in 1688, and obliged to give security for his appearance on the first day of next term, which was afterwards continued. He was several times discharged and examined; and at length warrants being issued out against him, he was obliged to conceal himself for two or three years. Being at last permitted to appear before the king and council, he represented his innocence so effectually that he was acquitted. In August 1699, he, with his wife and family, embarked for Pennsylvania; whence he returned in 1701, in order to vindicate his proprietary right, which had been attacked during his absence. Upon Queen Anne's accession to the crown, he was in great favour with her, and was often at court. But, in 1707, he was involved in a lawsuit with the executors of a person who had been formerly his steward; and, though many thought him aggrieved, the court of chancery did not think proper to relieve him; upon which account he was obliged to live within...
produced. When he returned home he married and had two children; but he was 37 years of age before he gained possession of the family estate, after which he took up his residence at Downing.

On the death of his wife he set out again for the continent, where he became acquainted with Voltaire, Buffon, Pallas, and other eminent characters. Being an author as early as the year 1750 (then only 24 years of age), he had acquired a considerable degree of reputation in that capacity, by the time he became acquainted with the aforementioned philosophers. His reputation as a naturalist was established by his British Zoology in four vols. 4to, and still farther increased by his epistolary correspondence with so great a man as Linnaeus. He undertook a tour to Cornwall at an early period of life, and also felt an irresistible propensity to survey the works of nature in the northern parts of the kingdom. For this purpose he set out for Scotland in 1771, and published an amusing account of his tour in three vols. 4to, which was destined to receive such a share of public favour as to pass through several editions. His Welsh tour was published in 1778, and his journey from Chester to London in 1782, in one volume 4to. About 1784 came out his Arctic Zoology, a work which was very much esteemed, both in his own, and in many other countries. He also gave the world a natural history of the parishes of Holywell and Downing, within the latter of which he had resided for more than 50 years. Not long before his death appeared his View of Hindostan, in two vols. 4to, to undertake which it seems he had solicitations from private friends, as well as the wishes of persons entirely unknown to him, which were expressed in the public prints. This was unquestionably a very bold attempt in a man who was turned of 70, a period at which the faculties of the mind must certainly be impaired, especially when exerted with vigour for such a number of years before. Notwithstanding his great age, however, the work is executed in a able manner, bearing a strong resemblance to the introduction of his Arctic Zoology.

He also published a letter on the earthquake which was felt at Downing in Flintshire, in the year 1753; another which was inserted in the Philosophical Transactions in 1756; his Synopsis of Quadrupeds in 1771; a pamphlet on the militia; a paper on the turkey, and a miscellaneous volume.

Almost every species of literary honour was conferred upon him; for he was complimented with the degree of LL. D. by the university in which he was educated; he was also fellow of the Royal Society, and a member of the Society of Antiquaries; a fellow of the Royal Society of Upsal in Sweden; a member of the American Philosophical Society; an honorary member of the Anglo-Linnaean Society, &c. &c. He was enabled to exhibit the greatest hospitality at his table, in consequence of the ample fortune which was left him at his father's decease, and he gave the profits arising from the sale of several publications to charitable endowments. By his generous patronage a number of engravers met with great encouragement, and he contributed not a little to the promotion of the fine arts.

About the age of 50 he married for the second time, a Miss Mostyn, sister of his neighbour, the late Sir Roger Mostyn of Flintshire. The concluding part of his life was cheerful, and it may be affirmed that he scarcely felt
PEN

[ 119 ]

Penny

felt the advances of old age. He died at his seat at
Downing in 1708, and in the 72d year of his age.

He inherited from nature a strong and vigorous con-
stitution; his countenance was open and intelligent;
his disposition active and cheerful; and his vivacity,
both in writing and conversation, made him perpetually
entertaining. His heart was kind and benevolent, and
in the relations of domestics his conduct was highly
worthy of imitation. The distresses in which his poor
neighbours were at any time involved gave him un-
feigned uneasiness, and he endeavoured to relieve them
by every means in his power. He was possessed of can-
dour, and free from common prejudices, a truth fully
clined in all his publications. The people of Scotland
were proud to confess, that he was the first English
traveller who had fairly represented their country in its
favourable, as well as in its less pleasing appearances.
His style is lively, and fitted to convey the ideas which
he intended to express, but it is not always correct.
In zoology his arrangement is judicious, and his descrip-
tions characteristic. If we discover several traces of
vanity in those works which he published near the close
of life, it ought to be remembered that it is the vanity
of an old man, which is seldom disagreeable; and it is
also the vanity of one who in the meridian of life gave
the world such fruits of his labours as will be justly
admired in all succeeding ages, while a taste for polite
and valuable literature is cherished among men.

PENNATULA, or SEA-PEN, a genus of animals
belonging to the order zoophyta. See Helmintholo-
gy Index.

PENNI, GIOVANNI FRANCESCO, born at Florence
in 1588, was the disciple of Raphael, who observing his
genius and integrity, intrusted his domestic concerns
entirely to his management; by which means he got the
appointment of Ratto, or the "steward," which he
retained ever after. The genius of Penni was univer-
sal; but his greatest pleasure was in painting landscapes
and buildings; he was an excellent designer, and co-
loured extremely well in oil, distemper, and fresco.
He painted portraits in an exquisite style; and had
such happy natural talents, that Raphael left him heir
to his fortune in partnership with Julie Romano his fel-
low disciple. After Raphael's death, Penni painted
many pictures at Rome, particularly in the palace of
Chigi, so exactly in the style of his master, that they
might not undeservedly have been imputed to him: he
finished, in conjunction with Giusto and Pierino del Va-
gga, the celebrated designs of the battles of Constantine,
and others, which Raphael had left imperfect; but differ-
ing with them about a copy of the transfiguration,
which the pope intended for the king of France, they
separated. Penni went to Naples; but the air of that
country disagreeing with his constitution, he died soon
after in 1598. He had a brother called Lucrezia Penni,
who worked at Genoa and other parts of Italy in con-
junction with Pierino del Vaga, who married his sister;
he went thence to England, where he worked for
Henry VIII. and for several merchants; was employ-
ed by Francis I. at Fontainbleau; but at last quitted
the pencil, and devoted himself to engraving.

PENNY, or PENNY, in commerce, an ancient En-
glish coin, which had formerly considerable currency;
but is now generally distrusted into an imaginary mo-
ney, or money of account. Camden derives the word
from the Latin pecunia, "money."

The ancient English penny, penig, or penying, was
the first silver coin struck in England; nay, and the
only one current among our Saxon ancestors: as is
agreed by Camden, Spelman, Dr Hicks, &c.

The penny was equal to weight to our three-pence;
first of them made one shilling, or guinea Saxons; 30 a
mark or maunce, equal to 7s. 6d.

Till the time of King Edw. I. the penny was struck
with a cross, so deeply indented in it, that it might be
easily brake, and parted, on occasion, into two parts,
there called half-pennies; or into four, there called
fourslings or farthings,—but that prince coined it
without indenture, in lieu of which, he first struck round
halfpence and farthings.

He also reduced the weight of the penny to a stan-
ard; ordering that it should weigh 32 grains of wheat,
taken out of the middle of the ear.——This penny was
called the penny sterling. Twenty of these pence were
to weigh an ounce; whence the penny became a
weight as well as a coin. See Sterling and Penny-
Weight.

The penny sterling was long disused as a coin; and
was scarce known, but as a money of account, contain-
ing the twelfth part of a shilling; but of late years it
has been introduced into the British current coin.

PENNY, in ancient statistics, &c. is used for all sil-
ver money. And hence the word-penny, over-penny,
hundred-penny, tithing-penny, and brother-penny.

Penny-Weight, a Troy weight, containing twenty-
four grains; each grain weighing a grain of wheat
gathered out of the middle of the ear, well dried. The
name took its rise hence, that this was anciently the
weight of one of our ancient silver pennies. See Penny.

Twenty of these penny-weights make an ounce Troy.

PENRITH, an ancient town of the county of Cumber-
land in England, seated under a hill called Penrith-
Fell, near the rivers Eamont and Louthor. It is a
great thoroughfare for travellers; but has little other
trade, except tanning, and a small manufacture of
cheeks. Formerly it had a castle, but it is now in ruins.

In the churchyard is a monument of great antiquity,
consisting of two stone pillars 11 feet 6 inches high, and
5 in circumference in the lower part, which is rounded;
the upper is square, and tapers 10 inches; in the square
part is some fretwork, and the relievo of a cross; and
on the interior side of one is the faint representation of
some animal. Both these stones are mortised at their
lower part into a round one: they are about 15 feet
asunder, and the space between them is inclosed on each
side with two very large but thin semicircular stones
so that there is left between pillar and pillar a walk of
two feet in breadth. Two of these lesser stones are plain,
the others have certain figures, at present scarcely intel-
ligible. Not far from these pillars is another called the
giant's thumb, five feet eight inches high, with an ex-
panded head, perforated on both sides; from the middle
the stone rises again into a lesser head, rounded at top;
but no part has a tendency to the figure of a cross, being
in no part mutilated: The pillars are said to have been
set up in memory of Sir Owen Gower, a-famous war-
ner.
Penrose, Thomas, was the son of the reverend Mr. Penrose, rector of Newbury, Berks, a man of high character and abilities, descended from an ancient Cornish family, beloved and respected by all who knew him. Mr. Penrose, jun., being intended for the church, pursued his studies with success, at Christ-Church, Oxon, until the summer of 1762, when his eager turn to the naval and military line overpowering his attachment to his real interest, he left his college, and embarked in the unfortunate expedition against Nova Colonia, in South America, under the command of Captain Macnamara. The issue was fatal. The Clive (the largest vessel) was burnt; and though the Ambuscade escaped (on board of which Mr. Penrose, acting as lieutenant of marines, was wounded), yet the hardships which he afterwards sustained in a prize sloop, in which he was stationed, utterly ruined his constitution. Returning to England with ample testimonials of his gallantry and good behaviour, he finished, at Hereford College, Oxon, his course of studies; and having taken orders, accepted the curacy of Newbury, the income of which, by the voluntary subscription of the inhabitants, was considerably augmented. After he had continued in that station about nine years, it seemed as if the clouds of disappointment, which had hitherto overshadowed his prospects, and tinctured his poetical essays with gloom, were clearing away; for he was then presented by a friend, who knew his worth and honoured his abilities, to a living worth near 500£ per annum. It came, however, too late; for the state of Mr. Penrose’s health was now such as left little hope, except in the assistance of the waters of Bis-
tol. Thither he went; and there he died in 1779, aged 36 years. In 1768 he married Miss Mary Slocock of Newbury, by whom he had one child, Thomas, who was educated at Winton College.

Mr. Penrose was respected for his extensive erudition, admired for his eloquence, and equally beloved and esteemed for his social qualities. By the poor, towards whom he was liberal to his utmost ability, he was venerated to the highest degree. In oratory and composition his talents were great. His pencil was ready as his pen, and on subjects of humour had uncommon merit. To his poetical abilities the public, by their reception of his Flights of Fancy, &c. have given a favourable testimonial.

PENRYN, a town of Cornwall, in England, seated on a hill at the entrance of Falmouth-haven by Pendennis castle. The inhabitants in 1811 were 2713, and the streets are broad and well paved. There are so many gardens and orchards in it, that it resembles very much a town in a wood. It is well watered with rivulets, and has an arm of the sea on each side of it, with a good custom-house and quay, and other neat buildings. It drives a considerable trade in pilchards, and in the Newfoundland fishery. It was anciently governed by a portreeve; but James I. made it a corporation, consisting of a mayor, 11 aldermen, 12 common-councilmen, with a recorder, steward, &c. an office of record every three weeks, with a prison, and power to try felons in their jurisdiction. And he granted that the mayor and two aldermen should be justices of the peace, and that they should have a gUILDHALL. There was once a monastery in this place, which was a cell to Kirton; and there are still to be seen a tower, and part of the garden walls, the ruins of a collegiate church. It has neither church nor chapel, but belongs to the parish of Gluvias, a quarter of a mile off. It has sent members to parliament ever since the first year of Queen Mary; and James II. granted it a new charter, whereby their election was vested in the magistracy only; but it was never made use of, all the inhabitants that pay scot and lot, who are not much above 100, being the electors. Mr. Rymer gives a very remarkable account how Penryn was once saved by a company of strolling players. He says, that towards the latter end of the 16th century the Spaniards were landing to burn the town just as the players were setting Samson upon the Philistines; which performance was accompanied with such drumming and shouting, that the Spaniards thought some ambush was laid for them, and scamped back to their ships. Queen Elizabeth founded a free-school in this place.

PENSACOLA, a town in North America, situated upon a bay of the same name in the gulf of Mexico. The bay is about 30 miles long and five broad, except at the entrance, where it does not much exceed a mile; and is defended by the fort of Barancas, situated about three miles from its mouth. The town, which is situated about ten miles from the mouth of the bay, is of importance chiefly for its harbour, which is the best in the gulf of Mexico.

The year 1781, so eventful to Britain in many respects, was also remarkable for the reduction of Pensacola by the Spaniards under Don Bernardo Galvez. Great preparations for this expedition had been making at the Havannah; but a dreadful hurricane obliged it to put back to
The town, with the whole province of West Florida, was confirmed to the Spaniards by the treaty of 1795, and continued in their possession till the 24th May 1819, when it was taken after a trifling resistance by the American general Jackson, on pretence that the Spaniards, though then at peace with the United States, had aided the Seminole Indians in their hostilities. By a treaty published in May 1819, this town with the whole of East and West Florida was ceded to the United States, but the treaty has not yet been ratified by the king of Spain. (June 1819.) W. Long. 87. 12. N. Lat. 30. 28.

PENSANCE, a town of Cornwall, in England, at the bottom of Mounts bay, about ten miles from the Land's End. It was burnt in 1595 by the Spaniards, who, with four galleys, surprised this part of the coast, and set fire to several villages and farms: but it was soon after rebuilt, made one of the coinage towns, and has now a considerable trade. It lies in the parish of Maw-dern, noted for its restorative spring, very effectual in the cure of lameness as well as the choliastic &c. It is well built, and has many ships belonging to it. The population in 1801 exceeded 3000 souls. The shore abound with lead, tin, and copper ore; the veins appear on the utmost extent of land at low-water mark.

PENSILLES HORTI. Hanging Gardens, in antiquity. See BABYLON, No. 5.

PENSILVANIA, one of the United States of North America, had its name from the famous Quaker William Penn, son of Sir William, commander of the English fleet in Oliver Cromwell's time, and in the beginning of Charles II.'s reign, who obtained a grant of it in the year 1679. It is bounded on the east by Delaware bay and river; on the north by the state of New York; on the south by Maryland and Virginia; and on the west by Ohio. Its extent from north to south is about 153 miles; its breadth is about 273; its area is 24,500 square miles.

New York, the Jerseys, and Pensilvania, were discovered, with the rest of the continent of North America, in the reign of Henry VII. by Sebastian Cabot, for the crown of England; but Sir Walter Raleigh was the first adventurer that attempted to plant colonies on these shores, in the reign of Queen Elizabeth; and, in honour of that princess, gave all the eastern coast of North America the name of Virginia. Mr Hudson, an Englishman, sailing to that part of the coast which lies between Virginia and New England, in the beginning of the reign of James I. and being about to make a settlement at the mouth of Hudson's river, the Dutch gave him a sum of money to dispose of his interest in this country to them. In the year 1608 they began to plant it; and, by virtue of this purchase, laid claim to all those countries which are now denominated New York, New Jersey, and Pensilvania; but there remaining some part of this coast which was not planted by the Hollanders, the Swedes sent a fleet of ships thither, and took possession of it for that crown; but the Dutch having a superior force in the neighbourhood, compelled the Swedes to submit to their dominion, allowing them, however, to enjoy the plantations they had settled. The English not admitting that either the Dutch or Swedes had any right to countries first discovered and planted by a subject of England, and part of them at that time possessed by the subjects of Great Britain, under charter

Vol. XVI. Part I. Q from
from Queen Elizabeth and King James I.; King
Charles II. during the first Dutch war in 1664, granted
the countries of New York, the Jerseys, and Pensilvan-
ia, of which the Dutch had usurped the possession,
to his brother James duke of York; and Sir Robert Carr
being sent over with a squadron of men of war and land
forces, and summoning the Dutch governor of the city
of New Amsterdam, now New York, to surrender, he
thought fit to obey the summons, and yield that capital
to the English. The rest of the places in the possession
of the Dutch and Swedes followed his example; and
these countries were confirmed to the English by the
Dutch at the next treaty of peace between the two na-
tions. The duke of York afterwards parcellled them
out to under proprietors; selling, in particular, to Wil-
liam Penn the elder, in 1683, the town of Newcastle,
alias Delaware, and a district of 12 miles round the
same; to whom, his heirs, and assigns, by another deed
of the same date, he made over all that tract of land
from 12 miles south of Newcastle to the Whore-hills,
otherwise called Cape Henlopen, now divided into the
two counties of Kent and Sussex, which, with Newcastle
district, are commonly known by the name of the Three
Lower Counties upon Delaware River. All the rest of
the under proprietors, some time after, surrendered
their charters to the crown; whereby New York and
the Jerseys became royal governments; but Penn re-
tained that part of the country which had been sold to
him by the duke of York, together with what had been
granted to him before in 1682, which now constitutes
the province of Pensilvania. As soon as Penn had got
his patent, he began to plant the country. Those who
went over from England were generally Dissenters and
Quakers, whose religion is established by law here, but
with a toleration of all other Protestant sects. The
Dutch and Swedes, who were settled here before Mr
Penn became proprietor, choosing still to reside in this
country, as they did in New York and the Jerseys, ob-
tained the same privileges as the rest of his majesty’s
subjects; and their descendants are now in a manner
the same people with the English, speaking their lan-
guage, and being governed by their laws and customs.
Mr Penn, however, not satisfied with the title granted
him by King Charles II. and his brother, bought the
lands also of the Indians for a valuable consideration,
or what they esteemed such (though 20 miles were pur-
chased, at first, for less than an acre about Philadelphia
would pay now), paying them in cloth, tools, and uten-
sils, to their entire satisfaction; for they had not hands
to cultivate the hundredth part of their lands, and if
they could have raised a product, there was nobody to
buy: the purchase, therefore, was all clear gain to them;
and, by the coming of the English, their paltry trade
became so profitable, that they soon found their condi-
tion much altered for the better; and are now as well
clothed and fed as the European peasantry in many
places.

The air in Pensilvania is sweet and clear. The fall,
or autumn, begins about the 20th of October, and lasts
till the middle of December, when the winter sets
in, which continues till March, and is sometimes ex-
tremely cold and severe; but the air is then generally
dry and healthy. The river Delaware, though very
broad, is often frozen over. From March to June, that
is, in the spring, the weather is more inconstant than in
the other seasons. In the months of July, August, and
September, the heats would be almost intolerable, if
they were not mitigated by frequent cool breezes. The
wind during the summer is generally south-west; but in
the winter blows for the most part from the north-west
over the snowy frozen mountains and lakes of Canada,
which occasions the excessive cold during that season.
On the whole, the climate of this state differs not ma-
terially from that of Connecticut, except that on the
west side of the mountains the weather is much more
regular. The hot southwesterly winds get chilled by
passing over the long chain of Alleghany mountains.
The mean annual temperature of Philadelphia, accord-
ing to Humboldt, is 54.8, of winter 33.8, of spring 53,
of summer 75.2, and of autumn 56.1.

This is upon the whole one of the healthiest states
in the Union. In 1705, and 1797, Philadelphia was
visited by the yellow fever; but since the latter period
it has been entirely exempted from this disease. Among
the people called Quakers, who are the oldest settlers,
there are instances of longevity, occasioned by their
living in the cold cultivated countries, and the tempera-
ture imposed on them by their religion. There are fewer
long-lived people among the Germans than among other
nations, occasioned by their excess of labour and low
diet. They live chiefly upon vegetables and watery
food, that affords too little nourishment to repair the
waste of their strength by hard labour. The most gen-
eral diseases are rheumatism and pleurisy. The first
is very common in the interior, and often becomes
chronic. The goitre is said to prevail in a slight de-
gree at Pittsburg.

As to the face of this country, towards the coast, like
the adjacent colonies, it is flat, but rises gradually to the
Appalachian mountains on the west. Nearly one-third
of this state may be called mountainous; particularly
the counties of Bedford, Huntingdon, Cumberland,
part of Franklin, Dauphin, and part of Bucks and
Northampton, through which pass, under various names,
the numerous ridges and spurs, which collectively form
what are called the great range of Alleghany mountains.
There is a remarkable difference between the country
on the east and west side of the range of mountains we
have just been describing. Between these mountains
and the lower falls of the rivers which run into the
Atlantic, not only in this, but in all the southern states,
are several ranges of stones, sand, earths, and minerals,
which lie in the utmost confusion. Blocks of stone, of
vast extent, particularly of limestone, have their sev-
eral layers broken in pieces, and the fragments thrown
confusely in every direction. Between these lower falls
and the ocean is a very extensive collection of sand,
clay, mud, and shells, partly thrown up by the
waves of the sea, partly brought down by floods from
the upper county, and partly produced by the decay of
vegetable substances. The country west of the Alle-
gany mountains, in these respects, is totally different.
It is very irregular, broken, and variegated, but there
are no mountains; and when viewed from the most
western ridge of the Alleghany, it appears to be a vast
extended plain. All the various strata of stone appear
to have lain undisturbed in the situation wherein they
were first formed. The layers of clay, sand, and coal,
are nearly horizontal. Scarcely a single instance is to
be found to the contrary. Every appearance, in short,
tends to confirm the opinion, that the original crust, in which the stone was formed, has never been broken up on the west side of the mountains, as it evidently has been eastward of them.

The chief rivers are three, Delaware, Susquehanna, and Schuylkill. The Delaware, rising in the state of New York, takes its course southward; and after dividing this province from that of New Jersey, falls into the Atlantic ocean between the promontories or capes May and Henlopen, forming at its mouth a large bay, called from the river Delaware Bay. This river is navigable above 200 miles. Ships of the line can ascend to Philadelphia. The Susquehanna rises also in the state of New York, and running south through the middle of the province, falls into the bay of Chesapeake. It is not navigable near the sea, owing to rocks. The Schuylkill has its source within the state, and runs south, till at length, turning to the eastward, it falls into the river Delaware 6 miles below the city of Philadelphia. It navigable for boats 100 miles. The Allegheny river traverses the north-western parts of the state, and joining the Monongahela at Pittsburgh, forms the Ohio. All these rivers admit of boat navigation.

The principal mineral productions are, iron ore, which is found in great quantities in several counties, and of various kinds; copper ore, said to be found, but is not wrought; lead ore, yielding 20 per cent. of metal; black lead; slate of a good quality; freestone and limestone; marble, black, white, and variegated; coal of an excellent quality on the Susquehanna, Allegheny, Monongahela, Leveigh, and Schuylkill rivers. There are also several mineral springs, some of which are in high estimation for their medicinal virtues. The salt springs of Conemaugh produce a hundred bushels of salt per day. In Venango county an oil spring rises from the bed of the Allegheny river, which yields a gallon in the course of an hour or two.

Pennsylvania abounds in excellent wood, oak, chestnut, beech, elm, black walnut, bass wood, butternut, locust and magnolia. The latter is not found farther north than this state. The sugar maple is abundant, and in the hilly parts near Lake Erie is found in the proportion of six or eight trees to an acre. About one million of pounds of sugar were made from the maple in this state in 1810.

The wild animals are now rare in this state, having retired as cultivation advanced. Deer are still common in the uncultivated districts; and the brown bear, wolf, wild cat, and fox, are met with occasionally. The musk-rat is found in marshy places. The beaver and otter are nearly extinct: the cougour is rarely seen. The wild turkey, with some species of pheasants, grouse, and pigeons, are found. The rivers and creeks abound with salmon, trout, shad, carp, eels, rockfish, &c. The caterpillar sometimes does much injury to vegetation. The grass or meadow-worm is another destructive insect which occasionally visits the country. The mosquito is sometimes troublesome in low valleys, but never in elevated parts. Mr Cobett states, as the result of his own observations and experiments, that even low situations may be kept free of this insect, if care is taken to remove all filth and putrid or decayed matter. The beetle, known by the name of tumblebug, is in many parts destructive to the Indian corn. The other kinds of grain are liable to be injured by a species of grasshopper, which appears at an interval of 17 or 18 years.

The population of this state at different periods was as follows:

<table>

As it is believed that the rate of increase has not diminished, the number will probably be about 1,250,000 at present (1819), which gives about 42 inhabitants to each square mile. Pennsylvania is the third state in point of population; Virginia being the first, and New York the second. The chief town is Philadelphia, which is estimated to contain 120,000 inhabitants.

The constitution of this state is said to have been drawn up by the late Sir William Jones. The legislative power is vested in a general assembly, consisting of a senate and house of representatives. The senators are elected for four years, the representatives for one, by the free citizens of 21 years of age, who have resided two years within the state and paid taxes. A fourth part of the senate is renewed annually. Senators must be 25 years of age, and must have resided four years in the state; representatives must be 21 years of age, and must have resided three years in the state. The number of representatives cannot be less than 60, nor more than 100. The governor is elected by the citizens for three years, and is commander-in-chief of the army and navy, except when called into the service of the United States. Persons holding public offices are only required to acknowledge the being of a God, and a future state of rewards and punishments. The judges are appointed by the governor, and may be impeached or removed by him, on the address of two-thirds of both houses. Pennsylvania was the first state that carried into execution the ideas of philosophical writers on the subject of criminal law. Only the two crimes of murder and arson are punished with death; inferior crimes with hard labour. The laws are mild, and the grand object of making the punishment contribute to the reformation of the individual, is steadily kept in view. The prison of Philadelphia is the best conducted institution of the kind in the world; and its system of discipline has served as a model to the most enlightened states in Europe.

The militia of this state in 1812 consisted of 90,414 men, of whom 2005 were artillery and cavalry. There are no taxes for the general government. Those for the expences of the state government are very small. The most entire religious freedom exists here. Indeed Pennsylvania was the first among the North American states to set the example of complete liberty of conscience. In 1802 there were 36 congregations of Presbyterians, 84 of German Calvinists, 84 of German Lutherans, 54 of Quakers, 26 of Episcopalians, 15 of Baptists, 11 of Roman Catholics, 8 of Scotch Presbyterians, 8 of Moravians; of free Quakers, Congregationalists, Universalists, each 1, and the Jews had two synagogues. In 1817 the number of Baptist churches was 60.

There are many charitable and benevolent institutions in this state. Those in the capital are very nu-
Pennsylvania, though it has but one considerable port (Philadelphia) carries on a very extensive commerce. The whole exports in 1817 amounted to $8,735,592 dollars, of which 5,538,003 consisted of domestic produce, and 3,197,589 of foreign. The domestic articles of export consist chiefly of wheat and flour, beef and pork, flaxseed, iron utensils, lumber, soap and candles; the imports, of British manufactures, wine, gin, rum, sugar, teas, nankins, and silk. There were nine banks in the state in 1816, whose capital together amounted to 10,334,120 dollars; the deposits including those due to other banks, to 8,440,474 dollars; and the notes discounted to 13,329,091 dollars.

There are three handsome bridges over the Schuylkill in this state. One of these consists of a single wooden arch of 345 feet span, and 45 feet in breadth. The Lehigh chain bridge is 475 feet long, in two whole, and two half spans. The wire bridge near Philadelphia is 400 feet long. The whole weight is only 4700 pounds. There are many other bridges deserving of notice, though generally of wood: one at Columbia, over the Susquehanna, is above a mile in length; another at Harrisburgh, about three fourths of a mile. There are at other places steam ferry boats, for the conveyance of passengers across the rivers. There are also a considerable number of steam passage boats which ply on the Delaware.

It was proposed, so far back as 1790, to extend the water communication from Philadelphia to Lake Erie, a distance of 561 miles, by joining the Susquehanna and the Delaware by a canal to extend from the Schuylkill to the Schuylkill. Some progress has been made in this undertaking, but the means scarcely exist yet for the completion of such an extensive scheme.

The long ascendancy of the Quakers in this state has stamped the manners of the people with a character of moderation and order. Fractions are less violent here than in other states, and personal animosities less rancorous. The Pennsylvanians are less obstinate, selfish, and determined, than the people of New England, and less rash and impetuous than the inhabitants of the southern states. They are, comparatively speaking, obliging, well informed, and liberal in their opinions; but not distinguished for generosity, a high spirit, or warmth of character. They have abolished slavery, however, and have always been conspicuously active in works of humanity, and in promoting useful improvements. There is perhaps no part of the United States in which an emigrant from Europe will feel himself more comfortable than in Pennsylvania, so far as depends on the character of the people.

In the Philosophical Transactions for 1777, there is an account of a spring in Pennsylvania, which rises from a copper mine, and yields 800 hogsheads in twenty-four hours. The water is of a pale green colour, of an acid, sweet, astrigent, inky, and nauseous taste. The saline matter which it holds in solution is probably sulphate of copper; for a piece of polished iron immersed in it is soon covered with a crust of metallic copper. It contains also, it is said, cuppers or sulphate of iron.

Among the other curiosities of this province may be reckoned another spring, about 14 feet deep, and about 100 square in the neighbourhood of Reading. A full mill
PEN

Pension

Pensioner.

mill stream flows from it. The waters are clear, and full of fishes. From appearances it is probable that this spring is the opening or outlet of a very considerable river, which, a mile and a half or two miles above this place, sinks into the earth, and is conveyed to this outlet in a subterraneous channel. In the northern parts of Pensylvania there is a creek, called Oil creek, which empties into the Alleghany river. It issues from a spring, on the top of which floats an oil similar to that called Barbadoes tar, and from which one man may gather several gallons in a day. The troops sent to guard the western posts halted at this spring, collected some of the oil, and bathed their joints with it. This gave them great relief from the rheumatic complaints with which they were affected. The waters, of which the troops drank freely, operated as a gentle purge.

There are three remarkable grottos or caves in this state; one near Carlisle in Cumberland county; one in the township of Durham, in Bucks county; and the other at Swetara in Lancaster county. Of the two former there are no particular descriptions. The latter is on the east bank of Swetara river, about two miles above its confluence with the Susquehanna. Its entrance is spacious, and descends so much as that the surface of the river is higher than the bottom of the cave. The vault of this cave is of a solid limestone rock, perhaps 20 feet thick. It contains several apartments, some of them very high and spacious. The water is incessantly percolating through the roof, and falls in drops to the bottom of the cave. These drops petrify as they fall, and have gradually formed solid pillars, which appear as supports to the roof. Thirty years ago there were ten such pillars, each six inches in diameter, and six feet high; all so ranged that the place they enclosed resembled a sanctuary in a Roman church. No royal throne ever exhibited more grandeur than this laus natures.

The resembances of several monuments are found indented in the walls on the sides of the cave, which appear like the tombs of departed heroes. Suspended from the roof is the bell (which is nothing more than a stone projected in an unusual form), so called from the sound that it occasions when struck, which is similar to that of a bell. Some of the stalactites are of a colour like sugarcandy, and others resemble leaf sugar; but their beauty is much defaced by the country people. The water, which percolates through the roof, so much of it as is not petrified in its course, runs down the declivity, and is both pleasant and wholesome to drink. There are several holes in the bottom of the cave, descending perpendicularly, perhaps into an abyss below, which renders it dangerous to walk without a light. At the end of the cave is a pretty brook, which, after a short course, loses itself among the rocks. Beyond this brook is an outlet from the cave by a very narrow aperture. Through this the vapours continually pass outwards with a strong current of air, and ascend, resembling at night the smoke on funerals. Part of these vapours appear on ascending to be condensed at the head of this great aetherial, and the more volatile parts to be carried off, through the aperture communicating with the exterior air before mentioned, by the force of the air in its passage.

PENSION, a sum of money paid annually for services or considerations already past. The yearly pay-
PEN [ 126 ]

Pensioner, a man who has under him a lieutenant, a standard-bearer, a clerk of the check, secretary, paymaster, and harbourer.

PENSIONER, in the university of Cambridge and in that of Dublin, has a very peculiar meaning; for those students, either under graduates or bachelors of arts, are called pensioners, who live wholly at their own expense, and who receive no emolument whatever from the college of which they are members. They are divided into two kinds, the greater and the less; the former of which are generally called fellow-commoners, because they eat with the fellows of their college; the latter are always called pensioners, and eat with the scholars, who are those students of the college, either under graduates or bachelors who are upon the foundation, who receive emoluments from the society, and who are capable of being elected fellows. See Servitor and Sizar.

PENSTOCK, a sluice or flood-gate, serving to retain or let go at pleasure the water of a mill-pond, or the like.

PENTACHORD (compounded of πετάμ, five, and γότα, string), an ancient musical instrument with five strings. The invention of the pentachord is referred to the Scythians; the strings were of bullocks leather, and they were struck with a cymbal made of goats horn.

PENTACOSTIC, in Poetry, a set of verses so disposed, that as there are always five acrostics of the same name, in five divisions of each verse. See Acrostic.

PENTAGONY, Five Fingers, in Botany, a name given by some authors to the ricinus or palma Christi, from the figure of its leaf.

PENTADACTYLOS PISCIS, the five-fingered fish, the trivial name of a fish common in all the seas of the East Indies, and called by the Dutch there viif vinger visch.

PENTAGON, in Geometry, a figure of five sides and five angles. See Geometry.

In fortification, pentagon denotes a fort with five bastions.

PENTAGON, PANTOGRAPH, or PANTOGRAPHER, an instrument designed for drawing figures in what proportion you please, without any skill in the art.

The instrument is otherwise called a parallelogram.

The following is the description of this instrument by Mr. Adams.

"It is an instrument (says Mr. Adams) as useful to the experienced draftsman, as to those who have made but little progress in the art. It saves a great deal of time, either in reducing, enlarging, or copying of the same size, giving the outlines of any drawing, however crooked or complex, with the utmost exactness; nor is it confined to any particular kind, but may with equal facility be used for copying figures, plans, sea-charts, maps, profiles, landscapes, &c.

"Description and use of the Pantographer.—I have not been able to ascertain who was the inventor of this useful instrument. The earliest account I find is that of the Jesuit Scheiner, about the year 1631, in a small tract entitled Pantographie, sive ars nova delineandi. The principles are self-evident to every geometer; the mechanical construction was first improved and brought to its present state of perfection by my father, about the year 1750. It is one, among many other improvements and inventions completed by him, that others have ingloriously, and many years after, assumed to themselves.

"The pantograph is usually made of wood, or brass, and consists of four flat rules, two of them long, and two short. The two longest are joined at the end, by a double pivot, which is fixed to one of the rules, and works in two small holes placed at the end of the other. Under the joint is an ivory caster, to support this end of the instrument. The two smaller rules are fixed by pivots at E and H, near the middle of the larger rules, and are also joined together at their other end, G.

"By the construction of this instrument, the four rules always form a parallelogram. There is a sliding box on the longer arm, and another on the shorter arm. These boxes may be fixed at any part of the rules by means of their milled nuts; each of these boxes is furnished with a cylindric tube, to carry either the tracing point or crayon or fulcrum.

"The fulcrum or support K, is a leaden weight inclosed in a mahogany box, on this the instrument moves when in use; there are two moveable rollers, to support and facilitate the motions of the pantographer; their situation may be varied as occasion requires.

"The graduations are placed on two of the rules: on each of them are two scales, the fiducial edges of the boxes are to be set to these, according to the work to be performed by the instrument.

"The crayon, the tracer, and fulcrum, must in all cases be in a right line, so that when they are set, if a string be stretched over them, and they do not coincide with it, there is an error either in the setting or graduations.

"The long tube which carries the pencil or crayon, moves easily up or down another tube; there is a string affixed to the long or inner tube, passing afterwards through the holes in the three small knobs to the tracing point, where it may, if necessary, be fastened. By pulling this string, the pencil is lifted up occasionally, and thus prevented from making false or improper marks upon the copy.

"To use this instrument when the copy is to be of the same size as the original.—Place the instrument upon a large table, and set the sliding boxes B and D, to the divisions marked 12. Put the crayon into the box B, place the box D upon the fulcrum or leaden foot; the tracing point at C. Then lay a piece of paper under the crayon, and the original drawing under the tracer, and move the tracing point over the principal strokes of the original, and the crayon will form the required copy.

"To reduce a drawing, &c. to half the size of the original.—Set the boxes B and D, to the divisions marked one-half, place the fulcrum at B, the crayon at D, and tracer at C.

"To reduce a drawing, &c. to less than one-half the original.—Suppose one-third, one-fourth, one-fifth, &c. Place the fulcrum at B, crayon at D, and tracer at C, and slide the boxes B and D, to the divisions marked one-third, one-fourth, one-fifth, &c. on the longer scales. It may be proper to observe here, that if the copy be less
For greater than one-half the original drawing.

Suppose it be required to make a drawing, two-thirds three-fourths, four-fifths, &c. Set the boxes B and D, to corresponding divisions, as two-thirds, three-fourths, four-fifths, &c. on the shorter scales, place the fulcrum at D, the crayon at C, and tracer at B.

When the original drawing is to be enlarged.

Suppose one-eighth, one-sixth, &c. set the boxes B and D, to one-eighth, one-sixth, &c. on the longer scales, place the fulcrum at B, the crayon at C, and tracer at D.

Where the copy is required of a size differing from the fractional parts laid down on the instrument. For this purpose there are two scales laid down, containing 100 unequal parts, one scale numbered from 10 to 80, the other from 50 to 100.

If the copy is to be under one-half the original size, place the boxes B and D, to any two corresponding divisions under 50, the fulcrum at B, and crayon at D.

If the copy is to be larger than one-half the original place the boxes B and D, to corresponding divisions between 50 and 100; the fulcrum at B, and crayon at D.

To change the situation of the pantograph. Copy first as much as the pantographer will take in; then make three points on the original, and as many corresponding points on the copy. Then remove the fulcrum to another situation, but so that when the tracing point is applied to the three points marked on the original, the crayon may exactly coincide with the other three points on the copy, and proceed as before; and so on for every change in the situation of your instrument, and by this means a pantographer of two feet and a half in length will copy a drawing of any size whatsoever.

PENTAMETER, in ancient poetry, a kind of verse, consisting of five feet, or metres, whence the name. The two first feet may be either dactyls or spondees at pleasure; the third is always a spondee; and the two last anapestes: such is the following verse of Ovid.

1 2 3 4 5

Carminis | bus ut | ces tem | pus in om | ne meis.

A pentameter verse subjoined to a hexameter, constitutes what is called elegiac. See ELEGIAE.

PENTANDRIA (from πεντα, five, and ἄνδρας, a man or husband) the name of the fifth class in Linæus’s sexual method, consisting of plants which have hermaphroditic flowers, with five stamens or male organs. See BOTANY INDEX.

PENTAPETALOUS, an appellation given to flowers which consist of five petals or leaves.

PENTAPETES, a genus of plants belonging to the monadelphious class, and in the natural method ranking under the 37th order, Columnifera. See BOTANY INDEX.

PENTAPOLIS. This name is given to the five cities, Sodom, Gomorrah, Admah, Zeboim, and Zoar (Wisdom x. 6.). They were all five condemned to utter destruction, but Lot interceded for the preservation of Zoar, otherwise called Bala. Sodom, Gomorrah, Admah, and Zeboim, were all consumed by fire Pentapolis, from heaven, and in the place where they stood was made the lake Asphaltites, or the lake of Sodom.

PENTAPOLIS (Ptolemy), a district of Cyrenaica; situated on the Mediterranean; denominated from its five cities; namely, Benneice, Arsinoe, Ptolemais, Cyrene, and Apollonia.

PENTAPOLIS of the Philistines, (Josephus); taking name from five principal cities, Gaza, Cath, Ascalon, Azotus, and Ekron.

PENTATEUCH. This word, which is derived from the Greek πεντάτευχος, from πέντε, five, and τεύχος, an instrument or volume, signifies the collection of the five instruments or books of Moses, which are Genesis, Exodus, Leviticus, Numbers, and Deuteronomy: each of which books we have given an account of under their several names.

There are some modern critics who have disputed Moses’s right to the Pentateuch. They observe that the author speaks always in the third person. “Now the man Moses was very meek above all the men which were upon the face of the earth. The Lord spake unto Moses, saying, &c. Moses said to Pharaoh, &c.” Thus they think he would never have spoken of himself; but would at least sometimes have mentioned himself in the first person. Besides this, they say, the author of the Pentateuch sometimes abridges his narration like a writer who collected from some ancient memoirs. Sometimes he interrupts the thread of his discourse; for example, he makes Lamech the bigamist to say (Gen. iv. 23.), “Hear my voice, ye wives of Lamech, hearken unto my speech; for I have slain a man to my wounding, and a young man to my hurt,” without informing us before-hand to whom this is related. These observations, for example (Gen. xii. 6.), “And the Canaanite was then in the land,” cannot be reconciled to the age of Moses, since the Canaanites continued to be the masters of Palestine all the time of Moses. The passage out of the book of the wars of the Lord, quoted in the book of Numbers (xxi. 14.) seems to have been clapped in afterwards, as also the first verses of Deuteronomy. The account of the death of Moses, which is at the end of the same book, cannot certainly belong to this legislator; and the same judgment may be made of other passages, wherein it is said, that the places mentioned lay beyond Jordan; that the bed of Og was at Ramah to this day: that the hayoth of Jair, or the cities of Jair, were known to the author, though probably they had not that name till after Moses’s time (Numb. xxxii. 41. Deut. iii. 14.).

It is observed also in the text of the Pentateuch, that there are some places that are defective; for example, in Exodus (xii. 8.), we see Moses speaking to Pharaoh, where the author omits the beginning of his discourse. The Samaritan inserts in the same place what is wanting in the Hebrew. In other places, the same Samaritan copy adds what is deficient in the Hebrew text; and what it contains more than the Hebrew seems so well connected with the rest of the discourse, that it would be difficult to separate them. Lastly, they believe that they observe certain strokes in the Pentateuch which can hardly agree with Moses, who was born and bred in Egypt; as what be says of the earthly paradise; of the rivers that watered it, and ran through it; of the cities of Babylon, Erech, Rezen, and Calneh; of the gold
Pentateuch, the book of Moses, contains the five books of the Old Testament: Genesis, Exodus, Leviticus, Numbers, and Deuteronomy.

Pentecost, a festival of the Jews, celebrated on the 50th day after the 7th of Nisan, which is the second day of the Passover. It commemorates the giving of the law to Moses.

Pentathlon, in antiquity, a general name for the five exercises performed at the Greek games: wrestling, boxing, running, jumping, and playing at the discus.

Pentecost, a solemn festival of the Jews, so called, because it was celebrated on the 50th day after the 7th of Nisan, which was the second day of the Passover. The Hebrews called it the feast of weeks, because it was kept seven weeks after the Passover. They then offered the first fruits of the wheat harvest, which was then completed. Besides, which they presented at the temple seven lambs of that year, one calf, and two rams, for a burnt-offering; two lambs for a peace-offering; and a goat for a sin-offering (Lev. XXIII. 15, 16. Exod. XXXIV. 22. and Deut. XVI. 9, 10.). The feast of Pentecost was instituted among the Israelites, first to oblige them to worship in the temple of the Lord, then to acknowledge his absolute dominion over the whole country, and to offer him the first-fruits of their harvest; and, secondly, that they might call to mind, and give thanks to God, for the law which he had given them from Mount Sinai, on the 50th day after their coming out of Egypt.

The modern Jews celebrate the Pentecost for two days. They deck the synagogue and their own houses with garlands of flowers. They hear a sermon or oration in praise of the law, which they suppose to have been delivered on this day. The Jews of Germany make a very thick cake, consisting of seven layers of paste, which they call Saim. The seven layers represent the seven heavens, which they think God was obliged to reascend from the top of this mountain. See Leo of Modena and Buxtorf's Synag. Jud.

It was on the feast of Pentecost that the Holy Ghost miraculously descended on the apostles of our Lord, who were assembled together after his ascension in a house at Jerusalem (Acts II.).

Penthesilea, queen of the Amazons, succeeded Orythia, and gave proofs of her courage at the siege of Troy, where she was killed by Achilles. Pliny says that she invented the battle-axe.

Penthesilea, queen of the Amazons, succeeded Orythia, and gave proofs of her courage at the siege of Troy, where she was killed by Achilles. Pliny says that she invented the battle-axe.

Pentheus, in Botany, a genus of the pentaphyllum order, belonging to the pentaphyllum class of plants.

The calyx is quinquefolium; there are either five petals or none; the capsule is five-pointed and quinquefolium.

Pentland, or Picland Frith, a narrow strait of six miles between the mainland of Scotland and the Orkney islands. This strait is the great thoroughfare of shipping between the eastern and western seas, the terror of mariners, and has been the grave of thousands. The navigation of this strait was formerly extremely dangerous by the island of Stromness, and two rocks called the Skerries, lying near the middle of it; but it is now greatly improved, and comparatively safe, in consequence of a lighthouse erected on the Skerries.

Penula, among the ancient Romans, was a coat garment or cloak worn in cold or rainy weather.

Penultima, or Penultimate Syllable, in Grammar, denotes the last syllable but one of a word, and the antepenultimate syllable in the last but two syllables.

Penumbra, in Astronomy, a partial shade observed between the perfect shadow and the full light of an eclipse. It arises from the magnitude of the sun's body: for, were he only a luminous point, the shadow would be all perfect; but, by reason of the diameter of the sun, it happens, that a place which is not illuminated by the whole body of the sun, does yet receive rays from a part thereof.

Peor, in the language of Hindostan, means a soldier armed with a sword and target. In common use it is a footman, so armed, employed to run before a person. This proper word; from which peor is a corruption.

Primal, a famous mountain beyond Jordan, where Eusebius places the birth of Absalom. This mountain is called Nebi, Pigah, and Peor, near one another, and probably made but the same chain of mountains. It is very likely that Peor took its name from some deity of the same name, which was worshiped there; for Peor, Pegeor, or Baal-peor, was known in this country. See Num. XXV. 3. Deut. IV. 3. Ps. CV. 28.

Peb, a city of the tribe of Judah, which is not read in the Hebrew, nor in the Vulgate, but only in the Greek of the Septuagint (Josh. XIV, 56.). Eusebius says it was near Bethelhem, and Jerome adds, that in his time it was called Poera.

Pepin, in the language of the Franks, is the Germanic word for Peter, and means the same thing as Peter.

Pepin, or le Petit, grandson to Pepin the Short, and first king of the two races of French monarchs.

Pepin, in the language of the Franks, is the Germanic word for Peter, and means the same thing as Peter.

Pepin, or le Petit, grandson to Pepin the Short, and first king of the two races of French monarchs.
narches, was mayor of the palace to Childeric III. a weak prince; he contrived to confine him and his son Thiriri in different monasteries; and then, with the assistance of Pope Stephen III, he usurped the sovereign power. He died in 768, aged 54.

PEPLUS, a genus of plants belonging to the hexandria class, and in the natural method ranking under the 17th order, Calycanthemae. See Botany Index.

PEPLUS, a long robe worn by the women in ancient times, reaching down to the feet, without sleeves, and so very fine, that the shape of the body might be seen through it. The Athenians used much ceremony in making the pelus, and dressing the statue of Minerva with it. Homer makes frequent mention of the pelus of that goddess.

PEPPER, PIPER, in Natural History, an aromatic berry of a hot quality, chiefly used in seasoning. We have three kinds of pepper at present used in the shops, the black, the white, and the long pepper.

Black pepper is the fruit of the piper, and is brought from the Dutch settlements in the East Indies. See PIPER, Botany Index.

The common white pepper is factitious, being prepared from the black in the following manner: they steer the grains in sea water exposed to the heat of the sun for several days, till the rind or outer bark loosen; they then take it out, and, when it is half dry, rub it till the rind falls off; then they dry the white fruit, and the remains of the rind blow away like chaff. A great deal of the heat of the pepper is taken off by this process, so that the white kind is more fit for many purposes than the black. However, there is a sort of native white pepper produced on a species of the same plant; which is much better than the factitious, and indeed little inferior to the black.

The long pepper is a dried fruit, of an inch or an inch and a half in length, and about the thickness of a large goose quill: it is of a brownish grey colour, cylindrical in figure, and said to be produced on a plant of the same genus.

Pepper is principally used by us in food, to assist digestion: but the people in the East Indies esteem it as a stomachic, and drink a strong infusion of it in water by way of giving them an appetite: they have also a way of making a fiery spirit of fermented fresh pepper with water, which they use for the same purposes. They have also a way of preserving the common and long pepper in vinegar, and eating them afterwards at meals.

Jamaica Pepper, or Pimento. See LAURUS, Botany Index.

PEPPER-MINT. See MENTHA, Botany and Materia Medica Index.

PEPPER-WATER. See CAPICUM, Botany Index.

PEPPER-WATER, a liquor prepared in the following manner, for microscopic observations: Put common black pepper, grossly powdered, into an open vessel so as to cover the bottom of it half an inch thick, and put to rain or river water till it covers it an inch; shake or stir the whole well together at the first mixing, but never disturb it afterwards: let the vessel be exposed to the air uncovered; and in a few days there will be seen a pellicle on this skin swimming on the surface of the liquor, presenting several colours.

This is a cauceries of multitudes of small animals; and being examined by the microscope, will be seen all in motion: the animals, at first sight, are so small as not to be distinguishable, unless to the greatest magnifiers; but they grow daily till they arrive at their full size. Their numbers are also continually increasing, till the whole surface of the liquor is filled with them, to a considerable depth. When disturbed, they will sometimes dart down to the bottom; but soon after come up to the surface again. The skin appears soonest in warm weather, and the animals grow the quickest: but in the severest cold it will succeed, unless the water freezes.

About the quantity of a pin's head of this scum, taken up on the nib of a new pen, or the tip of a hair-pencil, is to be laid on a plate of clear glass; and if applied first to the third magnifier, then to the second, and finally to the first, will show the different animals it contains, of several kinds and shapes as well as sizes.

PEPPERMINT-TREE. See EUCALYPTUS, Botany Index.

PERA, one of the suburbs of Constantinople, where ambassadors and Christians usually reside. See CONSTANTINOPLE.

PERAMBULATOR, in surveying, an instrument for measuring distances, called also odoometer, podometer, sway-wiser, and surveying-wheel.

It consists of a wheel AA, fig. 1, two feet seven inches and a half in diameter; consequently half a pole, or eight feet three inches, in circumference. On one end of the axis is a nut, three quarters of an inch in diameter, and divided into eight teeth; which, upon moving the wheel round, fall into the eight teeth of another nut c, fixed on one end of an iron rod Q, and thus turn the rod once round in the time the wheel makes one revolution. This rod, lying along a groove in the side of the carriage of the instrument, under the dotted line, has at its other end a square hole, into which is fitted the end b of a small cylinder P. This cylinder is disposed under the dial-plate of a movement, at the end of the carriage B, in such a manner as to be moveable about its axis; its end o is cut into a perpetual screw, which falling into the 32 teeth of a wheel perpendicular thereto, upon driving the instrument forward, that wheel makes a revolution each 16th pole. On the axis of this wheel is a pinion with six teeth, which falling into the teeth of another wheel of 60 teeth, carries it round every 16th pole, or half a mile.

This last wheel, carrying a hand or index round with it over the divisions of a dial-plate, whose outer limb is divided into 160 parts, corresponding to the 160 poles, points out the number of poles passed over. Again, on the axis of this last wheel is a pinion, containing 20 teeth, which falling into the teeth of a third wheel which hath 40 teeth, drives it once round in 320 poles, or a mile. On the axis of this wheel is a pinion of 12 teeth, which, falling into the teeth of a fourth wheel having 72 teeth, drives it once round in 12 miles.

This fourth wheel, carrying another index over the inner limb of the dial-plates, divided into 12 for miles, and each mile subdivided into halves, quarters, and furlongs, serves to register the revolutions of the other hand, and to keep account of the half miles and miles passed over as far as 12 miles.

The use of this instrument is obvious from its construction. Its proper office is in the surveying of roads, etc.
It has been supposed that the ancient Romans were Per
acquainted with an instrument of this kind. The found-
ation of this opinion is an expression of Julius Capito-
linus in his life of the emperor Pertinax. The words are, *Et alia (vehicula), iter metietia, et horas mon-
strantia.* "Carriages for measuring the length of the
road, and marking the time of the journey."

PERCA, the Perca; a genus of fishes belonging to
the order of thoracii. See Ichthyology Index.

PERCEPTION, is a word which is so well under-
stood, that it is difficult for the lexicographer to give
any explanation of it. It has been called the first and
most simple act of the mind by which it is conscious
of its own ideas. This definition, however, is impre-
oper, as it confounds perception with consciousness; al-
though the objects of the former faculty are things with-
out us, those of the latter the energies of our own minds.
Perception is that power or faculty by which, through
the medium of the senses, we have the cognizance of
objects distinct and apart from ourselves, and learn that
we are not mere parts in the system of nature. By what
process the senses give us this information, we have
endeavoured to show elsewhere. (see Metaphysics,
Part I. chap. I.) and we should not again introduce
the subject, but to notice a singular opinion of a very
able writer, whose work has been given to the public
since our article alluded to had issued from the press.

Dr Sayers has endeavoured to prove that no man can
perceive two objects, or be conscious of two ideas at
the same instant. If this be true, not only our theory of
time (see Metaphysics, Part II. chap. vii.) is grossly
aburd, but even memory itself seems to be an imaginary
faculty. If a man be not conscious of his present exist-
ence, at the very instant when he thinks of a past event,
or reviews a series of past transactions, it is difficult,
to us indeed impossible, to conceive what idea he can have
of time, or what he can mean when he says that he re-
members a thing. But let us examine the reasoning by
which the ingenious author endeavours to establish his
opinion.

If we reflect (says he) upon the surprising velocity
of mind by which ideas pass through the mind, and the remark-
able rapidity with which the mind turns itself, or is di-
rected from one object of contemplation to another, this
might alone give us some suspicion that we may probably
be mistaken in supposing ideas to be synchronously per-
ceived. Other arguments may be adduced to strengthen
this suspicion. It will be granted, I believe, that the
mind, whether immaterial or the result of organization,
hastertainly a wholeness or unity belonging to it, and
that it is either not composed of parts, or that no one of
the parts from which it originates is itself mind: in this
case, it is difficult to conceive how two ideas should be
impressed upon the mind at the same instant: for this
would be supposing that part of the mind could receive
one idea, and part another, at the same time; but if the
parts do not perceive singly, this is evidently impossible.

If, on the other hand, this self-division of the mind
does not take place, then if two ideas are nevertheless to
be perceived at the same instant, it would seem that those
ideas must be so blended with each other, that neither of
them could appear distinct. If we examine the manner
in which a complex idea is perceived, we shall find very
clearly, that the whole of such an idea is never present
to the mind at once. In thinking of a centaur, for in-
stance,
Perception, stance, can we at the same moment be thinking of the parts of a man and the parts of a horse? Can we not almost detect the gliding of the mind from one to the other? In contemplating the complex idea of gold, are the ideas of its colour, ductility, hardness, and weight, all present to the mind at the same instant? I think, if we accurately attended to it, we shall find a perceptible time has elapsed before this complex idea has been perfectly formed in our mind: but if all the parts of a complex idea cannot be recalled at the same instant, is it not reasonable to infer that these parts are also singly impressed, and not all originally perceived at the same instant?"

This reasoning is plausible, but perhaps not convincing. Surely we have all been conscious of bodily pain or pleasure with our eyes open, and been offended by disagreeable smells at the very instant that we looked at objects beautifully coloured. That our ideas pass through the mind with great velocity, and that the mind can rapidly excite one sensation from another, are truths which cannot be controverted; but instead of leading us to suppose that two or more objects cannot be synchronously perceived, or two or more ideas synchronously apprehended, they appear to furnish a complete proof of the reverse of all this. For we beg leave to ask how we come to know that ideas pass with velocity through the mind, if we be not all the while conscious of something that is permanent? If we can contemplate but one idea at once, it is plainly impossible that two or more can be compared together; and therefore we cannot possibly say that any particular train has passed through the mind with a degree of velocity greater or less than that which we have usually experienced; nay, we cannot say that we have ever experienced a train of ideas at all, or even been conscious of a single idea, besides the immediate object of present apprehension. That the mind is an individual, we most readily grant; but that it should therefore be incapable of having two ideas synchronously excited in it, is a proposition for which the author has brought no evidence. That it is difficult to conceive how this is done, we acknowledge; but not that it is more difficult than to conceive how a single idea is excited in the mind; for of the mode in which mind and matter mutually operate on each other, we can form no conception. We know that objects make an impression on the organs of sense, that this impression is by the nerves communicated to the brain, and that the agitation of the brain excites sensation in the mind: but in what way it excites sensation we know not; and therefore have no reason to suppose that two or more different agitations may not excite two or more synchronous sensations, as well as one agitation excites one sensation. To the agitations given to the brain operates on the mind, is known by experience; but experience gives us no information respecting the mode of that operation. If the mind be, as our author and we suppose, one individual, it cannot, as mind, be either divisible or extended; and therefore it is certain that the operation in question cannot be, in the proper sense of the word, impression. Hence we have no right to infer, if two objects be perceived at once, either that the idea of the one must be impressed on a part of the mind different from that which receives the impression of the other, or that the two impressions must be so blended with each other, that neither of them could appear distinct; for this would be to reason from one mode of operation to another; with which, upon acknowledged principles, it can have nothing in common.

By far the greater part of our ideas are relics of visible sensations; and of every thing which we can actually see at once, we at once contemplate the idea. That we could at once perceive a centaur, if such a being were presented to us, cannot surely be doubted by any one who has ever looked at a man on horseback; and therefore that we can at the same time contemplate the whole idea of a centaur, is a fact of which consciousness will not permit us to doubt.—If, indeed, we choose to analyze this complex idea into its component parts, it is self evident that the mind must glide from the one to the other, because the very analysis consists in the separation of the parts, of which, if after that process we think of them, we must think in succession: but that we may have at the same instant, either an actual or ideal view of all the parts of it, is a proposition so evident as to admit of no other proof than an appeal to experience. In contemplating what the author calls the complex idea of gold, it cannot be denied that the ideas of its colour, ductility, hardness, and weight, are never all present to the mind at the same instant: but the reason is obvious. These are not all ideas, in the proper sense of the word, but some of them are ideas, and some notions, acquired by very different processes and very different faculties. Colour is an idea of sensation, immediately suggested through the organ of sight; ductility is a relative notion, acquired by repeated experiments; and gold might be made the object of every sense, without suggesting any such notion. The writer of this article never saw any experiment made on the ductility of gold, and has therefore a very obscure and indistinct notion of that property of the metal; but he is conscious, that he can perceive, at the same instant, the yellow colour and circular figure of a guinea, and have a very distinct, though relative notion, of its hardness.

We conclude, therefore, that the mind is capable of two or more synchronous perceptions, or synchronous ideas; that during every train which passes through it, it is conscious of its own permanent existence; and that if it were limited to the apprehension of but one idea at once, it could have no remembrance of the past, or anticipation of the future, but would appear to itself, could it make any comparison, to pass away like a flash of lightning.

Perch, in land-measuring, a rod or pole of 16½ feet in length, of which 40 in length and 4 in breadth make an acre of ground. But, by the customs of several counties, there is a difference: in Staffordshire it is 24 feet; and in the forest of Sherwood 25 feet, the foot being there 18 inches long; and in Herefordshire a perch of ditching is 21 feet, the perch of walling 16½ feet, and a pole of denshired ground is 12 feet, &c.

Perch, a fish. See Perca, Ichthyology Index.

Perche, a territory of Orléannois in France, 35 miles long, and 30 broad; bounded on the north by Normandy; on the south, by Maine and Dunois; on the east, by Beauce; and on the west by Maine. It takes its name from a forest, and is pretty fertile. The inhabitants carry on a pretty good trade; and the principal town is Bellesmes.
PERCUTION, the impression a body makes in falling or striking upon another; or the shock of two bodies in motion. See Dynamics and Mechanics.

PERDICUM, a genus of plants, belonging to the syngenesia class; and in the natural method ranking under the 49th order, Composite. See Botany Index.

PERDIX, the partridge. See Tetrao, Ornithology Index.

PEREASLAW, a strong populous town of Poland, in the palatinate of Kiovia, situated on the river Tribez; in E. Long. 32. 44. N. Lat. 49. 46.

PERENNIALS, or Perennial Flowers, in Botany, a term applied to those plants whose roots abide many years, whether they retain their leaves in winter or not. Those which retain their leaves are called evergreens; but such as cast their leaves are named deciduous or peridotes.

PERFECT, something to which nothing is wanting, or that has all the requisites of its nature and kind.

PERFECT Cadence, in Music. See Cadence.

PERFECT Tense, in Grammar. See Preterite.

PERFECTION, the state or quality of a thing perfect.

Perfected, divided, according to Chauvinus, into physical, moral, and metaphysical.

Physical or natural perfection, is that whereby a thing has all its powers and faculties, and those too in full vigour; and all its parts both principal and secondary, and those in their due proportion, constitution, &c. in which sense man is said to be perfect when he has a sound mind in a sound body. This perfection is by the schools frequently termed necessitas, because a thing is enabled thereby to perform all its operations.

Moral perfection is an eminent degree of virtue or moral goodness, to which men arrive by repeated acts of piety, beneficence, &c. This is usually subdivided into absolute or inherent, which is actually in him to whom we attribute it; and imputative, which exists in some other, and not in him it is attributed to.

Metaphysical, transcendental, or essential perfection, is the possession of all the essential attributes, or of all the parts necessary to the integrity of a substance; or it is that whereby a thing has or is provided of every thing belonging to its nature. This is either absolute, where all imperfection is excluded, such as the perfection of God; or secundum quid, and in its kind.

PERFORMANS MANUS.
PERFORMATE Pedis.
PERFORATUS MANUS.
PERFORATUS Pedis.
PERFUME, denotes either the volatile effluvia from any body affecting the organ of smelling, or the substance emitting those effluvia; in which last sense the word is most commonly used. The generality of perfumes are made up of musk, ambergris, civet, rose and cedar woods, orange-flowers, jasmine, joquill, tuberoses, and other odoriferous flowers. These drugs commonly called aromatics, such as storax, frankincense benzoin, cloves, mace, &c. enter the composition of a perfume; some are also composed of aromatic herbs or leaves, as lavender, marjoram, sage, thyme, hyssop, &c.

The use of perfumes was frequent among the Hebrews, and among the orientals in general, before it was known to the Greeks and Romans. In the time of Moses perfumes must have been known in Egypt, since he speaks of the art of the perfumer, and gives the composition of two kinds of perfumes (Exod. xxx. 25), of which one was to be offered to the Lord upon the golden altar which was in the holy place; and the other was appointed for the anointing of the high priest and his sons (ibid. 34, &c.) as also of the tabernacle, and all the vessels that were used in divine service.

The Hebrews had also perfumes which they made use of in embalming their dead. The composition is not known, but it is certain that they generally made use of myrrh, aloes, and other strong and astringent drugs, proper to prevent putrefaction (John xix. 49.). See the article Embalming.

Besides the perfumes for these purposes, the Scripture mentions other occasions whereon the Hebrews used perfumes. The spouse in the Canticles (i. 3.) comends the scent of the perfumes of her lover; and her lover in return says, that the scent of the perfumes of his spouse surpasses the most excellent odours (ibid. iv. 10—14.). He names particularly the spikenard, the calamus, the cinnamon, the myrrh, and the aloes, as making a part of these perfumes. The voluptuous woman described by Solomon (Prov. vii. 17.) says, that she had perfumed her bed with myrrh, aloes, and cinnamon. The epics in the book of Wisdom (ii. 7.) encourage one another to the luxurious use of odours and costly perfumes.

Isaiah (liv. 9.) reproaches Judea, whom he describes as a spouse faithless to God, with being painted and perfumed to please strangers. “Thou wentest to the king with ointment, and diest increase thy perfumes.” Ezekiel (xxiii. 41.) seems to accuse the Jews with having profaned the odours and perfumes, the use of which was reserved to sacred things, by applying them to their own use.

They came afterwards to be very common among the Greeks and Romans, especially those composed of musk, ambergris, and civet. The nardus and molothrum were held in much estimation, and were imported from Syria. The unguentum nardinum was variously prepared, and contained many ingredients. Molothrum was an Indian plant. Perfumes were also used at sacrifices to regale the gods; at feasts, to increase the pleasures of sensation; at funerals, to overpower odorous smells, and please the noses of the dead; and in the theatres, to prevent the offensive effluvia, proceeding from a crowd, from being perceived.

Since people are become sensible of the harm they do to the head, perfumes are generally disused among us; however, they are still common in Spain and Italy.

PERGAMA, (Virgil), the citadel of Troy; which, because of its extraordinary height, gave name to all high buildings (Servius). Others say the walls of Troy were called Pergauma.

PERGAMUM, (Pliny); called also Perground, (Virgil); Pergamia, (Plutarch); a town of Crete.
Pergamus, built by Agamemnon in memory of his victory, (Velleius). Here was the burying-place of Lycurgus (Aristoxenus, quoted by Plutarch). It was situated near Cydonia (Servius); to what point not said: but Strabo helps him out, who places the Doric temple of Diana, which stood near Cydonia (Strabo), to the north of the territory of Pergamum,—Another Pergamus (Pliny, Strabo); a town of Lydia, situated on the Caicus, which runs by it. It was the royal residence of Eumenes, and of the kings of the Attalids (Livy). There an ancient temple of Asclepius stood; an asylum (Tactius). The ornament of Pergamus was the royal library, vying with that of Alexandria in Egypt; the kings of Pergamus and Egypt rivalled each other in this respect (Pliny). Strabo ascribes this rivalry to Eumenes. Plutarch reckons up 200,000 volumes in the library at Pergamus. Here the membrana perga-
mena, whence the name parchment, were invented for the use of books, (Varro, quoted by Pliny). The country of Galen, and of Oribasius chief physician to Julian the Apostate (Eunapius), called by some the ape of Galen. Here P. Scipio died (Cicero). Attalus son of Eumenes dying without issue, bequeathed his kingdom to the Roman people, who reduced it to a province, (Strabo). Pergamus, the epithet (Martial). Here was one of the nine conventus jurisdicti, or assemblies of the Asinum Romanum, called Pergamum, and the ninth in order (Pliny); which he also calls juridiction Perga-
mena.

PERGAMUS, an ancient kingdom of Asia, formed out of the ruins of the empire of Alexander the Great. It commenced about the year 283 B.C. The first sovereign was one Philetærus an eunuch, by birth a Paphlagonian, of a mean descent, and in his youth a menial servant to Antigonus one of Alexander's captains. He afterwards served Lysimachus king of Ma-
cedon and Thrace, who appointed him keeper of his treasures lodged in Pergamus. While he held this employment, having fallen under the displeasure of Arisino wife to Lysimachus, she found means to make a quarrel between him and his master; upon which Philetærus seized on the castle of Pergamus, together with the treasures entrusted to his care, amounting to 50,000 talents. At first he offered his service, together with his treasures, to Seleucus king of Persia; but both Seleucus and Lysimachus dying soon after, he kept possession of the town and territory also till his death; which happened 20 years after his revolt from Lysimachus.

Philetærus left the city of Pergamus to his brother, or, according to some, to his brother's son Eumenes I, and he, laying hold of the opportunity offered by the divisions among the Seleucids, possessed himself of many strongholds in the province of Asia; and having hired a body of Galatians, defeated Antiochus at he was returning from a victory gained over his bro-
ther Seleucus Callinicus. By this victory he obtained possession of the greater part of Asia; however, he did not long enjoy his acquisitions; for he died next year of immoderate drinking, a vice to which he was greatly addicted.

Eumenes was succeeded by Attalus I nephew of Philetærus, and the first who took upon him the title of king of Pergamus. He defeated the Gauls, who were desirous of settling in his territory; and, accor-
ding to Livy, was the first of the Asiatic princes who refused to pay a contribution to these barbarians. When Seleucus Ceraunus was engaged in other wars, he invaded his territories, and conquered all the provinces on this side of Mount Taurus; but was soon driven out of his new acquisitions by Seleucus and his grand-
father Achæus, who entering into an alliance against him, deprived him of all his newly acquired territo-
ries, and even besieged him in his capital. Upon this Attalus invited to his assistance the Gauls who had settled in Thrace; and with their help not only obli-
ged the enemy to raise the siege of Pergamus, but quickly recovered all the provinces he had lost. Af-
ter this he invaded Ionia and the neighbouring prov-
ces, where several cities voluntarily submitted to him. The Teians, Colophonians, with the inhabitants of Egea and Lemnos, sent deputies declaring themselves ready to acknowledge him for their sovereign; the Car-
senses, on the other side the river Lykus, opened their gates to him, having first expelled the governor set over them by Achæus. From hence he advanced to Asia, and encamping on the banks of the river Megithus, received homage from the neighbouring nations. But here the Gauls being frightened by an eclipse of the moon, re-
 fuse to proceed farther; which obliged Attalus to re-
turn to the Hellespont, where he allowed his allies to settle, giving them a large and fruitful territory, and promising that he would always assist and protect them to the utmost of his power.

Attalus having thus settled his affairs with equal honour and advantage to himself, entered into an alliance with Rome, and afterwards joined them in their war against Philip king of Macedon. Here he had the command of the Rhodian fleet; with which he not only drove the Macedonians quite out of the seas, but having landed his men, he, in conjunction with the Athenians, invaded Macedon, and obliged Philip to raise the siege of Athens, which he had greatly distressed; for which services the Athenians not only heaped on him all the favours they could, but called one of their tribes by his name; an honour they had never bestowed on any for-
enger before.

Attalus, not contented with all he had yet done against Philip, attempted to form a general confederacy of the Greeks against him. But while he was han-
gruing the Bœotians to this purpose, and exhorting them with great vehemence to enter into an alliance with the Romans against their common enemy, he fell down speechless. However he came to himself again, and desired to be carried by sea from Thessal to Perga-

mum, where he died soon after his arrival, in the 72d year of his age and 43d of his reign.

This prince was a man of great generosity, and such an enthusiast in learning and learned men, that he caused a grammarian named Daphnides to be thrown in to the sea from the top of a high rock, because he spoke disrespectfully of Homer.

Attalus was succeeded by his eldest son Eumenes II. He was exceedingly attached to the Romans, insomuch that he refused the daughter of Antiochus the Great in marriage, lest he should thus have been led into a dif-
f erence with that people. He also gave notice to the Roman senate of the transactions of Ariarathes king of Cappadocia, who was making great preparations both by sea and land... Nor did Eumenes stop here; for...
Pergamus, when he saw the war about to break out between Antiochus and the Romans, he sent his brother Attalus to Rome to give information of the proceedings of Antiochus. The senate heaped honours both on Eumenes and his brother; and in the war which followed, gave the command of their fleet to the king of Pergamus in conjunction with C. Livius Salinator. The victory gained on this occasion was in a great measure owing to Eumenes, who boarded some of the enemy's ships in person, and during the whole action behaved with uncommon bravery. Some time afterwards Eumenes, entering the territories of Antiochus with a body of 5000 men, ravaged all the country about Thyatira, and returned with an immense booty. But in the mean time Antiochus invading Pergamus in his turn, ravaged the whole country, and even laid siege to the capital. Attalus, the king's brother, held out with a handful of men till the Achaeans, who were in alliance with Eumenes, sent 1000 foot and 100 horse to his assistance. As this small body of auxiliaries were all chosen men, and commanded by an experienced officer, they bore up with such bravery that the Syrians were obliged to raise the siege. At the battle of Magnesia, too, Eumenes behaved with the greatest bravery: not only sustaining the first attack of the enemy's elephants, but driving them back again on their own troops, which put the ranks in disorder, and gave the Romans an opportunity of giving them a total defeat by attacking them opportunely with their horse. In consequence of this defeat, Antiochus was obliged to conclude a peace with the Romans on such terms as they pleased to prescribe; one of which was, that he should pay Eumenes 400 talents, and a quantity of corn, in recompense for the damage he had done him.

Eumenes now thought of obtaining some reward from the Romans equivalent to the services he had done them. Having gone to Rome, he told the senate, that he was come to beg of them that the Greek cities which had belonged to Antiochus before the commencement of the late war, might now be added to his dominions; but his demand was warmly opposed by the ambassadors from Rhodes, as well as by deputies from all the Greek cities in Asia. The senate, however, after hearing both parties, decided the matter in favour of Eumenes, adding to his dominions all the countries on this side of Mount Taurus which belonged to Antiochus; the other provinces lying between that mountain and the river Maeander, excepting Lycia and Caria, were bestowed on the Rhodians. All the cities, which had paid tribute to Attalus, were ordered to pay the same to Eumenes; but such as had been tributary to Antiochus were declared free.

Soon after this Eumenes was engaged in a war with Prusias king of Bithynia, who made war upon him by the advice of Hannibal, the celebrated Carthaginian general. But Eumenes, being assisted by the Romans, defeated Prusias in an engagement by sea, and another by land; which so disheartened him, that he was ready to accept of peace on any terms. However, before the treaty was concluded, Hannibal found means to draw Philip of Macedon into the confederacy, who sent Philoctes, an old and experienced officer, with a considerable body of troops to join Prusias. Hereupon Eumenes sent his brother Attalus to Rome with a golden crown, worth 15,000 talents, to complain of Prusias for making war on the allies of the Roman people without any provocation. The senate accepted the present, and promised to adjust every thing to the satisfaction of their friend Eumenes, whom they looked upon to be the most steady ally they had in Asia. But in the mean time Prusias, having ventured another sea-fight, by a contrivance of Hannibal's gained a complete victory. The Carthaginian commander advised him to fill a great many earthen vessels with various kinds of serpents and other poisonous reptiles, and in the heat of the fight to throw them into the enemies ships so as to break the pots and let the serpents loose. All the soldiers and seamen were commanded to attack the ship in which Eumenes was, and only to defend themselves as well as they could against the rest; and that they might be in no danger of mistaking the ship, a herald was sent before the engagement with a letter to the king. As soon as the two fleets drew near, all the ships of Prusias, singling out that of Eumenes, discharged such a quantity of serpents into it, that most of the soldiers could do their duty, but were forced to fly to the shore, lest they should fall into the enemy's hands. The other ships, after a faint resistance, followed the king's example, and were all driven ashore with great slaughter, the soldiers being no less annoyed by the stings of the serpents, than by the weapons of the enemy. The greatest part of the ships of Eumenes were burnt, several taken, and the others so much shattered that they became quite unserviceable. The same year Prusias gained two remarkable victories over Eumenes by land, both of which were entirely owing to stratagems of Hannibal. But, while matters were thus going on to the disadvantage of Eumenes, the Romans interfered, and by their deputies not only put an end to the differences between the two kings, but prevailed on Prusias to betray Hannibal; upon which he poisoned himself, as hath been related under the article Hannibal.

Eumenes being thus freed from such a dangerous enemy, engaged in a new war with the kings of Cappadocia and Pontus, in which also he proved victorious. His friendship for the Romans he carried to such a degree of enthusiasm, that he went in person to Rome to inform them of the machinations of Perseus king of Macedon. He had before quarrelled with the Rhodians, who sent ambassadors to Rome to complain of him. But as the ambassadors happened to arrive while the king himself was present in the city, the Rhodian ambassadors could not obtain any hearing, and Eumenes was dismissed with new marks of favour. This journey, however, had almost proved fatal to him; for, on his return, as he was going to perform a sacrifice at Delphi, two assassins, sent by Perseus, rolled down two great stones upon him as he entered the straits of the mountains. With one he was dangerously wounded on the head, and with the other on the shoulder. He fell with the blows from a steep place, and thus received many other bruises; so that he was carried on board his ship when it could not well be known whether he was dead or alive. His people, however, soon finding that he was still alive, conveyed him to Corinth, and from Corinth to Aegina, having caused their vessels to be carried over the isthmus.

Eumenes remained at Aegina till his wounds were cured,
cured, which was done with such secrecy, that a report of his death was spread all over Asia, and even believed at Rome; nay, his brother Attalus was so convinced of the truth of this report, that he not only assumed the government, but even married Stratonic the wife of Eumenes. But in a short time Eumenes convinced them both of his being alive, by returning to his kingdom. On the receipt of this news, Attalus resigned the sovereignty in great haste, and went to meet his brother; carrying a halberd, as one of his guards. Eumenes received both him and the queen with great tenderness, nor did he ever say any thing which might tend to make them uneasy; only it is said he whispered in his brother’s ear when he first saw him, “Be in no haste to marry my wife again till you are sure that I am dead.”

The king being now more than ever exasperated against Perses, joined the Romans in their war against him; but during the course of it he suddenly cooled in his affection towards those allies whom he had hitherto served with so much zeal, and that to such a degree, that he admitted ambassadors from Perses, and offered to stand neutral if he would pay him 1000 talents, and for 1500, to influence the Romans to grant him a safe and honourable peace. But these negociations were broke off without effect, by reason of the distrust which the two kings had of one another. Eumenes could not trust Perses unless he paid him the money beforehand; while, on the other hand, Perses did not care to part with the money before Eumenes had performed what he promised; neither could he be induced to pay the sum in question, though the king of Pergamus offered to give hostages for the performance of his promise. What the reason of such a sudden change in the disposition of Eumenes was, is nowhere told; however, the fact is certain. The negociations above mentioned were concealed from the Romans as long as possible; but they soon came to be known: after which the republic began to entertain no small jealousy of their old friend, and therefore heaped favours on his brother Attalus, without taking any notice of the king himself. Eumenes had sent him to Rome to congratulate the senate on the happy issue of the war with Perses, not thinking that his practices had been discovered. However, the senate without taking any notice of their disaffection to Eumenes at first, entertained Attalus with the greatest magnificence; then several of the senators who visited him proceeded to acquaint him with their suspicions of the king, and desired Attalus to treat with them in his own name, assuring him, that the kingdom of Pergamus would be granted him, if he demanded it, by the senate. These speeches had at first some effect; but Attalus, being of an honest disposition, and assisted by the advice of a physician called Stratius, a man of great probity, resolved not to comply with their desire. When he was admitted to the senate, therefore, he first congratulated them on the happy issue of the Macedonian war, then modestly recounted his own services; and lastly, acquainted them with the motive of his journey; intreated them to send ambassadors to the Gauls, who by their authority might secure his brother from any danger of their hostilities; and he requested them also, that the two cities of Ænus and Maronea might be bestowed on himself. The senate, imagining that Attalus designed to choose some other day to sue for his brother’s kingdom, not only granted all his requests, but sent him richer and more magnificent presents than they had ever done before. Upon this Attalus immediately set out on his return to Pergamus, which so provoked the senators, that they declared the cities free which they had promised to Attalus, thus rendering ineffectual their promise which they were ashamed openly to revoke; and as for the Gauls, who were on all occasions ready to invade the kingdom of Pergamus, they sent ambassadors to them, with instructions to behave in such a manner as would rather tend to encourage them in their design than dissuade them from it.

Eumenes, being alarmed at those proceedings, resolved to go in person to Rome, in order to justify himself. But the senate having already condemned him in their own minds, resolved not to hear his vindication. For this reason, as soon as they heard of his design, they made an act that no king should be permitted to enter the gates of Rome. Eumenes, however, who knew nothing of this act, set forward on his journey, and landed at Brundusium; but no sooner did the Roman senate get intelligence of his arrival there, than they sent a questor acquainting him with the decree of the senate; and telling him at the same time, that if he had any business to transact with the senate, he was appointed to hear it, and transmit it to them; but if not, that the king must leave Italy without delay. To this Eumenes replied, that he had no business of any consequence to transact, and that he did not stand in need of any of their assistance; and without saying a word more, went on board his ship, and returned to Pergamus.

On his return home, the Gauls, being encouraged by the cold reception which he had met with at Rome, invaded his territories, but were repulsed with great loss by the king, who afterwards invaded the dominions of Prusias, and possessed himself of several cities. This produced new complaints at Rome; and Eumenes was accused, not only by the ambassadors of Prusias, but also by those of the Gauls and many cities in Asia, of keeping a secret correspondence with Perses king of Macedon. This last charge was confirmed by some letters which the Romans themselves had intercepted; so that Eumenes found it impossible to keep up his credit any longer at Rome, though he sent his brothers Athenaeus and Attalus thither to intercede for him. The senators, in short, had conceived the most implacable hatred against him, and seemed absolutely bent on his destruction, when he died, in the 39th year of his reign, leaving his kingdom and his wife to his brother Attalus. He left one son, but he was an infant, and incapable of governing the kingdom; for which reason Eumenes chose rather to give the present possession of the crown to his brother, reserving the succession to his son, than to endanger the whole by committing the management of affairs to his son’s tutors.

Attalus, in the beginning of his reign, found himself greatly distressed by Prusias king of Bitheusia, who not only overthrew him in a pitched battle, but advanced to the very walls of Pergamus, ravaging the country as he marched along; and at last reduced the royal city itself. The king, however, saved himself by a timely flight, and dispatched ambassadors to Rome, complaining of the bad usage of Prusias. The latter endeavoured to defend himself, and to throw the blame on Attalus.
Perg., lus. But, after a proper inquiry was made into the matter, Prusias was found to be entirely in the wrong; in consequence of which, he was at last obliged to conclude a peace with his adversary on the following terms. 1. That he should immediately deliver up Attalus 20 ships with decks. 2. That he should pay 500 talents to Attalus within the space of 20 years. 3. That he should pay 100 talents to some of the other Asiatic nations by way of reparation for the damages they had sustained from him. And, 4. Both parties should be content with what they had before the beginning of the war.

Some time after this, Prusias having made an unnatural attempt on the life of his son Nicomedes, the latter rebelled, and with the assistance of Attalus, drove his father from the throne, and, as is said, even murdered him in the temple of Jupiter. The Romans took no notice of these transactions, but showed the same kindness to Attalus as formerly. The last enterprise in which we find Attalus engaged, was against Andronicus, the pretended son of Pergamus king of Macedon, where he assisted the Romans; after which he gave himself up entirely to ease and luxury, committing state affairs entirely to his ministers; and thus continued to his death, which happened in the 82d year of his age, about 138 B.C.

Attalus II. was succeeded by Attalus III. the son of Eumenes; for the late king, considering that he only held the crown as a trust for his nephew, passed by his own children in order to give it to him, though he appears to have been by no means of worthy of it. He is said to have been deprived of his senses through the violence of his grief for his mother's death; and indeed, throughout his whole reign, he behaved more like a madman than anything else. Many of his subjects of the highest quality were cut off with their wives and children, upon the most groundless suspicions; and for these executions he made use of mercenaries hired out from among the most barbarous nations. Thus he proceeded till he had cut off all the best men in the kingdom; after which he fell into a deep melancholy, imagining that the ghosts of those whom he had murdered were perpetually haunting him. On this he shut himself up in his palace, put on a mean apparel, let his hair and beard grow, and sequestered himself from all mankind. At last he withdrew from the palace, and retired into a garden, which he cultivated with his own hands, and filled with all sorts of poisonous herbs. These he used to mix with wholesome pulse, and send packets of them to such as he suspected. At last, being weary of this amusement, and living in solitude, because nobody durst approach him, he took it in his head to found the trade of a founder, and make a brazen monument. But while he laboured at melting and casting the brass, the heat of the sun and furnace threw him into a fever, which in seven days put an end to his tyranny, after he had sat on the throne five years.

On the death of the king, a will was found, by which he left the Roman people heirs of all his goods; upon which they seized on the kingdom, and reduced it to a province of their empire by the name of Asis Proper. But Aristonicus, a son of Eumenes by an Ephesian courtesan, reckoning himself the lawful heir to the crown, could by no means be satisfied with this usurpation of the Romans, and therefore assembled a consider-
PERGAMUS, though exceeding cruel method. Most of the cities in the kingdom had no other water than what was brought from a considerable distance in aqueducts. These Aquilii did not demolish, but poisoned the water, which produced the greatest abhorrence of him throughout all the east. At last, however, the whole country being reduced, Aquilii triumphed, the unhappy Aristonicus was led in chains before his chariot, and probably ended his miserable life in a dungeon. The country remained subject to the Romans while their empire lasted, but is now in the hands of the Turks. The city is half ruined, and is still known by the name of Pergamus. It is inhabited by about 3000 Turks, and a few families of poor Christians. E. Long. 27. 27. N. Lat. 32. 3.

PERGUNNAAH, in the language of Hindostan, means the largest subdivision of a province, whereof the revenues are brought to one particular head Cutchery, from whence the accounts and cash are transmitted to the general Cutchery of the province.

PERIAGOGE, in Rhetoric, is used where many things are accumulated into one period which might have been divided into several.

PERIAGUA, a kind of large canoe made use of in the Leeward islands, South America, and the gulf of Mexico. It is composed of the trunks of two trees hollowed and united together; and thus differs from the canoe, which is formed of one tree.

PERIANDER, tyrant of Corinth and Corcyra, was reckoned among the seven wise men of Greece; though he might rather have been reckoned among the most wicked men, since he changed the government of his country, deprived his countrymen of their liberty, usurped the sovereignty, and committed the most shocking crimes. In the beginning of his reign he behaved with mildness; but after his having sent to the tyrant of Syracuse to consult him on the safest method of government, he abandoned himself to cruelty. The latter, having heard Periander’s envoys, took them into a field, and, instead of answering them, pulled up before them the ears of corn which exceeded the rest in height. Periander, on being told of this action, understood what was meant by it. He first secured himself by a good guard, and then put the most powerful Corinthians to death. He abandoned himself to the most enormous crimes; committed incest with his mother, kicked to death his wife Melissa, daughter of Procles king of Epidaurus, notwithstanding her being with child; and was so enraged at Lycophron, his second son, for lamenting his mother’s death, that he banished him into the island of Corcyra. Yet he passed for one of the greatest politicians of his time; and Heraclides tells us, that he forbade voluptuousness; that he imposed no taxes, contenting himself with the custom arising from the sale and the import and export of commodities; that, though wicked himself, he hated the wicked, and caused all pimps to be drowned; lastly, that he established a senate, and settled the expence of its members. He died 58.; B. C.

PERIANTHIUM, (from wupa, “round,” and arpav, “the flower,”) the flower cup properly so called, the most common species of calyx, placed immediately under the flower, which is contained in it as in a cup. See Botany Index. Vol. XVI. Part I.

PERICARDIUM, in Anatomy, a membranous bag filled with water, which contains the heart in man and many other animals. It is formed by a duplicature of the mediastinum, or membrane which divides the thorax into two unequal parts. See Anatomy, No. 1.

PERICARP, (from wupa, “round,” and sevav, “fruit,”) the seed vessel, that organ of a plant containing the seeds, which it discharges when ripe. The seed vessel is in fact the developed seed-bud, and may very properly be compared to the fecundated ovary in animals; for it does not exist till after the fertilizing of the seeds by the male dust, and the consequent fall of the flower. All plants, however, are not furnished with a seed vessel; in such as are deprived of it, the receptacle or calyx performs its functions by inclosing the seeds as in a matrix, and accompanying them to perfect maturity.

PERICHORUS, in antiquity, a name given by the Greeks to their profane games or combats, that is, to such as were not consecrated to any of the gods.

PERICLES, was one of the greatest men that ever flourished in Greece. He was educated with all imaginable care; and beside other masters, he had for his tutors Zeno, Eleates, and Anaxagoras. He learned from the last of these to fear the gods without superstition, and to account for an eclipse from a natural cause. Many were unjust enough to suspect him of atheism, because he had perfectly studied the doctrine of that philosopher. He was a man of undoubted courage; and of such extraordinary eloquence, supported and improved by knowledge, that he gained almost as great an authority under a republican government as if he had been a monarch; but yet he could not escape the satirical strokes of the comic poets. His dissoluteness with women was one of the vices with which he was chiefly charged. He died the third year of the Peloponnesian war, after long sickness, which had weakened his understanding. Aspasia, Pericles’s favourite, was a learned woman of Miletus; she taught Socrates rhetoric and politics. As Pericles cared not much for his wife, he willingly gave her up to another, and married Aspasia, whom he passionately loved.

PERICRANIIUM, in Anatomy, a thick solid coat or membrane covering the outside of the cranium or skull. See Anatomy, No. 4.

PERIGEE, in Astronomy, that point of the sun or moon’s orbit wherein they are at the least distance from the earth; in which sense it stands opposed to apogee.

PERIGORD, a province of France, which makes part of Guienne, bounded on the north by Angoumois and a part of Marche, and on the east by Quercy and Limosin; on the south by Agenois and Bazadois; and on the west, by Bourledois, Angoumois, and a part of Saintonge. It is about 83 miles in length, and 60 in breadth. It abounds in iron mines, and the air is pure and healthy. Perigueux is the capital town.

PERIGORD-Stone, is supposed to be an ore of manganes, of a dark grey colour, like basalt.

PERIGRAPH, a word usually understood to express a careless or inaccurate delineation of any thing; but in Vesalius it is used to express the white lines or impressions that appear on the musculus rectus of the abdomen.
PERIGUEUX, an ancient town of France, capital of the province of Perigord, seated on the river Isle, in E. Long. 0 33; N. Lat. 45 18. It is remarkable for the ruins of the temple of Venus, and an amphitheatre.

PERIHELIUM, in Astronomy, that part of a planet or comet’s orbit wherein it is in its least distance from the sun; in which sense it stands in opposition to apheleum.

PERIMETER, in Geometry, the bounds or limits of any figure or body. The perimeters of surfaces or figures are lines; those of bodies are surfaces. In circular figures, instead of perimeter, we say circumference, or periphery.

PERINÆUM, or PERINEUM, in Anatomy, the space between the anus and the parts of generation, divided into two equal lateral divisions by a very distinct line, which is longer in males than in females.

PERIOD, in Astronomy, the time taken up by a star or planet in making a revolution round the sun; or the duration of its course till it return to the same part of its orbit. See PLANET.

The different periods and mean distances of the several planets are as follows:

There is a wonderful harmony between the distances of the planets from the sun, and their periods round him; the great law whereof is, that the squares of the periodical times of the primary planet, are to each other as the cubes of their distances from the sun? and likewise, the squares of the periodical times of the secondaries of any planet are to each other as the cubes of their distances from that primary. This harmony among the planets is one of the greatest confirmations of the Copernican hypothesis. See Astronomy, p. 100 and 101.

For the periods of the moon, see Moon, Astronomy Index.

The periods of several comets are now pretty well ascertained. See Astronomy, No. 306.

PERIOD, in Chronology, denotes a revolution of a certain number of years, or a series of years, whereby, in different nations, and on different occasions, time is measured; such are the following.

Calippic Period, a system of seventy-six years. See Calippic, and Astronomy, No. 11, &c.

Dionysian Period, or Victorian Period, a system of 532 lunæ-solar and Julian years; which being elapsed, the characters of the moon fall again upon the same day and era, and revolve in the same order, according to the opinion of the ancients.

This period is otherwise called the great paschal cycle, because the Christian church first used it to find the true time of the pascha or easter. The sum of these years arises by multiplying together the cycles of the sun and moon.
PERIODIC, or PERIODICAL, something that terminates and comprehends a period; such is a periodic month; being the space of time wherein the moon dispatches her period.

PERIOECI, in Geography, such inhabitants of the earth as have the same latitudes, but opposite longitudes, or live under the same parallel and the same meridian, but in different semicircles of that meridian, or in opposite points of the parallel. These have the same common seasons throughout the year, and the same phenomena of the heavenly bodies; but when it is noon-day with the one, it is midnight with the other, there being twenty-four hours in an east or west direction. These are found on the globe by the hour-index, or by turning the globe half round, that is, 180 degrees either way.

PERIOSTEUM, or PERIOSTIUM, in Anatomy, a nervous vascular membrane, ended with a very quick sense, immediately surrounding, in every part, both the internal and external surfaces of all the bones in the body, excepting only so much of the teeth as stand above the gums, and the peculiar places on the bones in which the muscles are inserted. It is hence divided into the external and internal periostium; and where it externally surrounds the bones of the skull, it is generally called the pericranium. See Anatomy Index.

PERIPATETICS, philosophers, followers of Aristotle, and maintainers of the peripatetic philosophy; called also Aristotelians. Cicero says, that Plato left two excellent disciples, Xenocrates and Aristotle, who founded two sects, which only differed in name: the former took the appellation of Academicians, who were those that continued to hold their conferences in the Academy, as Plato had done before; the others, who followed Aristotle, were called Peripatetics, from περιπάτωμα, "I walk;" because they disputed walking in the Lyceum.

Ammonius derives the name Peripatetic from Plato himself, who only taught walking; and adds, that the disciples of Aristotle, and those of Xenocrates, were equally called Peripatetics; the one Peripatetics of the Academy, the other Peripatetics of the Lyceum: but that in time the former quit its the title Peripatetic of that of Academic, on account of the place where they assembled, and the latter retained simply that of Peripatetic. The greatest and best part of Aristotle's philosophy was borrowed from Plato. Serranus asserts, and says he could demonstrate, that there is nothing exquisite in any part of Aristotle's philosophy, dialectics, ethics, politics, physics, or metaphysics, but is found in Plato. And of this opinion are many of the ancient authors, such as Clemens Alexandrinus, &c. Gale attempts to show, that Aristotle borrowed a good deal of his philosophy, both physical, about the first matter, and metaphysical about the first being, his affections, truth, unity, goodness, &c. from the Scriptures; and adds from Clearchus, one of Aristotle's scholars, that he made use of a certain Jew, who assisted him therein.

Aristotle's philosophy preserved itself in puris naturibus for a long time: in the earlier ages of Christianity, the Platonic philosophy was generally preferred; but this did not prevent the doctrine of Aristotle from forcing its way into the Christian church. Towards the end of the fifth century, it rose into great credit; the Platonics interpreting in their schools some of the writings of Aristotle, particularly his dialectics, and recommending them to young persons. This appears to have been the first step to that universal dominion which Aristotle afterwards obtained among the learned, which was at the same time much promoted by the controversies which Origen had occasioned. This father was zealously attached to the Platonic system; and therefore, after his condemnation, many, to avoid the imputation of his errors, and to prevent their being counted among the number of his followers, openly adopted the philosophy of Aristotle. Nor was any philosophy more proper for furnishing those weapons of subtle distinctions and captious sophisms, which were used in the Nestorian, Arian, and Eutychian controversies. About the end of the sixth century, the Aristotelian philosophy, as well as science in general, was almost universally derided; and it was chiefly owing to Boetius, who explained and recommended it, that it obtained a higher degree of credit among the Latins than it had hitherto enjoyed. Towards the end of the seventh century, the Greeks abandoned Plato to the monks, and gave themselves up entirely to the direction of Aristotle; and in the next century, the Peripatetic philosophy was taught everywhere in their public schools, and propagated in all places with considerable success. John Damascenus very much contributed to its credit and influence, by composing a concise, plain, and comprehensive view of the doctrines of the Stagirite, for the instruction of the more ignorant, and in a manner adapted to common capacities. Under the patronage of Photius, and the protection of Bardas, the study of philosophy for some time declined, but was revived again about the end of the ninth century. About the middle of the 11th century, a revolution in philosophy commenced in France, when several famous logicians, who followed Aristotle as their guide, took nevertheless the liberty of illustrating and moulding anew his philosophy, and extending it far beyond its ancient limits. In the 12th century, three methods of teaching philosophy were in use by the different doctors: the first was the ancient and plain method, which confined its researches to the philosophical notions of Porphyry, and the dialectic system, commonly attributed to St Augustine, and in which was laid down this general rule, that philosophical inquiries were to be limited to a small number of subjects, lest by their becoming too extensive, religion might suffer by a profane mixture of human subtlety with its divine wisdom. The second method was called the Aristotelian, because it consisted in explications of the works of that philosopher, several of whose books being translated into Latin, were almost everywhere in the hands of the learned. The third was termed the free method, employed by such as were bold enough to search
after truth, in the manner the most adapted to render their inquiries successful, without rejecting the success of Aristotle and Plato. A reformed system of the Peripatetic philosophy was first introduced into the schools in the university of Paris, from whence it soon spread throughout Europe; and has subsisted in some universities even to this day, under the name of school philosophy. The foundation thereof is Aristotle’s doctrine, often misunderstood, but oftener misapplied; whence the retainers thereto may be denominated Reformed Peripatetics. Out of these have sprung, at various times, several branches; the chief are the Thomists, Scotists, and Nominalists. See these articles.

The Peripatetic system, after having prevailed with great and extensive dominion for many centuries, began rapidly to decline towards the close of the 17th when the disciples of Ramus attacked it on the one hand, and it had still more formidable adversaries to encounter in Descartes, Gassendi, and Newton. See Philosophy.

Peripatones, in antiquity, the name of that walk in the Lyceum where Aristotle taught, and whence the name of Peripatetics given to his followers.

Peripetiae, in the drama, that part of a tragedy wherein the action is turned, the plot unravelled, and the whole concludes. See Catastrophe.

Periphery, in Geometry, the circumference of a circle, ellipse, or any other regular curvilinear figure. See Geometry.

Periphrasis, circumlocution, formed of περί, "about," and προφέρω, "I speak;" in rhetoric, a circumlocution, tour of words, much affected by orators, to avoid common and trite manners of expression. The periphrasis is of great use on some occasions; and it is often necessary to make things be conceived which are not proper to name. It is sometimes polite to suppress the names, and only intimate or design them. These terms of expression are also particularly serviceable in oratory; for the sublime admitting of no direct citations, there must be a compass taken to insinuate the authors whose authority is borrowed. A periphrasis, by turning round a proper name to make it understood, amplifies and raises the discourse; but care must be taken it be not too much swelled, nor extended, mal a propos; in which case it becomes flat and languid. See Cireculacoum and Oratory.

Periploca, Virginian Silk: a genus of plants belonging to the pentandria class; and in the natural method ranking under the 30th order, Contortae. See Botany Index.

Peripneumony, Peripneumonia, formed from περί, "about," and πνεῦμα, "lungs," in Medicine, an inflammation of some part of the thorax, properly of the lungs; attended with an acute fever, and a difficulty of breathing. See Medicine, No 184.

Perirrhzenes, a vessel made of stone or brass which was filled with holy water, and with which all those were sprinkled who were admitted by the ancients to their sacrifices. Beyond this vessel no profane person was allowed to pass. We are told by some, that it was placed in the adytum, or inmost recess of the temple: others say it was placed at the door, which indeed seems to be the most likely opinion. It was used both by Greeks and Romans, and has been evidently borrowed, like many other Pagan ceremonies, by the church of Rome. The Hebrews also had a vessel for purification.

Perisch, in Geography, the inhabitants of either frigid zone, between the polar circles and the pole, where the sun, when in the summer signs, moves only round about them, without setting; and consequently their shadows in the same day turn to all the parts of the horizon.

Peristaltic, a vermicular spontaneous motion of the intestines, performed by the contraction of the circular and longitudinal fibres of which the fleshly coat of the intestines are composed; by means whereof the chyle is driven into the orifices of the lachrymal veins, and the feces are protruded towards the anus.

Perisyle, in Ancient Architecture, a building encompassed with a row of columns on the inside.

Peritoneum, in Anatomy, is a thin, smooth and lubricious membrane, investing the whole internal surface of the abdomen, and containing most of the viscera of that part as it were in a bag. See Anatomy Index.

Perithrochium, in Mechanics, denotes a wheel or circle, concentric with the base of a cylinder, and movable together with it about its axis. See Mechanics.

Perjury, in Law, is defined by Sir Edward Coke to be a crime committed when a lawful oath is administered, in some judicial proceeding, to a person who swears wilfully, absolutely, and falsely, in a matter material to the issue or point in question. In ancient times, it was in some places punished with death; in others it was made the false swearer liable to the punishment due to the crime he had charged the innocent person with; in others a pecuniary mulct was imposed. But though escaped human, yet it was thought, amongst the ancients in general, that the divine vengeance would most certainly overtake it; and there are many severe inflictions from the hand of God upon record, as monuments of the abhorrence in which this atrocious crime is held by the Deity. The souls of the deceased were supposed to be employed in punishing perjured persons. Even the inanimate creation was thought to take revenge for this crime. The Greeks supposed that no person could swear falsely by Styx without some remarkable punishment, and that no person guilty of perjury could enter the cave of Faustus at Corinth without being made a memorable example of divine justice. In Sicily, at the temple of the Palaces, there were fountains called Dalia, from which issued boiling water, with flames and balls of fire; and we are told that if any person swore falsely near them, he was instantly struck dumb, blind, lame, or dead, or was swallowed up by the waters. But though perjury was thus held in general abhorrence notwithstanding the credit which was given to such accounts of divine inflictions, it was so much practised by the Greeks, that Graeca fides became a proverb. Lovers perjuries, however, were supposed to pass unnoticed, or to be very slightly punished with blackness of the nails, a decayed tooth, or some small diminution of beauty.

The ancient philosophers, however, were so afraid of perjury, that even an oath before a judge was never admitted but for want of other proof. Plato's precept was, "Not to administer an oath wantonly, but on deep grounds, and with the strictest caution." Ulpian gave
his opinion thus: "Some are forward to take oaths from a contempt of religion; others, from an extraordinary awe of the Divine Majesty, carry their fear to an unreasonable superstition; so make an equitable decision of a judge necessary."

"No man will perjure himself (says Aristotle) who apprehends vengeance from Heaven and disgrace among men." Clinias was so very scrupulous, that rather than take an oath (though lawfully), he suffered the loss of three talents. Perjury, in the time of Philo Judaeus, was abominated and capitally punished among the Jews; though since they have much degenerated, having been poisoned with the books of the Talmud, which says, "He who breaks his promissory oath, or any vow he enters into by the year, if he has a mind that they should be ineffectual and invalid, let him raise the last day of the year, and say, Whatever promises, oaths, and vows I may think fit to make in the year following, let them be null, void, and of no effect." Tract. iii. part 2, be Talmud, in the treatise Nedarim. 4. And the modern Jews use the same artifice, thinking they may then lawfully deceive the Christians. See Hieron, ex Dicitia Talmud, c. 3, and Magister Johannes de Corcon. Legum, tit. iv. c. 7.

In our law, no notice is taken of any perjury but such as is committed in some court of justice having power to administer an oath; or before some magistrate or proper officer invested with a similar authority, in some proceedings relative to a civil suit or a criminal prosecution: for it esteems all other oaths unnecessary at least, and therefore will not punish the breach of them. For which reason it is much to be questioned, how far any magistrate is justifiable in taking a voluntary affidavit in any extrajudicial matter, as is too frequent upon every petty occasion; since it is more than possible that, by such idle oaths, a man may frequently, in foro conscientiae, incur the guilt, and at the same time evade the temporal penalties of perjury. The perjury must also be corrupt (that is, committed non animo), willful, positive, and absolute; not upon surprise, or the like: it also must be in some point material to the question in dispute; for if it only be in some trifling collateral circumstance, to which no regard is paid, it is no more penal than in the voluntary extrajudicial oaths before mentioned. Subornation of perjury is the offence of procuring another to take such a false oath as constitutes perjury in the principal. The punishment of perjury and subornation, at common law, has been various. It was anciently death; afterwards banishment, or cutting out the tongue; then forfeiture of goods; and now it is fine and imprisonment, and never more to be capable of bearing testimony. But the statute 5 Eliz. c. 9. (if the offender be prosecuted thereon) inflicts the penalty of perpetual infamy, and a fine of 30l. on the suborner; and in default of payment, imprisonment for six months, and to stand with both ears nailed to the pillory. Perjury itself is thereby punished with six months imprisonment, perpetual infamy, and a fine of 20l. or to have both ears nailed to the pillory. But the prosecution is usually carried on for the offence at common law; especially as, to the penalties before inflicted, the statute 2 Geo. II. c. 25. superadds a power for the court to order the offender to be sent to the house of correction for a term not exceeding seven years, or to be transported for the same period; and makes it felony, without benefit of clergy, to return or escape within the time. It has sometimes been wished, that perjury, at least upon capital accusations, whereby another's life has been or might have been destroyed, was also rendered capital, upon a principle of retaliation; as it was universally by the laws of France. And certainly the odiousness of the crime pleads strongly in behalf of the French law. But it is to be considered, that they admitted witnesses to be heard only on the side of the prosecution, and used the rack to extort a confession from the accused. In such a constitution, therefore, it was necessary to throw the dread of capital punishment into the other scale, in order to keep in awe the witnesses for the crown; on whom alone the prisoner's fate depended; so naturally does one cruel law beget another. But corporal and pecuniary punishments, exile, and perpetual infamy, are more suited to the genius of the English law; where the fact is openly discussed between witnesses on both sides, and the evidence for the crown may be contradicted and disproved by those of the prisoner. Where indeed the death of an innocent person has actually been the consequence of such wilful perjury, it falls within the guilt of deliberate murder, and deserves an equal punishment; which our ancient law in fact inflicted. But the mere attempt to destroy life by other means not being capital, there is no reason that an attempt by perjury should much less than this crime should, in all judicial cases, be punished with death. For to multiply capital punishments lessens their effect, when applied to crimes of the deepest dye; and, detestable as perjury is, it is not by any means to be compared with some other offences, for which only death can be inflicted; and therefore it seems already (except perhaps in the instance of deliberate murder by perjury) very properly punished by our present law; which has adopted the opinion of Cicero, derived from the law of the twelve tables, Perjurii pex qui divinum, exercitum; humana, deduct. See OATH.

PERIWIG. See PERRUKI.

PERIZONIUS, JAMES, a learned and laborious writer, was born at Dam in 1651. He became professor of history and eloquence at the university of Franeker, when, by his merit and learning, he made that university flourish. However, in 1693, he went to Leyden, where he was made professor of history, eloquence, and the Greek tongue; in which employment he continued till his death, which happened in 1715. He wrote many Dissertations, and other learned and curious works, particularly Origines Babylonice et Egyptiaci, 2 vols. 8vo. &c. But the part of his labours which is the most generally known, and perhaps the most useful, is the notes which he wrote upon Sanscrit Minerva. That work, as published by Perizonius, certainly suggested the idea of Harris's Hermes; and we hesitate not to say, that our countryman has made hardly any improvement on the system of his master.

PERIZZITES, the ancient inhabitants of Palestine, mingled with the Canaanites. There is also great probability that they themselves were Canaanites; but having no fixed habitations, sometimes dispersed in one country and sometimes in another, they were for that reason called Perizzites, which signifies scattered or dispersed. Phersonoth stands for hamlets or villages. The Perizzites did not inhabit any certain portion of the land of Canaan; there were some of them on both sides the
PERIZZITES, the river Jordan, in the mountains, and in the plains. In several places of Scripture the Canaanites and Perizzites are mentioned as the two chief peoples of the country. It is said, for example, that in the time of Abraham and Lot the Canaanite and Perizite were in the land (Gen. xiii. 7). The Israelites of the tribe of Ephraim complained to Joshua that they were too much pent up in their possession (Josh. xvii. 15); he bid them go, if they pleased, into the mountains of the Perizzites, and Reubenites or giants, and there clearing the land, to cultivate and inhabit it. Solomon subdued the remains of the Canaanites and Perizzites which the children of Israel had not rooted out, and made them tributary to him (1 Kings ix. 20, 21, and 2 Chr. viii. 7). There is still mention made of the Perizzites in the time of Ezra (ix. 1.), after the return from the captivity of Babylon, and several Israelites had married wives from that nation.

PERKIN, a beverage prepared from pears. See Cyderkin, under Agriculture, No. 626.

PERMEABLE, a term applied to bodies of so loose a texture as to let something pass through them.

PERMSKI, or Permia, a town of the Russian empire, and capital of a province of the same name, seated on the river Kama between the Dvina and the Oby; E. Long. 55° 50', N. Lat. 57° 10'.

PERMUTATION, in commerce, the same with bartering. In the canon-law, permutation denotes the actual exchange of one benefice for another.

PERNAMBUCO, a province of Brazil, in South America, bounded on the north and east by the ocean, on the south by Bahia, and on the west by Piau. It is about 300 miles in length and as much in breadth.

The Dutch became masters of it in 1630, but the Portuguese soon after retook it. It produces a great quantity of sugar, cotton, and Brazil wood. An insurrection broke out in this province on the 7th April 1817. The Portuguese authorities were driven out, and a republican constitution proclaimed; but in the following month the revolutionists were subdued.

PERNO, a kibe or childkin, is a little ulcer, occasioned by cold, in the hands, feet, heals, nose, and lips. It will come on when warm parts are too suddenly exposed to cold, or when parts from being too cold are suddenly exposed to a considerable warmth; and has always a tendency to gangrene, in which it frequently terminates. It most commonly attacks children of a sanguine habit and delicate constitution; and may be prevented or removed by such remedies as invigorate the system, and are capable of removing any tendency to gangrene in the constitution.

PERONÆUS, in Anatomy, is an epithet applied to some of the muscles of the perone or fibula. See Anatomy, Table of the Muscles.

PERONES, a sort of high shoes which were worn not only by country people, but by men of ordinary rank at Rome. In the early times of the commonwealth they were worn even by senators; but at last they were disused by persons of figure, and confined to ploughmen and labourers. They were very rudely formed, consisting only of hides undressed, and reaching to the middle of the leg. Virgil mentions the pereones as worn by a company of rustic soldiers on one foot only.

PERONNE, a strong town of France, in the department of Somme. It is said never to have been taken, though often besieged. It is seated on the Somme. E. Long. 3° 1', N. Lat. 44° 50'. Population 3700 in 1850.

PERORATION, in Rhetoric, the epilogue or last part of an oration, wherein what the orator had insisted on throughout his whole discourse is urged afresh with greater vehemence and passion. The peroration consists of two parts: 1. Recapitulation; wherein the substance of what was diffused throughout the whole speech is collected briefly and curtly, and summed up with new force and weight. 2. The moving the passions; which is so peculiar to the peroration, that the masters of the art call this part sedes affectuum. The passions to be raised are various, according to the various kinds of oration. In a panegyric, love, admiration, emulation, joy, &c. In an invective, hatred, contempt, &c. In a deliberation, hope, confidence, or fear. The qualities required in the peroration are, that it be very vehement and passionate, and that it be short; because, as Cicero observes, tears soon dry up. These qualities were well observed by Cicero, who never had an equal in the management of this part of an orator's province; for peroration was his master-piece.

Concerning peroration (says Dr. Blair), it needless to say much, because it must vary so considerably, according to the strain of the preceding discourse. Sometimes the whole pathetic part comes in most properly at the peroration. Sometimes, when the discourse has been entirely argumentative, it is fit to conclude with summing up the arguments, placing them in one view, and leaving the impression of them full and strong on the mind of the audience. For the great rule of a conclusion, and what nature obviously suggests, is, to place that last on which we choose that the strength of our case should rest.

"In all discourses, it is a matter of importance to hit the precise time of concluding, so as to bring our discourse just to a point; neither ending abruptly and unexpectedly, nor disappointing the expectation of the hearers when they look for the close, and continuing to hover round and round the conclusion till they become heartily tired of us. We should endeavour to get off with a good grace; not to end with a languishing and drawing sentence, but to close with dignity and spirit, that we may leave the minds of the hearers warm, and dismiss them with a favourable impression of the subject and of the speaker."

PEROTIS, a genus of plants belonging to the triandria class, and in the natural method ranking under the 4th order, Gramina. See Botany Index.

PERPENDICULAR, in Geometry, a line falling directly on another line, so as to make equal angles on each side. See Geometry.

PERPETUAL, something that endures always, or lasts for ever.

PERPETUAL Motion. See Movement.

PERPIGNAN, a considerable town of Roussillon, in France, with a strong citadel, an university, and a bishop's see. It is seated on the river Tet; over which there is a handsome bridge. E. Long. o. 43', N. Lat. 45° 18'.

PERQUISITE, in a general sense, something gained by a place over and above settled wages.
Perquisite, in Low, is any thing gotten by a man's own industry, or purchased with his money; in contradistinction to what descends to him from his father or other ancestor.

PERRAULT, Claude, the son of an advocate in parliament, was born at Paris in 1613; and was bred a physician, though he never practised but among his relations, friends, and the poor. He discovered early a particular taste for the sciences and fine arts; of which he acquired a consummate knowledge without the assistance of a master: he excelled in architecture, painting, sculpture, mathematics, physics, and all those arts that relate to designing and mechanics. The entrance into the Louvre, which was designed by him, is, according to the judgment of Voltaire, one of the most august monuments of architecture in the world. M. Colbert put him upon translating Vitruvius into French, which he performed, and published it in 1679, folio, with figures from his own drawings; which are said to have been more exactly finished than the plates themselves. When the academy of sciences was established, he was one of its first members, and was chiefly depended on for mechanics and natural philosophy. His works are, Mémoires pour servir à l'Histoire naturelle des Animaux, folio, 1676, with figures; Essais de Physique, 4 vols, 1690, 1688; Recueil des plusieurs machines de nouvelle invention, 4to, 1700, &c. He died in 1688.

PERRAULT, Charles, the brother of Claude, was born at Paris in 1626, with as great a genius for arts, and a greater for letters, than his brother. Colbert chose him first clerk of the buildings, of which he was superintendant, and afterward made him comptroller general of the finances under him. He was one of the first members of the academy of the belles lettres and inscriptions, and was received into the French academy in 1671. His poem, La Peinture, printed in 1688, was universally admired: that entitled La selle de Louis le Grand, in which he exalted the modern authors above the ancient, was a prelude to a war with all the learned. After he had disengaged himself from this contest, he applied himself to draw up eulogies of several great men of the 17th century, with their portraits, of which he has collected 102. There are other esteemed works of Perrault.—Besides these there were two other brothers, Peter and Nicholas, who made themselves known in the literary world.

PERRON, James Davy du, a cardinal, distinguished by his abilities and learning, was born in the canton of Bern in 1536. He was educated by Julian Davy, his father, a learned Calvinist, who taught him Latin and the mathematics; after which, he by himself became acquainted with the Greek and Hebrew, philosophy, and the poets. Philip Desportes, abbot of Tyron, made him known to Henry III. king of France, who conceived a great esteem for him. Some time after, Du Perron abjured Calvinism, and afterwards embraced the ecclesiastical function; and having given great proofs of his wit and learning, he was chosen to pronounce the funeral oration of Mary queen of Scots. After the murder of Henry III. he retired to the house of Cardinal de Bourbon, and took great pains in bringing back the Protestants to the church of Rome. Among others he gained over Henry Sondanus, afterwards bishop of Pamiers. He also chiefly contributed to engage Henry IV. to change his religion; and that prince sent him to negotiate his reconciliation to the holy see, to which he succeeded. Du Perron was consecrated bishop of Evrault while he resided at Rome. On his return to France, he wrote, preached, and disputed against the reformed; particularly against Du Plessis Mornay, with whom he had a public conference in the presence of the king at Fontainebleau. He was made cardinal in 1604 by Pope Clement VIII, at the solicitation of Henry IV. who afterwards nominated him to the archbishopric of Sens. The king at length sent him to Rome with Cardinal Joyeuse, in order to terminate the disputes which had arisen between Paul V. and the Venetians. It is said that this pope had such a high opinion of the address of the cardinal Du Perron, that he used to say, "Let us pray to God to inspire the cardinal Du Perron, for he will persuade us to do whatever he pleases." After the death of Henry IV. he retired into the country, where he put the last hand to his work; and, setting up a printing-house, corrected every sheet himself. He died at Paris in 1618. His works were collected after his death, and published at Paris in 3 vols, folio.

PERROT, Nicholas, Sieur d'Abancourt, one of the first geniuses of his age, was born at Chalons in 1606. After studying philosophy about three years, he was sent to Paris to follow the law. At eighteen years of age he was admitted advocate of parliament, and frequented the bar; but he soon conceived a distaste for it, and therefore discontinued his practice. This displeased an uncle, but whose favour he recovered by quitting the Protestant religion. He could not, however, be prevailed upon to take orders in the Roman church; and some years after, he had a desire to return to the religion he had abjured. But, that he might not do any thing rashly, he resolved to study philosophy and divinity. For that purpose he chose for his master Mr. Stuart a Scotsman and Lutheran, a man of great learning. Almost three years he spent in the most assiduous study; and then set out from Paris to Champagne, where he abjured the Roman Catholic, and once more embraced the Protestant religion. In 1637 he was admitted a member of the French academy; a little after which he undertook a translation of Tacitus. Whiles he was engaged in that laborious task, he retired to his small estate of Abancourt, and lived there till his death in 1664. He was a man of fine understanding, of great piety and integrity, and of universal learning. Moreri has given a catalogue of his works, the greatest part of which consist of translations, which seemed rather originals.

PERRUKE, Peruke, or Periwig, was anciently a name for a long head of natural hair; such, particularly, as there was care taken in the adjusting and trimming of. Menage derives the word rather fancifully from the Latin, pilus, "hair." It is derived, according to this critic, thus, pilus, pelus, pelotus, pelteicus, pelticus, perusta, perucia, perruec. The Latins called it coma; whence part of Gaul took the denomination of Gallia Comata, from the long hair which the inhabitants wore as a sign of freedom. An ancient author says, that Absalom's perruke weighed 200 shekels. The word is now used for a set of false hair, curled, buckled, and sewed together on a frame or cowl; an-
PER

Perruks were once called *capillamentum* or "false perruke." It is doubted whether or not the use of perruks of this kind was known among the ancients. It is true, they used false hair; Martial and Juvenal make merry with the women of their time, for making themselves look young with their borrowed hair; with the men who changed their colours according to the seasons; and with the dotards, who hoped to deceive the Destinies by their white hair. But these seem to have scarce had any thing in common with our perruks; and were at best only composed of hair painted, and glued together. Nothing can be more ridiculous than the description Lampriadis gives of the emperor Commodus's perruke: it was powdered with scrapings of gold, and scented (if we may use the expression) with glutinous perfumes for the powder to hang by. In effect, the use of perruks, at least in their present mode, is not much more than 160 years old; the year 1629 is reckoned the epocha of long perruks, at which time they began to appear in Paris; from whence they spread by degrees through the rest of Europe. At first it was reputed a scandalous for young people to wear them, because the loss of their hair at that age was attributed to a disease the very name whereof is a reproach; but at length the mode prevailed over the misgiving, and persons of all ages and conditions have worn them, foregoing without any necessity the conveniences of their natural hair. It was, however, some time before the ecclesiastics came into the fashion: the first who assumed the perruke were some of the French clergy, in the year 1660; nor is the practice yet well authorized. Cardinal Grimard in 1684, and the bishop of Lavau in 1688, prohibited the use of the perruke to all priests without a dispensation or necessity. M. Thiers has express treatise, to prove the perruke indecent in an ecclesiastic, and directly contrary to the decrees and canons of councils. A priest's head, embellished with artificial hair curiously adjusted, he esteem a monster in the church; nor can he conceive anything so scandalous as an abbot with a florid countenance, heightened with a well-curl'd perruke.

PER. CAPTAIN JOHN was a famous engineer, who resided long in Russia, having been recommended to the czar Peter while in England, as a person capable of serving him on a variety of occasions relating to his new design of establishing a fleet, making his rivers navigable, &c. His salary in this service was 300l. per annum, besides travelling expenses and subsistence money on whatever service he should be employed, together with a further reward to his satisfaction at the conclusion of any work he should finish. After some conversation with the czar himself, particularly respecting a communication between the rivers Volga and Don, he was employed on that work for three summers successively; but not being well supplied with men, partly on account of the ill success of the czar's arms against the Swedes at the battle of Narva, and partly by the discouragement of the governor of Astracan, he was ordered at the end of 1707 to stop; and next year he was employed in refitting the ships at Verewke, and 1709 in making the river of that name navigable; but after repeated disappointments, and a variety of fruitless applications for his salary, he at last quitted the kingdom under the protection of Mr Whitworth, the English ambassador, in 1712: (See his narrative in the Preface to *The State of Russia*). In 1721 he was employed in stopping with success the breach at Dagenham, in which several other undertakers had failed; and the same year about the harbour at Dublin, to the objections against which he then published an Answer. He was author of *The State of Russia*, 1716, 8vo, and an account of the stopping of Dagenham Breach, 1721, 8vo; and died February 11, 1733.

PERRY, the name of a very pleasant and wholesome liquor extracted from pears, in the same manner as cyder is from apples. See CYDER, and AGRICULTURE Index.

The best pears for Perry, or at least the sorts which have been hitherto deemed the finest for making this liquor, are of a tart and harsh quality. Of these the Bosbury pear, the Bareland pear, and the horse pear, are the most esteemed for Perry in Worcestershire, and the squash pear, as it is called, in Gloucestershire; in both which counties, as well as in some of the adjacent parts, they are planted in the hedge-rows and most common fields. There is this advantage attending pear-trees, that they will thrive on land where apples will not so much as live, and that some of them grow to such a size, that a single pear-tree, particularly of the Bosbury and the squash kind, has frequently been known to yield, in one season, from one to four hogsheads of perry. The Bosbury pear is thought to yield the most lasting and most vinous liquor. The John pear, the Harpy pear, the Drake pear, the Mary pear, the Lullum pear, and several others of the hardest kinds, are esteemed the best for Perry, but the redder or more tawney they are, the more they are preferred. Pears as well as apples, should be full ripe before they are ground.

Dr Beale, in his general advertisements concerning cyder, subjoined to Mr Evelyn's *Pomona*, disapproves of Palladius's saying, that perry will keep during the winter, but that it turns sour as soon as the weather begins to warm; and gives, as his reasons for being of a contrary opinion, that he had himself tasted at the end of summer, a very brisk, lively, and vinous liquor, made of horse pears; that he had often tried the juice of the Bosbury pear, and found it both pleasanter and richer the second year, and still more so the third, though kept only in common hogsheads, and in but indifferent cellars, without being bottled; and that a very honest, worthy, and ingenious gentleman in his neighbourhood, assured him, as of his own experience, that it will keep a great while, and grow much the stronger for keeping, if put into a good cellar and managed with due care. He imputes Palladius's error to his possibly speaking of common eatable pears, and to the perry's having been made in a very hot country: but he would have ascribed it to a more real cause, perhaps, had he pointed out the want of a thorough regular fermentation, to which it appears plainly that the ancients were entire strangers; for all their vinous liquors were medicated by boiling before they were laid up in order to be kept.

PERSECUTION, is any pain or affliction which a person designedly inflicts upon another; and in a more restrained sense, the sufferings of Christians on account of their religion.

Historians usually reckon ten general persecutions, the first of which was under the emperor Nero, 31 years after our Lord's ascension; when that emperor having set
set fire to the city of Rome, threw the odium of that execrable action on the Christians, who under that pretense were wrapped up in the skins of wild beasts, and were relieved by dogs; others were crucified, and others burnt alive. The second was under Domitian in the year 95. In this persecution St John the apostle was sent to the Isle of Patmos, in order to be employed in digging in the mines. The third began in the third year of Trajan, in the year 100, and was carried on with great violence for several years. The fourth was under Antoninus the philosopher, when the Christians were banished from their houses, forbidden to show their heads, reproached, beaten, hurled from place to place, plundered, imprisoned, and stoned. The fifth began in the year 197, under the emperor Severus. The sixth began with the reign of the emperor Maximinus in 235. The seventh, which was the most dreadful persecution that had ever been known in the church, began in the year 250, in the reign of the emperor Decius, when the Christians were in all places driven from their habitations, stripped of their estates, tormented with racks, etc. The eighth began in the year 257, in the fourth year of the reign of the emperor Valerian. The ninth was under the emperor Aurelian, A.D. 284; but this was very inconsiderable: and the tenth began in the 15th year of Diocletian, A.D. 305. In this dreadful persecution, which lasted ten years, houses filled with Christians were set on fire, and whole droves were tied together with ropes and thrown into the sea. See Toleration.

PERSEES, the descendants of a colony of ancient Persians, who took refuge at Bombay, Surat, and in the vicinity of those cities, when their own country was conquered 1100 years ago by the Mahometan Arabs. They are a gentle, quiet, and industrious people, loved by the Hindoos, and living in great harmony among themselves. The consequence is, that they multiply exceedingly, whilst their countrymen in the province of Kerman are visibly diminishing under the yoke of the Mahometan Persians. Of the manners and customs of this amiable race, we have the following account in Heron's elegant translation of Niehuis's Travels.

The Perses (says he) make common contributions for the aid of their poor, and suffer most of their number to ask alms from people of a different religion. They are equally ready to employ their money and credit to ensure a brother of their fraternity from the abuses of justice. When a Persis behaves ill, he is expelled from their communion. They apply to trade, and exercise all sorts of professions.

The Perses have as little knowledge of circumcision as the Hindoos. Among them, a man marries only one wife, nor ever takes a second, unless when the first happens to be barren. They give their children in marriage at six years of age; but the young couple continue to live separate, in the houses of their parents, till they attain the age of puberty. Their dress is the same as that of the Hindoos, except that they wear under each ear a tuft of hair, like the modern Persians. They are much addicted to astrology, although very little skilled in astronomical calculations.

They retain the singular custom of exposing their dead to be eaten by birds of prey, instead of interring or burning them. I saw (continues our author) on a hill, at Bombay a round tower, covered with planks of wood, on which the Perses lay out their dead bodies. When the flesh is devoured, they remove the bones into two chambers at the bottom of the tower.

The Perses, followers of the religion of Zerdust or Zoroaster, adore one God only, eternal and almighty. They pray, however, a certain worship to the sun, the moon, the stars, and to fire, as visible images of the invisible divinity. Their veneration for the element of fire induces them to keep a sacred fire constantly burning, which they feed with consecrated wood, both in the temples, and in the houses of private persons who are in easy circumstances. In one of their temples at Bombay, I saw a fire which had burnt unextinguished for two centuries. They never blow out a light, lest their breath should soil the purity of the fire. See Polytheism.

The religion of the Perses enjoins purifications as strictly as that of the Hindoos. The disciples of Zerdust are not, however, obliged to abstain from animal food. They have accustomed themselves to refrain from the flesh of the ox, because their ancestors promised the Indian prince who received them into his dominions never to kill horned cattle. This promise they continue to observe under the dominion of Christians and Mahometans. The horse is by them considered as the most impure of all animals, and regarded with extreme aversion.

"Their festivals, demominated Chambore, which return frequently, and last upon each occasion five days, are all commemorations of some part of the work of creation. They celebrate them not with splendour, or with any particular ceremonies, but only dress better during those five days, perform some acts of devotion in their houses, and visit their friends."

The Perses were till lately but very little known: the ancients speak of them but seldom, and what they say seems to be dictated by prejudice. On this account Dr Hyde, who thought the subject both curious and interesting, about the end of the 17th century attempted a deeper investigation of a subject which till then had been but very little attended to. He applied to the works of Arabian and Persian authors, from whom, and from the relations of travellers, together with a variety of letters from persons in India, he compiled his celebrated work on the religion of the Perses. Other accounts have been given by different men, as accident put information in their way. But the most distinguished is by M. Anquetil du Patro, who undertook a voyage to discover and translate the works attributed to Zoroaster. Of this voyage he drew up an account himself, and read it before the Royal Academy of Sciences at Paris in May 1761. A translation of it was made and published in the Gentleman's Magazine for 1762, to which we refer our readers. The account begins at page 379, and is concluded at page 614. Remarks were afterwards made on Du Perron's account by Mr Yates. See the same Magazine for 1765, p. 229.

PERSEPOLIS, formerly the capital of Persia, situated in N. Lat. 35° 50. E. Long. 84. o. now in ruins, but remarkable for the most magnificent remains of a palace or temple that are to be found throughout the world. This city stood in one of the finest plains in Persia, being 18 or 19 leagues in length, and in some places...
Persepolis, places two, in some four, and in others six leagues in breadth. It is watered by the great river Araxes, now Bendemir, and by a multitude of rivulets besides. Within the compass of this plain, there are between 1000 and 1500 villages, without reckoning those in the mountains, all adorned with pleasant gardens, and planted with shady trees. The entrance of this plain on the west side has received so much grandeur from nature, as the city it covers could do from industry or art. It consists of a range of mountains steep and high, four leagues in length, and about two miles broad, forming two flat banks, with a rising terrace in the middle, the summit of which is perfectly plain and even, all of native rock. In these there are such openings, and the terraces are so fine and so even, that one would be tempted to think the whole the work of art, if the great extent, and prodigious elevation thereof, did not remain to dissemble them. One cannot from hence discern the walls of the city, because the banks are so high to be overlooked; but one can perceive on every side the ruins of walls and of edifices, which heretofore adorned the range of mountains of which we are speaking. On the west and on the north this city is defended in the same manner: so that considering the height and evenness of these banks, one may safely say that there is not in the world a place so fortified by nature.

The mountain Behemot, in the form of an amphitheatre, encircles the palace, which is one of the noblest and most beautiful pieces of architecture remaining of all antiquity. Authors and travellers have been exceedingly minute in their descriptions of these ruins; and yet some of them have expressed themselves so differently from others, that, had they not agreed with respect to the latitude and longitude of the place, one would be tempted to suspect that they had visited different ruins. These ruins have been described by Garcia de Silva Figueroa, Pietro de la Valle, Chardin, Le Brun, and Mr. Francklin. We shall adopt the description of an intelligent traveller. The ascent to the columns is by a grand staircase of blue stone containing 100 steps.

The first object that strikes the beholder on his entrance is the two portals of stone, about 50 feet in height each; the sides are embellished with two sphynx of an immense size, dressed out with a profusion of beadwork, and contrary to the usual method, they are represented standing. On the sides above are inscriptions in an ancient character, the meaning of which no one hitherto has been able to decipher.

At a small distance from these portals you ascend another flight of steps, which lead to the grand hall of columns. The sides of this staircase are ornamented with a variety of figures in basso relievo; most of them have vessels in their hands: here and there a camel appears, and at other times a kind of triumphal car, made after the Roman fashion; besides these are several led horses, oxen, and rams, that at times intervene and diversify the procession. At the head of the staircase is another basso relievo, representing a lion seizing a bull: and close to this are other inscriptions in ancient characters. On getting to the top of this staircase, you enter what was formerly a most magnificent hall: the natives have given this the name of chehel minor, or forty pillars; and though this name is often used to express the whole of the building, it is more particularly appropriated to this part of it. Although a vast number of ages have elaps'd since the foundation, 15 of the columns yet remain entire; they are from 70 to 80 feet in height, and are masterly pieces of masonry: their pedestals are curiously worked, and appear little injured by the hand of time. The shafts are enlaced up to the top, and the capitals are adorned with a profusion of fretwork.

From this hall you proceed along eastward, until you arrive at the remains of a large square building, by which you enter through a door of granite. Most of the doors and windows of this apartment are still standing; they are of black marble, and polished like a mirror: on the sides of the doors, at the entrance, are bas-reliefs of two figures at full length; they represent a man in the attitude of stabbing a goat: with one hand he seizes hold of the animal by the horn, and thrusts a dagger into his belly with the other; one hand of the goat's feet rests upon the breast of the man, and the other upon his right arm. This device is common throughout the palace. Over another door of the same apartment is a representation of two men at full length, behind them stands a domestic holding a spread out umbrella: they are supported by large round staffs, and appear to be in years, have long beards, and a profusion of hair upon their heads.

At the south-west entrance of this apartment are two large pillars of stone, upon which are carved four figures; they are dressed in long garments, and hold in their hands spears 10 feet in length. At this entrance also the remains of a staircase of blue stone are visible. Vast numbers of broken pieces of pillars, shafts, and capitals, are scattered over a considerable extent of ground, some of them of such enormous size, that it is wonderful to think how they could have been brought whole, and set up together. Indeed, every remains of these noble ruins indicate their former grandeur and magnificence, truly worthy of being the residence of a great and powerful monarch.

These noble ruins are now the shelter of beasts and birds of prey. Besides the inscriptions above mentioned, there are others in Arabic, Persian, and Greek. Dr. Hyde observes, that the inscriptions are very rude and clumsy; and that some, if not all of them, are in praise of Alexander the Great; and therefore are later than that conqueror. See the article Ruins.

PERSEVERANCE, in Theology, a continuance in a state of grace to a state of glory.

About this subject there has been much controversy in the Christian Church. All divines, except Unitarians, admit, that no man can be ever in a state of grace without the co-operation of the spirit of God; but the Calvinists and Arminians differ widely as to the nature of this co-operation. The former, at least such as exalt themselves the true disciples of Calvin, believe, that those who are once under the influence of divine grace can never fall totally from it, or die in mortal sin. The Arminians, on the other hand, contend, that the whole of this life is a state of probation; that without the grace of God we can do nothing that is good; that the Holy Spirit assists, but does not overpower, our natural faculties.
facilities; and that a man, at any period of his life, may resist, grieve, and even quench, the spirit. See THEOLOGY.

PERSEUS was the most ancient of all the Greek heroes. He founded the city of Mycenae, of which he became afterwards king, and where he and his posterity reigned for 100 years. He flourished, according to most chronologists, 1348, B.C.; but, according to Sir Isaac Newton, only 1028.

PERSEUS. See ASTRONOMY INDEX.

PERSIA,

A MOST ancient and celebrated empire of Asia, extending in length from the mouth of the river Araxes to that of the river Indus, about 1840 of our miles, and in breadth from the river Oxus, to the Persian gulf, about 1080 of the same miles. It is bounded on the north by the Caspian sea, the river Oxus, and Mount Caucasus; on the east, by the river Indus and the dominions of the Great Mogul; on the south, by the Persian gulf and the Indian ocean; and on the west, by the dominions of the Grand Signior.

We learn from Sir William Jones, the illustrious president of the Asiatic Society, that Persia is the name of only one province of this extensive empire, which by the present natives, and all the learned Musulmans who reside in the British territories in India, is called Iran. It has been a practice not uncommon in all ages to denominate the whole of a country from that part of it with which we are best acquainted; and hence have the Europeans agreed to call Iran by the name of that province of which Shiraz is the capital: See SHIRAZ.

The most ancient name, however, of this country was that of Elam, or, as some write it, Alam, from Alam, the son of Shem, from whom its first inhabitants are descended. Herodotus calls its inhabitants Cepheus; and in very ancient times the people are said to have called themselves Artaces, and the country where they dwelt Araxes. In the books of Daniel, Esdras, &c. it is called by the names of Pars, Pharas, or Pars, whence the modern name of Persis; but whence those names have been derived, is now uncertain.

That Persia was originally peopled by Elam the son of Shem, has been very generally admitted; but the truth is, that of the ancient history of this distinguished empire very little is perfectly known. For this ignorance, which at first seems strange, satisfactory reasons may easily be assigned, of which the principal are the superficial knowledge of the Greeks and Jews, and the loss of Persian archives or historical compositions. "That the Grecian writers before XENOPHON had no acquaintance with Persis, and that their accounts of it are wholly fabulous, is a paradox too extravagant to be seriously mentioned; but (says Sir William Jones) their connection with it in war or peace had been generally confined to bordering kingdoms under feudatory princes; and the first Persic emperor, whose life and character they seem to have known with tolerable accuracy, was the great Cyrus." Our learned author, however, is so far from considering Cyrus as the first Persian monarch, that he thinks it evident a powerful monarchy had subsisted in Iran for ages before the accession of that hero; that this monarchy was called the Medes dynasty; and that it was in fact the oldest monarchy in the world. The evidence upon which the present rests this opinion, is the work of a Mahometan traveller, compiled from the books of such Persians as fled from their country upon the innovation in religion made by Zoroaster: and if these books, of which a few still remain, be genuine, and the Mahometan a faithful compiler, facts of which Sir William has not the smallest doubt, the evidence is certainly sufficient to bear the superstructure which he has raised upon it.

If the Persian monarchy was thus ancient, it is natural to suppose that Persis or Iran was the original seat of the human race, whence colonies were sent out or emigrated of themselves to people the rest of the habitable globe. This supposition is actually made by our ingenious author, who strongly confirms it by remarks on the most ancient language of Persia, which he shows to have been the parent of the Sanscrit, as well as of the Greek, Latin, and Gothic (see PHILOLOGY). He therefore holds, as a proposition firmly established, "that Iran or Persia, in its largest sense, was the true centre of population, of knowledge, of languages, and of arts; which instead of travelling westward only, as it has been fancily supposed, or eastward, as might with equal reason have been asserted, were expanded in all directions to all the regions of the world." He thinks it from good authority that the Saxon Chronicle brings the first inhabitants of Britain from Armenia; that the Goths have been concluded to come from Persia; and that both the Irish and old Britons have been supposed to have proceeded from the borders of the Caspian: for all these places were comprehended within the ancient Iran.

Of this first Persian monarchy we have no historical accounts; and must therefore, having thus mentioned it, descend at once to the era of Cyrus. This prince is celebrated both by sacred and profane historians; but the latter are at no small variance concerning his birth and accession to the throne. According to Herodotus, Astyages, the last king of the Medes, being warned in a dream, that the son who was to be born of his daughter Mandane, should one day be lord of Asia, resolved to marry her, not to a Mede, but to a Persian. Accordingly he chose for her husband one Cambyses, a man of a peaceful disposition, and of no very high station. However, about a year after they were married, Astyages was frightened by another dream, which made him resolve to dispatch the infant as soon as it should be born. Hereupon the king sent for his daughter, and put her under confinement, where she was soon after delivered of a son. The infant was committed to the care of one Harpagus, with strict orders to destroy it in what manner he thought proper. But he, having acquainted his wife with the command he had received, by her advice gave it to a shepherd, desiring him to let it perish by exposure. But the
shepherd, out of compassion, exposed a still-born child which his wife happened to be then delivered of, and brought up the son of Mandane as his own, giving him the name of Cyrus.

When the young prince had attained the age of ten years, as he was one day at play with other children of the same age, he was chosen king by his companions; and having, in virtue of that dignity, divided them into several orders and classes, the son of Artembares, a lord of eminent dignity among the Medes, refused to obey his orders; whereupon Cyrus caused him to be seized, and whipped very severely. The boy ran crying to his father; and he immediately hastened to the king's palace, loudly complaining of the affront his son had received from the son of a slave, and interceding Astyages to revenge, by some exemplary punishment, the indignity offered to him and his family. Astyages, commanding both the huntsman and his son to be brought before him, asked the latter, how he, who was the son of so mean a man, had dared to abuse the son of one of the chief lords of the kingdom? Cyrus replied, that he had done no more than he had a right to do; for the boys of the neighbourhood having chosen him king, because they thought him most worthy of that dignity, and performed what he, vested with that character, had commanded, the son of Artembares alone had slighted his orders, and for his disobedience had suffered the punishment he deserved. In the course of this conversation Astyages happening to recollect, that his grandson, whom he had ordered to be destroyed, would have been about the same age with Cyrus, began to question the shepherd concerning his supposed son, and at last obtained from him a confession of the whole truth.

Astyages having now discovered Cyrus to be his grandson, sent for Harpagus, who also confessed that he had not seen Mandane's son destroyed, but had given him to the shepherd; at which Astyages was so much incensed, that, having invited Harpagus to an entertainment, he caused him to be served with the flesh of his own son. When he had done, the king asked him whether he liked his viands; and Harpagus answering, that he had never tasted anything more delicious, the officers appointed for that purpose brought in a basket, containing the head, hands, and feet of his son, desiring him to uncover the basket, and take what he liked best. He did as they desired, and beheld the mangled remains of his only child without betraying the least concern, so great was the command which he had over his passions. The king then asked him, whether he knew with what kind of meat he had been entertained. Harpagus replied, that he knew very well, and was always pleased with what his sovereign thought fit to ordain; and having thus replied, with a surprising temper he collected the mangled parts of his innocent son, and went home.

Astyages having thus vented his rage on Harpagus, began next to consult what he should do with Cyrus. The magi, however, easied him of his fears with regard to him, by assuring him, that as the boy had been once chosen king by his companions, the dream had been already verified, and that Cyrus never would reign in any other sense. The king, being well pleased with this answer, called Cyrus, and, owning how much he had been wanting in the affection which he ought to have had towards him, desired him to prepare for a journey into Persia, where he would find his father and mother in circumstances very different from those of the poor shepherd and his wife with whom he had hitherto lived. Cyrus, on his arrival at his father's house, was received with the greatest joy. When he grew up, he soon became popular on account of his extraordinary parts; till at last his friendship was courted by Harpagus, who had never forgot the cruel treatment he received from Astyages. By this means a conspiracy was formed against Astyages; who being overtaken in tw succecssive engagements, was taken prisoner and confined for life.

The account given by Xenophon of the rise of Cyrus is much more consonant to Scripture; for he tells us, that Babylon was conquered by the united forces of the Medes and Persians. According to him, Cyrus was the son of Cambyses king of the Medes, and Mandane the daughter of Astyages king of Persia. He was born a year after his uncle Cyaxares, the brother of Mandane. He lived till the age of twelve with his parents in Persia, being educated after the manner of the country, and insured to fatigue and military exercises. At this age he was taken to the court of Astyages, where he resided four years; when the revolt of the Medes and Persians from the Babylonians happened, and which ended in the destruction of the Babylonian empire, as related under the article BABYLON.

While Cyrus was employed in the Babylonian war, before he attacked the metropolis itself, he reduced all the nations of Asia Minor. The most formidable of these were the Lydians, whose king Croesus assembled a very numerous army, composed of all the other nations in that part of Asia, as well as of Egyptians, Greeks, and Thracians. Cyrus being informed of these vast preparations, augmented his forces to 156,000 men, and with them advanced against the enemy, who were assembled near the river Pactolus. After long marches, he came up with them at Thysum, not far from Sardis, the capital of Lydia. Besides the horse and foot, which amounted to 156,000, as already observed, Cyrus had 300 chariots armed with scythes, each chariot drawn by four horses abreast, covered with tresses that were proof against all sorts of missile weapons; besides he had likewise a great number of chariots of a larger size, upon each of which was placed a tower about 18 or 20 foot high, and in each tower were lodged 20 archers. These towers were drawn by 16 oxen yoked abreast. There was moreover a considerable number of camels, each mounted by two Arabian archers, the one looking towards the head, and the other towards the hinder part of the camel. The army of Croesus consisted of 420,000 men. The Egyptians, who alone were 120,000 in number, being the main strength of the army, were placed in the centre. Both armies were drawn up in a narrow plain, which gave room for the extending of the wings on either side; and the design of Croesus, upon which alone he founded his hopes of victory, was to surround and hem in the enemy's army.

When the two armies were in sight of each other, Croesus, observing how much his front exceeded that of Cyrus, made the centre halt, but commanded the two wings to advance, with a design to incline the Persian army, and begin the attack on both sides at once. When the two detached bodies of the Lydian forces were sufficiently extended, Cyrus gave the signal to the
main body, which marched up to the front of the Persian army, while the two wings attacked them in flank; so that Cyrus's army was hemmed in on all sides, and, as Xenophon expresses it, was inclosed like a small square drawn within a great one. This motion, however, did not at all alarm the Persian commander; but, giving his troops the signal to face about, he attacked in flank those forces that were going to fall upon his rear so vigorously, that he put them into great disorder. At the same time a squadron of camels was made to advance against the enemy's other wing, which consisted mostly of cavalry. The horses were so frightened at the approach of these animals, that most of them threw their riders, and trod them under foot; which occasioned great confusion. Then Artageas, an officer of great valour and experience, at the head of a small body of horse, charged them so briskly, that they could never afterwards rally; and at the same time the chariots, armed with scythes, being driven in among them, they were entirely routed. Both the enemy's wings being thus put to flight, Cyrus commanded his chief favourite Abrandates to fall upon the centre with the large chariots above mentioned. The first ranks, consisting mostly of Lydians, not being able to stand so violent a charge, immediately gave way; but the Egyptians, being covered with their bucklers, and marching so close that the chariots had not room to penetrate their ranks, a great slaughter of the Persians ensued. Abrandates himself was killed, his chariot overturned, and the greatest part of his men were cut in pieces. Upon his death, the Egyptians, advancing boldly, obliged the Persian infantry to give way, and drove them back quite to their engines. There they met with a new shower of darts and javelins from their machines; and at the same time the Persian rear advancing sword in hand, obliged their spearmen and archers to return to the charge. In the mean time Cyrus, having put to flight both the horse and foot on the left of the Egyptians, pushed on to the centre, where he had the misfortune to find his Persians again giving ground; and judging that the only way to stop the Egyptians, who were pursuing them, would be to attack them in the rear, he did so; and at the same time the Persian cavalry coming up to his assistance, the fight was renewed with great slaughter on both sides. Cyrus himself was in great danger; for his horse being killed under him, he fell among the midst of his enemies; but the Persians, alarmed at the danger of their general, threw themselves headlong on their opponents, rescued him, and made a terrible slaughter; till at last Cyrus, admiring the valour of the Egyptians, offered them honourable conditions; letting them know at the same time, that all their allies had abandoned them. They accepted the terms offered them; and having agreed with Cyrus that they should not be obliged to carry arms against Croesus, they engaged in the service of the conqueror, and continued faithful to him ever after.

The next morning Cyrus advanced towards Sardis, and Croesus marched out to oppose him at the head of the Lydians only; for his allies had all abandoned him. Their strength consisted mostly in cavalry; which Cyrus being well apprised of, he ordered his camels to advance; by whom the horses were so frightened, that they became quite ungovernable. However, the Lydians disbanded, and for some time made a vigorous resistance on foot; but were at last driven into the city, which was taken two days after: and thus the Lydian empire was totally destroyed.

After the conquest of Sardis, Cyrus turned his arms against Babylon itself, which he reduced in the manner related under that article. Having settled the civil government of the conquered kingdoms, Cyrus took a review of all his forces, which he found to consist of 620,000 foot, 120,000 horse, and 3000 chariots armed with scythes. With these he extended his dominion all over the nations to the confines of Ethiopia, and to the Red sea; after which he continued to reign peaceably over his vast empire till his death, which happened about 529 before Christ. According to Xenophon, he died a natural death; but others tell us, that, having engaged in a war with the Scythians, he was by them overthrown and cut in pieces with his whole army, amounting to 200,000 men. But this is very improbable, seeing all authors agree that the tomb of Cyrus was extant at Pasargada in Persia in the time of Alexander the Great; which it could not have been if his body had remained in the possession of the Scythians, as some authors assert.

In the time of Cyrus, the Persian empire extended from the river Indus to the Aegean sea. On the north it was bounded by the Euxine and Caspian seas, and on the south by Ethiopia and Arabia. That monarch kept his residence for the seven cold months at Babylon, by reason of the warmth of that climate; three months in the spring he spent at Susa, and two at Ecbatana during the heat of summer. On his deathbed he appointed his son Cambyses to succeed him in the empire; and to his other son, Smerdis, he gave several considerable governments. The new monarch immediately set about the conquest of Egypt; which he accomplished in the manner related in the history of that country.

Having reduced Egypt, Cambyses next resolved to conquer the Carthaginians, Hammonians, and Ethiopians. But he was obliged to drop the first of these enterprises, because the Phenicians refused to supply him with ships against the Carthaginians, who were a Phenician colony. However, he sent ambassadors into Ethiopia with a design to get intelligence of the state and strength of the country. But the Ethiopian monarch, being well apprised of the errand on which they came, treated them with great contempt. In return for the presents sent him by Cambyses, he sent his own bow; and advised the Persians to make war upon the Ethiopians when they could bend such a strong bow as easily as he did, and to thank the gods that the Ethiopians had no ambition to extend their dominions beyond their own country.

Cambyses was no sooner informed of this answer by his usual ambassador, than he flew into a violent passion; and ordered his army immediately to begin their march against Ethiopia, without considering that they were neither furnished with provisions nor any other necessary. When he arrived and the river at Thebes in Upper Egypt, he detached 50,000 men, with orders to destroy the temple of Jupiter Ammon; but all these perished in the desert; not a single person arriving either at the oracle, or returning to Thebes. The rest of the army, led by Cambyses himself, experienced incredible hardships; for not being provided with any necessaries, they had not marched a fifth part of the way when they were obliged to kill and...
PERIA.

He murdered his brother.

Persia. When these failed, the soldiers fed on grass and roots, as long as any could be found; and at last were reduced to the dreadful necessity of eating one another; every tenth man, on whom the lot fell, being condemned to serve as food for his companions. The king, however, obstinately persisted in his design; till, being apprehensive of the danger he himself was in, he retreated to Thebes, after having lost the greatest part of his army.

Cambyses was a man of a very cruel and suspicious temper, of which he gave many instances; and the following proved indirectly the cause of his death. We have already observed that the king of Ethiopia sent his bow in return for the presents brought to him by the ambassadors of Cambyses. The only man in the Persian army who could bend this bow was Smerdis the king's brother; and this instance of his personal strength so alarmed the tyrant, that, without any crime alleged, he caused him to be murdered. This gave occasion to one Smerdis, a magian, who greatly resembled the other Smerdis in looks, to assume the name of the deceased prince, and to raise a rebellion against Cambyses who was generally hated for his cruelty; and this he could the more easily do, as the chief management of affairs had been committed to this Smerdis during the king's absence. Cambyses, on receiving the news of this revolt, immediately ordered his army to march, in order to suppress it; but as he was mounting his horse, his sword, slipping out of its scabbard, wounded him in the thigh. On this accident, he asked the name of the city where he was; and being told that it was Ecbatan, he said in the presence of all his attendants, "Fate has decreed that Cambyses the son of Cyrus shall die in this place." For, having consulted the oracle of Butus, which was very famous in that country, he was told that he should die at Ecbatan. This he had always understood of Ecbatan in Media, and had therefore resolved to avoid it. Being now, however, convinced that his end approached, he assembled the chief Persian lords who served in the army, and having told them that his brother was certainly dead, he exhorted them never to submit to the impostor, or suffer the sovereignty again to pass from the Persians to the Medes, to which nation Smerdis belonged, but to use their utmost endeavours to place one of their own blood on the throne.

As the king's wound mortified, he lived but a few days after this; but the assembly supposing that he had spoken only out of hatred to his brother, quietly submitted to the impostor, who was thus for a time established on the throne. Indeed, from his conduct during the short time which he enjoyed the kingdom, he appears to have been not at all undeserving of a crown. He began with granting to all his subjects an exemption from taxes and military service for three years, and treated all of them in the most beneficent manner. To secure himself on the throne the more effectually, he married Atossa the daughter of Cyrus; thinking, that in case of a discovery he might hold the empire by her title. She had before been married to her brother Cambyses, on a decision of the magi that a king of Persia might do as he pleased; and by virtue of this decision Smerdis also married her as his brother. The extreme caution of Smerdis, however, promoted the discovery of his imposture. He had married all his predecessors' wives, among whom was one Phedyma, the daughter of Otanes a Persian nobleman of the first rank. Otanes, who suspected that the king was not Smerdis the son of Cyrus, sent a trusty messenger to his daughter, desiring to know whether he was so or not; but Phedyma, having never seen this Smerdis, could not give any answer. Her father then desired her to inquire at Atossa, who could not but know her own brother. However, he was again disappointed; for Phedyma acquainted him that all the king's wives were lodged in distinct and separate apartments, without being allowed to see each other. This greatly increased the suspicions of Otanes; upon which he sent his daughter a third message, desiring her, the next time she should be admitted to the king's bed, to take an opportunity of feeling whether he had ears or not: for Cyrus had formerly caused the ears of Smerdis the magian to be cut off for some crime of which he had been guilty; so that, if the king had ears, she might then be assured that he was Smerdis the son of Cyrus. The event showed that the suspicions of Otanes were just; and Phedyma having acquainted her father that the king had no ears, a conspiracy was immediately formed against him. While the conspirators were debating about the proper means of carrying on their designs into execution, Darius the son of Hystaspes happened to arrive at Susa where his father was governor, they all agreed to make him privy to their design. He told them, at their first meeting, that he thought nobody in the empire but himself had known that Smerdis the son of Cyrus was dead, and that the throne usurped by one of the magi; that he had come with a design to kill the usurper, without imparting his design to any one, that the glory of such an action might be entirely his own. But since others were apprised of the imposture, he insisted that the usurper should be dispatched without delay. Otanes, on the other hand, was for putting off the enterprise till some better opportunity offered; but Darius protested, that if they did not make the attempt that very day, he would prevent any one from accusing him, by disclosing the whole matter to the impostor himself.

In the mean time, Smerdis and his brother had by great promises prevailed on Prenaspes (the executioner of the true Smerdis) to bind himself by an oath not to discover the fraud they had put on the Persians, and even to make a public speech, declaring that the present king of Persia was really the son of Cyrus. At the time appointed, he began his discourse with the genealogy of Cyrus, putting his hearers in mind of the great favours the nation had received from that prince. After having extolled Cyrus and his family, to the great astonishment of all present, he confessed the whole transaction with regard to the death of Smerdis; telling the people that the apprehensions of the danger he must inevitably run by publishing the imposture had constrained him to conceal it so long; but now, not being able any longer to act such a dishonourable part, he acknowledged that he had been compelled by Cambyses to put his brother to death with his own hand, and that the person who succeeded the throne was Smerdis the magician. He then begged pardon of the gods and men for the crime he had committed; and fulfilling many imprecations against the Persians if they failed to reco-
ver the sovereignty, he threw himself headlong from the
top of the tower on which he stood, and died on the
spot.

In the meantime the conspirators, who were advanc-
ing towards the palace, were informed of what had
happened; and Otanes was again for deferring the ex-
cution of their enterprise: but Darius insisting upon the
danger of delay, they proceeded boldly to the palace;
and being admitted by the guards, who did not suspect
them, they killed both the usurper and his brother; af-
after which they exposed their heads to the people, and
declared the whole imposture. The Persians at this
time were so enraged, that they fell on the whole sect, and
killed every one of the magi they could meet with; and
had not the slaughter been stopped by night, not one of
the order would have been left alive. The day on
which this slaughter happened was afterwards celebrated
by the Persians with the greatest solemnity, and called
by the name of Megaphonia, or the slaughter of the
Magi. On that festival the magi durst not appear
abroad, but were obliged to shut themselves up in
their houses. Smerdis the magian reigned only eight
months.

When the tumult was a little subsided, the conspira-
tors, who were seven in number, met together in order
to elect a new king, or to determine what form of go-

government they should next introduce. Otanes was for a

the country as they went along, till at last the king, sensible of the danger he was in, resolved to give over the enterprise and return home. In order to do so with safety, he lighted a great number of fires in the night-time, and decamped, leaving behind him the old men and the sick, who fell into the hands of their enemies. The Scythians perceiving that Darius was gone, detached a considerable body to the bridge over the Danube; and as they were well acquainted with the roads, they got thither before the Persians. The Scythians had sent expressions before hand to persuade the Ionians, whom Darius had left to guard the bridge, to break it down and retire to their own country; and this they pressed the more earnestly, that as the time prescribed by Darius was now expired, they were at liberty to return home, without breaking their word or being wanting in their duty. Miltiades, prince of the Chersonesus of Thrace, was for embracing so favourable an opportunity of cutting off Darius's retreat, and shaking off the Persian yoke at once: all the other commanders agreed with him, except Hystaspes, prince of Miletus; who represented to the Ionian chiefs, that their power was connected with that of Darius, since it was under his protection that each of them was lord in his own city; and that the cities of Ionia would not fail to depose them and recover their liberty, if the Persian power should sink or decline. This speech made a deep impression on the rest, and it was at last determined that they should wait for Darius; and in order to deceive the Scythians, they began to break down the bridge, but advised them to return back and defeat Darius. They did so, but missed him; and he having thus safely escaped so great a danger, immediately repassed the Bosphorus, and took up his winter quarters at Sardis, leaving Megabzus, one of his chief generals, to complete the conquest of Thrace.

He conquers India.

The king having sufficiently refreshed his troops who had suffered extremely in the Scythian expedition, began to think of extending his dominions eastward; and in order to facilitate his design, resolved in the first place to discover those countries. With this view he caused a fleet to be built and equipped at Carpathyus, a city on the river Indus. The command of this fleet he gave to one Scylax, a Grecian of Cyndias, a city of Caria, who was well versed in maritime affairs. Him he ordered to sail down the current, and make the best discoveries he could of the countries lying on either side of the river, till he arrived at the southern ocean; from whence he was to steer his course westward, and that way return to Persia. Scylax, having exactly observed his instructions, and sailed down the river Indus, entered the Red sea by the straits of Babemandel, and on the thirtieth month from his first setting out, landed at the same place from whence Nechu king of Egypt formerly sent out the Phoenicians who circumnavigated Africa. From hence Scylax returned to Susa, where he gave a full account of his discoveries; upon which Darius, marching into India at the head of a powerful army, reduced that large country, and made it a province of the Persian empire, drawing from thence an annual tribute of 350 talents of gold.

Revolt of the Ionians.

Soon after the expedition of Darius against India happened the revolt of the Ionians, which gave occasion to his expedition into Greece; an account of which is given under the articles Attica, Greece, Sparta,
to him many of the nobility and governors of provinces, by whom he was immediately proclaimed king. Sogdianus, seeing himself thus deserted, contrary to the advice of all his friends, came to an accommodation with Ochus; who no sooner had him in his power than he caused him to be suffocated among ashes; a punishment invented on purpose for him. Ochus being firmly settled on the throne by the death of Sogdianus, changed his name to Darius; and is by historians commonly called Darius Nothus, or The Bastard. But Arsites, another of the brothers, seeing in what manner Sogdianus had got the better of Xerxes, and been afterwards driven out by Ochus, began to entertain thoughts of treating him in the same manner. He was not, however, so successful; for, being defeated in an engagement, he surrendered himself in hopes of mercy, but was immediately put to death by suffocation in ashes. Several other persons were executed; but these severities did not procure him the repose which he expected; for his whole reign was disturbed with violent commotions in various parts of the empire. One of the most dangerous was raised by Psinthus, governor of Lydia; but he being deserted by his Greek mercenaries, was at last overcome, and put to death: however, his son Arses took the crown, and reigned over the maritime provinces of Asia Minor for two years; till he also was taken prisoner by Tissaphernes, the new governor of Lydia, who put him to death. Other insurrections quickly followed this; but the greatest misfortune which befell Darius during the whole course of his reign was the revolt of the Egyptians, who could not be reduced. Before his death he invested Cyrus his youngest son with the supreme government of all the provinces of Asia Minor. This was done through the persuasions of his mother Parysatis, who had an absolute sway over her husband; and she procured this command for him, that he might thereby be enabled to contend for the kingdom after his father's death. She even insisted that the king should declare him heir to the crown before he died; but this he could not by any means be induced to do. He died in the year 405 B.C. and was succeeded by his son Arses, who was named Memnon on account of his extraordinary memory.

The most remarkable transaction which happened during the reign of this prince was the revolt of his brother Cyrus. This young prince had been raised to so great a power through the interest of his mother, on purpose that he might revolt, as we have already seen. He began with gaining over the cities under the government of Tissaphernes; which quickly produced a war with that governor. Cyrus then began to assemble troops, which he pretended were designed only against Tissaphernes. As he had given great assistance to the Lacedaemonians in their wars against the Athenians, he now in return demanded assistance from them; which request they very readily complied with, ordering their fleet immediately to join him, and to obey in every thing the commands of Tamos his admiral. At last Cyrus, having collected an army of 12,000 Greek mercenaries and 100,000 regular troops of other nations, set out from Sardis, directing his march towards Upper Asia; the army being entirely ignorant of the expedition on which they were going. When they arrived at Tarsus, the Greeks, suspecting that they were marching against the king, refused to proceed any further; but Cyrus having gained them over with presents and promises, they soon went on with satisfaction. Having arrived at Cunaxa in the province of Babylon, Cyrus found his brother with 500,000 men ready to engage him. Whereupon, leaping out of his chariot, he commanded his troops to stand to their arms and fall into their ranks; which was done with great expedition, no time being allowed the soldiers to refresh themselves. Clearchus, the commander of the Peloponnesian troops, advised Cyrus not to charge in person, but to remain in the rear of the Greek battalions; but this advice he rejected with indignation, saying, that he should thus render himself unworthy of the crown for which he was fighting. As the king's army drew near, the Greeks fell upon them with such a fury, that they routed the wing opposite to them almost at the first onset; upon which Cyrus was with loud shouts proclaimed king by those who stood next to him. But he, in the mean time, perceiving that Arsatexeres was wheeling about to attack him in flank, advancing against him with 600 chosen horse, killed Artageses captain of the king's guards with his own hand, and put the whole body in flight. In this encounter, discovering his brother, he spurred on his horse, and, coming up to him, engaged him with great fury; which in some degree turned the battle into a single combat. Cyrus killed his brother's horse, and wounded him on the ground; but he immediately mounted another horse, when Cyrus attacked him again, gave him a second wound, and had already lifted up his hand to give him a third, when the guards, perceiving the danger in which their king was, discharged their arrows at once against his antagonist, who at the same time throwing himself headlong upon his brother, was pierced through by his javelin. He fell dead upon the spot; and all the chief lords of his court, resolving not to survive him, were slain in the same place.

In the mean time, the Greeks having defeated the enemy's left wing commanded by Tissaphernes, and the king's right wing having put to flight Cyrus's left, both parties, being ignorant of what had passed elsewhere, imagined that they had gained the victory. But Tissaphernes acquainting the king that his men had been put to flight by the Greeks, he immediately rallied his troops, in order to attack them. The Greeks, under the command of Clearchus, easily repulsed them, and pursued them to the foot of the neighbouring hills. As night was drawing near, they halted at the foot of the hill, much surprised that neither Cyrus himself, nor any messenger from him, had appeared; for as yet they knew nothing of his death nor the defeat of the rest of the army. They determined therefore to return to their camp, which they did accordingly; but found there that the greatest part of their baggage had been plundered, and all their provisions taken, which obliged them to pass the night in the camp without any sort of refreshment. The next morning, as they were still expecting to hear from Cyrus, they received the news of his death, and the defeat of that part of the army. Whereupon they sent deputies to Arises, who was commander in chief of all the other forces of Cyrus, offering him, as conquerors, the crown of Persia. Arises rejected the offer, and acquainting them that he intended to set out early in the morning on his return to Ionia, advised them to join him in the night. They followed his advice, and, under the conduct of Clearchus, began their march;
march, arriving at his camp about midnight, whence they set out on their return to Greece. They were at a vast distance from their own country, in the very heart of the Persian empire, surrounded by a victorious and numerous army, and had no means of retreat but by forcing their way through an immense tract of the enemy's country. But their valour and resolution mastered all these difficulties; and, in spite of a powerful army, which pursued and harassed them all the way, they made good their retreat for 2,255 miles through the provinces belonging to the enemy, and got safe to the Greek cities on the Euxine sea. This retreat (the longest that was ever made through an enemy's country) was conducted at first by Clearchus; but he being cut off through the treachery of Tissaphernes, Xenophon was chosen in his room, who at last brought his men safe into Greece: for a full account of that famous retreat, see the article Xenophon.

The war with Cyrus was scarcely ended, when another broke out with the Lacedaemonians, on the following account. Tissaphernes being appointed to succeed Cyrus in all his power, to which was added all which he himself possessed formerly, began to oppress the Greek cities in Asia in a most cruel manner. On this they sent ambassadors to Sparta, desiring the assistance of that powerful republic. The Spartans having ended their long war with the Athenians, willingly laid hold of the present opportunity of breaking again with the Persians, and therefore sent against them an army under the command of Thimbro, who, being strengthened by the forces which returned under Xenophon, took the field against Tissaphernes. But Thimbro being soon recalled upon some complaints, Dercyllidas, a brave officer and experienced engineer, was appointed to succeed him; and he carried on the war to much more advantage than his predecessor. On his arrival in Asia, finding that Tissaphernes was at variance with another governor named Pharnabazus, he concluded a truce with the former, and marching against Pharnabazus, drove him quite out of Æolis, and several cities in other parts. The latter, however, immediately returned to the Persian court, where he made loud complaints against Tissaphernes, but gave the king a most salutary advice, which was to equip a powerful fleet, and give the command of it to Conon the Athenian, the best sea officer of his time, by which means he would obstruct the passage of further recruits from Greece; and thus soon put an end to the power of the Lacedaemonians in Asia. This advice being approved of, the king ordered 500 talents for the equipment of a fleet, with directions to give Conon the command of it.

In the mean time, Dercyllidas, with all his valour and skill, suffered himself to be drawn into such a disadvantageous situation that he must inevitably have been destroyed with his whole army, had it not been through the courage of Tissaphernes, who having experienced the Grecian valour at the battle of Cunaxa, could not by any means be induced to attack them. The Lacedaemonians, however, having heard that the Persian monarch was fitting out a great fleet against them, resolved to push on the war as vigorously as possible; and for this purpose sent over Agesilus one of their kings, and a most experienced commander, into Asia. This expedition was carried on with such secrecy, that Agesilus arrived at Ephesus before the Persians had the least notice of his designs. Here he took the field with 10,000 foot and 4,000 horse, and falling upon the enemy while they were totally unprepared, carried every thing before him. Tissaphernes deceived him into a truce till he had leisure to assemble his forces, but gained little by his treachery; for Agesilus deceived him in his turn, and while Tissaphernes marched his troops into Caria, the Greeks invaded and plundered Phrygia.

Early in the spring, Agesilus gave out that his design was to invade Lydia; but Tissaphernes, who remembered the last year's stratagem, now taking it for granted that Agesilus would really invade Caria, made his troops again march to the defence of that province. But Agesilus now led his army into Lydia as he had given out, and approached Sardis; upon which Tissaphernes recalled his forces from their former route, with a design to relieve the place. But Caria being a very mountainous country, and unfit for horse, he had marched thither only with the foot, and left the horse behind on the borders of that province. Whence, on their marching back to the relief of Sardis, the horse being some days march before the foot, Agesilus took the advantage of so favourable an opportunity, and fell upon them before the foot could come to their assistance. The Persians were routed at the very first onset; after which Agesilus overran the whole country, enriching both himself and his army with the spoils of the conquered Persians.

By this continued ill fortune Artaxerxes was so much provoked against Tissaphernes, that he soon after caused him to be put to death. On the death of Tissaphernes, Tithraustes, who was appointed to succeed him, sent large presents to Agesilus, in hopes of persuading him to abandon his conquests; but finding that commander was not by any means to be induced to relinquish the war, he sent Tidocrates of Rhodes into Greece, with large sums of money to corrupt the leading men in the cities, and rekindle a war against the Lacedaemonians. This strata punished the pride and insolence of the Peloponnesian court, where he made such great effect; for the cities of Bœotia, Argos, Corinth, and others, entering into a new alliance, obliged them to recall Agesilus to the defence of his own country.

After the departure of Agesilus, which happened in the year 354 B.C., the Lacedaemonians received a severe blow at Cunaxa, where their fleet was entirely defeated by that of Artaxerxes under Conon, 50 of their ships being taken in the engagement; after which, Conon and Pharnabazus being masters of the sea, sailed round the islands and coasts of Asia, taking the cities there which had been reduced by the Lacedaemonians. Sextos and Abydos only held out, and resisted the utmost efforts of the enemy, though they had been besieged both by sea and land.

Next year Conon having assembled a powerful fleet, again took Pharnabazus on board, and reduced the island of Melos, from whence he made a descent on the coasts of Lydia and Caria, pillaging all the maritime provinces, and loading his fleet with an immense booty. After this, Conon obtained leave of him to repair to Athens with 82 ships and 50 talents, in order to rebuild the walls of that city; having first convinced the Persians...
Pharnabazus, that nothing could more effectually contribute to the weakening of the power of Sparta than putting Athens again in a condition to rival its power. He no sooner arrived at Piræus the port of Athens, but he began to work; which, as he had a great number of hands, and was seconded by the zeal of all those that were well inclined to the Athenians, was soon completed, and the city not only restored to its former splendour, but rendered more formidable than ever. The Lacedaemonians were now reduced to the necessity of accepting such terms of peace as they could procure. The terms were, that all the Greek cities in Asia should be subject to the king of Persia, as also the islands of Cyprus and Clazomenae; that the islands of Scyros, Lemnos, and Imbros, should be restored to the Athenians, and all the cities of Greece, whether small or great, should be declared free; and by the same treaty, Artaxerxes engaged to join those who accepted the terms he proposed, and to assist them to the utmost of his power against such as should reject them.

Artaxerxes, being now disengaged from the Grecian war, turned his arms against Evagoras king of Cyprus. This man was descended from the ancient kings of Salamis, the capital city of the island of Cyprus. His ancestors had held that city for many ages in quality of sovereigns; but were at last driven out by the Persians, who, making themselves masters of the whole island, reduced it to a Persian province. Evagoras, however, being a man of an enterprising genius, soon became weary of living in subjection to a foreign power, drove out the Persian governor, and recovered his paternal kingdom. Artaxerxes attempted to drive him out of it; but, being diverted by the Greek war, was obliged to put off the enterprise. However, Conon, by means of Ctesias chief physician to Artaxerxes, got all differences accommodated, and Artaxerxes promised not to molest him in the possession of his small kingdom. But Evagoras soon becoming discontented with such a narrow possession, gradually reduced under his subjection almost the whole of the island. Some, however, were there, who held out against him, and these immediately applied to Artaxerxes for assistance; and he, as soon as the war with Greece was over, sent an army against Evagoras, intending to drive him quite out of the island. The Athenians, however, notwithstanding the favours lately conferred upon them by the king of Persia, could not forbear assisting their old ally in such a dreadful emergency. Accordingly, they sent him ten men of war under the command of Philocrates; but the Lacedaemonian fleet, commanded by Tarentius brother to Agesilaus, falling in with them near the isle of Rhodes, surrounded them, so that not one ship could escape. The Athenians, determined to assist Evagoras at all events, sent Chabrias with another fleet and a considerable body of land forces; and with the assistance of these he quickly reduced the whole island. But in a short time, the Athenians being obliged, in consequence of the treaty concluded with the Persians, to recall Chabrias, Artaxerxes attacked the island with an army of 300,000 men, and a fleet of 300 ships. Evagoras applied to the Egyptians, Libyans, Arabians, Tyrians, and other nations, from whom he received supplies both of men and money; and fitted out a fleet, with which he ventured an engagement with that of Artaxerxes. But being defeated, and obliged to shut himself up in Salamis, he was closely besieged by sea and land. Here at last he was obliged to capitulate, and abandon to the Persians the whole of the island, except Salamis, which he held as a king tributary to Artaxerxes.

The Cyprian war being ended, Artaxerxes turned his arms against the Cyprians, whose country lay between the Euxine and Caspian seas. But these nations were too well accustomed to war to be overcome by the Persians; and therefore the king was obliged to abandon the project, after having lost a great number of his Cyprian troops and all the horses which he took out with him, and Egypt. In his Egyptian expedition, which happened immediately after the Cyprian war, he was attended with little better success; which, however, was owing to the bad conduct of his general Pharnabazus. This commander being entrusted with the management of the Egyptian war, sent an ambassador to Athens, complaining that Chabrias had engaged in the service of an enemy of the king of Persia, with whom the state of Athens was in alliance, and threatening the republic with his master's resentment if proper satisfaction was not given: at the same time he demanded Iphicrates, another Athenian, and the best general of his time, to command the Greek mercenaries in the Persian service. This the Athenians complied with; and Iphicrates having mustered his troops, so exercised them in all the arts of war, that they became afterwards very famous among the Greeks under the name of iLpocratesian soldiers. Indeed he had sufficient time to instruct them; for the Persians were so slow in their preparations, that two whole years elapsed before they were ready to take the field. At the same time Artaxerxes, that he might draw the more mercenaries out of Greece, sent ambassadors to the different states in it, declaring it to be his will and pleasure that they should live at peace with each other, on the terms of the treaty lately concluded: which declaration was received with pleasure by all the states except Thibes, who aspired at the sovereignty of Greece; and accordingly refused to conform to it. All things, however, at last being ready for the expedition, the troops were mustered at the city then called Aeg, and since Ptolemais; where they were found to consist of 300,000 Persians under their king, and 20,000 Greeks led by Iphicrates. The fleet consisted of 300 galleys, besides a vast number of other vessels which followed with provisions. The fleet and army began to move at the same time; and that they might act in concert, they separated as little as possible. It was proposed, that the war should begin with the siege of Pelusium; but Nectanebus, the revolted king of Egypt, had provided so well for the defence of the place, that it was thought expedient to drop the enterprise, and make a descent at one of the mouths of the Nile. In this they succeeded: for the Egyptians not expecting them at that place, had not taken such care to fortify it as at Pelusium. The fortress of consequence was easily taken, and all the Egyptians in it put to the sword. After this, Iphicrates was for embarking the troops without loss of time, and attacking Memphis the capital of Egypt. Had this opinion been followed before the Egyptians recovered from the consternation into which they were thrown, it is highly probable that the whole country might have been reduced at once: but Pharnabazus would undertake nothing before the rest of the forces were come up. Iphicrates then, in
the utmost vexation at losing so favourable an opportunity, pressed Pharnabazus to allow him to attack the place with the Greek mercenaries only; but he refused this also, from a mean jealousy of the honour which Iphicrates might acquire; and in the mean time the Egyptians recovered sufficient courage to put themselves in such a posture of defence, that they could not be attacked with any probability of success; and at the same time, the Nile overflowing as usual, obliged them to return to Phoenice. The expedition was again undertaken 12 years after, but without success.

The last years of the reign of Artaxerxes were greatly disturbed by dissensions in his family; which at last broke his heart, and he died in the 94th year of his age, and 46th of his reign. He was succeeded by one of his sons named Ochus, who behaved with such cruelty, that almost one half of his dominions revolted as soon as he came to the throne. But, by reason of the dissensions of the rebels among themselves, all of them were reduced, one after another; and among the rest, the Sidonians, finding themselves betrayed, burnt themselves to the number of 40,000, together with their wives and children.

Ochus, having quelled all the insurgents, immediately set himself about reducing Egypt, and for this purpose procured a reinforcement of other 10,000 mercenaries from Greece. On his march, he lost a great number of his men drowned in the lake Serbonis, which lies between Phoenice and Egypt, extending about 30 miles in length. When the south wind blows, the whole surface of this lake is covered with sand, in such a manner that no one can distinguish it from the firm land. Several parties of Ochus's army were lost in it for want of proper guides; and it is said that whole armies have sometimes perished in the same place. When he arrived in Egypt, he detached three bodies to invade the country in different parts; each being commanded by a Persian and a Greek general. The first was led by Achares the Theban, and Rosaces governor of Lydia and Ionia: the second by Nicostaurus the Theban and Aristizanes; the third by Mentor the Rhodian and Bagos the eunuch. The murder of the latter he kept with himself, and encamped near Pelusium, with a design to watch the events of the war there. The event was successful, as we have related under the article Egypt; and Ochus having reduced the whole country, dismantled their strongholds, plundered the temples, and returned to Babylon loaded with booty.

The king, having ended this war with such success, conferred very high rewards on his mercenaries and others who had distinguished themselves. To Mentor the Rhodian he gave 100 talents, and other presents to a great value; appointing him also governor of all the coasts of Asia, and committing to his care the whole management of the war which he was still carrying on against some provinces that had revolted in the beginning of his reign; and all these either by stratagems, or by force, he at last reduced; restoring the king's authority in all these places. Ochus then, finding himself free from all troubles, gave his attention to nothing but his pleasures, leaving the administration of affairs entirely to Bagos the eunuch, and to Mentor. These two agreed to share the power between them; in consequence of which the former had the provinces of Upper Asia, and the latter all the rest. Bagos, being by birth an Egyptian, had a great zeal for the religion of his country, and endeavoured, on the conquest of Egypt, to influence the king in favour of the Egyptian ceremonies; but, in spite of all his endeavours, Ochus not only refused to comply, but killed the sacred bull, the emblem of the Egyptian god Aphis, plundered the temples, and carried away their sacred records. This Bagos supposed to be the highest Ochus guilt which a human creature could commit; and therefore poisoned his master and benefactor in the 21st year of his reign. Nor did his revenge stop here; for he kept the king's body, causing another to be buried in its stead; and because the king had caused his attendants to eat the flesh of Aphis, Bagos cut his body in pieces, and gave it so mangled to be devoured by cats, making handles for swords of his bones. He then placed Arsies, the youngest of the deceased king's sons on the throne, that he might the more easily preserve the whole power to himself.

Arsies did not long enjoy even the shadow of power which Bagos allowed him, being murdered in the second year of his reign by that treacherous eunuch, who now conferred the crown on Darius Codomannus, a distant relative of the royal family. Neither did he deserve to have him enjoy the crown much longer than his predecessor; for, finding that he would not suffer himself to be guided by him in all things, the treacherous Bagos brought him a poisonous potion; but Darius got rid of him by his own artifice, causing him to drink the poison which he brought. This established Darius in the throne as far as security from internal enemies could do so; but in a very little time his dominions were invaded, and, we may say, the same moment conquered, by Alexander the Great. The particulars of that hero's conquest are related under the article Macedon; we shall therefore here only take notice of the fate of Darius himself, with which the Persian empire concluded for many ages. After the battle of Arbela, which was decisive in favour of Alexander, the latter took and plundered Persopolis, from whence he marched into Media, in order to pursue Darius, who had fled to Ecbatana, the capital of that province. This unhappy prince had still an army of 30,000 foot, among whom were 4000 Greeks, who continued faithful to the last. Besides these, he had 4000 slingers and 3000 horse, most of them Bactrians, and commanded by Bessus, governor of Bactria. When Darius heard that Alexander was marching to Ecbatana, he retired into Bactria, with a design to raise another army; but soon after, changing his mind, he determined to venture a battle with the forces he still had left. On this Bessus governor of Bactria, and Naharzanes a Persian lord of great distinction, formed a conspiracy against him, proposing to seize his person, and, if Alexander pursued them, to gain his friendship and protection by betraying their master into his hands; but if they escaped, their design was to murder him, and usurp the crown. The troops were easily gained over, by representing to them the desperate situation of Darius's affairs; but Darius himself, though informed of their proceedings, and solicited to trust his person among the Greeks, refused to give credit to the report, or follow such a salutary counsel. The consequence of this was, that he was in a few days seized by the traitors; who, out of respect to the royal
near, he perceived Darius lying in the cart, and very
near his end, having several darts sticking in his body.
However, he had strength enough left to call for some
water, which Polystratus readily brought him. Darius,
after drinking, turned to the Macedonian, and with a
faint voice told him, that, in the deplorable state to
which he was reduced, it was no small comfort to him
that his last words would not be lost: he then charged
him to return his hearty thanks to Alexander for the
kindness he had shown to his wife and family, and to
acquaint him, that, with his last breath, he besought the
gods to prosper him in all his undertakings, and make
him sole monarch of the universe. He added, that it did
not so much concern him as Alexander to pursue and
bring to condign punishment those traitors who had
treated their lawful sovereign with such cruelty, that
being the common cause of all crowned heads. Then,
taking Polystratus by the hand, “Give Alexander
your hand, says he, as I give you mine, and carry him
in my name, the only pledge I am able to give, in this
condition, of my gratitude and affection.” Having ut-
tered these words, he expired in the arms of Polystratus.
Alexander coming up a few minutes after, bewailed his
death, and caused his body to be interred with the high-
est honours. The traitor Bessus being at last reduced
His murder to extreme difficulties, was delivered up by his own men
naked and bound into the hands of the Macedonians;
on which Alexander gave him up to Onathres the
brother of Darius, to suffer what punishment he should
think proper. Plutarch tells us that he was executed in
the following manner: Several trees being by main
force bent down to the ground, and one of the traitor’s
limbs tied to each of them, the trees, as they were suf-
ficed to return to their natural position, flew back with
such violence, that each carried with it the limb that
was tied to it.

Thus ended the empire of Persia, 209 years after it had been founded by Cyrus. After the death of the
Parthian navy, the Persian dominions became subject to Scythian,
leucus Nicatur, and continued subject to him for 62
years, when the Parthians revolted, and conquered the
greatest part of them. To the Parthians they continued
subject for 475 years; when the sovereignty was
again restored to the Parthians, as related under the
article PARTHIA.

The restorer of the Persian monarchy was Artaxerxes, or Artaxares, who was not only a private per-
son, but of spurious birth. However, he possessed
great abilities, by which means he executed his ambi-
tious projects. He was no sooner seated on the throne
than he took the pompous title of king of kings, and
formed a design of restoring the empire to its ancient
glory. He therefore gave notice to the Roman govern-
ors of the provinces bordering on his dominions, that
he had a just right, as the successor of Cyrus, to all
the Lesser Asia; which he therefore commanded them
immediately to quit, as well as the provinces on the
frontiers of the ancient Parthian kingdom, which were
already his. The consequence of this was a war with
Alexander Severus the Roman emperor. Concerning
the event of this war there are very different accounts.
It is certain, however, that on account of his exploits
against Artaxares, Alexander took the titles of Par-
thianus and Persicus; though, it would seem, with no
great
great reason, as the Persian monarch lost none of his dominions, and his successors were equally ready with himself to invade the Roman territories.

Succeeded by Sapor, who took the Roman emperor.

Artaxares dying after a reign of 12 or 15 years, was succeeded by his son Sapor; a prince of great abilities both of body and mind, but fierce, haughty, intractable, and cruel. He was no sooner seated on the throne than he began a new war with the Romans. In the beginning he was unsuccessful; being obliged, by the young emperor Gordian, to withdraw from the Roman dominions, and was even invaded in his turn; but, in a short time, Gordian being murdered by Philip, the new emperor made peace with him upon terms very advantageous to the Persians. He was no sooner gone than Sapor renewed his incursions, and made such alarming progress, that the emperor Valerian, at the age of 72, marched against him in person with a numerous army. An engagement ensued, in which the Romans were defeated, and Valerian taken prisoner. Sapor pursued his advantages with such insolence of cruelty, that the victors took some of the captives, Callistus a Roman general, and then under Odenatus, prince of Palmyrene. Thus they not only protected themselves from the insults of the Persians, but even gained many great victories over them, and drove Sapor with disgrace into his own dominions. In his march he is said to have made use of the bodies of his unfortunate prisoners to fill up the hollow roads, and to facilitate the passage of his carriages over such rivers as lay in his way. On his return to Persia, he was solicited by the kings of the Cadusians, Armenians, Bactrians, and other nations, to set Valerian at liberty; but to no purpose. On the contrary, he used him the worse; treated him daily with indignities, set his foot upon his neck when he mounted his horse, and, as is affirmed by some, flayed him alive after some confinement; and caused his skin to be tanned, which he kept as a monument of his victory over the Romans. This extreme insolence and cruelty was followed by an uninterrupted course of misfortune. Odenatus defeated him in every engagement, and even seemed ready to overthrow his empire; and after him Aurelian took ample vengeance for the captivity of Valerian. Sapor died in the year of Christ 273, after having reigned 31 years; and was succeeded by his son Hormisidas, and he by Varanes I. Concerning both these princes we know nothing more than that the former reigned a year and ten days, and the latter three years; after which he left the crown to Varanes II. who seems to have been so much averse by the power of the Romans, that he durst undertake nothing. The rest of the Persian history, to the overthrow of the empire by the Saracens, affords nothing but an account of their continued invasions of the Roman empire, which more properly belongs to the history of Rome: and to which therefore we refer. The last of the Persian monarchs of the line of Artaxares, was Isidigeres, or Jezdegerd, as he is called by the Arabian and Persian historians, who was contemporary with Omar the second caliph after Mahomet. He was scarcely seated on the throne, when he found himself attacked by a powerful army of Saracens under the command of one Sādī, who invaded the country through Chaldea. The Persian general took all imaginable pains to harass the Arabs on their march; and having an army superior to them in numbers, employed them continually in skirmishes; which were sometimes favourable to him and sometimes otherwise. But Sadī, perceiving that this long war would destroy his army, determined to hasten forward, and force the enemy to a general engagement. The Persians declined this for a long time; but at length, finding a convenient place where all their forces might act, they drew up in order of battle, and resolved to wait for the Arabs. Sadī having disposed his men in the best order he could, attacked the Persians with the utmost fury. The battle lasted three days and three nights; the Persians retiring continually from one post to another, till at last they were entirely defeated; and thus the capital city, and the greatest part of the dominions of Persia, fell into the hands of the Arabs. The conquerors seized the treasures of the king; which were so vast, that, according to a Mahometan tradition, their prophet gave the Saracen army a miraculous view of those treasures before the engagement, in order to encourage them to fight.

Jezdegerd retired into Chorasan, where he maintained himself as king, having under his subjection two other provinces, named Kerman and Sogdian. But after he had reigned in this limited manner for 15 years, one of the governors of the few towns he had left betrayed it, and called in the Turks. This place was called Meqow, seated on the river Gibon or Ouxus. Jezdegerd immediately marched against the rebels and their allies. The Persians were defeated; and the unfortunate monarch, having with much difficulty reached the river, found there a little boat, and a fisherman to whom it belonged. The king offered him a bracelet of precious stones; but the fellow, equally brutal and stupid, told him that his fare was five farthings, and that he would neither take more nor less. While they disputed, a party of the rebel forces came up, and knowing Jezdegerd, killed him, in the year 672.

Jezdegerd left behind him a son named Firewuz and a daughter named Dara. The latter espoused Bostenay, whom the rabbinical writers have dignified with the title of the head of the captivity; and who, in fact, was the prince of the Jews settled in Chaldea. As for Firewuz, he still preserved a little principality; and when he died, left a daughter named Mah Asid, who married Walid the son of the caliph Abdalmalek, by whom she had a son named Yezid, who became caliph, and consequently sovereign of Persia; and so far was this prince from thinking himself above claiming the title derived from his mother, that he constantly styled himself the son of Khosrow king of Persia, the descendant of the caliph Marwan; and among whose ancestors on the side of the mother were the Roman emperor and the Khazars.

Persia continued to be subject to the Arabs till the decline of the Saracen empire, when it was seized by various usurpers, till the time of Jenghis Khan, who conquered it as well as almost all the rest of Asia. After his death, which happened in the year 1227, Persia, together with the neighbouring countries, were governed by officers appointed by his successors, who reigned at Ksarakorum, in the eastern parts of Tartary, till the year 1253, when it became once more the seat of a mighty empire under Hulaku the Mongol, who in 1256 abolished the caliphate, by taking the city of Bagdad, as related under that article. After the death of Hulaku,
Persia.

Persia.

His son Abaka succeeded to his extensive dominions; and his first care was to shut up all the avenues of his empire against the other princes of the race of Jenghiz Khan, who reigned in different parts of Tartary. His precautions, however, were of little avail; for in the very beginning of his reign he was invaded by Barkan Khan, of the race of Jagatay the son of Jenghiz Khan, from Great Bukharia, with an army of 300,000 men. Abaka was but indifferently prepared to oppose such a formidable power; but, happily for him, his antagonist died before the armies came to an engagement, upon which the invaders dispersed and returned to Tartary. In the year 1264, Armenia and Anatolia were ravaged by the Mamlukes from Egypt, but they were obliged to fly from Abaka; who thus seemed to be established in the possession of an empire almost as extensive as that of the ancient Persian kings. His tranquillity, however, was of short duration; for, in 1268, his dominions were invaded by Borak Khan, a prince likewise of the race of Jagatay, with an army of 100,000 men. He quickly took possession of the province of Chuban, where he met with little opposition, and in 1269 advanced as far as Aderbijan, where Abaka had the bulk of his forces. A bloody battle ensued; in which Abaka was victorious, and Borak obliged to fly into Tartary, with the loss of all his baggage and great part of his army. Abaka died in 1282, after a reign of 17 years, not without suspicion of being poisoned; and was succeeded by his brother Ahmed Khan. He was the first of the family of Jenghiz Khan who embraced Mahometanism; but neither he nor his successors appear to have been in the least versed in the arts of government; for the Persian history, from this period, becomes only an account of insurrections, murders, rebellions, and poisonings, till the year 1335, when it split all to pieces, and was possessed by a great number of petty princes; all of whom were at perpetual war with each other till the time of Timur Beg, or Tamerlane, who once more reduced them all under one jurisdiction.

After the death of Tamerlane, Persia continued to be governed by his son Shah Rukh, a wise and valiant prince; but immediately after his death fell into the same confusion as before; being held by a great number of petty tyrants, till the beginning of the 16th century, when it was conquered by Shah Ismael Safi, or Sefi; of whose family we have the following account. His father was Sheyk Hayder or Haydr, the son of Sultan Juneyd, the son of Sheyk Ibrahim, the son of Sheyk Ali, the son of Sheyk Mosa, the son of Sheyk Sefi, who was the 13th in a direct line from All the son-in-law of the prophet Mahomet. When Tamerlane returned from the defeat of Bajazet the Turkish sultan, he carried with him a great number of captives out of Caramania and Anatolia, all of whom he intended to put to death on some remarkable occasion; and with this resolution be entered Arurebil, or Ardevil, a city of Aderbijan, about 25 miles to the east of Taurus, where he continued for some days. At this time lived in that city the Sheyk Safi, or Sefi, above mentioned, reputed by the inhabitants to be a saint, and, as such, much revered by them. The fame of Sefi's sanctity so much moved Tamerlane, that he paid him frequent visits; and when he was about to depart, promised to grant whatever favour he should ask. Sheyk Sefi, who had been informed of Tamerlane's design to put the captives to death, requested of the conqueror that he would spare the lives of those unfortunate men. Tamerlane, desirous of oblliging him, not only granted this request, but delivered them up to him to be disposed of as he thought fit; upon which the Sheykh furnished them with clothes and other necessaries as well as he could, and sent them home to their respective countries. This generous action proved very beneficial to the family; for the people were so much affected with such an extraordinary instance of virtue, that they repaired in great numbers to Sefi, bringing with them considerable presents; and this so frequently, that few days passed in which he was not visited by many. Thus the descendants of the Sheykh made a conspicuous figure till the year 1486, when they were all destroyed by the Turcomans except Ismael, who fled to Gilian, where he lived under the protection of the king of that country; after which he became conspicuous on the following occasion.

There was at that time, among the Mahometans, a vast number of people dispersed over Asia; and among these a particular party who followed that of Haydr: the father of Ismael, which Sheyk Sefi, one of his ancestors, had brought into great reputation. Ismael, who had assumed the surname of Sefi, or Sge, finding that Persia was all in confusion, and bearing that there was a great number of the Hayderian sect in Caramania, removed thither. There he collected 7000 of his party all devoted to the interest of his family; and while he was yet only 14 years of age, conquered Shirwan. After this he pursued his conquests; and as his antagonists never united to oppose him, had conquered the greatest part of Persia, and reduced the city of Bagdad, by the year 1510. However, his conquests on the west side were soon stopped by the Turks; for, in 1511, he received a great defeat from Selim I. who took Tauris; and would probably have crushed the empire of Ismael in its infancy, had he not thought the conquest of Egypt more important than that of Persia. After his defeat by Selim, Ismael never undertook any thing of consequence. He died in 1523, leaving the crown to his eldest son Thamasp I.

The new shah was a man of very limited abilities and was therefore invaded by the Turks almost instantly on his accession to the throne. However, they were obliged to retreat by an inundation, which overflowed their camp, and which frightened them with its red colour, probably arising from the nature of the soil over which it passed. Thamasp, however, reduced Georgia to a province of the Persian empire; that country being in his time divided among a number of petty princes, who, by reason of their divisions, were able to make little opposition.

The reigns of the succeeding princes afford nothing remarkable till the time of Shah Abbas I. surnamed the Shah Ab-Great. He ascended the throne in the year 1584; and his first care was to recover from the Turks and Tartars the large provinces they had seized which formerly belonged to the Persian empire. He began with declaring war against the latter, who had seized the finest part of Chorasan. Accordingly, having raised a powerful army, he entered that province, where he was met by Abdallah Khan the chief of the Usbek Tartars. The two armies lay in sight of each other for six months;
but at length Abbas attacked and defeated his enemies, forcing them, for that time, to abandon Chorasan. Here he continued for three years; and on his leaving that place, fixed the seat of government at Isphahan, where it has continued ever since. His next expedition was against the Turks. Understanding that the garrison of Tauris was in no expectation of an enemy, he formed a design of surprising the place; and having privately assembled a few forces, he marched with such celerity, that he reached a pass called Shibli very near Tauris, in six days, though it is usually 18 or 20 days journey for the caravans. Here the Turks had posted a few soldiers, rather for the purpose of collecting the customs on such commodities as were brought that way, than of defending the pass against an enemy. Before they came in sight of this pass, Abbas and some of his officers left the rest of the army, and rode briskly up to the turnpike. Here the secretary of the customshouse taking them for merchants, demanded the usual duties. Abbas replied, that the person who had the purse was behind, but at the same time ordered some money to be given him. While the secretary was counting it, he was suddenly stabbed by the Shah's officers, and the officers who were with him suddenly falling upon the few soldiers who were there, obliged them to submit; after which he entered the pass with his army.

The governor of Tauris marched out with all the troops he could collect on so short a warning; but being inferior to the Persians, he was utterly defeated, and himself taken prisoner; after which the city was obliged to submit, as also a number of places in the neighbourhood. One city only called Orumi, being very strongly situated, resisted all the efforts of Abbas; but was at last taken over by the assistance of the Cords, whom he gained over by promising to share the plunder of the place with them. But instead of this, he formed a design to cut them all off at once; fearing that they might at another time do the Turks a service of the same nature that they had done to him just now. For this reason he invited their chiefs to dine with him; and having brought them to a tent, he gave an instance to which had several witnesses, when he motioned on the inside two executioners, who cut off the heads of the guests as soon as they entered.

After this Shah Abbas considerably enlarged his dominions, and repelled two dangerous invasions of the Turks. He attempted also to promote commerce, and civilize his subjects; but stained all his great actions, by his abominable cruelties, which he practised on every one who gave him the least cause of offence; may frequently without any cause at all. He took the isle of Ormus from the Portuguese, who had kept it since 1507, by the assistance of some English ships in 1622; and died six years after, aged 70.

The princes who succeeded Shah Abbas the Great, were remarkable only for their cruelties and debaucheries, which occasioned a revolution in 1716, when the Shah Hussain was deposed by his Aghas, a people inhabiting the country between Persia and India; who being oppressed by the ministers, revolted under the conduct of one Mereweis. The princes of the Afghan race continued to enjoy the sovereignty for no more than 16 years, when Ahsaff the reigning shah was deposed by one of his officers. On this Thamas, otherwise called Prince Thamas, the only survivor of the family of Abbas, assembling an army, invited into his service Nadir Khan, who had obtained great reputation for his valour and conduct. He was the son of a Persian nobleman, on the frontiers of Uzbeck Tartary, and his uncle, who was his guardian, keeping him out of possession of the castle and estate which was his inheritance, he took to robbing the caravans; and, having increased his followers to upwards of 5000 men, became the terror of that part of the country, and especially of his uncle, who had seized his estate. He therefore resolved to make his peace with him, and invited him to the castle, where he entertained him in a splendid manner; but Nadir Khan ordered his throat to be cut next night, and all his people to be turned out of the castle. No sooner had Nadir Khan got the command of the Persian army, than he attacked and defeated the usurper Esriff, put him to death, and recovered all the places the Turks and Russians had made themselves masters of during the rebellion, and then Prince Thamas seemed to be established on the throne: but Nadir Khan, to whom Thamas had given the name of Thamas Kosti Khan, that is, the Slaver Thamas, thinking his services not sufficiently rewarded, and pretending that the king had a design against his life, or at least to set him aside, conspired against his sovereign, and put him to death, as is supposed after which, he usurped the throne, styling himself Shah Nadir or King Nadir.

He afterwards laid siege to Canahar, of which a son of Mereweis had possessed himself. During this siege the court of the Great Mogul being distracted with factions, one of the parties invited Shah Nadir to come to their assistance, and betrayed the Mogul into his hands. He thereupon marched to Delhi, the capital of India, and summoned all the viceroys and governors of provinces to attend him, and bring with them all the treasures they could raise; and those that did not bring as much as he expected, he tortured and put to death. Having thus amassed the greatest treasure that ever prince was master of, he returned to Persia, giving the Mogul his liberty, on condition of his resigning to the provinces on the west side of the Indus to the crown of Persia. He afterwards made a conquest of Uzbeck Tartary, and plundered Bochara the capital city. Then he marched against the Daghestan Tartars; but the great part of his army in their mountains, without fighting. He defeated the Turks in several engagements, but laying siege to Bagdad, was twice compelled to raise the siege. He proceeded to change the religion of Persia to that of Omar, hanged up the chief priest, put his own son to death, and was guilty of such cruelty, that he was at length assassinated by his own relations, anno 1747. A contest upon this ensued between these relations for the crown, which has rendered Persia a scene of the most horrible confusion for upwards of 40 years.

The reader will form some notion of the troubles of this unhappy country from the following series of particulars to the throne between the death of Nadir and the accession of Kerim Khan. We give it from Franklin's Observations. 1st, Adil Shah. —2d, Ibnezzar Shab. —3d, Shah Rohk Shab. —4th, Soleeman Shab-—5th, Ismaeal Shab.—6th, Azan Khan Afghan.—7th, Hassun Khan Kejar.—8th, Ali Merdan Khan Bukhari.—9th, Kerim Khan Zand.
Persia.

Their reigns, or more properly the length of time they respectively governed with their party, were as follows: Adil Shah, nine months. Ibraheem Shah, six months. Shah Rekh Shah, after a variety of revolutions, at length regained the city of Meschid: he is now alive (1787), and above 80 years of age, reigning in Choraan, under the direction of his son Nussir Ullah Meereza. Sulaiman Shah, and Ismaeel Shah, in about forty days were both cut off, almost as soon as they were elevated. Azad Khan Afghan, one of Kerim Khan's most formidable rivals and competitors, was subdued by him, brought prisoner to Shiraz, and died there a natural death. Hossan Khan Kajar, another of Kerim Khan's competitors, was besieging Shiraz, when his army suddenly mutinied and deserted him. The mutiny was attributed to their want of pay. A party sent by Kerim Khan took him prisoner. His head was instantly cut off, and presented to Kerim Khan. His family were brought captives to Shiraz. They were well treated, and had their liberty given them soon after, under an obligation not to quit the city. Ali Merdan Khan was killed by a musket shot as he was walking on the ramparts of Meschid encouraging his men. Kerim Khan Zund, by birth a Curdistan, was a most favourite officer of Nadir Shah, and at the time of his death was in the southern provinces. Shiraz and other places had declared for him. He found means at last, after various encounters with doubtful success, completely to subdue all his rivals, and finally to establish himself as ruler of all Persia. He was in power about 30 years; the latter part of which he governed Persia under the appellation of vakeel or regent, for he never would receive the title of Shah. He made Shiraz the chief city of his residence, in gratitude for the assistance he had received from its inhabitants and those of the southern provinces. He died in the year 1779, regretted by all his subjects, who esteemed and honoured him as the glory of Persia.

When the death of Kerim Khan was announced in the city, much confusion arose; two and twenty of the principal officers of the army, men of high rank and family, took possession of the ark, or citadel, with a resolution to acknowledge Abul Futtah Khan (the eldest son of the late vakeel) as their sovereign, and to defend him against all other pretenders; whereupon Zikea Khan, a relation of the late vakeel by the mother's side, who was possessed of immense wealth, enlisted a great part of the army into his pay, by giving them very considerable bounties. Zikea Khan was of the tribe of Zund (or the Lackeries); a man remarkably proud, cruel, and unrelenting. Having assembled a large body of troops, he immediately marched them to the citadel, and laid close siege to it for the space of three days; at the expiration of which, finding he could not take it by force, he had recourse to treachery. To each of the principal khans he sent a written paper, by which he swore upon the Koran, that if they would come out and submit to him, not a hair of their heads should be touched, and that they should have their effects secured to them. Upon this a consultation was held by them; and it appearing that they could not subsist many days longer, they agreed to surrender themselves, firmly relying on the promises that had been made to them. Zikea Khan, in the mean time, gave private orders, for the khans to be seized, and brought separately before him as

they came out of the citadel. His orders were strictly obeyed, and these deluded men were all massacred in his presence; he was seated the whole time, feasting his eyes on the cruel spectacle.

Zikea Khan's tyranny became soon intolerable, and murdered. He was cut off by his own body guard, when Abul Futtah Khan, who was at the time in the camp, was proclaimed king by the unanimous voice of the troops, whom he immediately led back to Shiraz. On his arrival he was acknowledged as sovereign by all ranks of people, and took quiet possession of the government.

Mahomed Sedick Khan, only brother of the late Mahomed Sedick Khan, who had during that prince's life filled the high office of beglerbeg of Fars, and had been appointed guardian of his son Abul Futtah Khan, was seized by him at this period governor of the city of Bassora, which government had been taken by the Persians, previous to the vakeel's death. Upon hearing the news of his brother's decease, he became ambitious of reigning alone, and from that instant formed schemes for the destruction of his nephew; but as it was necessary for him to be on the spot for the advancement of his views, he determined to withdraw the Persian garrison from Bassora, who were all devoted to his interest: accordingly he evacuated that place, and marched immediately for Shiraz.

The news of Sadick Khan's approach threw the inhabitants of Shiraz, into the greatest consternation; their minds were variously agitated on the occasion; some, from his known public character, expected he would honestly fulfil the commands of his deceased brother; others, who had been witnesses to the confusion of former times, on similar occasions, rightly imagined that he would set up for himself; and indeed this proved to be the case: for having entered Shiraz a very few days after, he caused Abul Futtah Khan to be seized, deprived of sight, and put into close confinement.

After this event, Sadick Khan openly assumed the which he government. As soon as the intelligence reached Ali Murad Khan, who was at Jafpan, that lord instantly rebelled: deeming himself to have an equal right to the government with Sadick Khan, as in fact he had, he could ill brook the thought of being obedient to him, and openly declared himself a competitor for the empire. Persia was by this means again involved in all the horrors of a civil war. Ali Murad Khan indeed took possession of Shiraz, assumed the government, and gave to the empire the flattering prospect of being settled under the government of one man; but this prospect was soon obscured by the power and credit acquired by Aka Mahomed Khan.

On the night following Kerim Khan's death, this Aka Mahomed found means to make his escape from Shiraz, and fled to the northward, where collectin some troops, he soon made himself master of Mazanderan and Ghilan, and was proclaimed nearly about the time that Ali Murad Khan had taken Shiraz. It is remarkable (say our author), that from his first entering into competition for the government, he has been successful in every battle which he has fought. He is an enemy, having been made so whilst an infant, by the command of Nadir Shah, but possesses great personal bravery.

Ali Murad Khan, hearing of the success of Aka Mahomed,
Mahomed Khan, determined to go against him; but as he was previously proceeding to Isaphan to suppress a rebellion, he fell suddenly from his horse and expired on the spot.

"At this period, Jaafar Khan, the eldest and only surviving son of Sadick Khan, was governor of Khum; he deemed this a favourable opportunity to assert his pretensions to the government, and immediately marched with what few troops he had to Isaphan: soon after his arrival he was joined by the greater part of the malcontents, who were then in arms. In this situation he remained some time; but Akau Mahomed Khan coming down upon him with his army, he was obliged to risk his fate in a battle, and, being defeated, fled with the small remains of his troops, taking the road to Shirazu. Soon after finding himself strengthened by an increase of his army, he determined to venture a second engagement with his opponent Akau Mahomed Khan; and for this purpose marched with his army towards Isaphan: the two armies met near Yezekhaast, when a battle ensued, and Akau Mahomed Khan's superior fortune again prevailing, Jaafar Khan was defeated, and retired to Shirazu, which he quitted on the 25th of June 1787, and shortly after marched his army to the northward, but returned in October without having effected anything."

Such was the state of Persia in 1788. Mr. Franklin, from whose excellent Observations on a Tour made in the years 1786-7 these particulars are mostly extracted, says that Jaafar Khan is the most likely, in case of success against his opponent, to restore the country to a happy and reputable state: but it will require a long space of time to recover it from the calamities into which the different revolutions have brought it—a country, if an oriental metaphor may be allowed, once blooming as the garden of Eden, fair and flourishing to the eye;—now, sad reverse! despoiled and leafless by the cruel ravages of war, and desolating contention."

As to the air and climate of this country, considering the great extent thereof, it cannot but be very different, according to the situation of its several parts; some being frozen with cold, whilst others are burnt with heat at the same time of the year. The air, wherever it is cold, is dry; but where it is extremely hot, it is sometimes moist. All along the coast of the Persian gulf, from west to east, to the very mouth of the river Indus, the heat for four months is so excessive, that even those who are born in the country, unable to bear it, are forced to quit their houses, and retire to the mountains; so that such as travel in these parts, at that season, find none in the villages, but wretched poor creatures, left there to watch the effects of the rich, at the expense of their own health. The extreme heat of the air, as it is unsupportable, so it makes it prodigiously unhealthy; strangers frequently falling sick there, and seldom escaping. The eastern provinces of Persia, from the river Indus to the borders of Tartary, are subject to great heats, though not quite so unhealthy as on the coasts of the Indian ocean and the Persian gulf; but in the northern provinces, on the coast of the Caspian sea, the heat is full as great, and, though attended with moisture, as unhealthy as on the coast before mentioned. From October to May, there is no country in the world more pleasant than this; but the people carry inde-

liable marks of the malign influence of their summer, looking all of them of a faint yellow, and having neither strength nor spirits; though, about the end of April, they abandon their houses, and retire to the mountains, which are 25 or 30 leagues from the sea. But this moistness in the air is only in those parts; the rest of Persia enjoys a dry air, the sky being perfectly serene, and hardly so much as a cloud seems to fly therein. Though it seldom rains, it does not follow that the heat admits of no mitigation: for in the night, notwithstanding there is not a cloud to be seen, and the sky is so clear, that the stars alone afford a light sufficient to travel by, a brisk wind springs up, which lasts until within an hour of the morning, and gives such a coolness to the air, that a man can bear a tolerable warm garment. The seasons in general, and particularly in the middle of this kingdom, happen thus: in the winter, beginning in November, and lasting until March is very sharp and rude, attended with frost and snow which last descends in great flakes on the mountains but never on the plains. The climate of Shirazu, the capital of Persia Proper, is represented by a traveller who lately visited it, as one of the most agreeable in the world, the extremes of heat and cold being seldom felt.

"During the spring of the year the face of the country appears uncommonly beautiful. The flowers, of which they have a great variety, and of the brightest hues, the fragrant herbs, shrubs, and plants, the rose, the sweet basil, and the myrtle, all here contribute to refresh and perfume the natural mildness of the air. The nightshade of the garden (called by the Persians Boobool hez, dastouran), the goldfinch, and the linnet, by their melodious warblings at this delightful season of the year, serve to add to the satisfaction of the mind, and to inspire it with the most pleasing ideas. The beauties of nature are here depicted in their fullest extent; the natural historian and the botanist would here meet with ample scope for pursuing their favourite investigations. With such advantages, added to the salubrity of the air, how can it be wondered at that the inhabitants of Shirazu should so confidently assert the pre-eminence of their own city to any other in the world?—or that such beauties should fail of calling forth the poetical exertions of a Hafiz, a Sadi, or a Jami? The mornings and evenings are cool, but the middle of the day is very pleasant. In summer the thermometer seldom rises above 73 in the day time, and at night it generally sinks as low as 62. The autumn is the worst season of the year, that being the time when the rains begin to fall, and during the autumnal months it is considered by the natives the most unhealthy; colds, fluxes, and fevers being very general. In winter a vast deal of snow falls, and very thick, but ice is rarely to be found, except on the summits of the mountains, or towards Isaphan, and the more northern parts of Persia. One thing which is now to be esteemed in this country, and renders it preferable to any other part of the world, is its nights, which are always clear and bright: and the dew, that in most places is of so pernicious and dangerous a nature, is now of the least ill consequence here: there is none at all in summer, and in the other seasons it is of such a nature that if the brightest scimitar should be exposed to it all the night, it would not receive the least rust; a circumstance I have myself experienced. This dryness in the air causes their buildings to last a great while, and it is undoubtedly..."
unoubtedly one of the principal reasons that the celebrated ruins of Persepolis have endured for so many ages, and, comparatively speaking, in so perfect a state. The great dryness of the air exempts Persia from thunder and earthquakes. In the spring, indeed, there sometimes falls hail; and, as the harvest is then pretty far advanced, it does a great deal of mischief. The rainbow is seldom seen in this country, because there rise not vapours sufficient to form it; but in the night there are seen rays of light shooting through the firmament, and followed as it were by a train of smoke. The winds, however brisk, seldom swell into storms or tempests; but, on the other hand, they are sometimes poisonous and infectious on the shore of the Gulf, as all travellers agree. M. Tavernier says, that at Gombroon people often find themselves struck by a south wind, in such a manner, that they cry, "I burn!" and immediately fall down dead. M. le Brun tells us, that he was assured while he was there, that the weather was sometimes so excessively sultry as to melt the seals of letters. At this time the people go to their shirts, and are continually sprinkled with cold water; and some even lie several hours naked in the water. Among the inconveniences consequent from this malignant disposition of the air, one of the most terrible is the engendering, in the arms and legs, a kind of long small worms, which cannot be extracted without great danger of breaking them; upon which a mortification ensues.

The soil of Persia is in general stony, sandy, barren, and everywhere so dry, that, if it be not watered, it produces nothing, not even grass; but, where they can turn the water into their plains or valleys, it is not unprofitable. There is a great difference in point of fertility in the different provinces of the empire; and those of Media, Iberia, Hyrcania, and Bactria, are now in a great measure what they were formerly, and surpass most of the others in their productions. All along the Persian gulf, the soil is still more barren, cattle less plenty, and every thing in a worse condition than anywhere else.

Though there is scarcely a province in Persia which does not produce wine, yet the wine of some provinces is much more esteemed than that of others; but Shiraz, or, as it is written by Mr. Francklin, Shiraz, wine is universally allowed to be the very best in Persia; inasmuch that it is a common proverb there, That to live happily, one must eat the bread of Yezdi, and drink the wine of Shiraz.

The grain most common in Persia is wheat; which is wonderfully fair and clean. As for barley, rice, and millet, they only make bread of them in some places, as in Coursistan, when their wheat brake is exhausted before the return of harvest. They do not cultivate in this country either oats or rye; except where the Armenians are settled, who make great use of the latter in Lent. Rice is the universal aliment of all sorts of people in Persia; for this reason they are extremely careful in its cultivation; for, after they have sown it in the same manner as other grain, they in three months time transplant it, root by root, into fields, which are well watered, otherwise it would never attain that perfection in which we find it there; since it is softer, sooner boiled, and more delicious, than the same grain in any other part of the world. Perhaps its taste is, in some measure, heightened by a practice which they follow to give it a glossy whiteness, viz. by cleansing it, after it is beaten out of the husks, with a mixture of flour and salt. Corn ripens exceedingly in this country; so that in some parts they have a threefold crop in one year. The Persian bread is generally very thin, white, and good; and commonly cheap enough.

Metals of all sorts have been found in Persia. Since the reign of Shah Abbas the Great, iron, copper, and lead, have been very common; but there are no gold or silver mines open at present; though, as Persia is a very mountainous country, such might very probably be found, if pains were taken to search them out. There are silver mines in Kerman and Mazanderan, and one not far from Spauhawn; but they cannot be worked for want of wood. Minerals are also found in Persia in abundance; especially sulphur, saltpetre, salt, and alum. Nothing is more common in this country than to meet with plains, sometimes 10 leagues in length, covered entirely with salt, and others with sulphur or alum. In some places salt is dug out of mines, and even used in building houses. Marble, freestone, and slate are found in great plenty about Hamadan. The marble is of four colours, viz. white, black, red and black, and white and black. Persia yields two sorts of petroleum or naptha; namely, black and white. In the neighbourhood of Taurus they find azure; but it is not so good as that brought from Tartary. Among the most valuable productions of Persia are the precious stones called turquoises, of which there are several rocks or mines.

The horses of Persia are the most beautiful of the East, though they are not so much esteemed as those of Arabia; so great, however, is the demand for them, that the finest ones will fetch from 90l. to 400l. sterling. They are higher than the English saddle horses; straight before, with a small head, legs wonderfully slender, and finely proportioned; they are mighty, gentle, good travellers, very light and sprightly, and do good service till they are 18 or 20 years old. The great numbers of them sold into Turkey and the Indies, though none can be carried out of the kingdom without special license from the king, is what makes them so dear. Next to horses we may reckon mules, which are much esteemed here, and are very fine; and next to these we may justly place asses, of which they have in this country two sorts; the first bred in Persia, heavy and doltish, as asses in other countries are; the other originally of an Arabian breed, the most docile and useful creature of its kind in the world. They are used wholly for the saddle; being remarkable for their easy manner of going, and are very sure-footed, carrying their heads lofty, and moving gracefully. Some of them are valued at 20l. sterling. The mules here are also very fine; they pace well, never fall, and are seldom tired. The highest price of a mule is about 45l. sterling. Camels are also numerous in Persia, and very serviceable; they call them kechty-krouch-komin, i.e. the ships of the land; because the inland trade is carried on by them as the foreign is by ships. Of these camels there are two sorts, the northern and southern; the latter, which is much the smaller, but swifter, will carry a load of about 700 weight, and trot as fast as a horse will gallop; the other will travel with a load of 1200 or 1300 weight; both are profitable to their masters, as costing little or nothing to keep. They travel
Peria. travel without halter or reins; grazing on the road from time to time, notwithstanding their load. They are managed entirely by the voice; those who direct them making use of a kind of song, and the camel moving brisker, or at its ordinary pace, as they keep a quicker or slower time. The camels shed their hair so clean in the spring, that they look like scalded swine: but then they are pitched over, to keep the flies from stinging them. The camels' hair is the most profitable fleece of all the tame beasts: fine stuffs are made of it; and in Europe, hats, with a mixture of a little beaver.

As beef is little eaten in Persia, their oxen are generally employed in ploughing, and other sorts of labour. Hogs are nowhere bred in Persia, if we except a province or two on the borders of the Caspian sea. Sheep and deer are very common throughout all Persia.

Of wild beasts, the number is not great in that country, because there are few forests; but where there are any, as in Hyrcania, now called Tubristan, abundance of lions, bears, tygers, leopards, porcupines, wild boars, and wolves are to be found; but the last are not so numerous as any of the other species.

There are but few insects in this country; which may be ascribed to the dryness of the climate. In some provinces, however, there is an infinite number of locusts or grasshoppers, which fly about in such clouds as to darken the air. In certain parts of the Persian dominions they have large black scorpions, so venomous, that such as are stung by them die in a few hours. In others they have lizards frightfully ugly, which are as long, and as thick as a large toad, their skins being as hard and rough as that of the sea-dog; they are said to attack and kill men sometimes; but that may be doubted. The southern provinces are infested with gnats; some with long legs, like those we call midges; and some white, and as small as fleas, which make no buzzing, but sting suddenly, and so smartly that the sting is like the prick of a needle. Among the reptiles is a long square worm, called by the inhabitants hasar-joy, i.e. "thousand feet," because its whole body is covered with feet; it runs prodigiously fast; and its bite is dangerous, and even mortal if it gets into the ear.

There are in Persia all the several sorts of owls which we have in Europe, but not in such great plenty; excepting, however, wild and tame pigeons, of which vast numbers are kept all over the kingdom, chiefly on account of their dung; which is the best manure for melons. It is a great diversion among the lower sort of people in town or country to catch pigeons, though it be forbidden: for this purpose they have pigeons so taught, that flying in one flock, they surround such wild ones as they find in the field, and bring them back with them to their masters. The partridges of this country are the largest and finest in the world, being generally of the size of our owls. Geese, ducks, cranes, herons, and many other sorts of water fowl, are common here; as are likewise nightingales, which are heard all the year round, chiefly in the spring; martlets, which learn whatever words are taught them; and a bird called nowra, which chatters incessantly, and repeats whatever it hears. Of birds of a larger size, the most remarkable is the pelican, by the Persians called tacab,

i.e. "water-carrier;" and also mure, i.e. "sheep," because it is as large as one of these animals *. There are in Persia various birds of prey. Some of their falcons are the largest and finest in the world; the people take great pains to teach them to fly at game; the Persians having generally 500 of this sort of birds, each of which has a person to attend it.

There is perhaps no country in the world which, generally speaking, is more mountainous than Persia; but many of them yield neither springs nor metals, and few of them are shaded with trees. It is true, some of the chief of them are situated on the frontiers, and serve as a kind of natural ramparts, or bulwarks, to this vast empire. Among the latter are the mountains of Caucasus and Arrarat, sometimes called the mountains of Dagestan, which fill all the space between the Euxine and Caspian seas; those called Taurus, and the several branches thereof, run through Persia from NATOLIA to India, and fill all the middle of the country.

As to rivers, except the Araxes, which rises in the mountains of Armenia, and falls into the KUR or Cyrus, before it reaches the Caspian sea, there is not one navigable stream in this country. The Oxus divides Persia on the north-east from Uzbek Tartary. The Indus also may now be reckoned among the rivers of Persia, as the provinces lying to the west of that river are now in possession of that country: this river is said to run a course of more than 1000 miles, and overflows all the low grounds in April, May, and June.

The seas on the south of Persia are, the gulf of Persia or Bassora, the gulf of Ormus, and the Indian ocean. The only sea on the north is the Caspian or Hyrcanian sea, which is more properly a lake, having no communication with any other sea. These seas, together with the lakes and rivers, supply Persia with plenty of fish. The Caspian sea contains very fine fish on one side; and the Persian gulf on the other is believed to have more fish than any other sea in the world. On the coasts of this gulf is taken a sort of fish, for which they have a particular name; its flesh is of a red colour, very delicious, and some of them weigh 200 or 300 pounds. The river fish are chiefly barbels; but far from being good. Those of the lakes are carp and shad. In the river at Seohawa are a great number of crabs, which crawl up the trees, and live night and day under the leaves, whence they are taken; and are esteemed very delicious food.

In his voyage from Gombroon up the Persian gulf, Mr. Ives makes mention of several islands, named Kuris, Pololoo, Keyes, Indarabie, Shittewar, and Busheel. Some of these were quite barren; on others there were a few trees and bushes, with little fishing towns, and a few small vessels lying along shore. The date trees were thinly scattered among the hills; but though a small portion of green might here and there be discovered, yet such was the barrenness of these islands in general, that it was for some time a matter of surprise how sheep and goats could possibly subsist upon them. On closer examination, however, it was found, that the soil produced a kind of grass, red and juicy mutton, on which these animals principally feed. The Persian coast, as they sailed along, afforded a most romantic prospect, appearing at first to be a continued rock, rent and torn

* the text is missing some information.
under by earthquakes; but it was afterwards discovered, that some part of it was only sand hardened by the rains and sun.

Narban Point terminates in a long and low piece of land, which runs off into the gulf from the foot of the Persian hills. Between this point and the main land is a channel, in which a ship of 500 tons burden might easily ride. The Portuguese had formerly a settlement here, the remains of which are still to be seen. A large river empties itself into the sea at this place; and Mr Ives observes, that "Providence seems here to have allotted a spot of ground amidst unapproachable rocks and deserts, capable of affording the kind production of vegetables for man and beast." The adjacent country is subject to the Arabs.

Through all the Persian gulf, Mr Ives remarks that the spring water on the islands is much better than that on the continent; and the water nearest the sea on the islands has greatly the advantage over that which is found in the middle parts. This holds good, however, only in those parts which are near the sea; for about 12 miles up the country, both on the Persian and Arabian side of the gulf, the water is very good. At the island called Bareen or Baharen, divers go down to the bottom of the sea, at certain known depths, and come up again with their vessels hilled with fresh water. This fresh water is found in holes or little natural wells, some fathoms below the surface of the sea. The Arabs have certain marks on the island to teach them where to dive for the fresh water. Mr Ives was assured by an Arabian merchant, that he himself had discovered a spring upon the shore, by which one of these wells is served. He put into this spring a bit of heavy stick; and in two or three days an Arabian diver brought it to him again from the bottom of one of these holes.

The English and other nations, trade with the Persians several ways, particularly by the gulf of Ormus at Gombroon, and by the way of Turkey. A trade also was not many years since opened by the English with Persia through Russia and the Caspian sea; but that is now discontinued, having been prohibited by the court of Russia, who were apprehensive that the English would teach the Persians to build ships, and dispute the navigation of the Caspian sea with them. The principal commodities at the hands of the Persians are wrought silks, mohair camelots, carpets, leather; for which, and some others, the European merchants exchange chiefly woollen manufactures; but the trade is carried on altogether in European shipping, the Persians have scarce any ships of their own, and the Russians the sole navigation of the Caspian sea. There is not a richer or more profitable trade in the world, than that which is carried on between Gombroon and Surat in the East Indies; and the English East India Company frequently let out their ships to transport the merchandise of the Banians and Armenians from Persia to India. The shah or sovereign of Persia, is the chief merchant; and he usually employs his Armenian subjects to traffic for him in every part of the world. The king's agents must have the refusal of all merchandise, before his subjects are permitted to trade. It is computed that Persia produces yearly upwards of 22,000 bales of silk, chiefly in the provinces of Chilan and Mazandaran, each bale weighing 263 pounds. Vast quantities of Persian silk were used to be imported into Europe, especially by the Dutch, English, and Russians, before the civil wars began. The goods exported from Persia to India are, tobacco, all sorts of fruits, pickled and preserved, especially dates, marmalade, wines, distilled waters, horses, Persian feathers, and Turkey leather of all sorts and colours, a great quantity whereof is also exported to Muscovy and other European countries. The exports to Turkey are, tobacco, galls, thread, goats hair, stuffs, mats, box-work, and many other things. As there are no posts in the east, and trading by commission with the use of bills of exchange, is little known, traffic must proceed in a very awkward heavy manner, in comparison of that of Europe.

The most current money of Persia are the abassees. Money worth about 1s. 4d. sterling; they are of the finest silver. An abasse is worth two mahmodues; a mahmood, two shahes; and a shah, ten single or five double casbheges; these last pieces are of brass, the others of silver, for gold is not current in trade. The shahes are not very common; but mahmodones and casbheges are current everywhere. Horses, camels, houses, &c. are generally sold by the toman, which is an imaginary coin, worth 200 shahes, or 50 abassees; and they usually reckon their estates that way. Such a one, they say, is worth so many tomanas, as we say pounds in England.

Persia is an absolute monarchy, the lives and estates of the people being entirely at the disposal of their prince. The king has no council established, but is advised by such ministers as are most in favour; and the resolutions taken among the women of the harem frequently defeat the best laid designs. The crown is hereditary, excluding only the females. The sons of a daughter are allowed to inherit. The laws of Persia exclude the blind from the throne; which is the reason that the reigning prince usually orders the eyes of all the males of the royal family, of whom he has any jealousy, to be put out. The king has generally a great many wives, which it would be death for any one besides the eunuchs, who have the superintendence of them, to look at, or even see by accident; wherefore, when he travels, notice is given to all men to quit the road, nay their very houses, and to retire to a great distance.

The prime minister is called attaeem doulet, which signifies the director of the empire, and also azem, or the great supporter of the empire; as he alone almost sustains the whole weight of the administration. This minister's chief study is to please his master, to secure to himself an ascendant over his mind, and to avoid whatever may give him any uneasiness or umbrage. With this view, he never fails to flatter him, to extol him above all the princes upon earth, and to throw a thick veil over every thing that might help to open his eyes, or discover to him the weakness of the state. He even takes particular care to keep the king in utter ignorance; to hide from him, or at least to soften, all unwelcome news; and, above all, to exalt immoderately every the least advantage he obtains over his enemies. As he takes these methods, which indeed are and must be taken, more or less, by the ministers of every despotic prince, to secure the favour and confidence of his master; so the inferior officers and governors of provinces are obliged to employ all the means in their power to secure the prime minister's, they depending no less upon him than he does upon the king.

There
PER

The Persians have a gradation of despotism and slavery, down from the prime minister to the lowest retainer to the court, or dependent on the government. Children are sometimes in Persia required by the king to cut off the ears and nose, and even to cut the throats of their parents; and these orders cannot be objected to, without endangering their own lives. Indeed their baseness and mercenary are such, that they will perpetrate such atrocious deeds without the least scruple or difficulty, when they have a promise or expectation of possessing their posts. The prime ministers, notwithstanding the precarious footing on which they stand, in effect of their abilities or good fortune, sometimes continue in their employments during life, or, if removed are only banished to some city, where they are allowed to spend the remainder of their days in a private station.

Next to the prime minister are the nadir, or grand-master of the household; the mehter, or groom of the chambers, who is always a white eunuch; the mirakbor bashe, or master of the horse; the mir-shikar bashe, or great huntsman and falconer; the divanbaghi, or chief justice, to whom there lies an appeal from the degnos, or the lieutenant of police, in every town; the vacka novice, or recorder of events, or first secretary of state; the musalau-she-elmenelek, or master of the accounts and finances of the kingdom; the numes humbashis, or the king's chief physicians; the shirkada-fishiba, or inspector of the palace, and regulator of rank at court; and the khan, or governor of provinces, under whom are other governors, called zulians, appointed also by the king.

Civil matters are all determined by the cazi, and ecclesiastical ones (particularly divorces) by the sheick-elsellem, or head of the faith; an officer answering to the multi among the Turks; under him are the sheick-elselom, and cadi, who decide in all matters of religion, and make all contracts, testaments, and other public deeds, being appointed by the king in all the principal towns; and next to these are the peshnas, or directors of the prayers; and the moullahs, or doctors of the law.

Justice is carried on in Persia in a very summary manner; the sentencer, whatever it may be, being always put into execution on the spot. Theft is generally punished with the loss of nose and ears; robbing on the road, by ripping up the belly of the criminal, in which situation he is exposed upon a gibbet in one of the most public parts of the city, and left there until he expires in torment.

There is no nobility in Persia, or any respect shown to a man on account of his family, except to those who are of the blood of their great prophet or patriarchs; but every man is esteemed according to the post he possesses; and when he is dismissed, he loses his honour, and he is no longer distinguished from the vulgar.

With respect to the forces of Persia, their two bodies, called the Korthies and Goulans, that serve on horseback, are well kept and paid, and may amount, the former to about 25,000, and the latter to about 15,000. The Korthies are descended from an ancient but foreign race; and the Goulans are either Georgian renegades or slaves, or the children of slaves of all nations. The infantry, called Tungchies, are picked out from among the most robust and vigorous of the peasants, and compose a body of 40,000 or 50,000. The Persians have few fortified towns, and had no ships of war, till Koli Khan built a royal navy, and among them had a man of war of 80 guns; but since the death of that warrior, we hear no more of their fleet.

The arms of the king of Persia are a lion couchant, looking at the sun as he rises over his back. His usual title is Shah or Pashtov, the "disposer of kingdoms." They add also to the king's titles those of sultan, and shan or chum, which is the title of the Tartar sovereigns. To acts of state the Persian monarch does not subscribe his name; but the grant runs in this manner: viz. This act, or edict, is given by him whom the universe obeys.

The ancient Persians are known to have been exceedingly voluptuous and effeminate. After the conquest of the empire by Alexander, the Greek discipline and martial spirit being in part communicated to them, they became much more formidable; and hence the Parthian were found to be a match not only for the Syro-Macedonian princes, but even for the Romans. Of their manners we know little or nothing, but that to their valor and military skill they joined in a surprising degree all the luxury and dissipation of the ancient Persians.

The modern Persians, like the Turks, plundering the adjacent nations for beauty to breed by, are men of a good stature, shape, and complexion; but the Gauls or ancient Persians, are bony, ill-shaped, and clumsy, with a rough skin, and olive complexions. In some provinces, not only the exemptions but the constitution of the inhabitants, suffer greatly by the extreme brachy and unwholesomeness of the air. The Persian women too, are generally handsome and well-shaped, but most inferior to those of Georgia and Circassia. The men wear large turbans on their heads, some of them very rich, interwoven with gold and silver; a vest, girt with a sash; and over it a loose garment, something shorter with sandals, or slippers, on their feet. When they ride, which they do every day, if it be but to a house in the same town, they wear pliant boots of yellow leather; the furniture of their horses is extremely rich, and the stirrups generally of silver: whether on horseback or on foot, they wear a broadsword and a dagger in their sash. The dress of the women does not differ much from that of the men; only their veils are longer, and they wear stiffened caps on their heads, and their hair down.

With respect to outward behaviour, says an intelligent traveller, "The Persians are certainly the Persians of the East. Whilst a rude and insolent demeanour peculiarly marks the character of the Turkish nation towards foreigners and Christians, the behaviour of the Persians would, on the contrary, do honour to the most civilized nations: they are kind, courteous, civil, and obliging, to all strangers, without being guided by those religious prejudices so very prevalent in every other Mahometan nation; they are fond of inquiring after the manners and customs of Europe, and in return very readily afford any information in respect to their own country. The practice of hospitality is with them so great a point, that a man thinks himself highly honoured if you will enter his house and partake of what the family affords; whereas, going out of a house without making a calcan, or taking any other refreshment, is deemed in Persia a high affront."

Their usual drink is water and sherbet, as in the Mahometan countries, wine being prohibited; but as in all Mahometan nations they pay the least regard to this prohibition. Many of them drink wine publicly, and do...
most all of them in private (excepting those who have performed the pilgrimage to Mecca, and ecclesiastics): they also are very liable to be quarrelling when inebriated, which is often attended with fatal consequences. They eat opium, and in much less quantities than the Turks; and indeed in every thing they say or do, eat or drink, they make a point to be as different from this nation as possible, whom they detest to a man, beyond measure; esteeming Jews and Christians superior to them, and much nearer to salvation.

Every one knows, that the religion of the Persians is Mahometan; and that they are of the sect of Ali, for whom they entertain the most extravagant veneration. Mr Franklinc heard one of his guides on the road prove another for the expression O God! O Ali! No (said his zealous companion), Ali first, God second! This attachment is the source of their hatred to the Turks, and of many strange customs among themselves, which we have not room to enumerate; a few, however, must be mentioned.

"Their mode of living is as follows: They always rise at daybreak, in order to perform their devotions. Their first prayer is denominated numas zohr, or the morning prayer; it is said before sunrise; after which they eat a slight meal called nausha, or breakfast; this consists of grapes, or any other fruits of the season, with a little bread and cheese made of goats' milk; they afterwards drink a cup of very strong coffee without milk or sugar; then the caleen or pipe is introduced. The Persians, from the highest to the lowest ranks, all smoke tobacco.

"Their second hour of prayer is called numas zuhr, or mid-day prayer, and is always repeated when the sun declines from the meridian. Their dinner, or chahart, which is soon after this prayer, consists of curds, bread, and fruits of various kinds; animal food not being usual at this meal.

"The third hour of prayer is called numas asr, or the afternoon prayer, said about four o'clock.

"The fourth hour of prayer is numas shahm, or evening prayer, which is said after sunset; when this is finished, the Persians eat their principal meal, called shahm or supper. This generally consists of a pilau, dressed with rich meat sauces, and highly seasoned with various spices; sometimes they eat kebab or roast meat. When the meal is ready, a servant brings notice thereof, and at the same time presents a ewer and water; they then wash their hands, which is an invariable custom with the Persians both before and after eating. They eat very quick, conveying their food to their mouths with their fingers; the use of knives and forks being unknown in Persia. Sherbets of different sorts are introduced, and the meal concludes with a desert of delusive fruits. The supper being finished, the family sit in a circle, and entertain each other by relating pleasant stories (of which they are excessively fond), and also by repeating passages from the works of their most favourite poets, and amusing themselves at various kinds of games. The fifth and last prayer is styled numas akhri, the last prayer; or sometimes numas shab, or the night prayer, repeated about an hour after supper."

The most remarkable law among the Persians respects remarriage. A man may divorce his wife when he chooses; a law respecting marriage, without assigning any other reason for the divorce than that it is his pleasure. If he should change his mind, he may again marry her, divorce her a second time, and a third time marry her; but here this privilege stops. No man is allowed to marry the woman whom he has thrice divorced. A widow is obliged to mourn four months for her deceased husband before she can be married to another; but a concubine may form a new connection the instant that her keeper expires.

At the naming of children in Persia, Mr Franklinc informs us that the following ceremony is observed: of naming a child. The third or fourth day after the child is born, the child's friends and relations of the woman who has lain in assemble at her house, attended by music and dancing girls hired for the occasion; after playing and dancing some time, a mullah or priest is introduced, who, taking the child in his arms, demands of the mother what name she chooses the infant should be called; being told, he begins praying, and after a short time applies his mouth close to the child's ear, and tells him distinctly three times (calling him by name) to remember and be obedient to his father and mother, to venerate his Koran and his prophet, to abstain from those things which are unlawful, and to practise those things which are good and virtuous. Having repeated the Mahometan profession of faith, he then redelivers the child to his mother; after which the company are entertained with sweetmeats and other refreshments, a part of which the females present always take care to carry away in their pockets, believing it to be the infallible means of their having offspring themselves.

The Persians excel more in poetry than any other sort of literature; and astrologers are now in as great reputation in Persia as the magi were formerly. Their books are all manuscripts, the art of printing having not yet been introduced among them: they excel indeed in writing, and have eight different hands. They write from the right hand to the left, as the Arabs do. In their short hand, they use the letters of the alphabet; and the same letters differently pointed, will have 20 different significations. In short, the Persians are born with as good natural parts as any people in the East, but make a bad use of them; being great dreamers, cheats, liars, and flatterers, and having a strong propensity to voluptuousness, luxury, idleness, and indolence; vices indeed to which the Asiatics in general are much addicted. See Persia, Supplement.
PER

Persica, or double-flowering dwarf-almond. These two
reach not above the height of three or four feet, though
their flowers are of equal beauty with the former.

Of the peach-trees cultivated for the sake of their fruit
there is a great number. They are raised from the stones
of the fruit, which should be planted in autumn on a
bed of light dry earth, about three inches deep and
four inches asunder. In the winter the beds should be
covered with mulch to protect them from the frost. In
this bed they should remain for a year; when they are
to be taken up and planted in a nursery, where they are
to remain one or two years; after which they must be
removed to the places where they are to continue.

PERSCARIA. See Polygonum, Botany Index.

PERCUCUS sinus, in Ancient Geography, (Mela,
Phily); a part of the sea which the Romans called
Mare Rubrum, and the Greeks Mare Erythraeum;
washing Arabia Felix on the east, between which and
Carmania, entering into the land, it washes Persia on
the south. Its large mouth consists of straight sides,
like a neck, and then the land retiring equally a vast
way, and the sea surrounding it in a large compass of
shore, there is exhibited the figure of a human head
(Mela). Theophratus calls this bay Sinus Arabicus, a
name it equally claims with Persicus, only for distinc-
tion sake Persicus is appropriated to it by others.

PERSIMON. See Diospyros, Botany Index.

From the persimon is made a very palatable liquor in
the following manner: As soon as the fruit is ripe, a suffi-
cient quantity is gathered, which is very easy, as each
tree is well stocked with them. These persimon apples
are put into a dough of wheat or other flour, formed into
cakes, and put into an oven, in which they continue
till they are quite baked and sufficiently dry, when they
are taken out again; then, in order to brew the liquor,
a pot full of water is put on the fire, and some of the
cakes are put in: these become soft by degrees as the
water grows warm, and crumble in pieces at last; the
pot is then taken from the fire, and the water in it well
stirred about, that the cakes may mix with it: this is
then poured into another vessel, and they continue to
steep and break as many cakes as are necessary for a
brewing: the malt is then infused, and they proceed as
usual with the brewing. Beer thus prepared is reckon-
ed much preferable to other beer. They likewise make
brandy of this fruit in the following manner: having
collected a sufficient quantity of persimons in autumn,
they are altogether put into a vessel, where they lie for
a week till they are quite soft: then they pour water on
them, and in that state they are left to ferment of them-

himselves, without promoting the fermentation by any stimu-
tation. The brandy is then made in the common way,
and is said to be very good, especially if grapes (in par-
ticular of the sweet sort), which are wild in the woods,
be mixed with the persimon fruit. Some persimons are
ripe at the end of September, but most of them later,
and some not before November and December, when the
cold first overcomes their acrimony. The wood of
this tree is very good for joiners instruments, such as
planes, handles to chisels, &c. but if after being cut
down it lies exposed to sunshine and rain, it is the first
wood which rots, and in a year's time there is nothing
left but what is useless. When the persimon trees get
once into a field, they are not easily got out of it again,
as they spread much.

PERSON, an individual substance of a rational in-
telligent nature. Thus we say, an ambassador represents
the person of his prince; and that, in law, the father
and son are reputed the same person.

The word person, persona, is thought to be borrowed
from per sonando, from personating or counterfeiting; and
is supposed to have first signified a mask: because, as
Boethius informs us, in larva concusa sonus volabant;
and hence the actors who appeared masked on the stage
were sometimes called larvati and sometimes personati.
He likewise says, that as the several actors represented
each a single individual person, viz. Oedipus, or Claudines,
or Medusa, or Medea; for this reason; other people, who were at the same time distinguished by something in their form, character, &c. whereby they might be known, came likewise to be called by the Latinus persona, and by the Greek, euripus. Again, as above, certain qualities, which in figure somewhat resembles the snout of an animal. The bulk of the genera of this natural order, are arranged under the class and order, didymus and anguispermum, of the Sexual Method.

The rest, although they cannot either into the artificial class just mentioned, nor, for want of the classical meaning of the term, in any other; as Cicero, Plato, and others, in which sense a drop of water, separated from the ocean, may be called an individual. Personality, in its true meaning, is an individual nature in each of these senses; logically, according to Boethius, because person is not spoken of universals, but only of singulars and individuals; we do not say the person of an animal or a man, but of Cicero and Plato: and physically, since Socrates' hand or foot are never considered as persons. This last kind of individual is denominated in two ways: positively, when the person is said to be the whole of the action; for whatever thing action is attributed to the philosophers, it is called a person: and negatively, as we are said, with the Thomists, &c. that a person consists in this: that it does not exist in another as a more perfect being. Thus a man, though he consists of two different things, viz. body and spirit, is not two persons; because neither part of itself is a complete principle of action, but one person, since the manner of his consisting of body and spirit is such as constitutes one whole principle of action; nor does he exist in any other as a more perfect being; as, for example, Socrates' foot does in Socrates, or a drop of water in the ocean.

PERSONAL, any thing that concerns, or is related to, the person: thus it is a maxim in ethics, that all faults are personal.

Personal action, in law, is an action levied directly and solely against the person, in opposition to a real or mixed action. See Action.

Personal good, or Chatel, in law, signifies any movable thing belonging to a person, whether alive or dead. See Chatel.

Personal identity. See Metaphysics, Part III. Chap. iii.

Personal verb, in grammar, a verb conjugated in all the three persons; thus called into position to an impersonal verb, or that which has the third person only.

Vest XI. Part I.

PERSONALITY, in the schools, is that which constitutes an individual a distinct person.

PERSONAL, is the name of the 49th order in

Littre's Fragment of a Natural Method, consisting of a number of plants whose flowers are furnished with an irregular growing or gnarled petal, which in figure

Y
Perspective is the art of drawing on a plane surface true resemblances or pictures of objects, as the objects themselves appear to the eye from any distance and situation, real or imaginary.

It was in the 16th century that Perspective was revived, or rather reinvented. It owes its birth to painting, and particularly to that branch of it which was employed in the decorations of the theatre, where landscapes were properly introduced, and which would have looked unnatural and horrid if the size of the objects had not been pretty nearly proportioned to their distance from the eye. We learn from Vitruvius, that Agatharchus, instructed by Eschylus, was the first who wrote upon this subject; and that afterwards the principles of the art were more distinctly taught by Democritus and Anaxagoras, the disciples of Agatharchus. Of the theory of this art, as described by them, we know nothing; since none of their writings have escaped the general wreck that was made of ancient literature in the dark ages of Europe. However, the revival of painting in Italy was accompanied with a revival of this art. The first person who attempted to lay down the rules of perspective was Pietro del Borgo, an Italian. He supposed objects to be placed beyond a transparent tablet, and endeavoured to trace the images which rays of light, emitted from them, would make upon it. But we do not know what success he had in this attempt, because the book which he wrote upon the subject is not now extant. It is, however, very much commendned by the famous Egnazio Dante; and, upon the principles of Borgo, Albert Durer constructed a machine, by which he could trace the perspective appearance of objects.

Balthazar Perussi studied the writings of Borgo, and endeavoured to make them more intelligible. To him we owe the discovery of points of distance, to which all lines that make an angle of 45 degrees with the ground-line are drawn. A little time after, Guido Ubaldi, another Italian, found that all the lines that are parallel...
parallel to one another, if they be inclined to the ground-line, converge to some point in the horizontal line; and that through this point also, a line drawn from the eye, parallel to them, will pass. These principles put together enabled him to make out a pretty complete theory of perspective.

Great improvements were made in the rules of perspective by subsequent geometrarians; particularly by Professor Gravesend, and still more by Dr. Brooke Taylor, whose principles are in a great measure new, and far more general than any before him.

In order to understand the principles of perspective, it will be proper to consider the plane on which the representation is to be made as transparent, and interposed between the eye of the spectator and the object to be represented. Thus, suppose a person at a window looks through an upright pane of glass at any object beyond it, and, keeping his head steady, draws the figure of the object upon the glass with a black lead pencil, as if the point of the pencil touched the object itself: he would then have a true representation of the object in perspective as it appears to his eye.

In order to this two things are necessary: first, that the glass be laid over with strong gum-water, which, when dry, will be fit for drawing upon, and will retain the traces of the pencil and, secondly, that he looks through a small hole in a thin plate of metal, fixed about a foot from the glass, between it and his eye, and that he keeps his eye close to the hole; otherwise he might shift the position of his head, and consequently make a false delineation of the object.

Having traced out the figure of the object, he may go over it again with pen and ink; and when that is dry, put a sheet of paper upon it, and trace it thereon with a pencil: then taking away the paper and laying it on a table, he may finish the picture by giving it the colours, lights, and shades, as he sees them in the object itself; and then he will have a true resemblance of the object.

To every person who has a general knowledge of the principles of optics, this must be self-evident: for as vision is occasioned by pencils of rays coming in straight lines to the eye from every point of the visible object, it is plain that, by joining the points in the transparent plane, through which all those pencils respectively pass, an exact representation must be formed of the object, as it appears to the eye in that particular position, and at that determined distance; and were pictures of things to be always first drawn on transparent planes, this simple operation, with the principle on which it is founded, would comprise the whole theory and practice of perspective. As this, however, is far from being the case, rules must be deduced from the sciences of optics and geometry for drawing representations of visible objects on opaque planes; and the application of these rules constitutes what is properly called the art of perspective.

Previous to our laying down the fundamental principles of this art, it may not be improper to observe, that when a person stands right against the middle of one end of a long avenue or walk, which is straight and equally broad throughout, the sides thereof seem to approach nearer and nearer to each other as they are fur-
7. The pictures of all vertical lines are vertical, and the pictures of horizontal lines are horizontal, because these lines are parallel to the perspective plane.

8. The point of sight $S$ is the vanishing point of all lines perpendicular to the perspective plane.

The above proposition is a sufficient foundation for the whole practice of perspective, whether on direct or inclined pictures, and serves to suggest all the various practical constructions, each of which has advantages which suit particular purposes. Writers on the subject have either confined themselves to one construction, from an affection of simplicity or fondness for system; or have multiplied precepts, by giving every construction for every example, in order to make a great book, and give the subject an appearance of importance and difficulty. An ingenious practitioner will avoid both extremes, and avail himself of the advantage of each construction as it happens to suit his purpose. We shall now proceed to the practical rules, which require no consideration of intersecting planes, and are all performed on the perspective plane by means of certain substitutions for the place of the eye and the original figure. The general substitution is as follows:

Let the plane of the paper be first supposed to be the ground-plan, and the spectator to stand at $F$ (fig. 3). Let it be proposed that the ground-plan is to be represented on a plane surface, standing perpendicularly on the line $GKL$ of the plan, and that the point $K$ is immediately opposite to the spectator, or that $FK$ is perpendicular to $GL$; then $FK$ is equal to the distance of the spectator's eye from the picture.

Now suppose a piece of paper laid on the plan with its straight edge lying on the line $GL$; draw on this paper $KS$ perpendicular to $GL$, and make it equal to the height of the eye above the ground plan. This may be much greater than the height of a man because the spectator may be standing on a place much raised above the ground plan. Observe also that $KS$ must be measured on the same scale on which the ground-plan and the distance $FK$ were measured. Then draw $HSO$ parallel to $GL$. This will be a horizontal line, and (when the picture is set upright on $GL$) will be on a level with the spectator's eye, and the point $S$ will be directly opposite to his eye. It is therefore called the principal point, or point of sight. The distance of his eye from this point will be equal to $FK$. Therefore make $SP$ (in the line $SK$) equal to $FK$, and $P$ is the projecting point or substitute for the place of the eye. It is sometimes convenient to place $B$ above $S$, sometimes to one side of it on the horizontal line, and in various other situations; and writers, ignorant of, or inattentive to, the principles of the theory, have given it different denominations, such as point of distance, point of view, &c. It is merely a substitute for the point $E$ in fig. 1, and its most natural situation is below, as in this figure.

The art of perspective is conveniently divided into {graphicography}, which teaches how to make a perspective draught of figures on a plane, commonly called the ground-plan; and {scenography}, which teaches how to draw solid figures, as such figures as are raised above this plan.

Fundamental Prob. I. To put into perspective any given point of the ground-plan.

First general construction.

From $B$ and $P$ (fig. 3) draw any two parallel lines $BA$, $BV$, cutting the ground-line and horizon-line in $A$ and $V$, and draw $BP$, $AV$, cutting each other in $b$; $b$ is the picture of $B$.

For it is evident that $BA$, $PV$, of this figure are analogous to $BA$ and $EV$ of fig. 1. and that $BA = BV = bA = bV$.

If $BA'$ be drawn perpendicular to $GL$, $PV$ will fall on $PS$, and need not be drawn. $AV$ will be $A'S$. This is the most easy construction, and nearly the same with Ferguson's.

Second general construction.

Draw two lines $BA$, $BA''$, and two lines $PV$, $PD$, parallel to them, and draw $AV$, $A'D$, cutting each other in $b$; $b$ is the picture of $P$ by Cor. 2a. This construction is the foundation of all the rules of perspective that are to be found in the books on this subject. They appear in a variety of forms, owing to the ignorance or inattention of the authors to the principles. The rule most generally adhered to is as follows:

Draw $BA$ (fig. 4.) perpendicular to the ground-line, and $AS$ to the point of sight, and set off $A\beta$ equal to $BA$. Set off $SD$ equal to the distance of the eye in the opposite direction from $S$ that $\beta$ is from $A$, where $B$ and $E$ of fig. 1. are on opposite sides of the picture; otherwise set them the same way. $D$ is called the point of distance. $\alpha \beta D$, cutting $AS$ in $\beta$. This is evidently equivalent to drawing $BA'$ and $PS$ perpendicular to the ground-line and horizon-line, and $BA'$ and $PD$ (fig. 3.) making an angle of $45^\circ$ with these lines, with the additional puzzle about the way of setting off $A\alpha''$ and $SD$, which is avoided in the construction here given.

This usual construction, however, by a perpendicular and the point of distance, is extremely simple and convenien; and two points of distance, one on each side of $S$, serve for all points of the ground plan. But the first general construction requires still fewer lines, if $BA$ be drawn perpendicular to $GL$, because $PV$ will then coincide with $PS$.

Third general construction.

Draw $BA$ (fig 4.) from the given point $B$ perpendicular to the ground-line, and $AS$ to the point of sight. From the point of distance $D$ set off $D\delta$ equal to $BA$, on the same or the contrary sides as $S$, according as $B$ is on the same or the contrary side of the picture as the eye. Join $d$, $A$, and draw $D\delta$ parallel to $dA$. $\delta$ is the picture of $B$. For $SD$, $D\delta$, are equal to the distances of the eye and given point from the picture, and $SD = \delta D = \delta A$.

This construction does not naturally arise from the original lines, but is a geometrical consequence from their position and magnitude; and it is of all others the most generally convenient, as the perpendicular distance of any number of points may be arranged along $SD$ without confusion, and their direct situations transferred to the ground-line by perpendiculars such as $BA$; and nothing
Perspective.

Prob. 2. To put any straight line BC (fig. 5) of the ground plan in perspective.

Find the pictures d, c, of its extreme points by any of the foregoing constructions, and join them by the straight line b c.

Perhaps the following construction will be found very generally convenient.

Produce CB till it meet the ground-line in A, and draw PV parallel to it; join AV, and draw PE, PC, cutting AV in b, c. V is its vanishing point, by Cor. 3. of the fundamental theorem.

It must be left to the experience and sagacity of the drawer to select such circumstances as are most suitable to the multiplicity of the figures to be drawn.

Prob. 3. To put any rectilinear figure of the ground plan in perspective.

Put the bounding lines in perspective, and the problem is solved.

The variety of constructions of this problem is very great, and it would fill a volume to give them all. The most generally convenient is to find the vanishing points of the bounding lines, and connect these with the points of their intersection with the ground line.

For example, to put the square ABCD (fig. 6) into perspective.

Draw from the projecting point PV, PW, parallel to AB, BC, and let AB, BC, CD, DA meet the ground-line, in a, a, b, b, and draw a V, a V, a W, a W, cutting each other in b c d, the picture of the square ABCD.

The demonstration is evident.

This construction, however, runs the figure to great distances on each side of the middle line, when any of the lines of the original figure are nearly parallel to the ground-line.

The following construction (fig. 7.) avoids this inconvenience.

Let D be the point of distance. Draw the perpendiculars a A, b B, c C, d D, and the lines a b, b c, c d, d a, parallel to PD. Draw s A, s B, s C, s D, and d e, e f, g D, D h, cutting the former in a, b, c, d, the angles of the picture.

It is not necessary that D be the point of distance, only the lines a b c d, &c. must be parallel to PD.

Remark. In all the foregoing constructions the necessary lines (and even the finished picture) are frequently confounded with the original figure. To avoid this great inconvenience, the writers on perspective direct us to transpose the figure; that is, to transfer it to the other side of the ground-line, by producing the perpendiculars a A, b B, c C, d D, till a A', b B', c C', &c. are respectively equal to a a, b b, c c, &c.; or, instead of the original figure, to use only its transposed substitute A'B'C'D'.

This is an extremely proper method. But in this case the point P must also be transposed to P' above B, in order to retain the first or most natural and simple construction, as in fig. 9, where it is evident, that when B A = A B', and S P = S P', and B P' is drawn, cutting A S in b, we have b A : : b S = B A : P S = B A : P S, and b is the picture of B, whence follows the truth of all the subsequent constructions with the transposed figure.

Prob. 4. To put any curvilinear figure on the ground plan into perspective.

Put a sufficient number of its points in perspective by the foregoing rules, and draw a curve line through them.

It is well known that the conic sections and some other curves, when viewed obliquely, are conic sections or curves of the same kind with the originals, with different positions and proportions of their principal lines, and rules may be given for describing their pictures founded on this property. But these rules are very various, unconnected with the general theory of perspective, and more tedious in the execution, without being more accurate than the general rule now given. It would be a useless affectation to insert them in this elementary treatise.

We come in the next place to the delineation of figures not in a horizontal plane, and of solid figures. For this purpose it is necessary to demonstrate the following.

Theorem II.

The length of any vertical line standing on the ground plane is to that of its picture, as the height of the eye to the distance of the horizon line from the picture of its foot.

Let BC (fig. 3) be the vertical line standing on B, fig. 1, and let EF be a vertical line through the eye. Make BD equal to EF, and draw DE, CE, BE. It is evident that DE will cut the horizon line in some point d, CE will cut the picture plane in c, and BE will cut it in b, and that b c will be the picture of BC, and is vertical, and that BC is to b c as BD to b d, or as EF to b d.

Cor. The picture of a vertical line is divided in the same ratio as the line itself. For BC : BM = b c : b m.

Prob. 5. To put a vertical line of a given length in perspective standing on a given point of the picture.

Through the given point b (fig. 9) of the picture, fig. 3, draw S b A from the point of sight, and draw the vertical line AD, and make AE equal to the length of height of the given line. Join EB, and draw b s parallel to AD, producing s e, when necessary, till it cut the horizontal line in d, and we have b c : : b d : : AE : AD, that is, as the length of the given line to the height of the eye, and b d is the distance of the horizon-line, from the point b, which is the picture of the foot of the line. Therefore (Theor. 2.) b c is the required picture of the vertical line.

This problem occurs frequently in views of architecture; and a comprehensive method of solving it would be particularly convenient. For this purpose, draw a vertical line XZ at the margin of the picture, or on a separate paper, and through any point V of the horizon-line draw VX. Set off XY, the height of the vertical line, and draw VY. Then from any points b, r, on which it is required to lay the pictures of lines equal to XY, draw b s, r l, parallel to the horizontal line, and draw the vertical...
PROB. 6. To put any sloping line in perspective.

From the extremities of this line, suppose perpendiculars meeting the ground plane in two points, which we shall call the base points of the sloping line. Put these base points in perspective, and draw, by last problem, the perpendiculars from the extremities. Join these by a straight line. It will be the picture required.

PROB. 7. To put a square in perspective, as seen by a person not standing right against the middle of either of its sides, but rather nearly even with one of its corners.

In fig. 10. let ABCD be a true square, viewed by an observer, not standing at $a$, directly against the middle of its sides $AD$, but at $O$ almost even with its corner $D$, and viewing the side $AD$ under the angle $AOD$; the angle $AOD$ (under which he would have seen $AD$ from $o$) being 60 degrees.

Make $AD$ in fig. 11. equal to $AD$ in fig. 10. and draw $SP$ and $Oo$ parallel to $AD$. Then, in fig. 11., let $O$ be the place of the observer's eye, and $SO$ be perpendicular to $SP$; then $S$ shall be the point of sight in the horizon $SP$.

Take $SO$ in your compasses, and set that extent from $S$ to $P$; then $P$ shall be the true point of distance, taken according to the foregoing rules.

From $A$ and $D$ draw the straight lines $AS$ and $DS$; draw also the straight line $AP$, intersecting $DC$.

Lastly, through the point of intersection $C$ draw $BC$ parallel to $AD$; and $ABCD$ in fig. 11. will be a true perspective representation of the square $ABCD$ in fig. 10. The point $M$ is the centre of each square, and $AMC$ and $BMD$ are diagonals.

PROB. 8. To put a reticulated square in perspective, as seen by a person standing opposite to the middle of one of its sides.

A reticulated square is one that is divided into several little squares, like net-work, as fig. 12. each side of which is divided into four equal parts, and the whole surface into four times four (or 16) equal squares.

Having divided this square into the given number of lesser squares, draw the two diagonals $AXC$ and $BXD$.

Make $AD$ in fig. 13. equal to $AD$ in fig. 12. and divide it into four equal parts, as $A, e, g, i, s$, and $iD$.

Draw $SP$ for the horizon, parallel to $AD$, and, through the middle point $e$ of $AD$, draw $OS$ perpendicular to $AD$ and $SP$.—Make $S$ the point of sight, and $O$ the place of the observer's eye.

Take $SP$ equal to $SO$, and $P$ shall be the true point of distance.—Draw $AS$ and $DS$ to the point of sight, and $AP$ to the point of distance, intersecting $DS$ in $C$; then draw $BC$ parallel to $AD$, and the outlines of the reticulated square $ABCD$ will be finished.

From the division points $e, g, s, i$, draw the straight lines $ef, gh, si, ik$, tending towards the point of sight $S$; and draw $BD$ for one of the diagonals of the square, the other diagonal $AC$ being already drawn.

Through the points $r$ and $s$, where these diagonals cut $ef$ and $ik$, draw $l$ parallel to $AD$. Through the centre-point $x$, where the diagonals cut $gk$, draw $s$ parallel to $AD$.—Lastly, through the points $v$ and $w$, where the diagonals cut $ef$ and $ik$, draw $pq$ parallel to $AD$; and the reticulated perspective square will be finished.

This square is truly represented, as if seen by an observer standing at $O$, and having his eye above the horizontal plane $ABCD$ on which it is drawn; as if $OS$ was the height of his eye above that plane: and the lines which form the small squares within it have the same letters of reference with those in fig. 12, which is drawn as it would appear to an eye placed perpendicularly above its centre $x$.

PROB. 9. To put a circle in perspective.

If a circle be viewed by an eye placed directly over its centre, it appears perfectly round, but if it be obliquely viewed, it appears of an elliptical shape. This is plain by looking at a common wine-glass set upright on a table.

Make a true reticulated square, as fig. 12. of the same diameter as you would have the circle; and setting one foot of the compasses in the centre $x$, describe as large a circle as the sides of the square will contain. Then, having put this reticulated square into perspective, as in fig. 13., observe through what points of the cross lines and diagonals of fig. 12. the circle passes; and through those points in fig. 13. draw the ellipses, which will be as true a perspective representation of the circle, as the square in fig. 13. is of the square in fig. 12.

This is Mr. Ferguson's rule for putting a circle in perspective; but the following rules by Woll are perhaps more universal.

If the circle to be put in perspective be small, describe a square about it. Draw first the diagonals of the square, and then the diameters $a$ and $c$ (fig. 14.) cutting one another at right angles; draw the straight lines $fg$ and $bc$ parallel to the diameter $de$. Through $b$ and $f$ and likewise $c$ and $g$, draw straight lines meeting $DE$, the ground line of the picture in the points $3$ and $4$. To the principal point $V$ draw the straight lines $1, V, 3, V, 4, V$, and $2, T$, and to the points of distance $L$ and $K$, $2, L$ and $1, K$. Lastly, join the points of intersection, $a, b, c, f, g, h, i, c, c$, by the area $a, b, d, f, a, b, d, f$, and $a, b, d, f$, $g, e, c, a$ will be the circle in perspective.

If the circle be large as to make the foregoing practice inconvenient, bisect the ground line $AB$, describing, from the point of bisect as a centre, the semicircle $AG$ (fig. 15.), and from any number of points in the circumference $C, F, G, H, I, &c.$ draw to the ground line the perpendiculars $C, F, A, G, H, I, &c.$ From the points $A, 1, 2, 3, 4, 5, 6$, draw straight lines to the principal point or point of sight $V$, likewise straight lines from $B$ and $A$ to the points of distance $L$ and $K$. Through the common intersections draw straight lines as in the preceding case; and you will have the points $a, c, f, g, a, b, i, b$, representatives of $A, C, F, G, H, I, B$. Then join the points $a, c, f, &c.,$ as formerly directed, and you have the perspective circle $a, c, f, g, h, i, b, h, g, f, c, a$.

Hence
Hence it is apparent how we may put not only a circle but also a pavement laid with stones of any form in perspective. It is likewise apparent how useful the square is in perspective; for, as in the second case, a true square was described round the circle to be put in perspective, and divided into several smaller squares, so in this third case we make use of the semicircle only for the sake of brevity instead of that square and circle.

**PROB. 10. To put a reticulated square in perspective as seen by a person not standing right against the middle of either of its sides, but rather nearly even with one of its corners.**

In fig. 16. let O be the place of an observer, viewing the square ABCD almost even with its corner D. Draw at pleasure SP for the horizon, parallel to AD, and make SO perpendicular to SP: then S shall be the point of sight, and P the true point of distance, if SP be made equal to SO.

Draw AS and DS to the point of sight, and AP to the point of distance, intersecting DS in the point C; then draw BC parallel to AD, and the outlines of the perspective square will be finished. This done, draw the lines which form the lesser squares, as taught in Prob. 8, and the work will be completed.—You may put a perspective circle in this square by the same rule as it was done in fig. 15.

**PROB. 14. To put a cube in perspective, as if viewed by a person standing almost even with one of its edges, and seeing three of its sides.**

In fig. 17. let AB be the breadth of either of the six equal square sides of the cube AG; O the place of the observer, almost even with the edge CD of the cube, S the point of sight, SP the horizon parallel to AD, and P the point of distance taken as before.

Make ABCD a true square; draw BS and CS to the point of sight, and BP to the point of distance, intersecting CS in C. Then draw FG parallel to BC, and the uppermost perspective square side BFGC of the cube will be finished.

Draw DS to the point of sight, and AP to the point of distance, intersecting DS in the point I: then draw GI parallel to CD; and, if the cube be an opaque one, as of wood or metal, all the outlines of it will be finished; and then it may be shaded as in the figure.

But if you want a perspective view of a transparent glass cube, all the sides of which will be seen, draw AH toward the point of sight, FH parallel to EA, and EH parallel to AD: then AHFD will be the square base of the cube, perspectively parallel to the top BFGC; ABFH will be the square side of the cube, parallel to CGID, and FGHI will be the square side parallel to ABCD.

As to the shading part of the work, it is much more children's play, in comparison of drawing the lines which form the shape of any object, that no rules need be given for it. Let a person sit with his left side toward a window, and he knows full well, that if any solid body be placed on a table before him, the light will fall on the left-hand side of the body, and the right-hand side will be in the shade.

**PROB. 15. To put any solid in perspective.**

Put the base of the solid, whatever it be, in perspective by the preceding rules. From each bounding point of the base, raise lines representing in perspective the altitude of the object; by joining these lines and shading the figure according to the directions in the preceding problem, you will have a scenographic representation of the object. This rule is general; but as its application to particular cases may not be apparent, it will be proper to give the following examples of it.

**PROB. 16. To put a cube in perspective as seen from one of its angles.**

Since the base of a cube standing on a geometrical plane, and seen from one of its angles, is a square seen from one of its angles, draw first such a perspective square; then raise from any point of the ground-line DE (fig. 18.) the perpendicular HI equal to the side of fig. 18. the square, and draw to any point V in the horizontal line HR the straight lines VI and VH. From the angles a, b, and c, draw the dotted lines a 2 and c 2 parallel to the ground line DE. Perpendicular to those dotted lines, and from the points 1 and 2, draw the straight lines L 1 and M 2. Lastly, since HI is the altitude of the intended cube in a, L 1 in c and b, M 2 in d, draw from the point a the straight line f a perpendicular to aE, and from the points b and c, b g and c e, perpendicular to b e 1, and a b d e being according to rule, make a f = HI, b g = c e = L 1, and a d = M 2. Then, if the points g, h, e, f, be joined, the whole cube will be in perspective.

**PROB. 17. To put a square pyramid in perspective, as standing upright on its base, and viewed obliquely.**

In fig. 19. let AD be the breadth of either of the fig. 10. four sides of the pyramid ATCD at its base ABCD; and MT its perpendicular height. Let O be the place of the observer, S his point of sight, SE his horizon, parallel to AD and perpendicular to OS; and let the proper point of distance be taken in SE produced toward the left hand, as far from S as O is from S.

Draw AS and DS to the point of sight, and DL to the point of distance, intersecting AS in the point B. Then, from B, draw BC parallel to AD; and ABCD shall be the perspective square base of the pyramid.

Draw the diagonal AC, intersecting the other diagonal BD at M, and this point of intersection shall be the centre of the square base.

Draw MT perpendicular to AD, and of a length equal to the intended height of the pyramid; then draw the straight outlines AT, CT, and DT; and the outlines of the pyramid (as viewed from O) will be finished; which being done, the whole may be so shaded as to give it the appearance of a solid body.

If the observer had stood at o, he could have only seen the side ATD of the pyramid; and two is the greatest number of sides that he could see from any other place of the ground. But if he were at any height above the pyramid, and had his eye directly over its top, it would then appear as in fig. 20. and he would see all its four sides E, F, G, H, with its top t, just over the centre of its square base ABCD; which would.
would be a true geometrical and not a perspective square.

**Prob. 18. To put two equal squares in perspective, one of which shall be directly over the other, at any given distance from it, and both of them parallel to the plane of the horizon.**

In fig. 21., let ABCD be a perspective square on a horizontal plane, drawn according to the foregoing rules, S being the point of sight, SP the horizon (parallel to AD), and P the point of distance.

Suppose AD, the breadth of this square to be three feet; and that it is required to place just such another square EFGH directly above it, parallel to it and two feet from it.

Make AF and DH perpendicular to AD, and two thirds of its length: draw EH, which will be equal and parallel to AD; then draw ES and HS to the point of sight S, and K and L to the point of distance P, intersecting HS in the point G: this done, draw FG parallel to EH; and you will have two perspective squares ABCD and EFGH, equal and parallel to one another, the latter directly above the former, and two feet distant from it; as was required.

By this method shelves may be drawn parallel to one another, at any distance from each other in proportion to their lengths.

**Prob. 19. To put a truncated pyramid in perspective.**

Let the pyramid to be put in perspective be quintangular. If, from each angle of the square whence the top is cut off, a perpendicular be supposed to fall upon the base, these perpendiculars will mark the bounding-points of a pentagon, of which the sides will be parallel to the sides of the base of the pyramid, within which it is inscribed. Join these points, and the interior pentagon will be formed with its longest side parallel to the longest side of the base of the pyramid.

From the ground line EH (fig. 22.) raise the perpendiculars AM, and make it equal to the altitude of the intended pyramid. To any point V draw the straight lines LV and LV, and by a process similar to that in Prob. 16., determine the scenographical altitudes a, b, c, d, e. Connect the upper points f, g, h, i, k, by straight lines, and draw k I, m n, g n, and the perspective of the truncated pyramid will be completed.

Con. If in a geometrical plane two concentric circles be described, a truncated cone may be put in perspective in the same manner as a truncated pyramid.

**Prob. 20. To put in perspective a hollow prism lying on one of its sides.**

Let ABCDE (fig. 23.) be a section of such a prism. Draw HI parallel to AB, and distant from it the breadth of the side on which the prism rests; and from each angle internal and external of the prism let fall perpendiculars to HI. The parallellogram will be thus divided by the scenographical process below the ground-line, so that the side AB of the real prism will be parallel to the corresponding side of the scenographical view of it. To determine the altitude of the internal and external angles. From H (fig. 24.) raise HI perpendicular to the ground-line, and on it make all the transeptides H 1, H 2, H 3, H 4, and H 5. Then if from any point V in the horizon be drawn the straight lines VH, V 1, V 2, V 3, V 4, V 5 or V 6; by a process similar to that of the preceding problem, will be determined the height of the internal angles, viz. r = a; 22 b, 4 = c d j; and of the external angles, 22 e c, and in z e; and when these angles are formed and put in their proper places, the scenograph of the prism is complete.

**Prob. 21. To put a square table in perspective, standing on four upright square legs of any given lengths with respect to the breadth of the table.**

In fig. 21. let ABCD be the square part of the floor of the table, on which the table is to stand, and EFGH the surface of the square table, parallel to the floor.

Suppose the table to be three feet in breadth, and its height from the floor to be two feet; then two thirds of AD or EH will be the length of the legs i and k; the other two (l and m) being of the same length in perspective.

Having drawn the two equal and parallel squares ABCD and EFGH, as shown in Prob. 18., let the legs be square in form, and fixed into the table at a distance from its edges equal to their thickness. Take A a and D d equal to the intended thickness of the legs, and a b and d c also equal thereto. Draw the diagonals AC and BD, and draw straight lines from the points a, b, c, d, towards the point of sight S, and terminating at the side BC. Then, through the points where these lines cut the diagonals, draw the straight lines n o, a, p and q, parallel to AD; and you will have formed four perspective squares (like ABCD in fig. 19.) for the bases of the four legs of the table: and then it is easy to draw the four upright legs by parallel lines, all perpendicular to AD; and to shade them as in the figure.

To represent the intended thickness of the table-board, draw c k parallel to EH, and HG toward the point of sight S; then shade the spaces between these lines, and the perspective figure of the table will be finished.

**Prob. 22. To put five square pyramids in perspective, standing upright on a square pavement composed of the surfaces of 81 cubes.**

In fig. 23. let ABCD be a perspective square drawn in according to the foregoing rules, S the point of sight, P the point of distance in the horizon PS, and AC and BD the two diagonals of the square.

Divide the side AD into 9 equal parts (because 9 times 9 is 81) as A a, a b, b c, &c. and from these points of division, a, b, c, &c. draw lines toward the point of sight S, terminating at the furthermost side BC of the square. Then, through the points where these lines cut the diagonals, draw straight lines parallel to AD, and the perspective square ABCD will be subdivided into 81 lesser squares, representing the upper surfaces of 81 cubes, laid close one to another’s sides in a square form.

Draw AK and DL, each equal to A a, and perpendicular to AD; and draw LN toward the point of sight S; then draw KL parallel to AD, and its distance from AD will be equal to A a. This done, draw a e, e m, m a, d b, b c, c f, f a, a e, and a a, all parallel to AK; and the space A D L K will be subdivided into
PERSPECTIVE.

HK parallel to AD, and you will have the second perspective square GHKL of the parallelogram.—Go on in this manner till you have drawn as many perspective squares up toward S as you please.

Through the point c, where DG intersect g S, draw b f parallel to AD; and you will have formed the two perspective square bases A b c d and c f D g of the two pyramids at A and D.

From the point f (the upper outward corner of c f D g) draw f h toward the point of distance, till it meets AS in h; then, from this point of meeting, draw h m parallel to GI, and you will have formed the two perspective squares G a i k and i m I n, for the square bases of the two pyramids at G and I.

Proceed in the same manner to find the bases of all the other pyramids, at the corners of the rest of the perspective squares in the parallelogram ABCD, as shown by the figure.—Then,

Having placed the first two pyramids at A and D upright on their square bases, as shown in Prob. 9, and made them of any equal heights at pleasure, draw ES and FS from the tops of these pyramids to the point of sight S; place all the rest of the pyramids upright on their respective bases, making their tops touch the straight lines ES and FS; and all the work, except the shading part, will be finished.

PROB. 24. To put a square pyramid of equal sized cubes in perspective.

Fig. 27. represents a pyramid of this kind; consist- Fig. 27. ing as it were of square tables of cubes, one table above another; 81 in the lowest, 49 in the next, 25 in the third, 9 in the fourth, and 1 in the fifth or uppermost. These are the square numbers of 9, 7, 5, 3, and 1.

If the artist is already master of all the preceding operations, he will find less difficulty in this than in attending to the following description of it: for it cannot be described in a few words, but must be executed in a very short time.

In fig. 28. having drawn PS for the horizon, and taken S for the point of sight therein (the observer being at O) draw AD parallel to PS for the side (next the eye) of the first or lowermost table of cubes. Draw AS and DS to the point of sight S, and DP to the point of distance P, intersecting AS in the point B. Then, from B, draw BC parallel to AD, and you will have the surface ABCD of the first table.

Divide AD into nine equal parts, as A a, a b, b c, c d, &c. then make AK and DL equal to A a, and perpendicular to AD. Draw KL parallel to AD, and from the points of equal division at a, b, c, &c. draw lines to KL, all parallel to AK. Then draw h S to the point of sight S, and from the division points a, b, c, &c. draw lines with a black lead pencil, all tending towards the point of sight, till they meet the diagonal BD of the square.

From these points of meeting draw black lead lines to DC, all parallel to AD; then draw the parts of these lines with black ink which are marked 1, 2, 3, 4, &c. between h E and DC.

Having drawn the first of these lines & g with black ink, draw the parts a i, b k, c l, &c. (of the former lines which met the diagonal BD) with black ink also; and rub out the rest of the black lead lines, which
would otherwise confuse the following part of the work. Then, draw LF towards the point of sight S; and, from the points where the lines 1, 2, 3, 4, &c. meet the line DC, draw lines down to LF, all parallel to DL; and all the visible lines between the cubes in the first table will be finished.

Make \( i G \) equal and perpendicular to \( i i \), and \( q M \) equal and parallel to \( i G \); then draw GM, which will be equal and parallel to \( i q \). From the points \( k, l, m, n, \&c. \), draw \( k, n, l o, m p, \&c. \) all parallel to \( i G \), and the outsides of the seven cubes in the side \( G q \) of the second table will be finished.

Draw GS and MS to the point of sight S, and MP to the point of distance P, intersecting GS in H; then, from the point of intersection H, draw HI parallel to AD; and you will have the surface GHIM of the second table of cubes.

From the points \( n, o, p, q, \&c. \) draw black lead lines toward the point of sight S, till they meet the diagonal MH of the perspective square surface GHIM; and draw SM, with black ink, toward the point of sight.

From those points where the lines drawn from \( n, o, p, q, \&c. \) meet the diagonal MH, draw black lead lines to MI, all parallel to AD; only draw the whole first line \( y t \) with black ink, and the parts 2, 3, 4, &c. and \( u t, v u, p v, \&c. \) of the other lines between \( y N \) and MI, and GM and \( y t \), with the same; and rub out all the rest of the black lead lines, to avoid further confusion. Then, from the points where the short lines 1, 2, 3, &c. meet the line MI, draw lines down to \( q E \), all parallel to \( M q \), and the outer surfaces of the seven cubes in the side \( M E \) will be finished; and all these last lines will meet the former parallels 2, 3, 4, &c. in the line \( q E \).

Make \( i O \) equal and perpendicular to \( y t \), and \( y P \) equal and parallel to \( i O \); then draw OP, which will be equal and parallel to \( y t \).—This done, draw OS and PS to the point of sight S, and PP to the point of distance P in the horizon. Lastly, from the point Q, where PP intersects OS, draw QR parallel to OP; and you will have the outlines OQRP of the surface of the third perspective table of cubes.

From the points \( u, v, w, x, \) draw upright lines to OP, all parallel to \( i O \), and you will have the outer surfaces of the five cubes in the side \( O Y \) of this third table.

From the points where these upright lines meet OP, draw lines toward the point of sight S, till they meet the diagonal PQ; and from these points of meeting draw lines to PR, all parallel to OP, making the parts 2, 3, 4, 5, of these lines with black ink which lie between \( ZY \) and PR. Then, from the points where these lines meet PR, draw lines down to \( y N \); which will bound the outer surfaces of the five cubes in the side PN of the third table.

Draw the line \( Z \) with black ink; and, at a fourth part of its length between \( Z \) and \( Z \), draw an upright line to \( S \), equal in length to that fourth part, and another equal and parallel thereto from \( Z \) to \( V \); then draw SV parallel to \( Z \) Z, and draw the two upright and equidistant lines between \( Z \) Z and SV, and you will have the outer surfaces of the three cubes in the side \( Z \) S of the fourth table.

Draw SS and VS to the point of sight S in the horizon, and VP to the point of distance therein, intersecting SS in T; then draw TU parallel to SV, and you have STUV, the surface of the fourth table, which being reticulated or divided into 9 perspective small squares, and the uppermost cube \( W \) placed on the middlemost of the squares, all the outlines will be finished; and when the whole is properly shaded, as in fig. 27, the work will be done.

**PROB. 25. To represent a double cross in perspective.**

In fig. 29, let ABCD and EFGH be the two per-spective squares, equal and parallel to one another, the uppermost directly above the lowermost, drawn by the rules already laid down, and as far asunder as is equal to the given height of the upright part of the cross; \( S \) being the point of sight, and \( P \) the point of distance, in the horizon PS taken parallel to AD.

Draw AE, DH, and CG; then AEHD and DHGC shall be the two visible sides of the upright part of the cross; of which, the length \( AE \) is here made equal to three times the breadth \( EH \).

Divide DII into three equal parts, HI, I, K, and LD. Through these points of division, at I and K, draw MO and PR parallel to AD; and make the parts \( MN, IO, P Q, K R \), each equal to HI: then draw MP and OR parallel to DH.

From M and O, draw MS and OS to the point of sight \( S \); and from the point of distance \( P \) draw PN cutting MS in T: from T draw TU parallel to MO, and meeting OS in U; and you will have the uppermost surface MTUO of one of the cross pieces of the figure.—From B, draw BS to the point of sight \( S \); and from U draw UV parallel to OR; and OUVR shall be the perspective square end next the eye of that cross part.

Draw PMX (as long as you please) from the point of distance \( P \), through the corner \( M \); lay a ruler to \( N \) and \( S \), and draw \( XN \) from the line PX:—then lay the ruler to \( I \) and \( S \), and draw YZS.—Draw XY parallel to MO; and make \( XW \) and \( YB \) equal and perpendicular to \( XY \); then draw WB parallel to XY, and WXYB shall be the square visible end of the other cross part of the figure.

Draw BK toward the point of sight \( S \); and from \( U \) draw UP to the point of distance \( P \), intersecting \( YS \) in \( Z \); then, from the intersection \( Z \), draw \( Z \) C parallel to MO, and \( Z \) E parallel to HD, and the whole delineation will be finished.

This done, shade the whole, as in fig. 3c. and you will have a true perspective representation of a double cross.

**PROB. 26. To put three rows of upright square objects in perspective, equal in size, and at equal distances from each other, on an oblong square plane, the breadth of which shall be of any assigned proportion to the length thereof.**

**Fig. 31.** is a perspective representation of an oblong square plane, three times as long as it is broad, having a row of nine upright square objects on each side, and one of the same number in the middle; all equally high, and at equal distances from one another, both long-wise and cross-wise, on the same plane.

In fig. 32, PS is the horizon, \( S \) the point of sight, \( P \) Fig. 32_ the
the point of distance, and AD (parallel to PS) the breadth of the plane.

Draw AS, NS, and DS, to the point of sight S; the point N being in the middle of the line AD; and draw DF to the point of distance F', intersecting AS in the point B; then, from B draw BC parallel to AD, and you have the perspective square ABCD.

Through the point i, where DB intersects NS, draw a line parallel to AD; and you will have subdivided the perspective square ABCD into four lesser squares, as A to N, N to D, a B to i, and i C to E.

From the point C (at the top of the perspective square ABCD) draw CP to the point of distance P, intersecting AS in E; then from the point E draw EF parallel to AD; and you will have the second perspective square BEFC.

Through the point f, where CE intersects NS, draw a line parallel to AD; and you will have subdivided the square BEFC into the four squares B to k, k to f to C, b F to m, and m to f.

From the point F (at the top of the perspective square BEFC) draw FP to the point of distance P, intersecting AS in I; then from the point I draw IR parallel to AD, and you will have the third perspective square EIKF.

Through the point n, where EK intersects NS, draw a line parallel to AD; and you will have subdivided the square EIKF further into four lesser squares, E to m, m to g, f, e I to n, and n to K.

From the point K (at the top of the third perspective square EIKF) draw KP to the point of distance P, intersecting AS in L; then from the point L draw LM parallel to AD, and you will have the fourth perspective square ILMK.

Through the point p, where KL intersects NS, draw a line parallel to AD; and you will have subdivided the square ILMK into the four lesser squares I to d, d to p, p to h, d L to q, and q to M.

Thus we have formed an upright square ALMD, whose perspective length is equal to four times its breadth, and it consists of 16 equal perspective squares. If greater length was still wanted, we might proceed further on toward S.

Take A to 3, equal to the intended breadth of the side of the upright square object AQ (all the other sides being of the same breadth), and AO for the intended height. Draw O to 18 parallel to AD, and make D 8 and 47 equal to A to 3, then draw 3 to S, 4 to S, 7 to S, and 8 to the point of sight S; and among them we shall have the perspective squares of all the 27 upright objects on the plane.

Through the point g, where DB intersects 8 S, draw a line parallel to AD, and you have the three perspective squares A to 3, 4 to 6, 7, 8 to 10, D of the three upright square objects to A, N, and D.

Through the point 21, where a b intersects 8 S, draw a line 14 to 11 parallel to AD; and you will have the perspective squares, a to 15, 16, 17, 18, 19, 20, and 21 to 22, for the bases of the second cross row of objects; namely, the next beyond the first three at A, N, and D.

Through the point w, where C E intersects 8 S, draw a line parallel to BC; and you will have three perspective squares, at B, K, and C, for the base of the third row of objects; one of which is set up at B.

Through the point x, where f c intersects 8 S, draw a line parallel to b f; and you will have three perspective squares, at b, l, and x, for the bases of the fourth cross row of objects.

Go on in this manner, as you see in the figure, to find the rest of the square bases up to LM; and you will have 27 upon the whole oblong square plane, on which you are to place the like number of objects, as in fig. 31.

Having assumed AO for the perspective height of the three objects at A, N, and D (fig. 32) next the observer's eye, and drawn O 18 parallel to AD, in order to make the objects at N and D of the same height as that at O; and having drawn the upright lines 4 15, 7 W, 8 X, and D 22, for the heights at N and D; draw OS and RS, 15 S and WS, XS and 22 S, all to the point of sight S; and these lines will determine the perspectively equal heights of all the rest of the upright objects, as shown by the two placed at a and B.

To draw the square tops of these objects, equal and parallel to their bases, we only need give one example, which will serve for all.

Draw 3 R and 2 Q parallel to AO, and up to the line RS; then draw PQ parallel to OB, and OPQR shall be the top of the object at A, equal and parallel to its square base A 2 3. In the same easy way the tops of all the other objects are formed.

When all the rest of the objects are delineated, shade them properly, and the whole perspective scheme will have the appearance of fig. 31.

**Prob. 27. To place a square box in perspective, containing a given number of lesser square boxes of a depth equal to their width.**

Let the given number of little square boxes or cells be 16, then 4 of them make the length of each side of the four outer sides a b, b c, c d, d a, as in fig. 33, and the depth a f is equal to the width a c. Whoever can draw the reticulated square, by the rules laid down towards the beginning of this article, will be at no loss about putting this perspective scheme in practice.

**Prob. 28. To put stairs with equal and parallel steps in perspective.**

In fig. 34, let a b be the given breadth of each step, and a i the height thereof. Make b c, c d, d e, &c., each equal to a b; and draw all the upright lines a i, b i, c n, d p, &c., perpendicular to a h (to which the horizon s S is parallel); and from the points i, l, n, p, r, &c., draw the equidistant lines i B, l C, n D, &c., parallel to a h; these distances being equal to that of f B from a h.

Draw x i touching all the corner-points i, n, p, r, s, and draw a 16 parallel to x i, as far from it as you want the length of the steps to be.

Towards the point of sight S draw the lines a 1, i 2, k 3, l 4, &c., and draw 16 15, 14 13, 12 11, to 9 8 7, 6 5, 4, 3, and 2, all parallel to a h, and meeting the lines w 15, u 13, s 11, &c., in the points w 15, i 13, s, &c. In the points w 15, 13, 11, 9, 7, 5, 3, and 1, then from these points draw 15 14, 13 12, 11 10, 9 8, 7 6, 5 4, and 3 2, all parallel to a h; and the outlines of the steps will be finished. From the point 16 draw 16 A parallel to a a, and A x 16 will be the top of the uppermost step.

Z 2
Fig. 35. This done, shade the work as in fig. 35. and the whole will be finished.

PROB. 29. To put stairs with flats and opening in perspective, standing on a horizontal pavement of squares.

In fig. 36, having made S the point of sight, and drawn a rectangled pavement AB with black lead lines, which may be rubbed out again; at any distance from the side AB of the pavement which is nearest to the eye, and at any point where you choose to begin the stair at that distance, as a, draw Ga parallel to BA, and take a b at pleasure for the height of each step.

Take a b in your compasses, and set that extent as many times upward from F to E as is equal to the first required number of steps O, N, M, L, K; and from these points of division in EF draw 1 b, 2 d, 3 f, 4 h, and E k, all equidistant from one another, and parallel to F a; then draw the equidistant upright lines a b, b d, d f, f h, h e, e k, and I m, all perpendicular to F a; then draw m b, touching the outer corners of these steps at m, k, d, f, a, b; and draw n s parallel to m b, as far from it as you want the length of the steps K, L, M, N, O to be.

Towards the point of sight S draw m n, 1/5, k o, i 6, h p, q, d r, and b s. Then parallel to the bottom line BA through the points o, p, q, r, s, draw n 8; 5, 14; 6, 15; 7, 16; 1, 17; and 2 s: which done, draw n 9 and 66 parallel to l m, and the outlines of the steps K, L, M, N, O will be finished.

At equal distances with that between the lines marked 8 and 14, draw the parallel lines above marked 9 to 11, 12 and 13; and, draw perpendicular lines upwards from the points n, o, p, q, r, s, as in the figure.

Make H m equal to the intended breadth of the flat above the square opening at the left hand, and draw HW toward the point of sight S, equal to the intended length of the flat: then draw WP parallel to HW, and the outlines of the flat will be finished.

Take the width of the opening at pleasure, as from F to C, and draw CD equal and parallel to FE. Draw GH parallel to CD, and the short lines marked 33, 34, &c. just even with the parallel lines 1, 2, &c. From the points where these short lines meet CD draw lines toward the point of sight S till they meet DE; then from the points where the lines 38, 39, 40, &c. of the pavement meet C y, draw upright lines parallel to CD; and the lines which form the opening will be finished.

The steps P, Q, R, S, T, and the flat U above the arch V, are done in the same manner with those in fig. 34, as taught in Prob. 28. and the equidistant parallel lines marked 18, 19, &c. are directly even with those on the left-hand side of the arch V, and the upright lines to the right-hand side are equidistant with those on the left.

From the points where the lines 18, 19, 20, &c. meet the right-hand side of the arch, draw lines toward the point of sight S; and from the points where the pavement lines 29, 30, 31, 32, meet the line drawn from A towards the point of sight, draw upright lines toward the top of the arch.

Having done the top of the arch, as in the figure, and the few steps to the right hand thereof, shade the whole as in fig. 37. and the work will be finished.

PROB. 30. To put upright conical objects in perspective, as if standing on the sides of an oblong square, at distances from one another equal to the breadth of the oblong.

In fig. 38. the bases of the upright cones are per. Fig. 39. perspective circles inscribed in squares of the same diameter; and the cones are set upright on their bases by the same rules as are given for pyramids, which we need not repeat here.

In most of the foregoing operations we have considered the observer's eye to be above the level of the tops of all the objects, as if he viewed them when standing on high ground. In this figure, and in fig. 41. and fig. 42. we shall suppose him to be standing on low ground, and the tops of the objects to be above the level of his eye.

In fig. 38. let AD be the perspective breadth of the Fig. 39. oblong square ABCD; and let A a and D d (equal to A d) be taken for the diameters of the circular bases of the two cones next the eye, whose intended equal heights shall be AE and DF.

Having made S the point of sight in the horizon parallel to AD, and found the proper point of distance therein, draw AS and AS to contain the bases of the cones on the left-hand side, and DS and D S for those on the right.

Having made the two first cones at A and D of equal height at pleasure, draw ES and FS from their tops to the point of sight, for limiting the perspective heights of all the rest of the cones. Then divide the parallelogram ABCD into as many equal perspective squares as you please; find the bases of the cones at the corners of these squares, and make the cones thereon, as in the figure.

If you would represent a ceiling equal and parallel to ABCD, supported on the tops of these cones, draw EF, then EFGH shall be the ceiling; and by drawing c f parallel to EF, you will have the thickness of the floor-boards and beams, which may be what you please.

This shows how any number of equidistant pillars may be drawn of equal heights to support the ceiling of a long room, and how the walls of such a room may be represented in perspective at the back of these pillars. It also shows how a street of houses may be drawn in perspective.

Fig. 41. is the representation of a square hollow, fig. 41. of which the depth AG is equal to three times its width AD; and S is the point of sight over which the observer's eye is supposed to be placed, looking perpendicularly down into it, but not directly over the middle.

Draw AS and DS to the point of sight S; make ST the horizon parallel to AD, and produce it to such a length beyond T that you may find a point of distance therein not nearer S than if AD was seen under an angle of 60 degrees.

Draw DU to the point of distance, intersecting AS in B; then from the point B draw BC parallel to AD;
and you will have the first perspective square ABCD, equal to a third part of the intended depth.

Draw CV to the point of distance, intersecting AS in E; then from the point E draw EF parallel to AD; and you will have the second perspective square BEFC, which, added to the former one, makes two thirds of the intended depth.

Draw FW to the point of distance, intersecting AS in G; then from the point G draw GH parallel to AD; and you will have the third perspective square EGHF, which, with the former two, makes the whole depth AGHD three times as great as the width AD, in a perspective view.

Divide AD into any number of equal parts, as suppose 8; and from the division-points a, b, c, d, &c. draw lines toward the point of sight S, and ending at GH; then through the points where the diagonals BD, EC, GF, cut these lines, draw lines parallel to AD; and you will have the parallelogram AGHD reticulated, or divided into 192 small and equal perspective squares.

Make AI and DM equal and perpendicular to AD; then draw IM, which will be equal and parallel to AD; and draw IS and MS to the point of sight S.

Divide AI, IM, and MD, into the same number of equal parts as AD is divided; and from these points of division draw lines toward the point of sight S, ending respectively at GK, KL, and LH.

From those points where the lines parallel to AD meet AG and DH draw upright lines parallel to AI and DM; and from the points where these lines meet IK and LM draw lines parallel to IM; then shade the work, as in the figure.

Prob. 32. To represent a semicircular arch in perspective as if it were standing on two upright walls, equal in height to the height of the observer’s eye.

After having gone through the preceding operation, this will be more easy by a bare view of fig. 42, than it could be made by any description; the method being so much like that of drawing and shading the square how.

We need only mention, that a B E A and DF, D E, are the lines where the semicircular arch is built; that S is the point of sight in the horizon T, taken in the centre of the arch; and in fig. 41, is the point of distance; and that the two perspectival squares ABCD and BEFC make the parallelogram AEFD of a length equal to twice its breadth AD.

Prob. 33. To represent a square in perspective, as viewed by an observer standing directly even with one of its corners.

In fig. 43, let A 9 BC be a true square, viewed by an observer standing at some distance from the corner C, and just even with the diagonal C 9.

Let SP be the horizon, parallel to the diagonal AB; and S the point of sight, even with the diagonal C 9. Here it will be proper to have two points of distance p and P, equidistant from the point of sight S.

Draw the straight line r 17 parallel to AB, and draw A 8 and B 10 parallel to CS. Take the distance between 8 and 9 in your compasses, and set it off all the way in equal parts from 8 to 10, and from 10 to r 17.

The line 1 17 should be produced a good way farther both to right and left hand from 9, and divided all the way in the same manner.

From these points of equal division, 8, 9, 10, &c. draw lines to the point of sight S, and also to the two points of distance p and P, as in the figure.

Now it is plain, that a c b g is the perspective representation of A 9 BC, viewed by an observer even with the corner C and diagonal C g. But if there are other such squares lying even with this, and having the same position with respect to the line n, it is evident that the observer, who stands directly even with the corner C of the first square, will not be even with the like corners G and K of the others; but will have an oblique view of them, over the sides FG and IK, which are nearest his eye: and their perspective representations will be g k f d and h k i 3, drawn among the lines in the figure: of which the spaces taken up by each side lie between three of the lines drawn toward the point of distance p, and three drawn to the other point of distance P.

Prob. 34. To represent a common chair, in an oblique perspective view.

The original lines to the point of sight S, and points Fig. 43 of distance p and P, being drawn as in the preceding operation, choose any part of the plane; as l m n 13, on which you would have the chair L to stand. There are just as many lines (namely two) between l and m, n 13 and n, drawn toward the point of distance p, at the left hand, as between l and 13, or m and n, drawn to the point of distance P on the right: so that l m, m n, n 13, and 13 l, form a perspective square.

From the four corners l, m, n, 13, of this square raise the four legs of the chair to the perspective perpendicular height you would have them: then make the seat of the chair a square equal and parallel to l m n 13, as taught in Prob. 18, which will make the two sides of the seat in the direction of the lines drawn toward the point of distance p, and the fore and back part of the seat in direction of the lines drawn to the other point of distance P. This done, draw the back of the chair leaning a little backward, and the cross bars therein tending to the seat; and the point of distance P. Then shade the work as in the figure; and the perspective chair will be finished.

Prob. 35. To present an oblong square table in an oblique perspective view.

In fig. 43. M is an oblong square table, as seen by an observer standing directly even with C 9 (see Prob. 33.), the side next the eye being perspectively parallel to the side a c of the square a b c g. The forementioned lines drawn from the line 1 17 to the two points of distance p and P, form equal perspective squares on the ground plane.

Choose any part of this plane of squares for the feet of the table to stand upon; as at p, q, r, and s, in direction of the lines o p and r s for the two long sides, and t s and q r for the two ends; and you will have the oblong square or parallelogram g r s t for the part of the floor or ground-plane whereon the table is to stand; and the breadth of this plane is here taken in proportion to the length as 6 to 10; so that, if the length of the table be ten feet, its breadth will be six.

On the four little perspective squares at q, r, s, and t,
In order to paint upon a plane a deformed copy ABCDEKIHGF of an original picture, which shall appear regular, when seen from a given point O, elevated above the plane, by rays reflected from a polished cylinder, placed upon the circle l n p, equal to its given base; from the point R, which must be supposed to lie perpendicularly under O, the place of the eye, draw two lines R a, R e, which shall either touch the base of the cylinder, or else cut off two small equal segments from the sides of it, according as the copy is intended to be more or less deformed. Then, taking the eye, raised above R, to the given height RO, somewhat greater than that of the cylinder, for a luminous point, describe the shadow a c k f (of a square, fig. 39. or parallelogram standing upright upon a c e l, as a base, and containing the picture required) anywhere behind the arch l n p. Let the lines drawn from R to the extremities and divisions of the base a, b, c, d, e, cut the remotest part of the shadow in the points f, g, h, i, k, and the arch of the base in l, m, n, o, p; from which points draw the lines l A, m BG, n CH, o DI, p EK, as if they were rays of light that came from the focus R, and were reflected from the base l n p, so that each couple, l A, l R, produced, may cut off equal segments from the circle. Lastly, transfer the lines l a, m b, n g, &c. and all their parts in the same order, upon the respective lines l A, m BG, &c. and having drawn regular curves, by estimation, through the points A, B, C, D, &c. through F, G, H, I, K, and through every intermediate order of points; the figure ACÈKHGF, so divided, will be the deformed copy of the square, drawn and divided upon the original picture, and will appear similar to it, when seen in the polished cylinder, placed upon the base l n p, by the eye in its given place O.

The practical methods of drawing these images seem to have been carried to the greatest perfection by J. Leopold, who, in the Acta Liptiensia for the year 1712, has described two machines, one for the images to be viewed with a cylindrical, and the other with a conical mirror. The person possessed of this instrument has nothing to do but to take any print he pleases, and while he goes over the passage of it with one pen, another traces the anamorphosis.

By methods of this kind, groves of trees may be cut, so as to represent the appearance of men, horses, and other objects from some one point of view, which are not at all discernible in any other. This might easily be effected by one person placing himself in any particular situation, and giving directions to other persons what trees to top, and in what manner. In the same method it has been contrived, that buildings of circular and other forms, and also whole groups of buildings, consisting of walls at different distances and with different positions to one another, should be painted so as to exhibit the exact representation of particular objects, which could only be perceived in one situation. Bettinus has illustrated this method by drawings in his Apiaria.

It may appear a bold assertion to say, that the very short sketch now given of the art of perspective is a sufficient foundation for the whole practice, and includes all the expeditious rules peculiar to the problems which most generally occur. It is, however, true, and the intelligent
PERSPECTIVE.

telligent reader will see, that the two theorems on which the whole rests, include every possible case, and apply with equal facility to pictures and originals in any position, although the examples are selected of perpendicular pictures, and of originals referred to horizontal planes, as being the most frequent. The scientific foundation being so simple, the structure need not be complex, nor swell into such volumes as have been published on the subject, by volumes which by their size deter from the perusal, and give the simple art the appearance of intricate mystery; and by their prices, defeat the design of their authors, viz. the dissemination of knowledge among the practitioners. The treatises on perspective acquire their bulk by long and tedious discourses, minute explanations of common things, or by great numbers of examples; which indeed do make some of these books valuable by the variety of curious cuts, but do not at all instruct the reader by any improvements made in the art itself. For it is evident that most of those who have treated this subject have been more conversant in the practice of designing than in the principles of geometry; and therefore when, in their practice, the cases which have offered have put them on trying particular expedients, they have thought them worth communicating to the public as improvements in the art; and each author, fond of his own little expedient, (which a scientific person would have known for an easy corollary from the general theorem), has made it the principle of a practical system—in this manner narrowing instead of enlarging the knowledge of the art; and the practitioner tired of the bulk of the volume, in which a single maxim is tediously spread out, and the principle on which it is founded kept out of his sight, contents himself with a remembrance of the maxim (not understood), and keeps it slightly in his eye to avoid gross errors. We can appeal to the whole body of painters and draughtsmen for the truth of this assertion; and it must not be considered as an imputation on them of remissness or negligence, but as a necessary consequence of the ignorance of the authors from whom they have taken their information. This is a strong term, but it is not the less just. Several mathematicians of eminence have written on perspective, treating it as the subject of pure geometry, as it really is; and the performances of Dr Brook Taylor, Gravesande, Wolf, De la Caille, Emerson, are truly valuable, by presenting the art in all its perspicuous simplicity and universality. The works of Taylor and Emerson are more valuable, on account of the very ingenious and expeditious constructions which they have given, suited to every possible case. The merit of the first author has been universally acknowledged by all the British writers on the subject, who never fail to declare that their own works are composed on the principle of Dr Brook Taylor; but any man of science will see that these authors have either not understood them, or aimed at pleasing the public by fine cuts and uncommon cases; for without exception, they have omitted his favourite constructions, which had gained his predilection by their universality, and attached themselves to inferior methods, more usually expedient perhaps, or inventions (as they thought) of their own. What has been given in this article is not preferred to be according to the principles of Dr Brook Taylor, because the principles are not peculiar to him, but the necessary results of the theory itself, and inculcated by every mathematician who had taken the trouble to consider the subject. They are sufficient not only for directing the ordinary practice, but also for suggesting modes of construction for every case out of the common track. And a person of ingenuity will have a laudable enjoyment in this, without much stretch of thought, inventing rules for himself; and will be better pleased with such fruits of his own ingenuity, than in reading the tedious explanation of examples devised by another. And for this purpose we would, with Dr Taylor, “advise all our readers not to be contented with the scheme they find here; but, on every occasion, to draw new ones of their own, in all the variety of circumstances they can think of. This will take up more time at first, but they will find the vast benefit and pleasure of it by the extensive notions it will give them of the nature of the principles.”

The art of perspective is necessary to all arts where there is any occasion for designing; as architecture, fortification, carving, and generally all the mechanical arts; but it is more particularly necessary to the art of painting, which can do nothing without it. A figure in a picture, which is not drawn according to the rules of perspective, does not represent what is intended, but something else. Indeed we hesitate not to say, that a picture which is faulty in this particular, is as blamable, or more so, than any composition in writing which is faulty in point of orthography or grammar. It is generally thought very ridiculous to pretend to write a heroic poem, or a fine discourse, upon any subject, without understanding the propriety of the language in which we write; and to us it seems no less ridiculous for one to pretend to make a good picture without understanding perspective: Yet how many pictures are there to be seen, that are highly valuable in other respects, and yet are entirely faulty in this point? Indeed this fault is so very general, that we cannot remember that we ever have seen a picture that has been entirely without it; and what is the more to be lamented, the greatest masters have been the most guilty of it. Those examples make it to be less regarded; but the fault is not the less, but the more to be lamented, and deserves the more care in avoiding it for the future. The great occasion of this fault, is certainly the wrong method that is generally used in educating of persons in this art: for the young people are generally put immediately to drawing; and when they have acquired a facility in that, they are put to colouring. And these things they learn by rote, and by practice only; but are not all instructed in any rules of art. By which means, when they come to make any designs of their own, though they are very expert at drawing out and colouring every thing that offers itself to their fancy; yet for want of being instructed in the strict rules of art, they do not know how to govern their inventions with judgment, and become guilty of so many gross mistakes which prevent themselves, as well as others, from finding that satisfaction they otherwise would do in their performances. To correct this for the future, we would recommend it to the masters of the art of painting, to consider if it would not be necessary to establish a better method for the education of their scholars, and to begin their instructions with the technical parts of painting, before they let them loose to follow the inventions of their own uncultivated imaginations.

The
The art of painting, taken in its full extent, consists of two parts; the inventive, and the executive. The inventive part is common with poetry, and belongs more properly and immediately to the original design (which it invents and disposè in the most proper and agreeable manner) than to the picture, which is only a copy of that design already formed in the imagination of the artist. The perfection of this art of painting depends upon the thorough knowledge the artist has of all the parts of his subject; and the beauty of it consists in the happy choice and disposition that he makes of it: And it is in this that the genius of the artist discovers and shows itself, while he indulges and humour his fancy, which here is not confined. But the other, the executive part of painting, is wholly confined and strictly tied to the rules of art, which cannot be dispensed with upon any account; and therefore in this the artist ought to govern himself entirely by the rules of art, and not to take any liberties whatsoever. For any thing that is not truly drawn according to the rules of perspective, or not truly coloured or truly shaded, does not appear to be what the artist intended, but something else. Wherefore, if at any time the artist happens to imagine that his picture would look the better, if he should serve a little from these rules, he may assure himself, that the fault belongs to his original design, and not to the strictness of the rules; for what is perfectly agreeable and just in the real original objects themselves, can never appear defective in a picture where those objects are exactly copied.

Therefore to offer a short hint of thoughts we have some time had upon the method which ought to be followed in instructing a scholar in the executive part of painting: we would first have him learn the most common affections of practical geometry, and the first elements of plain geometry and common arithmetick. When he is sufficiently perfect in these, we would have him learn perspective. And when he has made some progress in this, so as to have prepared his judgment with the right notions of the alterations that figures must undergo, when they come to be drawn on a flat, he may then be put to drawing by view, and be exercised in this alone with perspective, till he comes to be sufficiently perfect in both. Nothing ought to be more familiar to a painter than perspective; for it is the only thing that can make the judgment correct, and will help the fancy to invent with ten times the ease that it could do without it.

We earnestly recommend to our readers the careful perusal of Dr Taylor's Treatise, as published by Colson in 1749, and Emerson's published along with his Optics. They will be surprised and delighted with the instruction they will receive; and will then truly estimate the splendid volumes of other authors, and see their frivolity.

Perspective is also used for a kind of picture or painting, frequently seen in gardens, and at the ends of galleries; designed expressly to deceive the sight by representing the continuation of an alley, a building, landscape, or the like.

Aerial Perspective, is sometimes used as a general denomination for that which more restrictedly is called aerial perspective, or the art of giving a due diminution or degradation to the strength of light, shade, and colours of objects, according to their different distances, the quantity of light which falls upon them, and the medium through which they are seen; the chiaro oscuro, or claire obscur, which consists in expressing the different degrees of light, shade, and colour of bodies, arising from their own shape, and the position of their parts with respect to the eye and neighbouring objects, whereby their light or colours are affected; and keeping, which is the observance of a due proportion in the general light and colouring of the whole picture, so that no light or colour in one part may be too bright or strong for another. A painter, who would succeed in aerial perspective, ought carefully to study the effects which distance, or different degrees or colours of light, have on each particular original colour, to know how its hue or strength is changed in the several circumstances that occur, and to represent it accordingly. As all objects in a picture take their measures in proportion to those placed in the front, so, in aerial perspective, the strength of light, and the brightness of the colours of objects close to the picture, must serve as a measure, with respect to which all the same colours at several distances must have a proportional degradation in like circumstances.

Bird's eye view in Perspective, is that which supposes the eye to be placed above any building, &c. as in the air at a considerable distance from it. This is applied in drawing the representations of fortifications, when it is necessary not only to exhibit one view as seen from the ground, but so much of the several buildings as the eye can possibly take in at one time from any situation. In order to this, we must suppose the eye to be removed a considerable height above the ground, and to be placed as it were in the air, so as to look down into the building like a bird that is flying. In representations of this kind, the higher the horizontal line is placed, the more of the fortification will be seen, and vice versa.

Perspective Machine, is an instrument by which any person, without the help of the rules of art, may delineate the true perspective figures of objects. Mr. Ferguson has described a machine of this sort, of which he ascribes the invention to Dr. Bovis.

Fig. 45. is a plan of this machine, and fig. 46. is a representation of it when made use of in drawing distant objects in perspective.

In fig. 45. a b e f is an oblong square board, represented by ABEF in fig. 46. x and y (X and Y) are two hinges on which the part c l d (C L D) is movable. This part consists of two arches or portions of circles C M L and C N L (D M L) joined together at the top L, and at bottom to the cross bar d c (D C), to which one part of each hinge is fixed, and the other part
part to a flat board, half the length of the board $a b e f$ (ABEF), and glued to its uppermost side. The centre of the arch $c m l$ is at $d$, and the centre of the arch $d n l$ is at $e$.

On the outer side of the arch $d n l$ is a sliding piece $r$ (much like the nut of the quadrant of altitude belonging to a common globe), which may be moved to any part of the arch between $b$ and $l$: and there is such another slider $o$ on the arch $c m l$, which may be set to any part between $c$ and $l$. A thread $e p n$ (CPN) is stretched tight from the centre $c$ (C) to the slider $r$ ($N$), and such another thread is stretched from the centre $D$ to the slider $o$ ($O$); the ends of the thread being fastened to these centres and sliders.

Now it is plain, that, by moving these sliders on their respective arches, the intersection $p$ ($P$) of the threads may be brought to any point of the open space within the arches. In the groove $k$ ($K$) is a straight sliding bar $i$ ($I$), which may be drawn further out, or pushed further in at pleasure.

To the outer end of this bar $I$ (fig. 46.) is fixed the upright piece $H Z$, in which is a groove for receiving the sliding piece $Q$. In this slider is a small hole $r$ for the eye to look through, in using the machine; and there is a long slit in $H Z$, to let the hole $r$ be seen through when the eye is placed behind it, at any height of the hole above the level of the bar $I$.

How to delineate the perspective figure of any distant object or objects, by means of this machine.

Suppose you wanted to delineate a perspective representation of the house $q s r p$ (which we must imagine to be a very gay off, without the limits of the plate), place the machine on a steady table, with the end $E F$ of the horizontal board $A B E F$, toward the house, so that when the Gothic-like arch $D L C$ is set upright, the middle part of the open space (about $P$) within it may be even with the house when you place your eye at $Z$ and look at the house through the small hole $r$.

Then fix the corners of a square piece of paper with four wafers on the surface of that half of the horizontal board which is nearest the house; and all is ready for drawing.

Set the arch upright, as in the figure; which it will be when it comes to the perpendicular side $i$ of the upright piece $s$ fixed to the horizontal board behind $D$. Then place your eye at $Z$, and look through the hole $r$ at any point of the house, as $q$, and move the sliders $N$ and $O$ till you bring the intersection of the threads at $P$ directly between your eye and the point $q$; then put down the arch flat upon the paper on the board, as at $S T$, and the intersection of the threads will be at $W$.

Mark the point $W$ on the paper with the dot of a black lead pencil, and set the arch upright again as before; then look through the hole $r$, and move the sliders $N$ and $O$ till the intersection of the threads come between your eye and any other point of the house, as $p$; then put down the arch again to the paper, and make a pencil mark thereon at the intersection of the threads, and draw a line from that mark to the former one at $W$; which line will be a true perspective representation of the corner $p q$ of the house.

Proceed in the same manner, by bringing the intersection of the threads successively between your eye and other points of the outlines of the house, as $r$, $s$, &c. and put down the arch to mark the like points on the paper, at the intersection of the threads; then connect these points by straight lines, which will be the perspective outlines of the house. In like manner find points for the corners of the doors and windows, top of the house, chimneys, &c. and draw the finishing lines from point to point: then shade the whole, making the lights and shades as you see them on the house itself, and you will have a true perspective figure of it. Great care must be taken, during the whole time, that the position of the machine be not shifted on the table; and to prevent such an inconvenience, the table should be very strong and steady, and the machine fixed to it either by screws or clamps.

In the same way, a landscape, or any number of objects within the field of view through the arch, may be delineated, by finding a sufficient number of perspective points on the paper, and connecting them by straight or curved lines as they appear to the eye. And as this makes every thing in perspective equally easy, without taking the trouble to learn any of the rules for drawing, the operations must be very pleasing and agreeable. Yet as science is still more so, we would by all means recommend it to our readers to learn the rules for drawing particular objects; and to draw landscapes by the eye, for which, we believe, no perspective rules can be given. And although any thing may be very truly drawn in perspective by means of this machine, it cannot be said that there is the least degree of science in going that way to work.

The arch ought to be at least a foot wide at bottom, that the eye at $Z$ may have a large field of view through it: and the eye should then be, at least, 10½ inches from the intersection of the threads at $P$ when the arch is set upright. For if it be nearer, the boundaries of view at the sides near the foot of the arch will subduct an angle at $Z$ of more than 60 degrees, which will not only strain the eye, but will also cause the outermost parts of the drawing to have a disagreeable appearance.

To avoid this, it will be proper to draw back the sliding bar $I$, till $Z$ be 14½ inches distant from $P$; and then the whole field of view, through the foot wide arch, will not subduct an angle to the eye at $Z$ of more than 45 degrees, which will give a more easy and pleasant view, not only of all the objects themselves, but also of their representations on the paper wherein they are delineated. So that whatever the width of the arch be, the distance of the eye from it should be in this proportion: as 12 is to the width of the arch, so is 14½ the distance of the eye (at $Z$) from it.

If a pane of glass, laid over with gum water, be fixed into the arch, and set upright when dry, a person who looks through the hole $r$ may delineate the objects upon the glass which he sees at a distance through and beyond it, and then transfer the delineation to a paper put upon the glass, as mentioned in the beginning of the article Perspective.

Mr Peacock likewise invented three simple instrument for drawing architecture and machinery in perspective, of which the reader will find sketches and descriptions in the 7th volume of the Philosophical Transactions. These descriptions are not inserted here, because we do not think the instruments superior to that described by Ferguson, and because we wish that our readers who have occasion to draw may make themselves so much masters of the art of perspective, as to be above
the aid of such mechanical contrivances. But for the sake of those whose opportunities of improvement in the art do not enable them to practise it without such help, we annex the following description of an instrument invented for this purpose by Dr Wollaston, and to which he has given the name of Camera Lucida.

"Having a short time since (says the author) amused myself with attempts to sketch various interesting views, without an adequate knowledge of the art of drawing, my mind was naturally employed in facilitating the means of transferring to paper the apparent relative positions of the objects before me; and I am in hopes that the instrument, which I contrived for this purpose, may be acceptable even to those who have attained to greater proficiency in the art, on account of the many advantages it possesses over the camera obscura.

"The principles on which it is constructed will probably be most distinctly explained by tracing the successive steps, by which I proceeded in its formation.

"While I looked directly down at a sheet of paper on my table, if I hold between my eye and the paper a piece of plain glass, inclined from me downwards at an angle of 45°, I see by reflection the view that is before me, in the same direction that I see my paper through the glass. I might then take a sketch of it; but the position of the objects would be reversed.

"To obtain a direct view, it is necessary to have two reflections. The transparent glass must for this purpose be inclined to the perpendicular line of sight only the half of 45°, that it may reflect the view a second time from a piece of looking-glass placed beneath it, and inclined upwards at an equal angle. The objects now appear as if seen through the paper in the same place as before; but they are direct instead of being inverted, and they may be discerned in this manner sufficiently well for determining the principal positions.

"The pencil, however, and any object, which it is to trace, cannot both be seen distinctly in the same state of the eye, on account of the difference of their distances; and the efforts of successive adaption of the eye to one or to the other would become painful if frequently repeated. In order to remedy this inconvenience, the paper and pencil may be viewed through a convex lens of such a focus, as to require no more effort than is necessary for seeing the distant objects distinctly. These will then appear to correspond with the paper in distance as well as direction, and may be drawn with facility, and with any desired degree of precision.

"This arrangement of glasses will be best understood from inspecting fig. 47. a b in the transparent glass; be the lower reflector; b d a convex lens (of 12 inches focus); e the position of the eye; and f g h e the course of the rays.

"In some cases a different construction will be preferable. Those eyes, which without assistance are adapted to seeing near objects alone, will not admit the use of a convex glass; but will on the contrary require one that is concave to be placed in front, to render the distant objects distinct. The frame for a glass of this construction is represented at i k, (fig. 49.) turning upon the same hinge at h with a convex glass in the frame 1 m, and moving in such a manner, that either of the glasses may be turned alone into its place, as may be necessary to suit an eye that is long or short sighted.
The principles on which the height of the stem is adjusted will be readily understood by those who are accustomed to optical considerations. For as in taking a perspective view the rays from the paper are rendered parallel, by placing a lens at the distance of its principal focus from the paper, because the rays received from the distant objects are parallel; so also when the object seen by reflection is at so short a distance that the rays received from it are in a certain degree divergent, the rays from the paper should be made to have the same degree of divergence in order that the paper may be seen distinctly by the same eye; and for this purpose the lens must be placed at a distance less than its principal focus. The stem of the instrument is accordingly marked at certain distances to which the conjugate foci are in the several proportions of 2, 3, 4, &c. to 1, so that distinct vision may be obtained in all cases, by placing the painting proportionally more distant.

By transposing the convex lens to the front of the instrument and reversing the proportional distances, the artist might also enlarge his smaller sketches with every desirable degree of correctness, and the naturalist might delineate minute objects in any degree magnified.

**Perspective Glass, or Graphical Perspective.** See Dioptics.

**PERSPIRATION,** in Physiology, the excretion of a fluid through the pores of the skin. Perspiration is distinguished into sensible and insensible; and here sensible perspiration is the same with sweating, and insensible perspiration which escapes the notice of the senses.

**Perspicuity,** properly signifies the property which any thing has of being easily seen through; hence it is generally applied to such writings or discourses as are easily understood.

**Perspicuity,** in composition. See Oratory, No. 43.

**PERTH,** a county of Scotland, including Menteith, Braidalbin, Athol, Strathlene, part of Gowrie, and Perth Proper; is bounded by Badenoach and Lochaber on the north and north-west; by Marr on the northeast; by Argyle and Lennox on the west and southwest; having Clackmannanshire, part of Stirlingshire, and the Forth to the south; the shores of Kinross and Fife to the south-east, and Angus to the east. It extends above 70 miles in length, and near 60 at its greatest breadth, exhibiting a variety of Highlands and Lowlands; mountains, hills, dales, and straths, diversified with pasture grounds, corn fields, and meadows; rivers, lakes, forests, woods, plantations, inclosures, towns, villages, and a great number of elegant seats, beautifully situated, belonging to noblemen and gentlemen. The chief rivers of Perthshire are the Tay, the Teith, and the Erne, besides a great number of subordinate streams. The river Tay is famous for its salmon-fishery. The river Erne rises from Loch Erne, a lake seven miles long, in the mountainous country of Strathlene: this river, after a course of 34 miles from west to east, during which it receives many streams and rivulets, falls into the Tay at Abernethy.

The Teith (says a late traveller), on the southern bank of which the city of Perth stands, is truly a noble river. It rises in Braidalbin, on the frontiers of Lorne. Before it has advanced many miles from its source, its stream is considerably augmented by the accession of several small rivulets. Soon after, it diffuses its waters into a small lake called Loch Dochart; and indeed the river itself there bears rather the name of the Dochart. Continuing its course from Loch Dochart, it soon again expands into another lake. Out of this it proceeds to Kilfin, still bearing, if I remember right, the name of the Dochart. Here it meets with another river which flows hither by a more northerly course. The waters are diffused into the famous Loch Tay, 16 miles in length. Issuing from this spacious lake at Kenmore, the Tay is soon after increased by the accession of the Lyon. It proceeds onward in an eastern direction through Athol, receiving as it advances all the waters in the country, till at Logierait it is joined by the large river of Tummel. Here it beeds to the south, and advancing about eight miles reaches Dunkeld; whence taking a more northern direction, it continues its course towards Perth; being as it advances still augmented by the accession of various tributary streams, the most considerable of which is the Almond. At Perth it turns to the south-east, and receiving as it proceeds the waters of the Erne, passes by Abernethy, once the capital of the Pictish Kingdom. Soon after this, it expands itself to the breadth of three miles. Contracting its breadth, as it approaches Dundee, it there opens into the German ocean.

Such is the noble river; on the southern bank of which, where it has increased into a vast body of water, and not a great many miles above where it discharges itself into the ocean, Perth is advantageously situated. A person acquainted with the general character of great rivers, and with their influence in determining the aspect and the fertility of the districts through which they pass, might readily, without further knowledge of the local circumstances than what is conveyed in this account of the course of the Tay, and of the situation of Perth upon it, conclude the city to stand amid delightful scenery, and to enjoy most of the advantages which natural circumstances afford, for the promotion of trade and industry.

Freestone, lead, iron, and copper ores, with some lapis calaminaris, are found in different parts of Perthsire. The soil, being generally rich and well manured, produces excellent wheat, and all kinds of grain. The hilly country abounds with pasture for the black cattle, horses, sheep, goats, and deer. The heaths, woods, and forests, are stored with variety of game; the rivers teem with salmon and trout; the gardens and orchards are stored with all kinds of herbs, roots, apples, pears, cherries, plums, and almost every species of fruit found in South Britain. The houses and attire, even of the commonalty, are neat and decent; and every peasant can produce a good quantity of linen, and great store of blankets, made in his own family. Indeed, this is the case through all the Lowlands of Scotland. Flax is reared by every husbandman; and being dressed at home, is sent to the females of his family into thread for linen; this is woven by country weavers, of whom there is a great number through all the low country, and afterwards...
wards bleached or whitened by the good-wife and her servants; so that the whole is made fit for use at a very small expence. They likewise wash, card, spin, and weave their wool into tartan for plaids, kerseys, and coarse russet-cloth, for common wearing, besides great part of it which is knit into caps, stockings, and mitts. Plaids, made of the finest worsted, are worn either plain or variegated, as veils, by women of the lower, and even of the middle rank; nay some years ago, ladies of fashion wore silken plaids with an undress: this is a loose piece of drapery, gathered about the head, shoulders, and waist, on which it is crossed, so as to leave the hands at liberty, and produces a very good effect to the eye of the spectator. The Lowlanders of Perthshire are civilized, hospitable, and industrious: the commerce of the country consists chiefly in corn, linen, and black cattle; there are, moreover, some merchants who trade to foreign countries.—For an account of the different divisions of this country above mentioned, see the articles as they occur in the order of the alphabet.

The population of this county in 1801 amounted to 126,366 (A), and in 1811 to 135,093.

The following table shows the state of the population, according to its parishes at two different periods:

Increase, 14,371

See Perthshire, Supplement.

Perth Proper, stretching 20 miles in length, and at some places 15 in breadth, is bounded on the north-east, by the Carse of Gowrie; on the east, by Angus; on the west, by Stratherne; on the north, by Atholl; and on the south, by the frith of Tay. This is likewise a fruitful country, populous and well cultivated, abounding with gentlemen who possess opulent estates; with farmers who understand agriculture; and with manufacturers who turn their industry to great account. North-eastward from Perth to Brechin lies the vale of Strathmore, one of the most fertile districts in Scotland, which gives the title of Earl to the noble family of Lyon.

Perth,
Perth, the capital of the county of that name, is an agreeable, populous town, situated 20 miles within land, on the south bank of the river Tay. It was otherwise called St John's, from a church dedicated to St John, as the patron of the place. It is a royal borough, second in dignity to the metropolis, the seat of a large prebendary, and gave the title of Earl to the family of Drummond, which is now forfeited. James Drummond, 4th earl, was created duke of Perth by James II. for adhering to whose interests he was outlawed. His two grandsons were attained in 1745. No less than 14 national councils have been held at Perth between 1201 and 1459. But the oldest was at Scone, A.D. 926. Perth, in the reign of Edward I. of England, was possessed by the English, who secured it with fortifications: but after an obstinate resistance, they were expelled by Robert Bruce. In the year 1715, the rebels made it a place of arms, and retired to it, after the battle of Dumblane; but they were in a little time dislodged by the duke of Aigyle, and retreated northwards with the pretender. They possessed it also in 1745. The pretender was proclaimed king, new magistrates were appointed, and an attempt was made to restore the town. The town is popular and handsome; the streets are well paved, and tolerably clean at all times; and the houses, though not stately, make a very decent appearance. Both the streets and houses are, for the greater part, disposed in a regularity of plan, which proves them not to be of the most remote antiquity. It is indeed true that the level situation, being singularly favourable to regularity, might, even from the first, give this an advantage over many of our old boroughs. Several streets run in a direction parallel with the river, as far as a right line can bear this relation to a curve line, nearly between east and west: these are again intersected by others extending between north and south. It should seem that anciently particular streets were inhabited, each by a particular class of artisans. The names still preserved seem to indicate as much. The shop-keepers or merchants occupied one street; the hammermen a second; and other craftsmen, in the same manner, each a separate street. Many of the houses in that street called the Water-gate, seem to be very old buildings. Towards the south end of the Water-gate stands the famous palace of the Gowrie family. The house, and the very room, where the attempt of the Gowries to seize or assassinate the king was supposed to have been made, is now converted into barracks for a train of artillery; but the back-stair, down which the Ruthvens were thrown, is pulled down. This strange event, however magnified or attested by contemporary writers, is made up of so many improbabilities, or circumstances for which no reason can be assigned, that Sir David Dalrymple, in republishing the account printed by authority, 1650, preparatory to his further observations on it, seems justified in absolutely discrediting a fact which passed for problematical with so many persons at the very time. Dr Robertson supposes it a plot of Elizabeth to get James into her power. Mr Cant having discussed the whole story of the conspiracy in his Muse's Threnodie, p. 185—261, concludes, "that this as well as a very impolitic measure, the best way of accounting for it is by James's known hatred to the Puritans, and wish to get rid of two popular characters." The king had been seized and forced from his favourites by the father of the Ruthvens 12 years before (1582), and though he affected to forgive him, took the first opportunity to condemn and execute him as a traitor, 1584. Mr Camden was too good a courtier to speak with impartiality of any part of this weak monarch's conduct. Though the name of Gowrie was abolished, the title of Ruthven was revived in the person of Sir Thomas Ruthven of Freeland, whom Charles II. 1651, created Lord Ruthven: but the honour, on the death of his son David in 1704, devolved on Isabel, surviving daughter of his second sister, who married Sir Francis Ruthven, and was succeeded, 1732, by his son James.

The castle of Perth stood near the red bridge, which terminated the narrow street called Skinner-gate. At the end of the Castle-street another narrow street leads west to the Black-friars, called Cowree feu-row, where the curfew bell was. The kings of Scotland before James II. were crowned at Scone, and resided at Perth as the metropolis of the nation. James resided and was educated in the castle of Edinburgh, and was crowned there 1437. The parliaments and courts of justice were removed from Perth to Edinburgh, but Perth kept its priority till 22 James III. 1482.

The church in which John Knox harangued is still standing, and is now divided into three; named the east, the middle, and the west kirk. The east kirk was lately very handsomely modernised within. There is an old hospital, a considerable building, the founding of which is ascribed to James VI. The town-house shuts up the eastern end of the High-street. A monastery of Carthusians was here established by King James I. of Scotland, who lost his life on the very spot, by the treachery of Athol and his accomplices. The king was buried in a very stately monument in this place, which was called monasterium walla virtutis, one of the most magnificent buildings in the kingdom, which with the rest was destroyed by the populace. James VI. created George Hay commendator of the Carthusian priory, giving him all its emoluments, with a vote and seat in parliament; but these not being sufficient to encompass the title, he surrendered it back to the king. The only remains of this magnificent structure is to be seen in the carved stones with which the south east porch of St John's church is built, now greatly decayed. The king's garment full of stabs was preserved here after the reformation.

The town was anciently provided with a stone bridge over the river, which an inundation swept away; but a new and very fine one has lately been built, the most beautiful structure of the kind in North Britain, and was designed and executed by Mr Smeaton. Its length is 900 feet; the breadth (the only blemish) 22 within the parapets. The piers are founded 10 feet beneath the bed of the river, upon oakens and beechen piles, and the stones laid in pizzolano, and cramped with iron. There are nine arches, of which the centre is 75 feet in diameter. This noble work opens a communication with all the different great roads of the kingdom, and was completed at the expense of 26,000L. Of this the commissioners of forfeited estates, by his majesty's permission, gave 11,000L; Perth 2000L; private subscribers 47 66L; the royal boroughs 500L. But still this great work would have met with a check for want of money, had not the earl of Kinnoul, with his characteristic public spirit, advanced the remaining sum, and taken the security
civility of the tolls, at his own hazard. The whole expense has now been defrayed, and the toll has ceased.

This town has but one parish, which has two churches, besides meetings for separatists, who are very numerous. One church, which belonged to a monastery, is very ancient; not a vestige of the last is now to be seen; for the disciples of Knox made a general desolation of every edifice that had given shelter to the worshippers of the church of Rome; it being one of his maxims, to pull down the nests, and then the rooks would fly away.

The flourishing state of Perth it is said was originally owing to numbers of Cromwell's wounded officers and soldiers choosing to reside here, after he left the kingdom, who introduced a spirit of industry among the people. But this town, as well as all Scotland, dates its prosperity from the year 1745; the government of this part of Great Britain having never been settled till a little after that time.

That this town does not owe its origin to William I. 1163, as Bonar says, is evident from its being mentioned as a considerable place in the foundation charter of Holyroodhouse by David I. 1128.

The population of Perth in 1791 is said to have been nearly 20,000; but it is supposed that it has since increased to 22,000. The returns of the population, however, in the census for 1801, are only 14,878, and for 1811, 16,948.

The trade of Perth is considerable. Its staple manufacture is linen, but of late the cotton manufacture has almost superseded it. It exports annually 150,000l. worth of linen, from 24,000 to 30,000 bales of wheat and barley to London and Edinburgh, and a very large quantity of cured salmon. That fish is taken there in vast abundance; 3000 having been caught in one morning; weighing, one with another, 16 pounds, the whole capture 48,000 pounds. The fisheries begin on St Andrew's day, and ends August 26th old style. The rents of the fisheries amount to considerably upwards of 3000l. per annum. Smelts come up this river in May and June. W. Long. 3, 27. N. Lat. 56. 22.

PERTH Amboy. See New Jersey.

PERTINAX, an illustrious Roman-emperor after the death of Commodus. He was descended of a mean family; and like his father, who was either a slave or the son of a mammedile slave, he for some time followed the employment of drying wood and making charcoal. His poverty did not, however, prevent him from receiving a liberal education. For some time he was employed in teaching a number of pupils the Greek and the Roman languages in Etruria. He left this laborious profession and became a soldier, and by his valour and intrepidity gradually rose to offices of the highest trust in the army, and was made consul by M. Aurelius for his services. He was afterwards entrusted with the government of Mesia, and at length he presided over the city of Rome as governor. When Commodus was murdered, Pertinax was universally chosen to succeed to the imperial dignity; and his refusal, on the plea of old age, and increasing infirmities, did not prevent his being saluted emperor and Augustus. He complied with reluctance; but his mildness, his economy, and popularity, convinced the senate and the people of the prudence and the justice of their choice. He forbade his name to be inscribed on such places or estates as were part of the imperial domains, and asserted that they belonged not to him but to the public. He melted all the silver statues which had been raised to his predecessor, and he exposed to sale all his consecrations, horses, arms, and all the instruments of his pleasure and extravagance. With the money raised from these relics he enriched the empire, and was enabled to abolish all the taxes which Commodus had laid on the rivers, ports, and highways, through the empire. These patriotic actions gained him the affection of the worthyst and most deserving of his subjects; but the extravagant, luxurious, and vicious, raised their clamours against him; and when the emperor attempted to introduce among the prætorian guards such discipline as was absolutely necessary to preserve the peace and tranquillity of Rome, the flames of rebellion were kindled, and the minds of the soldiers totally alienated. Pertinax was apprized of their mutinying, but he refused to fly at the hour of danger. He scorned the advice of such of his friends as wished him to withdraw from the impending storm; and he unexpectedly appeared before the sedition troops, and with a mild, and without any fear or concern boldly asked them, whether they who were bound by duty to defend the person of their prince and emperor, were come to betray him and to shed his blood? His undaunted courage and intrepidity would have had the desired effect, and the soldiers had begun to retire, when one of the most sedition of them advanced and darted his javelin at the emperor's breast, exclaiming: The soldiers send you this. The rest instantly followed the example; and Pertinax, muffing up his head, and calling upon Jupiter to avenge his death, remained unmoved, and was immediately dispatched. His head was cut off and carried upon the point of a spear in triumph to the camp. This abominable murder happened in the 103d year of the Christian era.

It was no sooner known that Pertinax had been murdered, than the enraged populace flocked from all quarters of the city; and uttering dreadful menaces against the authors of his death, ran up and down the streets in quest of them. The senators were not less concerned for his death than the people; the more, because they were now convinced, that the soldiers would suffer none to reign but tyrants. However, as they had more to lose than the common people, they did not offer to revenge his death; but either shut themselves up in their own houses, or in those of the soldiers of their acquaintance, thinking themselves there more safe. Such was the unfortunate and much-lamented end of Publius Helvius Pertinax, after he had lived 66 years 7 months and 26 or 28 days; and reigned, according to Dio Cassius, 87 days, that is from the 1st of January to the 28th of March. His body, together with his head, was interred with great pomp by Didius Julianus, his successor, in the burying-place of his wife's family. The emperor Septimius Severus, with the title of emperor, assumed the name of Pertinax, which he knew would above any thing else recommend him to the army in Illyricum, and to the Roman people. He punished with great severity all those who had been necessary to his death, disbanded the prætorian guards, honoured his memory with a most magnificent funeral, at which was carried the effigies of the deceased prince, pronounced his panegyric, and caused him to be ranked in the number of the gods, appointing the son chief priest to his father. The day
day of his accession to the empire was yearly celebrated with the Circensian games; and his birthday, for many years after, with other sports. He performed great things, says Herodian, during his short administration, and would have restored the empire to its former lustre, had he been indulged with a longer reign.

PERU.

PERU, a country of South America, is bounded on the north by Popayan, on the east by Amazonia, on the south by Chili, and on the west by the Pacific ocean; extending from 1° 45' north to 26° 10' south latitude, and between 56° and 81° west longitude from Greenwich, being about 1800 miles in length.

This country was discovered by the Spaniards; and the first intelligence they had of it was on the following occasion. When de Balboa having been raised to the government of the small colony at Santa Maria in Darien, made frequent inroads into the adjacent country, subdued several of the caciques or petty princes, and collected a considerable quantity of gold. In one of these expeditions, the Spaniards contended so violently about the division of some gold which they had taken, that they were on the point of coming to blows with one another. A young cacique who was present, astonished at such contention about a thing of which he knew not the use, tumbled the gold out of the balance with indignation, and turning to the Spaniards, told them, that since they valued gold so highly, he would conduct them to a country near the southern ocean, where the most common utensils were made of that metal.

Balboa was transported at the news. He immediately concluded, that the ocean mentioned by the cacique was that which Columbus had long sought for in vain, and that the rich territory described to him must be part of the East Indies. He was therefore impatient till he should arrive at that happy country, in comparison with the discovery of which all former exploits almost vanished into nothing. In order therefore to procure a force sufficient to ensure success in his enterprise, he first secured the friendship of the neighbouring caciques, and then dispatched some of his officers to Hispaniola, with a large quantity of gold as a proof of his past success, and an earnest of what he expected. By this means he secured the friendship of the governor, and procured a considerable reinforcement. But though he now imagined himself sufficiently strong to attempt the discovery, there were still prodigious difficulties to be surmounted.

Balboa was looked upon as the most difficult that had been undertaken by any Spanish adventurer. On this arduous task Balboa set out on the 1st day of September 1513, about the time that the periodical rains began to abate. He had only 190 Spaniards along with him; but all of them were hardy veterans, inured to the climate of America, and very much attached to their leader. A thousand Indians attended in order to carry their provisions and other necessaries; and they had along with them some of those fierce dogs so terrible to the natives of America.

Balboa proceeded by sea, and without difficulty, to the territories of a cacique whose friendship he had gained; but as soon as he began to advance into the interior parts of the country, he met with all the difficulties above mentioned. Some of the caciques also, at his approach, fled with all their people to the mountains, carrying off or destroying whatever could afford subsistence to an army. Others collected their force in order to oppose him; however, Balboa continued unmoved in spite of all difficulties, and at last, after a most painful journey of 25 days, he arrived at a sight of the South sea; when, with the most extravagant transports of joy, he went into it up to the middle, and took possession of the ocean in his master's name, vowing to defend it against all the enemies of Spain.

That part of the South sea which Balboa now discovered, he called the Gulf of St. Michael; which name it still retains, and is situated to the east of Panama. From some of the neighbouring caciques he extorted provisions and gold by force; others sent him presents voluntarily; and he had the satisfaction to hear, that the adjacent coasts abounded with pearl-oysters. The inhabitants were also unanimous in declaring, that there was to the southward a very rich and populous country, where the people had tame animals, which they endeavoured to describe to him, meaning the Peruvian sheep. But, however, impatient he might be to visit this empire, he considered it as highly improper to venture thither with a handful of men exhausted by labour and disease. He therefore led back his followers to Santa Maria, in order to refresh them after their fatigues; and from thence he sent an account to the court of Spain of the important discovery he had made, demanding a reinforcement of 1000 men, in order to conquer the country he had newly discovered. But here his hopes were all blasted at once. The king indeed determined to prosecute the discovery, but refused to continue Balboa in his government, appointing Padre Juan Davila to supersede him, and giving him the command of 15 stout vessels, with 1200 soldiers, to ensure his success.

Balboa, though much mortified by his disgrace, submitted.
submitted to the king's pleasure without repining. It was not long, however, before he met with an additional misfortune; the new governor tried him for some pretended irregularities committed before his arrival, and fined him of almost all he was worth. In the mean time the Spaniards, paying no regard to the treaties concluded by Balboa with the Indians, plundered and destroyed all indiscriminately, insomuch that the whole country, from the gulf of Darien to the lake Nicaragua, was desolated. The new comers had also arrived at the most unlucky time of the year, namely, about the middle of the wet season, when the excessive rains produced the most violent and fatal diseases. To this was joined an extreme scarcity of provisions; so that in the space of a month above 600 Spaniards perished in the utmost misery.

Balboa failed not to send violent remonstrances to Spain against the conduct of the new governor; and he, on the other hand, accused his antagonist of having deceived the king by false accounts of the country, and magnifying his own exploits beyond measure. At last the king, sensible of his error in superseding Balboa, appointed him adelantado, or lieutenant-governor of the countries on the South sea, with very extensive privileges and authority; enjoining Pedrarias to support him in all his enterprises, and to consult with him in every thing which he himself undertook. It was impossible, however, to extinguish the envy of Pedrarias; and therefore, though a reconciliation took place in appearance, even so far, that Pedrarias agreed to give his daughter in marriage to Balboa, yet he soon after had him condemned and executed on pretence of disloyalty, and an intention to revolt from the king.

On the death of Balboa, the thoughts of conquering Peru were for a time laid aside; however, it still remained an object of desire to all the Spanish adventurers in America. Accordingly, several armaments were fitted out with a design to explore and take possession of the countries to the east of Panama; but, either through the difficulties which attended the undertaking itself, or the bad conduct of the adventurers, all of them proved unsuccessful, until at last it became a general opinion, that Balboa's scheme had been entirely visionary.

Still, however, there were three persons settled at Panama, on whom the common opinions made so little impression, that they determined to go in quest of this country, looked upon to be chimerical by the generality of their neighbours. Their names were Francisco Pizarro, Diego de Almagro, and Hernando Luque. Pizarro and Almagro were soldiers of fortune, and Luque was an ecclesiastic, who acted both as priest and schoolmaster at Panama. Their confederacy was authorised by Pedrarias, governor of Panama; and each engaged to employ his whole fortune in the adventure. Pizarro, being the least wealthy of the three, engaged to take upon himself the greatest share of the fatigue and danger, and to command in person the armament which was to go first upon the discovery. Almagro offered to conduct the supplies of provisions and reinforcements of troops which might be necessary; and Luque was to remain at Panama, in order to negotiate with the governor, and to superintend whatever was carrying on for the general interest.

In 1524, Pizarro set sail from Panama with a single vessel of small burthen and 112 men; and so little was he or his countrymen at that time acquainted with the climate of America, that the most improper season of the year was chosen for his departure: the periodical winds, which were then set in, being directly opposite to the course which he proposed to steer. The consequence of this was, that, after beating about 70 days with much danger and fatigue, he had advanced scarce as far to the south east as a skillful navigator will now make in three days. He touched at several places of Terra Firma; but finding that country exceedingly inhospitable and unhealthy, he was obliged to retire to Chuchama, opposite to the Pearl islands, where he hoped to receive some reinforcements from Panama. Here he was found by Almagro, who had set out in quest of him with a reinforcement of 73 men, and had suffered distresses very much resembling those of Pizarro himself. In particular, he had lost all eye in combat with the Indians. However, he had advanced as far as the river of St. Juan in the province of Topayan, where the country showing a better aspect, and the inhabitants more friendly, our projectors again began to indulge themselves in hopes, and determined by no means to abandon their scheme.

Almagro returned to Panama, in hopes of recruiting their shattered troops. But the bad accounts of the service gave his countrymen such an unfavourable idea of it, that Almagro could levy no more than 80 men, and these with great difficulty. Slander as this reinforcement was, however, the adventurers did not hesitate in renewing their enterprise. The disasters and disappointments they met with in this new attempt, were scarcely inferior to those they had already experienced, when part of the armament at last reached the bay of St Matthew on the coast of Quito, and landed at Tumbez to the south of the river of Emalards, where they met with a more fertile and champaign country than any they had yet seen; the natives also were more civilized, and clothed in garments of cotton or woolen stuff, adorned with trinkets of gold and silver. But notwithstanding these favourable appearances, Pizarro did not think it fit to attack such a powerful empire with a handful of soldiers already exhausted; and therefore retired to a small island called Gallo, with part of the troops; from whence he dispatched Almagro to Panama, in hopes of obtaining a reinforcement.

The reception which Almagro met with was by no means agreeable. Some of the adventurers had informed their friends of the many dangers and losses which they had sustained; which not only disheartened people from engaging in the service, but weighed so much with Pedro de los Rios, the successor of Pedrarias, that he prohibited the raising of new recruits, and even dispatched a vessel to bring home Pizarro and his companions from the island of Gallo. Almagro and Luque, though much mortified with this disappointment, privately advised Pizarro not to relinquish an enterprise on which they had built all their hopes. He therefore positively refused to obey the orders of the governor, and employed all his address in persuading his men not to abandon him. But the calamities to which they had been exposed had such an effect upon them, that when he drew a line upon the sand with his sword, and telling such as wished to return that they might pass over it, only 13 had resolution to remain with him.
Pizarro with his little troop now fixed their residence on the isle of Gorgona, which they considered as a safer retreat than Gallo, as being farther removed from the coast, and uninhabited, so that they might with the greater security wait for supplies. Here they continued five months in the most unwholesome climate imaginable, and at last had come to a resolution of committing themselves to sea on a float, when a vessel arrived from Panama to their relief. This was the effect of the continued solicitations of Almagro and Luque; who, though they could not prevail upon the governor to favour the undertaking, had succeeded so far as to induce him to send a small vessel to the relief of Pizarro and his unfortunate associates. However, the more effectually to show his disapprobation of Pizarro’s scheme, the governor refused to allow one landman to go on board of the ship which he sent. — The hopes of the adventurers were now again revived, and Pizarro easily induced them to resume their scheme. Instead of returning to Panama, therefore, they sailed to the south-east, and in 20 days after the discovery of Gorgona, they discovered the coast of Peru. Having touched at some places of less note, they at length arrived at Tumbes, remarkable for its stately temple, and a palace of the incas or sovereigns of the country. Here they found that what had been told them concerning the riches of the country was true; not only ornaments and sacred vessels being made of gold and silver, but even such as were for common use. Yet to attempt the conquest of this opulent empire with their slender force, would have been madness; they contented themselves therefore with viewing it, procuring two of the beasts of burden called llamases, to which they gave the name of sheep, some vessels of gold and silver, and two young men, whom they proposed to instruct in the Castilian language. With these Pizarro arrived at Panama in the year 1527, near three years after he had set out from that place on his expedition.

The empire of Peru, thus discovered, is said to have been originally possessed by independent tribes, justly reckoned among the most savage even in America; living more like wild beasts than men. For several ages they lived in this manner, when suddenly there appeared on the banks of a lake called Titicaca, a man and woman of majestic form, and clothed in decent garments. They declared themselves to be the children of the sun, sent by their beneficent parent to instruct and reclaim mankind.

The names of these two extraordinary personages were Manco Capac and Mama Ocla. At their persuasion, several of the dispersed savages united, and, receiving their commands as heavenly injunctions, followed them to Cuzco, where they settled, and began to lay the foundations of a city. Manco Capac instructed the men in agriculture, and other useful arts; while Mama Ocla taught the women to spin and weave; after which Manco turned his attention towards the introduction of proper laws and regulations into his new state.

Thus, according to the Indian tradition, was founded the empire of the Incas, or lords of Peru. At first its extent was small, the territory of Manco Capac reaching not above eight leagues from Cuzco to his capital. Within these narrow limits, however, he exercised the most perfect despotism, and the same was maintained by his successors, all of whom were not only obeyed as monarchs, but revered as deities. Their blood was held to be sacred, and, by prohibiting intermarriages with the people, was never contaminated by mixing with that of any other race. The family, thus separated from the rest of the nation, was distinguished by peculiarities in dress and ornaments, which it was unlawful for others to assume. Among the Peruvians, however, it is said, that this high degree of veneration was made use of by the monarchs only to promote the good of their subjects. If we may believe the accounts given by their countrymen, the Peruvian monarchs extended their empire not with a view to increase their own power and wealth, but from a desire of diffusing the blessings of civilization, and the knowledge of the arts which they possessed, among the barbarous people whom they reduced, and, during a succession of 12 monarchs, not one deviated from this character.

The Peruvians were taught by Manco to adore the Creator of heaven and earth, whom they denominated Modern Pacha Camac, that intelligence which animated the world. They seldom built temples or offered sacrifices to him, but worshipped him in their hearts. One Religion of temple, however, dedicated to The unknown God, or the Peru-Spaniards found at their arrival, erected in a valley, thence named the valley of Pacha Camac. The sacrifices instituted in honour of the sun consisted chiefly of lambs; besides which they offered all sorts of cattle, fowls, and corn, and even burnt their finest clothes on the altar by way of incessant. They had also drink offerings made of maize or Indian corn, steeped in water. Nor were those oblations the only acts of adoration in general use among them. When they first drank after their meals, they dipped the tip of their finger into the cup, and lifting up their eyes with great devotion, gave the sun thanks for their liquor, before they presumed to take a draught of it.

Besides the worship of the sun, they paid some kind of veneration to the images of several animals and vegetables that had a place in their temples. These were generally the images brought from the conquered nations, where the people worshipped all the creatures, animate or inanimate; it being the custom, when a province was subdued, to remove all their idols to the temple of the sun at Cuzco.

Exclusive of the solemnities at every full moon, four grand festivals were celebrated annually. The first of those, called Raymi, was held in the month of June, immediately after the summer solstice, and was kept not only in honour of the sun, but of their first Inca, Manco Capac, and Coya Mama Ocla, his wife and sister, whom the Incas considered as their first parents, descended immediately from the sun, and sent by him into the world to reform and polish mankind. At this festival, all the viceroys, generals, governors, and nobility, were assembled at the capital city of Cuzco; and the emperor, or Inca, officiated in person as high-priest; though on other occasions the sacerdotal function was discharged by the regular pontiff, who was usually either the uncle or brother of the Inca.

The morning of the festival being come, the Inca, accompanied by his near relations, drawn up in order according to their seniority, went barefoot in procession, at break of day, to the market-place, where they re-
mained looking attentively towards the east in expectation of the rising sun. The luminary no sooner appeared, than they fell prostrate on their faces in the most profound veneration, and universally acknowledged it to be their god and father.

The local princes, and moiety, that were not of the blood royal, assembled in another square, and performed the like ceremony. Out of a large flock of sheep the priests then chose a black lamb, which they offered in sacrifice, first turning its head towards the east. From the entrails of the victim, on this occasion, they superstitiously drew prognostics relating to peace and war, and other public events.

That the Peruvians believed in the immortality of the soul, appears from the practice of the Incas, who constantly inculcated to the people, that, on leaving this world, they should enter into a state of happiness provided for them by their god and father the sun.

Before the arrival of the Spaniards in America, the Peruvians were acquainted with some points of astronomy. They had observed the various motions of the planets Venus, and the different phases of the moon. The common people divided the year only by the seasons; but the Incas, who had discovered the annual revolution of the sun, marked out the summer and winter solstices by high towers, which they erected on the east and west of the city of Cuzco. When the sun came to rise directly opposite to four of those towers, on the east side of the city, and to set against those of the west, it was then the summer solstice; and in like manner, when it rose and set against the other towers, it was the winter solstice. They had also erected marble pillars in the great court before the temple of the sun, by which they observed the equinoxes. This observation was made under the equator, when the sun being directly vertical, the pillars cast no shade. At those times they crowned the pillars with gazulds of flowers and odoriferous herbs, and celebrating a festival, offered to their adored luminary rich presents of gold and precious stones.

They distinguished the months by the moon, and their weeks were called quarters of the moon; but the days of the week they marked only by the ordinal numbers, as first, second, &c. They were astonished at the eclipses of the sun and moon. When the former hid his face, they concluded it was on account of their sins, imagining that this phenomenon portended famine, war, and pestilence, or some other terrible calamity. In a similar state of the moon, they apprehended that she was sick, and when totally obscured, that she was dying. At this alarming crisis they sounded their trumpets, and endeavoured by every kind of noise to rouse the lunar planet from her supposed lethargy; teaching their children to cry out, and call upon mamaquila, or "mother moon," that she would not die and leave them to perish.

They made no predictions from any of the stars, but considered dreams, and the entrails of beasts which they offered in sacrifice, as instructive objects of divination. When they saw the sun set, they imagined that he plunged into the ocean, to appear next morning in the east.

Among a people wholly void of letters, the speculative essays of the understanding must have been very rude and imperfect. They had, however, among them amentas, or philosophers, who delivered moral precepts, and likewise cultivated poetry. Comedies and tragedies composed by those bards were acted on their festivals before the king and the royal family, the performers being the great men of the court, and the principal officers of the army. The amusements also comprised songs and ballads, but if we may judge from the roughness of the music with which they are said to have been accompanied, they were far from being agreeable to a polished ear.

That the Peruvians were not unacquainted with painting and statuary, appears from the furniture and ornaments of their temples and palaces; but in all the imitations of mechanic arts they were extremely deficient. Though many goldsmiths were constantly employed, they had never invented an anvil of any metal, but in its stead made use of a hard stone. They beat their plate with round pieces of copper in place of hammers; neither had they any files or graving tools. Instead of bellows for melting their metals, they used copper pipes, of a yard long, almost of the form of a trumpet. Having no tongs to take their heated metals out of the fire, they made use of a stick or copper bar. Their carpenters had no proper tools, but hatchets made of copper or flint; nor had they learnt the use of iron; though the country affords mines of that metal. Instead of nails, they fastened their timber with cords or the tough twigs of trees. A thorn, or a small bone, served them for a needle; and instead of thread, the sinews of animals, or the fibres of some plant. Their knives were made of flint or copper.

When the Spaniards first visited this country, they found it agitated by a civil war. Huana Capac, their 12th monarch from the founder of the state, was seated on the throne; who is represented as a prince most conspicuous for his abilities in war than for his pacific virtues. By him the kingdom of Quito was subdued, which almost doubled the extent of the dominions and power of the Peruvian empire. Notwithstanding the ancient and fundamental law against polluting the blood of the Inca with any foreign alliace, Huana married the daughter of the conquered monarch, by whom he had a son named Atabalaipa, commonly written Atabali, to whom, at his death in 1529, he left the kingdom of Quito, bestowing the rest of his dominions upon Huascar his eldest son by a mother of the royal race. This produced a civil war, in which Atabali proved victorious, and afterwards attempted to secure himself on the throne by putting to death all the descendants of Marco Capac, styled the children of the sun, whom he could seize either by force or stratagem; however, from a political motive, he spared the life of his rival Huascar, who had the misfortune to be taken prisoner in an engagement, that, by issuing out orders in his name, he might more easily establish his own authority, and cover the illegality of his birth.

This contest had so much engaged the attention of the Peruvians, that they never once attempted to check the progress of the Spaniards. It was some time, however, before Pizarro was informed of this contest, so much in his favour. The first intelligence which he received of it was a message from Huascar, asking his assistance against Atabali, whom he represented as a rebel and an usurper. Pizarro perceived the importance of the intelligence, and therefore determined
Peru. to push forward, while intestine discord put it out of the power of the Peruvians to attack him with their whole force. Being obliged to divide his troops, in order to leave a garrison in St Michael, which might serve for a place of retreat in case of a disaster, he began his march with only 62 horsemen and 18 foot-soldiers, 20 of whom were armed with cross-bows, and only three with muskets. He directed his course towards Caxamalca, a small town at the distance of 12 days march from St Michael, where Atabali was encamped with a considerable body of troops. Before he had proceeded far, an officer dispatched by the Inca met him with a valuable present from that prince, accompanied with a proffer of his alliance, and his assurances of a friendly reception at Caxamalca. Pizarro, according to the usual artifice of his countrymen in America, pretended to come as the ambassador of a powerful monarch, and declared that he was now advancing with intention to offer Atabali his aid against those enemies who disputed his title to the throne.

As the object of the Spaniards in entering their country was altogether incomprehensible to the Peruvians, they had formed various conjectures concerning it, without being able to decide whether they should consider their new guests as beings of a superior nature, who had visited them from some beneficent motive, or as formidable avengers of their crimes, and enemies to their repose and liberty. The continual professions of the Spaniards, that they came to enlighten them with the knowledge of truth, and lead them in a way of happiness, favoured the former opinion; the outrages which they committed, their rapaciousness and cruelty, were awful confirmations of the latter. While in this state of uncertainty, Pizarro's declaration of his pacific intentions so far removed all the Inca's fears, that he determined to give him a friendly reception. In consequence of this resolution, the Spaniards were allowed to march in tranquillity across the sandy desert between St Michael and Motupe, where the most feeble effort of an enemy, added to the unavoidable distresses which they suffered in passing through that comfortless region, must have proved fatal to them.

From Motupe they advanced towards the mountains which encompass the low country of Peru, and passed through a defile so narrow and inaccessible, that a few men might have defended it against a numerous army. But here likewise, from the same inconsiderate credulity of the Inca, the Spaniards met with no opposition, and took quiet possession of a fort erected for the security of that important station. As they now approached near to Caxamalca, Atabali renewed his professions of friendship; and, as an evidence of his sincerity, sent them presents of greater value than the former.

On entering Caxamalca, Pizarro took possession of a large court, on one side of which was a house which the Spanish historians call a palace of the Inca, and on the other a temple of the sun, the whole surrounded with a strong rampart or wall of earth. When he had posted his troops in this advantageous station, he dispatched Hernando Soto, and his brother Ferdinand, to the camp of Atabali, which was about a league distant from the town. He instructed them to confirm the declaration which he had formerly made of his pacific disposition, and to desire an interview with the Inca, that he might explain more fully the intention of the Spaniards in visiting his country. They were treated with all the respectful hospitality usual among the Peruvians in the reception of their most cordial friends, and Atabali promised to visit the Spanish commander next day in his quarters. The decent deportment of the Peruvian monarch, the order of his court, and the reverence with which his subjects approached his person and obeyed his commands, astonished those Spaniards, who had never met in America with anything more dignified than the petty cacique of a barbarous tribe. But their eyes were still more powerfully attracted by the vast profusion of wealth which they observed in the Inca's camp. The rich ornaments worn by him and his attendants, the vessels of gold and silver in which the repast offered to them was served up, the multitude of utensils of every kind formed of those precious metals, opened prospects far exceeding any idea of opulence that a European of the 16th century could form.

On their return to Caxamalca, while their minds were yet warm with admiration and desire of the wealth which they had beheld, they gave such a description of it to their countrymen, as confirmed Pizarro in a resolution which he had already taken. From his own observation of American manners during his long service in the New World, as well as from the advantages which Cortes had derived from seizing Montezuma, he knew of what consequence it was to have the Inca in his power. For this purpose, he formed a plan as daring as it was perfidious. Notwithstanding the character he had assumed of an ambassador from a powerful monarch, who courted an alliance with the Inca, and in violation of the repeated offers which he had made to him of his own friendship and assistance, he determined to avail himself of the unsuspicious simplicity with which Atabali relied on his professions, and to seize his person during the interview to which he had invited him. He prepared for the execution of his scheme with the same deliberate arrangement, and with as little compunction, as if it had reflected no disgrace on himself or his country. He divided his cavalry into three small squadrons, under the command of his brothers Ferdinand, Soto, and Benalcazar; his infantry was formed into one body, except 20 of most tried courage, whom he kept near his own person to support him in the dangerous service which he reserved for himself; the artillery, consisting of two field-pieces, and the cross-bow men, were placed opposite to the avenue by which Atabali was to approach. All were commanded to keep within the square, and not to move until the signal for action was given.

Early in the morning the Peruvian camp was all in motion. But as Atabali was solicitous to appear with the greatest splendour and magnificence in his first interview with the strangers, the preparations for this were so tedious, that the day was far advanced before he began his march. Even then, lest the order of the procession should be deranged, he moved so slowly, that the Spaniards became impatient and apprehensive that some suspicion of their intention might be the cause of this delay. In order to remove this, Pizarro dispatched one of his officers with fresh assurances of his friendly disposition. At length the Inca approached. First of all appeared
Pizarro, who during this long conference had with difficulty restrained his soldiers, eager to seize the rich spoils of which they had now so near a view, immediately gave the signal of assault. At once the martial music struck up, the cannon and muskets began to fire, the horse salilled out fiercely to the charge, the infantry rushed on sword in hand. The Peruvians, astounded at the suddenness of an attack which they did not expect, and dismayed with the destructive effects of the firearms, and the irresistible impression of the cavalry, fled with universal consternation on every side, without attempting either to annoy the enemy or to defend themselves. Pizarro, at the head of his chosen band, advanced directly towards the Inca; and though his nobles and people crowded around him with officious zeal, and fell on him in numbers at his feet, while they vied one with another in sacrificing their own lives, that they might cover the sacred person of their sovereign, the Spaniards soon penetrated to the royal seat; and Pizarro seizing the Inca by the arm, dragged him to the ground, and carried him as a prisoner to his quarters. The fate of the monarch increased the precipitate flight of his followers. The Spaniards pursued them towards every quarter, and, with deliberate and unrelenting barbarity, continued their slaughter wretched fugitives, who never once offered at resistance. The carnage did not cease until the close of day. Above 4000 Peruvians were killed. Not a single Spaniard fell, nor was one wounded but Pizarro himself, whose hand was slightly hurt by one of his own soldiers, while struggling eagerly to lay hold on the Inca.

The plunder taken on this occasion was immense; but the Spaniards were still unsatisfied; which being observed by the Inca, he endeavoured to apply himself to their ruling passion, avarice, in order to obtain his liber- ty: and therefore offered such a ransom as astonished them, even after all they knew concerning the opulence of the country. The apartment in which he was confined was 22 feet in length and 16 in breadth; and all this space he engaged to fill with vessels of gold as high as he could reach. This proposal was eagerly caught by Pizarro, and a line was drawn upon the walls to mark the stipulated height.

Atabalipa, charmed with the thoughts of liberty, immediately set about performing his part of the agreement, and dispatched messengers into all parts of the empire, in order to collect the immense quantity of gold which he had promised; and though the unfortunate monarch was now in the hands of his enemies, such was the re- neration which his subjects had for him, that his orders were obeyed with as great alacrity as though he had been at full liberty; while he, in the mean time, fretting himself with the hopes of being soon released, made no preparations for expelling the invaders from his dominions.

In a short time Pizarro received intelligence that Almagro was arrived at St Michael with a reinforcement equal to the force he had with him. This was a matter of great joy to the Spaniards, and no small vexation to Atabalipa, who now considered his kingdom as in danger of being totally overrun by these strangers, whose force he neither knew, nor the means they had of transporting themselves. For this reason he determined to put his brother Huascar to death, lest he should join the strangers against him. To this he was the rather in-
clined, as he had got information that the captive prince had been making applications to them, and had offered them a much larger sum than what was stipulated for the Inca's ransom; and in consequence of this determination the unfortunate prince lost his life.

In the mean time the Indians daily arrived at Caxamalca with vast quantities of treasure; the sight of which so much enflamed the Spaniards, that they insisted upon an immediate division: and this being complied with, there fell to the share of each horseman 8000 pesos, at that time not inferior to the value of as many pounds sterling in the present century, and half as much to each foot soldier, Pizarro and his officers receiving shares proportionable to their dignity. A fifth part was reserved for the emperor, together with some vessels of curious workmanship as a present. In consequence of this immense acquisition of wealth, many of the Spaniards became clausorous for their discharge; which was readily granted by their general, as well knowing that the display of their riches would not fail to allure adventurers more hardly, though less opulent, to his standard.

After this division of the spoil, Atabalipa was very importunate with Pizarro in order to recover his liberty; but the Spaniard, with unparalleled treachery and cruelty, had now determined to put him to death. To this he was urged by Almagro's soldiers, who, though they had received an equal share with the rest, were still unsatisfied. The Inca's ransom had not been completed; and they were apprehensive, that whatever sums might afterwards be brought in, the troops of Pizarro would appropriate them to themselves as part of that ransom. They insisted with Pizarro, therefore, to put him to death, that all the adventurers might for the future be on an equal footing. Accounts were likewise received that troops were assembling in the remote provinces of the empire, which Pizarro suspected to be done by the Inca's orders. These accounts were heighted by one Philipillo an Indian interpreter, who had conceived a passion for one of the unhappy monarch's wives; and for this reason wished to have him put to death. Atabalipa himself, too, had the misfortune to have his own ruin by his conceiving a contemptuous notion of Pizarro, which he had not the precaution to conceal.

He had, since they were first discovered by him, admired the European arts of reading and writing, and wished much to know whether he should regard it as a natural or acquired talent. In order to determine this, he desired one of the soldiers who guarded him to write the name of God upon the nail of his thumb. This he showed to several Spaniards successively, asking its meaning; and to his surprise, they all returned the same answer. At length Pizarro entered; and, on presenting it to him, he blushed, and was obliged to own his ignorance; which inspired the Inca with the contemptuous notion of him above mentioned.

In order, however, to give some show of justice to such a detestable action, and that he might be exempted from standing singly as the perpetrator, Pizarro resolved to accuse the Inca of some capital crime, and institute a court of judicature for the purpose of trying him. For this purpose, he appointed himself and Almagro, with two assistants, as judges, with full powers to acquit or condemn: an attorney-general was named to carry on the prosecution in the king's name; counsellors were chosen to assist the prisoner in his defence; and clerks were ordained to record the proceedings of court. Before this strange tribunal a charge was exhibited still more amazing. It consisted of various articles; that Atabalipa, though a bastard, had dispossessed the lawful owner of the throne, and usurped the regal power; that he had put his brother and lawful sovereign to death; that he was an idolater, and had not only permitted, but commanded the offering up of human sacrifices; that he had a great number of concubines; that since his imprisonment, he had wasted and embezzled the royal treasures, which now belonged of right to the conquerors; and that he had excited his subjects to take up arms against the Spaniards. On these heads of accusation they proceeded to try the sovereign of a great empire, over whom they had no jurisdiction. To all these charges the Inca pleaded not guilty. With respect to the death of his brother, he alleged, that the Spaniards could take no cognizance of the fact. With regard to the taxes which he had levied, and the wars he had carried on, they were nothing to the Spaniards; and as to the conspiracy against the Spaniards, he utterly denied it. He called heaven and earth to witness the integrity of his conduct, and how faithfully he had performed his engagements, and the perfidy of his accusers. He desired to be sent over to Spain to take his trial before the emperor; but no regard was paid to his importunities. He was condemned to be burnt alive; which cruel sentence was mitigated, as a great favour, to strangling; and the unhappy monarch was executed without mercy.

The death of the Inca was followed by a revolution in the Spanish affairs, who now became generally odious. Hideous cries were set up by his women as the funeral procession passed by their apartment; many offered to bury themselves alive with him; and on being hindered, strangled themselves out of grief and vexation. The whole town of Caxamalca was filled with lamentation, which quickly extended itself over the whole kingdom. Friends and enemies accused the Spaniards of inhumanity and treachery. Loads of gold that were coming to Caxamalca by order of the deceased Inca were now stopped; and the loss of the treasure was the first unfortunate consequence which the Spaniards felt from their late iniquitous conduct. The two factions of Indians united against Pizarro; and many of the Spaniards not only exclaimed against the cruelty of the judges, but would even have mutinied, had not a sense of the impending danger kept them quiet. At Cuzco the friends of the emperor Huascar proclaimed Manco Capac the legitimate brother of the late Inca, determining to support him to the last against all the machinations of his enemies. Pizarro, in the mean time, set up Tupac, the son of Atabalipa, causing him to be treated with all the honours due to an emperor. Immediately he set out for Cuzco, the gaining of which was absolutely necessary for his design. An army of Indians accompanied the prince, and resolved to dispute his progress. The contest, however, was soon decided; the Spanish cavalry bore down every thing before them, and great numbers of Indians were slain. The conquerors gained a considerable booty; and Pizarro dispatched Almagro to reduce Cuzco, while he himself founded a new colony in the fruitful valley of Xauna; which, however, was not permanent, being
being afterwards removed to the place where Lima now stands.

While Pizarro was thus employed, another commander named Ferdinand Soto, was detached with 60 horse to make the best of his way to Cuzco, and clear the road for the march of the remainder of the army. He was opposed by a formidable collection of Indians, who had fortified themselves in order to defend a pass against him: for which reason, fearing lest his strength might be unequal, he sent a message to Pizarro, desiring that the Inca might join him, thinking that his presence would awe the Peruvians, and prevent the further effusion of blood; but his expectations were frustrated by the death of the Inca, which happened about this time; so that there was now a necessity for having recourse to arms; for as the Spaniards set up no person in his room, the title of Manco Capac was universally acknowledged.

In the mean time, a new supply of soldiers arriving from Spain, Benalcazar, governor of St Michael, undertook an expedition against Quito, where, according to the reports of the natives, Atabalipa had left the greatest part of his treasure. He accomplished his purpose with very great difficulty, having a country covered with rocks and mountains to pass, and being opposed by large bodies of the natives. But when he got possession of the city, to his extreme mortification, he found that the inhabitants had carried off all their gold and silver; for they being now acquainted with the ruling passion of the Spaniards, had taken care to disappoint it, by removing the treasures which they knew very well had been the cause of the expedition.

About the same time Alvarado governor of Guatimala, invaded the province of Chili. In this expedition his troops endured such hardships, and suffered so much from the cold among the Andes, that a fifth part of the men and all the horses died, and at the same time the rest were so much dispirited and emaciated, that they became quite unfit for service. What was worst of all, when they had arrived at the end of their journey, they met with a body of Spaniards drawn up in hostile array to oppose them. These had been sent against him by Pizarro, who claimed Chili as part of his jurisdiction, and were now joined by Benalcazar, with the troops under his command. Alvarado, however, advanced boldly to the attack; but on the interposition of some moderate men in each party, the difference was accommodated. Alvarado engaged to return to his government, upon his being paid 100,000 pesos to defray the expense of his armament. However, most of his followers remained in the country, and enlisted in the service of Pizarro.

In the mean time Ferdinand Pizarro, the brother of the general, had landed in Spain, where he produced such immense quantities of gold and silver as astonished the court, even after all they had seen of the wealth of their new discovered territories. The general’s authority was confirmed to him, with new powers and privileges, and the addition of 70 leagues extending along the coast, to the southward of the territory granted in his former patent. Almagro had the title of adelantado or governor conferred upon him, with jurisdiction over 200 leagues of a country lying southward from the province allotted to Pizarro; he himself was made a knight of the order of St Jago.

Of these transactions some accounts were received at Peru before the arrival of Ferdinand Pizarro himself; and no sooner did Almagro hear that he had obtained the royal grant of an independent government, than, pretending that Cuzco, the capital of all Peru, lay within his jurisdiction, he attempted to seize it. Pizarro was no less ready to oppose him; and a very dangerous civil war was about to take place, when the quarrel was made up, on condition that Almagro should attempt the conquest of Chili; and if he did not find there an establishment equivalent to his expectations, Pizarro should yield up to him part of Peru.

By this reconciliation Pizarro was left at liberty to settle the internal policy of his province, which, though little qualified for a legislator, he attempted, by dividing the country into various districts, appointing magistrates to preside in each, and establishing such regulations concerning the administration of justice, the royal revenue, &c. as occurred to him. The seat of government he removed from Cuzco to Lima, which he named Ciudad des los Reyes, and which name it still retains among the Spaniards in all legal and formal deeds. Its other name, Lima, is a corruption of Rimac, the name of the valley in which the city stands.

In the mean time Almagro had set out on his expedition to Chili; the event of which has been related under the article Chili; and while he was thus employed, Pizarro encouraged some of his most distinguished officers to invade those provinces of the empire which had not yet been visited by the Spaniards. This he did with a view to keep them employed, and prevent tumults; but it was attended with very terrible consequences. No sooner did Manco Capac the Inca perceive the security of the Spaniards in thus dividing their forces, than he seized the opportunity of making one vigorous effort to redress the wrongs of himself and his countrymen, and expel the invaders, who had tyrannized in such a cruel manner. Though strictly guarded by the Spaniards, he found means to communicate his intentions to the chief men of his nation, whom he joined in the year 1536, under pretence of celebrating a festival which he had obtained liberty from Pizarro to attend. Upon this the standard of war was immediately erected, and a formidable army, according to the Spanish historians, of 200,000 men collected. Many Spaniards were massacred in their habitations, and several detachments entirely cut off; and while this vast army laid siege to Cuzco, another formidable body invested Lima, and kept the governor closely shut up. The greatest effort, however, was made against Cuzco, which was defended by Pizarro and his two brothers, with only 170 men. The siege lasted nine months; many of the Spaniards were killed; among whom was Juan Pizarro, the general’s brother, and the best beloved of them all. The rest were reduced to the most desperate situation, when Almagro appeared suddenly in the neighbourhood of Cuzco. He had received such accounts of the insurrection in Peru, as would at any rate have determined him to return to the assistance of Pizarro; but besides this, he had now received the royal
Patent, creating him governor of Chili, and doomed it certain beyond all contradiction, that Cuzco lay within his jurisdiction; for which reason he hastened to prevent it from falling into the hands of the Peruvians. On his arrival his assistance was solicited by both parties. The Inca made many advantageous proposals; but at length despairing of obtaining any certain union with a Spanish ally, he attacked him in the night by surprise with a great body of chosen troops. But the Spanish valour and discipline prevailed against the numbers of their enemies; and the Peruvians were repulsed with such slaughter, that a great part of the remainder dispersed, and Almagro advanced to the gates of Cuzco without opposition. Pizarro's brothers took measures to oppose his entrance; but prudence for the present restrained both parties from entering into a civil war while they were surrounded with enemies; and therefore each leader endeavoured to corrupt the followers of his antagonist. In this Almagro had the advantage; and so many of Pizarro's troops deserted in the night, that Almagro was encouraged to advance towards the city, where he surprised the sentinels, and, entering the houses where the two brothers were lodged, he compelled them, after an obstinate defence, to surrender at discretion; and Almagro's authority over Cuzco was immediately recognized as authentic.

In this fray only two or three persons were killed; but matters soon began to wear a more serious aspect. Francis Pizarro, having dispersed the Peruvians who invested Lima, and received considerable reinforcements from other provinces, ordered 500 men under the command of Alonso de Alvarado to march to Cuzco, in hopes of relieving his brothers, if they were not already cut off. They advanced to a small distance from the capital, before they knew that they had a more formidable enemy than the Indians to encounter. When they saw their countrymen drawn up on the banks of a river to oppose them, they were greatly surprised; however, Almagro, who wished rather to gain them than to fight, began with attempting to seduce their leader. Alvarado could not by any means be gained over; but being inferior in military skill, Almagro attacked him by surprise, entirely defeated and dispersed his army, taking himself and some of his principal officers prisoners.

This victory seemed decisive; and Almagro was advised to make it so by putting to death Gonzalo and Ferdinand Pizarro, Alvarado, and some others whom he could not hope to gain. This advice, however, he declined from motives of humanity, and a desire of making his adversary appear the aggressor. For these reasons, instead of marching directly against Pizarro, he retired quietly to Cuzco; which gave his adversary time to recollect himself from the disorder into which the news of so many disasters had thrown him. He began again to practise upon Almagro those arts which had before proved successful; and Almagro again offered himself to be deceived by pretended offers of pacification. The negotiations for this purpose were protracted for several months; and while Almagro was employed in detecting and eluding the fraudulent intentions of the governor, Gonzalo Pizarro and Alvarado found means to corrupt the soldiers who guarded them, and not only made their own escape, but persuaded 60 of Almagro's men to accompany them. There now remained only Ferdinand Pizarro in the hands of Almagro; and he was delivered by another act of treachery.

The general proposed that all points of controversy should be submitted to the decision of their sovereign; and that Ferdinand Pizarro should be instantly set at liberty, and return to Spain, together with some officers whom the general proposed to send over to show the justice of his claims. Though the intention of Pizarro by making this proposal was evident, Almagro was deceived by it, and released those whom Pizarro wanted; which he had no sooner done, than the latter threw off all disguise, and openly declared, that arms alone must now decide the matter between them. He therefore immediately set out for Cuzco with an army of 700 men, to which Almagro had only 500 to oppose. From the weakness of his forces, probably, Almagro did not attempt to guard some strong passes, through which Pizarro had to march, but waited patiently for his adversary in a plain open country.

In the mean time, Pizarro advanced without any obstruction from his enemy; and an engagement soon happened, in which Almagro was defeated and taken prisoner. The conquerors behaved with great cruelty, massacring a great number of officers, and treating Almagro himself with great severity. The Indians had assembled in great numbers to see the battle, with an intention to join the vanquished party; but were so much overawed by the Spaniards, that they retired quietly after the battle was over, and thus lost the only opportunity they ever had of expelling their tyrants.

Almagro, after having for some months languished in prison, was at length formally tried, and condemned to die by Pizarro. Notwithstanding his consummate bravery, for which he was remarkable, this hardy veteran could not bear the deliberate approach of death, but condescended to use entreaties to save his life. The Pizarros, however, continued inflexible; and he was first strangled in prison, and then publicly beheaded. He and strang left one son by an Indian woman, whom he appointed his successor, by virtue of a power granted him by the emperor.

As during these dissensions all intercourse with Spain ceased, it was some time before the accounts of the civil war were received at court. The first intelligence was given by some of Almagro's soldiers, who had left America on the ruin of their cause; and they did not fail to represent the injustice and violence of Pizarro in the strongest colours, which strongly prejudiced the emperor against him. In a short time, however, Ferdinand Pizarro arrived, and endeavoured to give matters a new turn. The emperor was uncertain which of them he ought to believe; and therefore thought it necessary to send over some person with ample powers to inquire into the merits of the cause, and to determine certainly who was in the wrong. If he found the governor still alive, he was to assume only the title of judge, in order to have the appearance of acting in concert with him; but if he was dead, the viceroy might then produce his commission appointing him Pizarro's successor in the government. This complaisance to Pizarro, however, proceeded more from a dread of his power than from any other thing; for in the mean time, his brother Ferdinand was arrested at Madrid, and con-
Peru divided by Pizarro among his associates.

While this gentleman was preparing for his voyage, Pizarro considering himself as the unrivalled master of Peru, proceeded to parcel out his territories among the conquerors; and this division been made with any degree of impartiality, the extent of country which he had to bestow was sufficient to have gratified his friends, and to have gained his enemies. But Pizarro conducted this transaction, not with the equity and candour of a judge attentive to discover and to reward merit, but with the illiberal spirit of a party-leader. Large districts, in parts of the country most cultivated and populous, were set apart as his own property, or granted to his brothers, his adherents, and favourites. To others, lots less valuable and inviting were assigned. The followers of Almagro, amongst whom were many of the original adventurers, to whose valour and perseverance Pizarro was indebted for his success, were totally excluded from any portion in those lands, towards the acquisition of which they had contributed so largely. As the vanity of every individual sets an immoderate value upon his own services, and the idea of each, concerning the recompense due to them, rose gradually to a more exorbitant height in proportion as their conquests extended, all who were disappointed in their expectations exclaimed loudly against the rapaciousness and partiality of the governor. The partisans of Almagro murmured in secret, and meditated revenge.

Rapid as the progress of the Spaniards in South America had been since Pizarro landed in Peru, their avidity of dominion was not yet satisfied. The officers to whom Ferdinand Pizarro gave the command of different detachments, penetrated into several new provinces; and though some of them were exposed to great hardships in the cold and barren regions of the Andes, and others suffered distress not inferior amidst the woods and marshes of the plains, they made many discoveries and conquests which extended their knowledge of the country, as well as added to their power. Pedro de Valdivia re assumed Almagro's scheme of invading Chili; and, notwithstanding the fortitude of the natives in defending their possessions, made such progress in the conquest of the country, that he founded the city of St Jago, and gave a beginning to the establishment of the Spanish dominion there. But of all the enterprises undertaken about this period, that of Gonzales Pizarro was the most remarkable. The governor, who seems to have resolved that no person in Peru should possess any station of distinguished eminence or authority but those of his own family, had deprived Benalcazar, the conqueror of Quito, of his command in that kingdom, and appointed his brother Gonzales to take the government of it. He instructed him to attempt the discovery and conquest of the country to the east of the Andes; which, according to the information of the Indians, abounded with cinnamon and other valuable spices. Gonzales, not inferior to any of his brothers in courage, and no less ambitious of acquiring distinction, eagerly engaged in this difficult service. He set out from Quito at the head of 340 soldiers, near one half of whom were horsemen, with 4000 Indians to carry their provisions. In for-}

The person nominated to this important trust was Cristoval Vaca de Castro.

33 Expedition of Gonzales Pizarro.

PE R U.

cing their way through the defiles, or over the ridges of the Andes, excess of cold and fatigue, to neither of which they were accustomed, proved fatal to the greater part of the wretched attendants. The Spaniards, though more robust, and inured to a variety of climates, suffered considerably, and lost some men; but when they descended into the low country, their distress increased. During two months it rained incessantly, without any interval of fair weather long enough to dry their clothes. The vast plains upon which they were now entering, either altogether without inhabitants, or occupied by the rudest and least industrious tribes of the New World, yielded little subsistence. They could not advance a step but as they cut a road through woods, or made it through marshes. Such incessant toil and continual scarcity of food, seem more than sufficient to have exhausted and dispirited any troops. But the fortitude and perseverance of the Spaniards in the 16th century were insuperable. Altered by frequent but false accounts of rich countries before them, they persisted in struggling on, until they reached the banks of the Coca or Napo, one of the large rivers whose waters pour into the Maraguan and contribute to its grandness. There, with infinite labour, they built a bark, which they expected would prove of great utility, both in conveying them over rivers, in procuring provisions, and in exploring the country. This was manned with 50 soldiers, under the command of Francis Orellana, the officer next in rank to Pizarro. The stream carried them down with such rapidity, that they were soon at the head of their countrymen, who followed slowly and with difficulty by land.

At this distance from his commander, Orellana, a young man of an aspiring mind, began to fancy himself independent; and, transported with the predominant passion of the age, he formed the scheme of distinguishing himself as a discoverer. by following the course of the Maraguan until it joined the ocean, and by exploring the vast regions through which it flows. This scheme of Orellana's was as bold as it was treacherous. For, if he be chargeable with the guilt of having violated his duty to his commander, and with having abandoned his fellow-soldiers in a pathless desert, where they had hardly any hopes of success or even of safety, but what were founded on the service which they expected from the bark, his crime is, in some measure, balanced by the glory of having ventured upon a navigation of near 2000 leagues, through unknown situations, in a vessel hastily constructed with green timber; and by very unskillful hands, without provisions, without a compass, or a pilot. But his courage and activity supplied every defect. Committing himself fearlessly to the guidance of the stream, the Napo bore him along to the south, until he reached the great channel of the Maraguan. Turning with it towards the coast, he held on his course in that direction. He made frequent descents on both sides the river, sometimes seizing by force of arms the provisions of the fierce savages seated on its banks, and sometimes procuring a supply of food by a friendly intercourse with more gentle tribes. After a long series of dangers, which he encountered with amazing fortitude, and of distresses which he supported with no less magnanimity, he reached the ocean, where new perils awaited him. These he likewise surmounted, and got safe to
he had passed. From the time that his brother made the partial division of his conquests which has been mentioned, the adherents of Almagro, considering themselves as proscribed by the party in power, no longer entertained any hope of bettering their condition. Great numbers in despair resorted to Lima, where the house of young Almagro was always open to them: and the slender portion of his father’s fortune, which the governor allowed him to enjoy, was spent in affording them subsistence. The warm attachment with which every person who served under the elder Almagro devoted himself to his interests, was quickly transferred to his son, who was now grown up to the age of manhood, and possessed all the qualities which captivated the affections of soldiers. Of a graceful appearance, dexterous at all martial exercises, bold, open, generous, he seemed to be formed for command; and as his father, conscious of his own inferiority from the total want of education, had been extremely attentive to have him instructed in every science becoming a gentleman, the accomplishments which he had acquired heightened the respect of his followers, as they gave him distinction and eminence among illiterate adventurers. In this young man the Almagrians found a point of union which they wanted; and looking up to him as their head, were ready to undertake any thing for his advancement. Nor was affection for Almagro their only incitement: they were urged on by their own distresses. Many of them, destitute of common necessaries, and weary of loitering away life, a burden to their chief, or to such of their associates as had saved some remnant of their fortune from pilage and confiscation, longed impatiently for an occasion to exert their activity and courage, and began to deliberate how they might be avenged on the author of all their misery. Their frequent cabals did not pass unobserved; and the governor was warned to be on his guard against men who meditated some desperate deed, and had resolution to execute it. But, either from the native intrepidity of his mind, or from contempt of persons whose poverty rendered their machinations of little consequence, he disregarded the admonitions of his friends. “Be in no pain (said he carelessly) about my life; it is perfectly safe, as long as every man in Peru knows that I can in a moment put out him who dares to harbour a thought against it.” This security gave the Almagrians full leisure to digest and ripen every part of their scheme; and Juan de Herrada, an officer of great abilities, who had the charge of Almagro’s education, took the lead in their consultations, with all the zeal which that connection inspired, and with all the authority which the ascendant that he was known to have over the mind of his pupil gave him.

On Sunday, the 26th of June, at midday, the season which is of tranquillity and repose in all sultry climates, Herrada, at the head of 18 of the most determined conspirators sallied out of Almagro’s house in complete armour; and drawing their swords, as they advanced hastily towards the governor’s palace, cried out, “Long live the king, but let the tyrant die.” Their associates, warned of their motions by a signal, were in arms at different stations ready to support them. Though Pizarro was usually surrounded by such a numerous train of attendants as suited the magnificence of the most opulent subject of the age in which he lived, yet as he was just risen from table, and most of his own domestics had retired...
government in case Pizarro was no more, all who had not sold themselves to the tyrant hastened to acknowledge him. Uncertainty and jealousy, which had for too long a time kept them dispersed, were no longer an obstacle to their re-union. Castro, who was as relentless as if he had grown old in the service, did not suffer their impatience to languish, but instantly led them against the enemy. The two armies engaged at Chupas on the 16th of September 1542, and fought with irresistible obstinacy. Victory, after having wavered a long time, at the close of the day decided in favour of that party whose cause was the most just. Those among the rebels who were most guilty, dreadless to languish and under disgraceful tortures, provoked the conquerors to murder them, crying out, like men in despair, It was I who killed Pizarro. Their chief was taken prisoner, and died on the scaffold.

While these scenes of horror were transacting in America, the Spaniards in Europe were employed in finding out expedients to terminate them; though no measures had been taken to prevent them. Peru had only been made subject to the audience of Panama, which was too remote to superintend the maintenance of good order, and had too little influence to make its decisions respected. A supreme tribunal was then established at Lima for the dispensation of justice, which was to be invested with authority sufficient to enforce and to reward a due obedience to the laws. Blasco Nunez Vela, who presided in it as viceroy, arrived in 1544, attended by his subordinates in office, and found every thing in the most dreadful disorder.

To put an end to those tumults which now subsisted, would have required a profound genius, and many other qualities which are seldom united. Nunez had none of these advantages. Nature had only given him probity, firmness, and ardent; and he had taken no pains to improve these gifts. With these virtues which were almost defects in his situation, he began to fulfill his commission, without regard to places, persons, or circumstances.

Contrary to the opinion of all intelligent persons, who wished that he should wait for fresh instructions from Europe, he published ordinances, which declared victors not. He determined that the lands the conquerors had seized should not pass to their descendents, and which dispossessed those who had taken part in the civil commotions. All the Peruvians who had been enslaved by monks, bishops, and persons belonging to the government, were declared free. Those who belonged to other masters were to be freed from their shackles at the death of their oppressors. They could no longer be compelled to bury themselves in the mines, nor could any kind of labour be exacted from them without payment. Their tribute was fixed. The Spaniards who travelled on foot were deprived of the right of taking three Indians to carry their baggage; and those who travelled on horseback, of the right of taking five. The caciques were discharged from the obligation of furnishing the traveller and his retinue with provisions gratis. Other tyrannical establishments also would soon have been proscribed; and the conquered people were on the eve of being sheltered under the protection of laws, which would at least have tempered the rigours of the right of conquest, if even they had not entirely
repaired the injustice of them; but it should seem that the Spanish government was only to be unfortunate in the good it attempted to affect.

A change so unexpected filled those with consternation who saw their fortunes wrested from them, or who lost the flattering hope of transmitting them to their posterity. Even those who were not affected by these interesting views, being accustomed to look upon the Indians as the instruments and victims of their avarice, had no conception that any other ideas could prevail concerning them. From astonishment they proceeded to indignation, murmuring, and sedition. The viceroy was degraded, put in irons, and banished to a desert island, till he could be conveyed to Spain.

Gonzales Pizarro was then returned from his hazardous expedition, which had employed him long enough to prevent him from taking a part in those revolutions which had so rapidly succeeded each other. The anarchy he found prevailing at his return, inspired him with the idea of seizing the supreme authority. His fame and his forces made it impossible that this should be refused him; but his usurpation was marked with so many enormities, that Nunez was regretted. He was recalled from exile, and soon collected a sufficient number of forces to enable him to take the field. Civil commotions were then renewed with extreme fury by both parties. No quarter was asked or given on either side. The Indians took part in this as they had done in the preceding wars; some ranged themselves under the standard of the viceroy, others under the banners of Gonzales. From 15,000 to 20,000 of these unhappy wretches, who were scattered about in each army, dragged up the artillery, levelled the roads, carried the baggage, and destroyed one another. Their conquerors had taught them to be sanguinary. After a variety of advantages for a long time alternately obtained, fortune at length favoured the rebellion under the walls of Quito in the month of January, in the year 1545; and Nunez with the greatest part of his men were massacred.

Pizarro took the road of Lima, where they were deliberating on the ceremonies with which they should receive him. Some officers wished that a canopy should be carried for him to march under, after the manner of kings. Others, with adulation still more extravagant, pretended that part of the walls of the town, and even some houses must be pulled down; as was the custom at Rome, when the generals obtained the honours of a triumph. Gonzales contented himself with making his entrance on horseback, preceded by his lieutenant, who marched on foot. Four bishops accompanied him, and he was followed by the magistrates. The streets were strewed with flowers, and the air resounded with the noise of bells and various musical instruments. This homage totally turned the head of a man naturally haughty, and of confined ideas. He spoke and acted in the most despotic manner.

Had Gonzales possessed judgment and the appearance of moderation, it would have been possible for him to render himself independent. The principal persons of his party wished it. The majority would have beheld this event with indifference, and the rest would have been obliged to consent to it. Blind cruelties, insatiable avarice, and unbounded pride, altered these dispositions. Even those, whose interests were con-
and the river of the Amazon to the meridian, which divides the Spanish from the Portuguese dominions; and on the west it is bounded by the South sea, extending, according to Antonio de Ulloa, 600 leagues in length, and about 200 in its greatest breadth; but this greatly exceeds the computation of all other geographers. He however observes, that it must be owned a great part of those vast dominions are either inhabited by nations of Indians, or have not hitherto been sufficiently peopled by the Spaniards, if indeed they have been thoroughly known; and that all the parts that can properly be said to be peopled, and actually subject to the Spanish government, are those intercepted by the two Cordillerias of the Andes, which, in comparison to the extent of the country, may be termed a street or lane, 15 leagues, or sometimes more, from east to west; to this must be added several detached governments, separated by the very extensive tracts inhabited by free Indians.

The climate of Quito differs from all others in the same parallel, since even in the centre of the torrid zone, or although under the equinoctial, the heat is not only very tolerable, but even in some places the cold is painful; while others enjoy all the advantages of a perpetual spring, the fields being constantly covered with verdure, and enamelled with flowers of the most lively colours. The mildness of the climate, free from the extremes of heat and cold, and the constant equality of the day and night, render this country, which from its situation might be thought to be parched by the constant heat of the sun, and scarcely inhabitable, both pleasant and fertile; for nature has here dispensed her blessings with so liberal a hand, that this country in several respects surpasses those of the temperate zones, where the vicissitudes of winter and summer, and the change from heat to cold, cause the extremes of both to be more sensibly felt. However, in different parts of the country, the air is very different; in one part are mountains of a stupendous height and magnitude, with their summits covered with snow. The plains are temperate, the valleys hot, and, according to the high or low situations of the country, are found all the variety of gradations in temperature possible to be conceived between the extremes of heat and cold.

Quito, the capital, in 13° south latitude, and 79° 50' west longitude from Greenwich, is so happily situated, that neither heat nor cold are troublesome, though both may be felt in its neighbourhood; and what renders this equality more delightful is, that it is constant throughout the whole year, the difference between the seasons being scarce perceptible. Indeed the mornings are cool, the remainder of the day warm, and the nights of an agreeable temperature. See Quito.

The winds, which are pure and salubrious, blow for the most part from north to south, but never with any violence, though they sometimes shift their quarters, but without any regard to the season of the year. Such signal advantages resulting from the climate, soil, and aspect of this country, would be sufficient to render it the most enviable spot upon earth, as it is supposed to be the most elevated; if, whilst enjoying these delights, the inhabitants were not harassed by terror, and exposed to continual danger; for here tremendous tempests of thunder and lightning prevail, which are sufficient to appal the stoutest heart; whilst earthquakes frequently spread universal apprehensions, and sometimes bury cities in ruins.

The distinction of winter and summer consists in a very minute difference; the interval between the month of September and those of April, May, or June, is here called the winter season, and the other months compose the summer. In the former season the rain chiefly prevails, and in the latter the inhabitants frequently enjoy whole days of fine weather; but whenever the rains are discontinued for above a fortnight, the inhabitants are in the utmost consternation, and public prayers are offered up for their return. On the other hand, when they continue a short time without intermission, the like fears prevail, and the churches are again crowded with supplicants to obtain fine weather; for a long drought produces dangerous diseases, and a continual rain, without intervals of sunshine, destroys the fruits of the earth. The city of Quito, however, enjoys one peculiar advantage, in being free from mosquitoes and other troublesome insects, such as fleas and venomous reptiles, except the migua or pique, which is a very small insect shaped like a flea, but hardly visible to the sight.

Though there is much barren land in the country, the soil, fertility of the soil in some spots is incredible, for the fruits and beauties of the several seasons are visible at the same time; and the curious European observers, with a pleasing admiration, that while some herbs of the field are fading, others of the same kind are springing up; while some flowers lose their beauty, others blow to continue the enamelled prospect; thus, when the fruits of the trees have attained their maturity, and the leaves begin to change their colour, fresh leaves blossom, and fruits are seen in their proper gradations in size and ripeness on the same tree. The same incessant fertility is conspicuous in the corn, both reaping and sowing being carried on at the same time; so that the declivities of the neighbouring hills exhibit all the beauties of the four seasons in one assemblage. Though all this is generally seen, yet there is a settled time for the grand harvest: yet sometimes the most favourable season for sowing in one place is a month or two after that of another, though their distance does not exceed three or four leagues. Thus in different spots, and sometimes in one and the same, sowing and reaping are performed throughout the whole year, the forwardness or retardment naturally arising from the different situations, such as mountains, rising grounds, plains, and valleys; and the temperature being different in each, the best times for performing the several operations of husbandry must also differ. The chirimoya is considered as one of the most delicious fruits in the world. Its dimensions are various, being from one to five inches in diameter. Its figure is imperfectly round, flatted towards the stalk, where it forms a kind of navel; but all the other parts are nearly circular. It is covered with a thin soft shell, which adheres so closely to the pulp as not to be separated from it without a knife. The outward coat is green, variegated with prominent veins, forming all over it a kind of net-work. The pulp is white, and contains a large quantity of juice resembling honey, of a sweet taste, mixed with a gentle acid of a most exquisite flavour. The seeds are formed in several parts of the pulp, and are somewhat flat. The tree is high and tufted, the stem large and round, but with some inequalities,
qualities, full of elliptic leaves, terminating in a point. The blossom differs little from the colour of the leaves, which is a darkish green; and though far from being beautiful, is remarkable for its incomparable fragrance.

The granadilla in its shape resembles an hen's egg, but is larger. The outside of the shell is smooth, glossy, and of a faint carnation colour, and the inside white and soft. The shell contains a viscid liquid substance, full of very small and delicate grains, less hard than those of the pomegranate. This medulla substance is separated from the shell by a fine and transparent membrane. Its fruit has a delightful sweetness blended with acidity, very cordial and refreshing, and so wholesome, that there is no danger of eating to excess.

The frutilla, or Peruvian strawberry, is very different from that of Europe in size; though they are here generally not above an inch in length, they are much larger in other parts of Peru; but their taste, though juicy, and not unpleasant, is not equal to those in Europe.

Thin bread is observed to abound more in women than in men, which is the more remarkable, as those causes which induce men to leave their country, as travelling, commerce, and war, naturally bring over more men from Europe than women. But there are many families in which there are a number of daughters, without one son among them. The women enjoy a better state of health than the men, which may be owing in some measure to the climate, and more particularly to the early intemperance and voluptuousness of the other sex.

The Creoles are well made, of a proper stature, and of a lively and agreeable countenance. The Mestizos are also in general well made, often taller than the ordinary size, very robust, and have an agreeable air. The Indians, both men and women, are commonly low of stature, though strong and well proportioned; but more natural defects are to be found among them than in any of the rest. Some are remarkably short, some idiots, dumb, or blind. Their hair is generally thick and long, which they wear loose on their shoulders; but the Indian women plat theirs behind with a ribbon, and cut that before a little above the eyebrows, from one ear to the other. The greatest disgrace that can be offered to an Indian of either sex is to cut off their hair; for whatever corporal punishment their masters think proper to inflict on them, they bear with patience; but this affront they never forgive; and accordingly the government has interposed, and limited this punishment to the most enormous crimes. The colour of the hair is generally a deep black: it is lank, harsh, and as coarse as that of a horse. On the contrary, the male Mestizos, in order to distinguish themselves from the Indians, cut off their hair; but the females do not adopt that custom.

The Mestizos in general wear a blue cloth, manufactured in this country; but though they are the lowest class of Spaniards, they are very ambitious of distinguishing themselves as such, either by the colour or fashion of the clothes they wear.

The Mestizo women affect to dress in the same manner as the Spanish, though they cannot equal the ladies in the richness of their stuff. The meaner sort wear no shoes; but, like the men of the same rank, go bare-footed.

The dress of the Indians consists of white cotton drawers, which hang down to the calf of the leg, where they are loose, and edged with a lace suitable to the stuff. The use of a shirt is supplied by a black cotton frock, made in the form of a sack, with three openings at the top, one in the middle for the head, and others at the corners for the arms; thus covering their naked bodies down to the knees. Over this is a serge cloak, with a hole in the middle for putting the head through, and a hat made by the natives. This is their general dress, which they never lay aside, even while they sleep; and they have no additional clothing for their legs or feet. The Indians, who have acquired some fortune, particularly the barbers and phlebotomists, distinguish themselves from their countrymen by the fineness of their drawers, and by wearing a shirt, which, though without sleeves, has a lace four or five fingers in breadth, fastened round like a kind of ruff or band. They are fond of silver or gold buckles to their shoes, though they wear no stockings; and instead of a mean serge cloak, wear one of fine cloth, which is often adorned with gold or silver lace.

There are two kinds of dresses worn by the Indian women, made in the same plain manner with those worn by the men in general, the whole consisting of a short petticoat and a veil of American baize. But the dress of the lowest class of Indian women is only a bag of the same make and stuff as that of the men, which they fasten on their shoulders with two large pins; it reaches down to the calf of the leg, and is fastened round the waist with a kind of girdle. Instead of a veil, they wear about the neck a piece of the same coarse stuff dyed black; but their arms and legs are naked.

The people have dishes unknown in Europe; but are food and particularly fond of cheese; and have excellent butter, drink, &c. in the neighbourhood of Quito. Sweetmeats are very much admired.

Rum is commonly drank here by persons of all ranks, but their favourite liquor is brandy. The disorders arising from the excessive use of spirituous liquors are chiefly seen among the Mestizos; and the lower class of women, both among the Creoles and Mestizos, are also extremely addicted to the same species of debauchery.

Another liquor much used in this country is mate, which is made of an herb known in all these parts of America by the name of Paraguay, as being the produce of that country. Some of it is put into a calabash tipped with silver, called here mate, with sugar and some cold water. After it has continued there some time, the calabash is filled with boiling water, and they drink the liquor through a pipe fixed in the calabash. It is also usual to squeeze into the liquor a small quantity of the juice of lemons or Seville oranges, mixed with some perfumes from odoriferous flowers. This is their usual drink in the morning fasting, and many use it also at their evening regale. The manner of drinking it appears very indelicate, the whole company taking it successively through the same pipe, it being carried several times round the company till all are satisfied. This among the Creoles is the highest enjoyment: so that
that when they travel, they never fail to carry with them a sufficient quantity of it, and till they have taken their dose of mate they never eat.

The vice of gaming is here carried to an extravagant height, to the ruin of many families, some losing their stocks in trade, others the very clothes from their backs, and afterwards those belonging to their wives, which they hazard, stimulated by the hope of recovering their own.

The common people, the Indians, and even the domestics, are greatly addicted to stealing. The Mestizos, though arrant cowards, do not want audacity in this way; for though they will not venture to attack any one in the street, it is a common practice to snatch off a person's hat, and immediately seek their safety in flight. This acquisition is sometimes of considerable value; the hats worn by persons of rank, and even by the wealthy citizens when dressed, being of white beaver, worth fifteen dollars, besides the hatband of gold or silver lace, fastened with a gold buckle set with diamonds or emeralds. Robberies on the highway are seldom heard of.

In most of the towns and villages, different dialects are spoken, Spanish being no less common than the Inca, the language of the country. The Creoles use the latter as much as the former, but both are considerably adulterated by borrowed words and expressions. The first language generally spoken by children is the Inca; for the nurses being Indians, many of them do not understand a word of Spanish, and thus they afterward learn a jargon composed of both languages.

The sumptuous manner of performing the last offices for the dead, demonstrates how far the power of habit is capable of prevailing over reason and prudence, for their ostentation is so great in this particular, that many families of credit are ruined by posthumously endow ing to excel others; and the people here may be said to toil and scheme to lay up wealth, to enable their successors to lavish honours upon a body insensible of all pageantry.

The commerce of the province of Quito is chiefly carried on by Europeans settled here, and others who occasionally arrive. The manufactures of this province are only cottons, some white and striped bai ze, and cloths, which meet with a good market at Lima, for supplying the inward provinces of Peru. The returns are made partly in silver, and partly in fringes made of gold and silver thread, and wine, brandy, oil, copper, tin, lead, and quicksilver. On the arrival of the galleons at Carthagena, these traders resort thither to purchase European goods, which, at their return, they consign to their correspondents all over the province. The coasts of New Spain supply this province with indigo, of which there is a very large consumption at the manufactures, blue being universally the colour which this people adopt for their apparel. They also import, by way of Guayaquil, iron and steel both from Europe and the coast of Guatemala.

The disposition of the Indians in the province of Quito is extremely remarkable, and they appear to have no resemblance to the people found there by those who first discovered the country. They at present possess a tranquility not to be disturbed either by fortunate or unfortunate events. In their mean apparel they are as contented as a prince clothed in the most splendid robes. They show the same disregard to riches; and even the authority and grandeur within their reach is so little the object of their ambition, that to all appearance it seems to be the same to an Indian whether he be created an alcalde, or obliged to perform the office of a common executioner.

Their sloth is so great that scarcely any thing can induce them to work. Whatever therefore is necessary to be done is left to the Indian women, who are much more active; they spin and make the half shirts and drawers which form the only apparel of their husbands; they cook the provisions, grind barley, and brew the beer called *chicha*; while the husband sits squatt ing on his hams, the usual posture of the Indians, looking at his busy wife. The only domestic service they do is to plough their little spot of land, which is sown by the wife. When they are once seated on their hams, no reward can induce them to stir: so that if a traveller has lost his way, and happens to come to one of their cottages, they charge their wives to say that they are not at home. Should the passenger slight and enter the cottage, the Indian would still be safe; for having no light but what comes through a hole in the door, he could not be discovered; and should the stranger even see the Indian, neither entreaties nor rewards would prevail on him to stir a step with him.

They are lively only in parties of pleasure, rejoicings, entertainments, and especially dancing; but in all these the liquor must circulate briskly, and they continue drinking till they are entirely depraved both of sense and motion.

It is remarkable that the Indian women, whether maid or married, and Indian young men before they are of an age to contract matrimony, are never guilty of this vice: it being a maxim among them, that drunkenness is the privilege of none but masters of families, who, when they are unable to take care of themselves, have others to take care of them.

The women present the *chicha* (A) to their husbands in calabashes, till their spirits are raised; then one plays on a pipe and tabor, while others dance. Some of the best voices among the Indian women sing songs in their own language, and those who do not dance, squat down in the usual posture till it comes to their turn. When tired with intemperance, they all lie down together, without regarding whether they be near the wife of another or their own sister or daughter. These festivities sometimes continue three or four days, till the priest coming

---

(A) This is a liquor made from maize by the following process. The maize, after being soaked in water till it begins to grow, is dried in the sun, then parched a little, and at last ground. The flour, after it has been well kneaded, is put with water into a large vessel, and left two or three days to ferment. Its taste is nearly that of the most indifferent kind of cider. It is a refreshing, nourishing, and aperitive liquor; but it will not keep above eight days without turning sour.
in one general and instantaneous destruction. The river of Latacunga was the receptacle of this dreadful flood, till becoming swollen above its banks, the torrent rolled over the adjacent country, continuing to sweep away houses and cattle, and rendered the land near the town of the same name as the river one vast lake. Here, however, the inhabitants had sufficient warning to save their lives by flight, and retreated to a more elevated spot at some distance. During three days the volcano ejected cinders, while torrents of lava with melted ice and snow poured down the sides of the mountain. The eruption continued for several days longer, accompanied with terrible roarings of the wind, rushing through the craters which had been opened. At length all was quiet, and neither smoke nor fire were to be seen; until in May 1744 the flames forced a passage through several other parts on the sides of the mountain; so that in clear nights the flames, being reflected by the transparent ice, exhibited a very grand and beautiful illumination. On the 13th of November following, it ejected such prodigious quantities of fire and lava, that an inundation equal to the former soon ensued, and the inhabitants of the town of Latacunga for some time gave themselves over for lost.

The most southern mountain of the Cordilleras is that of Mocas or Sangay, which is of a prodigious height, and the far greatest part of it covered with snow; yet from its summit issues a continual fire, attended with explosions which are plainly heard at 40 leagues distance. The country adjacent to this volcano is entirely barren, being covered with cinders ejected from its mouth. In this mountain rises the river Sangay, which being joined by the Upano, forms the Payna, a large river which discharges itself into the Maranon.

Pichincha, though famous for its great height, is 1278 yards lower than the perpendicular height of Cotopaxi, and was formerly a volcano, but the mouth or crater on one of its sides is now covered with sand and calcined matter; so that at present neither smoke nor fire issue from it. When Don George Juan and Don Antonio de Ulloa were stationed on it for the purpose of making astronomical observations, they found the cold on the top of this mountain extremely intense, the wind violent, and they were frequently involved in so thick a fog, or, in other words, a cloud, that an object at an or eight paces distance was scarcely discernible. The air grew clear, by the clouds moving nearer to the earth, and on all sides surrounding the mountain to a vast distance, representing the sea with the mountains standing like an island in the centre. When this happened, they heard the dreadful noise of the tempests that discharged themselves on Quito and the neighbouring country. They saw the lightning issue from the clouds, and heard the thunder roll far beneath them. While the lower parts were involved in tempests of thunder and rain, they enjoyed a delightful serenity; the wind was abated, the sky clear, and the enlivening rays of the sun moderated the severity of the cold. But when the clouds rose, their thickness rendered respiration difficult; snow and hail fell continually, and the wind returned with all its violence; so that it was impossible entirely to overcome the fear of being, together with their hut, blown down the precipice on whose edge it was built, or of being buried in it by the conflagrant
Peru.  stant accumulations of ice and snow. Their fears were
likewise increased by the fall of enormous fragments of
rocks. Though the smallest crevice visible in their hut
was stopped, the wind was so piercing that it penetrated
through; and though the hut was small, crowded with
inhabitants, and had several lamps constantly burning,
the cold was so great, that each individual was obliged
to have a clay-pipe of coal, and several men were
constantly employed every morning to remove the snow
which fell in the night. By the severities of such a
climate their feet were swollen, and so tender that walk-
ing was attended with extreme pain, their hands cov-
ered with chilblains, and their lips so swollen and
chopat that every motion in speaking drew blood.

57
Province of
Lima.

58
Climate, soil, &c. to this pro-
vince.

The next division of Peru is the audience of Lima,
which is bounded on the north by Quito, on the east
by the Cordilleras of the Andes, on the south by the
audience of Los Charcos, and on the west by the Paci-
fic ocean, it being about 770 miles in length from north
to south, being of an unequal breadth.

The climate and soil of this country is uncommonly
various; in some places it is exceedingly hot, in others
insupportably cold; and in the city of Lima, where rain
never falls, it is always temperate. The seasons vary
within the compass of a few miles, and in certain parts
of the audience all the vicissitudes of weather are ex-
perienced in 24 hours. It is extremely remarkable that
no rains fall or rivers flow on the sea coasts, though the
country is refreshed by thick fogs, and the heat abated
by dense clouds that never condense into showers. This
phenomena has drawn the attention of many natural-
hists, without their being able satisfactorily to account
for it.

Spring begins toward the close of the year, that is
about the end of November or the beginning of Decem-
ber, when the vapours which fill the atmosphere during
the winter subside, and the sun, to the great joy of the
inhabitants, again appears, and the country then begins
to revive, which, during the absence of his rays, had
continued in a state of languor. This is succeeded by
summer, which, though hot from the perpendicular di-
rection of the sun's rays, is far from being insupport-
able; the heat, which indeed would otherwise be exces-
sive, being moderated by the south winds, which always
blow at this season, though with no great force. Win-
ter begins at the latter end of November or the begin-
ing of July, and continues till November or December, when
the south winds begin to blow stronger, and to produce
a certain degree of cold, not indeed equal to that in
countries where ice and snow are known, but so keen
that the light dresses are laid by, and cloth or other
warm stuffs worn. During the winter the earth is cov-
ered with so thick a fog, as totally to intercept the
rays of the sun: and the winds, by blowing under the
shelter of this fog, retain the particles they contracted
in the frozen zone. In this season only the vapours dis-
solve into a very small dew, which everywhere equally
moistens the earth; by which means all the hills, dur-
ing the other parts of the year offer nothing to the
sight but rocks and wastes, are clothed with verdure
and enamelled with flowers of the most beautiful col-
lours: these flowers never fall in such quantities as to
impart the roads or incommode the traveller; a very
thin stuff will not soon be wet through; but the con-

P E

R U.

being exhaled by the sun, fertilizes every part of the
country.

From a table of meteorological observations made in
the city of Lima, from the month of March 1791, to
March 1792, it appears that the thermometer was low-
est during the month of September, when it descended
to 6.4°, and that it was highest in the month of March,
when it rose as high as 87°. These temperatures do-

1687.
1687. It began at four in the morning, and destroyed many of the finest public buildings and houses, in which a great number of the inhabitants perished; but this was little more than a prelude to what followed; for two hours after, the shock returned with such impetuous conjunctions, that all was laid in ruins, and the inhabitants felt themselves happy in being only spectators of the general devastation, by having saved their lives, though with the loss of all their property. During this second shock, the sea retired considerably, and then returning in mountainous waves, entirely overwhelmed Callao, which is at five miles distance from Lima, and all the adjacent country, together with the miserable inhabitants. From that time six earthquakes have happened at Lima previous to that of 1746. This last was on the 28th of October, at half an hour after ten at night, when the concussions began with such violence, that in little more than three minutes the greatest part, if not all the buildings in the city, were destroyed, burying under their ruins those inhabitants who had not made sufficient haste into the streets and squares, the only places of safety. At length the horrible effects of the first shock ceased; but the tranquillity was of short duration, the concussions swiftly succeeding each other. The force of Callao also broke into mines; but what it suffered from the earthquake in its building was inconsiderable, when compared to the dreadful catastrophe which followed; for the sea, as is usual on such occasions, receding to a considerable distance, returned in mountainous waves, foaming with the violence of the agitation, and suddenly buried Callao and the neighbouring country in its flood. This, however, was not entirely effected by the first swell of the waves; for the sea receding farther, returned with still greater impetuosity, and covered both the walls and other buildings of the place; so that whatever had escaped the first inundation was totally overwhelmed by those succeeding mountainous waves. Twenty-three ships and vessels, great and small, were then in the harbour, 19 of which were sunk, and the other four, among which was a frigate named St. Fermin, were carried by the force of the waves to a considerable distance up the country. This terrible inundation and earthquake extended to other parts on the coast, and several towns underwent the same fate as the city of Lima; where the number of persons who perished within two days after it began, amounted, according to the bodies found, to 1,300, besides the maimed and wounded, many of whom lived only a short time in great torture. The present population of this city, taken from accurate sources, amounts to 52,627.

The country of Lima enjoys great fertility, producing all kinds of grain and a prodigious variety of fruit. Here industry and art supply that moisture which the clouds withhold. The ancient Inca of Peru caused small canals to be formed, in order to conduct the waters of the rivers to every part of the country. The Spaniards, finding these useful works executed to their hands, had only to keep them in order; and by these are watered spacious fields of barley, large meadows, plantations, vineyards, and gardens, all yielding uncommon plenty. Lima differs from Quito, where the fruits of the earth have no determined season; for here the harvest is gathered in, and the trees drop their leaves in the proper season.

Although the summer here is hot, yet venemous crea-

Vol. XVI. Part I.
this jurisdiction are famous for vast quantities of large
and excellent olives, far exceeding the finest produ-
ced in Europe, being nearly, it is said, the size of a
hen's egg.

The audience of Charcas, the last division of Peru,
is equal in extent to that of Lima; but many of its
parts are not so well inhabited, some being full of vast
deserts and impenetrable forests, while others have ex-
tensive plains intercepted by the stupendous height of
the Cordilleras: the country is inhabited only in such
parts as are free from those inconveniences. It is bound-

60

ed on the north by the diocese of Cusco, and reaches
southward to Buenos Ayres; on the east it extends to
Brasil; and on the west it reaches to the Pacific ocean,
particularly at Atacama. The remainder of the pro-

61

vince borders on the kingdom of Chili.

This audience is divided into the archbishopric of
Plata, and five bishoprics. We shall begin with the
former.

The famous mountain of Potosi is known all over the
commercial world for the immense quantity of silver it
has produced. The discovery of this amazing treasure
happened at the commencement of the year 1545, by a
mere accident, which we shall mention afterwards.
At a small distance from it are the hot medicinal baths,
called Don Diego, whither some resort for health and
others for amusement.

At the time when the first conquests were made,
when emigrations were most frequent, the country of
the Incas had a much greater reputation for riches than
New Spain; and, in reality, for a long time much more
considerable treasures were brought away from it. The
desire of partaking of them must necessarily draw thi-

er, as was really the case, a greater number of Cast-
tilians. Though almost all of them went over thither
with the hope of returning to their country to enjoy the
fortune they might acquire, yet the majority settled in
the colony. They were induced to this by the softness
of the climate, the salubrity of the air, and the good-
ness of the provisions. Mexico presented not the same
advantages, and did not give them reason to expect so
much independence as a land infinitely more remote
from the mother-country.

Cusco attracted the conquerors in multitudes. They
found this capital built on a ground that was very irregu-
lar, and divided into as many quarters as there were
provinces in the empire. Each of the inhabitants might
follow the usages of his native country; but every body
was obliged to conform to the worship established by the
founder of the monarchy. There was no edifice that
had any grandeur, elegance, or convenience; because
the people were ignorant of the first elements of archi-
tecture. The magnificence of what they called the pa-
lace of the sovereign, of the princes of the blood, and of
the great men of his empire, consisted in the profusion
of the metals that were lavished in decorating them.
The temple of the Sun was distinguished above all other
edifices; its walls were incrusted or sheathed with
gold and silver, ornamented with divers figures, and
loaded with the idols of all the nations whom the Incas
had enlightened and subdued.

62

As it was not a solicitude for their own preservation
which occupied the Spaniards at first, they had no sooner
pillaged the immense riches which had been amassed

63

at Cusco for four centuries, than they went in great
numbers in 1534, under the order of Sebastian de Ben-
alcazar, to undertake the destruction of Quito. The
other towns and settlements of the empire were over-
run with the same spirit of rapine; and the citizens
and the temples were plundered in all parts.

Those of the conquerors, who did not take up their
residence in the settlements which they found already
formed, built towns on the sea-coasts, where before
there were none: for the sterility of the soil had not
permitted the Peruvians to multiply much there; and
they had not been induced to remove thither from the
extremity of their country, because they sailed very
little. Paita, Truxillo, Callao, Pisco, and Arica, were
the roads which the Spaniards deemed most convenient
for the communication they intended to establish among
themselves and with the mother country. The differ-
ent positions of these new cities determined the degree
of their prosperity.

Those which were afterwards built in the inland parts
of the country were not erected in regions which pre-

64

sented a fertile soil, copious harvests, excellent pastures,
a mild and salubrious climate, and all the conveniences
of life. These places, which had hitherto been so well
cultivated by a numerous and flourishing people, were
now totally disregarded. Very soon they exhibited only
a deplorable picture of a horrid desert; and this wild-
ness must have been more melancholy and hideous than
the dreary aspect of the earth before the origin of so-
iceties. The traveller, who was led by accident or
curiosity into these desolate plains, could not forbear
adorning the barbarous and bloody authors of such de-

65

vastations, while he reflected that it was not owing
even to the cruel illusions of glory, and to the fanaticism
of conquest, but to the stupid and abject desire of
gold, that they had sacrificed so much more real trea-
sure, and so numerous a population.

This insatiable thirst of gold, which neither tended
to subsistence, safety, nor policy, was the only mo-
tive for establishing new settlements, some of which
have been kept up, while several have decayed, and
others have been formed in their stead. The fate of
them all has corresponded with the discovery, progress,
or declension of the mines to which they were subordi-
nate.

Fewer errors have been committed in the means of
procuring provisions. The natives had hitherto lived
hardly on any thing else but maize, fruits, and pulse,
for which they had used no other seasonings except salt,
and pimento. Their liquors, which were made from
different roots, were more diversified: of these the chicha
was the most usual; but the conquerors were not satis-

66

67

factory either with the liquors or with the food of the
people they had subdued. They imported vines from the
Old World, which soon multiplied sufficiently in the

68

lands of the coast at Ica, Pisco, Nasca, Moquegua,
and Truxillo, to furnish the colony with the wine and
brandy it wanted. Olives succeeded still better; and
yielded a greater abundance of oil, which was much
superior to that of the mother-country. Other fruits
were transplanted with the same success. Sugar suc-
ceeds so well, that none of any other growth can be
compared to that which is cultivated in those parts,
where it never rains. In the inland country wheat and
barley
barley were sown; and at length all the European quadrupeds were soon found grazing at the foot of the mountains.

This was a considerable step; but there still remained much more to be done. After they had provided for a better and a greater choice of subsistence, the next care of the Spaniards was to have a dress more commodious and more agreeable than that of the Peruvians. These were, however, better clothed than any other American nation. They owed this superiority to the advantage which they alone possessed, of having the Llama and Pacos, domestic animals which served them for this use. See Camelus, Mammalia Index.

After the conquest, all the Indians were obliged to wear clothes. As the oppression under which they groaned did not allow them to exercise their former industry, they contented themselves with the coarser cloths of Europe, for which they were made to pay an exorbitant price. When the gold and silver which had escaped the rapacity of the conquerors were exhausted, they thought of re-establishing their national manufactories. These were some time after prohibited, on account of the deficiency which they occasioned in the exports of the mother country. The impossibility which the Peruvians found of purchasing foreign stuffs and paying their taxes, occasioned permission to be given at the end of ten years for their re-establishment. They have not been discontinued since that time; and have been brought to as great a degree of perfection as it was possible they could be under a continual tyranny.

With the wool of the vicuna, a species of wild pacos, they make, at Cusco, and in its territory, stockings, handkerchiefs, and scarfs. These manufactures would have been multiplied, if the spirit of destruction had not fallen on animals as well as on men. The same wool, mixed with that of the sheep imported thither from Europe, which have exceedingly degenerated, serves for carpets, and makes also tolerably fine cloth. Fleeces of inferior quality are employed in serges, druggets, and in all kinds of coarse stuffs.

The manufactures subservient to luxury are established at Arequipa, Cusco, and Lima. In these three towns is made a prodigious number of gold toys and plate, for the use of private persons, and also for the churches. All these manufactures are but coarsely wrought, and mixed with a great deal of copper. We seldom discover more taste in the gold and silver laces and embroideries which their manufactures also produce. This is not altogether the case in regard to their lace, which, when mixed with that of Europe, looks very beautiful. This last manufacture is commonly in the hands of the nuns, who employ in it the Peruvian girls, and the young Mestees of the towns, who for the most part before marriage pass some years in the convent.

Other hands are employed in painting and gilding leather for rooms, in making with wood and ivory pieces of inlaid work and sculpture, and in drawing figures on the marble that is found at Cusca, or on linen imported from Europe. These different works, which are almost all manufactured at Cusco, serve for ornaments for houses, palaces, and temples: the drawing of them is not bad, but the colours are neither exact nor permanent. If the Indians, who invent nothing, but are excellent imitators, had able masters and excellent models, they would at least make good copies. At the close of the last century, some works of a Peruvian painter, named Michael de St Jacques, were brought to Rome; and the connoisseurs discovered marks of genius in them.

Though the Peruvians were unacquainted with coin, of the they knew the use of gold and silver; for they employed them in different kinds of ornaments. Independent of what the torrents and accident procured them of these metals, some mines had been opened of little depth. The Spaniards have not transmitted to us the manner in which these rich productions were drawn from the bosom of the earth. Their pride, which has deprived us of so much useful knowledge, undoubtedly made them think, that, in the inventions of a people whom they called barbarous, there was nothing that was worthy to be recorded.

The difference as to the manner in which the Peruvians worked their mines, did not extend to the mines themselves. The conquerors opened them on all sides. At first the gold mines tempted the avarice of the greater number. Fatal experience discouraged those whom passion had not blinded. They clearly saw, that, for some enormous fortunes raised in this manner, great numbers who had only moderate fortunes, were totally ruined. These mines sunk into such discredit, that, in order to prevent them from being abandoned, the government was obliged to take the 20th part of their produce, instead of the fifth which it at first received.

The mines of silver were more common, more equal, and richer. They even produced silver of a singular species, rarely found elsewhere. Towards the sea-coast, great lumps of this metal are found in the sands.

There are a greater number of other mines which are infinitely more important, and are found in the rocks and on the mountains. Several of them gave false hopes. Such, in particular, was that of Ucuntaya, discovered in 1713. This was only an incrustation of almost massive silver, which at first yielded several millions, but was soon exhausted.

Others which were deeper have been alike deserted. Their produce, though equal to what it was originally, was not sufficient to support the expense of working them, which augmented every day. The mines of Quito, Cusco, and Arequipa, have experienced that revolution which awaits many of the rest.

There are greater numbers of very rich mines which the waters have invaded. The disposition of the ground, which from the summit of the Cordilleras goes continually shelving to the South sea, must necessarily render these events more common at Peru than in other places. This inconvenience, which with greater care and skill might often have been prevented or diminished, has been in some instances remedied.

Joseph Salcedo, about the year 1660, had discovered, not far from the town of Pina, the mine of Lurquacocha. It was so rich, that they often cut the silver with a chisel. Prosperity had so elevated the mind of the proprietor, that he permitted all the Spaniards who came to seek their fortunes in this part of the New World, to work some days on their own account, without weighing or taking any account of the presents he made them. This generosity drew around him an infinite number of people, whose avidity made them quarrel with each other, and the love of money made them take up arms.
and fall upon one another; and their benefactor, who had neglected no expedient to prevent and extinguish their sanguinary contentions, was hanged as being the author of them. Whilst he was in prison, the water got possession of his mine. Superstition soon made it imagined that this was a punishment for the horrid act they had perpetrated against him. This idea of divine vengeance was revere for a long time; but at last, in 1740, Diego de Bazan associated with other opulent people to avert the springs which had deluged so much treasure. The labours which this difficult undertaking required, were not finished till 1754. The mine yields as much now as it did at first. But mines still richer than this have been discovered. Such, for example, is that of Potosi, which was found in the same country where the Incas worked that of Poroce.

An Indian, named Hualpa, in 1545, pursuing some deer, in order to climb certain steep rocks laid hold of a bush, the roots of which loosened from the earth, and brought to view an ingot of silver. The Indian had recourse to it for his own use; and never failed to return his treasure every time that his wants or his desires solicited him to it. The change that had happened in his fortune was remarked by one of his countrymen, and he discovered to him the secret. The two friends could not keep their counsel and enjoy their good fortune. They quarrelled; on which the indiscreet confidant discovered the whole to his master, Villarroel, a Spaniard who was settled in the neighbourhood. Upon this the mine became known, and was worked; and a great number of them were found in his vicinity; the principal of which are in the northern part of the mountain, and their direction is from north to south. The most intelligent people of Peru have observed, that this is in general the direction of the richest mines.

The fame of what was passing at Potosi soon spread abroad; and there was quickly built at the foot of the mountain a town, consisting of 60,000 Indians and 10,000 Spaniards. The sterility of the soil did not prevent its being immediately peopled. Corn, fruit, flocks, American stuffs, European luxuries, arrived there from every quarter. Industry, everywhere where the current of money, could not search for it with so much success as at its source. It evidently appeared that in 1738 these mines produced annually near 978,000l. without reckoning the silver which was not registered, and what had been carried off by fraud. From that time the produce has been so much diminished, that no more than one-sixth part of the coin which was formerly struck is now made.

At the mines of Potosi, and all the mines of South America, the Spaniards, in purifying their gold and silver, used mercury, with which they are supplied from Guanaca Velica. The common opinion is, that this mine was discovered in 1564. The trade of mercury was then still free: it became an exclusive trade in 1571. At this period all the mines of mercury were shut; and that of Guanaca Velica alone was worked, the property of which the king reserved to himself. It is now found to diminish. This mine is dog in a prodigiously large mountain, 60 leagues from Lima. In its profound abyss are seen streets, squares, and a chapel, where the mysteries of religion on all festivals are celebrated. Millions of flambeaux are continually kept to enlighten it.

Private people at their own expence work the mine of Guanaca Velica. They are obliged to deliver to government, at a stipulated price, all the mercury they extract from it. As soon as they have procured the quantity which the demands of one year require, the work is suspended. Part of the mercury is sold on the spot, and the rest is sent to the royal magazines throughout all Peru; from whence it is delivered out at the same price it is sold for in Mexico. This arrangement, which has occasioned many of the mines to drop, and prevented others from being opened, is inexcusable in the Spanish system. The court of Madrid, in this respect, merits the same reproaches as a ministry in other countries would incur, that would be blind enough to lay a duty on the implements of agriculture.

Peru originally included the provinces of Quito and Potosi, which are described with it in this article; but these provinces are now separated from it. The area of Peru, thus restricted in its limits, is 33,628 square leagues, as stated in the beginning of this article. The population by the last census amounted to 1,576,122 persons of all ages and conditions; but the returns are believed to be under the truth, and the real amount of the population is believed to be about 1,300,000. Of these four-tenths are Indians. The remainder is made up of European Spaniards, Spanish Creoles, Mestizos, Negroes, Mulattoes, and Samboes. It is ascertained, from a census in 1551, that the present number of inhabitants in Peru, Santa Fe, and Buenos Ayres, does not much exceed one third of the number at the conquest.

Peru, in its present extent, contained in 1791, 69 mines of gold which were then wrought, 784 mines of silver, four of quicksilver, four of copper, 12 of lead. The whole produce of its silver mines for the ten years, ending in 1789, was 29,728,154 dollars; of its gold mines, 4,424,635. For both metals, the average annual produce was 3,415,218 dollars.

The produce of the royal duties from the mines of Potosi from 1556 to 1780—224 years, was 1,550,707,743 dollars. The corresponding produce of silver from the mines is 2,400,000,000 dollars. But, as a great part of the silver was smuggled, the actual produce of the mines must have been much greater.

The commerce of Peru with the adjacent provinces of Chili, Guayaquil, Panama, and Goatemala, employs 45 vessels of different sizes, the tonnage of which is 35,550 quintals; and they are manned by 1,460 seamen. The annual imports in this trade for five years, ending 1789, was 2,066,824 dollars, and the exports 1,694,755. The imports of Peru from the mother country, for the five years ending 1779, were 23,838,183 dollars, or 4,767,636 annually; but, in the five years ending 1789, from the removal of certain restrictions on the trade, they had increased to 42,099,313 dollars, or 8,419,862 dollars annually. The exports were 21,302,385 dollars in the former period, and 35,979,339 in the latter.

The revenue of Peru amounts to nearly 5,000,000 dollars annually; but the clear revenue derived from the colony of Old Spain does not exceed 300,000 dollars.

Balsam
PETAGUEL, a territory of South America, in Brazil; bounded on the north by Dele, on the east by the sea, on the south by the captainship of Rio-Grande, and on the west by Tupyra. It contains mines of silver.

PETAL, in Botany, one of the coloured leaves which compose the flower.

PETALISM, a mode of deciding on the guilt of citizens, similar to the Athenian ostracism. It was introduced in Syracuse about the year before Christ 460, in order to prevent the tyranny of the richer citizens, who had often about that time aimed at the diadem. To prevent, therefore, the evils daily arising from thence, and to bring down the aspiring minds of the wealthy citizens, the Syracusans were forced to make a law not unlike that of the Athenian ostracism; for as at Athens every citizen was to write on a shell the name of the person whom they conceived to be the most likely, on account of his wealth and adherents, to aspire to the crown; so at Syracuse they were to write on a leaf the names of such as they apprehended powerful enough to usurp the sovereignty. When the leaves were counted, he who had the most suffrages against him was, without any further inquiry, banished for five years. This new-contrived method of impairing the estates, and weakening the interest of the overgrown citizens, was called petalism, from the Greek word petalon, which signifies "a leaf." This law was attended with many evil consequences; for those who were most capable of governing the commonwealth were driven out, and the administration of public affairs committed to the meanest of the people; nay, many of the chief citizens, who were able to render their country great service, fearing to fall under penalties of this law, withdrew from the city, and lived private in the country, not concerning themselves with public affairs: whence all the employments being filled with men of no merit or experience, the republic was on the brink of ruin, and ready to fall into a state of anarchy and confusion. The law therefore of petalism, upon more mature deliberation, was repealed soon after it had been first enacted, and the reins of government were again put into the hands of men who knew how to manage them.

PETARD, in the art of war. See GUNNERY.

PETAU, DENIS, or DIONYSIUS PETAVIUS, a French Jesuit of great erudition, was born at Orleans in 1583. His father was a man of literature, and observing strong parts and an excellent genius for letters in his son, he took every means in his power to improve him. He used to tell his son, that he ought to qualify himself so, as to be able to attack and confound "the grant of the Allophylus," meaning that most eminent scholar Joseph Scaliger, whose abilities and learning were allowed to have done great honour and much service to the reformers. Young Petavius seems to have entered readily into his father's views; for he studied most intensely, and afterwards levelled much of his erudition against Scaliger. He joined the study of the mathematics to that of the belles lettres; and afterwards applied himself to a course of philosophy, which he began in the college of Orleans, and finished at Paris. He afterwards maintained theses in Greek, which was as familiar to him as Latin; and the Latin, it is said, he understood better than he did his own native language. When he was pretty well advanced, he had free access to the king's library, which he often visited on account of the Latin and Greek manuscripts. Among other advantages which accompanied his literary pursuits, was the friendship of Isaac Casaubon.
PET

bon, whom Henry IV. called to Paris in 1600. It was at Casaubon's instigation, that Petavius, though then but very young, undertook an edition of The Works of Synesius. In this edition he corrected the Greek from the manuscripts, translated that part which yet remained to be translated into Latin, and wrote notes upon the whole. He was but 19 years of age when he was made professor of philosophy in the university of Bourges; and he spent the two following years in studying the ancient philosophers and mathematicians. In 1602, when Morel, professor of Greek at Paris, published The Works of Chrysostom, some part of Petavius's labours on Synesius were added to them: from the title of which we learn, that he then took the name of Petavius, which he afterwards changed into Petcheli. His own edition of The Works of Synesius did not appear till 1612.

He entered into the society of the Jesuits in 1603, and did great credit to it by his vast and profound erudition. He became a zealous advocate for the church of Rome; and there was no way of serving it more agreeable to him than that of criticiising and abusing its adversaries. He was most bitter against Scaliger; nor did he even spare his friend Casaubon whenever he came in his way.—Petavius excelled particularly in the dark science of chronology; he learned the world in general better obliged to him for some exact and nice disquisitions on this subject. His chief work, which is in great repute to this day, he entitled, Rationarium Temporum. It is an abridgement of universal history, from the earliest times to 1632, in chronological order, with references to proper authorities. It was improved, and several additions made to it, by Perizonius, and others after his death. This eminent father, after a very laborious life, died at Paris in the end of the year 1652, aged 69. Gassendus, in his life of Pereschius, says he was the most consummate scholar the Jesuits ever had; an opinion very likely to be true, when we consider that he often contended successfully with Scaliger, Salmassius, and others, whose abilities have been universally acknowledged. His judgment, however, was not equal to his erudition, and his controversial writings are full of sourness and spleen. We have the following character of a great work of Petavius by an ambassador of celebrity, but who perhaps is as much biased on the side of indigence as he thinks his learned Jesuit was in favour of the church of Rome. The Dogmata Theologica of Petavius are a work of incredible labour and compass: the volumes which relate solely to the incarnation (two folios, 5th and 6th, of 837 pages) are divided into 16 books—the first of his history, the remainder of controversy and doctrine. The Jesuit's learning is copious and correct: his Latinity is pure, his method clear, his argument profound and well connected; but he is the slave of the fathers, the scourge of heretics, and the enemy of truth and candour, as often as they are inimical to the Catholic cause.

PETAW, an ancient town of Germany, in the circle of Austria, and in Stria. It is a handsome place, and is seated on the river Drave, 33 miles north-east of Ciley, and 109 south of Vienna. E. Long. 19° 35. N. Lat. 45° 40.

PETCHELI, a province of Asia, in China, and the chief in the whole empire; bounded on the east by the sea, on the north by the great wall, on the west by Chansi, and on the south by Chantong and Honan. This province contains nine cities of the first class, which have several others under their jurisdiction; these are about 40 in number, less considerable indeed, but all surrounded with walls and ditches. Petcheli has few mountains. Its soil is sandy, and produces very little rice; but all other kinds of grain abound there, as well as the greater part of the fruit-trees we have in Europe. It pays an annual tribute to the emperor, which, according to Father Martin, consists of 521,333 bags of rice, wheat, and millet; 224 pounds of linseed; 45,755 of spun silk; 13,748 of cotton; 8,727,248 trusses of straw for the horses belonging to the court, and 180,870 measures of salt, each containing 124 pounds; which is proportionally much inferior to that paid by other provinces. The population of this province is estimated at 38,000,000.

"It is remarked that the people of this province have not the same aptitude for acquiring the sciences as those who inhabit the southern provinces of the empire; but they are more robust and warlike; and better calculated to endure the hardships and fatique of war. This is the case with the Chinese of all the other northern countries.

"The face of the country here being flat and level, permits the use of a kind of carriage, the construction of which appears to be rather singular. Father Martin, one of the first missionaries in China, thus describes it: 'They use, in the province of Petcheli, a kind of chariot with one wheel, and constructed in such a manner, that there is room in the middle for only one person, who sits as if on a horseback; the driver pushes behind, and, by means of wooden levers, makes the chariot advance with safety and expedition.' This has perhaps given rise to the report of chariots driven in that country by the wind, which the Chinese direct over land with sails, as they do ships at sea. A French missionary, who traversed this province in 1768, seems to have made use of the same kind of carriage. 'We quitted the canal (says he) to travel in carts, which is customary in this part of China; but it is disagreeable beyond description. The cart is amazingly clumsy, and has a great resemblance to the carriage of a gun: there is room in it for only one person, who is frequently obliged to sit cross-legged, as our tailors do in Europe; it jolts prodigiously; and, while the traveller is exposed to the scorching rays of the sun, such clouds of dust sometimes arise as almost suffocate him.'

"The temperature of the air of this province does not seem to agree with its latitude. Although Petcheli extends no farther than to the 42d degree of north latitude, yet all the rivers there are so much frozen during four months in the year, that horses and waggons with the heaviest load's may safely pass them. It deserves to be remarked, that the whole body of ice is formed in one day, and that several are necessary to thaw only the surface. What may appear no less extraordinary is, that during these severe frosts one does not feel that sharp and pinching cold which accompanies the production of ice in Europe. These phenomena cannot be accounted for, but by attributing them to the great quantity of nitre which is found dispersed throughout this province, and to the serenity of the sky, which, even during winter, is seldom obscured by a cloud. The physical explanation, which we have given of this singular temperature, is fully confirmed by experiments lately made by Father Amiot at Peking, which convinced him, that in this capital and neighbourhood, as far as seven or eight
PETECHII, a name given to those spots, whether red or of any other colour, which appear in malignant fevers.

PETELIA. See Strongoli.

PETER, St, the apostle, born at Bethsaida, was son of John, Jona, or Joana, and brother of St Andrew (John i. 42, 43). His first name was Simon or Simeon; but when our Saviour called him to the apostleship, he changed his name into Cephas, that is, in Syriac, a stone or a rock; in Latin petra, whence Peter. He was a married man; and had his house, his mother-in-law, and his wife, at Capernaum upon the lake of Gennesareth (Mark i. 29. Matth. viii. 14. Luke iv. 38.). St Andrew having been first called by Jesus Christ, met his brother Simon, and told him (John i. 41.) we have found the Messiah, and then brought him to Jesus. Jesus beholding him, said to him, You are Simon son of Jona; henceforth you shall be called Cephas, that is, stone or rock. After having passed one day with our Saviour, they returned to their ordinary occupation, which was fishing. Yet it is thought they were present with him at the marriage of Cana in Galilee. This happened in the 30th year of the vulgar Christian era.

Towards the end of the same year, Jesus Christ being on the shore of the lake of Gennesareth, saw Peter and Andrew busy about their fishery, and washing their nets, (Luke v. 1, 2, 3.) He entered into their boat, and bid Peter throw out his nets into the sea, in order to fish. Peter obeyed him, though he had already fished the whole night without catching anything. They took up so many fishes at this draught, that their own vessel, and that of James and John, sons of Zebedee, were filled with them. Then Peter threw himself at the feet of Jesus, and said to him, Depart from me, Lord, for I am a sinner. Then Jesus said to them, Follow me, and I will make you fishers of men. He said the same thing to James and John; and immediately they quitted their boats and nets, and followed our Saviour.

Some time after, Jesus coming to Capernaum, entered into the house of St Peter, where his mother-in-law lay sick of a fever. He immediately healed her, and she began to minister to him (Luke iv. 38. and Matt. viii. 14.). A little while before the feast of the passover of the following year, being the 32d of the vulgar era, after Jesus returned into Galilee, he made choice of twelve apostles, among which St Peter has always the first place (Matt. x. 2. Luke vi. 13.). One night that Jesus Christ walked upon the waters of the lake of Gennesareth, St Peter asked him leave to come and meet him (Matt. xiv. 28, 29.). Jesus gave him leave; but he seeing a great wave coming, was afraid, and therefore began to sink. Then Jesus held him up, and said, O man of little faith, why was you afraid? After
Peter also landed on the other side of the lake, and the multitude that he had fed the day before beyond the lake being come to him at Capernaum, he spoke to them of his body and of his blood, which he was to give to his disciples to eat and drink. This so offended the multitude, that several of them quitted him thereupon. He therefore asked his apostles if they also would leave him; to which Peter replied, To whom shall we go, Lord; for thou hast the words of eternal life (John vi. 53, 54, &c.). One day, as our Saviour was near Caesarea Philippi, he asked his apostles whom the world took him for? they answered, that some said he was John the Baptist; others, Elias; and others Jeremiah, or one of the prophets. But whom do you say I am? says Jesus Christ. Simon Peter answered, Thou art Christ, the son of the living God. Jesus then said unto Peter, Blessed art thou Simon Barjonus; for flesh and blood hath not revealed unto me, but my Father which is in heaven (Matt. xvi. 13, 14, &c.). And I say unto thee, that, as thou art Peter, so upon this rock will I build my church, and the gates of hell shall not prevail against it; and I will give unto thee the keys of the kingdom of heaven, and whatsoever thou shalt bind on earth shall be bound in heaven, and whatsoever thou shalt loose upon earth shall be loosed in heaven. About six or eight days after this, our Saviour taking Peter, James, and John, up a high mountain apart, from the other disciples, showed them a glimpse of his glory, and was transfigured before them (Matt. xvi. 1, 2, &c., and Luke ix. 28.). Whereupon Peter, seeing Moses and Elias together with Jesus, cried out to them in an ecstasy, Lord, it is good for us to be here: if you please we will make three tents; one for you, one for Moses, and one for Elias.

Jesus returning from thence to Capernaum, those who gathered the tribute money came to Peter, and said, Does not your master pay tribute? Whereupon Jesus ordered Peter to throw his line into the sea, and that he should find there wherein to pay the toll for them two in the mouth of the first fish he should take. Peter obeyed; and finding a piece of money in the mouth of the fish, he gave it to the tribute-gatherers, as he was directed. One day, as Jesus was discoursing concerning the forgiveness of injuries (Matt. xviii. 21, 22.), St Peter asked him, how often they must forgive, and whether it was sufficient to pardon an offender seven times? Jesus told him, I say, you must pardon not only as far as seven times, but even seventy-times seven. Upon another occasion (Matt. xix. 27—29.), as our Saviour was speaking of the danger of riches, Peter said to him, Lord, we have left all things to follow thee; what reward shall we have for it? Jesus answered him, I tell you in truth, that you who have left all things to follow me shall receive an hundred fold even in this world, and in the other eternal life; and at the last day, when the Son of man shall come to judge the world, you shall sit upon twelve thrones to judge the twelve tribes of Israel.

On the Tuesday before our Saviour’s passion, Peter showed him the fig-tree he had cursed the evening before, which was now dried up and withered (Mark xi. 12—21.); and the day following, as they sat upon the mountain of Olives, he, with the other apostles, asked Jesus when the temple was to be destroyed (Matt. xxiv. 1, 2, &c. Mark xiii. 1, 2, &c. Luke xxii.). On Thursday he was sent with St John to prepare all things for the passover; and at evening, when Jesus was come into the city with his apostles, and being sat down at table, began to speak of him that should betray him, Peter made signs to John to ask him who this should be (John xiii. 24.). After supper, the disciples entered into dispute which should be the greatest among them: whereupon Jesus Christ, laying aside his garments, betook himself to wash their feet, to give them an example of humility in his own person. St Peter at first made some difficulty, and would not suffer his master to wash his feet: but Jesus telling him, that if he did not wash his feet, he could have no part in him; St Peter replied, Lord, wash not only my feet, but my hands and head also (John xiii. 6—10.).

Some time after, Jesus said to him (Luke xxii. 31, 32, &c.), Peter, Satan has desired to sift you as men sift wheat; but I have prayed for you, that your faith may not fail: and when you are converted, confirm your brethren. By this he warned St Peter of his fall, that was just at hand, and of his renouncing him; from which by the assistance of God, he was afterwards to recover. St Peter then asked him, where was he going? and said, he was ready to follow him everywhere, not only to prison, but to death itself. But Christ declared to him, that he would be so far from following him to death that he would abjure him three times that very night before the cock should crow, or before break of day. When supper was ended, he went to the garden of Olives, where, taking Peter, James, and John, he went with them apart, that they might be witnesses of his agony. Peter, though before he had showed so much resolution, yet fell asleep with the rest; which occasioned Jesus to say to him, Do you sleep, Simon? Could you not watch with me one hour? (Mark xiv. 37, Matt. xxvi. 40, &c.).

Judas being come with the soldiers to seize Jesus, Peter drew his sword, and cut off the right ear of one called Malchus, who was servant to the high-priest: but Jesus bid him put up his sword into the scabbard, and told him, that all those who fought with the sword should perish by the sword: and at the same time healed Malchus’s ear (John xviii. 10, &c.). Peter followed Jesus afar off, as far as the house of Caiphas, and was let in by means of another disciple, who was known in the family. The soldiers and servants that had brought Jesus, having lighted a fire in the middle of the hall, Peter mingled among them to warm himself also; when a maid-servant, having looked earnestly upon him, said, Surely this man was with Jesus of Nazareth. But Peter made answer, I know not what you say, for I do not so much as know the man. Presently after he went out into the porch, when immediately the cock crew. A little while after another maid said to those that were present, This man was with Jesus of Nazareth. But Peter denied it with an oath. About an hour after, one of the company affirmed that Peter was a disciple of Jesus. Others insisted upon the same thing; and said that surely he was one of them, for his very speech betrayed him to be a Galilean. Lastly, one of them, being a kinsman of Malchus whose ear Peter had cut off, affirmed the same thing; and asked him, Did not I see you with him in the garden? Peter again denied it with an oath, protesting that he did not know the man. And at the same time the cock crowed the second time.
time. Then Jesus, being in the same hall, and not far from Peter, looked upon him; and Peter then remembering what Jesus had said to him, that before cock-crow he should deny him thrice, he went out of Caiaphas’s house, and wept bitterly (Matt. xxvi. 73, 75. Mark xiv. 34, 72.).

Very probably he remained in secret, and in tears, all the time of our Saviour’s passion, that is, all Friday and Saturday following; but on Sunday morning, Jesus being risen, and Mary having been at the tomb, and not finding the body of Jesus, she came in haste into the city, to tell Peter and John that they had taken away their master, and that she could not find where they had put him. Peter and John made haste thither, and John coming first, did not go into the sepulchre. Peter then coming up to him, presently stooped down, and saw the linen clothes wherein the body had been wrapt. He went then into the sepulchre, and John with him; after which they returned to Jerusalem, not knowing what had come to pass. But soon after Jesus appeared to the three women, who had come first to the sepulchre, and bid them not to give his apostles notice of his resurrection. And the same day our Saviour also appeared to Peter, to comfort him, and assure him that his repentance had been acceptable to him.

Some days after, St. Peter being returned into Galilee as Jesus had commanded him, and going to fish in the sea of Galilee, or in the lake of Gennesareth, with some other of the apostles, Jesus appeared to them on the shore, and bid them throw out their nets on the right side of the vessel. They threw them out, and took such a multitude of fishes that they could not draw up their nets again. Then St. John said to Peter, It is the Lord. Peter immediately girded up himself, for he was naked, and swimming to shore he came to Jesus: then drawing their nets to shore, Jesus dined with them. After dinner, Jesus said to Peter, Simon, son of Jonas, do you love me more than these? He answered, Yes, Lord, you know that I love you. Jesus says to him, Then feed my lambs. He put the same question to him again; and Peter making the same answer, our Lord said to him again, Feed my sheep. He repeated a third time; at which St. Peter was troubled, and said, You know, Lord, that I love you. Jesus replied to him, Feed my sheep. I tell you for a truth, that when you were young, you girded yourself, and went where you pleased; but now you are old, another shall gird you, and lead you where you would not go. This he said to let him know what death he was to die. At the same time, Peter seeing St. John the Evangelist, said to our Saviour, Lord, what must become of him? Jesus answered, if I will that he tarry till I come, what does that concern you? Do you follow me? Thus he refused to declare in what manner St. John should end his life.

After that Jesus Christ had ascended into heaven, and that the apostles had been witnesses of his ascension, they returned to Jerusalem, to wait there for the Holy Ghost, whom our Saviour had promised to send them; and being assembled together in a house, they continued there in prayer, and in the union of charity, till the time that the Holy Ghost descended upon them, in the form of tongues of fire. During this interval, St. Peter proposed to the apostles, and to the rest of the assembly, to fill up the place that the traitor Judas had left vacant in the apostleship. The proposal was agreed to by all; and two persons were proposed, Joseph Baraba and Matthias: upon this last the lot fell; and from that time he was admitted one of the apostles. The tenth day after the ascension of our Saviour, being the day of Pentecost, the Holy Ghost having descended upon the apostles, and upon all the faithful that were assembled with them, and having replenished them with supernatural gifts, and especially with the gift of tongues, all those who were witnesses of this miracle expressed their admiration at it: and there being upon that day at Jerusalem a great many Jews from several provinces of the east, they could not comprehend by what means these men, who were Galileans, should speak the languages of all these pagan nations (Acts ii. 1, 2, &c.). Some of them said, that the apostles were full of new wine. But St. Peter standing up, told them, that what they heard and saw was not the effect of drunkenness, but was the completion of the promise that the Holy Ghost had made by the prophet Joel (ii. 28.), to send his spirit upon all flesh, and to give the spirit of prophecy to young men, old, to men and women. He declared to them of Jesus Christ, and told them that he was the true Messiah, that he was risen from the dead as the scripture had foretold he should; declaring that himself and the other apostles were witnesses of his resurrection, of his ascension into heaven, and of the mission of the Holy Ghost, the visible effects of which they saw with their own eyes in the gifts of languages wherewith they had been replenished.

Then those that heard him were touched with compassion, and asked the apostles, brethren, what shall we do? Peter answered them, Repent, and be baptized, and you shall receive the Holy Ghost. Then he instructed them, baptized them, and that very day three thousand persons were added to the church (Acts iii. 1, 2, &c.). Some days after, St. Peter and John, going to the temple at the hour of prayers, met at a gate of the temple, a man who had been lame from his birth, so that he was carried about. This man seeing Peter and John, asked alms of them: upon which Peter said to him, Silver or gold I have not; but such as I have I give thee: In the name of Jesus of Nazareth, rise up and walk. Presently the man got up, and went into the temple along with them, lifting up his voice, and glorifying God. He held St. Peter, telling the people then assembled all that had happened unto him. Then Peter, taking this occasion, told the people, that it was not by his own power that he had performed the miracle they so much wondered at, but that it was by the power of Jesus Christ that this man was healed. He then laid before them the great crime they had committed, in putting Jesus Christ to death, who was the Saviour of the world, and the Messiah; and after he had shown them by all the prophecies that Christ was to die thus, he exorted them to repentance, and to make a proper return of the death of Christ.

He was thus speaking to the people, when the priests and Sadducees coming upon them, laid hold on Peter and John, and put them in prison, until the day following, it being now late (Acts iv. 1, 2, &c.). But the number of those that were converted this day at the second preaching of St. Peter was about five thousand. The day following, the rulers, magistrates, and
PET

chief priests being assembled on this occasion, ordered the apostles to be brought before them; and then asked them, by whose authority they performed the miracle of healing the lame man? St Peter answered, that it was in the name of Jesus of Nazareth, whom they had crucified, and whom God raised again from the dead. The assembly were surprised at the boldness of the apostles upon this occasion: but came to a resolution to dismiss them, charging them at the same time to teach no more in the name of Jesus; and threatening them if they should persist in disobedience to these orders. The two apostles returned to their brethren, and related to them all that had passed; which having heard, the brethren raised their voices to heaven, begging God to give them strength and courage to declare his word with perfect liberty; and having finished their prayers, the place shook wherein they were assembled, and they were again filled with the Holy Ghost.

At this time many of the faithful sold their estates, and brought the money to the apostles (id. v. 1, 2, &c.). Of this number was a man called Anania, with his wife Sapphira, who, by a private agreement between themselves, concealed a part of the money for which they had sold their land, and brought the rest to St Peter, as if it were the whole sum. Anania came first; and St Peter said to him, Anania, how came Satan to seduce you, and prevail with you to lie to the Holy Ghost, by concealing part of the price of your land? It is not men that you thought to impose on, but God. Immediately Anania fell down dead, and they carried him out and buried him. About three hours after, his wife Sapphira came in, and St Peter said to her almost the same things he had before said to her husband, and immediately she fell down also, and gave up the ghost. This affair infused a great awe in the whole church, and amongst all those that heard of it. (See Acts v.)

The number of believers considerably increased every day; so that they even brought the sick into the streets, and laid them where Peter was to pass, that at least his shadow might cover some of them, by which means they were healed of their distemper. Then the high-priest and his associates; that is, the Pharisees, caused the apostles to be apprehended and put into prison. But an angel brought them forth, and bid them go into the temple, and there boldly declare all the words of life which God had taught them. This they performed: upon which the princes and priests caused them to be brought before them; and having demanded why they had disobeyed their orders in continuing to speak still in the name of Jesus Christ, Peter and the apostles answered, that it was more necessary to obey God than man. This answer provoked them very much, and they were going to condemn them to death, when Gamaliel prevailed with them to change their resolution, by representing to them, that if this matter proceeded from God, it was in vain for them to oppose it; but if otherwise, then it should soon vanish of itself. So they dismissed the apostles, after giving them 39 stripes a-piece, and charged them to speak no more in the name of Jesus Christ.

After the martyrdom of St Stephen, a persecution was carried on against the faithful at Jerusalem, and they were obliged to take shelter in several places. The apostles alone continued at Jerusalem (Acts viii. 1, 2; Peter. 3, &c.). St Philip the deacon going to Samaria, the Samaritans received the word of the Lord, and several of them were baptized. Then St Peter and St John repaired thither also, to give them the Holy Ghost; which St Philip, being only a deacon, had not power to do. Simon the magician was also baptized among others; and admiring the power that the apostles had, of conferring the Holy Ghost, would have bought the same power of the apostles, and accordingly offered money to St Peter. But Peter with indignation replied to him, Thy money and thy perdition, who thinkest the gifts of God can be bought with money? Thou hast no part with us, nor hast any pretensions to this ministry, for thy heart is not right before God. Repent therefore of this wickedness, and pray to God if perhaps he will pardon the wicked thoughts of thy heart. After this Peter and John returned again to Jerusalem. See Acts viii.

The fire of persecution being now pretty well extinguished, St Peter departed from Jerusalem (Acts ix. 32, &c.), and visiting the disciples from city to city, he came also to see the saints that dwelt at Lydda. Here he found a man called Æneas, who had been paralytic for eight years. St Peter said to him, Æneas, rise up; Jesus Christ the Lord cures you. He presently got up; and all that dwelt at Lydda that saw the miracle were converted to the Lord. There was also at Joppa a certain holy woman, named Tabitha, who happening to die while St Peter was at Lydda, the disciples sent to desire him to come to them. Whereupon St Peter came, and entering into the chamber where Tabitha lay dead, he caused every body to go out, and betook himself to prayers. Then turning himself towards the corpse, he said, Tabitha, arise. At which instant she opened her eyes, and seeing St Peter, she sat up. This miracle was much famed at Joppa, and was the occasion that many were converted. St Peter stayed there a good while, taking up his lodging with one Simon a tanner.

Now there was at Cesarea of Palestine a centurion called Cornelius, a man that feared God (Acts x. 1, 2, 3.), and to whom it was revealed by an angel, that he should send to Joppa to Peter, who should tell him what he had to do. Cornelius immediately sent two of his servants; and while they were upon the road, the Lord sent a vision to Peter, to prepare him to go to this man without any scruple, although he was not a Jew; for as yet the door of the gospel had not been opened to the Gentiles. St Peter, then being at the top of the house, fell into a trance, and saw, as it were, a great sheet of linen cut down from heaven, which was full of all kinds of animals and reptiles, both clean and unclean. He had this vision three times, and heard a voice, saying, Arise Peter, kill and eat. But Peter answered, Lord, I have never eaten any thing unclean. The voice replied, Call not that unclean which God has purified. After which the sheet was again taken up into heaven. At the same time, the men came in that had been sent by Cornelius. They acquainted him with what had happened to their master, and desired him to go along with them to Cesarea. The day following St Peter set out thither, and was accompanied by some of the brethren of Joppa. (See Acts x.)
When Peter was returned to Jerusalem, the faithful of the circumcision said to him, why have you gone unto the uncircumcised, and why do you eat with them? but Peter having related to them all that passed, they were satisfied, and glorified God who had given the gift of repentance leading to life as well to the Gentiles as to the Jews. It is thought, that a little after this Peter went to Antioch, where he founded the Christian church of which he was bishop (Gal. ii. 11.). It is believed that he continued here seven years, though not constantly: for during this time, he went to Jerusalem, and to the provinces of Asia Minor, to Bithynia, Cappadocia, and Pontus, as is concluded from the epistle that he afterwards addressed to the faithful of these provinces. From thence he went to Rome, in the 42d year of the Christian era; and it is thought that at his leaving Antioch he there fixed St Ignatius in his place. Eusebius thinks, that the chief occasion of his going to Rome was to oppose Simon Magnus, who by his deceits had perverted a great number of persons. However, the presence of St Peter, and the true miracles that he opposed to the tricks of Simon, ruined, or much diminished, the reputation of this impostor.

St Peter, leaving Rome, came to Jerusalem at the passover, in the 44th year of the Christian era, when Herod Agrippa began to persecute the church. That prince put St James the Greater, brother of John, to the sword (Acts xii. 1 &c.); and perceiving that his death was agreeable to the Jews, he moreover caused Peter to be apprehended and put in prison, with a design of executing him publicly after the passover. But the very night that Herod thought of putting him to death, as Peter, loaded with chains, was asleep between two soldiers, the angel of the Lord awakened him, broke off his chains, opened the prison door, and brought him out the length of the street. Then the angel leaving him, he came to the house of Mary the mother of John, where many of the faithful were assembled at prayers; and having knocked at the door, a damsel named Rhoda came to open it; but when she heard Peter's voice, instead of opening the door, she ran in a transport of joy to acquaint the family that Peter was at the door. Those who heard her could not believe it, and said it was his angel, and not himself: but continuing to knock, and being let in, he informed them of what had happened to him.

He then left Jerusalem; but we are not told what became of him till the time of the council held at Jerusalem in the year 51. It is thought that before this time he made his second journey to Rome, from whence he wrote his first epistle.

St Peter was obliged to leave Rome in the year 51 by order of the emperor Claudius, who had banished all Jews from thence, because of the tumults they continually raised there, excited by one Chrestus, as Suetonius says, meaning probably by this name Jesus Christ. The apostle then returned into Judæa, where was held the council of Jerusalem; in which, after a strict examination of the matter proposed to Peter and the apostles, he spoke to them with much wisdom, saying (Acts xv. 7, 8, &c.) that God having given his Holy Ghost and the gift of faith to the Gentiles as well as to the Jews, they ought not to impose the yoke of the legal observances on the new converts, which (as he says) neither we nor our fathers have been able to bear. But we believe, that it is through the grace of Jesus Christ that both we and they shall be saved. St James the Less, bishop of Jerusalem, seconded this opinion of St Peter; and the council came to this conclusion, That no new obligation should be imposed on the Gentiles, but only that they should be required to abstain from fornication, from the use of blood, and from meats offered to idols. The resolution of this council was written to the faithful of Antioch, because it was there this question was first started.

Some time after, St Peter coming to Antioch (Gal. ii. 11. &c.), he ate and drank with the Gentiles, without regarding that distinction of meats enjoined by the law. But after that, when some of the faithful of Jerusalem came to Antioch, being converted Jews, St Peter, out of fear to offend them, separated himself from the converted Gentiles, and would no longer eat with them as before. St Paul, fearing that what St Peter did, might be interpreted, as if he had a desire to oblige the Gentiles to Judaize, and to submit themselves to the yoke of the law, and so to revoke and annul what he himself had determined in the council of Jerusalem, he withstood Peter to his face, and openly expostulated with him, telling him he was much in the wrong to endeavour to oblige the Gentiles, at least tacitly by his own manner of acting, to live as the Jews do; and St Peter received this reprehension with silence and humility.

The particulars of St Peter's life are little known from the 51st year of the vulgar era, in which the council of Jerusalem was held, till his last journey to Rome, which was some time before his death. Then being acquainted by revelation that the time of his death was not far off (2 Pet. i. 14.), he had a mind to write to the faithful that had been converted by him, to put them in mind of the truths he had before taught them. He sent them therefore his second epistle.

St Peter and St Paul came to Rome about the same time, in the year of Christ 65, where they performed many miracles, and made many converts. Simon Magnus by his tricks continued here to deceive the people, pretending himself to be the Messiah, and even attempting to ascend into heaven; for having caused himself to be carried up into the air by his demons, in a fiery chariot, St Peter and St Paul betook themselves to their prayers; and then the impostor, being forsaken by his demons, fell down upon the ground, which fall some time afterwards occasioned his death. See Simon Magnus.

Soon after this St Peter was taken up and thrown into prison, where it is said he continued for nine months; at last he was crucified at Rome in the Via Latina; with his head downwards, as he himself had desired of his executioners. This he did out of a sense of humility, for fear it should be thought, as St Ambrose says, that he affected the glory of Jesus Christ, and the more to augment the pain of his execution.

It is said, that the body of St Peter was at first buried in the catacombs, two miles from Rome, from whence it was afterwards transported to the Vatican, where it has lain ever since. His festival is celebrated with that of St Paul on the 29th of June. St Peter died in the 66th year of the vulgar era, after having been bishop of Rome for about 24 or 25 years. His age might be about 74 or 75 years. It is generally agreed.
agreed, that St. Linus was his successor. The following is the portraiture that Nicephorus gives us of St. Peter, which he has probably taken from the ancient pictures that were preserved of this apostle. He was not fat, but pretty tall and upright, having a fair and palish countenance. The hair of his head and beard was thick, frizzled, and not long. His eyes were black, and blood-shot; his eyebrows protuberant and lofty; his nose something long, and rather flat than sharp.

The two epistles of St. Peter are addressed to those Jewish converts who were scattered throughout Pontus, Galatia, &c. not only upon the persecution raised at Jerusalem, but upon former dispensations of the Jews into those places on several other occasions. The first epistle is principally designed to comfort and confirm them under those fiery trials and manifold temptations they were then subjected to, and to direct and instruct them how to behave in the several states and relations both of the civil and the Christian life, that they might not be engaged in those rebellions against Caesar and his officers, then fomented among the Jews; and that they might stop the mouths of those who spoke against them as evil doers. In the second epistle, he prosecutes the same subject, to prevent their apostasy from the faith, on account of any persecutions they were liable to. He likewise guards them against the corrupt principles of the Gnostics, and those who scoffed at the promise of Christ's coming, as if it would never be verified.

St. Peter's style, says a modern author, expresses the noble vehemence and fervour of his spirit, the full knowledge he had of Christianity, and the strong assurance he had of the truth and certainty of his doctrine; and he writes with the authority of the first man in the college of the apostles. He writes with that quickness and rapidity of style, with that noble neglect of some of the formal consequences and niceties of grammar, still preserving its true reason and natural analogy (which are always marks of a sublime genius), that you can scarce perceive the pause of his discourse and distinction of his periods. The great Joseph Scaliger calls St. Peter's first epistle majestic; and we hope he was more judicious than to exclude the second, though he did not name it.

A noble majesty, and becoming freedom, is what distinguishes St. Peter; a devout and judicious person cannot read him without solemn attention and awful concern. The conflagration of this lower world, and future judgment of angels and men, in the third chapter of the second, is described in such strong and terrible terms, such awful circumstances, that in the description we see the planetary heavens and this our earth wrapped up with devouring flames, hear the groans of an expiring world, and the crashes of nature tumbling into universal ruin.

The authority of the second epistle of St. Peter was for some time doubted of, as Origen, Eusebius, St. Jerome and others have observed. What made the ancients call it in question, is the difference of its style from the first. The third chapter, which describes the catastrophe of the visible world, made Grotius think this epistle was written after the taking of Jerusalem; because that was not to happen till after the destruction of that city; upon which he conjectures, that Simeon bishop of Jerusalem is the author of this epistle, and that the inscription which carries St. Peter's name is corrupted. But the best critics admit this epistle to be the genuine work of St. Peter, who discovers himself, where he says, that he was present at our Lord's transfiguration; and where he tells the Jews, this was the second letter he had written to them. The reader may see this question fully discussed, and the authority of this epistle established beyond all doubt, by the learned Dr. Sherlock, in his Dissertation on the authority of the Second Epistle of St. Peter.

St. Peter has been made the author of several books; such were, his Acts, his Gospel, his Revelation, his work about preaching, and another about judgment. There is extant a large history of St. Peter, called the Recognitions, ascribed to St. Clement.

Peter of Blois, a learned man of the 12th century, was born about the year 1120, at the city of Blois in France, from whence he derived his name. His parents, being opulent, gave him a learned education. In his youth, when he studied in the university of Paris, he was excessively fond of poetry; and when he was a little further advanced in life, he became no less fond of rhetoric, to the study of which he applied with the greatest ardour. From Paris he was removed to Bononia in Italy, to acquire the civil and canon law; in the knowledge of both which he was very much excelled. He appears from his writings to have cultivated medicine, and several branches of the mathematics, with no little care and success. The study of theology was the chief delight and business of his life, in which he spent the greatest part of his time. He made the greatest progress. But unfortunately it was that scholastic theology, which consisted in vain attempts to prove and explain the many absurd opinions which then prevailed in the church, by the subtleties of Aristotelian logic. In attempting to explain in this manner the most absurd of all opinions that ever existed amongst mankind, he was the very first person who employed the famous word transubstantiation, which was soon after adopted by the church of Rome, and hath ever since made so great a noise. Being appointed preceptor to William II. king of Sicily in 1167, he obtained the custody of the privy seal, and next to the archbishop of Palermo, the prime minister, had the greatest influence in all affairs. But his power was not of long duration; for the archbishop being banished in 1168, our author soon after left the court of Sicily, and returned into France. He was not long, however, without a royal patron, being invited into England by Henry II. who employed him as his private secretary, made him archdeacon of Bath, and gave him some other benefits. When he had spent a few years at court, he conceived a disgust at that way of life, (of which he hath drawn a very unpleasing picture in one of his letters), and retired into the family of Richard archbishop of Canterbury, who had made him his chancellor about the year 1176. In this station he continued to the death of the archbishop in 1183, enjoying the highest degree of favour with that prelate, though he used much freedom in reproving him for his remissness in the government of the church. Our author remained in the same station in the family of Archbishop Baldwin, who succeeded Richard, acting both as his secretary and chancellor. He was also sent by that prelate on an embassy to Rome in 1187, to plead his cause before
made such an impression on his mind, that he conceived the almost impracticable design of forming a navy. His first care was to get some Hollanders to build some small vessels at Moscow; and he passed two successive summers on board English or Dutch ships, which set out from Archangel, that he might instruct himself in every branch of naval affairs (A). In 1696 czar John died, and Peter was now sole master of the empire. In 1698 he sent an embassy to Holland; and went to Cango in the retinue, and visited England, as well as Holland, in order to inform himself fully in the art of ship-building. At Amsterdam he worked in the yard as a private ship-carpenter, under the name of Peter Michaelof; but he has been often heard to say, that if he had never gone to England, he had still remained ignorant of that art. In 1700 he had got together a body of standing forces, consisting of 30,000 foot; and now the vast project he had formed displayed itself in all its parts. He opened his dominions, which till then had been shut up, having first sent the chief nobility of his empire into foreign countries to improve themselves in knowledge and learning. He invited into Russia all the foreigners he could meet with, who were capable of instructing his subjects in any manner, and offered them great encouragement to settle in his dominions. This raised many discontent; and the despotic authority he exerted on that occasion was scarcely powerful enough to suppress them. In 1700, being strengthened by the alliance of Augustus king of Poland, he made war on Charles XII, king of Sweden. His first ill success did not deter him; for he used to say, I know that my armies must be overcome for a great while; but even this will at last teach them to conquer. He afterwards gained considerable advantages; and founded Petersburg in 1703. In 1709 he gained a complete victory over the Swedes at Pultowa. In 1712 he was inclosed by the Turks on the banks of the Pruth; and seemed inevitably lost, had not the czarina Catherine bribed the grand visir, and the czar’s prudence completed his deliverance. In 1716 he made a tour through Germany and Holland, and visited the royal academy of sciences at Paris. It would be endless to enumerate all the various establishments for which the Russians are obliged to him. He formed an army according to the manner of the pol- test and most experienced nations: he fitted out fleets in all the four seas which border upon Russia: he caused many strong fortresses to be raised after the best plans; and made convenient harbours: he introduced

(A) The following circumstance, it is said, in some measure determined Peter to attempt those reformatiions which he afterwards accomplished. Great events have been sometimes the effect of little causes; and it is at least possible, that without the occurrence we are going to relate, Russia might still have been in a state of barbarism. A young Genevese, called Le Fort, about 1695, went to Moscow with the Danish ambassador. The czar Peter, who was then 19 years old, met with this Genevese, who had soon learnt the Russian tongue, and spoke almost all the languages of Europe. Le Fort ingratiated himself with the prince, entered into his service, and soon afterwards into his familiarity. He made him comprehend that there was a different manner of living and reigning from what had unhappily obtained throughout his vast and miserable empire. A prince must be born with an uncommon greatness of soul to listen readily to a stranger, and to be able to divest himself of the prejudices of a throne and of his country. The czar was sensible that neither himself nor his people were yet to be reckoned among men; and that he had an empire to form, but could have no assistance at home. From that time he took a resolution to leave his dominions; and set out, like another Prometheus, to borrow celestial fire for animating his countrymen.
Peter was tall of stature, and of a bold and majestic aspect, though sometimes disfigured by convulsions, which altered his features. This deformity was ascribed to poison, given him, as it is said, by his sister Sophia; but it was indeed no other than wine and brandy, which he often drank to excess, relying too much on the strength of his constitution. He conversed with persons in all stations, from the mechanic to the general of an army; and his conversation was neither like that of a barbarian who makes no distinction between men, nor of a popular prince who seeks to please all the world, but that of a person who aims at instruction. He loved women as much as the king of Sweden, his rival, dreaded them, and all were equally agreeable to him; he valued himself on drinking large draughts, rather than sipping delicious wine. We are told that kings and legislators should never suffer themselves.

(b) Alexis, like his father, is said to have married a slave, and, like him, quitted Muscovy secretly, but had not the same success in his undertakings; and the being but a bad imitator of his father, cost him his life. He became an example of the most terrible severity that ever was given from the tribunal of the throne: but, what is much to the honour of the empress Catherine, she had no hand in the misfortunes of that prince, who was born of another woman, and loved nothing that his father loved. Catherine was not in the least suspected of acting the cruel stepmother. The great crime of the unfortunate Alexis was his being too much a Russian, and his disproving every thing that was grand and immortal, and projected by his father for the glory of the nation. One day, hearing some Muscovites lamenting the insupportable fatigue they were to undergo in the building of Petersburg, he said, “Take courage, this city will not stand long.” When he was called to attend his father in a journey of 500 or 700 leagues, which the czar often made, he esteemed sickness. He took violent purges for a distemper of which he had not; and such quantities of medicines, with excessive drinking of brandy, impaired his health and his wits. At first he had an inclination to learning, was acquainted with geometry and history, and had learnt the German tongue; but he would never learn it; for which he was most reproached by his father. They had married him in 1714 to the princess of Wolfenbuttel, sister of the empress consort to Charles VI. This marriage was unfortunate; the princess was often abandoned for a debauch in brandy, and for Aforvisina, a Finland wench, of a large stature, well made, and very agreeable. It is reported that the princess died of chagrin, if it be possible for chagrin to prove mortal; and that afterwards the czarowitz secretly espoused Aforvisina in 1713, when the empress Catherine had just brought him a brother, at which he had no reason to be uneasy.

The misunderstandings between the father and the son became every day more serious; till at length the father, about the year 1716, threatened the prince to disinherit him; and the prince told him that he intended to go into a monastery.

The czar, in 1717, renewed his journeys, as well with a view to politics as curiosity. He came at last into France. If the son had entertained an inclination to revolt, if he had actually had a party formed in his favour, now was the time to declare himself; but instead of remaining in Russia, making himself popular, and creating dependents, he took a journey in his turn, having with much difficulty scraped together some thousands of ducats which he had secretly borrowed. He threw himself under the protection of the emperor Charles VI, brother of his deceased wife. They kept him for some time incognito at Venice, from whence he passed to Naples, where he resided almost a year, while neither his father nor any person in Russia knew the place of his retreat.

While the son kept himself thus concealed, the father was at Paris, where he was received with all the respect paid him in other places, but with a gallantry nowhere to be found but in France. If he went to visit a manufactury, and one piece of work attracted his sight more than another, he was presented with it the next day. He went to dine at the duke d'Antin's at Petitbourg, where the first thing he saw was his own picture at full length, in the same habit that he wore. When he was at the royal mint of medals, they struck all kinds before him, and presented him with them; at last they struck one which they let drop on purpose at his feet, and left him to take it up. He there saw himself perfectly engraven with these words, Peter the Great. The reverse was a Fame, and round her in letters Vires acquirit eundo; an allusion no less just than flattering to a prince who really acquired new merit by travelling.

After he had seen this country, where every thing disposes men to gentleness and indulgence, he returned to his own, and resumed his severity. He had engaged his son to return from Naples to Petersburg, from whence that young prince was conducted to Moscow before the czar his father; who began with depriving him of his succession to the throne, by making him sign a solemn act of renunciation at the end of January 1718, in consideration of which act the father promised the son to spare his life.

It was not altogether improbable that such an act would have been some time or other annulled. The czar, therefore,
themselves to be transported by passion; but never was any man more passionate than Peter the Great, or more merciless. In a king this is more than an inhumanity for which we make amends by confessing it; but it was generally remarked of Peter, and he himself said to a magistrate of Holland, at his second voyage, "I have reformed my nation, and have not been able to reform myself." It is true, the cruelties with which he is reproached were not novelties at the court of Moscow, any more than at that of Morocco: it was not uncommon to see a czar, with his own royal hand, inflict 100 lashes on the naked shoulders of a prime officer of the crown, or of a lady of the palace, for failing in their duty, by getting drunk; or to try the goodness of his sake, by striking off the head of a criminal. Peter had himself performed some of those ceremonies of his country; Le Fort, however (see note a), had authority enough over him at times to stay his hand even when lifted up to strike, but he had not Le Fort always near him.

The czar's first marriage is thus related in the memoirs of Peter Henry Bruce, Esq. "It took place in 1690, when he was only 18. He was married to Ottokessa Lapuchin, a boyar's daughter, by whom he had Prince Alexis; some time after he turned her away and shut her up in a monastery, on suspicion of infidelity. It was said, that in one of her jealous fits she charged Prince Menzikoff with carrying the czar to drabs of his former acquaintance, who had been his customers for cakes; upbraiding him with his first occupation: and that Menzikoff ever after bore an irreconcilable enmity to both her and her son. After the divorce, one Miss Mons, a very beautiful young lady, born at Moscow, of foreign parents, as much in favour with the czar, but when he was abroad, Mr Keyserling, then residing at Moscow as envoy from the king of Prussia, paid his addresses to, and married her. When the czar returned, he was so much offended at Keyserling, that he ordered him to leave Moscow, which occasioned his immediate recall by the king his master, who sent another in his room. It was believed, if his public character had not protected him, he would have severely felt his majesty's displeasure.

"The czar was some time after smitten with the charms of another beautiful young lady, the daughter of a foreign merchant in this city: he first saw her in her father's house, where he dined one day. He was so much taken with her appearance, that he offered her any terms she pleased, if she would live with him; which this virtuous young woman modestly refused: but fearing the effects of his authority, she put on a resolution, and left Moscow in the night, without communicating her design even to her parents. Having provided a little money for her support, she traveled on foot several miles into the country, till she arrived at a small village where her nurse lived with her husband and their daughter, the young lady's foster-sister, to whom she discovered her intention of concealing herself in the wood near that village: and to prevent any discovery, she set out the same night, accompanied by the husband and daughter. The husband being a timber-man by trade, and well acquainted with the wood, conducted her to a little dry spot in the middle of a morass, and there he built a hut for her habitation.

Therefore, in order to give it more force, forgetting that he was a father, and only remembering that he was the founder of an empire, which his son might overturn, and involve in its ancient barbarity, ordered a public process to be drawn up against that unfortunate prince, for some concealment, with which he was charged, in the confession that they had exacted of him.

An assembly was held of the bishops, inferior ecclesiastics, and professors; who found in the Old Testament, that those who cursed their father or their mother should be put to death; that David indeed had pardoned Absalom, who had rebelled against him, but that Absalom was never pardoned by God. Such was their opinion, without drawing any conclusion; but it was in effect signing a warrant for his death. Alexis had not in fact cursed his father, neither had he ever revolted like Absalom; he had never lain publicly with the king's concubines; but he had left the kingdom without his father's permission, and had written letters to his friends in which he only declared that he hoped they would one day be mindful of him in Russia. But whatever might be his case, of 124 lay judges, who were appointed to sit on him, there was not one that judged his offences less than capital; and those who could not write, made others sign for them. It is reported in Europe, that the czar had got translated from Spanish into Russian the criminal process against Don Carlos, that unfortunate prince whom his father Philip II. had confined in a prison, where the heir of that great monarchy ended his days. But there was nothing like a process carried on against Don Carlos, nor was it ever known whether that prince died a natural or a violent death. Peter, the most despotic of princes, wanted no example. Certain it is that the prince died the day after the sentence, and that the czar had at Moscow one of the best apothecary's shops in Europe. It is probable, however, that the prince Alexis, the heir of the most extensive empire in the world, being condemned unanimously by his father's subjects, which were one day to be his own, might die of the sudden shock and change given to the body at the apprehension of so strange and dismal a sentence. The father went to see his son in his last agonies; and it is said he shed tears. Injulie uceuncte furent en fata nepotes. These tears, however, did not prevent the wheels from being covered with the broken limbs of his son's friends. He beheaded his own brother-in-law Count Lapuchin, brother to his wife Ottokessa Lapuchin whom he had divorced, and uncle to Prince Alexis. The prince's confessor had also his head cut off. If Muscovy has been civilized, she has, it must be confessed, paid dear for her improvement.

The remainder of the czar's life was nothing but a series of grand projects, labours, and exploits, that seemed to efface the memory of his excessive severities, which were perhaps necessary. He made frequent speeches to his court and to his council. In one he told them that he had sacrificed his son to the welfare of his dominions.
She had deposited her money with her nurse to procure little necessaries for her support, which were faithfully conveyed to her at night by the nurse or her daughter, by one of whom she was constantly attended in the night time.

"The next day after her flight, the czar called at her father's to see her, and finding the parents in anxious concern for their daughter, and himself disappointed, fancied it a plan of their own contriving. He became angry, and began to threaten them with the effects of his displeasure if she was not produced: nothing was left to the parents but the most solemn protestations, with tears of real sorrow running down their cheeks, to convince him of their innocence, and ignorance of what was become of her; assuring him of their fears that some fatal disaster must have befallen her, as nothing belonging to her was missing, except what she had on at the time. The czar, satisfyed of their sincerity, ordered great search to be made for her, with the offer of a considerable reward to the person who should discover what was become of her, but to no purpose: the parents and relations, apprehending she was no more, went into mourning for her.

"Above a year after this she was discovered by an accident. A colonel who had come from the army to see his friends, going to hunt in the wood, and following his game through the morass, he came to the hut, and looking into it saw a pretty young woman in a mean dress. After inquiring of her who she was, and how she came to live in so solitary a place, he found out at last that she was the lady whose disappearance had made so great a noise; in the utmost confusion, and with the most fervent entreaties, she prayed him on her knees that he would not betray her; to which he replied, that he thought her danger was now past, as the czar was then otherwise engaged, and that she might with safety discover herself, at least to her parents, with whom he would consult how matters should be managed. The lady agreed to this proposal; and be set out immediately, and overjoyed her parents with the happy discovery; the issue of their deliberation was to consult Madame Catharine (as she was then called) in what manner the affair should be opened to the czar. The colonel went also upon this business, and was advised by Madame to come next morning and she would introduce him to his majesty, when he might make the discovery and claim the promised reward. He went according to appointment; and being introduced, told the accident by which he had discovered the lady, and represented the miserable situation in which he found her, and what she must have suffered by being so long shut up in such a dismal place, from the delicacy of her sex. The czar showed a great deal of concern that he should have been the cause of all her sufferings, declaring that he would endeavour to make her amends. Here Madame Catharine suggested, that she thought the best amends his majesty could make, was to give her a handsome fortune and the colonel for a husband, who had the best right, having caught her in pursuit of his game. The czar, agreeing perfectly with Madame Catharine's sentiments, ordered one of his favourites to go with the colonel, and bring the young lady home; where she arrived to the inexpressible joy of her family and relations, who had all been in mourning for her. The marriage was under the direction and at the expense of the czar, who himself gave the bride to the bridegroom; saying, that he presented him with one of the most virtuous of women; and accompanied his declaration with very valuable presents, besides settling on her and her heirs three thousand rubles a-year. This lady lived highly esteemed by the czar, and every one who knew her. Besides the concurring reports of other people, I had the story from her own mouth."

On the whole, that Peter I. was a great man, few will deny who know what real greatness is. A minute account of the life of this distinguished emperor would make a large volume; we have been able to give but the mere outlines of it: the anecdotes, however at the end, show in some degree the nature of the man; at all events they show one important truth, that it is a more difficult thing to reform one's self than to reform a kingdom; to conquer one's passions, than to conquer the world. The Russians, however, if there be any good in civilization, owe to him every thing: and they seem to be sensible of it; for a very pompous oration was delivered to his memory by Michael Lomonossoff, before the Academy of Sciences at St. Petersburgh, on the 26th of April 1755. For a minuter account of his improvements, &c. see RUSIA, PETERSBURGH, and CATHERINE I.

Peter the Wild Boy. This extraordinary creature occasioned great speculation among the learned; but we do not know that any satisfactory causes have been assigned for the striking difference between him and other human beings.

The following account of him is extracted from the parish-register of North-church, in the county of Hertford. "Peter, commonly known by the name of Peter the Wild Boy, lies buried in this churchyard, opposite to the porch. In the year 1725 he was found in the woods near Hamelen, a fortified town in the electorate of Hanover, when his majesty George I. with his attendants, was hunting in the forest of Hertswold. He was supposed to be then about 12 years of age, and had subsisted in those woods upon the bark of trees, leaves, berries, &c. for some considerable length of time. How long he had continued in that wild state is altogether uncertain; but that he had formerly been under the care of some person, was evident from the remains of a shirt collar about his neck at the time when he was found. As Hamelen was a town where criminals were confined to work upon the fortifications, it was then conjectured at Hanover that Peter might be the issue of one of those criminals, who had either wandered into the woods and could not find his way back again, or being discovered to be an idiot was inhumanly turned out by his parents, and left to perish or subsist for himself. In the following year 1726, he was brought over to England, by the order of Queen Caroline then princess of Wales, and put under the care of Dr Arbuthnot with proper masters to attend him. But notwithstanding there appeared to be no natural defect in his organs of speech, after all the pains that had been taken with him he could never be brought distinctly to articulate; a single syllable, and proved totally incapable of receiving any instruction. He was afterwards intrusted to the care of Mrs Titchbourne, one of the queen's bedchamber women, with a handsome pension annexed to the charge. Mrs Titchbourne usually spending a few weeks every summer at the house of Mr James Penn, a yeoman farmer at Auster's
End in this parish, Peter was left to the care of the said Mr. Fenn, who was allowed 35l. a-year for his support and maintenance. After the death of James Fenn he was transferred to the care of his brother Thomas Fenn, at another farm-house in this parish called Broadway, where he lived with the several successive tenants of that farm, and with the same provision allowed by government, to the time of his death, Feb. 22. 1793, when he was supposed to be about 72 years of age.

"Peter was well made, and of the middle size. His countenance had not the appearance of an idiot, nor was there any thing particular in his form, except that two of the fingers of his left hand were united by a web up to the middle joint. He had a natural ear for music, and was so delighted with it, that if he heard any musical instrument played upon, he would immediately dance and caper about till he was almost quite exhausted with fatigue; and though he could never be taught the distinct utterance of any word, yet he could easily learn to hum a tune. All those idle tales which have been published to the world about his climbing up trees like a squirrel, running upon all four like a wild beast, &c. are entirely without foundation; for he was so exceedingly timid and gentle in his nature, that he would suffer himself to be governed by a child. There have been also many false stories propagated of his incontinence; but from the minutest inquiries among those who constantly lived with him, it does not appear that he ever discovered any natural passion for women, though he was subject to the other passions of human nature, such as anger, joy, &c. Upon the approach of bad weather he always appeared sullen and uneasy. At particular seasons of the year he showed a strange fondness for stealing away into the woods, where he would feed eagerly upon leaves, beech-mast, acorns, and the green bark of trees, which proves evidently that he had subsisted in that manner for a considerable length of time before he was first taken. His keeper therefore at such seasons generally kept a strict eye over him, and sometimes even confined him, because if he ever rambled to any distance from his home he could not find his way back again; and once in particular, having gone beyond his knowledge, he wandered as far as Norfolk, where he was taken up, and being carried before a magistrate, was committed to the house of correction in Norwich, and punished as a sturdy and obstinate vagrant, who would not (for indeed he could) give any account of himself: but Mr. Fenn having advertised him in the public papers, he was released from his confinement, and brought back to his usual place of abode.

"Notwithstanding the extraordinary and savage state in which Peter was first found greatly excited the attention and curiosity of the public; yet, after all that has been said of him, he was certainly nothing more than a common idiot without the appearance of one. But as men of some eminence in the literary world have in their works published strange opinions and ill-founded conjectures about him, which may seem to stamp a credit upon 

Vol. XVI. Part I.  

what they have advanced; that posterity may not through their authority be hereafter misled upon the subject, this short and true account of Peter is recorded in the parish-register by one who constantly resided above 30 years in his neighbourhood, and had daily opportunities of seeing and observing him."

Perhaps our readers will not be displeased if we present them with Lord Monboddo's account of this extraordinary creature (A). "It was in the beginning of June 1782 (says his lordship) that I saw him in a farm-house called Broadway, within about a mile of Berkhamsted, kept there upon a pension which the king pays. He is but low of stature, not exceeding five feet three inches; and although he must now be about 70 years of age, has a fresh healthy look. He wears his beard; his face is not at all ugly or disagreeable; and he has a look that may be called sensible and sagacious for a savage. About 20 years ago he was in use to elope, and to be missing for several days; and once, I was told, he wandered as far as Norfolk; but of late he has been quite tame, and either keeps in the house or saunters about the farm. He has been the 13 last years where he lives at present; and before that he was 12 years with another farmer, whom I saw and conversed with. This farmer told me, that he had been put to school somewhere in Hertfordshire, but had only learned to articulate his own name Peter, and the name of King George, both of which I heard him pronounce very distinctly. But the woman of the house where he now is (for the man happened not to be at home) told me, that he understood every thing that was said to him concerning the common affairs of life; and I saw that he readily understood several things that she said to him while I was present. Among other things she desired him to sing Nancy Dawson; which he did, and another tune which she named. He never was mischievous, but had always that gentleness of nature which I hold to be characteristic of our nature, at least till we became carnivorous, and hunters or warriors. He feeds at present as the farmer and his wife do; but, as I was told by an old woman (one Mrs. Gollop, living at a village in the neighbourhood called Hemsted), who rembered to have seen him when he first came to Hertfordshire, which she computed to be 55 years before the time I saw her), he then fed very much upon leaves, and particularly upon the leaves of cabbage, which he ate raw. He was then, as she thought, about 15 years of age, walked upright, but could climb trees like a squirrel. At present he not only eats flesh, but has also got the taste of beer, and even of spirits, of which he inclines to drink more than he can get. And the old farmer above mentioned, with whom he lived twelve years before he came to this last farmer, told me, that he had acquired that taste before he came to him, which is about 21 years ago. He has also become very fond of fire, but has not yet acquired a liking for money; for though he takes it, he does not keep it, but gives it to his landlord or landlady, which I suppose is a lesson that they have taught him. He retains so much

(A) This eccentric writer, in support of his hypothesis, that man in a state of nature is a mere animal, without clothes, houses, the use of fire, or even speech, adduces the orang-outang, or man in the woods, and this Peter the wild man and others, as examples. He denies the want of the organs of speech as an objection, and insists they only want the artificial use of them.
much of his natural instinct, that he has a fore-feeling of bad weather, growling and howling, and showing great disorder, before it comes.

"These are the particulars concerning him which I observed myself, or could learn by information from the neighbourhood." From all these facts put together his lordship makes the following observations:

"1st. Whatever doubts there may be concerning the humanity of the orang-outang, it was never made a question but that Peter was a man.

"2dly, That he was, as the Dean [Swift] says, of a father and mother like one of us. This, as I have said, was the case of two savages found in the Dismal swamp in Virginia, of the one found in the island of Diego Garcia, and of him that was discovered by M. le Roy in the Pyrenees, and in general of all the savages that have been found in Europe within these last 300 years; for I do not believe, that for these 2000 years past there has been a race of such savages in Europe.

"3dly, I think there can be no reason to doubt of what was written from Hanover, and published in the newspapers, that he was found going upon all fours, as well as other solitary savages that have been found in Europe. It is true that others have been found erect; which was the case of the two found in the Dismal swamp of Virginia, like one of the man of the Pyrenees, and of him in the island of Diego Garcia; but these I suppose were not exposed till they had learned to walk upright; whereas Peter appears to have been abandoned by his parents before he had learned that lesson, but walked as we know children do at first.

"4thly, I think it is evident that he is not an idiot, not only from his appearance, as I have described it, and from his actions, but from all the accounts that we have of him, both those printed and those attested by persons yet living; for as to the printed accounts, there is not the least information of that kind in any of them, except in one, viz. Wye's letter, No. 8, wherein is said, that some imputed his not learning to speak to want of understanding; which I should think showed rather want of understanding in those who thought so, when it is considered that at this time he had not been a year out of the woods, and I suppose but a month or two under the care of Dr. Arbuthnot, who had taken the charge of his education. The Dean indeed tells us, that he suspected he was a pretender, and no genuine wild man, but not a word of his being an idiot. And as to the persons living, not one with whom I have conversed appeared to have the least suspicion of that kind; though it is natural that men who were not philosophers, and knew nothing of the progress of man from the mere animal to the intellectual creature, nor of the improvement of our understanding by social intercourse and the arts of life, but believed that man when he came to a certain age has from nature all the faculties which we see him exert, and particularly the faculty of speech, should think him an idiot, and wanting even the capacity of acquiring understanding. I knew an officer of dragoons, a man of very good sense, who was quartered where Peter then lived for some months, and saw him almost every day, and who assured me that he was not an idiot, but showed common understanding, which was all that could be expected from one no better educated than he.

"Lastly, those who have considered what I have said (b) of the difficulty of articulation, will not be surprised that a man who had lived a savage for the first 14 or 15 years of his life, should have made so little progress in that art. I cannot, however, have the least doubt, that if he had been under the care of Mr. Braidwood of Edinburgh, he would have learned to speak, though with much more difficulty than a man who had been brought up tame among people who had the use of speech, and who consequently must know the advantage of it. And I can have as little doubt that Mr. Braidwood could have taught the orang-outang in Sir Ashton Lever's collection, who learned to articulate a few words, so as to speak plainly enough."

---

(b) Lord Monboddo, far from thinking speech or articulation natural to man, rather wonders how he can by any teaching or imitation attain to the ready performance of such various and complicated operations. Add to this, when the organs are completely formed to one language, how hard it is to make them answer another.
with parties who amused themselves with wandering about the woods or dancing in the circular pavilion. How they employ themselves now it is not so easy to say, as it was overrun and subjected by the forces of that unhappy nation, and of course tainted with their destructive principles. It was retaken by the Spaniards, and properly belongs to the king of Sardinia. There is only one farm-house on the island, in an apartment of which Rousseau was lodged.

**Peter-Pence**, was an annual tribute of one penny, paid at Rome out of every family at the feast of St Peter. And this was the Saxo king, when he went in pilgrimage to Rome about the year 749, gave to the pope, partly as alms and partly in recompense of a house erected in Rome for English pilgrims. And this continued to be paid generally until the time of King Henry VIII. when it was enacted, that from henceforth no person shall pay any pensions, Peter-pence, or other impositions, to the use of the bishop or see of Rome.

**PETERBOROUGH**, a city of Northamptonshire, about 82 miles from London. It is the least city except perhaps Ely, and unquestionably the poorest bishopric, though one of the oldest towns in England. It had a monastery dedicated to St Peter, and founded as early as the year 655, to which the abbots of Croyland and his monks flying for protection in the year 870, they were overtaken and murdered in a court of this monastery, called the monks churchyard, because they were all buried here; and to this day is to be seen the tombstone with their effigies, which had been erected over their common grave. Soon after this the Danes destroyed both the monastery and friars, so that it lay destitute for about 100 years. The monks were, however, restored, and lived very sumptuously, with a mitred abbots at their head, till the reformation, when Henry VIII. converted it into a bishop's see. The cathedral, which is said to be more than 1000 years old, though apparently more modern, is a most noble Gothic fabric, and was much more so before it was defaced in the civil wars. The west front, which is 156 feet broad, is very stately; and besides columns curiously adorned, is supported by three of the tallest arches in Britain. The windows of the cloisters are finely stained with scripture history and the succession of its abbots. There are in the church, monuments of Queen Catherine, wife of Henry VIII, and of Mary, daughter of Edward VI, and the figure of one Mr Scarlet the sexton, who buried them, and lived to 95, after he had buried all the housekeepers of the town twice over. There is but one parish-church besides the cathedral. The city is governed by a mayor, recorder, and aldermen, by a charter of Henry VIII. All its officers are elected by the dean and chapter, consisting of six prebendaries, who are all lords of the manor. Besides the dean and chapter, who are an ecclesiastical corporation distinct from the bishop, there are eight petty canons, four students in divinity, one epistle, one gospeller, a subdean, subtreasurer, and chanter, eight choristers, eight singing men, two chancellors, besides a steward, organist, &c. a grammar school, and two charity schools.

The river Nene, over which there is here a wooden bridge, is navigable by barges to Northampton, 50 miles further, which bring coal, corn, &c. and by which they export in some years 6000 quarters of malt, besides other goods, especially the woolen manufactures either of cloth or stockings, in which the poor are employed. The air of Peterborough is said not to be very wholesome, by reason of the neighbouring fens; but the water of the river is good, the highest spring-tide never coming up within five miles of the town; and there is excellent water in their wells. The streets are poor, and the houses but mean; there is, however, a handsome market-house, over which are kept the assizes and sessions. Its jurisdiction extends over 32 towns and hamlets, wherein the civil magistrates appointed by the royal commission are vested with the same power as judges of assize, and hold their quarterly sessions in this city. The number of inhabitants in 1801 was 3449, and in 1811, 3674.

**PETERHEAD**, a town in Scotland, in the county of Aberdeen, lies about 30 miles north-east of that city. It stands on the most easterly point in Scotland, and from thence due west that kingdom is broadest. Peterhead is the nearest land to the northern continent of Europe, and lies within 300 miles of the Cape, which is called the Nors of Norway. Through this channel the grand body of the herrings pass in their annual migrations from Shetland and the north seas to the more southern latitudes, attended with the all-devouring cod and ling; on which account Peterhead, or, as it is sometimes called, Buchaness, hath always been the second station of the Dutch busses after leaving the Shetland islands. Tradition says, that some hundred years ago the Dutch offered Lord Mareschal, then the proprietor of the coast, to cover a small island called Inchkeith with silver for the property of it to carry on their fisheries, which for obvious reasons could not be accepted. Be that as it may, the Dutch, in time of peace, still frequent the coast in July and August, and sometimes 100 sail are seen within sight of land, busily employed in the herring and white fisheries. The natives, to whom this treasure properly belongs, have lately made some attempts towards the white fishery, of which they cure and vend, chiefly at the London market, 4000 barrels of delicate small cod and ling annually. They also fit out some vessels for the Hebride fishery off Barrahead for the Barcelona market; and they claim the merit of having taught the islanders how to take and cure the large fish which abound on their coasts. They have often gained the highest premiums allowed by government for curing white fishes.

Few harbours in Great Britain are of more importance to navigation than this town Peterhead, as, in case of violent storms from the easterly points, large vessels engaged betwixt this and the mouth of the Forth have not a port that they can safely take at every time of the tide, that of Aberdeen excepted. If therefore they cannot make their way to sea in the teeth of a strong easterly wind, or double this headland that they may gain the Murray frith, they must inevitably come on shore. This harbour lies on a spacious bay, where vessels of any burden may ride in all other winds, and is therefore the general rendezvous of the shipping which frequent the northern seas, where they cast anchor on clean ground, and ride safely till the storms have abated. But though nature hath done so much for the benefit of navigation, something is left for the exercise of human aid. The harbour can at present contain in perfect safety 40 or 50 sail of vessels drawing 12 feet water, and is capable of being extended so as to admit a greater number of ships drawing 20 feet: by which means not only casual merchantmen but small ships of war with their convoys

\[ \text{Ft2} \]
would find this a most desirable refuge when pursued by superior force. The harbour is defended by a good battery. A considerable trade is carried on from this place directly to the Baltic for deals, iron, hemp, tar, and other articles. There is also a manufacture of sewing thread, which employs many young girls. A mineral well in the summer-months gives great gaiety to the place; its salutary virtues have long, and we believe very justly, been celebrated. The waters of this spring are powerfully diuretic, and are thought to be efficacious in removing complaints in the bowels.

Twelve pounds avoidicosis of this water were analysed by Dr Laing, who found it composed of

- Muriate of iron, 30.75 grains.
- Carbonate of iron, 3.25.
- Muriate of lime, 7.00.
- Silicious earth, 2.00.
- Sulphate of lime, 2.00.
- Soda, 13.25.

Total weight, 53.311 grains.

Carbonic acid gas, 83.5 cubic inches. The ingenious author of the above analysis recommends this water very much in cases of scrofula. Its most valuable property is tonic, which is no doubt derived from the iron that enters into its composition.

There are here many elegant houses for the accommodation of strangers. There is also a ball-room, under which there are two salt-water baths. These baths are much frequented in nervous disorders: their effect in strengthening the constitution is often surprising. Owing to the open peninsulated situation, the air of this place is esteemed peculiarly pure and healthful; even the fogs rising from the sea are thought to be medicinal: the town is therefore much enlivened by the concourse of company who frequent it on these accounts. Upon the whole, the town is neat and well built, the houses are handsome, and the streets tolerably spacious and very clean; and has every appearance of a thriving and pleasant place. In 1793, the population was 4100, being 1613 greater than in 1755; in 1801, the numbers increased to 4413, and in 1811, to 4707.

Peterhoffs, in Russia, is situated about 20 miles from Petersburg, and is distinguished for its palace and gardens. The palace was begun by Peter I. and finished by Elizabeth. As it is placed upon an eminence, it commands a most superb view of Cronstadt, Petersburg, the intervening gulf, and the opposite coast of Carelia. The palace is most magnificently furnished, and the suite of apartments are truly princely. The presence-chamber is richly ornamented with portraits of the sovereigns of the house of Romanoff, who have reigned in Russia since 1613.

The gardens of Peterhoff (says an intelligent traveller) have been celebrated for their taste and elegance; and from the number of jet d'eaux, fountains, basons, cascades, parterres, &c. they have been compared to those of Versailles: and indeed in one respect they are far superior; for the water-works of the latter only play upon particular occasions, while those of Peterhoff are perennial. These gardens, which at the time of their formation were greatly admired in this country, though not congenial to the taste of the empress, are suffered to remain in their present state; as during summer her majesty principally resides at Tzarshkoe-Selo, where the

The gardens of Peterhoff (says an intelligent traveller) have been celebrated for their taste and elegance; and from the number of jet d'eaux, fountains, basons, cascades, parterres, &c. they have been compared to those of Versailles: and indeed in one respect they are far superior; for the water-works of the latter only play upon particular occasions, while those of Peterhoff are perennial. These gardens, which at the time of their formation were greatly admired in this country, though not congenial to the taste of the empress, are suffered to remain in their present state; as during summer her majesty principally resides at Tzarshkoe-Selo, where the grounds are disposed in a more modern and pleasing manner. A vast number of silver dolphins and gilded statues are scattered through them; but the most remarkable figures are those of two gladiators placed in a basin of water. These are represented, not with the sword and buckler, the ancient implements of war, but with a brace of pistols. These they point to each other in a threatening posture, while the water gushes impetuously from the barrels. In that part of the garden which lies between the palace and the gulf, close to the water, is a building which was the favourite retreat of Peter I. It is preserved, together with its furniture, entirely in its original state, with a kind of religious veneration. Its plainness shows the frugal simplicity in which that monarch was accustomed to live. In the same celebrated gardens there is a remarkable building called the mountain for sledges, and often by travellers the flying mountain. It stands (says Mr Cox) in the middle of an oblong area, inclosed by an open colonnade, with a flat roof, which is railed for the convenience of holding spectators. The circumference of this colonnade is at least half a mile. In the middle of the area stands the flying mountain, stretching nearly from one end to the other. It is a wooden building, supported upon pillars, representing an elevation of the ground, or a mountain composed of three principal ascents, gradually diminishing in height, with an intermediate space to resemble valleys: from top to bottom is a floored way, in which three parallel grooves are formed. It is thus used: a small carriage containing one person being placed in the centre groove upon the highest point, goes with great rapidity down one hill; the velocity which it acquires in its descent carries it up a second; and it continues to move in a similar manner until it arrives at the bottom of the area, where it rolls for a considerable way on the level surface, and stops before it attains the boundary: it is then placed in one of the side grooves, and drawn up by means of a cord fixed to a windlass. To a person unacquainted with the mechanism, this entertainment would appear tremendous; but as the grooves always keep the carriage in its right direction, there is not the least danger of being overturned. At the top of the mountain is a handsome apartment for the accommodation of the court and principal nobility: there is also room for many thousand spectators within the colonnade and upon its roof. Near the flying mountain is a spacious amphitheatre, in which tournaments are usually exhibited.

Peters, Father, a Jesuit, was confessor and counsellor to James II. king of England. This prince dismissed him in 1688, because he was considered as the author of those troubles in which the kingdom was then involved. He was (says Bishop Burnet) the most violent of the king's advisers, and the person most listened to. Though he had the honour of being nobly descended, he was a man of no extensive erudition, and was eminent only for his bigotry and forwardness. Though Burnet is not always to be believed, yet certain it is, from the testimony of other historians, that Father Peters was by no means a person properly qualified to direct King James in the critical situations in which he then stood.

Petersburg, St, a city in Russia, and capital of a province of the same name, and of the whole empire. It is situated in N. Lat. 59, 26, 23, and F. Long.
PET

Long. 30. 25. and contains about 250,000 inhabitants.

It was founded in the year 1703 by Czar Peter the
Great, whose ambition it was to have a fleet on the
Baltic; for which reason he determined to found a
city which might become the centre of trade through-
out all his dominions. The spot he pitched upon was
a low, fenny, uncultivated island, formed by the
branches of the river Neva, before they fall into the
gulf of Finland. In the summer this island was cover-
ed with mud; and in winter became a frozen pool,
rendered almost inaccessible by dreary forests and deep
morasses, the haunts of bears, wolves, and other sav-
age animals. Having taken the fort of Naltsburg,
and the town of Neischanz, in the year 1703, this
mighty conqueror assembled in Ingria above 300,000
men, Russians, Tartars, Cossacks, Livonians, and
others, even from the most distant parts of his empire,
and laid the foundation of the citadel and fortifica-
tions, which were finished in four months, almost
in despite of nature. He was obliged to open ways
through forests, drain bogs, raise dykes, and lay cause-
ways, before he could pretend to found the new city.
The workmen were ill provided with necessary tools and
implements, such as spades, pick-axes, shovels, planks,
and wheel-barrowes; they were even obliged to fetch
the earth from a great distance in the skirts of their gar-
ments, or in little bags made of old mate and rags sewed
together. They had neither huts or houses to shelter
them from the severity of the weather: the country,
which had been desolated by war, could not accommo-
date such a multitude with provisions; and the supplies
by the lake Ladoga were often retarded by contrary
winds. In consequence of these hardships, above 100,000
men are said to have perished: nevertheless the work
proceeded with incredible vigour and expedition; while
Peter, for the security of his workmen, formed a great
camp, in such a manner, that his infantry continued in
Finland, and his cavalry were quartered in Ingria.
Some Swedish cruisers being descried in the neighbour-
hood, the czar posted a body of troops in the isle of Ruz-
ari, by whom the Swedes were repulsed, and the work
men with no further interruption. The buildings of the
city keept pace with the fortresses, which is the centre of
the town, surrounded on all sides by the Neva; and in
little more than a year, above 30,000 houses were erect-
ed. At present there may be about double that num-
er in Petersburg, though many of them are paucity
and inconsiderable. In order to people this city, Peter
invited richer merchants, artificers, mechanics, and se-
men, from all the different countries of Europe: he de-
molished the town of Muscovy, and brought hither
not only the materials of the houses, but the inhabitants
themselves. A thousand families were drawn from Mos-
cow; he obliged his nobility to quit their palaces and
their villas in and about Moscow, and take up their resi-
dence at Petersburg, in a much more cold and com-
fortless climate. Finally, resolving to remove hither the
trade of Archangel, he issued an ordinance, im-
porting, that all such merchandise as had been convey-
ed to Archangel, in order to be sold to foreigners,
should now be sent to Petersburg, where they should
pay no more than the usual duties. These endeavours
and regulations have rendered this one of the greatest
and most flourishing cities in Europe. The Russian
boyars and nobility have built magnificent palaces, and
Petersburg are now reconciled to their situation. At first many
houses were built of timber; but these being subject to
sudden conflagrations in spite of all the precautions that
could be taken, the czar, in the year 1714, issued an
order, that all new houses should be walled with brick
and covered with tiles. The fort is an irregular hexa-
gon, with opposite bastions. This, together with all
the rest of the fortifications, was in the beginning form-
ed of earth only; but in the sequel they were faced with
strong walls, and provided with casemates, which are
bomb-proof. In the curtain of the fort, on the right
hand side, is a noble dispensary, well supplied with ex-
cellent medicines, and enriched with a great number of
porcelain vases from China and Japan. From one of
the gates of the fort a draw-bridge is thrown over an
arm of the river, in which the czar's galleys and other
small vessels are sheltered in the winter. The most re-
markable building within the fort is the cathedral, built
by the direction of an Italian architect. Petersburg is
partly built on little islands, some of which are connect-
ed by draw-bridges; and partly on the continent. In
the highest part, on the bank of the Neva, the czar fixed
his habitation, or ordinary residence, built of fre-
stone, and situated so as to command a prospect of the
greater part of the city. Here likewise is a royal found-
dery; together with the superb houses of many nobles-
men. The marshy ground on which the city is built,
being found extremely slippery, dirty, and incommodi-
uous, the czar ordered every inhabitant to pave a certain
space before his own door. In the year 1716, Peter,
taking a fancy to the island Wasili-Osteros, which he
had given as a present to Prince Mazitikoff, resumed
the grant, and ordered the city to be extended into this
quarter. He even obliged the boyars, or nobles, to
build stone houses on this spot, though they were alre-
dy in possession of others on the side of Ingria: accord-
ingly this is now the most magnificent part of the city.
On the other side of a branch of the Neva stands
the czar's country or summer palace, provided with a
fine garden and orangery. On the bank of the same river is
the shabos, or suburbs, in which the servants generally
choose their habitation. Petersburg is very subject to
dangerous inundations. In the year 1715, all the
bastions and draw-bridges were either overwhelmed
or carried away. The breadth, depth, and rapidity of
the Neva, have rendered it extremely difficult, if not
impracticable, to join the islands and the continent by
bridges. Besides, Peter was averse to this expedient
for another reason; resolved to accustom his subjects to
navigation, be not only rejected the project of a bridge,
but also ordered that no boat should pass between the
islands and continent, except by the help of sail only.
In consequence of this strange regulation, many lives
were lost: but at length he gained his point; and by
habituating his sluggish Muscovites to the dangers of the
sea, in a little time produced a breed of hardy sailors.
The adjacent country is so barren, that the town must
be supplied with provisions from a great distance; conse-
quentially they are extremely dear. Here are woods
in plenty, consisting of pine, fir, alder, birch, poplar,
and elm; but the oak and the beech are generally
brought from Cassan. In winter the weather is extreme-
ly cold, and hot in the summer. In June the length of

Digitized by Google
Petersburg, the night does not exceed three hours, during which the natives enjoy a continued twilight: but in December the sun is not visible more than three hours above the horizon.

The czar Peter, who was indefatigable in his endeavours to improve and civilize his subjects, neglected nothing which he thought could contribute to these purposes. He condescended even to institute and regulate assemblies at Petersburg: these were opened at five in the afternoon, and the house was shut at ten: between these hours the fashionable people of both sexes met without ceremony, danced, conversed, or played either at cards or at chess, this last being a favourite diversion among the Russians. There was likewise an apartment appointed for drinking brandy, and smoking tobacco. Plays and operas were likewise introduced for the same purposes; but as Peter had little relish, and less taste, for those entertainments, they were performed in a very awkward manner in his lifetime: however, since his death these performances have been brought to a greater degree of art and decorum.

This great northern legislator established, in the neighbourhood of Petersburg, manufactures of linen, paper, saltpetre, sulphur, gunpowder, and bricks, together with water-mills for sawing timber. He instituted a marine academy, and obliged every considerable family in Russia, to send at least one son or kinman, between the ages of ten and eighteen, to this seminary, where he was instructed in navigation, learned the languages, was taught to perform his exercises, and to live under the severest discipline. To crown his other plans of reformation, he granted letters patent for founding an academy, upon a very liberal endowment; and though he did not live to execute this scheme, his emperor, who survived him, brought it to perfection.

Peter the great has been much censured for transferring the seat of the empire from Moscow to St Petersburg; the former of which lay nearer to the centre of his dominions. But these objections will have but little weight with those who consider the consequences of this removal. The new city is nearer than Moscow was to the more civilized parts of Europe; and from an intercourse with them the manners of the Russians have been improved, and the nobility in particular have lost much of their feudal importance. Above all, the grand object of Peter, that of having a formidable navy in the Baltic has certainly been obtained, and the empress of Russia is now the arbiter of the north, and in some degree the mediator of all Europe. In short, the erection of St Petersburg was perhaps one of the best acts of Peter's reign, and has in its consequences been the most beneficial. Indeed it is at least probable, that if through any revolution the seat of government should be again transferred to Moscow, we should nowhere see the traces of these memorable improvements, which the passing century has given birth to, but in the annals of history; and Russia would again, in all probability, relapse into her original barbarism.

The erection of such a city as Petersburg in so short a time is truly wonderful. Mr Cocks says his mind was filled with astonishment, when he reflected that so late as the beginning of the 18th century, the ground on which it stands was one vast morass, occupied by a very few fishermen's huts. The present divisions of the town, some of which we have already mentioned, are called, 1. The Admiralty quarter; 2. The Vassili Ostrof Petersburg or Island; 3. The Fortress; 4. The island of St Petersburg; and, 5. The various suburbs of Livonia, of Moscow, of Alexander Nevski, and of Wiburg.

The late empress has done so much for this city, that she may not improperly be called its second foundress. It is nevertheless, still an infant place, and, as Mr Wraexall observes, 'only an immense outline which will require future empresses, and almost future ages, to complete.'

"The streets in general, says a late traveller, are Coarse's Tread broad and spacious; and three of the principal ones, namely, which meet in a point at the admiralty, and reach to the extremities of the suburbs, are at least two miles in length. Most of them are paved; but a few are still suffered to remain floored with flanks. In several parts of the metropolis, particularly in the Vassili Ostrof, wooden houses and habitations, scarcely superior to common cottages, are blended with the public buildings; but this motley mixture is far less common than at Moscow, where alone can be found any idea of an ancient Russian city. The brick houses are ornamented with a white stucco, which has led several travellers to say that they are built with snow; whereas, unless I am greatly mistaken, there are only two stone structures in all Petersburg. The one is a palace, building by the empress upon the banks of the Neva, called the marble palace; it is of hewn granite, with marble columns and ornaments; the other is the church of St Isaac, constructed with the same materials, but not yet finished.

"The mansions of the nobility are many of them vast piles of building, but are not in general upon so large and magnificent a scale as several I observed at Moscow: they are furnished with great cost, and in the same elegant style as at Paris or London. They are situated chiefly on the south side of the Neva, either in the Admiralty quarter, or in the suburbs of Livonia and Moscow, which are the finest parts of the city." See NEVA.

"Petersburg, although it is more compact than the other Russian cities, and has the houses in many streets contiguous to each other, yet still bears a resemblance to the towns of this country, and is built in a very straggling manner. By an order issued many years ago by the government, the city was inclosed within a rampart, the circumference whereof is 21 versts, or 14 English miles."

The public hospital is under an admirable system of management, both with regard to the cleanliness and comfort of the inmates. The revenues arise from the surplus profit of the Lombard bank, and amount to about 120,000 roubles per annum; by which provision is made for upwards of 200 people in the house, and assistance given to 1,500 out patients.

The Foundling Hospital, though inferior in magnitude to that of Moscow, had 6000 children on its lists in 1813, of whom 600 were kept within the house. The expense incurred for the whole is 40,000 roubles per annum. The children upon being sent here are immediately vaccinated, and when recovered, placed out with different families to nurse, till the period of their education commences. They are next selected, according to their natural talent, for the several employments, liberal or mechanical, to which they seem most inclined, and are brought up accordingly under excel-
PET

Petersburg. Some are sent to the manufactories; some to the military schools, and others kept at home, and instructed in the arts of the belles lettres.

The fashionable promenade of the boulevards consists of three avenues of trees carried round three sides of the admiralty, a building which exhibits perhaps the longest regular façade in Europe: it is upwards of a quarter of an English mile in extent, adorned at intervals with six several porticoes, and surmounted rather fantastically, with a thin taper dome and spire.

The academy of arts is zealously patronised by the government; and from the revenues allotted to it, is well furnished with models from the antique, as well as other matters suited to the institution. The labours of the students exhibit some of the highest specimens of imitative excellence. Their designs in architecture are of great merit, and their pictures possess a free style of execution, combined with chasteness and harmony of colouring, seldom equalled in any modern school.

The mint is a pretty large establishment, furnished with a very complete coinage apparatus, exactly similar to that employed in London, and made in England by Messrs. Watt and Bolton. The labourers are all peasants, and receive merely soldiers pay. They are daily strip to the skin, and so narrowly searched, that even the cunning of a Russian cannot find a secure mode of peculation. From excessive issues the paper money has long been very low in value. In 1814, according to Mr. James, the paper rouble was worth only 10d. instead of 3s. 4d.

Of the edifices lately erected in Petersburg, the cathedral church of the virgin of Canaan is the most magnificent. It was opened in 1814, having been 15 years in building, and cost no less than 15,000,000 of roubles. The plan was furnished by Worowitchki, a Russian slave, educated at the imperial academy under the patronage of his master Count Strogomon. He displayed an extraordinary genius for architecture, and not only planned the cathedral, but superintended the execution of the work. He just lived to see it finished. The building is in the form of a cross with a cupola in the centre; each arm of the cross terminates with a Corinthian portico; and that in the front is received into a grand semicircular colonnade four columns in depth. The arc of this colonnade was intended to have been ornamented with the statues of St. Peter and St. Paul, raised on gigantic blocks of solid granite ten or twelve feet high, but this has not yet been accomplished. The design is thought to be wanting in harmony; but the decorations are chase, and the effect of the whole is noble and imposing in a very high degree.

Education among the higher classes of the male sex is very much neglected. The tutorage of a French abbé at home, and a short residence at one of the universities, is the only chance given to the son of a man of consequence for pursuing the belles lettres, or for acquiring any other knowledge than such as may be picked up in society. But the professional education of those who are destined for the civil, military or commercial line is much better. Girls are brought up with a degree of attention proportionate to the neglect with which the other sex is treated. The Couvent de Demoiselles, and the Institute of Catherine, both flourishing under the patronage and perpetual inspection of the empress dowager, are the chief seminaries for females at Petersburg. Notwithstanding the timidity of the female character, a public examination is held every three years, and rewards are bestowed on those who have made the greatest progress. The convent contains two separate establishments, one for the instruction of 260 girls, the daughters of the burgesses, the other for those of the class of nobility. The period of education is about nine years, during which they receive instruction in the French, German, and Russian languages, in the Russian history, in natural philosophy, music, dancing, embroidery, writing, arithmetic, and geometry.

There are various manufactures in the city or neighbourhood conducted by the government. There is a cotton manufactury on the Neva, for which 600 boys and girls are furnished from the Foundling hospital. There is an imperial plate glass manufactury worked by the emperors slaves; an extensive cloth manufactury; a porcelain manufactury, and several others. It is believed that the government loses considerably by these establishments, but they are supported with the view of naturalizing these species of industry.

The trade of Petersburg is extensive. The number of ships entered at the port in 1813, was 690, of which 343 were British.

We have already said that Petersburg is very liable to be inundated. An inundation of a very alarming nature took place when Mr. Coxe was there in September 1777, of which the following account was given in Journal St Petersburg, September 1777: "In the evening of the 9th, a violent storm of wind blowing at first S. W. and afterwards W. raised the Neva, and its various branches to so great a height, that at five in the morning the waters poured over their banks, and suddenly overflowed the town, but more particularly the Vaissili Ostrov and the island of St. Petersburg. The torrent rose in several streets to the depth of four feet and a half, and overturned, by its rapidity, various buildings and bridges. About seven, the wind shifting to N. W. the flood fell as suddenly; and at midnight most of the streets, which in the morning could only be passed in boats, became dry. For a short time, the river rose 10 feet 7 inches above its ordinary level."

All our readers have unquestionably heard of the equestrian statue of Peter I. in bronze. We shall give an account of that extraordinary monument in Mr. Coxe's own words. "It is (says he) of a colossal size, and is the work of Monsieur Falconet, the celebrated French statuary, cast at the expense of Catherine II. in honour of her great predecessor, whom she reveres and imitates. It represents that monarch in the attitude of mounting a precipice, the summit of which he has nearly attained. He appears crowned with laurel, in a loose Asiatic vest, and sitting on a housing of bear skin: his right hand is stretched out as in the act of giving benediction to his people; and his left holds the reins. The design is masterly, and the attitude is bold and spirited. If there be any defect in the figure, it consists in the flat position of the right hand; and for this reason, the view of the left side is the most striking, where the whole appearance is graceful and animated. The horse is rearing upon its hind legs; and its tail, which is full and flowing, slightly touches a bronze serpent, artfully contrived to assist in supporting the vast weight."
P E T [ 232 ]

Petersburg. Weight of the statue in due equilibrium. The artist has, in this noble essay of his genius, represented Peter as the legislator of his country, without any allusion to conquest and bloodshed; wisely preferring his civil qualities to his military exploits. The contrast between the composed tranquillity of Peter (though perhaps not absolutely characteristic) and the fire of the horse, eager to press forwards, is very striking. The simplicity of the inscription corresponds to the sublimity of the design, and is far preferable to a pompous detail of exalted virtues, which the voice of flattery applies to every sovereign without distinction. It is elegantly finished in brass characters, on one side in Latin, and on the opposite in Russian. Petro primo Catharina secunda, 1782; i.e. Catherine II. to Peter I."

"The statue, when I was at Petersburg, was not erected, but stood under a large wooden shed near the Neva, within a few yards of its enormous pedestal. When Falconet had conceived the design of his statue, the base of which was to be formed by a huge rock, he carefully examined the environs of Petersburg; if, among the detached pieces of granite which are scattered about these parts, one could be found of magnitude correspondent to the dimensions of the equestrian figure. After considerable research, he discovered a stupendous mass half buried in the midst of a morass. The expense and difficulty of transporting it were no obstacles to Catherine II. By her order the morass was immediately drained, a road was cut through a forest, and carried over the marshy ground; and the stone which, after it had been somewhat reduced, weighed at least 1,500 tons, was removed to Petersburg. This more than Roman work was, in less than six months from the time of its first discovery, accomplished by a windlass, and by means of large friction balls alternately placed and removed in grooves fixed on each side of the road. In this manner it was drawn, with 40 men seated upon its top, about four miles, to the banks of the Neva; there it was embarked in a vessel constructed on purpose to receive it, and thus conveyed about the same distance by water to the spot where it now stands. When landed at Petersburg, it was 42 feet long at the base, 36 at the top, 21 thick, and 17 high; a bulk greatly surpassing in weight the most boasted monuments of Roman grandeur, which, according to the fond admirers of antiquity, would have baffled the skill of modern mechanics, and were alone sufficient to render conspicuous the reign of the most degenerate emperors.

"The pedestal, however, though still of prodigious magnitude, is far from retaining its original dimensions, as, in order to form a proper station for the statue, and to represent an ascent, the summit whereof the horse is endeavouring to attain, its bulk has been necessarily diminished. But I could not observe, without regret, that the artist has been desirous to improve upon nature: and, in order to produce a resemblance of an abrupt broken precipice, has been too lavish of the chisel.

"The statue was erected on the pedestal on the 27th of August 1782. The ceremony was performed with great solemnity, and was accompanied with a solemn inauguration. At the same time the empress issued a proclamation, in which, among other instances of her clemency, she pardons all criminals under sentence of death; all deserters who should return to their respective corps within a limited time; and releases all criminals condemned to hard labour, provided they had not been guilty of murder."

Mr Coxe informs us, that the weather is extremely changeable in this capital, and the cold is at times extreme; against which the inhabitants take care to provide (see PEASANT), though some of them nevertheless unfortunately fall victims to it. "As I traversed the city, (says Mr Coxe), on the morning of 12th January, I observed several persons whose faces had been bitten by the frost: their cheeks had large scars, and appeared as if they had been singed with an hot iron. As I was walking with an English gentleman, who, instead of a fur cap, had put on a common hat, his ears were suddenly frozen: he felt no pain, and would not have perceived it for some time, if a Russian, in passing by, had not informed him of it, and assisted him in rubbing the part affected with snow, by which means it was instantly recovered. This, or friction with flannels, is the usual remedy; but should the person in that state approach the fire, or dip the part in hot water, it immediately merits and drops off... The common people continue at their work as usual, and the drivers piled in the streets with their sledges, seemingly unaffected by the frost; their beards were incrusted with iced ice, and the horses were covered with icicles.

"It sometimes happens that coachmen or servants, while they are waiting for their masters, are frozen to death. In order to prevent as much as possible these dreadful accidents, great fires of whole trees, piled one upon another, are kindled in the court-yard of the palace and the most frequented parts of the town. As the flames blazed above the tops of the houses, and cast a glare to a considerable distance, I was frequently much amused by contemplating the picturesque groups of Russians, with their Asiatic dress and long beards, assembled round the fire. The centinels upon duty, having no beards, which are of great use to protect the glands of the throat, generally tie handkerchiefs under their chins, and cover their ears with small cases of flannel."

The police of this city has been much admired. This establishment consists of a police master, two presidents, the one for criminal, the other for civil cases, and two constables, chosen from the burgher class. To this is committed the care to maintain decorum, good order and morals; the attainment of which is thus accomplished.

The residence is divided into ten departments, each of which has a president who must possess a correct knowledge of the inhabitants in his own department, of which he is regarded as the censor morum. His house must be a refuge both night and day for all in distress; and he must not leave the city for two hours under any pretext whatever, without appointing a substitute to act in his absence. The constables and watchmen of his department are subject to his orders; and in the discharge of his duty, he has two sergeants to attend him.

The night watchmen have stations assigned them, and are to be aided in the seizing of offenders, or in any service their commanders may require. There is also a command of 120 men, who are supported by a regiment

P E T
giment of hussars, should the nature of their duty be at
time so hazardous as to render such a measure nec-
necessary.

This piece of political mechanism is so harmoniously
collected in all its parts, that it becomes the admiration
every foreigner.

So extraordinary is the vigilance observed by every
part of this admirable whole, that all secret inquisitions
are totally superfluous. The police has a knowledge of
every person in the residence; travellers are subject to
certain formalities, in consequence of which to hide the
place of their abode, or the time of their departure, are
like impracticable. Every householder must declare to
the police who lodges with him, or what strangers
have put up at his house. When travellers leave the
town, they must publish in the newspapers their name,
quality, and place of abode, three different times, and
produce the papers containing such advertisement.

Peter, John, a doctor, in a sea-port town in
Virginia, 25 miles southward of Richmond, seated on
both sides of the Appamatox river, about 12 miles above
its junction with James river, and contained 5668 in-
habitants in 1810. There is no regularity, and very
little elegance in Petersburg. It is merely a place of
business. The Free Masons have a hall tolerably ele-
gen; and the seat of the Bowling family is pleasant
and well built. It is rather unhealthy. Like Rich-
mond, Williamsburg, Alexandria, and Norfolk, it is a
corporation; and what is singular, Petersburgh city
comprehends part of three counties. The celebrated
Indian queen, Pocahontas, from whom descended the
Randolph and Bowling families, formerly resided at this
place. It is a place of considerable trade. Tobacco is
the staple produce of which above 20,000 hogheads are
annually received at the warehouses.

PETERSFIELD, a handsome town of Hampshire
in England, and sends two members to parliament. It
is seated in W. Long. 1. 5. N. Lat. 51. 5.

PETERWARADIN, a fortified town in Scelivia,
and one of the strongest frontier places the house of
Austria has against the Turk, seated on the Danube
between the Drave and the Save. E. Long. 20. 0. N.
Lat. 45. 20.

PETIOLE, in Botany, the slender stalks that sup-
port the leaves of a plant.

PETIT, or PETEU, a French word signifying little
or small.

Petite Guerre, denotes the operations of detached
parties and the war of posts. See War, Part III.

Petit Sergente. See Sergante.

Petit Treson. See Treason.

Petit, John, a student at the Sorbonne, very early
gained to himself a character by his knowledge, and
those eloquent orations which he pronounced before the
university of Paris. He was employed in the famous
embassy which was sent from France to Rome, for
the purpose of healing the schism in 1407; but he soon lost
all the honour which he had acquired. John Sans
Peur, duke of Burgundy, having treacherously contri-
vied to assassinate Louis of France, duke of Orleans,
only brother to Charles VI. John Petit, entirely devoted
to the views of the murderer, maintained in a public
disputation, at Paris, the 8th of March 1408, that the
murder was lawful. He had the effrontery to assert,
that it is allowed to employ fraud, treason, and

VOL XVI. Part I.

every other method, however base, in order to get rid of
a tyrant; and that no faith ought to be kept with him." He
dared to add further, that "the man who should
commit such an action, not only deserved to be exempted
from punishment, but to receive a reward." This
sanguinary doctrine was loudly exclaimed against; but
the duke of Burgundy's powerful influence sheltered
Petit for some time. Some eminent writers, however,
of that period, with Gerson at their head, denounced
the doctrine to John de Montaigu, bishop of Paris, who
condemned it as heretical the 23rd November 1414.

It was likewise condemned by the council of Constance
the year following at the instigation of Gerson; but no
notice was taken either of Petit's name or his writings.

In fine, the king, on the 16th of September 1416,
ordered the parliament of Paris to pronounce a severe de-

Pettit.

 virous and durable colours proper for enamelling, from Sir Theodore Mayerne at London, who recommended Petitet to Charles I. He had the honour to paint the portraits of that monarch and the whole royal family, and continued in England until Charles’s unhappy end: he then went to Paris, where he was highly favoured by Louis XIV. and acquired an ample fortune. Being a Protestant, the revocation of the edict of Nantz obliged him to retire to Geneva; but settling soon after at Vevey in the canton of Berne, he passed the remainder of his life in ease and influence. He died in 1691.

Petitet may be called the inventor of painting portraits in enamel. Though his friend Bordier made several attempts before him, and Sir Theodore Mayerne had facilitated the means of employing the most beautiful colours; yet Petitet completed the works, which under his hand acquired a softness and liveliness of colouring that will never change, and will ever render his works variable. He made use of gold and silver plates, and seldom enamelled on copper. When he first came in vogue, his price was 20 louis a head, which he soon raised to 40. It was his custom to take a painter with him, who painted the picture in oil; after which Petitet sketched out his work, which he always finished after the life. When he painted the king of France, he took those pictures for his copies that most resembled him; and the king afterwards gave him a sitting or two to finish his work.

PETIVER, JAMES, a celebrated English botanist, was contemporary with Plukenet; but we are wholly unacquainted with the precise time of his birth. He was by profession an apothecary, having served an apprenticeship under Mr Felsham, apothecary to Bartholomew’s hospital. He settled in Aldersgate-street where he commenced business on his own account, where he continued during the whole of his life. His business was extensive; and he was afterwards chosen apothecary to the Charter-house. Excepting Sir Hans Sloane, and Mr Courtne, he was the only person after the Tradesmen, who made any important collections in natural history, previous to those of the present day. He employed the captains and surgeons of different ships to bring him home specimens; and by means of printed directions he enabled them to select proper objects. In this manner his collection soon became so valuable, that he was offered 4000l. for it by Sir Hans Sloane, some time prior to his decease; but, after he died, it was purchased by that naturalist. His fame was extended both at home and abroad by his valuable museum. He was chosen a fellow of the Royal Society; and having become acquainted with Ray, he assisted him in arranging the second volume of his History of Plants. He died on the 20th of April, 1718; and his funeral was honoured by the attendance of Sir Hans Sloane, and other eminent men, as pall-bearers.

He published several works, on different subjects of natural history, such as Musae Petitiouianae Centuriae decem, 1692—1703, 8vo: Gasophyziac Naturea et Arta, Decades decem, folio, 1702, with 100 plates: A catalogue of Mr Ray’s English Herbal, illustrated with figures, folio, 1713, and continued in 1715: Many small publications, which may be found enumerated in Dr Pultney’s book: Many papers in the Philosophical Transactions; and a material article in the third volume of Ray’s work, entitled, Plantae Rariores Chinenses,
PETRARCH, Petrarca, et Afrique, à Iacopo Petruccio ad opus consummandum collato, &c. Many of his small tracts having become scarce, his works were collected and published, exclusive of his papers in the Transactions, in 2 vols. folio, in the year 1762.

PETIVERIA, a genus of plants belonging to the hexandria class, and in the natural method ranking under the 12th order, Holopneuro. See Botany Index.

PETRARIUS, (Cesar, Lucian), a town of Greece, on the coast of Illyricum, near Durrbachium, and not far from the mouth of the river Panyus.—Another Petra, (Livy); a town of Maceda, a district of Thrace, lying towards Macedonia; but in what part of Macedonia, he does not say.

PETRAE (Ptolomy), Petraea (Silius Italicus), Petrina (Italics), in both which last verba is understood; an inland town of Sicily, to the south-west of Enegnum. Now Petraglia (Cluverius).

PETRAE (2 Kings xiv.), a town of the Amalekites; near the Adescens Scorpionides (Judges i.) and the valley of Salt in the south of Judea; afterwards in the possession of the Edomites, after destroying the Amalekites.

PETRE, Recem, or Reuem, so called from Recem, king of the Midianites, slain by the Israelites (Num. xxxvi.). Formerly called Arex, now Petra; the capital of Arabia Petraea (Josephus). Ptolemy places it in Long. 66. 31. 45. from the Fortunate islands, and Lat. 30. 20. It declines therefore 80 miles to the south of the parallel of Jerusalem, and 36 miles, more or less, from its meridian to the east. Josephus says, that the mountain on which Aaron died stood near Petra; which Strabo calls the capital of the Nabataeans; at the distance of three or four days journey from Jericho. This Petra seems to be the Sela of Isaih xvi. 1. and xiii. 11. the Hebrew name of Petra, a rock. Though some imagine Petra to be no older than the time of the Macedonians.

PETRARCH, Francis, a celebrated Italian poet, was born at Arezzo in 1304, and was the son of Petrarco di Parenzo. He studied grammar, rhetoric, and philosophy, for four years at Carpentras; from whence he went to Montpellier, where he studied the law under John Andreas and Chou de Fistina, and probably from the latter he derived a taste for Italian poetry. A Petrarck only studied the law out of complaisance to his father, who on his visiting him at Bologna had thrown in the fire all the Latin poets and orators except Virgil and Cicero; he, at 22 years of age, hearing that his father and mother were dead of the plague at Avignon, returned to that city to settle his domestic affairs, and purchased a country house in a very solitary but agreeable situation, called Pauchace; where first knew the beautiful Laura, with whom he fell in love, and whom he has immortalized in his poems. He at length travelled into France, the Netherlands, and Germany; and at his return to Avignon entered into the service of Pope John XXII. who employed him in several important affairs. Petrarch was in hopes of being raised to some considerable post; but being disappointed, he applied himself entirely to poetry; in which he met with much applause, that in one and the same day he received letters from Rome and the chancellor of the university of Paris, by which they invited him to receive the poetic crown. By the advice of his friends, he preferred Rome to Paris, and received that crown from the senate and people on the 8th of April 1341. "The ceremony of his coronation (says Gibbon) was performed in the Capitol, by his friend and patron the supreme magistrate of the republic. Twelve patrician youths were arrayed in scarlet; six representatives of the most illustrious families, in green robes, with garlands of flowers, accompanied the procession; in the midst of the princes and nobles, the senator, count of Angiollara, a kinsman of the Colonna, assumed his throne; and at the voice of a herald Petrarch arose. After disrobing on a text of Virgil, and thrice repeating his vows for the prosperity of Rome, he knelt before the throne, and received from the senator a laurel crown, with a more precious declaration, 'This is the reward of merit.' The people shouted, 'Long life to the Capitol and the poet!' A sonnet in praise of Rome was accepted as the effusion of genius and gratitude; and after the whole procession had visited the Vatican, the profane wreath was suspended before the shrine of St. Peter. In the act or diploma which was presented to Petrarch, the title and prerogatives of poet-laureat are revived in the Capitol after the lapse of 1300 years; and he receives the perpetual privilege of wearing, at his choice, a crown of laurel, ivy, or myrtle; of assuming the poetic habit; and of teaching, disputing, interpreting, and composing, in all places whatsoever, and on all subjects of literature. The grant was ratified by the authority of the senate and people; and the character of citizen was the recompense of his affection for the Roman name. They did him honour, but they did him justice. In the familiar society of Cicero and Livy, he had imbibed the ideas of an ancient patriot; and his ardent fancy kindled every idea to a sentiment, and every sentiment to a passion." His love of solitude at length induced him to return to Vauclose; but, after the death of the beautiful Laura, Provence became insupportable to him, and he returned to Italy in 1352; when, being at Milan, Galeas Vicenesti made him counsellor of state. Petrarch spent most of the rest of his life in travelling to and from the different cities in Italy. He was archdeacon of Parma, and canon of Padua; but never received the order of a priest. All the priests and great men of his time gave him public marks of esteem; but he lived at Arcqua, three miles from Padua, the Florentines deputed Boccace to go to him with letters, by which they invited him to Florence, and informed him, that they restored to him all the estate of which his father and mother had been deprived during the disensions between the Guelphs and Gibelines. He died a few years after at Arqua, in 1374. He wrote many works that have rendered his memory immortal; these have been printed in four volumes folio. His life has been written by several authors. Amongst these there was one by Mrs Susanna Dobson, in 2 volumes 8vo, collected and abridged from the French. In this work we have the following elegant and just character of Petrarch.

"Few characters, perhaps, have set in a stronger light the advantages of well-regulated dispositions than that of Petrarch, from the contrast we behold in one particular of his life, and the extreme misery he suffered from the indulgence of an affection, which, though noble and delightful when justly placed, becomes a reproach and a torment to its possessor when once di..."
rected to an improper object. For, let us not deceive ourselves or others; though (from the character of Laura) they are acquitted of all guilt in their personal intercourse, yet, as she was a married woman, it is not possible, on the principles of religion and morality, to clear them from that just censure which is due to every deflection of the mind from those laws which are the foundation of order and peace in civil society, and which are stamped with the sacred mark of divine authority.

In this particular of his character, therefore, it is sincerely hoped that Petrarch will serve as a warning to those unhappy minds, who, partaking of the same feelings under the like circumstances, but not yet suffering his misery, may be led, by the contemplation of it, by a generous regard to the honour of human nature, and by a view to the approbation of that all-seeing Judge who penetrates the most secret recesses of the heart, to check every unhappy inclination in its birth, and destroy, while yet in their power, the seeds of those passions which may otherwise destroy them.

As to the cavils or censures of those who, incapable of tenderness themselves, can neither enjoy the view of it when presented in its most perfect form, nor pity its sufferings when, as in this work, they appear unhappily indulged beyond the bounds of judgment and tranquillity; to such minds I make no address, well convinced, that, as no callous heart can enjoy, neither will it ever be in danger of being misled, by the example of Petrarch in this tender but unfortunate circumstance of his character.

To susceptible and feeling minds alone Petrarch will be ever dear. Such, while they regret his failings, and consider them as warnings to themselves, will love his virtues; and, touched by the glowing piety and heart-felt contrition which often impressed his soul, will ardently desire to partake with him in those pathetic and sublime reflections which are produced in grateful and affectionate hearts, on reviewing their own lives, and contemplating the works of God.

Petrarch had received from nature a very dangerous present. His figure was so distinguished as to attract universal admiration. He appears, in his portraits, with large and many features, eyes full of fire, a blooming complexion, and a carriage that beamed all the genius and fancy which shone forth in his works. In the flower of his youth, the beauty of his person was so very striking, that wherever he appeared, he was the object of attention. He possessed an understanding active and penetrative, a brilliant wit, and a fine imagination. His heart was candid and benevolent, susceptible of the most lively affections, and inspired with the noblest sentiments of liberty.

But his failings must not be concealed. His temper was, on some occasions, violent, and his passions headstrong and unruly. A warmth of constitution hurried him into irregularities, which were followed with repentance and remorse.—No essential reproach, however, could be cast on his manners, till after the 23d year of his age. The fear of God, the thoughts of death, the love of virtue, and those principles of religion which were inculcated by his mother, preserved him from the surrounding temptations of his earlier life.

A resemblance has been traced, in several instances, between this admired poet and our late famous Yorick. —Both, we know, had great wit and genius, and no less imprudence and eccentricity; both were canons, or prebendaries, the Italian of Padua, &c. and the Englishman of York; they both "ran over France, without any business there." If the bishop of Lombras patronised and corresponded with the one, a prelate of the English church, now deceased, desired, in a letter, bert. Arch. to shanudjas;* with the other. In their attachments to York. Laura and Eliza, both married women, these two pre- his bendaries were equally warm, and equally innocent. And, even after death, a most remarkable circumstance. But, has attended them both; some persons, we are told, stole Petrarch's bones, in order to sell them; and, in like manner, Yorick's body, it is confidently affirmed, was also stolen, and his skull has been exhibited at Oxford.

PETRE, petre, of Saltpetre. See Nitre, Chemistry and Mineralogy Index.

PETREA, in Botany, a genus of plants belonging to the dianemias class; and in the natural method ranking under the 40th order, Personatae. See Botany. Index.

PETREL. See Procellaria, Ornithology Index.

PETRIFICATION, in Natural History, denotes the conversion of wood, bones, and other substances, principally animal or vegetable, into stone. These bodies are more or less altered from their original state, according to the different substances they have lain buried among in the earth; some of them having suffered very little change, and others being so highly impregnated with crystalline, sparry, pyritic, or other extraneous matter, as to appear mere masses of stone or lump of the matter of the common pyrites; but they are generally of the external dimensions, and retain more or less of the internal figure, of the bodies into the pores of which this matter has made its way. The animal substances thus found petrified are chiefly seashells; the teeth, bony palates, and bones of fish; the bones of land animals, &c. These are found variously altered, by the insinuation of stony and mineral matter into their pores; and the substance of some of them is now wholly gone, there being only stony, sparry, or other mineral matter, changing in the shape and form of the animal or vegetable. Respecting the manner in which petrification is accomplished, we know but little. It has been thought by many philosophers, that this was one of the rare processes of nature; and accordingly such places as afforded a view of it, have been looked upon as great curiosities. However, it is now discovered, that petrification is exceedingly common: and that every kind of water carries in it some earthy particles, which being precipitated from it, become stone of a greater or lesser degree of hardness: and this quality is most remarkable in those waters which are much impregnated with selenitic matter. It has been found by observation, that iron contributes greatly to the process: indeed it may do by its precipitation of any aluminous earth which happens to be dissolved in the water by means of an acid; for iron has the property of precipitating this earth. Calcareous earth, however, by being soluble in water without any acid, must contribute very much to the process of petrification, as they are capable of a great degree of hardness by means only of being joined.
The name petrification belongs only, as we have seen, to bodies of vegetable or animal origin; and in order to determine their class and genus, or even species, it is necessary that their texture, their primitive form, and in some measure their organization, be still discernible. Thus we ought not to place the stony kernels, moulded in the cavity of some shell, or other organized body, in the rank of petrifications, properly so called.

Petrifications of the vegetable kingdom are almost all either gravely or siliceous; and are found in gullies, trenches, &c. Those which strike fire with steel are principally found in sandy fissures; those which effervescence in acids are generally of animal origin, and are found in the horizontal beds of calcareous earth, and sometimes in beds of clay or gravel; in which case the nature of the petrification is different. As to the substances which are found in gypsum, they seldom undergo any alteration, either with respect to figure or composition, and they are very rare.

Organized bodies, in a state of petrification, generally acquire a degree of solidity of which they were not possessed before they were buried in the earth, and some of them are often fully as hard as the stones or matrices in which they are enveloped. When the stones are broken, the fragments of petrifications are easily found, and easily distinguished. There are some organized bodies, however, so changed by petrification, as to render it impossible to discover their origin. That there is a matter more or less agitated, and adapted for penetrating bodies, which crumbles and separates their parts, draws them along with it, and disperses them here and there in the fluid which surrounds them, is a fact of which nobody seems to entertain any doubt. Indeed we see almost every substance, whether solid or liquid, insensibly consume, diminish in bulk, and at last, in the lapse of time, vanish and disappear.

A petrified substance, strictly speaking, is nothing more than the skeleton, or perhaps image, of a body which has once had life, either animal or vegetable, combined with some mineral. Thus petrified wood is not in that state wood alone. One part of the compound or mass of wood having been destroyed by local causes, has been compensated by earthy and sandy substances, diluted and extremely minute, which the waters surrounding them had deposited while they themselves evaporated. These earthy substances, being then moulded in the skeleton, will be more or less indurated, and will appear to have its figure, its structure, its size, in a word, the same general characters, the same specific attributes, and the same individual differences. Further, in petrified wood, no vestige of ligneous matter appears to exist. We know that common wood is a body in which the volume of solid parts is greatly exceeded by that of the pores. When wood is buried in certain places, lapidific fluids, extremely divided and sometimes coloured, insinuate themselves into its pores and fill them up. These fluids are afterwards moulded, and condensed. The solid part of the wood is decomposed and reduced into powder, which is expelled without the mass by aqueous filtrations. In this manner, the places which were formerly occupied by the wood are now left empty in the form of pores. This operation of nature produces no apparent difference either of the size or of the shape; but it occasions, both at the surface and in the inside, a change of substance, and the ligneous texture is inverted, that is to say, that which was pore in the natural wood, becomes solid in that which is petrified; and that which was solid or full in the first state, becomes porous in the second. In this way, says M. Musard, petrified wood is much less extended in pores than solid parts, and at the same time forms a body much more dense and heavy than the first. As the pores communicate from the circumference to the centre, the petrification ought to begin at the centre, and end with the circumference of the organic body subjected to the action of the lapidific fluids. Such is the origin of petrifications. They are organized bodies which have undergone changes at the bottom of the sea or the surface of the earth, and which have been buried by various accidents at different depths under the ground.

In order to understand properly the detail of the formation of petrified bodies, it is necessary to be well acquainted with all their constituent parts. Let us take wood for an example. Wood is partly solid and partly porous. The solid parts consist of a substance, hard, ligneous, and compact, which forms the support of the vegetable; the porous parts consist of vessels or interstices which run vertically and horizontally across the ligneous fibres, and which serve for conducting air, lymph, and other fluids. Among these vessels, the trache which rise in spiral forms, and which contain only air, are easily distinguished. The cylindric vessels, some of which contain lymph, and others the success proprius, are full only during the life of the vegetable. After its death they become vacant by the evaporation and absence of the fluids with which they were formerly filled. All these vessels, whether ascending or descending, unite with one another, and form great cavities in the wood and in the bark. According to Malpighi and Duhamel, the ligneous fibres are themselves tubular, and afford a passage to certain liquors; in short, the wood and bark are interspersed with utriculi of different shapes and sizes. The augmentation of the trunk in thickness, according to Malpighi is accomplished by the annual addition of a new exterior covering of fibres and of trachite. Others think that a concentric layer of sap-wood is every year hardened, whilst a new one is forming from the bark. But it is on all sides agreed that the concentric layers of wood are distinct from one another, because at the point of contact between any two of them, the new vessels, as well as new fibres, are more apparent and perceptible than they are in any other place. Having made these preliminary remarks on the structure of vegetables, we shall now proceed to give an abridged account of the manner in which M. Mongez explains their petrification.

In proportion to the tenderness and bad quality of wood, it imbibes the greater quantity of water; therefore this sort will unquestionably petrify more easily than that which is hard. It is thought that all the petrified wood so often found in Hungary has been originally soft, such as firs or poplars. Suppose a piece of wood buried in the earth; if it be very dry, it will suck up the moisture which surrounds it like a sponge. This moisture, by penetrating it, will dilate all the parts of which it is composed. The trache, or air-vessels, will
be filled first, and then the lymphatic vessels and those which contain the succus proprius, as they are likewise empty. The water which forms this moisture keeps in dissolution a greater or a less quantity of earth; and this earth, detached, and carried along in its course, is reduced to such an attenuated state, that it escapes our eyes and keeps itself suspended, whether by the medium of fixed air or by the motion of the water. Such is the lapidific fluid. Upon evaporation, or the departure of the menstruum, this earth, sand, or metal, again appears in the form of precipitate or sediment in the cavities of the vessels, which by degrees are filled with it. This earth is there moulded with exactness: The lapse of time, the simultaneous and partial attrition of the particles, makes them adhere to one another; the lateral suction of the surrounding fibres, the obstruction of the moulds, and the hardening of the moulded earth, become general; and there consists nothing but an earthy substance which prevents the sinking of the neighbouring parts. If the deposit is formed in a manner in general pretty pure, it preserves a whiter and clearer colour than the rest of the wood; and as the concentric layers are only perceptible and distinct in the wood, because the vessels are more apparent on account of their size, the little earthy cylinders, in the state of petrified wood, must be there a little larger, and consequently must represent exactly the turnings and separations of these layers. At the place of the utriculi, globules are observed, of which the shapes are as various as the moulds wherein they are formed. The anastomoses of the proper and lymphatic vessels, form besides points of support or reunion for this earthy substance.

With regard to holes formed by worms in any bits of wood before they had been buried in the earth, the lapidific fluid, in penetrating these great cavities, deposits there as easily the earthy sediment, which is exactly moulded in them. These vermiciform cylinders are somewhat less in bulk than the holes in which they are found, which is owing to the retreat of the more refined earth and to its drying up.

Let any one represent to himself this collection of little cylinders, vertical, horizontal, inclined in different directions, the stony masses of utriculi and of anastomoses, and he will have an idea of the stony substance which forms the groundwork of petrifaction. Hitherto not a single ligneous part is destroyed; they are all existing, but surrounded on every side with earthy deposits; and that body which, during life, was composed of solid and of empty parts, is now entirely solid: its destruction and decomposition do not take place till after the formation of these little deposits. In proportion as the water abandons them, it penetrates the ligneous substance, and destroys it by an insensible fermentation. The woody fibres being decomposed, form in their turn voids and interstices, and there remains in the whole piece nothing but little stone cylinders. But in proportion as these woody fibres disappear, the surrounding moisture, loaded with earth in the state of dissolution, does not fail to penetrate the piece of wood, and to remain in its new cavities. The new deposit assumes exactly the form of decomposed fibres; it envelopes in its turn the little cylinders which were formed in their cavities, and ends by incorporating with them. We may suppose here, that in proportion as it decomposes, there is a reaction of the ligneous part against the lapidific fluid: from this reaction a colour arises which stains more or less the new deposit; and this colour will make it easily distinguishable from that which has been laid in the inside of the vessels. In all petrified wood this shade is generally perceptible.

We have then, says M. Mongez, four distinct epochs in the process by which nature converts a piece of wood into stone, or, to speak more justly, by which she substitutes a stony deposit in its place: 1. Perfect vegetable wood, that is to say, wood composed of solid and of empty parts, ligneous fibres, and of vessels. 2. Wood having its vessels obstructed and choked up by an earthy deposit, while its solid parts remain unaltered. 3. The solid parts attacked and decomposed, forming new cavities between the stony cylinder, which remain in the same state, and which support the whole mass. 4. These new cavities filled with new deposits, which incorporate with the cylinders, and compose nothing else but one general earthy mass representing exactly the piece of wood.

Among the petrifications of vegetables called dendrites, are found part of shrubs, stems, roots, portions of the trunk, some fruits, &c. We must not, however, confound the impressions of mosses, ferns, and leaves, or incrustations, with petrifications.

Among the petrifications of animals, we find shells, crustaceous animals, polyarti, some worms, the bony parts of fishes and of amphibious animals, few or no real insects, rarely birds and quadrupeds, together with the bony portions of the human body. The corne ammonis are petrified shell-fish; and with regard to figured and accidental bodies, these are haeres natures.

In order, says M. Bertrand, in his Dictionnaire des Fossiles, that a body should become petrified, it is necessary that it be, 1. Capable of preservation under ground: 2. That it be sheltered from the air and running water (the ruins of Herculanenum prove that bodies which have no connection with free air, preserve themselves untouched and entire). 3. That it be secured from corrosive exhalations. 4. That it be in a place where there are vapours or liquids, loaded either with metallic or stony particles in a state of dissolution, and which, without destroying the body, penetrate it, impregnate it, and unite with it in proportion as its parts are dissipated by evaporation.

It is a question of great importance among naturalists, to know the time which Nature employs in petrifying bodies of an ordinary size.—It was the wish of the emperor, duke of Lorraine, that some means should be taken for determining this question. M. le Chevalier de Baillou, director of the cabinet of natural history of his imperial majesty, and some other naturalists, had, several years ago, the idea of making a research which might throw some light upon it. His imperial majesty being informed by the unanimous observations of modern historians and geographers, that certain pillars which are actually seen in the Danube in Servia, near Belgrade, are remains of the bridge which Trajan constructed over that river, presumed that these pillars having been preserved for so many ages beloved to be petrified, and that they would furnish some information with regard to the time which nature employs in changing wood into stone. The emperor thinking this hope well founded, and wishing to satisfy his curiosity, ordered his ambassador at the court of Constantinople
To ask permission to take up from the Danube one of the pillars of Trajan's bridge. The petition was granted, and one of the pillars was accordingly taken up; from which it appeared that the petrifaction had only advanced three-fourths of an inch in the space of 1500 years. There are, however, certain waters in which this transmutation is more readily accomplished.—Petrifications appear to be formed more slowly in earths that are porous and in a slight degree moist than in water itself.

When the foundations of the city of Quebec in Canada were dug up, a petrified savage was found among the last beds to which they proceeded. Although there was no idea of the time at which this man had been buried under the ruins, it is however true, that his quiver and arrows were still well preserved. In digging a leadmine in Derbyshire, in 1744, a human skeleton was found among stag's horns. It is impossible to say how many ages this carcass had lain there. In 1695 the entire skeleton of an elephant was dug up near Tonna in Thuringia. Some time before this epoch the petrified skeleton of a crocodile was found in the mines of that country. We might cite another fact equally curious which happened at the beginning of the last century. John Monte, curate of Stiegarp in Scania, and several of his parishioners, wishing to procure turf from a drained marshy soil, found, some feet below ground, an entire cart with the skeletons of the horses and cart. It is presumed that there had formerly been a lake in that place, and that the cart attempting to pass over on the ice, had by that means probably perished. In fine, wood partly fossil and partly coal-like, has been found at a great depth, in the clay of which tile was made for the abbey of Fontenay. It is but very lately that fossil wood was discovered at the depth of 75 feet in a well between Issy and Vauvres near Paris. This wood is in sand between a bed of clay and pyrites, and water was found four feet lower than the pyrites. M. de Laumont, inspector general of the mines, says (Journal de Physique, May 1736), that in the leadmine at Pontepan near Rennes, is a fissure, perhaps the only one of its kind. In that fissure, sea-shells, rounded pebbles, and an entire beech, have been found 240 feet deep. This beech was laid horizontally in the direction of the fissure. Its bark was converted into pyrites, the sap-wood into jet, and the centre into coal.

A great many pieces of petrified wood are found in different counties of France and Savoy. In Courbinaux in Savoy, and in the mountains of Misi, trees of a considerable thickness have been taken from the earth, which were entirely changed into a very fine agate, as also their branches and their roots. In sawing them, the annual circles of their growth have been distinguished. Pieces have been taken up, on which it was distinctly seen that they had been gnawed by worms; others bear visible marks of the hatchet. In fine, pieces have been found which were petrified at one end, while the other still remained in the state of wood fit for being burned. It appears then that petrified wood is a great deal less rare in nature than is commonly imagined.

Cronstedt has excluded petrifications from any place in the body of his system of mineralogy, but takes notice of them in his appendix. He distinguishes them by the name of Mineralia Larvata, and defines them to be "mineral bodies in the form of animals or vegetables." The most remarkable observations concerning them, according to MR. Kirwan, who differs in some particulars from Mongez, are as follow. 1. Those of shells are found on or near the surface of the earth; those of fish deeper; and those of wood deeper still. Shells in substance are found in vast quantities, and at considerable depths. 2. The substances most susceptible of petrifaction are those which most resist the putrefactive process; of which kind are shells, the harder kinds of wood, &c.; while the softer parts of animals, which easily putrefy, are seldom met with in a petrified state. 3. They are most commonly found in strata of marl, chalk, limestone, or clay; seldom in sandstone, still more seldom in gypseum; and never in gneiss, granite, basalt, or schoorl. Sometimes they are found in pyrites, and ores of iron, copper, and silver; consisting almost always of that kind of earth or other mineral which surrounds them; sometimes of silice, agate, or cornelian. 4. They are found in climates where the animals themselves could not have existed. 5. Those found in slate or clay are compressed and flattened.

The different species of petrifications, according to Cronstedt, are,

I. Terra Larvata; extraneous bodies changed into a limy substance, or calcareous changes. These are, 1. Loose or friable. 2. Indurated. The former are of a chalky nature in form of vegetables or animals; the second filled with solid limestone in the same forms. Some are found entirely changed into a calcareous spar. All of them are found in France, Sweden, and other countries in great plenty.

On these petrifications Cronstedt observes, that shells and corals are composed of limy matter even when still inhabited by their animals, but they are classed among the petrifications as soon as the calcareous particles have obtained a new arrangement; for example, when they have become sparry; filled with calcareous earth either hardened or loose, or when they lie in the strata of the earth. "These," says he, "form the greatest part of the fossil collections which are so industriously made, often without any regard to the principal and only use they can be of, viz. that of enriching zoology. Mineralogists are satisfied with seeing the possibility of the changes the limestone undergoes in regard to its particles; and also with receiving some insight into the alteration with the earth has been subject to from the state of the strata which are now found in it." The calcined shells, where the petrifications are of a limy or chalky nature, answer extremely well as a manure; but the indurated kind serve only for making grottoes. Gypsumous petrifications are extremely rare; however, Chardin informs us that he had seen a lizard inclosed in a stone of that kind in Persia.

II. Larvae, or bodies changed into a flinty substance. These are all indurated, and are of the following species. 1. Cornelians in form of shells from the river Tomm in Siberia. 2. Agate in form of wood; a piece of which is said to be in the collection of the Count de Tessin. 3. Coraloids of white flint (Millepora) found in Sweden. 4. Wood of yellow flint found in Italy, in Turkey near Adrianople, and produced by the waters of Lough-neagh in Ireland.

III. Larvae Arglilacea; where the bodies appear to...
be changed into clay. These are found either loose and friable, or indurated. Of the former kind is a piece of porcelain clay met with in a certain collection, with all the marks of the root of a tree upon it. Of the latter kind is the osteocolla; which is said to be the roots of the poplar-tree changed, and not to consist of any calcareous substance. A sort of fossil ivory, with all the properties of clay, is said likewise to be found in some places.

IV. Larvae insolites; where the substances are impregnated with great quantities of salts. Human bodies have been twice found impregnated with vitriol of iron in the mine of Falun, in the province of Dalarnen in Sweden. One of them was kept for several years in a glass case, but at last began to moulder and fall to pieces. Turf and roots of trees are likewise found in water strongly impregnated with vitriol. They do not flame, but look like a coal in a strong fire; neither do they decay in the air.

V. Bodies penetrated by mineral inflammable substances. 1. By pit-coal, such as wood; whence some have imagined coal to have been originally produced from wood. Some of these substances are fully saturated with the coaly matter; others not. Among the former Cronstedt reckons jet; among the latter the substance called mumia vegetabilis, which is of a loose texture, resembling amber, and may be used as such. 2. Those penetrated by asphaltum or rock-oil. The only example of these given by our author is a kind of turf in the province of Skone in Sweden. The Egyptian mummies, he observes, cannot have any place among this species, as they are impregnated artificially with asphaltum, in a manner similar to what happens naturally with the wood and coally matter in the last species. 3. Those impregnated with sulphur which has dissolved iron, or with pyrites. Human bodies, bivalve and univalve shells and insects, have been all found in this state; and the last are found in the slum slate at Andrarum, in the province of Skone in Sweden.

VI. Larvae metaliferæ; where the bodies are impregnated with metals. These are, 1. Covered with native silver; which is found on the surface of shells in England. 2. Where the metal is mineralized with copper and sulphur. Of this kind is the faltherts or grey silver ore, in the shape of ears of corn, and supposed to be vegetables, found in argillaceous slate at Frankenberg and Tahlitteren in Hesse. 3. Larvae cupriferæ, where the bodies are impregnated with copper. To this species principally belong the turquoises or Turkey stones, improperly so called; being ivory and bones of the elephant or other animals impregnated with copper. At Simore in Languedoc there are bones of animals dug up, which, during calcination, assume a blue colour; but according to Cronstedt it is not probable that these owe their colour to copper. 4. With mineralized copper. Of these our author gives two examples. One is where the copper is mineralized with sulphur and iron, forming a yellow marcasitical ore. With this some shells are impregnated which lie upon a bed of loadstone in Norway. Other petrifications of this kind are found in the form of fish in different parts of Germany. The other kind is where the copper is impregnated with sulphur and silver. Of this kind is the grey silver ore, like ears of corn, found in the slate quarries at Hesse. 5. Larva ferriferæ, with iron in form of a calx, which has assumed the place or shape of extraneous bodies. These are either loose or indurated. Of the loose kind are some roots of trees found at the lake Langelma in Finland. The indurated kinds are exemplified in some wood found at Orbissan in Bohemia. 6. Where the iron is mineralized, as in the pyriticous larva, already described.

VII. Where the bodies are tending to decomposition, or in a way of destruction. Among these, our author enumerates MOULD and TURF. See likewise the article FOSSIL.

We shall add the following description of a very curious animal petrification. The Abbé de Sauvages, celebrated for his refined taste and knowledge in natural history, in a tour through Languedoc, between Alais and Uzes, met with a narrow vein of no more than two toises wide, which crosses the road, and is bordered on one side by a gray dirty soil, and on the other by a dry sandy earth, each of a vast extent, and on a level with the narrow vein which separates them. In this narrow vein only are contained petrified shells, cemented together by a whitish marl. They are in prodigious plenty; among which there is one species which the abbé does not remember to have known to have been anywhere described, and may probably be a new acquisition to natural history.

This shell has the shape of a horn, somewhat incurvated towards the base. It seems composed of several cups, let into each other, which are sometimes found separate. They have all deep channels, which extend, as in many other shells, from the base to the aperture; the projecting ribs which form these channels are mostly worn away, being rarely to be found entire. Sometimes several are grouped together; and as a proof that they are not a fortuitous assemblage caused by the petrifaction, they are fixed together through their whole length, in such sort, that their base and aperture are regularly turned the same way. The abbé should have referred this to the genus which Linneæus and the marquis d'Argenville named dentals, had they not been let into each other. He found some of them whose aperture or hollow was not stopped up by the petrifaction, and seemed as cones adapted to one another, forming a row of narrow cells, separated by a very thin partition: this row occupied not more than one half of the cavity of the shell.

Our article has already extended to such a length as to preclude any further additions; we cannot, however, finish it without observing, that fossil bones are very common in Dalmatia. They are of various kinds, and in their nature apparently very extraordinary; but we have found no tolerable account or probable conjecture of their origin. Vitaliano Donati of Padua, in his Saggio sopra la storia naturale dell' Adriatico, was the first who took notice of them; and Fortis, in his Travels into Dalmatia, has given a copious account of them. They are most common in the islands of Cherò and Otero. See Fortis's Travels into Dalmatia; and those of our readers who wish to prosecute this inquiry may consult with advantage Parkinson's Organic Remains of a Former World, two vols. 4to.

PETRIFIED CITY. The story of a petrified city is well known all over Africa, and has been believed by many considerable persons even in Europe. Louis XIV. was so fully persuaded of its reality, that he ordered
dered his ambassador to procure the body of a man petrified from it at any price. Dr Shaw's account of this affair is as follows: "About 40 years ago (now more than 70), when M. le Maire was the French consul at Tripoli, he made great inquiries, by order of the French court, into the truth of the report concerning a petrified city as Ras Sem; and amongst other very curious accounts relating to this place, he told me a remarkable circumstance, to the great discredit, and even confutation, of all that had been so positively advanced with regard to the petrified bodies of men, children, and other animals.

"Some of the janizaries, who, in collecting tribute, traversed the district of Ras Sem, promised him, that, as an adult person would be too cumbersome, they would undertake, for a certain number of dollars, to bring him from thence the body of a little child. After a great many pretended difficulties, delays, and disappointments, they produced at length a little Cupid, which they had found, as he learned afterwards, among the ruins of Leptis; and, to conceal the deceit, they brought another with them, and showed me the distinguishing characteristics of that deity. However, they paid them for it, according to promise, 1000 dollars, which is about 153l. sterling of our money, as a reward for their faithful service and hazardous undertaking; having run the risk, as they pretended, of being strangled if they should have been discovered in thus delivering up to an infidel, one of those unfortunate Mahometans, as they take them originally to have been.

"But notwithstanding this cheat and imposition had made the consul desist from searching after the petrified bodies of men and other animals; yet there was one matter of fact, as he told me, which still very strangely embarrassed him, and even strongly engaged him in favour of the current report and tradition. This was some little loaves of bread, as he called them, which had been brought to him from that place. His reasoning, indeed thereupon, provided the pretended matter of fact had been a fact, and evident, was just and satisfactory; for where we find loaves of bread, there, as he urged, some persons must have been employed in making them, as well as others for whom they were prepared. One of these loaves he had, among other petrifications, very fortunately brought with him to Cairo, where I saw it, and found it to be an echinities of the disoid kind, of the same fashion with one I had lately found and brought with me from the deserts of Marrah. We may therefore reasonably conclude, that there is nothing to be found at Ras Sem, unless it be the trunks of trees, echinities, and such petrifications as have been discovered at other places.

"M. le Maire's inquiries, which we find were supported by the promise and performance of great rewards, have brought nothing further to light. He could never learn that any traces of walls, or buildings, or animals, or utensils, were ever to be seen within the verge of these pretended petrifications. The like account I had from a Sicilian renegado, who was the janissary that attended me whilst I was in Egypt; and as in his earlier years he had been a soldier of Tripoli, he assured me that he had been several times at Ras Sem. This I had confirmed again in my return from the Levant by the interpreter of the British factory at Tunis, who was likewise a Sicilian renegado; and being the libertus or freed-

Vol. XVI. Part I.

man of the bashaw of Tripoli, was preferred by him to be the bey or viceroy of the province of Darnas, where Ras Sem was immediately under his jurisdiction. His account was likewise the same; neither had he ever seen, in his frequent journeys over this district, any other petrifications than what are above mentioned. So that the petrified city, with its walls, castles, streets, shops, cattle, inhabitant, and utensils, were all of them at first the mere inventions of the Arabs, and afterwards propagated by such persons, who, like the Tripoli ambassador, and his friend above mentioned, were credulous enough to believe them.

"However, there is one remarkable circumstance relating to Ras Sem that deserves well to be recorded. When the winds have blown away the billows of sand, which frequently cover and conceal these petrifications, they discover, in some of the lower and more depressed places of this district, several little pools of water, which is usually of so ponderous a nature, that, upon drinking it, it passes through the body like quicksilver. This perhaps may be that petrifying fluid which has so long contributed to the conversion of the palm tree and the chittim into stone: for the formation not only of these, but of petrifications of all kinds, may be entirely owing to their having first of all lodged in a bed of loam, clay, sand, or some other proper nudes or matrix, and afterwards gradually been acted upon and pervaded by such a petrifying fluid as we may suppose this to be."

To this account it may not be amiss to subjoin the memorial of Cassem Aga, the Tripoli ambassador at the court of Britain. The city, he says, is situated two days journey south from Ounguela, and 17 days journey from Tripoli by caravans to the south-east. "As one of my friends (says the ambassador) desired me to give him in writing an account of what I knew touching the petrified city, I told him what I had heard from different persons, and particularly from the mouth of one man of credit who had been on the spot: that is to say, that it was a very spacious city, of a round form, having great and small streets therein, furnished with shops, with a vast castle magnificently built: that he had seen there several sorts of trees, the most part olives and palms, all of stone, and of a blue or rather lead colour: that he saw also figures of men in a posture of exercising their different employments; some holding in their hands stuffs, others bread, every one doing something, even women suckling their children, and in the embraces of their husbands, all of stone: that he went into the castle by three different gates, though there were many more, where he saw a man lying upon a bed of stone: that there were guards at the gates with pikes and javelins, in their hands: in short, that he saw in this wonderful city many sorts of animals, as camels, oxen, horses, assae, sheep, and birds, all of stone, and of the colour above mentioned.

We have subjoined this account, because it shows in striking colours the amazing credulity of mankind, and the avidity with which they swallow the marvellous, and the difficulty of discovering the truth respecting places or things at a distance from us.

PETROBRUSSIANS, a religious sect, which had its rise in France and the Netherlands about the year 1110. The name is derived from Petrus Bruus, a Provençal, who made the most laudable attempt to reform the
the abuses and remove the superstition that disgraced the beautiful simplicity of the gospel. His followers were numerous; and for 20 years his labour in the ministry was exemplary and unremitting. He was however burnt in the year 1130 by an enraged populace set on by the clergy.

The chief of Bryny's followers was a monk named Henry; from whom the Petrobrussians were also called Henricians. Peter the Venerable, abbot of Clugny, has an express treatise against the Petrobrussians; in the preface to which he reduces their opinions to five heads.

1. They denied that children before the age of reason can be justified by baptism, in regard it is our own faith that saves by baptism. 2. They held that no churches should be built, but that those that already are should be pulled down; an inn being as proper for prayers as a temple, and a stable as an altar. 3. That the cross ought to be pulled down and burnt, because we ought to abhor the instruments of our Saviour's passion. 4. That the real body and blood of Christ are not exhibited in the eucharist, but merely represented by their figures and symbols. But such errors, alas! so near the mark, do not avail the dead. F. Langlois objects Manichemie to the Petrobrussians; and says, they maintained two gods, the one good, the other evil: but this we rather esteem an effect of his zeal for the catholic cause, which determined him to blacken the adversaries thereof, than any real sentiment of the Petrobrussians.

PETROJOANNITES, were followers of Peter John, or Peter Joannis, i.e. Peter the son of John, who flourished in the 12th century. His doctrine was not known till after his death, when his body was taken out of his grave and burnt. His opinions were, that he alone had the knowledge of the true sense wherein the apostles preached the gospel; that the reasonable soul is not the form of man; that there is no grace infused by baptism; and that Jesus Christ was pierced with a lance on the cross before he expired.

PETROLEUM, or Rock Oil; a thick oily substance exuding from the earth, and collected on the surface of wells in many parts of the world. See MINERALOGY Index.

PETROMYZON, the Lamprey, a genus of fishes belonging to the order Cartilaginii. See Ichthyology Index.

PETRONIUS was a renowned Roman senator. When governor of Egypt, he permitted Herod, king of the Jews, to purchase in Alexandria any quantity of corn which he should judge necessary for the supply of his subjects, who were afflicted with a severe famine. When Tiberius died, Caius Caligula, who succeeded him, took from Vitellius the government of Syria, and gave it to Petronius, who discharged the duties of his office with dignity and honour. From his inclination to favour the Jews, he ran the risk of losing the emperor's friendship and his own life; for when that prince gave orders to have his statue deposited in the temple of Jerusalem, Petronius, finding that the Jews would rather suffer death than see that sacred place profaned, was unwilling to have recourse to violent measures; and therefore preferred a moderation, dictated by humanity, to a cruel obedience. We must not confound him with another of the same name, viz. Petronius Granius, who was a centurion in the eighth legion, and served under Cesar in the Gallic war. In his voyage to Africa, of which country he had been appointed governor, the ship in which he sailed was taken by the pirates, who caused all the soldiers to be put to the sword, and promised to save the governor's life, provided that he would renounce Caesar's party. To this proposal Petronius replied, that Caesar's officers were accustomed to great liberalities, and not to receive it; and, at the same time, he stabbed himself with his own sword.

PETRONIUS Arbiter, Titus, a celebrated critic and polite writer of antiquity, the favourite of Nero, supposed to be the same mentioned by Tacitus in the 16th book of his Annals. He was procurel of Bithynia, and afterwards consul, and appeared capable of the greatest employments. He was one of Nero's principal confidants, and in a manner the superintendent of his pleasures; for that prince thought nothing agreeable or delightful but what was approved by Petronius. The great favours shown him drew upon him the envy of Tigellineus, another of Nero's favourites, who accused him of being concerned in a conspiracy against the emperor; in which Petronius was seized, and was sentenced to die. He met death with spirit; his friends were permitted to watch him, and seem to have tasted it nearly as he had done his part. He would sometimes open a vein, and sometimes close it, conversing with his friends in the meanwhile, not on the immortality of the soul, which was no part of his creed, but on topics which pleased his fancy, as of love-verses, agreeable and passionate airs; so that it has been said "his dying was barely ceasing to live." Of this disciple of Epicurus, Tacitus gives the following character: "He was (says he) neither a spendthrift nor a debaucher, like the generality of those who ruin themselves; but a refined voluptuary, who devoted the day to sleep, and the night to the duties of his office, and to pleasure." This courtier is much distinguished by a satire which he wrote, and secretly conveyed to Nero; in which he ingeniously describes, under borrowed names, the character of this prince. Voltaire is of opinion that we have no more of this performance but an extract made by some obscure libertine, without either taste or judgment. Peter Petit discovered at Traw in Dalmatia, in 1665, a considerable fragment containing the sequel of Trojanus's Feast. This fragment, which was printed the year after at Padua and at Paris, produced a paper war among the learned. While some affirmed that it was the work of Petronius, and others denied it to be so, Petit continued to assert his right to the discovery of the manuscript, and sent it to Rome, where it was acknowledged to be a production of the 1st century. The French criticism, who had attacked its authenticity, were silent from the moment it was deposited in the royal library. It is now generally attributed to Petronius, and found in every subsequent edition of the works of that refined voluptuary. The public did not form the same favourable opinion of some other fragments, which were extracted from a manuscript found at Belgrade in 1658, and printed at Paris by Nordi in 1659, though they are ascribed by the editor Charpentier, to several other learned men, to Petronius; yet, on account of the Gallicisms, and other barbarous expressions with which they abound, they have generally been considered as unworthy of that author. His genuine works are, 1. A Poem on the civil war between Cesar and Pompey, translated into prose by Abbe de Marolles, and into French verse by President Bouhier; 1737, in 4to. Petronius,
tronies, full of fire and enthusiasm, and disgusted with Lucan's flowery language, opposed Pharsalia to Pharsalia; but his work, though evidently superior to the other in some respects, is by no means in the true style of epic poetry. 2. A Poem on the Education of the Roman Youth. 3. Two Treatises; one upon the Corruption of Eloquence, and the other on the Causes of the Decay of Arts and Sciences. 4. A Poem on the Vanity of Dreams. 5. The Shipwreck of Liceae. 6. Reflections on the Inconstancy of Human Life. And, 7. Trimalcion's Banquet. To this last performance morality is not much indebted. It is a description of the pleasures of a corrupted court; and the painter is rather an ingenious courtier than a person whose aim is to perform abuses. The best editions of Petronius are those published at Venice, 1495, in 4to; at Amsterdam, 1660, in 8vo, cum notas criticas; ibid. with Boschius's notes, 1677, in 4to; and 1700, two vols. in 4to. The edition of criticus was reprinted in 1753, in two vols. 4to, with the learned Peter Burman's commentaries. Petronius died in the year 65 or 66.

PETRONEIUS MAXIMUS, was born in the year 395, of an illustrious family, being at first a senator and consul of Rome. He put on the imperial purple in 395, after having effected the assassination of Valentinian III. In order to establish himself upon the throne, he married Eudoxia the widow of that unfortunate prince; and as she was ignorant of his villany, he confessed to her, in a transport of love, that the strong desire he had of being her husband, had made him commit this atrocious crime. Whereupon Eudoxia privately applied to Censoric, king of the Vandals, who coming into Italy with a very powerful army, entered Rome, where the usurper then was. The unhappy wretch endeavoured to make his escape; but the soldiers and people, enraged at his cowardice, fell upon him, and overwhelmed him with a shower of stones. His body was dragged through the streets of the city for three days; and, after treating it with every mark of disgrace, they threw it into the Tiber the 12th of June the same year, 395. He reigned only 77 days. He had some good qualities. He loved and cultivated the sciences. He was prudent in his councils, circumspect in his actions, equitable in his judgments; a facetious companion, and steady friend. He had the good fortune to win the affections of every body, while he remained a private character; but as a prince, he was so much the more detestable, so that, after he had obtained the throne by villany, he kept possession of it only by violence. The crown was scarcely on his head before it appeared to him an insupportable burden. “Happy Dometes (exclaimed he in his despair), thou wert a king during a single entertainment.”

PETROSA BISBA, in Anatomy, a name given to the fourth and fifth bones of the cranium, called also ossa temporum and ossa squamosa; the substance whereof, as their first and last names express, is squamoso and very hard. See Anatomy Index.

PETROSELINUM (APRIUM PETROSelinum, LIN.) Parsley, a plant which is commonly cultivated for culinary purposes. See Botany and Gardening Index.

PETTEIA, in the ancient music, a term to which we have no one corresponding in our language. The melopoeia, or the art of arranging sounds in succession so as to make melody, is divided into three parts, which the Greeks call lepsi, mnis, and chrestis; the Latin ccmpsio, mnisio, and causio; and the Italians cruscio, mnoimento, and suoio. The last of these is called by the Greeks cruscio, and by the Italians pettia; which therefore means the art of making a just discernment of all the manners of raising or combining sounds among themselves, so as they may produce their effect, i.e. may express the several passions intended to be raised. Thus it shows what sounds are to be used, and what not; how often they are severally to be repeated; with which to begin, and with which to end; whether with a grave sound to rise, or an acute one to fall, &c. The pettia constitutes the manners of the music; chooses out this or that passion, this or that motion of the soul, to be awakened; and determines whether it be proper to exercise it on this or that occasion. The pettia, therefore, is in music much what the manners are in poetry.

It is not easy to discover whence the denomination should have been taken by the Greeks, unless from cruscio, their game of chess, the musical pettia being a sort of combination and arrangement of sounds, as chess is of pieces called studio calcet, or “chess-men.”

PETTY, SIR WILLIAM, son of Anthony Petty, a clothier, was born at Rumsay, a small town in Hampshire, in 1623; and while a boy took great delight in spending his time among the artificers, whose trades he could work at when but twelve years of age. Then he went to the grammar school there: at fifteen he was master of the Latin, Greek, and French tongues, and of arithmetic and those parts of practical geometry and astronomy useful to navigation. Soon after he went to Cass in Normandy, and Paris, where he studied anatomy, and read Vesalins with Mr. Hobbes. Upon his return to England, he was preferred in the king's navy. In 1643, when the war between the king and parliament grew hot, he went into the Netherlands and France for three years; and having vigorously prosecuted his studies, especially in physic, at Utrecht, Leyden, Amsterdam, and Paris, he returned home to Rumsay. In 1647, he obtained a patent to teach the art of double writing for seventeen years. In 1648, he published at London "Advice to Mr. Samuel Hartlib, for the advancement of some particular parts of learning." At this time he adhered to the prevailing party of the kingdom; and went to Oxford, where he taught anatomy and chemistry, and was created a doctor of physic. In 1650, he was made professor of anatomy there; and soon after a member of the college of physicians in London. The same year he became physician to the army in Ireland; where he continued till 1659, and acquired a great fortune. After the restoration, he was introduced to King Charles II. who knighted him in 1661. In 1662, he published "A Treatise of taxes and contributions." Next year he was greatly applauded in Ireland for his invention of a double-bottomed ship. He died at London, in 1687, of a gangrene in the foot, occasioned by the swelling of the gout.

The character of his genius is sufficiently seen in his writings, which were much more numerous than those we have mentioned above. Among these, it is said, he wrote the history of his own life, which unquestionably contained a full account of his political and religious principles, as may be conjectured from what he has left us upon those subjects in his will. In that he has these remarkable words: "As for legacies to the poor, I am at a stand; and for beggars by trade and election, I give
them nothing: as for impotents by the hand of God, the
public ought to maintain them: as for those who can get
no work, the magistrates should cause them to be em-
ployed; which may be well done in Ireland, where are
fifteen acres of improveable land for every head: as for
prisoners for crimes by the king, or for debt by their
prosecutors, those who compassionate the sufferings of
any object, let them relieve themselves by relieving such
sufferers; that is, give them alms (A), &c. I am con-
tented that I have assisted all my poor relations, and
put many into a way of getting their own bread, and
have laboured in public works and inventions, and have
sought out real objects of charity; and do hereby con-
jure all who partake of my estate, from time to time
to do the same at their peril. Nevertheless, to answer cus-
tom, and to take the sure side, I give twenty pounds to
the most wanting of the parish wherein I die.1 As for
his religion, he says, "I die in the profession of that
faith, and in the practice of such worship, as I had
established by the laws of my country; not being able
to believe what I myself please, nor to worship God bet-
ter than by doing as I would be done unto, and observ-
ing the laws of my country, and expressing my love and
honour to Almighty God, by such signs and tokens as
are understood to be such by the people with whom I
live." He died possessed of a very large fortune, and
his family was afterwards ennobled.

The variety of pursuits in which Sir William Petty
was engaged, shows him to have had a genius capable
of any thing to which he chose to apply it; and it is
very extraordinary, that a man of so active and busy a
spirit could find time to write so many things as it ap-
pears he did.

PETTY, anything little or diminutive, when com-
pared with another.

PETTY-Bag, an office in chancery; the three clerks
of which record the return of all inquisitions out of ever-
cy county, and make all patents of comtrollers, gaugers,
customers, &c.

PETTY-Chaps. See Motacilla, Ornithology
Index.

PETTY-Foger, a little tricky solicitor or attorney,
without either skill or conscience.

PETTY or PETIT, Larceny. See Larceny.

PETTY-Pastry, among confectioners, a sort of small
pies, made of a rich crust filled with sweetmeats.

PETTY-Singel, among falconers, are the toes of a hawk.

PETTY-Tally, in the sea language, a competent al-
lowance of victuals, according to the number of the ship's
company.

PETTY, or PETIT, Treason. See Treason.

PETUNISE, in Natural History, one of the two sub-
stances of which porcelain or china-ware is made. The
petunise is a coarse kind of flint or pebble, the surface
of which is not so smooth when broken as that of our com-
mon flint. See Porcelain.

PETWORTH, in Sussex in England, five miles
from Midhurst and the Sussex Downs, and 49 from
London, is a large and handsome town, with 2664 in-
habitants. It is adorned with several seats of gentlemen,
particularly the magnificent seat of the Perces, earls of
Petworth Northumberland, many of whom lie buried in a sepa-
rate vault of its church. In the duke of Somerset's ar-
mory, in this place, there is a sword which, by circum-
stances, appears to have been the weapon of the famous
Henry Hotspur, though it is less unwieldy than other
ancient swords.

PEUEDANUM, or Sulphur-Wort, a genus of
plants belonging to the pentandra class, and in the na-
tural method ranking under the 45th order, Umbellitaer.
See Botany Index.

PEUTEMAN, PETER, was born at Rotterdam in
1650, and was a good painter of inanimate objects; but
the most memorable particular relative to this artist was
the incident which occasioned his death.

He was requested to paint an emblematical picture
of mortality, representing human skulls and bones, sur-
rounded with rich gems and musical instruments, to ex-
press the vanity of this world's pleasures, amusements,
or possessions; and that he might imitate nature with
the greater exactness, he went into an anatomy room,
where several skeletons hung by wires from the ceiling,
and bones, skulls, &c. lay scattered about; and im-
mediately prepared to make his designs.

While he was thus employed, either by fatigue, or
by intemperance, insensibly he fell asleep; but was sud-
denly roused by a shock of an earthquake, which hap-
pened at that instant, on the 18th of September 1692.
The moment he awoke, he observed the skeletons move
about as they were shaken in different directions, and
the loose skulls roll from one side of the room to the
other; and being totally ignorant of the cause, he was
struck with such a horror, that he threw himself down
stairs, and tumbled into the street half dead. His
friends took all possible pains to efface the impression
made on his mind by that unlucky event, and acquaint-
ated him with the real cause of the agitation of the ske-
letons; yet the transaction still affected his spirits in so
violent a manner, that it brought on a disorder, which
in a short time ended his days. His general subjects
were either allegorical or emblematical allusions to the
shortness and misery of human life.

PEWIT, Sea-crow, or Mire-Crow. See LARUS,
Ornithology Index.

PEWTER, a facitious metal used in making domes-
tic utensils, as plates, dishes, &c.—The basis of the me-
tal is tin, united to small portions of lead, zinc, bismuth,
and antimony. “ We have (says Dr Watson) three
sorts of pewter in common use; they are distinguished
by the name of Plate, Trifle, or Ley. The plate pew-
ter is used for plates and dishes; the trifle, chiefly for
pints and quarts; and the ley-metal for wine measures,
&c. Our very best pewter is said to consist of 100
parts tin, and 17 of antimony, though others allow only
10 parts of the latter. Besides this composition, there
are other kinds, compounded of tin, antimony, bismuth,
and copper, in several proportions.

PEYRERE, ISAAC LA, a remarkable character for
versatility in religious opinions, was born at Bourdeaux,
of Protestant parents, in 1594. He entered the service of

(A) In the town of Rumsey there is a house which was given by him for the maintenance of a charity-school: the rest of which is still applied to that use.
of the Prince of Conde, who was much pleased with the singularity of his genius. From the perusal of St Paul's writings he took into his head to aver, that Adam was not the first of the human race; and, in order to prove this extravagant opinion, he published in 1655 a book, which was printed in Holland in 1650 and in 1651, with this title: Praedamites, sive exercitatio super versibus 12, 13, 14. cap. 15. Epistolae Pauli ad Romanos. This work was burnt at Paris, and the author imprisoned at Brussels, through the influence of the archbishop of Mainz's grand vicar. The Prince of Conde having obtained his liberty, he travelled to Rome in 1656, and there gave in to Pope Alexander VII. a solemn renunciation both of Calvinism and Pradamiat. His conversion was not thought to be sincere, at least with regard to this last heresy. His desire to be the head of a new sect is evident; and his book discovers his ambition; for he there pays many compliments to the Jews, and invites them to attend his lectures. Upon his return to Paris, notwithstanding the earnest solicitations of his holiness to remain at Rome, he went again into the Prince of Conde's service in the quality of librarian. Some time after he retired to the seminary des Vertus, where he died the 30th of January 1676, at the age of 82, after the sacraments of the church had been administered to him. Father Simon says, that when he was importuned in his last moments to retract the opinion which he had formed respecting the Preadamites, his answer was, Hic quaecumque ignorant blamament. His having no fixed sentiments of religion is supposed to proceed more from a peculiar turn of mind than a corruption of the heart; for good nature, simplicity of manners, and humanity, seem to have formed his character. "He was (says Niceron) a man of a very equal temper, and most agreeable conversation. He was a little too fond, however, of indulging his wit, which sometimes bordered on raillery; but he took care never to hurt nor wound the feelings of his neighbour. His learning was extremely limited. He knew nothing of Greek or Hebrew; and yet he ventured to give a new interpretation of several passages of the sacred volume. He pigged himself on his knowledge of the Latin; but excepting a few poems which he had read, he was by no means an adept in that language. His style is very unequal; sometimes swelling and bombast, at other times low and groveling. Besides the work already mentioned, he has left behind him, I. A treatise as singular as it is scarce, intitled, Du rappel de Juifs, 1643, in 8vo. The recal of the Israelites, in the opinion of this writer, will be not only of a spiritual nature, but they will be reinstated in the temporal blessings which they enjoyed before their rejection. They will again take possession of the holy land, which will resume its former fertility. God will then raise up to them a king more just, and more victorious, than any of their former sovereigns had been. Now, though all this is doubtless to be understood spiritually of Jesus Christ, yet our author is of opinion, that it ought also to be understood of a temporal prince, who shall arise for the purpose of effecting the temporal deliverance of the Jews; and that this prince shall be no other than the king of France, for the following reasons: first, it is believed, will carry conviction to few minds: 1. Because the two titles of Most Christian, and of Elderst Son of the Church, are ascribed to him by way of excellence. 2. Because it is presumable, if the kings of France possess the virtue of curing the evil or scrofula, which can only afflict the bodies of the Jews; that they will likewise have the power of curing their obstinate incredulity, and the other invertebrate diseases of their souls. 3. Because the kings of France have for their arms a fleur de luce; and because the beauty of the church is in scripture compared to the beauty of lilies. 4. Because it is probable that France will be the country whither the Jews shall first be invited to come and embrace the Christian faith, and whither they shall retreat from the persecution of the nations that have dominion over them; for France is a land of freedom, it admits of no slavery, and whoever touches it is free. Peyreire, after explaining his strange system, proposes a method of converting the Jews to Christianity; a method, says Niceron, which will not be acceptable to many. He proposes to reduce the whole of religion to a bare faith or belief in Jesus Christ; taking it for granted, without any shadow of proof, that it is as difficult to comprehend the articles of our faith, as to observe the ceremonies of Moses. From this scheme (says he) there would result a double advantage to the church; the reunion of the Jews, and of all those Christians who are separated from the body of the church." Peyreire, when he wrote this book, was a Calvinist; but his Calvinism too nearly resembled the Deism of our age. He confessed himself, that his reason for quitting the Protestants was on account of their being the first and principal opponents of his book concerning the Preadamites. II. A curious and entertaining account of Greenland, printed in 8vo, 1647. When he was asked, on occasion of this work, why there were so many witches in the north? he replied, "It is because part of the property of these pretended conjurers, when condemned to suffer death, is declared to belong to their judges." III. An equally interesting account of Iceland, 1663, 8vo. IV. A letter to Philotimus, 1658, in 8vo, in which he explains the reasons of his recantation, &c. We find in Moret the following epigraph of him, written by a poet of his own times.

La Peyreire ici est, ce bon Israelite, Huguenot, Catholique, enfin Preadamite: Quatre religions lui plurent à la fois, Et son indifférence eût si peu commune, Qu'après quatre-vingts ans qu'il eut à faire un choix, Le bon homme partit, & n'en choisit pas une.

PEYRONIUS, FRANCIS DE LA, for a long time practised surgery at Paris with such distinguished eclat, that he obtained for himself the appointment of first surgeon to Louis XV. He improved this favourable situation with his majesty, and procured to his profession those honours which had the effect to quicken its progress, and those establishments which contributed to extend its benefits. The Royal College of Surgery at Paris was founded by his means in 1731, was enlightened by his knowledge, and encouraged by his munificence. At his death, which happened at Versailles the 24th of April 1747, he bequeathed to the society of surgeons in Paris two thirds of his effects, his estate of Marigny, which was sold to the king for 200,000 livres, and his library. This useful citizen also left to the society of surgeons at Montpellier two houses, situated in
In the year 1785, he was appointed to the command of some ships employed in a voyage round the world, which unfortunately proved his last. Of this voyage, as far as it was accomplished, full accounts have been already published, from which it is manifest that Peyrousse was admirably qualified to discharge such a trust. He was an experienced and skilful seaman; a man of mathematical and physical science, uncorrupted by that false philosophy which disgraced many of his attendants, and capable of the utmost perseverance in every commendable pursuit. To these excellent qualities he added caution and courage, with a disposition truly benevolent towards the savages whom he visited. Most of the calumnies attendant on the voyage, with the exception of the last, were occasioned by the disobedience of his officers, or their neglecting to follow his advice.

The last dispatches of this great and truly excellent man were dated from Botany Bay, February 7, 1788; and since that period, no account of him has been received which is entitled to the smallest credit.

PEZAY, N. MASSON, MARQUIS DE, born at Paris, very early applied himself to the study of letters, and afterwards went into the army. He was made a captain of dragoons; and had the honour of giving some lessons on tactics to the ill-fated Louis XVI. Being appointed inspector general of some coasting vessels, he repaired to the maritime towns, and executed his commission with more care and attention than was to have been expected from a votary of the muses. But as, at the same time, he showed too much haughtiness, a complaint was brought against him to the court, and he was banished to his country seat, where he died soon after, in the beginning of 1778. He was the intimate friend and companion of Dora. He had studied, and successfully imitated, his manner of writing; but his poems have more delicacy, and are less disfigured with trifling conversations of gallantry. He has left behind him, 1. A translation of Catullus, which is not much esteemed. 2. Les Saisons Helvetiennes, Alsatiques, et Franc-Comtoises, in 8vo, 1770; a work very agreeably diversified, full of charming landscapes, but written with too little accuracy. 3. Les Soirées Provençales, in manuscript, which are said to be nowise inferior in merit to the foregoing ones. 4. La Rosière de Salency; a pastoral in three acts, and which has been performed with success on the Italian theatres. 5. Les campagnes de Mailbois, in 3 vols 4to, and a volume of maps.

PEZÈNAS, a place in France about 24 miles from Montpellier. The soil about it is sandy. The rock is limestone. The fields are open, and produce corn, wine, and oil. There are to be seen at this place the extensive ruins of a castle, which formerly belonged to the Montmorency family. This strong fortress was blown out of the rock on which it stands, and appears to have been complicated and full of art. The walls are lofty, and above 8 feet in thickness. The rock, which is perpendicular, is a mass of shells, such as turbinites, oysters, cockles, with a calcareous cement. From hence the circumjacent plain, decked with luxuriant verdure, and shut in by rugged mountains, affords a most delightful prospect. E. Long. 3° 35'. N. Lat. 43° 18'.

PEZÌZA, CUP-MUSHROOM, a genus of plants of the natural order of fungi, belonging to the cryptogamia class. See Botany Index.
PHAÇA, a genus of plants belonging to the diadelphus class; and in the natural method ranking under the 22d order, Papilionaceae. See Botany Index.

PHÆA, in Antiquity, a famous sow which infested the neighbourhood of Cromyion. Theseus destroyed it as he was travelling from Trozzen to Athens to make himself known to his father. Some imagine that the boar of Cato in Cynthia comes from this sow. According to some authors, Phæa was a woman who prostituted herself to strangers, whom she murdered, and afterwards plundered.

PHÆACIA, one of the ancient names of the island Corcyra. Phæacians the people, who were noted for their independence and luxury.

PHÆDON, a disciple of Socrates, who had been seized by pirates in his youth; and the philosopher, who seemed to discover something uncommon in his countenance, bought his liberty for a sum of money. Phæon, after Socrates's death, returned to Elis his native country, where he founded a sect of philosophers who composed what was called the Ethic school. The name of Phædon is affixed to one of Plato’s dialogues.

PHÆDRA, in fabulous history, was a daughter of Minos and Pasiphaea; she married Theseus, by whom she was the mother of Acamas and Demophon. They had already lived for some time in conjugal felicity, when Venus, who hated all the descendants of Apollo, because he had discovered her amours with Mars, inspired Phædra with the strongest passion for Hippolytus the son of Theseus, by the amazon Hippolyte. This passion she long attempted to stifle, but in vain; and therefore, in the absence of Theseus, she addressed Hippolytus with all the impatience of despair. He rejected her with horror and disdain. She, however, incensed by the reception she had met, resolved to punish his coldness and refusal; and at the return of Theseus she accused Hippolytus of attempts upon her virtue. He listened to her accusation; and without hearing Hippolytus’s defence, he banished him from his kingdom, and imprisoned Neptune, who had promised to grant three of his requests, to punish him in an exemplary manner. As Hippolytus fled from Athens, his horses were suddenly terrified by a sea monster, which Neptune had sent on the shore; and he was thus dragged through precipices and over rocks, trampled under the feet of his horses, and crushed under the wheels of his chariot. When his tragic end was known at Athens, Phædra confessed her crime, and hung herself in despair, unable to survive one whose death her extreme guilt had occasioned. The death of Hippolytus, and the infamous passion of Phædra, is the subject of one of the tragedies of Euripides and of Seneca. She was buried at Trozzenz, where her tomb was still to be seen in the time of the geographer Pausanias, near the temple of Venus, which she had built to render the goddess favourable to her incestuous passion. Near her tomb was a myrtle, whose leaves were full of small holes, which, it was reported, Phædra had done with a hair pin, when the vehemence of her passion had rendered her melancholy and almost desperate. She was represented in a painting in Apollo’s temple at Delphi, as suspended in the air, while her sister Ariadne stood near her, and fixed her eyes upon her.

PHÆDRUS, an ancient Latin writer, who composed five books of fables, in iambic verse. He was a Thracian; and was born, as there is reason to conclude, some years before Julius Caesar made himself master of the Roman empire. How he came into the service of Augustus is not known: but his being called Augustus’s freedman in the title of the book, shows that he had been that emperor’s slave. The fables of Phædrus are valued for their wit and good sense, expressed in very pure and elegant language; and it is remarkable that they remained buried in libraries altogether unknown to the public, until they were discovered and published by Peter Vitilus, or Philoecus, a learned French gentleman, toward the close of the 17th century.

PHÆNOMENON, in philosophy, denotes any remarkable appearance, whether in the heavens or earth, and whether discovered by observation or experiment.

PHAETON, in fabulous history, was the son of the Sun, or Phœbus and Clymene, one of the Oceanides. He was son of Cephalus and Aurora, according to Hesiod and Pausanias; or of Tithonus and Aurora, according to Apollodorus. He is, however, more generally acknowledged to be the son of Phœbus and Clymene. He was naturally of a lively disposition, and a handsome figure. Venus became enamoured of him, and entrusted him with the care of one of her temples. This distinguishes favour of the goddess rendered him vain and aspiring; and when Eosphaeus, the son of Io, had told him, to check his pride, that he was not the son of Phœbus, Phaeton resolved to know his true origin, and at the instigation of his mother he visited the palace of the Sun. He begged Phœbus, that if he really were his father, he would give him incontestable proofs of his paternal tenderness, and convince the world of his legitimacy. Phœbus received him with great tenderness, and swore by Styx to grant whatever he requested as a proof of his acknowledging him for his son. The youth boldly asked the direction of the chariot of the sun for one day. His father, grieved and surprised at this demand, used all his arguments to dissuade him from the rash attempt; but all was in vain: and being by his oath reduced to submit to his obstinacy, entrusted him with the reins, after he had directed him how to use them. The young adventurer was however soon sensible of his madness. He was unable to guide the fiery steeds; and loosing the reins, Jupiter, to prevent his consuming the heavens and the earth, struck him with a thunderbolt, and hurled him from his seat into the river Eridanus or Po. His sisters Phæthousa, Lambetha, and Phœbe, lamenting his loss upon its banks, were changed by the gods into black poplar trees; and Cynicus king of Liguria, also grieving at his fate, was transformed into a swan.

The poets say, that while Phaeton was driving the chariot of his father, the blood of the Ethiopians was dried up; and their skin became black; a colour which is still preserved among the greatest part of the inhabitants of the torrid zone. The territories of Libya were also, they tell us, parched up, on account of their too great vicinity to the sun; and ever since, Africa, unable to recover her original verdure and fruitfulness, has exhibited a sandy country and uncultivated waste. According to those who explain this poetical fable, Phaeton was a Ligurian prince, who studied astronomy; and in whose age the neighbourhood of the Po was visited with uncommon heats.

PHAETON.
PHAETON, a genus of birds belonging to the order of anseres. See Ornithology Index.

PHAGEDENA, in Medicine, denotes a corroding ulcer.

PHAGENIC MEDICINES, those used to eat off proud or fungous flesh; such as are all the caustics.

PHAGENIC FEVER, in Chemistry, denotes a water made from quicklime and sublimate; and is very efficacious in the cure of phagedenic ulcers. To prepare this water, put two pounds of fresh quicklime in a large earthen pan, and pour upon it about ten pounds of rain-water; let them stand together for two days, stirring them frequently: at last leave the lime to settle well; then pour off the water by inclination, filtrate it, and put it up in a glass bottle, adding to it an ounce of corrosive sublimate in powder; which from white becomes yellow, and sinks to the bottom of the vessel.

The water being settled, is fit for use in the cleansing of wounds and ulcers, and to eat off superficial flesh, and especially in gangrene; in which case may be added to it a third or fourth part of spirit of wine.

PHALENA, the MOTH, a genus of insects belonging to the order of lepidoptera. See Entomology Index.

PHALANCIUM, a genus of insects belonging to the order of aperta. See Entomology Index.

PHALANGOSIS, in Surgery, is a tumour and relaxation of the eyelids, often so great as to deform the eye, and considerably to impede vision. Sometimes the eyelid when in this state subsides or sinks down, occasioned perhaps either by a palsy of the muscle which sustains and elevates the eyelid, or else from a relaxation of the cutsis above, from various causes. But in the paralytic or relaxed case, the use of cordial and nervous medicines must be proposed internally; and outwardly, balsam of Peru and Hungary water are to be employed. If all these fail, the remaining method of cure is to extirpate a sufficient quantity of the relaxed cutis.

PHALANX, in Grecian antiquity, a square battalion of soldiers, with their shields joined and pikes crossing each other; so that it was next to impossible to break it.

The Macedonian phalanx is supposed by some to have had the advantage in valour and strength, over the Roman legion: its number was 8000 men. But the word phalanx is used for a party of 28, and several other numbers; and even sometimes for the whole body of foot. See Legion.

Phalanx is applied, by anatomists, to the three rows of small bones which form the fingers. See Anatomy Index.

PHALARIS, a remarkable tyrant, born at Crete, where his ambitious designs occasioned his banishment: he took refuge in Agrigentum, a free city of Sicily, and there obtained the supreme power by stratagem. The circumstance which has chiefly contributed to preserve his name in history is his cruelty; in one act of which he gave, however, an example of strict justice. It is thus related: Perillus, a brass-founder at Athens, knowing the cruel disposition of Phalaris, contrived a new species of punishment for him to inflict on his subjects. He cast a brasen bull, bigger than the life, with an opening in the side to admit the victim; who being shut up in the body, a fire was kindled under it to roast them to death; and the throat was so contrived, that their dying groans resembled the roaring of a bull. The artist brought it to the tyrant, expecting a great reward. Phalaris admired the invention and workmanship, but ordered the inventor to be put into it to make the first trial. In allusion to which, Ovid says,

Neque enim lae equor uifa,
Quae nec artifices arte perire sua.

The end of this detestable tyrant is differentially related; but it is very generally believed, with Cicero, that he fell by the hands of the Agrigentines; and, as some suppose, at the instigation of Pythagoras. Ovid tells us, that his tongue was cut out; and that he was then put into the bull to perish by the same slow fire by which means he had murdered so many before. Others say that he was stoned to death; and all agree that his end was violent. He reigned, Eusebius says, 28 years; others say 16. After all, there is great uncertainty both as to his life, death, and history. Many of the circumstances related of him, as they are collected by Mr Boyle, depend upon the authenticity of those epistles which go under the name of the tyrant; and which have been justly questioned, and with great probability rejected, as the spurious productions of some modern sophist. See Bentley, p. 177, col. 2.

Phalaris, or Canary-grass, a genus of plants belonging to the triandria class. See Botany Index.

PHALERIUM, among the ancient Romans, were military rewards bestowed for some signal act of bravery. Authors do not agree whether the Phaleri were a suit of rich trappings for a horse, or golden chains something like the torques, but so formed as to hang down to the breast and display a greater profusion of ornament. The last opinion appears to have the greater prevalence, but perhaps both are true.

PHALEARUS (Nepos), a village and port of Athens; this last neither large nor commodious, for which reason Themistocles put the Athenians on building the Piraeus; both joined to Athens by long walls. The Phalarus lay nearer the city (Pausanias). Demetrius Phalarus, the celebrated scholar of Theophrastus, was of this place; to whom the Athenians erected above 300 statues; which were afterwards destroyed by his enemies, on his flight to Ptolemy king of Egypt (Strabo). Here Demosthenes was wont to declaim, to accustom his voice to surmount the noise and roaring of the sea; a just and lively emblem of popular assemblies. See Phalaeucian Verse, in ancient poetry, a kind of verse consisting of five feet; the first of which is a spondee, the second a dactyl, and the three last trochees.

PHALUS, the Morel, a genus of plants of the order of fungi, and belonging to the cryptogamy class. See Botany Index.

PHALLUS, among the Egyptians, was the emblem of fecundity. It was very frequently worshipped by women, especially by those who were barren. This custom was introduced among the Greeks; and festivals in honour of it were called phalere. See Mysteries, No 38, &c. Among the Hindoos, a similar-emblem called tingam is used, and for similar purposes. See Hindoos, No 4.

PHALTI, or PHALTIEL, son of Laish. He married Michal, after Saul had taken her from David; but David afterwards took her away from Phalti (2 Sam. xxv. 44. 2 Sam. iii. 15). Some interpreters are of opinion
PHA

PHAKI did not meddle with Michal all the time she continued in his house, for fear that both of them should incur the penalty of death, to be inflicted on adulterers (Levit. xx. 10.), because Michal had not been legally divorced; but these reasons are frivolous. Saul looked upon David as a rebel to his king, and an outlaw, whose goods and wives belonged to him, and which he could absolutely dispose of. He would not have given Michal to Phaki, nor would he have received her, if he had not thought he might use her as his wife. If Michal had no children by Phaki, by whom then were those children that the scripture says she had, since it is known she had none by David? see 1 Sam. xxii. 8, and vi. 22.

PHANATIC, or FANATIC, a visionary; one who fancies he sees spirits, spectres, apparitions, or other imaginary objects, even when awake; and takes them to be real. See PHANTASY and FANATIC.

Such are phrenetics, necromancers, hypochondriac persons, lycanthropi, &c. See PHRENETIC, HYPOCHONDRIAC, LYCANTHROPI.

Hence the word is also applied to enthusiasts, pretenders to revelation, new lights, prophecies, &c. See ENTHUSIAST, and SECOND SIGHT.

PHANTASIA was the daughter of Nicarchus of Memphis in Egypt. It has been supposed that she wrote a poem on the Trojan war, and another on the return of Ulysses to Ithaca, from which compositions Homer copied the greatest part of his Iliad and Odyssey, when he visited Memphis, where they were deposited.

PHANTASM, a term sometimes used in a synonymous sense with idea, or notion retained in the mind, of an external object.

PHANTASMAGORIA, an optical deception. See SCIENCE, Amusements of.

PHANTASY, or FANCY, the Imagination; one of the powers of the mind, by which the species of objects received by the external organs of sense are retained, recalled, further examined, and either compounded, or divided: See IMAGINATION; and METAPHYSICS, Part I. Chap. ii. Or it is that internal sense whereby the ideas of absent things are formed, and represented to the mind as if they were present. In melancholia and mania this faculty is very strong, representing many extravagant and monstrous things, and framing its images as lively as those of sensation: whence the visions and deceptions those persons are liable to.

PHANUEL, of the tribe of Asher, the father of a holy widow and prophetess called Anna, who was in the temple when our Saviour was presented there by his parents (Luke ii. 36, 37, 38).

PHAON, a young man of Mytilene, in the island of Lesbos, received from Venus, as fable reports, an alabaster vase filled with an essence which had the virtue of conferring beauty. He had no sooner anointed his body with it than he became the most beautiful of men. The ladies of Mytilene fell desperately in love with him; and the celebrated Sappho threw herself down a precipice because he would not encourage her passion. He is said to have been killed by a husband who surprised him with his wife. We have in Ovid a letter from Sappho to Phaon, which Mr Pope has translated into English verse.

PHARA, in Ancient Geography, a village between Egypt and Arabia Petraea; or, according to Ptolemy, at a promontory situated between the Sinus Heropoliotes and Eranitis of the Red sea; where Ismael is said to have dwelt. In Hebrew it is Paran, and in most interpreters; Pharan, Septuagint and Vulgate. Phara, the people (Ptolemy). Paran or Pharan, the name of the wilderness in its neighbourhood, adjoining to Cadesh.

PHARAOH, in Ancient Geography, a town of Achaea in Peloponnesus, on the river Pireus, 70 stadia from the sea, and to the south of Paros 550 stadia. Another, of Crete (Pliny) a colony from the Phare of Messenia (Stephenus). A third Phare, Phere (Strabo, Ptolemy); Phara, (Polybius); a town of Messenia, on the river Nedo (Strabo); on the north side of the Sinus Messenius, and to the north-west of Abas. An ciently read Phare in Homer (Pausanias, Statius), though now read Phare. Pharaonis is the name of the people.

PHARAMOND is the name which is given by the generality of historians to the first king of France. He is said to have reigned at Treves, and over a part of France, about the year 420: and to have been succeeded by his son Clodion: but the account which is given of these two princes is very uncertain. It is probable Pharamond was properly no more than a general of an army, the head of a military society of Franks, who were masters of their persons and their fortunes. Gregory of Tours seems to have been of this opinion. "It is not generally known (says he) who was the first king of the French. Sulphius Severus, who mentions several things respecting that nation, takes no notice of its first monarch; he only says that it had generals." Be that as it may, the institution of the famous Salique law (so named from the Salians the most illustrious of the Franks) is generally attributed to Pharamond. "This law fixed the punishment of crimes, and various points of police. There is no just ground for believing that it expressly settled the right of succession to the crown; it only says, that, with relation to the Salic land, women have no share of heritage, without restricting it to the royal family in particular; for all those were generally called Salic lands, which were held by right of conquest; and it is easy to conceive that a nation of soldiers, whose general was their king, would not submit to be governed by a woman. A long custom, supported by the principles of the nation, came in time to be the established law of the kingdom." (See M. Abbé Millet, Elem. de l'Histoire de France, tom. i.).

PHARAOH, a common name of the kings of Egypt. Josephus says, that all the kings of Egypt, from Mosis, the founder of Memphis, who lived several ages before Abraham, have always had the name of Pharaoh, down to the times of Solomon, for more than 3300 years. He adds, that in the Egyptian language the word Pharaoh signifies a king; and that those princes did not assume this name but when they ascended the throne, at which time they quitted also their former name. From hence it comes to pass, says Josephus, that Herodotus names none of the kings of Egypt after Mosis the builder of Memphis, though he had 330 kings for his successors, because they had all the name of Pharaoh; but because this name did not pass to women also, he names an Egyptian queen Nicaule who I
ceed them. Lastly, I find, adds Josephus, from the ancien
cent records of our nation, that from the age of Solomon
no king of Egypt had any longer the name of Pharaoh.

But Josephus is not very accurate in this passage.
True it is, Herodotus says, that Mines, or Mineus,
was the first king of Egypt, and founder of Membis; that
there were 330 kings after him in Egypt; that after
them there was a queen called Nicotris, and not Nica-
ule, as Josephus writes it; but it is not true that
these kings had no other name but Pharaoh. Herodotus says
expressly, that in the books of the Egyptian priests were
read the names and the catalogue of 330 kings; that in
this number of 330 there were 18 Ethiopians, and a
woman that was a foreigner called Nicotris, and that all
the others were Egyptians. These princes therefore had
every one his proper name mentioned in the catalogue
of the Egyptian kings. So likewise we see in the frag-
ments of Manetho, that every king of Egypt had a
name peculiar to him; and we find the name Pharaoh
only in Scripture.

What Josephus adds concerning Queen Nicaule, or
Nicotris, whom he pretends to be the same as the queen
of Sheba, of whom mention is made in Scripture
(1 Kings x. 1, 2, &c.) is entirely fabulous; and as to
what he says, that since the time of Solomon the kings
of Egypt have no longer had the name of Pharaoh, is
manifestly false, since we still find his name in the sec-
second book of Kings, under Hezekiah (2 Kings xvi.
21;) under Josiah (xxiii. 29, 30, 33, &c.), where this
name is joined to Nebuchadnezzar, which was the proper
name of this prince; under Jehoahazim (xxiii. 33;) and in
the prophets Isaiah, Jeremiah, and Ezekiel, who are much
later than Solomon. It is very probable that the Egyp-
tians gave the name of Pharaoh to their kings as long
as the Egyptian language was in common use, and as long
as their kings were of their own nation: but after the
conquest of Egypt by Alexander the Great, and that
the Grecians introduced their language with their go-
vernment, the name of Pharaoh was known no longer
among them. The first prince known to us by the name
of Pharaoh was he in whose time Abraham went down
to Egypt, when Sarah, who passed only for Abraham's
sister, was by the command of Pharaoh brought to his
palace in order to become his wife. See ABRAHAM.

But the Lord smote Pharaoh and his family with great
infirmities, and gave him to know that she was Abra-
ham's wife; whereupon Pharaoh sent for Abraham, re-
stored him his wife, and at the same time gave orders
that he should be conducted out of Egypt, with every
thing that belonged to him. See SARAH.

The second Pharaoh spoken of in the Scripture is he
who reigned when Joseph arrived there. This prince or
his successor had the mysterious dream of the fat and
lean kine, and the seven full and barren ears of corn,
which Joseph explained so much to his satisfaction, that
he made him governor of his house and of all Egypt,
reserving only to himself the name of a king. This is
the same Pharaoh who sent for and entertained the pa-
triarch Jacob and his family in Egypt, and gave them
the land of Goshen for their habitation. See JOSEPH
and JACOB.

The third Pharaoh known in holy writ is he who per-
secuted the Israelites. Moses tells us that he was a new
king, and had no knowledge of Joseph (Exod. i. 8.).
This prince, observing that the Israelites had become
very numerous and powerful, resolved to oppress them
by hardship and labour; and set cruel and pitiless task-
masters over them. But the more he oppressed them,
the faster they multiplied; insomuch that he gave orders
to the Egyptian midwives, who assisted the Hebrew
women in their labour, to put all the male children to
death, and to save alive the females only. But this com-
mand was not strictly executed. The midwives feared the
Lord, and preserved alive not only the female
children, but the males also.

Pharaoh, seeing this project did not succeed to his
wishes, published a decree (Exod. i. 22.) that all the
male children born of Hebrew women should be thrown
into the Nile, and that only the females should be
spared. This order was rigorously executed; yet by the
providence of God Moses was preserved, and even
brought up in Pharaoh's own court, by his own daugh-
ter, who by chance had found the child, as he was ex-
posed upon the Nile.

Moses being grown up, and having killed an Egyp-
tian who had abused an Hebrew, was obliged to fly
from Egypt to avoid that death that Pharaoh had threatened
him with.

Several years after, being about 80 years old, he re-
turned again by an order from God, and performed
mighty miracles before Pharaoh. See MOSES. There
is a good deal of probability that this Pharaoh before
whom Moses appeared, and in whose sight he smote
Egypt with so many plagues, was a different person
from him who would have laid hands on him after he
had slain the Egyptian. This same Pharaoh having at
last been compelled to send away the Hebrews, and to
suffer them to go out of Egypt, soon repented of the lea-
ve he had given, and pursued them at the head of
his army with his chariots. But he was drowned in the
Red sea, wherein he had rashly entered in the eager-
ness of his pursuit. Some historians pretend to give us
the name of this Pharaoh; some, as Apion, call him
Amonis or Amasis; Eusebius calls him Chanechris;
Usher calls him Amenophis; but we may assure our-
selves that there can be nothing certain in all this.

The fifth Pharaoh known to us is he who gave pro-
tection to Hadad son of the king of Edom, who gave
him to wife the sister of his own queen, enriched him
with lands, and brought up his son Genuhah in his
own court. Hadad returned to Idumea after the death
of David.

The sixth Pharaoh is he who gave his daughter in
marriage to Solomon king of the Hebrews (1 Kings
iii. 1;) and having taken Gezer, he set it on fire,
drove the Canaanites out of it, and gave it for a present
to Solomon, in lieu of a dowry for his daughter, whom
he had married to this prince (1 Kings ix. 16.).

The seventh is Shishak, who entertained Jeroboam in
his dominions, a rebellious subject of Solomon, and of-
fered him a refuge in opposition to the king his master.
The same Shishak declared war against Rehoboam the
son and successor of Solomon, besieged and took Jeru-
alem, carried away all the king's treasures, and those of
the house of God, and particularly the golden bucklers
that Solomon had made. See SHISHAK.

The eighth is that Pharaoh with whom Hezekiah
made a league against Sennacherib king of Assyria, in
the year of the world 3290. See SENNACHERIB. This
Pharaoh is probably the same whom Herodotus names
Sethon,
The ninth is Pharaoh Nebcho, son of Pharaoh, who came to meet Sennacherib before Pul, and whose assistance Sennacherib sent an army of rats, which gnawed the bowstrings and the thongs of the bucklers of Sennacherib's soldiers.

The tenth is Pharaoh Hophrah, who entered into an alliance with Zedekiah king of Judah, and attempted to come to his assistance against Nebuchadnezzar king of Chaldea. It was against this Pharaoh that Ezekiel pronounced several of his prophecies (see Ezekiel xxix. xxx. xxxi. xxxii.). He is called Apries in Herodotus, lib. ii. c. 161. He is also mentioned in Habakkuk ii. 15, 16. See also Isaiah xix. xx. and Jeremiah xlv. 16, &c. See Apries, and Egypt, No. 13, &c.

PHARAOON is the name of a game of chance, the principal rules of which are: the banker holds a pack consisting of 52 cards; he draws all the cards one after the other, and lays them down alternately at his right and left hand; then the ponte may at his pleasure set one or more stakes upon one or more cards, either before the banker has begun to draw the cards, or after he has drawn any number of couples. The banker wins the stake of the ponte when the card of the ponte comes out in an odd place on his right hand, but loses as much to the ponte when it comes out in an even place on his left hand. The banker wins half the ponte's stake when it happens to be twice in one couple. When the card of the ponte being but once in the stock happens to be the last, the ponte neither wins nor loses; and the card of the ponte being but twice in the stock, and the last couple containing his card twice, he then loses his whole stake. De Moivre has shown how to find the gain of the banker in any circumstances of cards remaining in the stock, and of the number of times that the ponte's cards is contained in it. Of this problem he enumerates four cases, viz. when the ponte's card is once, twice, three, or four times in the stock. In the first case, the gain of the banker is \( \frac{1}{n} \), \( n \) being the number of cards in the stock.

In the second case, his gain is \( \frac{n-2}{n(n-1)} \), \( \frac{2}{n(n-1)} \), \( \frac{n-1}{n-1} \), supposing \( y=\frac{1}{n} \). In the third case, his gain is \( \frac{3y}{2(n-1)} \), supposing \( y=\frac{1}{n} \). In the fourth case, the gain of the banker, or the loss of the ponte, is \( \frac{2n-5}{n-1} \), \( \frac{2n-5}{n-3} \), \( \frac{2n-5}{n-3} \), supposing \( y=\frac{1}{n} \).

De Moivre has calculated a table, exhibiting this gain or loss for any particular circumstance of the play; and he observes, that at this play the least disadvantage of the ponte, under the same circumstances of cards remaining in the stock, is when the card of the ponte is but twice in it, the next greater when three times, the next when once, and the greatest when four times. He has also demonstrated, that the whole gain per cent. of the banker, upon all the money that is adventured at this game, is 21. 19s. 10d. See De Moivre's Doctrine of Chances, p. 77, &c. p. 105, &c.

PHAREZ, son of Judah and Tamar (Gen. xxxviii. 27, 28, &c.). Tamar being just ready to lie in, found herself with child of twins. One of them appeared first, and putting his arm out, he immediately drew it back again. The midwife tied a scarlet thread upon his arm, to distinguish him for the first-born; but having withdrawn his hand, his brother got before him into the world: whereupon he was called by his mother Pharex, i.e. one breaking forth; as the other, with the thread on his hand, was called Zarath. The sons of Pharex were Hezron and Hamul (Numb. xxvi. 20, 21.). F. Calmet, upon this article, explains the text as if Pharex, and not Zarath, had put out his hand, and drew it in again.

PHARISEES, a famous sect of the Jews, who distinguished themselves by their zeal for the traditions of the elders, which they derived from the same fountain with the written word itself; pretending that both were delivered to Moses from Mount Sinai, and were therefore both of equal authority. From their rigorous observance of these traditions, they looked upon themselves as more holy than other men; and therefore separated themselves from those whom they thought sinners or profane, so as not to eat or drink with them; and hence, from the Hebrew word pharic, which signifies "to separate," they had the name of Pharisics or Separatists.

This sect was one of the most ancient and considerable among the Jews; but its original is not very well known (A); however, it was in great repute in the time of our Saviour; and must have had its original at the same time with the traditions, and they grew up together.

(A) The Jesuit Serrarius places their first rise about the time of Eadras; because it was then that the Jews first began to have interpreters of their tradition. Maldonat, on the other hand, will not have this sect to have arisen among the Jews till a little before the time of Christ. Others, perhaps, with more probability, refer the origin of the Pharisees to the time of the Maccabees.

Dr Lightfoot thinks, that Pharisaism rose up gradually, from a period which he does not assign, to the maturity of a sect. It is certain, from the account given by Josephus, that in the time of John Hyrcanus, the high priest and prince of the Asmonean line, about 108 years before Christ, the sect was not only formed, but made a considerable figure; and that it had advanced to a high degree of popularity and power about 80 years before Christ. Jos. Antiq. lib. xiii. cap. 10. § 5, 6. cap. 15. § 5. and cap. 16. § 1. According to Basnage, Hist. of the Jews, book ii. cap. 9. § 2. one Aristobulus, an Alexandrian Jew, and a Peripatetic philosopher, who flourished about 125 years before Christ, and wrote some allegorical commentaries on the scripture, was the author of those traditions, by an adherence to which the Pharisees were principally distinguished from other sects.
PHARISEES: the name of a sect, the leaders of which were called Pharisees. They were distinguished from the Sadducees by the former's belief in the resurrection of the dead, and in the observance of the law in all its minutiae. They were a powerful influence in the religious life of the Jewish nation, and played a considerable part in the life of Jesus. They were known for their strict observance of the law, and their emphasis on the literal interpretation of the Scriptures.

The Pharisees were a diverse group, ranging from the simple and unlearned to the learned and influential. They were often accused of hypocrisy and of using their religious knowledge to gain power and influence. Jesus criticized them for this, saying that they were more concerned with outward appearances than with true righteousness.

Despite these criticisms, the Pharisees played an important role in the religious life of the Jewish nation. They were among the first to recognize Jesus as the Messiah, and many of them adopted him as their religious leader. They also played a significant role in the development of Jewish law and tradition, and their influence can be seen in the many references to them in the New Testament.
island, adjoining to the continent of Egypt, over-again
Alexandria. On this island stood a cognominal light-
tower, of four sides, each side a stadium in length; and
the tower so high as to be seen 100 miles off. Some af-
firm, each of its four corners rested on a large sea-crab
of glass or of hard transparent stone of Ethiopia or Mem-
phis. Others imagine the crumbs were only added ex-
ternally to the base by way of ornament, or as emble-
matical of its situation and use. The architect was So-
strates the Cnidian, as appears by an inscription on the
tower, under Polemy Philadelphia, who laid out 800
talents upon it. On account of the port of Alexandria,
the entrance to which was difficult and dangerous, the
Pharos was called the key of the Egyptian sea, or even
of Egypt itself (Lucan) ; and Pharos, from being a pro-
per name, became an appellative to denote all light-
houses.

Pharos, or Pharc, a light-house; a pile raised near
a port, where fire is kept burning in the night, to
 guide and direct vessels near at hand. The pharos of
Alexandria, built in the island of Pharos, at the mouth
of the Nile, was anciently very famous, insomuch as
to communicate its name to all the rest. This most mag-
nificent tower consisted of several stories and galleries,
with a lantern at top, in which a light being contin-
ually burning, might be seen for many leagues at sea,
and along the coast. It was accounted one of the seven
wonders of the world. It was built by the famed archi-
tect Sostrates, a native of Chidies, or, according to some,
by Deiphones, the father of Sostrates; and cost Polemy
Philadelphia 800 talents. The several stories were
adorned with columns, balustrades, galleries of the finest
marble and workmanship; to which some add, that the
architect had contrived to fasten some looking-glasses so
artificially against the highest galleries, that one could
see in them all the ships that sailed on the sea for a
great way. Instead of which noble structure, one sees
now only a kind of irregular castle, without ditches or
outworks of any strength, the whole being accommodat-
ed to the inequality of the ground on which it stands,
and which it seems is no higher than that which it
should command. Out of the midst of this clumsy
building rises a tower, which serves for a light-house,
but which has nothing of the beauty and grandeur of the
the old one. The Colossus of Rhodes also served as a
phare.

Pharpar, or Pharpas, is one of the rivers of
Damascus, or rather it is an arm of the Barada or Chry-
sorrhoas, which waters the city of Damascus and the
country about it (2 Kings v. 12). "Are not Abana and
Pharpar, rivers of Damascus, better than all the
waters of Israel?" The river of Damascus has its foun-
tain in the mountains of Libanus. At its approach to
the city it is divided into three arms, one of which
passes through Damascus. The other two water the
gardens round about, and then reunite, they lose them-
selves at four or five leagues from the city, to-
w ard the north. See Macredel's Travels from Alep-
po to Jerusalem; see also the articles Abana and Da-
mascus.

Pharsalia, Pharsalium, Pharsalus, or Phars-
salus, in Ancient Geography, a town of the Pithiotes,
a district of Thessaly, near Phere and Larissa, to which
last place Pompey fled from the plains of Pharsalus;
watered by the river Enipeus, which falls into the Api-
damus, and both together into the Penus. Between
Pharsalia. Pharsalus and Enipeus, Pompey drew up his men at the
fatal battle of Pharsalia.

In this battle, the advantage with respect to num-
bers was greatly on the side of Pompey. That general
himself was on the left with the two legions which Ca-
sar had returned to him at the beginning of the war.
Scipio, Pompey's father-in-law, was in the centre, with
the legions he had brought from Syria, and the rein-
forcements sent by several kings and states of Asia. The
Cilician legion, and some cohorts which had served in
Spain, were in the right, under the command of Ara-
nus. As Pompey's right wing was covered by the Eni-
peus, he strengthened the left with his slingers, archers,
and the 7000 Roman horse, on whom chiefly his party
founded their hopes of victory. The whole army was
drawn up in three lines, with very little spaces be-
tween them. In conformity to this disposition, Cesar's army
was drawn up in the following order: The tenth le-

gion, which had on all occasions signalized itself
above all the rest, was placed in the right wing, and
the ninth in the left; but as the latter had been con-
siderably weakened in the action at Dyrhrachium, the
eighth legion was posted so near as to be able to sup-
port and reinforce it upon occasion. The rest of Cesar's
forces filled up the space between the two wings.
Mark Antony commanded the left wing, Sylla the
right, and Cneius Domitius Calvinus the main body.
As for Caesar, he posted himself in the right over-
against Pompey, that he might have him always in his
sight.

Thus was the whole plain covered, from Pharsalia
to the Enipeus, with two armies, dressed and armed after
the same manner, and bearing the same ensigns, the
Roman eagles. Pompey observing how well the enemy
kept their ranks, expecting quietly the signal of battle,
and on the contrary how impatient and unsteady his own
men were, running up and down in great disorder for
want of experience, he began to be afraid lest his ranks
should be broken upon the first onset; and therefore
commanded the foot in the front to keep their ground,
and quietly wait for the enemy. The two armies, though
within reach of each other, kept a mournful silence;
but at length the trumpets sounded the charge, and Cres-

car's army advanced in good order to begin the attack,
being encouraged by the example of one Cains Crass-
inus, a centurion, who at the head of 120 men, threw
himself upon the enemy's first line with incredible fury.
This he did to acquire himself of a promise he had so-
lemnly made to Caesar, who, meeting him as he was go-
ing out of his tent in the morning, asked him, after some

discourse, What his opinion was touching the event of
the battle? To which he, stretching out his hand, replied
aloud, Thine is the victory, Caesar; thou shalt gloriously
conquer, and I myself this day will be the subject of thy
praise either dead or alive. In pursuance of this promise
he broke out of his rank as soon as the trumpet sound-
ed; and, at the head of his company, ran in upon the
enemy, and made great slaughter of them. But while
he was still pressing forward, forcing his way through
the first line, one of Pompey's men ran him in at the
mouth with such violence, that the point of his sword

came out at the hind part of his neck. Upon his death
Pompey's soldiers took courage, and with great bravery
stood the enemy's onset. While the foot were thus
 sharply
Pharsalia. sharply engaged in the centre, Pompey's horse in the left wing marched up confidently; and having first widened their ranks, with a design to surround Caesar's right wing, charged his cavalry, and forced them to give ground. Hereupon Caesar ordered his horse to retreat a little, and give way to the six cohorts which he had posted in the rear as a body of reserve. These, upon a signal given, coming up, charged the enemy's horse with that resolution and good order which is peculiar to men who have spent all their lives in camps. They remembered their instructions, not striking at the legs or thighs of the enemy, but aiming only at their faces. This unexpected and new manner of fighting had the desired effect. For the young patricians, whom Caesar contemptuously calls the *pretty young dancers*, not being able to beat the thoughts of having their faces deformed with scars, turned their backs, and, covering their faces with their hands, fled in the utmost confusion, leaving the foot at the mercy of the enemy. Caesar's men did not pursue the fugitives; but charging the foot of that wing, now naked and unguarded, surrounded them, and cut most of them in pieces.

Pompey was so transported with rage, in seeing the flower of his forces thus put to flight or cut in pieces, that he left his army, and retired slowly towards his camp, looking more like a man distracted and beside himself than one who by his exploits had acquired the name of the Great. When he had reached the camp, he retired to his tent without speaking a word to any; and continued there, like one distracted and out of his senses, till his whole army was defeated. Caesar no sooner saw himself master of the field than he marched to attack the enemy's entrenchments, that Pompey might not have time to recollect himself. When Pompey was informed that his rival was advancing to attack his entrenchments, he then first seemed to have recovered his senses, and cried out, *What, into my camp too!* He said no more; but immediately laying aside the marks of his dignity, and putting on such a garment as might best favour his flight, he stole out at the decuman gate, and took the road to Lancissa, which city had hitherto shown great attachment to him. In the mean time Caesar began the attack on the enemy's camp, which was vigorously defended by the cohorts Pompey had left to guard it; but they were at length forced to yield. Caesar was not a little surprised, when, after having forced the entrenchments, he found the enemy's tents and pavilions richly adorned with carpets and hangings, their couches strewn with flowers, their tables ready spread, and sideboards set out with abundance of plate, bowls, and glasses, and some of them even filled with wine. So great was the confidence of Pompey's party, that they made preparations beforehand for pleasures to be enjoyed after the victory, which they thought certain. In Pompey's tent, Caesar found the box in which he kept his letters: but, with a moderation and magnanimity worthy of himself, he burnt them all, without reading one; saying, that he had rather be ignorant of crimes, than obliged to punish them.

The next day, when the dead were numbered, it appeared that Caesar had scarce lost 200 men; among whom were about 30 centurions, whom Caesar caused to be buried with great solemnity. He did particular honours to the body of Crassus, who had begun the Pharsalia battle; and ordered his ashes to be deposited in a tomb, which he erected to his memory. On Pompey's side, the number of the dead amounted to 15,000 according to some, and to 25,000 according to others. Caesar took 24,000 prisoners, eight eagles, and 180 ensigns.

Pharsalia, an epic poem, composed by Lucan on the civil war between Pompey and Caesar, and particularly on the victory of the latter over the former, of which we have given an account in the preceding article. It is a poem universally acknowledged to have great beauties and great defects; but we are the less capable of estimating its merit as a whole, that either time has deprived us of the last books, or its author has left it incomplete. "The subject of the Pharsalia (says an excellent critic) carries undoubtedly all the epic grandeur and dignity: neither does it want unity of object, viz. the triumph of Caesar over the Roman liberty. In the choice of that subject, he thinks, however, that the author was not happy. The civil wars were too recent to admit in the description of them the embellishments of fiction and machinery. The fables of the gods mixed with the exploits of Caesar and Pompey, instead of raising, would have diminished, the dignity of such well-known facts." Another objection to the subject, perhaps more forcible than this, arises from the success of the war and the abilities of the generals. Lucan was a friend to liberty, and wished to raise the character of Pompey and Cato; but in spite of his utmost efforts, they are always eclipsed by the superior talents and consequent success of Caesar. All his characters, however, are drawn with spirit, and with uncommon regard to truth; and some of the speeches which he puts into the mouths of his heroes are equal for moral sublimity to anything that is to be found in all antiquity.

"There are in the Pharsalia (continues the critic already quoted) several very poetical and spirited descriptions. But the author's chief strength does not lie either in narration or description. His narration is often dry and harsh; his descriptions are often overwrought, and employed too upon disagreeable objects. His principal merit consists in his sentiments, which are generally noble and striking, and expressed in that glowing and ardent manner which peculiarly distinguishes him. Lucan is the most philosophic and the most public-spirited poet of all antiquity. He was the nephew of the famous Seneca the philosopher; was himself a Stoic; and the spirit of that philosophy breathes throughout his poem. We must observe, too, that he is the only ancient epic poet whom the subject of his poem really and deeply interested. Lucan recounted no fiction. He was a Roman, and had felt all the direful effects of the Roman civil wars, and of that severe despotism which succeeded the loss of liberty. His high and bold spirit made him enter deeply into this subject, and kindle, on many occasions, into the most real warmth. Hence, he abounds in exclamations and apostrophes, which are almost always well-timed, and supported with a vivacity and fire that do him no small honour." But it is the fate of this poet, that his beauties can never be mentioned, without their suggesting his blamishes also. As his principal excellence is a lively and glowing
PHARUS, a genus of plants belonging to the monocotyledonous class; and in the natural method ranking under the fourth order, Graminaceae. See Botany Index.

PHARYNX. See Anatomy, No. 92.

PHASCUM, a genus of plants of the order of musci, belonging to the cryptogamia class. See Botany Index.

PHASEOLUS, the Kidney-bean; a genus of plants, belonging to the diadalphiia class. See Botany Index.

PHASES, in Astronomy, from the Greek word Φάσης, “to appear;” the several appearances or quantities of illumination of the moon, Venus, Mercury, and the other planets. See Astronomy.

PHASGA, or PISGAH, (Moses), a mountain on the other side Jordan, joined to Abaram and Nebo, and running south to the mouth of the Arnon; from which Moses had a view of the promised land, and where he died, having before appointed Joshua his successor. Wells takes Pisgah and Nebo to be different names of one and the same mountain, a part or branch of the mountains Abiram (Deut. xxxii. 49, compared with Deut. xxxiv. 1.). Or that the top of Nebo was peculiarly called Pisgah; or some other part of it, cut out in steps, as the primitive word denotes: and thus it is rendered by Aquila, by a Greek word signifying cut out (Jerome). There was also a city of this name, id.; and the adjoining country was in like manner called Pisgah, id.

PHASIANUS, a genus of birds belonging to the order of galline. See Ornithology Index.

PHASIS, a river which falls into the Euxine sea about 700 miles from Constantinople. “From the Iberian Caucasus (says Gibbon), the most lofty and craggy mountains of Asia, that river descends with such oblique vehemence, that in a short space it is traversed by 120 bridges. Nor does the stream become placid and navigable till it reaches the town of Sarapana, five days journey from the Cyrus, which flows from the same hills, but in a contrary direction, to the Caspian lake. The proximity of these rivers has suggested the practice, or at least the idea, of wafting the precious merchandise of India down the Oxus, over the Caspian, up the Cyrus, and with the current of the Phasis into the Euxine and Mediterranean seas. As it successively collects the streams of the plain of Colchoe, the Phasis moves with diminished speed, though accumulated weight. At the mouth it is 60 fathoms deep, and half a league broad; but a small woody island is interposed in the midst of the channel: the water, so soon as it has deposited an earthy or metallic sediment, floats on the surface of the waves, and is no longer susceptible of corruption. In a course of 100 miles, 40 of which are navigable for large vessels, the Phasis divides the celebrated region of Colchoe or Mingrelia, which, on three sides, is fortified by the Iberian and Armenian mountains, and whose maritime coast extends about 200 miles, from the neighbourhood of Trebizond to Dioscurias and the confines of Circassia. Both the soil and climate are relaxed by excessive moisture: 28 rivers, besides the Phasis and his dependent streams, convey their waters to the sea; and the hollowness of the ground appears to indicate the subterraneous channels between the Euxine and the Caspian.”

PHASMATA, in Physiology, certain appearances arising from the various shades of colour in the clouds by the light from the heavenly bodies, especially the sun and moon. These are infinitely diversified by the different figures and situations of the clouds, and the appulse of the rays of light; and, together with the occasional flashings and shootings of different meteors, they have, no doubt, occasioned those prodigies of armies fighting in the air, &c. of which we have such frequent accounts in many writers. See 2 Maccab. xi. 8. Melaneth. Meteor. 2. Shel. de Comet, ann. 1618.

Kircher and Schottus have erroneously attempted to explain the phenomenon from the reflection of terrestrial objects made on opaque and coagulated clouds in the middle region of the air, which, according to them, have the effect of a mirror. Thus, according to those authors, the armies pretended by several historians to have been seen in the skies, were no other than the reflection of the like armies placed on some part of the earth. See Hist. Acad. Roy. Scienc. ann. 1726, p. 405, et seq.

PHEASANT. See Phasianus, Ornithology Index.

Pheasant’s Eye, or Bird’s Eye. See Adonis, Botany Index.

PEBE, a deaconess of the port of Corinth, called Cenchrea. St Paul had a particular esteem for this holy woman; and Theodoret thinks the apostle lodged at her house for some time, while he continued in or near Corinth. It is thought she brought to Rome the epistle he wrote to the Romans, wherein she is commended and recommended in so advantageous a manner. He says (Rom. xvi. 1, 2), “I commend unto you Phebe our sister, which is a servant of the church which is at Cenchrea: that ye receive her in the Lord, as becometh saints, and that ye assist her in whatsoever business she hath need of you; for she hath been a succourer of many, and of myself also.” Some moderns have advanced a notion, that Phebe was wife to St Paul; but none of the ancients have said anything like it. It is thought, in quality of deaconess, she was employed by the church in some ministrations suitable to her sex and condition; as to visit and instruct the Christian women, to attend them in their sickness, and distribute alms to them.

PHEGOR, or PEGOR, a deity worshipped at a very early period by the Midianites and Moabites, and probably by all the other tribes which then inhabited Syria. Much has been said concerning the functions of this god, and the rank which he held among the Pagan
PHEGOS, in Botany, a name which Theophrastus, Dioscorides, and others, give to a plant used by fullers in dressing their cloths, and of which there were two kinds, a smaller called simply phexos, and a larger called himphexos. This plant is sometimes called phexos; and is thus confounded with a kind of marsh cudweed, or graphalium, called also by that name; but it may always be discovered which of the two plants an author means, by observing the sense in which the word is used, and the use to which the plant was put. The phexos, properly so called, that is, the cudweed, was used to stuff beds and other such things, and to pack up with earthen vessels to prevent their breaking; but the phexos, improperly called phexos, only about cloths: this was, however, also called stebe and enophon.

PHERECRATES, a Greek comic poet, was contemporary with Plato and Aristophanes. After the example of the ancient comedians, who never introduced upon the theatre imaginary but living characters, he acted his contemporaries. But he did not abuse the liberty which at that time prevailed upon the stage; and laid it down as a rule to himself never to destroy the reputation of any person. Twenty-seven comedies are attributed to him, of which there now only remain some fragments collected by Hertelius and Grotius. From these fragments, however, it is easy to discern, that Pherecrates wrote the purest Greek, and possessed that ingenious and delicate raillery which is called attic urbanity. He was the author of a kind of verse called, from his own name, Pherecratick. The three last feet were in hexameter verse, and the first of those three feet was always a spondee. The verse of Horace (for example, quanvis pontica pinus) is a Pherecratick verse. We find in Plutarch a fragment of this poet upon the music of the Greeks, which has been critically examined by M. Burett of the academy of inscriptions. See the 1st volume of the collection published by that learned society.

PHERICIDES, a native of Scyros, flourished about the year 560 before the Christian era, and was disciple of Pittacus, one of the seven wise men of Greece (see Pittacus). He is said to have been the first of all the philosophers who has written on natural subjects and the essence of the gods. He was also the first, it is said, who held the ridiculous opinion, "that animals are mere machines." He was Pythagoras's master, who loved him as his own father. This grateful scholar having heard that Pherecydes lay dangerously ill in the island of Delos, immediately repaired thither, in order to give every necessary assistance to the old man, and to take care that no means should be left untried for the recovery of his health. His great age, however, and the violence of his disease, having rendered every prescription ineffectual, his next care was to see him decently buried; and when he had paid the last duty to his remains, and erected a monument to his memory, he set out again for Italy. Other causes have been assigned for the death of Pherecydes: some say he was eaten up by lice, and others that he fell headlong from the top of Mount Corycus in his way to Delphi. He lived to the age of 85 years, and was one of the first prose writers among the Greeks.

"Marvellous circumstances have been related of him, is, which only deserve to be mentioned, in order to show history of that what has been deemed supernatural by ignorant spectators.
spectators may be easily conceived to have happened from natural causes. A ship in full sail was at a distance approaching its harbour; Pherecydes predicted that it would never come into the haven, and it happened accordingly; for a storm arose which sunk the vessel. After drinking water from a well, he predicted an earthquake, which happened three days afterwards. It is easy to suppose that these predictions might have been the result of a careful observation of those phenomena which commonly precede storms or earthquakes in a climate where they frequently happen.

"It is difficult to give in any degree an accurate account of the doctrines of Pherecydes; both because he delivered them, after the manner of the times, under the concealment of symbols; and because very few memoirs of this philosopher remain. It is most probable that he taught those opinions concerning the gods and the origin of the world which the ancient Grecian theologonsists borrowed from Egypt;" and of which the reader will find accounts in different articles of this work. See Egypt, Metaphysics, Mysteries, Mythology, and Polytheism.

Pherecydes was the wife of Battus king of Cyrene, and the mother of Arcesilaus. After his son's death, she recovered the kingdom by means of Amasis king of Egypt, and to avenge the murder of Arcesilaus, she caused all his assassins to be crucified round the walls of Cyrene, and she cut off the breasts of their wives, and dragging them up near the bodies of their husbands. It is said that she was devoured alive by worms; a punishment which, according to some of the ancients, was inflicted by Providence for her unparalleled cruelties.

Phial, a well-known vessel made of glass, used for various purposes.

Leyden Phial, is a phial of glass coated on both sides with tin-foil for a considerable way up the sides, of great use in electrical experiments. The discovery that electricity may be accumulated in an apparatus of this kind, was originally made in the year 1747 by Mr. Von Kleist, dean of the cathedral in Comin. But this remarkable property was first satisfactorily observed at Leyden, with a bottle containing some water which served for the inside coating, and the accidental application of the hands on the outside served for another coating. Hence a bottle coated on both sides for the purpose of being charged with electricity, has received the name of Leyden phial, or otherwise electric jar. See Electricity, passim.

Phidias, the most famous sculptor of antiquity, was an Athenian, and a contemporary of the celebrated Pericles, who flourished in the 8th Olympiad. This wonderful artist was not only consummate in the use of his tools, but accomplished in those sciences and branches of knowledge which belong to his profession, as history, poetry, fable, geometry, optics, &c. He first taught the Greeks to imitate nature perfectly in this way; and all his works were received with admiration. They were also incredibly numerous; for it was almost peculiar to Phidias, that he united the greatest facility with the greatest perfection. His Nemesis was ranked among his first pieces: it was carved out of a block of marble, which was found in the camp of the Persians after they were defeated in the plains of Marathon. He made an excellent statue of Minerva for the Plateans; but the statue of this goddess in her magnificent temple at Athens, of which there are still some ruined remains, was an astonishing production of human art. Pericles, who had the care of this populous situation, gave orders to Phidias, whose prodigious talents he well knew, to make a statue of the goddess; and Phidias formed a figure of ivory and gold 39 feet high. Writers never speak of this illustrious monument of skill without raptures; yet what has rendered the name of the artist immortal, proved at that time his ruin. He had carved upon the shield of the goddess his own portrait and that of Pericles; and this was, by those that envied him, made a crime in Phidias. He was also charged with embezzling part of the materials which were designed for the statue. Upon this he withdrew to Ely, and revenged himself upon the ungrateful Athenians, by making for the Elisians the Olympic Jupiter: a prodigy of art, and which was afterwards ranked among the seven wonders of the world. It was of ivory and gold; 60 feet high, and every way proportioned. The majesty of the work did equal the majesty of the god (says Quintilian), and its beauty seems to have added lustre to the religion of the country.

Phidias concluded his labours with this masterpiece: and the Elisians, to do honour to his memory, erected, and appropriated to his descendants, an office, which consisted in keeping clean this magnificent image.

Phidias, in Grecian antiquity, feasts celebrated with great frugality at Sparta. They were held in the public places and in the open air. Rich and poor assisted at them equally, and on the same footing; their design being to keep up peace, friendship, good understanding, and equality among the citizens great and small. It is said that those who attended this feast brought each a bushel of flour, eight measures of wine named chorus, five pounds of cheese, and two pounds and a half of figs, with some money.

Phila, in Mythology, one of the attributes of Venus, which distinguishes her as the mother of love, from philos, to love.

Philadelphia, in antiquity, were games instituted at Sardis to celebrate the union of Caracalla and Geta, the sons of Septimius Severus.

Philadelphia, the capital of the state of Pennsylvania in North America, situated in W. Long. 75. 8. N. Lat. 39. 57. It is one of the most beautiful and regular cities in the world, being of an oblong form, situated on the west bank of the river Delaware, on an extensive plain, about 18 miles (some say more) from the sea. The length of the city east and west, that is, from the Delaware to the Schuykill, upon the original plan of Mr Penn, is about three miles, and the breadth, north and south, rather less than one mile. But a great part of the plot covered by the city charter is yet unbuilt. The inhabitants, however, have not confined themselves within the original limits of the city, but have built north and south along the Delaware two miles in length. The longest street is Second-street, about 700 feet from Delaware river, and parallel to it. The circumference of that part of the city which is built, if we include Kensington on the north and Southwark on the south, may be about five miles. Market-street is 100 feet wide, and runs the whole length of the city from the river.
Chesnut-street, which was finished in 1793. The university stands on the west side of Fourth-street, and was incorporated in the year 1771, the funds of which produce annually a revenue of about 236,531; and the students on an average amount to 510. In the city and suburbs are 10 rope-walks, 13 breweries, 6 sugar-houses, 7 hair-powder manufactories, 2 rum-distilleries, 15 manufactories of earthen ware, and the public mint for the whole United States.

The university of Philadelphia was founded during the war. Its funds were partly given by the state, and partly taken from the old college of Philadelphia. A medical school, which was founded in 1765, is attached to the university; and has professors in all the branches of medicine, who prepare the students for degrees in that science. Besides the university and medical school, there is the Protestant Episcopal academy, a very flourishing institution; the academy for young ladies; another for the Friends or Quakers, and one for the Germans, besides five free schools.

In Market-street are the handsome buildings between Frankfort and Fourth-streets, which is the principal market, built of brick, and is 1,100 feet in length. This market, in respect to the quantity, the variety, and neatness of the provisions, is not equalled in America, and perhaps not exceeded in the world.

There are various literary and philosophical institutions in Philadelphia. The American Philosophical Society was incorporated in 1782, and has published five volumes of Transactions. The Philadelphia Medical Society established in 1790; the College of Physicians in 1789; the Medical Lyceum in 1804; the Academy of Fine Arts in 1805; the Linnean Society in 1806; the Agricultural Society in 1809; and the Academy of Natural Sciences, which commenced a Journal in 1817. Peale's Museum, founded in 1784, contains an extensive collection of objects connected with natural history.

The style of living in Philadelphia is substantial, and among the richer classes splendid, though not very refined. Many of the houses are richly furnished, and a considerable number of carriages are kept. All classes live well, and apparently there is less economy and less exertion than in England. The dress of the gentlemen is taken from England, that of the ladies from France. The distinction between the blacks and whites is jealously kept up here. The former are not allowed to go into the same church with the latter.

The wages of labour and prices of commodities in Philadelphia may serve as a specimen of those of the large towns of America generally. In October 1817, according to Mr Fearn, labourers were paid from 4s. 6d. to 5s. 7d. per day; female servants 4s. 6d. to 9s. per week, with board; men servants 5s. 6d. to 6s. 9d. per month; carpenters from 31s. 6d. to 40s. 6d. per week; shoemakers 31s. 6d. to 40s. 6d. — they work more hours than in London. Fish from 2d. to 6d. per pound; beef 3d.; bacon 7d. to 8d.; butter 17d. to 20d.; eggs 1d. to 2s. 6d.; turkeys 5s. 6d.; flour 10 dollars per barrel of 190 pounds; lump sugar 1s. to 1s. 9d.; teas 4s. 6d. to 9s.; Liverpool salt 3s. 6d. per bushel; Shores 1s. 7d. to 1s. 9d. per pair; best hats 40s. 6d.; superfine coats 8l. 1s. 6d.

The philanthropic and useful institutions in Philadelphia are very numerous and extremely well conducted. In the Alms House and House of Employment,
The average number of persons maintained in 1810 was 735; and the average weekly expense for each was 1 dollar 21 cents per week. The poor are employed here in the fabrication of coarse manufactures. The Friends' Alms House was established by the Quakers for the infirm and indigent members of their own community. The Abolition Society for promoting the abolition of slavery, and for the relief of free negroes unlawfully held in slavery, was established in 1774. The Washington Benevolent Society has nearly 3000 members. The asylum for the relief of lunatics was planned by the Quakers in 1813. The society for alleviating the misery of public prisons, instituted in 1787, has been the means of introducing great improvements into these establishments. The Pennsylvania hospital, founded in 1756, affords relief to poor persons afflicted with diseases. The Dispensary affords medical advice and assistance to the indigent sick who are unable to pay for a physician.

The Penitentiary of this city has been justly celebrated, as having set the first example of the efficacy of labour, and a system of moral discipline, in reforming the lives of criminals, and in diminishing the expense of prisons, by rendering the labour of the prisoners the source of their own support. The prison instead of being a scene of idleness, debauchery, and profligacy, has the appearance of a large manufactury, in which all are usefully employed, and none seem extremely unhappy. The leading features of the system of discipline established here, will be understood from the following account of the regulations given in "Mease's Picture of Philadelphia."

1. Cleanliness, so intimately connected with morality, is the first thing attended to, previously to any attempts at that internal purification, which it is the object of the discipline to effect. The criminal is washed, his clothes effectually purified and laid aside, and he is clothed in the peculiar habit of the jail, which consists of grey cloth, made by the prisoners, adapted to the season. The attention to this important point is unremitted, during their confinement. Their faces and hands are daily washed; they are shaved, and change their linen once a-week; their hair is kept short; and, during the summer, they bathe in a large tub. Their apartments are swept and washed once or twice a-week, as required, throughout the year.

2. Work, suitable to the age and capacity of the convicts, is assigned, and an account is opened with them. They are charged with their board, clothes, the fine imposed by the state, and expense of prosecution, and credited for their work; at the expiration of the time of servitude, half the amount of the sum, if any, left after deducting the charges, is required by law to be paid to them. As the board is low, the labour constant, and the working hours greater than among mechanics, it is easy for the convicts to earn more than the amount of their expenses; so that, when they go out, they receive a sum of money sufficient to enable them to pursue a trade, if so disposed, or, at least, that will keep them from want until they find employ, and prevent the necessity of stealing. On several occasions, the balance paid to a convict has amounted to more than one hundred dollars; in one instance it was one hundred and fifty dollars; and from ten to forty dollars are commonly paid. When, from the nature of the work at which the convict has been employed, or his weakness, his labour does not amount to more than the charges against him, and his place of residence is at a distance from Philadelphia, he is furnished with money to bear his expenses home. The price of boarding is sixteen cents per day, and the general cost of clothes for a year is nineteen dollars thirty-three cents.

3. The prisoners lie on the floor, on a blanket, and about thirty sleep in one room; they are strictly prohibited from keeping their clothes on at night. The hours for rising and retiring are announced by a bell; and at those times they go out and come in with the greatest regularity. For their own comfort, they have established a set of rules respecting cleanliness, on breach of which a fine is exacted. No one is permitted even to spit on the floor. A large lamp is hung up, out of the reach of the prisoners, in every room, which enables the keeper or watch to see every man; and for this purpose a small aperture is made in every door. The end of the cord by which the lamps are suspended is outside of the rooms; the solitary cells is the punishment for extinguishing these lamps.

4. Their diet is wholesome, plain, and invigorating, and their meals are served up with the greatest regularity and order; a bell announces when they are ready, and all collect at the door leading to the passage where they eat, before any one is allowed to enter. They then take their seats without hurry or confusion, and all begin to eat at the same time. While eating, silence is strictly enjoined by the presence of the keepers, who give notice of the time for rising from table. For breakfast, they have about three-fourths of a pound of good bread, with molasses and water. At dinner, half a pound of bread and beef, a bowl of soup and potatoes. Sometimes herrings in the spring. At supper, corn meal mush (mash?) and molasses, and sometimes boiled rice.

The black seat at a separate table. There is also a table set apart for those who have committed offences for the first time, but not of sufficient enormity to merit the solitary cells; such as indolence, slighting work, impudence, &c.; and to such no meat is given. Every one finds his allowance ready on his trencher. The drink is molasses and water, which has been found to be highly useful, as a refreshing draught, and as a medicine. Spirituous liquors or beer never enter the walls of the prison. The cooks and bakers, who are convicts, are allowed thirty cents per day by the inspectors. The decency of deportment, and the expression of content, exhibited by the convicts at their meals, renders a view of them, while eating, highly interesting. No provisions are permitted to be sent to the convicts from without.

5. The regularity of their lives almost secures them against disease. A physician, however, is appointed to attend the prison; a room is appropriated for the reception of the sick or hurt, and nurses to attend them. The effect of the new system has been seen in no particular more evidently than in the diminution of disease among the convicts.

6. Religious instruction was one of the original remedies prescribed for the great moral disease, which the present penal system is calculated to cure. Divine service is generally performed every Sunday, in a large room.
7. Corporal punishments are strictly prohibited; whatever offence may have been committed. The keepers carry no weapons, not even a stick. The solitary cells and low diet have on all occasions been found amply sufficient to bring down the most determined spirit, to tame the most hardened villain that ever entered them. Of the truth of this there are striking cases on record. Some veterans in vice, with whom it was necessary to be severe, have declared their preference of death by the gallows to a further continuance in that place of torment. In the cells, the construction of which renders conversation among those confined in them difficult, the miserable man is left to the greatest of all possible punishments, his own reflections. His food, which consists of only half a pound of bread per day, is given him in the morning; in the course of a few days or weeks, the very nature of the being is changed; and there is no instance of any one having occasion for the infliction of the punishment a second time. Such is the impression which the reports of its effects have left among the convicts, that the very dread of it is sufficient to prevent the frequent commission of those crimes for which it is the known punishment, as swearing, impudence, rudeness, quarrelling, indolence repeated, or willful injury to the tools, or to articles of manufacture.

There are fourteen inspectors, three of whom are elected by the select and common councils in joint meeting, in May and November; two by the commissioners of the Northern Liberties, and two by the commissioners of Southwark, at the same time. We extract the following account of the malignant fever which prevailed in Philadelphia in 1793 and 1797, from a pamphlet written by Mr. Carey. "The symptoms which characterized the first stage of the fever were, in the greatest number of cases, after a chilly fit of some duration, a quick tense pulse; hot skin; pain in the head, back, and limbs; flushed countenance; inflamed eyes; moist tongue; oppression and sense of soreness at the stomach, especially upon pressure; frequent sick qualms, and retchings to vomit, without discharging anything, except the contents last taken into the stomach; costiveness, &c."

The early symptoms generally continued with more or less violence from one to three, four, or even five days; and then gradually abating, left the patient free from every complaint, except general debility. On the febrile symptoms suddenly subsiding, they were immediately succeeded by a yellow tinge in the opaque cornea, or whites of the eyes; an increased oppression at the præcordia, a constant puckering of everything taken into the stomach, with much straining, accompanied with a hoarse hollow noise.

If these symptoms were not soon relieved, a vomiting of matter resembling coffee-grounds in colour and consistence, commonly called the black vomit, sometimes accompanied with or succeeded by hemorrhages from the nose, fauces, gums, and other parts of the body; a yellowish purple colour, and putrescent appearance of the whole body, hiccup, agitations, deep and distressed sighing, comatose delirium, and finally death, are the consequence. When the disease proved fatal, it was generally between the fifth and eighth days.

"This was the most usual progress of this formidable disease through its several stages. There were, however, very considerable variations in the symptoms as well as in the duration of its different stages, according, to the constitution and temperament of the patient, the state of the weather, the manner of treatment, &c."

In some cases, signs of putrescence appeared at the beginning or before the end of the third day. In these, the black vomiting, which was generally a mortal symptom, and universal yellowness, appeared early. In these cases, also, a low delirium, and great prostration of strength, were constant symptoms, and coma came on very speedily. In other, the symptoms inclined more to the icterous than the inflammatory type."

PHILADELPHIA, an ancient town of Turkey in Asia, in Phocis. It is seated at the foot of Mount Sinus, by the river Cogamus, from whence there is an exceeding fine view over an extensive plain. This place was founded by Attalus Philadelphus, brother of Eumenes.

It was very liable to earthquakes, which, perhaps, arose from its vicinity to the region called Catakeumene*. So severe were those earthquakes, that even the Fortuna or temple walls were not secure; and so frequent were they that these experienced daily convulsions. The inhabitants, therefore, who were not numerous, lived in perpetual apprehension, and their constant employment was in repairs. In fact, so great were their fears, that their chief residence was in the country, the soil of which was very fertile. Such is Strabo's account of this place. In the year 1097, it was taken by assault by John Ducas the Greek general. It was without difficulty reduced also in the year 1106, under the same emperor. The Turks marched from the East with a design to plunder it and the maritime towns. The emperor Manuel, in 1175, retired for protection from the Turks to this place. In 1300, it fell by lot to Karaman. In 1306, it was besieged by Alifarnas, and considerably harassed; but was not taken. In 1391, this place alone refused to admit Bajazet; but it was at length forced to capitulate for want of provisions. It has been matter of surprise that this town was not totally abandoned; and yet it has survived many cities less liable to inconveniences, and is still an extensive place, though in its appearance it is poor and mean. Some remnants of its walls are still standing, but with large gaps. The materials of the wall are small stones strongly cemented. It is thick, lofty, and has round towers. Near this place, between the mountains, there is a spring of a purgative quality; it is much esteemed, and many people resort to it in the hot months. It tastes like ink, is clear, but tinges the earth with the colour of ochre. The famous wall, which credibility has asserted to be made of human bones, stands beyond this and beyond the town. See the next article.

When Dr Chandler was there, he tells us, "The Travels bishop of Philadelphia was absent; but the proto-papas or chief priest of this district, whom we went to visit, received us at his palace, a title given to a very indifferent house or rather a cottage of clay. We found him ignorant
 PHI

unknown of the Greek tongue, and were forced to discourse with him by an interpreter in the Turkish language. He had no idea that Philadelphia existed before Christianity, but told us it had become a city in consequence of the many religious foundations. The number of churches he reckoned at 24, mostly in ruins, and mere masses of wall decorated with painted saints. Only six are in a better condition, and have their priests. The episcopal church is large, and ornamented with gilding, carving, and holy portraits. The Greeks are about 300 families, and live in a friendly intercourse with the Turks, of whom they speak well. We were assured that the clergy and laity in general knew as little of Greek as the proto-papas; and yet the liturgies and offices of the church are read as elsewhere, and have undergone no alteration on that account.

"The Philadelphiaans are a civil people. One of the Greeks sent us a small earthen vessel full of choice wine. Some families beneath the trees, by a Jill of water, invited us to alight, and partake of their refreshments. They saluted us when we met; and the age or governor, on hearing that we were Franks, bade us welcome by a messenger.

"Philadelphia possessing waters excellent in dyeing, and being situated on one of the most capital roads to Smyrna, is much frequented, especially by Armenian merchants. The Greeks still call this place by its ancient name, but the Turks call it Allahijur. The number of inhabitants is about 7000 or 8000; of whom 2000 are supposed to be Christians. It is about 40 miles E. S. E. of Smyrna. E. Long. 28. 15. N. Lat. 38. 23."

PHILADELPHIA-Stones, a name which some authors have given to what is otherwise called Christian bones, found in the walls of that city. It is a vulgar error that these walls are built of bones; and the tradition of the country is, that when the Turks took the place, they fortified it for themselves, and built their walls of the bones of the Christians whom they had killed there. Dr. Smyth in one of his epistles, mentions this wall as an instance of Turkish barbarity. This idle opinion has gained credit merely from a loose and porous stone of the sparry kind, found in an old aqueduct, which is still in the wall. Sir Paul Rycaut brought home pieces of these stones, which even he supposed to have been bones, but they proved on examination to be various bodies, chiefly vegetable, incrusted over and preserved in a spar of the nature of that which forms inclusions in Knaresborough spring, and other places with us. These bodies are often cemented together in considerable numbers by this matter, and their true shape lost in the congeries, till a diligent and judicious eye traces them regularly.

PHILADELPHIA Society, in ecclesiastical history, an obscure and inconsistent society of mystics. They were formed about the end of the last century by an English female fanatic, whose name was Jane Leadley. This woman seduced, by her visions, predictions, and doctrines, several disciples, among whom were persons of learning. She believed that all dissentions among Christians would cease, and the kingdom of the Redeemer become a scene of charity and felicity, if Christians, disregarding the forms of doctrine or discipline of their several communions, would all join in commit-

ting their souls to the care of the internal guide, to be instructed, governed, and formed, by his divine impulse and suggestions. But she went farther than this: she even pretended a divine commission to proclaim the approach of this glorious communion of saints; and was convinced that the society established by herself was the true kingdom of Christ. One of her leading doctrines was that of the final restoration of all intelligent beings to perfection and happiness.

PHILADELPHUS, in antiquity, was a title or surname borne by several ancient kings; formed from the Greek φίλος, "friend, lover," and ἀδελφός, "brother," q. d. one who loves his brother or brethren. See POLEMY and EGYPT.

PHILADELPHUS, the Pipe-tree, or Mock-orange; a genus of plants belonging to the Icosandra class. See BOTANY Index.

The coronarius, white syringa, or mock-orange, has been long cultivated in the gardens of this country as a flowering shrub; it is not well known in what country it is to be found native. It rises seven or eight feet high; sending up a great number of slender stalks from the root. These have a grey bark, branch out from their sides, and are garnished with oval spear-shaped leaves. This shrub by its flowers makes a fine figure in May and June; for they are produced in clusters both at the end and from the sides of the branches. They are of a fine white colour, and exceedingly fragrant.

PHILENI, were two brothers, citizens of Carthage, who sacrificed their lives for the good of their country. At the time when the Carthaginians ruled over the greatest part of Africa, the Cyrenians were also a great and wealthy people. The country in the middle between them was all sandy, and of an uniform appearance. There was neither river nor mountain to distinguish their limits; a circumstance which engaged them in a terrible and tedious war with one another. After their armies and fleets had been often routed and put to flight on both sides, and they had weakened one another pretty much; and fearing lest, by and by, some third people should fall upon the conquered and conquerors together, equally weakened, upon a cessation of arms they made an agreement, "that upon a day appointed deputies should set out from their respective homes, and the place where they met another should be accounted the common boundary of both nations." Accordingly, the two brothers called Phileni, sent from Carthage, made all dispatch to perform their journey. The Cyrenians proceeded more slowly. These last, perceiving themselves a little behind, and becoming apprehensive of punishment at home for mismanaging the affair, charged the Carthaginians with setting out before the time; made a mighty bustle upon it; and, in short, would rather choose any thing than go away undone. But whereas the Carthaginians desired any other terms, provided only they were fair, the Cyrenians made this proposal to the Carthaginians, "either to be buried alive in the place which they claimed as the boundary to their nation, or that they would advance forward to what place they inclined upon the same condition." The Phileni accepting the offer, made a sacrifice of themselves and their lives to their country, and so were buried alive. The Carthaginians dedicated altars in that place to the memory of the two brothers. These altars, called Are Philenorum, served as a boundary to the empire
PHI [ 262 ]

PHILANTHROPY is compounded of two Greek words which signify the love of mankind. It is therefore of nearly the same import with benevolence (A); and differs from friendship, as this latter affection subsists only between a few individuals, whilst philanthropy comprehends the whole species.

Whether man has an instinctive propensity to love his species, which makes him incapable of happiness but in the midst of society, and impels him to do all the good that he can to others, feeling their felicity as addition to his own, is a question that has been warmly debated among philosophers ever since metaphysics was studied as a science. With the opinions of the ancients we shall not, in this detached article, trouble our readers; but it would be unpardonable to pass without notice the different theories which on so interesting a subject have divided the moderns.

Hobbes, who believed, or pretended to believe, that right results from power, and that in society there is no other standard of justice than the law of the land, or the will of the supreme magistrate, built his opinions upon a theory of human nature, in which philanthropy has no place. According to him, mankind, in the original state of nature, were wholly selfish. Each endeavoured to seize, by fraud or force, whatever he thought would contribute to his comfort; and as all had nearly the same wants, the inevitable consequence of this selfishness was universal war. We are taught indeed by the same philosopher, that, in a series of ages, mankind discovered the miseries of this state of nature; and therefore, upon the same basis of universal selfishness, formed societies, over which they placed supreme governors for the purpose of protecting the weak against the violence of the strong. He does not, however, explain how men, whose angry and selfish passions were thus excited to the utmost against each other, could enter upon this friendly treaty; or, supposing it formed, how the ignorant multitude were induced to pay obedience to the more enlightened few. Clogged with this and other insurmountable difficulties, his philosophy of human nature soon fell into merits contempt; but about the origin of philanthropy those who united in opposition to him still thought very differently from one another.

The elegant Shaftesbury, who had imbibed much of the spirit of Plato, endeavoured, like his master, to deduce all the duties of man, and almost all his actions, from a number of internal feelings or instincts which he supposed to be interwoven with his constitution by the immediate hand of God. This system appeared so honourable to human nature, and at the same time was so easily comprehended, that the noble lord had soon many followers, and may indeed be considered as the founder of a school which has produced philosophers Philanthropists whose works do honour to the age and country in which they flourished. Among these we must reckon Bishop Butler, Hutchinson, Lord Kames, Dr Beattie, and perhaps Dr Reid.

According to the system of these writers, the whole duty of man results from an intuitive principle, to which they have given the name of the moral sense; and with this sense they conceive philanthropy to be inseparably united, or rather perhaps to make an essential part of it. (See Moral Philosophy). If this theory be carried to its utmost extent, as it has been by some of its patrons, it seems to follow, that peace and harmony should reign among savages; and that a man who had from his infancy grown up in solitude, would be delighted with the first sight of a fellow-creature, and run to him with eagerness as to a new source of enjoyment. This conclusion, however, is contrary to acknowledged facts. Savages are generally divided into small tribes or hordes; and though the attachment of individuals to their own tribe appears indeed to be abundantly strong, the tribes themselves are frequently at war, and entertain a constant jealousy of each other. Savages, too, are almost universally afraid of strangers; and the few solitary individuals, who have been caught in parts where they had run wild from their infancy, instead of being delighted with the appearance of fellow-men, have either fled from them with their utmost speed, or been fixed to the spot in terror and astonishment. These are no indications of that instinctive philanthropy for which some writers so strenuously plead. They have indeed induced others to deny, that in human nature there is any instinctive principles at all; and to endeavour to account for our several propensities by the influence of education producing early and deep-rooted habits.

At the head of this school stood Locke and Hartley. The former, employing himself almost wholly on the intellectual powers of man, and combating the absurd, though generally received, belief, that there are in the human mind innate principles of speculative truth, has touched but incidentally on our principles of action. It seems, however, to be evident that he did not consider any one of these principles as innate; and his opinion was adopted by Hartley, who studied the sensitive part of human nature with greater industry and success than perhaps any writer who had preceded him in that department of science. This philosopher refuses all kind of instinct to man, even the love of a mother to her new-born infant, and that which has been generally supposed innate—the propensity of the infant to suck the breast. It is therefore needless to say that in his theory of human nature innate philanthropy can have no place.

The reader, however, must not suppose that the theory of Hartley is the theory of Hobbes. Though he admits no innate principles of action in the human mind, he is far from dreaming that the original state of man was a state of war and selfishness, or that the acquisition of philanthropic sentiments is not natural. He considers such

(A) We say nearly of the same import; because benevolence extends to every being that has life and sense, and is of course susceptible of pain and pleasure; whereas philanthropy cannot comprehend more than the human race.
any virtue themselves, they cannot fail to inculcate the Philanthro-
duty of loving each other on their tender offspring. Benevolence, thus generated, soon extends to their daily
companions; and takes a wider and a wider range as these
companions are multiplied, and as children advance
towards the state of manhood. New objects then pro-
sent themselves to the mind. A man soon discovers,
that, as he is a member of a community, his happiness
as an individual depends in a great measure on the pro-
spersity of the whole. Hence arises patriotism, and that
pleasure which we all take in the eminence of our
countrymen. But the principle of benevolence stops
not here. He whose mind is enlarged by a liberal
education, considers all particular countries as provinces
of one great country extended over the whole globe;
and all mankind, of course, as not only sharing the same
nature with himself, but as being in reality his fellow-
citizens and brethren. The principles of religion, if
he be actuated by them, must aid these reflections, and
make him wish the happiness of all who stand in the
same relation with himself to the Great Governo
of the world. This is philanthropy; and we see how it
may spring, by the great law of association, from desires
which, in their original state, cannot be considered as
other than selfish. It is a calm sentiment, which we
believe hardly ever rises to the warmth of affection,
and certainly not to the heat of passion.

Should any of our readers be disposed to controvert
this opinion, or to fancy it degrading to human nature,
we will not enter into controversy with them; we only
beg leave to ask, whether they have ever rejoiced in the
good fortune of a stranger or a foreigner, or regretted
his loss, with any portion of those feelings which they
have frequently experienced on hearing of the prosperity
or the death of a friend or a neighbour? We answer
candidly for ourselves, that we feel no interest which
can be called passion or affection in the fortunes of a na-
tive of China; and yet we should be sorry to think that
our philanthropy is less than that of other men. A com-
mon clown, we are inclined to believe, seldom extends
his affection beyond his friends and neighbours; and
though, from having often heard his country praised,
and knowing that he belongs to his country, he would
probably be offended at the man who should prefer
another to it; yet if no misfortune befal him, or his
friends and neighbours, we imagine that his grief for
public calamities may be borne with patience. In his
mind no such associations have been formed as comprise
the good of a country, far less of all countries; and
therefore his philanthropy must be confined to a very
limited range. We doubt not, however, but that as op-
portunity offers, and as circumstances permit, such a man
is ready to feed the hungry and clothe the naked of all
countries; not indeed from sentiments of affection either
innate or acquired, but from the obvious reflection that
he is not exempted from those calamities which have be-
fallen them, and from a still higher principle—a sense of
duty to that God who has made of one blood all na-
tions upon earth, and commanded them to be mutually
aiding to each other.

PHILEMON, a Greek comic poet, was son to Da-
mon, and contemporary with Menander. Any advantage
he had over this poet, was owing less to his own merit
than to the intriguies of his friends. Plautus has imita-
cated his comedy du Marchant. He is reported to have
died laughing on seeing his ass eat figs. He was then
about:
PHILEMON

about 97 years of age. His son Philemon, the younger, was also the author of 54 comedies, of which there are still extant some condiderable fragments collected by Grotius. These clearly prove that he was not a poet of the first rank. He flourished about the year 274 before our Saviour.

PHILEMON was a rich citizen of Colossae in Phrygia. He was converted to the Christian faith, with Appia his wife, by Epaphras the disciple of St Paul; for St Paul himself did not preach at Colossae, Coloss. ii. 1. Perhaps we should have known nothing of St Philemon, had it not been on the account of his slave Onesimus, who having robbed him, and run away from him, came to Rome, where he found St Paul, and was very serviceable to him. St Paul converted him, baptized him, and sent him back to his master Philemon; to whom he wrote a letter still extant, and which passes for a masterpiece of that kind of eloquence, natural, lively, strong, and pathetic, that was peculiar to St Paul. Philemon (1. 2.) had made a church of his house, and all his domestics, as well as himself, were of the household of faith. His charity, liberality, and compassion, were a sure refuge to all who were in distress. The Apostolical Constitutions say, that St Paul made him bishop of Colossae; but the Menma insinuate, that he went to Gaza in Palestine, from which he was the apostle and first bishop. From hence he returned to Colossae, where he suffered martyrdom with Appia his wife, in the time of Nero. They relate several particulars of his martyrdom, and say, that his body remained at Colossae, where it performed several miracles.

PHILETAS, a Greek poet and grammarian, of the island of Cos, flourished under Philip and Alexander the Great, and was preceptor of Ptolemy Philadephus. He was the author of some Elegies, Epigrams, and other works, which have not come down to us. He is celebrated in the poems of Ovid and Propertius, as one of the best poets of his age. Elian reports a very improbable story of him, namely, "that his body was so slender and feeble, that he was obliged to have some lead in his pockets, to prevent him from being carried away by the wind."

PHILETUS. St Paul, writing to Timothy (2 Tim. ii. 16, 17, 18.) in the 6th year of Christ, and a little while before his own martyrdom, speaks thus: "But shun profane and vain babblings, for they will increase unto more ungodliness. And their word will eat as doth a canker; of whom is Hymenaeus and Philetus; who concerning the truth have err'd, saying, that the resurrection is past already, and overthrow the faith of some." We have nothing very certain concerning Philetus; for we make but small account of what is read in the false Abdias, in the life of St James major, even supposing this author had not put the name of Philetus instead of Phygelius. This is the substance of what is found in Abdias. St James the son of Zebodiee, passing through the synagogues of Judea and Samaria, preached everywhere the faith of Jesus Christ. Hermogones and Philetus strenuously opposed him, affirming, that Jesus Christ was not the Messiah. Hermogones was a notable magician, and Philetus was his disciple, who being converted, was desirous to bring his master to St James; but Hermogones bound him up so by his magic art, that he could not come at the apostle. Philetus found means to make St James acquainted with what had happened to him; upon which St James unbound him, and Philetus came to him. Hermogones perceiving how ineffectual his art was against the saint, became himself a convert as well as Philetus.

PHILIBEC, is a little plaid, called also kit, and is a sort of short petticoat reaching nearly to the knees, worn by the Scotch Highlanders. It is a modern substitute for the lower part of the plaid, being found to be less cumbersome, especially in time of action, when the Highlanders used to tuck their breasthun into their girdle. Almost all of them have a great pouch of badger and other skins, with tassels dangling before, in which they keep their tobacco and money.

PHILIP, foster-brother of Antiochus Epiphanes (1 Macc. vi. 14, & 55; 2 Macc. ix. 29.), was a Phrygian by birth, and very much in Antiochus's favour. This prince made him governor of Jerusalem (2 Macc. viii. 8. v. 22.) where he committed many outrages upon the Jews, to force them to forsake their religion. Seeing that Apollonius and Seron were defeated by Judas Maccabæus, he sent for new succours to Ptolemy governor of Cilicia-Syria, who sent him Gorgias and Nicanaus with a powerful army. Some time after, Antiochus going beyond the Euphrates, to extort money from the people, Philip went along with him; and Antiochus finding himself near his end (1 Macc. vi. 14.) made him regent of that kingdom, put his diadem into his hands, his royal cloak, and his ring, that he might render them to his son the young Antiochus Eupator. But Lysias having taken possession of the government in the name of young Eupator, who was but a child, Philip not being able to cope with him, durst not return into Syria: but he went into Egypt, carrying the body of Epiphanes along with him, there to implore assistance from Ptolemy Philometor against Lysias the usurper of the government of Syria. The year following, while Lysias was busy in the war carrying on against the Jews, Philip got into Syria, and took possession of Antioch: but Lysias returning into the country, with great diligence, rebuilt Antioch, and put Philip to death, who was taken in the city.

PHILIP the apostle was a native of Bethsaida in Galilee. Jesus Christ having seen him, said to him, "Follow me," John i. 43, 44, &c. Philip followed him; and soon after finding Nathanael, Philip said to him, "We have found the Messiah, of whom Moses and the prophets have spoken, Jesus of Nazareth, the son of Joseph." Nathanael asked him, "Can any thing good come out of Nazareth?" To which Philip replied, "Come and see." Then he brought Nathanael to Jesus, and they went with him to the marriage of Cana in Galilee. St Philip was called at the very beginning of our Saviour's mission; and when Jesus Christ was about to feed the 5000 that followed him (Luke vi. 13. Mat. x. 2. John vi. 5-7.), he asked St Philip, only to prove him, whence bread might be bought for such a multitude of people? Philip answered, that 200 pennyworth of bread would not he sufficient for every one to taste a little. Some Gentiles, having a curiosity to see Jesus Christ, a little before his passion, they addressed themselves to St Philip (John xii. 21, 22), who mentioned it to St Andrew, and these two to Christ. At the last supper, Philip desired our Saviour, that he would be pleased to show them the Father, being all that they desired (John xiv. 8-10.) But Jesus told them, that seeing the Son they saw the
The upper Asia fell to this apostle’s lot, where he took great pains in planting the gospel, and by his preaching and miracles made many converts. In the latter part of his life, he came to Hierapolis in Phrygia, a city very much addicted to idolatry, and particularly to the worship of a serpent of a prodigious bigness. St Philip by his prayers procured the death, or at least the disappearance, of this monster, and convinced its worshippers of the absurdity of paying divine honours to such odious creatures. But the magistrates, enraged at Philip’s success, imprisoned him, and ordered him to be severely scourged, and then put to death, which some say was by crucifixion; others, by hanging him up against a pillar. St Philip is generally reckoned among the married apostles; and it is said he had three daughters, two whereof preserved their virginity, and died at Hierapolis: the third, having led a very spiritual life, died at Ephesus. He left behind him no writings. The gospel under his name was forged by the Gnostics, to countenance their bad principles and worse practices. The Christian church observes the festival of this saint, together with that of St James, on the first day of May. Eiseb. lib. iii. c. 30.

Philip, the second of the seven deacons, was chosen by the apostles after our Saviour’s resurrection. (Acts xvi. 5.) This deacon, they say, was of Caesarea in Palestine. It is certain that his daughters lived in this city (Acts xxi. 8. 9.). After the death of St Stephen, all the Christians, excepting the apostles, having left Jerusalem, and being dispersed in several places, St Philip went to preach at Samaria (id. viii. 1. 2. &c.), where he performed several miracles, and converted many persons. He baptized them; but being only a deacon, he could not confer on them the Holy Ghost. Wherefore having made known to the apostles at Jerusalem, that Samaria had received the word of God, Peter and John came thither, and the Samaritans that were converted received the Holy Ghost. St Philip was probably at Samaria when the angel of the Lord ordered him to go to the south part of the country, in the road that leads from Jerusalem to old Gaza. Philip obeyed, and there met with an Ethiopian eunuch belonging to Queen Candace, who had the care of her revenues, and had been at Jerusalem to worship God there (id. viii. 26. 27. &c.).

He was then returning into his own country, and was reading the prophet Isaiah as he went along in his chariot. Philip, hearing the eunuch reading the prophet Isaiah, said to him, Do you understand what you read? The eunuch replied, How should I understand, except somebody explain it to me? He desired Philip therefore to come and sit down by him in the chariot. The passage the eunuch was reading is this: "He was led as a sheep to the slaughter, and like a lamb dumb before his shearer, so he opened not his mouth." The eunuch then says to Philip, Pray, whom does the prophet speak of in this place? Is it of himself, or of some other? Then Philip began to instruct him concerning Jesus Christ. And having gone on together, they came to a fountain; when the eunuch said to Philip, Here is water, what hinders me from being baptized? Philip told him that he might be so, if he believed with all his heart. He replied, I believe that Jesus Christ is the son of God. He then ordered the chariot to stop, and they both alighted.

Vol. XVI. Part I.

and went down into the water, where Philip baptized the eunuch. Being come out of the water, the Spirit of the Lord took away Philip, and the eunuch saw no more of him. But Philip was found again at Azotus, and he preached the gospel in all the cities he passed through, till he arrived at Cesarea in Palestine. After this, the scripture does not inform us of any particulars relating to Philip. The modern Greeks say that he went to Trales in Asia, where he founded a church, of which he was the apostle and bishop; and where he rested in peace, after performing many miracles. The Latins, on the contrary, say that he died at Cesarea, and that three of his daughters were there buried with him.

It is thought, that the eunuch converted by St Philip was the first apostle of the Ethiopians; and that the Abyssines boast of having received the Christian faith from him.

Philip II. was the fourth son of Amyntas, king of Lepri- Macedonia. He was sent to Thebes as a hostage by his father, where he learnt the art of war under Epaminendas, and studied with the greatest care the manners and the pursuits of the Greeks. He discovered, from his earliest years, that quickness of genius and greatness of courage which afterwards procured him so great a name and such powerful enemies. He was recalled to Macedonia; and at the death of his brother Perdiccas he ascended the throne as guardian and protector of the youthful years of his nephew. His ambition, however, soon discovered itself, and he made himself independent about the year 360 before Christ. The valour of a prudent general, and the policy of an experienced statesman, seemed requisite to ensure his power. The neighbouring nations, ridiculing the youth and inexperience of the new king of Macedonia, appeared in arms; but Philip soon convinced them of their error. Unable to meet them as yet in the field of battle, he suspended their fury by presents, and soon turned his arms against Amphipolis, a colony tributary to the Athenians. Amphipolis was conquered, and added to the kingdom of Macedonia; and Philip meditated no less than the destruction of a republic which had rendered itself so formidable to the rest of Greece, and had even claimed submission from the princes of Macedonia. His designs, however, were as yet immature; and before he could make Athens an object of conquest, the Thrace and the Illyrians demanded his attention. He made himself master of a Thracian colony, to which he gave the name of Philippi, and from which he received the greatest advantages on account of the gold mines in the neighbourhood. These made it a very important capture. He settled in it a number of workmen, and was the first who caused gold to be coined in his own name. He employed his wealth in procuring spies and partisans in all the great cities of Greece, and in making conquests without the aid of arms. It was at the siege of Methone in Thrace that Philip had the misfortune to receive a wound in his right eye from the stroke of an arrow. In the midst of his political prosperity, Philip did not neglect the honour of his family. He married Olympias the daughter of Neoptolemus, king of the Molossi; and when, some time after, he became father of Alexander, the monarch, conscious of the inestimable advantages which arise from the lessons, the example, and conversation of a learned and virtuous preceptor, wrote a letter with his own hand to the philosopher Aristotle, and
begged him to retire from his usual pursuits; and to dedicate his whole time to the instruction of the young prince. Everything seemed now to conspire to his aggrandizement; and historians have observed that Philip received in one day the intelligence of three things, which could gratify the most unbounded ambition, and flatter the hopes of the most aspiring monarch: the birth of a son, an honourable crown at the Olympic games, and a victory over the barbarians of Illyricum. But all these rather increased than satiated his ambition: he declared his inimical sentiments against the power of Athens, and the independence of all Greece, by laying siege to Olynthus, a place which, on account of its situation and consequence, would prove most injurious to the interests of the Athenians, and most advantageous to the intrigues and military operations of every Macedonian prince. The Athenians roused by the eloquence of Demosthenes, sent 17 vessels and 2000 men to the assistance of Olynthus; but the money of Philip prevailed over all their efforts. The greatest part of the citizens suffered themselves to be bribed by the Macedonian gold, and Olynthus surrendered to the enemy, and was instantly reduced to ruins. Philip soon after defeated the Athenians, and made a greater number of them prisoners, whom he dismissed without ransom. Of this victory, the fruit of that excellent discipline which he had established in his army, the Macedonian phalanx had the principal honour. This was a body of infantry heavily armed, consisting commonly of 16,000 men, who had each of them a shield six feet high and a pike 21 feet long. (See PHALANX). The success of his arms, and especially his generosity after victory, made his alliance and a peace a desirable object to the people of Athens; and as both parties were inclined to this measure, it was concluded without delay. His successes were as great in every part of Greece: he was declared head of the Amphictyonic council, and was entrusted with the care of the sacred temple of Apollo at Delphi. If he was recalled to Macedonia, it was only to add fresh laurels to his crown, by victories over his enemies in Illyricum and Thessaly. By assuming the mask of a moderateur and peace-maker, he gained confidence; and in attempting to protect the Peloponnesians against the encroaching power of Sparta, he rendered his cause popular; and by ridiculing the insults that were offered to his person as he passed through Corinth, he displayed to the world his moderation and philosophic virtues. In his attempts to make himself master of Euboea, Philip was unsuccessful; and Phocion, who despised his gold as well as his meanness, obliged him to evacuate an island whose inhabitants were as insensible to the charms of money as they were unmoved at the horrors of war, and the bold efforts of a vigilant enemy. From Euboea he turned his arms against the Scythians; but the advantages he obtained over this indigent nation were inconsiderable, and he again made Greece an object of plunder and rapine. He advanced far in Boeotia, and a general engagement was fought at Cheronaea. The fight was long and bloody, but Philip obtained the victory. His behaviour after the battle reflects great disgrace upon him as a man and as a monarch. In the hour of festivity, and during the entertainment which he had given to celebrate the trophies he had won, Philip saluted from his camp, and with the inhumanity of a brute, he insulted the bodies of the slain, and exulted over the calamities of the prisoners of war. His insolence, however, was checked, when Demades, one of the Athenian captives, reminded him of his mean action by the following speech: "Why do you, O king, act the part of a Thersites, when you think yourself not superior to his dignity, and the character of an Agamemnon?" The reproach was felt; Demades received his liberty; and Philip learned how to gain popularity even among his fallen enemies; by relieving their wants and easing their distresses. At the battle of Cheronea the independence of Greece was extinguished; and Philip, unable to find new enemies in Europe, formed new enterprises, and meditated new conquests. He was nominated general of the Greeks against the Persians, and was called upon, as well from inclination as duty, to revenge those injuries which Greece had suffered from the invasions of Darius and Xerxes. But he was stopped in the midst of his warlike preparations, being stabbed by Pausanias, who entered the theatre at the celebration of the nuptials of his daughter Cleopatra. This murder has given rise to many reflections upon the causes which produced it; and many who consider the recent repudiation of Olympias and the resentment of Alexander, are apt to investigate the causes of his death in the bosom of his family. The ridiculous honours which Olympias paid to her husband's murderer strengthened the suspicion; yet Alexander declared that he had murdered the kingdom of Persia to revenge his father's death upon the Persian satraps and princes, by whose immediate intrigues the assassination had been committed. The character of Philip is that of a sagacious, artful, prudent, and intriguing monarch: he was brave in the field of battle, eloquent and dissimulating at home, and he possessed the wonderful art of changing his conduct according to the disposition and caprice of mankind, without ever altering his purpose, or losing sight of his ambitious aims. He possessed much perseverance, and in the execution of his plans he was always vigorous. He had that eloquence which is inspired by strong passions. The hand of an assassin prevented him from achieving the boldest and the most extensive of his undertakings; and he might have acquired as many laurels, and conquered as many nations, as his son Alexander did in the succeeding reign; and the kingdom of Persia might have been added to the Macedonian empire, perhaps with greater moderation, with more glory, and with more lasting advantages. The private character of Philip lies open to censure, and raises indignation. The admirer of his virtues is disgusted to find him among the most abandoned prostitutes, and disgracing himself by the most unnatural crimes and lascivious indulgences which can make even the most debauched and the most profligate to blush. He was murdered in the 47th year of his age, and the 24th of his reign, about 336 years before the Christian era. His reign is become uncommonly interesting, and his administration a matter of instruction. He is the first monarch whose life and actions are described with peculiar accuracy and historical faithfulness. Philip was the father of Alexander the Great and of Cleopatra, by Olympias; he had also by Audacia an Illyrian, Cyno, who married Amyntas the son of Perdiccas, Philip's elder brother; by Nicopolia a Thessalian, Nicea, who married Cassander; by Philene a
Larissae dancer, Aristeus, who reigned some time after Alexander's death; by Cleopatra, the niece of Attalus, Carausus and Europa, who were both murdered by Olympias; and Ptolemy the first king of Egypt, by Arsinoe, who in the first month of her pregnancy was married to Lagus. Of the many memorable actions and sayings reported by Plutarch of this prince, the following are the most remarkable. Being present at the sale of some captives, in an indelicate posture, one of them informed him of it; "Set this man at liberty (says Philip), I did not know that he was my friend." Being solicited to favour a lord of his court, who was like to lose his character by a just but severe sentence, Philip refused to hearken to the solicitation, and added, "I had rather that he be disgraced than myself." A poor woman was importuning him to do her justice; and as she sent her away from day to day, under the pretence that he had no time to attend to her petition, she said to him with some warmth, "Cease then to be a king." Philip felt all the force of this reproof, and immediately gave her satisfaction.—Another woman came to ask justice of him as he was going out from a great entertainment, and was condemned. "I appeal (exclaimed she)!" "And to whom do you appeal (said the king to her)?" "To Philip fasting." This answer opened the eyes of the monarch, who retracted his sentence. If he possessed any virtue, it was principally that of suffering injuries with patience. Demochares, to whom the Cretans gave the surname of Partheniastes, on account of his excessive petulance of tongue, was one of the deputies whom the Athenians sent to this monarch. Philip, at the conclusion of the audience, begged the ambassadors to tell him, "If he could be of any service to the Athenians;" to which Demochares gave an insolent return, which he forgave. Having learned that some Athenian ambassadors charged him, in full assembly, with atrocious calumnies: "I am under great obligations (said he) to those gentlemen, for I shall henceforward be so circumspect in my words and actions, that I shall convict them of falsehood." One saying of Philip, which does him less honour than those we have before mentioned, was, "Let us amuse children with playthings, and men with oaths." This abominable maxim, which was the soul and spring of his policy, gave rise to the observation, "That he was in full length, what Louis XI. afterwards was in miniature." It is well known that Philip had a person about him, who called out at times. "Philip, remember that thou art mortal;" but whether we should place this to the account of his pride or his humility, it is difficult to say.

Philip V. was king of Macedonia, and son of Demetrius. His infancy, at the death of his father, was protected by Antigonus, one of his friends, who ascended the throne, and reigned for 12 years, with the title of Independent monarch. When Antigonus died, Philip recovered his father's throne, though only 15 years of age, and he early distinguished himself by his boldness and his ambitious views. He came to the throne in the year 320 before our Saviour, and the beginning of his reign was rendered glorious by the conquests of Aratus; a general who was as eminent for his love of justice as his skill in war. But so virtuous a character could hardly fail to be disagreeable to a prince who wanted to indulge himself in every species of dissipation and vice; and indeed his cruelty to him soon displayed his character in its true light; for to the gratification of every vice, and every extravagant propensity he had the meanness to sacrifice this faithful and virtuous Athenian. Not satisfied with the kingdom of Macedonia, Philip aspired to become the friend of Hannibal, and wished to share with him the spoils which the distresses and continual loss of the Romans seemed soon to promise. But his expectations were frustrated; the Romans discovered his intrigues; and though weakened by the valour and artifice of the Carthaginian, yet they were soon enabled to meet him in the field of battle. The consul Levius entered without delay his territories of Macedonia; and after he had obtained a victory over him near Apollonia, and reduced his fleet to ashes, he compelled him to sue for peace. This peaceful disposition was not permanent; and when the Romans discovered that he had assisted their formidable enemy Hannibal with men and money, they appointed T. Q. Flaminius to punish his perfidy, and the violation of the treaty. The Roman consuls, with his usual expedition, invaded Macedonia; and in a general engagement, which was fought near Cynopephale, the hostile army was totally defeated, and the monarch saved his life with difficulty by flying from the field of battle. Destitute of resources, without friends either at home or abroad, Philip was obliged to submit to the mercy of the conqueror, and to demand peace by his ambassadors. It was granted with difficulty; the terms were humiliating; but the poverty of Philip obliged him to accept the conditions, however disadvantageous and degrading to his dignity. In the midst of these public calamities, the peace of his family was disturbed; and Perseus, the eldest of his sons by a concubine, raised seditions against his brother Demetrius, whose condescension and humanity had gained popularity among the Macedonians, and who from his residence at Rome, as an hostage, had gained the good graces of the senate, and by the modesty and innocence of his manners had obtained forgiveness from that venerable body for the hostilities of his father. Philip listened with too much avidity to the false accusations of Perseus; and when he heard it asserted that Demetrius wished to rob him of his crown, he not only hesitated to punish with death so unworthy and so ungrateful a son. No sooner was Demetrius sacrificed to credulity, than Philip became convinced of his cruelty and rashness; and to punish the perfidy of Perseus, he attempted to make Antigonus, another son, his successor on the Macedonian throne. But he was prevented from executing his purpose by death, in the 42d year of his reign, 178 years before the Christian era. The assassination of Demetrius succeeded his father, and with the same ambition, with the same rashness and oppression, renewed the war against the Romans, till his empire was destroyed, and Macedonia became a Roman province. Philip has been compared with his great ancestor of the same name; but though they possessed the same names, the same ambition, and were tainted with the same vices, yet the father of Alexander was more sagacious and more intriguing, and the son of Demetrius was more suspicious, more cruel, and more implacable; and, according to the pretended prophecy of one of the Sybils, Macedonia was indebted to one Philip for her

Philip, after the fatigues of the war, by way of relaxation gave himself up entirely to pleasure and dissipation. Tired of his wife Bertha, and fond of Bertrade, spouse of Foulques count of Anjou, he carried her off from her husband. Having, in 1093, legally annulled his own marriage under the pretext of barrenness, and Bertrade's marriage with the count of Anjou having been set aside under the same pretext, Philip and she were afterwards solemnly married by the bishop of Beauvais. This union was declared void by Pope Urban II. a Frenchman by birth, who pronounced the sentence in the king’s own dominions, to which he had come for an asylum. Philip, fearing that the anathema of the Roman pontiff might be the means of exciting his subjects to rebellion, sent deputies to the pope, who obtained a delay, during which time he was permitted to use the crown. To know what is meant by his permission, it is necessary to recollect, that at that period kings appeared on public solemnities in royal habit, with the crown on their heads, which they received from the hand of a bishop. This delay was not of long duration. Philip was excommunicated anew in a council held at Poitiers in 1100; but in the year 1104, Lambert bishop of Arras, legate of Pope Pascal II. at last brought him his absolution to Paris, after having made him promise never to see Bertrade more; a promise which he did not keep. It would appear that the pope afterwards approved their marriage; for Suger informs us, that their sons were declared capable of succeeding to the crown. Philip died at Meulan the 29th of July, 1108, aged 57 years, after having witnessed the first crusade, in which he declined taking any part. His reign, which comprehends a period of 48 years, was the longest of any of his predecessors, excepting that of Clovis, and of all who came after him, except those of Louis XIV. and Louis XV. It was distinguished by several great events; but Philip though brave in battle, and wise in counsels, was no very excellent character. He appeared so much the more contemptible to his subjects, as that age abounded with heroes. Philip is not the first of the French monarchs (as is commonly reported), who, in order to give the greater authority to his charters, caused them to be subscribed by the officers of the crown; for Henry I. has sometimes done the same before him.

Philip II. surnamed Augustus, the conqueror and giver of God, son of Louis VII. (called the younger), king of France, and of Alix, his third wife, daughter of Thibault, count of Champagne, was born the 22d of August 1165. He came to the crown, after his father’s death in 1180, at the age of 15 years. His youth was not spent like that of the generality of other princes; for, by avoiding the rock of pleasure on which so many are apt to split, his courage thereby became the more lively and intrepid. The king of England seemed willing to take advantage of his minority, and to seize upon a part of his dominions. But Philip marched against him, and compelled him, sword in hand, to confirm the ancient treaties between the two kingdoms. As soon as the war was ended, he made his people enjoy the blessings of peace. He gave a check to the oppressions of the great lords, banished the comedian, punished blasphemers, caused the streets and public places of Paris to be paved, and annexed to that capital a part of the adjacent villages. It was enclosed, by walls with towers;
and the inhabitants of other cities were equally proud to fortify and embellish theirs. The Jews having for a long time practised the most shameful frauds in France, Philip expelled them from his kingdom, and declared his subjects quit with them; an action unjust, contrary to the laws of nature, and consequently to religion. The tranquillity of France was somewhat disturbed by a difference with the count of Flanders, which was how-

ever happily terminated in 1184. Some time after he declared war against Henry II. king of England, and took from him the towns of Issoudun, Tours, Mans, and other places. The epidemic madness of the crusades then agitated all Europe; and Philip, as well as other princes, caught the infection. He embarked in the year 1190, with Richard I. king of England, for the relief of the Christians in Palestine, who were oppressed by Saladin. Those two monarchs sat down before Acre, which is the ancient Ptolemais; as did almost all the Christians of the east, while Saladin was engaged in a civil war on the banks of the Euphrates. When the two European monarchs had joined their forces to those of the Asiatic Christians, they counted above 300,000 fighting men. Acre surrendered the 13th of July 1191; but the unhappy disagreement which took place between Philip and Richard, rivals of glory and of interest, did more mischief than could be compensated by the success-

ful exertions of those 300,000 men. Philip, tired of these divisions, and dis pleasured with the behaviour of Richard his vassal, returned to his own country, which, perhaps, he should never have left, or at least have seen again with more glory. Besides, he was attacked (say historians) with a languishing disorder, the effects of which were attributed to poison; but which might have been occasioned merely by the scorching heat of a cli-

tome so different from that of France. He lost his hair, his beard, and his nails; nay, his very flesh came off. The physicians urged him to return home; he determined to follow their advice. The year after, he obliged Baudouin VIII. count of Flanders to leave him the county of Artois. He next turned his arms against Richard king of England, from whom he took Evreux and Vexin; though he had promised upon the holy gospels never to take any advantage of his rival during his absence; so that the consequences of this war were very unfortunate. The French monarch, repulsed from Rouen with loss, made a truce for six months; during which time he married Ingelburge, princess of Den-

mark, whose beauty could only be equalled by her virtue. The divorcing of this lady, whom he quitted in order to marry Agnes daughter of the duke of Merania, embrac-

ed him with the court of Rome. The pope issued a sentence of excommunication against him; but it was taken off upon his promising to take back his former wife. John Sans-terre succeeded to the crown of England in 1199, to the prejudice of his nephew Arthur, to whom of right it belonged. The nephew, supported by Philip, took up arms against the uncle, but was defeated in Poictou, where he was taken prisoner, and afterwards murdered. The murderer, being summoned before the court of the peers of France, not having appeared, was declared guilty of his nephew’s death, and condemned to lose his life in 1203. His lands, situated in France, were forfeited to the crown. Phillip soon set about gathering the fruit of his vassal’s crime. He seized upon Normandy, then carried his

victorious arms into Maine, Anjou, Touraine, Poictou, and brought those provinces, as they ancientsly were, under the immediate authority of his crown. The Eng-

lish monarchs had no other part left them in France, but the pro-

vince of Guienne. To crown his happiness, his new enemy was embroiled with the court of Rome, which had lately excommunicated him. The ecclesiastical thunder was very favourable for Philip. Innocent II. put into his hands, and transferred to him, a perpetual right to the kingdom of England. This king of France, when formerly excommunicated by the pope, had declared his censures void and abusive; he thought very differently, however, when he found himself the executor of a bull investing him with the English crown. To give the greater force to the sentence pronounced by his holiness, he employed a whole year in building 1700 ships, and in preparing the finest army that was ever seen in France. Europe was in expectation of a deci-

sive battle between the two kings, when the pope laughed at both, and artfully took to himself what he had bestowed upon Philip. A legend of the holy see persuaded John Sans-terre to give his crown to the court of Rome, which received it with enthusiasm. Then Philip was expressly forbid by the pope to make any attempt upon England, now become a see of the Roman church, or against John who was under her protection. Meanwhile, the great preparations which Philip had made, alarmed all Europe; Germany, England, and the Low Countries, were united against him in the same manner as we have seen them united against Louis XIV. Ferrand, count of Flanders, joined the emperor Otto IV. He was Philip’s vassal; which was the strongest reason for declaring against him. The French king was nowise discouraged; his fortune and his courage dissi-

pated all his enemies. His valour was particularly conspicuous at the battle of Bouvines, which was fought on the 27th of July 1214, and lasted from noon till night. Before the engagement, he knew well that some of his nobles followed him with reluc-

tance. He assembled them together; and placing himself in the midst of them, he took a large golden cup, which he filled with wine, and into which he put several slices of bread. He ate one of them himself, and offering the cup to the rest, he said, “My companions, let those who would live and die with me follow my example.” The cup was emptied in a moment, and those who were the least attached to him fought with all the bravery that could be expected from his warmest friends. It is also reported, that after showing the army the crown that was worn by seigneurs upon these occasions, be said, “If any one thought himself more worthy than he was to wear it, he had only to explain himself; that he should be content it were the prize of that man who should display the greatest valour in battle.” The enemy had an army of 150,000 fighting men; that of Philip was not half so numerous; but it was composed of the flower of his nobility. The king run great hazard of his life; for he was thrown down under the horses feet, and wounded in the neck. It is said 30,000 Germans were killed; but the number is probably much exagger-

ated. The counts of Flanders and Boulogne were led to Paris with irons upon their feet and hands; a barbarous custom which prevailed at that time. The French king made no conquest on the side of Germany after-
after this ever memorable action; but it gained him an additional power over his vassals. Philip, conqueror of Germany, and possessor of almost all the English dominions in France, was invited to the crown of England by the subjects of King John, who were grown weary of his tyranny. The king of France, upon this occasion, conducted himself like an able politician. He persuaded the English to ask his son Louis for his crown; but as he wished at the same time to manage the pope, and not lose the crown of England, he chose to assist the prince his son, without appearing to act himself. Louis made a descent upon England, was crowned at London, and excommunicated at Rome in 1216; but that excommunication made no change upon John's situation, who died of grief. His death extinguished the resentment of the English, who having declared themselves for his son Henry III. forced Louis to leave England. Philip-Augustus died a little time after, at Mantes, the 14th of July 1223, aged 59, after a reign of 43 years. Of all the kings of the 3d race, he made the greatest accession to the crown-lands, and transmitted the greatest power to his successors. He reunited to his dominions Normandy, Anjou, Maine, Touraine, Poitou, &c. After having subdued John Sans-terre, he humbled the great lords, and by the overthrow of foreign and domestic enemies, took away the counterpoise which balanced his authority in the kingdom. He was more than a conqueror; he was a great king and an excellent politician; fond of splendour on public occasions, but frugal in private life; exact in the administration of justice; skilful in employing alternately flattery and threatenings, rewards and punishments. He was zealous in the defence of religion, and always disposed to defend the church; but he knew well how to procure from her succour for supplying the exigencies of the state. The lords of Coucy, Rhétel, Roche, and several others, seized upon the property of the clergy. A great many of the prelates applied for protection to the king, who promised them his good offices with the deprecators. But, notwithstanding his recommendations, the pillages continued. The bishops redressed their complaints, and invited Philip to wage against their enemies. "With all my heart (said he) but in order to fight them, it is necessary to have troops, and troops cannot be raised without money." The clergy understood his meaning; they furnished subsidies, and the pillages ceased. The enterprizes of Philip-Augustus were almost always successful; because he formed his projects with deliberation, and executed them without delay. He began by rendering the French happy, and in the end rendered them formidable; though he was more inclined to anger than to gentleness, to punish than to pardon, he was regretted by his subjects as a powerful genius and the father of his country. It was in his reign that the marshal of France was first, for the first time, at the head of the army. It was then, also, that families began to have fixed and hereditary surnames: the lords took them from the lands which they possessed; men of letters from the place of their birth; the converted Jews and rich merchants from that of their residence. Two very cruel evils, viz. leprosy and usury, were prevalent at that time; the one infected the body, the other proved the ruin of the fortunes of families. The number of lepers was so great, that the smallest villages were obliged to have an hospital for the cure of that distemper. It is remarkable, that when Philip was on the point of engaging Richard, the English, who were lying in ambush near the Loire, ran away with his equipage, in which he caused to be carried all the deeds or writings respecting the rights of the crown; a custom which is used at this day by the grand sieur. Philip caused copies of his charters to be collected wherever they could be found; but after all his endeavours, some of them were never recovered. The surname of Augustus was given to Philip by his contemporaries. Mezerai is mistaken, when he asserts that Paulus Emiliius was the first who rendered the name of conqueror by that of Augustus; a learned critic has proved the contrary by undoubted authorities. Philip of Valois, first king of France of the collatoral branch of the Valois, was son to Charles count of Valois, brother of Philip the Fair. He mounted the throne in 1328, on the death of his cousin Charles the Fair, after having held for some time the regency of the kingdom. France was much divided in the beginning of his reign, by disputes about the succession to the crown. Edward III. of England laid claim to it as grandson of Philip the Fair, by his mother; but Philip of Valois took possession of it as first prince of the blood. The people gave him, upon his accession to the throne, the title of fortunate; to which might have been added, for some time, that of victorious and just. He marched to the relief of his vassal the count of Flanders, whose subjects, on account of bad usage, had taken up arms against him. He engaged the rebels at Cassel, performed prodigies of valour, and gained a signal victory, the 24th of August 1328. Having made all quiet, he went home, after saying to the count of Flanders, "Be more prudent and more humane, and you will have fewer disloyal subjects." The victorious Philip devoted the time of peace to the internal regulations of his kingdom. The financiers were called to an account, and some of them condemned to death; among others Peter Remi, general of the finances, who left behind him near 20 millions. He afterwards enacted the laws respecting freeholds, imposing a tax upon churches, and commoners who had no quality. Then, also, began to be introduced the form of appel comme d'abus, the principles of which are more ancient than the name. The year 1329 was distinguished by a solemn homage paid to Philip, by Edward king of England, for the duchy of Guienne, upon his knees, and with his head uncovered. The interior peace of the kingdom was disturbed by disputes about the distinction of the church and state. An assembly was summoned for hearing the two parties, in the presence of the king; and in this assembly Peter de Cugnieres, his majesty's advocate, defended the secular jurisdiction with great ability, as a man well-informed, and an enlightened philosopher. Bertrand bishop of Autun, and Roger archbishop of Sens, pled the cause of the church; with less ingenuity and judgment. This did not, however, prevent the king from showing them favours, though the controversy itself laid the foundation of all the disputes which were afterwards agitated about the authority of the two powers; disputes which contributed not a little to confine the ecclesiastical jurisdiction within narrower limits. While Philip was employing himself in some useful regulations, he was unhappily interrupted by
by Edward III. declaring war against France. This prince immediately recovered those parts of Guienne of which Philip was in possession. The Flemish having again revolted from France in spite of oaths and treaties, joined the standard of Edward; and required that he would assume the title of king of France, in consequence of his pretensions to the crown; because, then, agreeably to the letter of their treaty, they only followed the king of France. From this period dates the union of the flower-de-luce and leopards in the arms of England. Edward, in order to justify the change of his arms, caused the following manifest to be published in the verse of the times.

Ren sum regnorum, hina ratione, duorum:
Anglorum in regno sum rex ego jure patrono;
Matriis jure quidem Francorum nuncupor idem:
Hinc est armorum variatio, facta meorum.

In the way of a parody to these lines, Philip made the following reply:

Pseudo regnorum qui diceris esse doorem,
Francorum regno privoberis, atque patrono,
Succedunt mares haec regno, non mulieres:
Hinc est armorum variatio stulta turvarum.

In the mean time Philip put himself in a posture of defence. His arms were at first attended with some success; but those advantages were far from compensating the loss of the battle of Ecluse, in which the French fleet, consisting of 120 large ships, and manned by 40,000 seamen, was best by that of England in the year 1340. This defeat is to be attributed, in part, to the little attention which had been paid to the navy of France, notwithstanding her favourable situation, by being washed by two seas. She was obliged to make use of foreign ships, which obeyed but slowly, and even with some reluctance. This war, which had been alternately discontinued and renewed, began again with more heat than ever in 1345. The two armies having come to an engagement at the 26th of August 1346, near Cressy, a village in the county of Ponthieu, the English there gained a signal victory. Edward had only 40,000 men, while Philip had nearly twice that number; but the army of the former was inflamed to war, and that of the latter was ill-disciplined and overcome with fatigue Marches. France lost from 25,000 to 30,000 men; of which numbers were John King of Bohemia (who, though blind, fought gallantly), and about 1500 gentlemen, the flower of the French nobility. The loss of Calais, and several other places, was the sad fruit of this defeat. Some time before Edward had challenged Philip of Valois to a single combat; which he refused, not on the score of cowardice, but from the idea that it was improper for a sovereign prince to accept a challenge from a king who was his vassal. At length, in 1347, a truce for six months was concluded between France and England, and afterwards protracted at different times. Philip died a short time after, the 23rd of August 1350, aged 57 years, and far from bearing on his monument the title of Fortunate. He had, however, reunited Dauphiny to France. Humbert, the last prince of that country, having lost all his children, and wearied with the wars which he had held out against Savoy, turned a Dominican, and gave his province to Philip, in 1349, on condition that the eldest son of the kings of France should bear the title of Dauphin. Philip likewise added to his domain Rousillon and a part of Cerdagne, by lending some money to the king of Majorca, who gave him those provinces as a security; provinces which Charles VIII., afterwards restored without any reimbursement. It is surprising that in so unfortunate a reign he should have been able to purchase those provinces after having paid a great deal for Dauphiny; but the duty on salt, the rise on the other taxes, and especially the frauds committed in the coinage of money, are supposed to have enabled him to make those acquisitions. The fictitious and ideal value of the coin was not only raised, but a great deal of bad money was issued upon the mint. The officers of the mint were sworn upon the gospel to keep the secret: but how could Philip flatter himself that so gross a fraud would not be discovered?

Philip II., son of Charles V. and of Isabella of Portugal, who was born at Valladolid on the 21st of May 1527, became king of Naples and Sicily by his father’s abdication in 1554. He ascended the throne of Spain on the 17th of January 1556 by the same means. Charles had made a truce with the French, but his son broke it; and having formed an alliance with England, poured into Picardy an army of 40,000 men. The French were cut to pieces at the battle of St Quentin, which was fought on the 20th of August 1557. That town was taken by assault, and the day on which the breach was mounted Philip appeared armed cap-a-pie, in order to animate the soldiers. It was the first and last time that he was observed to wear this military dress. It is well known, indeed, that his terror was so great during the action that he made two vows: one, that he should never again be present in a battle; and the other, to build a magnificent monastery dedicated to St Lawrence, to whom he attributed the success of his arms, which he executed at Escorial, a village about seven leagues from Madrid. After the engagement, his general, the duke of Savoy, wanted to kiss his hand; but Philip prevented him, saying, “It is rather my duty to kiss yours, who have the merit of a glorious victory; and immediately presented him with the colours taken during the action. The taking of Catelet, Ham, and Noyon, were the only advantages which were derived from a battle which might have proved the ruin of France. When Charles V. was informed of this victory, it is said he asked the person who brought him the intelligence, “if his son was at Paris?” and being answered in the negative, he went away without uttering a single word. The duke of Guise having had time to assemble an army, repaired the disgrace of his country by the taking of Calais and Thionville. While he was animating the French, Philip gained a pretty considerable battle against Marshal de Thernes near Gravelines. His army was, on this occasion, commanded by Count Egmont, whom he afterwards caused to be beheaded. The conqueror made no better use of the victory of Gravelines than he had done of that of St Quentin; but he reaped considerable advantage from the glorious peace of Cateau-Cambrésis, the masterpiece of his politics. By that treaty, concluded the 13th of April 1559, he gained possession of the strong places of Thionville, Marienbourg, Mont- médi, Hesdin, and the county of Charrois. This war, so terrible, and attended with so much cruelty, was terminated, like many others, by a marriage. Philip took
for his third wife Elizabeth, daughter of Henry II. who had been promised to Don Carlos.

After these glorious achievements, Philip returned in triumph to Spain, without having drawn a sword. His first care, upon his arrival at Valladolid, was to demand of the grand inquisitor the spectacle of an auto-da-fe. This was immediately granted him; 40 wretches, some of whom were priests or monks, were strangled and burnt, and one of them was burnt alive. Don Carlos de Seza, one of these unfortunate victims, ventured to draw near to the king, and said to him, "How, Sir, can you suffer so many wretches to be committed to the flames? Can you be witness of such barbarity without weeping?" To this Philip coolly replied, "If my own son were suspected of heresy, I would myself give him up to the severity of the inquisition. Such is the horror which I feel when I think of you and your companions, that if an executioner were wanting, I would supply his place myself." On other occasions he conducted himself agreeably to the spirit which had dictated this answer. In a valley of Fiedmont, bordering on the country of the Milanese, there were some heretics; and the governor of Milan had orders to put them all to death by the gibbet. "These men," said the king, "are my friends; I am glad that they shall not be put to death."

The spirit of cruelty, and shameful abuse of his power, had the effect to weaken that power itself. The Flemish, no longer able to bear so hard a yoke, revolted. The revolution began with the fine and large provinces of the continent; but the maritime provinces only obtained their liberty. In 1579 they formed themselves into a republic, under the title of the United Provinces. Philip sent the duke of Alva to reduce them; but the cruelty of that general only served to exasperate the spirit of the rebels. Never did either party fight with more courage, or with more fury. The Spaniards, at the siege of Haarlem, having thrown into the town the head of a Dutch officer who had been killed in a skirmish, the inhabitants threw to them the heads of eleven Spaniards, with this inscription: "Ten heads for the payment of the tenth penny, and the eleventh for interest." Haarlem having surrendered at discretion, the conquerors caused all the magistrates, all the pastors, and above 1,500 citizens, to be hanged.

The duke of Alva being at length recalled, the grand commander of the Requesenes was sent in his place, and after his death Don John of Austria; but neither of those generals could restore tranquillity in the Low Countries. To this son of Charles V. succeeded a grandson no less illustrious, namely, Alexander Farnese duke of Parma, the greatest man of his time; but he could neither prevent the independence of the United Provinces, nor the progress of that republic which arose under his own eye. It was then that Philip, always at his ease in Spain, instead of coming to reduce the rebels in Flanders, proscribed the prince of Orange, and set 25,000 crowns upon his head. William, superior to Philip, disdained to make use of that kind of vengeance, and trusted to his sword for his preservation.

In the mean time the king of Spain succeeded to the crown of Portugal, to which he had a right by his mother Isabella. This kingdom was subjected to him by the duke of Alva, in the space of three weeks, in the year 1580. Antony, prior of Crato, being proclaimed king by the populace of Lisbon, had the resolution to come to an engagement; but he was vanquished, pursued, and obliged to fly for his life.

A cowardly assassin, Balthasar Gerard, by a pistol-shot killed the prince of Orange, and thereby delivered Philip from his most imposable enemy. Philip was charged with this crime, it is believed without reason; though, when the news was communicated to him, he was imprudent enough to exclaim, "If this blow had been given two years ago, the Catholic religion and I would have gained a great deal by it."

This murder had not the effect to restore to Philip the Seven United Provinces. That republic, already powerful by sea, assisted England against him. Philip having resolved to distress Elizabeth, fitted out, in 1588, a fleet called the Invincible. It consisted of 150 large ships, on which were mounted 26,500 pieces of cannon, 8,000 seamen, 20,000 soldiers, and all the flower of the Spanish nobility. This fleet, commanded by the duke of Medina Sidonia, sailed from Lisbon when the season was far too advanced, and, being overtaken by a violent storm, a great part of it was dispersed. Twelve ships, driven upon the coast of England, were captured by the English fleet, which consisted of 100 ships; 50 were wrecked on the coasts of France, Scotland, Ireland, Holland, and Denmark. Such was the success of the Invincible. See ARMADA.

This enterprise, which cost Spain 40 millions of ducats, 20,000 men, and 100 ships, was productive only of disgrace. Philip supported this misfortune with a heroic resolution. When one of his courtiers told him, with an air of consternation, what had happened, he coolly replied, "I sent to fight the English, and not the winds. God's will be done." The day after Philip ordered the bishops to return thanks to God for having preserved some remains of his fleet; and he wrote thus to the pope: "Holy Father, as long as I remain master of the fountain head, I shall not much regard the loss of a rivulet. I will thank the Supreme Disposer of empires, who has given me the power of easily repairing a disaster which my enemies must attribute solely to the elements which have fought for them."

At the same time that Philip attacked England, he was encouraging in France the Holy League; the object of which was to overturn the throne and divide the state. The leaguers conferred upon him the title of Protector of their association; which he eagerly accepted, from a persuasion that their exertions would soon conduct him, or one of his family, to the throne of France. He thought himself so sure of his prey, that when speaking of the principal cities in France, he used to say, "My fine city of Paris, my fine city of Orleans, in the same manner as he would have spoken of Madrid and Seville. What was the result of all those intrigues? Henry IV. embraced the Catholic religion, and by his abjuration of Protestantism made his rival lose France in a quarter of an hour.

Philip, at length, worn out by the debaucheries of his youth, and by the toils of government, drew near his last hour. A slow fever, the most painful gout, and a complication of other disorders, could not disengage him from business, or draw from him the least compla-
the support of his own household. Philip was very jealous of outward respect; he was unwilling that any should speak to him but upon their knees. The duke of Alva having one day entered this prince's cabinet without being introduced, he received the following harsh salutation, accompanied with a stormy countenance: "An impudence like this of yours would deserve the hatchet." If he thought only how to make himself be feared, he succeeded in doing so; for few princes have been more dreaded, more abhorred, or have caused more blood to flow than Philip II. of Spain. He had succeeded, if not all at once, to maintain against Turkey, France, England, Holland, and almost all the Protestants of the empire, without having a single ally, not even the branch of his own house in Germany. Notwithstanding so many millions employed against the enemies of Spain, Philip found in his economy and his resources wherewith to build 30 citadels, 64 fortified places, 9 sea ports, 25 arsenals, and as many palaces, without including the Escorial. His debts amounted to 140 millions of ducats, of which after having paid seven millions of interest, the greatest part was due to the Genoese. Moreover, he had sold or alienated a capital stock of 100 millions of ducats in Italy. He made a law, fixing the majority of the kings of Spain at 14 years of age. He affected to be more than commonly devout; he ate often at the refectory with the monks; he never entered their churches without kissing all the relics; he caused knead his bread with the water of a fountain which was thought to possess a miraculous virtue; he boasted of never having danced, and of never wearing breeches after the Grecian fashion. Grave and solemn in all his actions, he drove from his presence a woman who had smiled, while he was blowing his nose. One great event of his domestic life is the death of his son Don Carlos. The manner of this prince's death is not certainly known. His body, which lies in the monument of the Escorial, is there separated from his head; but it is pretended that the head is separated only because the leaden coffin which contains the body is too small. The particulars of his crime are as little known as the manner in which it was committed. There is no evidence, nor is there any probability, that Philip would have caused him to be condemned by the inquisition. All that we know of the matter is, that in 1568 his father, having discovered that he had some correspondence with the Hollanders his enemies, arrested him himself in his own room. He wrote at the same time to Pope Pius V. in order to give him an account of his son's imprisonment; and in his letter to this pontiff, the 20th of January 1568, he says, "that from his earliest years the strength of a wicked nature has stilled in Don Carlos every paternal instruction." It was Philip II. who caused to be printed at Anvers, between 1569 and 1572, in 8 vols folio, the fine Polyglot Bible, which bears his name; and it was he who subjected the islands afterwards called the Philippines. He married successively, 1st, Mary daughter of John III. King of Portugal; 2dly, Mary daughter of Henry VIII. of England; 3dly, Elizabeth of France, daughter of Henry II.; 4thly, Anne daughter of the emperor Maximilian II. Don Carlos was the son of his first wife, and Philip III. of the last.

PHILLIPPI, in Ancient Geography, a town of Macedon,
PHI

in the territory of the Edones, on the confines of Thrace (Pliny, Ptolemy), situated on the side of a steep eminence; anciently calledDatum and Drenides (Appian), though Strabo seems to distinguish them. This town was famous on several accounts; not only as taking its name from the celebrated Philip of Macedon, father to Alexander the Great, who considered it as a fit place for carrying on the war against the Thracians, but also on account of two battles fought in its neighbourhood between Augustus and the republican party. In the first of these battles, Brutus and Cassius had the command of the republican army; while Octavius, afterwards Augustus, and Mark Antony, had the command of their adversaries. The army of Brutus and Cassius, consisted of 19 legions and 20,000 horse; the imperial forces of an equal number of legions, but more complete, and 13,000 horse; so that the numbers on both sides were pretty equal. The troops of Brutus were very richly dressed, most of them having their armours adorned with gold and silver; for, Brutus, though very frugal in other respects, was thus extravagant with respect to his men, thinking that the riches that they had about them would make them respect themselves the more, and prevent these from falling into the enemy's hands. Both the republican generals appear to have been inferior in skill to Mark Antony; for as to Octavius, he is allowed never to have conquered but by the valour of others. A little before the first engagement, Octavius, who had been indisposed, was carried out of the camp, at the persuasion of Arcturus his physician, who had dreamt that he saw a vision directing him to be removed. Brutus's men, who opposed the wing commanded by Octavius, charged without orders, which caused great confusion. However, they were successful; for part of them, taking a compass about, fell upon the enemy's rear; after which they took and plundered the camp, making a great slaughter of such as were in it, and among the rest putting 2000 Lacedæmonians to the sword who were newly come to the assistance of Octavius. The emperor himself was sought for, but in vain, having been conveyed away for the reason above mentioned; and as the soldiers pierced the litter in which he was usually carried, it was then reported that he had been killed. This threw that whole part of the army into such consternation, that when Brutus attacked them in front, they were most completely routed; three whole legions being cut in pieces, and a prodigious slaughter made among the fugitives. But by the imprudence of the general in pursuing too far, the wing of the republican army commanded by Cassius was left naked and separated from the rest of the army; on which they were attacked at once in front and in flank, and thus they were defeated and their camp taken, while Brutus imagined that he had gained a complete victory. Cassius himself retired to an eminence at a small distance from Philippi; whence he sent one of his greatest intimates to procure intelligence concerning the fate of Brutus. That general was on his way, and already in view, when the messenger set out. He soon met his friends; but they surrounding him to inquire the news, Cassius, who beheld what passed, imagined that he was taken prisoner by the enemy, retired to his tent, and in despair caused one of his freedmen cut off his head. Thus far at least, is certain, that he went into the tent with that freedman, and that his head was found separated from his body when Brutus entered. However, the freedman was never afterwards seen.

The second engagement was pretty similar to the first. Brutus, again opposed Octavius, and met with the same success; but in the mean time Antony, to whom he ought undoubtedly to have opposed himself, having to do only with the remnant of Cassius, gained a complete victory over them. What was worst, the fugitives, instead of leaving the field of battle altogether, fled for protection to Brutus's army; where crowding in among the ranks, they carried despair and confusion wherever they went, so that a total defeat ensued, and the republican army was almost entirely cut in pieces. After the battle, Brutus got an end to his own life, as is related more fully under the article Rome.

The city of Philippi is likewise remarkable on account of an epistle written by St. Paul to the church in that place. It was a Roman colony (Luke, Pliny, Coin, Inscription). It is also remarkable for being the birth-place of Adrestus, the Peripatetic philosopher, and disciple of Aristotle. The town is still in being, and is an archbishop's see; but greatly decayed and badly peopled. However, there is an old amphitheatre, and several other monuments of its ancient grandeur.

F. Long. 44. 55. N. Lat. 41. 0.

PHILIPPICS, or Philippics, in literature, is a name which is given to the orations of Demosthenes against Philip king of Macedon. The Philippics are reckoned the master-pieces of that great orator: Longinus quotes many instances of the sublime from them; and points out a thousand latent beauties. Indeed that pathetic in which Demosthenes excelled, the frequent interrogations and apostrophes wherewith he attacked the insolence of the Athenians, where could they be better employed? Whatever delicacy there be in the oration against Leptines, the Philippics have the advantage over it, were it only on account of the subject, which gives Demosthenes so fair a field to display his chief talent, we mean, with Longinus, that of moving and astonishing.

Dismusus Malicarmeneus ranks the oration on the Halsone among the Philippics, and places it the eighth in order: but though his authority be great, yet that force and majesty wherein Cicero characterizes the Philippics of Demosthenes, seem to exclude the oration on the Halsone out of the number; and authorize the almost universal opinion of the learned, who reject it as spurious. Libanæus, Photius, and others, but above all the lenguishness of the style, and the lowness of the expressions, which reign throughout the whole, father it on Hesegipps.

PHILIPPICS is likewise applied to the fourteen orations of Cicero against Mark Antony. Cicero himself gave them this title in his epistle to Brutus; and posterity have found it so just, that it has been continued to our times. Juvenal, Sat. x, calls the second the divine Philippic, and witnesses it to be of great fame, conspicius divina Philippica forma. That orator's intitling his last and most valued orations after the Philippics of Demosthenes shows the high opinion he had of them. Cicero's Philippics cost him his life; Mark Antony having been so irritated with them, that when he arrived at the triumvirate, he procured Cicero's murde,
PHI [ 275 ]

The Philippines, Philippine Islands, are certain islands of Asia, which lie between 17° and 36° degrees of east longitude, and between 6° and 20° degrees of north latitude; about 300 miles south-east of China. They are said to be about 1,200 in number, of which there are 400 very considerable. They form a principal division of that immense Indian Archipelago, which consists of so many thousand islands, some of which are the largest, and many of them the richest, in the world. The Philippines form the northernmost cluster of these islands, and were discovered in the year 1521 by the famous navigator Ferdinand Magellan, a Portuguese gentleman, who had served his native country both in the wars of Africa and in the East Indies; particularly under Albuquerque, the famous Portuguese general, who reduced Goa and Málaca to the obedience of that crown. Magellan having had a considerable share in those actions, and finding himself neglected by the government of Portugal, and even despised, as it is said, the small advance of a ducat a month on his pay, left the court of Portugal in disgust, and offered his services to Charles V., then emperor of Germany and king of Spain, whom he convinced of the probability of discovering a way to the Spice islands, in the East Indies, by the west; whereupon the command of five small ships being given him, he set sail from Seville, on the 10th of August 1519, and standing over to the coast of South America, proceeded southward to 52°, where he fortunately hit upon a strait, since called the Strait of Magellan, which carried him into the Pacific ocean or South sea; and then steering northward, repassed the equator; after which, he stretched away to the west, across that vast ocean, till he arrived at Guam, one of the Ladrones, on the 10th of March 1521; and soon after sailed to the westward, and discovered the Philippines, which he died on St. Lazarus's day; and, in honour of that saint, he called them the Archipelago of St. Lazarus. He took possession of them in the name of the king of Spain, but happened to be killed in a skirmish he had with the natives of one of them. His people, however, arrived afterwards at the Moluccas, or Clove islands, where they left a colony, and returned to Spain by the way of the Cape of Good Hope; being the first persons that ever sailed round the globe. But there was no attempt made by the Spaniards to subdue or plant the Philippine islands until the year 1564, in the reign of Philip II., son of Charles V., when Don Louis de Velasco, viceroy of Mexico, sent Miguel Lopez Delagases thither with a fleet, and a force sufficient to make a conquest of these islands, which he named the Philippines, in honour of Philip II., then upon the throne of Spain; and they have remained under the dominion of that crown till taken by Sir William Draper. The Philippines are scarce inferior to any other islands of Asia in all the natural productions of that happy climate; and they are by far the best situated for an extensive and advantageous commerce. By their position, they form the centre of intercourse with China, Japan, and the Spice islands; and whilst they are under the dominion of Spain, they connect the Asiatic and American commerce, and become a general magazine for the rich manufactures of the one and for the treasures of the other. Besides, they are well situa-

ed for a supply of European goods, both from the side of Acapulco and by the way of the Cape of Good Hope. In fact, they formerly enjoyed a traffic in some degree proportioned to the peculiar advantages of their situation, but the Spanish dominion is too vast and unconnected to be improved to the best advantage.—The spirit of commerce is not powerful in that people. The trade of the Philippines is thought to have declined; its great branch is now reduced to two ships, which annually pass between these islands and Acapulco in America, and to a single port of Manila in the island of Luconia.

Indeed the Spaniards appear by no means to be actuated by the spirit of industry; for, so far from improving the fine situation of these islands to the utmost, it happens, on the contrary, that the trade is hurtful to the mother-country; for (to confine ourselves to Manila, with which they have most to do), instead of taking Spanish manufactures, they trade with the Chinese for spices, silks, stockings, Indian stuffs, calliases, cottons, and many other articles; and with the Japanese for cabinets, and all sorts of lacquered works, for all which they pay in gold or silver. All these commodities, together with what the islands produce, and great quantities of wrought plate by the Chinese artisans, are collected at Manila, and transported annually in two ships to Acapulco in Mexico. Each of these ships is esteemed worth 600,000l. sterling; and in the war which began in 1739, and which was not distinguished by such a series of wonderful successes as that which ended in 1763, the taking of one of the galleons which carry on the trade between Manila and America, was considered one of the most brilliant advantages which we gained. This trade is not laid open to all the inhabitants of Manila, but is confined by very particular regulations, somewhat analogous to those by which the trade of the registers from Cadiz to the West Indies is restrained. The ships employed are all king's ships, commissioned and paid by him; and the tonnage is divided into a certain number of babies, all of the same size. These are divided among the convents at Manila, but before the suppression of the Jesuits principally among them, as a donation to support their missions, for the propagation of the Roman Catholic faith. Most of the religious are concerned in this trade, and sell to the merchants at a great price what room is in the ship they are not to occupy. This trade is by a royal edict limited to a certain value, but it always exceeds it, each ship being generally worth 3,000,000l. of dollars. The returns made from America are in silver, cochineal, sweetmeats, together with some European millinery ware for the women, and some strong Spanish wine. It is obvious, that the greatest part of the treasure remitted does not remain at Manila, but is dispersed over India for goods. Many strong remonstrances against this Indian trade to Mexico have been made to the court of Spain, wherein they urge, that the silk manufactures of Valencia and other parts of Spain, the linens from Cadiz, and their other manufactures, are hurt in their sale in Mexico and Peru, by the Chinese being able to afford them goods of the same sort cheaper than they are able; that were this trade laid open, the whole treasure of the New World would centre in Spain, or with European merchants; but now it enriches only some religious orders and a few private persons. Wise as these arguments are, the Jesuits and priests, versant in intrigue, M in a
and the most selfish set of men on earth, had interest enough at court to stop the effect.

At Cavite in this bay are a fort, a town, and a fine dock-yard, where these large galleons are built and repaired, and where they load and unload, together with all the other large ships that trade to this bay.

The principal of the Philippine islands are Luconia or Manilla, Tandago or Samar, Masbate, Mindora, Luban, Panaga, Panay, Leyte, Bohol, Sibu, Sogbu, Negros, St John, Xilo, and Mindanao. In most of these, the Spanish power prevails, and all are under the governor of Luconia; but there are some in which that nation has little authority, or even influence, such as Mindanao.

The inhabitants of these islands consist of Chinese, Ethiopians, Malays, Spaniards, Portuguese, Pintados or Painted People, and Mestees, a mixture of all these. Their persons and habits resemble those of the several nations whence they derive their original; only, it is observable, that the features of the blacks of these islands are as agreeable as those of the white people. There is not a soil in the world that produces greater plenty of all things for life; as appears by the multitude of inhabitants to be found in the woods and mountains, who subsist almost entirely by the fruits of the earth, and the venison they take. Nor can any country appear more beautiful; for there is a perpetual verdure, and buds, blossoms, and fruit, are found upon the trees all the year round, as well on the mountains as in the cultivated gardens. Vast quantities of gold are washed down from the hills by the rains, and found mixed with the sand of their rivers. There are also mines of other metals, and excellent leadstones, found here; and such numbers of wild buffaloes, that a good huntsman on horseback, armed with a spear, may kill 10 or 20 in a day. The Spaniards take them for their hides, which they sell to the Chinese; and their carcasses serve the mountain-eaters for food. Their woods also abound with deer, wild hogs, and goats. Of the last, there is such plenty in one of these islands, that the Spaniards gave it the name of Cabras. Horses and cows have been likewise imported into these islands, from New Spain, China, and Japan, which have multiplied considerably; but the sheep that were brought over came to nothing. The trees produce a great variety of gums; one kind, which is the commonest, by the Spaniards called breu, is used instead of pitch; of the others some are medicinal, others odoriferous.

In these islands are monkeys and baboons of such a size, as to defend themselves if attacked by men. When they can find no fruit in the mountains, they go down to the sea to catch crabs and oysters; and that the oysters may not close and catch their paws, they first put in a stone to prevent their shutting close: they take crabs by putting their tail in the holes where they lie, and when the crab lays hold of it, they draw him out. There are also great numbers of civet-cats in some of the islands. The bird called tavon, is a black sea-fowl, something less than a hen, and has a long neck; it lays its eggs on the sand by the sea side, 40 or 50 in a trench, and then covers them, and they are hatched by the heat of the sun. They have likewise the bird salgara, which builds her nest on the sides of rocks. This is a species of swallow the nests of which are so much esteemed in the east, being a kind of jelly that dissolves in warm water.

The Spaniards have introduced several of the American fruits, which thrive here as well as in America; the cocoa or chocolate-nut particularly, which increases so that they have no occasion now to import it from Mexico. Here is also the Fountain-Tree, from which the natives draw water; and there is likewise a kind of cane, by the Spaniards called caucaro, which, if cut, yields fair water enough for a draught, of which there is plenty in the mountains, where water is most wanted.

These islands being hot and moist, produce abundance of venomous creatures, as the soil does poisonous herbs and flowers, which do not kill those who touch or taste them, but so infect the air, that many people die in the time of their blossoming.

The orange, lemon, and several other trees, bear twice a year. A sprig, when planted, becomes a tree and bears fruit in a year's time; so that without any hyperbole it may be affirmed, that a more luxuriant verdant soil can scarcely be conceived. The woods are filled with old, large, and lofty trees, and such as yield more sustenance to man than is to be found in almost any other part of the world. These islands, however, besides their other inconveniences, of which they have many, are very subject to earthquakes, which often prove very fatal. See Manilla.

Philippines, a religious society of young women at Rome, so called from their taking St Philip de Neri for their protector. The society consists of 100 poor girls, who are brought up till they are of age to be married, or become nuns, under the direction of some religious women, who teach them to read, write, and work, and instruct them in the duties of Christianity. They wear a white veil, and a black cross on their breasts. See Macedonia.

Philippistes, a sect or party among the Lutherans; the followers of Philip Melancthon. He had strenuously opposed the Ubiquists, who arose in his time; and the dispute growing still hotter after his death; the university of Wittenberg, who espoused Melancthon's opinion, were called by the Fiscians, who attacked it, Philippistes.

Philips, Fabian, was author of several books relating to ancient customs and privileges in England. He was born at Prestbury in Gloucestershire, September 28, 1601. When very young, he spent some time in one of the Inns of Chancery; and went from thence to the Middle-Temple, where he became learned in the law. In the civil wars, he was a bold assessor of the king's prerogative; and was so strongly attached to Charles I. that, two days before that monarch was beheaded, he wrote a protestation against the intended murder, and caused it to be printed, and affixed to posts in all public places. He likewise published, in 1649, a pamphlet entitled "Periplus Ercouea; or King Charles I. no Man of Blood, but a Martyr for his People," which was reprinted in 1660, 8vo. In 1663, when the courts of justice at Westminster, especially the chancery, were voted down by Oliver's parliament, he published, "Considerations against the dissolving and taking them away," for which he received the thanks of parliament. He was for some time filizier for Lon-
don, Middlesex, Cambridge-shire, and Huntingdonshire; and spent much money in reseaching records, and writing in favour of the royal prerogative. The only advantage he received for this attachment to the royal cause was, the place of one of the commissioners for regulating the law, worth 200l. per annum, which only lasted two years. After the restoration of Charles II. when the bill for taking away the tenures was depending in parliament, he wrote and published a book to show the necessity of preserving them, entitled, "Tenenda non tollenda; or, the Necessity of Preserving Tenures in capite, and by Knight's service, which, according to their first institution, were, and are yet, a great part of the salus populi, Sec. 1660," 4to. In 1663 he published, "The Antiquity, Legality, Reason, Duty, and Necessity of Pre-emption and Pannage for the King," 4to; and afterwards many other pieces upon subjects of a similar kind. He assisted Dr Bates in his "Elenchus Motuum;" especially in searching the records and office papers that work. He died, November 17th, 1662, in his 89th year. He was a man well acquainted with records and antiquities; but his manner of writing is neither close nor well digested. He published a political pamphlet in 1681, entitled, "Ursa Major et Minor; showing that there is no such Fear, as is fictitiously pretended, of Popery and Arbitrary Power."

PHILIPS, Ambrose, an English poet, was descended from a very ancient and considerable family of that name in Leicestershire. He received his education at St John's College, Cambridge; during his stay at which university, he wrote his pastoral, which acquired him at that time so high a reputation. His next performance was, "The Life of Archbishop Williams," written, according to Mr Cibber, to make known his political principles, which in the course of it he had a free opportunity of doing, as the archbishop, who is the hero of his work, was a strong opponent to the high-church measures.

When he quitted the university, and came to London, he became a constant attendant at, and one of the wits of, Button's coffee-house, where he obtained the friendship and intimacy of many of the celebrated geniuses of that age, more particularly of Sir Richard Steele, who, in the first volume of his Tatler, has inserted a little poem of Mr Philips's, which he calls a Winter Piece, dated from Copenhagen, and addressed to the Earl of Dorset, on which he bestows the highest encomiums; and, indeed, so much justice is there in these his commendations, that even Mr Pope himself, who had a fixed aversion to the author, while he affected to despise his other works, used always to except this from the number.

The first dislike Mr Pope conceived against Mr Philips proceeded from that jealousy of fame which was so conspicuous in the character of that great poet; for Sir Richard Steele had taken so strong a liking to the pastorals of the latter, as to have formed a design for a critical comparison of them with those of Pope, in the conclusion of which the preference was to have been given to Philips. This design, however, coming to Mr Pope's knowledge, that gentleman, who could not bear a rival near the throne, determined to ward off this stroke by a stratagem of the most artful kind; which was no other than taking the same task on himself; and, in a Guardian, by drawing the like comparison, and giving a like preference, but on principles of criticism apparently fallacious, to point out the absurdity of such a judgment. However, notwithstanding the ridicule that was drawn on him in consequence of his standing as it were in competition with so powerful an antagonist, it is allowed, that there are, in some parts of Philips's pastorals, certain strokes of nature, and a degree of simplicity, that are much better suited to the purposes of pastoral, than the more correctly turned periods of Mr Pope's versification. Mr Philips and Mr Pope being of different political principles, was another cause of enmity between them; which arose at length to so great a height, that the former, finding his antagonist too hard for him at the weapon of wit, had even determined on making use of a rougher kind of argument; for which purpose he even went so far as to hang up a rod at Button's for the chastisement of his adversary whenever he should come thither; which, however, Mr Pope declining to do, avoided the argumentum batae legionis, in which he would have no doubt, have kindled himself on the weakest side of the question. Our author also wrote several dramatical pieces; The Briton, Distressed Mother, and Humphrey Duke of Gloucester; all of which met with success, and one of them is at this time a standard of entertainment at the theatres, being generally repeated several times in every season. Mr Philips's circumstances were in general, through his life, not only easy, but rather affluent, in consequence of his being connected, by his political principles, with persons of great rank and consequence. He was concerned with Dr Hugh Boulter, afterwards archbishop of Armagh, the right honourable Richard West, Esq., lord chancellor of Ireland, the reverend Mr Gilbert Burrell, and the reverend Mr Henry Stevens, in writing a series of papers called the Free Thinker, which were all published together by Mr Philips, in three volumes in 12mo.

In the latter part of Queen Anne's reign, he was secretary to the Hanover Club, who were a set of noblemen and gentlemen who had formed an association in honour of that succession, and for the support of its interests, and who used particularly to distinguish in their toasts such of the fair sex as were most zealously attached to the illustrious House of Brunswick. Mr Philips's station in this club, together with the zeal shown in his writings, recommended him to the notice and favour of the new government. He was, soon after the accession of King George I., put into the commission of the peace, and appointed one of the commissioners of the lottery. And, on his friend Dr Boulter's being made prime of Ireland, he accompanied that prelate across St George's Channel, where he got considerable preferments bestowed on him, and was elected a member of the House of Commons there, as representative for the county of Armagh. At length, having purchased an annuity for life of 400l. per annum, he came over to England some time in the year 1748; but having a very bad state of health, and being moreover of an advanced age, he died soon after, at his lodgings near Vauxhall, in Surrey.

"Of his personal character (says Dr Johnson) all I have heard is, that he was eminent for bravery, and skill in the sword, and that in conversation he was solemn and pompous." He is somewhere called Quaker Philips, but, however, appears to have been of integrity;
PHI

grity; for the late Paul Whitehead relates, that when Mr Addison was secretary of state, Philips applied to him for some preferment, but was coolly answered, "that it was thought that he was already provided for, by being made a justice for Westminster. To this observation our author, with some indignation, replied, "Though poetry was a trade he could not live by, yet he scorned to owe subsistence to another which he ought not to live by."

The following anecdote is told of our author by Dr Johnson: "At a coffee-house, he (Philips) was discoursing upon pictures, and prying the painters, who, in their historical pieces, always draw the same sort of sky. "They should travel (said he), and then they would see that there is a different sky in every country, in England, France, Italy, and so forth." "Your remark is just (said a grave gentleman who sat by), I have been a traveller, and can testify what you observe is true; but the greatest variety of skies that I found was in Poland." "In Poland, Sir? (says Philips)." "Yes, in Poland; for there is Sobiesky, and Sabrancky, and Jabionsky, and Podebradsky, and many more skies."

Phillips, Catharine, a very ingenious lady, the daughter of Mr John Fowler merchant, was born at London in January 1631, and educated at a school at Hackney. She married James Philips of the priory of Cardigan, Esq., and went with the viscountess of Dungannon into Ireland, where she translated Corneille's tragedy of Pompey into English, which was several times acted there with great applause.

She translated also the four first acts of Horace, another tragedy of Corneille, the fifth being done by Sir John Denham. This excellent and amiable lady, for such it seemed she was, died of the small pox in London the 22d of June 1664, much and justly regretted; "having not left (says Langbaine) any of her sex her equal in poetry. She not only equalled (adds he) all that is reported of the poetesses of antiquity, the Lesbian Sappho and the Roman Sulpitia, but justly found her admirers among the greatest poets of our age. Cowley wrote an ode upon her death. Dr Jeremy Taylor had addressed to her his "Measures and Offices of Friendship:" the second edition of which was printed in 1657, 12mo. She assumed the name of Oriinda. In 1667, were printed, in folio, "Poems by the most deservedly admired Mrs Catharine Philips, the matchless Oriinda. To which is added, Monsieur Corneille's Pompey and Horace, translated. With several other translations from the French:" and her picture before them, engraved by Faithorne. There was likewise another edition in 1698, folio; in the Preface of which we are told, that "she wrote her familiar letters with great facility, in a very fair hand, and perfect orthography; and if her letters were collected with those excellent discourses she wrote on several subjects, they would make a volume much larger than that of her poems." In 1705, a small volume of her letters to Sir Charles Cotrell was printed, under the title of "Letters from Oriinda to Poliarthus." The editor of these letters tells us, that "they were the effect of so happy intimacy between herself and the late famous Poliarthus, and are an admirable pattern for the pleasing correspondence of a virtuous friendship. They will sufficiently instruct us, how an intercourse of writing between persons of different sexes ought to be managed with delight and innocence; and teach the world not to load such a commerce with censure and detraction, when it is removed at such a distance from even the appearance of guilt."

Philips, John, an eminent English poet, was born in 1676. He was educated at Winchester and Oxford, where he became acquainted with Milton, whom he studied with great application, and traced in all his successful translations from the ancients. The first poem which distinguished our author, was his Splendid Shilling, which is in the Tatler styled the "finest burlesque poem in the English language." His next was entitled Bennheim, which he wrote at the request of the Earl of Oxford, and Mr Henry St John, afterwards Lord Bolingbroke, on the victory obtained there and in the year 1703-4. It was published in 1705; and the year after he finished another poem upon cyder, the first book of which had been written at Oxford. It is on the model of Virgil's Georgics, and is a very excellent piece. We have no more of Mr Philips but a Latin ode to Henry St John, Esq. which is esteemed a masterpiece. He was contriving greater things; but illness coming on, he was obliged to drop everything but the care of his health. This care, however, did not save him: for, after lingering a long time, he died at Hereford, Feb. 15. 1708, of a consumption and asthma, before he had reached his 33rd year. He was interred in the cathedral of that city, with an inscription over his grave, and had a monument erected to his memory in Westminster-abbey by Sir Simon Harecourt, afterwards Lord-chancellor, with an epitaph upon it written by Dr Atterbury, though commonly ascribed to Dr Freind. He was one of those few poets whose muse and manners were equally excellent and amiable; and both were so in a very eminent degree.

Dr Johnson observes, that "Philips has been always praised, without contradiction, as a man modest, blameless, and pious; who bore a narrow fortune without discontent, and tedious and painful maladies without impatience; beloved by those that knew him, but not ambitious to be known. He was probably not formed for a wide circle. His conversation is commended for its innocent gaiety, which seems to have flowed only among his intimates; for I have been told, that he was in company silent and barefoot, and employed only upon the pleasures of his pipe. His addiction to tobacco is mentioned by one of his biographers, who remarks, that in all his writings except Bennheim he has found an opportunity of celebrating the fragrant flame. In common life, he was probably one of those who please by not offending, and whose person was loved, because his writings were admired. He died honoured and lamented before any part of his reputation had withered, and before his patron St John had disgraced him. His works are few. The Splendid Shilling has the uncommon merit of an original design, unless it may be thought precluded by the ancient Centaurs. To degrade the sounding works and stately construction of Milton, by an appli- cation to the lowest and most trivial things, gratifies the mind with a momentary triumph over that grandeur which hitherto held its captives in admiration; the words and things are presented with a new appearance, and novelty is always grateful where it gives no pain. But the merit of such performances begins and ends with
with the first author. He that should again adapt Milton's phrase to the gross incidents of common life, and even adapt it with more art, which would not be difficult, must yet expect but a small part of the praise which Philips has obtained: he can only hope to be considered as the repeater of a jest.

There is a Latin ode written to his patron St John, in return for a present of wine and tobacco, which cannot be passed without notice. It is gay and elegant, and exhibits several artful accommodations of classic expressions to new purposes. It seems better turned than the odes of Hannae. To the poem on cyder, written in imitation of the Georgics, may be given this peculiar praise, that it is grounded in truth; that the precepts which it contains are exact and just; and that it is therefore at once a book of entertainment and of science. This I was told by Miller, the great gardener and botanist, whose expression was, that 'there were many books written on the same subject in prose, which do not contain so much truth as that poem.' In the disposition of his matter, so as to intersperse precept, relating to the culture of trees, with sentiments more generally pleasing, and in easy and graceful transitions from one subject to another, he has very diligently imitated his master; but he unhappily pleased himself with blank verse, and supposed that the numbers of Milton, which impress the mind with reverence, combined as they are with subjects of inconceivable grandeur, could be sustained by images which at most can rise only to elegance. Contending angels may shake the regions of heaven in blank verse; but the flow of equal measures and the embellishment of rhyme, must recommend to our attention the art of engraving, and decide the merit of the redstreak and pearmain. What study could confer, Philips had obtained; but natural deficiency cannot be supplied. He seems not born to greatness and elevation. He is never lofty, nor does he often surprise with unexpected excellence: but perhaps to his last poem may be applied what Tully said of the work of Lucretius, that 'it is written with much art, though with few blazes of genius.'

It deserves to be remarked, that there were two poets of both the names of our author, and who flourished in his time. One of them was Milton's nephew, and wrote several things, particularly some memoirs of his uncle, and part of Virgil Travestied. The other was the author of two political farces, which were both printed in 1716; 1. The Earl of Marr married, with the Humours of Jocky the Highlandman. 2. The Pretender's Flight; or a Mock Coronation, with the Humours of the facetious Harry St John.

PHILIPSBURG, is an imperial town of Germany, in the circle of the Upper Rhine. It is very strong, and looked upon as one of the bulwarks of the empire. It is seated in a morass, and fortified with seven bastions and several advanced works. The town belongs to the bishop of Spire, but all the works and the fortifications to the empire. It has been several times taken and retaken, particularly by the French in 1734, when the duke of Berwick was killed at the siege; but it was rendered back the year following, in consequence of the treaty of Vienna. It is seated on the river Rhine, over which there is a bridge, seven miles south of Spire, 22 south-east of Worms, and 40 north-east of Strasburg. E. Long. 8. 33'. N. Lat. 49. 12.'
Philistines. — They are constantly mentioned in Scripture as strangers; Philistine and, though possessed of a very considerable part of the Land of Promise, yet God would never suffer them to be driven out, being Egyptians by descent, and not original natives, whose land only was promised to Abraham and his seed. Their arrogance and ambition were great; and so irreconcilable was their enmity (A) to the Israelites, that one would be almost tempted to think they were created on purpose to be a thorn in their sides; for though the hand of God was evidently against them several times, and particularly when they detained the ark, yet they hardened their hearts, and closed their eyes against conviction. They seem to have entertained a very fond veneration for their deities, in which they persisted, though they were eye witnesses of the shame and ignominy which befel them in the presence of the captive ark; nay, they were so biased in their favour, as to imagine that their gods might prevail against Him who had in so glaring a manner put them to shame and disgrace. They were much engaged in trade; which, considering their situation, they may have exercised from the beginning; but, by the accession of the fugitive Edomites in David's time, they rose to so great a reputation as merchants, that the Greeks, it seems, preferred them to all other nations in that respect, and from them called all the country bordering on theirs Palestine. Their language was not so different from that spoken by the Hebrews as to cause any difficulty for them to converse together, as will be perceived by their intercourse with Abraham and Isaac; so that, in all this region, the several nations spoke one and the same tongue, perhaps with some variation of dialect. They had doubtless the arts and sciences in common with the most learned and ingenious among their contemporaries, and perhaps some of them in greater perfection. They had giants among them; but whether they were originally of the breed of the Anakims, who retired hither when they were expelled from Hebron, or were sprung from accidental births, is not easily determined. We must not forget, that the invention of the bow and arrow is ascribed to this people.

"Their religion was different at different times; under their first race of kings, they used the same rites with the Hebrews. Abimelech, in the sin he had like to have committed with Sarah, through Abraham's timidity, was favoured with a divine admonition from God; and, by his speech and behaviour at that time, it seems as if he had been used to converse with the Deity. In after-times, they fell into endless superstitions, and different kinds of idolatry; each of the principal or five cities seemed to have an idol of its own. Marna, Marnas, or Marnash, was worshipped at Gaza; and is said to have migrated into Crete, and to have become the Cretan Jupiter. Dagon was worshipped at Azotus; he seems to have been the greatest, the most ancient, and most

(A) "From a passage in Chronicles, it is guessed to have been of very ancient date; where it is said, that 'the men of Gath slew the children of Ephraim, who would have taken their cattle from them.' This incident is nowhere else to be found; and there are various notions concerning the sense in which we must take this passage. As to the time of the transaction, most people allow it to have been while the children of Israel were sojourners in Egypt. It plainly appears, by the next verse, that Ephraim himself was living at that period. The Targum supposes his children miscomputed the time they were to serve in Egypt, and began too early an attempt upon their Promised Land."
most favourite god they had; to which may be added, that he perhaps subsisted the longest of any that did not straggle out of the country. To him they ascribed the invention of bread-corn, or of agriculture, as his name imports. We cannot enter into the common notion of his being represented as a monster, half man, half fish; nor consequently into another, almost as common, that he is the same with the Syrian goddess Derceco, who, we are told, was represented under some such mixed form. Our opinion is, that this idol was in shape wholly like a man; for we read of his head, his hands, and his feet. He stood in a temple at Azotus, and had priests of his own who paid him a very constant attendance. Next to Dagon was Baalzebub the god of Ekron. In the text of the New Testament he is called Beelzebub, and the prince of devils. His name is rendered lord of flies; which by some is held to be a mock appellation bestowed on him by the Jews; but others think him so styled by his worshippers, as Hercules Apomys and others were, from his driving those insects away; and urge, that Ahaziah, in his sickness, would scarcely have applied to him, if his name had carried in it any reproach. But it must be remembered, it is the sacred historian that makes use of that contemptuous term in derision; whereas the idolatrous monarch, who was one of his votaries, might call by his common name, supposed to have been Baal-zeboath, the lord of armies, or Baal-shamin, lord of heavens, or some other bordering on Baal-zebub. How, or under what form he was represented is uncertain: some place him on a throne, and stire him like a king; others paint him as a fly. Not to dwell on this obscurity, it appears that he became an oracle of the highest repute for omniscience and veracity; that he had priests of his own; and that he, in the middle times at least, was much sought after by those who were anxious about futurity. Derceco we take certainly to have been the goddess of Ascalon; but we are supported by profuse authority, without the least countenance from Scripture. Ceth is seemingly the only city of all the five unprovided with a deity; wherefore, as the Scripture declares, that Ashtaroth, or Astarte, was worshipped by this people, we are ready to place her at Ceth, and the rather, as this of all their cities may have had most communication with Sidon. To speak in general concerning their religious rites and ceremonies, which is all we can do, they seem to have erected very large and spacious temples, or very wide halls, for the celebration of their solemn seasons and festivals (for such they surely had); their religious offices were attended with much pomly, and a great concourse from all parts; and they presented their gods with the chief part of their spoil, and carried them about with them when they went to war. We do not find in Scripture that they sacrificed their children; and yet the Curetes (n) are said to be their descendents."

With respect to the history of this extraordinary people, we find from the above extract, that they were not comprehended in the number of nations devoted to extermination, and whose territory the Lord had abandoned to the Hebrews; nor were they of the cursed seed of Canaan. However, Joshua did not forbear to give their lands to the Hebrews, and to set upon them by command from the Lord, because they possessed a country which was promised to the people of God (Josh. xv. 45—47. and xvii. 2, 3). But these conquests of Joshua must have been ill maintained, since under the Judges, under Saul, and at the beginning of the reign of David, the Philistines oppressed the Israelites. True it is, Shamgar, Samson, Samuel, and Saul, made head against them, but did not reduce their power; and they continued independent down to the reign of David, who subjected them to his government. They continued in subjection to the kings of Judah down to the reign of Jehoram, son of Jehoshaphat; that is, for about 246 years. However, Jehoram made war against them, and probably reduced them to his obedience again; because it is observed in Scripture, that they revolted again from Uzziah; and that this prince kept them to their duty during the time of his reign (2 Chron. xxvi. 16 and xxvii. 6, 7.) During the unhappy reign of Ahaz, the Philistines made great havoc in the territories of Judah; but his son and successor Hezekiah subdued them (2 Chron. xxviii. 18 and 2 Kings xvii. 8). Lastly, they regained their full liberty under the latter kings of Judah; and we may see by the menaces denounced against them by the prophets Isaiah, Amos, Zephaniah, Jeremiah, and Ezekiel, that they brought a thousand hardships and calamities upon the children of Israel: for which cruelties God threatened to punish them. Esarhaddon besieged Ashod or Azoth, and took it (Isa. xx. 1). And according to Herodotus, Psmummicus king of Egypt took the same city, after a siege of 29 years. There is great probability, that Nebuchadnezzar, when he subdued the Ammonites, Moabites, Egyptians, and other nations bordering upon the Jews, reduced also the Philistines. After this, they fell under the dominion of the Persians; then under that of Alexander the Great, who destroyed the city of Gaza, the only city of Phoenicia that dared oppose him. After the persecution of Antiochus Epiphanes, the Ammonites subjected under their obedience several cities of the Philistines; and Trypho gave to Jonathan Maccabæus the government of the whole coast of the Mediterranean, from Tyre as far as Egypt, which included all the country of the Philistines.

PHILLTREA, Mock-PriVet; a genus of plants belonging to the diandra class. See Botany Index.

PHILo, an ancient Greek writer, was of a noble family among the Jews, and flourished at Alexandria during the reign of Caligula. He was the chief of an embassy sent to Rome about the year 42, to plead the cause of the Jews against Aiton, who was sent by the Alexandrians to charge them with neglecting the honours due to Caesar. Caligula, however, would not allow him to speak, and behaved to him in such a manner that Philo was

(n) "The Curetes sacrificed their children to Saturn; and from the similitude this name bears to Cerebrites or Philistines, it has been advanced that they are the same people; but as we have no warrant for saying the Philistines practised so barbarous and unnatural a custom, we may venture to pronounce, that they learned it not from them, but borrowed it elsewhere."
was in considerable danger of losing his life. Others again tell us that he was heard; but that his demands were refused. He afterwards went to Rome in the reign of Claudius; and there, Eusebius and Jerome inform us, he became acquainted with St Peter, with whom he was on terms of friendship. Photius adds, that he became a Christian, and afterwards, from some motive of resentment, renounced it. Great part of this, however, is uncertain, for few believe that St Peter was at Rome so early as the reign of Claudius, if he ever was there at all.

Philo was educated at Alexandria, and made very great progress in eloquence and philosophy. After the fashion of the time, he cultivated, like many of his nation and faith, the philosophy of Plato, whose principles he so thoroughly imbibed, and whose manner he so well imitated, that it became a common saying, “At Plato philonizatum, aut Philo platonizatum.” Josephus says, he was a man “eminently on all accounts;” and Eusebius describes him, “copious in speech, rich in sentiments, and sublime in the knowledge of holy writ.” He was, however, so much immersed in philosophy, particularly the Platonic, that he neglected the Hebrew language, and the rites and customs of his own people. Scaliger says, that Philo “knew no more of Hebrew and Syriac than a Gaul or a Scythian.” Grotius is of opinion, that “he is not fully to be depended on, in what relates to the manners of the Hebrews,” and, what is unworthy of him, “he was yet very ignorant of Jewish customs.” Fabricius thinks differently; for though he allows some inadvertencies and errors of Philo with regard to these matters, yet he does not see a sufficient foundation on which to charge so illustrious a doctor of the law with ignorance. He allows, however, that Philo’s passion for philosophy had made him more than half a Pagan; for it led him to interpret the whole law and the prophets upon Platonic ideas; and to admit nothing as truly interpreted which was not agreeable to the principles of the academy. Besides, this led him farther; he turned everything into allegory, and deduced the darkest meanings from the plainest words. This most pernicious practice Origen, it is known, imitated, and exposed himself by it to the scoffs of Celsius and of Origen. Philo’s writings abound with high and mystical, new and sublime, far-fetched and abstracted, notions; and indeed the doctrines of Plato and Moses are so promiscuously blended, that it is not an easy matter to assign to each his principles. There are certainly, however, in his works many excellent things. Though he is continually Platonising and allegorising the Scriptures, he abounds with fine sentiments and lessons of morality; and his morals are rather the morals of a Christian than of a Jew. History, together with his own writings, give us every reason to believe that he was a man of great prudence, constancy, and virtue.

His works were first published in Greek by Turnebus at Paris 1552. A Latin translation made by Gelenius was afterwards added, and printed several times with it. The Paris edition of 1540 in folio was the best for a

whole century; which made Cotelierius say, that “Philo was an author that deserved to have a better text and a better version.” In 1742, a handsome edition of his work was published at London by Dr Mangey in two volumes folio; which is certainly preferable if it were only for the paper and print, but it is not so good a one as Philo deserves.

Many of our readers may be desirous of further details respecting this celebrated man; we refer such therefore to Josephus’s Antiquities, Eusebius’s Ecclesiastical History, St Jerome’s work, De Scripturebus Ecclesiasticis, Fabricius Biblioth. Graec. Curs. Hist. Liter. and vol. ii. of Monuments of the Greek Church.

PHILOCLES, an admiral of the Athenian fleet during the Peloponnesian war. He recommended to his countrymen to cut off the right hand of such of the enemies as were taken, that they might be rendered unfit for service. His plan was adopted by all the ten admirals except one; but their expectations were frustrated, and instead of being conquerors they were totally defeated at Ægospotamus by Lysander, and Philocles was put to death with the rest of his colleagues.

PHILOCTETES, in fabulous history, the son of Peuan, was the faithful companion of Hercules; who at his death obliged him to swear not to discover the place where his ashes were interred, and presented him with his arrows dipped in the Hydra’s blood. The Greeks at the siege of Troy being informed by an oracle that they could never take that city without those fatal arrows, went to Philoctetes, and insisted upon his discovering where he had left his friend; when Philoctetes, to evade the guilt of perjury, let them know where Hercules was interred, by stamping upon the place: but he was punished for the violation of his oath, by dropping an arrow upon that foot; which, after giving him great agony, was at length cured by Machaboeus. He was afterwards taken by Ulysses to the siege of Troy, where he killed Paris with one of his arrows.

PHILOLAUS, of Crotona, was a celebrated philosopher of antiquity, of the school of Pythagoras, to whom that philosopher’s Golden Verses have been ascribed. He made the heavens his principal object of contemplation; and has been idle (as supposed to have been the author of that true system of the world which Copernicus afterwards revived. This made Bullialdus place the name of Philolaus at the head of two works, written to illustrate and confirm that system.

"He was (says Dr Enfield) a disciple of Archytas, and flourished in the time of Plato. It was from him that Plato purchased the written records of the Pythagorean system, contrary to an express oath taken by the society of Pythagoreans, pledging themselves to keep secret the mysteries of their sect. It is probable, that among these books were the writings of Timaeus, upon which Plato formed the dialogue that bore his name. Plutarch relates, that Philolaus was one of the persons who escaped from the house which was burned by Cylon, during the life of Pythagoras; but this account cannot be correct. Philolaus was contemporary with Plato, and therefore certainly not with Pythagoras. Interfering

(A) We say idly, because there is undoubted evidence that Pythagoras learned that system in Egypt. See PHILOSOPHY.
PHILOLOGY

Definition. PHILOLOGY is composed of the two Greek words φιλος and λογος, and imports "the desire of investigating the properties and affections of words." The sages of Greece were, in the most ancient times, denominated ἀπολογοι, that is, wise men. Pythagoras renounced this pompous appellation, and assumed the more humble title of φιλολογος, that is, a lover of wise men. The learned Greeks were afterwards called philologers; and in process of time, in imitation of this epithet, the word philologer was adopted, to import "a man deeply versed in languages, etymology, antiquities, &c."

Hence the term philology, which denotes the science that we propose briefly to discuss in the following article.

Though philology, in its original import, denoted only the study of words and language, it gradually acquired a much more extensive, and at the same time a much more useful, as well as more exalted, signification. It comprehended the study of grammar, criticism, etymology, the interpretation of ancient authors, antiquities; and, in a word, every thing relating to ancient manners, laws, religion, government, language, &c. In this enlarged sense of the word, philology becomes a science of the greatest utility; opens a wide field of intellectual investigation; and indeed calls for a more intense exertion of industry, and multifarious erudition, than most of those departments of literature which custom hath dignified with more high-sounding names. It is indeed apparent, that, without the aid of philological studies, it is impossible upon many occasions, to develop the origins of nations; to trace their primary frame and constitution; to discover their manners, customs, laws, religion, government, language, progress in arts and arms; or to learn by what means and what measures the most celebrated states of antiquity rose into grandeur and consideration. The study of history, so eminently useful to the legislator, the divine, the military man, the lawyer, the philosopher, and the private gentleman who wishes to employ his learned leisure in a manner honourable and improving to himself, and useful to his country, will contribute very little towards enlightening the mind without the aid of philological researches. For these reasons we shall endeavour to explain the various branches of that useful science as fully and as intelligibly as the nature of the present undertaking will permit.

Most of the branches of philology have been already object of canvassed under the various heads of CRITICISM, ETC. this article.

MOLOGY, GRAMMAR, LANGUAGE, &c. There still remains one part, which has either been slightly touched upon, or totally omitted, under the foregoing topics: we mean, the nature and complexion of most of the oriental tongues; as also some of the radical dialects of the languages of the west. As we would willingly gratify our readers of every description to the utmost of our power, we shall endeavour in this place to communicate to them as much information upon that subject as the extent of our reading, and the limits prescribed one single article, will permit.

Before we enter upon this subject, we must observe, that it is not our intention to fill our pages with a tedious, uninteresting, catalogue of barbarous languages, spoken by savage and inconsiderable tribes, of which little, or perhaps nothing, more is known than barely their names. Such an enumeration would swell the article without communicating one single new idea to the reader's antecedent stock. We shall therefore confine our inquiries to such languages as have been used by considerable states and societies, and which of consequence have acquired a high degree of celebrity in the regions of the east.

What was the antediluvian language, or whether it variety of was divided into a variety of dialects as at this day, can dialects be only determined by the rules of analogy; and these forces the hypothesis. We are, therefore, led to believe, that whatever might have been the primitive language of mankind, if human nature was then constituted as it is at present, a great variety of dialects must of necessity have sprung up in the space of near 2000 years. If we adopt the Moses account of the antediluvian events, we must admit that the descendants of Cain for some ages lived separated from those of Seth. Their manner of life, their religious ceremonies, their laws, their form of government, were probably different, and these circumstances would of course produce a variety in their language. The posterity of Cain were an inventive race. They found out the art of metallurgy, music, and some think of writing; and in all probability many other articles consi-
PHILOLOGY.

History of the ease and accommodation of life were the produce of their ingenuity. A people of this character must have paid no small regard to their words and modes of expression. Wherever music is cultivated, language will naturally be improved and refined. When new inventions are introduced, a new race of words and phrases of necessity spring up, corresponding to the recent stock of ideas to be intimated. Besides, among an inventive race of people, new vocabularies would be continually fabricated, in order to supply the deficiencies of the primitive language, which was probably scanty in words, and its phraseology unpolished. The Cainites, then, among their other improvements, cannot well be supposed to have neglected the cultivation of language.

Many conjectures have been hazarded by ancient and modern authors with respect to the origin of writing; an art nearly connected with that of speaking. According to Pliny, "the Assyrian letters had always existed; some imagined that letters had been invented by the Egyptian Mercury; others ascribed the honour of the invention to the Syrians." The truth seems to be, that letters were an antediluvian invention, preserved among the Chaldeans or Assyrrians, who were the immediate descendants of Noah, and inhabited these very regions in the neighbourhood of which the ark rested, and where that patriarch afterwards fixed his residence. This circumstance, we think, affords a strong presumption that the use of letters was known before the deluge, and transmitted to the Assyrrians and Chaldeans by Noah their progenitor, or at least by their immediate ancestors of his family. If, then, the art of writing was an antediluvian invention, we think that in all probability it originated among the posterity of Cain.

The descendants of Seth, according to the oriental tradition, were chiefly addicted to agriculture and tending of cattle. They devoted a great part of their time to the exercises of piety and devotion. From this circumstance they came to be distinguished by the title of the (a) sons of God. According to this description, the Sethites were a simple (b), unimproved race of people till they mingled with the race of Cain; after which period they at once adopted the improvements and the vices of that wicked family.

It is not, however, probable, that all the descendants of Seth, without exception, mingled with the Cainites. That family of which Noah was descended had not incorporated with the race of Cain: it was, according to the sacred historian, lineally descended from Seth, and had preserved the worship of the true God, when, it is probable, the greatest part of mankind had apostatized and become idolaters (c). Along with the true religion, the progenitors of Noah had preserved that simplicity of manners and equability of character which had distinguished their remote ancestors. Agriculture and rearing cattle had been their favourite occupations. Accordingly we find, that the patriarch Noah, immediately after the deluge, became a husbandman, and "planted a vineyard." The chosen patriarchs, who doubtless imitated their pious ancestors, were shepherds, and employed in rearing and tending cattle. Indeed there are strong presumptions that the Chaldeans, Assyrians, Syrians, Canaanites, and Arabians, in the earliest ages followed the same profession.

From this deduction, we imagine it is at least probable, that the ancestors of Noah persisted in the observance of the same simplicity of manners which had been handed down from Adam to Seth, and from him to Enoch, Methuselah, Lamech, and from this last to Noah. According both to scripture and tradition, innovations were the province of the Cainites, while the descendants of Seth adhered to the primitive and truly patriarchal institutions.

If these premises are allowed the merit of probability, the origin may justly infer that the language of Noah, whatever it was, differed very little from that of Adam (d) preserved in the family, and that if it is possible to ascertain the language of the former, that of the latter will of course be discovered. We shall then proceed to throw together a few observations relating to the language of Noah, and leave our readers to judge for themselves. We believe it will be superfluous to suggest, that our intention in the course of this deduction is, if possible, to trace the origin and antiquity of the Hebrew tongue; and to try to discover whether that language, or any of its sister dialects, may claim the honour of being the original language of mankind.

Whatever may have been the dialect of Noah and his family, that same dialect, according to the Mosaic account, must have obtained, without any alteration, till the era of the building of the tower of Babel. Upon this occasion a dreadful convulsion took place: the language of mankind was confounded, and men were scattered abroad upon the face of the earth. For this catastrophe (e) extended, is not the business of the present inquiry to determine. One thing is certain beyond all controversy, namely, that the last languages of all the nations which settled near the centre of population were but slightly affected by its influence. A very judicious writer has observed, that 3000 years after, the inhabitants of those countries exhibited a very strong resemblance of cognition, "in their language, manner.

(a) From this passage (Gen. chap. vi. verse 2.) misunderstood, originated the absurd idea of the connection between angels and mortal women. See Joseph. Antiq. Jud. i. cap. 4. See Euseb. Chron. lib. i. All the fathers of the church, almost without exception, adopted this foolish notion. See also PhiLo. Jud. p. 198. edit. Turn. Paris 1532.

(b) The orientals, however, affirm, that Seth, whom they call Edris, was the inventor of astronomy.

(c) We think it highly probable that idolatry was established before the flood; because it prevailed almost immediately after that catastrophe. See POLYTHEISM.

(d) For the first language communicated to Adam; see the article on LANGUAGE; also Schickford's Connect. vol. i. lib. ii. p. xii. et seq.

(e) Josephus and the fathers of the church tell us, that the number of languages produced by the confusion of tongues was 72; but this is a mere rabbinical legend.
PHILOLOGY.

At the same time he observes, that the resemblance in all those particulars was most remarkable among the inhabitants of Mesopotamia. This observation, with respect to language, will, we doubt not, be vouched by every one of our readers who has acquired even a superficial knowledge of the languages current in those quarters at a very early period.

It appears, then, that the languages of the Armenians, Syrians, Assyrians, Arabians, and probably of the Chanaanites, did not suffer materially by the confusion of tongues. This observation may, we imagine, be extended to many of the dialects (r) spoken by the people who settled in those countries not far distant from the region where the sacred historian has fixed the original seat of mankind after the deluge. The inference then is, that if Noah and his family spoke the original language of Adam, as they most probably did, the judgment which effected the confusion of tongues did not produce any considerable alteration in the language of such of the descendants of Noah as settled near the region where that patriarch had fixed his residence after he quitted the ark.

But supposing the changes of language produced by the catastrophe at the building of the tower as considerable as has ever been imagined, it does not, after all, appear certain, that all mankind, without exception, were engaged in this impious project. If this assertion should be well founded, the consequence will be, that there was a chosen race who did not engage in that enterprise. If there was such a family, society, or body of men, it will follow, that this family, society, &c. retained the language of its great ancestor without change or variation. That such a family did actually exist, is highly probable, for the following reasons.

1. We think there is reason to believe that Ham, upon the heavy curse denounced upon him by his father, retired from his brethren, and fixed his residence elsewhere. Accordingly we find his descendants scattered far and wide, at a very great distance from the Gavrylian mountains, where the ark is generally supposed to have rested immediately after the flood. Some of them we find in Chaldea, others in Arabia Felix, others in Ethiopia (c), others in Canaan, and others in Egypt; and, finally, multitudes scattered over all the coast of Africa. Between these countries were planted many colonies of Chalmites, in Elam, Assyria, Syria, Arabia, &c. We find, at the same time, the descendants of Shem and Japhet settled, in a great degree, contiguous to each other. This dispersion of the Hamites, irregular as it is, can scarce, we think, have been accidental; it must have been owing to some uncommon language cause, and none seems more probable than that assigned above. If, then, the descendants of Ham separated early, and took different routes, as from their posterior situations it appears they did, they could not all be present at the building of the tower.

2. It is not probable that the descendants of Shem and those who were engaged in this undertaking, since we find that they were not scattered abroad upon the face of all the earth. The children of Shem were Elam, Assur, &c. Arphaxad, Lud, and Aram. Elam settled near the mouth of the river Tigris, in the country which, by the Gentile writers, was called Elam. Above him, on the same river, lay the demesne of Assur, on the western side. In like manner, upon the same river, above him, was situated Aram, who possessed the country of Aramea; and opposite to him was Arphaxad, or Arbaces, or Arbacon, and his country was denominated Arpmachites. Lud, as some think, settled in Lydia, among the sons of Japhet; but this opinion seems to be without foundation (h). Here, then, there is a dispersion, but such as must have originated from the nature of the thing. The four, or rather the five brothers, all settled contiguous, without being scattered abroad upon the face of the whole earth. Besides, there was no confusion of language among these tribes: they continued to use one and the same lip through many succeeding generations.

From these circumstances it appears, that the posterity of Shem were not involved in the guilt of the building of the tower, and of consequence did not suffer in derge their punishment. If then the language of the people of Shem was not confounded upon the erection of the tower, the presumption is, that they retained the language of Noah, which, in all probability, was that of Adam. Some dialectical differences would in process of time creep in, but the radical fabric of the language would remain unaltered.

3. The posterity of Shem appears in general to have cultivated the pastoral life. They imitated the style of living adopted by the antediluvian posterity of Seth. No sooner had Noah descended from the ark, than he became Ish ha Adamah, a man of the earth; that is a husbandman, and planted a vineyard. We find that some ages after, Laban the Syrian had flocks and herds; and that the chief wealth of the patriarch Abraham and his children consisted in their flocks and herds. Even his Gentile descendants, the Ismaelites and Midianites, seem to have followed the same occupation. But people of this profession are seldom given to changes; their wants are few, and of consequence they are under few or

---

(r) The language of the Medes, Persians, Phoenicians, and Egyptians, very much resembled each other in their original complexion; and all had a strong affinity to the Hebrew, Chaldean, Syriac, &c. See Walton's Proleg.; Gale's Court of the Gent. vol. i. lib. i. ch. 11. p. 70. et seq.; Boch. Phalez and Chanaan, pass. To these we may add the Greek language, as will appear more fully below.

(c) Josephus informs us, that all the nations of Asia called the Ethiopians Cushim, lib. i. cap. 7.

(h) The ancient name of Lydia was Mazonia. See Strab. Casamb, lib. xiii. p. 386. chap. 7. Rhod. 577. The Lydians were celebrated for inventing games; on which account they were nicknamed by the Eolian Greeks Aedui, Lydi or Lodhi, from the Hebrew word hats, ludere, illudere, desiderare. We find (Ezek. chap. xxvii. ver. 10.) the men of Elam and the men of Lud joined in the defence of Tyre; which seems to intimate, that the Elamites and Ludim were neighbours. If this was actually the case, then Lud settled in the same quarter with his brothers.
PHILOLOGY.

History of or no temptations to deviate from the beaten track. This circumstance renders it probable that the language of Noah, the same with that of Adam, was preserved with little variation among the descendants of Arphaxad down to Abraham.

We have observed above, that Ham, upon the curse denounced against him by his father, very probably left the society of his other brothers, and emigrated elsewhere, as Cain had done in the antediluvian world. There is a tradition still current in the East, and which was adopted by many of the Christian fathers (1), that Noah, in the 530th year of his life, by divine appointment, did, in the most formal manner, divide the whole terraqueous globe among his three sons, obliging them that they would take an oath to stand by the decision. Upon this happened a migration at the birth of Peleg, that is, about three centuries after the flood. It is affirmed that Nimrod the arch-rebel disregarded this partition, and encroached upon the territory of Ashur, which occasioned the first war after the flood.

The Greeks had acquired some idea of this partition, which they supposed to have been between Jupiter, Neptune, and Pluto. Plato seems to have heard of it (k): "For (says he) the gods of old obtained the dominion of the whole earth, according to their different allotments. This was effected without any contention, for they took possession of their several provinces in a fair and amicable way, by lot." Josephus (f), in his account of the dispersion of mankind, plainly insinuates a divine destination; and Philo-Judaeus (l) was of the same opinion before him.

In consequence of this arrangement, the sons of Shem possessed themselves of the countries mentioned in the preceding pages: the posterity of Japhet had spread themselves towards the north and west; but the Hamites, who had separated from their brethren in consequence of the curse, not choosing to retire to their quarters, which were indeed very distant from the place where the ark rested, seized upon the land of Canaan (m). Perhaps, too, it might be suggested by some malicious spirits, that the aged patriarch was dealing partially when he assigned Ham and his posterity a quarter of the world to inhabit not only remote from the centre of population, but likewise sequestered from the rest of mankind (n). Be that as it may, the children of Ham removed eastward, and at length descending from the Cardecan or Gordyean mountains, directed their course westward, and arrived at the plains of Shinar, which had been possessed by the Ashurim ever since the era of the first migration at the birth of Peleg. The sacred historian informs us, that the whole earth "was of one language and of one speech;" that in journeying from the east, they lighted upon the plain of Shinar, and dwelt there. In this passage we find no particular people specified; but as we find Nimrod, one of the descendants of Ham, settled in that country, we are sure that they were the offspring of that patriarch. It would not, we think, be easy to assign a reason how one branch of the family of Ham came to plant itself in the midst of the sons of Shem by any other means but by violence.

It is indeed generally supposed, that Nimrod, at the head of a body of the children of Ham, made war upon of Babel Ashur, and drove him out of the country of Shinar; and they laid the foundation of that kingdom, the beginning of which was Babel; that this chief, supported by all the Cushites, and a great number of apostates from the families of Shem and Japhet who had joined him, refused to submit to the divine ordinance by the mouth of Noah, with respect to the partition of the earth; and that he and his adherents were the people who erected the celebrated tower, in consequence of a resolution which they had formed to keep together, without repairing to the quarters assigned them by the determination of heaven. This was the crime which brought down the judgment of the Almighty upon them, by which they were scattered abroad upon the face of all the earth. The main body of the children of Shem and Japhet were not engaged in this impious undertaking; their language, therefore, was not confounded, nor were they themselves scattered abroad. Their habits were contiguous; those of the Shemites towards the centre of Asia; the dwellings of Japhet were extended towards the north and north-west; and the languages of both these families continued for many ages without the least variation, except what time, climate, laws, religion, new inventions, arts, sciences, and commerce, &c. will produce in every tongue in a succession of years.

The general opinion then was, that none but the progeny of Ham and their associates were present at the building of the tower, and that they only suffered by the judgment (o) consequent upon that attempt. There are

---

(k) Critias, vol. iii. page 100. Serr. Apollodorus mentions a time when the gods respectively selected particular cities and regions, which they were to take under their peculiar protection.

(f) Lib. x. p. 236. Turn. Paris 1852. We have a plain allusion to this distribution (Deut. ch. xxxii. ver. 7). "When the most High divided to the nations their inheritance, when he separated the sons of Adam, he set the bounds of the people, according to the number of the children of Israel; for the Lord's portion is his people; Jacob is the lot of his inheritance." From this passage it appears, that the whole was arranged by the appointment of God, and that the land of Canaan was expressly reserved for the children of Israel. St. Paul, Acts ch. xvii. ver. 16. speaks of this divine arrangement, "God made of one blood all nations of men, to dwell on all the face of the earth; and determined the bounds of their habitation."

(n) The ark, according to the most probable accounts, rested upon Mount Ararat in Armenia.

(o) We think it by no means improbable that Noah, well knowing the wickedness of the family of Ham, and especially their inclination to the idolatry of the antediluvians, might actually intend to separate them from the rest of mankind.

(c) Some learned men have imagined that this confusion of language, which the Hebrew calls of Lip, was only
PHILOLOGY.

History of Language.

are even among the Pagans some allusions to the division of the world among the three sons of Noah. Many of the learned have imagined that this patriarch was Saturn; and that his three sons were Jupiter, Neptune, and Pluto, as has been observed above.

Berosus*, in his history of the Babylonians, informs us, that Noah, at the foot of Mount Baris or Luban, where the ark rested, gave his children their last instructions, and then vanished out of sight. It is now generally believed that the Xisuthrus of Berosus was Noah.

Eusebius†, another heathen writer, tells us, that the city Babel was first founded, and afterwards the celebrated tower; both which were built by some of those people who escaped the deluge. They were the same with those who in after times were inhabited under the name of giants. The tower was at length ruined by the hand of the Almighty, and those giants were scattered over the whole earth." This quotation plainly intimates, that according to the opinion of the author, only the rascally mob of the Hamites, and their apostate associates, were engaged in this daring enterprise.

Indeed it can never be supposed that Shem, if he was alive at that period, as he certainly was, would co-operate in such an absurd and impious undertaking. That devout patriarch, we think, would rather employ his influence and authority to divert his descendants from an attempt which he knew was undertaken in contradiction to an express ordinance of Heaven: and it is surely very little probable that Elam, Ashur, Arphaxad, and Aram, would join that impious confederacy, in opposition to the re-announcements of their father.

The building of the tower, according to the most probable chronology, was undertaken at a period so late, that all mankind could not possibly have concurred in the enterprise.

Many of the fathers were of opinion, that Noah settled in Armenia, the country where the ark rested; and that his descendants did not leave that region for five generations‡, during the space of 659 years. By this period the human race must have been so amazingly multiplied, that the plains of Shinar could not have contained them. According to the Samaritan Pentateuch, and the Septuagint version, Peleg was born in the 134th year of his father Eber. Even admitting the vulgar opinion, that the tower was begun to be built, and the dispersion consequent upon that event to have taken place at this era, the human race would have been by much too numerous to have universally concurred in one design.

From these circumstances, we hope it appears that the whole mass of mankind was not engaged in building the tower; that the language of all the human race was not confounded upon that occasion; and that the dispersion reached only to a combination of Hamites, and of the most profligate part of the two other families, who had joined their wicked confederacy.

We have pursued this argument to considerable length, therefore because some have inferred, from the difference in lan-
guages existing at this day, that mankind cannot have sprung from two individuals; because from the connection still existing among languages, some have been bold enough to question the fact, though plainly recorded in sacred history; and lastly, because we imagine that some of our readers, who do not pretend to pursue the writings of the learned, may be gratified by seeing the various opinions respecting the confusion of tongues, and the dispersion of mankind, collected into one mass, equally brief, we hope, and intelligible; and this view of these opinions, with the foundations on which they respectively rest, we think may suffice to prove, that the language of Noah was for some ages preserved unmixed among the descendants of both Shem and Japhet.

To gratify still farther such of our curious readers as may not have access to more ample information, we shall in this place exhibit a brief detail of the circumstances which attended this fatal attempt. The people engaged in it have been held up as a profligate race. The Almighty himself denominates them "the children of men," which is the very appellation by which the antediluvian sinners were characterized; the sons of God saw the daughters of men, &c. Their design in raising this edifice was "to make them a name, and to prevent their being scattered abroad upon the face of the whole earth."§

Whatever resolution the rest mankind might take, chap. ii., they had determined to maintain themselves on that spot. The tower was intended as a centre of union, and perhaps as a fortress of defence. Such a stupendous fabric, they imagined, would immortalize their memory, and transmit the name of their confederacy with eclat (r) to future ages. This design plainly intimates, that there was only a party concerned in the undertaking, since, had all mankind been engaged in it, the purpose would have been foolish and futile. Again, they intended, by making themselves a name, to prevent their being scattered abroad upon the face of the earth. This was an act of rebellion in direct contradiction to the divine appointment, which constituted their crime, and brought down the judgment of Heaven upon their guilty heads. The consequence of the confusion of languages was, that the projectors left off to build (q), and were actually scattered abroad, contrary to their intention.

Abydenus, in his Assyrian Annals, records, that the Pagan (q) "tower was carried up to heaven; but that the"
domination concerning the tower of Babel.

a temporary failure of pronunciation, which was afterwards removed. This they are led to conclude, from the agreement of the languages of these people in after times.

(r) Many foolish and absurd notions have been entertained concerning this structure. Some have imagined that they meant to build shelter there in case of a second deluge; others, that it was intended for idolatrous purposes; others, that it was to be employed as an observatory. Its dimensions have likewise been most extravagantly magnified. Indeed Strabo, lib. 16. mentions a tower of immense size remaining at Babylon in his time, the dimensions of which were a stadium every way. This, however, seems to have been the remains of the temple of Belz or Belus.

(q) For a description of the tower, see the article BABEL.

(a) See the Greek original of this quotation, Euseb. Chron. lib. 1. page 73.
PHILOLOGY.

History of gods ruined it by storms and whirlwinds, and overthrew it upon the heads of those who were employed in the work, and that the ruins of it were called Babylon. Before this there was but one language subsisting among men: but now there arose multiform speech; and he adds, that a war soon after broke out between (a) Titus and Cronus. (r) The Sybiline oracles give much the same account of this early and important transaction.

(8r) Philip. lib. 13. cap. 3.

"Justin informs us, that the Phcenicians who built Tyre were driven from Assyria by an earthquake. These Phcenicians were the descendants of Mizraim the youngest son of Ham; and were, we think, confederates in building the tower, and were driven away by the catastrophe that ensued. Other allusions to the dispersion of this branch of the family occur in Pagan authors, which the limits to be observed in an inquiry of this nature oblige us to omit. Upon the whole, we think it probable that the country of Shinar lay desolate for some time after this revolution; for the dread of the judgment inflicted upon the original inhabitants would deter men from settling in that inauspicious region. At last, however, a new colony arrived, and Babyl, or Babylon, became the capital of a flourishing kingdom. Our readers, we believe, will expect that we should say something of Nimrod the mighty hunter, who is generally thought to have been deeply concerned in the transactions of this period. According to most authors, both ancient and modern, this patriarch was the leader of the confederates who erected the tower; and the chief instigator to that enterprise. But if the tower was built at the birth of Pheleg, according to the Hebrew computation, that chief was either a child, or rather not born at that period (u). The Seventy have pronounced him a giant, as well as a huntsman. They have translated the Hebrew word gevir, which generally signifies strong, mighty, by the word gavas, giant; an idea which we imagine those translators borrowed from the Greeks. The antediluvian giants are called Nephelim and Rephaim, but never Gevurim. The Rabbinical writers, who justly hated the Babylonians, readily adopted this idea (s); and the fathers-of the church, and the Byzantine historians, have universally followed them. He has been called Nimrod, Nebrod, Nebryth, Nebroth, and Nebris. Not-a few have made him the first Barchus, and compounded his name of Bar, a son, and Cush, that is, the son of Cush. Some have imagined that he was Odys. 1. 1., the Orion of the Pagans, whose shade is so nobly described by Homer. But the etymology of this last name implies something honourable, and very un-.
PHILOLOGY.

History of the banks of the river Themodoon, in the territory of Pontus, bordering on Armenia and the Less. These, in ancient times, were called Albyes or Chalybes, because they were much employed in forging and polishing iron. Their neighbors, at length, gave them the name of Child or Called, which imports, in the Armenian dialect, fierce, horrid, robust. This title the Greeks adopted, and out of it formed the word ἁλίμια, "Chaldeans."

The Mosaic history informs us (c), that Ashur went out of that land (Shinar, and built Nineveh and several other considerable cities. One of the successors of Ashur was the celebrated Ninus, who first broke the peace of the world, made war upon his neighbours, and obliged them by force of arms to become his subjects, and pay tribute. Some authors make him the immediate successor of Ashur, and the builder of Nineveh. This we think is not probable; Enesiabius as we have observed above, gives a list of six Arabian princes who reigned in Babylon. These we take to have been the immediate successors of Nimrod, called Arabians; because these people were Cushites. Ninus might be reputed the first king of the Assyrians, because he figured beyond his predecessors; and he might pass for the builder of Nineveh, because he greatly enlarged and beautified that city. We therefore imagine, that Ninus was the fifth or sixth in succession after Ashur.

Ninus, according to Dioecorus Scylus 2, made an alliance with Arius king of the Arabsians, and conquered the Babylonians. This event, in our opinion, put an end to the empire of the Hamites or Cushites in Shinar or Babylonia. The author observes, that the Babylon which figured afterwards did not then exist. This fact is confirmed by the prophet Isaiah (1): "Behold the land of the Chasidim; this people was not till Ashur founded it for them that dwell in the wilderness. They set up the towers thereof, &c." After Babylonia was subdued by the Assyrians under Ninus, the capital was either destroyed by that conqueror or deserted by the inhabitants. At length it was re-occupied by some one or other of the Assyrian monarchs, who collected the roving Chasidim, and obliged them to settle in the new city. These were subject to the Assyrian empire till the reign of Sardanapalus, when both the Medes and Babylonians rebelled against that emperor, and annihilated him.

The Chasidim were celebrated by all antiquity for their proficiency in astronomy, astrology, magic, and curious sciences. Or or Ophoe (p) was a kind of universal language for those branches of learning. Such was their reputation in those studies, that over a great part of Asia and Europe a Chaldee and an astrologer were synonymous terms. These sciences, according to the tradition of the Orientals, had been invented by Seth, whom they called Eridis; and had been cultivated by his descendants downward to Noah, by whom they were transmitted to Shem, who conveyed them to Arphaxad and his posterity.

To us it appears probable, that the religious sentiments transmitted from Noah through the line of Shem, were kept alive in the family of Arphaxad, and so handed down to the families of Serug, Nahor, Terah, Abram, Nahor II. and Haran, &c. The Jewish rabbis, and all the Persian and Mahomedan writers, make Abraham contemporary with Nimrod; who, say they, persecuted him most cruelly for adhering to the true religion. That these two patriarchs were contemporary is very improbable, since Nimrod was the third generation after Noah, and Abram the tenth. Abram has been invested by the rabbinical writers with every department of learning. According to them, he was transported from Charruce into Chanaan and Egypt, astronomy, astrology, mathematics, geography, magic, alphabetical writing, &c. &c.

After the Babylonian captivity, when the Jews were dispersed over all the east, and began to make priests of the gate among the Pagans, wonderful things were reported of Abram with respect to his acquirements in human erudition, as well as his supereminence in virtue and piety. These legendary tales were believed by the proselytes, and by them retailed to their connections and acquaintances. But certainly the holy man either was not deeply versed in human sciences, or did not deem them of importance enough to be communicated to his posterity; since the Jews are, on all hands, acknowledged to have made little progress in these improvements. To think of raising the fame of Abraham, by clasping him with the philosophers, betrays an extreme defect in judgment. He is entitled to praise of a higher kind; for he excelled in piety, was the father of the faithful, the root of the Messiah, and the friend of God. Before these, all other titles vanish away. Such of our readers, however, as have leisure enough, and at the same time learning enough to enable them to consult the rabbinical legends, will be furnished with a full and ample detail.

The Greeks formed their Χαλδος, Chalybes. Xenoph. Cyrop. lib. iii. p. 43. Steph. represents the Chaldeans, who inhabited a mountainous country bordering upon Armenia, as a very fierce warlike people. Ib. page 107. we have an example of theirrapacious character. Ib. ib. lib. iv. p. 192. Hen. Steph. we have an account of their bravery and of their arms. Another instance of their rapacity occurs in their plundering the cattle of Job.

(c) A dispute has arisen about the sense of verse 10. chap. x. Out of that land went forth Ashur, and built Nineveh. Some approve our translation, which we think is just; others, considering that the inspired writer had been speaking of Nimrod and the beginning of his kingdom, are of opinion that it should be translated, And out of this land He (that is Nimrod) went into Ashur and built Nineveh. This they make a military expedition, and a violent invasion into the territory of Ashur.

(d) Ur or Ophoe was situated between Ninisib and Cordemis. See Ammianus Marcell. Expeditio Juliana, lib. xvi. It lay not far from the river Tigris. Strabo, lib. xvi. p. 739, tells us that the Chaldean philosophers were divided into different sects, the Orcheni, the Borsipperi, and several others. Diod. Sicul. likewise, lib. ii. p. 82. Steph. gives an exact detail of the functions, profession, and establishment of the Chaldeans, to which we must refer our curious readers.
PHILOLOGY.

In the progress of this disquisition, we have seen that the language of Noah was, in all probability, the same or nearly the same with that of Adam. Additions and improvements might be introduced, but still the radical stamina of the language remained unchanged. It has likewise, we hope, appeared, that the confusion of language at the building of the tower of Babel was only partial, and affected none but the rebellious crew of the race of Ham, and the apostate part of the families of Sheen and Japhet. We have concluded, that the main body of the race of Sheen, at least, were neither dispersed nor their language confounded; and that consequently the descendants of that patriarch continued to speak their paternal dialect or the uncorrupted language of Noah. To these arguments we may take the liberty to add another, which is, that in all probability the worship of the true God was preserved in the line of Arphaxad, after the generality of the other sects had lapsed into idolatry. Out of this family Abraham was taken, in whose line the true religion was to be preserved. Whether Abraham was an idolater when he dwelt in Chaldea, the Scripture does not inform us, though it seems to be evident that his father was. One thing, however, is certain, namely, that Jehovah (יְהוָה) appeared to him, and pronounced a blessing upon him before he left Ur of the Chaldees. This circumstance no doubt indicates, that this patriarch had made uncommon advances in piety and virtue, even prior to his migration. The progenitors of his family had been distinguished by adhering to the true religion. About this time, however, they began to degenerate, and to adopt the Zabism of their apostate neighbours. It was then that Abraham was commanded by Heaven to "leave his kindred and his father's house, and to travel into a land which was to be shown him." The Almighty intended that the true religion should be preserved in his line, and therefore removed him from a country and kindred, by the influence of whose bad example his religious principles might be endangered. His family had only of late apostatized; till that period they had preserved both the language and religion of their venerable ancestors.

But however much Abraham might differ from the other branches of his family in his religious sentiments, his language was certainly in union with theirs. The consequence of this unquestionable position is, that the language which he carried with him into Chanaan was exactly the same with that of his family which he relinquished when he began his peregrinations. But if this be true, it will follow, that the language afterwards denominating Hebrew, and that of the Chasidim or Chaldeans, were originally one and the same. This position, we think, will not be controverted. There is then an end of the dispute concerning the original language of mankind. We have advanced some presumptuous proofs in the preceding pages, that the language of Adam was transmitted to Noah, and that the dialect of the latter was preserved in the line of Arphaxad downwards to the family of Abraham; and it now appears that the Hebrew and Chaldean were originally spoken by the same family, and of course were the same between themselves, and were actually the first language upon earth, according to the Mosaic history. Numberless additions, alterations, improvements, we acknowledge, were introduced in the course of 2000 years; but still the original stamina of the language were unchanged. Our readers will please to observe that the Orientals are not a people given to change; and that this character, in the earliest ages, was still more prevalent than at present. This assertion, we presume, needs no proof.

In confirmation of these presumptive arguments, we may add the popular one which is commonly urged upon this occasion, viz. that the names of antediluvian persons and places mentioned by the sacred historian, are generally of Hebrew original, and significant in that language. Some of them, we acknowledge, are not so; but in this case it ought to be remembered, that a very small part of that language now exists, and that probably the radicals from which these words are descended are among the number of those which have long been lost.

SECT. I. The Hebrew Language.

Having thus proved the priority of the Hebrew language to every other language that has been spoken by men, we shall now proceed to consider its nature and genius; from which it will appear still more evidently to be an original language, neither improved nor debased by foreign idioms. The words of which it is composed are short, and admit of very little flexion. The names of places are descriptive of their nature, situation, accidental circumstances, &c. Its compounds are few, and artificially joined together. In it we find few of those artificial affixes which distinguish the other cognate dialects; such as the Chaldean, Syrian, Arabian, Phcenician, &c. We find in it no traces of improvement from the age of Moses to the era of the Babylonian captivity. The age of David and Solomon was the golden period of the Hebrew tongue; and yet, in our opinion, it would puzzle a critic of the nicest acumen to discover much improvement even during that happy era. In fact, the Jews were by no means an inventive people. We bear nothing of their progress in literary pursuits; nor do they seem to have been industrious in borrowing from their neighbours. The laws and statutes communicated by Moses were the principal objects of their studies. These they were commanded to contemplate day and night; and in them they were to place their chief delight. The consequence of this command was, that little or no regard could be paid to taste, or any other subject.

(x) Compare Gen. chap. xii. ver. 2. with Acts, chap. vii. ver. 4.
subject of philosophical investigation. Every unimproved
language abounds in figurative expressions borrow-
ed from sensible objects. This is in a peculiar, manner
the characteristic of the language in question; of which
it would be superfluous to produce instances, as the fact
must be obvious even to the attentive reader of the
English Bible.

In the course of this argument, we think it ought to
be observed, and we deem it an observation of the great-
est importance, that if we compare the other languages
which have claimed the prize of originality from the
Hebrew with that dialect, we shall quickly be convinced
that the latter has a just title to the preference. The
writers who have treated this subject, generally bring
into competition the Hebrew, Chaldean, Syriac, and
Arabian. Some one or other of these has commonly
been thought the original language of mankind. The
arguments for the Syrian and Arabian are altogether
futile. The numerous improvements superinduced upon
these languages, evidently prove that they could not
have been the original language. In all cognate dia-
lects, etymologists hold it as a maxim, that the least
improved is likely to be the most ancient.

We have observed above, that the language of Abra-
ham and that of the Chaldeans were originally the
same; and we are persuaded, that if an able critic
should take the pains to examine strictly these two
languages, and to take from each what may reasonably
be supposed to have been improvements or additions
since the age of Abraham, he will find intrinsic evidence
sufficient to convince him of the truth of this position.
There appear still in the Chaldean tongue great num-
bers of (γ) words the same with the Hebrew, perhaps
as many as mankind had occasion for in the most early
ages; and much greater numbers would probably be
found if both languages had come down to us entire.
The construction of the two languages is indeed somewhat
different; but this difference arises chiefly from the su-
perior improvement of the Chaldean. While the
Hebrew language was in a manner stationary, the Chaldean
underwent progressive improvements; was mollified
by anthologies, rendered sonorous by the disposition of vocal
sounds, acquired a copiousness by compounds, and a ma-
nesty by suffixes and prefixes, &c. In process of time,
however, the difference became so great, that the Israe-
lites did not understand the Chaldean language at the
era of the Babylonish captivity. This much the pro-
phet intimates, when he promises the pious Jews pro-
scription from a fierce people; a people of a deeper
speech than they could perceive; of a stammering
tongue, that they could not understand.

The priority of the Chaldean tongue is indeed con-
tended for by very learned writers. Camden calls
it the mother of all languages; and most of the fathers
were of the same opinion. Amira has made a col-
lection of arguments, not inconsiderable, in favour of
it; and Myricus (§) after him, did the same. Erpe-
nius (¶), in his Oration for the Hebrew tongue, thought
the argument for it and the Chaldean so equal, that he
did not choose to take upon him to determine the ques-
tion.

Many circumstances, however, concur to make us
assign the priority to the Hebrew, or rather to make
us believe that it has suffered fewest of those changes
to which every living tongue is more or less liable. If
we strip this language of every thing obviously advent-
titious, we shall find it extremely simple and primitive.
Every thing masoretical, supposing the vowels and
points (γ) essential, was certainly unknown in its ori-
ginal character. 2. All the prefixed and affixed letters
were added time after time, to give more compass and
to the precision of the language. 3. The various voices
and numbers, of the moods, tenses, numbers, and persons of verbs, were
posterior improvements; for in that tongue, nothing
at first appeared but the indeclinable radix. 4. In the
same manner, the few adjectives that occur in the lan-
guage, and the numbers and regimen of nouns, were not
from the beginning. 5. Most of the Hebrew nouns are
derived from verbs; indeed many of them are written
with the very same letters. This rule, however, is not
general; for often verbs are derived from nouns, and
even some from prepositions. 6. All the verbs of that
language, at least all that originally belonged to it, uni-
formly consist of three letters, and seem to have been at
first pronounced as monosyllables. If we anastomize
the Hebrew language in this manner, we shall reduce
it to very great simplicity; we shall confine it to a few
names of things, persons, and actions; we shall make
all its words monosyllables, and give it the true charac-
ters of an original language. If at the same time we
reflect on the small number of (h) radical words in that
dialect, we shall be more and more convinced of its ori-
ginality.

It will not be expected that we should enter into a
minute discussion of the grammatical peculiarities of this
ancient language. For these we must refer our readers
to the numerous and elaborate grammars of that tongue,
which are everywhere easily to be found. We shall on-
ly make a few strictures, which naturally present them-
selves, before we dismiss the subject.

The generality of writers who have maintained the
superior antiquity of the Hebrew language, have at the
same time contended that all other languages of Asia,
and most of those of Europe, have been derived from
that tongue as their source and matrix. We, for our
own part, are of opinion, that perhaps all the languages in
those corners of the globe were coeval with it, and
were originally one and the same; and that the differ-
ences which afterwards distinguished them sprang from
climate, caprice, inventions, religions, commerce, con-
quests,

(f) Most of the Chaldean names mentioned in Scripture are pure Hebrew words compounded; such as Nebu-
chadnezzar, Nebuwadlwan, Radkahoth, Rbohpaog, Belchowar, Raburis, Nahar, Malakuth, Phrat or Pharad,
Barowes, Carchemish, Ur, Cutha, Heb. Cushi, &c. All these words, and a multitude of others which we could
mention, approach so near the Hebrew dialect, that their original is discernible at first sight. Most of these are
compounds, which the limits prescribed will not allow us to decompound and explain.

(G) The futility of these points will be proved in the following part of this section.

(h) The radical words in the Hebrew language, as it now stands, are about 300.
quests, and other accidental causes, which will occur
to our intelligent readers. We have endeavoured to
prove, in the preceding pages, that all mankind were
not concerned in the building of the fatal tower, nor
affected by the punishment consequent upon that at-
tempt: and we now add, that even that punishment
was only temporary; since we find, that those very
Hamites or Cushim, who are allowed to have been af-
fected by it, did certainly afterwards recover the former
organization of their kins, and differed not more from
the original standard than the descendants of Japhet and
Shem.

The Jewish rabbis have pretended to ascertain the
number of languages generated by the vengeance of
Heaven at the building of Babel. They tell us that
mankind was divided into 70 nations and 70 languages,
and that each of these nations had its tutelar or guardian
angel. This fabulous legend is founded on the num-
ber of the progeny of Jacob at the time when that pa-
triarch and his family went down into Egypt. Others
attribute its origin to the number of the sons and grand-
sons of Noah, who are enumerated Gen. chap. x.

The fathers* of the church make the languages at
the confusion to amount to 72; which number they
complete by adding Cainan and Elishah, according to
the Septuagint, who are not mentioned in the Hebrew
text. This opinion, they think, is supported by the
words of Moses, when he saith, that † when the Most
High divided to the nations their inheritance, when
he separated the sons of Adam, he set the bounds of
the people according to the number of the tribes of
Israel." That is, say they, he divided them into 72
nations, which was the number of the children of Israel
when they came into Egypt. The Targum of Ben-
Uzziel plainly favours this interpretation; but the Je-
rusalem Targum intimates that the number of nations
was only 12, according to the number of the tribes of
Israel. This passage, however, seems to refer to
the tribes of the Chanaanian; and imports, that the Almigh-
ty assigned to the different septs of that family such a
tract of land as he knew would make a sufficient inherit-
ance for the children of Israel ‡. Others have increase-
ed the different languages of the dispersion to 120; but
the general opinion has fixed them to 70 or 72. Our
readers need scarce be put in mind that these opinions
are futile and absurd; neither founded in Scripture, pro-
phetic history, or common sense. At the same time, it
must not be omitted, that according to Horapollo §, the
Egyptians held, that the world was divided into 72 ha-
itable regions; and that, in consequence of this tradi-
tion, they made the cynocephalus the emblem of the
world, because that in the space of 72 days that animal
pines away and dies.

It has been made a question, whether the Hebrew
language was denominated from Heber the progenitor
of Abraham, or from a word which in that tongue im-
ports over, beyond. Most of the Christian fathers, prior
to St Origen, believed that both the Gentile name He-
brew, and the name of the language, were derived from
the name of the patriarch; but that learned man

imagined, that Abraham was called the Hebrew, not
because he was a descendant of Heber, but because he
was a transfluvians, or from beyond the river Eu-
phrates. The learned Bochart * has strained hard
† Philog. lib. i. c. 15. to prove the former position; but to us his arguments
do not appear decisive. We are rather inclined to
believe, that Abraham was called Chibri, (Hebrew),
from the situation of the country from which he emi-
gated when he came to the country of Chanaan; and
that in process of time that word became a Gentile
appellation, and was afterwards applied to his poste-
ritiy (1) often by way of reproach, much in the same
manner as we say a Northlander, a Norman, a Trans-
manus, &c.

Here we may be indulged an observation, namely,
that Abraham, a Hebrew, lived among the Chalde-
aans, travelled among the Chanaanites, sojournered
among the Philistines, lived some time in Egypt, and in all
appearance conversed with all those nations without
any apparent difficulty. This circumstance plainly
proves, that all these nations at that time spoke nearly
the same language. The nations had not yet begun
to improve their respective dialects, nor to deviate in
any great measure from the monosyllabic tongue of
the Hebrews. With respect to the language of Cha-
nan, afterwards the Phoenician, its similarity to the
Hebrew is obvious from the names of gods, men, ci-
ties, mountains, rivers, &c. which are the very same
in both tongues, as might be shown in numberless
cases, were this a proper place for etymological re-
searches.

Before we dismiss this part of our subject, we would
wish to gratify our unlearned readers with a brief ac-
count of the Hebrew letters, and of the Masoretical
points which have in a manner been ingrained on these
letters. In the course of this deduction, we shall
endeavour to follow such authors as are allowed to have
handled that matter with the greatest acuteness, learn-
ing, and perspicuity. If upon any occasion, we
should be tempted to hazard a conjecture of our own,
it is cheerfully submitted to the censure of the pub-
lic.

Much has been written, and numberless hypotheses
proposed, with a view to investigate the origin of al-
phabetic writing. To give even an abridged account
of all these, would fill many volumes. The most plau-
sible, in our opinion, is that which supposes that the
primary characters employed by men were the figures of
material objects, analogous to those of the Mexicans, so
often mentioned by the authors who have written the
history of that people at the era of the Spanish inva-
sion of their country. As this plan was too much circum-
scribed to be generally useful, hieroglyphical figures
were in process of time invented as subsidies to this
contrasted orthography. In this scheme, we imagine,
the process was somewhat more extensive. A lion
might be sketched, to import fierceness or valour; an
ox, to denote strength; a stag, to signify swiftness; a
hare, to intimate timorousness, &c.

The next step in this process would naturally extend
to

23 Origine of
the name Hebrew.

(1) The Egyptians might not eat bread with the Hebrews, for that is an abomination to the Egyptians. The Philistines (Samuel I. pass.) always call the Israelites Hebrews by way of reproach.
PHILOLOGY.

Hebrew letters, were the same with the Hebrew. That the Assyrian or Chaldæan and Hebrew languages were the same, has, we hope, been fully proved already: that their letters were the same in the original structure, can scarce be controverted. Those letters, we think, were antediluvian; whether, to use the expression of Plato, they were dictated by some god, or fabricated by some man divinely inspired. As this opinion may admit some dispute, we shall take the liberty to subjoin our reasons.

1. It appears that the era of this invention is buried in impenetrable obscurity. Had an invention of such capital importance to mankind been made in the post-diluvian ages, we imagine the author would have been commemorated in the historical annals of the country where he lived (1).

2. The art of writing in alphabetical characters, according to the sacred records, was practised at so early a period, that there was not a long enough interval between that and the deluge to give birth to that noble invention. If we consider the state of the world during some ages after that disastrous event, we shall quickly be convinced that little respite could be found from the labour and industry indispensably requisite to provide the necessaries, and only a few of the conveniences, of life. Such a state of things was certainly most unfavourable to the invention of those arts and improvements which contribute nothing towards procuring the accommodations of life. The consequence is obvious.

Moses has recorded the history of the creation, of a few of the capital transactions of the antediluvian world, the birth, the age, the death, of the lineal descendants of Seth. He has preserved the dimensions of the ark, the duration of the universal deluge, its effects upon man and all terrestrial animals, the population of the world by the posterity of Noah, the age, &c. of the patriarchs of the line of Shem, from which his own ancestors had sprung. To this he has subjoined the petty occurrences which diversified the lives of Abraham, Isaac, and Jacob, and their descendants. Whence did the historian derive his information? We believe few of our readers will be so enthusiastic as to imagine that the author received it from divine inspiration. Tradition is a fallible guide; and in many cases the accounts are so minutely precise, as to defy the power of that species of conveyance. The inspired author most certainly has extracted his abridgment from written memoirs, or histories of the transactions of his ancestors regularly transmitted from the most early periods. These annals he probably abridged, as Ezra did, afterwards the history of the kings of Israel. If this was the case, as it most certainly was, the art of writing in alphabetical letters must have been known and practised many ages before Moses. It has indeed been pretended, that the Jewish decalogue, inscribed upon two tables of stone, was the very first specimen of alphabetical writing. The arguments adduced in proof of this fact are lame and inconclusive.

(k) See Phedrus, page 1240. See also page 374. Phil.

(1) It is true, the Egyptians attribute the invention to their Thoth, and the Phœnicians to their Hercules, or Melicerta or Baal; but these were only imaginary personages.
PHILOLOGY.

Sect. I.

Hebrew Language.

elusive (m.). Had that been the case, some notice must have been taken of so palpable a circumstance. Moses wrote out his history, his laws, and his memoirs; and it appears plainly from the text, that all the learned among his countrymen could read them. Writing was then no novel invention in the age of the Jewish legislator, but current and generally known at that era.

The patriarch Job lived at an earlier period. In that book we find many allusions to the art of writing, and

(m) The most ingenious and plausible of those arguments which have fallen under our observation, is given by Mr. Johnson vicar of Cranbrook, a writer of great learning and piety, who flourished in the beginning of the 18th century, and whose works deserve to be more generally known than we have reason to think they are at present. After endeavouring to prove that alphabetical writing was not practised before the era of Moses, and expatiating upon the difficulty of the invention, this excellent scholar attempts to show, that the original Hebrew alphabet was actually communicated to the Jewish legislator at the same time with the two tables of the law. "I know not (says he) any just cause why the law should be written by God, or by an angel at his command, except it were for want of a man that could well perform this part. This could give no addition of authority to the law, especially after it had been published in that astonishing and miraculous manner at Mount Sinai. The true writing of the original was indeed perfectly adjusted, and precisely ascertained to all future ages, by God's giving a copy of it under his own hand; but this, I conceive, had been done altogether as effectually by God's dictating every word to Moses, had he been capable of performing the office of an amanuensis." The learned writer goes on to suppose, that it was for the purpose of teaching Moses the alphabet, that God detained him forty days in the mount; and thence he concludes, that the Decalogue was the first writing in alphabetical characters, and that those characters were a divine, and not a human invention.

It is always rash, if not something worse, to conceive reasons not assigned by God himself, for any particular transaction of his with those men whom he from time to time inspired with heavenly wisdom. That is not for the purpose of teaching Moses the alphabet that God detained him forty days in the mount, when he gave him the two tables of the law, seems evident from his detaining him just as many days when he gave him the second tables after the first were broken. If the legislator of the Jews had not been sufficiently instructed in the art of reading during his first stay in the mount, he would have been detained longer; and it is not conceivable, that though in a fit of pious passion he was so far thrown off his guard as to break the two tables, his mind was so totally unhinged by the idolatry of his countrymen, as to forget completely an art which, by the supposition, the Supreme Being had spent forty days in teaching him! "But if Moses could, at his first ascent into the mount, perform the office of an amanuensis, why are the original tables said to have been written by the finger of God, and not by him who wrote the second?" We pretend not to say why they were written by God rather than man; but we think there is sufficient evidence, that by whomsoever they were written, the characters employed were of human invention. The Hebrew alphabet, without the Masoretic points, is confessedly defective; and every man who is in any degree acquainted with the language, and is not under the influence of inveterate prejudice, will readily admit that those points are no improvement. But we cannot, without impiety, suppose an art invented by infinite wisdom, to fall short of the utmost perfection of which it is capable: an alphabet communicated to man by God, would undoubtedly have been free both from defects and from redundancies; it would have had a distinct character for every simple sound, and been at least as perfect as the Greek or the Roman.

But we need not fill our pages with reasonings of this kind against the hypothesis maintained by Mr. Johnson. We know that "Moses wrote all the words of the Lord," i.e. the substance of all that had been delivered in Exod. xx, xxii, xxiii, before he was called up into the mount to receive the tables of stone; nay, that he had long before commanded by God himself to "write in a book" an account of the victory obtained over Amalek (Exod. xvii. 14). All this, indeed, the learned writer was aware of; and to reconcile it with his hypothesis, he frames another, more improbable than even that which it is meant to support. "It is not unreasonable (says he) to believe that God had written these tables of stone, and put them in Mount Horeb, from the time that by his angel he had there first appeared to Moses; and that, therefore, all the time after, while he kept Jethro's sheep thereabouts, he had free access to those tables, and perused them at discretion. But if belief should rest upon evidence, we beg leave to reply, that to believe all this would be in the highest degree unreasonable; for there is not a single hint in the Scripture of the tables having been written at so early a period, or upon such an occasion, as God's first appearance to Moses in the burning bush. We know how reluctant Moses was to go upon the embassy to which he was then appointed; and it is strange, we think passing strange, that when he records so faithfully his own backwardness, and the means made use of by God to reconcile him to the arduous undertaking, he should make no mention of these important tables, if at that period he had known any thing of their existence. Besides all this, it is not wonderful, if Moses had been practising the art of writing, as our author supposes, from the time of the burning bush to the giving of the law, he should then have stood in need of forty days teaching from God, to enable him to read with ease the first tables; and of other forty, to enable him to write the second? This gives such a mean view of the natural capacity of the Hebrew legislator, as renders the hypothesis which implies it wholly incredible. See a Collection of Discourses, &c. in two volumes, by the reverend John Johnson, A. M. vicar of Cranbrook in Kent.
and some passages which plainly prove its existence. This shows that alphabetical characters were not confined to the chosen seed, since Job was in all probability a descendant of Huz, the eldest son of Nahor the brother of Abraham. From this circumstance, we think we may fairly conclude, that this art was known and practised in the family of Terah the father of Abraham.

3. There was certainly a tradition among the Jews in the age of Josephus, that writing was an antediluvian invention. That historian pretends, that the descendants of Seth erected two pillars, the one of stone and the other of brick, and inscribed upon them their astronomical observations and other improvements. This legend shows that there did exist such an opinion of the antiquity of the art of writing.

4. There must have been a tradition to the same purpose among the Chaldeans, since the writers who have copied from Berosus, the celebrated Chaldean historian, speak of alphabetical writing as an art well known among the antediluvians. According to them, Oannes the Chaldean legislator gave his disciples an insight into letters and science. This person also wrote concerning the generation of mankind, of their different pursuits, of civil polity, &c. Immediately before the deluge (say they) the god Cronus appeared to Sisuthrus or Xisuthrus, and commanded him to commit to writing the beginning, improvement, and conclusion of all things down to the present term, and to bury these accounts securely in the temple of the Sun at Seppara. All these traditions may be deemed fabulous in the main; but still they evince that such an opinion was current; and that though the use of letters was not indeed eternal, it was, however, prior to all the records of history; and of course, we think, an antediluvian discovery.

This original alphabet, whatever it was, and however constructed, was, we think, preserved in the family of Noah, and from it conveyed down to succeeding generations. If we can then discover the original Hebrew alphabet, we shall be able to investigate the primary species of letters expressive of those articulate sounds by which man is in a great measure distinguished from the brute creation. Whatever might be the nature of that alphabet, we may be convinced that the ancient Jews deemed it sacred, and therefore preserved it pure and unmixed till the Babylonish captivity. If, then, any monuments are still extant inscribed with letters prior to that event, we may rest assured that these are the remains of the original alphabet.

There have, from time to time, been dug up at Jerusalem, and other parts of Judea, coins and medals, and medallions, inscribed with letters of a form very different from those square letters in which the Hebrew Scriptures are now written.

When the Samaritan Pentateuch was discovered (Q) it evidently appeared that the inscriptions on those medals and coins were drawn in genuine Samaritan characters. The learned Abbé Barthelemy, in his * Dissert. Mem. de l'Academ. de l'Inscript. &c. on the two medals of Antigonus king of Judea, proved that all the inscriptions on the coins and medals of Jonathan and Simon Maccabenus, and also on his, were invariably in the Samaritan character, down to the 40th year before the Christian era.*

It was easy to prove, from the Mishna and Jerusalem Talmud, that the Scriptures publicly read in the synagogues to the end of the second century were written in the Samaritan character, we mean in the same character with the Pentateuch in question. As the ancient Hebrew, however, ceased to be the vulgar language of the Jews after the return from the Babylonish captivity, the copies of the Bible, especially in private hands, were accompanied with a Chaldaic paraphrase, and at length the original Hebrew character fell into disuse, and the Chaldaic was universally adopted.

It now appears that the letters inscribed on the ancient coins and medals of the Jews were written in the Samaritan form, and that the Scriptures were written in the very same characters: we shall therefore leave it to our readers to judge whether (considering the implacable hatred which subsisted between these two nations) it be likely that the one copied from the other; or at least that the Jews preferred to the beautiful letters used by their ancestors, the rude and inelegant characters of their most detested rivals. If, then, the inscriptions on the coins and medals were actually in the characters of the Samaritan Pentateuch (and it is absurd to suppose that the Jews borrowed them from the Samaritans), the consequence plainly is, that the letters of the inscriptions were those of the original Hebrew alphabet, coeval with that language, which we dare to maintain was the first upon earth.

It may, perhaps, be thought rather superfluous to mention, that the Samaritan colonists, whom the kings of Assyrria planted in the cities of Samaria (F), were natives of countries where Chaldaic letters were current, and who were probably ignorant of the Hebrew language and characters. When those colonists embraced the Jewish religion, they procured a copy of the Hebrew Pentateuch written in its native character, which, from superstition, they preserved inviolate as they received

---

(q) The celebrated Archbishop Usher was the first who brought the Samaritan Pentateuch into Europe. In a letter to Ludovico Capellos he acknowledges, that the frequent mention he had made of it by some authors, would not suffer him to be at rest till he had procured five or six copies of it from Palestine and Syria.
(r) 2 Kings, chap. xvii. ver. 24. "And the king of Assyrria brought men from Babylon, and from Cuthah, and from Hamath, and from Avah, and placed them in the cities of Samaria." Babylon and Cuthah, and Avah, were neighboring cities, and undoubtedly both spoke and wrote in the Chaldaic style. The natives of Hamath spoke the Syriac, which at that time differed very little from the Chaldaic.
PHILOLOGY.

From the reasons above exhibited, we hope it will appear, that if the Hebrew alphabet, as it appears in the Samaritan Pentateuch, was not the primitive one, it was at least that in which the Holy Scriptures were first committed to writing.

Scaliger has inferred, from a passage in Eusebius* and another in St Jerome†, that Ezra, when he reformed the Jewish church, transcribed the Scriptures from the ancient characters of the Hebrews into the square letters of the Chaldeans. This, he thinks, was done for the use of those Jews who, being born during the captivity, knew no other alphabet than that of the people among whom they were educated. This account of the matter, though probable in itself, and supported by passages from both Talmuds, has been attacked by Buxtorf with great learning and no less acrimony. Scaliger, however, has been followed by a crowd of learned men (5), whose opinion is now pretty generally espoused by the sacred critics.

Having said so much concerning the Hebrew alphabet in the preceding pages, we find ourselves laid under a kind of necessity of hazarding a few strictures on the vowels and Masoretic points; the first essential, and the last an appendage, of that ancient language. The number of the one, and the nature, antiquity, and necessity of the other, in order to read the language with propriety and with discrimination, have been the subject of much and often illiberal controversy among philological writers. To enter into a minute detail of the arguments on either side, would require a complete volume: we shall, therefore, briefly exhibit the state of the controversy, and then adduce a few observations, which, in our opinion, ought to determine the question.

The controversy then is, Whether the Hebrews used any vowels; or whether the points, which are now called by that name, were substituted instead of them? or if they were, whether they be of a Moses, or were invented by Ezra, or by the Masorites (x)? This controversy has exercised the wits of the most learned critics of the two last centuries, and is still far enough from being determined in the present. The Jews maintain, that these vowel points (u) were delivered to Moses along with the tables of the law; and consequently bold them as sacred as they do the letters themselves. Many Christian authors who have handled this subject, though they do not affirm their divine original, nor their extravagant antiquity, pretend, however, that they are the only proper vowels in the language, and regulate and ascertain its true pronunciation. Though they differ from the Jews with respect to the origin of these points, they yet allow them a pretty high antiquity, ascribing them to Ezra and the members of the great synagogue.

At length, however, about the middle of the 16th century, Elias Levi, a learned German Jew who then resided at Rome, discovered the audacity, and made a modern invention; and it appears that these appendages had never been in use till after the writing of the Talmuds, about 500 years after Christ. This innovation raised Elias a multitude of adversaries, both of his own countrymen and Christians. Among the latter appeared the two Buxtorfs, the father and the son, who produced some cabbalistical books of great antiquity (x), at least in the opinion of the Jews, in which there was expressed mention of the points. The Buxtorfs were answered by Capellus and other critics, till Father Morinus†, having examined all that had been urged on both sides, produced his learned dissertation on that subject; against which there has been nothing replied of any consequence, whilst his work has been universally admired, and his opinion confirmed by those who have beaten the same field after him.

According to this learned father, it plainly appears that neither Origen, nor St Jerome, nor even the compilers of the Talmuds, knew anything of what has been called the vowel points; and yet these books, according to the same author, were not finished till the seventh century. Even the Jewish rabbis who wrote during the eighth and ninth centuries, according to him, were not in the least acquainted with these points. He adds, that the first vestiges he could trace of them were in the writings of Rabbi Ben Aber chief of the western, and of Rabbi Ben Naphthali chief of the eastern school, that is, about the middle of the tenth century; so that they can hardly be said to be older than the beginning of that period.

Some learned men (y) have ascribed the invention of the vowel points in question to the rabbis of the school of Tiberias; which, according to them, flourished about the middle of the second century. This opinion is by no means probable, because it appears plain from history, that before that period all the Jewish seminaries in that province were destroyed, and their heads forced into exile. Some of these retired into Babylonia, and settled at Sora, Nabedas, and Pompebiata, where they established famous universities. After this era, there remained no more any rabbinical schools in Judæa, headed by professors capable of undertaking this difficult operation, nor indeed of sufficient authority to recommend it to general practice, had they been ever so thoroughly qualified for executing it.

Capellus and Father Morin, who contend for the late introduction of the vowel-points, acknowledge that

---

(x) These points are 14 in number, whose figures, names, and effects, may be seen in most Hebrew grammars.

(u) These are the so-called masorah or massoreth, which signifies "tradition," and imports the unwritten canon by which the reading and writing of the sacred books was fixed.

(y) See Buxtorf the father, in Tiber. cap. 5, 6, 7. Buxtorf the son, de Antiq. Fuct. P. II. i.
PHILOLOGY.

Hebrew Language.

that there can certainly be no language without vocal sounds, which are indeed the soul and essence of speech; but they affirm that the Hebrew alphabet actually contains vowel characters, as well as the Greek and Latin and the alphabets of modern Europe. These are alpha, alpha, and the others; they call the matres lectionis, or, if you please, the parents of reading. To these some, we think very properly, add ain or ai, eijin. These, they conclude, perform exactly the same office in Hebrew that their descendants do in Greek. It is indeed agreed upon all hands, that the Greek alphabet is derived from the Phoenician, which is known to be the same with the Samaritan or Hebrew. This position we shall prove more fully when we come to trace the origin of the Greek tongue. Hitherto the analogy is not only plausible, but the resemblance precise. The Hebrews and Samaritans employed these vowels exactly in the same manner with the Greeks; and so all was easy and natural.

But the asserters of the Masoretic system maintain that the letters mentioned above are not vowels but consonants or aspirations, or any thing you please but vocal letters. This they endeavour to prove from their use among the Arabeans, Persians, and other oriental nations: But to us it appears abundantly strange to suppose that the Greeks pronounced beta, gamma, delta, &c. exactly as the Hebrews and the Phoenicians did, and yet at the same time did not adopt their mode of pronunciation with respect to the five letters under consideration. To this argument we think every objection must undoubted yield. The Greeks borrowed their letters from the Phcenicians; these letters were the Hebrew or Samaritan. The Greeks wrote and (z) pronounced all the other letters of their alphabet, except the five in question, in the same manner with their originals of the east: if they did so, it obviously follows that the Greek and oriental office of these letters was the same.

Another objection to reading the Hebrew without the aid of the Masoretic vowel points, arises from the consideration, that without these there will be a great number of radical Hebrew words, both nouns and verbs, without any vowel intervening amongst the consonants, which is certainly absurd. Notwithstanding this supposed absurdity, it is a well known fact, that all the copies of the Hebrew Scripture, used in the Jewish synagogues throughout the world, are written or printed without points. These copies are deemed sacred, and kept in a coffer with the greatest care, in allusion to the ark of the testimony in the tabernacle and temple. The prefect, however, reads the portions of the law and hagiographa without any difficulty. The same is done by the remains of the Samaritans at this day. Every oriental scholar knows that the people of these countries look upon consonants as the stems of words. Accordingly, in writing letters, in dispatches upon business, and all affairs of small moment, the vowels are generally omitted. It is obvious, that in every original language the sound of the vowels is variable and of little importance. Such was the case with the Hebrew tongue: Nor do we think that the nates of the country would find it a matter of much difficulty to learn to read without the help of the vowels. They knew the words beforehand, and so might readily enough learn by practice what vowels were to be inserted.

When the Hebrew became a dead language, as it certainly was in a great measure to the vulgar after the return from the Babylonic captivity; such subsidiaries might we think, have been useful, and of course might possibly have been adopted for the use of the vulgar: but the scribe, the lawyer, and the learned rabbi, probably disdained such beggarly elements. We shall in this place hazard a conjecture, which, to us at least, is altogether new. We imagine that the Phcenicians, who were an inventive, ingenious people, had, prior to the age of Cadmus, who first brought their letters into Greece, adopted the more commodious method of inserting the vowels in their proper places; whereas the Jews, zealously attached to the customs of their ancestors, continued to write and read without them. In this manner the Gephyrus, who were the followers of Cadmus, communicated them to the Jones their lib. 25 and upon that ground have often endeavoured to trace the origin of Greek words in the Hebrew, Phcenician, Chaldean, and Arabian languages. Reading without the vowel points we have seldom failed in our search; but when we followed the method of reading by the Masoretic points, we seldom succeeded; and this, we believe, every man of tolerable erudition will make a trial will find by experience to be true. This argument appears to us superior to every objection. Upon this basis, the most learned Bochart has erected his etymological fabric, which will be admired by the learned and ingenious as long as philology shall be cultivated by men.

It has been urged by the zealots for the Masoretic system, that the Arabeans and Persians employ the vocal points. That they do so at present is readily granted; but whether they did so from the beginning seems to be the question. That Arabia was overspread with Jewish exiles at a very early period, is abundantly certain. It was natural for them to retire to a land where they would not hear of war nor the sound of the trumpet. Accordingly we find that, prior to the age of the Arabian impostor, Arabia swarmed with Jewish settlements. From these Jews, it is highly probable that their neighbours learned the use of the points in question; which in the course of their conquests the Sarmacens communicated to the Persians.

It has been alleged with great show of reason, that without the vowel points, it is often impossible to develop the genuine signification of many words which occur frequently in the language: many words of different and sometimes opposite significations are written with exactly the same consonants. Without the points, then, how are we to know the distinction? In answer to this objection, we beg leave to observe, that during the first period of a language, it is impossible that there should

(2) This is so true, that, according to Hesychius and Suidas, θανάτως, to act the Phcenician, signified "to read.

VOL. XVI. Part I.

+ P p
PHILOLOGY.

Section I.

Ouiar elceim eth aor khi tōb ouiabdēi elceim ben aor oubēn nōsekh.

According to the Masorites.

Bereshith bara Elohim eth ashammajim veeth aaretz.

Vasareetz ajetha thoon vaboou, vekhoshek gnael penē theom verousakh elohim merakhepheth gnael penē hamālin.

Vasmer elohim jehi or, vajehi or.

Vajjem elohim eth aor ki tob vajbedel elohim bein aor oubein hakhoshek.

Upon the whole, we presume to give it as our opinion, that in the most early periods, the vowels, aleph, he, jod or yod, vau or wau, and perhaps ain or ajin, were regularly written wherever they were sounded. This to us appears plain from the practice of the oldest Greeks. It is agreed on all hands that the Phoenician and Phoenician alphabets were the same; and that the former was that of the Jews originally.

The Greeks certainly wrote the vowels exactly, so did the Greeks who copied their alphabet: If the Phoenicians wrote their vowels, so then did the Jews of the age of Cadmus; but Cadmus was contemporary with some of the earliest judges of Israel; the consequence is evident, namely, that the Jews wrote their vowels as late as the arrival of that colony-chief in Greece. We ought naturally to judge of the Hebrew by the Chaldaic, Syriac, and Arabic, its sister dialects. All these languages in ancient times had their vowels regularly inserted; and why not the Hebrew in the same manner with the rest?

As these first vowels which were coeval with the other letters, often varied in their sound and application, the points, in all appearance, were first invented and employed to ascertain their different sounds in different connections. Other marks might be invented to point out the various tones of voice, like the vau, or accents, with which the vowels were to be enounced, as was done among the later Greeks. In process of time, in order to promote celerity of writing, the vowels were omitted, and the points substituted in their place.

Before we conclude our observations on the Hebrew language, we ought, perhaps, to make an apology for omitting to interlard our details with quotations from the two Talmuds, the Mishna, the Gemara, the Cabalas, and a multitude of rabbinical writers who are commonly cited upon such an occasion. We believe we could have quoted almost numberless passages from the two Buxtorfs, Father Morin, Capellus, and other Hebrew critics, with no great trouble to ourselves, and little emolument to the far greater part of our readers. But our opinion is that such a pedantic display of philological erudition would probably have excited the mirth of our learned, and aroused the indignation of our unlearned, readers. Our wish is, to gratify readers of both descriptions, by contributing to the edification of one class without disgusting the other.

We cannot, we imagine, fairly take leave of the sacred language, without giving a brief detail of those excellencies, which, in our opinion, give it a just claim to the superiority over those other tongues which have sometimes contended with it for the prize of antiquity:
Sect. I.  

PHILOLOGY.

We would not, however, be thought to intimate that this tongue continued altogether without changes and imperfections. We admit that many radical words of it were lost in a course of ages, and that foreign ones were substituted in their place. The long sojournings of the Israelites in Egypt, and their close connection with that people, even quoad sacra, must have introduced a multitude of Egyptian vocables and phrases into the vulgar dialect at least, which must have gradually incorporated with the written language, and in process of time have become part of its essence. In Egypt, the Israelites imbibed those principles of idolatry which nothing less than the final extermination of their polity could eradicate. If that people were so obstinately attached to the Egyptian idolatry, it is not very probable that they would be averse from the Egyptian language. Besides, the Scripture informs us, that there came up out of Egypt a mixed multitude; a circumstance which must have infected the Hebrew tongue with the dialect of Egypt. As none of the genuine Hebrew radicals exceed three letters, whatever words exceed that number in their radical state may be justly deemed of foreign extraction.

Some Hebrew critics have thought that verbs constitute the radicals of the whole language; but this opinion appears to us ill founded: for though many Hebrew nouns are undoubtedly derived from verbs, we find at the same time numbers of the latter deduced from the former.

Before we conclude our detail of the Hebrew tongue, a few of our readers may possibly imagine that we ought to give some account of the Hutchinsonian system; a system so highly in vogue not many years ago. But as this allegorical scheme of interpretation is now in a manner exploded, we shall beg leave to recall our curious Hebraist to Mr Holloway’s Originals, a small book in 2 vols 8vo, but replete with multifarious erudition, especially in the Hutchinsonian style and character.—Fides sit penes autorem.

Sect. II. The Arabic Language.

We now proceed to give some account of the Arabian or Arabic language, which is evidently one of the sister dialects of the Hebrew. Both, we imagine, were originally the same; the former highly improved and enlarged; the latter, in appearance, retaining its original simplicity and rude aspect, spoken by a people of a genius by no means inventive. In this inquiry, too, as in the former, we shall spare ourselves the trouble of descending to the grammatical minutiae of the tongue; a method which, we are persuaded, would neither gratify our learned nor edify our unlearned readers. To those who are inclined to acquire the first elements of that various, copious, and highly improved tongue, we beg to recommend Erpenius Rudimenta Ling. Arab.; Goll’s Gram. Arab.; the Dissertations of Hariri, translated by the elder Schultens; Mr Richardson’s Persic and Arabic Gram. &c.

We have pronounced the Hebrew and Arabian sister dialects; a relation which, as far as we know, has been seldom controverted: but we think there is authentic historical evidence that they were positively one and the same, at a period when the one as well as the other
PHILOLOGY.

The following detail will, we hope, fully authenticate the truth of our position.

† Gen. ii. 9; Gen. ii. 11.

"Unto Eber (says the Scripture) were born two sons. The name of one was Peleg, because in his days the earth was divided; and his brother's name was Joktan," or rather Yuktan. This last, says the sacred historian, "had thirteen sons; and their dwelling reached from Mesha (Mocha) to Sephar (A)," a mount of the east. According to this account, the descendants of Yuktan possessed all the maritime coasts of Arabia from Mesha (Mocha) to Mount Sephar towards the east of that peninsula. Moses, describing the rivers of paradise, tells us, that one of the branches of that river "encompassed the whole land of Havilah, where there was great store of gold." Havilah was the twelfth son of Yuktan, whom the Arabsians call Kobtan; and consequently his territory was situated towards the eastern limit of the possessions of the postcrity of the youngest son of Eber. Yuktan or Kobtan was too young to be concerned in the building of the tower; and consequently retained the language of his family, which was undoubtedly the Hebrew. His descendants must have carried the same language into their respective settlements, where it must have been transmitted to succeeding generations. The original language of all the tribes of the Arabsians who inhabit a vast tract of country along the southern shore, according to this deduction, was that of their father Kobtan, that is, the Hebrew. Indeed, the most learned Arabsians of modern times unanimously acknowledge this patriarch as the founder of their language as well as of their nation.

The other districts of Arabia were peopled by the offspring of Abraham. The Ishmaelites, the posterity of that patriarch by Hagar, penetrated into the very centre of the peninsula; incorporated, and in process of time became one people with the Kobtanites. Another region was possessed by the children of the same holy man by Cheturah his second wife. The Moabites, Ammonites, Edomites, Amalekites, &c. who settled in the various regions of Arabia Petraea, were all branches of Abraham's family, and used the same language with their great progenitor. The Scripture indeed speaks of people who inhabited the country last mentioned prior to the branches of Abraham's family; but these, according to the same history, were extirpated by the former. The conclusion then is, if we credit the Mosaic account, that all the inhabitants of the three divisions of Arabia did, in the earliest periods, universally use the Hebrew tongue.

There was, we are sensible, a region of Arabia inhabited by the Cushim, or descendants of Cush. This district was situated on the confines of Babylonia. Our translators have confounded this country with the modern Ethiopia; and have consequently ascribed the exploits of the Arabian Cushim to the Ethiopians. The Arabian kings of Babylon were of those Cushim. These were conquered and expelled Babylonia by the Chasidim. These spoke the Chaldean dialect, as will appear when we come to speak of that of the Abyssinians.

Here the candid reader is desired to reflect that the Hebrew and Chaldaic are cognate dialects.

The foregoing proofs, deduced from the Mosaic history, will be corroborated by a mass of internal evidence in the succeeding parts of our inquiry.

The Arabic tongue, originally pure Hebrew, was in a process of time greatly transformed and altered from its divided simple unsophisticated state. The Arabsians were divided into many different tribes; a circumstance which naturally produced many different dialects. These, however, were not of foreign growth. No foreign enemy ever conquered those independent hordes. The Persians, Greeks, and Romans, sometimes attempted to invade their territories; but the roughness of the ground, the scarcity of forage, the penury of water, and their natural bravery, always protected them. They were indeed once invaded by the Abyssinians or Ethiopians with some show of success; but these invaders were in a short time expelled the country. Their language, of consequence, was never adulterated with foreign words or exotic phrases and idioms. Whatever augmentations or improvements it received were derived from the genius and industry of their natives, and not from adventurous or imported acquisitions. From this circumstance we may justly infer, that the Arabian tongue was a long time stationary, and of course differed in no considerable degree from its Hebrew archetype. The learned Schultens, in his Commentary on Job, hath shown, to the conviction of every candid inquirer, that it is impossible to understand that sublimes composition without having recourse to the Arabic idioms. That patriarch was a Chuzite. His country might be reckoned a part of Arabia. His three friends were actually Arabsians, being the descendants of Ishmael and Esau. His country bordered with that of the predatory Chaldeans, who were an Arabian banditti. When we consider all these circumstances in cumulo, we are strongly inclined to believe that the book of Job was actually written in Arabic, as the language stood at that period; which, according to the most probable opinion, could not have been later than the age of Moses. The learned are generally agreed that this whole book, the three first chapters excepted, is a poetical composition, replete with the most brilliant and most magnificent imagery, the boldest, the justest, and most gorgeous tropes and allusions, and a grandeur of sentiment wholly divine. Whoever has read the poetical compositions of the modern Arabsians, on divine subjects, with any degree of taste, will, we flatter ourselves, discover a striking similarity both of diction and sentiment. Be this as it may, we think there is no reason to conclude that the Arabic dialect deviated much from the Hebrew standard prior to the Christian era.

At the two various tribes among which the peninsula of Arabia was principally divided, the principal were the Hemyarites and the Kareb. Though some of those were tributary to the Tolban, or Hemyarite sovereign of Arabia Felix, yet they took no great pains to cultivate the language of that province, and of course these people did not thoroughly

PHILOLOGY.

As for the independent tribes, they had no temptation to cultivate any other language than their own.

The Kureish tribe was the noblest and the most learned of all the western Arabs; and the kaaba, or square temple of Mecca, was before the era of Mohammed solely under their protection. This temple drew annually a great concourse of pilgrims from every Arabian tribe, and indeed from every other country where the Sabian religion prevailed. The language of the Kureish was studied with emulation by the neighbouring tribes. Numbers of the pilgrims were people of the first rank, and possessed all the science peculiar to their country or their age. Great fairs were held during their residence at Mecca, and a variety of gay amusements filled up the intervals of their religious duties. In these entertainments literary compositions bore the highest and most distinguished rank; every man of genius considering not his own reputation alone, but even that of his nation or his tribe, as interested in his success. Poetry and rhetoric were chiefly esteemed and admired; the first being looked upon as highly ornamental, and the other as a necessary accomplishment in the education of every leading man. An assembly at a place called Oedia, had been in consequence established about the end of the sixth century, where all were admitted to a rivalship of genius. The merits of their respective productions were impartially determined by the assembly at large; and the most approved of their poems, written on silk, in characters of gold, were with much solemnity suspended in the temple, as the highest mark of honour which could be conferred on literary merit. These poems were called the Mothabat, “suspended,” or Mothabebat, “golden.” Seven of these are still preserved in many European libraries.

From this uncommon attention to promote emulation, and refine their language, the dialect of the Kureish became the purest, the richest, and the most polite, of all the Arabian idioms. It was studied with a kind of predilection; and about the beginning of the seventh century it was the general language of Arabia, the other dialects being either incorporated with it, or sliding gradually into disuse. By this singular idiomatic union the Arabic has acquired a prodigious fecundity; whilst the luxuriance of synonyms, and the equivocal or opposite usage of the same or similar words, hath furnished their writers with a wonderful power of indulging, in the fullest range, their favourite passion for antithesis and quaint allusion. One instance of this we have in the word veli; which signifies a prince, a friend, and also a slave. This same word, with the change of one letter only, becomes vali; which, without equivocation, imports a sovereign. Examples of this kind occur in almost every page of every Arabic dictionary.

But all these advantages of this incomparable language are merely modern, and do not reach higher than the beginning of the sixth century. Prior to that era, as we have observed above, a variety of dialects obtained; and as the Arabs were by their situation in a manner sequestered from all the rest of mankind, it may not perhaps be superfluous to inquire briefly into the cause and origin of this instantaneous and universal change.

For a course of more than 20 centuries, the Arabs had been shut up within the narrow limits of their own peninsula, and in a great measure secluded from the rest of the world. Their commerce with India was purely mercantile, and little calculated to excite or promote intellectual improvements. They traded with the Egyptians from time immemorial; but since the invasion and usurpation of the pastor kings, every shepherd, that is, every Arabian, was an abomination to the Egyptians. From that quarter, therefore, they could not derive much intellectual improvement. Besides, when an extensive territory is parcelled out among a number of petty septs or clans, the feuds and contests which originate from interfering interests and territorial disputes, leave but little time, and less inclination, for the culture of the mind. In these circumstances, the military art alone will be cultivated, and the profession of arms alone will be deemed honourable. Of consequence, we find that, in the general opinion, poetry, rhetoric, and the profession of arms, were the only sciences cultivated by the people in question. As for the science of arms, we are convinced that it was both studied and practised at a very early period; but as to the two former, we imagine they were very late acquisitions, and sprung from some circumstance external and adventitious.

The tribe of the Kureish were much engaged in commerce. They exported frankincense, myrrh, cassia, galbanum, and other drugs and spices, to Damascus, Tripoli, Palmyra, and other commercial cities of Syria and its neighbourhood. Upon these occasions the Arabian traders must have become acquainted with the Greek language, and perhaps with the more amusing and affecting parts of the Grecian literature. They might bear of the high renown of Homer and Demosthenes; and it is not impossible that some of them might be able to read their compositions. Every body knows with what unremitting ardour the learned Arabs, under the first caliphs, perused and translated the philosophical works of the Grecian sages. The very same spirit might animate their predecessors, though they wanted learning, and perhaps public encouragement, to arouse their exertions. From this quarter, we think, the Arabs may have learned to admire, and then to imitate, the Grecian worthies.

The Ptolemies of Egypt were the profound patrons of commerce as well as of learning. Under these princes all nations were invited to trade with that happy country. The Arabs, now no longer fettered by Egyptian jealousy, carried their precious commodities to Alexandria; where the Grecian literature, though no longer in its meridian splendour, shone however with a clear unfaded lustre. The court of the first Ptolemies was the retreat of all the most celebrated geniuses of Greece and of the age; in a word, Alexandria was the native land of learning and ingenuity. Here the ingenious Arab must have heard the praises of learning incessantly proclaimed; must have been often present at the public exhibitions of the poets and orators; and even though he did not understand them exactly, might be charmed with the melody of the diction, and struck with surprise at their effects on the audience. The reader will please to reflect, that the Arabian traders were the first men of the nation, both with respect to birth, learning, and fortune. These wise men, to use the law of Institution, inspired with the natural curiosity of Scripture, inspired with the natural curiosity of the race, might hear of the celebrated Olympic games, the public recitations before that assembly, and the
PHILOLOGY.

The glorious prize bestowed upon the conquerors. Such information might animate them to institute something parallel at Mecca, with a view to improve their language, and at the same time to derive honour and emolument to themselves. The Koreishim might promise themselves the like advantages from the establishment of the fair and assembly at Ocaul, as the natives of Elisa drew from the institution of the Olympic games. For these reasons, we conjecture, the literary competitions at the place just mentioned were instituted at so late a period, though the nation had existed more than 2000 years before the establishment of this anniversary. Upon the whole, we are inclined to believe, that the Arabs, notwithstanding all the fine things recorded of them by their own poetical historians, and believed perhaps too easily by those of other countries, were in the days of ignorance like the earliest Romans, latrones et semiarbari. For our part, we think it by no means probable, that a people of that character should, after so long a course of years, have stumbled upon so laudable and so beneficial an institution, without taking the hint from some foreign one of a similar complexion. This we acknowledge is only a conjecture, and as such it is submitted to the judgment of the reader.

There were, as has been observed above, two principal dialects of the original Arabic: the Hamyarite spoken by the genuine Arabs, and the Koreishite or pure Arabic, which at last became the general language of that people. The former of these inclined towards the Syriac or Chaldaic: the latter being, according to them, the language of Ishmael, was deeply inducted with the Hebrew idiom. The oriental writers tell us that Terra, the grandfather of Hamyar, was the first whose language deviated from the Syriac to the Arabic. Hence, say they, the Hamyaritic dialect must have approached near to the purity of the Syriac, and of consequence must have been more remote from the true genius of the Arabic than that of any of the other tribes. The fact seems to stand thus: The Hamyarites were neighbours to the Chaldæans and Syrians, and consequently were connected with those people by commerce, wars, alliances, &c. This circumstance introduced into their language many phrases and idioms from both these nations. That Terra was concealed from both the dialect of the Hamyarites, is a mere oriental legend, fabricated by the Arabs after they began to peruse the Hebrew Scriptures. The Koreish being situated in the centre of Arabia, were less exposed to intercourse with foreigners, and therefore preserved their language more pure and unadulterated.

The learned well know, that the Koran was written in the dialect of the Koreish; a circumstance which communicated additional splendour to that branch of the Arabic tongue. It has been proved, that the language of the original inhabitants of Arabia was genuine Hebrew; but upon this supposition a question will arise, namely, whether the Arabsians actually preserved their original tongue pure and unsophisticated during a space of 3000 years, which elapsed between the deluge and birth of Mohammed? or, whether, during that period, according to the ordinary course of human affairs, it underwent many changes and deviations from the original standard?

The admirers of that language strenuously maintain the former position; others, who are more moderate in their attachment, are disposed to admit the latter.

Chardin observes of the oriental languages in general, that they do not vary and fluctuate with time like the European tongues. "Ce qu'il y a de plus admirable, dit il, et de plus remarquable, dans ces langues, c'est qu'elles ne changent point, et n'ont point changé du tout, soit à l'égard de termes, soit à l'égard du tour: rien n'y est, ni nouveau ni vieux, nulle bonne façon de parler n'a cessé d'être en crédit. L'Alcoran, par exemple, est aujourd'hui, comme il y a mille ans, le seul ouvrage, le plus court, et plus élégante digtion." It is not to our purpose to transcribe the remaining part of the author's reflection upon this subject: From the above it plainly appears that he concludes, that the Arabian tongue has suffered no change since the publication of the Koran; and at the same time insinuates, that it had continued invariable in its original purity through all ages, from the days of Kowtan to the appearance of that book. Whether both or either of these sentiments is properly authenticated will appear in the sequel.

The learned Dr Robertson, late professor of oriental languages in the university of Edinburgh, informs us, debted by that the Arabsians, in order to preserve the purity of their language, strictly prohibited their merchants, who the purity were obliged to go abroad for the sake of commerce, all of their language with strange women. We know not where guest this injunction is recorded, but certainly it was a most terrible interdict to an amorous son of the desert. If such a prohibition actually existed, we suspect it originated from some other source than the fear of corrupting their language. Be that as it may, the Doctor, as well as the great Schultens, is clearly of opinion, that the language in question, though divided into a great number of streams and canals, still flowed pure and limpid in its course.

Our readers are acquainted with the history of the orientals are already apprized of the steady attachment of those people to ancient customs and institutions. We readily allow, that in the article of Language this same predilection is abundantly obvious; but every oriental scholar must confess, that the style of the Koran is at this day in a manner obsolete, and become almost a dead language. This fact we believe, and has been the quizzed of the Koran now abundantly from the standard of the Koran in little more than 1000 years, and that too after an archetype is ascertained; by a variety of reason we may infer, that much greater deviations must have affected the language in the space of 3000 years.

It is universally allowed, by such as maintain the unsullied purity of the Arabian tongue, that it was originally the same with the Hebrew, or with the ancient Syriac and Chaldaic. Let any one now compare the words, idioms, and phraseology of the Koran with the remains of those three languages, and we think we may venture to affirm that the difference will be palpable. This circumstance, one would think, indicates in the strongest terms a remarkable alteration.

The Arabs themselves are agreed, that, notwithstanding the amazing fecundity of their language, vast numbers of its radical terms have been irrecoverably lost. But this loss could not be supplied without either fabricating new words or borrowing them from foreign languages. To the latter method we have seen their aver-
Sect. II. PHILOLOGY.

Arabic Language. Ancient and modern Arab historians, and Arabic writers generally, have always thought it probable that the patriarch Job alludes in Language, to the ancient Arabic language of the Syriac and Chaldaean, and that the dialect of the Syrian or Chaldate, in which those passages where he seems to intimate an inclination to have his sufferings recorded in a book and graven in the rock for ever, was the language of the Syrian or Chaldaic, and that it was the language of the Syriac or Chaldaic nation. This we have imputed to the connection of that people with the Chaldeans, who were allies of the Israelites. If the Chaldaic dialect was infected with the Syriac and Chaldaic, there can be no doubt that they derived their letters from the same quarter.

We conclude then, that the Chaldaic art in Chaldaic of writing from the earliest antiquity, and that the letters they employed were the rude Chaldaic in their unimproved state. Some of the Egyptians do indeed hold, that Islamel was the first author of letters; but a still more ancient Egypt, that his characters were rude and indistinct, without any interval between letters or words, and that these were adopted by strangers, and his other children: but this tradition hath met with little credit.

With respect to the highly polished Korêshites, it is agreed on all hands, that they were unacquainted with the use of letters till a few years before the birth of Mohammed. Two difficulties here present themselves. The first is, how the Korâshites, without the art of writing, happened to excel all the other dialects of Art of writing, the Arabic tongue, assisted by that art, apparently so urgent and necessary for preserving a language in its original purity, the Kareishites. The second is, how the Korâshites learned that most useful art at so late a period as the sixth century. It is a well known fact, that ever after the Babylonish captivity Arabia swarmed with Jewish villages, in which the art of writing was generally known; and almost at the beginning of the Christian era, multitudes of Christians retired to the same country, in order to avoid the persecutions which they suffered in the Roman empire. In these circumstances, we think it rather strange, that the Kareishites, highly polished and acute as they were, never thought of laying hold on the opportunity of learning an art so very useful. These two problems we leave to be solved by our more learned readers.

But however they be solved, it is universally acknowledged, that the Kareish were ignorant of letters till a few years before the birth of their prophet. Ebn Chalchhan (b), one of their most celebrated historians, informs us, that Moramir the son of Morra, an Anbarian, a native of Anbaria, a city of Irak (c), first invented alphabetical characters, and taught his countrymen to use them, from whom this noble invention was derived to the Kareishites. These letters, though neither beautiful nor convenient, were long used by the Kareish. They were denominated Caphrite, from Caphra, a city of Irak. In this character the original copy of the Koran was written. These we think were the original clumsy characters which were retained by the vulgar, after the beautiful square Chaldaic letters were invented, and probably used by priests, philosophers, and the learned.

* In Cypriote.

See this whole detail in Dr Pococke’s Specim. Hist. Arab. p. 250. et seq.

(b) Iraéc, “Babylonie,” from Erech, one of the cities built by Nimrod. The Arabians have generally restored the ancient names of places. Thus, with &c. Eta is, Paur, Sidoen Sect, Egypt Medir, &c.
learned in general. These letters are often at this day used by the Arabs for the titles of books and public inscriptions.

Abuali the son of Mocla *, about 300 years after the death of Mohamed, found out a more elegant and more expeditious character. This invention of Abuali was afterwards carried to perfection by Ibn Bowla, who died in the year of the Hegira 413, when Kader was caliph of Baghdad. This character, with little variation, obtains at this day. As we think this article of some importance, we shall, for the sake of our unlearned readers, transcribe an excellent account of this whole matter from the very learned Schultens.

"The Coptic character, says he, which had been brought from the region of the Chaldeans to the province of Hejaz, and to Mecca its capital, in the age of Mohamed, was employed by the Koréishites, and in the Koran it was first written. But as this character was rude and clumsy, in consequence of its size, and ill calculated for expedition, Abuali Ibn Mocla devised a more elegant and expeditious one. This person was visit to Avarhiss the 41st caliph, who began to reign in the year of the Hegira 322. Accordingly, in the 10th century, under this emperor of the Saracens, the form of the Arabian alphabet underwent a change; and the former clumsy embarrased character was made to give way to the polished, easy, and expeditious type. Regarding this expedition alone, the author of the invention left very few vowel characters; and as the Hebrew manner of writing admits five long ones and five short in different shapes, he taught: how to express all the vowels, both long and short, suitably to the genius of the language, by three, or rather by two, small points, without any danger of a mistake: an abbreviation truly deserving applause and admiration; for by placing a very small line above he expressed a and e; and by placing the same below he meant to intimate i only. To the other short ones, o and u, he assigned a small waw above. In order to represent the long ones, he called in the matres lectionis, the "quiescent letters μ, ν"; so that phata with elf intimated a and o long, i.e. hamets and cholem; jod placed after kefram became tseri and chirek long. Waw annexed to damma made shurekh."

In this passage, the great orientalist acknowledges that the visit above mentioned, who carried the Arabian alphabet to the pinnacle of perfection, invented and annexed the vowel points for the sake of ease and expedition in writing; from which we may infer, prior to the tenth century the Arabs had no vowel points; and consequently either read without voices, or contented themselves with the matres lectionis above mentioned.

The design of the author of the invention, in fabricating these points, was confessedly ease and expedition in writing; a circumstance which furnishes a violent presumption that the Hebrew vowel-points were devised and annexed at some late period for the very same purposes.

Some, indeed, have gone so far as to affirm that the Arabs were the original fabricators of the vowel-points. "The Arabs t (says the learned Dr Gregory Sharp) were the original authors of the vowel points. They invented three, called fatha, and damma, and kefram: but these were not in use till several years after Mohammed; for it is certain that the first copies of the Koran were without them. The rabbis stole them from the Arabs." This, however, is carrying the matter too far, since it is certain that the Jews were acquainted with the points in question long before the period above mentioned. Though it is not our intention to enter into a minute detail of the peculiarities of this noble language, we cannot omit observing one thing, which indeed belongs to grammar, but is not generally taken notice of by the Arabic grammarians. The roots of verbs in this dialect are universally trilingual; so that the composition of the 29 Arabian letters would give near 23,000 elements of the language. This circumstance demonstrates the surprising extent of it: for although great numbers of its roots are irrecoverably lost, and some perhaps were never in use; yet if we suppose 10,000 of them, without reckoning quadrilaterals, to exist, and each of them to admit only five variations, one with another, in forming derivative nouns, the whole language would then consist of 50,000 words, each of which may receive a multitude of changes by the rules of grammar.

Again, the Arabic seems to abhor the composition of words, and invariably expresses very complex ideas by circumlocution; so that if a compound word be found in any dialect of that language, we may at once pronounce it of foreign extraction. This is indeed a distinguishing feature in the structure of this tongue, as well as of some of its sister dialects. This circumstance has, in our opinion, contributed not a little to the amazing fecundity of that language: for as every ingredient in the composition of a complex idea requires a word to express it, as many words became necessary to complete the language as there were simple ideas to be intimated by discourse. Were all the compounds of the Greek language to be dissolved, as probably once they were, the vocabularies of that tongue would infinitely exceed their present number.

The Arabic authors boast most unconsciously of the richness and variety of their language. No human understanding, say they, is capacious enough to comprehend all its treasures. Inspiration alone can qualify one for exhausting its sources. * Ebn Chalawah, a most renowned grammarian of theirs, has spent a whole volume upon the various names of the lion, which amount to 500; another on the names of the serpent, which make up 200. Mohamed Al Firkacabodius affirms that he wrote a book on the usefulness and different denominations of honey, in which he enumerates 80 of them; and after all, he assures us that he was still far from having exhausted his subject. To excel in a language so amazingly copious, was certainly a proof of uncommon capacity, and considered as no mean talent even among the Koréishites. Hence Mohamed, when some people were expressing their admiration of the eloquence of the Koran, told them that he had been taught by the angel Gabriel the language of Ishmael, which had fallen into desuetude.

In a language so richly replenished with the choicest Oratory and poetry and most energetic terms, both oratory and poetry were cultivated with ease. All the difficulty consisted in making a choice among words and phrases equally elegant. We may compare one of those poets or orators to a young gentleman, of a taste highly refined, walking into a repository where a profusion of the richest and
and most elegant dresses are piled up in wild confusion. Our bean is here distressed with variety; but to be able to choose the most handsome and most becoming, he must have received from nature a superior good taste; which he must likewise have cultivated by assiduous industry, and by associating with the most genteel company.

The orations of the Arabs were of two kinds, metrical and prosaic. The former they compared to pearls set in gold, and the latter to loose ones. They were ambitious of excelling in both; and whoever did so, was highly distinguished. His success in either of those departments was thought to confer honour, not only on his family, but even on his tribe. In their poems were preserved the genealogies of their families, the privileges of their tribes, the memory of their heroes, the exploits of their ancestors, the propriety of their language, the magnificence of banquets, the generosity of their wealthy chiefs and great men, &c. After all, we cannot avoid being of the unpopular opinion, that this mighty parade of eloquence and poetry did not reach backward above two centuries before the birth of Mohammed, as it certainly vanished at the era of the propagation of his religious institutions. The two succeeding centuries were the reigns of superstition and bloodshed. The voice of the muse is seldom heard amidst the din of arms.

The ancient Arabs, at whatever time poetry began to be in request among them, did not at first write poems of considerable length. They only expressed themselves in metre occasionally, in acute rather than harmonious strains. The Proverbs of Solomon, and the book of Ecclesiastes seem to be composed in this species of versification. The prose of the Arabs was never digested into rules till some time after the death of Mohammed; and this is said to have been done by Al Khalti al Farabidi, who lived in the reign of the caliph Harun al Raschid.

After so many encomiums on the copiousness of the Arabic tongue, one class of our readers may possibly expect that we should subjoin a brief detail of its genius and character; and this we shall do with all possible brevity.

All the primary or radical words of the language are composed of different combinations of consonants by triads; so that the various combinations and conjunctions of radicals make more than 10,000, even without including those which may arise from the meeting of guttural letters. From this quality of the language has flowed that stability of the dialect which has preserved it pure and entire for so many thousand years, and secured it from those changes and that fluctuation to which most other tongues are subject.

Perhaps, notwithstanding its copiousness and variety, no other language can vie with the one in question in point of perspicuity and precision. It is possessed of a brevity and rotundity which, amidst the greatest variety, enables it to express with clearness and energy what could not be expressed in any other tongue without tedious circumlocations. To this purpose we shall beg leave to transcribe a passage from Bishop Pococke's own language. As we imagine, few of our readers who will have the curiosity to peruse this article can be unacquainted with the Latin tongue.

we shall give it as it stands in the original, without a translation:

"Neque in nulla certa landis parte, mira illa qua, non solum verborum in significando, perspicuitate, sed in prolatione, elegantiac et dulcedini caverunt, sedulitas; quoque, non solum accuratia, inter literas ex significantia proportione, sensus vel intensio, veri excursio, res postulaverint, literarum appositione, subductione, vel juxta organorum, rationem perspexerunt; sed et ne quid delicatius aurius ingratur, ne quid horridum, aut aequum, reperiat, effecerunt. Hoc in genere est, quod nusquam in verbo aliquo, genuine apud Arabes originis, concurrunt, non interdico gente vocalis alicujus motione consonantes, cum vel tres, vel plures, alius in linguis frequenter collidantur. Immo neque, si adint, que asperiat medicos sint, vocales, quas libet temere tamen committunt consonantes; sed ita natura postulat, ut congruere debeant illa, quae se invicem, sine asperitas inductione consequi, et inter se connecti non possint; illi vel situs, vel literarum mutatione, eas abijiciendo, inserendo, emoliendo, aliis quibus possent modii, remedies querunt, adeo ab uni, quod vel absoneum, vel dissonum est, abhorrent. Quod si nobis secus videntur, et asperius sonare ab Arabibus prolata, illud aurius nostris, et usui, non lingua impusantum, nec mollius illis sonare nostr, quom eorum nobis sensendum. Quin et gutturale, que nobis maxima asperitas causa videntur, absentiam, ut magnum in lingua Graeca defectum, argument Arabus."

The learned Dr Hunt, late professor of the Hebrew and Arabic languages at Oxford, is of the same opinion with the very learned prelate, part of whose oration we have transcribed above, with respect to the delicacy and elegance of the Arabian language:—"Nusquam, mihi credites, (inquit ille) aurius magis parcit quam in Arabic; nulla lingua a omnibus, alienior quam Arabica. Quamquam enim nonnullos ejus litterae minus frustrasse suaviter, immo durius etiam sonuerint, ita tamen Arabes eae temperarunt cum leibus, duras cum mollibus, graves cum acutis miscendo, voces inde non minus auriis jucundae, quam pronunciatae faciles confecerint, totique sermoni miram sonorum tam dulcedinem quam varietatem addiderint. Quod quidem orationis modulandae studium in Corano adeo manifestum est, ut primi Islamismi oppugnatores eum libros magica ideo arte scriptum dixerint. Non auriis tantum gratias est Arabicum, sed et animi conceptus exprimendis aptus, non suas sententiae semper accommodandas, et felici verbo junctura eorum naturam depingens."

To these we might add quotations from Erpenius’s oration on the same subject, from Colius, Schultens, Hottinger, Bochart, and Sir William Jones; besides a whole cloud of Oriental witnesses, whose extravagant encomiums would rather astonish than edify the far greater part of our readers. These panegyrics may perhaps be in some measure hyperbolical; but in general we believe them pretty well founded. At the same time we are convinced that the Arabic, however melodious in ears of a native, sounds harsh and unharmonious in that of an European.

When we consider the richness and variety of the difficulty in the Arabic tongue, we are led to conclude, that to acquire a tolerable degree of skill in its idioms, is a more thorough difficult task than is generally imagined; at least some knowledge of it.
people who have acquired the knowledge of the Greek and Latin, and likewise of the more fashionable modern languages, with facility enough, have found it so. Bo
d that as it may, there are two classes of men who, in our opinion, cannot handomely dispense with the knowledge of that almost universal tongue: the gentleman, who is to be employed in the political transactions of the most respectable mercantile company upon earth, in the eastern parts of the world; and the divine, who applies himself to investigate the true purport of the sacred oracles: without this, the former will often find himself embarrassed in both his civil and mercantile negotia
tions; and the latter will often grope in the dark, when a moderate acquaintance with that tongue would make all sunshine around him.

Bochart, Hottinger, Schultens, Pocock, Hunt, and Robertson, &c. have taken wonderful pains, and labished a profusion of learning, in proving the affinity and dialectical cognation between the Hebrew and Arabic. Much of this labour, we think, might have been spared. We presume to affirm, that no person tolerably versed in both languages can read a single paragraph of the Arabic version of the New Testament, or indeed of the Koran itself, without being convinced of the truth of this position: it is but stripping the latter of its adventitious frippery, and the kindred features will immediately appear.

The learned professors of the university of Leyden were the first who entered upon the career of Arabian learning. To them the European students are principally indebted for what knowledge of that language they have hitherto been able to attain. Though several Italians have contributed their endeavours, yet the fruit of their labours has been rendered almost useless by more commodious and more accurate works printed in Holland.

The palm of glory, in this branch of literature, is due to Golius, whose works are equally profound and elegant; so perspicuous in method, that they may always be consulted without fatigue, and read without languor. Erpenius's excellent grammar, and his memorable dictionary, will enable the student to explain the history of Taimur by Ibn Arabyiah. If he has once mastered that sublime work, he will understand the learned Arabic better than most of the Khatbes of Constantinople or of Mecca.

The Arabian language, however, notwithstanding all its boasted perfections, has undoubtedly shared the fate of other living languages; it has gradually under
gone such considerable alterations, that the Arabic spoke and written in the age of Mohammed may be now regarded as a dead language: it is indeed so widely different from the modern language of Arabia, that it is taught and studied in the college of Mecca just as the Latin is at Rome.

The dialect of the Highlands of Yemen is said to have the nearest analogy to the language of the Koran, because these Highlanders have little intercourse with strangers. The old Arabic is through all the East, like the Latin in Europe, a learned tongue, taught in colleges, and only to be acquired by the perusal of the best authors.

"Ut folia in sylvis proveniuntur in annos, &c."
PHILOLOGY.

Chaldaean, which signifies "a mountain of witnesses."

Every body knows, that when Jacob and Laban made their compact, the latter denounced the heap of stones reared upon that occasion in this manner; while the former called it Galed, as we now write and pronounce it. This pronunciation, however, does not appear to us altogether genuine. The word is probably compounded of *gal*, *cumulus*, "a heap," and *yi* chad, atermitas, securum, "eternity, an age!" so that יאָלֶד, galched, or galed, as it came to be written afterwards, signified an "everlasting heap." Laban then had respect to the end for which the monument was erected; but Jacob alluded to its duration. It appears, however, upon this and every other occasion, when Chaldaic words are mentioned, that יאָלֶד, a was a favourite letter both with the Syrians and Chaldaeans. We may likewise observe, that the same people always changed the Hebrew מ. shin, into מ. thaw, in order to avoid the serpentine sound of that consonant.

The Chaldaic names of gods, men, places, &c. which occur in Scripture, appear to be no other than Hebrew polished and improved. *Bel, Belus* in Latin, is evidently יאָלֶד. Baal, or we think rather יבֹל, Bechel. The Phoenicians, and sometimes the Hebrews, used it to signify the most high. The Chaldaeans used their word *Bel* for the same purpose; and because this word originally imported the High One, they dignified their first monarch with that name. They denominated their capital city *Ba-Bel*, which imports the temple of *Bel*, and afterwards *Babylon*, which intimates the abode or dwelling of our lord the sun. *Nebo* was a name of the moon among the Babylonians, derived from the Hebrew ובו, *waboh*, *vaticiniari*, to prophecy. *Asur* was the planet Mars, from *אָסָר* or *Euror*, accinisit, "to gird," alluding to the girding on of arms. *Ahad* was an Assyrian name of the sun, מ. *ahad, unus*, "one." *Netsar* was the name of an Arabian idol, which often occurs in the composition of Babylonian names. In Arabic it signifies an eagle: we think, however, that the word is the Hebrew נטָסָר, *custodivit*, servavit, "to keep, to preserve." To these names of deities many more might be added, which the nature of our design will not allow us to mention.

Almost all the Chaldean proper names which occur either in sacred or profane history are evidently of Hebrew original, or cognate with that language. We shall subjoin a few examples: *Nabonassar* is evidently compounded of *Nabo* and *nassar*, both Hebrew words. *Nabopolassar* is made up of *Nabo-Pul*, the same with *Bel*, and *Aser* or Asor, above explained. *Beltesis* is made up of *Bel* and מ. *Eska*, "fire." Nebuchadnezzar, Belshazzar, Belitshazzar, Ningilissar, Nebuzaradan, Rambag, Rabsaris, Nergal Sharezer, Rabshakeh, Ezarhaddon, Merodach, Evil Merodach, and numberless others, are so manifestly reducible to Hebrew vocables, when compounded, that the oriental scholar will readily distinguish them.

Names of places in the Chaldaic are likewise so nearly Hebrew, that nothing but the dialectical tone separates them. Thus *Ur* of the Chaldeans is actually מ. *light*, that city being sacred to the sun: *Sippara* is plainly the Hebrew word *Zipporah*; *Carchemish*, a city on the Euphrates, is evidently compounded of *Kir* or *Kar*, "a city," and *Chemosh*, a name of the sun. In short, every Chaldean or old Syrian word now extant, with Chaldean out any difficulty, bewray their Hebrew original. As Language, for their dialectical differences, these we remit to the Chaldaic grammars and lexicons.

We now proceed to the consideration of the Phoenician language, which is known to have been that of the language derived from the ancient Canaanites. That this was one of the original dialects, and consequently a cognate of the Hebrew, is universally acknowledged. Instead therefore of endeavouring to prove this position, we may refer our readers to the works of the learned Mr Bochart, where that author has in a manner demonstrated this point, by deriving almost all the names of the Phoenician colonies from the Hebrew, upon the supposition that the dialect of those people was closely connected with that tongue.

St Augustine, de Civitate Dei, has observed that in his time many of the vulgar in the neighborhood of Carthage and Hippo spoke a dialect of the old Punic which nearly resembled the Hebrew. Procopium, de bello Goth. informs us, that there existed even in his days in Africa a pillar with this inscription in Hebrew, "We flee from the face of Joshua the robber, the son of Nun." The names of all the ancient cities built by the Carthaginians on the coast of Africa are easily reducible to a Hebrew original. The Carthaginian names of persons mentioned in the Greek and Latin History, such as Himilco, Hamilcar, Asdrubal, Hannibal, Hanno, Dido, Anna or Hannah, Sophonisba, Gisgo, Maharbal, Adherbal, &c. all breathe a Hebrew extraction.

The Greeks borrowed a great part of their religious worship from the people of whose language we are treating; of consequence, the names of most of their gods are Phoenician. Almost every one of these is actually Hebrew, as might easily be shown. The names of persons and places mentioned in the fragments of Sanchoniathon, preserved by Eusebius, are all of Hebrew complex. The names mentioned in the Hebrew scriptures of places which belonged to the Canaanites prior to the invasion of the Israelites under Joshua, are as much Hebrew as those which were afterwards substituted in their stead. The Punic scene in Plautus has been analysed by Bochart and several other learned men, by whom the language has been clearly proved to be deduced from the Hebrew, with some dialectical variations.

The island of Melita (now Malta) was inhabited by a colony of Phoenicians many ages before the Moors took possession of it. Among the vulgar of that island many Punic vocables are current to this day, all which may be readily traced up to the Hebrew original. To these we may add many inscriptions on stones, coins, medals, &c. which are certainly Phoenician, and as certainly of Hebrew extraction. We have thrown together these few hints without pursuing them to any great length, as we deemed it unnecessary to dwell long on a point so hackneyed and so generally acknowledged.

Before we proceed to treat of the ancient language of the Ethiopians, we find ourselves obliged to hazard the ethio-

If we can once settle that single point, the discovery will open an avenue to their primitive dialect, the article about which we are chiefly concerned in the present discussion.

In our Section concerning the Hebrew language, we were led often to mention the patriarch Cush the eldest son of Ham. The posterity of this family chief, under-
PHILOLOGY.

Chaldean Language, &c.

His son Nimrod, possessed themselves of Shinar, afterwards denominated Chaldea. These were probably the
Arabians whose kings (according to Eusebius, Africanus, and other ancient chronologers) reigned in Babyloni
during several successive generations. Those were the Cushim or Cushites, whom the learned Mr. Bryant
has conducted over a great part of the world, and to whose industry and ingenuity he has ascribed almost all
the inventions, arts, sciences, laws, policy, religions, &c., which distinguished mankind in the earliest ages.

In process of time, the posterity of Chasid or Chessed, called Chasdim or Chasidim, in the east, and Chaldeans in the west, drove out the Cushim, and seized upon their country. The Cushim retired westward, and spread themselves over that part of Arabia situated towards the south-east. They probably extended themselves over all the eastern part of that peninsula, from the sea to the wilderness between Arabia and Syria. Those were the Ethiopians mentioned in Scripture by a very unpardonable inadvertency of our translators. These, then, we think, were the primitive Cushim.

Josephus informs us; that all the Atinatics called the Ethiopians of Africa by the name of Cushim. This denomination was not given them without good reason; it imports at least, that they deemed them the descendants of Cush; it being the constant practice of the orientals in the early ages to denominate nations and tribes from the name of their great patriarch or founder. The name Cushim must then have been given to the Ethiopians, from a persuasion that they were the progeny of the son of Ham who bore that name. By what routesoever the Cushim penetrated into that region of Africa which was called by that name, it may be taken for granted that they were the descendants of Cush above mentioned.

It has been observed above, that the posterity of Cush possessed the country of Shinar or Chaldea at a very early period, but were expelled by the Chasdim or Chaldeans. Upon this catastrophe, or perhaps somewhat later, a colony from the fugitive Cushim transported themselves from the south and south-east coast of Arabia, a sea which lies between that country and Ethiopia. However, imperfect the art of navigation might be in that age, the distance was so small that they might easily enough make a voyage cross that narrow sea in open boats, or perhaps in canoes. However that may have been, it cannot be doubted that the tribes on both sides of that branch of the sea were kindred nations.

If, then, both the northern and southern Cushim sprung from the same stock, there can be no doubt that both spoke the same language. The language of the Babylonian Cushim was Chaldaic, and of consequence that of the Egyptian Cushim was the same. We may therefore rest assured, that whatever changes the Egyptian dialect may have undergone in the course of 3000 years, it was originally either Chaldaic, or at least a branch of that language. Scaliger informs us, that the Egyptians called themselves Chaldeans; and that, says he, not without reason, because of those many sacred and profane books which are extant among them, the most
elegant and most beautiful are written in a style near Chaldean that of the Chaldean or Assyrian. Marianus Victorius, Language, &c., who was the first that reduced the Ethiopic tongue to the rules of grammar, tells us, in his Proœmium, that the Ethiopians call their tongue Chaldaic; that it springs from the Babylonian; and is very like the Hebrew, Syrian, and Arabic. At the same time (he concludes), that this language may be easily learned by those who are masters of the Hebrew. The learned Bochart, and Bishop Walton in his Proleg. are clearly of the same opinion.

The vulgar letters of the Ethiopians, according to Diodorus Siculus, were the same with the sacred characters of the Egyptians (d). From this account, if the Sicilian may be trusted, the sacred letters of these people, concerning which so many wise conjectures have been formed, were actually Chaldaic. To carry on this investigation a little farther, we may observe, that Sir William Jones seems to have proved, by very plausible arguments, that the Sanscrit characters were deduced from the Chaldaic. This circumstance affords a presumption that the Ethiopian Cushim were likewise concerned with the Egyptians; who, as is remarked in the Section concerning the Sanscrit, probably introduced the religion of the Brahmins into Hindostan. This is advanced as a conjecture only; and yet when we consider the affinity between the Egyptian and Gentoo religions, we are strongly inclined to hope that this surmise may one day be verified by undeniable facts.

The original Ethiopians were a people highly civilized; their laws, their institutions, and especially their religion, were celebrated far and wide. Homer talks in raptures of the piety of the Ethiopians, and sends his gods every now and then to revel 12 days with that devout people. The Sicilian addsuce a number of very specious arguments to prove that these two nations had sprung from the same stock. He mentions a similarity of features, of manners, of customs, of laws, of letters, of the fabrication of statues, of religion, as evidences of the relation between those two neighbouring nations. There was, every body knows, a communion, as to sacred rites, between the two countries. The Egyptians sent annually a deputation of their priests, furnished with the portable statues of their gods, to visit the fanes of the devout Ethiopians. Upon this occasion, a solemn religious banquet was prepared, which lasted 12 days, and of which the priests of both nations were partakers. It was, we imagine, a kind of sacramental institution, by which both parties publicly avouched their agreement in the ceremonies of their religion respectively. These observations plainly show, that the most ancient Ethiopians were a people highly civilized; indeed so much, that the Egyptians were at one time contented to be their scholars. The tone of their language was certainly the same with that of the Chaldeans or Arabian Cushim, from whom they are descended. We know not whether there are any books in the ancient Ethiopian now extant; so that it is not easy to produce instances of its coincidence with the Chaldaic. Diogenes Laertius informs us, that Thrasylus, in his Enarratione, s. w. (d) We find the same observation confirmed by Heliodorus (Ethiop. lib. x. p. 476). 

The royal letters of the Ethiopians (says he) were the sacred characters of the Egyptians.” Cassiodorus likewise assures us, “That the letters inscribed upon the Egyptian obelisks were Chaldaean.” See Sect. Sanscrit.
PHILOLOGY.

Sect. III.

Chaldean talogues of the books composed by Democritus, mentions one, πάντα τά τοι Μυστήρια γενέσθαι, concerning the sacred letters in the island of Merce (€); and another concerning the sacred letters in Babylon. Had these books survived the ravages of time, they would in this age of research and curiosity have determined not only the point under our consideration, but the affinity of sacred rites among the Chaldeans, Ethiopians, and Egyptians.

We have now shown that the Ethiopians were a colony of Cushites; that the Cushites were originally sovereigns of Shinar or Chaldea, and consequently spoke either Chaldaic, or a dialect of that tongue; that their colonists must have used the same language; that the ancient Ethiopians were a people highly polished, and celebrated in the most early ages on account of their virtue and piety. It has likewise appeared that the common letters of that people were the sacred characters of the Egyptians. These letters, we imagine, were the Cushite; for which see the section on the Arabic. When they were discarded, and the modern substituted in their room, cannot be determined; nor is it, we apprehend, a matter of much importance. We shall therefore drop that part of the subject, and refer our curious and inquisitive readers to the very learned Job Ludolf’s (F) excellent grammar and dictionary of the Abyssinian or Geez tongue, where they will find every thing worth knowing on that subject. We shall endeavour to gratify our readers with a very brief account of the modern Ethiopian or Abyssinian tongue; for which both they and we will be obliged to James Bruce, Esq. that learned, indefatigable, and adventurous traveller; who, by his observations on that country, which he made in person, often at the hazard of his life, has discovered, as it were, a new world both to Europe and Asia.

The most ancient language of Ethiopia, which we shall now call Abyssinia (its modern name), according to that gentleman, was the Geez, which was spoken by the ancient Cushite shepherds. This, we should think, approaches nearest to the old Chaldaic. Upon a revolution in that country, the court resided many years in the province of Amhara, where the people spoke a different language, or at least a very different dialect of the same language. During this interval, the Geez, or language of the shepherds, was dropt, and retained only in writing, and as a dead language: the sacred Scriptures being in that tongue only saved it from going into disuse. This tongue is exceedingly harsh and unharmonious. It is full of these two letters D and T, in which an accent is put that nearly resembles stammering. Considering the small extent of sea that divides this country from Arabia, we need not wonder that it has great affinity with the Arabic. It is not difficult to be acquired by those who understand any other of the oriental languages; and as the roots of many Hebrew words are only to be found here, it seems to be absolutely necessary to all those who wish to obtain a critical skill in that language.

The Ethiopic alphabet consists of 26 letters, each of which, by a virgule or point annexed, varies its sound in such a manner as that those 26 form as it were 62 distinct letters. At first they had but 25 of these original letters, the Latin P being wanting: so that they were obliged to substitute another letter in its place. Paulus, for example, they call Tautilus, Altus, or Catulius: Petros, they pronounced Ketros. At last they substituted T, and added this to the end of their alphabet; giving it the force of P, though it was really a repetition of a character rather than the invention of a new one. Besides these, there are 20 others of the nature of diphthongs; but some of them are probably not of the same antiquity with the letters of the alphabet, but have been invented in later times by the scribes for convenience.

The Amharic, during the long banishment of the royal family in Shoa, became the language of the court, and seven new characters were of necessity added to answer the pronunciation of this new language; but no book was ever written in any other language than Geez. There is an old law in the country, handed down by tradition, that whoever shall attempt to translate the Holy Scripture into Amharic or any other language, his throat shall be cut after the manner in which they kill sheep, his family sold to slavery, and their houses razed to the ground.

Before we leave this subject, we may observe, that all the ancients, both poets and historians, talk of a double race of Ethiopians; one in India, and another in Africa. What may have given rise to this opinion it is not easy to discover. Perhaps the swarthc complex of both peoples may have led them to this sentiment. Evenus indeed informs us, that “a numerous colony of people emigrated from the banks of the P. Indus, and, crossing the ocean, fixed their residence in the country now called Ethiopia.” For our part, we are rather inclined to believe, that the original Ethiopians transported themselves into India, and there perhaps co-operated with the Egyptians in digging the excavations and framing the statues, some of which are still to be seen in that country, and which we have mentioned in another Section. The Greeks called those people Aethiops, Ethiope, we believe, from their sun-burnt countenance; but indeed they were very little acquainted either with the country or its inhabitants.

The most ancient name of Egypt was Mizraim, of ancient consequence the Arabians still call it Meeri. It was likewise distinguished by other names, such as Oceanis, Aethiops, &c. It appears from the sacred historian, that it first of all was inhabited by the desendants of Mizraim, the second Hebrew son of Ham. Mizraim had several sons, who, according to the Scripture account, settled respectively in that country. If we trust to the sacred records, there will be little difficulty in ascertaining the language of the Mizraim. It will appear to be one of the sister dialects of the Hebrew, Phoenician, Arabic, Chaldaic, &c.; and this, to us, appears to be the fact. But the origin of that people, their language, religion, laws, and institutions, have been so warped and confounded, both by their own historians and those of other countries, that one is scarce able to determine what to believe or what to

(F) A very learned German, who published a grammar and dictionary of the Geez in folio.
to reject. Herodotus, Diodorus Siculus, Strabo, Ptolemy, and most other ancient geographers and historians, are universally agreed, that Egypt, at least that part of it called Delta, was overflowed by the sea, and consequently uninhabitable for many centuries after the dispersion of mankind. When we consider the low situation of the Delta, and the violent current of the tide from the coast of Phoenicia and Palestine towards that shore, we would be almost tempted to adopt this hypothesis; but the sacred records avouch the contrary. According to them, we find Egypt a populous, rich, and flourishing kingdom, as early as the age of Abraham.

Had the Lower Egypt been a pool of stagnating water at any time after the general deluge, we think it could not have been drained, cleared, cultivated, and stocked with inhabitants, so early as the days of Abraham.

Diodorus Siculus, however, is positive that the Egyptians were a colony of Ethiopians; and this he endeavours to prove by the similarity of features, customs, laws, religious ceremonies, &c. between the two nations. That there was a constant intercourse of good offices between these two branches of the Hamites, cannot be questioned; and that they nearly resembled each other in many respects, is too evident to admit of contradiction. The excavations, originally dug out of the solid rocks of porphyry and marble, in which the natives resided before the plains were drained, have been observed by a most judicious traveller (c) a very few years ago. At the same time, the most accurate and judicious travellers (n) who have visited that region in modern times, are generally of opinion that the land has gained nothing on the sea since the period when Herodotus wrote his description of that country; from which circumstances we may be led to conclude, that the idea of the inundation of the Delta is not founded in fact.

But even admitting that the Egyptian Delta has acquired nothing from the sea since the age of Herodotus to the present, it certainly does not follow that the region in question was never overflowed by that element; since there are in many parts of the globe, large tracts of land, certainly once covered with sea, which have continued to this day in the very same situation in which they were 2000 years ago. We leave the decision of this point to the judgment of our readers.

We have already hinted our opinion of the nature of the Egyptian language; but because Egypt is generally thought to have been the native land of hieroglyphics, and because many are of opinion that hieroglyphical characters were prior to alphabetical, we shall hazard a few conjectures with respect to this species of writing.

The end of speech, in general, is to enable men to communicate their thoughts and conceptions one to another when present; the use of writing is to perform the same office when people are at so great a distance that vocal sounds cannot mutually reach them. Hieroglyphics are said to have been invented to supply this defect. The most ancient languages were everywhere full of tropes and figures borrowed from sensible objects. As in that stage of society men have not learned to abstract and generalize, all their ideas are borrowed from such objects as most forcibly strike their senses.

This circumstance would naturally suggest to savages the idea of conveying their sentiments to each other, when absent, by delineations of corporeal objects. Thus, if a savage asked a loan of his friend's horse, he might find means to have conveyed to him the figure of that animal; and so of others. This was the very lowest species of ideal communication, and has been styled picture-writing.

Necessity would soon impel our savage correspondents to fabricate a method more extensively useful, which would likewise be suggested by the constant use of the metaphorical mode of speech. Some savage leader, more sagacious than the vulgar herd, would observe that certain sensible objects were fitted, according to the rules of analogy, to represent certain human passions, and even some abstract ideas; and this would be readily enough adopted by the herd as a new improvement. In this case a horn might be the emblem of power, a sword of bravery, a lion of fury, a fox of cunning, a serpent of malice, &c. By and by artificial signs might be contrived to express such ideas as could not readily be denoted by bodily objects. This might be called symbolic writing. Such was the foundation of the Chinese characters; and hence that prodigious number of letters of which the written language of that people is composed. Farther they could not proceed, notwithstanding their boasted inventive powers; and farther, we believe, no nation ever did proceed, who had once upon a time no other characters but hieroglyphical. The Mexicans had arrived at the very lowest stage of hieroglyphical writing, but had not taken one step towards alphabetical. The Hurons employ hieroglyphical symbols, but never entertained a single idea of alphabetical. Hieroglyphical characters are the images of objects conveyed to the mind by the organs of vision; alphabetical are arbitrary artificial marks of sound, accommodated by compact to convey to the mind the ideas of objects by the organs of hearing. In a word, we think that there is not the least analogy between these two species to conduct from the one to the other: we are therefore of opinion, that hieroglyphical characters were never the vulgar use.

We know that in this point we differ from many learned, judicious, and ingenious writers; some of whom have taken much pains to investigate the intermediate steps through which the inventors of characters must have passed in their progress from hieroglyphical to alphabetical writing. These writers have adopted a plan analogous to Bishop Wilkins's project of an artificial language. In this theory, we own, we are led to suspect that they supposed all mankind were once upon a time savages, and were left to hammer out words, as well as characters, by necessity, ingenuity, experience, practice, &c. For our part, we have endeavoured to prove, in our section on the Hebrew language, that alphabetical writing was an antediluvian invention; and we now lay it down as our opinion, that among all those nations which settled near the centre of civilisation,

(c) See Mr Bruce's Travels, vol. i.

(n) Mr Bruce, Dr Shaw, Bishop Pococke, Savary, Volney, &c.
PHILOLOGY.

Chaldean hieroglyphics were, comparatively, a modern fabric. The Orientals are, at this day, extravagantly devoted to allegory and fiction. Plain and unadorned truth has with them no charms. Hence that extravagant medley of fables and romance with which all antiquity is replete, and by which all ancient history is disguised and corrupted. Every doctrine of religion, every precept of morality, was tendered to mankind in parables and proverbs. Hence, says the Scripture, to understand a proverb, the words of the wise, and their dark sayings. The eastern sages involved their maxims in this enigmatical dress for several reasons: to fix the attention of their disciples; to assist their memory; to gratify their allegorical taste; to sharpen their wit and exercise their judgment; and sometimes perhaps to display their own acuteness, ingenuity, and invention.

It was among the ancients an universal opinion, that the most sacred arcana of religion, morality, and the sublime sciences, were not to be communicated to the uninitiated rabble. For this reason every thing sacred was involved in allegorical darkness.

Here, then, we ought to look for the origin of hieroglyphical or picture writing among the civilized nations of the east. They did not employ that species of writing because they were ignorant of alphabetical characters, but because they thought it to conceal the most important heads of their doctrines under hieroglyphical figures. The Egyptian priests were most celebrated for their skill in devising those emblematical representations; but other nations likewise employed them. We learn from the fragments of Berosus the Chaldean historian, preserved by Syncellus and Alexander Polyhistor, that the walls of the temple of Belus at Babylon were covered all over with those emblematical paintings. These characters were called ἀκα, because they were chiefly employed to represent sacred objects; and ἀλφά, because they were originally carved or engraved. Their name points to their original use, instead of conveying the nature of the objects represented, which the nature of our design will not permit, we must refer our readers to Herodotus, lib. ii. Diodorus Sic. lib. i. Strabo, lib. xvii. Plut. Isis et Osiris; and among the Christian fathers to Clem. Alex. Euseb. Prep. Evang.; but chiefly to Horapollo’s Hieroglyphica.

From this deduction we would conclude, that this species of writing was an adventitious mode in Egypt, peculiar to the priests, and employed chiefly to exhibit things sacred; and that among all civilized people it did not supersede the use of alphabetical characters, nor did the use of the latter originate from the former. When alphabetical letters were invented, if indeed they were a human invention, they were antecedent to the other in use and extent. The Egyptian priests alone knew the true import of those sacred symbols; and communicated that knowledge first to their own children from generation to generation, then to the initiated, and last of all to the graudees of the nation, all of whom were indeed initiated. The hieroglyphics of Egypt were not then the symbols of any sacred occult language; but signs invented by the priests, and prophets or wise men, in order to represent their deities, the attributes and perfections of their deities, and the mysterious arcana of their religion, and many other circumstances relating to objects of importance, which were deemed either too sacred or too important to be imparted to the vulgar.

The Egyptians ascribed the invention of letters to a person whom they called Thoth, Θῶθ, or Θεόθ, Θεόθ, and the Greeks Thoth; and the Romans Mercurius. Plato calls him a god, or a godlike man; Diodorus makes him privy councillor to Osiris; Sanchoniathon ap. Prop. Ev. connects him with the Phoenician Cronus or Saturn. To this Mercury the Egyptians ascribed the invention of all the arts and sciences. He was probably some very eminent inventive genius, who flourished during the first ages of the Egyptian monarchy, and who perhaps taught the rude savages the art of writing.

According to Diodorus Siculus, the Egyptians had two kinds of letters: the one sacred, the other common: the former the priests taught their own children, the latter all learned promiscuously. In the sacred character the rites and ceremonies of their religion were couched; the other was accommodated to the ordinary business of life. Clem. Alex. mentions three different styles of writing employed by the Egyptians; Strim. lib. v. "The pupils, who were instructed by the Egyptians, first learned the order and arrangement of the Egyptian letters, which is called epistolography, that is, the manner of writing letters; next, the sacred character, which the sacred scribes employed; lastly, the hieroglyphic character, one part of which is expressed by the first elements, and is called Cyriologic, that is, caput, and the other symbolic. Of the symbolic kind, one part explains properly by imitation; and the other is written tropically, that is, in tropes and figures; and a third by certain enigmatical expressions. Accordingly, when we intend to write the word sun, we describe a circle; and when the moon, the figure of that planet appearing humped, conformable to the appearance of that luminary after the change." In this passage we have an excellent description of the three different modes of writing used by the Egyptians; the common, the sacred, and the hieroglyphic. The last he describes according to its three divisions, in exact conformity to our preceding observations.

By the description above translated, it plainly appears, that the sacred character of the Egyptians was and posterity in time to alphabetical characters. entirely different from the hieroglyphic; and by this consideration we are in a good measure justified, in supposing, as we have done all along, that the sacred letters of the Egyptians were actually the Chaldæan. The inscriptions on the obelisks mentioned by Cassiodorus, so often quoted, were certainly engraved in the sacred character; and the character in which they were drawn was that above mentioned. If the sacred letters were Chaldæic, the sacred language was probably the same.

The Egyptians pretended, that the Babylonians derived the knowledge of the arts and sciences from them; while, on the other hand, the Babylonians maintained, that the former had been tutored by them. The fact is, they both spoke the same language; used the same religious rites; had applied with equal success to astrology, astronomy, geometry; arithmetic, and the other sciences:
PHILOLOGY.

The most faithful specimen of the vulgar language of the Egyptians, is, we believe, still preserved in the Coptic, which, however, is so replete with Grecisms, that it must be difficult to trace it out.

Under the Ptolemies, the Greek was the language of the court, and consequently must have diffused itself over all the country. Hence, we believe, two-thirds of the Coptic are Greek words, diversified by their terminations, declensions, and conjunctions only.

To be convinced of the truth of this, our learned and curious readers need only consult Christian Scholtiz's Egyptian and Coptic grammar and dictionary, corrected and published by Godfried Woide, Oxford, 1788.

The Egyptians and Phoenicians were in a manner cousin-germans, and consequently must have spoken the same language; that is, one of the sister dialects of the Hebrew, Chaldean, Arabian, Cushite, &c. This is not a mere conjecture; it may be realized by almost numberless examples. It is true, that when Joseph's brethren went down to Egypt, and that ruler designed to converse with them, they could not understand the Egyptian idiom which he spoke; nor would he, had he been actually an Egyptian, have understood them without an interpreter. The only conclusion from this circumstance is, that by this time the Egyptian had deviated considerably from the original language of mankind. The Irish and Welch, every body knows, are only different dialects of the Celtic tongue; and yet experience proves, that a native of Ireland and another of Wales cannot well comprehend each other's language, nor converse intelligibly without an interpreter. The Erse, spoken in the Highlands of Scotland, and the Irish, are known to be both branches of the old Celtic; yet a Scotch Highlander and an Irishman can hardly understand each other's speech. By a parity of reason, a Hebrew and an Egyptian might, in the age of Joseph, speak only different dialects of the same original tongue, and yet find it difficult to understand one another. The fact seems to be, the Hebrew dialect had been in a manner stationary, from the migration of Abraham to that period; whereas the Egyptian, being spoken by a powerful, civilized, and highly cultivated people, must have received many improvements, perhaps additions, in the course of near two centuries.

The descendants of Canaan and of Mizraim were strictly connected in their religious ceremonies: they worshipped the same objects, namely, the Host of Heaven; they mourned Osiris and Adonis in concert; they carried on a joint commerce, and, we think, spoke the same language: we may, therefore conclude, that their vulgar letters were nearly the same, both in form, disposition, and number. Their original number was probably 16, viz. five vowels, six mutes, simple and middle, four liquids, and the solitary s. — With these, it is likely, was joined a mark of aspiration, or an h, such as we have in the Roman alphabet, and find on some Greek monuments. Cadmus was originally an Egyptian; that leader brought a new set of letters into Greece. These are generally deemed to be Phoenician. They were nearly the same with the ancient Pelasgic, as will be shown in the section of the Greek language. The latter, we think, were from Egypt, and consequently the former must have been from the same quarter. Danaus, Perseus, Lelex, &c. were of Egyptian extraction: they too adopted the Cadmean characters, without substituting any of their own.

The Jonim or Ionians, emigrated from Gaza, a colony of Egyptians; and their letters are known to have differed very little from those of Cadmus and the Pelasgic. The conclusion, therefore is, that the vulgar Egyptian letters were the same with the Phoenician.

We are abundantly sensible that there are found up-on Egyptian monuments characters altogether different from those we have been describing. At what time, by what people, and to what language, these letters belonged, we will not pretend to determine. It seems to be Ethiopians, the Chaldeans, the Persians, the Greeks, the Romans, the Saracens, have, at different times, been sovereigns of that unhappy country. Perhaps other nations, whose memory is now buried in oblivion, may have erected monuments, and covered them with inscriptions composed of words taken from different languages, perhaps, upon some occasions, whimsically devised, with a view to perplex the curious antiquaries of future ages. Some of these are composed of hieroglyphics intermingled with alphabetical characters, artificially deranged, in order to render them unintelligible. These we do not pretend to develope; because the most inquisitive and sagacious antiquaries are not yet agreed as to their purport and signification.

We shall now go on to show, that most part of the names of persons and places, &c. which have been conveyed down to us, may, in general, be reduced to a Hebrew, Phoenician, Syrian, or Chaldean original. As the first of these languages is most generally known, we shall employ it as our arch-type or standard, beginning with those terms which occur in Scripture.

The word Pharaoh, the title of the melch or king of Egypt, is, we think, compounded of two terms, which plainly discover a Hebrew original. According to an oriental tradition, the first who assumed this title was the sovereign of the royal shepherds; a race of people from Arabia and Phoenicia. They conquered Egypt at an early period, and kept possession of it for several centuries. They gloried in the title 'Pharaoh,' which according to Josephus contra Apion, signifies 'royal shepherd.' The word 'Pharaoh' is compounded of 'Phar,' 'a bullock,' and נ and רכש, "to feed;" hence וינא, Pharaoh, as we think it ought to be written. The name given to Joseph is evidently of kin with the Hebrew; for 'zaphnah' differs very little from the Hebrew verb 'tzaphan,' which signifies to hide, to keep secret; 'Pancuh or Phaneh, signifies much the same with the Hebrew 'Phanah,' aspexit: so that the name actually intimates one who sees hidden things; which was certainly the very idea the prince intended to convey by giving him that name. Potipherah, or Potipherah, the name of Joseph's father-in-law, has likewise a dialectical affinity with the Hebrew idiom. In that language 'Paijah' signifies "to open, to explain," which was one part of the sacerdotal office; and 'Phar' imports "a bullock." Potiphar was
then priest of the bullock, that is, the ox, *apo*; sacred to the sun (1). This person was priest or prince of On, which, according to Cyprianus on Hoses, was an Egyptian name of that luminary. The Hebrew word *hun* or *chon* signifies "power, wealth, sufficiency;" a very proper epithet for the sun, who was thought to bestow those blessings. The name of Joseph's wife was *Anath* or *Amath*, compounded of *Isahah*, "a woman," and *Naath* or *Nett*, an Egyptian name of Minerva, "a votary of Minerva."

Almost all the names of cities belonging to Egypt which are mentioned in Scripture are evidently Hebrew. To be accredited to this position, our curious readers may consult Jamieson's *Spicilegia*, an excellent book very little known. The names of most of the Egyptian deities are significant in the Hebrew tongue; and in that dialect the names appear to have been imposed with great judgment and propriety, plainly indicating some office assigned them, or pointing to some peculiar judgment. We shall produce a few instances.

**Osiris** was the great divinity of Egypt; he was certainly the sun. The Egyptians gave their deities a variety of names in allusion to their various offices and attributes. Jablonski has in a manner wearied himself with tracing the signification of this name. In Hebrew we have *Oshir*, "to grow rich, to be enriched." The sun may be called the great enricher of nature, and therefore might properly be called by a name alluding to that quality. *Ishah* is the Hebrew word for women, and Horapollo assigns this very derivation. *Anubis* was one of the names of Mercury among the Egyptians: He was always figured with the head of a dog. He accompanied *Isis* in her peregrinations in quest of Osiris, and frightened away the wild beasts from attacking the princess. In Hebrew, *Nubah* signifies "to bark." Here the analogy, we think, is evident. Many Egyptian names begin with *con*, such as *Canus*, *Canopus*, &c. The Hebrew word *Cohen* or *Cohem*, *Syr. Con* or *Chon*, intimates both a prince and a priest. *Ob* or *Aub*, in Hebrew, imports *a bottle, a flagon," anything round and prominent like the human belly. In the language of Egypt it was often applied to the sun, in allusion to its rotundity. In the temple of Jupiter *Ammon* or *Anon*, in the desert of Libya, there was a statue of the god representing the *snail* of the human body, which was probably framed in allusion to this fancy. Hence the Pythoress, or people who, according to the Scripture, had familiar spirits, were said to prophecy by the inspiration of Ob, as the Delphic priestess did by that of Apollo. Again, many Egyptian names end with *siris*, as Calaisia, Teramiasia. This termination is no doubt a cognate of the Hebrew and Chaldean *sar* or *zar*, signifying "a prince, or graniade, &c." The river Nile in the Ethiopic dialect is called *Siris*; that is, we believe, the king of rivers. The same flood seems to derive the name by which it is generally known, from the Hebrew *nehel*, "a valley, or torrent running down a valley." The same river was often called *Oceanus*, a word composed of *og*, or *oc*, or *och*, which signifies "a king, a leader," and the Hebrew *oim*, "a fountain," so that the word imports the king of fountains. The Hebrews always denominated the land of Egypt the land of Mizrakim; the Egyptians themselves, in later times, seemed to have called it *Agyptis*, *Egyptus*, "Egypt," which some think is compounded of *Ai*, Hebrew, "an island, a country, a province," and *Copt* or *Cupit*, "a famous city in that country."

From this specimen, we hope it will appear that the Egyptian language in the more early ages was one of those dialects into which that of the descendants of the postdiluvian patriarchs was divided, and perhaps subdilated, a few centuries after the deluge. Among all those, we believe, such an affinity will be found, as plainly demonstrates that they originally sprang from one common stock. Here we might easily follow the Egyptian language into Greece; and there we are persuaded we might trace a vast number of Egyptian terms into that tongue, which, however, the nature of this inquiry will not permit. If our learned readers should incline to know more of the affinity of the Egyptian tongue with the others so often mentioned, they may consult Bochart's *Chanaan*, Walton's *Proleg. Gebelin's *Monde Prim.* Jamieson's *Spicilegia*, &c.

**SECT. IV. Of the Persian Language.**

The Persian language is divided into the ancient and modern; the former of which is at this day very imperfectly known, the latter is at present one of the most expressive, and at the same time one of the most highly polished, in the world. We shall, in treating of this language, in compliance with the plan we have all along followed, begin with the ancient.

When Mohammed was born, and *Anuubi*ravan, at whom he calls the just king, sat on the throne of Persia, birth of two languages were generally prevalent in that empire (k). The one was called *Derz*, and was the dialect of the court, being only a refined and elegant branch of the *Parsi*, so called from the province of which *Shi-* *in Persia, *roz* is now the capital; and that of the learned, in which most books were composed, and which had the name of *Pahlavi*, either from the heroes who spoke it in former times, or from *pahl*, a tract of land which included some considerable cities of Iran: The ruder dialects of both were spoken by the rustics of several provinces; and many of these distinct idioms were very mucular, as happens in every kingdom of considerable extent. Besides the *Parsi* and *Pahlavi*, a very ancient and a and abstruse tongue was known to the priests and philo-more magnificans, called the language of the *Zend,* because a book language than on religious and moral duties which they held sacred, either and which bore that name, had been written in it; known only while the *Pasad* or comment on that work was com-to the posed in *Pahlavi*, as a more popular dialect. The letter-letters of this book were called *send*, and the language asta.

The *Zend* and the old *Pahlavi* are now almost extinct in *Iran,* and very few even of the Guebres can read it; while the *Parsi* remaining almost pure in *Shabnameh,* has

(1) The Septuagint (Gen. xii. v. 43. and 50.) translate On by 'Hawor.

(k) The moderns call the empire of Persia *Iran*; a name unknown to the ancients.
PHILOLOGY.

Sect IV.

The very learned and laborious Sir William Jones is of opinion that the Pārsi abounds with words from the Sanscrit, with no other change than such as may be observed in the numerous dialects of India: that very many Persian imperatives are the roots of Sanscrit verbs; and that even the moods and tenses of the Persian verb substantive, which is the model of all the rest, are deductible from the Sanscrit by an easy and clear analogy. From this he infers that the Pārsi, like the various idiom dialects, is derived from the language of the Brahmans. This conclusion, we imagine, is not altogether just, since by the same train of reasoning we may infer that the Sanscrit is derived from the Pārsi.

The same learned gentleman adds, that the multitude of compounds in the Persian language proves that it is not of Arabic but Indian original. This is undoubtedly true; but though the Pārsi is not of Arabic original, it does not necessarily follow that it is of Sanscrit. We might with the same propriety, and with an equal show of reason, conclude, that the Greek language is descended of the Sanscrit, because it too abounds with compounds. We may then rest assured, that neither the one nor the other argument adduced by the ingenious president proves that the Pārsi tongue is a descendant of the Sanscrit.

The gentleman so often mentioned, assures us, that the Zend bears a strong resemblance to the Sanscrit: which, however, it might do without being actually derived from it, since we believe every oriental scholar will find that all the languages from the Mediterraean to the utmost coast of Hindostan exhibit very strong signatures of a common original. The Pārsi, however, not being the original dialect of Iran or Persia, we shall pursue it no farther at present, but return to give some account of the Pahlavi, which was probably the primitive language of the country. We have observed above, that the Zend or comment on the Zend was composed in the Pahlavi for the use of the vulgar. This, according to Sir William, was a dialect of the Chaldaic; and of this assertion he exhibits the following proof.

By the nature of the Chaldaean tongue, most words ended in the first long vowel, like šemait, “heaven;” and that very word, unaltered in a single letter, we find in the Pahlavi, together with lait, “night,” med, “water,” nîrî, “fire,” mårî, “rain,” and a multitude of others, all Arabic or Hebrew, with a Chaldaean termination; so nomãr, by a beautiful metaphor from prunng trees, means in Hebrew to compose verses, and thence, by an easy transition, to sing them; now in Pahlavi we see the verb nomãrûmîn, “to sing,” with its forms nomãrûnemî, “I sing,” and nomãrûnmai, “be sung;” the verbal terminations of the Persian being added to the Chaldaic root. All these words are integral parts of the language; not adventitious like the Arabic nouns and verbsals engrafted on the modern Persian.

From this reasoning it plainly appears, 1st, That Pahlavi was the ancient language of Persia; and, 2d, That the ancient Persian was a cognate dialect of the Chaldaic, Hebrew, Arabic, Phœnician, &c. M. Anquetil has annexed to his translation of the Zendavesta two vocabularies in Zend and Pahlavi, which he found in an approved collection of Rosaci or Traditional Pieces in modern Persian. His vocabulary of the Pahlavi strongly confirms this opinion concerning the Chaldaic origin of that language. But with respect to the Zend, it abounded with vast numbers of pure Sanscrit words, to such a degree, that six or seven words in ten belonged to that language.

From this deduction it would appear, that the oldest derived languages of Persia were Chaldaic and Sanscrit: and that when they had ceased to be vernacular, the Pahlavi and Sanscrit, and Zend were deduced from them respectively, and the Pārsi either from the Zend, or immediately from the dialect of the Brahmans: but all had perhaps a mixture of Tartarian; for the best lexicographers assert, that numberless words in ancient Persian are taken from the Cimmerians. With respect to the last of these, we cannot help being of opinion, that colonies of people from the neighbour of the Medes travelled themselves into Græ Tartary, and perhaps into Europe. These colonists brought along with them those vocabularies which still occur in their dialect. Emigrants from those quarters must have found their way into Scandinavia, since numberless Persian words are still current in those regions. Perhaps Odin and his followers emigrated from the neighbourhood of Media and Persia, and brought with them the dialect of the nations from whose country they had taken their departure.

With respect to the Zend, it might well be a dialect of the Sanscrit, and was probably a sacred language; and if so, concealed from the vulgar, and reserved for the offices of religion. If Zoroastres, or Zarathusth, as the orientals call him, travelled into Egypt, and was initiated in the mysteries of the Egyptian religion, as some pretend he was, he might be instructed in the sacred dialect of that people by the priests under whom he studied. When that philosopher returned into Persia, and became the apostle of a new religion, he might compose the volume of his laws and religious institutions in the sacred language of his Egyptian tutors. This language then became that of the Magi, who concealed it carefully from the knowledge of the uninitiated, as the priests did in Egypt and the Brahms in Hindostan.

In our Section on the Sanscrit language, we shall give a detail of a number of particulars, which to us seem to furnish a presumption that the language in question was imported from Egypt into Hindostan. We confess there are not sufficient data to improve these presumptions into absolute certainty; but we hope the time is at hand when the worthy members of the Asiatic Society will discover abundant materials to ascertain the truth of this position. We are the rather inclined to adopt this hypothesis, when we consider the character of Zoroastres in connection with that of the Egyptian Cohens and of the Indian Brahms.

If this opinion should one day appear to be well-founded, we believe the coincidence between the language of the Zend and the Sanscrit will be easily accounted for, without making the Hindoos masters of Iran or Persia, and then driving them back to the shores of the Ganges. That the nations of Turan or Scythia
PHILOLOGY.

The very name Phars or Pharas is certainly of Hebrew origin, and alludes to the skill that people possessed in horsemanship. The original seems to be Phares, singular, a horse, and Pharas a horseman. Consequently the people were denominated Parsi, and the country Pars, because they were trained from their infancy to ride the great horse, which indeed they deemed their greatest honour. This name was perhaps first imposed upon them by the neighbouring nations, and in process of time became their gentle appellation. Mitthras is generally known to have been the chief divinity of the Persians; a name which is plainly derived from Mithra, great. We find in Strabo the Persian god Amanus, which is plainly a cognate of Hamah, the sun or fire. Hence we believe comes Hamaram, the heart or chapel, where the fire sacred to the sun was kept burning; which, we believe, the Greeks called Hephaistos, or fire-temples. Herodotus mentions a custom among the Persians, according to which, when they came to engage an enemy, they cast a rope with a kind of gin at the end of it on their enemy, and by those means endeavoured to entangle and draw him into their power. The people of Persia who employed this net or gin were called Sargates, from sargus, sereg, or seri, a word which in Hebrew, Arabick, and Chaldaick, signifies a hamper or entangle: hence perhaps the Greek word Epagoras, a basket or net. Sar or zar in Hebrew, Phoenician, Syriack, &c. signifies a lord, a prince; and hence we have the initial syllable of the far-famed sar-tush, Zoroastres. In a word, most of the Persian names that occur in the Grecian histories, notwithstanding the scandalous manner in which they have been disguised and metamorphosed by the Greeks, may still with a little skill and industry be traced back to a Hebrew, Chaldaick, Syriack, or Phoenician origin. In the books of Daniel, Ezra, Nehemiah, and Esther, we find a number of Persian names which are all of a Hebrew or Chaldaick complexion: to investigate these at much greater length would be foreign to the design of the present article. If our curious reader should incline to be more fully satisfied as to this point, he may consult Bochart's Chanaan, D'Herbelot's Bib. Orient. Walton's Proleg. &c.

It now appears, we hope, to the entire satisfaction of our readers, that the Pahlavi is a remnant of the old Persian, and that the latter is a cognate branch of the Hebrew, Chaldaick, Syriack, &c. We have likewise adduced some presumptive proofs that the Zend was copied from the sacred language of the Egyptians: we shall now endeavour to explain by what changes and revolutions the language first mentioned arrived at its present summit of beauty and perfection.

We have observed above, that the Scyths, whom Progress of the old Persians called Scynt, Scir, and whom the modern Persians call Turan, often invaded and overran Persia at a very early period. The consequence was, an infusion of Scythian or Tartarian terms, with which that language was early impregnated. This in all probability occasioned the first deviation from the original standard. The conquests of Alexander, and the dominion of his successors, must, one would imagine, introduce an inundation of Greek words. That event, however, seems to have affected the language in no considerable degree, at least very few Grecian terms occur in the modern Persian.

The empire of the Arsacide or Parthians, we apprehend, produced a very important alteration upon the ancient Persian. They were a semi-Scythian tribe; and as they conquered the Persians, retained the dominion of those parts for several centuries, and actually incorpo-
rated with the natives, their language must necessarily have given a deep tincture to the original dialect of the Persians. Sir William Jones has observed, that the letters of the inscriptions at Istakhr or Persepolis bear some resemblance to the old Runic letters of the Scandinavians. Those inscriptions we take to have been Parthian; and we hope, as the Persians were a Tartarian clan, this conjecture may be admitted till another more plausible is discovered. The Persians, it is true, did once recover the empire; and under them began the reign of the Deri and Parsi tongues: the former consisting of the old Persian and Parthian highly polished; the latter of the same languages in their uncultivated vernacular dress. In this situation the Persian language remained till the invasion of the Saracens in 636; when these barbarians overran and settled in that fine country; demolished every monument of antiquity, records, temples, palaces, every remnant of ancient superstition; massacred or expelled the ministers of the Magian idolatry; and introduced a language, though not entirely new, yet widely differing from the old exemplar.

But before we proceed to give some brief account of the modern Persian, we must take the liberty to hazard one conjecture, which perhaps our defects in modern Persian may not find themselves disposed to admit. In modern Persian we find the ancient Persian names wonderfully distorted and deflected from that form under which they appear in the Scripture, in Ctesias, Megasthenes, and the other Greek authors. From this it has been inferred, that not only the Greeks, but even the sacred historians of the Jews, have changed and metamorphosed them most unmercifully, in order to accommodate them to the standard of their own language. As to the Greeks, we know it was their constant practice, but we cannot believe much of the Hebrews. We make no doubt of their writing and pronouncing the names of the Persian monarchs and governors of that nation nearly in the same manner with the native Persians. It is manifest, beyond all possibility of contradiction, that in this period all the Tyrian and Phenician names of persons and places when they had occasion to mention them, nor those of the Egyptians when they occurred in their writings. The Babylonian and Chaldaic names which are mentioned in the Old Testament vary nothing from the Chaldean original. No reason can be assigned why they should have transformed the Persian names more than the others. On the contrary, in Ezra, Nehemiah, and Esther, we find the Persian names faithfully preserved throughout.

The fact, we imagine, is this: Our modern admirers of the Persians have borrowed their names of the ancient kings and heroes of that country from romances and fabulous legends of more modern date and composition. The archives of Persia were destroyed by the Saracens: nothing of importance was written in that country till two centuries after the era of Mohammed. What succeeded was all fiction and romance. The authors of those entertaining compositions either forged names of heroes to answer their purpose, or laid hold on such as were celebrated in the ballads of their country, or preserved by vulgar tradition. The names were no doubt very different from those of the ancient kings and heroes of Persia; and probably many of them had undergone considerable changes during the continuance of the Parthian empire. Upon this foundation has the learned Mr. Richardson erected a very irregular fabric, new, and to use his own expression, think built upon pillars of ice. He has taken much pains to invalidate the credit of the Grecian histories of the Persian empire, by drawing up in battle array against their records legends of romantic writers, who were not born till near 1000 years after the events had taken place; and to complete the probability, who lived 200 years after all the chronicles of the Medes and Persians had been finally destroyed by the fury of the Saracens.

After the decisive victory obtained over the Persians at Kadessa, their ancient government was overthrown, their religion proscribed, their laws trampled under foot, and their civil transactions disturbed by the forcible introduction of the lunar for the solar calendar; while, at the same time, their language became almost overwhelmed by an inundation of Arabic words: which from that period, religion, authority, and fashion, incorporated with their idiom.

From the seventh till the tenth century the Persian tongue, now impregnated with Arabic words, appears to have laboured under much discouragement and neglect. Bagdad, built by Almanzor, became soon after the year 752 the chief residence of the caliphs, and the general resort of the learned and the ambitious from every quarter of the empire. At length the accession of the Buyah princes to the Persian throne marked in the tenth century the great epoch of the revival of Persian learning. About the year 977 the throne of Persia was filled by the great Azaduddinwi, who first assumed the title of Sultan, afterwards generally adopted by eastern princes. He was born in Isphahan, and had a strong attachment to his native kingdom. His court, whether at Bagdad or in the capital of Persia, was the standard of taste and the favourite residence of genius. The national dialect of the prince was particularly distinguished, and became soon the general language of composition in almost every branch of polite learning. From the end of the tenth till the 14th century may be considered the most flourishing period of Persian literature. The epic poet Ferdousi, in his romantic history of the Persian kings and heroes, displays an imagination and smoothness of numbers hardly inferior to Homer. The whole fanciful range of Persian enchantment he has interwoven in his poems, which abound with the noblest efforts of genius. This bard has stamped a dignity on the monsters and fictions of the east, equal to that which the prince of epic poetry has given to the mythology of ancient Greece. His language may at the same time be considered as the most refined dialect of the ancient Persian, the Arabic being introduced with a very sparing hand: whilst Sadi, Jami, Hafiz, and other succeeding writers, in prose as well as verse, have blended in their works the Arabic without reserve; gaining perhaps in the nervous luxuriance of the one language what may seem to have been lost in the softer delicacy of the other. Hence Esh Farshin Anju, in the preface to the dictionary called Farshang Jangwur, says, that the Deri and the Arabic idioms were the languages of heaven; God communicating to the angels his milder mandates in the delicate accents of the first, while his stern commands were delivered in the rapid accents of the last.

For near 300 years the literary fire of the Persians...
Sect. IV.

PHILOLOGY.

The Persian adjectives admit of no variation but in the degrees of comparison. The comparative is formed by adding ter, and the superlative by adding terrin to the positive.

The Persians have active and neuter verbs like other nations; but many of their verbs have both an active and neuter sense, which can be determined only by the construction. Those verbs have properly but one conjunction, and but three changes of tense: the imperative, the aorist, and the preterite; all the other tenses being formed by the help of particles or of auxiliary verbs. The passive voice is formed by adding the tenses of the substantive verb to the participle of the active.

In the ancient language of Persia there were very few or no irregularities; the imperative, which is often irregular in the modern Persian, was originally formed from the infinitive, by rejecting the termination ceden: for originally all infinitives ended in den, till the Arabs introduced their harsh consonants before that syllable, which obliged the Persians, who always affected a sweetness of pronunciation, to change the old termination of some verbs into tem, and by degrees the original infinitive grew quite obsolete; yet they still retain the ancient imperative, and the aorists which are formed from it. This little irregularity is the only anomalous part of the Persian language; which nevertheless far surpasses in simplicity all other languages ancient or modern.

With respect to the more minute and intricate parts of this language, as well as its derivations, compositions, constructions, &c. we must refer our readers to Minisik's Institutiones Linguae Turcicae, cum rudimentis parallelis linguarum Arab. et Pers.; Sir William Jones's Persian Grammar; Mr Richardson's Arabian and Persian Dictionary; D'Herbelot's Bibl. Orient.; Dr Hyde de Relig. orient. Pers. &c. Our readers, who would penetrate into the innermost recesses of the Persian history, colonies, antiquities, connections, dialects, may consult the last mentioned author, especially chap. xxxv. De Persia et Persarum nominibus, et de moderna atque veteri lingua Persica, ejusque dialectis.

In the preceding inquiry we have followed other authors, whose accounts appeared to us more natural, and much less embarrassing.

To conclude this section, which might easily have been extended into a large volume, we shall only take the liberty to put our readers in mind of the vast utility of the Arabic and Persian languages. Numberless events are preserved in the writing of the orientals which were never heard of in Europe, and must have for ever lain concealed from the knowledge of its inhabitants, had not these two tongues been studied and understood by the natives of this quarter of the globe. Many of those events have been transmitted to posterity in poems and legendary tales like the Runic fragments of the north, the romances of Spain, or the heroic ballads of our own country. Such materials as these, we imagine, may have suggested to Firdausi, the celebrated heroic poet of Persia, many of the adventures of his Shahnun; which, like Homer when strait of the machinery of supernatural beings, is supposed to contain much true history, and a most indubitable picture of the superstition and manners of the times. The knowledge of these two languages has laid open to Europe all the treasures of oriental learning, and has enriched the minds of Britons with

---

The genius of the modern Persian

We shall now annex a few strictures on the genius of that noble language; though it is our opinion that the province of the philologist is to investigate the origin, progress, and final improvement of a language, without descending to its grammatical minutiae or peculiar idiomatic distinctions. We have already observed, that the tongue under consideration is partly Arabic and partly Persian, though the latter generally has the ascendant. The former is nervous, impetuous, and masculine; the latter is flowing, soft, and luxuriant. Wherever the Arabic letters do not readily incorporate with the Persian, they are either changed into others or thrown away. Their letters are the Arabic, with little variation; those being found more commodious and expeditious than the old letters of the Dari and Persian. Their alphabet consists of 32 letters, which, like the Arabic, are read from right to left; their form and order will be learned from any grammar of that language. The letters are divided into vocals and consonants as usual. The Arabic characters, like those of the Europeans, are written in a variety of different hands; but the Persians write their poetical works in the Tafl, which answers to the most elegant of our italic hands.

There is a great resemblance between the Persian and English languages in the facility and simplicity of their form and construction: the former, as well as the latter, has no difference of terminations to mark the gender either in substantives or adjectives; all inanimate things are neuter; and animals of different sexes have either different names, or are distinguished by the words ner, male, and made, female. Sometimes indeed a word is made feminine, after the manner of the Arabsians, by having w added to it.

The Persian substantives have but one variation of case, which is formed by adding a syllable to the nominative in both numbers; and answers often to the dative, but generally to the accusative, case in other languages. The other cases are expressed for the most part by particles placed before the nominative. The Persian have two numbers, singular and plural; the latter is formed by adding a syllable to the former.
PHILOLOGY.

Sect. IV.

Sanskrit and Bengal.

The ancient coins of many different and distant kingdoms of Asia are stamped with Sanskrit characters, and mostly contain allusions to the old Sanskrit mythology. Besides, in the names of persons and places, of titles and dignities, which are open to general notice, even to the farthest limits of Asia, may be found manifest traces of the Sanscrit. The scanty remains of Coptic antiquities afford little scope for comparison between that idiom and this primitive tongue; but there still exists sufficient ground to conjecture, that, at a very early period, a correspondence did subsist between these two nations. The Hindoos pretend, that the Egyptians frequented their country as disciples, not as instructors; that they came to seek that liberal education and those sciences in Hindostan, which none of their own countrymen had sufficient knowledge to impart. Perhaps we may examine the validity of this claim hereafter.

But though numberless changes and revolutions have from time to time convulsed Hindostan, that part of it which lies between the Indus and the Ganges still preserves that language whole and inviolate. Here they still offer a thousand books to the perusal of the curious, many of which have been religiously handed down from the earliest periods of human existence.

The fundamental part of the Sanscrit language is divided into three classes: Dhaat, or roots of verbs, which some call primitive elements; Shabd, or original nouns; and Etya, or particles. The latter are ever indeclinable, as in other languages; but the words comprehended in the two former classes must be prepared by certain additions and inflexions to fit them for a place in composition. And here it is that the Character- art of the grammarian has found room to expand its titles of itself, and to employ all the powers of refinement. Not a syllable, not a letter, can be added or altered but by regimen; not the most trifling variation of the sense, in the minutest subdivision of declension or conjugation, can be effected without the application of several rules: all the different forms for every change of gender, number, case, person, tense, mood, or degree, are methodically arranged for the assistance of the memory, according to an unerring scale. The number of the radical or elementary parts is about 700; and to these, as to the verbs of other languages, a very plentiful stock of verbal nouns owes its origin; but these are not thought to exceed those of the Greek either in quantity or variety.

To the triple source of words mentioned above, every term of truly Indian original may be traced by a laborious and critical analysis. All such terms as are thoroughly proved to bear no relation to any one of the Sanscrit roots, are considered as the production of some remote and foreign idiom, subsequently ingrafted upon the main stock; and it is conjectured, that a judicious investigation of this principle would throw a new light...
Sanskrit and Bengali languages.

The Sanskrit language is very copious and nervous. The first of these qualities arises in a great measure from the vast number of compound words with which it is almost overstocked. "The Sanscrit (says Sir William Jones) like the Greek, Persian, and German, delights in compounds; but to a much higher degree, and indeed to such excess, that I could produce words of more than 20 syllables; not formed ludicrously like that by which the buffoon in Aristophanes describes a feast, but with perfect seriousness, on the most solemn occasions, and in the most elegant works." But the style of its best authors is wonderfully concise. In the regularity of its etymology it far exceeds the Greek and Arabic; and, like them, it has a prodigious number of derivatives from each primary root. The grammatical rules also are numerous and difficult, though there are not many anomalies. As one instance of the truth of this assertion, it may be observed, that there are seven declensions of nouns, all used in the singular, the dual, and the plural numbers, and all of them differently formed, according as they terminate with a consonant, with a long or a short vowel; and again, different also as they are of different genders; not a nominative case can be formed to any one of these nouns without the application of at least four rules, which vary likewise with each particular difference of the nouns, as above stated: add to this, that every word in the language may be used through all the seven declensions, which is a full proof of the difficulty of the idiom.

The Sanskrit grammars are called Bećāktrin, of which there are many composed by different authors; some too abstruse even for the comprehension of most brahmins, and others too prolix to be ever used as references. One of the shortest, named the Sārākooter, consists between two and three hundred pages, and was compiled by Anoobhōhi Seroopnām Achiṅgir, with a conciseness that can scarcely be paralleled in any other language.

The Sanskrit alphabet contains 50 letters; and it is one boast of the brahmins, that it exceeds all other alphabets in this respect: but it must be observed, that as of their 34 consonants, near half carry combined sounds, and that six of their vowels are merely the correspondent long ones to as many which are short, the advantage seems to be little more than fanciful. Besides these, they have a number of characters which Mr. Hall'd calls connected vowels, but which have not been explained by the learned president of the Asiatic Society.

The Sanskrit character used in Upper Hindostan is said to be the same original letter that was first delivered to the people by Brakma, and is now called Disumāgur, or the language of angels, which shows the high opinion that the brahmins have entertained of that character. Their consonants and vowels are thoroughly, perhaps whimsically, modified and diversified; to enumerate which, in this place, would contribute very little either to the entertainment or instruction of our readers. All these distinctions are marked in the Beća (l), and must be modulated accordingly; so that they produce all the effect of a laboured recitative: but by an attention to the music of the chant, the sense of the passage rested equally escapes the reader and the audience. It is remarkable, that the Jews in their synagogues chant the Pentateuch in the same kind of melody; and it is supposed that this usage has descended to them from the remotest ages.

The Sanskrit poetry comprehends a very great variety of different metres, of which the most common are these:

The munnee hurrench chhund, or line of 12 or 19 syllables, which is scanned by three syllables in a foot, and the most approved foot is the anapest.

The cābee chhund, or line of eleven syllables.

The anishhote chhund, or line of eight syllables.

The poems are generally composed in stanzas of four lines, called aṣṭhōges, which are regular or irregular.

The most common slough is that of the anūihote chhund, or regular stanza of eight syllables in the line. In this measure the greatest part of the Maḥābāret is composed. The rhyme in this kind of stanza should be alternate; but the poets do not seem to be very nice in the observance of a strict correspondence in the sounds of the terminating syllables, provided the feet of the verse are accurately kept.

This short anūihote aṣṭhōge is generally written by two verses in one line, with a pause between; so the whole then assumes the form of a long distich.

The irregular stanza is constantly called anyāchhund, of whatever kind of irregularity it may happen to consist. It is most commonly compounded of the long line cābee chhund and the short anūihote chhund alternately; in which form it bears some resemblance to the most common lyric measure of the English.

Perhaps our readers may feel a curiosity to be informed of the origin of this oriental tongue. If we believe the brahmins themselves, it was coeval with the race of man, as was observed towards the beginning of this section. The brahmins, however, are not the only people who ascribe a kind of eternity to their own particular dialect. We find that the Sanskrit in its primitive destination was appropriated to the offices of religion. It this tongue is indeed pretended, that all the other dialects spoken in Hindostan were emanations from that fountain, to which they might be traced back by a skilful etymologist. This, we think, is an argument of no great consequence, since we believe that all the languages of Europe, by the same process, may be deduced from any one of those current in that quarter of the globe. By a parity of reason, all the different dialects of Hindostan may be referred to the language in question. Indeed, if we admit the authority of the Mosaic history, all languages whatsoever are derived from that of the first man. It is allowed that the language under consideration is impregnated with Persian, Chaldaic, Phoenician, Greek, and

(2) The books which contain the religion of the brahmins.
 PHILOLOGY.  

and even Latin idioms. This, we think, affords a presumption that the Sanscrit was one of those original dialects which were gradually produced among the descendants of Noah, in proportion as they gradually receded from the centre of population. What branch or branches of that family emigrated to Hindostan, it is not easy to determine. That they were a party of the descendants of Shem is most probable, because the other septs of his posterity settled in that neighborhood. The sum then is, that the Hindoos were a colony consisting of the descendants of the patriarch Shem.

It appears, however, by almost numberless monuments of antiquity still existing, that at a very early period a different race of men had obtained settlements in that country. It is now generally admitted, that colonies of Egyptians had peopled a considerable part of Hindostan. Numberless traces of their religion occur everywhere in those regions. The very learned president himself is positive, that vestiges of those sacerdotal wanderers are found in India, China, Japan, Tibet, and many parts of Tartary. Those colonists, it is well known, were zealous in propagating their religious ceremonies wherever they resided, and wherever they travelled. There is at the same time even at this day a striking resemblance between the sacred rites of the vulgar Hindoos and those of the ancient Egyptians. The prodigious statues of Salsette and Elephanta fabricated in the Egyptian style; the vast excavations hewn out of the rock in the former; the woody hair of the statues, their distorted attitudes, their grotesque appearances, their triple heads, and various other configurations—plainly indicate a foreign original. Those phenomena suit no other people on earth so exactly as the sons of Mizraim. The Egyptian priests used a sacred character, which none knew but themselves; none were allowed to learn except their children and the choice of the initiated. All these features mark an exact parallel with the brahmins of the Hindoos. Add to this, that the dress, diet, lustrations, and other rites of both sects, bore an exact resemblance to each other. Sir William Jones has justly observed, that the letters of the Sanscrit, stript of all adventitious appendages, are really the same Chaldaic characters. We learn from Cassiodorus, the following particulars: "The height of the obelisks is equal to that of the cirrus; now the higher is dedicated to the sun, and the lower to the moon, where the sacred rites of the ancients are intimated by Chaldaic signatures by way of letters." Here then it is plain that the sacred letters of the Egyptians were Chaldaic, and it is allowed that those of the brahmins were of the same complexion; which affords a new presumption of the identity of the Sanscrit with those just mentioned.

That the Egyptians had at a very early period penetrated into Hindostan, is universally admitted. Osiris, their celebrated monarch and deity, according to their mythology, conducted an army into that country; taught the natives agriculture, laws, religion, and the culture of the vine, &c. He is said at the same time to have left colonies of priests, as a kind of missionaries, to instruct the people in the ceremonies of religion. Sanscrit, another Egyptian potentate, likewise overran Hindostan with an army, and taught the natives many useful arts and sciences. When the pastor-kings invaded and conquered Egypt, it is probable that numbers of the priests, in order to avoid the fury of the merciless invaders, who demolished the temples and persecuted the ministers of religion, left their native country, and transported themselves into India. These, we should think, were the authors both of the language and religion of the brahmins. This dialect, as imported by the Egyptians, was probably of the same contexture with the sacred language of that people, as it appeared many ages after. The Indians, who have always been an inventive and industrious race of men, in process of time cultivated, improved, diversified, and constructed that language with such care and assiduity, that it gradually arrived at that high degree of perfection in which at present it appears.

Had the learned president of the Asiatic Society (m), when he instituted a comparison between the deities of Hindostan on the one side and of Greece and Italy on the other, examined the analogy between the gods of Hindostan and those of Egypt, we think he would have performed a piece of service still more eminent. Having first demonstrated the similarity between the divinities of India and Egypt, he might then have proceeded to investigate the resemblance of the Egyptian and Phoenician with those of Greece and Rome. By this process a chain would have been formed which would have conducted his reader to comprehend at one view the identity of the Zabian worship almost throughout the world.

We foresee that it will be objected to this hypothesis, that all the dialects of Hindostan being clearly reducible to the Sanscrit, it is altogether impossible that it could have been a foreign language. To this we answer, that at the early period when this event is supposed to have taken place, the language of the posterity of the sons of Noah had not deviated considerably from the primitive standard, and consequently the language of the Egyptians and the Hindoos was nearly the same. The Sanscrit was gradually improved: the language of the vulgar, as is always the case, became more and more different from the original archetype; but still retained such a near resemblance to the mother-tongue as proved the verity of its extraction.

To the preceding account of the Sanscrit language we shall annex a few strictures on the language of Bengali, which we believe is derived from the most common use in the southern parts of Hindostan.

Though most of the ancient oriental tongues are read from right to left, like the Hebrew, Chaldaic, Arabic, &c., yet such as properly belong to the whole continent of India proceed from left to right—like those of Europe. The Arabic, Persian, &c., are the grand sources whence the former method has been derived; but with these, the numerous original dialects of Hindostan have not the smallest connection or resemblance.

The great number of letters, the complex mode of combination, and the difficulty of pronunciation, are considerable.
considerable impediments to the study of the Bengali language; and the carelessness and ignorance of the people, and the inaccuracy of their characters, aggravate these inconveniences. Many of their characters are spurious; and these, by long use and the hurry of business, are now almost naturalized into the language.

The Bengali alphabet, like that of the Sanscrit, from which it is derived, consists of 50 letters, whose form, order, and sound, may be learned from Mr. Halhed's grammar of the Bengali language. The vowels are divided into long and short, the latter of which are often omitted in writing. Most of the oriental languages are constructed upon the same principle, with respect to the omission of the short vowel. The Hebrews had no sign to express it before the invention of the Masoretic points; in Arabic it is rarely inserted unless upon very solemn occasions, as in the Koran; in the modern Persian it is universally omitted: so to all the consonants in the Sanscrit, the short vowel is an invariable appendage, and is never signified by any diacritical mark; but where the construction requires that the vowel should be dropped, a particular stroke is set under the letter. It is in vain to pretend, in a sketch like this, to detail the sound and pronunciation of these letters: this must be acquired by the ear and by practice.

In the Bengali language, there are three genders, as in Greek, Arabic, &c. The authors of this threefold division of genders, with respect to their precedence, appear to have considered the neuter as a kind of residuum resulting from the two others, and as less worthy or less comprehensive than either (see section of the Greek). The terminations usually applied upon this occasion are a for the masculine, and e for the feminine. In Sanscrit, as in Greek and Latin, the names of all things animate have different genders, founded on vague and incomprehensible distinctions: the same is the case with the Bengali.

A Sanscrit noun, on its first formation from the general root, exists equally independent of case as of gender. It is neither nominative, nor genitive, nor accusative; nor is impressed with any of those modifications which mark the relation and connection between the several members of a sentence. In this state it is called an imperfect or crude noun. To make a nominative of a word, the termination must be changed and a new form supplied. Thus we see, that, in the Sanscrit at least, the nominative has an equal right with any other inflection to be called a case. Every Sanscrit noun has seven cases, exclusive of the vocative; and therefore comprehends two more than even those of the Latin. Mr. Halhed above mentioned details all the varieties of these with great accuracy, to whose grammar we must refer our readers. The Bengali has only four cases beside the vocative; in which respect it is much inferior to the other.

It would be difficult to account for the variety of words which have been allotted to the class of pronouns by European grammarians. The first and second person are chiefly worthy of observation; these two should seem to be confined to rational and conversable beings only: the third supplies the place of every object in nature; wherefore it must necessarily be ended with a capacity of shifting its gender respectively as it shifts the subject; and hence it is in Sanscrit frequently denominated an adjective. One of the demonstratives hic or id usually serves for this purpose; and generally the latter, which in Arabic has no other name than ihmeer and Bengalese language, ghayb, "the pronoun of the absentee," for whose name it is a substitute.

In most languages where the verb has a separate inflection to each person, that inflection is sufficient to Bengalese ascertain the personality; but in Bengal compositions, though the first and second persons occur very frequently, nothing is more rare than the usage of the pronoun of the third; and names of persons are inserted with a constant and disgusting repetition, to avoid, as it should seem, the application of the words he and she. The second person is always ranked before the first, and the third before the second. The personal pronouns have seven cases, which are varied in a very irregular manner. Leaving these to the Bengalese grammar, we shall proceed to the verb.

The Sanscrit, the Arabic, the Greek and Latin verbs, are furnished with a set of inflections and terminations so comprehensive and so complete, that by their form alone they can express all the different distinctions both of persons and time. Three separate qualities in them are perfectly blended and united. Thus by their root they denote a particular act, and by their inflection both point out the time when it takes place and the number of the agents. In Persian, as in English, the verb admits but of two forms, one for the present tense and one for the aorist; and it is observable, that while the past tense is provided for by a peculiar inflection, the future is generally supplied by an additional word conveying only the idea of time, without any other influence on the act implied by the principal verb. It is also frequently necessary that the different state of the action, as perfect or imperfect, be further ascertained in each of the tenses, past, present, and future. This also, in the learned languages, is performed by other variations of inflections, for which other verbs and other particles are applied in the modern tongues of Europe and Persia.

Every Sanscrit verb has a form equivalent to the middle voice of the Greek, used through all the tenses voice of with a reflective sense, and the former is even the most extensive of the two in its use and office: for in Greek the reflective can only be adopted intransitively when the action of the verb descends to no extraneous subject; but in Sanscrit, the verb is both reciprocal and transitive at the same time.

Neither the Sanscrit, nor the Bengalese, nor the Hindostanic, have any word precisely answering to the sense of the verb I have, and consequently the idea is always expressed by est mih; and of course there is no auxiliary form in the Bengali verb correspondent to I have written, but the sense is conveyed by another mode. The very substantive, in all languages, is defective and irregular, and therefore the Sanscrit calls it a semi-verb. It is curious to observe that the present tense of this verb, both in Greek and Latin, and also in the Persian, appears plainly to be derived from the Sanscrit. In the Bengalese, this verb has but two distinctions of time, the present and the past; the terminations of the several persons of which serve as a model for those of the same tense in all other verbs respectively.

Verbs of the Bengali language may be divided into three classes, which are distinguished by their penultimate letter. The simple and most common form has Ss.
an open consonant immediately preceding the final letter of the infinitive. The second is composed of those words whose final letter is preceded by another vowel or open consonant going before it. The third consists entirely of causals derived from verbs of the first and second conjugations. The reader will easily guess at the impossibility of prosecuting this subject to any greater length: we shall therefore conclude with a few remarks collected from the grammar so often mentioned, which we apprehend may be more amusing, if not more instructing.

The Greek verbs in μι are formed exactly upon the same principle with the Sanscrit conjugations, even in the minutest particulars. Instances of this are produced in many verbs, which from a root form a new verb by adding the syllable μι, and doubling the first consonant. This mode furnishes another presumption of the Egyptian origin of the Sanscrit. Many Greeks travelled into Egypt; many Egyptian colonies settled in Greece. By one or other of these channels the foregoing innovation might have been introduced into the Greek language.

To form the past tense, the Sanscrit applies a syllabic augment, as is done in the Greek; the future has for its characteristic a letter analogous to that of the same tense in the Greek, and it omits the reduplicating of the first consonant. It may be added, that the reduplication of the first consonant is not constantly applied to the present tense of the Sanscrit more than to those of the Greek.

The natural simplicity and elegance of many of the Asiatic languages are greatly debased and corrupted by the continual abuse of auxiliary verbs; and this inconvenience has evidently affected the Persian, the Hindostan, and the Bengal idioms.

The infinitives of verbs in the Sanscrit and Bengalese are always used as substantive nouns. Every body knows that the same mode of arrangement very often occurs in the Greek.

In the Sanscrit language, as in the Greek, there are forms of infinitives and of participles comprehensive of time; there are also other branches of the verb that seem to resemble the gerunds and supines of the Latin.

All the terms which serve to qualify, to distinguish, or to augment, either substance or action, are classed by the Sanscrit grammarians under one head; and the word used to express it literally signifies _increase or addition_. According to their arrangement, a simple sentence consists of three members; the _agent_, the _action_, the _subject_; which, in a grammatical sense, are reduced to two; the _noun_ and the _verb_. They have a particular word to specify such words as amplify the noun which imports quality, and answers to our _adjectives_ or _epithets_. Such as are applied to denote relation or connection, are intimated by another term which we may translate _preposition_.

The adjectives in Bengalese have no distinction of gender or number; but in Sanscrit these words preserve the distinction of gender, as in the Greek and Latin.

Prepositions are substitutes for cases, which could not have been extended to the number necessary for expressing all the several relations and predicaments in which a noun may be found, without causing too much embarrassment in the form of a declension. Those are too few in the Greek language, which occasions much in convenience. See sect. Greek.

The Latin is less polished than the Greek, and of consequence bears a much nearer resemblance to the Sanscrit, both in words, inflections, and terminations.

The learned are now convinced that the use of numerical figures was first derived from India. Indeed the antiquity of their application in that country far exceeds the powers of investigation. All the numerals in Sanscrit have different forms for the different genders, as in Arabic. There appears a strong probability that the European method of computation was derived from India, as it is much the same with the Sanscrit, though we think the Europeans learned it from the Indians. The Bengalse merchants compute the largest sums by _fours_; a custom evidently derived from the original mode of computing by the fingers.

The Sanscrit language, among other advantages, has a great variety in the mode of arrangement; and the words are so knit and connected together, that every sentence appears like one complete word. When two or more words come together in _regimine_, the last of them only has the termination of a case, the others are known by their position; and the whole sentence so connected, forms but one compound word, which is called a _foot_.

### Sect. VI. Of the Chinese Language.

The Chinese, according to the most authentic accounts, are a people of great antiquity. Their situation was such, as in the earliest ages of the world, in a great measure secured them from hostile invasion. Their little commerce with the rest of mankind preceded them the knowledge of those improvements which a mutual emulation had often generated among other nations, who were situated in such a manner, with relation to each other, as served to promote a mutual intercourse and correspondence. As China is a large and fertile country, producing all the necessaries, conveniences, and even the luxuries of life, its inhabitants were not under the necessity of looking abroad for the two former, nor exposed to the temptation of engaging in foreign commerce, in order to procure the latter. Perfectly satisfied with the articles which their own country produced, they applied themselves entirely to the practice of agriculture and other arts connected with that profession; and their frugality, which they retain even to this day, taught them the lesson of being contented with little; of consequence though their population was almost incredible, the produce of their soil was abundantly sufficient to yield them a subsistence. Their inventions were their own; and as they borrowed nothing from other people, they gradually began to despise the rest of mankind, and, like the ancient Egyptians, branded them with the epithet of barbarians.

Those people had at an early period made amazing proficiency in the mechanical arts. Their progress in the liberal sciences, according to the latest and indeed the most probable accounts, was by no means proportioned. In mathematics, geometry, and astronomy, their knowledge was contemptible; and in ethics, or moral philosophy, the complexion of their laws and customs
customs proves their skill to have been truly superficial. They value themselves very highly at present upon their oratorical talents; and yet of all languages spoken by any civilized people, theirs is confessedly the least improved. To what this untowardly defect is owing, the learned have not yet been able to determine.

The language of the Chinese is totally different from those of all other nations, and bears very strong marks of an original tongue. All its words are monosyllabic, and compositions and derivations are altogether unknown. Their nouns and verbs admit of no flexions; in short, every thing relating to their idiom is peculiar, and incapable of being compared with any other dialect spoken by any civilized people. Most barbarous languages exhibit something that resembles an attempt towards those dialectical modifications of speech; whereas the Chinese, after a space of 4000 years, have not advanced one step beyond the very first elements of ideal communication. This circumstance, we think, is a plain demonstration that they did not emigrate from that region where the primitive race of mankind is thought to have fixed its residence. Some have imagined, we believe with good reason, that they are a Tartarian race, which, breaking off from the main body of that numerous and widely extended people, directed their march towards the south-east. There, falling in with delightful and fertile plains which their poverty now inhabit, they found themselves accommodated so much to their liking, that they dropped all desire of changing their habitations. The country of China is, indeed, so environed with mountains, deserts, and seas, that it would have been difficult for men in their primitive state to have emigrated into any of the neighbouring regions. Thus secluded from the rest of mankind, the Chinese, in all probability, were left to the strength of their own inventive powers to fabricate a language, as well as the other arts and improvements necessary for the support and convenience of life.

It is indeed obvious that their stock of vocables, when they emigrated from Tartary, was neither ample nor properly accommodated to answer the purposes of the mutual conveyance of ideas. With this slender stock, however, they seem to have been satisfied; for it does not appear that any additions were afterwards made to that which was originally imported. Instead of framing a new race of terms by compound- ing their primitive ones; instead of diversifying them by inflections, or multiplying them by derivatives, as is done in every other language; they rather chose to retain their primitive words, and by a variety of modifications introduced upon their orthography or pronunciation, to accommodate them to a variety of significations. Were it possible to scrutinize all the Tartarian dialects, and to reduce them to their primitive monosyllabic character, perhaps the original language of the Chinese might be investigated and ascertained. We know that attempts have been made to compare it with some of the other Asiatic languages, especially the Hebrew: This labour has, however, proved unsuccessful, and no primeval identity has been discovered. Before this comparison could be instituted with the most distant prospect of success, the language last mentioned must be stripped of all its adventitious qualities; and not only so, but it must be reduced to the monosyllabic tone, and then contrasted with the Chinese monosyllables; an undertaking which we are persuaded would not be readily executed. After all, we are convinced that no resemblance of any importance would be discovered.

The Chinese language must then, in our opinion, Process of have been a Tartarian dialect, as the people them- themselves were colonists from Tartary. We have observed too, above, that those people have not hitherto found out the art of composition of words. This is the more surprising, when we consider that, in the characters which form their written language, they employ many compositions. For example, the character by which they represent misfortune, is composed of one hieroglyphic which represents a house, and another which denotes fire; because the greatest misfortune that can befall a man is to have his house on fire. With respect to the language which they use in speech, though they very often employ many words to express one thing, yet they never run them together into one word, making certain changes upon them that they may incorporate the more conveniently, but always preserve them entire and unaltered.

The whole number of words in the Chinese language Pancre of does not exceed 1200: the nouns are but 326. Its words must certainly appear surprising, that a people whose manners are so highly polished and refined, should be able to express so many things as must of necessity attend such a course of life by so small a number of words, and those too monosyllables. The difficulties which attend this singular mode must be felt almost every instant; circumstances which, according to the ordinary course of things, should have induced them to attempt both an augmentation of the number of their words and an extension of those which they had by composition and derivation. We learn from Du Halde that the Chinese have two different dialects: the one vulgar, which is spoken by the vulgar, and the other, called the Mandarin language, and is current only among the learned. The latter is properly that which was formerly spoken at court in the province of Kiang-nan, and gradually spread among the polite people in the other provinces. Accordingly, this language is spoken with more elegance in the provinces adjoining to Kiang-nan than in any other part of the kingdom. By slow degrees it was introduced into all parts of the empire, and consequently became the universal language.

It then appears that the modern language of China was originally the court dialect, and utterly unknown to the bulk of the people. From this circumstance we think it may fairly be concluded that this dialect was deemed the royal tongue, and had been fabricated on purpose to distinguish it from the vulgar dialects. We learn from Herodotus, that the Ethio- piopians had a royal language which was the same as the sacred idiom of the Egyptians. This Mandarin tongue was originally an artificial dialect fabricated with a view to enhance the majesty of the court, and to raise its very style and diction above that of the rest of mankind. The Chinese, a wonderfully inventive people, might actually contrive a language of that complexion, with an intention to render it obscure...
PHILOLOGY.

Chinese

Language

and enigmatical (n). Such a plan would excite their admiration, and would at the same time greatly exceed their comprehension. In process of time, when the Chinese empire was extended, the Mandarins who had been brought up at court, and understood nothing of the provincial dialects, found it convenient to have the most eminent persons in every province taught the language employed by themselves, in order to qualify them for transacting the affairs of government with them in a language which both understood. By this means the royal dialect descended to the vulgar, and in process of time became universal. The Tartar dialect formerly in use vanished; only a few vestiges of it remained; which gradually incorporating with the royal language, occasioned the variation of provincial tongues above mentioned.

We are therefore clearly of opinion, that the modern language of the Chinese was deduced from the original Mandarin, or court dialect, and that this last was an artificial speech fabricated by the skill and ingenuity of that wonderful people. The learned have long held it up as the primary dialect, because, say they, it bears all the signatures of an original unimproved language. In our opinion, nothing appears more ingeniously artificial. It is universally allowed that, in its structure, arrangement, idioms, and phraseology, it resembles no other language. Is not every learned man now convinced that all the Asiatic languages yet known, discover unequivocal symptoms of their cognition and family resemblance? The Ethiopians, Chaldeans, Arabsians, Persians, Egyptians, Hebrews, Phoenicians, the Brahmins, Bengalese, the Hindoos bordering upon China, all speak only different dialects of one language, varying from the original in dialect only, some in a greater some in a lesser degree: why should the Chinese alone stand altogether insulated and unallied?

The languages of the North all wear congenial features. The Tartar or Tatar dialects of every clan, of every nation, of every denomination, exhibit the most palpable proofs of a near affinity: the Gothic and Slavonian dialects, which pervade a great part of Europe and some parts of Asia, are obviously brethren, and may easily be traced up to an Asiatic original. Even some of the American jargon dialects contain vocables which indicate an Asiatic or European original. Our readers, we flatter ourselves, will agree with us, that had the language of the Chinese been the original language, a resemblance must have still existed between it and its descendants. If it had originated from any other language, it would have retained some characteristic features of its parent archetype. As neither of these is to be found in the fabric of the language under consideration, the conclusion must be, that it is a language entirely different from all other tongues; that it is constructed upon different principles, descended from different parents, and framed by different artists.

The Chinese themselves have a common and immemorial tradition, that their language was framed by Yao their first emperor, to whom they attribute the invention of every thing curious, useful, and ornamental. Traditional history, when it is ancient, uniform, and universal, is generally well founded; upon this occasion we think the tradition above mentioned may be fairly admitted as a collateral evidence.

The paucity of vocables contained in this singular proof of language, we think another presumption of its artificial structure. The Chinese Onomateta would find it an arduous task to devise a great number of new terms, and would therefore rest satisfied with the smallest number possible. In other languages we find the like economy was observed. Rather than fabricate new words, men chose sometimes to adapt old words to new, and, upon some occasions, even to contrary significations. To spare themselves the trouble of coining new terms, they contrived to join several old ones into one; whence arose a numerous race of compounds. Derivatives too were fabricated to answer the same purpose. By this process, instead of creating new vocables, old ones were compounded, diversified, deflected, ramified, metamorphosed, and tortured into a thousand different shapes.

The Greek is deservedly esteemed a rich and copious language; its radical words have been curiously traced by several learned men, who, after the most laborious and exact scrutiny, have found that they do not amount to more than 300. The Sanscrit language is highly compounded; its radical terms, however, are very few in number. Upon the whole, we think we may conclude, that the mere any language abounds in compounds and derivatives, the smaller will be the number of its radical terms. The Arabic admits of no composition, and of consequence its words have been multiplied almost in infinitum: the Sanscrit, the Persian, and the Greek, abound with compounds, and we find their radicals are few in proportion.

There are, we think, three different methods which may be employed in order to enrich and extend the range of a language. 1st, By fabricating a multitude of words; the plan which has been pursued by the Arabs. 2d, By framing a multitude of compounds and derivatives; the artifice employed by the Greeks and the authors of the Sanscrit. 3d, By varying the significations of words without enlarging their number; the method practised by the Chinese and their colonists. The Arabsians, we think, have shown the most fertile and inventive genius, since they have enriched their language by actually creating a new and a most numerous race of words. The fabricators of the Sanscrit and the collectors of the Greek have exhibited art, but comparatively little fertility of genius. Leaving, therefore, the Arabsians, as in justice we ought, masters of the field in the contest relating to the formation of language, we may range the Greek and Sanscrit on the one side, and the Chinese on the other; and having made this arrangement, we may attempt to discover on which side the largest proportion of genius and invention seems to rest.

The

(n) An attempt of this nature, among a people like the Chinese, is by no means improbable; nor is its success less probable. For a proof of this, we need only have recourse to Bishop Wilkins's Artificial Language, and Psalmanazar's Dictionary of the language of Formosa.
The Greek and Sanscrit (for we have selected them as most highly compounded) exhibit a great deal of art in modifying, arranging, and diversifying their compounds and derivatives, in such a manner as to qualify them for intimate complex ideas; but the Chinese have performed the same office by the help of a race of monosyllabic notes, simple, inflexible, invariable, and at the same time few in number. The question then comes to be, whether more art is displayed in new-modelling old words by means of decensions, compounds, and derivatives; or by devising a plan according to which monosyllabic radical terms, absolutely invariable, should, by a particular modification of sound, answer all the purposes performed by the other. The latter appears to us much more ingeniously artificial. The former resembles a complicated machine composed of a vast number of parts, congenial indeed, but loosely connected; the latter may be compared to a simple, uniform engine, easily managed, and all its parts properly adjusted. Let us now see in what manner the people in question managed their monosyllabic notes, so as to qualify them for answering all the purposes of speech.

Though the number of words in the Chinese language does not amount to above 1200; yet that small number of vocables, by their artificial management, is sufficient to enable them to express themselves with ease and perspicuity upon every subject. Without multiplying words, the sense is varied almost in infinitum by the variety of the accents, inflections, tones, aspirations, and other changes of the voice and enunciation; circumstances which make those who do not thoroughly understand the language frequently mistake one word for another. This will appear obvious by an example.

The word teou pronounced slowly, drawing out the ę and raising the voice, signifies a lord or master. If it is pronounced with an even tone, lengthening the ę, it signifies a hog. When it is pronounced quick and lightly, it imports a kitchen. If it be pronounced in a strong and masculine tone, growing weaker towards the end, it signifies a column.

By the same economy, the syllable po, according to the various accents, and the different modes of pronunciation, has eleven different significations. It signifies glass, to boil, to winnow rice, wise or liberal, to prepare, an old woman, to break or cleave, inclined, a very little, to water, a slave or captive. From these examples, and from almost numberless others which might be adduced, it is abundantly evident that this language, which at first sight appears so poor and confined, in consequence of the small number of the monosyllables of which it is composed, is notwithstanding very copious, rich, and expressive.

Again, the same word joined to various others, imports a great many different things; for example mou, when alone, signifies a tree, wood; but when joined with another word, it has many other significations. Mou leoo, imports "wood prepared for building"; mou lan is "bars, or wooden grates"; mou hia, "a box"; mou song, "a chest of drawers"; mou tsiang, "a carpenter"; mou eul, "a mushroom"; mou nu, "a sort of small orange"; mou tseung, "the planet Jupiter"; mou miang, "cotton," &c.

This word may be joined to several others, and has as many different significations as it has different combinations.

Thus the Chinese, by a different arrangement of their monosyllables, can compose a regular and elegant discourse, and communicate their ideas with energy and precision; may even with gracefulness and propriety. In these qualities they are not excelled either by the Europeans or Asiatics, who use alphabetical letters. In fine, the Chinese so naturally distinguish the tones of the same monosyllable, that they comprehend the sense of it, without making the least reflection on the various accents by which it is determined.

We must not, however, imagine, as some authors have consequence, that those people cant in speaking, and make a great sort of music which is very disagreeable to the ear, a method on pronunciation. These different tones are pronounced so curiously, that even strangers find it difficult to perceive their difference even in the province of Kiang-nan, where the accent is more perfect than in any other. The nature of it may be conceived by the guttural pronunciation in the Spanish language, and by the different tones that are used in the French and Italian; these tones are almost imperceptible; they have, however, different meanings, a circumstance which gave rise to the proverb, that the tone is all.

If the fineness and delicacy of their tones are such as to be scarce perceptible to a stranger, we must suppose that they do not rise high, but only by small intervals; so that the music of their language must somewhat resemble the music of the birds, which is within a small compass, but nevertheless of great variety of notes. Hence it will follow, that strangers will find it very difficult, if not impossible, to learn this language; more especially if they have not a delicate ear and a flexible voice, and also much practice. The great difference then between the Chinese and Greek accents consists in this, that the Greeks had but two accents, the grave and acute, distinguished by a large interval, and that not very exactly marked: for the acute, though it never rises above a fifth higher than the grave, did not always rise so high, but was sometimes pitched lower according to the voice of the speaker. The Chinese must have many more accents, and the intervals between them must be much smaller, and much more carefully marked: for otherwise it would be impossible to distinguish them. At the same time, their language must be much more musical than the Greek, and perhaps more so than any language ought to be; but this becomes necessary for the purposes above mentioned. Du Halde is positive, that notwithstanding the perpetual variation of accents in the Chinese tongue, and the almost imperceptible intervals between these tones, their enunciation does not resemble singing; many people, however, who have resided in China, are equally positive that the tone with which they utter their words does actually resemble canting; and this, when we consider the almost imperceptible intervals by which they are perpetually raising and lowering the tone of their voice, appears to us highly probable.

As the people of whose language we are treating at present communicate a variety of different significations to their monosyllabic words by their different accentuation, so they employ quantity for the very same purpose. By lengthening or shortening the vowels of their words, they employ them to signify very different things. The same they perform by giving their words different aspi-
rations, as likewise by sounding them with different degrees of roughness and smoothness, and even sometimes by the different motion, posture, or attitude, with which their enunciation is accompanied. By these methods of diversifying their monosyllables (says Dr. Halde), they make 230 of them serve all the purposes of languages, and these too not much varied in their termination; since all the words in that language either terminate with a vowel or with the consonant ン, sometimes with the consonant ン annexed.

From this account, we think it is evident that the Chinese, by a wonderful exertion of ingenuity, do, by different tones and prosodical modifications, by means of a very considerable number of words, all invariable radicals, actually perform all that the most polished nations have been able to achieve by their compounds, derivatives, &c. diversified by declensions, conjugations, and flexions of every kind; circumstances which, in our opinion, reflect the greatest honour on their inventive powers.

With respect to the grammar of this language, as it admits of no flexions, all their words being indeclinable, their cases and tenses are all formed by particles. They have no idea of genders; and even the distinction of numbers, which in almost all other languages, even the most unimproved, is marked by a particular word, is in the Chinese only indicated by a particle. They have only the three simple tenses, namely, the past, present, and future; and for want of different terminations, the same word stands either for the verb or the verbal substantive, the adjective or the substantive derived from it, according to its position in the sentence.

The Chinese language being composed of monosyllables, and these indeclinable, can scarce be reduced to grammatical rules: we shall, however, attempt to lay before our readers as much of the texture of that singular dialect as may enable them to form some vague idea of its genius and constitution. We shall begin with the letters, and proceed regularly to the remaining parts as they naturally succeed each other.

The art of joining the Chinese monosyllables together is extremely difficult, and requires a very long and laborious course of study. As they have only figures by which they can express their thoughts, and have no accents in writing to vary the pronunciation, they are obliged to employ as many different figures or characters as there are different tones, which give so many different significations to the same word. Besides some single characters signify two or three words, and sometimes even a whole period. For example, to write these words, good morrow, Sir, instead of joining the characters which signify good and morrow with that of Sir, a different character must be used, and this character alone expresses these three words. This circumstance greatly contributes to multiply the Chinese characters.

This method of joining the monosyllables is indeed sufficient for writing so as to be understood; but it is deemed trifling, and is used only by the vulgar. The style that is employed, in order to shine in composition, is quite different from that which is used in conversation, though the words are in reality the same. In writings of that species, a man of letters must use more elegant phrases, more lofty expressions, and the whole must be dignified with tropes and figures which are not in general use, but in a peculiar manner adapted to the nature of the subject in question. The characters of Cochin-China, of Tong-king, of Japan, are the same with those of the Chinese, and signify the same things; though, in speaking, these nations do not express themselves in the same manner: of consequence the language of conversation is very different, and they are not able to understand each other; while, at the same time, they understand each other's written language, and use all their books in common.

The learned must not only be acquainted with the characters that are employed in the common affairs of life, but must also understand their various combinations, and the numerous and multiform dispositions and arrangements which of several simple strokes make the compound characters. The number of their characters exceeding amounts to 80,000; and the man who knows the great number of them is of course the most learned. From this circumstance we may conclude, that many years must be employed to acquire the knowledge of such a prodigious number of characters, to distinguish them when they are compounded, and to remember their shape and import. After all, a person who understands 10,000 characters may express himself with tolerable propriety in this language, and may be able to read and understand a great number of books. The generality of their learned men do not understand above 15,000 or 20,000, and few of their doctors have attained to the knowledge of above 40,000. This prodigious number of characters is collected in their great vocabulary called Hau-pien. They have radical letters, which show the origin of words, and enable them to find out those which are derived from them: for instance, the characters of mountains, trees, man, the earth, of a horse, under which must be sought all that belongs to mountains, trees, man, &c. In this search one must learn to distinguish in every word those strokes or figures which are above, beneath, on the side, or in the body of the radical figure.

Clemens Alexandrinus (see Section Chaldean, &c.) informs us, that the Egyptians employed three sorts of characters: The first was called the epistolary, which was used in writing letters; the second was denominated sacred, and peculiar to the sacerdotal order; the last hieroglyphical, which was appropriated to monumental inscriptions and other public memorials. This mode of representation was twofold: one, and the most simple, was performed by describing the picture of the object which they intended to represent, or at least one that resembled it pretty nearly; as when they exhibited the sun by a circle and the moon by a crescent: the other was properly symbolic; as when they marked eternity by a serpent with his tail in his mouth, the air by a man clothed in an azure robe studded with stars, &c.

The Chinese, in all probability, had the same variety of characters. In the beginning of their monarchy, they communicated their ideas by drawing on paper the images of the objects they intended to express; that is, they drew the figure of a bird, a mountain, a tree, waving lines, to indicate birds, mountains, forests, rivers, &c. There were, however, an infinite number of ideas to be communicated, whose objects do not fall under the cognizance of the senses; such as the soul, the thoughts, the
PHILOLOGY.

Chinese Language.

119 and truly hieroglyphical, since they are composed of simple letters which retain the significance of the primitive characters. The original character for the sun was a circle, thus ☀; this they called ge: They now represent that luminary by the figure ☀, to which they still give the original name. But human institutions having annexed to these last framed characters the very same ideas indicated by the original ones, the consequence is, that every Chinese letter is actually significant, and that it still retains its significance, though connected with others. Accordingly the word tai, which imports "misfortune, calamity," is composed of the letter mien, "a house," and the letter ho, "fire," so that the symbolical character for misfortune is the figure of a house on fire. The Chinese characters, then, are not simple letters without any signification, like those of the Europeans and other Asiatics; but when they are joined together, they are so many hieroglyphics, which form images and express thoughts.

Upon the whole, the original characters of the Chinese were real pictures (see Section of the Egyptian language); the next improvement was the symbolical character; the third and last stage is the present mode, in which artificial signs have been fabricated, in order to represent such thoughts or ideas as could not be represented by one or other of the methods above described. Du Halde, vol. ii. p. 400, et seq. has furnished us with rules for pronouncing the Chinese vowels and consonants; a piece of information which, we apprehend, would be of little consequence to our readers, and which we shall therefore pass over, and proceed to give a brief account of their grammar. As the whole language is composed of monosyllables and, and these indeclinable, its grammatical structure must be simple and obvious: we shall only mention what to us appears singular and important.

In the Chinese language there is no diversity of genders or cases, and of consequence no declensions. Very often the noun is not distinguished from the verb; and the same word which in one situation is a substantive, in another may become an adjective, and even a verb.

The adjective always goes before the substantive; but if it follow it, it becomes a substantive.

The cases and numbers are known only by the composition. The plural number is distinguished by the particle men, which is common to all nouns; but when the noun is preceded by some word that signifies number, the particle men is not annexed.

The Chinese genitive, both singular and plural, when it comes after nouns, is often made by it; and there is no other case in that language. The same particle is sometimes placed after pronouns, as if they were derivatives.

The comparative degree is formed by adding the particle keng, which is always set before the noun, and signifies much. The particle to is sometimes used, which likewise imports much.

The Chinese have only three personal pronouns, nigo, "I," ni, "thou," and ta, "he:" these become plural by adding the syllable men. They are made possessive by adding the syllable ti, as nigo ti, "mine," ni ti, "thine," ta ti, "his." The patronymics are formed by putting the name of the city, country, &c. after the pronoun: choan is the pronoun relative who, what, which.

Chinese verbs have only three tenses, the preterperfect, the present, and the future. When there is no particle added to the verb, it is the present: the preterperfect is made by adding the particle leno: to distinguish the future tense they use the particle tsiang or hoet; and these are all the varieties incident to their verbs.

The Chinese language has no words that are properly adverbs; they only become so by custom, or by the place they possess in discourse. They are often obliged to employ several words to express the adverbs of other languages: they have none that are demonstrative, or proper for calling or exhorting; but in their stead they are obliged to use nouns and verbs.

Perhaps our readers may wish to know the Chinese their numerals; and may imagine that they bear a resemblance to those of the European or other Asiatic dialects. In this, however, they will be disappointed.

They stand as follows:

There are a great many particles proper to numbers in the Chinese language: they are frequently used, and in a way peculiar to it; for every numeral has a particle importing the object to which it is attached. Thus co is used for man, and yo for a woman; &c.; hoes is used for illustrious men; tsoe or tsoh is used for ships, dogs, bears; moy is used for pearls and precious things; pen is used for books; ten is appropriated to oxen and cows; too is used for letters and little bundles of paper; co is employed for corn and pulse. Those distinctions indicate a language manufactured on purpose to be employed.
PHILOLOGY.

The style of the Chinese, in their elaborate compositions, is mysterious, concise, and allegorical, after the eastern manner. It is often obscure to those who do not understand the language thoroughly; and it requires a considerable degree of skill to avoid mistakes in reading an author of elegance and subtilty. Their writers express a great deal in few words; and their expressions are lively, full of spirit, intermingled with bold comparisons and lofty metaphors. They affect to insert in their compositions many sentences borrowed from their five canonical books; and as they compare their books to pictures, so they liken these quotations to the five principal colours employed in painting; and in this their eloquence chiefly consists.

They prefer a beautiful character to the most finished picture; and nothing is more common than to see a single page covered with old characters, if they happen to be fair and elegant, sold at a very high price. They honour their characters in the most common books; and when they happen to light by chance upon a printed leaf, they gather it up with the greatest care and respect.

In China there are three varieties of language; that of the common people, that of the people of fashion, and that employed in writing books. Though the first is not so elegant as either of the other two, it is not however inferior to our European languages; though those who are but superficially acquainted with the Chinese may, in fact, imagine it uncouth and barbarous. This low and rude language is pronounced and written in many different ways, as is generally the case in other countries.

But a more polished, and at the same time a much more energetic, language, is employed in almost infinite number of novels; some perhaps true, but many more the vehicles of fiction. These are replete with lively descriptions, characters highly finished, morality, variety, wit, and vivacity, in such a degree as to equal in purity and politeness the most celebrated authors of Europe. This was the language of the Mandarins; and though exquisitely beautiful in its kind, was still inferior to the language of books. This last might be styled the *hypersublime*; and of this there are several degrees and intervals before an author can arrive at what they call the *language of the king*. This mode of writing cannot be well understood without looking upon the letters; but when understood, it appears easy and flowing. Each thought is generally expressed in four or six characters: nothing occurs that can offend the nicest ear; and the variety of the accents with which it is pronounced produces a soft and harmonious sound.

The difference between the *king* and their other books consists in the difference of the subjects upon which they are written. Those of the former are always grand and sublime, and of course the style is noble and elevated; those of the latter approach nearer to the common affairs and events of life, and are of consequence detailed in the Mandarin tongue. In writing on sublime subjects no punctuations are used. As these compositions are intended for the learned only, the author leaves to the reader to determine where the sense is complete; and those who are well skilled in the language readily find it out.

The copiousness of the Chinese language is in a great measure owing to the multitude of its characters. It is likewise occasioned, in some degree, by the difference of their signification, as also by the artificial method of their conjunction, which is performed most commonly by uniting them two and two, frequently three and three, and sometimes four and four.

Their books are very numerous and bulky, and of their course exceeding cumbersome. A dictionary of their language was compiled in the 18th century. It consisted of 95 large volumes. An appendix was annexed of 25 volumes. Their other books are voluminous in proportion. The Chinese, one may say, are a nation of learned men. Few people of rank neglect the belles lettres; for ignorance in a man of any degree of eminence is deemed an indelible stain on his character.

For their manner of writing, the implements with which they write, and the materials upon which they draw their characters, we must refer our readers to the article *writing*. It would, we believe, afford our readers some pleasure, could we discover and explain the reasons which have hitherto prevented the Chinese from adopting the letters employed from time immemorial by the other nations of Europe and Asia.

The Chinese have ever looked upon themselves as obstacles greatly superior to the rest of mankind. In ancient times they entertained such contemptible notions of foreigners, that they scorned to have any further commerce with them than to receive their homage. They were indeed, at a very early period, highly revered by the Indians, Persians, and Tartars. In consequence of this veneration, they looked upon themselves as the favourites of heaven. They imagined they were situated in the middle of the earth, in a kind of paradise, in order to give laws to the rest of mankind. Other men they looked upon with contempt and disdain, and deemed them deformed in body and defective in mind, cast out into the remote corners of the world as the dross and dregs of nature. They boasted that themselves only had received from God rational souls and beautiful bodies, in order to qualify them for being sovereigns of the species.

Such are the sentiments of the Chinese; and with such sentiments it is by no means surprising that their improvements in language, in writing, and other appendages of the belles lettres, have not been proportioned to their progress in mechanics. When people are once fully persuaded that they have already arrived at the summit of perfection, it is natural for them to sit down contented, and solace themselves with the idea of their own superior attainments. The Chinese had early entertained an exalted opinion of their own superiority to the rest of mankind; and therefore imagined that they had already carried their inventions to the *ne plus ultra* of perfection; the consequence was, that they could make no exertions to carry them higher.

The Chinese, for the space of 3200 years, had almost no intercourse with the rest of mankind. This was the consequence of their insulated situation.—They of course, *compared themselves with themselves*; and finding that they excelled all their barbarian neighbours,
bours, they readily entertained an opinion that they
exelled all the rest of mankind in an equal propor-
tion. This conceit at once stifled the emotions of ambition, and deprived them of all opportunities of
learning what was going forward in other parts of the
world.

They despised every other nation. People are little
disposed to imitate those whom they despise; and
this perhaps may be one reason why they are at
this day so averse from adopting the European inven-
tions.

A superstitious attachment to the customs of the
ancestors, is the general character of the Asiatic nations.
This is evidently a kind of discrétel feature among
the Chinese. The institutions of Fohi are looked up
to among them with equal veneration as those of Thoth
were among the Egyptians. Among the latter, there
was a law which made it capital to introduce any inno-
vation into the music, painting, or statuary, instituted by
that legislator. We hear of no such law among the
former; but custom established, and that invariably, for
a space of 5000 years, might operate as forcibly among
the Chinese as any law did among the people first men-
tioned. An attachment to ancient customs is often
more powerful and more coercive than any law that
can be promulgated and enforced by mere human
authority. These reasons, we think, may be assigned as
the impediments to the progress of the Chinese in the
belles lettres, and perhaps in the cultivation of the other
sciences.

Though the language of the Chinese is confessedly
different from all the other known languages in its char-
acter and construction, it contains, however, a great
number of words evidently of the same origin with those
which occur in other dialects, used by people, who, ac-
cording to the natural course of things, could never
have been connected with that remote country. A
few of these we shall produce before we conclude this
section. We shall begin with the import of the name
China.

China, or, as the orientals write it, Sin, is perhaps the
Latin sinus, "the bosom, the heart, the middle." The
Chinese actually imagine that their country is sit-
atuated in the very middle of the earth, and of conse-
quince call it Chung, "the middle, the heart;" a denomin-
ation which exactly suits their opinion.

Tu, in Chinese, intimates every thing that falls under
the cognizance of the senses, every thing that strikes
the sight; in Latin, tuer.

Tu, a table, a plank, a figure that renders every thing
sensible: 2. To see, to look upon, to appear; Greek
τοιοῦ, whence τοιόν, tendo.

Tui, to examine attentively, to inspect carefully.

Tui, the most apparent, chief, principal, first; 2. Light-
ning, thunder.

Tu, a sign by which we know one, letter of acknow-
l edgedgment. All these ideas are contained in the
Hebrew τοι, σήμα, which we believe has produced
the Egyptian thoth, the god or godlike man who in-
vented letters, geometry, music, astronomy, &c.

Tai, a dye, a theatre; Greek of old θεωρεῖν, then
θεώραω, "to see, to look;"

Tan, Latin tansum, "so much;"

Tan, land, country, region, a syllable annexed to the
VOL. XVI. Part I.

end of a great number of words. Aqui tan, Aquitania,
Chinese "a land of water;" Mauri tan, Mauritania, "the land
Language of the Moors." The orientals prefix ta, whence Farsi-
tan, Faristan, "the land or country of the Persians;" Cha-
stitan, Chasistan, "the country of Chaz;" Turque-
tan, Turquetian, "the land of the Turks."

T, a chief, an emperor, a title of dignity; whence
the Greek τά, "to honour;" hence, too, the word θά,
"bright, glorious;" whence θαυμά, "Jupiter;" θαῦμα, div-
eine;" the Latin Dius, now Deus, "God;" and Diuus,
with the digamma Ἐλευκυμ inserted; the Celtic Dhio-
ς, &c. It signified originally "bright, glorious," and
was an epithet of the Sun.

Tum, Latin tumultus, "to swell;"

Liven, "to love;" Hebrew ב, leb, "the heart;"

Latin, libet. This word pervades all the dialects of
the Gothic tongue, still retaining either the same or a near-
ly analogous signification.

Li, "letters;" Latin, littera, "to daub," as the Chi-
inese actually do in forming their letters.

Lo, "to contain, that which contains;" Celtic, leg; French, leve, loge, loger.

Lum, "a rule;" hence Latin, limes, "a line;"

Sui, "with;" Greek του, "with;" Celtic, cyn, cym,
whence Latin, cum, com, &c.

Xim, "very high, elevated, sacred, perfect;" Latin,
eximius.

Sia, "the heart;" Persian, سیا, "the heart."

Sien, "chief, first;" Celtic, cun, cewn, son, "the
head;" metaphorically, the chief, the first, the prin-
cipal; Thibet, cun, or cen, "great, elevated;" Arabic,
same, "to be elevated or raised."

Sina, or Sing, "a constellation, a star, an element;"

Hebrew, שים: Greek, οὖμ, όμος; Latin, signum.

Sie, "a man of learning;" Goth. Sax. Engl. see; to
see, see.

Cem, "a priest;" Heb. cemen; Syr. cun; Egypt-
can, cun.

Quin, "a king;" Celtic, cen, cend, "head, chief;"

Gothic, haunic; Germ. Flem. Engl. king, also queen.

Min, "a river;" Welch, men, "the water of a ri-
ver;" Latin, mensa, "to flow;" and perhaps amoenus,
"pleasant."

Hem, "hatred;" Greek, εμ, "cruel, horrible, odio-
us.

Kew, "a dog;" Greek ὄμος, id.

Ven, "beauty;" Latin, Venus, venustas; Iceland.

Swed. we, "pleasant;" Scotch, weisome.

Hon, "the soul, breath;" Greek, ἄνεμος; Latin, ani-
num, animus.

To these instances of the analogy between the Chi-
inese language and those of the other people of Asia and
Europe many more might be added; but the preced-
ing, it is hoped, will serve as a specimen, which is all
that can be expected from an inquiry of the nature of
the present.

SECT. VII. Of the Greek Language.

BEFORE we enter upon the consideration of the es-
sential and constituent parts of this noble language, we
must beg leave to settle a few preliminaries, which, we

Our...
PHILOLOGY.

Sect. VI.

The Greeks, according to the most authentic accounts, were descended of Javan or Jeno, the fourth son of Japhet, the eldest son of the patriarch Noah. The Scriptures of old, and all the orientals to this day, call the Greeks Jonim, or Jassam, or Javenoth. We have already observed, in the beginning of the article concerning the Hebrew language, that only a few of the descendants of Ham, and the most profligate of the posterity of Shem and Japhet, were concerned in building the tower of Babel. We shall not now resume the arguments then collected in support of that position; but proceed to investigate the character of that branch of the posterity of Javan which inhabited Greece and the neighbouring regions.

At what period the colonists arrived in these parts cannot be certainly determined, nor is it of great importance in the question before us. That they carried along with them into their new settlements the language of Noah and his family, is, we think, a point that cannot be controverted. We have endeavoured to prove that the Hebrew, or at least one or other of its sister-dialects, was the primeval language of mankind. The Hebrew, then, or one of its cognate branches, was the original dialect of the Jonim or Greeks.

Be that as it may, before these people make their appearance in profane history, their language deviates very widely from this original archetype. By what means, at what period, and in what length of time this change was introduced, is, we believe, a matter not easy to be elucidated. That it was progressive, is abundantly certain both from the rules of analogy and reason.

The colonies, which traversed a large tract of country before they arrived at their destined settlements, must have struggled with numberless difficulties in the course of their peregrinations. The earth, during the period which immediately succeeded the universal deluge, must have been covered with forests, intersected with swamps, lakes, rivers, and numberless other impediments. As the necessaries, and a few of the conveniences of life, will always engross the first cares of mankind, the procuring of these comforts will, of necessity, exclude all concern about arts and sciences which are unconnected with these pursuits. Hence we think it probable, that most of those colonies which migrated to a very great distance from the plains of Shinar, which we believe to have been the original seat of mankind, in a great measure neglected the practice of the polite but unnecessary modes of civilization which their ancestors were acquainted with, and practised before the era of their migration. Certain it is, that those nations which continued to reside in the neighbourhood of that centre of civilization, always appear in a cultivated state; while, at the same time, the colonists who removed to a considerable distance appear to have sunk into barbarism, at a period more early than the annals of profane history can reach. This appears to have been the situation of the primary inhabitants of Greece. Their own historians, the most partial to their own countrymen that can well be imagined, exhibit a language very unpromising picture of their earliest progenitors. Diodorus Siculus, in delineation of the character of the original men, we believe sketches his draught from the first inhabitants of Greece. He represents them as Lib. i. absolute savages, going out in small parties to make war upon the wild beasts of the field, which (according to him) kept them in continual alarm. "Necessity obliged them to band together for their mutual security; they had not sagacity enough to distinguish between the wholesome and poisonous vegetables; nor had they skill enough to lay up and preserve the fruits of autumn for their subsistence during the winter." The scholiast on Pindar describes the situation of the inhabitants of Peloponnesus in the following manner. "Now Pylton some have affirmed that the nymphs, who officiated in Ode 4. performing the sacred rites, were called Melissae. Of these Mnesaeus of Patara gives the following account. They prevailed upon men to relinquish the abominable practice of eating raw flesh torn from living animals, and persuaded them to use the fruits of trees for food. — 128 Melissa, one of them, having discovered bee-hives, ate Process of the honey-combs, mingled the honey with water for their civil-drink, and taught the other nymphs to use the same beverage. She called bees Melisseus, Melissae, from her own name, and bestowed much care on the management of them.

"These things (says he) happened in Peloponnesus; nor is the temple of Ceres honoured without nymphs, because they first pointed out the mode of living on the fruits of the earth, and put an end to the barbarous practice of feeding on human flesh. The same ladies, too, from a sense of decency, invented garments made of the bark of trees."

Hecataeus the Milesian, treating of the Peloponnesians, affirms, "that before the arrival of the Heleus, or Strake, a race of barbarians inhabited that region; and that all the most all Greece was, in ancient times, inhabited by barbarians. In the earliest times (says Pausanias) it is said that the barbarians inhabited most part of the country called Hellas. The original Greeks, if we may believe an author of deep research and superior ingenuity, were strangers to all the most useful inventions of life. Even the use of fire was unknown till it was found out and communicated by Prometheus, who is thought to have been one of the first civilized persons of mankind. Hence, according to some, his inventions, in a strain that indicates the uncultivated state of the world prior to the age in which he flourished. For the entertainment of our readers, we shall translate as much of that passage as suits our present purpose.

"Of the human race

Now hear the tale, how foolish erst they were:
I taught them thought and exercise of reason:
If taught they saw before, they saw in vain.
Hearing, they heard not; all was shapeless dreams
For a long space of time, at random mixt.

(o) The Greeks borrowed this contemptuous epithet from the Egyptians. See Herod. lib. ii. cap. 158.
In wild confusion: for they neither knew
Tile-cover'd houses standing in the sun,
Nor timber work; but, like the earth-bred ant,
They lodged in numless caves dug under ground:
No certain sign had they of winter cold,
Nor of the flow'ry spring, or summer store,
But blindly manag'd all; till I them taught
What time the stars appear, what time they set,
Hard to be scan'd: then arithmetic rare,
That queen of arts, by dint of patient thought
Descry'd, I taught them; and how vocal sounds
From letters joint'd arose.'

This character, though applied to mankind in general, was in reality that of the most ancient Greeks. These forbidding features had been transmitted to the poet by tradition as those of his ancestors: he was a Greek, and of consequence imputes them to all mankind without distinction.

Phroneus, the son and successor of Inachus*, is said to have discovered the treaty, and to have taught them the use of some new inventions. This circumstance raised his character so high among the savage aborigines of the country, that succeeding ages* deemed him the first of men.

Pelagus obtained the like character, because he taught the Arcadians to live upon the fruit of the fagus, to build sheds to shelter them from the cold, and to make garments of the skins of swine.

But what clearly demonstrates the unpolished character of the most ancient Greeks is, the extravagant honours lavished by them upon the inventors of useful and ingenious arts. Most of these were advanced to divine honours, and became the objects of religious worship to succeeding generations. The family of the Titans affords a most striking instance of this species of adulation. Jupiter, Juno, Mars, Apollo, Venus, Diana, &c. were sprung of this family. By the useful inventions which these personages communicated to the uncivilized nations of Greece, they obtained such lasting and such extravagant honours, that they justly out the sidereal divinities of the country, and possessed their high rank as long as Paganism prevailed in those regions. To these testimonies of the savagism of the original Greeks, others almost without number might be added; but those adduced in the preceding part of this inquiry will, we hope, satisfy every candid reader as to the truth of the position advanced.

While matters were in this situation with respect to the primitive Jonin or Greeks, a new colony arrived in those parts, which in a few years considerably changed the face of affairs. The people who composed this colony were called Pelasgi; concerning whose origin, country, character, and adventures, much has been written, and many different opinions exhibited by the learned. It is not our province to enter into a detail of their arguments and systems; we shall only inform our readers, that the general opinion is, that they were natives either of Egypt or Phocinia. We have seen a dissertation in manuscript upon this subject, from which we are allowed to extract the following particulars.

The author, we think, has proved by very plausible arguments, that these people could not be descendants of the Egyptians nor Phociniacs. He maintains, that the Pelasgi were a great and numerous tribe; that they overspread all the coast of Asia Minor from Mount Mycale to Troas; that they were masters at one time of all the Asiatic and Grecian islands; that they overran Greece and many of the neighbouring countries; and all this in less than half a century. These facts he seems to have proved from Homer, Herodotus, Diodorus Siculus, Pausanias, and other Greek authors, approved of for the authenticity. He shows, that they were a civilized generation; that they were well acquainted with military affairs, legislation, agriculture, navigation, architecture, letters, &c. He insists, that Phocinia could not at any given period have furnished such a numerous body of emigrants, even supposing the whole nation had emigrated, and left their native country a desert. He believes that this event took place before the invasion of Canaan by the Israelites; that consequently the Pelasgic migration was not occasioned by that catastrophe. He has shown, we think by very probable arguments, that the Egyptians in the earliest ages were averse to foreign expeditions, especially by sea, because that people hated this element, and besides could be under no temptation to emigrate: add to this, they were accustomed to live on small matters, and their country was abundantly fertile and easily cultivated. It appears (says he) from Herodotus, that the Pelasgi were not acquainted with the religion of the Zabians, which could not have been the case had they emigrated from either of these countries. He makes it appear, at least to our satisfaction, that Herodotus is mistaken when he supposes that the deities of Greece were derived from Egypt. He demonstrates, that the names of the greatest part of those deities are of Phocician extraction; and this opinion he establishes by a very plausible etymological deduction. He asserts, that had the Pelasgi been natives of either of the countries above mentioned, it would be absurd to suppose them ignorant of the names and religious rites of their respective nations. He finds, that the Egyptian and Phocian colonies, which afterwards settled in Greece, were enemies to the Pelasgi, and either subdued or expelled them the country, which, he imagines, would scarce have been the case had both parties sprung from the same ancestors. After settling these points, he concludes, that the people in question were the progeny of the Arabian shepherds, who, at a very early period, invaded and subdued both the Lower and Upper Egypt. After possessing that country about a century and a half, they were conquered by Asemophia king of the Upper Egypt, who drove them out of the country. Upon this the fugitives retired to Palestine, where Manetho the Egyptian historian loses sight of them, and either through malice or ignorance confounds them with the Israelites. This writer supposes that those fugitives gradually directed their course for the west and north-west coasts of Asia Minor, whence they conveyed themselves over to Greece.

Such are the arguments by which the author of the dissertation above mentioned supports his hypothesis. It is, for ought we know, altogether new, and to us it appears by no means improbable. If our curious readers should wish to know more of this subject, they may consult Gellini's preliminary Discourse to his Greek Dictionary, Lord Monboddo's Inquiry into the Origin and Progress of Language, vol. i. towards the end, and Mr. Bryant's Analysis of Ancient Mythology, passim.

Be this as it may, nothing is more certain than that the Pelasgi were the first people who in some degree civilized the savages of ancient Greece. It is not our business...
business at present to enumerate the many useful inventions which they communicated to the Greeks, at that time worse than barbarians. We deem it, however, absolutely necessary, as an introduction to our subject, to hazard a few conjectures on the language and letters of those adventurers; a point strictly connected with the subject soon to fall under consideration.

Whether we suppose the Pelasgi to have been the off-spring of the Phoenicians, Egyptians, or Arabian shepherds, it will make little difference as to their language; every man of learning and research is convinced that those three nations, especially at that early period, spoke a dialect of the Hebrew. The Pelasgi, then, must have spoken a dialect of that language when they arrived in Greece. Perhaps it might have undergone several changes, and acquired some new modifications, during so many years as had passed since they began to be a separate nation, and in the course of so many peregrinations. Some monuments of their still extant prove this fact beyond all contradiction. As these people incorporated with the aborigines of Greece, the remains of the original language of mankind, or at least so much of it as had been retained by them, gradually coalesced with that of the new settlers. From this, we think, it is obvious, that prior to the arrival of the new colonists from the East, the language now current among the two united tribes must have been a dialect of the Phoenician, Arabian, Hebrew, &c. Be that as it may, Herodotus affirms that the Pelasgi in his time spoke a barbarous language, quite unintelligible to the modern Greeks.

The reason of this difference between the language of the Hellenes or Greeks in the age of Herodotus, and that of the remains of the Pelasgi at that period, seems to be this: Prior to the time of that historian, the Greek language had, from time to time, undergone many changes, and received vast improvements; whereas, on the contrary, that of the remnant of the Pelasgi, who were now reduced to a very low state, had remained stationary, and was then just in the same predicament in which it had been perhaps a century after their arrival in the country.

As the Pelasgi, as was observed above, were a people highly civilized and well instructed in the various arts at the time known in the eastern world, they were skilled in agriculture, architecture, music, &c. (?). The presumption then is that they could not be unacquainted with alphabetical writing. This most useful art was well known in the countries from which they emigrated; and of course it is impossible to imagine that they did not export this art as well as the others above mentioned. Diodorus Siculus imagines that the Pelasgi knew not the use of alphabetical letters, but that they received them from Cadmus and his Phoenician followers; that those letters were afterwards called Pelasgic, because the Pelasgi were the first people of Greece who adopted them. This account must go to the score of national vanity, since very soon after he acknowledges that Linus wrote the exploits of the first Bacchus and several other romantic fables in Pelasgic characters; and that Orpheus, and Promachus, the master of Homer, employed the same kind of letters. Zeno-
bius likewise informs us that Cadmus slew Linus for teaching characters different from his. These letters could be none other than the Pelasgic.

Pausanias, in his Attic, relates that he himself saw an inscription upon the tomb of Corinthus, who lived at the time when Crotumus, who was contemporary with Deucalion, was king of the Argives. This inscription then was prior to the arrival of Cadmus; and consequently letters were known in Greece before they were introduced by this chief. It likewise appears from Herodotus himself, that the Ionians were in possession of alphabetical characters before the coming of the Phoenicians. "For (says he) the Ionians having received letters from the Phoenicians, changing the figure and sound of some of them, ranged them with their own, and in this manner continued to use them afterwards." If, then, the Ionians arranged the Phoenician characters with their own, it is obvious that they had alphabetical characters of their own.

Besides these historical proofs of the existence of Pelasgic characters, monuments bearing inscriptions in the same letters have been discovered in several parts of Greece and Italy, which place this point beyond the reach of controversy. What characters these may be easily determined. As the Pelasgi emigrated from Arimn, the presumption is that their letters were Phoenician. They are said by Dr Swinton to have been 13 in number, whereas the Phoenician alphabet consists of 16. The three additional letters were probably invented by the latter people after the Pelasgi had left the eastern quarters. The Phoenician letters imported by the Pelasgi were, no doubt, of a coarse and clumsy construction, unfavourable to expedition in writing, and unpleasing to the eye. Besides, the Phoenician characters had not as yet received their names; and accordingly the Romans, who derived their letters from the Arcadian Pelasgi, had no names for theirs. The probable period is, that prior to this era the Pelasgic letters had not been distinguished by names. These were of course no other than the original letters of the Phoenicians in their first uncouth and irregular form; and for this reason they easily gave way to the Cadmean, which were more beautiful, more regular, and better adapted to expedition.

Hitherto we have seen the Pelasgi and the Ionians incorporated, living under the same laws, speaking the same language, and using the same letters. But another nation, and one too of vast extent and population, had at an early period taken possession of a considerable part of the country afterwards distinguished by the name of Hellas or Greece. The Thracians were a great and mighty nation; inferior to none except the Indians; the father of Grecian history. These people at a very early period, had extended their quarters over all the northern parts of that country. They were, in ancient times, a learned and polished nation. From them

(v) The Arcadians, who were a Pelasgic tribe, were highly celebrated for their skill in music. They introduced this art into Italy. See Dion. Halicarn. lib. i.

(a) The Athenians were originally called Ionians.
in succeeding ages, the Greeks learned many useful and ornamental sciences. Orpheus (r) the musician, the legislator, the poet, the philosopher, and the divine, is known to have been of Thracian extraction. Thamyris and Linus were his disciples, and highly respected among the Greeks for their learning and ingenuity. That these people spoke the same language with the Greeks, is abundantly evident from the connection between them and these Thracian bards. The Thracian language, then, whatever it was, contributed in a great proportion towards forming that of the Greeks. From the remains of the Thracian dialect there appears to have been a very strong resemblance between it and the Chaldean. This position we could readily support by the most plausible etymological deduction, did the limits prescribed us in this article admit such an inquiry. It appears, however, that the *Thracians, Gete, and Daci or Davi, spoke nearly the same language. The Goths, so much celebrated in the annals of the lower empire, were the descendants of the Gete and Daci, and consequently retained the dialect of their ancestors. The reader, therefore, must not be surprised, if in tracing the materials of which the Greek language is composed, we should sometimes have recourse to the remains of the Gothic.

We have now found out three branches of the Greek language; that of the Ionim or Aborigines, that of the Pelasgic tribe, and that of the Thracians. These three, we imagine, were only different dialects of the very same original tongue. This assertion we could readily prove by the comparison of a great number of words taken from the last two, were this a proper place for such a discussion.

Some centuries after the arrival of the Pelasgi, Cadmus, an Egyptian (s) by birth, and a sojourner in Phoenicia, arrived in Bœotia with a multitude of followers. This colony-chief and his countrymen introduced letters and several other useful improvements into the country in question. As these people were natives of Phoenicia and its environs, their alphabet was that of their native country, consisting of 16 letters. That the Phoenician alphabet was nearly the same with the Samaritan and Hebrew, has been so often and so clearly demonstrated by the learned of this and the former century, that it would be altogether superfluous to insist upon it in this short inquiry. The Phoenicians, as is generally known, wrote from right to left, and the old Grecian characters, inverted, exactly resemble the other.

† Scaliger.

The names of the Cadmean characters are Syrian †, which shows the near resemblance between that language and the Phoenician. They stand thus: alpha, beta, gamma, delta, &c. The Syrians used to add η to the Hebrew vocables; hence alph becomes alpha, beth, betha or beta, &c. In the Cadmean alphabet we find the vowel letters, which is an infallible proof that this was the practice of the Phoenicians in the age of Cadmus; and this very circumstance furnishes a presumption that the Jews did the same at the same period.

After all, it is evident that the oldest Greek letters, which are written from right to left, differ very little from those of the Pelasgi. The four double letters δ, θ, ρ, σ, are said to have been added by Palamedes about 20 years before the war of Troy. Simonides is generally supposed to have added the letters ζ, ϒ, though it appears by some ancient inscriptions that some of these letters were used before the days of Palamedes and Simonides.

In the year of our Lord 1456 seven brazen tables were discovered at Engubium, a city of Umbria in the Apennines, of which five were written in Pelasgic or Etruscan characters and two in Latin. The first of these tables is thought to have been composed about 168 years after the taking of Troy, or 1206 years before Christ. By comparing the inscription on these tables with the old Ionic characters, the curious have been enabled to discover the resemblance.

The old Ionic character wrote from right to left continued in general use for several centuries: it was composed of the Cadmean and Pelasgic characters, with some variations of form, position, and sound. The Athenians continued to use this character till the year of Rome 300. The old I onic was gradually improved into the new, and this quickly became the reigning mode. After the old I onic was laid aside, the (Bauwet) Boustrophedon came into custom, which goes backwards and forwards as the ox does with the plough. They carried the line forward from the left, and then back to the right. The words were all placed close together, and few small letters were used before the fourth century. If our curious readers would wish to know more of letters and alphabets, we must remit them to Chishul, Morton, Postellus, the great Montfaucon, Gebelin, Astle, &c. For our part we are chiefly concerned at present with the Phoenician and Cadmean systems; and on these perhaps we may have dwelt too long.

Having now, we hope sufficiently proved that the Greek alphabet was derived from the Phoenician, in order to convince our curious but illiterate readers of the certainty of our position, as it were by osoc demonstration, we shall annex a scheme of both alphabets, to which we shall subjoin some strictures upon such letters of the Greek alphabet as admit any ambiguity in their nature and application.

A, alpha, had two sounds, the one broad like a in the English word all; the other slender, as ec in end, spend, defend. The Hebrews certainly used it so, because they had no other letter to express that sound; the Arabs actually call the first of their alphabet cifs; and they as well as the Phoenicians employ that letter to express both the sound of A and E promiscuously. The Greeks call their letter E υς, that is E slender, which seems to have been introduced to supply the place of A slender.

If, eta, was originally the mark of the spiritus asper, and no doubt answered to the Hebrew א. It is still retained in that capacity in the word İnṣa, and in words with the spiritus asper beginning books, chapters, sections,

(r) Orpheus seems to be compounded of two oriental words, or, "light," and φι, "the mouth." Though some deduce it from the Arabian ḥarif, a learned man."

PHILOLOGY.

Sect. VI.

Greek Language.

Originally marked both the sound of "e" and "h"; that is, it was sometimes sounded short as at present, and sometimes long, where it is now supplied by H. As it was found convenient to distinguish these two different quantities of sound by different letters, they adopted H, the former "spiritus asper," to denote the long sound of "e," and substituted the present "spiritus asper" ['] in its place.

Iota, in the Hebrew or Phoenician "jod" or "yod." We imagine it originally served the purpose of both "iota" and "ypsilon." It had two different sounds; the one broad and full, the other weak and slender. The latter had the sound of the modern "epsilon." That this was actually the case, appears in several monumental inscriptions: And upon this depends the variation of some cases of the demonstrative pronoun and of the second declension.

O, omicron, or small o, in the original Greek had three different sounds. It sounded o short, as at present; and likewise o long, now denoted by Ω or large O. It likewise marked the sound of the improper diphthong eu, sounding like the English diphthong eu. The Ω was taken from the Phoenician wau or V.

Epsilon, we have observed before, was adopted to supply a mark for the sound of I slender.

E, epsilon, is compounded of δ. Dion. Halic. however, informs us, that this letter should be pronounced ι, according to the Doric plan.

Theta, was not known in the old Greek. It is compounded of γ and the "spiritus asper," both which were of old written separately thus Θ.

X, chi, is compounded of χ, xi, and the "spiritus asper," both which were originally written separately.

Phi, ϕ. This letter is compounded of β, ϖ, and the "spiritus asper." Thus BH, ϕH.

Psi, ϖ, like the foregoing, is compounded of ϖ, χ, and the "spiritus asper" as above.

The original Greek article was imported from the east. It was the Hebrew or Phoenician "ha." This particle sometimes signifies "one," and sometimes it answers to our demonstrative "the;" both in its adverbial and demonstrative capacity it imports demonstration. In the earliest stages of the two oriental languages, it was probably written apart, as ha-me-lek, "the king." In process of time it came to be joined with the following word, as Hammeclech. From this we think the Greek article was deduced. It is still retained in the Doric dialect in its pristine character. The difference between ho and ha in the eastern language is nothing. Here then we have the articles μ masculine and α feminine. Upon these several changes were superinduced, in order to render them more useful for the purposes of language. For those changes we know of no archetype.

The Greeks then having adopted the Hebrew, or Phoenician, or Chaldean article ho, and changed it into ho for the masculine, seem to have arranged its variations in the following manner:

Sing.
Nom. ι
Gen. ι
Dat. ι
Acc. ι
Plu.
Nom. ι
Gen. ι
Dat. ι
Acc. ι

In the earliest stages of the Greek language, ι and ι were sounded in the same manner, or nearly so, as was the flexion observed above. The accusative was at first like the first nominative; for distinction's sake it was made to terminate in ι, which letter was likewise adopted to characterise the genitive plural; the genitive plural; was annexed to the dative singular, to distinguish it from the dative singular. The radical word was still without inflexion.

When the article was inflected in this manner, the process stood as follows: we take λογος for an example.

Sing.
Nom. ι λογος
Gen. ι λογος
Dat. ι λογος
Acc. ι λογος
Plu.
Nom. ι λογος
Gen. ι λογος
Dat. ι λογος
Acc. ι λογος

In this arrangement our readers will observe, that in the time under consideration, ι was not yet introduced; and therefore μαθημα or little ι was the same letter in the genitive plural as in the accusative singular; but in the latter case it was sounded long by way of distinction.

The article Ha, which is still retained in the Doric dialect, was varied as follows:

Sing.
Nom. ι
Gen. ι
Dat. ι
Acc. ι
Plu.
Nom. ι
Gen. ι
Dat. ι
Acc. ι

These variations differ a little from those of the masculine; and they were no doubt made for the sake of distinction, as is usual in such cases. We shall now give an example of the feminine as it must have stood before variations were introduced. We shall employ τεχνα.

Sing.
Nom. τεχνα
Gen. τεχνα
Dat. τεχνα
Acc. τεχνα
Plu.
Nom. τεχνα
Gen. τεχνα
Dat. τεχνα
Acc. τεχνα

Afterwards,
Afterwards, when the Chaldean article "da" was adopted for the neuter gender, the letter μ or ο was changed into η, and prefixed to it; and then the Greeks, who, in their declension of adjectives, always followed the neuter gender, began to prefix it to the oblique cases.

In this manner we think the Greek nouns stood originally; the only change being made upon the article. At length, instead of prefixing that word, and expressing it by itself, they found it convenient to affix a fragment of it to the noun, and so to pronounce both with more expedition. Thus, δανος, & c. became δαυνος, ευ δαυνος became δαυνος, and of course λαος and λαυανος, &c. The spiritus asper, or rough breathing, was thrown away, in order to facilitate the coalition. Nouns of the neuter gender, as was necessary, were distinguished by using ι instead of ζ. In oriental words the Greeks often change ε into η, and vice versa.

In this case the Greeks seem to have copied from an eastern archetype. In Hebrew we find an arrangement exactly similar. To supply the place of the pronouns possessive, they affix fragments of the personals: Thus, they write ben-ι, "my son," instead of ben-αι, and deus-α, "our words," instead of deus-αι, &c. The persons of their verbs are formed in the same manner. In this way, in our opinion, the variations of the first and second declensions were produced.

After that a considerable number of their nouns were arranged under these two classes, there remained an almost infinite number of others which could not conveniently be brought into these arrangements; because their terminations did not readily coalesce with the articles above mentioned. These, like nouns of the neuter gender, were in a manner secluded from the society of the two other classifications. It is probable that these for a long time continued indeclinable. At last, however, an effort was made to reduce them into a class as well as the others. All these excluded nouns originally terminated with η, which appears from their genitives as they stand at present. By observing this case, we are readily conducted to the termination of the pristine vocable. The genitive always ends in η, which ending is formed by inserting ι between the radical word and η. By throwing out ι we have the ancient nominative: Thus, ιτιτι, genitive τιτιτιτι; taking out ι we have τιτιτι, the original inflexible termination. Αυτη, genitive Αυτητη; throw out ι and you have Δητη. Παλαι, negative Παλαιτη; take away ι and there remains Παλαιτη. Оμη, genitive Оμητη; by throwing out ι we have Ομη. Αμη, genitive Αμητη, Αμητη. Κατη, genitive Κατητη, Κατητη; originally Κατητη, because originally ι had the sound of ι, as was observed above. Μη, genitive Μητη, Μητη. Ειδη, genitive Ειδη, Ειδη, the old noun. In short, the genitive is always formed by inserting ι immediately before η, which is always the termination of the nominative; and by this rule, we easily discover the noun such as it was in its original form.

The dative of this declension was closed with ascryptum; the same with that of the second, namely, subscryptum. The accusative commonly terminates with ι; but was originally ended with ι. The Romans imitated the Aeolian dialect, and they commonly ended it with en or im. The Greeks, perhaps in this imitated their progenitors, for a was their favourite vowel. The nominative plural ended in η, which nearly resembles the English plural, and was possibly borrowed from the Thracians. The genitive plural in all the declensions ends in ου; the dative ends in οι, the ι being inserted to distinguish it from the dative singular. When a strong consonant, which would not easily coalesce with ι, comes immediately before it, that consonant is thrown out to avoid a harsh or difficult sound. The sum then is; the cases of nouns of the first and second declensions consist of the radical word with fragments of the articles annexed, and these were the first classifications of nouns. The other nouns were left out for some time, and might be denominated neuters; at length they too were classified, and their variations formed as above. In this process the Greeks deviated from the oriental plan; for these people always declined their nouns by prefixes prefixed. Whether the Greeks were gainers by this new process, we will not pretend positively to determine. We are, however, inclined to imagine that they lost as much in perspicuity as they gained by variety.

It is generally believed that the Greeks have no Greek ablative; to this opinion, however, we cannot assent. It is true, that the dative, and what we would call the ablatives, are always the same, yet so much is there no more reason to believe that the latter is wasting in Greek, than that the ablative plural is wasting in Latin, because in that language both these cases are always alike.

In the eastern languages there are only two genders, analogous to the established order of nature, where all animals are either male or female. But as the people of the east are, to this day, strongly addicted to personification, they ranged all objects of which they had occasion to speak, whether animate or inanimate, under one or other of these two classes. Hence arose what is now called the masculine and feminine genders. The orientals knew nothing of a neuter gender, because, indeed, all objects were comprehended under the foregoing classes. The Phoenician feminine was formed from the masculine, by adding ῥα, oh. In this the Greeks in many cases imitated them. The Greek and Latin Gender

The use of the article in the Greek language is, we further observe, rather indeterminate; it is often prefixed to proper names, where there is no need of demonstration nor on the general distinction. On the contrary, it is often omitted in cases where both the one and the other seem to require its assistance. In short, in some cases it seems to be a mere expletive. Though both Lord Monboddo and Mr Harris have treated of this part of speech, neither the one nor the other has ascertained its proper use. (See Origin and Progress of Language, vol. ii. p. 53. Hermes, p. 214. et seq.)—We know not any objection to
PHILOLOGY. Sect. VII.

...to the early use of articles among the Greeks so plausible as the total neglect of them among the Romans. But it ought to be considered, that after the flexions were introduced, the use of the article was in a great measure neglected. Accordingly, Lord Monboddo observes that it is very seldom used as such by Homer, but commonly in place of the relative pronoun ας, ει, i. — Thus it would appear, that at the time when the Greek language was reduced to the Greek standard, the article was not commonly used by the Greeks; and of course the Latins never employed it. There can be no doubt but the pronoun ὁδι, in the northern languages, is the same with the Greek ἵνα, and the Hebrew וה. This among the northern people is always a relative, which affords a presumption that the Greeks originally used the article in the same manner as we do at present. The fact is, that the articles having once got into vogue, were often positively used as mere expletives to fill up a gap; and that, on the other hand, when there was no occasion for pointing out an object, it being fully determined by the tenor of the discourse, it was often omitted.

In forming adjectives, they followed the same plan that they had done with substantives. Their great effort was to make their adjectives agree with their substantives in gender, number, and case. This arrangement improved the harmony of speech; and nothing could be more natural than to make the word expressing the quality correspond with the subject to which it belonged.

Adjectives denote qualities, and thus are susceptible of degrees, nature taught them to invent marks for expressing the difference of these degrees. The qualities may exceed or fall below each other by almost numberless proportions; it was, however, found convenient to restrict these increases and decreases to two denominations. The positive is, properly speaking, of degree of comparison at all; therefore we need only point out the formation of the comparative and superlative.

The former is generally thought to be fabricated, by first adding the Hebrew word י exceedingly, to the positive, and then affixing the Greek termination ας; and the latter, by affixing the Syrian word ταυτ and the syllable ας, in the same manner.

Every nation, even the most uncivilized, have early acquired the notion of number. Numerical characters and names are the same in many different languages. These terms were discovered, and, in use, long before grammar came to any perfection; and therefore remain either inflexible or irregular. The first way of computing among the Greeks was by the letters of the alphabet; so that Α signified one and Ω twenty-four: in this manner the rhapsothoies of Homer are numbered; and so are the divisions of some of the Psalms, as is generally known. But a more artificial plan of computation was obviously necessary. They divided the letters of the alphabet into decades or tens, from Α to τ=10. To express the number 6, they inserted ζ βαυα=6; so that by this means the first decade amounted to 10. In the next decade every letter increased by tens, and so Π denoted 100. In this decade they inserted η σωρα=90. In the third, every letter rose by 100; so that α) σωρα=900. By inserting these three Phoenician characters they made their alphabet amount to 900. To express chilias Greek or thousands, they began with the letters of the alphabet as before; and to make the distinction, they placed a dot under each character, as the units, tens, hundreds, were distinguished by an acute accent over them.

But in monumental inscriptions, and in public instruments, a larger and more lasting numerical character was fabricated. The begun with Τ, and repeated that letter till they arrived at Π=5. This is the first letter of ωυ, five. Then they proceeded, by repeating 1 till they came to Τ, the first letter of ωυ, 10. Then they repeated a over and over, so that four Τ=40. To express 100, they used this method; they inclosed a in the belly of Α=10, Ρ=100, Ρ=10,000, &c. Often, however, Χ signifies 1000; and then we have δε Χιλια, 2000; τε Χιλια, 3000; and so of the rest.

The word pronoun signifies a word placed instead of a noun or name; and indeed the personal pronouns are really such: this needs no explanation. The pronoun of the first person is one of those words which have continued invariable in all languages; and the other personals are of the same character. The relatives, possessives, demonstratives, and gentiles, are generally derived from these, as may be discerned by a very moderate adept in the language. Our readers will therefore, we hope, easily dispose with our dwelling upon this part of speech.

In ancient languages, verbs, according to the order of nature, have only three tenses or times, namely, the past, present, and future. The intermediate tenses were the invention of more refined ages.—The Greek, in the most early periods, had no other tenses but those above mentioned. The manner of forming these we shall endeavour to point out, without touching upon the nature of the rest, since an idea of them may be acquired from any common grammar.

We have observed above, that the flexion of nouns of the first and second declensions are formed by annexing fragments of the articles to the radical words; and that the variation of the tenses was produced by joining the substantive verb, according to the same analogy. Every Greek verb was originally an inflexible bilateral, trilateral, quadrilateral or dissyllable radix. The variations were formed a long while after in the manner above intimated.

The Greeks had their substantive or auxiliary verb, from the Phenician or Chaldean verb י, face. This verb, taking away the gentle aspirate from both beginning and end, actually becomes α. This vocable the Greeks brought along with them from the East, and manufactured after their own manner, which appears to have been thus:

Pres. αλ, αλ, αλ, σα, σα, σα, σα, σα,
Cont. α, α, α, α, σα, σα, σα, σα,
Fut. αλ, αλ, αλ, αλ, αλ, αλ, αλ, αλ.

We place αι in the third person plural, because for many centuries αα supplied the sound of the diphthong αι. By these variations it will appear that the radical verb was rendered capable of inflexion. We have observed that Greek verbs were a collection of bilateral,

PHILOLOGY.

Greek Language.

Literal, triliteral, or quadriliteral, radical words.—The
following may serve for examples: ι, λ, λγ, λγου, λγα, λγω.

These radicals are taken at random; and we believe
our Grecian student, by adding the terminations, will
readily find them all significant verbs. With these rad-
cials, then, and the substantive verb, we suppose the
present and future tenses were formed.

But it is now generally admitted that the modern
present was not the original one of the verb. The
second, or Attic future, appears plainly to have been the
most ancient present. When the language was im-
proved, or rather in the course of being improved, a new
present was invented, derived indeed from the former,
but differing widely from it in its appearance and com-
plexion. Upon this occasion, the old present was de-
graded, and instead of imitating what was doing at pre-
cent, was made to import what was immediately to be
done hereafter. By this means, χαιμων, contracted into
χαιμω, I am writing, came to intimate, I am just go-
ing to write. This change was probably made for
the sake of enriching the language, for variety, for energy.
Thus, ρωτειν contracted ρωτει, ρωτειν, ρωτειν, ρωτειν, &c.
According to this theory, we find, that such verbs
as now have no second future retain their original form,
only the circumflex has been removed in order to ac-
commodate them to the general standard. Gramma-
rarians have now chosen the three characteristic letters
of active verbs from the present, first future, and perfect.
The true characteristic of the original verb was that of
the present second future. Many verbs are now desti-
tute of that tense, because since the invention of the
new present, those have fallen into disuse.

Let us now take the verb λνω, dico, in order to
make a trial; and let us write the radix and the auxiliary,
first separately, and then in conjunction: Thus,
λνω, λνο, λνω, λνω, λνω, λνω, λνω, λνω. Then
we will have contracted λνω, λνω, λνω, λνω, λνω, λνω.
Here, we believe, every thing is self-
evident.

The English would run thus: Saying I am, saying
thou art, saying he is, &c. At first the radix and the
auxiliary were pronounced separately, as we do our
helping verbs in English, and would have been in the
same manner had words been then distinguished in
writing.

The present first future occupied the same place that
it now does, and concurred in its turn to complete the
future in conjunction with the radix. That the sub-
stantive verb was inflected in the manner above laid
down, is obvious from its future middle ρωτειν, and
from the future of the Latin verb rump, which was of
old es, esse, &c. Verbs in λω, μω, σω, εω, often take
lib. 87. Verbs in λω and εω assume ε by analogy, as
x. v. 511. πλωλ, πλωλ, unde πλωλ, Il. x. v. 727. εω.
εωωω, Pind. Nem. Od. y. Δvodec. 2. τεε, τεε, καιε,
Theoc. Idyll. 22. v. 63. In fine, the Εολic dialect
after the liquids often inserts ε.

It must be observed, that the Greeks, in order to
accelerate the pronunciation, always throw out the ε and
ό, except in verbs ending in ρμω, του, αμω; where they
generally change them into υ and α. When the last letter
Vol. XVI. Part I.
which had a radix that would not admit this conjunction, they hardened the θ into θε, as in τον, preterite 
τικικα, τεκνικα. Many other ways were contrived to facilitate this re-union. These are detailed in every 
Greek grammar, and so need not be mentioned.—
What has been said with respect to this configuration, we offer as a pure conjecture, without the most remote 
intention of obtruding it upon our readers.
If it is admitted, that the auxiliary has formed the conjunctional termination of the active verb among the 
Greeks, it will likewise be admitted, that the radical 
verb and the other made originally two distinct words: 
that, according to this scheme, the preterite would proceed thus, ἔσεσα, said I have; ἔσεσά, said thou hast; ἔσεσα, said he hath, &c. This process to us appears ra-
tional, elegant, and advantageous. The pluperfect was 
not then invented, and therefore it does not come under 
our consideration. The other tenses were all deduced 
from those described; and in forming these intermediate 
distinctive tenses, we believe that both critics and gram-
rarians, and perhaps philosophers too, were employed.
See Grammar.
The eastern nations have diversified their verbs, by 
affixing fragments of the personal pronouns to the rad-
ix, by which they gained only the advantage of ex-
hibiting the genders of the persons engaged in being, 
acting, and suffering; but a perpetual repetition of 
these was unavoidable. The Greeks, by their artifi-
cial combination of the radix with the two auxiliaries, 
avoided the necessity of repeating their personal pro-
nouns, as we and the other modern inhabitants of Eu-
rope are obliged to do; and at the same time, by diver-
sifying the terminations of their nouns and verbs, won-
derfully improved the beauty and harmony of their 
language. The arrangement above insisted on is so 
very different from that of the orientals, and so entirely 
Gothic, that we think there can be no doubt that the 
Greeks borrowed this manoeuvre from the Thracians.
Every person moderately acquainted with the Greek 
language will, upon examination, discover a wonderful 
coincidence between the structure, idioms, and phraseo-
logy, of the English and Greek languages; so many 
genial features must engender a strong suspicion that 
there once subsisted a pretty intimate relation be-
 tween them.
In the preceding deduction, we find ourselves obli-
ged once more to differ from the very learned author 
of the Origin and Progress of Language. As we took 
the liberty to question his originality of the Greek 
language, and at the same time presumed to attack 
the godly structure raised by philosophers, critics, and 
grammarians; so we now totally differ from that 
learned writer as to his theory of the creation of 
verbs out of the inable matter of έμι, έμ, &c. This 
whole fabric, in our opinion, leans on a feeble foun-
dation.
The apparatus of intermediate tenses, of augment,
derivation of tenses, with their formation, participles, 
and idiomatical constructions, and other essentials or 
appendages, we omit, as not coming within the verge of 
the disquisition.

(3) We say generally, because in verbs ending in ά, the ά is sometimes retained, as τελον, τελεσ, &c.
Sect. VII.

PHILOLOGY.

The former should have been posterior in point of time to the latter.

We are well aware, that the very learned Kistler, and most other moderns, deeply skilled in the origin, progress, and structure, of the Greek language, have thought otherwise. The general opinion has been, that the Greek middle voice answered exactly to the Hebrew conjugation hikhpel, and in its pristine signification imported a reciprocity, or when the agent acts upon itself. For our part, we only intended a few hints upon the subject, which our learned readers may pursue, approve, or reject, at pleasure.

If we might pretend to investigate the formation of the passive voice, we should imagine that the modern present was formed from the ancient one, by inserting such letters as were found necessary for beauty, variety, energy, &c.; the first future from the second future middle of the verb στῆμι, once στήνω. This future is στηνεῖμι; and, joined to the radix, always occupies that place, στηνεῖμι, στηνεῖμι, στηνεῖμι, στηνεῖμι, and of the rest: whether μαίνει, μαίνει, μαίνει, which occur so frequently as the terminations of the middle and passive voices, are fragments of some obsolete verb, we will not pretend to determine.

From verbs in μαίνει, μαίνει, μαίνει, are formed verbs in μαίνει; which in the present, imperfect, and second aorist, as it is called, only have a different form, by assuming μαίνει with a long vowel preceding it, in the present active; which vowel is preserved in each person singular. This collection of irregular verbs seems to be formed from the verb μαίνει, which in some dialects might be μαίνει. Indeed the imperfect μαίνει, μαίνει, μαίνει, seems to imply as much: in this, however, we dare not be positive.

In the whole of this analysis of the formation of verbs, we have laid down what to us appears most plausible. That metaphysical critics may discover inaccuracies in the preceding detail we make no doubt; but our candid readers will doubtless reflect, that no language was ever fabricated by philosophers, and that the elements of language were hammered out by peasants, perhaps by savages. Critics have created a philosophy of language we admit, and have a thousand times discovered wonderful acuteness and ingenuity in the mechanism of words and sentences, where the original onomatopoeia never apprehended any, and which possibly never existed but in their own heated imagination. If our more enlightened readers should find any thing in the preceding detail worthy their attention, so much the better; if the contrary should happen, we presume they will take up with the hackneyed system. We have all along neglected the dual number, because it regularly follows the type of the other numbers.

Be that as it may, before we drop this subject we must take the liberty to subjoin an observation or two with respect to the consequences of the practice of new modelling the present, and of course the imperfect, tenses of verbs.

1st. After this arrangement they commonly retained all the other tenses exactly as they had stood connected with the primitive verb: this needs no example. 2d. They often collected the tenses of verbs, whose present and imperfect were now obsolete, in order to supply this defect. Thus we have ἰστῶμεν, ἰστήμεθα, ἰστῆμεν. 3d. They often formed present and imperfect tenses without any other tenses annexed: The poets in particular seem to have fabricated these two tenses at pleasure.

If this procedure was convenient for the poets, it was certainly most incommodeous with respect to the vulgar, as well as to foreigners who had an inclination to learn the language. The vulgar, some ages after Homer and Hesiod, must have found it as difficult to understand their poems as our people do to comprehend those of Chaucer and Spenser. By this disposition, too, the etymology of verbs were almost entirely confounded. The present second future being, as has been observed, the ancient present, the attention of the curious etymologist was naturally diverted to the modern present, where it was utterly impossible to discover the radical word. A few examples will elucidate this point: ἢστε, to stretch, to extend, old present ἢσται; ἢσται is the radix, which at once appears to be a Persian word signifying a large tract of country. Hence Mauritania "the land of the Mauri," Aquitania, Bretania; and with s prefixed, Hindo-stan, Chus-stan, Turque-stan. The obsolete verb ἢσται, whence ἢσται, is evidently derived from ἅπο, an Egyptian name of the moon: ἅπο, second future ἅπαντον, to show, from the Egyptian word phau or pan, a name of the sun: ἅπαντος, future second ἅπαντος; ἅπαντος is obviously the offspring of ἅπο, ἄπο, a drum or timbrel, from beating or striking, &c. In such etymological researches, the student must be careful to turn the Ionic α into the Doric α; because the Dorics were latest from the coast of Palestine, and consequently retained the largest share of the Phoenician dialect: thus ἀπελοῦσθαι, to rejoice, turning α into α becomes ἀπέλυσθαι. This word, throwing away the termination, becomes γαθης, plainly signifying a wine press (v). It is likewise to be observed, that the Αἱλιώτες often change α into ο, as ὑπεράνει, instead of ὑπεράνει, &c.

It is not our intention to enter into the arrangement and peculiar constructions of the Greek language. There is, however, one, which we cannot well pass over in silence. As that tongue is destitute of those words in which the Latinas call gerunds, to supply this defect they happily employ the infinitive with the article prefixed: thus ἐν τοῖς ἀναπαυούσις, in order to their being friends: ἐν τοῖς ἀναπαυούσις Ἀθηναισί, from their having elected a king; ἐν τοῖς ἀναπαυούσις Ἕλλησις, from their flying out of the city. In these phrases the infinitive is said to assume the nature of a substantive noun; agreeing with the article before it, exactly as if it were a noun of the neuter gender. Idioms of this kind occur in our own tongue; only with us the verb, instead of being expressed in the infinitive, is turned into the participle. According to this arrangement, the first of the preceding phrases, which, according to the Greek, would stand toward to be friends, in English is, in order to their being friends. This anomaly, then, if it indeed it such, is of no manner of consequence. The French, if we are not mistaken, would express it in the very same manner with the Greek, that is, pour étre amis.

From treating of verbs, we should naturally proceed to

(Ś) Hence it came to signify rejoicing, from the mirth and revelry attending the treading of the vine-press.
to the consideration of adverbs, which are so denominated, because they are generally the concomitants of verbs. Every thing relating to that part of speech, in the Greek tongue, may be seen in the Port Royal or any other Greek grammar. Instead therefore of dwelling upon this beaten topic, we shall hazard a conjecture upon a point to which the critics in the Greek tongue, as far as we know, have not hitherto adverted.

The most elegant and most admired writers of Greece, and especially Homer, and after him Hesiod, abound with small particles, which appear to us pure expletives, created as it were to promote harmony, or fill up a blank without sense or signification. How those expletive particles should abound in that language beyond any other, we think, is a matter not easy to be accounted for. It has been said by the Zoili, that if you extract these nonentities from the poems of that hard, qui solus meruit dico poeta, a magnum inane, a mighty blank, would be left behind. We would willingly do justice to that pugny race of words, and at the same time vindicate the prince of poets from that groundless imputation. Plato likewise, the prince of philosophers, has been often accused of too frequently employing these superfluous and unnecessary particles.

Those particles were no doubt imported from the east. It would be ridiculous to imagine that any description of men, however enthusiastically fond they might be of harmonious numbers, would sit down on purpose to fabricate that race of monosyllables purely to eke out their verses; mere sounds without significance. In the first place, it may be observed, that there is a very strict connection among the particles of all cognate languages. To this we may add, that the not understanding the nature, relations, signification, and original import of those seemingly unimportant terms, has occasioned not only great uncertainty, but numberless errors in translating the ancient languages into the modern. The Greek language in particular loses a considerable part of its beauty, elegance, variety, and energy, when these adverbial particles with which it is replete are not thoroughly comprehended. An exact translation of these small words, in appearance insignificant, would throw new light not only on Homer and Hesiod, but even upon poets of a much posterior date. Particles, which are generally treated as mere expletives, would often be found energetically significant. It is however, altogether impossible to succeed in this attempt without a competent skill in the Hebrew, Chaldaic, Arabian, Persian, and old Gothic languages. We shall here take the liberty to mention a few of these particles which are most familiar, one or other of which occur in almost every line of Homer, and which we believe are either not understood or misunderstood. Such are διά, δι', μέ, μετ', μετά, γι'ν, με, από, προ, προς. Δια is nothing else but the Chaldaic particle δια, the parent of the English the. It likewise signifies by turns, in your turn; διά is the same word in the Ionic dialect; με is a particle of the Hebrew affirmative με amen, fides, veritas. Με, a kind of oath by the moon, called mana, almost over all the east; hence Dor. μαια, γι'ν, an oath by γι'ν, that is, the earth; από, another oath by the same element, probably from the oriental word of the same import; προ is a fragment of προ mentioned before; γι'ν, of γι'ν the earth, and προ or προ, an Egyptian name of the sun; με, as, a particle which per-
PHILOLOGY.

In these examples, and indeed everywhere, those prepositions intimate different relations, and yet are prefixed to the same cases. Sometimes the same preposition seems to assume two opposite significations: this appears from the preposition *ανά*, just mentioned, which intimates both for, instead of, and against or opposite to.

What has been observed with respect to the prepositions above mentioned, the reader will readily enough apply to *επί*, *μετά*, *νά*, *πρός*. These incongruities certainly imply something irregular; and seem to intimate that those anomalies were so deeply incorporated with the constitution of the language, that the subsequent improvers found it impossible to correct them. Indeed to prefix a preposition to a case already distinguished by the affixed termination, appears to us a superfluity at least, if not an absurdity; for certainly it would have been more natural to have said *τοιούτα ἐπί* *παράκατον*, than in *ἀνά παράκατον*. Some very learned men, who have inquired into the origin of languages, have been of opinion that prepositions were the last invented species of words. If this opinion be well founded, we may suppose (and we think that this supposition is not altogether improbable) that the casual terminations of the Greek language were first affixed to the radices, in the manner above exhibited; and that prepositions were afterwards fabricated and prefixed to the cases already in use.

The syntax or construction of the Greek language does not, according to our plan, come within the compass of our present inquiry. This the curious Greek student will easily acquire, by applying to the grammars composed for that purpose. We have already hazarded a few conjectures with respect to the formation of the most important and most distinguished classes of words into which it has been divided by the most able grammarians, without, however, descending to the minutiae of the language. As prepositions are the chief materials with which its other words, especially verbs, are compounded, we shall briefly consider the order in which they probably advanced in this process.

Complex ideas are compounded of a certain number or collection of simple ones. Of those complex notions, some contain a greater and some a smaller number of simple conceptions. In language, then, there are two ways of expressing those complex ideas, either by coining a word to express every simple idea separately, according to the order in which they stand in the mind; or by trying to combine two or more simple terms into one, and by that method to intimate one complex idea by one single word. The Arabians, notwithstanding all the boasted excellencies of their language, have never arrived at the art of compounding their words, in order to answer this noble purpose; and the sister dialects are but slenderly provided with this species of vocables. The Greeks, of all other nations (except perhaps those who spake the Sanscrit language), are unrivalled in the number, variety, propriety, elegance, energy, and expression of their compound terms. The Greeks, like the Arabians, in the earliest stages of their language, had only a collection of radical disjointed words, consisting of the jargons of the aboriginal Greeks, of the Pelasgi, Thracians, &c. How these words were arranged and constructed, we have no data remaining upon which we can found a critical investigation. We must therefore remain satisfied with such probable conjectures as the nature of the case, and the analogy of the language, seem to suggest.

The prepositions were originally placed before the nouns, whose relations they pointed out. For example, let us take the *ἐπὶ*, *πρὸς*, *διὰ*, *διὰ τοῦ*, *ἐν*, *τοιούτα*, *πρός τοιοῦτα*, *ἐν τοιούτῳ*, *ἐπί τοιούτῳ*. In this manner the parts of every compound word were placed separately, at least as much as other words which had no connection.

The first compound words of the Greek language The first compound words of the Greek language were the radical nouns with the article, and the radical part of the substantive or auxiliary verb. The success of this experiment encouraged them to attempt the same in other words. By this noble invention they found themselves able to express, in one word, with ease and significance, what in other languages, and formerly in their own, required a tedious ambages or circumlocution. In process of time, as their language was gradually mollified, they increased the number of their compounds, till their language, in that respect, infinitely excelled all its parent dialects. In this process they were careful to unite such letters as not only prevented asperity and difficulty of pronunciation, but even promoted harmony and elegance. But this was the labour of posterior ages.

The Greeks were entirely ignorant of the derivation or etymology of their language: for this we need only consult Plato's Cratylus, Aristotle's Rhetoric, Demetrius Phalereus, Longinus, &c. In deducing patronymics, abstracts, possessives, gentiles, diminutives, verbal, &c. from radicals of every kind, they have shown the greatest art and dexterity. Examples of this occur almost in every page of every Greek author. But this extended no farther than their own language; every foreign language was an abomination to the Greeks. But more of this in the sequel.

The original materials of the Greek tongue were undoubtedly rough and discordant, as we have described materials them above. They had been collected from different of the quarters, were the produce of different countries, and had been imported at very distant periods. It would therefore be an entertaining, if not an instructing, speculation, if it were possible to discover by what men and by what means, this wonderful fabric was founded, erected, and carried to perfection. The writers of Greece afford us no light. Foreigners were unacquainted with that originally insignificant canton. Everything beyond Homer is buried in eternal oblivion. Orpheus is indeed reported to have composed poems; but these were soon obliterated by the hand of time. The verses now ascribed to that philosophical hero are none of his. Linus wrote, in the Pelasgic dialect, the *a•Pατερικι*, the chief of the first Bacchus; Thamyris the Thra•i. lican wrote; and Pronapides the master of Homer was a celebrated poet. The works of all these bards did not long survive; and it is a certain fact that the Greek tongue was highly polished even more early than the age in which these worthies flourished. Homer, no doubt, imitated their productions, and some are of opinion that he borrowed liberally from them. The Greeks knew no more of the original character of their language, than of the original character and complexion of
PHILOLOGY.

Sect. VII.

of their progenitors. They allowed, indeed, that their language was originally barbarous and uncouth; but by what means or by what persons it was polished, enriched, and finally arranged, was to them an impenetrable secret.

We have already demonstrated that the Ionim or aborigines of Greece were a race of barbarians; that consequently their language, or rather their jargon, was of the same contexture. The Pelasgi found both the people and their speech in this uncultivated state. These people arrived in Greece about the year before Christ 1760. It was then that the language of Greece began to be cultivated. Before the age of Homer the work seems to have been completed. Nothing of consequence was afterwards added to the original stock; on the contrary, not a few moieties were deducted from the Homeric treasure. The Pelasgi, as was said before, arrived in Greece an. ant. Chr. 1760. Homer is thought to have been born an. ant. Chr. 1041; consequently the cultivation of the Greek tongue was completed in a period of about 700 years. But upon the supposition that Orpheus, Linus, Thanymys, &c. wrote long before Homer, as they certainly did, that language had arrived nearly at the standard of perfection two centuries before; by which computation the period of its progress towards its stationary point is reduced to 500 years. But as the Pelasgi were a colony of foreigners, we ought to allow them one century at least to settle and incorporate with the natives, and to communicate their language, laws, manners, and habits, to the aborigines of the country. By this deduction we shall reduce the term of cultivation to less than four centuries.

During this period Greece was furiously agitated by tumults and insurrections. That country was divided into a number of independent states, which were perpetually engaged in quarrels and competitions. The profession of arms was absolutely necessary for the protection and preservation of the state; and the man of conduct and prowess was honoured as a demi-god, and his exploits transmitted with eclat to posterity. The Greek tongue was then rough and unpolished; because, like the ancient Romans, the bravest men were more disposed to act than to speak. Every language will take its colour from the temper and character of those who employ it; and had it not been owing to one class of men, the Greek tongue would have continued equally rough to the era of Homer as it had been a century after the arrival of the Pelasgi.

There has appeared among barbarous or half-civilized people a description of men whose profession it has been to frequent the houses or palaces of the great, in order to celebrate their achievements, or those of their ancestors, in the sublimest strains of heroic poetry. Accordingly, we find that the Germans had their bardes, the Gauls their fadas, the Scandinavians their scalds or scaldres, the Irish their fileus, all retained for that very purpose. They lived with their chieftains or patrons; attended them to battle; were witnesses of their heroic deeds; animated them with martial strains; and celebrated their prowess, if they proved victorious; or, if they fell, raised the song of woe, and chanted the mournful dirge over their sepulchres. These bardos were always both poets and musicians. Their persons were held sacred and inviolable. They attended public entertainments, and appeared in all national con-

ventions. The chief of them were employed in the Greek temples of the gods; and the less illustrious, like our minstrels of old, strolled about from place to place, and exercised their functions wherever they found employment.

Among the ancient Greeks there was a numerously the particlile of men of the very same description who were made a at once poets and musicians, and whose office it was made to celebrate the praises of the great, and to transmit their exploits to posterity in the most exaggerated encomiums. These poetical vagrants were styled Aesop or songsters. Some of these lived in the houses of great men; while others, less skilful or less fortunate, strolled about the country in the manner above described. The more illustrious of these Aesop who were retained in the temples of the gods, were certainly the first improvers of the language of the Greeks. Among the Hebrews we find the first poetical compositions were hymns in honour of Jehovah, and among the Pagans the same practice was established. In Greece, when all was confusion and devastation, the temples of the gods were held sacred and inviolable. There the Aesop improved their talents, and formed religious anthems on those very models which their progenitors had chanted in the east.

The language of the Greeks was yet rugged and unmellowed: their first care was to render it more soft and more flexible. They enriched it with vocabularies suited to the offices of religion; and these, we imagine, were chiefly imported from the east. Homer every where mentions a distinction between the language of gods and men. The language of gods imports the oriental terms retained in the temples, and used in treating of the ceremonies of religion; the language the last of men intensifies the ordinary civil dialect which sprung from the mixed dialects of the country. The priests no doubt concurred in promoting this noble and important purpose. From this source the strolling Aesop drew the rudiments of their art; and from these last the vulgar deduced the elements of a polished style.

To these Aesop of the superior order we would ascribe those changes mentioned in the preceding part of this inquiry, by which the Greek tongue acquired that variety and flexibility, from which two qualities it has derived a great share of that ease, beauty, and versatility, by which it now surpasses most other languages. The diversity of its terminations furnishes a most charming variety, while at the same time the sense is communicated to the reader or hearer by the relation between them. By this economy the poet and orator are left at liberty to arrange their vocabularies in that order which may be most soothing to the ear, and best adapted to make a lasting impression on the mind.

Few colonies have emigrated from any civilized country without a detachment of priests in their train. The supreme powers, whoever they were, have always been worshipped with music and dancing. The Hebrews, Phoenicians, and Egyptians, delighted in these musical and jocund festivals. The priests who attended the Iones, Dores, Eolians, Thebans, Athenians, &c. from the east, introduced into Greece that exquisite taste, those delicate musical feelings, which distinguish the Greeks from all the neighbouring nations. Hence that numerous race of onomatopoeas, by which the Greek language is invested with the power of expressing almost every passion of the human soul, in such terms as oblige it to feel and actually
to assimilate to the passion it would excite. Numerous
instances of this occur in every page of Homer,
Hesiod, Pindar, Sophocles, Euripides, and even of A-
ristophanes: to quote instances would be to insult the
Greek student.

Every body knows that the practice of writing in
verse was antecedent to the date of prosaic composition.
Here, then, the Ass and the ministers of religion
chiefly displayed their skill and discernment. By a ju-
dicious mixture of short and long syllables; by a jun-
tion of consonants which naturally slide into each other;
by a careful attention to the rhythm, or harmony result-
ing from the combination of the syllables of the whole
line—they completed the metrical tone of the verse,
guided by that delicacy of musical feeling of which they
were possessed before rules of prosody were known
among men.

Much liberty was certainly used in transposing let-
ters, in varying terminations, in annexing prefixes and
affixes, both to nouns and other kinds of words where
such adjuncts were possible: and upon this occasion we
think it probable, that those particles of which we have
spoken above, might be treated like filling worris, as in
to starch the borders or chinks of a building. Verses were
then clumsy and irregular, as the quantity of vowels was not
duly ascertained, and the collision of heterogeneous con-
sonants not always avoided. Probably these primitive
verses differed as widely from the finished strains of
Homer and his successors, as those of Chaucer and
Spencer do from the smooth polished lines of Dryden
and Pope.

The poetical compositions of the earliest Greeks were
not, we think, in the hexameter style. As they were
chiefly calculated for religious services, we imagine they
resembled the Hebrew iambics preserved in the song of
Aaron and Miriam, Deborah and Barak, Psalms, Pro-
verbs, &c. which were indeed calculated for the same
purpose. Archilochus perhaps imitated these, though
the model upon which he formed his iambics was not
generally known. The later dramatic poets seem to
have copied from the same archetypes. Hexameters, it
is probable, were invented by Orpheus, Linus, Thamyris,
Museus, &c. The first of these travelled into Egypt,
where he might learn the hexameter measure from that
people, who used to bewail Maneros and Osiris in ele-
gitious strains. This species of metre was first consecrated
to theology, and the most profound sciences of moral
and natural philosophy; at length it was brought down
to celebrate the exploits of kings and heroes.

Res gestas regumque, ducumque, et fortia bella,
Quo scribi posse rat numero monstravit Homerus.

We have hazarded a conjecture above, importing that
the earliest poetical compositions of the Greeks were con-
secrated to the service of the gods. We shall now pro-
cure a few facts, which will furnish at least a presumptu-
ous evidence of the probability of that conjecture.

Orpheus begins his poem with ancient chaos, its trans-
formations and changes, and pursues it through its va-
umous revolutions. He then goes on to describe the off-
spring of Saturn, that is time, the other, love, and light.
In short, his whole poem is said to have been an oriental
allegory, calculated to inspire mankind with the fear of
the gods, and to deter them from murder, rape, unna-
atural lusts, &c.

Museus was the favourite scholar of Orpheus, or per-
haps his son. He composed prophecies and hymns, and
wrote sacred instructions, which he addressed to his son.
He prescribed stonements and lustrations; but his great
work was a Theogony, or History of the Creation, &c.

Melampus brought the mysteries of Proserpine from Melampus.
Egypt into Greece. He wrote the whole history of the
disasters of the gods. This seer is mentioned by Homer
himself.

Olen came from Lycia, and composed the first hymn Olen,
that was sung in Delos at their solemnities; he probably
emigrated from Patara a city of Lycia, where Apollo
had a celebrated temple and oracle.

The Hyperborean damsels used to visit Delos, where
they chanted sacred hymns in honour of the Delian god.
To these we add the great Homer himself, if indeed Homer and
the hymns commonly annexed to the Odyssey are his Hesiod's
composition. Hesiod's Theogony is too well known to
need to be mentioned.

From these instances we hope it appears, that the
origin of the poetry of Greece is to be found in the
temples; and that there, its measure, numbers, rhythm,
and other appendages, were originally吸取.

The Grecian poets, however, enjoyed another ad-
vantage which that class of writers have seldom pos-
sessed, which arose from the different dialects into which
their language was divided. All those dialects were dif-
gent, adopted indifferently by the prince of poets; a circum-
stance which enabled him to take advantage of any word
from any dialect, provided it suited his purpose. This
at the same time that it rendered versification easy, dis-
fused an agreeable variety over his composition. He
even accommodated words from Macedonia, Epirus,
and Illyricum, to the purposes of his versification: Be-
sides, the laws of quantity were not then clearly ascer-
tained; a circumstance which afforded him another con-
veniency. Succeeding poets did not enjoy these advan-
tages, and consequently have been more circumscribed
both in their diction and numbers.
The Greek language, as is generally known, was di-
vided into many different dialects. Every sept, or petty
canton, had some peculiar forms of speech which dis-
tinguished it from the others. There were, however, four
different dialectical variations which carried it over all
the others. These were the Attic, Ionic, Æolic, and
Dorie. These four dialectical distinctions originated
from the different countries in the east from which the
tribes respectively emigrated. The Attics consisted, 1st,
of the barbarous aborigines; 2d, of an adventitious co-
lonny of Egyptian Saiics; 3d, a branch of Ionians from
the coast of Palestine. These last formed the old Ionian
dialect, from which sprung the Attic and modern Æolic.
The Æolians emigrated from a different quarter of the
same coast; the inhabitants of which were a remnant of
the old Canaanites, and consequently different in dialect
from the two first-mentioned colonies. The Doris
sprang from an unpolished race of purple fishermen on
the same coast, and consequently spoke a dialect more coarse
and rustic than any of the rest. These four nations emi-
grated from different regions; a circumstance which, in
our opinion, laid the foundation of the different dialects
by which they were afterwards distinguished.

It is impossible in this short sketch to exhibit an exact
view of the distinguishing features of each dialect. Such
an analysis would carry us far beyond the limits of the
article.
PHILOLOGY

Sect. VII.

article in question. For entire satisfaction on this head, we must refer the Grecian student to Mattea's Geaca Linguae Dialecti, where he will find every thing necessary to qualify him for understanding that subject. We shall content ourselves with the few observations following.

The Athenians being an active, brisk, volatile race, delighted in contractions. Their style was most exquisitely polished. The most celebrated authors who wrote in that dialect were the following: Plato, Thucydides, Xenophon, Demosthenes, and the other orators; Eschylus, Euripides, Sophocles, Aristophanes, Menander, Diphilus, with the other comic and tragic poets. That dialect was either ancient or modern. The ancient Attic was the same with the Ionic.

The Ionic, as was said, was the ancient Attic; but when that nation emigrated from Attica and settled on the coast of Asia Minor, they mingled with the Carian and Pelasgi, and of course adopted a number of their vocables. They were an indolent, luxurious, and dissolute people; of course their style was indeed easy and flowing, but verbose, redundant, and without nerves. This, however, is the leading style in Homer; and after him a prodigious number of writers on every subject have used the same dialect, such as Herodotus of Halicarnassus the celebrated historian; Ctesias of Conid the historian of Persia and India; Hecateus of Miletus; Megasthenes the historian, who live under Seleucus Nicator; Hippocrates the celebrated physician of Cos; Hellanicus the historian often mentioned with honour by Polybius; Anaxerion of Teis, Alcmeus, Sappho of Lesbos, excellent poets; Therycides Syrus the philosopher; and a multitude of other persons of the same profession, whom it would be superfluous to mention upon the present occasion.

The Eolic and Doric were originally cognate dialects. When the Dorians invaded Peloponnesus, and settled in that peninsula, they incorporated with the Eolians, and their two dialects blended into one produced the new Doric. The original Doris inhabited a rugged mountainous region about Ousa and Pindus, and spoke a rough unpolished language similar to the soil which they inhabited. Andreas Schottius, in his observations on poetry, lib. ii. cap. 50. proves from an old manuscript of "Theocratus, that there were two dialects of the Doric tongue, the one ancient and the other modern; that this poet employed Ionick and the modern Doric; that the old Doric dialect was rough and cumbersome; but that Theocritus has adopted the new as being more soft and mellow." A prodigious number of poets and philosophers wrote in this dialect, such as Epicharmus the poet; Ibycus the poet of Rhegium; Corinna the poetess of Thespis, or Thebes, or Corinth, who bore away the prize of poetry from Pindar; Erynya a poetess of Lesbos; Moschus the poet of Syracuse; Sappho the poetess of Mytilene; Pindaros of Thessaly, the prince of lyric poets; Archimedes of Syracuse, the renowned mathematician; and almost all the Pythagorean philosophers. Few historians wrote in that dialect; or if they did, their works have not fallen into our hands. Most of the hymns sung in temples of the gods were composed in Doric; a circumstance which evinces the antiquity of that dialect and which, at the same time, proves its affinity to the oriental standard.

After that the Greek tongue was thoroughly polished by the steps which we have endeavoured to trace in the preceding pages, conscious of the superior excellency of their own language, the Greeks, in the pride of their heart, stigmatized every nation which did not employ their language with the contemptuous title of barbarous. Such was the delicacy of their pampered ears, that they could not endure the untutored voice of the people whom Greeks called barbarians. This extreme delicacy produced three very pernicious effects; for, 1st. It induced them to metamorphose and sometimes even to mingle foreign names, in order to reduce their sound to the Grecian standard; and, 2d. It prevented their learning the languages of the east, the knowledge of which would have opened to them an avenue to the records, annals, antiquities, laws, customs, &c. of the people of those countries, in comparison of whom the Greeks themselves were of yesterday, and knew nothing. By this unlucky bias, not only they, but even we who derive all the little knowledge of antiquity we possess through the channel of their writings, have suffered an irreparable injury. By their transformation of oriental names they have in a manner stopped the channel of communication between the histories of Europe and Asia. This appears evident from the fragments of Ctesias's Persian history, from Herodotus, Xenophon, and all the other Greek writers who have occasion to mention the intercourse between the Greeks and Persians. 3d. It deprived them of all knowledge of the etymology of their own language, without which it was impossible for them to understand its words, phraseology, and idioms, to the bottom. We mentioned Plato's Cratylus above. In that dialogue, the divine philosopher endeavours to investigate the etymology of only a few Greek words. His deductions are absolutely childish, and little superior to the random conjectures of a school-boy. Varro, the most learned of all the Romans, has not been more successful. Both stumbled on the very threshold of that useful science; and a scholar of very moderate proficiency in our days knows more of the origin of these two noble languages, than the greatest adepts among the natives did in theirs. By prefixes, affixes, transpositions of letters, new conjunctions of vowels and consonants for the sake of the music and rhythm, they have so disguised their words, that it is almost impossible to develop their original. As a proof of this, we remember to have seen a manuscript in the hands of a private person where the first twelve verses of the Iliad are carefully analysed; and it appears to our satisfaction, that almost every word may be, and actually is traced back to a Hebrew, Phoenician, Chaldean, or Egyptian original: And we are convinced that the same process will hold good in the like number of verses taken from any of the most celebrated poets of Greece.

This investigation we found was chiefly conducted by reducing the words to their original invariable state, which was done by stripping them of prefixes, affixes, &c. These strictures are, we think, well founded; and consequently need no apology to protect them.

These imperfections, however, are counterbalanced by numberless excellencies; and we are certainly much more indebted to that incomparable people for the information they have transmitted to us through the medium of their writings, than injured by them in not conveying to us and to ourselves more authentic and more ample communications of ancient events and occurrences. Without fatiguing our readers with superfluous enumerations on a language which has long ago been extolled perhaps to
Sect. VII.

PHILOLOGY.

the labours of men of the most enlarged capacity and the most refined taste, we shall now proceed to make a few observations on spirits and accents; which being rather appendages than essentials of the language, we have on purpose reserved for the last place.

Every word in the Greek language beginning with a vowel is marked with a spirit of breathing. This aspiration is double, namely lente et asper, "the gentle, and rough or aspirated." The gentle accent, though always marked, is not now pronounced, though in the earliest periods of the language it was undoubtedly enunciated, though very softly. Both these aspirations were imported from the east. They were actually the Hebrew ה he and א heth. The former denoted the spiritus lentis, and the latter the spiritus asper. The Hebrew prefixed ה or ה to words beginning with a vowel, and of course the Greeks followed their example. These people seem to have delighted in aspirates; and of consequence the letter ḫ is, some think, rather too often affixed to the terminations of their words. Every word beginning with ה had the aspirate joined to ḫ, probably with a design to render the aspiration still more rough.

The Greek accents are three in number; the acute, the grave, and the circumflex. The acute raises and sharpens the voice; the grave depresses and flattens it; the circumflex first raises and sharpens the voice, and then depresses and flattens it. It is obviously composed of the other two. The learned author of the Origin and Progress of Language has taken much pains to prove that these accents were actually musical notes, invented and accommodated to raise, depress, and suspend the voice, according to a scale of musical proportions. It is scarcely possible, we think, for a modern Greek scholar to comprehend distinctly the ancient theory of accents. These the native Greeks learned from their infancy, and that with such accuracy that, even the vulgar among the Athenians would have hissed an actor or actress off the stage or an orator off the pulpitum, on account of a few mistakes in the enunciation of those notes.

The elevations, depressions, and suspensions of the voice upon certain syllables, must have made their language so full of enjambments that it was like recitative, or something nearly resembling cant. But the little variety of these syllabic tones, and the voice not resting upon them, but running them on without interruption, sufficiently distinguished them from music or cant. Be that as it may, we think it highly probable, that the wonderful effects produced by the harmonies of the orators of Greece on the enraptured minds of their hearers, were owing in a great measure to those artificial musical tones by which their syllables were so happily diversified.

To this purpose we shall take the liberty to transcribe a passage from Dion. Halie. De Structura Orat. in his which we find translated by the author of the Origin and Progress of Language, vol. ii. book 3d, part ii. chap. 7, page 387. "Rhetorical composition is a kind of music, differing only from song or instrumental music, in the degree, not in the kind; for in this composition the words have melody, rhythm, variety, or change, and what is proper or becoming: So that the ear in it, as well as in music, is dlighted with the melodies it, or to the rhythm, is fond of variety, and delighted with all those what is proper and suitable."

With respect to accents, it may be observed that only one syllable of a word is capable of receiving the acute accent, however many there be in the word. It was thought that the raising the tone upon more than one syllable of the word, would have made the pronunciation too various and complicated, and too like chanting.

The grave accent always takes place when the acute is wanting. It accords with the level of the discourse; whereas the acute raises the voice above it.

The circumflex accent being composed of the other two is always placed over a long syllable, because it is impossible first to elevate the voice and then to depress it on a short one. Indeed among the Greeks a long syllable was pronounced like two short ones; and we apprehend it was sometimes written so, especially in later times. It is altogether obvious from two learned Greek authors, Dion. Halie, and Aristarchus, that the Greek accents were actually musical notes, and that these tones did not consist of loud and low, or simply elevating and depressing the voice; but that they were uttered in such a manner as to produce a melodious rhythm in discourse.

In a word, the acute accent might be placed upon any syllable before the antepenult, and rose to a fifth in the diatonic scale of music; the grave fell to the third below it. The circumflex was regulated according to the measure of both, the acute always preceding. The grave accent is never marked except over the last syllable. When no accent is marked, there the grave always takes place. Some words are called enclitics. These have no accent expressed, but throw it back upon the preceding word. The circumflex, when the last syllable is short, is often found over the penult, but never over any other syllable but the last or the last but one.

The ancient Greeks had no accentual marks. They are the ancestors of our modern accentual marks. They have learned these modifications of voice by practice from their infancy; and we are assured by good authority, had no accentual marks. In pronouncing they observe them to this day.

The accentual marks are said to have been invented by a famous grammarian, Aristarchus of Byzantium, keeper of the Alexandrian library under Ptolemy Philopater, and Epiphanes, who was the first likewise who is supposed to have invented punctuation. Accentual marks, however, were not in common use till about the seventh century; at which time they are found in manuscripts. If our curious readers would wish to enter more deeply into the theory of accents, we must remind them to Origin of Language, vol. ii. lib. 2. passim; and to Mr. Foster's Essay on the different Nature of Accent and Quantity.

Such, in general, are the observations which we thought the nature of our design obliged us to make on the origin and progress of the Greek language. Some of our more learned readers may perhaps blame us for not interspersing the whole dissertation with quotations from the most celebrated writers in the language which has been the object of our researches. We are well aware that this is the general practice in such cases. The books were before us, and we might have transcribed from them more quotations than the nature of an article of this kind would permit. In the first part there were no books in X x that
that language to quote from, because the Greeks knew nothing of their own origin, nor of that of their language, and consequently have recorded nothing but dreams and fictions relating to that subject. Even when we had made considerable progress in our inquiry, the nature of the plan we have adopted excluded in a great measure the use of quotations. When we drew near the conclusion, we imagined that our learned readers would naturally have recourse to the passages alluded to without our information, and that the unlearned would not trouble themselves about the matter. The Greek student who intends to penetrate into the depths of this excellent language, will endeavour to be thoroughly acquainted with the books after mentioned.

Aristotle’s Rhetoric and Poetics, his book De Interpretatione, especially with Ammonius’s Commentary. Ammonius was a native of Alexandria, and by far the most acute of all the ancient grammarians.

Dion. Halic. De Structura Orationis, where, amidst abundance of curious and interesting observations, will be found the true pronunciation of the Greek letters.

Demetrius Phalereus De Elocutione; a short essay indeed, but replete with instruction concerning the proper arrangement of words and members in sentences.

Longinus, the prince of critics, whose remains are

176

Books to be studied by every one who wishes to be a master of this language.

1 See Gaza, above commendation. Theodorus Gaza and the other refugees from Constantinople, who found an hospitable reception from the munificent family of the Medici, and whose learned labours in their native language once more revived learning and good taste in Europe. These, with some other critics of less celebrity, but equal utility, will unlock all the treasures of Grecian erudition, without however disclosing the source from which they flowed. To these one might add a few celebrated moderns, such as Mons. Fourmont the Elder, Mons. Gebelin, Abbé Pezron, Salmasius, and especially the learned and industrious Lord Monboddo.

We shall now give a very brief account of the vast extent of the Greek language even before the Macedonian empire was erected; at which period, indeed, it became in a manner universal, much more than ever the Latin language could accomplish notwithstanding the vast extent of the Roman empire.

Greece, originally Hellas, was a region of small extent, and yet sent out many numerous colonies into different parts of the world. These colonies carried their native language along with them, and industriously diffused it wherever they formed a settlement. The Ionians, Æoles, and Dorians, possessed themselves of all the west, and north-west coast of the Lesser Asia and the adjacent islands; and there even the barbarians learned that polished language. The Greek colonies extended themselves along the south coast of the Euxine sea as far as Sinope, now Trebizund, and all the way from the west coast of Asia Minor: though many cities of barbarians lay between, the Greek tongue was understood and generally spoken by people of rank and fashion.

There were Greek cities on the north coast of the Euxine sea to the very eastern point, and perhaps beyond these limits; likewise in the Tauric Chersonesus, or Crim Tartary; and even to the mouth of the Danube, the straits of Caffa, &c. In the neighbourhood of all these colonies, the Greek language was carefully propagated among the barbarians, who carried on commerce with the Greeks.

A great part of the south of Italy was planted with Greek cities on both coasts; so that the country was universally prevailed. In Sicily it was in a manner vernacular. The Ionians had sent a colony into Egypt in the reign of Ptolemy; and a Greek settlement had been formed in Cyrenia many ages before. The Phocians had built Massilia or Marseilles as early as the reign of Cyrus the Great, where some remains of the Greek language are still to be discovered. Caesar tells us, that in the camp of the Helvetii registers were found in Greek letters. Perhaps no language ever had so extensive a spread, where it was not propagated by the law of conquest.

The Greek tongue, at this day, is confined within very narrow limits. It is spoken in Greece itself, except in Epirus, and the western parts of Macedonia. It is likewise spoken in the Grecian and Asiatic islands, in Candia or Crete, in some parts of the coast of Asia Minor, and in Cyprus: but in all these regions, it is much corrupted and degenerated.

As a specimen, we shall insert a modern Greek song, and the advertisement of a quack medicine, which with other plunder, was brought by the Russians from Chosim or Chotzim in 1772.

Song in modern Greek.

Translation.

With dire misfortunes, pains, and woes, O'erwhelm'd, ingulph'd, I struggling fight; O'er my friend bark proud billows close, To plunge her deep in lasting night. Rough seas of ills incessant roar, Fierce winds adverse, with howling blast, Heave surge on surge. Ah! far from shore My found'ring skiff shall sink at last. Involve'd in low'ring darksome clouds, Mid sultry fogs, I pant for breath; Huge foaming billows rend my shrouds, While yawning gulfs extend beneath. From bursting clouds loud thunders roll, And deaf'ning peals terrific spread; Red lightnings dart from pole to pole, And burst o'er my devoted head. When shall the friendly dawning rays Guide me to pleasures once posseted; And breezy gales, o'er peaceful seas, Waft to some port of endless rest?
