That, in looking at a horse, an ox, a sheep, we should be struck with a feeling of their resemblance in certain respects,—that to those respects, in which they are felt to resemble each other, we should give a name, as we give a name to each of them individually, comprehending under the general name such objects only as excite, when considered together with others, the feeling of this particular relation,—all this has surely nothing very mysterious in it. It would, indeed, be more mysterious, if, perceiving the resemblances of objects that are constantly around us, we did not avail ourselves of language, as a mode of communicating to others our feeling of the resemblance, as we avail ourselves of it in the particular denomination of the individual, to inform others of that particular object of which we speak; and to express the common resemblance which we feel by any word, is to have invented already a general term, significant of the felt relation. The process is in itself sufficiently simple; and, if we had never heard of any controversies with respect to it, we probably could not have suspected, that the mere giving of a name to resemblances which all perceive, and the subsequent application of the name only where the resemblance is felt, should have been thought to have any thing in it more mysterious, than the mere giving of a name to the separate objects which all perceive, and the repetition of that name when the separate objects are again perceived. It assumes, however, immediately an air of mystery when we are told, that it relates to the predicables of the schools, and to all that long controversy with respect to the essence of universals, which divided not merely schoolman against schoolman, but nation against nation,—when kings and emperors, who had so many other frivolous causes of warfare, without the addition of this, were eager to take up arms, and besiege towns, and cover fields with wounded and dead, for the honour of the universal *a parte rei*. It is difficult for us to think, that that could be simple which could produce so much fierce contention; and we strive to explain in our own mind, and, therefore, begin to see many wonderful, and perhaps unintelligible, or at least doubtful things, in phenomena, which we never should have conceived to require explanation, if others had not laboured to explain them, by clouding them with words. It is with many intellectual controversies as with the gymnastic exercises of the arena; the dust, which the conflict itself raises, soon darkens that air which was clear before,—

and the longer the conflict lasts the greater the dimness which arises from it. When the combatants are very many, and the combat very long and active, we may still, indeed, be able to see the mimicry of fight, and distinguish the victors from the vanquished; but even then we scarcely see distinctly; and all which remains, when the victory at last is won, or when both parties are sufficiently choaked with dust and weary, is the cloud of sand which they have raised, and perhaps some traces of the spots where each has fallen.

It surely cannot be denied, that the mind, with its other susceptibilities of feeling, has a susceptibility also of the feeling of the relation of similarity; or, in other words, that certain objects, when we perceive or think of them together, appear to us to resemble each other in certain respects,—that, for example, in looking at a horse, a crow, a sparrow, a sheep, we perceive that the horse and sheep agree in having four legs, which the crow and sparrow have not; and that, perceiving the horse and sheep to agree in this respect, and not the birds, we should distinguish them accordingly, and call the one set quadrupeds, the other bipeds, is as little wonderful as that we should have given to each of these animals its individual designation. If there be that relative suggestion which constitutes the feeling of resemblance,—and what sceptic, if he analyze the process fairly, will deny this as a mere feeling, or state of mind?—the general term may almost be said to follow of course. Yet for how many ages did this simple process perplex and agitate the schools,—which, agreeing in almost every thing that was complicated and absurd, could not agree in what was simple and just; and could not agree in it precisely because it was too simple and just to accord with the other parts of that strange system, which, by a most absurd misnomer, was honoured with the name of philosophy. That during the prevalence of the scholastic opinions as to perception,—which were certainly far better fitted to harmonize with errors and mysteries than with simple truths,—the subject of generalization should have appeared mysterious, is not, indeed, very surprising. But I must confess, that there is nothing in the history of our science which appears to me so wonderful, as that any difficulty,—at least, any difficulty greater than every phenomenon of every kind involves,—should now be conceived to be attached to this very simple process; and, especially, that philosophers should be so nearly unanimous in an opinion on the subject, which, though directly opposed to the prevalent error in the ancient schools, is not the less itself an error.

The process, as I have already described it to you, is the following:—In the first

place, the perception of two or more objects; in the second place, the feeling or notion of their resemblance, immediately subsequent to the perception; and, lastly, the expression of this common relative feeling by a name, which is used afterwards, as a general denomination, for all those objects, the perception of which is followed by the same common feeling of resemblance. The general term, you will remark, as expressing uniformly some felt relation of objects, is, in this case, significant of a state of mind essentially distinct from those previous states of mind which constituted the perception of the separate objects, as truly distinct from these primary perceptions as any one state of mind can be said to differ from any other state of mind. We might have perceived a sheep, a horse, an ox, successively, in endless series, and yet never have invented the term quadruped, as inclusive of all these animals, if we had not felt that particular relation of similarity, which the term quadruped, as applied to various objects, denotes. The feeling of this resemblance, in certain respects, is the true general notion, or general idea, as it has been less properly called, which the corresponding general term expresses; and, but for this previous general notion of some circumstance of resemblance, the general term, expressive of this general notion, could as little have been invented, as the terms green, yellow, scarlet, could have been invented, in their present sense, by a nation of the blind.

In the view which is taken of this process of generalization, as of every other process, there may be error in two ways,—either by adding to the process what forms no part of it, or by omitting what does truly form a part of it. Thus, if we were to say, that, between the perception of a horse and sheep, and the feeling of their resemblance in a certain respect, there intervenes the presence of some external independent substance,—some universal form or species of a quadruped, distinct from our conceiving mind, which, acting on the mind, or being present with it, produces the notion of a quadruped, in the same way as the presence of the external horse or sheep produced the perception of these individually,—we should err, in the former of these ways, by introducing into the process, something of which we have no reason to suppose the existence, and which is not merely unnecessary, but would involve the process in innumerable perplexities and apparent inconsistencies, if it did exist. This redundancy would be one species of error; but it would not less be an error, though an error of an opposite kind, were we to suppose that any part of the process does not take place,—that, for example, there is no relative suggestion, no rise in the mind of an intervening general notion of resemblance,

before the invention and employment of the general term, but the mere perception of a multitude of objects, in the first place; and, then, as if in instant succession without any other intervening mental state whatever, the general names under which whole multitudes are classed.

I have instanced these errors of supposed excess and deficiency, in the statement of the process, without alluding to any acts which have maintained them. I may now, however, remark, that the two opposite errors, which I have merely supposed, are the very errors involved in the opinions of the Realists and Nominalists, the great combatants in that most disputatious of controversies, to which I have before alluded,—a controversy, which, in the strong language of John of Salisbury, even at that early period, of which alone he could speak, had already employed fruitlessly more time and thought than the whole race of the Cæsars had found necessary for acquiring and exercising the sovereignty of the world: “*Quæstionem*,” he calls it, “*in qua laborans mundus jam senuit, in qua plus temporis consumptum est, quam in acquirendo et regendo orbis imperio consumperit Cæsarea domus; plus effusus pecunie, quam in omnibus divitiis suis possederit Cræsus. Hæc enim tamdiu multos tenuit, ut cum hoc unum totâ vitâ quærerent, tandem nec istud, nec aliud, invenirent.*”

However absurd, and almost inconceivable the belief of the substantial reality of genera and species, as separate and independent essences, may appear, on first consideration, we must not forget that it is to be viewed as a part of a great system, with which it readily harmonizes, and with which a juster view of the generalizing process would have been absolutely discordant.

While the doctrine of perception, by species, prevailed, it is not wonderful, as I have already said, that those who conceived ideas, in perception, to be things distinct from the mind,—the idea of a particular horse, for example, to be something different, both from the horse itself, and from the mind which perceived it,—should have conceived also, that, in forming the notion of the comparative nature of horses, in general, or quadrupeds, or animals, there must have been present, in like manner, some species distinct from the mind, which, of course, could not be particular, like the sensible species, but universal, so as to correspond with the universality of the notion, and the generic term. Such, accordingly, in its great outline, was the ancient doctrine as to universals. I need not attempt to detail to you, if indeed it be possible now to detail them with any approach to accuracy, the various refinements and modifications of this general doctrine, in its transmission from the Pythagorean school, to Plato and Aristotle, and, in the later ages,

to the schoolmen, his followers; all of whom, for many centuries, and by far the greater number, during the whole long reign of entities and quiddities, professed this belief of the existence of universal forms, as real, and independent of the conceptions, or other feelings of the mind itself.—the doctrine of universality, a *parte rei*, as it was termed.

The sect of the Nominalists, the great opponents of the Realists, in this too memorable controversy, though some hints of a similar opinion may be traced in some of the ancient philosophers, particularly of the Stoical school, owes its origin, as a sect, to Roscelinus a native of Brittany, who, in the eleventh century, had the boldness to attack the doctrine of the universal a *parte rei*. Roscelinus was himself eminently distinguished for his acuteness in the theology and dialectics of that age, in which theology itself was little more than a species of dialectics; and, most fortunately for the furtherance of his opinions, he had the honour of ranking among his disciples the celebrated Abelard; who, though probably known to you chiefly from the circumstances which attended his ill-fated passion for Eloise, was not less distinguished for his wonderful talents and acquirements of every sort. "To him alone," it was said, in the epitaph inscribed on his tomb, "to him alone, of all mankind, lay revealed, whatever can be known to man. Cui soli patuit scibile quicquid erat." These two eminent logicians, Roscelinus and Abelard, though differing in some slight respects in their own Nominalism, coincided in rejecting wholly the Realism, which, till then, had been the unquestioned doctrine of the schools. According to them, there was no universality a *parte rei*, nor any thing that could be called universal, but the mere general terms, under which particular objects were ranked. The denial of the reality of universals, however, which was an attack on the general faith, was of course regarded as a heresy, and was probably regarded the more as an unwarrantable innovation, on account of the heresies, in opinions more strictly theological, of which both Roscelinus and his illustrious pupil had been convicted. Though their talents, therefore, were able to excite a powerful division in the schools, their doctrine gradually sunk beneath the orthodoxy of their opponents; till, in the fourteenth century, the authority of the sect was revived by the genius of William Occam, an Englishman, one of the most acute polemics of his age, and the controversy, under his powerful championship, was agitated again, with double fervour. It was no longer, indeed, a mere war of words, or of censures and ecclesiastical penalties, but, in some measure also, a war of nations; the Emperor Lewis of Bavaria siding with Oc-

cam, and Lewis the Eleventh of France giving the weight of his power to the Realists. The violence on both sides was like that which usually rages only in the rancour of political faction, or the intolerance of religious persecution. Indeed, as might well be supposed, in a period in which an accusation of heresy was one of the most powerful and triumphant arguments of logic, which nothing could meet and repel but an argument of the same kind, religion was soon introduced into the controversy; and both sects, though agreeing in little more, concurred, with equal devotion, in charging their opponents with no less a sin than the sin against the Holy Ghost.

At the Reformation, the fury of the controversy was suspended by more important interests—interests which affected equally both those who separated from the Romish church and those who adhered to it; and perhaps too, in some degree, by the wider views which at that time were beginning to open in literature and general science. The question has since been a question of pure philosophy, in which there has been no attempt to interest sovereigns in wars of metaphysics, or to find new subjects for accusations of religious heresy. It has continued, however, to engage, in a very considerable degree, the attention of philosophers, whose general opinion has leant to that of the sect of the Nominalists. In our own country, particularly, I may refer to the very eminent names of Hobbes, Berkeley, Hume, Dr. Campbell, and Mr. Stewart, who are Nominalists, in the strictest sense of that term. Indeed the only names of authority which I can oppose to them, are those of Locke and Dr. Reid.

Locke and Reid, however, though holding opinions on this subject very different from those of the Nominalists, are not Realists—for, after the view which I have given you of the peculiar opinions of that sect, it is surely unnecessary for me to add, that there are no longer any defenders of the universal a *parte rei*. There is no one now—certainly no one worthy of the name of a philosopher—who believes that there is any external entity corresponding with the general notion man, and distinct from all the individual men perceived by us, and from our mind itself, which has perceived them. The only opinion which can now be considered as opposed to that of the rigid Nominalists, is the opinion which I have endeavoured to exhibit to you, in a form more simple than that in which it is usually exhibited, stripped, as much as it was possible for me to strip it, of all that obscurity with which a long controversy of words had clouded it; and precluding, therefore, I trust, those mistakes as to the nature of our general notions or feelings of resemblance, on which alone the

denial of the notions as states of mind seems to have been founded. The view which I have given however, though, I flatter myself, more clear in its analysis and reference to a particular class of feelings, is, in the main, inasmuch as it contends for a general feeling, of which every general term is significant, the same with the doctrine of Locke and Reid; and may, indeed, be traced far back in the controversy of universals; a considerable number of philosophers, who agreed with the stricter Nominalists in rejecting the notion of universal essences, having adopted this middle doctrine, or at least a doctrine nearly approaching to it; and been distinguished accordingly, from the other parties, by the name of *Conceptualists*—"conceptualists." Their joint opposition to the absurdities of Realism, however, occasioned them to be confounded with the Nominalists, from whom they differed certainly as much as from the Realists themselves; and I cannot but think, that it is merely in consequence of being thus confounded with Conceptualism, and presenting, therefore, some vague notions of more than mere general terms and particular perceptions, that the doctrine of the Nominalists has been able to obtain the assent and sanction of its illustrious modern defenders, whom I am thus almost inclined to consider as unconsciously, in thought, Conceptualists, even while they are Nominalists in argument and language. Or rather, for the word conception, I confess, does not seem to me a very proper one for expressing that feeling of general resemblance which I consider as a mere feeling of relation—I almost think that some obscure glimpse of that more precise doctrine which I have now delivered to you, must have had a sort of truly unconscious influence on the belief of the Nominalists themselves, in that imperfect view which they present to others of the process of generalization.

Of that rigid Nominalism which involves truly no mixture of Conceptualism, or of the belief of those feelings of relation for which I have contended, but denies altogether the existence of that peculiar class of feelings, or states of mind which have been denominated general notions, or general ideas, asserting the existence only of individual objects perceived, and of general terms that comprehend these, without any peculiar mental state denoted by the general term, distinct from those separate sensations or perceptions which the particular objects, comprehended under the term, might individually excite,—it seems to me that the very statement of the opinion itself is almost a sufficient confutation, since the very invention of the general term, and the extension of it to certain objects only, not to all objects, implies some reason for this limitation,—some feeling of general agreement of the objects

included in the class, to distinguish them from the objects not included in it, which is itself that very general notion professedly denied. As long as some general notion of circumstances of resemblance is admitted, I see very clearly how a general term may be most accurately limited; but if this general notion be denied, I confess that I cannot discover any principle of limitation whatever. Why have certain objects been classed together, and not certain other objects, when all have been alike perceived by us; and all, therefore, if there be nothing more than mere perception in the process, are capable of receiving any denomination which we may please to bestow on them? Is it arbitrarily, and without any reason whatever, that we do not class a rose-bush with birds, or an elephant with fish? and if there be any reason for these exclusions, why will not the Nominalist tell us what that reason is—in what feeling it is found—and how it can be made accordant with his system? Must it not be that the rose-bush and a sparrow, though equally perceived by us, do not excite that general notion of resemblance which the term bird is invented to express—do not seem to us to have those relations of a common nature, in certain respects, which lead us to class the sparrow and the ostrich, however different in other respects, as birds; or the petty natives of our brooks and rivulets with the mighty monsters of the deep, under one general and equal denomination? If this be the reason, there is more, in every case, than perception, and the giving of a general name; for there is a peculiar state of mind—a general relative feeling—intervening between the perception and the invention of the term, which is the only reason that can be assigned for that very invention. Can the Nominalist then assert, that there is no feeling of the resemblance of objects, in certain respects, which thus intervenes between the perception of them as separate objects, which is one stage of the process, and the comprehension of them under a single name, which is another stage of the process,—or must he not rather confess, that it is merely in consequence of this intervening feeling we give to the number of objects their general name, to the exclusion of the multitudes of objects to which we do not apply it, as it is in consequence of certain other feelings, excited by them individually, we give to each separate object its proper name, to the exclusion of every other object? To repeat the process, as already described to you, we perceive two or more objects,—we are struck with their resemblance in certain respects;—We invent a general name to denote this feeling of resemblance,—and we class, under this general name, every particular object, the perception of which is followed by the same feeling of resemblance, and no objects

but these alone. If this be a faithful statement of the process,—and for its fidelity I may safely appeal to your consciousness,—the doctrine of the Nominalists is not less false than that of the Realists. It is false, because it excludes that general feeling of resemblance,—the relative suggestion,—which is all that the general name itself truly designates, and without which, therefore, it never would have been invented; while the doctrine of the Realists is false, by inserting in the process those supposed separate entities which form no part of it. The one errs, as I have already said, by excess, the other by deficiency.

Even in professing to exclude the general notion of resemblance, however, the Nominalist unconsciously proceeds on it; and no stronger proof can be imagined of the imperfectness of the view which his system gives of our generalizations, than the constant necessity under which we perceive him to labour, of assuming, at every stage of his argument, the existence of those very notions, or feelings of relative suggestion, against which his argument is directed. The general term, we are told, is significant of all objects of a certain kind, or a particular idea is made to represent various other ideas of the same sort; as if the very doctrine did not necessarily exclude all notion of a kind or sort, independent of the application of the term itself. “An idea,” says Berkeley, “which, considered in itself, is particular, becomes general, by being made to represent or stand for all other particular ideas of the same sort;” and he instances this in the case of a line of any particular length,—an inch, for example,—which, to a geometer, he says, becomes general, as “it represents all particular lines whatsoever; so that what is demonstrated of it, is demonstrated of all lines, or, in other words, of a line in general.” It is truly inconceivable that he should not have discovered, in this very statement, that he had taken for granted the existence of general notions, the very states of mind which he denied; since, without these, there can be no meaning in the restriction of any sign, to “ideas of the same sort.” If we have previously a notion of what he himself, rather inconsistently, calls a line in general, we can easily understand how the word line may be limited to ideas of one sort; but if we have no such previous general notion, we cannot have any knowledge of the sort to which we are, notwithstanding, said to limit our term. An inch, which is certainly not the same figure as a foot or a yard, is, on the principles of Nominalism, which exclude all knowledge of the nature of lines in general, essentially different from these; and might as well, but for that general notion of the resemblance of lines which all have, independently of the term, and previously to the term, but which No-

minimalism does not allow to exist, be significant of a square, or a circle, as of any other simple length. To say that it represents all particular lines whatsoever, is either to say nothing, or it is to say that certain general notions of resemblance exist truly, as a part of our consciousness, and that we are hence able to attach a meaning to the phrase, “all particular lines whatsoever;” which we could not if a foot, a yard, or a mile, did not appear to us to resemble each other in some respect. It is in vain that Berkeley, who is aware of the objection which may be brought from the universal truths of geometry, against a system which denies every thing but particular ideas, and the signs of particular ideas, endeavours to reconcile this denial of the conception of universality, with that very-universality which it denies. It is quite evident, that, if we have no general notions of squares and triangles, our demonstration of the properties of these figures never can go beyond those particular squares or triangles conceived by us in our demonstration. Thus, says Berkeley, who states the objection, and endeavours to answer it,—“having demonstrated that the three angles of an isosceles rectangular triangle are equal to two right ones, I cannot therefore conclude this affection agrees to all other triangles, which have neither a right angle, nor two equal sides. It seems, therefore, that, to be certain this proposition is universally true, we must either make a particular demonstration for every particular triangle, which is impossible, or, once for all, demonstrate it of the abstract idea of a triangle, in which all the particulars do indifferently partake, and by which they are all equally represented. To which I answer, that though the idea I have in view, whilst I make the demonstration, be, for instance, that of an isosceles rectangular triangle, whose sides are of a determinate length, I may, nevertheless, be certain it extends to all other rectilinear triangles, of what sort or bigness soever; and that because neither the right angle, nor the equality, nor determinate length of the sides, are at all concerned in the demonstration. It is true, the diagram I have in view includes all these particulars; but then there is not the least mention made of them in the proof of the proposition. It is not said the three angles are equal to two right ones, because one of them is a right angle, or because the sides comprehending it are of the same length; which sufficiently shows that the right angle might have been oblique, and the sides unequal, and, for all that, the demonstration have held good; and for this reason it is that I conclude that to be true, of any oblique angular or scalenon, which I had demonstrated, of a particular right-angled equicrural triangle, and not because I demonstrated the pro-

position of the abstract idea of a triangle."⁶

"This answer," I have said in my observations on Dr. Darwin's *Zoonomia*, "This answer evidently takes for granted the truth of the opinion which it was intended to confute, by supposing us, during the demonstration, to have a general idea of triangles, without particular reference to the diagram before us. It will be admitted, that the right angle, and the equality of two of the sides, and the determinate length of the whole, are not expressed in the words of the demonstration; but words are of consequence only as they suggest ideas, and the ideas, suggested by the demonstration, are the same as if these particular relations of the triangle had been mentioned at every step. It is not said that the three angles are equal to two right angles, because one of them is a right angle, or because the sides which comprehend that angle are of the same length; but it is proved that the three angles of the triangle, which has one of its angles a right angle, and the sides, which comprehend that angle, of equal length, are together equal to two right angles. This particular demonstration is applicable only to triangles, of one particular form. I cannot infer from it the existence of the same property, in figures essentially different: for, unless we admit the existence of general ideas, an equilateral triangle differs as much from a scalene rectangular triangle, as from a square. In both cases, there is no medium of comparison. To say that the two triangles agree, in having three sides, and three angles, is to say, that there are general ideas of sides and angles; for, if they be particularized, and if, by the words *sides* and *angles*, be meant equal sides, and equal angles, it is evident that the two triangles do not agree in the slightest circumstance. Admitting, therefore, that I can enunciate a general proposition, the conception of which is impossible, I can be certain that the three angles of every triangle are together equal to two right angles, only when it has been demonstrated of triangles of every variety of figure; and, before this can be done, I must have it in my power to limit space, and chain down imagination."[†]

In Dr. Campbell's illustrations of the power of signs, in his very ingenious work on the *Philosophy of Rhetoric*, he adopts and defends this doctrine, of the general representative power of particular ideas,—making, of course, the same inconsistent assumption which Berkeley makes, and which every Nominalist must make, of those general notions of orders, sorts, or kinds, which his ar-

gument would lead us to deny. "When a geometrician," says he, "makes a diagram with chalk upon a board, and from it demonstrates some property of a straight-lined figure, no spectator ever imagines that he is demonstrating a property of nothing else but that individual white figure of five inches long, which is before him. Every one is satisfied that he is demonstrating a property of all that order, whether more or less extensive, of which it is both an example and a sign; all the order being understood to agree with it in certain characters, however different in other respects."[‡] There can be no question that every one is, as Dr. Campbell says, satisfied, that the demonstration extends to a whole order of figures; and the reason of this is, that the mind is capable of forming a general notion of an order of figures; for it really is not easy to be understood, how the mind should extend any demonstration to a whole order of figures, and to that order only, of which order itself it is said to be incapable of any notion. "The mind," continues Dr. Campbell, "with the utmost facility, extends or contracts the representative power of the sign as the particular occasion requires. Thus, the same equilateral triangle will, with equal propriety, serve for the demonstration, not only of a property of all equilateral triangles, but of a property of all isosceles triangles, or even of a property of all triangles whatever."[§] The same diagram does, indeed, serve this purpose, but not from any extension or contraction of the representative power of the sign according to occasion. It is because we had a general notion of the nature of triangles,—or of the common circumstances in which the figures, to which alone we give the name of *triangles*, agree,—before we looked at the diagram, and had this general notion, common to the whole order, in view, during the whole demonstration. "Nay, so perfectly is this matter understood," Dr. Campbell adds, "that, if the demonstrator, in any part, should recur to some property, as to the length of a side, belonging to the particular figure he hath constructed, but not essential to the kind mentioned in the proposition, and which the particular figure is solely intended to represent, every intelligent observer would instantly detect the fallacy. So entirely, for all the purposes of science, doth a particular serve for a whole species or genus."^{||} But, on Dr. Campbell's principles, what is the species or genus, and how does it differ from other species or genera? Instead of the explanation, therefore, which he gives, I would rather say, so certain is it, that, during the whole demonstration, or, at

⁶ Berkeley's Works, Lond. 1784, v. i. p. 13.

least, as often as any mention of the figures occurs, the general notion of the species or genus of figures, that is to say, of the circumstance of resemblance of these figures, has been present to the mind ; since, if it had no such general notion, it could not instantly detect the slightest circumstance which the species or genus does not include. The particular idea is said to be representative of other ideas "that agree with it in certain characters." But what are these characters? If we do not understand what they are, we cannot, by our knowledge of them, make one idea representative of others ; and, if we do know what the general characters are, we have already that general notion which renders the supposed representation unnecessary.

In this case, as in many other cases, I have no doubt, notwithstanding the apparent extravagance of the paradox, that it is because the doctrine of the Nominalists is very contrary to our feelings, we do not immediately discover it to be so. If it were nearer the truth, we should probably discover the error which it involves much more readily. The error escapes us, because our general terms convey so immediately to our mind that common relation which they denote, that we supply, of ourselves, what is wanting in the process as described by the Nominalist—the feeling of the circumstances of resemblance, specific or generic, that are to guide us in the application, as they led us to the invention of our terms. We know what it is which he means, when he speaks of particular terms, or particular ideas, that become more generally significant, by standing for ideas of the same sort, or the same order, or species, or genus, or kind ; and we therefore make, for him, by the natural spontaneous suggestions of our own minds, the extension and limitation, which would be impossible on his own system. But for such an illusion, it seems to me scarcely possible to understand, how so many of the first names, of which our science can boast, should be found among the defenders of an opinion which makes reasoning nothing more than a mere play upon words, or, at best, reduces very nearly to the same level the profoundest ratiocinations of intellectual, or physical, or mathematical philosophy, and the technical labours of the grammarian, or the lexicographer.

The system of the Nominalists, then, I must contend, though more simple than the system of the Realists, is not, any more than that system, a faithful statement of the process of generalization. It is true, as it rejects the existence of any universal form or species, distinct from our mere feeling of general resemblance. But it is false, as it rejects the general relative feeling itself, which every general term denotes, and without which, to direct us in the extension and limi-

tation of our terms, we should be in danger of giving the name of *triangle*, as much to a square or a circle, as to any three-sided figure. We perceive objects,—we have a feeling or general notion of their resemblance,—we express this general notion by a general term. Such is the process of which we are conscious ; and no system which omits any part of the process can be a faithful picture of our consciousness.

LECTURE XLVII.

TRUE THEORY OF GENERALIZATION REPEATED.—INCONGRUITY IN THE LANGUAGE OF THE CONCEPTUALISTS.—SMITH'S THEORY OF THE INVENTION OF GENERAL TERMS IN RUDE PERIODS OF SOCIETY.—ABSURDITY OF NOMINALISM.—USE OF GENERAL TERMS NOT TO ENABLE MAN TO REASON, BUT TO REASON WELL.

My last Lecture, Gentlemen, was employed on a subject which has engaged, in an eminent degree, the attention of philosophers, both from the difficulty which was supposed to attend it, and from the extensive applications which were to be made of it, as the ground-work of every proposition, and, consequently, of all our knowledge. It was necessary, therefore, to give you a sketch of the great controversy as to Universals, that so long divided the schools,—of which one party, that of the Realists,—formerly so powerful when the general theory of the primary mental functions of perception accorded with the Realism,—may now, when our theory of perception is too simple to accord with it, be considered as altogether extinct. It was scarcely possible that universal forms or species should continue to hold a place in the philosophy of mind, or in our systems of dialectics, when even sensible species had been universally abandoned.

In stating the opinion on the subject of this controversy, which I consider as the only one worthy of your assent, and indeed so obviously just that it seems to me as if it could scarcely have failed to occur to every mind, but for the darkness of insignificant terms and phrases, with which the controversy itself had enveloped it,—I endeavoured to free it, as much as possible, from this mere verbal darkness, and to exhibit the process to you in that simple order of succession in which it appears to me to take place.

The process I stated to be the following :

We perceive two or more objects—this is one state of the mind. We are struck with the feeling of their resemblance in certain respects. This is a second state of the mind. We then, in the third stage, give a name to these circumstances of felt resem-

semblance, a name which is, of course, applied afterwards only where this relation of similarity is felt. It is unquestionably not the name which produces the feeling of resemblance, but the feeling of resemblance which leads to the invention or application of the name; for it would be equally just and philosophic to say that it is the name of the individual, John or William, which gives existence to the individual John or William, and that he was nobody, or nothing, till the name, which made him something, was given, as to say, that the name man, which includes both John and William, is that which constitutes our relative notion of the resemblance of John and William, expressed by their common appellation; and that, but for the name, we could not have conceived them to have any common or similar properties,—that is to say, could not have had any general relative notion, or general idea, as it has been wrongly called, of human nature, of the respects in which John, William, and all other individual men agree. So far is the general term from being essential to the rise of that state of mind which constitutes the feeling of resemblance, or, in other words, to the general notion, whatever it may be, which the term expresses, that it is only for a very small number of such general relative feelings that we have invented general terms. There are scarcely any two objects at which we can look without perceiving a resemblance of some sort; but we never think of giving a name to each pair of relatives, on account of some slight circumstance in which they may have been felt by us to agree, more than we think of giving a name to every separate individual object which we perceive—to every blade of grass in our fields—to every rose on a bush, or even to every rose-bush in our garden. It is necessary, for the convenience of social life, that we should have general terms to express the most important general resemblances,—a general word, *man*, for example, to express briefly those very general circumstances of resemblance which we discover in all the individuals to whom that name is given, and thus to save us from the repetition of innumerable proper names, when we speak of circumstances common to the whole multitude;—it is not necessary that we should have a general term to express, in like manner, every less extensive resemblance which we may discover in any two or more individual men; and, accordingly, for such minute resemblances we do not invent any general term, yet the feelings of resemblance, or notions of general circumstances of agreement, though they may be more or less important, so as to prompt in some cases, and not in other cases, to the use of a common appellation, are still in kind, as mere feelings of relation, the same, whether the general term for expressing them

be invented or not; and feelings which arise as much when no name is given as when a name is given, cannot surely be dependent on names that do not exist in the greater number of cases at all, and that, when they are formed, exist only after these very feelings which they are invented to express.

If our mind be capable of feeling resemblance it must be capable of general notions, which are nothing more than varieties of this very feeling; for we surely cannot perceive objects to resemble each other, without perceiving them to resemble each other in certain respects rather than in others; and this very notion of the respects in which they are similar, is all that is meant by the general relative feeling.

The circumstances in which all individual men agree form my general notion of man, or human nature. When I use the term man, I employ it to express every being in whom these circumstances are to be found,—that is to say, every being who excites, when considered together with the other beings whom I have before learned to rank as man, the same relative feeling of resemblance. When I hear the term man, these general circumstances of agreement occur to me vaguely, perhaps, and indistinctly, but probably as distinctly as the conception of the individual John or William, which recurs when I hear one of those names.

Indeed, there can be no doubt that the exact meaning of our general terms is much more distinctly conceived by us than that of our particular terms,—that we have a far clearer notion of a line, for example, than of an inch or three-fourths of an inch,—of rectilinear angles in general, as formed by the meeting of any two straight lines in any direction, than of an angle of sixty-five degrees, for which one particular inclination of the meeting lines is absolutely necessary, and an inclination, which only the nicest measurement can discriminate, from that which forms an angle of sixty-four or of sixty-six. The general term, it is evident, in proportion as it is more and more general, involves the consideration of fewer particulars, and is, therefore, less confused; while the particular term must involve all the particulars included in the general one, with many more that distinguish the species or the individual, and that are difficult themselves to be distinguished, in consequence of the faintness of the limits in which they shadow into each other. To this it is owing that the sciences, which are most strictly demonstrative; that is to say, the sciences in which our notions are the clearest, are not those which relate to particular objects, and which, consequently, involve particular conceptions and particular terms, but the sciences of number and quantity, in which every term is a general one,

and every notion, therefore, which it expresses, general.

With each advance in generalizing, the general notion, or the feeling of resemblance in certain circumstances, becomes different, because the circumstances in which it is necessary that the general resemblance should be felt, are fewer, and common, therefore, to a greater number of objects; the general term being, in every stage, applicable to the whole number of objects, as exciting, when considered together, that relative feeling of similarity, the suggesting of which is all that constitutes the variety, species, genus, order, or class.

The words *John*, *man*, *animal*, *substance*, in the progressive scale of generalization, are words which I understand, and none of which I feel to be exactly synonymous with the others, but to express either less or more, so as to admit progressively of wider applications than could be allowed at a lower point of the scale. Since they are felt, then, not to be exactly synonymous, each term, if it be understood at all, must excite in the mind a different feeling of some sort or other, and this different state of mind is nothing more than a notion of agreement in certain circumstances, more or fewer, according to the extent of the generalization.

If, then, the generalizing process be, first, the perception or conception of two or more objects,—2dly, The relative feeling of their resemblance in certain respects,—3dly, The designation of these circumstances of resemblance, by an appropriate name,—the doctrine of the Nominalists, which includes only two of these stages,—the perception of particular objects, and the invention of general terms, must be false, as excluding that relative suggestion of resemblance in certain respects, which is the second and most important step of the process; since it is this intermediate feeling alone that leads to the use of the term, which otherwise it would be impossible to limit to any set of objects. Accordingly, we found that, in their impossibility of accounting, on their own principles, for this limitation,—which it is yet absolutely necessary to explain in some manner or other,—the Nominalists, to explain it, uniformly take for granted the existence of those very general notions, which they at the same time profess to deny,—that, while they affirm, that we have no notion of a kind, species, or sort, independently of the general terms which denote them, they speak of our application of such terms only to objects of the same kind, species, or sort; as if we truly had some notions of these general circumstances of agreement, to direct us,—and that they are thus very far from being Nominalists in the spirit of their argument, at the very moment, when they are Nominalists in assertion,—strenuous opposers of

those very general feelings, of the truth of which they avail themselves, in their very endeavour to disprove them.

If, indeed, it were the name which formed the class, and not that previous relative feeling, or general notion of resemblance of some sort, which the name denotes, then might any thing be classed with any thing, and classed with equal propriety. All which would be necessary, would be merely to apply the same name uniformly to the same objects; and, if we were careful to do this, *John* and a triangle might as well be classed together, under the name *man* as *John* and *William*: Why does the one of those arrangements appear to us more philosophic than the other? It is because something more is felt by us to be necessary in classification, than the mere giving of a name at random. There is, in the relative suggestion that arises on our very perception or conception of objects, when we consider them together, a reason for giving the generic name to one set of objects rather than to another,—the name of *man*, for instance, to *John* and *William*, rather than to *John* and a triangle. This reason is the feeling of the resemblance of the objects which we class,—that general notion of the relation of similarity in certain respects, which is signified by the general term,—and without which relative suggestion, as a previous state of the mind, the general term would as little have been invented, as the names of *John* and *William* would have been invented, if there had been no perception of any individual being whatever to be denoted by them.

That we have general relative feelings of the resemblances of objects, and that our general terms are significant of these, and limited, therefore, to the particular objects which excite some common feeling of resemblance, is then, I conceive, sufficiently evident; and yet, the existence of such general notions is not merely rejected by the greater number of philosophers, but the assertion of it has been considered as a subject rather of ridicule than of any serious confutation, as if confutation itself would have been too great an honour.

I must confess, however, that some incautious expressions of the Conceptualists, and their erroneous analysis and classification of the general feeling, did justify in part this ridicule, as they involved an appearance of inconsistency and contradiction, which a more accurate analysis of the general feeling asserted, and a very slight change of phraseology and arrangement would have removed. These improprieties, it may be of importance to point out to you, as furnishing, perhaps, some explanation of the error of New Nominalism.

The use of the word *idea* for expressing

the notion or feeling of resemblance, was, in the first place, unfortunate. Idea, from its etymological sense, and its common application to the conceptions of external objects, seems almost, in itself, to imply something which can be individualized, and offered to the senses. The general idea, therefore, which we are said to form, from the consideration of the various ways in which two lines can meet one another, seems to us, as an idea, to be something which we must be capable of representing in a diagram, like any of the particular angles considered by us; and what we can thus image in a diagram, must evidently be particular; so that, if we ascribe to it properties of more than one particular angle, our reference must, on this very account, seem to involve an inconsistency or multitude of inconsistencies. The general idea of an angle, therefore, which is not a right angle, nor acute nor obtuse, but at once all of these, and none of them, is to our conception, in every respect, as truly absurd as a whole which is less than a part of itself, or a square of which the angles are together equal to four right angles, and at the same time equal to five such angles, and only to three or two.

Such are the inconsistencies that must always seem to flow from the use of the word *idea* in this case, as if presenting to us a particular image of what cannot be particular.

The same remark may, in a great measure, be applied to the use of the word *conception*, which also seems to individualize its object; and which, as commonly employed to signify some fainter revival of a past feeling, may lead, and has led, to very mistaken views of the nature of our general notions. In these, according to the process described by me, there is nothing which can be said to be in any respect a conception, or fainter transcript of the past; and, therefore, if I were to invent a name for the opinion with respect to universals which I hold, it would not be as a Conceptualist, but as a Notionist, or Relationist, that I should wish to be classed. The feeling of the relation of similarity is no part of the perception or conception of the separate objects which suggest it. It is a feeling of a different species, absolutely new—a relation, and nothing more; and the general term, which is not expressive of what can strictly be termed a conception, is invented only to express all that multitude of objects, which, however different in other respects, agree in exciting one common feeling of relation—the relation of a certain similarity.

The phrase, *general notion*, which is that which I have preferred, would in this case have been far more appropriate, and would have obviated that tendency to individual representation, which the word *conception*, and

still more, the word *idea*, produce; and consequently, all those apparent inconsistencies, which do not attend the notion of the mere feeling of agreement of various objects, but arise only from the attempt to form an individual representation of what is in itself general, and therefore, by its very nature, incapable of being individually represented.

Still more unfortunate, however, than the classing of our general notions with conceptions or ideas, was a verbal impropriety that may at first seem to you of little consequence,—the mere use of the indefinite article, in a case in which certainly it ought not to have been employed. It was not the mere general notion of the nature and properties of triangles, but the general idea of a triangle, of which writers on this branch of intellectual philosophy have been accustomed to speak. The influence of this improper use of the article has not before been remarked; yet I have no doubt that it is the very circumstance which has chiefly tended to produce a denial of the general notion itself. It is a striking lesson, how much the progress of philosophy may be retarded, even by the slightest inaccuracy of language, which leads those who consider the doctrine without due attention and analysis, to ascribe to it the inconsistencies which are not in the doctrine itself, and thus to reject, as absurd, what, in another form of expression, would perhaps have appeared to them almost self-evident.

According to the view which I have given you of the generalizing process, all that is truly general is, a relation that is felt by us. We have a feeling, or general notion, of the circumstances of agreement of many individual objects, but not a notion of an object, uniting at once all the qualities of the individual objects, and yet excluding every quality which distinguishes each from each. This would truly be a species of Realism still more absurd than the old scholastic universal *à parte rei*. The general idea of a man, who is neither dark nor fair, tall nor short, fat nor thin, nor of any degree intermediate between these extremes, and yet is, at the same time, dark and fair, tall and short, fat and thin, is that of which we may very safely deny the existence: for a man must be particular, and must therefore have particular qualities, and certainly cannot have qualities that are inconsistent. But a dark and a fair man, a tall and a short man, a fat and a thin man, all agree in certain respects, or, in other words, excite in us a certain relative feeling or notion of general resemblance; since, without a feeling of this kind, we never should have thought of classing them together under one general term. We have not a general idea of a man, but we are impressed with a certain common relation of similarity of all the individuals, whom, on

that account, and on that account alone, we rank together under the common appellation of men.

A general idea of a man is, then, it will be allowed, an unfortunate, or, to speak more accurately, an absurd expression. But the absurdity of such an expression does not render it less absurd to deny, that we have any general notion or relative feeling whatever of the circumstances in which men agree—that general notion which preceded the invention of the general term *man*, and without which the general term would be absolutely incapable of being limited or applied to one set of objects more than to another. Yet all the valuable remarks of Mr. Locke, on this subject, have been neglected or forgotten; while one passage has been well remembered, and often quoted, because nothing is so well remembered as the ridiculous. The passage, indeed, it must be confessed, is abundantly ridiculous; but what is ridiculous in it arises, very evidently, from the source which I have pointed out, and not from the doctrine, that there is a general feeling, of some sort, corresponding with every general term that is not absolutely insignificant.

“Does it not require some pains and skill,” says Mr. Locke, in this often-quoted passage—“Does it not require some pains and skill to form the general idea of a triangle, (which is yet none of the most abstract, comprehensive, and difficult;) for it must be neither oblique, nor rectangle, neither equilateral, equicrural, nor scalenon; but all and none of these at once. In effect, it is something imperfect that cannot exist; an idea, wherein some parts of several different and inconsistent ideas are put together.”*

Of this strange description, so unworthy of its great author, and I may add, so unworthy also of the doctrine which he supported, the authors of the *Memoirs of Scriblerus* have not failed to avail themselves, converting Mr. Locke's universal triangle into an universal lord mayor.

“Martin supposed an universal man to be like a knight of a shire, or a burgess of a corporation, that represented a great many individuals. His father asked him, if he could not frame the idea of an universal lord mayor? Martin told him, that, never having seen but one lord mayor, the idea of that lord mayor always returned to his mind; that he had great difficulty to abstract a lord mayor from his fur-gown and gold chain; nay, that the horse he saw the lord mayor ride upon not a little disturbed his imagination. On the other hand, Crambe, to show himself of a more penetrating genius, swore that he could frame a conception of a lord

mayor, not only without his horse, gown, and gold chain, but even without stature, feature, colour, hands, head, feet, or any body, which he supposed was the abstract of a lord mayor.”†

This abstract of a lord mayor, though it may be more ludicrous, is not more absurd, than Locke's abstract of a triangle; for a triangle must be particular, and must, therefore, be equilateral, equicrural, or scalene. It would have been very different, if he had stated merely, that all triangles, whether equilateral, equicrural, or scalene, are felt by us to agree in certain respects,—that they are not felt by us to have this general resemblance, because we have previously classed them together; but that we have classed them together, because we have previously felt this general resemblance,—that the general notion, therefore, cannot have depended for its origin on the name which follows it,—and that it is this general notion or feeling of resemblance, of which the general term is truly significant, the term being considered by us as fairly applicable to every object which excites the same relative feeling. This, it is evident, from his whole reasoning, was fundamentally, or nearly the opinion of Locke himself, who was led into the error of his very strange description, merely by conceiving, that a general notion of the common circumstances and properties of triangles was a conception, or a general idea of a triangle.

But, whether this was or was not the opinion of Mr. Locke, the process which I have described is not the less just. We perceive two or more objects—we have a feeling or general notion, of their resemblance in certain respects—and, in consequence of this general notion, we invent the general term, and limit it to such objects as correspond with the notion previously existing,—that is to say, we limit it to objects which agree in exciting this relative suggestion. It is hence the very nature of our general notion not to be particular; for who can paint or particularize a mere relation? It is the feeling of resemblance which constitutes it—not the objects themselves which are felt to be similar; and to require, therefore, that our mental notion of the common properties of triangles, scalene, equilateral, and isosceles, should itself be a triangle, equilateral, isosceles, or scalene, is not more philosophic, or, I may say, not even less absurd, than it would be to require of us a visual delineation of a sound or a smell, and to deny that we have any sensations of melody and odour because we cannot represent these in pictures to the eye.

I have already remarked, that it is only for a small number of the resemblances which

* Essay Concerning Human Understanding, B. IV. c. 7. sect. 9.

† Pope's Works.—*Memoirs of Martinus Scriblerus*, chap. vii.

we perceive in objects, that we have invented general terms. The general term, therefore, far from being essential to the generalization, is only a record of a generalization previously made. It marks what we have felt, and enables us to refer, with exactness, to this past feeling.

When I speak of our invention of a general term, however, I speak of what we do, in the present mature state of our language, not of what was likely to take place in the early generalizations of savage life; for there seems to me very little reason to doubt the justness of that theory of appellatives, which is hinted, indeed, in some earlier writers, but has been particularly maintained by Condillac and Dr. Smith,—a theory which supposes the words, now used as appellatives to have been originally the proper names of individual objects, extended to the objects that were perceived to be similar to those to which the name had primarily been given. The theory is stated with great force by Dr. Smith, in the ingenious dissertation appended to his *Theory of Moral Sentiments*. It would be injustice to his opinion, to attempt to express it in any words but his own.

“The assignation of particular names, to denote particular objects, that is, the institution of nouns substantive, would probably be one of the first steps towards the formation of language. Two savages, who had never been taught to speak, but had been bred up remote from the societies of men, would naturally begin to form that language by which they would endeavour to make their mutual wants intelligible to each other, by uttering certain sounds, whenever they meant to denote certain objects. Those objects only which were most familiar to them, and which they had most frequent occasion to mention, would have particular names assigned to them. The particular cave whose covering sheltered them from the weather, the particular tree whose fruit relieved their hunger, the particular fountain whose water allayed their thirst, would first be denominated by the words cave, tree, fountain, or by whatever other appellations they might think proper, in that primitive jargon, to mark them. Afterwards, when the more enlarged experience of these savages had led them to observe, and their necessary occasions obliged them to make mention of other caves, and other trees, and other fountains, they would naturally bestow upon each of those new objects the same name by which they had been accustomed to express the similar object they were first acquainted with. The new objects had none of them any name of its own, but each of them exactly resembled another object which had such an appellation. It was impossible that those savages could behold the new objects without recollecting

the old ones; and the name of the old ones, to which the new bore so close a resemblance. When they had occasion, therefore, to mention, or to point out to each other, any of the new objects, they would naturally utter the name of the correspondent old one, of which the idea could not fail, at that instant, to present itself to their memory in the strongest and liveliest manner. And thus, those words, which were originally the proper names of individuals, would each of them insensibly become the common name of a multitude. A child that is just learning to speak, calls every person who comes to the house its papa, or its mamma; and thus bestows upon the whole species those names which it had been taught to apply to two individuals. I have known a clown who did not know the proper name of the river which ran by his own door. It was the river, he said, and he never heard any other name for it. His experience, it seems, had not led him to observe any other river. The general word river, therefore, was, it is evident, in his acceptance of it, a proper name, signifying an individual object. If this person had been carried to another river, would he not readily have called it a river? Could we suppose any person living on the banks of the Thames so ignorant, as not to know the general word river, but to be acquainted only with the particular word Thames, if he was brought to any other river, would he not readily call it a Thames? This, in reality, is no more than what they, who are well acquainted with the general word, are very apt to do. An Englishman, describing any great river which he may have seen in some foreign country, naturally says, that it is another Thames. The Spaniards, when they first arrived upon the coast of Mexico, and observed the wealth, populousness, and habitations of that fine country, so much superior to the savage nations which they had been visiting for some time before, cried out, that it was another Spain. Hence it was called New Spain, and this name has stuck to that unfortunate country ever since. We say, in the same manner, of a hero, that he is an Alexander; of an orator, that he is a Cicero; of a philosopher, that he is a Newton. This way of speaking, which the grammarians called an Antonomasia, and which is still extremely common, though now not at all necessary, demonstrates how much mankind are naturally disposed to give to one object the name of any other which nearly resembles it, and thus to denominate a multitude by what originally was intended to express an individual.

“It is this application of the name of an individual to a great multitude of objects, whose resemblance naturally recalls the idea of that individual, and of the name which expresses it, that seems originally to have giv-

an occasion to the formation of those classes and assortments, which, in the schools, are called genera and species.*

That the first designation of species and genera, by appellatives, was nothing more than this ingenious speculation supposes it to have been,—the extension of mere proper names from similar objects to similar objects, I have very little doubt. But still, it must be remembered, that the extension was from similar objects to objects felt to be similar,—that, before the extension, therefore, there must have been a general notion of the circumstances of resemblance,—and that, without this intermediate feeling of his mind, the savage would as little have thought of calling one tree by the name which he had previously given to another tree, as he would have thought of extending this name to the cave which sheltered him, or the fountain at which he quenched his thirst. In short, whatever our theory of the origin of general terms may be, it either must take for granted the previous existence of general relative notions, corresponding with them, or it must suppose that the terms were invented at random, without any reason whatever, to guide us in our application or limitation of them. To state any reason of this kind, is to state some general resemblance that is felt by us, and consequently some notion of general circumstances of resemblance, which must be independent of the general term, because it is prior to it. This, which the Nominalist on reflection, I should conceive, must admit, is all for which the Conceptualist contends, or, at least, is all for which I contend, in that view of the generalizing process which I have given you.

The decision of the controversy might, indeed, as I have now said, be very safely trusted to the Nominalist himself, if he would only put a single question to his own mind, and reflect for a few moments before giving an answer. Why do I class together certain objects, and exclude certain others from the class which I have formed? He must say, either that he classes them together because he has classed them together, and that he excludes the others because he excludes them, which is surely not a very philosophic answer, though it is all which can be understood in the assertion, that it is the name which constitutes as well as defines the genus; or he must say, that there is some reason which has led him to give the general name to certain objects and not to certain others. The reason for which the name is given, must, of course, be something which is felt prior to the giving of the name, and independent of it; and the only reason

which can be conceived is, that certain objects have a resemblance which certain other objects do not partake, and that the general name is therefore invented to express the objects which agree in exciting this common notion of relation. Before the name was invented, therefore, there must have been a feeling of circumstances of resemblance, common to certain individuals,—a feeling, which is neither the perception that precedes it, nor the name which follows it, but a state of mind intervening between the perception of the separate objects, and the verbal designation of them, as a species or genus. In short, it is that general relative suggestion, or general notion of resemblance, on which we must admit our classifications to be founded, or contend that they are founded upon nothing.

Since all reasoning implies some generalization, the Nominalist, who allows nothing general but terms, is, of course, led, or forced, by his theory, to deny the possibility of reasoning of any kind without the aid of general terms; a denial which seems to me one of the boldest, because the least consistent with the observed facts, which it is possible either for dogmatism or scepticism to make; as if the infant, long before he can be supposed to have acquired any knowledge of terms, did not form his little reasonings on the subjects, on which it is important for him to reason, as accurately probably as afterwards; but, at least, with all the accuracy which is necessary for preserving his existence, and gratifying his few feeble desires. He has, indeed, even then, gone through processes which are admitted to involve the finest reasoning, by those very philosophers who deny him to be capable of reasoning at all. He has already calculated distances, long before he knew the use of a single word expressive of distance, and accommodated his induction to those general laws of matter, of which he knows nothing but the simple facts, and his expectation that what has afforded him either pain or pleasure will continue to afford him pain or pleasure. What language does the infant require, to prevent him from putting his finger twice in the flame of that candle which has burned him once? or to persuade him to stretch his hand, in exact conformity with the laws of optics, to that very point at which some bright trinket is glittering on his delighted eyes? To suppose that we cannot reason without language, seems to me, indeed, almost to involve the same inconsistency, as to say, that man is incapable of moving his limbs till he have previously walked a mile.

The use of general terms is not to enable man to reason, but to enable him to reason well. They fix the steps of our progress;

U 2

* Smith's *Considerations concerning the First Formation of Languages*, from the beginning.

they give us the power of availing ourselves, with confidence, of our own past reasonings, and of the reasonings of others; they do not absolutely prevent us from wandering, but they prevent us from wandering very far, and are marks of direction to which we can return: without them we should be like travellers journeying on an immense plain, without a track, and without any points on the sky to determine whether we were continuing to move east or west, or north or south. We should still be moving, indeed, and each step would be a progress, if it were compared merely with the step that went before. But there could be no long journey onwards; and, after years of wandering, we might, perhaps, return to the very spot from which we set out, without even so much knowledge as to have the slightest guess that we were again where we had been before.

To drop this allegory, however, it is very evident that, though we should be capable of reasoning even without language of any sort, and of reasoning sufficient to protect ourselves from obvious and familiar causes of injury, our reasonings, in such circumstances, must be very limited, and as little comparable to the reasoning of him who enjoys the advantage of all the new distinctions of a refined language, as the creeping of the diminutive insect to the soaring of the eagle. Both animals, indeed, are capable of advancing; but the one passes from cloud to cloud almost with the rapidity of the lightning, which is afterwards to flash from them, and the other takes half a day to move over the few shrunk fibres of a withered leaf.

What must be the arithmetic of that people in South America of whom Condamine tells us, whose whole numeration did not extend beyond three, and who had no resource afterwards but to point first to their fingers and then to their hair! What the reasonings of arithmetic would be to such a people every other species of reasoning would be to us, if our general vocabulary bore no greater proportion to the feelings that were to be expressed by it, than this very limited numeral vocabulary, to all the possible combinations of numbers!

The extent of error into which we should be likely to fall, in our classifications and reasonings in general, if our language were of this very imperfect kind, it is, of course, impossible for us, in our present circumstances, to guess; though we may derive some assistance, in our estimation of these possible absurdities, from facts of which voyagers occasionally tell us. I may take, for an example, a fact mentioned by Captain Cook, in describing the people of Wateoo, a small island on which he lighted in his voyage from New Zealand to the Friendly Islands. "The inhabitants," he says, "were

afraid to come near our cows and horses, nor did they form the least conception of their nature. But the sheep and goats did not surpass the limits of their ideas; for they gave us to understand that they knew them to be birds." "It will appear rather incredible," he adds, "that human ignorance could ever make so strange a mistake, there not being the most distant similitude between a sheep or goat and any winged animal. But these people seemed to know nothing of the existence of any other land animals besides hogs, dogs, and birds. Our sheep and goats, they could see, were very different creatures from the two first; and, therefore, they inferred that they must belong to the latter class, in which they knew that there is a considerable variety of species." "I would add," says Mr. Stewart, who quotes this very striking fact, together with the judicious remark of Cook,—"I would add, that the mistake of these islanders perhaps did not arise from their considering a sheep or goat as bearing a more striking resemblance to a bird than to the two classes of quadrupeds with which they were acquainted, but from the want of a generic word, such as quadruped, comprehending these two species; which men in their situation would no more be led to form, than a person who had seen only one individual of each species would think of an appellative to express both, instead of applying a proper name to each. In consequence of the variety of birds, it appears that they had a generic name comprehending all of them, to which it was not unnatural for them to refer any new animal they met with."*

The observation of Mr. Stewart with respect to the influence of a generic name on this seemingly very strange arrangement of these very rude zoologists, is ingenious and just. It must be remembered, however, in opposition to his general doctrine on the subject, that the application of the generic term, even in this very strange manner, is a proof, not that we are without general notions, but that we truly have general notions that are independent of the mere terms which express them. It was not merely because they had a generic term that they extended this term to the unknown sheep and goats, but because the sheep and goats coincided, in some measure, with the general notion expressed by the general term. Of this the most striking evidence is contained in the very statement of Captain Cook. The cows and horses, sheep and goats, were all equally unknown to the islanders. Why, then, did they not class the cows and horses with birds as much as the goats and sheep? As far as the mere possession of a generic word

* Stewart's Elements, Part II. c. iv. sect. 1.

could have led to this application—if a word alone were necessary—it was common to all the new cases alike. When all these were equally unknown, there must have been some previous general notion of certain circumstances of resemblance in birds, with which the goats and sheep coincided more exactly than the cows and horses. Nor is it very difficult to guess what this previous notion was: The bulk of the different animals must have led to the distinction. The winged tribes with which they were acquainted, though they might perhaps approach, in some slight degree, to the stature of the smaller quadrupeds, could have no resemblance in this respect to the horses and cows. A bird, in their mental definition of it, was certainly a living thing, of certain various sizes familiar to them, and not a dog or a hog. A sheep or a goat was seen by them to be a living thing, not a dog nor a hog, and of a size that implied no remarkable opposition to that involved in their silent mental definition of a bird. In such circumstances, it was classed by them as a bird, with as much accuracy as is to be found in many of our systematic references, even in the present improved state of science and natural history,—in that, for example, which classes and ranks, under one word, the whale that swims with the man that walks; or, to use a case still more analogous, even the ant that creeps with the gnat that flies,—and, with equal accuracy, they excluded the cows and horses that did not coincide with the general notion, of which a certain resemblance of size formed an essential part. The extension of the term to the one set of quadrupeds, and the exclusion of the other set, must have had some reason; and this reason, whatever it may have been, must have been some general feeling of resemblance of some sort,—a relative suggestion, intervening between the perception of the animals and the application of the term.

LECTURE XLVIII.

ANALYSIS OF THE PROCESS OF REASONING.

GENTLEMEN, my last Lecture brought to a conclusion the remarks which I had to offer on that very interesting tribe of our suggestions of relation which constitute the feelings of resemblance,—a tribe, on the existence of which, as we have seen, all classification depends, and in a great measure the whole power of language, as an instrument or medium either of distinct thought in the mind of the individual, or of reciprocal communication of thought from mind to mind.

The examination of this species of relation

led us into one of the most memorable controversies in the whole science of Intellectual Philosophy; and though I knew well that there could be no reason to fear your adoption of the absurdities of Realism, and, therefore, did not think it necessary to occupy your time with any serious confutation of that obsolete hypothesis, I knew also too well the prevailing influence of the opposite error of Nominalism, and the high authorities which sanction it, not to think it necessary to put you fully on your guard against the fallacy of this system, by showing you how incomplete it is, and, therefore, how unfit to be adopted as a narrative of the actual Process of Generalization.

This process I described, as involving, not two stages only, as the Nominalists contend, but three. In the first place, the perception or conception of the two or more external objects, or the conception of the two or more internal feelings that are afterwards classed together; in the second place, the feeling or general relative notion of the resemblance, which these separate objects bear to each other, in certain respects, the relative suggestion, in consequence of which alone we are led to class them together; in the third place, the expression of this felt general resemblance, by a general term, as significant of that silent mental generalization which has already classed them together. The mental generalizing may, indeed, be considered as complete, before the invention of the general term; the term being of use, only as fixing and recording, or conveying to others the knowledge of that general notion or feeling of resemblance which preceded the first use of the general word.

At the same time, however, that I exhibited to you,—as simply and forcibly as the complex nature of the process would allow me,—the doctrine of general notions, as distinct mental affections of a peculiar species, arising from that susceptibility of the mind by which we perceive, together with various other relations, the relations that constitute the resemblances of objects,—I took occasion to point out to you some errors of thought, and consequent improprieties of arrangement and expression, on the part of the Conceptualists, which I regarded as having had the chief effect in preventing the universal and ready adoption of this doctrine of the threefold nature of the process, as consisting in perceptions, relations, and verbal signs,—a doctrine, which, but for the almost universal prevalence of the opposite system of Nominalism, would have appeared to me to stand little in need of any argument in its support; since the fact of the extension of general terms only to certain objects, to the exclusion of others, seems, of itself, sufficiently to show, that there is a certain general notion of resemblance,—a pe-

cular state of mind,—intervening between the primary perceptions, and the use of the general term, which forms, as it were, the measure of adjustment of the particular objects,—that are arranged in the same class, if they agree with this general notion, and excluded, if they do not agree with it. An arrangement, without some principle of resemblance to direct the order in which objects are placed, seems to me absolutely unworthy of the name of an arrangement, and certainly could be but of very little aid to the memory,—even if it could be of any advantage to remember divisions, and subdivisions, that were founded upon nothing. The classifications, which our dictionaries form, according to the mere initial sounds of words,—which Dr. Reid, in reference to works of this kind, calls a sort of modern categories,—would be far more philosophic, than a classification which implied no previous notion of resemblance whatever. “Of all methods of arrangement,” he says, “the most antiphilosophical seems to be the invention of this age;—I mean the arranging the arts and sciences by the letters of the alphabet, in Dictionaries and Encyclopædias. With these authors the categories are A, B, C,” &c. Yet these literal categories, antiphilosophical as they certainly would be, if their authors professed to give them as a scientific arrangement, still involve a resemblance of some sort, however insignificant and irrelative to the great purposes of science. Every other arrangement in science would be still more unphilosophical, because involving no relation whatever, if, according to the principles of the Nominalist, there were no general notions,—no relative feelings of resemblance,—independent of the terms of classification; but objects were first classed together, without any reason for being so classed together, more than any other objects, till the mere general term of the classification became a reason for itself; as if birds, beasts, and fishes, were not called animals, because they were previously felt to agree in certain respects, but were felt to have this relation of agreement in certain respects, because they had previously been comprehended in the one generic term *animal*.

With respect to the origin of the general terms themselves,—as distinct from the general relative feelings which they express,—I stated to you a speculation of Condillac and Dr. Smith, which appears to me to be one of the most simple and beautiful speculations in the theoretical history of language. In ascribing it to these distinguished philosophers, however, I speak of it only as it is clearly developed by them; for there are many hints of the same opinion to be found in works of an earlier date. The speculation to which I allude, is that which sup-

poses the proper names of individual objects to have become appellatives of a whole class, by extension from similar objects to similar—the principle, which could not fail to operate in this way, being a principle which still continues to operate even in the common phraseology of the most common minds,—though, by rhetoricians, whose art is, in a great measure, the art of making common things mysterious, it has been advanced to the dignity of a figure of speech.

The brief expression or result of the feeling of resemblance is a general term,—but when all which we feel, in our relative suggestions of resemblance, or in any other of our relative suggestions, is enunciated in language, it is termed a proposition, which, notwithstanding the air of mystery that invests it in our books of logic, is the expression of this common feeling of relation, and nothing more. The word *animal*, for example, is a general term, expressive of a particular relation of resemblance that is felt by us. A horse is an animal, is a proposition, which is merely a brief expression of this felt resemblance of a horse to various other creatures included by us in the general term. It is the same in all the other species of relations which we are capable of feeling. In the relation of position, for example, when we say that the planet Mercury is that which is next to the sun, our mere feeling of the local relation,—that particular relative suggestion which arises on the consideration of the sun, together with its planetary attendants,—by this expression of it in words, becomes, what is termed in logic, a proposition. In the relative suggestion of degree, to say that gold is heavier than copper;—in the relative suggestion of proportion, to say, that four are to twenty, as twenty to a hundred;—in the relative suggestion of comprehension, to say, that there is a portion of heat even in the coldest snow, is to state, as a proposition, what, in the mind itself, is the mere feeling of a certain relation. In all such cases, it is very evident that the verbal statement of the proposition does not alter the nature of the relative suggestion, or feeling of relation, which it expresses, but simply expresses to others a relation that must have been felt, before the proposition could be framed,—that it is not the word *animal*, for example, which produces the feeling of the general resemblance of those various beings which we have classed together under that term,—nor the word *heavier*, which makes us feel the greater pressure of a piece of gold, than of an equal bulk of copper,—but those feelings, previously existing, which have led to the verbal proposition that expresses to others those previous feelings. To insist on a distinction so obvious, seems to me, indeed, almost as if I were labouring to prove what it would be impossible for any one to deny.

But if you reflect on the influence of the doctrine of the Nominalists, with respect to general terms, as constituting all that can be said to be general in reasoning, you will perceive how necessary it is, that you should be fully impressed with the priority of the relative feeling involved in each proposition, to the proposition which expresses it,—and its consequent independence of those forms of language which render it capable of being communicated to other minds, but do not alter its nature, as a feeling of that particular mind in which it has previously arisen.

The proposition being only an expression of a relation of some kind or other, which has been previously felt, may, of course, be as various as the species of relative suggestions of which our minds are susceptible. There may be, as we have seen, propositions of resemblance, of order, of degree, of proportion, of comprehension; to which last class, indeed—that class which includes all the relations of a whole to its parts—the others, as I have already remarked, may, by a little effort of subtilty, be reduced; since every affirmative proposition enunciates or predicates—to use the technical word—some quality or attribute of a subject, which may be said to form a part of the very essence of the subject itself, or, at least, of our complex notion of the subject. The one quality, of which we speak, is comprehended with other qualities in that general aggregate to which we state it to belong.

On this class of our relative suggestions, therefore,—that which involves the feeling of the relation of the parts comprehended to the comprehending whole,—it will be necessary to bestow a little fuller illustration, that you may understand clearly the nature of the process of reasoning,—that most important of all our mental processes—which logicians and metaphysicians have contrived to render so obscure, but which is in itself nothing more than a series of felt relations of this particular class in the instances which I selected before, of a house and its apartments; a tree and its stems and foliage; a horse, and its head, and limbs, and trunk. The relation which I have termed the relation of comprehension, or comprehensiveness, is so very obvious, that a mere allusion to it is sufficient, without any commentary. In these cases, the parts, which together form the whole, are truly substances that admit of being separated, and can as easily be conceived to exist separately as together.

But substances are not conceived by us, only as composed of certain elementary substances, which constitute them, by their mere juxtaposition, in apparent contiguity, and which may exist apart, after division. They are also conceived by us, as subjects of qualities, which coexist in them, and which cannot exist apart, or, in other words—for

the qualities of substances, as perceived by us, are nothing more—they are capable of affecting us as sentient beings, directly or indirectly, in various ways. A flake of snow, for example, is composed of particles of snow, which may exist separately; and this composition of separate particles in seeming coherence is one species of totality; but the same snow, without any integral division, may be considered by us as possessing various qualities, that is to say, is capable of affecting us variously. It is cold, that is to say, it excites in us a sensation of chilliness;—it is white, that is to say, it produces in our mind a peculiar sensation of vision, by the light which it reflects to us;—it has weight—is of a certain crystalline regularity of figure—is soft or hard, according as it is more or less compressed—liquefiable at a very low temperature—and my conception of snow is of that permanent subject which affects my senses in these various ways. The conglomerated flakes in a snow-ball are not more distinctly parts of the mass itself, which we consider, than the coldness, whiteness, gravity, regular form, softness or hardness, and ready fusibility, are felt to be parts of our complex notion of snow, as a substance.

When I think of cases, in which the relation is of a substance to parts that are themselves substances—as when I say, that a room is a part of a house, or that a tree has branches—it is quite evident that in these very simple propositions I merely state the relation of parts to a comprehending whole. But is the statement at all different in kind, when I speak, in the common forms of a proposition, of the qualities of objects, when I say, for example, that snow is white, man capable of reasoning, the wisest of mankind still fallible? Do I not merely state one of the many qualities, comprehended in that totality of qualities, which constitutes the subject as known to me? I do not indeed divide a mass into integral parts, but I divide a complex notion into its parts, or at least separate from that complexity a quality which I feel to belong, and state to belong, to that whole complex notion from which I have detached it. It is as it were a little analysis and synthesis. I decompose, and, in expressing verbally to others the mental decomposition which I have made, I combine again the separated elements of my thought—not, indeed, in the same manner, for the analytic process is as different as matter is from mind—but with the same feeling of agreement or identity which rises in the mind of a chemist when he has reduced to one mass the very elements into which he had previously transmuted the mass, by some one of the analyses of his wonderful art.

What, then, is reasoning—which is no-

thing more than a number of propositions, though of propositions consecutive in a certain order—but a continued series of analytic operations of this kind, developing the elements of our thought? In every proposition, that which is affirmed is a part of that of which it is affirmed, and the proposition, however technical its language may be, expresses only the single feeling of this relation. When I say snow is white, I state one of the many feelings which constitute my complex notion of snow. When I say man is fallible, I state one of the many imperfections which, as conceived by me, together with many better qualities, constitute my complex notion of man. These statements of one particular relation are simple propositions, in each of which a certain analysis is involved. But, when I reason, or add proposition to proposition in a certain series, I merely prosecute my analysis, and prosecute it more or less minutely, according to the length of the ratiocination. When I say man is fallible, I state a quality involved in the nature of man, as any other part of an aggregate is involved in any other comprehending whole. When I add, he may therefore err, even when he thinks himself least exposed to error, I state what is involved in the notion of his fallibility. When I say, he therefore must not expect that all men will think as he does, even on points which appear to him to have no obscurity, I state that which is involved in the possibility of his and their erring even on such points. When I say, that he therefore should not dare to punish those who merely differ from him, and who may be right even in differing from him, I state what is involved in the absurdity of the expectation that all men should think as he does. And when I say, that any particular legislative act of intolerance is as unjust as it is absurd, I state only what is involved in the impropriety of attempting to punish those who have no other guilt than that of differing in opinion from others, who are confessedly of a nature as fallible as their own.

In all this reasoning, though composed of many propositions, there is obviously only a progressive analysis, with a feeling, at each step, of the relation of parts to the whole, the predicate of each proposition being the subject of a new analysis in the proposition which follows it. Man is fallible. He who is fallible may err, even when he thinks himself least exposed to error. He who may be in error, even when he thinks himself safest from it, ought not to be astonished that others should think differently from him, even on points which may seem to him perfectly clear; and thus, successively, through the whole ratiocination, the predicate becomes in its turn a subject of new analysis, till we arrive at the last proposition, which

is immediately extended backwards to the primary subject of analysis, man,—as involved in that which is itself involved in that primary complex conception, or aggregate of many qualities. There are minds, perhaps, which, merely by considering man, and opinion, and punishment, would discover, without an intervening proposition, that fallible man ought not to set himself up in judgment as a punisher of the speculative errors of fallible man; there are others, perhaps, who might not perceive the conclusion, without the whole series of propositions enumerated, though the conclusion is involved, as an element, in the first proposition,—man is fallible; and according as the particular intellect is more or less acute, more or fewer of the intervening propositions will be necessary.

In every such case of continued intellectual analysis, it is impossible for us not to feel when we have arrived at the conclusion, that the last proposition is as truly contained in the first as any of the intervening propositions, though it is not seen by us, till exhibited, as it were, in its elementary state, by the repetition of analysis after analysis. It is, in this respect, precisely like the decompositions of chemical analysis, which are constantly showing us something new, in the very substances which we carry about with us, or in those which are every moment before our eyes. The air, for example, after being long considered as simple, in the sense in which chemists use that term, is afterwards shown to be composed of different gaseous fluids; nor are even these regarded as simple, but each is believed to be composed of a certain base and the matter of heat; and it is impossible to predict, or even to guess, what future analyses may be made even of these elements. Yet the atmosphere, now considered as compound, is, in kind, the same air which was continually flowing around the earth before this analysis; and, in the mere animal function of respiration, all mankind had, from the first moment of their infant breath, been incessantly employed in separating, into its constituent parts, the very substance which they considered as incapable of division. The last chemist, whose labours, when this scene of earthly things is to perish, are to close the long toils of his predecessors, will perhaps regard scarcely a single substance in nature in the same light in which we now regard it; and yet it is evident that the same terrestrial objects, which now meet our eyes, must continually have been present to his sight;—the same seasons presenting the same herbage and flowers and fruits to the same races of animals,—to which, indeed, he may have given different names, or may have detected in them new elements, or proportions of elements, but of which all his

arrangements and analyses are incapable of altering the nature.

In the truths of reasoning, which a profound and penetrating genius is able in like manner to exhibit to us, we perceive a similar analysis, which presents to us, as it were, the elements of our own former conceptions; since the very reasoning, if it be at all intelligible, must begin with some conception already familiar to us in which it asserts something to be contained, and proceeds only by tracing similar relations. A new truth, of this kind, is not so much added to us, therefore, as evolved from the primary truth already familiar; it is not as if new objects were presented to us, to be seen, but as if our intellectual senses—if I may venture to use that expression—were quickened and rendered more acute, so as to perceive clearly what we saw dimly, or not even dimly before, though we might have seen it as now, if we had not been too dull of vision to perceive what was in our very hands. The truths, at which we arrive, by repeated intellectual analysis, may be said to resemble the premature plant, which is to be found inclosed in that which is itself inclosed in the bulb or seed which we dissect. We must carry on our dissection, more and more minutely, to arrive at each new germ; but we do arrive at one after the other, and when our dissection is obliged to stop, we have reason to suppose, that still finer instruments, and still finer eyes, might prosecute the discovery almost to infinity. It is the same in the discovery of the truths of reasoning. The stage at which one inquirer stops, is not the limit of analysis, in reference to the object, but the limit of the analytic power of the individual. Inquirer after inquirer discovers truths which were involved in truths formerly admitted by us, without our being able to perceive what was comprehended in our admission. It is not absolutely absurd to suppose, that whole sciences may be contained in propositions that now seem to us so simple as scarcely to be susceptible of further analysis, but which hereafter, when developed by some more penetrating genius, may, without any change, in external nature, present to man a new field of wonder and of power. Of the possibility of this, the mathematical sciences furnish a most striking example. The rudest peasant may be said to have in his mind all, or nearly all, those primary notions, of which the sublimest demonstrations of the relations of number and quantity are the mere development. He would be astonished, indeed, if he could be made to understand, that on notions, which appear to him of so very trifling import, have been founded some of the proudest monuments of the intellectual achievements of man, and that, among the names to which his country and the world look with the

highest veneration, are the names of those whose life has been occupied in little more than in tracing all the forms of which those few conceptions, which exist in his mind as much as in theirs, are susceptible. What geometry and arithmetic are to his rude notions of numbers, and magnitudes, and proportions, some other sciences unknown to us, indeed, at present, but not more unknown to us than geometry and arithmetic are now to him, may be, in relation to conceptions which exist, and perhaps have long existed in our mind, but which we have not yet evolved into any of their important elements. As man is quicker or slower in this internal analysis, the progress of all that philosophy which depends on mere reasoning is more or less rapid. There may be races of beings, or at least we can conceive races of beings whose senses would enable them to perceive the ultimate embryo plant, inclosed in its innumerable series of preceding germs; and there may, perhaps, be created powers of some high order, as we know that there is one Eternal Power, able to feel, in a single comprehensive thought, all those truths, of which the generations of mankind are able, by successive analyses, to discover only a few, that are, perhaps, to the great truths which they contain, only as the flower which is blossoming before us is to that infinity of future blossoms enveloped in it, with which, in ever renovated beauty, it is to adorn the summers of other ages.

"Lo! on each seed, within its slender rind,
Life's golden threads in endless circles wind;
Maze within maze the lucid webs are roll'd,
And, as they burst, the living flame unfold.
The pulpy acorn, ere it swells, contains
The oak's vast branches in its milky veins,
Each ravel'd bud, fine film, and fibre-line,
Traced with nice pencil on the small design,
The young Narcissus, in its bud compress'd,
Cradles a second nestling on its breast,
In whose fine arms a younger embryo lies,
Folds its thin leaves, and shuts its floret-eyes;
Grain within grain successive harvests dwell,
And boundless forests slumber in a shell."*

Such, too, perhaps, are the boundless truths that may be slumbering in a single comprehensive relation at present felt by us. The evolutions of thought, however, in our processes of reasoning, though in one respect they may be said to resemble the evolution of organic germs, have this noble distinction, that, if their progress be unobstructed, the progress itself is constant improvement. We have no reason to believe that the earth, after the longest succession of the ages during which it is to exist, will, at least without some new exertion of the power of its Creator, exhibit any races of organized beings different from those which it now pours out on its surface, or supports and feeds. But, when thought rises from thought,

* Darwin's Botanic Garden, Canto IV. v. 381—394.

in intellectual evolution, the thought which rises is not a mere copy of the thought from which it rose, but a truth which was before unknown and unsuspected, that may be added to the increasing stores of human wisdom, and which, in addition to its own importance, is the presage, and almost the promise, of other truths which it is to evolve in like manner.

Every truth, indeed, at which we arrive in our reasoning, becomes thus far more than doubly valuable, for the field of fresh discoveries to which it may be opening a track,—the facility of new analyses, after each preceding analysis, increasing, as this great field opens more and more on our view, with a wider range of objects,—stimulating at once, and justifying the hopes, which, in the language of Akenside,

"urge us on,
With unremitted labour, to pursue
Those sacred stores, that wait the ripening soul,
In Truth's exhaustless bosom."*

If the profoundest reasonings, then, as we have seen, be nothing more than a continued analysis of our thought, stating at every step what is contained in conceptions that previously existed as complex feelings of our mind, it may, on first reflection, seem extraordinary, when we consider the important truths which have been thus afforded to us, that we should have been able previously to form opinions, which involve these important truths afterwards detected in them, without having at the time the slightest knowledge, or even the slightest suspicion, that any such truths were contained in the general notions and general phraseology which we formed. But the reason of this is sufficiently obvious, when we attend to the nature and order of the process of generalization, the results of which are the subjects of this consecutive analysis. If, indeed, we had advanced, in regular progress, from the less to the more general, from individuals to species, from species to genera, and thus gradually upward, since we should then have known previously the minute specific circumstances involved in the higher orders and classes to which we had gradually ascended, it might have been absurd to suppose that these specific circumstances, previously known, could be discovered to us by analysis. The mode in which we generalize, is, however, very different. In our systematic tables, indeed, if we were to judge from these only, we might seem to have a regular advance from individuals to classes, through species, genera, orders. But, in the actual process of generalizing, we form classes and orders before we distinguish the minuter varieties. We are struck first with some resemblance of a multitude of objects, perhaps a very remote one, in consequence

of which we class them together, and we attend afterwards to the differences which distinguish them, separating them into genera and species according to these differences. Every general term which we use, must express, indeed, an agreement of some sort, that has led us to invent and apply the term; but we may feel one resemblance, without feeling, or even suspecting other resemblances as real,—and the very circumstance of agreement which we perceive, at the time when we class objects together as related, may involve, or comprehend, certain circumstances to which we then paid no attention, and which occur to us only in that intellectual analysis of ratiocination of which I spoke. It is as if we knew the situation and bearings of all the great cities in Europe, and could lay down, with most accurate precision, their longitude and latitude. To know this much, is to know that a certain space must intervene between them, but it is not to know what that space contains. The process of reasoning, in the discoveries which it gives, is like that topographic inquiry which slowly fills up the intervals of our map, placing here a forest, there a long extent of plains, and beyond them a still longer range of mountains, till we see, at last, innumerable objects connected with each other, in that space which before presented to us only a few points of mutual bearing. The extent of space, indeed, is still precisely the same, and Paris, Vienna, and London, are to each other what they were before. The only difference is, that we know what is contained, or a part, at least, of what is contained, in the long lines that connect them.

The reasoning which proceeds from the complex to the less complex, detecting, at each stage, some unsuspected element of our thought, may be termed strictly *analytical reasoning*,—the relation involved in each separate proposition of the series, being simply, as we have seen, the relation of parts to the whole. It is exactly the same relation, however, which is felt in reasonings that seem to proceed in an opposite way, exhibiting to us, not the whole first, and then some element of that whole, but first the elements, and then the whole which they compose. When we say, five and eight added together make thirteen, and when we say thirteen may be divided into eight and five, we express equally the comprehension of eight and five in thirteen, which is all that is felt by us in that particular proposition. Every synthesis, therefore, as much as its corresponding analysis, since one relation alone is developed at every step, implies the same elementary consideration of a whole and its parts,—the difference being merely in the order of the propositions, not in the nature of the feeling of relation involved in any one of the separate propositions.

* Pleasures of Imagination, B. L. v. 211—214.

To this relation of comprehension, or the relation of a whole and its parts, I have said, the other relations of coexistence, in all the propositions which express them, might, in strictness of analysis, be reduced,—even that relation of proportion which is of such importance in the reasonings of geometry and arithmetic;—so that every species of reasoning would be, in the strictest sense of the word, analytical, evolving only qualities essential to the very nature of the subjects of the different proportions. When, therefore, in developing one of the relations of proportion, I say, four are to five as sixteen to twenty, I state a relation of the number four, which may be regarded as comprehended in my notion of that number, as any other quality is comprehended in any other subject.

It is one of the many properties of the number four, that when considered together with those other numbers, five, sixteen, twenty, it impresses us with a feeling of the relation of proportion, a feeling that its proportion to five is the same as the proportion of sixteen to twenty; and it is a property, which, as soon as the relation is felt by us, it is impossible for us not to regard as essential to the number four,—as when we discover any new quality of a material substance, it is impossible for us not to add this quality, as another part, to our previous complex notion of the substance. We cannot, indeed, perceive this property of the number four till we have considered it at the same time with the other numbers. But, as little can we know the physical qualities which form parts of our complex notion of any substance, till we have considered the substance together with other substances. For example, who could have predicted, on the mere sight of an alkaline solution, that, if mixed with oil, it would convert the oil into a soap, or, if added to a vegetable infusion, would change the colour of the infusion to green? We must have observed these mixtures, or at least have read or heard of the effects, before we could regard the changes as effects of the presence of the alkali,—that is to say, before we could include, in our complex notion of the alkali, as a substance, the qualities of forming soap with oils and of giving a peculiar tinge to vegetable infusions. But, having seen, or read, or heard of these effects, we feel that now, in our complex notion of the alkali, is included, as a part in its comprehending whole, the conception of these particular qualities. In like manner, the affinity of one metal to another with which it admits of amalgamation, may be said to form a part of our complex notion of the metal; and it is the same with every other substance, the various properties of which, as soon as these properties are discovered by us, so as to admit of being stated to others, seem to us to be truly

included in the notion of the substance itself, though before they could be so included various other substances must have been considered at the same time. When, therefore, I say four are to five as sixteen to twenty, I state truly a property included in the number four,—the property, by which it affects us with a certain feeling of relation when considered together with certain other numbers,—though, for discovering the property originally, and for feeling it afterwards, it was necessary that the other numbers should be considered together with it; as, when I state that mercury admits of being amalgamated with other metals, I state a property included in my complex notion of mercury, though, for originally discovering the property, and for feeling it afterwards, I must have considered the mercury together with the other metals with which I state its readiness of entering into chemical union. When I consider the same number four together with other numbers, I discover various other relations, as when I endeavour to form new combinations of mercury, or of other chemical substances, I discover new relations, which I add to my complex notions of the substances themselves. As my original conception of mercury becomes more complex by all the new relations which I trace, so my original conception of the number four, which seemed at first a very simple one, becomes gradually more complex by the detection of the various relations of proportion, which are truly comprehended in it as a subject of our thought,—as every new relation which I discover in a chemical substance is comprehended in my widening conception of the substance itself,—and the arithmetical or geometrical proportion, like the chemical quality, may thus strictly be reduced to the general class of the relations of comprehension.

In this way, every new proportion which is traced out, in a long series of such arithmetical or geometrical propositions, may be considered as the result of a mere analysis, by which elements existing before, but unsuspected, are evolved, as in the other species of reasoning more obviously analytic. It is evident, indeed, that the statement of any property inherent in any subject, must, in rigid accuracy of arrangement, be analytical. But, without insisting on so subtle a process, it may be easier at least, though it should not be more accurate, to regard our reasonings of this kind in the same manner as we formerly regarded our feelings of the simple relation of proportion, involved in each proposition of the reasoning, as forming a class apart; the reasonings we may call, in distinction from our more obvious analytic reasonings, *proportional reasonings*, as we termed the simple relative suggestions which they involve, relations of proportion.

Whatever be the species of reasoning, however, it is necessary that the propositions which form the reasoning should follow each other in a certain order; for, without this order, though each proposition might involve some little analysis, and consequently some little accession of knowledge, the knowledge thus acquired must be very limited. There could be no deduction of remote conclusions, by which the primary subject of a distant proposition might be shown, through a long succession of analyses, to have properties which required all these various evolutions before they could themselves be evolved to view. In the proportional reasonings of geometry, we know well that the omission of a single proposition, or even a change of its place, might render apparently false, and almost inconceivable by us, a conclusion which, but for such omission or change of place of a few words of the demonstration, we should have adopted instantly, with a feeling of the absolute impossibility of resisting its evidence.

How is it then, that, when order is so essential to discovery, the propositions which we form in our own silent reasoning, arrange themselves, as they rise in succession, in this necessary order; and what are we to think of that art, which, for so many ages, was held out, not so much as an auxiliary to reason, as with the still higher praise of being an instrument that might almost supply its place, by the possession of which the acute and accurate might argue still more acutely and accurately, and imbecility itself become a champion worthy of encountering them; and though not perhaps the victor, at least not always the vanquished?

But to these subjects I must not proceed till my next Lecture.

LECTURE XLIX.

THE ORDER OF THE PROPOSITIONS IN A RATIOCINATION IS NOT OWING TO ANY SAGACITY—IS WHOLLY INDEPENDENT OF OUR WILL—AND TRULY DEPENDS ON THE NATURAL ORDER OF SUGGESTION.—DIVERSITY IN OPINION AMONG MANKIND UNAVOIDABLE FROM THE VARIETY IN THEIR TRAINS OF SUGGESTION.—WHAT LOCKE TERMS SAGACITY, MAY BE, IN PART, PRODUCED INDIRECTLY.—DIFFERENCE BETWEEN THE TRAINS OF THOUGHT THAT ARISE IN MEDITATION AND THOSE SUBMITTED TO THE PUBLIC EYE IN A TREATISE.—THERE IS A RATIONAL LOGIC.—ANALYSIS OF THE SCHOLASTIC LOGIC.

GENTLEMEN, after considering and classing our feelings of relation,—as they arise,

in any particular case, from the simple perception or conception of two or more objects,—I proceeded, in my last Lecture, to consider them as they arise in those series which are denominated reasoning—series that correspond, of course, with the division which we have made of the species of relations involved in the separate propositions that compose them; but of which the most important are those which I termed analytical, as involving in every stage the consideration of a whole and its parts, or those which I termed proportional, as involving some common relation of intellectual measurement. To the former of these orders, indeed, the analytical—the others might, as I stated to you, and endeavoured to prove, admit of being reduced; but as the process which reduces them all to this one great order might seem too subtle, and could afford no additional advantage in our inquiry, I conceived it more advisable, upon the whole, to retain our original division.

Every reasoning is a series of propositions; but every series of propositions is not reasoning, however just the separate propositions may be. The half of eighteen is equal to the cube of three—man is liable to error—marble is a carbonate of lime—these propositions following each other, lead to no conclusion different from those which each separately implies and expresses. To constitute reasoning, it is necessary that there should be some mutual relation of the subjects and predicates of the different propositions. The order in which the different propositions arrange themselves, so as to present to us this mutual relation of the successive subjects and predicates, is therefore of the utmost importance to our consecutive analyses, in the reasonings that are strictly analytic, and to our consecutive measurements in the reasonings which I have termed proportional.

On what does this order depend?

Let us suppose, for example, that A is equal to D,—that we are ignorant of this exact relation,—that we wish to estimate it precisely,—that we have no mode of considering them together, but that, without knowing the relation of equality of A to D, we know the relation which these bear to some other objects which may be termed intermediate—that, for example, we know A to be equal to B, which we know to be equal to the half of C, and that C is known by us to be the double of D. If the proportional relative A is equal to B, which is the half of C, which is the double of D, follow each other in our mind in this order, it will be absolutely impossible for us to doubt that A is exactly equal to D, since it is equal to that which is the half of the double of D. But, if any one of these relations of the intermediate objects do not arise in our mind, whether it be the

relation of A to B, of B to C, of C to D, the relation of equality of A to D, which is instantly and irresistibly felt by us, after the former series, will not be felt, though the series should be exactly the same in every respect, with the exception of this single proposition omitted in it. It is not enough that we may have formerly observed and measured B and C, and known their relation to D, unless B occur to us while A is in our thought; and we might thus have all the knowledge which is necessary for discovering the proportional relation of A and D, without the slightest knowledge of the proportion, or even the slightest possibility of knowing it, unless our thoughts should arrange themselves in a certain order. It is quite essential to our demonstration that B and C should arise at certain times; and they do arise at certain times. How is it that this happens?

The common opinion on the subject makes this order a very easy matter. We have a certain sagacity, it is said, by which we find out the intervening propositions that are so, and they are arranged in this order because we have discovered them to be suitable for our measurement, and put them in their proper place. "Those intervening ideas, which serve to show the agreement of any two others," says Locke, "are called proofs. A quickness in the mind to find out these intermediate ideas (that shall discover the agreement or disagreement of any other), and to apply them rightly, is, I suppose, that which is called sagacity."* And reason itself, in another part of his work, he defines to be "the faculty which finds out these means, and rightly applies them."† I need not quote to you the common expressions to the same purport which are to be found in other writers.

That, in some minds, these intervening conceptions, on which demonstration depends, do arise more readily than in others, there can be no question; and it is by a very natural and obvious metaphor, that minds, able to detect those secret relations, which are not perceived by others, to whom the same intervening conceptions have not arisen, —or have arisen without suggesting the same feeling of common relation, are said to have peculiar sagacity. But it is a metaphor only, and is far from solving the difficulty. The question still remains, what that process truly is which the word sagacity is borrowed to denote, —whether the intermediate conceptions, that arise more readily in certain minds than in others, arise in consequence of any skill in discovering them, or any voluntary effort in producing them, or

whether they do not arise in consequence of laws of suggestion that are independent alike of our skill and of any efforts which that skill might direct? A and D are before us, and have a relation which is at present unknown, but a relation which would be evolved to us, if B and C were to arise to our mind. Do they then arise at our bidding? Or do they arise without being subject to our command, and without obeying it?

After the remarks which I made, in reference to intellectual phenomena, in some degree analogous, I trust that you are able, of yourselves, to decide this question, by the argument which I used on the occasions to which I refer. The mind, it can scarcely fail to occur to you, cannot will the conception of B or C, however essential they may be to our reasoning; since to will them, —at least if we know what we will, which is surely essential to volition, —implies the existence of the very conceptions which we are said to will, as states of the mind present and prior to the exercise of that sagacity which is said to produce them. If B and C, therefore, rise to our thought, in the case supposed by us, it cannot be because we have willed them; but they must rise in consequence of laws of mind that are independent of our volition. In short, we do not find them out, as Locke says, but they come to us; and when they have thus risen in our mind, we do not apply them, as he says, because we regard them as suitable; but the relation which is involved in them is felt without any intentional application, merely in consequence of their presence together in the mind. The skilful application, indeed, of which he speaks, involves an error of precisely the same kind as that which is involved in the assertion of the volition of the particular conceptions which are said to be thus applied. It necessarily assumes the existence of the very relative feeling for the rise of which it professes to account; since, without this previous feeling, the comparative suitability of one medium of proof, rather than another, could not be known. The right application of fit conceptions to fit conceptions, in the choice of intermediate ideas, presupposes then, in the very sagacity which is said to apply them rightly, a knowledge of the relation which the intermediate idea bears to the object to which it is applied, —of the very relation, for discovering which alone it is of any consequence that the intermediate idea should be applied.

The subjects of our intervening propositions, in our trains of reasoning, —B and C, for example, by which we discover the relation of A to D, do not, then, and cannot arise in consequence of our willing them; since to will them, would be to have those very subjects of comparison, which we will to exist, already present to our mind, which

* Essay concerning Human Understanding, B. iv. c. ii. sect. 2.

† Ibid. B. iv. c. xvii. sect. 2.

wills them; and, to will them, with peculiar sagacity, on account of their fitness as subjects of comparison, would be to have already felt that relation, for the mere purpose of discovering which, they are said to be willed. Though arising in conformity with our general desire, then, they do not arise in consequence of any particular volitions; and yet they arise, and arise in the very order that is necessary for developing the remote relation. The whole seeming mystery of this order, in the propositions which form our longest processes of reasoning, depends on the regularity of the laws which guide our simple suggestions in the phenomena of mere association formerly considered by us. Our various conceptions, in our trains of thought, we found, do not follow each other loosely, but according to certain relations. It is not wonderful, therefore, that A should suggest B, which is related to it,—B C,—C D. All this might take place by simple suggestion, though no relation were felt, and consequently no proposition or verbal statement of relation framed. But it is not a train of simple suggestions only which the laws of mind involve. We are susceptible of the feeling of relation of parts of the train, as much as of the conceptions themselves; and when A has excited the relative conceptions of B, it is not wonderful that we should feel the relation of A and B; or, when C is excited, the relation of B and C, more than that any other feeling of our mind should arise in its ordinary circumstances,—that we should hear the sound of a cannon, in consequence of the vibration of a few invisible particles of air, or see the flash which precedes it, in consequence of some slight affection of our visual nerves. It is impossible for us to will any one of the conceptions in the series A, B, C, D, though we may have the general wish of discovering the relation of A and D, and consequently their relation to any common objects of comparison. It is equally impossible for us to will our feeling of any one of the relations of these to each other, though we may be desirous of discovering their relations; since to will any particular feeling of relation, would be to have already felt that relation. But the conceptions rise after each other, in a certain order, in consequence of the natural order of the course of suggestion; and our feelings of relation, therefore, and consequently our propositions, which are only our feelings of relations expressed in language, correspond, as might be supposed, with the regularity of the conceptions which suggest them.

The sagacity of which Locke and other writers speak, may then, since it is nothing more than a form of our simple suggestion itself, be reduced to that peculiar tendency of the suggesting principle, varying in different minds, of which I before treated, when

considering the Secondary Laws of Suggestion, in their relation to Original Genius. The same objects do not suggest to all the same objects, even where past observation and experience may have been the same; because the peculiar suggestions of the objects, the relations of which are afterwards felt, depend, in a great measure, on constitutional tendencies, varying in different individuals, and, in a great measure, also, on tendencies modified by long habit; and, therefore, varying in different individuals, as these habits may have been different. To some minds,—the common minds, which, in the great multitudes of our race, think what others have thought, as they do what others have done,—the conceptions which form their trains of memory, that scarcely can be called trains of reflection, rise, as we have seen, according to the relation of mere contiguity, or former proximity in time, of the related images. The conceptions of minds of a higher order rise in almost infinite variety, because they rise according to a relation which does not depend on former coexistence of the very images themselves, but is itself almost infinitely various.

It is this tendency of our suggestions, to rise according to the relation of analogy, which gives inventive vigour to our reasoning, as it gives richness and novelty to our products of mere imagination. By continually presenting to us new objects, in succession, it, of course, presents to us new relations, and leads the philosophic genius from the simplest perceptions of objects, which the dullest of mankind equally behold, but in which the objects themselves are all which they see, to those sublime relations of universal nature, which bind every thing to every thing, in the whole infinity of worlds, and of which the knowledge of the immensity is scarcely so wonderful as the apparent insignificance of the means by which the knowledge has been acquired.

The sagacity, then, of which Locke and other writers speak, is as little wonderful in itself, as any other modification of the suggesting principle. Since the tendencies to suggestion are various, in different minds, the conceptions, which rise according to those tendencies, are of course various; and with the order of our conceptions, that are felt to be related, the relations which we feel must vary. There may, indeed, be the same conclusion formed, when the intervening conceptions, in the trains of reflection of different individuals, have been different. But it is much more likely, that, when these intervening conceptions, of which the relations are felt, have been different, the conclusion, or ultimate relation which results from the whole, should itself be different; and that men should not agree in opinion, seems, therefore, to be almost a part of the very

laws of intellect, on which the simplest phenomena of thought depend. Even by the same individual, as I remarked before, when treating of the Laws of Simple Suggestion, what opposite conclusions are formed on the same subjects, in different circumstances of health and happiness, or of disease and misfortune,—and conclusions which are drawn, with the same logical justness from the premises, in one case, as in the other. The process of reasoning, which is only the continued feeling of the relations of the conceptions that have arisen by the common laws of suggestion, is equally accurate; but, though the reasoning itself may have been as accurate, the conceptions of which the successive relations have been felt, during the process of reasoning, were different, in consequence of the tendency of the mind, in these different states, to suggest different and almost opposite images. This tendency to form, under slight changes of circumstance, opposite conclusions, on the same subjects, is happily illustrated by Chaulieu, the French poet, in some verses, in which he considers himself as viewing nature during a fit of the gout, and of course seeing nothing in it but what is dreadful; when he is surprised to find different views breaking upon him, of beauty in the universe, and benevolence in its Author, and discovers that the change has arisen, not from any greater brightness of the sky, or from any happier objects that surround him, but from the mere cessation of that paroxysm which had shed, while it lasted, its own darkness on the scene. It is almost as little possible for him, whose train of conceptions is uniformly gloomy, to look upon nature, or, I may say, even upon the God of Nature, in the same light as that happier mind, which is more disposed to images of joy, as for one, to whose eyes the sunshine has never carried light, to think of the surface of that earth on which he treads, with the same feeling of beauty and admiration as the multitudes around him whose eyes are awake to all the colours that adorn it. What is true, in these extreme cases, is not less true in cases that are less remarkable. How few are the opinions of any sort, in which the greater number of mankind concur; and, even in the case of those opinions, in which they are unanimous, how few, if they were to attempt to support them by argument, would support them by argument precisely similar. All might set out with the same conception, in their primary design; and, if the discovery of the strongest proofs depended on the mere will to discover the strongest, all would instantly, by the exercise of this simple will, be omnipotent logicians. But all are not omnipotent logicians; for the intermediate conceptions which rise to one mind, do not rise to others; and the relations, therefore, which those intermediate conceptions sug-

gest, are felt of course, and stated, only by those to whom the conceptions which suggest them have arisen.

The differences of opinion in mankind, then, far from being wonderful, are such as must have arisen, though there had been no other cause of difference than the variety of the conceptions, which, by the simple laws of suggestion, occur in the various trains of thought of individuals, diversifying, of course, the order of propositions in their reasonings, and consequently the relation which the conclusion involves. The objects compared, at every stage of the argument, have been different; and the results of the comparison of different objects, therefore, cannot well be expected to be the same. I formerly alluded to a whimsical speculation of Diderot, in which he personifies the senses, and makes them members of a society, capable of holding communication with each other, and of discoursing scientifically, on one subject at least,—that of numbers, in the calculations of which, he conceives that each of them might become as expert as the most expert arithmeticians. In all their other colloquies, however, it is quite evident that each must appear to the rest absolutely insane; because each must speak of objects and relations, of which the others would be incapable of forming even the slightest notion. “I shall remark only,” says Diderot, “that, in such a case, the richer any sense was, in notions peculiar to itself, the more extravagant would it appear to the rest,—that the stupidest of the whole would, therefore, infallibly be the one that would count itself the wisest,—that a sense would seldom be contradicted, except on subjects which it knew the best, and that there always would be four wrong, against the one that was right; which may serve to give a very fair opinion of the judgments of the multitude.”* In the reasonings of mankind, indeed, the sources of difference are not so striking and obvious, as in this allegorical society. But, in many instances, they are nearly as much so; and merely because the same order of propositions, that is to say, the same order of conceptions and relative feelings, has not arisen in the reasonings of the ignorant, they laugh inwardly at the follies and extravagance of the wise, with the same wonder and disdain with which, in Diderot’s fabled society of the senses, the Ear would have listened to the Eye, when it spoke, with calm philosophy, of forms and colours, or which, in return, the Eye would have felt for the seeming madness of the Ear, when it raved, in its strange ecstasies, of airs and harmonies.

The different order of propositions in our trains of reasoning, and, consequently, in a

* Œuvres, tom. II. p. 153-4.

great measure, the different results of reasoning, may, then, it appears, depend on the mere differences of simple suggestion, in consequence of which different relations are felt, because the relative objects suggested to the mind are different. But, in like manner, as there are, in different minds, different tendencies of simple suggestion, there are also, in different minds, peculiar tendencies to different relative suggestions, from the contemplation of the same objects. Any two objects may have various relations, and may, therefore, suggest these variously. The same two columns, for example, when we look at the remains of ancient splendour, in some magnificent ruin, may, in the moment of the first suggestion, produce, in our mind, the feeling of their resemblance or difference,—of their relative position,—of their comparative degrees of beauty,—of their proportion in dimensions,—or various other relations that may be easily imagined, which connect them, as parts of one whole, with the melancholy traces of present decay, or the still more melancholy vestiges of the flourishing past. In different minds, there is a tendency to feel some of these relations, more than others,—a tendency which may be traced, in part, to original constitutional diversities; but which depends also, in part, on factitious habits, and on transient circumstances of the moment, intellectual or bodily. In short, there are secondary laws of relative suggestion, constitutional, habitual, and temporary, as there are secondary laws of simple suggestion, in like manner, constitutional, habitual, and temporary; and these secondary laws, as well as those of simple suggestion, since they vary the relations which are felt by individuals, and, therefore, the results of reflective thought, which different individuals present to the world, are unquestionably to be taken into account, in our estimation of diversities of genius,—diversities that consist both in the variety of the conceptions which arise and the variety of the relations which those conceptions suggest,—and which, as one splendid compound, you are now, I flatter myself, able to reduce to the simple elements that compose it.

From the influence, then, which education has on the tendencies, both of simple and relative suggestion, we can, in this way, indirectly produce, in part, that sagacity, or ready discovery of means of proof which I have shown to be absolutely beyond our direct volition. We can continually render ourselves acquainted with more objects, and can thus increase the store of possible suggestions, which may, on occasion, present to us new means of proof; and we can even, by the influence of certain habits, so modify the general tendency of suggestion, that certain relations, rather than others, shall rise to the mind, or shall rise, at least,

more rapidly and readily. How many arguments occur to a well-cultivated understanding, in treating every subject which comes beneath its review, that never would have occurred to others;—and, though not one of the separate suggestions, which either strengthen or adorn the reasoning, has been the object of a particular volition,—the general cultivation, from which they all flow, has been willed, and would not have taken place but for that love of letters and science which continued to animate the studies which it produced,—making it delightful to know what it was happiness almost to wish to learn.

These remarks, on the order of propositions which constitute reasoning, have shown you, I trust, that they depend on tendencies of the mind more lasting than our momentary volitions,—that the relations which they involve could not be felt by us, unless we had previously the conceptions, which are the subjects of the relations,—and that it is impossible for us to will any one of these conceptions; since, in that case, the conception must have existed before it was willed into existence. The conceptions, then, and the feelings of relation,—that is to say, the propositions in the order in which they present themselves to our internal thought,—arise, by the simple laws of suggestion only,—conception suggesting conception, and that which is suggested being felt to have a relation of some sort to the conception which suggested it.

The laws of simple suggestion,—according to which conceptions do not follow each other loosely, but those only which have a certain relation of some sort to each other,—furnish, as I have already said, the true explanation of the regularity of our reasonings. While there is a continued desire of discovering the relations of any particular object, it is not wonderful that, with this continued desire, the reasoning should itself be continuous; since the remaining conception of the object, the relations of which we wish to explore, and which must be as permanent as the permanent desire that involves it, will, of course, suggest the conception of objects related to it; and, therefore, the relations themselves, as subsequent feelings of the mind. If we wish to discover the proportion of A to D, these conceptions, as long as the very wish which involves them remains, must, by the simple laws of suggestion, excite other conceptions related to them; and, in the multitude of relative objects, thus capable of being suggested, it is not wonderful that there should be some one B or C, which has a common relation to both A and D; and which, therefore, becomes a measure for comparing them, or suggests this very relation, without any such

intentional comparison. Indeed, since A and D, both conceived together, form one complex feeling of the mind, it might be expected, that the relative objects most likely to arise by suggestion, would be such as have a common relation to both parts—if I may so term them—of the complex feeling by which they are suggested,—the very proofs, or intermediate conceptions, which form the links of our demonstration.

You are aware that, in these remarks, I speak of the series of propositions that arise in our mind when we meditate on any subject, not of the series which we submit, in discourse or in written works, to the consideration of others. Though it is impossible for us, even in these cases, to will a single conception or a single feeling of relation,—since this would be to will into existence that which already exists,—it is, unquestionably, in our power not to clothe in words the conceptions or relations that have arisen in our thought; and, by this mere omission of the parts of our internal series, which we regret as feeble, or irrelevant to our principal object, the whole series of propositions, as expressed, may seem very different, certainly far more forcible than that which really passed through our mind, and produced in us that conviction or persuasion which we wish to diffuse. But still it must be remembered, that it is the omission only which makes the difference, and that, in the whole series of propositions which we express in language, there is not a single conception or feeling of relation which we have directly willed.

Such is the process of ratiocination, considered as a natural process of the mind. But what are we to think of that art of reasoning, which, for so many ages, banished reason from the schools;—of that art which rendered it so laborious a drudgery to be a little more ignorant than before, which could produce so much disputation without any subject of dispute, and so many proud victories of nothing over less than nothing! I need not say that it is to the scholastic art of logic I allude.

That there may be, or rather that there is a rational logic, I am far from denying; and that many useful directions, in conformity with a certain system of rules, may be given to the unexperienced student that may facilitate to him acquisitions of knowledge, which, but for such directions, he would have made only more slowly, or perhaps not made at all. The art of reasoning, however, which a judicious logic affords, is not so much the art of acquiring knowledge as the art of communicating it to others, or recording it in the manner that may be most profitable for our own future advancement in

the track which we have been pursuing. Its direct benefit to ourselves is rather negative than positive—teaching us the sources of error in our mental constitution, and in all the accidental circumstances of the language which we are obliged to use, and the society in which we must mingle,—and thus rather saving us from what is false, than bestowing on us what is true. Indeed, since we cannot, as I have shown, produce directly in our mind any one conception, or any one feeling of relation, it is very evident that the influence of any art of reasoning on our trains of thought must be indirect only.

But if an art of reasoning is to be given to us, it is surely to be an art which is to render the acquisition of knowledge more easy, not more difficult; an art which is to avail itself of the natural tendency of the mind to the discovery of truth, not to counteract this tendency, and to force the mind, if it be possible, to suspend the very progress which was leading it to truth. With which of these characters did the syllogistic logic more exactly correspond?

The natural progress of reasoning I have already explained to you, and illustrated by examples both of the analytic and proportional kind. One conception follows another conception, according to certain laws of suggestion, to which our Divine Author has adapted our mental constitution; and, by another set of laws, which the same Divine Author has established, certain feelings of relation arise from the consideration of the suggesting and suggested object. This is all in which reasoning, as felt by us, truly consists. We have the conception of A, it suggests B, and, these two conceptions coexisting, we feel some relation which they bear to each other. B, thus suggested, suggests C; and the relation of these is felt in like manner,—and thus, through the longest ratiocination, analytical or proportional, each subject of our thought suggests something which forms a part of it and is involved in it, or something which has to it a certain relation of proportion; and the relation of comprehension in the one case, or of proportion in the other case, is felt accordingly at every step. Nothing, surely, can be simpler than a process of this kind; and it is not easy to conceive how the process could be made shorter than nature herself has rendered it, unless every truth were known to us by intuition. Objects, and the relation of objects,—these are all which reasoning involves; and these must always be involved in every reasoning. While reasoning, then, or a series of propositions, is necessary for the development of truth, the intervening conceptions which form the subjects of those propositions that connect one remote conception with another must arise successively in the mind, and their relations be felt, in like manner, successive-

ly. What is it which the syllogistic art would confer on us in addition? To shorten the process of arriving at truth, it forces us to use, in every case, three propositions instead of the two which nature directs us to use. Instead of allowing us to say man is fallible—he may therefore err even when he thinks himself most secure from error—which is the spontaneous order of analysis in reasoning,—the syllogistic art compels us to take a longer journey to the same conclusion, by the use of what it calls a major proposition,—a proposition which never rises spontaneously, for the best of all reasons, that it cannot rise without our knowledge of the very truth which is by supposition unknown. To proceed, in the regular form of a syllogism, we must say, all beings that are fallible may err, even when they think themselves most secure from error. But man is a fallible being—he may therefore err, even when he thinks himself most secure from error. In our spontaneous reasonings, in which we arrive at precisely the same conclusions, and with a feeling of evidence precisely the same, there are, as I have said, no major propositions, but simply what, in this futile art, are termed technically the minor and the conclusion. The invention and formal statement of a major proposition, then, in every case, serve only to retard the progress of discovery, not to quicken it, or render it, in the slightest degree, more sure.

This retardation of the progress of reasoning is one circumstance which distinguishes the syllogism; but the absurdity, which is implied in the very theory of it, distinguishes it still more. It constantly assumes, as the first stage of that reasoning by which we are to arrive at a particular truth, our previous knowledge of that particular truth. The major is the very conclusion itself under another form, and its truth is not more felt than that which it professes to develop. Thus, to take one of the trifling examples which, in books of logic, are usually given, with a most appropriate selection, to illustrate this worse than trifling art—when, in order to prove that John is a sinner, I do not adduce any particular sin of which he has been guilty, but draw up my accusation more irresistibly, by the major of a syllogism. All men are sinners. John is a man, therefore John is a sinner. If I really attached any meaning to my major proposition, all men are sinners, I must, at that very moment, have felt as completely that John was a sinner, as after I had pursued him, technically, through the minor and conclusion.

The great error of the theory of the syllogism—an error which, if my time allowed, it would be interesting to trace in its relation to the ideal systems of forms and species,

which prevailed when the syllogistic art was invented, and during the long ages of its sway—consisted in supposing that, because all our knowledge may be technically reduced, in some measure, to general maxims, these maxims have naturally a prior and paramount existence in our thought, and give rise to those very reasonings which, on the contrary, give rise to them.

It is not on account of our previous assent to the axiom,—A whole is greater than a part,—that we believe any particular whole to be greater than any part of it; but we feel this truth in every particular case, by its own intuitive evidence, and the axiom only expresses briefly our various feelings of this kind without giving occasion to them. The infant from whom half his cake has been taken, and who has seen it taken, and who yet does not believe that he has less cake afterwards than he had before, is very likely to prove a most obstinate denier of that general proposition by which we might attempt to convince him that he now must have less cake than he had at first; because a whole is greater than a part, and consequently a part less than a whole. "Is it impossible," says Locke, "to know that one and two are equal to three, but by virtue of this or some such axiom, the whole is equal to all its parts taken together? Many a one knows that one and two are equal to three, without having heard or thought on that or any other axiom by which it might be proved; and knows it as certainly as any other man knows that the whole is equal to all its parts, or any other maxim, and all from the same principle of self-evidence; the equality of those ideas being as visible and certain to him, without that or any other axiom, as with it,—it needing no proof to make it perceived. Nor, after the knowledge that the whole is equal to all its parts, does he know that one and two are equal to three better or more certainly than he did before; for, if there be any odds in those ideas, the whole and parts are more obscure, or at least more difficult to be settled in the mind, than those of one, two, and three."

The general axiom, then, is in every case posterior to the separate feelings, of which it is only the brief expression, or at least, without which, as prior to our verbal statement of the axiom, the axiom itself never could have formed a part of our system of knowledge. The syllogism, therefore, which proceeds from the axiom to the demonstration of particulars, reverses completely the order of reasoning, and begins with the conclusion, in order to teach us how we may arrive at it. It is, in the great journey of truth, as if, in any of our common journeyings from place to place—from Edinburgh to Lon-

• Essay Concerning Human Understanding, B. iv. c. vii. sect. 10.

don, for example—we were to be directed first to go to London, and then to find out York or some other intermediate town, when we might be quite sure of knowing the way from York to London, because we must already have travelled it. Is this the sort of direction which we could venture to give to any traveller, or would not every traveller, if we were to venture to give him such a direction, smile at our folly? It would have been happy for science if the similar folly of the dialectic directions of the schools had been as easily perceived. But we all know what it is to journey from place to place; and few know, accurately, what it is to journey from truth to truth. In the one case, we are fond of the shortest road, and very soon find out what that shortest road is. In the other case, it is by no means certain that we are fond of the shortest road, or at least we have an unfortunate tendency to believe that a road is the shortest possible, merely because, being a great deal longer, it may have made us go through much very rapid exercise to very little purpose.

"God has not been so sparing to men," says Mr. Locke, "as to make them barely two-legged animals," and left it to Aristotle to make them rational.*† Indeed the most convincing proof of their own independent rationality is, that, with the incumbrance of the logical system of the schools, they were able to shake this off, and to become reasoners in the true and noble sense of that term, by abandoning the art which made them only disputants.

LECTURE L.

ANALYSIS OF THE SCHOLASTIC LOGIC CONTINUED.—ORDER II. RELATIONS OF SUCCESSION.

IN my last lecture, Gentlemen, after analysing the process of ratiocination, and explaining the laws on which the order of its regular series of propositions depends,—I proceeded to consider the logic of the schools as an instrument of reasoning,—not on account of any merits which I supposed it to possess, as a useful instrument for this purpose, but merely from that interest which even error itself acquires, when it is regarded as the error of all the wise, or of all who were considered as wise for many ages. The ruins of a mighty intellectual system must surely be viewed by us with some portion at least of that emotion which is so readily excited by the decaying monuments, and

the mere workmanship of mechanic art, in the ruins of an ancient city, or even of the solitary castle of some distinguished chieftain. It is impossible not to pause on the intellectual ruin, as we would pause on some half-worn sculpture, or fallen column,—when the same column or sculpture, if existing entire in any modern edifice, would scarcely attract our regard.

In considering this ancient system,—ancient, unfortunately, only if we date it from the period at which it began its destructive reign, and not, if we date it from the period of its decay,—I endeavoured to show you, by a comparison of the process of the syllogistic art with the process by which, without any such artificial system, we advance from truth to truth, in those progressive feelings of relation which arise when we are said to reflect or meditate on a subject, how much simpler and shorter the natural process of two propositions at every stage is, than the artificial process of three at every stage; and what inconsistency is implied, in the very theory of the syllogism, if considered as an art of acquiring truth, and not merely as an art of communicating it; since the very knowledge implied in the major proposition, which, in the syllogism, is the first proposition of the series, supposes the previous feeling of that relation, which is expressed in the conclusion, for the discovery of which ultimate relation alone the syllogism is supposed to be invented. If we have previously felt this relation, which the conclusion expresses, we have evidently no need of the syllogism, which is technically to unfold it to us: if we have not previously felt it, we cannot admit the major proposition of the syllogism, which is the first step of the reasoning; and that which teaches us, by a series of propositions, only what we have admitted already, before the first proposition, cannot surely be supposed to add much to our stock of truths.

The natural process of reasoning, by two propositions, instead of the three, which the syllogism would force us to use, has been allowed, indeed, by logicians to have a place in their system; because, with all their fondness for their own technical modes and figures, they had not quite sufficient hardihood to deny, that it is at least possible for us to reason sometimes, as in truth we always reason. Their only resource, therefore, was to reduce this natural process under their own artificial method, and to give it a name, which might imply the necessity of this reduction, before the reasoning itself could be worthy of that honourable title. They supposed, accordingly, the proposition, which was technically wanting, to be understood in the mind of the thinker or hearer, and termed the reasoning, therefore, an enthymeme. It was, they said, a truncated or imperfect syllogism. They

X 2

* Creatures.—Orig.

† Essay concerning Human Understanding, B. iv. c. xvii. sect. 4.

would have expressed themselves more accurately, if they had described their own syllogism, or, in its relation to the natural analytic process of our thought, a cumbrous and overloaded enthymeme.

The imperfection of syllogism, as an instrument of reasoning for the acquisition of knowledge, is strikingly shown by the very examples which every writer on the subject employs to illustrate its power. If all the instances that have been used, for this purpose, in the innumerable works of the schoolmen, were collected together,—though they might make a pretty large volume, they would not communicate to the most ignorant reader a single truth; and can we think, then, that the superior facility, which it gives for the discovery of truth, is an excellence to which it may fairly lay claim? If the art could have been made profitable, in any way, for discovery, there can be no doubt that some zealous admirer of it, in the enthusiasm of his admiration, would have illustrated its power by some applications of it that were more than verbal trifling. Yet, I may safely venture to say, that a mere perusal of the reasonings, brought forward as illustrative of the power of the syllogism, would be sufficient to convince the reader, if he had any doubt before, of the absolute inefficacy of the art, of which he was perusing the shadowy achievements.

It is very justly remarked, by Dr. Reid,—in his “Brief Account of Aristotle’s Logic,” published by Lord Kames, in the last volume of his Sketches,—“That the defects of this system were less apparent, in the original works of its inventor, than in the works of his commentators,—from this circumstance, that Aristotle, in discussing the legitimate syllogisms, never makes use of real syllogisms to illustrate his rules, but avails himself of the mere letters of the alphabet, as representative of the subjects and predicates of his propositions.”* “The commentators, and systematical writers in logic,” says Dr. Reid, “have supplied this defect, and given us real examples, of every legitimate mode, in all the figures. We acknowledge this to be charitably done, in order to assist the conception in matters so very abstract; but whether it was prudently done for the honour of the art, may be doubted. I am afraid this was to uncover the nakedness of the theory: it has undoubtedly contributed to bring it into contempt; for when one considers the silly and unconstructive reasonings that have been brought forth by this grand organ of science, he can hardly forbear crying out, ‘Parturiunt montes, et nascitur ridiculus mus.’” Many of the writers on logic,” continues Dr. Reid, “are acute and in-

genious, and much practised in the syllogistical art; and there must be some reason, why the examples they have given of syllogisms are so lean.”†

The reason of this leanness, of which Dr. Reid speaks, is not very difficult of discovery. It is to be found in the nature of the syllogism itself, which, as I have shown, assumes, and must assume, in every case, as evident, and already felt, in the major proposition, the very truth which the technical reasoner is afterwards supposed to discover by the aid of the two following propositions. No choice, therefore, was left to the illustrator of the technical process, but of such puerile and profitless examples as have been uniformly employed for illustration; because any other examples would have shown the total inapplicability of his boasted art. It is very evident, that the art could not be regarded as of the slightest efficacy, unless the conclusion, which was the important proposition, were to be attended with belief; and since the truth of the conclusion, if felt at all, must, as I have shown, have been felt, before the major proposition itself could have been admitted, this primary feeling of the truth of the conclusion, before the opening of the argument, necessarily limited the argument itself to the demonstration of propositions, of which no proof was requisite. Since the major is only another form of expressing the conclusion, it is manifest, that, if the syllogism had attempted to add any thing to our knowledge, it must have enunciated something in the major proposition which was previously unknown,—which, therefore, as unknown, we should have required to be itself proved, and of which the remaining propositions of the syllogism were far from affording any proof. To obtain immediate assent, therefore, for the major, it was absolutely necessary not to enunciate in it any thing which was not either self-evident or previously demonstrated; and the unfortunate logician, if he expected his syllogism to be credited, was thus obliged to show the wonders of his art, by proving Peter to be a sinner, because all men are sinners; or demonstrating that a horse has four legs, because it is a quadruped. All quadrupeds have four legs—but a horse is a quadruped—therefore a horse has four legs.

These remarks, though relating chiefly to the influence of this technical process, as a supposed mode of facilitating the acquisition of knowledge in our own meditative reasonings, may have already shown you, that, if the syllogism was inefficacious, and, I may say, even worse than inefficacious, as a process for discovering truth, it was not less inadequate as an instrument for communicat-

* Ch. iv. sect. 3.—The language somewhat varied.

† Ch. iv. sect. 3.

ing truth to others ; though it is for its supposed advantages in this respect that, of late at least, when we are beginning to recover from our transcendental admiration of it, it has been chiefly panegyricized or defended. A very little attention to the nature of the different propositions of the syllogism will be sufficient to show that the same fundamental error, which renders it useless for discovering truth, renders it equally useless for the development of it ; and that, as our internal reasoning is only a series of enthymemes, it is only by such a series of enthymemes as that by which truth unfolds itself to our own minds, that it can be successfully unfolded to the minds of others.

In the attempt to communicate knowledge by the technical forms of reasoning, the major proposition, as first stated in the argument, must of course have been supposed to be understood and admitted when stated, since, if not admitted by the hearer or reader as soon as stated, it would itself stand in need of proof ; and, if it was so understood and admitted, of what use could the remaining propositions of the syllogism be, since they could communicate no truth that was not communicated and felt before ? There is no absurdity in supposing, that we may admit the conclusion of a syllogism, without admitting the major proposition ; since the major, though it involves the conclusion, involves some more general relations. We may admit, for example, that Peter is six feet high, though, if his stature were attempted to be demonstrated to us by the syllogism—All men are six feet high, but Peter is a man, therefore Peter is six feet high,—we should certainly object to the major proposition, and form our belief only on particular observation of the individual. But though we may thus admit the proposition which forms the conclusion of a syllogism, without admitting the major proposition, from which it is said to flow, it is absolutely impossible that we should know the meaning of the major, and admit it, without admitting also, tacitly, indeed, but with equal feeling of its truth, the conclusion itself. The whole question, as we have seen, relates to the feeling of the truth of the major proposition ; for, if it be true, and felt to be true, all the rest is already allowed ; and yet this most important of all propositions, which, if the conclusion be of a kind that demands proof, must itself demand proof still more, is the very proposition which is most preposterously submitted to us in the first place for our assent, without any proof whatever,—the honour of a proof being reserved only for a proposition, which, if the major require no proof, must be itself too clear to stand in need of it. As a mode of communicating knowledge, therefore, the syllogism is, if

possible, still more defective than as a mode of acquiring it. It does not give any additional knowledge, nor communicate the knowledge which it does communicate in any simpler, or shorter, or surer way. On the contrary, whatever knowledge it gives, it renders more confused by being more cumbersome ; and it cannot fail to train the mind, which receives instruction in this way, to two of the most dangerous practical errors,—the errors of admitting, without proof, only what requires proof, and of doubting, that is to say, of requiring proof, only of what is evident. Such is the syllogism, considered as an instrument, either for facilitating our own attainments in knowledge or for communicating these attainments to others.

The triumph of the syllogistic art, it must be confessed, however, is not as an art of acquiring or communicating truth, but as an art of disputation—as the great art of proving anything by anything, quidlibet per quodlibet probandi. And, if it be a merit to be able to dispute long and equally well, on subjects known and unknown, to vanquish an opponent, by being in the wrong, and sometimes too by being in the right, but without the slightest regard either to the right or wrong, and merely as these accidental circumstances may have corresponded with certain skilful uses of terms without a meaning,—this merit the logicians of the schools unquestionably might claim. Indeed, in controversies of this sort, in those ages of endless controversy, “success,” as it has been very truly remarked, “tended no more to decide the question, than a man’s killing his antagonist in a duel serves now to satisfy any person of sense that the victor had right on his side, and that the vanquished was in the wrong.”

Of this system of logic, the views given by philosophers, during the period in which it flourished, are almost innumerable ; and, in no other works can we find so striking a mixture of intellectual strength and intellectual weakness, of acuteness, capable of making the nicest and most subtle distinctions, with an imbecility of judgment, incapable of estimating the insignificance of any one of those subjects on which so many nice and subtle distinctions were made. All these commentaries, and systematic views, however,—though all that is valuable in them were condensed into a few pages—would scarcely be equal in value to the few pages of a commentary of a different kind ; in which the maxims of logic are adapted, with most singular happiness, to a ludicrous theory of syllogisms, the striking coincidences of which with the actual laws of the syllogism will be best felt by those to whom the rules of syllogizing are almost familiar.

“Though I’m afraid I have transgressed

upon my reader's patience already, I cannot help taking notice of one thing more extraordinary than any yet mentioned; which was Crambe's Treatise of Syllogisms. He supposed that a philosopher's brain was like a great forest, where ideas ranged like animals of several kinds; that those ideas copulated, and engendered conclusions; that when those of different species copulate, they bring forth monsters or absurdities; that the major is the male; the minor the female, which copulate by the middle term, and engender the conclusion. Hence they are called the *præmissa*, or predecessors of the conclusion; and it is properly said by the logicians *quod pariant scientiam, opinionem*, they beget science, opinion, &c. Universal propositions are persons of quality; and therefore in logic they are said to be of the first figure. Singular propositions are private persons, and therefore placed in the third or last figure, or rank. From those principles all the rules of syllogisms naturally follow.

"I. That there are only three terms, neither more nor less; for to a child there can be only one father and one mother.

"II. From universal premises there follows an universal conclusion, as if one should say, that persons of quality always beget persons of quality.

"III. From singular premises follows only a singular conclusion, that is, if the parents be only private people, the issue must be so likewise.

"IV. From particular propositions nothing can be concluded, because the *individua vaga* are (like whoremasters and common strumpets) barren.

"V. There cannot be more in the conclusion than was in the premises, that is, children can only inherit from their parents.

"VI. The conclusion follows the weaker part, that is, children inherit the diseases of their parents.

"VII. From two negatives nothing can be concluded, for from divorce or separation there can come no issue.

"VIII. The medium cannot enter the conclusion, that being logical incest.

"IX. An hypothetical proposition is only a contract, or a promise of marriage; from such, therefore, there can spring no real issue.

"X. When the premises, or parents, are necessarily joined, (or in lawful wedlock,) they beget lawful issue; but contingently joined, they beget bastards.

"So much for the affirmative propositions; the negative must be deferred to another occasion.

"Crambe used to value himself upon this system, from whence he said one might see the propriety of the expression,—such a one has a barren imagination; and how common

is it for such people to adopt conclusions that are not the issue of their premises; therefore as an absurdity is a monster, a falsity is a bastard; and a true conclusion that followeth not from the premises, may properly be said to be adopted. But then what is an enthymeme? (quoth Cornelius.) Why, an enthymeme (replied Crambe,) is when the major is indeed married to the minor, but the marriage kept secret.*

Of the direct influence of the school logic, in retarding, and almost wholly preventing the progress of every better science, I need not attempt any additional illustration, after the remarks already offered. But the indirect influences of this art were not less hurtful.

One of the most hurtful consequences of this method, was the ready disguise of venerable ratiocination which it afforded for any absurdity. However futile an explanation might be, it was still possible to advance it in all the customary solemnities of mood and figure; and it was very natural, therefore, for those who heard what they had been accustomed to regard as reasoning, to believe, that, in hearing a reasoning, they had heard a reason. Of this I may take an instance which Lord Kames has quoted from the great inventor of the system himself, and one which very few of his followers have been able to surpass. "Aristotle, who wrote a book about mechanics, was much puzzled about the equilibrium of a balance, when unequal weights are hung upon it, at different distances from the centre. Having observed that the arms of the balance describe portions of a circle, he accounted for the equilibrium by a notable argument. 'All the properties of the circle are wonderful. The equilibrium of the two weights that describe portions of a circle is wonderful; therefore the equilibrium must be one of the properties of the circle.' What are we to think of Aristotle's logic," continues Lord Kames, "when we find him capable of such childish reasoning? and yet that work has been the admiration of all the world, for centuries upon centuries—nay, that foolish argument has been espoused and commented upon, by his disciples, for the same length of time."†

As another very hurtful consequence of this technical system, I may remark, that the constant necessity of having recourse to some syllogistic form of argument, and of using these forms, in cases in which the opinions, involved in the syllogism, were at least as clear before the syllogism as after it, rendered argument and belief, by a sort of indissoluble association, almost synonymous terms. If we had still to prove John to be

* Memoirs of Martinus Scriblerus, B. i. c. 8.

† Sketches of the History of Man, B. iii. Sk. i. 2.

fallible, after having proved, or at least obtained assent to the proposition, that all men are fallible, it was not easy to discover any truth so self-evident as not to stand at least equally in need of demonstration. Hence the constant tendency in the scholastic ages to prove what did not stand in need of proof. Every thing was to be demonstrated and every thing was demonstrated; though it must be confessed, that the only effect of the demonstration frequently was to render obscure—at least as obscure as any thing self-evident could be rendered—what, but for the demonstration, could not have admitted of the slightest doubt.

Akin to this tendency of proving every thing—even self-evident propositions—by some syllogistic form, was the tendency which the mind acquired, to apply many varieties of technical phraseology to the same proposition, so as to make many propositions of one, as if every repetition of it, in another form of language, were the enunciation of another truth. It is impossible to take up a volume of any of the old logicians, and to read a single page of it, without discovering innumerable examples of the influence of which I speak. Indeed, as the forms of technical expression, or at least the possible combinations of these, are almost infinite, it is, in many cases, difficult to discover what principle of forbearance and mercy to the reader led the logician to stop at one of his identical propositions, rather than to extend the supposed ratiocination through many similar pages. There can be no doubt, at least, that the principle which produced many pages, might, with as much reason, have produced a whole volume.

It is not easy to imagine a proposition that would less stand in need of proof than that which affirms what is possible and what is impossible, not to be the same; or if, for the honour of logic, that nothing might be allowed to be credited without mood and figure, a syllogism should be thought necessary, a single syllogism seems all that could, with any decency, be claimed. But how many syllogisms does an expert logician employ to remove all doubt from this hardy proposition! The example which I take is not from those darker ages in which almost any absurdity may readily be supposed, but from the period which produced the *Essay on the Human Understanding*. It is from a work of a logician, David Dierdon, a professor in one of the French universities—an author, too, of no ordinary merit, who, in many cases, reasons with singular acuteness, and whose works were held in such high admiration, that he was requested, by a provincial synod of the church, to make as much haste as possible to publish his course of philosophy for the benefit of the churches,

tanquam ecclesiis nostris pernecessarium. The argument which I quote from him, may be considered, therefore, not as an instance of logical pleonasm peculiar to him, but as a very fair example of the technical argumentation of the period.

His demonstration, that things possible and things impossible are not the same, is contained in six weighty paragraphs, of which I translate literally the first two, that are sufficiently absurd indeed, but not more absurd than the paragraphs which follow them.

“Whatever, of itself and in itself, includes things contradictory, differs in itself from that which, of itself and in itself, does not imply any thing contradictory. But what is impossible of itself and in itself, involves things contradictory,—for example, an irrational human being, a round square. But what is possible of itself and in itself, includes no contradiction. Therefore, what is impossible in itself, differs from what is possible.

Things contradictory are not the same; for example, a man, and not a man. But what is possible in itself and impossible in itself are contradictory, which I prove thus:—What is possible in itself and what is impossible in itself, are contradictory: But what is impossible in itself, is not possible in itself; therefore what is possible in itself, and what is impossible in itself, are contradictory; therefore they are not the same in themselves.

“Quod ex se et in se includit contradictoria, differt in se ab eo quod ex se, et in se non involvit contradictoria. Sed impossibile, ex se, et in se involvit contradictoria; puta homo irrationalis, quadratum rotundum, &c. Possibile vero ex se, et in se non includit contradictoria. Ergo, impossibile in se differt a possibili.

“Contradictoria non sunt idem; puta homo et non homo. Sed possibile in se et impossibile in se sunt contradictoria, quod sic probatur. Possibile in se, et non possibile in se, sunt contradictoria. Sed impossibile in se est non possibile. Ergo, possibile in se, et impossibile in se, sunt contradictoria. Ergo in se non sunt idem.”

I have already said, that the two paragraphs which I have quoted, are but a small part of the ratiocination; for, as the reasoner supposes his adversary to be very obstinate, he thinks it necessary to assail him with a multitude of arguments, even after these which he has so strenuously urged.

* Dierdonis *Philosophiæ Contractæ*, Pars II. quæ est *Metaphysica*, Pars I. cap. i. sect. 10, 11.—The same subject is treated at much greater length, in his larger work on *Metaphysics*, from the 9th to the 28th page.

What but the constant habit of mere verbal disputation could have reconciled even the dullest reasoner to such reasoning as this? If we had not previously believed what is impossible, and what is possible, not to be in themselves the same, could we have believed it more, after all this labour? The only circumstance which could make us have any doubt on the subject, is the long labour of such a demonstration, in which the truth is almost hid from our view by the multitude of words.

"So spins the silkworm small, its slender store,
And harbours till it clouds itself all o'er."

The reign of this philosophy may now, indeed be considered merely as a thing which has been, for it is scarcely necessary to speak of one or two devoted admirers of the Aristotelian method, who may, perhaps, not yet have vanished from among us,—thrown as they are, unfortunately, on too late an age, with opinions, which, in other ages, might have raised them to the most envied distinctions—who love what is very ancient, and who love what is written in Greek, and who have, therefore, two irresistible reasons for venerating that philosophy, which is unquestionably much older than Newton, or Des Cartes, or Bacon, and, as unquestionably, written in a language which saves it from vulgar eyes. Or rather, to speak with more candour of such misplaced sages of other times, there may, perhaps, be some few generous, but erring lovers of wisdom, who, impressed with the real merits of Aristotle, and with the majesty of that academic sway, which he exercised for so long a period of the history of our race, give him credit for merit still greater and more extensive than he really possessed,—but merit it must, at the same time, be acknowledged, which was long as indisputable as his real excellence, and which all the learned and honoured, of every nation, in which learning could confer honour, united in ascribing to him, and gloried in being his worshippers. The worship, however, is now past, but there are effects of the worship which still remain. We have laid aside the superstition; but, as often happens, in laying aside the superstition, we have retained many of the superstitious practices.

That we reason worse than we should have done, if our ancestors had reasoned better, there can be no doubt, because we should have profited by the results of their better reasoning; but I have almost as little doubt that we suffer from their errors, in another way, by having imbibed, as it was scarcely possible for us not to imbibe, some portion of the spirit of their Dialectic subtleties; some greater passion, for distinctions

merely verbal, and for laborious demonstrations of things self-evident, than we should have felt, from the mere imperfection of our intellectual nature, if the logic of Aristotle had never been.

In the division which I made of the relations suggested, by objects either perceived or conceived by us, I arranged these relations in two classes,—those of *Coexistence* and *Succession*. I have now considered, as fully as my limits will permit, the former of these classes, both as the relations occur separately, and as they occur in those series which constitute reasoning, that at each step are only progressive feelings of relation, varying as the conceptions of the relative objects are different, and connected with each other, because the conceptions that arise in the course of the reasoning, are not loose, but regular. The inquiry has led us into some of the most interesting discussions, in the Philosophy of the Mind,—discussions, interesting from their own absolute importance, and, I may add, from the peculiar obscurity which has been supposed to hang over these processes of thought, though, as I flatter myself, you have seen, this obscurity does not arise so much from any peculiar difficulty in the subject as from the labour which has been generally, or, I may say, almost universally, employed to make it difficult. For many ages, indeed, all the powers of the human understanding seem to have had scarcely any other occupation than that of darkening the whole scene of nature, material and intellectual,—that scene, on which the light of nature and the light of Heaven were shining, as they shine upon it now, and in which it seemed to require all those efforts of voluntary ignorance, which the wise of those ages were so skilful and so successful in making, not to see what was before them, and on every side. You have all, perhaps, read or heard of that celebrated sage of antiquity, who is said to have put out his eyes, for no other purpose than that he might study nature better; and, if the anecdote, which there is no reason to credit, were true, it would certainly have been a sufficient proof of that insanity which his fellow-citizens, on another celebrated occasion, ascribed to him. What Democritus is thus said to have done, is the very folly in which all mankind concurred for a long succession of centuries. They put out their eyes that they might see nature better; and they saw, as might be supposed, only the dreams of their own imagination.

The order of relations which we have next to consider, are those which, as involving the notion of time, or priority and subsequence, I have denominated *Relations of Succession*. On these, however, it will not

* Pope's Works—Dunciad, B. iv. v. 253-4.

be necessary to dwell at any length. They require, indeed, very little more than to be simply mentioned,—the only questions of difficulty which they involve having been discussed fully in my Preliminary Lectures, in which it was necessary, before proceeding to examine the changes or affections of the mind in its varying phenomena, and the mental powers or susceptibilities which these changes or affections denote, that we should understand what is meant by the terms change and power, cause and effect. Any part of these discussions it would be quite superfluous now to repeat; since, after the full illustration of the Doctrine of Power or Efficiency, which I then submitted to you, and the frequent subsequent allusions to it, I may safely take for granted that the doctrine itself cannot have escaped from your memory.

The relations of succession, then, as the very name implies, are those which the subjects of these relations bear to each other, as prior or posterior in time. What we term a cause suggests its particular effect; what we term an effect suggests its particular cause, when we have previously become acquainted with their order of succession. If the cause, however, suggested nothing more than the simple conception of the effect, and the effect nothing more than the simple conception of the object which was its cause, the suggestions would, of course, be referable to the power or susceptibility formerly considered by us,—that of simple suggestion, or association, as it is commonly termed. But the cause does not suggest the effect, merely as a separate object of our thought, nor the effect the cause, as a separate object. It suggests also the new feeling of their mutual relation. When I look at a picture of Titian, for example, and the conception of the painter instantly arises, I do not think of Titian merely as an individual, unconnected with the object which I perceive, I do not think of him in the same manner as I may have thought of him repeatedly at other times when the reading of his name, or the mention of him in conversation on works of art, or any other accidental circumstance, may have recalled him to my mind. If I had only the conception of Titian as I may have conceived him in those other cases, the suggestion would be truly a simple suggestion; but this simple conception of the artist is instantly followed by another feeling of his connexion with that particular work of his art, which is before my eyes,—a relation which it requires no great analytic discrimination to separate from the simple conception itself, and which arises precisely in the same way as the other relations which have been considered by us,—the relation of resemblance, for example, when, in music, one air suggests to us a similar melody,—or

the relation of proportion, when we think of the squares of the sides of a right angled triangle, in Pythagoras's celebrated theorem.

The relations of succession, then, are as distinct from the simple perceptions or conceptions which suggest them, and as truly indicative, therefore, of a peculiar power or susceptibility of the mind, as the relations of coexistence are distinct from the perceptions or conceptions which suggest them. They are relations either of casual or of invariable antecedence or consequence; and we distinguish these as clearly in our thought as we distinguish any other two relations. We speak of events which happened after other events as mere dates in chronology. We speak of other events as the effects of events or circumstances that preceded them. The relation of invariable antecedence and consequence, in distinction from merely casual antecedence and consequence, is, as I have already frequently stated, this relation of causes and effects. When I regard any object, and feel this relation of uniform proximity of succession, which it bears to some prior object, I term it an effect of that prior object. When I look forward instead of backward, and regard the present object in relation to some other object which is not yet existing, I feel a relation, which, in reference to the effect that is to be produced, may be termed fitness or aptitude, and it is on our knowledge of these fitnesses or aptitudes that all practical science is founded. By our acquaintance with this relation, we acquire a command, not merely of existing things, but almost of things that, as yet, have scarcely any more real existence than the creations of poetic fancy. We lead the future, almost at our will, as if it were already present. While mechanic hands are chipping the rough block, or adding slowly stone to stone, with little more foresight than of the place where the next stone is to be added, there is an eye which has already seen that imperial edifice in all its finished splendour, which other eyes are incapable of seeing, till year after year shall have unfolded, through a series of progressive changes, that finished form which is their ultimate result. What is true in architectural design is not less true in all the other arts which science has evolved. There are hands continually toiling to produce what exists already to the mind of that philosopher whom they almost blindly obey,—who, by his knowledge of the various aptitudes or things, knows not merely what is, but what must be,—beholding, through a long series of effects, that ultimate effect of convenience or beauty which is at once to add some new enjoyments to life, and to confer additional glory on the intellectual empire of that being whom God has formed to image, however faintly, the power by which he raised

him into existence. We cannot look around us without discovering, in every work of human art which meets our eye, the benefits which we have received from our knowledge of this one relation. Whatever industry has conferred upon us,—the security, the happiness, the splendour, and, in a great measure, the very virtues of social life,—are referable to it; since industry is nothing more than the practical application of those productive fitnesses which must have been felt and known before industry could begin.

"These are thy blessings, Industry, rough power,
Whom labour still attends, and sweat and pain;
Yet the kind source of every gentle art,
And all the soft civility of life:
Raiser of human kind! by Nature cast
Naked and helpless, out amid the woods
And wilds, to rude inclement elements!
And still the sad barbarian, roving, mix'd
With beasts of prey, or for his acorn meal
Fought the fierce tusky boar;—a shivering wretch
Aghast and comfortless, when the bleak North,
With winter, charged, let the mix'd tempest fly,
Hail, rain, and snow, and bitter-breathing frost:—
Then to the shelter of the hut he fled,
And the wild season, sordid, pined away.
For home he had not.—Home is the resort
Of love, of joy, of peace and plenty, where,
Supporting and supported, polish'd friends
And dear relations mingle into bliss.
But this the rugged savage never felt,
Ev'n desolate in crowds;—and thus his days
Roll'd heavy, dark, and unenjoy'd along.
A waste of time!—till Industry approach'd,
And roused him from his miserable sloth;
His faculties unfolded; pointed out
Where lavish Nature the directing hand
Of art demanded: show'd him how to raise
His feeble force by the mechanic powers,
To dig the mineral from the vaulted earth;
On what to turn the piercing rage of fire,
On what the torrent and the gather'd blast;
Gave the tall ancient forest to his axe;
Taught him to chip the wood and hew the stone,
Till, by degrees, the finish'd fabric rose;
Tore from his limbs the blood-polluted fur,
And wrapt him in the woolly vestment warm:—
Nor stopp'd at barren bare necessity,
But, still advancing bolder, led him on
To pomp, to pleasure, elegance and grace;
And, breathing high ambition through his soul,
Set science, wisdom, glory in his view,
And bade him be the lord of all below.*"

Such is the value of that susceptibility of our mind, by which we feel the relations of objects to each other as successive, when considered in reference to what is commonly termed science. It has made us what we are; and when we think of what we now are, and of what the race of mankind once was,—to speculate on the future condition of man in those distant ages, which still await him on this scene of earth,—when new relations shall have been evolved in objects the most familiar to us, and new arts consequently developed, which, with our present knowledge, no genius can anticipate, is almost as if we were speculating on the possible functions and enjoyments of some higher being.

"How near he presses on the angel's wing!
Which is the seraph? which the child of clay?"
Young.

LECTURE LI.

OF THE FEELINGS BELONGING TO THE ORDER OF SUCCESSION, CONCLUDED. REDUCTION OF CERTAIN SUPPOSED FACULTIES TO RELATIVE SUGGESTION; I. JUDGMENT; II. REASON; III. ABSTRACTION.

GENTLEMEN, in my last Lecture, I began the remarks which I had to offer on the relations of succession,—that order of relations which remained to be examined after our examination of the relations of coexistence.

Objects, or events, or feelings, when we consider them in the relation which they bear to each other as successive, may be regarded as casually prior or posterior, when they occur as parts of different trains, or as invariably antecedent and consequent, when they occur as parts of a single train in the order of causes and effects.

On the relation of objects, as casually successive, I felt it unnecessary to dwell at any length. It has already, indeed, been in some measure discussed, when I treated of the laws of those simple suggestions, or associate trains of images, which rise according to this relation of proximity in time. As there is nothing permanent in the relation, it scarcely can be counted an object of science. Its only advantage—but this a very great advantage—is that which it affords as an assistance to our memory, which is thus enabled to preserve much knowledge that might otherwise be lost; since we are able, by the accidental bearings of other events in time, to form a sort of chronology of many of those little events of life, that are great in relation to our wishes and affections, and that probably would have been forgotten, but for those fixed points, in the track of our life, which recall to us what lay between. By the aid of these, we are able to journey again over hours, and days, and months of happiness, in years the most remote, connecting together, in one delightful series, events which would have been of little moment if remembered singly, but which, when combined, are almost representative of the group of pleasures and friendships that existed once, but may perhaps exist to us no more; as in the similar order of contiguity in place, it would be productive but of slight gratification, if we were to think only of some separate tree, or rock, or stream, or meadow, of the landscape of our infancy. It is when the whole scene rises before us in combination, when the tree, under which we hollowed out our seat, waves over the rock, from which we have leapt with a sort of fearful delight to the opposite overhanging cliff, and the rivulet foams in the narrow channel

between, spreading out, afterwards, its waters in the sunny expanse in which we bathed, and separating the field of our sports from the churchyard, at which we have cast, in twilight, many a trembling glance; when all which nature blended before us, in the perceptions of our earliest years, thus coexists in our conception, it is then that we truly recognise the scene, not as an object of memory only, but as if present to our very eyes and heart. Such is the effect of the representation of objects in the order in which they coexisted in place; and it is not wonderful, that the feeling of the relation of their order in time should have a similar influence on our emotions, by giving unity of connexion, and thus, as it were, additional and more interesting reality to all which we remember. The priority and subsequence of the events remembered, according to this slight accidental relation, may have arisen, indeed, from circumstances the most unimportant in themselves; but it is enough to our feelings, that they arose thus successively, constituting a part of the very history of our life, and forming some of the many ties which connect us with those of whom the very remembrance is happiness. What was truly casual in its origin, almost ceases to appear to us casual, by the permanent connexions which it afterwards presents to our memory. Other successions of events may be imagined, which would have been more interesting to others, and in which it would have been easier to trace some principle of original connexion. But, though more regular, and more interesting to others, they would not have been the events of our youth; as a scene might perhaps readily be imagined, far more lovely to other eyes than the landscape of our early home, but in which our eyes, even in admiring its loveliness, would look in vain for a charm, which, if it be not beauty itself, is at least something still more tenderly delightful.

The relation even of casual succession, then, by the connexion and grouping of events to which it gives rise, and the consequent aid and interest which it yields to our remembrance, affords no slight accession of enjoyment and permanent utility. The relations of invariable antecedents and consequents, however, which are felt by us to be essentially different from mere casual proximity, and to be all that is truly involved in our notion of power or causation, are of much greater importance to that intellectual, and moral, and physical life, which may almost be said to depend on them. Even if they gave us nothing more than our knowledge of the uniform connexions of past events, as objects of mere speculative science, at once constituting and explaining the phenomena that excited our astonishment, and awoke that early curiosity which they have continued to busy ever

since, they would furnish, by the view which they open of the powers of nature, and of all the gracious purposes to which those powers have been subservient, one of the sublimest delights of which our spiritual being is capable.

This gratification they would yield to us, even if we were to regard them only in the past, as objects of a science purely speculative. But, when we consider the relations of events, in their aptitudes to precede and follow, as equally diffused over the time that is to come, as presenting to us, everywhere, in the past or present sequences observed by us, the source of some future good or future evil; of good which we can obtain, and of evil which we can avoid, merely by knowing the order in which these past sequences have occurred; the knowledge of these invariable relations of succession becomes to us inestimable, not as a medium only of intellectual luxury, but as the medium of all the arts of life, and even of the continuance of our very physical existence, which is preserved only by an unceasing adaptation of our actions to the fitnesses or tendencies of external things.

All practical science is the knowledge of these aptitudes of things in their various circumstances of combination, as every art is the employment of them, in conformity with this knowledge, with a view to those future changes which they tend to produce in all the different circumstances in which objects can be placed. To know how to add any enjoyment to life, or how to lessen any of its evils, is nothing more, in any case, than to know some form of that particular relation which we are considering—the relation which objects bear to each other, as antecedent and consequent. In the conclusion of my last Lecture, I treated of it, in regard to the physical sciences and arts,—those intellectual energies, which have given to the savage man, and consequently to all mankind,—since, in every state of society, refined or rude, in the palace, as much as in the hut, or in the cave, man must be born a savage,—another life, a life almost as different from that with which he roams in the woods, as if he had been suddenly transported from the barren waste of earth to those Elysian groves of which poets speak, and that god-like company of bards, and heroes, and sages, with which they have peopled the delightful scene.

Of the importance of the feeling of this relation to the physical sciences, which is abundantly evident of itself, it would be vain to attempt to give any fuller illustration. But it must be remembered, that the mind is a subject of this relation, as much as the body; that there are aptitudes of producing certain feelings, as much as of producing certain material changes; and that the power which discerns or feels the mere aptitude,

in the one case, is not essentially distinct from the power which discerns or feels the mere aptitude, in the other case. The particular relations that are felt, are indeed different as the relative objects are different, but not that general susceptibility of the mind, by which it is capable of feeling the relation of fitness or unfitness. To foreknow, in mechanics, what combination of wheels and pulleys will be able to elevate a certain weight, is to feel one sort of fitness, or relation of antecedence. To foreknow, in chemistry, what more powerful attraction will overcome an affinity that is weaker, and precipitate a substance, which we wish to obtain, from the liquid that holds it in solution, is to feel another sort of fitness. The particular feelings of relation, in these cases, imply acquirements that are very different; but no one, on account of this mere difference of the objects of which the relation of antecedence and consequence is felt, thinks of classing the chemical foresight as indicative of an intellectual power essentially different from that which, in the applications of mechanic foresight, feels the relation of the weights and pulleys in a machine, and foresees, by a knowledge of this relation, the equilibrium or preponderance which is to result. The experience which gives the foresight, is indeed different, but the power which reasons from that different experience is the same. The susceptibility of the same feeling of the relation of productive aptitude, however, has, in certain mental cases, been supposed to be different, merely because its objects are different; and discriminations of mere fitness or unfitness, which are truly referable to the same simple capacity of relative suggestion, that foresees the future by knowing the present, have been formed into a class apart, as if not the discriminations only were different, but the power itself which has formed them.

When we feel any of the mechanical or chemical relations of succession, and predict, accordingly, events which are to take place, we are commonly said to do this by the power of reasoning. Even in many of the mental phenomena, when we venture, in like manner, to predict the future, from our knowledge of the relation of feelings to each other, as uniformly successive, we are said to make the prediction by the power of reasoning. When a statesman, for example, meditates on the probable effects of a particular law which is about to be enacted, and, from his knowledge of the interests, and passions, and prejudices, the wisdom and the very ignorance of man, calculates the relative amount of good and evil, which it may possibly produce to those frail, half-stubborn, half-yielding multitudes, whom he must often benefit against their will, and save from the long evil, of which they see only the mo-

mentary good, there is no one who hesitates in ascribing this political foresight to the sagacity of his power of reasoning, or of drawing accurate conclusions, as to future sequences of events, from his observations of the past. In the calculation of the motives which may operate in the general mind, however, nothing more is implied than a knowledge of the relation of certain feelings to other feelings, as reciprocally antecedent and consequent. But, if the states of mind, the relation of which, as successive to other states of mind, is felt by us, be of a different order; if, instead of a legislator, feeling accurately the relation of certain feelings to certain attendant emotions in the mind of the people, we imagine a critic feeling, with equal precision, the relation of certain perceptions of form, or colour, or sound, to certain emotions of admiration or disgust that are to arise in the mind of him who has those perceptions, though all which is felt, in both cases, is a certain relation of customary antecedence, we are instantly said to speak of a different power of the mind. The power which we consider, is said to be the power of Taste.

This distinction of the power of taste, in appreciating the excellence of the fine arts, and the beauties of nature, from that general capacity of feeling the aptitudes of certain feelings to be followed by certain other feelings, of which it is only a modification, has arisen, there can be very little doubt, from the complexity of the term taste, in our common phraseology, as involving two classes of feelings, that admit of being separated in our thought, by a very easy analysis,—emotions, and judgments of the objects that are fit or unfit to excite those emotions. Certain objects are not merely perceived by us, as forms, or colours, or sounds; the perception of these forms, and colours, and sounds, is followed by an emotion which is of various nature, according to the nature of the object. What we call beauty, is, in our mind, an emotion; as, in external things, it is the aptitude to produce this emotion. To feel this emotion is one state of mind; to know the relation which other previous feelings bear to it, what forms, or sounds, or colours, separately or together, have a fitness of producing the emotion, is another state of mind, as distinct from it, as the political sagacity of the statesman, in anticipating the violence of popular feeling, on any particular occasion, is distinct from those passions and prejudices of the vulgar, which he foresees, as the certain effects of certain necessary measures, and which he strives accordingly, by some of the expedients of his mighty art, to disarm or to dissipate. If the judgments of taste had been as clearly distinguished from the emotions which it measures in their relation to the objects that are likely or un-

likely to produce them, as the wisdom of the politician, from the passions which that wisdom contemplates, in their relation to the circumstance which may tend to inflame them, we should as little have thought of ranking it as a peculiar power, as we think, at present, of inventing new names of faculties corresponding with all the variety of events corporeal or mental, in which we are capable of inferring the future from the past, by our knowledge of the reciprocal tendencies of objects; of ranking, for example, as a peculiar intellectual power, distinct from the general power of reason, the skill with which the legislator adapts his regulations to the varying circumstances of society, or, as in the physics of matter, we think of ascribing to different intellectual powers, the reasonings of the chemist and of the mechanician. Chemistry, mechanics, politics, taste, that is to say, the critical part of taste, of course imply previous observation of the successions of those different phenomena, material and mental, which are the subject of these respective sciences; an experience of the past that is different in each particular case; but, when the successions of the different phenomena have been observed, it is the same faculty, which, in all these sciences alike, predicting the future from the past, feels the relation of antecedence of each phenomenon to its successive phenomena, distinguishing the particular antecedents that are more or less likely to be followed by particular consequents. To call taste a science, like chemistry, or mechanics, or even politics, may seem at first a bold, and perhaps even an unwarrantable use of the term; but I have no hesitation in calling it a science, because it is truly a science, as much as any other knowledge of the successions of phenomena to which we give that name,—the science of certain effects which may be anticipated as the consequents of certain antecedents. It is a science, indeed, which is not capable of the universality of some other sciences, because it is a science of emotions, that must, in some measure at least, have been felt by him who judges of the fitness of certain objects to produce these emotions; and all have not this sensibility. But the sensibility relates to the existence of the emotions only, which, as I have already stated, are mental phenomena of a different class from the subsequent judgments, which estimate the fitness of objects to excite the emotions. The feeling of these emotions is unquestionably not a science, more than the feelings of security and patriotism, or discontent and selfish ambition, which the statesman must have in view, are sciences. But the knowledge of those objects which will excite the most general emotions of beauty and admiration, is a science, as the political knowledge of the means that will have most

general influence in producing the emotions of civil happiness and contentment, or the fury of popular indignation, is a science. Both are nothing more than the experience of the feelings which follow certain other feelings, and the consequent feeling of the relation of their future aptitudes. We may deny the name of a science to both, but, if we allow it to the one, I cannot see any reason which should lead us to deny it to the other.

Of the emotions,—of the aptitudes of producing which taste is the science,—it is not at present my intention to speak. As emotions, they come under our consideration afterwards; and even the few remarks which I may have to offer on taste itself, as the knowledge of the fitness of certain objects to excite the emotion of beauty, and other kindred emotions, I shall defer, till I have treated of the emotions which are its subjects. My only object at present is to point out to you the proper systematic place, in our arrangement, of those mere feelings of the aptitude of certain objects for exciting certain emotions,—which constitute the judgments distinguished by the name of taste. It is peculiarly important for me to point this out to you at present; since, but for the analysis which I have made of the emotion itself, as one state of mind, and the knowledge of what is fitted to excite it, as a very different state of mind, you might conceive, that my classification of our intellectual phenomena, as referable to the two mental susceptibilities under which I have arranged them, was defective, from the omission of one very important faculty. You now, I trust, see my reason for dividing what is commonly denominated taste, into its two distinct elements, one of which is as much an emotion, as any of our other emotions; the other, which is only the knowledge of the particular forms, colours, sounds, or conceptions, that are most likely to be followed by this emotion, is as much a feeling of the relation of fitness, as any of the other suggestions of fitness, on which every science, that has regard to the mere successions of phenomena, as reciprocally antecedent and consequent, is founded.

I am aware that many authors have concurred, in not regarding taste as a simple faculty of the mind; but the taste, of which they speak, is chiefly the very emotion of pleasure, to the production of which they conceive various circumstances to be essential. The two great elements, as it appears to me, which it is of most importance to distinguish, are the emotion itself, in whatever way it may arise, and however complex it may be, and the feeling of the relation of certain forms, sounds, colours, conceptions, or various combinations of these, to this emotion as their effect,—the feeling of the rela-

tion of the one, as successive in time to the other, and of the corresponding aptitude of that other for producing it. Whatever additional analysis may be formed by philosophers of the emotion itself, this analysis, at least, seems to me obvious and indisputable. I proceed upon it, therefore, with confidence, and flatter myself, that you will have no difficulty in forming in your own mind the same analysis,—referring the one element to our susceptibility of the relative suggestions of fitness, that are necessarily as various, as the phenomena which precede and follow are various,—the other primary element to our susceptibility of emotion.

In concluding my view of the phenomena of Simple Suggestion, or, as it is more commonly termed, Association, I considered those various modifications of it, which philosophers, from a defective analysis of the phenomena, had converted into separate intellectual powers. In concluding my view of the phenomena of Relative Suggestion, it may be necessary, in like manner, to take such a view, though the field, over which we have to move, is, in this case, a more narrow one.

The tendency of the mind, which I have distinguished by the name of relative suggestion, is that by which, on perceiving or conceiving objects together, we are instantly impressed with certain feelings of their mutual relation. These suggested feelings are feelings of a peculiar kind, and require, therefore, to be classed separately from the perceptions or conceptions which suggest them, but do not involve them.

Our relative suggestions, then, as you have seen, are those feelings of relation which arise from the perception or conception of two or more objects, or two or more affections of our mind,—feelings which are of considerable variety, and which I classed under two heads, as the relations of coexistence, and the relations of succession. It is easy for us, in every case, to separate this feeling of relation from the perceptions or conceptions themselves. We perceive or conceive objects; we feel them to be variously related; and the feeling of the relation itself is not more mysterious than the perception or simple suggestion which may have given rise to it. The law of mind, by which, on considering four and eight, I feel a certain relation of proportion,—the same precise relation which I feel, on considering together five and ten, fifty and a hundred,—is as clear and intelligible a law of our mental constitution, as that by which I am able to form the separate notion either of four or eight, five or ten, fifty or a hundred.

With this susceptibility of relative suggestion, the faculty of judgment, as that term is commonly employed, may be considered as

nearly synonymous; and I have accordingly often used it as synonymous, in treating of the different relations that have come under our review.

But those who ascribe judgment to man, ascribe to him also another faculty, which they distinguish by the name of reason; though reasoning itself is found, when analyzed, to be nothing more than a series of judgments. The whole is thus represented as something different from all the parts which compose it. Whether we reason syllogistically with the schoolmen, or according to those simpler processes of thought, which nature teaches, our reasoning is divisible into a number of consecutive judgments, or feelings of relation; and if we take away these consecutive judgments, we leave nothing behind which can be called a ratiocination. In a simple proposition, we take one step, or feel one relation; in an enthymeme, we take two steps, or feel two relations; in a syllogism, we take three steps, or feel three relations; but we never think, when we speak of the motion of our limbs, that the power of taking three steps differs essentially from the power of taking one; and that we must, therefore, invent new names of bodily faculties for every slight variety, or even every simple repetition of movement. If this amplification of faculties would be absurd in treating of the mere motion of our limbs, it is surely not more philosophic in the case of the intellectual exercise. Whatever is affirmed, in any stage of our reasoning, is a relation of some sort,—of which, as felt by us, the proposition that affirms the relation is only a verbal statement,—is a series of such judgments, or feelings of relation, and nothing distinct from them, though the mutual relations of the series, which together form the reasoning, have led us falsely to suppose, as I have said, that the whole is something more than all the parts which constitute the whole.

The circumstance, which led to the distinction of reason from judgment, was perhaps, however, not the mere length and mutual connexion of the series, so much as that mistake with respect to the power falsely ascribed to the mind, of finding out, by some voluntary process, those intervening propositions, which serve as the medium of proof. The error on which this opinion is founded, I have already sufficiently exposed; and therefore need not repeat, at any length, the confutation of it.

We cannot invent, as I showed you, a single medium of proof; but the proofs arise to us, independently of our will, in the same manner as the primary subject of the proposition, which we analyze in our reasoning, itself arose. The desire of tracing all the relations of an object, when we meditate, may co-exist with the successive feelings of relations

as they arise; and it is this complex state of mind, in which intention or desire continues to coexist with these successive feelings, to which we commonly give the name of reasoning. But it surely is not difficult to analyze this complex state, and to discover in it, as its only elements, the desire itself, with the conceptions which it involves, or which it suggests, and the separate relations of these conceptions, which rise precisely as they arose, and are felt precisely as they were felt before, on other occasions, when no such desire existed, and when the relative objects chanced to present themselves together to our perception, or in our loosest and most irregular trains of thought. The permanence of the desire, indeed, keeps the object to which it relates more permanently before us, and allows, therefore, a greater variety of relative suggestions belonging to it to arise; but it does not affect the principle itself, which develops these relations. Each arises, as before, unwilling. We cannot will the feeling of a relation, for this would be to have already felt the relation which we willed; as to will a particular conception in a train of thought, would be to have already that particular conception. Yet, while this power of willing conceptions and relations was falsely ascribed to the mind, it was a very natural consequence of this mistake, that the reasoning, which involved the supposed invention, should be regarded as essentially different from the judgments, or simple feelings of relation, that involved no such exercise of voluntary power.

Reasoning then, in its juster sense, as felt by us internally, is nothing more than a series of relative suggestions, of which the separate subjects are felt by us to be mutually related; as expressed in language, it is merely a series of propositions, each of which is only a verbal statement of some relation internally felt by us. There is nothing, therefore, involved in the ratiocination independently of the accompanying desire, but a series of feelings of relation, to the susceptibility of which feelings, accordingly, the faculty called reason, and the faculty called judgment, may equally be reduced. If we take away at each step the mere feeling of relation, the judgment is nothing; and if we take away the separate feelings termed judgments, nothing remains to be denominated reasoning.

Another faculty, with which the mind has been enriched, by those systematic writers who have examined its phenomena, and ranked them under different powers, is the faculty of abstraction,—a faculty by which we are supposed to be capable of separating in our thought certain parts of our complex notions, and of considering them thus abstracted from the rest.

This supposed faculty, however, is not merely unreal, as ascribed to the mind, but I

may add even that such a faculty is impossible, since every exertion of it would imply a contradiction.

In abstraction, the mind is supposed to single out a particular part of some one of its complex notions for particular consideration. But what is the state of the mind immediately preceding this intentional separation—its state at the moment in which the supposed faculty is conceived to be called into exercise? Does it not involve necessarily the very abstraction which it is supposed to produce? and must we not, therefore, in admitting such a power of voluntary separation, admit an infinite series of preceding abstractions, to account for a single act of abstraction? If we know what we single out, we have already performed all the separation which is necessary; if we do not know what we are singling out, and do not even know that we are singling out anything, the separate part of the complex whole may, indeed, rise to our conception; but it cannot arise by the operation of any voluntary faculty. That such conceptions do indeed arise, as states of the mind, there can be no question. In every sentence which we read, in every affirmation which we make, in almost every portion of our silent train of thought, some decomposition of more complex perceptions or notions has taken place. The exact recurrence of any complex whole, at any two moments, is perhaps what never takes place. After we look at a scene before us, so long as to have made every part of it familiar, if we close our eyes to think of it, in the very moment of bringing our eyelids together, some change of this kind has taken place. The complex whole, which we saw the very instant before, when conceived by us in this instant succession, is no longer, in every circumstance, the same complex whole. Some part, or rather many parts are lost altogether. A still greater number of parts are variously diversified; and though we should still call the scene the same, it would appear to us a very different scene, if our conception could be embodied and presented to our eye, together with the real landscape of which it seems to us the copy. If this change takes place in a single instant, at longer intervals it cannot fail to be much more considerable, though the very interval, which gives occasion to the greater diversity, prevents the diversity itself from being equally felt by us.

Abstraction, then, as far as abstraction consists in the rise of conceptions in the mind, which are parts of former mental affections, more complex than these, does unquestionably occur; and, since it occurs, it must occur according to laws which are truly laws of the mind, and must indicate some mental power, or powers, in consequence of which the conceptions termed abstract arise. Is it necessary, however, to have recourse to any

peculiar faculty, or are they not rather modifications of those susceptibilities of the mind, which have been already considered by us?

In treating of those states of the mind which constitute our general notions, I have already, in a great measure, anticipated the remarks which it might otherwise be necessary to offer, in explanation of abstraction. The relative suggestions of resemblance are, in truth, or at least involve as parts of the suggestion, those very feelings, for the production of which this peculiar faculty is assigned. We perceive two objects,—a rock, for example, and a tree: We press against them; they both produce in us that sensation, which constitutes our feeling of resistance. We give the name of hardness to this common property of the external objects; and our mere feeling of resemblance, when referred to the resembling objects, is thus converted into an abstraction. If we are capable of feeling the resemblance, the abstraction is surely already formed, and needs, therefore, no other power to produce it.

To that principle of relative suggestion, by which we feel the resemblance of objects in certain respects, to the exclusion, consequently, of all the other circumstances in which they have no resemblance, by far the greater number of our abstractions, and those which most commonly go under that name, may in this manner be traced; since, in consequence of this principle of our mind, we are almost incessantly feeling some relation of similarity in objects, and omitting, in consequence, in this feeling of resemblance, the parts or circumstances of the complex whole, in which no similarity is felt. What is thus termed abstraction, is the very notion of partial similarity. It would be as impossible to regard objects as similar in certain respects, without having the conceptions termed abstract, as to see without vision, or to hope without desire. The capacity of the feeling of resemblance, then, is the great source of the conceptions termed abstract. Many of them, however, may be referred, not to that susceptibility of the mind, by which our relative suggestions arise, but to that other susceptibility of suggestions of another kind, which we previously considered. In those common instances of simple suggestion, which philosophers have ascribed to a principle of association, they never have thought it necessary to prove, nor have they even contended, that the feelings which arise in consequence of this mere association, must be exact transcripts of the former feelings in every respect, however complex those former feelings may have been; that, when we have seen a group of objects together, no part of this group can be recalled, without the rest; no rock, or streamlet, of a particular valley, for example, without every tree,

and every branch of every tree, that were seen by us waving over the little current, and every minute angle of the rock, as if measured with geometrical precision. Suggestions of images so exact as this, perhaps never occur; and if every conception, therefore, which meets some circumstance of the complex perception which has given rise to it, be the result of a faculty, which is to be termed the faculty of abstraction, the whole imagery of our thought, which has been ascribed to an associating or suggesting principle, should have been considered rather as the result of this power, in its never-ceasing operation. But, if we allow, that in ordinary association, the principle of simple suggestion can account for the rise of conceptions, that omit some circumstances of the past, it would surely be absurd to attempt any limitation of the number of circumstances which may be omitted, by the operation of this principle alone, and to refer every circumstance that is omitted, beyond this definite number, to another faculty, absolutely distinct. The truth is, that it is only of certain parts of any complex perception, that our simple suggestions, in any case, are transcripts; that the same power which thus, without any effort of our volition, and even without our consciousness that such a suggestion is on the point of taking place, brings before us only three out of four circumstances that coexisted in some former perception, might as readily be supposed to bring before us two of the four, or only one; and that the abstraction, in such a case, would be thus as independent of our will, as the simple suggestion; since it would be, in truth, only the simple suggestion, under another name, being termed an abstraction, merely because, in certain cases, we might be able to remember the complex whole, with the circumstances omitted in the former partial suggestion, and thus to discover, by comparison of the two coexisting conceptions, that the one is to the other, as a whole to some part of the whole. If this comparison could be made by us in every case, there is not a single conception in our whole train of memory or fancy, which would not equally deserve to be denominated an abstraction.

Many of the states of mind, which we term abstractions, might thus arise by mere simple suggestion, though we had not, in addition to this capacity, that susceptibility of relative suggestion, by which we discover resemblance, and to which, certainly, we are indebted for the far greater number of feelings, which are termed abstract ideas. The partial simple suggestion of the qualities of objects, in our trains of thought, is less wonderful, when we consider how our complex notions of objects are formed. In conceiving the hardness separately from the

whiteness of an object, we have no feeling that is absolutely new; we only repeat the process by which our conceptions of these qualities were originally formed. We received them separately, through the medium of different senses; and each, when it recurs separately, is but the transcript of the primary sensation.

But even though objects, as originally perceived, had been precisely, in every respect, what they now appear to us,—concretes of many qualities,—the capacity of relative suggestion, by which we feel the resemblances of objects, would be of itself, as I have said, sufficient to account for the abstractions, of which philosophers have written so much. It is superfluous, therefore, to ascribe to another peculiar faculty what must take place, if we admit only the common mental susceptibilities, which all admit. If we are capable of perceiving a resemblance of some sort, when we look at a swan and on snow, why should we be astonished that we have invented the word whiteness, to signify the common circumstance of resemblance? Or why should we have recourse for this feeling of whiteness itself to any capacity of the mind, but that which evolves to us the similarity which we are acknowledged to be capable of feeling?

Whatever our view of the origin of these partial conceptions may be, however, the truth of the general negative argument, at least, must be admitted, that we have no power of singling out, for particular consideration, any one part of a complex group; since in the very intention of separating it from the rest, we must already have singled it out in our will, and consequently in our thought; and that we do not need any new operation, therefore, to conceive, what we must have conceived before the supposed operation itself could take place.

I have now, then, brought to a conclusion my analysis of the intellectual phenomena; and have shown, I flatter myself, or at least have endeavoured to show, that all these phenomena, which are commonly ascribed to many distinct faculties, are truly referable only to two—the capacity of simple suggestion, which gives to us conceptions of external objects formerly perceived, and of all the variety of our past internal feelings, as mere conceptions, or fainter images of the past; and the capacity of relative suggestion, by which the objects of our perception or conception, that are themselves separate, no longer appear to us separate, but are instantly invested by us with various relations that seem to bind them to each other, as if our mind could give its own unity to the innumerable objects which it comprehends, and, like that mighty Spirit which once hovered over the confusion of unformed nature, convert

into a universe what was only chaos before.

We have a capacity of conceiving objects, a capacity of feeling the relations of objects; and to those capacities all that is intellectual in our nature is reducible. In treating of the phenomena of these two powers, I have not merely examined them, as I would have done if no previous arrangements of the same phenomena had been made by philosophers, but I have examined, afterwards, those arrangements also; not omitting, as far as I know, any one of the faculties of which those writers speak. If it has appeared, therefore, in this review, that the distinctions which they have made have been founded on errors, which we have been able to trace; and that the faculties of which they speak are all, not merely reducible, but easily reducible, to the two classes of the intellectual phenomena which I have ventured to form; this coincidence, or facility of corresponding reduction, must be allowed to furnish a very powerful argument in support of my arrangement, since the authors who have formed systems essentially different, cannot be supposed to have accommodated the phenomena of which they treated to a system which was not their own; though a theologist himself may, in some cases, perhaps with reason, be suspected of an intentional accommodation of this sort, for the honour of his system, and, in many more cases, without any intention of distorting a single fact, or omitting a single circumstance unfavourable to his own opinions, may, by the influence of those opinions, as a more habitual form of his thought, perceive every thing, in a stronger light, which coincides with them, and scarcely perceives those objects with which they do not harmonize.

That two simple capacities of the mind should be sufficient to explain all the variety of intellectual phenomena, which distinguish man from man, in every tribe of savage and civilized life, may indeed seem wonderful. But of such wonders, all science is nothing more than the development, reducing, and bringing as it were, under a single glance, the innumerable objects that seemed to mock, by their infinity, the very attempt of minute arrangement. The splendid profusion of apparent diversities, in that earth which we inhabit, are reduced by us chemically to a few elements that, in their separate classes, are all similar to each other. The motions, which it would be vain for us to think of numbering, of every mass, and of every particle of every mass, have been reduced to a few laws of motion still more simple; and if we regard the universe itself in the noblest light in which it can be viewed,—that which connects it with its omnipotent Creator,—its whole infinity of wonders are to be considered as the effect but of one simple voli-

tion. At the will of God, the world arose, and when it arose, what innumerable relations were present, as it were, and involved in that creative will; the feeling of a single instant, comprehending at once what was afterwards to occupy and to fill the whole immensity of space, and the whole eternity of time.

LECTURE LII.

RETROSPECT OF THE ORDERS OF THE PHENOMENA OF MIND, ALREADY CONSIDERED.—OF EMOTIONS,—CLASSIFICATION OF THEM, AS IMMEDIATE, RETROSPECTIVE, OR PROSPECTIVE,—AND EACH OF THESE SUBDIVIDED, AS IT INVOLVES, OR DOES NOT INVOLVE SOME MORAL AFFECTION.—I. IMMEDIATE EMOTIONS, INVOLVING NO MORAL AFFECTION.—1. CHEERFULNESS—MELANCHOLY.

GENTLEMEN, after the attention which we have paid to the class of external affections of the mind, and to that great order of its internal affections, which I have denominated intellectual, the only remaining phenomena which, according to our original division, remain to be considered by us, are our emotions.

This order of our internal feelings is distinguished from the external class, by the circumstances which I have already pointed out, as the basis of the arrangement,—that they are not the immediate consequence of the presence of external objects, but, when excited by objects without, are excited only indirectly, through the medium of those direct feelings, which are commonly termed sensations or perceptions. They differ from the other order of the same internal class,—from the intellectual states of mind, which constitute our simple or relative suggestions of memory or judgment,—by that peculiar vividness of feeling which every one understands, but which it is impossible to express by any verbal definition; as truly impossible, as to define sweetness, or bitterness, a sound, or a smell, in any other way, than by a statement of the circumstances in which they arise. There is no reason to fear, however, from this impossibility of verbal definition, that any one, who has tasted what is sweet or bitter, or enjoyed the pleasures of melody and fragrance, will be at all in danger of confounding these terms; and, as little reason is there to fear, that our emotions will be confounded with our intellectual states of mind, by those who have simply remembered and compared, and have also loved or hated, desired or feared.

Before we proceed to consider the order of emotions, it may be interesting to cast a

short glance over the other orders of the phenomena of the mind, before considered by us.

In the view which we have taken of the external or sensitive affections of the mind, we have traced those laws, so simple and so efficacious, which give to the humblest individual, by the medium of his corporeal organs, the possession of that almost celestial scene, in which he is placed, till he arrive at that nobler abode which awaits him,—connecting him not merely with the earth which he treads, but indirectly also with those other minds which are journeying with him in the same career, and that enjoy at once, by the same medium of the senses, the same beauties and glories that are shed around them, with a profusion so divine, as almost to indicate, of themselves, that a path so magnificent is the path to heaven. A few rays of light thus reveal to us, not forms and colours only, which are obviously visible, but latent thoughts, which no eye can see; a few particles of vibrating air enable mind to communicate to mind, its most spiritual feelings,—to awake and be awakened mutually to science and benevolent exertion, as if truths, and generous wishes, and happiness itself, could be diffused in the very voice that scarcely floats upon the ear.

Such are our mere sensitive feelings, resulting from the influence of external things, on our corresponding organs, which are themselves external. The view of the intellectual states of the mind, to which we next proceeded, laid open to us phenomena still more astonishing—those capacities, by which we are enabled to discover in nature more than the causes of those brief separate sensations which follow the affections of our nerves,—to perceive in it proportion and design, and all those relations of parts to parts, by which it becomes to us a demonstration of the wisdom that formed it,—capacities, by which, in a single moment, we pass again over all the busiest adventures of all the years of our life, or, with a still more unlimited range of thought, are present, as it were, in that remote infinity of space, where no earthly form has ever been, or, in the still more mysterious infinity of time,—in ages, when the universe was not, nor any being, but that Eternal One, whose immutable existence is all which we conceive of eternity.

Such are the wonders, of which we acquire the knowledge, in those phenomena of the mind which have been already reviewed by us. The order of feelings, which we are next to consider, are not less important, nor important only in themselves, but also in their relation to those other phenomena which have been the subjects of our inquiry; since they comprehend all the higher delights

which attend the exercise of our sensitive and intellectual functions. The mere pleasures of sense, indeed, as direct and simple pleasures, we do not owe to them; but we owe to them every thing which confers on those pleasures a more ennobling value, by the enjoyments of social affection which are mingled with them, or the gratitude which, in the enjoyment of them, looks to their divine author. We might perhaps, in like manner, have been so constituted with respect to our intellectual states of mind, as to have had all the varieties of these, our remembrances, judgments, and creations of fancy, without one emotion. But without the emotions which accompany them, of how little value would the mere intellectual functions have been! It is to our vivid feelings of this class we must look for those tender regards which make our remembrances sacred; for that love of truth and glory, and mankind, without which, to animate and reward us, in our discovery and diffusion of knowledge, the continued exercise of judgment would be a fatigue rather than a satisfaction; and for all that delightful wonder which we feel, when we contemplate the admirable creations of fancy, or the still more admirable beauties of their unfading model; that model which is ever before us, and the imitation of which, as it has been truly said, is the only imitation that is itself originality. By our other mental functions, we are mere spectators of the machinery of the universe, living and inanimate; by our emotions, we are admirers of nature, lovers of man, adorers of God. The earth, without them, would be only a field of colours, inhabited by beings who may contribute, indeed, more permanently, to our means of physical comfort, than any one of the inanimate forms which we behold, but who, beyond the moment in which they are capable of affecting us with pain or pleasure, would be only like the other forms and colours, which would meet us wherever we turned our weary and listless eye; and God himself, the source of all good, and the object of all worship, would be only the Being by whom the world was made.

In the picture which I have now given of our emotions, however, I have presented them to you in their fairest aspects: there are aspects, which they assume, as terrible as these are attractive; but even, terrible as they are, they are not the less interesting objects of our contemplation. They are the enemies with which our moral combat, in the warfare of life, is to be carried on; and, if there be enemies that are to assail us, it is good for us to know all the arms and all the arts with which we are to be assailed; as it is good for us to know all the misery which would await our defeat, as much as all the happiness which would crown our success,

that our conflict may be the stronger, and our victory, therefore, the more sure.

In the list of our emotions of this formidable class, is to be found every passion which can render life guilty and miserable,—a single hour of which, if that hour be an hour of uncontrolled dominion, may destroy happiness for ever, and leave little more of virtue than is necessary for giving all its horror to remorse. There are feelings, as blasting to every desire of good, that may still linger in the heart of the frail victim who is not yet wholly corrupted, as those poisonous gales of the desert, which not merely lift in whirlwinds the sands that have often been tossed before, but wither even the few fresh leaves which, on some spot of scanty verdure, have still been flourishing amid the general sterility.

When we consider the pure and generous, as well as the selfish and malignant desires of man, in the effects to which they have led,—that is to say, when we consider the varieties of some of our mental affections of this class,—we may be said to consider every thing which man has done and suffered, because we consider every thing from which his actions and his very sufferings have flowed. All civil history is nothing more than the record of the passions of a few leaders of mankind. “Happy, therefore,” it has been said, “the people whose history is the most wearisome to read.” Whatever the Cæsars, and Alexanders, and the other disturbers of the peace of nations, have perpetrated, may have been planned with relation to the particular circumstances of the time; but this very plan, even when accommodated to temporary circumstances, was the work of some human emotion which is not of a month, or year, or age, but of every time. In perusing the narratives of what they did, we feel that we are reading not so much the history of the individuals, as the history of our common nature; of those passions by which we are agitated, and which, while the race of mankind continue to subsist, will always, but for the securer restraints which political wisdom and the general state of society may have imposed, be sufficiently ready to repeat the same project of personal advancement, at the same expense of individual virtue and public happiness. The study of the mental phenomena, in their general aspect, as it is the study of the sources of human action, is thus, in one sense, a sort of compendious history of the civil affairs of the world, a history not merely of the past and the present, but of the future also. It resembles, in this respect, what we are told of the hero of a metaphysical romance,—that in physiognomy his penetration was such, that “from the picture of any person he could write his life, and from the features of the parents, draw the features of any child that was to be born.”

Such, in some measure, though certainly far less exact, is that future history of the world, which a speculator on the state and prospects of civil society draws from a knowledge of the nature of man. He may err, indeed, in his picture of unexisting things; but every political regulation, must, in part at least, proceed on views of events that do not yet exist, as thus prophetically imaged in the very nature of the mind, or it scarcely can deserve the name of an act of legislative wisdom; and he is truly the wisest politician, who is, in this sense, the most accurate historian of the future.

In now entering on the consideration of that order of our feelings, which I have comprehended under the name of Emotions, it may seem doubtful whether it would be more expedient to treat of them simply as elementary feelings, or in those complex forms in which they usually exist, and have received certain definite characteristic names that are familiar to you. This latter mode appears to me, on the whole, more advisable, as affording many advantages, direct and indirect, and allowing equally the necessary analysis in each particular case. If I were to treat of them only as elementary feelings, they might be classed under a very few heads; the whole, as I conceive, or certainly, at least, the greater number of them, under the following: Joy, grief, desire, astonishment, respect, contempt, and the two opposite species of vivid feelings, which distinguish to us the actions that are denominated vicious or virtuous. But, though the vivid feelings, to which we give these names, may, from their general analogy, admit of being comprehended in this brief arrangement, it must be remembered, that, brief as the vocabulary is, it comprehends feelings, which, though analogous, are still not precisely the same; that the single word joy, for example, expresses many varieties of delightful feelings, the single word desire, many feelings, which, in combination with their particular objects, are so modified by these, as to appear to us, in their complex forms, almost as different as any other feelings of our mind which we class under different names. It is in their complex state that they impress themselves most strongly on our observation in others, and form, in ourselves, all that renders most interesting to us the present and the future, and all that is most vivid in our remembrances of the past. Considered, therefore, in this aspect, they admit of much illustration from the whole field of human life, and afford opportunities for many practical references to conduct, and many analyses of the motives that secretly influence it,—for which there would scarcely be a place, if they were to be considered simply as elementary feelings. I repeat, therefore, that the order in which I intend to treat of them,

will regard them in their ordinary state of complication with particular conceptions or other emotions, though I shall be careful, at the same time, to state to you, in every case, as minutely as may be in my power, the elements of which the complex whole is composed.

In treating of them in this view, the most obvious principle of general arrangement seems to me to be one of which I have already more than once availed myself,—their relation to time; as immediate, or involving no notion of time whatever; as retrospective, in relation to the past; or as prospective, in relation to the future. Admiration, remorse, hope, may serve as particular instances, to illustrate my meaning in this distinction which I would make. We admire what is before us, we feel remorse for some past crime, we hope some future good.

In conformity with this arrangement of our emotions, as immediate, retrospective, prospective, the first set which we have to consider are those which arise without involving necessarily any notion of time.

These immediate emotions, as I have termed them, may be subdivided, according to the most interesting of their relations,—as they do not involve any feeling that can be termed moral, or as they do involve some moral affection.

Of the former kind, which do not involve necessarily any moral affection, are cheerfulness, melancholy, our wonder at what is new and unexpected, our mental weariness of what is long continued without interest, our feeling of beauty, and that opposite emotion, which has no corresponding and equal name, since ugliness can scarcely be regarded as coextensive with it,—our feelings of sublimity and ludicrousness.

To the latter subdivision may be referred the vivid feelings, that constitute to our heart what we distinguish by the names of vice and virtue,—if these vivid feelings be considered simply as emotions, distinct from the judgments, which may at the same time measure actions, in reference to some particular standard of morality, or to the amount of particular or general good, which they may have tended to produce, and which might so measure them, without any moral emotion, as a mathematician measures the proportion of one figure to another,—our emotions of love and hate,—of sympathy with the happy and with the miserable,—of pride and humility, in the various forms which these assume.

These, if not all, are at least the most important of our immediate emotions.

The first emotions, then, which we have to consider, of that order which has no reference to time, are Cheerfulness and Melancholy.

Cheerfulness, which, at every moment, may be considered only as a modification of joy, is a sort of perpetual gladness. It is that state which, in every one, even in those of the most gloomy disposition, remains for some time after any event of unexpected happiness, though the event itself may not be present to their conception at the time; and which, in many of gayer temperament, seems to be almost a constant frame of the mind. In the early period of life, this alacrity of spirit is like that bodily alacrity, with which every limb, as it bounds along, seems to have a delightful consciousness of its vigour. To suspend the mental cheerfulness, for any length of time, is then as difficult as to keep fixed, for any length of time, those muscles to which exercise is almost a species of repose, and repose itself fatigue. In more advanced life, this sort of animal gladness is rarer. We are not happy, without knowing why we are happy; and though we may still be susceptible of joy, perhaps as intense, or even more intense than in our years of unreflecting merriment, our joy must arise from a cause of corresponding importance. Yet, even down to the close of extreme old age, there still recur occasionally some gleams of this almost instinctive happiness, like a vision of other years, or, like those brilliant and unexpected coruscations, which sometimes flash along the midnight of a wintry sky, and of which we are too ignorant of the circumstances that produce them, to know when to predict their return.

Of Melancholy, I may remark, in like manner, that it is a state of mind, which even the gayest must feel for some time after any calamity, and which many feel for the greater part of life, without any particular calamity, to which they can ascribe it. Without knowing why they should be sorrowful, they still are sorrowful, even though the weathercock should not have moved a single point nearer to the east, nor a single additional cloud given a little more shade to the vivid brightness of the sun.

I need not speak of that extreme depression, which constitutes the most miserable form of insanity, the most miserable disease; that fixed and deadly gloom of soul, to which there is no sunshine in the summer sky, no verdure or blossom in the summer field, no kindness in affection, no purity in the very remembrance of innocence itself, no heaven, but hell,—no God, but a demon of wrath. With what strange feelings of more than commiseration, must we imagine Cowper to have written that picturesque description, of which he was himself the subject :—

Look where he comes. In this embower'd alcove
Stand close conceal'd, and see a statue move;
Lips busy, and eyes fix'd, foot falling slow,
Arms hanging idly down, hands clas'd below !—
That tongue is silent now; that silent tongue
Could argue once, could jest, or join the song,

Could give advice, could censure or commend,
Or charm the sorrows of a drooping friend.—
Now,* neither heathy wilds, nor scenes as fair
As ever recompens'd the peasant's care,—
Nor gales that catch the scent of blooming groves,
And waft it to the mourner as he roves,
Can call up life, into his faded eye,
That passes all he sees unheeded by.†

Cases of this dreadful kind, however, are fortunately rare : but some degree of melancholy all must have experienced; that internal sadness, which we diffuse unconsciously from our own mind over the brightest and gayest objects without, almost in the same manner, and with the same unflinching certainty, as we invest them with the colours, which are only in our mental vision.

The scenery, which *Eloisa* describes, is sufficiently gloomy of itself. But with what additional gloom does she cloud it in her description :—

The darksome pines that o'er yon rock reclin'd
Wave high, and murmur to the hollow wind,
The wandering streams that shine between the hills,
The grotts that echo to the tinkling rills,
The dying gales that pant upon the trees,
The lakes that quiver to the curling breeze;
No more these scenes my meditation aid,
Or lull to rest the visionary maid :
But o'er the twilight groves and dusky caves,
Long sounding isles and intermingled graves,
Black Melancholy sits, and round her throws
A death-like silence, and a dread repose.
Her gloomy presence saddens all the scene,
Shades every flower, and darkens every green,
Depends the murmur of the falling floods,
And breathes a browner horror on the woods.‡

Of the melancholy of common life, there are two species that have little resemblance. There is a sullen gloom, which disposes to unkindness, and every bad passion; a fretfulness, in all the daily and hourly intercourse of familiar life, which, if it weary at last the assiduities of friendship, sees only the neglect which it has forced, and not the perversity of humour which gave occasion to it, and soon learns to hate, therefore, what it considers as ingratitude and injustice; or, which, if friendship be still assiduous as before, sees, in these very assiduities, a proof not of the strength of that affection, which has forgotten the acrimony to sooth the supposed uneasiness which gave it rise, but a proof that there has been no offensive acrimony to be forgotten, and persists, therefore, in every peevish caprice, till the domestic tyranny become habitual. This melancholy temper, so poisonous to the happiness, not of the individual only, but of all those who are within the circle of its influence, and who feel their misery the more, because it may perhaps arise from one whom they strive, and vainly strive, to love, is the temper of a vulgar mind. But there is a melancholy of a gentler species, a melancholy

* Then, in the original.

† Cowper's Poems. Retirement, v. 283—286, 289—292, 331, 332, 337—340.

which, as it arises, in a great measure, from a view of the sufferings of man, disposes to a warmer love of man the sufferer, and which is almost as essential to the finer emotions of virtue, as it is to the nicer sensibilities of poetic genius. This social and intellectual effect of philosophic melancholy is described with a beautiful selection of moral images, by the Author of the Seasons.

He comes ! he comes ! in every breeze the Power
Of Philosophic Melancholy comes !
His near approach the sudden-starting tear,
The glowing cheek, the mild dejected air,
The softened feature, and the beating heart,
Pierc'd deep with many a virtuous pang, declare.
O'er all the soul his sacred influence breathes !
Inflames Imagination ; through the breast
Infuses every tenderness ; and far
Beyond dim earth exalts the swelling thought.
Ten thousand thousand fleet ideas, such
As never mingled with the vulgar dream,
Crowd fast into the mind's creative eye.
As fast the correspondent passions rise
As varied, and as high : Devotion rais'd
To rapture, and divine astonishment ;
The love of Nature, unconfin'd, and, chief,
Of human race ; the large ambitious wish,
To make them blest ; the sigh for suffering worth
Lost in obscurity ; the noble scorn
Of tyrant-pride ; the fearless great resolve ;
The wonder which the dying patriot draws,
Inspiring glory through remotest time ;
Th' awaken'd throb for virtue, and for fame ;
" He sympathies of love, and friendship dear :
With all the social offspring of the heart."

The same influence is, by another poet, made peculiarly impressive, by a very happy artifice. In Akenside's Ode to Cheerfulness, which opens with a description of many images and impressions of gloom, and in which the Power, who alone can dispel them, is invoked to perform this divine office, he returns at last to those images of tender sorrow, which he would be unwilling to lose, and for the continuance of which, therefore, he invokes that very cheerfulness, which he had seem'd before to invoke for a gayer purpose :—

Do thou conduct my fancy's dreams
To such indulgent placid themes,
As just the struggling breast may cheer,
And just suspend the starting tear,
Yet leave that sacred sense of woe
Which none but friends and lovers know.†

How universally a certain degree of disposition to melancholy, is supposed to be connected with genius, at least with poetic genius, is manifest from every description which has been given by those who have formed imaginary pictures of the rise and progress of this high character of thought. The descriptions, I have said, are imaginary, but they still show sufficiently the extent of that observation, on which so general an agreement must have been founded. The melancholy, indeed, is not inconsistent with occasional emotions of an opposite kind ; on the contrary, it is always supposed to be coupled with a disposition to mirth, on occasions in which others see perhaps as little

cause of merriment, as they before saw of melancholy ; but the general character to which the mind most readily returns, is that of sadness,—a sadness, however, of that gentle and benevolent kind, of which I before spoke. The picture which Beattie gives of his Minstrel, is exactly of this kind ; and even if it had not absolute truth, must be allowed to have at least that relative truth which consists in agreement with the notion which every one, of himself, would have been disposed previously to form.

And yet poor Edwin was no vulgar boy ;
Deep thought oft seem'd to fix his infant eye ;
Dainties he heeded not, nor gauds, nor toy,
Save one short pipe of rudest minstrelsy ;
Silent when glad ; affectionate, though shy ;
And now his look was most demurely sad ;
And now he laugh'd aloud, yet none knew why.
The neighbours start'd and sigh'd, yet bless'd the lad ;
Some deem'd him wondrous wise, and some believed
him mad.

In truth, he was a strange and wayward wight,
Fond of each gentle and each dreadful scene,
In darkness and in storm he found delight,
No less than when on ocean-wave serene,
The southern sun diffus'd his dazling shene.
Even sad vicissitude amused his soul ;
And if a sigh would sometimes intervene,
And down his cheek a tear of pity roll,
A sigh, a tear so sweet he wish'd not to control.‡

The state of melancholy, as I have already remarked, when it is not constitutional and permanent, but temporary, is a state which intervenes between the absolute affliction of any great calamity, and that peace to which, by the benevolent arrangement of Heaven, even melancholy itself ultimately leads. As it is nearer to the time of the calamity, and the consequent profound affliction, the melancholy itself is more profound, and gradually softens into tranquillity, after a period, that is in some degree proportioned to the violence of the affliction.

"Finem dolendi etiam qui consilio non fecerat, tempore invenit,"§ says Seneca. What then, you say, shall I forget my friend? No ! He is not to be forgotten. But soon, indeed, would he be forgotten, if his memory were to last only with the continuance of your grief. Fixed and sad as your brow now may be, it will soon require but a trifle to loose it into smiles. "Quid, ergo, inquis, obliviscar amici? Brevem illi apud te memoriam promittis, si cum dolore mansura est. Jam istam frontem ad risum quaelibet fortuita res transferet. Non differo in longius tempus, quo desiderium omne mulcetur, quo etiam acerrimi luctus residunt : cum primum te observare desieris, imago ista tristitiae discedet. Nunc ipse custodis dolorem tuum, sed custodienti quoque elabitur, eoque citius, quo est acrior, desinit."||

"The great philosopher Citophilus," says Voltaire, in one of the most pleasing of his little tales, "was one day in company with a

* Thomson's Seasons. Autumn, v. 1002—1027.

§ Epist. 63.

|| Epist. 63.

female friend, who was in the utmost affliction, and who had very good reason to be so. Madam, said he to her, the Queen of England, the daughter of our great Henry was as unfortunate as you. She was almost drowned in crossing our narrow channel, and she saw her royal husband perish on the scaffold.—I am very sorry for her, said the lady; and she began to weep her own misfortunes.

“But, said Citophilus, think of Mary Stewart. She loved, very honourably, a most noble musician, who sung the finest tenor in the world. Her husband killed her musician before her very eyes; and afterwards her good friend, and good relation, Queen Elizabeth, who first kept her in prison eighteen years, contrived to have her beheaded on a scaffold, covered most beautifully with the finest black.—That was very cruel, answered the lady; and she sunk back into her melancholy as before.

“You have perhaps heard of the beautiful Joan of Naples, said the comforter. She was seized, you know, and strangled.—I have a confused remembrance of it, said the lady.

“I must tell you, added the other, the adventures of a queen, who was dethroned in my own time, after supper, and who died in a desert island.—I know the whole story, she replied.

“Well, then, how can you think of being so miserable, when so many queens and great ladies have been miserable before you? Think of Hecuba! Think of Niobe!—Ah! said the lady, if I had lived in their time, or in the time of those beautiful princesses of whom you speak, and if, to comfort them, you had told them my griefs, do you think they would have listened to you?

“The next day the philosopher lost his only son, and was at the very point of death with affliction. The lady got a list made out of all the kings who had lost their children, and carried it to the philosopher. He read it, found the list to be very accurate, and did not weep the less. Three months afterwards, they met again, and were quite astonished, at meeting, to find themselves so gay. They resolved immediately to erect a beautiful statute to Time, and ordered this inscription to be put upon it, ‘*To the Comforter.*’”*

The tale, it must be admitted, is a very faithful picture of the power of time, the universal comforter, and of the comparative inefficacy of the ordinary topics of consolation. But how is it that time does produce this effect? Some remarks, which I formerly made in treating of association,

will aid us, I think, in explaining the mystery.

A very easy solution of it is sometimes attempted by the analogy of bodily pains and pleasures, which become more tolerable in the one case, and less delightful in the other case, when long continued; and the analogy must be admitted to a considerable extent, but is far from affording the complete solution required. We feel bodily pain, indeed, less acutely, after long torture, because our nervous frame is oppressed by the continued suffering. But, in the case of grief, there is not this oppression; and when we have ceased to grieve for one calamity, we are still as susceptible as before of the emotion itself, and require only some new calamity to feel again, with the same acuteness, all the agony which we suffered.

It is not mere corporeal exhaustion, therefore, that can account for the diminution of sorrow. It is because the source of the sorrow itself is removed as it were at a distance, and has admitted in the mean while of various soothing associations; and still more, of various other emotions, which, without any relation to our grief itself, have modified and softened it, by exciting an interest that was incompatible with it, or rather that changed its very nature, by the union with it which they may have formed.

The melancholy emotion, which remains after any great affliction,—after the death, for example, of a husband or a child,—is, of course, when recent, combined with few feelings that do not harmonize with the grief itself, and augment it, perhaps, rather than diminish it. In a short time, however, from the mere unavoidable events of life, other feelings, suggested by these events, combine with that melancholy with which they coexist, so as to form with it one complex state of mind. When the melancholy remembrance recurs, it recurs, therefore, not as it was before, but as modified by the combination of these new feelings. In the process of time, other feelings, that may casually but frequently coexist with it, combine with it in like manner; the complex state of mind partaking thus gradually less and less of the nature of that pure affliction which constituted the original sorrow, till at length it becomes so much softened and diversified by repeated combinations, as scarcely to retain the same character, and to be rather sadness, or a sort of gentle tenderness, than affliction. The coexistence of the melancholy thought, when it recurs, with other new feelings that may be accidentally excited at the time, constitutes, then, I conceive, one of the chief circumstances on which the softening influence depends.

It must be remembered too, as a very strong circumstance additional, that the effect is not confined to the direct feeling it

* Les deux Consolés, Œuvres, 1to. edit. of 1771, tom. xiv. p. 86, 87.

self, but that every surrounding object, which before was associating perhaps chiefly with the object of regret, and recalled this object more frequently than any other, becomes afterwards associated with other objects, which it recalls more frequently than the object of regret, in consequence of that secondary law of suggestion, by which feelings, recently co-existing or proximate, rise again more readily in mutual succession.

There is scarcely an object which can meet a father's eye, soon after the death of his child, which does not bring that child before him; thus aggravating, at every moment, the sorrow which was felt the very moment preceding. If, even at this period of recent affliction, we could, by any contrivance, prevent these melancholy suggestions by suggestions of a different kind, it is evident that we should not merely prevent the aggravation of distress which they occasion, but could not fail even to alleviate what was felt before, by the revival of thoughts and emotions which would have no peculiar relation to the object lost. This, which we cannot by any contrivance completely produce, is the effect which time necessarily produces by rendering stronger the suggestion of recent objects and events, and thus making every thing which meets our eyes, a memorial of every thing more than of him whom we lament. What time more fully produces, is produced, in some degree, by mere change of scene, especially if the country through which we pass be new to us; and is produced evidently in both cases, by the operation of the same principle.

Another very abundant source of the misery which is felt, in such a recent affliction, is the relation of the object lost to all the plans which have engaged us, and all the hopes which we have been forming. These, as the recent objects of thought, and its liveliest objects, must, of course, by the operation of the common laws of suggestion, frequently arise to the mind. They all now, however, seem frustrated, and our whole life, as it were, in those feelings which alone constituted life to us, suddenly rent or broken. He who listens to the lamentations of a disconsolate parent, for the loss of an only child, cannot fail to perceive how much of the affliction depends on this very circumstance, and how readily the delightful cares of education in past years, and the equally delightful hopes of years that were to come, arise to imbitter the anguish of the present. These cares and hopes must then arise, indeed, because they were the chief feelings with which the mind has been occupied. In the progress of time, however, other cares and other hopes unconnected with the lost object of regard, must necessarily engage the mind; and these, as more recent, arise, of course, more readily by suggestion, and thus fill, not the busy hours

of action only, but the very hours of meditation and repose.

On these causes combined, I conceive the soothing influence of time to depend. The melancholy is less frequently excited, because fewer objects now recall it, and it is at the same time gentler when it is excited; because it rises now, mingled as it were with other feelings that have at different times coexisted with it, and modified it; and these circumstances, if they be not sufficient to account for the tranquillity or serene grief which ultimately arises, must at least be allowed to be circumstances that concur powerfully with whatever other unknown circumstance may be instrumental in producing the same happy influence.

Of the facts which this theory of the mollifying influence of time assumes, there can be no question. The same principle, by which the objects that surround us were originally connected with the conception of the object of our regret, must, of course, continue its operation, when that object itself has certainly ceased to exist, and must connect new objects, therefore, as it before connected the past. In like manner, the principle which led to the combination of feelings that gave peculiar vividness to any one of our emotions, must continue to combine new feelings with the very affliction; and to combine new feelings with it, is in some degree to alter its nature, in the same way as the thousand offices of kindness, to which reciprocal friendship gives occasion, alter continually, by augmenting with their own united influence, those simple feelings of regard in which the friendship had its origin.

Such, then, is the bountiful provision of heaven, that man cannot long be wretched, from griefs to which his own guilt has not led,—and that sorrow, even though it had nothing else to comfort it, derives a never-failing comfort from that very continuance of affliction, which, but for our experience, might have seemed capable only of aggravating it. Time is truly *the comforter*, at once lessening the tendency to suggestion of images of sorrow, and softening that very sorrow when the images arise.

LECTURE LIII.

I. IMMEDIATE EMOTIONS, WHICH DO NOT NECESSARILY INVOLVE ANY MORAL FEELING, CONTINUED.—2. WONDER AT WHAT IS NEW AND STRANGE—UNEASY LANGUOR WHEN THE SAME UNVARIED FEELINGS HAVE LONG CONTINUED.—3. ON BEAUTY AND ITS REVERSE.

IN my last Lecture, Gentlemen, I entered on the consideration of our Emotions; and

after stating the small number of elementary feelings to which they seem to admit of being reduced, and the reasons which led me to prefer the consideration of them in the complex state in which they usually exist, I proceeded to arrange these complex varieties of them in three divisions, according to the relation which they bear to time, as immediate, retrospective, prospective. There are certain emotions which arise or continue in our mind, without referring to any particular object or time, such as cheerfulness or melancholy; or which regard their objects simply as existing, without involving, necessarily, any notion of time whatever, such as wonder, or our feelings of beauty and sublimity: these I denominate immediate. There are certain others which regard their objects as past, and which cannot exist without this notion of the past, such as remorse, or revenge, or gratitude: these I denominate retrospective emotions. There are certain others which regard their objects as future, such as the whole tribe of our desires: these I denominate prospective emotions.

It was to the first of these divisions, of course, that I proceeded in the first place; and since man, in the most important light in which we can consider him, is a social being, united by his emotions with whatever he can love or pity, or respect or adore, these, and other moral emotions, seemed to form a very proper subdivision of this particular order, as distinct from the emotions of the same order in which no moral feeling is involved.

The immediate emotions, in which no moral feeling is involved, and which admit, therefore, of being arranged apart, we found to be the following; cheerfulness, melancholy, our wonder at what is new or unexpected, and that emotion of languid uneasiness, which arises from the long continuance of the same objects, or of objects so nearly similar, as scarcely to afford the refreshment of variety; our feeling of beauty, and the emotion opposite to that of beauty; the emotion excited by objects which we term sublime, and the emotion, almost opposite to this, excited by objects which we term ludicrous.

I proceeded, accordingly, to consider these in their order; and, in my last lecture, offered some remarks on the first two in the series, cheerfulness and melancholy, that are obviously mere forms of two of the elementary feelings mentioned by me. I now, then, proceed to the consideration of the next in our arrangement, our feeling of wonder at what is new and strange, and of uneasy languor, when the same unvaried objects have long continued.

Long before we are capable of philosophizing on the different states of our mind, in different circumstances, or even of preserving any distinct memory of these states,

for subsequent speculations on their nature, we have already become familiar with many of the most important successions of events in that part of the physical universe, with which we are immediately connected, so that it is impossible for us to form any conjecture which can be said to approach to certainty, as to the positive nature of our primary feelings, when these successions of events were first observed by us. It seems most probable, however, that the feeling of wonder, which now attends any striking event that is unexpected by us, would not arise in the infant mind, on the occurrence of events, all of which might be regarded as equally new to it; since wonder implies not the mere feeling of novelty, but the knowledge of some other circumstances which were expected to occur, and is therefore, I conceive, inconsistent with absolute ignorance.

At present, with the experience which we have acquired of the order of physical changes, the situation of the mind is very different, on the occurrence of any seeming irregularity. The phenomena of nature are conceived by us, not as separate events, but as uniformly consequent in certain series. We, therefore, do not only see the present, but seeing the present, we expect the future. When the circumstances, which we observe in any case, are very similar to the circumstances formerly observed by us, we anticipate the future with confidence; when the circumstances are considered different, but have many strong similarities to the past, we make the same anticipation, but not with confidence; and if the event should prove to be different from the event anticipated by us, we treasure it up, for regulating our future anticipations in similar circumstances; but we do this, without any emotion of astonishment at the new event itself. It is when we have anticipated with confidence, and our anticipation has been disappointed by some unexpected result, that the astonishment arises, and arises always, with greater or less vividness of feeling, according to the strength of that belief which the expectation involved.

When new and striking objects occur, therefore, in any of the physical trains of events, or when familiar objects occur to us, in situations in which we are far from expecting to find them, a certain emotion arises, to which we give the name of astonishment, or surprise, or wonder, but which, whatever the name may be, is truly the same state of mind,—at least, as an emotion, the same; though different names may be given, with distinctive propriety, to this one emotion, when combined or not combined with a process of rapid intellectual inquiry, or with other feelings of the same class.

When the emotion arises simply, for instance, it may be termed, and is more com-

monly termed, surprise; when the surprise, thus excited by the unexpected occurrence, leads us to dwell upon the object which excited it, and to consider in our mind, what the circumstances may have been, which have led to the appearance of the object, the surprise is more commonly termed wonder; which, as we may dwell on the object long, and consider the possibilities of many circumstances that may have led to the unexpected introduction of it, is, of course, more lasting than the instant surprise, which was only its first stage.

Still, however, though the terms in this sense be not strictly synonymous, but expressive of states more or less complex, the wonder differs from the surprise, only by the new elements which are added to this primary emotion, and not by any original diversity of the emotion itself. Whether it be a familiar object, which we perceive in unexpected circumstances, or an object that is itself as new as it is unexpected, the first feeling of astonishment, which is the emotion now considered by us, is the same in kind, however different the series of subsequent feelings may be. We may feel, for example, only the momentary surprise itself, or we may begin to consider what circumstances are the most likely to have occasioned the presence of the object, and our surprise is, by this union of uncertain and fluctuating thought, converted into wonder; or we may be struck at the same time with the beauty or grandeur of the new object, and our mixed emotion of the novelty and beauty combined will obtain the name of admiration; the simple primary emotion, which we term surprise or astonishment, being in all these cases the same, and being only modified by the feelings of various kinds, that afterwards arise, and coexist with it.

In the History of Astronomy, that very elegant specimen of scientific history, which Dr. Adam Smith has bequeathed to us, in one of the Essays of his posthumous volume, he commences his inquiry with some remarks on the emotion which we are now considering; and contends, as many other philosophers have contended, for an essential distinction of the varieties of the emotion, both with respect to the objects that excite these varieties, and to the nature of the feelings themselves.

What is new and singular, he conceives to excite that feeling,—or sentiment, as he terms it,—which, in strict propriety, is called wonder; what is unexpected, that different feeling which is commonly termed surprise.

“We wonder,” he says, “at all extraordinary and uncommon objects, at all the rarer phenomena of nature, at meteors, comets, eclipses, at singular plants and animals, and at every thing, in short, with which we have before been either little or not at all ac-

quainted; and we still wonder, though forewarned of what we are to see.”

“We are surprised,” he continues, “at those things which we have seen often, but which we least of all expected to meet with in the place where we find them; we are surprised at the sudden appearance of a friend, whom we have seen a thousand times, but whom we did not imagine we were to see then.”*

This distinction, which Dr. Smith makes of wonder and surprise, seems, when we first consider it, a very obvious and accurate one; and yet I conceive, that if we analyse it more minutely, the difference, as I have already endeavoured to show, is more in the circumstances in which the emotions arise; and the thoughts, which are the consequences of the emotions, than in these emotions themselves, as simple feelings of the mind. The circumstances, in which they arise, are obviously very different; since, in the one case, the object is familiar, in the other, new; and the consequences are usually as different; since, in the one case, we are generally able to discover, by mere inquiry, what has led to the presence of the familiar object, in the unexpected situation; and when we know this, we know every thing, or cease to think of it, if such inquiry be ineffectual. In this case, therefore, there is little fluctuation of doubtful and varying conjecture, blending with the emotion and modifying it. In the other case, the very novelty of the object is gratifying to our love of the new, which is one of the strongest of our desires, and leads us to dwell on it with particular interest, while this very novelty, or uncommonness, which stimulates our curiosity to observe and inquire, renders inquiry less easy to be satisfied; and one inquiry, even when satisfactorily answered, far from giving us the knowledge which we desire, leaves of course, when the object is one with which we are unacquainted, many new properties to be investigated. In the one case, that in which a familiar object appears to us, where we did not expect to find it, there is only surprise, or little more; in the other case, when the object itself is new to us, there is surprise, followed by many very doubtful conjectures; and, during these conjectures, from the little satisfaction which they afford, a constant recurrence and mingling of the surprise, with the imperfect inquiries. It is not the emotion, therefore, which is different itself, but the mixture of inquiry and emotion, which, coexisting, form a state of mind different from the simple emotion itself. “The imagination and memory,” to use Dr. Smith’s own words, “extert themselves to no purpose, and in vain

*Smith’s Works, vol. v. p. 55. Lond. 1811-12, 8vo.

look around all their classes of ideas, in order to find one under which it may be arranged. They fluctuate to no purpose from thought to thought; and we remain still uncertain and undetermined where to place it, or what to think of it. It is this fluctuation and vain recollection, together with the emotion or movement of the spirits that they excite, which constitute the sentiment properly called wonder, and which occasion that staring, and sometimes that rolling of the eyes, that suspension of the breath, and that swelling of the heart, which we may all observe, both in ourselves and others, when wondering at some new object, and which are the natural symptoms of uncertain and undetermined thought. What sort of thing can that be? What is that like? are the questions which, upon such an occasion, we are all naturally disposed to ask. If we can recollect many such objects which exactly resemble this new appearance, and which present themselves to the imagination naturally, and as it were of their own accord, our wonder is entirely at an end. If we can recollect but a few, and which requires too some trouble to be able to call up, our wonder is indeed diminished, but not quite destroyed. If we can recollect none, but are quite at a loss, it is the greatest possible.*

Even from this very description which Dr. Smith has given us,—a description which seems to be, in its chief circumstances, a very faithful picture of the phenomena of wonder,—it might be collected, that wonder, as a mere emotion, independently of the trains of thought that may mingle with it, does not differ essentially from surprise; and so completely does he forget the distinction, laid down by himself, which would confine wonder and surprise to distinct objects, that he afterwards speaks of them both as produced by the same object, remarking, that when one accustomed object appears after another, which it does not usually follow, it first excites, by its unexpectedness, the sentiment properly called surprise, and afterwards, by the singularity of the succession, or order of its appearance, the sentiment properly called wonder. “We start and are surprised at seeing it there, and then wonder how it came there;”† that is to say, if I may attempt the analysis, according to the view which I have given you of the complex state or states of mind described, we are first surprised at the appearance of the unaccustomed object; we are desirous of knowing what circumstances have led to the appearance; and, by the various relations which the circumstances perceived bear to other circumstances that may have been present unobserved, and the consequent opera-

tion of the laws of suggestion, not one object only occurs, as a cause in which we might immediately acquiesce, but various possible causes arise to the mind, in judging of which we pass rapidly from one probability to another, and are lost and perplexed with a sort of anxious irresolution. The application of both terms to the emotions excited by one object, in our peculiar situation, is however, as I have before remarked, a sufficient proof that Dr. Smith had either forgotten his original distinction of wonder and surprise, or had seen that the distinction, precise and apposite as it appears at first, involves truly no specific difference of the astonishment itself, but merely of the circumstances which precede or attend it.

The defective analysis, however, on which the distinction of the mere emotion appears to me to be founded,—if I may venture to term it defective,—is an error of much less consequence than another error of Dr. Smith with respect to surprise,—and an error which seems rather incongruous with his former speculation, as to the supposed difference which we have been now considering. Surprise, he thinks to be nothing more than the sudden changes of feelings which are commonly regarded, and, I conceive, truly regarded, as only the circumstances which give occasion to the surprise, not the surprise itself. “Surprise,” he says, “is not to be regarded as an original emotion, of a species distinct from all others. The violent and sudden change produced upon the mind, when an emotion of any kind is brought suddenly upon it, constitutes the whole nature of surprise.”‡ Now, if there be any emotion which is truly original, it really seems to me very difficult to discover one, which could have a better claim to this distinction, than surprise. It certainly is not involved in either of the successive perceptions, or conceptions, or feelings of any kind, the unusual successions of which appear to us surprising; and, if it be not even in the slightest degree involved in either of them separately, it cannot be involved in the two, which contain nothing more, as successive, than they contained separately. When the two are regarded by the mind as objects, indeed, they may give rise to feelings which are not involved in themselves, and the emotion of surprise may be, or rather truly is, one of these secondary feelings; but the surprise is then an original emotion, distinct from the primary states of mind which gave rise to it, indeed, but do not constitute it. Sudden joy, and sudden sorrow, even in their most violent extremes, might succeed each other, reciprocally, in endless succession, without exciting surprise, if the

* Ibid. p. 68.

† Ibid. p. 70.

‡ Ibid. p. 60.

mind had been unsusceptible of any other feelings than joy and sorrow. Surprise is evidently not joy; it is as evidently not sorrow; nor is it a combination of joy and sorrow: it is surely, therefore, something different from both; and we may say with confidence, that before the mind can be astonished at the succession of the two feelings, it must have been rendered susceptible, at least, of a third feeling.

The error of Dr. Smith, in this case, is precisely the same as that fundamental error which we before traced in the system of Condillac and the other French metaphysicians; the error of supposing that a feeling, which is the consequence of certain other previous feelings, is only another form of those very feelings themselves. Joy and sorrow, as mere states or affections of the mind, are as truly different from that state or affection of mind which we term surprise, that may arise from the rapid succession of the two former states, as the fragrance of a rose, the bitterness of wormwood, or any other of our mere sensations, differs from those emotions of gratitude or revenge, into which these, or similar mere sensations, are, according to the very strange doctrine of Condillac, transformed; though, as we found, in examining that system, which assumes without any proof what it would certainly not have been very easy to prove, all which constitutes the supposed transformation, is the mere priority of one set of feelings and subsequence, in time, of another.

Surprise, in like manner, is not, as Dr. Smith contends, a mere rapid change of feelings, but is a new feeling, to which that rapid change gives rise; a state of mind, as clearly distinguishable from the primary feelings that may have given occasion to it, as gratitude is distinguishable from the mere memory of kindness received, or revenge, as an emotion from that mere feeling of injury received, which attends it, indeed, for ever in the mind of the vindictive, but preceded the first desire of vengeance that was kindled by the thought.

The importance of our susceptibility of this emotion of surprise of things unexpected, as a part of our mental constitution, is very obvious. It is in new circumstances that it is most necessary for us to be upon our guard; because, from their novelty, we cannot be aware of the effects that attend them, and require; therefore, more than usual caution, where foresight is impossible. But, if new circumstances had not produced feelings peculiarly vivid, little regard might have been paid to them, and the evil, therefore, might have been suffered, before alarm was felt. Against this danger nature has most providentially guarded us. We cannot feel surprise, without a more than ordinary in-

terest in the objects which may have excited this emotion, and a consequent tendency to pause, till their properties have become, in some degree, known to us. Our astonishment may thus be considered as a voice from that almighty goodness which constantly protects us, that, in circumstances, in which inattention might be perilous, whispers, or almost cries to us, Beware.

Of a kind very different from astonishment, which implies unexpected novelty, is the emotion of weary and languid uneasiness, which we feel from the long continuance of one unvaried object, or from a succession of objects so nearly similar, as scarcely to appear varied. Even objects that originally excited the highest interest, if long continued, cease to interest, and soon become painful. Who, that is not absolutely deaf, could sit for a whole day in a music-room, if the same air, without any variation, were begun again in the very instant of its last note? The most beautiful couplet of the most beautiful poem, if repeated to us without intermission, for a very few minutes, would excite more uneasiness than could have been felt from a single recitation of the dullest stanza of the most soporific inditer of rhymes. By a little wider extension of this principle, we may perceive, how the very excellence of a work of genius often operates against it, in the later estimation which we form of it. What is intrinsically excellent, may indeed admit of being frequently perused, without any diminution, or perhaps even with increase of pleasure,—a circumstance which has been assigned as the distinguishing mark of excellence in works of this sort. But there are limits to this susceptibility of repeated perusal with delight; and, if a work be very excellent, especially if the work be comprised in small compass, we are in great danger of passing these limits, till it become too familiar to us to give us any direct pleasure; and, if it were not for our remembrance of the pleasure which we formerly received, we might be led to think it incapable of giving us any very high delight, merely because it has given us so much delight, as to have wearied us with the too frequent voluntary repetition of it.

What works of genius gain with the multitude by extensive diffusion of the admiration which they excite when very popular, they thus often lose, in its intensity, as a permanent feeling of individuals. How weary are we of many of the lines of our best poets, which are quoted to us for ever, by those who read only what others quote: and the same remark may be made as to those longer passages, or whole pieces, which are collected in the volumes of so many publishers of beauties, as they term them, who see only the beauties which others have seen, and extract, therefore, and collect only what their com-

piling predecessors have extracted and collected, presenting to us very nearly the same volumes, with little more than the difference of the order of the pages. What we admired when we read it first, fatigues and disappoints us when we meet with it so often; and the author appears to us almost trite and common, in his most original images, merely because these images are so very beautiful, as to have become some of the common-places of rhetorical selection. He gains, indeed, by this ubiquity, many admirers, whom he otherwise would not have found; but he loses probably more than he gains, by the diminished pleasure which he affords to the few whose approbation is far more than equal in value to the homage of a multitude of dull admirers.

In travelling over a flat country, amid unvaried scenery, how weary does the mind become! and what refreshment would a single eminence give, that might show us, at a distance, rivers, and woods, and villages, and lakes, or the ocean, still more remote; or at least something more than a few hedge-rows, which, if they show us any thing, seem to show us constantly the same meadow which they have been showing us for miles before. Notwithstanding our certainty, that a road, without one turn, must lead us sooner to our journey's end, it would be to our mind, and thus indirectly to our body also, which is soon weary when the mind is weary, the most fatiguing of all roads. A very long avenue is sufficiently wearying, even when we see the house which is at the end of it. But what patience could travel for a whole day, along one endless avenue, with perfect parallelism of the two straight lines, and with trees of the same species and height, succeeding each other exactly at the same intervals? In a journey like this, there would be the same comfort in being blind, as there would be in a little temporary deafness, in the case before imagined, of the same unvaried melody endlessly repeated in a music-room.

I need not, however, seek any additional illustration of a fact, which, I may take for granted, is sufficiently familiar to you all, without any illustration. You cannot fail to have been subject to the influence of which I speak, in some one or other of its forms; and may remember that weariness of mind, which you would gladly have exchanged for weariness of body, and which it is perhaps more difficult to bear with good humour, than many profound griefs; because it involves, not merely the uneasiness of the uniformity itself, but the greater uneasiness of hope, that is renewed every moment, to be every moment disappointed. The change which we know must come, seems yet never to come. In the case of the supposed journey of a day along one

continued avenue, there can be no doubt, that the uniformity of similar trees, at similar distances, would itself be most wearisome. But what we should feel with far more fretfulness, would be the constant disappointment of our expectation, that the last tree which we beheld in the distance, would be the last that was to rise upon us;—when, tree after tree, as if in mockery of our very patience itself, would still continue to present the same dismal continuity of line.

The great utility of this uneasiness, that arises from the uniformity of impressions which may even have been originally pleasing, it is surely superfluous for me to point out. Man is formed, not for rest, but for action; and if there were no weariness on a repetition of the past, the most general of all motives to action would be instantly suspended. We act, that is to say, we perform what is new, because we are desirous of some result which is new; and we are desirous of the new, because the old, which itself was once new, presents to us no longer the same delight. If the old appeared to us, as it once appeared to us, we should rest in it with most indolent content.

Hope, eager Hope, the assassin of our joy,
All present blessings treading under foot,
Is scarce a milder tyrant than Despair.
Possession, why more tasteless than pursuit?
Why is a wish far dearer than a crown?*

It is not because hope treads our present blessings under foot, that they seem to us to have lost their brightness, but in a great measure, because they already seem to us to have faded, that we yield to the illusions of that hope which promises us continually some blessing more bright and less perishable, from the enjoyment of which it is afterwards to seduce us with a similar deceit.

The diminished pleasure, however, fading into positive uneasiness, which thus arises from uniformity of the past, answers, as we have seen, the most benevolent of purposes. It is to our mind, what the corresponding pain of hunger is to our bodily health. It gives an additional excitement, even to the active; and to far the greater number of mankind, it is perhaps the only excitement which could rouse them, from the sloth of ease, to those exertions by which their intellectual and moral powers are, in some degree at least, more invigorated, or by which, notwithstanding all their indifference to the welfare of others, they are forced to become the unintentional benefactors of that society, to which otherwise they might not have given the labour of a single bodily exertion, or even of a single thought.

After these remarks, on two of our very

* Night Thoughts, VII. v. 107—109, and 112, 113.

common emotions, I proceed to that which is next in the order of our arrangement.

And lo! disclosed in all her smiling pomp,
Where Beauty, onward moving, claims the praise
Her charms inspire.—O source of all delight,*
O thou that kindest in each human heart
Love, and the wish of poets, when their tongue
Would teach to other bosoms what so charms
Their own!—Thee, form divine! thee, Beauty, thee
The regal dome, and thy enlivening ray
The mossy roofs adore:—thou, better sun!
For ever beamed on the enchanted heart
Love, and harmonious wonder, and delight
Poetic! Brightest progeny of Heaven!
How shall I trace thy features? where select
The roseate hues to emulate thy bloom!†

The emotions of beauty, and the feelings opposite to those of beauty, to which I now proceed, are, next to our moral emotions, the most interesting of the whole class. They are emotions, indeed, which, in their effects, either of vice or virtue, may almost be considered as moral, being mingled, if not with our own moral actions, at least in our contemplation of the moral actions of others, which we cannot admire, without making them, in some measure, our own, by that desire of imitating them, which, in such a case, it is scarcely possible for us not to feel; or which, in like manner, we cannot view with disgust and abhorrence, without some strengthening in ourselves of the virtues that are opposite to the vices which we consider.

Delightful as our emotions of beauty are, important as they are in their indirect effects, and universally as they are felt, there is perhaps no class of feelings, in treating which so little precision has been employed by philosophers, and on which so little certainty has been attained. It is a very striking though a quaint remark of an old French writer, La Chambre, in his *Treatise on the Characters of the Passions*, that beauty has had a sort of double effect, in depriving men of their reason. "The greatest men," says he, "who have felt its effects, have been ignorant of its cause; and we may say, that it has made them lose their reason, both when they have been touched with the charms of it, and when they have attempted to say any thing about that very charm which they felt."

So many, indeed, have been the opinions of philosophers on this subject, and opinions so very confused, and so very contradictory, that I conceive it safest to proceed at once to the consideration of the subject itself, without attempting to give you any previous view of the opinions of others with respect to it. I am quite sure, that, if these opinions were exhibited to you in succession, your powers of inquiry would be distracted and oppressed rather than enlightened or invigo-

rated, and therefore would not be in a state very well fitted for prosecuting the investigation on which you might be called to enter. In questions which relate to objects that cannot be directly submitted to the senses, and that have been thus perplexed by many opposite doctrines and speculations, it is often necessary to endeavour to forget as much as possible what others have thought, and to strive to think as if the opinions of others had been unknown to us. I know no question in which this temporary forgetfulness could be of more profit than in that on which we are to enter.

When we speak of the emotion which beauty excites, we speak necessarily of an emotion that is pleasing; for it is only in the case of pleasing emotions that all writers concur in using the name, and only in such cases that the name is used, even by the vulgar, in their common phraseology. It is, in truth, only one of the many forms of that joyous delight, which I ranked as one of the elementary feelings to which our emotions are reducible. The pleasure, then, I may remark in the first place, is one essential circumstance of the emotion.

Another circumstance, which may not seem so obvious, but which I consider as not less constituent of beauty, in that maturer state of the mind in which alone we are capable of considering it, is, that we transfer, in part at least, the delight which we feel, and embody it in the object which excited it, whatever that object may have been; combining it at least partially with our very conception of the object as beautiful; much in the same way as we invest external forms with the colours which exist as feelings of our own mind, or as, in our vague conceptions of the sapid or odoriferous substances that are gratifying to our luxury, we consider as almost present in them and permanent, some part of the very delight which they afford. I know well that, philosophically, we consider these sapid and odoriferous substances, merely as the unknown causes of our sensations of sweetness and fragrance; but I have little doubt, at the same time, that it is only philosophically we do so consider them, and that while we smell a rose, without thinking of our philosophy, we do truly consider the fragrance, which we are at the moment enjoying, or at least a charm which involves a sort of shadowy resemblance of that peculiar species of delight, to be floating around that beautiful flower, as if existing there, independently of our feeling. We do not indeed think of the sensation of fragrance as existing without; for, if we characterized it as a sensation, this very judgment would imply a sort of philosophizing on its nature, which is far from taking place in such a moment. But, without regarding it as a sensation, and enjoying mere-

* "O Beauty, source of praise."—Orig.

† Pleasures of Imagination, book i. v. 271—273. second form of the poem, v. 282, 284—287, (from "O source," to "Their own!") first form of the poem, v. 275—282.

ly the actual feeling of the moment, we incorporate the charm as it were with the colours of the rose, with as little intention of forming this combination, and even with as little consciousness that any such combination is taking place, as when, in vision, we invest the external hardness,—the mere feeling of gentle and limited resistance, which the rosebud gives us as an object of touch, or of muscular compression, with the colours, which are at the moment arising from affections of a different organ. In the case of fragrance, it is more easy for us, indeed, to separate the sensation from the external form with which we combine it, and to imagine a rose without odour, than, in the case of vision, to separate the mere form and hue that mingle as if in one sensation; because there are many objects which we touch, that excite in us no sensations of fragrance, and no objects of touch which do not excite in us some sensations of colour. The coexistence is, therefore, more uniform, and the subsequent suggestions consequently more uniform and indissoluble in the one case than in the other. It is much easier for us, accordingly, to persuade those who have never read, or discoursed, or thought on such subjects, that the feelings of smell and taste are not inherent in their objects, than to persuade them that the actual colours, which form their sensations of vision, are not spread over the surfaces of external things. But the actual investment of external things, with the feelings of our own mind, does take place in our sensitive references to objects without; and, in some cases, as in those of vision, constitutes a union so close, that it is impossible even for our philosophy to break the union while the sensation continues. We know well, when we open our eyes, that whatever affects our eyes, is within the small compass of their orbit; and yet we cannot look for a single moment, without spreading what we thus visually feel over whole miles of landscape.

Still, I must repeat, not the slightest doubt is philosophically entertained by those who, when they open their eyes, yield like the vulgar to the temporary illusion, that the colours, thus supposed to be spread over the external scenery, are truly feelings of the mind, of which the external objects, or rather the rays of light that come from them, are merely the unknown causes. When questioned on the subject of vision, we state this opinion with confidence, and even with astonishment, that our opinion on the subject, in the present age of philosophy, should be doubted by him who has taken the superfluous trouble of putting such a question. At the very moment, probably, at which we give our answer, we have our eyes fixed on him to whom we address it. His complexion, his dress, are regarded by us as external

colours, and we are practically, at the very moment, therefore, belying the very opinion which we profess, and in speculation truly profess to hold.

These remarks show sufficiently the distinction of our speculative limitation of our feelings to mind, as the only subject of feeling, and our practical diffusion of these very feelings over matter, which, by its nature, is incapable of being the subject of any feeling; and they show, that it is very possible for the same mind to combine both, or rather, that there is no individual, who has accurately made the distinction, that does not, in almost every moment of his life, certainly in every moment of vision, go through that very process of spiritualizing matter, or of diffusing over matter his own sensations; which, in his speculations, appears to him to involve an absolute contradiction.

It is not enough, therefore, to urge in disproof of any diffusion of our mental feelings over material things, that our feelings are affections of mind, and cannot be affections of matter; since this would be to disprove a fact which, certainly in vision, and, as I conceive, in some degree in our other senses also, is continually taking place, notwithstanding the supposed demonstration of its impossibility.

To apply these remarks, however, to our particular subject.—Beauty, I have said, is necessarily an emotion that is pleasing; and it is an emotion which we diffuse, and combine with our conceptions of the object that may have excited it. These two circumstances, the pleasing nature of the emotion itself, and the identification of it with the object that excites it, are essential to it in those years in which alone it can be an object of reflection; and are, as I conceive, the only circumstances that are essential to it in all its varieties, and in whatever way the emotion itself may be produced. It is true, indeed, that when questioned, precisely as in the case of simple vision, whether we think that the emotion of beauty is a state or affection of matter, we should have no hesitation in affirming instantly, that it is a state of the mind, and is absolutely incapable of existing in any substance that is purely material. All this we should say with confidence, as we say with confidence that colour is an affection of the mind, and only an affection of the mind. Yet still, as in the case of colour, the temporary diffusion of our own feeling over the external object would take place as before. The beauty, as truly felt and reasoned upon, would be in our mind; the beauty, as considered by us at the time of the feeling, would be a delight that seemed to float over the object without—the object which we, therefore, term beautiful, as we term certain other objects red or green; not the mere unknown causes of the feelings

which we term redness, or greenness, or beauty, but objects that are red, and green, and beautiful. Even at the time of the diffusion, however, we do not say or even think that we diffuse the emotion of beauty any more than we say or think that we diffuse the sensations of colour; for this, as I have said, would be to have philosophized on the nature of the feelings or states of a substantial mind; but without any thought of the colours as sensations, or of the beauty as an emotion, we feel them as in the objects that excite them, that is to say, we reflect them from ourselves on the objects. The diffusion may be temporary, indeed, and depend on the actual presence of the object, but still the temporary diffusion does take place; and while the object is before us, it is as little possible for us not to regard it as permanently beautiful, though no eye were ever to behold it, as it would be for us to regard its colour as fading the very moment in which we close our eye. Beauty, then, is a pleasing emotion, and a delight which we feel, as if diffused over the object which excites it.

I shall proceed further in my inquiry in my next lecture.

LECTURE LIV.

OF IMMEDIATE EMOTIONS, NOT NECESSARILY INVOLVING ANY MORAL FEELING. — 3. BEAUTY AND ITS OPPOSITE, CONTINUED.

GENTLEMEN, the latter part of my Lecture, yesterday, was employed in considering one of the most interesting of our emotions,—that which constitutes the charm of beauty,—an emotion which every one must have felt sufficiently to understand, at the mere mention of the name, what it is, which is the subject of inquiry, and which, notwithstanding, when we endeavour to explain to others what we feel, no two individuals certainly would define by the same terms.

Of an emotion which is so delightful, and so universal, and, by a singular and almost contradictory character of thought, at once so clearly felt and so obscurely comprehended, many theories, as might well be supposed, have been formed by philosophers; and if the accurate knowledge of a subject bare any necessary proportion to the number of opinions with respect to it, that have been stated and canvassed, and the labour and ability of those who have advanced their own theories, or examined the theories of others, there now could be scarcely any more doubt, as to the nature of what is beautiful, than as to any property of a circle or a triangle, which geometricians have demonstrated.

Such a proportion however, unfortunately,

does not hold. There are subjects, which as little grow clearer by a comparison of many opinions with respect to them, as the waters of a turbid lake grow clearer by being frequently dashed together, when all that can be effected by the agitation is to darken them the more.

In such a case, the plan most prudent is to let the waters rest, before we attempt to discover what is at the bottom; or, to speak without a metaphor, where there is so much confusion and perplexity, from opposite opinions, it is often of great advantage to regard the subject, if we can so regard it, without reference to any former opinion whatever, as if the phenomena were wholly new, or ourselves the first inquirers.

This I in part attempted in my last lecture, the results of which it may be of advantage briefly to recapitulate.

Though we use the general name of *beauty*, in cases in which there is a great variety of the objects that excite it, and a very considerable variety also in the emotion itself which is thus excited, the emotion, to which we give the name, in all its varieties, is uniformly pleasing. This, then, is one essential circumstance of the emotion of beauty, or, to speak more accurately, of the tribe of different, though kindred emotions, which, from their analogy, we comprehend under that general name.

Another circumstance, which distinguishes the emotions of beauty, in all its varieties, from many other emotions that are pleasing in themselves, is, that, by a sort of reflex transfer to the object which excited it, we identify or combine our agreeable feeling with our very conception of the object, whether present or absent from us. Whatever is delightful at the moment in which we gaze or listen with delight, seems to us to be contained in the beautiful object, as the charms which were contained in that fabulous cestus described by Homer, that existed when none beheld them, and were the same whether the cestus itself was worn by Venus or by Juno.

In illustration of this embodying or reflecting process, the result of which seems to me to be that which constitutes an object to our conception as beautiful, it was necessary to offer some remarks, and especially to make some distinctions, without which, the supposition of this transfer of our delight, and diffusion of it, in the conception of the object that gave birth to it, might appear to involve a sort of absurdity; as if it implied, in the same object, a combination of material and mental affections, which are incapable of union.

It is particularly of importance, in this case, to distinguish our momentary sentiments from our philosophical judgments. As

I behold the sun, for example, it is impossible for me to regard it but as a plane circular surface of a few inches diameter. As I regard it philosophically, it is a sphere of such magnitude, as almost to pass the limits of my conception. If I were asked, what is the diameter of the sun? I should endeavour to state it, with as exact an approximation to its real magnitude as was possible for me. But if I were to state what every one feels, who knows nothing of astronomy, and what even the astronomer feels as much as the vulgar, when he turns his eye to that great luminary, I should say, that the diameter was scarcely a foot;—so different is our momentary sentiment, while we gaze, from the judgments which we form philosophically, after we have ceased to gaze; the impression of the momentary sentiment too, it must be remembered, being as irresistible as that of the judgment, or rather the more irresistible of the two. In like manner, when I look at any distant landscape, first with my naked eye, afterwards with a telescope held in one direction, and then with the same telescope inverted, I have a most undoubting belief that the objects thus seen in three different ways have continued exactly at the same distance from me; but, if I were to state what I feel visually, and what, with all my knowledge of the optical deception, it is impossible for me not to feel visually, I should say, in each of these ways of viewing the scene, that the objects were at different distances. To recur, however, to that instance which brings the difference of the philosophical and the momentary belief nearest to that which takes place in the feeling of beauty,—the case of the visual perceptions of colour,—it is well known, to every one who is acquainted with the theory of the secondary or acquired perceptions of sight, that the colours, which seem to us spread over that wide surface of landscape which terminates in the remote horizon, are spiritual, not corporeal modifications; the effect, indeed, of the presence of a few rays within the small orbit of the eye, but an effect only, not a part of the radiance; and that we yet diffuse as it were the colour, which exists but as a sensation of our mind, over those distant objects, which are not mind, but matter. If we were asked, what the material colour is, we should state, philosophically, that it is the unknown cause of that colour which is our sensation; that redness, for example, is a feeling of our own mind, and greenness a feeling of our own mind, and that what are truly redness and greenness in the external objects, being both equally unknown to us in themselves, have no other difference in our conception than as being the unknown causes of different mental feelings. This answer we should give, philosophically; but, at the same time, it would be impossible for us to

look on these unknown causes of our sensations of colour, without blending with them the very sensations which they cause, and seeing, therefore, in them the very greenness and redness which are feelings of our own mind. In like manner, when we philosophize on beauty, and separate the delight which is in us from the cause of the delight which is within us, beauty is simply that which excites in us a certain delightful feeling; it is like the greenness or redness of objects, considered separately from our perception of objects,—the greenness and redness, which material objects would have, though no mind sentient of colour were in existence. But still this is not the beauty which we feel; it is only the beauty which we strive in vain to conceive. The external beauty which we feel, involves our very delight reflected on it, and diffused, as much as, in the case of a visual object, it involves our sensations of colour diffused in it; the colour which we reflect, being in our mind, as the charm which we reflect, is also in our mind. In this sense, indeed, that ancient theory of beauty, which refers it to mind as its source, is a faithful statement of the phenomena; since it is our own spiritual delight which we are continually spreading around us; though, in the sense in which Plato and his followers intended their reference to be understood, it is far from being just, or at least far from having been proved to be just. In borrowing, therefore, the language which they use, we do not borrow a mere poetic rhapsody; but it becomes, with the interpretation which I would give it, the expression of a philosophic truth.

Mind, mind alone (bear witness, Earth and Heaven !)
The living fountains in itself contains
Of beauteous and sublime: here hand in hand,
Sit paramount the Graces: here enthron'd,
Celestial Venus, with divinest airs,
Invites the soul to never-fading Joy.*

It is the mind indeed alone that, in the view which I have given you, is the living fountain of beauty, because it is the mind which, by reflection from itself, embodies in the object or spreads over it its own delight. If no eye, that is to say, if no mind were to behold it, what would be the loveliest of those forms, on which we now gaze with rapture, and more than rapture? A multitude of particles more or less near or remote. It is the soul, in which these particles, directly or indirectly, excite agreeable feelings, which invests them in return with many seeming qualities that cannot belong to the mere elementary atoms which nature herself has made; which gives them, in the first place, that unity as a single form, which they do not possess of themselves, since, of themselves, however near they may be in seeming coherence,

* Pleasures of Imagination, book i. v. 481—486.

they are a multitude of separate and independent corpuscles, which, at the same time, spreads over them the colours, that are more truly the effect of our vision than the cause of it, and which diffuses among them still more intimately those charms and graces, which they possess only while we gaze, and without which, when the eyes that animate and embellish them are closed, they are again only a multitude of separate particles, more or less near or remote.

Another distinction, to which I alluded in my last lecture, and which, though apparently, and even really a verbal one, is a distinction of great importance, in its influence on our assent,—is the difference of the phrases, colour, and sensation of colour, beauty, and emotion of beauty. When we speak of colour or beauty simply, we speak of what we feel, without considering any thing more than the feeling itself. When we speak of the sensation of colour and of the emotion of beauty, we speak of these feelings, with reference to the mind; and, though colour, as felt by us, must of course be the sensation of colour, and beauty, as felt by us, be the emotion of beauty, it appears to us a very different proposition, to state, that in vision we combine our sensation of colour with external things, or our emotion of beauty with external things, and to say simply that we combine with them colour and beauty. We combine them, without knowing that we are combining them, consequently without thinking that the one is a sensation, the other an emotion, and both affections of mind alone. To think of them as a sensation and emotion, would be to have formed already the philosophic judgment, which separates them from the object, not the mere momentary sentiment, which combines them with it. In the case of vision, there can be no doubt that this is done every moment by the lowest of the people, who have not the slightest suspicion that the colour, or rather the cause of colour, as it exists without, is different from that redness or blueness which they think they see spread over the surface of objects; and it is not wonderful, therefore, that in combining, in our notion of the beautiful object, the delightful feeling of our mind, we should do this, with as little suspicion that the delight, which we have diffused over the object itself, is our own internal emotion.

That, in thinking of a beautiful object, we do consider some permanent delight as diffused, and as it were embodied in it, is, I think, evident on the slightest reflection on the objects which we term beautiful. And yet, when we first think of this diffusion of a mental feeling over a material object, if we have not been in the habit of attending to other phenomena of the mind, the very supposition of such a process may seem to involve an assumption that is scarcely warrant-

able; precisely as the uneducated multitude, and perhaps a very great majority of the smaller multitude who are educated, would smile, with something more than unbelief, if we were to endeavour to make them acquainted with that part of the theory of vision which relates to colour. But, to those who have been in the habit of considering the mental phenomena in general, and particularly the phenomena commonly ascribed to association, the diffusion of this feeling, and combination of it with our notion of the cause of the feeling, will seem only an instance of a very general law of our mental constitution. It is, indeed, only an instance of that general tendency to condensation of feelings, which gives the principal value to every object that is familiar to us; to the home of our infancy, to the walks of our youth, to every gift of friendship; nor only to these inanimate things, but, in a great measure also, to the living objects of our affection, to those who watched over our infant slumbers, or who were the partners of our youthful walks, or who left with us, in absence, or in death, those sacred gifts, which for a moment supply their place, with that brief illusion of reality, which gives to our remembrance a more delightful sadness. When we look to the gray hairs of him, in the serenity of whose parental eye, even in its most serious contemplation, there is a silent smile that is ever ready to shine upon us;

Whose authority, in show
When most severe, and mustering all its force,
Was but the graver countenance of love;
Whose favour, like the clouds of spring, might low'r,
And utter now and then an awful voice,
But had a blessing in its darkest frown :—

When we look to that gracious form, in whose thought, even in the moments in which he addresses to Heaven his gratitude or his prayer, we are still present, as he thinks of that common home of our immortality, to which he is only journeying before us,—or commends us to the protection of that great Being who has been, in his own long earthly career, the protection and happiness of his youth and of his age,—are there no feelings of our heart, no enjoyments of early fondness and increasing gratitude, and reverence unmixed with fear, which we have combined with the very glance of that eye, and the very tone of that voice, whose glance and tone are to us almost like a blessing? The friend whom we have long loved, is, at each single moment, what he has been to us, in many successive years. Without recalling to us the particular events of those years, he recalls to us their delights; or, rather, the very notion which we form of him contains in itself this diffused pleasure, like

some ethereal and immortal spirit of the past.

Nor, as I have already said, is it only in our moral affection for beings living like ourselves, and capable, therefore, of feeling and returning our kindness, that this condensation of regard takes place. It produces an affection of almost moral sympathy, when there can be no feeling of it, and therefore no possibility of return; and where that softening influence accordingly must be wholly reflected from our own mind. That, for inanimate objects, long familiar to us, we have a regard, in some degree similar to that which we feel for a friend, has been the remark of all ages; since every individual, in every age, must have been subject to the universal influence which gives occasion to it. A little attention to this process, by which an object of trifling value becomes representative of feelings that are inestimable, will not be uninteresting in itself, and will throw much light on that similar process, by which, in the case of beauty, I conceive objects to become representative, by a sort of spiritual reflection, of the pleasure which they excite. I cannot prepare you better for this discussion, than by quoting some remarks from the eloquent work of Dr. Smith.

"The causes of pain and pleasure, whatever they are, or however they operate, seem to be the objects which, in all animals, immediately excite those two passions of gratitude and resentment. They are excited by inanimated as well as by animated objects. We are angry, for a moment, even at the stone that hurts us. A child beats it, a dog barks at it, a choleric man is apt to curse it. The least reflection, indeed, corrects this sentiment, and we soon become sensible, that what has no feeling is a very improper object of revenge. When the mischief, however, is very great, the object which caused it becomes disagreeable to us ever after, and we take pleasure to burn or destroy it. We should treat in this manner the instrument which had accidentally been the cause of the death of a friend; and we should often think ourselves guilty of a sort of inhumanity, if we neglected to vent this absurd sort of vengeance upon it.

"We conceive, in the same manner, a sort of gratitude for those inanimated objects, which have been the cause of great or frequent pleasure to us. The sailor, who, as soon as he got ashore, should mend his fire with the plank on which he had just escaped from a shipwreck, would seem to be guilty of an unnatural action. We should expect that he would rather preserve it with care and affection, as a monument that was, in some measure, dear to him. A man grows fond of a snuff-box, of a pen-knife, of a staff, which he has long made use of, and conceives something like a real love and affection

for them. If he breaks or loses them, he is vexed out of all proportion to the value of the damage. The house which we have long lived in, the tree whose verdure and shade we have long enjoyed, are both looked upon with a sort of respect that seems due to such benefactors. The decay of the one, or the ruin of the other, affects us with a kind of melancholy, though we should sustain no loss by it. The Dryads and the Lares of the ancients, a sort of genii of trees and houses, were properly first suggested by this sort of affection, which the authors of those superstitions felt for such objects, and which seemed unreasonable, if there was nothing animated about them."*

The reason of this friendship for inanimate objects seems to me to be, that, with such objects, in the circumstances supposed, there is really combined a great part of that which forms the complex conception of our friend; and it is not wonderful, therefore, that there should be a considerable similarity of the feeling excited. There is not, indeed, and cannot be, in the case of lifeless matter, that admiration of virtue and genius, that gratitude for a preference voluntarily made, and for kindness voluntarily shown, and that confidence in future displays of similar devotion, which forms so gratifying and ennobling a part of friendship. But what constitutes the real tenderness of friendship, is something more than all these feelings. These may be felt, in attachments that are formed at any period of life, and at a very early period of mutual acquaintance. But that which gives to such a union its chief tenderness is long and cordial intimacy, and especially that intimacy which has taken its origin in an early period of life. The friend of our boyish sports, of our college studies, of our first schemes and successes, and joys, and sorrows, is he in whose converse the heart expands most readily, and with whom, in latest old age, we love to grow young again. With the very image of the person is mingled the remembrance of innumerable enjoyments and consolations shared in common. They are, as it were, condensed and fixed in it, and are reflected back upon us, as often as the image arises. But the remembrance of a long series of agreeable emotions may be mingled with inanimate scenes, as well as with persons; and if, by the reflection of these past emotions, it produce tenderness in the one case, it surely is not surprising that the same cause should produce a feeling of tenderness in the other; and that, as the chief source of the affection is thus in circumstances that are common to both, we should feel something very like regard for every long familiar object, while

* Theory of Moral Sentiments, Part II. sect. iii. c. 1.

it exists, and of grief, when it exists no more.

The old man, who pointed out the house of a deceased friend, and said, "Formerly I had only to climb those steps, to forget all the miseries of life,"* must have felt for the steps which he had so often trod, that regard which arises from the remembrance of past delight; a remembrance, which constituted so important a part of the pleasure formerly received by him, when they led him to the apartment of his friend, and to all that happiness, which was more than the mere forgetfulness of grief, even when there was grief, or the very miseries of life, to be forgotten.

The same effect, in heightening friendship, which is produced by long intimacy, is produced, in a great degree, by any single feeling of very vivid interest; such as that of peril shared together, the strong emotion of the moment of enterprise, the joy of the escape, and, in many cases, the glory which attended it, being blended and reflected from each individual, as from another self. In one of those admirable tragedies, which form a part of the series of plays on the Passions, there is a very striking picture of this kind, in the speech of an old maimed soldier, who, with all his modesty, has been forced to allude to some of his past exploits.

For I have fought, where few alive remain'd,
And none unscathed; where but a few remain'd
Thus marr'd and mangled;—as belike you've seen
O' summer nights, around the evening lamp,
Some wretched moths, wingless and half-consumed,
Just feebly crawling o'er their heaps of dead.
In Savoy, on a small, though desperate post,
Of full three hundred goodly chosen men,
But twelve were left;—and right dear friends were we
For ever after. They are all dead now;—
I'm old and lonely.†

In a real case of this sort, every vivid feeling which attended the action,—and the remembrance of which was, in a great measure, the remembrance of the action itself,—would be combined with the perception of each individual survivor. The common peril, the common escape, the common glory, would be conceived as one; and, in consequence of this unity, as often as the thought of the glorious action recurred, each would be to the others as it were another self. Indeed, so closely would the conception of the action itself, and of the right-dear friends be blended, that, in a case like that which the drama supposes, I have little doubt, that when all but one of the little band of heroes had perished, it would seem to the melancholy survivor,—when all the real component parts of the action had thus ceased to exist,—as if the happiness and glory of the

action had perished likewise; and old age and loneliness would be felt the more, as if stripped, not of the enjoyments of friendship only, but almost of the very honours of other years.

The same feeling in this case, too, it must be remarked, extends itself, if not equally, at least in a very high degree, to inanimate things; and there can be no question, that the sword which has been worn only as an ornament, and the sword which has been often wielded in battle, and in battle the most perilous, will be viewed by their possessors with very different regard. The weapon is itself a real component part of the glorious actions which it represents; and we transfuse, as it were, into the mere lifeless steel, a consciousness and reciprocity of our vivid feelings, exactly as, in the case of beauty, we animate the external object with our own delight, without knowing that we have done so.

The grief which we feel for the loss of an object, insignificant in itself, and deriving all its value from associations formed with it, presents, in another form, that transfusion of feeling from the mind, and concentration of it in the object, which constitute our lively pictures of beauty, when it is regarded, not as the unknown cause of our delightful feeling, but as that embodied delight itself.

An object long familiar to us, by occurring frequently, either in perception, or in trains of thought, together with many of our most interesting emotions, and the images of those friends of whom we think most frequently, is, by the common laws of suggestion, so closely associated with these emotions and ideas, that, when it is present to our mind, these shadowy images of happiness may almost be considered as forming with it a part of one complex feeling, or at least are very readily recalled by it. When such an object, therefore, is lost, and we think of it as lost, we do not conceive it as that simple object of perception which it was originally, when it first affected our senses; in which case, the loss of it could not be very seriously regarded by us; but we conceive it as that complex whole which it has become—the image or representative of many delightful feelings. Though it be only a snuff-box, or a walking-stick, as in the cases supposed by Dr. Smith, the mere circumstance of the loss would of itself give some degree of additional interest to our conception of the object, which makes it dwell longer in our mind than it would otherwise have done, and allows time, therefore, for the recurrence of a greater number of the images associated with it, that rise accordingly, and mingle with the conception. But with that complex state of mind, which arises from the union of these, in our rapid retrospect of

* De St. Lambert, tom. iii.

† Count Basil, a Tragedy, Act III. Scene 1.

other years,—a state which is not the mere conception of the walking-stick which we have lost, but of it and the other associate feelings,—the feeling of the loss is mingled, and is mingled, not more with the conception of the stick, than with all the co-existing associate feelings, vague and indistinct as these may be,—the conception, perhaps, of the friend who presented it to us,—of the walks during which it has been our companion,—of many of the innumerable events, of joy or sorrow, that have occupied us, since the time at which, like a new limb added to us, it became, as it were, a part of ourselves. Since the notion of the loss, therefore, is combined with all these conceptions, in one complex state of mind, it is not wonderful that it should appear to us, for the moment, as the loss, not of one part only, and that, if absolutely considered, the least important part of the whole, but as the actual loss of the associate group of images and emotions of which it is more than representative, and that it should excite our momentary sorrow, accordingly, as for that actual loss. We know, indeed, whenever we reflect, that all these objects are not lost, but the walking-stick only; and our reason, every moment, checks us with this truth; but still, every other moment, in spite of reason, the feeling of the loss and the conception of the vague complex whole, continuing to be blended, affect our mind with the blended regret. It is only one of the innumerable instances, in which our feelings continue obstinately to delude us, in spite of the knowledge which might be supposed capable of saving us from the illusion, as particularly in those striking cases of optical deception, to which, on account of the important light which they throw on the phenomena of the mind in general, I have already so frequently directed your attention. When we look at a pictured cylinder, or at any landscape in which the laws of perspective are observed, we know well that it is a flat surface at which we are looking. Yet it is absolutely impossible for us, notwithstanding this knowledge, to consider the cylinder as a plane, and all the rocks and groves and long-withdrawing vales of the landscape, as comprehended in a few inches of colouring. When we receive the portrait of a friend, it is vain for reason to tell us, that we have received only a flat surface of a little paint; when we lose a walking-stick, the gift of a friend, it is equally vain for reason to tell us, that we have suffered only a loss which we can repair for a few shillings at a toyshop.

It is in a great measure, then, by the momentary belief of the loss of more than the object itself, that I would explain that disproportioned emotion, which is felt to be absurd, yet is not felt the less on account of this seeming absurdity.

But, whatever may be thought of this explanation of that grief,—so far beyond the absolute value of the object,—which we feel, on the loss of any object that has been long familiar to us, there at least can be no doubt, as to the great fact itself, that an object, long familiar to us, does acquire additional value by this familiarity; and, as the object is absolutely the same, however frequently it may have met our eyes, or been used by us for any of the common purposes of life, it is only a relative value which it can have acquired,—a value consisting in our own feelings merely, which we must therefore have condensed in it, or attached to it in some way or other.

After these illustrations from phenomena that, if not absolutely of the same class, are at least very closely analogous, since they imply a sort of charm conceived by us as treasured in external things, and a charm which consists merely in the reflected feelings of our own mind, I trust it will not appear to you too bold an affirmation, to say, that the agreeable emotions which certain objects excite in us, are capable of being, in our conception, combined with the very notion of the objects themselves, and that we term such objects beautiful, by combining, in our notion of them, the delight which we feel, as we term them green, blue, crimson, by combining with them our feelings of colour. What is true of objects of sight, may be conceived as easily in every other species of beauty, natural or artificial, material or mental. Whatever excites the emotion, may be felt as of itself combined with the emotion which it excites; forms, colours, sounds, all that is ingenious in art, or amiable in morals. My limits will not permit me to trace all the varieties of beauty with any minute investigation, through this variety of its objects; but you may yourselves equally apply to them whatever remarks I have applied, more particularly, to one species of the delightful emotion.

It is of external objects, indeed, and particularly of objects of sight, that we think most frequently, when we speak or hear of beauty; but this does not arise from any exclusive peculiarity of the feeling excited by these objects, as if the term were only metaphorically applied to others, but because external objects are continually around us, so as more frequently to excite the emotion of beauty; and in a great measure, too, because the human form, itself an object of vision, is representative to us of the presence of all which we love, or those with whom our life is connected, and from whom its happiness has been derived, or from whom we hope to derive it. It is not wonderful, therefore, that when we think of beauty, we should think of that by which the emotion is

most vividly excited, and should be led accordingly to seek it there,—

Where Beauty's living image, like the Morn
That wakes in Zephyr's arms the blushing May,
Moves onward; or as Venus, when she stood
Effluent on the pearly ear, and smil'd,
Fresh from the deep, and conscious of her form,
To see the Tritons tune their vocal shells,
And each cerulean sister of the flood
With loud acclaim attend her o'er the waves,
To seek th' Italian bower.*

That we are susceptible of a similar delightful emotion from works of intellect, is sufficiently shown by the fine arts, which are founded on this happy susceptibility; nor is the delight felt only on the contemplation of works of fancy,—at least of fancy in the sense in which that term is commonly employed; it is felt in the result of faculties that seem, while exercised in the operations that produce the beautiful result, to be very foreign from every emotion, but that tranquil satisfaction which may be supposed to constitute a part of our assent to any interesting truth. How many theorems are there, to which a mathematician applies the term *beautiful*, as readily as it is applied by others to the design or the colouring of a picture, or to the words or air of a song; and though the delightful emotion which he expresses by that word is at once far inferior in degree, and only analogous in kind to the emotion excited by those objects, it still is so analogous as to deserve the denomination. In general physics, in like manner, how instantly do we speak of the beauty of an experiment, which is so contrived as to decide a point that has been long in controversy, by very simple means, and with the exclusion of every foreign circumstance that might affect the accuracy of the result; or of the beauty of a theory, which brings together many facts that were before dispersed, without any obvious bond of union, and exhibits them in luminous connexion to our view. The delightful emotion, in these intellectual forms of beauty, is, it will be admitted, far less lively than when it results from external things. But when we thus apply the term *beautiful* to the works of faculties, that are not immediately conversant with beauty, or in which, at least, beauty is scarcely even a secondary consideration, we are far from using a metaphor, any more than we use a metaphor, when we employ the same word in speaking of the beauty of a landscape, and of the beauty of human form, which are both objects of sight, but of which the resulting emotions, though analogous, are far from being the same. We employ the term, because, from the analogy of the delight in the different cases, it is the only term which can express our meaning; we do truly feel, on the contemplation of

such intellectual works, a delightful emotion, —as we feel a delightful emotion very similar, however superior it may be in intensity of pleasure, when we look on the charms of nature, or the imitative creations of art; and, as we conceive the very charm which we feel, to be diffused and stored in those beautiful forms on which we gaze, so does the charm which we feel, seem, for the moment, to flow over the severest works of intellect, in the conceptions which are embodied to us. Even reason itself, austere as it may seem, is thus only a part of Beauty's universal empire, that extends over mind and over matter with equal sway.

But though by some minds, which have not been conversant with the beautiful results of scientific inquiry, these severe and less obvious charms may not be readily admitted, of moral beauty it is surely impossible for any one to doubt; that charm which is felt by us, even before we have learned to distinguish virtue by its name, and which, even to the guilty who have abandoned it, still retains a sort of dreadful loveliness, which they would gladly forget, but which no effort can wholly banish from their remembrance, that is forced still to shudder and admire. It is the analogy of this moral beauty, indeed, which gives its most attractive charm to the beauty of the inanimate universe, and which adorns poetry with its most delightful images. To give our mere approbation to virtue, as we give our assent to any truth of reasoning, seems to be as little possible, as for those who are not blind, to open their eyes, in the very sunshine of noon, on some delightful scene, and to view it as a mere collection of forms without any colouring. The softer moral perfections, so essential to the happiness, and almost to the very existence of society, are like those mild lights and gentle graces, in the system of external things, without which the repose of nature would not be tranquillity but death, and its motions, in the waving bough, and the foamy waterfall, and the stream that glides from it, would be only the agitation of contiguous particles of matter. Well, indeed, may the poet of imagination exclaim,—

Is aught so fair
In all the dewy landscapes of the Spring,
In the bright eye of Hesper or the Morn,
In Nature's fairest forms, is aught so fair
As virtuous friendship? as the candid blush
Of him who strives with fortune to be just?
The graceful tear that streams for others' woes
Or the mild majesty of private life,
Where Peace with ever-blooming olive crowns
The gate,—where Honour's liberal hands effuse
Unenvied treasures, and the mowmy wings
Of Innocence and Love protect the scene!†

In all these cases of moral beauty, as in that to which our senses more immediately give rise, we conceive the delight which we

* Pleasures of Imagination, book i. v. 327—335.

† Pleasures of Imagination, book i. v. 500—511

feel, to be centred in the moral object ; and the very diffusion of the delight seems to connect us more closely with that which we admire,—producing what is not a mere sympathy, but something more intimate,—that union of mind with mind, in reflected and mingled feeling, which, notwithstanding all the absurd mysticism that has been written concerning it, has, in the manner which I have now described, in part at least, a foundation in nature.

But though, in all these great provinces of beauty, the material, the intellectual, and the moral, an object which we feel to be beautiful be merely an object with which, in our conception, or continued perception, if it be an object of sense, or, in our mere conception, if it be an object of another kind, we have combined, by a sort of mental diffusion, the delight which it has excited in us ; why, it will be said, do certain objects produce this effect ?

The examination of this point, however, I must defer till my next lecture.

LECTURE LV.

I. IMMEDIATE EMOTIONS NOT INVOLVING NECESSARILY ANY MORAL FEELING.—3. BEAUTY, AND ITS REVERSE, CONTINUED.—DIFFERENT SORTS OF BEAUTY.

GENTLEMEN, my last Lecture was employed in considering and illustrating, by various analogous phenomena of the mind, the process by which I conceive our feeling of delight, that arises from the object which we term beautiful, to be reflected, as it were, from our mind to the objects which excite it ; very much in the same way as we spread over external things, in the common phenomena of vision, the colour, which is a feeling or state, not of matter, but of mind. A beautiful object, when considered by us philosophically, like the unknown causes of our sensations of colour in bodies, considered separately from our visual sensations, is merely the cause of a certain delightful emotion which we feel ; a beautiful object, as felt by us, when we do not attempt to make any philosophic distinction, is, like those coloured objects which we see around us, an object in which we have diffused the delightful feeling of our own mind. Though no eye were to behold what is beautiful, we cannot but imagine that a certain delight would forever be flowing around it, as we cannot but imagine, in like manner, that the loveliest flower of the wilderness, which buds and withers unmarked, is blooming with the same delightful hues, which our vision would give to it, and surrounded with that sweetness of fragrance, which, in itself, is but a

number of exhaled particles, that are sweetness only in the sentient mind.

An object, then, as felt by us to be beautiful, seems to contain, in its own nature, the very delight which it occasions. But a certain delight must in this case be excited, before it can be diffused by reflection on that object which is its cause ; and it is only by certain objects that the delightful emotion is excited. Why, then, it will be said, is the effect so limited ? and what circumstances distinguish the objects that produce the emotion, from those which produce no emotion whatever, or, perhaps, even an emotion that may be said to be absolutely opposite ?

If the same effect were uniformly produced by the same objects, it might seem as absurd to inquire, how certain objects are beautiful and others not so, as to inquire, how it happens that sugar is not bitter, nor wormwood sweet,—the blossom of the rose not green, nor the common herbage of our meadows red. The question, however, assumes a very different appearance, when we consider the diversity of the emotions excited by the same object, and when we consider the very powerful influence of accidental association on our emotions of this kind. In such circumstances we may be fairly allowed to doubt, at least, whether objects, primarily and absolutely, have a power of producing this emotion, or whether it may not wholly depend on those contingent circumstances, which we find and must allow to be capable of modifying it to so very great an extent.

That certain circumstances do truly modify our emotion of beauty, there can be no doubt ; and even that they produce the feeling, when there is every reason to believe that, but for such circumstances, no emotion of the kind would have been excited. The influence of what is called fashion, in giving a temporary beauty to various forms, is a most striking proof of this flexibility of our emotion ; and it is a fact too obvious to require illustration by example.

“ If an European,” says Sir Joshua Reynolds in one of his discourses delivered at the Royal Academy, “ if an European, when he has cut off his beard, and put false hair on his head, or bound up his own natural hair in regular hard knots, as unlike nature as he can possibly make it, and after having rendered them immovable by the help of the fat of hogs, has covered the whole with flour, laid on by a machine with the utmost regularity,—if, when thus attired, he issues forth, and meets a Cherokee Indian, who has bestowed as much time at his toilet, and laid on with equal care and attention his yellow and red ochre, on particular parts of his forehead and cheeks, as he judges most becoming ; whoever of these two despises the other for this attention to the fashion of his

country, which ever first feels himself provoked to laugh, is the barbarian.*"

It is not necessary, however, to have recourse to savage life, to feel how completely the ornamental and the ridiculous in all the adventitious embellishments of fashion, differ only as the eyes which behold them are different. The most civilized European may soon become, in this respect, a Cherokee, and in his nice absurdities of decoration, be himself the very thing at which he would have laughed before.

Weary as we soon become of whatever we have admired, our weariness is not more rapid than our admiration of something new, which follows it, or rather precedes it. It seems as if, in order to produce this delightful emotion, nothing more were necessary for us than to say, Let this be beautiful. The power of enchantment is almost verified in the singular transformations which are thus produced; and in many of these, fashion is employed in the very way in which magic has been commonly fabled to be employed,—in making monsters, who are as little conscious of their degradation, while the voluntary metamorphosis lasts, as the hideous but unknowing victims of the enchanter's art. A few months, or perhaps even a few weeks, may, indeed, show them what monsters they have been; but what is monstrous in the past, is seen only by the unconscious monsters of the present hour, who are again, in a few months, to laugh at their own deformity. What we are, in fashion, is ever beautiful; but nothing is in fashion so ridiculous, as the beauty which has been; as in journeying with sunshine before us, what is immediately under our eye is splendour; but if we look back, we see a long shadow behind us, though all which is shadow now was once brilliant, as the very track of brightness along which we move.

The influence of fashion, on the mere trappings of dress, or furniture, or equipage, is the more valuable as an illustration, from the rapidity of its changes, and the universality of the emotion which it excites, that render it absolutely impossible for the most sceptical to doubt its power. The influence of particular associations on individual minds is, indeed, as powerful as the more general influence which, in each individual on whom it operates, is only one of the forms of that very particular influence. But, in these cases, it might have been doubted whether the peculiarity ascribed to association, might not rather have arisen from constitutional diversity. In the changes of universal fashion, however, there can be no doubt as to the nature of the sway that has been exercised; since every one will readily allow in another,

that change of which he is conscious in himself.

Yet, even though what is commonly termed fashion, the modifier or creator of general feeling, had not been, it is scarcely possible that we should not have discovered the influence of circumstances on our individual emotions. Even in the mere scenery of nature, which, in its most majestic features, its mountains, its rivers, its cataracts,—seems, by its permanence, to mock the power of man, how differently do the same objects affect us, in consequence of the mere accidents of former feelings and former events! The hill and the waterfall may be pleasing to every eye; but how doubly beautiful do they seem to the very heart of the expatriated Swiss, who almost looks, as he gazes on them, for the cottage of his home, half gleaming through the spray; as if they were the very hill and the waterfall which had been the haunt of his youth. To the exile, in every situation, what landscape is so beautiful as that which recalls to him perhaps the bleakest and dreariest spot of the country, which he has not seen for many dismal years? The softest borders of the lake, the gentle eminences, that seem to rise only to slope into the delightful valleys between, the fields, the groves, the vineyards, in all their luxuriance, these have no beauty to his eye. But let his glance fall on some rock that extends itself without one tuft of vegetation, or on some heath or morass of still more gloomy barrenness, and what was indifference till then, is indifference no more. There is an instant emotion at his heart, which, though others might scarcely conceive it to be that of beauty, is beauty to him; and it is to this part of the scene that his waking eye most frequently turns, as it is it alone which he mingles in his dream with the well-remembered scenery of other years.

That our emotion of beauty, which arises from works of art, is susceptible of modification by accidental circumstances, is equally evident. There are tastes in composition, of which we are able to fix the period, almost with the same accuracy as we fix the dates of any of those great events which fill our tables of chronology. What is green or scarlet to the eyes of the infant, is green or scarlet to the same eyes in boyhood, in youth, in mature manhood, in old age; but the work of art which gives delight to the boy, may excite no emotion but that of contempt or disgust in the man. It must be a miserable ballad, indeed, which is not read or heard with interest in our first years of curiosity; and every dauber of a village sign-post, who knows enough of his art to give four legs, and not two merely, to his red lion and blue bear, is sure of the admiration of the little critic who stops his hoop or his top to gaze on the wonders of his skill.

* Discourse VII.

Even in the judgments of our maturer years, when our discernment of beauty has been quickened by frequent exercise, and the study of the works of excellence of every age has given us a corresponding quickness in discerning the opposite imperfections, which otherwise we might not have perceived, how many circumstances are there, of which we are perhaps wholly unconscious, that modify our general susceptibility of the emotions of this class. Our youth, our age, our prevailing or temporary passions, the peculiar admiration which we may feel for some favourite author, who has become a favourite, perhaps, from circumstances that had little relation to his general merit, may all concur with other circumstances as contingent, in giving diversity to sentiments which otherwise might have been the same. It is finely observed by La Bruyere in his *Discours de Reception*, in 1693, when Corneille was no more and Racine still alive,—“Some,” says he, “cannot endure that Corneille should be preferred or even thought equal to him. They appeal to the age that is about to succeed. They wait, till they shall no longer have to count the voices of some old men, who, touched indifferently with whatever recalls to them the first years of their life, love perhaps in his *Œdipus* only the remembrance of their youth.” The same idea is happily applied, by another Academician, to account for the constant presence of love in French tragedy, by the universal sympathy which it may be expected to excite. “This passion,” says he, “which is almost the only one that can interest women, has nearly an equal influence on the other sex. How many are there, who have never felt any very violent emotions of ambition or vengeance! Scarcely is there one who has been exempt from love. The young are perhaps under its influence at present. With what pleasure do they recognise themselves in all which they see and hear! The old have loved. How delightful to them, to be recalled to their fairest and happiest years, by the picture of what was then the liveliest occupation of their thought! The mere remembrance is, to them, a second youth.”

If the emotion of beauty, which we receive from external things and works of intellectual art, be thus under the control of our passions and remembrances, the pleasure of moral beauty is also, in some measure, under the same control. The great principles of moral distinction are indeed too deeply fixed in our breast, by our divine Author, to allow approbation and pleasure to be attached to the contemplation of pure malignity, or withheld from pure benevolence. When evil is admired, therefore, it is in consequence of some disproportionate admiration attached to some real or supposed accompanying good; but still it is in the power of circum-

stances to produce this disproportionate admiration, and consequently to modify, in a great degree, the resulting emotion of moral beauty. In one age, or in one country, the self-denying virtues are held in highest estimation; in another age, or another country, the gentler social affections. There are periods of society in which valour, that gave virtue its name in the early ethics of one mighty people, constitutes almost the whole of that national virtue which commands general reverence, at the expense of the calmer and far nobler virtues of peace. There are other systems of polity in which these civil virtues rise to their just pre-eminence, and in which valour is admired, less for its absolute unthinking intrepidity, than for its relation to the sacred rights of which it is the guardian or the avenger; nor does the estimation perish completely with the circumstances that gave rise to it. At Rome, even when Roman liberty had bowed the neck to that gracious despot who prepared, by the habit of submission to usurped power, the servility that was afterwards,—while executioner succeeded executioner on the throne of the world,—to smile, and to shudder, and obey, because others had smiled, and shuddered, and kissed the dust before:—in the very triumph of usurpation, when a single hour at Pharsalia had decided the destiny of ages, and Utica had heard the last voice of freedom, like the fading echo of some divine step retiring from the earth, still slavery itself could not overcome the silent reverence of the heart for him who had scorned to be a slave.

Even when proud Cæsar, 'midst triumphal cars,
The spoils of nations, and the pomp of wars,
Ignobly vain, and impotently great,
Show'd Rome her Cato's figure drawn in state,
As her dead father's reverend image pass'd,
The pomp was darken'd, and the day o'ercast.
The triumph ceased—tears gush'd from every eye;
The world's great victor pass'd unheeded by.
Her last good man dejected Rome adored,
And honour'd Cæsar's less than Cato's sword.*

Such were the emotions with which the actions of Cato were regarded at Rome, and continued to be regarded during the whole reign of the stoical philosophy, producing those extravagant comparisons of a mortal and the gods, which were not more impious than absurd, and which were little accordant with the general spirit of a system of philosophy, of which piety to the gods was one of the most honourable characteristics. The character of perfect moral beauty, however, which the life of Cato seemed to exhibit to a Roman,—who, if not free, was at least a descendant of the free,—is very different from that which it would exhibit to the slaves, the descendants of slaves, that minister, as their ancestors have ministered, to the insignifi-

* Pope's Prologue to *Cato*, v. 27—36.

cant grandeur of some eastern court. I need not say, how very different feelings also it excites in the mind of those whom Christianity has taught a system of morals, that surpasses the morality of stoicism as much as the purest doctrines of the Porch surpassed, in moral excellence, the idle and voluptuous profligacy of other systems.

With these striking facts before us, it seems impossible then to contend for any beauty that is absolutely fixed and invariable. That general susceptibility of the emotion, sensitive, intellectual, and moral, which forms a part of our mental constitution, is, it appears, so modified by the circumstances in which individuals are placed, that objects which, but for these circumstances, would not have appeared beautiful to us, do seem beautiful; and that other objects, from the same cause, cease to give that delight which they otherwise would have produced. It is obviously, therefore, impossible to determine, with perfect certainty, the great point in question as to original beauty; since, whatever our primary original feelings may have been, they must, by the influence of such modifying circumstances, that are operating from the very moment of our birth, be altogether diversified, before we are able to speculate concerning them, and perhaps even in the infant, before any visible signs of his emotions can be distinctly discovered.

Since we cannot, then, decide with confidence, either affirmatively or negatively, in such circumstances, all which remains, in sound philosophy, is a comparison of mere probabilities. Do these however lead us to suppose, that originally all objects are equally capable of receiving the primary influences of arbitrary or contingent circumstances, which alone determine them to be beautiful? or do they not rather indicate original tendencies in the mind, in consequence of which it more readily receives impressions of beauty from certain objects than from others, however susceptible of modification these original tendencies may be, so as afterwards to be varied or overcome by the more powerful influence of occasional causes?

It must not be supposed, in an inquiry of this kind, that we are to look to those high delights which beauty, in its most attractive forms, affords; for though it may be false, that all the pleasure of beauty is derived from adventitious circumstances, it is certainly true, at least, that our most valuable pleasures of this class are derived from circumstances with which our imagination has learned to embellish objects. The only reasonable question is, not whether the chief emotions which we now term emotions of beauty, be referable to this source, but whether we must necessarily refer to it every emotion of this class, of every species and degree.

If then, in our estimate of mere probabilities, we attend to the signs which the infant exhibits, almost as soon as objects can be supposed to be known to him, it is scarcely possible not to suspect, at least, that some emotions of this kind are felt by him. The brilliant colours, in all their variety of gaudiness, which delight the child and the savage, may not indeed be the same which give most gratification to our refined sensibility; but still they do give to the child, as they give to the savage, a certain gratification, and a gratification which we should perhaps still continue to feel, if our love of mere gaudy colouring were not overcome by the delight which, in after-life, we receive from other causes that are inconsistent with this simple pleasure—a delight arising from excellencies which the child and the savage have not had skill to discern, but which, when discerned, produce the impression of beauty, in the same manner as the brilliant varieties of colour that are easily distinguished, and, therefore, instantly felt to be beautiful. What child is there who, in a toyshop, does not prefer the gaudiest toy, if all other circumstances of attraction be the same? or rather, to what child are not this very glare and glitter the chief circumstances of attraction? and in what island of savages have our circumnavigators found the barbarian to differ in this respect from the child? The refined critic may indeed feel differently; but this, as I have said, does not arise from defect of that original tendency to receive a pleasing emotion from the contemplation of those brilliant patchworks of colours which, though he has learned to regard them as tawdry, he would, in other circumstances, have admired with the savage, but from the development of tendencies to receive pleasure from other causes, which are inconsistent with this earlier delight,—tendencies which are original, like the other, existing in the mind of the savage as much as in his own more cultivated mind, but existing there inertly, because circumstances have not arisen to develop them.

It is vain to say, in this case, that the pleasure which the gaudy patches of colour afford, is not an *emotion* of any sort, but a mere pleasure of sense; for, of the direct sensual pleasure of the different rays of light, we are capable of judging, as well as the child; and, though we still continue to feel, in many cases, an emotion of beauty from objects on which brilliant colours are spread in various proportions, we are able to make a sort of analysis of our complex feeling, so as in some degree to distinguish our admiring emotion as a result of the previous sensitive feeling, by which the colours became visible to us. If we were to judge by these primary sensitive feelings alone, it certainly would not be on the most brilliant colours that our eye would love to rest, with that continued in-

tentness of vision to which the subsequent emotion of beauty leads, by the delight which it superadds, before the tawdry has been distinguished from finer species of beauty. On such colours, it would even be painful for it to rest, with that species of contemplation which the child indulges,—a contemplation in which, if there be many dazzling hues to glitter on him, he exhibits often to those around him an intensity of delight, that, if we did not make allowance for the more violent natural expression of pleasure, in our early years, might seem even to surpass our more refined gratifications, when the sources of this happy emotion have been rendered at once more copious and more pure, and our sensibility has been quickened by the very happiness which it has enjoyed.

The delight, it must be remembered too, arises not merely from the specific differences of colours as more or less pleasing, in which case the most pleasing could not be too widely spread, but from distributions of colours in gaudy variety, exactly as in the finer arrangements of tints, which are beauty to our maturer discernment.

I have said, that from the undoubted effect of circumstances, in modifying our original tendencies, and of circumstances that may in some degree have operated before we are capable of ascertaining their influence, it is only an estimate of probabilities to which our inquiry can lead. In vision, however, as far back as we can trace the emotion of beauty, some original emotion of this kind does seem to be felt in colours, and varied arrangements of colours; and if from vision we pass to that sense which is next to it in importance as a source of the feelings that produce our emotion of beauty, we shall find another tribe of our sensations that seem, in like manner, to favour the supposition of some original beauty, however inferior to those other analogous emotions of delight which are to be the growth of our maturer years. The class to which I allude, are our sensations of sound, a class which seems to me peculiarly valuable for illustration, as showing, I conceive, at once, the influence of original tendencies, and also of the modifying power of contingent circumstances. In different nations, we find different casts of music to prevail; in the variety of these national melodies, therefore, we recognise the power of circumstances in diversifying the original feelings. But to the diversifying power there are limits; for, however different the peculiar spirit of the national melodies may be, we find that in all nations certain successions of sounds alone are regarded as pleasing,—those which admit of certain mathematical proportions in their times of vibration. It is not every series of sounds, then, that is capable of exciting the emotion of beauty, but only certain series, however varied these may be.

The universality of this law of beauty in one of our senses, in which delight is felt from mere arrangements or successions of sounds, is a ground of presumption, at least, that all beauty is not wholly contingent, and affords analogies, which, not as proofs indeed, but simply as analogies, may fairly be extended to the other senses.

Even that fine species of beauty which is to be found in the expression of character, in animated forms, at least if we admit that species of silent language, which has been called the language of natural signs, does not seem to be, in all its varieties, absolutely dependent on the mental associations of the being who beholds it. These connexions, indeed, of the corporeal signs of mental qualities, with the qualities which they have been found to express, give to the beauty that is admired by us, in our maturer years, its principal power; but, though many, and, perhaps, the far greater number of these signs are unquestionably learned by experience, there seems reason to think, or at least there is no valid ground of positive disbelief, that there are at least some natural signs independent of experience, and equally universal in use and in interpretation. A smiling countenance, for example, appears, if we may judge from the language of his own little features, to be agreeable to the infant, and a frowning countenance to be disagreeable to him, as soon as he is capable of observing the different lineaments or motions which are developed in the smile or frown; though, I admit, it would be too much to say, with certainty, that even these signs, which we term natural, may not themselves be acquired by earlier observations than any which we are accustomed to take into account. Yet still, though the interpretation, even in these cases, may, however early, result from still earlier experience only, this has not been proved; nor is it necessary, from the general analogies of mind, to assume it as certain, without particular proof in the particular case. To those, therefore, whose philosophic spirit is easily alarmed by the word instinct, as if it expressed a connexion peculiarly mysterious, when, in truth, every connexion of one feeling with another, is equally mysterious, or equally free from mystery, and cannot fail to be so regarded by every one who has learned to consider accurately what is meant, even by the most regular antecedences and consequences of the events of nature; to that class of philosophers, who think that the word experience accounts for every thing, without reflecting on what it is that experience itself must primarily have been founded,—it may seem unphilosophic thus to speak of the possible instinctive use, or instinctive interpretation of smiles, or frowns, or signs of any sort. Yet, how many cases are there, in which it is ab-

olutely impossible to deny these very instincts; and cases too, in which the immediate effect of the instinct, as much as in the supposed case of beauty, is the production of emotion of some sort, or at least of the visible signs of emotion. In some of the lowest of the animals which we have domesticated,—in the cry of the hen, for example, the first time that a bird of prey is seen hovering at a distance, that cry, of which the force is so instantly, and so fully comprehended, by the little tremblers that cower beneath her wing, who does not perceive, in this immediate emotion of terror, an interpretation of natural signs, as instinctive as the language of affection that is instinctively used? Such a cry of alarm, indeed, is not necessary to the human mother of the little creature that has a safer shelter continually around him. But there are positive signs of pleasure, of which a delightful emotion may be the immediate consequence, as there are negative signs, which are merely warnings of evil to be shunned, that are followed immediately by an emotion of a different kind; and these additional sources of enjoyment, it is not unworthy of the kindness of Heaven to have communicated to the infant, who may thus feel, in the caress, a delight of more than mere tactual softness. The cry of the parent fowl scarcely seems more quick to be understood, than the smile of the mother, to awake in the little heart that throbs within her arms an answering delight; nor is there any philosophic inconsistency in supposing it, whatever error there might be in affirming it positively, to be a part of a natural language of emotion, which, like the undoubted natural language of other animals, is instinctively understood, in every age of life, as in every nation of the globe, and which is already felt as happiness or affection, before the happiness, of which it is the promise, can itself have been felt or even anticipated.

Of a still finer species of emotion, perhaps, than even that which arises from looks or features of the living countenance, may be counted the pleasure which is felt from the contemplation of moral beauty; and yet, if we trace back this feeling through a series of years, in the progress of individual emotion, though we may find many variations of it in various circumstances; it is far from certain, that we shall find it more lively in manhood, than in the early years of the unreflecting boy. It is not to be expected, indeed, that moral beauty is to be felt, before the consequences of actions, which render them to our conception moral, can be appreciated, or that it is to be felt, but in those very cases, in which such consequences can be known. There are many offences, therefore, that excite our instant abhorrence, of which a boy cannot feel the moral atrocity,

as there are many virtues, of which he is incapable of feeling the moral charm. But, in virtuous actions, of which the nature can be distinctly conceived by him, he is not the dullest to feel what is lovely, nor the dullest to feel, mixed with his indignation and his pity, disgust at actions of a different sort. In the ballad which he exults or weeps to hear, he loves and hates with a love and hatred, at least as strong as are felt by those to whom he listens; and it seems as if, far from requiring any slow growth of circumstances, to mature or develop his emotions, there were nothing more necessary to his feeling of the beauty of an heroic sacrifice, than his knowledge that an act was truly heroic, and nothing more necessary to his emotions of an opposite kind, than his knowledge that there was cruelty, or ingratitude on earth.

The observations which I have now made on different species of beauty, are not urged by me, as if of evidence sufficient to prove, positively, that we have feelings of beauty, which may be said to be original or independent of accidental associations of every sort; since this point, as I have already stated, is beyond our power to determine with perfect accuracy, because the mind cannot be a subject of our distinct examination, till many accidental causes, of the power of which, in the peculiar circumstances of the infant mind, we may be without the slightest suspicion, may have modified its original tendencies in the most important respects. The burthen of proof, however, does not rest with the believers, but with the deniers of original beauty; and, since the inquiry has not for its object what may be affirmed with certainty, but merely what may be regarded as more or less probable, even these very slight remarks may perhaps have been sufficient to show the greater probability to be on the side of that opinion, which supposes that all objects are not originally to the mind the same in beauty or deformity, or, to speak more accurately, that all objects are not originally equally incapable of exciting either of these emotions; but, on the contrary, that, though accidental circumstances may produce one or other of these emotions, when, but for the mere accidents, neither of them would have been produced, or may variously modify, or even reverse in some cases, the original tendencies; there yet are in the mind some original tendencies, independent of all association,—tendencies to feel the emotion of beauty on the contemplation of certain objects, and the emotion opposite to that of beauty, on the contemplation of certain other objects.

This latter supposition, which, doubtful as the question must, from the very nature of the circumstances, always be, seems to my own belief the more reasonable, is rendered, I think, not less, but more certain, by

the arguments which are urged against it, arguments that seem to me founded on a very false view of the circumstances that should be expected to follow, if the doctrine against which they are urged were just, or which, at least, are not applicable to the particular view which I have given you of beauty as an emotion, not a direct sensation.

It is not a sense of beauty, you must have remarked, for which I have contended,—a sense which, like our other senses, must force upon the mind constantly, or almost constantly, a particular feeling, when a particular object is present. The feeling of beauty, according to my view of it, is not a sensation, but an emotion, a feeling subsequent to the perception or conception of the object termed beautiful; and which, like other emotions, may, or may not, follow the particular perception or conception, according to the circumstances in which those primary feelings, to which it is only secondary, may have arisen.

It is vain, therefore, to contend, that objects which previously impressed us with no feeling of their beauty, may become beautiful to us, in consequence of associations; that is to say, of former pleasing or unpleasing feelings, peculiar to ourselves; for though it might be absurd to suppose that these former feelings could give us a new sense, it is far from absurd, that the objects of them may become to our minds the subjects of new pleasing emotions, and of emotions similar, perhaps, to those which were formerly excited by other objects. That we are originally susceptible of various other emotions is admitted, and even contended, by those who would trace to the suggestion of them our feeling of beauty; and these original susceptibilities, they will surely allow, may, like the susceptibility of beauty, be variously modified, by the circumstances in which the individual may be placed, and may be produced, in consequence of former associations, in circumstances in which they otherwise would not have arisen. There is not a single emotion, indeed, which does not admit of constant modifications in this way. Our love, our hate, our wonder, are at least as much dependent on the nature of our past feelings, as our delight in what seems to us beautiful. Why should this one emotion, then, be expected to differ from our other emotions, which are confessedly capable of being awakened or suspended, in different circumstances, though the mere object of contemplation be the same? To those, accordingly, who, from being accustomed to consider beauty as either permanent and unchangeable in objects, or as absolutely contingent on accidental associations, may find some difficulty in reconciling original beauty, of any sort or degree, with that influence of circumstances, which may modify it or overcome it, it may be of some assistance, to consider the analogy

of our other emotions; since we shall find, that this original tendency, subject to modification, which I suppose to take place in our feelings of beauty, is what truly takes place in our other emotions; with which, therefore, the emotion of beauty, in its variations in various circumstances may well be supposed to correspond. Let us take, for example, our emotions of desire—feelings as lively, at least, as our emotion of beauty, and in many cases far more lively—which arise in the mind, too, in circumstances in some degree similar; not on the contemplation of a present delightful object, indeed, like beauty, but on the contemplation of some delight that is future. No one, surely, whatever his opinion may be, as to the original indifference of objects that now seem beautiful, will maintain that all objects, painful and pleasing, are equally capable, originally, of exciting the emotion of desire. Yet no one, I conceive, will deny, that it is in the power of general fashion, or of various accidental circumstances, to render objects desirable, or, in other words, capable of exciting, when contemplated, this emotion of desire, that otherwise would have been not indifferent merely, but perhaps positively disliked; and to make objects cease to be desirable, which would have been highly prized by us, but for the factitious circumstances of society, or accidents that may have operated on ourselves with peculiar influence. There is a mode, in our very wishes, as there is a mode in the external habiliments which we wear; and, in their different objects, the passions of different ages and countries are at least as various, as the works of taste, to which they give their admiration. When, at the Restoration, the austerity of the Protectorate was succeeded by the disgraceful profligacy of the royal court, and when there was an immediate change of the desirableness of certain objects, as if our very susceptibilities of original passion had been changed, we do not suppose that any real change took place in the native constitution of man. In every original moral tendency or affection, he was precisely what he was before. In all ages, the race of mankind are born with certain susceptibilities, which, if circumstances were not different, would lead them as one great multitude to form very nearly the same wishes; but the difference of circumstances produces a corresponding diversity of passions, that scarcely seem to flow from the same source. In like manner, the race of mankind, considered as a great multitude, might be in all ages endowed with the same susceptibilities of the emotion of beauty, which would lead them upon the whole, to find the same pleasure, in the contemplation of the same objects, if different circumstances did not produce views of utility, and associations of various sorts, that diversify the emo-

tion itself. It is the same in different periods of life of the same individual ; the desirableness of objects varying, at least, as much as the feeling of beauty. I may add, that as there seem to be, in individuals, original constitutional tendencies to certain passions, rather than to others ; so there might be a constitutional difference, with respect to the original susceptibility of the emotion of beauty, that, of itself, might render certain objects more delightful to certain minds than others. But still, when the race of mankind are considered as one great multitude, as their native original tendencies to passion may be considered as the same, their native original susceptibilities of the pleasing impressions of beauty, in certain cases, might also have been the same ; though, as these original tendencies, if they did exist, might yet admit of being variously diversified, to measure them by any standard, would, even in these circumstances, be still as impracticable, as if there were no original tendencies whatever. There is no standard of desire ; and as little, even in these circumstances, should we expect to find an absolute standard of beauty. All of which we might philosophically speak, would be the agreement of the greater number of mankind in certain desires, and the agreement of the greater number of cultivated minds in certain emotions of beauty.

That the feeling of beauty, which so readily arises when the mind is passive, and capable, therefore, of long trains of reverie, should not arise when the mind is busied with other objects of contemplation, or even, in any very high degree, when the mind is employed in contemplating the beautiful object itself, but in contemplating it, with a critical estimation of its merits or defects, is no proof, as has been supposed, that trains of associate images are essential to the production of the emotion, but is what might very naturally be suspected, though no such trains were at all concerned. The feeling of beauty, it must be remembered, is not, as I have already said, a sensation, but an emotion. A certain perception must previously exist ; and though the perception may have a tendency to induce that different state of mind which constitutes the emotion, it has a tendency also, by suggestion, to induce many other states, and in certain circumstances, when there are any strong desires in the mind, may induce those other states, which may be accordant with the paramount existing desires, more readily than the emotion which has no peculiar accordance with them. It is the same in this case, too, with our other emotions, as with that of beauty. When we are intent on a train of study, how many objects occur to the mind, which, in other circumstances, would be followed by other emotions,—by various desires, for ex-

ample,—but which are not followed by their own specific desires, merely in consequence of our greater interest in the subject, the relations of which we are studying. Nor is this peculiar to our emotions only. It extends in some degree even to our very sensations. In two individuals who walk along the same meadow, the one after suffering some very recent and severe affliction, and the other with a light heart, and an almost vacant mind, how very different, in number and intensity, are the mere sensations that arise at every step ! Yet we surely do not deny, to him who scarcely knows that there are flowers around him, an original susceptibility of being affected by the fragrance of that very violet, the faint odour of which is now wafted to him in vain.

The great argument, however, which is urged by the deniers of any original beauty, is founded on that very view of the fluctuations of all our emotions of this class, which I endeavoured to exhibit to you in the early part of this lecture. When we consider the changes of every kind, with respect to all, or, at least, nearly all the varieties of this order of our emotions, not merely in different nations, or different ages of the world, but even in the same individual, in the few years that constitute his life ; and in many important respects, perhaps, in a few months or weeks, can we suppose they say, that amid these incessant changes, of which it is not difficult for us to detect the source, there should be any beauty that deserves the honourable distinction of being independent and original ? In what respect, however, does this formidable argument differ from that equally formidable argument which might be urged against the distinctions of truth and falsehood ? those distinctions, which it is impossible for the very sceptic, who professes to deny them, not to admit in his own internal conviction, and the validity of which, the deniers of any original beauty would be far from denying, or even wishing to weaken ; since the very wish to convince of the truth of their theory, whatever it may be, must be founded on this very distinction of a peculiar capacity in the mind, of a feeling of the truth of certain arguments, rather than of certain opposite arguments. If our tastes, however, fluctuate, do not our opinions of every sort vary in like manner ? and is not the objection in the one case, then, as powerful as in the other ? or, if powerless in one, must it not be equally powerless in both ? I need not speak of different nations, or ages of the world, in this, more than of the other case, of the very different systems of opinions of savage, semi-barbarous, and civilized life, in all their varieties of climate and state. Here, too, it is sufficient to think of one individual, to compare the wisdom of the mature well-educated man, with the ignorance

of his boyhood, and the proud, but irregular and fluctuating acquirements of his more advanced youth; and if, notwithstanding all these changes, when perhaps not a single opinion ultimately remains the same, we yet cannot fail to believe, that truth is something more than a mere arbitrary feeling, the result of accidental circumstances, that there is, in short, an original tendency in the mind to assent to certain propositions, rather than to certain other propositions opposite to these; we surely are not entitled to infer from the changes in the emotion of beauty, not more striking, that all in the mental susceptibility of it, is arbitrary and accidental.

Again, however, I must repeat, that in this review of the argument, I am not contending for the positive originality and independence of any species of beauty, but merely considering probabilities; and that, although, from the circumstances as they appear to us, I am led to adopt the greater probability of some original tendencies to feelings of this class, I am far from considering these as forming the most important of the class, or even as bearing any high proportion, in number or intensity, to the multitude of delightful feelings of the same order, that beam for ever, like a sort of radiant atmosphere within, on the cultivated mind, becoming thus, in their ever-increasing variety, one of the happiest rewards of years of study, that were too delightful in themselves to need to be rewarded.

LECTURE LVI

I. IMMEDIATE EMOTIONS, NOT NECESSARILY INVOLVING ANY MORAL FEELING.—3. BEAUTY, AND ITS REVERSE, CONTINUED.—THE EMOTION OF BEAUTY SEEMS TO BE AN ORIGINAL FEELING OF THE MIND.—MR. ALISON'S THEORY.

GENTLEMEN, the inquiries which engaged us in the Lecture of yesterday, related to the influence of accidental circumstances, on our emotion of beauty, an influence which we found to be capable of producing the most striking diversities, in our susceptibility of these emotions, of every species, whether arising from the contemplation of objects material, intellectual, or moral. So very striking, indeed, did these diversities appear, on our review, as naturally to give occasion to the inquiry, whether feelings, that vary so much, with all the variety of the circumstances that have preceded them, may not wholly depend on that influence, on which they have manifestly depended, to so great an extent. I stated to you, that, in such an inquiry, it is not possible to attain confidence in the result, since all the circumstances

which it would be necessary to know, cannot be known to us. It is long before the intellectual processes of the infant mind are capable of being distinctly revealed to another, directly or indirectly; and, in this most important of all periods, when thought is slowly evolved from the rude elements of sensation, the very circumstance, the influence of which we wish to trace, must have been exerting an influence that is wholly unperceived by us. The question, therefore, as to any susceptibility in the mind, of being affected with impressions of original beauty, is a question of probabilities, and nothing more.

Proceeding, then, with this limited confidence, in the results of our inquiry, we endeavoured to consider the phenomena of this order of our emotions, not, indeed, in perfect freedom from the influence of preceding accidental circumstances, since this distinct analysis is beyond our power, but with as near an approach to it as it was possible for us to attain; and, after a comparison of the probabilities, we found, I think, reason, I will not say to believe, but at least to incline to the opinion, that we are truly endowed with some original susceptibilities of this class,—susceptibilities, however, that are not so independent of arbitrary circumstances of association as to be incapable of being modified, or even wholly overcome by other tendencies that may be superinduced, but which, at the same time, are not so dependent on such circumstances, as, when these circumstances have not occurred to favour them, nor any other circumstance more powerful to counteract them, to be, of themselves, incapable of affecting us in the slightest degree with any of those delightful emotions, of which we have been endeavouring to trace the origin.

In examining this point, it was of great importance to make you sufficiently acquainted with one radical distinction; and, I trust, that now, after the remarks which I made, you are in no danger of confounding that view of beauty, which regards it as an emotion, dependent on the existence of certain previous perceptions or conceptions, which may induce it, but may also, by the operation of the common laws of suggestion, induce, at other times, in like manner, other states of mind, exclusive of the emotion,—with the very different doctrine, that regards beauty as the object of a peculiar internal sense, which might, therefore, from the analogy conveyed in that name, be supposed to be as uniform, in its feelings, as our other senses, on the presence of their particular objects, are uniform, or nearly uniform, in the intimations afforded by them. Such a sense of beauty, as a fixed regular object, we assuredly have not; but it does not follow that we are without such an original suscep-

tibility of a mere emotion, that is not, like sensation, the direct and uniform effect of the presence of its objects, but may vary in the occasions on which it rises, like our other emotions; love, for example, or hate, or astonishment, which various circumstances may produce, or various other circumstances may prevent from arising.

In conformity, then, with this view, though, from a comparison of all the circumstances of the case, as far as they can be known to us, I am led to regard the mind, as having originally certain tendencies to emotions of beauty, in consequence of which it may be impressed with them, on the contemplation of certain objects, without the necessary previous influence of any contingent circumstances, I yet allow the power of such circumstances, not merely to produce analogous emotions, when otherwise these would not have arisen, but also to modify, and even in some cases, to overcome our original tendencies themselves, in the same manner as we found that our original tendencies to other emotions might be modified and overcome, in particular cases of a different kind. I allow this influence of circumstances on our emotions of beauty, in the same manner as I allow the very general empire of prejudice, and the power of all the accidental circumstances, which may prepare the mind, less or more, for the reception, or for the denial of truth, though I do not regard truth itself as arbitrary in its own nature; that is to say, since truth is only a general name of a feeling common to many propositions, I do not regard all propositions, and the propositions opposite to them, as equally fitted to excite this feeling of truth in the mind. The analogy of truth, indeed, as that which there is a greater original tendency to feel, in certain propositions, than in others, though a tendency, which circumstances may, in certain minds, weaken and even reverse, seems to me a very important one, in this discussion, since precisely the same arguments which are urged by those who contend for the exclusive influence of association in the production of beauty, might be urged, as I showed you, with equal force, against those distinctions of truth and falsehood, which the assertors of the creative influence of association, in the less important department of taste, would surely be unwilling to abandon. If it be in the power of circumstances to make us regard objects as beautiful, which, but for those circumstances, would not have excited any emotion whatever, and, in many cases, even to reverse our emotions, which is all that the deniers of original beauty can maintain; it is not less in the power of circumstances, as the history of the different superstitions of the world, and of the very schools of wisdom, in all the various departments of philosophy, sufficiently shows, to

make us regard as true, what we otherwise should have regarded as false, and false what we otherwise should have regarded as true. The mind is formed, indeed, to feel truth, and to feel beauty; but it is formed also to be affected by circumstances, the influence of which may, in any particular case, be inconsistent with either of those feelings; and the resulting belief, or the resulting emotion, may naturally be supposed to vary with the strength of these accidental circumstances.

When I say, then, of the mind, that there seems greater reason, on the whole, to suppose it endowed with some original susceptibility of this pleasing emotion, I speak of these original susceptibilities, as developed in circumstances, in which the feelings which certain objects would naturally tend to excite, are not opposed by more powerful feelings; by views of utility, for example, which are promoted, in many cases, by deviations from forms, that of themselves would be the most pleasing—or, by the influence of habitual or even accidental associations. These unquestionably may, as we have already seen, suspend and even reverse our emotions of beauty, as they suspend or reverse our other emotions, even our most powerful emotions of desire; but, though they do this, it may be only in the same way, as every greater force overcomes a less, which still implies the existence of that less, though, if we saw only the one simple emotion, that results from the conflict of the unequal forces, we might be led to think that the impelling cause also was simple, and wholly in the direction of the emotions which we perceive. The writers, therefore, who would reduce our emotions of beauty entirely to the influence of association, and who endeavour to justify their theory by instances of the power of particular associations, seem to make far too great an assumption. They do not prove the influence of original beauty to be nothing, by proving the influence of other principles to be something more. What eye is there, however little exercised it may be in discriminating forms, which does not, at least in the mature state of the mind, whatever it may have done originally, feel the beauty of the circle or of the ellipse, considered simply as figures, without regard to any particular end? and though it may be easy to collect instances, in which we prefer to these forms, some one of the angular figures, on account of some useful purpose to which the angular figure, though less pleasing in itself, may be subservient, this does not prove that the curve is not felt as more beautiful in itself, but only that it is not felt to be beautiful, where the pleasing emotion which of itself it would excite, is overcome by the painful feeling that arises from obvious unfitness, in comparison with some other figure more suit-

able. Though a circle, for example, may in itself be more pleasing than an oblong, we may yet prefer an oblong for our doors and windows; the feelings of comparative convenience and inconvenience being more powerful than the feelings which they overcome, of beauty in the mere form, considered without reference to an end; or rather the fitness of one form for the use intended, involving in itself a species of beauty which may be termed natural beauty as much as the other. In the mere bodily sense of taste, we never think of contending, that all the original affections of the sense are indifferent, and become agreeable or disagreeable, by mere association; yet we know well, that it is in the power of habit to modify and reverse these feelings, so as to render a luxury to one, what is absolutely nauseous to another. Different nations have, indeed, an admiration of very different works of genius; but the mere cookery of different nations is, perhaps, still more strikingly various than their prevalent intellectual tastes. There is unquestionably, however, an original tendency to delight in sweetness, though certain circumstances may induce a preference of what is bitter, and there may, too, easily be an original tendency to feel the emotion of beauty from certain objects, though, by the similar influence of circumstances, we may be led to prefer to them, colours or proportions of a different kind. Upon the whole, the probable inference which, as I have already said, seems to me the most legitimate that can be drawn from the phenomena of beauty, with respect to its existence as an original emotion, is, that certain objects, various perhaps in different individuals, do tend originally, and without any views of indirect utility, or any previous associations, to excite emotions that are agreeable in themselves, and capable of being reflected back, and combined with the agreeable object; but that these may be variously modified by views of utility, or by permanent or even accidental associations; since there is nothing in any of our original tendencies which implies that they must be omnipotent, and the same in all times and circumstances. To the child, at least as soon as he is capable of making known to us in any way his delights and preferences, certain objects seem to be productive, in a higher degree than others, of that pleasing emotion, which we denominate beauty, when reflected and embodied, as it were, in the objects that excite it; and as certainly this delightful emotion varies in the course of his life, from object to object, innumerable times, according to circumstances, which we may not always be able to detect, but which it is generally not very difficult to trace, at least in some of their most striking and permanent influences.

In the case of those theories, which would

refer all beauty in the forms and colours, or other qualities of material things, to the suggestion of mental qualities, and the suggestion of associate trains of images in accordance with these, there is one circumstance which may have led to the illusion, if the theories are truly to be held to be illusive; and it is a circumstance common, you will perceive, to all those cases on which the theories are professedly founded. But the mere laws of suggestion, though no other laws of mind were concerned, and though beauty, as a primary direct emotion, were the exclusive invariable result of certain perceptions in all mankind alike, as immediate as the perceptions themselves, analogous objects would unquestionably suggest analogous objects; and, where the suggestions were rapid, and the pleasing emotion of beauty continued to coexist with various suggestions, it might not be very obvious, when we endeavoured to review the whole series of feelings, to which set of feelings the priority should be assigned; and whether the emotion which perhaps led to the suggestions of the analogous objects, by the mere influence of this common delightful feeling, might not be itself rather the result of them. The pleasure which preceded the suggestion of an agreeable object, and still continued after that object was suggested, might thus seem to be the effect of the suggestion of the agreeable object itself. When, therefore, in our endeavour to explain the beauty of any corporeal form, we dwell on it for any length of time, or even when we dwell on it with that mere passive gaze of pleasure which its beauty excites, a variety of analogous objects may be suggested during the delightful contemplation; and, among these, since the different mental affections, intellectual and moral, which we feel in ourselves, or observe in others, must present to us the most interesting of all analogies, it is not wonderful that some analogous mental qualities should very readily arise in our mind, as any other analogous object is suggested in any other train. The pleasure attached to the contemplation of the mental quality will, of course, blend with the pleasure previously felt from the material object; and may be conceived to be itself the chief constituent of that primary pleasure, since the subsequence is too rapid to be distinguishable on reflection. There is a pleasure also, it must be remembered, in such a case, from the mere perception of the analogy of the coexisting objects of thought,—a pleasure that constitutes the whole charm of the metaphorical language of the poet and the rhetorician,—which gives, therefore, an additional delight to the mental suggestion when the kindred image is suggested, and consequently leads us the more to ascribe to it the whole delight which we feel. But

though, when we consider any forms and colours, simple or combined, the analogy of some mental affection may be suggested, and though, when the analogous feeling is suggested, the pleasure of the beauty may be greatly increased, this is no proof that the material objects themselves are not pleasing, independent of the suggestion, though not perhaps to an equal degree. The softness of moonshine may derive no slight charm, and perhaps its chiefest charm, from the mild graces of the mind which it suggests, or the remembrance of many a delightful evening walk with friends whom we loved. But this certainly is far from proving that this softness of moonshine would not be delightful, in any degree, if it had not excited such analogous conceptions. The sun, bursting in all his majesty, like the sovereign of the ethereal world, through the clouds, which he seems to annihilate with the very brightness of his glory, presents unquestionably many moral analogies which add to our delight, when we gaze, above or below, on that instant change which all nature seems to feel :—

Denso velamine nubis
Obsitos, et tæta pressus caligine Titan,
Nativo demum radiantis acumine luec
Nubila perumpit Victor, seque assertit orbi,
Splendidi, et toto rutilans spatiat Olympo.

The similitude which these beautiful verses develop, is unquestionably most pleasing. But would there, indeed, be no delight in the contemplation of so magnificent an object, if some moral analogy were not excited, and if the sun itself, with the instant succession of darkness and splendour, and the light diffused over every object beneath, were all of which our mind could be said to be conscious?

Though, in this question of probabilities which we have been considering, the preponderance seems to me to be in favour of the belief of some original tendencies to the emotion of beauty, on the contemplation of certain objects, I have already said, that it is only a small part of this order of emotions, which we can ascribe to such a source; and these, as I conceive, of very humble value, in relation to other more important emotions of the order, which are truly the production of associations of various kinds. Though all objects might not have been originally indifferent, the objects of our livelier emotions at present, are certainly those which speak to us of moral analogies and happy remembrances. It will not be an uninteresting inquiry, then, in what way these associations operate, in giving birth to the emotions, or in aiding them with such powerful accessions of delight. Let us pass, then, from the question of original beauty, to this still more important investigation.

The investigation, when we first enter on

it, may seem a very easy one. It is, as we have found from our examination of the laws of mind, the nature of one object, either perceived or conceived, to suggest, by the common laws which regulate our trains of thought at all times, some other object or feeling, that has to it some one of many relations; and this again may suggest others, related to it in like manner. Each suggestion, during a long train of thought, may be the suggestion of some delightful object, and thus indirectly of the delightful emotions which such objects were of themselves capable of inducing; and though the amount of gratification additional, in each separate suggestion, may be slight, the gratification afforded by a long series of such images, all delightful in themselves, and all harmonizing with the object immediately before us, may be very considerable,—so considerable as to be sufficient not to favour merely, but absolutely to constitute that emotion, to which we give the name of beauty. Such is the view of the origin of this emotion, which has been given, with much felicity of language, and with much happy illustration of example and analysis, by my very ingenious and very eloquent friend, the author of the *Essays on the Nature and Principles of Taste*. The continued suggestion of trains of harmonizing images, Mr. Alison considers as essential to the emotion, which consists, according to him, not more in the kindred associate feelings themselves, that are recalled to the mind, than in the peculiar delight attending what he terms the exercise of the imagination in recalling them; that is to say, according to the view which I have given you of our mental functions, the delight which he supposes to attend the mere suggestion of image after image in associate and harmonizing trains of thought. This opinion, as to the delight of the mere exercise of imagination, seems to be founded on the belief of a sort of voluntary exertion of the mind, in such trains, when all which truly takes place in them, as I endeavoured, in former lectures, to explain to you, is the operation of the common laws of suggestion, that may be pleasing or painful in their influence, precisely as the separate feelings that rise by suggestion, are themselves pleasing or painful. The exercise of imagination, in such a case, is nothing more than these separate states themselves. When we gaze on a beautiful object, we do not call up the analogous images that may arise, but they arise of themselves unwilld; and if the images were of an opposite kind, the process would itself be painful. Indeed, if the supposed exercise of imagination were in itself as an exercise of the mind, necessarily pleasing, this exercise, Mr. Alison should have remembered, is not confined to objects that are beautiful, but is common to these

with the objects that excite emotions opposite to those of beauty, in which, therefore, it would not be very easy for him to account for its different effect. Since, according to his theory, the same species of exercise of imagination is involved in these likewise, it is very evident that, if necessarily pleasing, it should tend, not to increase, but to lessen the disagreeable feelings, and to convert ugliness itself into a minor sort of beauty. On the fallacy of this supposed part of the process, however, it is unnecessary for us to dwell. I allude to the supposed delight of the mere exercise at present, only to show, how necessary it has been felt, in this theory, to account by a multitude of images, for an amount of delight, which seems too great for any single image in suggestion. Here, then, lies the great difficulty, which that theory has to overcome. To him, who reflects on the circumstances that have attended the emotion, in cases in which it has been most strongly felt, does it appear, on this review, that a series of images succeeding images have passed through his mind? When we turn our eye, for example, on a beautiful living form, is there no immediate or almost immediate feeling of delight whatever,—but do we think of many analogies,—and, till these analogies have all been scanned, and the amount of enjoyment, which may have attended the different objects of them, been measured, is the countenance of smiles, or the form of grace, only a mass of coloured matter to our eyes? There are cases, surely, in which the feeling of beauty is immediately consequent on the very perception of the beautiful form,—so immediately consequent, that it would be difficult to convince the greater number of those, who have not been accustomed to reflect on such subjects, that there is any subsequence whatever, and that the delightful emotion is not itself the very glance, which gives that happy feeling in instant sequence to the soul. I have no hesitation even in saying, that the more intense the feeling of beauty may be, the less is the tendency of the mind to pass from the delightful form, which fills the heart as it fills the eyes, to images of distant analogy; that this transition takes place chiefly where the emotion is of a slight kind; and that what is said to constitute beauty, has thus an inverse and not a direct proportion to that very beauty which it is said directly to constitute. There can be no question, at least, that, in the language of every poet, and of every impassioned describer of these impassioned feelings, the total suspension of all our faculties, but of that which is fixed on the contemplation of the dazzling object itself, is stated as an essential character of excess of this emotion. There is uniformly described a sort of rapturous stupefaction, which overwhelms every other

thought or feeling; and though this, in its full extent, may be true only in those excessive emotions which belong rather to poetry than to sober life, even in sober life there is assuredly an approach to it; and we may safely, therefore, venture to assert, that the beauty which scarcely allows the mind to wander for a moment from itself, is not less than the beauty which allows its happy admirer to run over the thousand kind and gentle qualities which it expresses, or to wander, still more widely, over a thousand analogies in other objects.

If we attend, then, to the whole course of our feelings, during our admiration of the objects which we term beautiful, we are far from discovering the process of which Mr. Alison speaks. We do not find that there is, at least that there is necessarily, any wide combination, or rapid succession, of trains of those associate images or feelings which he terms ideas of emotion; and yet we have seen reason to believe, that the chief part of beauty is truly derived from that mental process which has been termed association,—the suggestion of some feeling or feelings, not involved in the primary perception, nor necessarily flowing from it. In what manner, then, does the suggestion act?

The modes, in which it acts, seem to me to be what I am about to describe,—modes, that are in perfect accordance with the general processes which we have found to take place in the mind, in the phenomena before considered by us.

The associate feelings, that produce this effect, are, I conceive, of two kinds. In the first place, any very vivid delight that may have been accidentally connected with any particular object, may be recalled in suggestion by the same object, so as afterwards to make it seem, in combination with this associate feeling, more pleasing than it originally seemed to us; and may, in like manner, and with similar effect, as when it is recalled by the same object, be recalled directly by an object similar or analogous to the former, which thus, even when we first gaze upon it, may appear to have a sort of original loveliness, which, but for the rapid and unperceived suggestion, it would not have possessed. One degree of beauty is thus acquired, by every object similar to that which has been a source to us of any primary pleasure; and with this faint degree of pleasing emotion, other pleasures, arising perhaps wholly from accidental sources, at various times, may be combined, in like manner, rendering the state of mind, in the progressive feeling, more complex, but still, as one feeling or state of the mind, not less capable of being again suggested by the perception of the same or similar objects, than the less complex emotion, that in the first stage preceded it. With every new accidental acces-

sion of pleasure, in the innumerable events that occur from year to year, the delight itself becomes more complex; till at length the whole amount of complex pleasure, which the same object may afford by this rapid suggestion to the mind which contemplates it, may be as different from that which constituted the feeling of beauty in the fourth or fifth stage of the growth of the emotion, as that beauty itself, in its fourth or fifth stage, differed from the simple original perception. Still, however, the pleasing emotion, though the gradual result of many feelings of many different stages, is itself always one feeling, or momentary state of the mind, that, as one feeling, admits of being suggested as readily and rapidly in any one stage, as in any of the stages preceding; and it is this immediate state of complex emotion, however slowly and gradually formed, which I conceive to be suggested, when objects appear to us beautiful; not the number of separate delightful states, which Mr. Alison's theory supposes to be essentially necessary. We feel the instant emotion of loveliness, on the perception of a particular object, though we may have been years in forming those complex associations, which have rendered the mind capable of now feeling that instant emotion. It is in this way, that a landscape, which bears a resemblance to the scene of our early youth, or to any other scene where we have been peculiarly happy, cannot fail to be felt as more beautiful by us, than by others who have not shared with us that source of additional embellishment. The countenance of one who is dear to us, sheds a charm over similar features, that might otherwise scarcely have gained from us a momentary glance. An author, whose work we have read at an early period with delight, when it was, perhaps, one of the earliest gifts which we received, or the memorial of some tender friendship, continues for ever to exercise no inconsiderable dominion over our general taste. In these, and innumerable cases of the same kind, which must have occurred to every one in his own experience, the direct suggestion is of an amount of particular delight, associated with the particular object. This, then, is one of the modes in which I conceive the emotion of beauty to be excited, and the chief source of all the pleasure which we class under that comprehensive name. It is sufficiently easy to be understood; it accounts for the variety of emotions in different individuals, when the object which one admires is such as to others seems scarcely of a nature to afford any pleasing emotion whatever; and, above all, it accounts for those more perplexing anomalies, which we sometimes find in the taste of the same individual, when he admires, in some cases, with an admiration that seems to us scarcely consistent with the refined fastidiousness which he displays

on other occasions. The delightful emotion which he feels from objects that appear to others inferior to the far nobler objects of which he disapproves, may, in such cases, be confined to him, because the associations from which the emotion has arisen, were his alone.

It is in this way, I have said, that the chief pleasure of the emotion arises. But, if all the influence of association on beauty were exercised in this way, by the direct suggestions of a particular amount of pleasure resulting from accidental causes, that have been peculiar to the individual, it would not be easy to account for the whole phenomena of this tribe of emotions; above all, for those regular gradations of beauty in different objects, which are felt in most cases with so general an agreement by the greater number of cultivated minds, and so uniformly, or almost uniformly, by the same individual. If every object had its own particular associations in the mind of every individual, and every object many opposite associations, it might be expected, that the emotion of beauty, or at least the estimate of the degree of beauty, would fluctuate in the same individual according to these caprices of accidental suggestion, and in the great multitude of society, would fluctuate at different moments, so as scarcely to admit of being fixed in any way. A face which at one time suggested one particular delight, might suggest by its various analogies, or various circumstances of the past, various degrees of delight, and with these, therefore, a perpetual variety of the resulting emotion. Notwithstanding all this variety, however, we estimate objects very nearly in the same way. There is a notion of excellence acquired in some manner,—a relative notion of fitness to excite a certain amount of delight, which seems to be for ever in our mind to direct us, according to which, we fix at some precise degree the varying beauty of the moment. There is every appearance, therefore, in such cases, of the suggestion of one general feeling, and not merely of various fluctuating feelings. The suggestion of this general feeling, which is in perfect accordance with the laws of thought already investigated by us, forms, I conceive, a second mode of association, in its influence on the emotion of beauty; and it is this chiefly which aids us in fixing the degrees of what we constantly, or almost constantly, recognise as less or more beautiful than certain other objects; that is to say, less or more fit to excite in cultivated minds a certain amount of pleasure.

I have already explained to you in what manner the process of generalizing takes place. We see two or more objects, we are struck with their resemblance in certain respects; we have a general notion of the circumstances in which they thus resemble each other, to the exclusion, of course, of the cir-

circumstances in which they have no resemblance. For many of these mere relative suggestions of resemblance we invent words, which, from the generality of the notion expressed by them, are denominated general terms; such as quadruped, animal, peace, virtue, happiness, excellence; but, though we invent many such general terms, we invent them, it is evident, only in a very few cases, comparatively with the cases of general feeling of resemblance of some sort, in which they are not invented, and we apply the same name frequently, in different cases, when the general feelings in our mind, however analogous, are not strictly the same. We apply the word peace, for example, to many states of international rest from war, which are far from conveying the same notions of safety and tranquillity; the word happiness, to many states of mind which we feel at the same time, or might feel, if we reflected on them, to be, in species and intensity, very different; the word beauty, to many objects which excite in us very different degrees of delightful emotion, and which we readily recognise as fit only to excite the emotion in these different degrees. In short, though our general terms be few, our general feelings are almost infinite,—as infinite as the possible resemblances which can be felt in any two or more objects; and though we have not words expressive of all the degrees of feeling, we have notions of these degrees as different,—notions of various degrees of beauty,—various degrees of happiness,—various degrees of excellence in general,—not imbodyed in words, but capable of being suggested to the mind by particular objects, as if they were so imbodyed. These notions have been formed by the mind, in the same way as all its other general notions have been formed, by the observation and comparison of many particulars, and they arise to the mind on various occasions, when the particulars observed correspond with the particulars before observed, in the same way as the word quadruped, which we have invented for expressing various animals known to us, occurs to our mind when we see for the first time some other animal, of which we had perhaps never heard, but which agrees, in the feeling of general resemblance which it excites, with the other animals formerly classed by us under that general word. This ready suggestion of general feelings which is continually taking place, in applications of which all must be sensible, and the possibility and likelihood of which no one will deny, is that which I suppose, in the case of the emotion at present considered by us, to direct our general estimate of degrees of beauty, or, in other words, our relative notion of the fitness of certain objects to excite a pleasing emotion of a certain intensity.

We discover this fitness, as we discover every other species of fitness, by observation of the past, and by observing this past in others, as well as in ourselves, we correct, by the more general coincidence of the associations of others, what would be comparatively irregular, and capricious in the results of our own limited associations as individuals. The accidents of one, or of a few, when variously mingled, become truly laws of thought of the many. As this observation is more and more enlarged, the irregularities of individual association are more and more counteracted by the foresight of the diversities of general sentiment, till, at length, the beauty of which we think, in our estimates of its degree of excellence, though still, in a certain degree, influenced by former accidental feelings of the individual, is, in a great measure, the beauty which we foreknow that others are to feel; and which we are capable thus of foreknowing, because we have made a wide induction of the objects, that have been observed by us, to excite the emotion in its various degrees, in the greater number of those whose emotions we have had opportunities of measuring.

As we say of a well-cultivated memory, that it is rich in images of the past, we may say of a well-cultivated mind in general, that it is rich in notions of beauty and excellence,—notions, which it has formed by attentive observation and study of various objects, as exciting, in various circumstances, various degrees of delight; but which ever after rise simply and readily to the mind by suggestion, according as the objects, perceived or imagined, are of a nature to harmonize with them. The general notion of what will be most widely regarded as beauty or excellence, in some one or other of its degrees, rises instantly, or at least may arise instantly to the mind, on the perception of the beautiful or excellent object, and with it the emotions, which have usually attended it. In our estimate of degrees of beauty, then, as often as we attempt to calculate these, it is the general notion, that has resulted from the contemplation of many excellent qualities, which, as one state of mind, arises to us, and directs us; not the many separate states, which constitute the remembrances of many separate qualities. These, indeed, are not necessarily excluded; though, as I have already said, they arise less, where the beauty is felt to be great, than where it is felt only in a less degree. Many analogous images may arise, and they do frequently arise; and, if pleasing in themselves, may add to the gratification previously felt; but though they may arise, and when they arise, they increase the amount of pleasure, they are far from being absolutely necessary to the pleasing emotion itself. Though we have a general notion attached to the word

peace, this cannot exist long in our mind, without exciting some particular conception in accordance with it; though we know what is meant by the general word *animal*, independently of the particular species, which it may at different moments suggest, we yet cannot continue long to think of what is meant by the mere general word, without the suggestion of some particular animals. It would not be wonderful, then, that the general notion of beauty, which we have attached to a particular form, should, of itself, give rise to particular suggestions of analogy, even though the form, on which we gaze, were not, of itself, capable of suggesting them; and it cannot, surely, be more wonderful, that it should allow these suggestions of objects analogous, when the particular form perceived is of a kind to concur in the tendency to this suggestion, with the general notion of beauty itself. It is this subsequent suggestion of trains of associate images, increasing perhaps the effect of the emotion that existed previously as a state of the mind, but not producing it, which has led the very ingenious theorist to whom I have before alluded, to ascribe to these mere consequences of the feeling of beauty, that very feeling itself, which more probably gave occasion to them. Indeed, if the suggestion of particular images after images, and not the suggestion of one general delight, or the more general suggestion of beauty or excellence itself, be essential to the very existence of the emotion, it seems to me quite impossible to account for that instant or almost instant delight, which beauty, in its form of most powerful attraction, seems to beam on the very eye that gazes on it.

What sublimer pomp
Adorns the seat where Virtue dwells on earth,
And Truth's eternal daylight shines around!
What palm belongs to man's imperial front,
And woman, powerful with becoming smiles!*

In these cases, there are instant conceptions of dignity, or of gentleness, which we attach to the imperial front of man, or to the more powerful, and more truly imperial smiles of woman. What we term expression, is the suggestion of that general character of intelligence and virtue, which is said to be expressed, not the necessary suggestion of many separate truths, nor the suggestion of many separate acts of kindness, which may be suggested, indeed, if we continue long to contemplate the intelligent and benevolent form; but which are, in that case, subsequent to the emotion, that, in its origin at least, truly preceded them.

Such are the modes in which I conceive the past, in our emotion of beauty, to influence the present. But if all which the past

presents to us, be conceptions of former delight, how happens it, that these conceptions, which often pass along our mind in reverie, with only faint and shadowy pleasure, should be heightened to so much rapture, when suggested by some real object before us? The images suggested may afford the sources of the delight; but the delight itself must be in some way modified, before it is converted into beauty. There is another part of the process, then, which we have not yet considered, to which it is necessary to direct your attention.

What is truly most important to the emotion of beauty, is this very part of the process which theorists have yet neglected. It is not the mere suggestion of certain conceptions, general or particular, for these often form a part of our trains of thought, without any very lively feeling as their consequence. It is the fixing and imbodying of these in a real object before us, which gives to the whole, I conceive, one general impression of reality. This, I have little doubt, takes place, in the manner explained by me in former Lectures, when I treated of the peculiar influence of objects of perception, in giving liveliness to our trains of suggestion, and consequently greater liveliness to all the emotions which attend them. The delight of which we think, when images of the past arise, is very different from the delight which seems to be imbodyed in objects, and to meet our very glance, as the terror of the superstitious, when they think of a spectre in twilight, is very different from that which they feel, when their terror is incorporated in some shadowy form that gleams indistinctly on their eye. But for a process of the kind which I have stated, I do not see how the effect of beauty, as seen, should be so very different as it most certainly is, from the effect produced by a long meditation on all those noble and gracious characters of virtue and intelligence, the mere expression, that is to say, the mere suggestion of which is stated to be all which constitutes it. It is, in short, as I have said, this very part of the process which seems to me the most important in the whole theory of beauty.

The increased effect of that incorporating process, which, I suppose, in the case of beauty, is, in truth, nothing more than what we have found to take place in all the cases of suggestion of vivid images, by objects of perception rather than by our fainter and more fugitive conceptions. The reality of what is truly before us, gives reality to all the associate images that blend and harmonize with it. We think of ancient Greece—we tread on the soil of Athens or Sparta. Our emotion, which was before faint, is now one of the liveliest of which our soul is susceptible, because it is fixed and realized in the existing and present object. The same

* Measures of Imagination, second form of the poem, book I. v. 547—551.

images arise to us, but they coexist now as they rise, with all the monuments which we behold, with the land itself, with the sound of those waves which are dashing now, as they dashed so many ages before, when their murmur was heard by the heroes of whom we think—all now lives before us, and when we behold a beautiful form, all the images suggested by it, live in like manner in it. It does not suggest to us what was once delightful, but it is itself representative of what was once delightful. The visions of other years exist again to our very eyes. We see embodied all which we feel in our mind; and the source of delight which is itself real gives instant reality to the delight itself, and to all the harmonizing images that blend with it. We may, even in solitude, think with pleasure of the kindness of smiles and tones which we have loved; but when a smile of the same kind is beaming on us, or when we listen to similar tones, it is no longer a mere dream of happiness, the whole seems one equal perception, and we are surrounded again, as it were, with all the vivid happiness of the past.

Though the result of our inquiry into original beauty, then, has led us to adopt the greater probability of some original susceptibilities of emotions of this sort, that are independent of the arbitrary associations which must be formed in the progress of life, we have found sufficient reason to ascribe to this slow and silent growth of circumstances of adventitious delight, almost all the beauty which is worthy of the name; and we have seen, I flatter myself, in what manner these circumstances operate in inducing the emotion. This happy effect, I have shown to be too instantaneous to be the result of a rapid review or suggestion of many particulars, in each separate case, but to depend on the combination with the objects which we term beautiful, of some instant complex feeling of past delight, or of those general notions of beauty and excellence, which, themselves, indeed, originally resulted from the observation of particulars, but which afterwards are capable of being suggested as one feeling of the mind, like our other general notions of every species; and, when combined with objects really existing, or felt as if really existing, to derive from this impression of reality in the harmonizing objects with which they are mingled in our perception, a liveliness without which they could not have exercised their delightful dominion on our heart.

Such, I conceive, then, in the principles on which it depends, is that delightful dominion which is exercised on our heart, not directly by mind only, but by the very forms of inanimate nature.

Hence the wide universe,
Through all the seasons of revolving worlds,
Bears witness with its people, gods and men,
To Beauty's blissful power, and, with the voice

Of grateful admiration, still resounds;—
That voice, to which is Beauty's frame divine,
As is the cunning of the master's hand
To the sweet accent of the well-tuned lyre.*

LECTURE LVII.

I. IMMEDIATE EMOTIONS, NOT INVOLVING NECESSARILY ANY MORAL FEELING.—3. BEAUTY, AND ITS REVERSE, CONCLUDED.—4. SUBLIMITY, LIKE BEAUTY, A MERE FEELING OF THE MIND.—SOURCES OF SUBLIMITY.

FOR several Lectures, Gentlemen, we have been engaged in considering one of the most interesting of our emotions—an emotion connected with so many sources of delight, material, intellectual, and moral, that it is not wonderful that it should have attracted, in a very high degree, the attention of metaphysical inquirers, and should even have become a subject of slight study with those lovers of easy reading, to whom the word metaphysical is a word of alarm, and who never think that they are studying metaphysics, when they are reading only of delicate forms, and smiles, and graces. What they feel in admiring beauty, is an emotion so very pleasing, that they connect some degree of pleasure with the very works that treat of it, and would perhaps be astonished to learn, that the inquiry into the nature of this emotion, which it would seem to them so strange not to feel, is one of the most difficult inquiries in the whole philosophy of mind.

It may be of advantage, then, after analytical investigation, which is in itself not very simple, and which has been so much confused by a multitude of opinions, to review once more, slightly, our progress and the results which we have obtained.

In whatever manner the pleasing emotion itself may arise, and however simple or complex it may be, we term *beautiful*, the object by which it is excited. But though, philosophically a beautiful object be considered by us merely as that which excites a certain delightful feeling in our mind, it is only philosophically that we thus separate completely the object from the delight which it affords. It is impossible for us to gaze upon it, without reflecting on it this very delight, or even to think of it, without conceiving some spirit of delight diffused in it,—a never-fading pleasure, that, as if in independence of our perception, exists in it or floats around it, as much when no eye beholds it, as when it is the gaze and happiness of a thousand eyes.

Such in its reflection from our mind, on

* Pleasures of Imagination, second form of the poem, book L v. 682—689.

the object that seems to embody it, is the beauty which we truly feel; and if the objects that excite it, were uniformly the same in all mankind, little more would have remained for inquiry. But, far from being uniform in its causes in all mankind, the emotion is not uniform in a single individual, for a single year, or even, in the rapid changes of fashion, for a few months of a single year. These rapid changes, at once so universal and so capricious in their influence, led us naturally to inquire, whether fashion, in all its arbitrary power, and other circumstances of casual association, peculiar to individual minds, be not the modifiers only, but perhaps the very sources of all those emotions which seem to vary with their slightest varieties.

In this inquiry, which, from the peculiar circumstance in which alone it is in our power to enter on it, cannot afford absolute certainty of result, but only such a result as a comparison of greater and less probabilities affords, we were led, on such a comparison, to a conclusion favourable to the supposition, that the mind has some original tendencies to receive impressions of beauty from certain objects, rather than from others, though it has, without all question, at the same time, other tendencies, which may produce feelings inconsistent with the pleasing emotion, that otherwise would have attended the contemplation of those objects, or sufficient of themselves to constitute the pleasing emotion, in cases in which there was no original tendency to feel it—that what is beauty, therefore, at one period of life, or in one age or country, even in cases in which there may have been an original tendency to feel it, may not be beauty at another period of life, or in another age or country, from the mere difference of the arbitrary circumstances which have variously modified the original tendency; in the same manner as we find circumstances capable of modifying, or even reversing other species of emotions; this difference of result being, not of itself, a proof of the unreality of all original distinctions of this sort, more than the prejudices and delusions of mankind, and their varying desires, are a proof, that truth and error are themselves indifferent, and all things originally equally desirable. It is like the descent of one of the scales of a balance, from which alone it would be absurd to conclude that the whole weight is in that single scale. The descent may have arisen only from the preponderance of a greater weight over a less, when, but for the addition of some new substance thrown into it, the sinking scale would have arisen, and the other scale have obeyed that natural tendency, which, of itself, would have directed its motion to the earth.

The error of those who ascribe to the sug-

gestion of mental qualities, the whole emotion of beauty, in every case, corporeal as well as mental, we found to be very probably occasioned, in part at least, by the very nature of the laws on which suggestion depends—analogue objects suggesting analogous objects—and corporeal qualities thus suggesting the very striking analogies of mind, in the same way as these mutually suggest each other—analogies which are pleasing in themselves, and may, when suggested, mingle their own pleasure with the delightful emotion previously excited by the corporeal object. But it is very evident that the suggestion of the mental quality may, in this case, be the effect, or the mere concomitant, not the cause, of that delightful emotion, which was itself, perhaps, the very circumstance that led us to dwell on the external object till the analogy was suggested; and, though no suggestion of this kind had taken place, the object might still have been felt by us as beautiful. The same remark may be applied to all the other forms of association, as much as to the suggestions of mere analogy. These may coexist with the emotion, and may add to it their own mingled delight; but they are not, therefore, proved to be essential to it in all its degrees. On the contrary, in many cases, it may be only because we have previously felt an object to be beautiful, that it suggests to us various objects of former similar delights—the delightful effect itself, when produced, being the very principle of analogy which alone may have connected the one object with the other.

Association, however, whether as primarily giving rise to the emotion of beauty, in certain cases, or as modifying it in others, is, without all doubt, the source of the most important pleasure of this kind which we feel. But how does this association act? Is it, as is commonly supposed, by the suggestion of a number of images related to the object, that transfer to it, as it were, the emotions which originally belonged to them?

This opinion, though supported and illustrated by genius of a very high order, we found, notwithstanding, by reflection on all which we feel during our admiration of beauty, to be little warranted by the phenomena. Such a train of images passing through the mind, and images accompanied with lively emotion, could scarcely fail to be remembered by us; or, at least, if they are not remembered by us, there is no reason, *a priori*, to suppose the existence of them. Yet we surely feel the charm of external loveliness, without any consciousness of such trains. The very moment in which we have fixed our eye on a beautiful countenance, or at least with an interval after our first perception so short as to be absolutely undistin-

guished by us, we feel, with instant delight, that the countenance is beautiful; and the more beautiful the object, the more, not the less, does it fix the mind, as if absorbed in the direct contemplation and enjoyment of it; and the less, therefore, in such a case, do we wander over the trains of images, on which the very feeling of beauty is, in this theory, said to depend.

It is not a number of images, then, which necessarily arise in the mind, though these may arise, and when they arise, may increase the pleasure that was felt before. What is suggested in the instant feeling of loveliness must itself be an instant feeling of delight; and the source of such instant delight, we found accordingly in the common laws of suggestion, that have been already so fully considered by us. The perception of an object has originally coexisted with a certain pleasure,—a pleasure which may perhaps have frequently recurred together with the perception, and which thus forms with it in the mind one complex feeling, that is instantly recalled by the mere perception of the object in its subsequent recurrences. With this complex state, so recalled, other accidental pleasures may afterwards coexist in like manner, and form a more complex delight; but a delight which is still, when felt, one momentary state of mind, and, as one state of mind, capable of being instantly recalled by the perception of the object, as much as the simpler delight in the earlier stage. The embellishing influence of association may thus be progressive in various stages; because new accessions of pleasure are continually rendering more complex the delight that is afterwards to be suggested; but that which is suggested in the later stages, though the result of a progress, is itself, in each subsequent perception of the object which it embellishes, immediate. We spread the charm over the object, with the same rapidity with which we spread over it the colours which it seems to beam on us.

Such is the great source of all the embellishments of beauty, when association operates by the direct suggestion of an amount of delight associated with the particular object. But though our estimate of degrees of beauty, if wholly dependent on associations peculiar to the object, might seem scarcely capable of any precision, we yet form our estimate with a precision and uniformity which almost resemble the exactness of our measurements of qualities, that do not depend on any arbitrary and capricious principle. There must, therefore, be in the mind some scale, in whatever way it may be acquired, by which we correct, in part at least, these accidental irregularities. This intellectual scale we found to be the result of the comparisons which a cultivated mind is continually mak-

ing; or of those general notions of resemblance which rise to us, when there has been no intentional comparison of object with object.

We observe, not merely what gives delight to ourselves, but what gives delight also to the greater number of the cultivated minds around us; and what might be capricious in one mind, is thus tempered by the result of more general associations in the many. As we form various notions of brightness from many varieties of light,—various notions of magnitude from many forms and proportions,—various notions of pleasure from many agreeable feelings,—so do we form, from the contemplation of many objects that have excited certain pleasing emotions in ourselves and others, various notions of beauty, which, in their various degrees, are suggested by the new objects that are similar to those which originally induced them; and many comparisons, in various circumstances, thus gradually rectifying what might have seemed capricious, if the comparisons had been fewer, we learn at last to attach certain notions of beauty to certain objects, with a precision which otherwise we should have been incapable of attaining. The mind becomes rich with many varieties of the general feeling of beauty,—a feeling that was the result of many particular images and emotions in ourselves, and of much observation of the similar impressions of others; but which is itself one state of mind, and capable, as one state of mind, of being suggested in constant sequence. From the multitude of former pleasing objects that have interested us, we have formed, in consequence of their felt resemblance—as it was impossible for us, with our power of feeling resemblance, not to form—a general notion of beauty or excellence; or rather, we have formed progressively various general notions of various species and degrees of beauty and excellence; and these general notions are readily suggested by the objects which agree with them, precisely in the same way as our other general notions, such, for example, as those expressed by the words, flower, bird, quadruped, when once formed in the mind are afterwards readily suggested by any new object that seems referable to the species or genus.

It is not enough, however, when we gaze on a beautiful object, that certain conceptions of former delight should be suggested; for these rise equally, on innumerable occasions, in our trains of thought, with little liveliness of present joy. The distinguishing liveliness of the emotion of beauty, as it lives before us, seems to me, if it depend on association, to be absolutely inexplicable, but for a process, which we considered fully, when the general phenomena of suggestion were under our review; the process which, when the images of a train are connected, not

with some former conception only, but with a real object of perception, invests with illusive present existence the whole kindred images of the harmonizing group, of which a part, and an important part, is truly recognised as existing.

The countenance on which we gaze recalls to us some complex feeling of beauty, that was previously formed; but, while it recalls it, it exists permanently before us; and embodying, as it were, this complex visionary delight in the object of our continued perception, we give a reality, that is in the object only, to the shadowy whole, of which the perception of the object, and the associate feelings of suggestion, are harmonizing parts; and the images of tenderness and joy, which, as mere conceptions, unembodied in any real object, might have passed through the mind in its train of reverie, with little pleasure, thus fixed, as it were, and living before us in the external loveliness, affect us with a delight that is more than mere imagination, because the object of it seems to be as truly existing without, as any other permanent object of our senses,—a delight that may have resulted from many former pleasures, but that is itself one concentrated joy.

In all our inquiries on this subject, we have had regard, as you may have remarked, to many feelings of the mind, and not to one simple quality of objects that can be termed the beautiful, for the beautiful exists nowhere, more than the soft, or the sweet, or the pleasing; and to inquire into the beautiful, therefore, if it have any accurate meaning, is not to inquire into any circumstance which runs through a multitude of our emotions, but merely to inquire what number of our agreeable emotions have a sufficient similarity to be classed together under one general name.

Beauty is not any thing that exists in objects independently of the mind which perceives them, and permanent therefore, as the objects in which it is falsely supposed to exist. It is an emotion of the mind, varying, therefore, like all our other emotions, with the varying tendencies of the mind, in different circumstances. We have not to inquire into the nature of any fixed essence which can be called the beautiful,—*τὸ καλόν*,—but into the nature of transient feelings, excited by objects which may agree in no respect, but as they excite emotions in some degree similar. What we term the emotion of beauty, is not one feeling of our mind, but many feelings, that have a certain similarity, as greenness, redness, blueness, are all designated by the general name *colour*. There is not one beauty, more than there is one colour or one form. But there are various beauties; that is to say, various pleasing emotions, that have a certain resemblance, in consequence of which we class them together. The beautiful exists no

more in objects, than species or genera exist in individuals. It is, in truth, a species or genus,—a mere general term, expressive of similarity in various pleasing feelings. Yet even those writers, who would be astonished, if we were to regard them, as capable of any faith in the universal *a parte rei*, believe this universal beauty *a parte rei*, and inquire, what it is which constitutes the beautiful, very much in the same way as the scholastic logicians inquired into the real essence of the universal.

By some, accordingly, beauty is said to be a waving line, by others, a combination of certain physical qualities; by others, the mere expression of qualities of mind, and by fifty writers, almost as many different things, as if beauty were any thing in itself, and were not merely a general name for all those pleasing emotions, which forms, colours, sounds, motions, and intellectual and moral aspects of the mind produce,—emotions that have a resemblance, indeed, but are far from being the same. They are similar, only as all the feelings of the mind, to which we give the name of pleasure, have a certain similarity, in consequence of which we give them that common name, though there is nothing which can be called pleasure, distinct from these separate agreeable feelings.

What is it which constitutes the pleasing? would be generally counted a very singular inquiry; and to say that it is a sight, or a smell, or a taste,—the brilliant, or the sweet, or the spicy, or the soft, would be counted a theory still more singular than the inquiry which led to it. Yet no one is surprised when we inquire what it is, which constitutes the beautiful; and we are scarcely surprised at the attempts of those who would persuade us, that all our emotions, to which we give that name, are only one, or a few of these very emotions.

Various forms, colours, sounds are beautiful; various results of intellectual composition are beautiful; various moral affections, when contemplated by the mind, are attended with a similar feeling. But we are not to suppose, because there may be a considerable similarity of the emotions excited by these different classes of objects, that any one of the classes comprehends the others, more than colours which are pleasing, comprehend pleasing odours, or tastes, or these respectively each other. A circle or a melody, a song or a theorem, an act of gratitude or generous forbearance, are all beautiful, as greenness, sweetness, fragrance, are pleasing; and the pleasing exists as truly as the beautiful, and is as fit an object of philosophic investigation.

After these remarks on beauty, it is unnecessary to make any remarks on the opposite emotion; the same observations, as to their nature, and the circumstances that produce or modify them, being equally applica-

ble to both. As certain forms, colours, sounds, motions, works of art, and moral affections, are contemplated with delight; the contemplation of certain other forms, colours, sounds, motions, works of art, and affections of our moral nature, is attended with a disagreeable emotion. I have already remarked, that for this opposite emotion, in its full extent, we have no adequate name; deformity, and even ugliness, which is a more general word, being usually applied only to external things, and not to the intellectual or moral objects of our thought; as we apply beauty alike to all. There can be no doubt, however, that the same analogy, which connects our various emotions of beauty, sensitive, intellectual, and moral, exists equally in the emotions of this opposite class; and that, though we are not accustomed to speak of the ugly, and to inquire into what constitutes it, as we have been accustomed to inquire into the beautiful, and its supposed constituents, it is only because beauty is the more attractive, and the empire which itself possesses, is possessed, in some measure, by its very name.

After the attention which we have paid to the emotions that are usually classed together under the general name of beauty, the emotions, to the consideration of which we have next to proceed, are those which constitute our feelings of sublimity. On these, however, it will not be necessary to dwell at any great length, since you will be able, of yourselves, to apply to them many of the remarks that were suggested by the consideration of the former species of emotion.

The feeling of sublimity, it may well be supposed, does not arise without a cause, more than our feeling of beauty; but the sublimity which we feel, like the beauty which we feel, is an affection of our mind, not a quality of any thing external. It is a feeling, however, which, like the feeling of beauty, we reflect back on the object that excited it, as if it truly formed a part of the object; and thus, instead of being merely the unknown cause of our emotion,—as when it is philosophically viewed,—the object which impresses itself on our mind, and almost on our senses, as sublime, is felt by us, as our own imbodied emotion, mingled, indeed, with other qualities that are material, but diffused in them, with an existence that seems independent of our temporary feeling.

When Dryden said of one of our most powerful and most delightful passions,—

*The cause of love can never be assign'd;
Tis in no face, but in the lover's mind,*

he probably was not aware that he was saying what was not poetically only, but philo-

sophically true, though in a sense different from that which he meant to convey. It is not the capricious passion alone which the lover feels, as in himself, but the very beauty that is felt by him in the external object, which is as truly an emotion of his own mind as the passion to which it may have given rise. Of all those forms on which we gaze with a delight that is never weary, because the pleasure which we have felt, as reflected by us to the object, is to us almost a source of the pleasure which we feel at the moment, or are about to feel, what, I have asked, would the loveliest be, but for the eyes which gaze on it, and which give it all its charms, as they give it the very unity that converts it into the form which we behold? A multitude of separate and independent atoms,—we found ourselves obliged to answer,—and nothing more. In like manner, I might ask, what, but for the mind which is impressed with the sublimity, would be the precipice, the cataract, the ocean, the whole system of worlds, that seem at once to fill the immensity of space, and yet to leave on our conception an infinity which even worlds without number could not fill? To these, too, sublime as they are felt by us to be, it is our mind alone which gives at once all the unity and sublimity which they seem to us to possess, as of their own nature. They are, in truth, only a number of atoms, that would be precisely the same in themselves, whether existing near to each other or at distances the most remote. But it is impossible for us to regard them merely as a number of atoms, because they affect us with one complex emotion, which we diffuse over them all. When precipice hangs over precipice, and we shrink back upon our perilous height as we strive to look down from the cliff, on the abyss beneath, in which we rather hear the torrent than see it, with our shuddering and dazzled eye, we have one vivid, though complicated feeling, which fills our whole soul; and the whole objects existing separately before us are one vast and terrifying image of all that is within us. In the hurricane that lays waste and almost annihilates whatever it meets, there is to our conception something more than the mere particles of air that form each successive blast: We animate it with our own feelings. It is not a cause of terror only, it is terror itself. It seems to bear about with it that awful sublimity of which we are conscious,—an emotion, that as it animates our corporeal frame with one expansive feeling, seems to give a sort of dreadful unity to the whole thunders of the tempest; or rather to form one mighty being of the whole minute elements, that when they rage, impelling and impelled, in the tumultuous atmosphere, are merely congregated, by accidental vicinity, as they exist equally together in the

gentlest breeze, or in the stillness of the summer sky.

That sublimity should be reflected to the object from the mind like beauty, is not wonderful, since, in truth, what we term beauty and sublimity, are not opposite, but, in the greater number of cases, are merely different parts of a series of emotions. I have already, in treating of beauty, pointed out to you the error into which the common language of philosophers might be very apt to lead you,—the error of supposing that beauty is one emotion, merely because we have invented that generic or specific name which comprehends at once many agreeable emotions; that have some resemblance, indeed, as being agreeable, and diffused, as it were, or concentrated in their objects, and are therefore classed together, but still are far from being the same. The beautiful, concerning which philosophers have been at so much pains in their inquiries, is, as we have seen, in the mode in which they conceive it to exist, a sort of real essence,—a universal *a parte rei*, which has retained its hold of the belief when other universals of this kind, not less real, had been suffered to retain a place only in the insignificant vocabulary of scholastic logic.

Our emotions of beauty, I have said, are various; and, as they gradually rise, from object to object, a sort of regular progression may be traced from the faintest beauty to the vastest sublimity. These extremes may be considered as united by a class of intermediate feelings, for which grandeur might, perhaps, be a suitable term, that have more of beauty or more of sublimity, according to their place in the scale of emotion. I have retained, however, the common twofold division of beauty and sublimity, not as thinking that there may not be intermediate feelings, which scarcely admit of being very suitably classed under either of these names, but because the same general reasoning must be applicable to all these states of mind, whatever names, or number of names, may be given to the varieties that fill up the intervening space. Indeed, if all the various emotions, to which, in their objects, we attach the single name of beautiful, were attentively considered, we might find reason to form of this single order, many subdivisions, with their appropriate terms; but this precision of minute nomenclature, in such a case, is of less importance, if you know sufficiently the general fact involved in it, that there is not one beauty, or one sublimity, but various feelings, to which, in their objects, we give the name of beauty, and various feelings, to which, in their objects, we give the name of sublimity; and that there may be intermediate feelings, which differ from these, as these respectively differ from each other. That which happens in innumerable other

cases, has happened in this case; we have a series of many feelings; we have invented the names *sublimity* and *beauty*, which we have attached to certain parts of this series; and, because we have invented the names, we think that the emotions which they designate are more opposed to each other than they seemed to us before. One feeling of beauty differs from another feeling of beauty; but they are both comprehended in the same term, and we forget the difference. One feeling of sublimity differs, in like manner, from another feeling of sublimity; but they also are both comprehended in one term, and their difference too is forgotten. It is not so, when we compare one emotion of beauty with another emotion of sublimity; the feelings are then not merely different, but they are expressed by a different term; and their opposition is thus doubly forced upon us. If we had not invented any terms whatever, we should have seen, as it were, a series of emotions, all shadowing into each other with differences of tint, more or less strong, and rapidly distinguishable. The invention of the terms, however, is like the intersection of the series, at certain places, with a few well-marked lines. The shadowing may still, in itself, be equally gradual; but we think of the sections only, and perceive a peculiar resemblance in the parts comprehended in each, as we think that we perceive a peculiar diversity at each bounding line.

To be convinced how readily the feelings, contrasted as they may seem at last, have flowed into each other, let us take some example. Let us imagine that we see before us, a stream gently gliding through fields, rich with all the luxuriance of summer, overshadowed at times by the foliage that hangs over it from bank to bank, and then suddenly sparkling in the open sunshine, as if with a still brighter current than before. Let us trace it till it widens to a majestic river, of which the waters are the boundary of two flourishing empires, conveying abundance equally to each, while city succeeds city on its populous shores, almost with the same rapidity as grove formerly succeeded grove. Let us next behold it, losing itself in the immensity of the ocean, which seems to be only an expansion of itself, when there is not an object to be seen but its own wild amplitude, between the banks which it leaves, and the sun that is setting, as if in another world, in the remote horizon;—in all this course, from the brook which we leap over, if it meet us in our way, to that boundless waste of waters, in which the power of man, that leaves some vestige of his existence in every thing else, is not able to leave one lasting impression; which, after his fleets have passed along in all their pride, is, the very moment after, as if they had never been, and which bears or dashes those navies that

are contending for the mastery of kingdoms, only as it bears or dashes the foam upon its waves; if we were to trace and contemplate this whole continued progress, we should have a series of emotions, which might, at each moment, be similar to the preceding emotion, but which would become, at last, so different from our earliest feelings, that we should scarcely think of them as feelings of one class. The emotions which rose, when we regarded the narrow stream, would be those which we class as emotions of beauty. The emotions which rose, when we considered that infinity of waters in which it was ultimately lost, would be of the kind which we denominate sublimity; and the grandeur of the river, while it was still distinguishable from the ocean, to which it was proceeding, might be viewed with feelings to which some other name or names might, on the same principle of distinction, be given. This progressive series we should see very distinctly as progressive, if we had not invented the two general terms; but the invention of the terms certainly does not alter the nature of these feelings, which the terms are employed merely to signify.

Innumerable other examples,—from increasing magnitude of dimensions, or increasing intensity of quality,—might be selected, in illustration of that species of sublimity which we feel in the contemplation of external things, as progressively rising from emotions that would be termed emotions of beauty, if they were considered alone. It is unnecessary, however, to repeat, with other examples, what is sufficiently evident, without any other illustration, from the case already instanced.

The same progressive series of feelings, which may thus be traced as we contemplate works of nature, is not less evident in the contemplation of works of human art, whether that art have been employed in material things, or be purely intellectual. From the cottage to the cathedral; from the simplest ballad air, to the harmony of a choral anthem; from a pastoral, to an epic poem or a tragedy; from a landscape or a sculptured Cupid, to a Cartoon or the Laocoon; from a single experiment in chemistry, to the elucidation of the whole system of chemical affinities, which regulate all the changes of the surface of our globe; from a simple theorem, to the Principia of Newton:—In all those cases in which I have merely stated what is beautiful and what is sublime, and left a wide space between, it is easy for your imagination to fill up the interval; and you cannot fill up this interval without perceiving that, merely by adding what seemed degree after degree, you arrive at last at emotions which have little apparent resemblance to the emotions with which the scale began. It is, as in the thermometric

scale, by adding one portion of caloric after another, we rise at last, after no very long progress, from the cold of freezing, to the heat at which water boils; though our feelings, at these two points, are as different as if they had arisen from causes that had no resemblance; certainly as different as our emotions of sublimity and beauty.

In the moral scene the progression is equally evident. By adding virtue to virtue, or circumstance to circumstance, in the exercise of any virtue, we rise from what is merely beautiful to what is sublime. Let us suppose, for example, that, in the famine of an army, a soldier divides his scanty allowance with one of his comrades, whose health is sinking under the privation. We feel, in the contemplation of this action, a pleasure, which is that of moral beauty. In proportion as we imagine the famine of longer duration, or the prospect of relief less probable, the action becomes more and more morally grand or heroic. Let us next imagine that the comrade to whose relief the soldier makes this generous sacrifice, is one whose enmity he has formerly experienced on some interesting occasion, and the action is not heroic merely, it is sublime. There is not a virtue, even of the most tranquil or gentle sort, which we may not, in like manner, render sublime, by varying the circumstance in which it is exercised; and by varying these gradually, we pass through a series of emotions, any two of which may be regarded as not very dissimilar; though the extremes, when considered without the parts of the series which connect them, may scarcely have even the slightest similarity.

When I speak of this progression of our feelings, by which emotion after emotion may rise, from the faintest of those which we refer to beauty to the most overwhelming of those which we term sublime, I am far from wishing you to think that such a progress is in all cases necessary to the emotion; I allude to it merely for the purpose of showing that sublimity is not, by its nature of a class of feelings essentially different from beauty; and that we may, therefore, very readily conceive that the laws which we have found applicable to beauty may be applicable of it also.

So far is it, indeed, from being indispensable to sublimity that beauty should be the characteristic of the same circumstance, in a less degree, that, in many instances, what is absolutely the reverse of beautiful becomes sublime, by the exclusion of every thing which could excite of itself that delightful but gentle emotion. A slight degree of barren dreariness in any country through which we travel, produces only feelings that are disagreeable; a wide extent of desolation, when the eye can see no verdure as far as it can reach, but only rocks that rise at irregular in-

tervals, through the sandy waste, has a sort of savage sublimity, which we almost delight to contemplate. In the moral world, the audacity of guilt cannot seem beautiful to us in any of its degrees; but it may excite in us, when it is of more than ordinary atrocity, that species of emotion which we are now considering. Who is there who can love Medea as she is represented to us in the ancient story? But to whom is she not sublime? It is not in Marius that we would look for a model of moral beauty; but what form is there which the painter would feel more internal sublimity in designing, than that bloodthirsty chief, sitting amid the ruins of Carthage, when, as a Roman poet, by a bold rhetorical figure, says, of the memorable scene, and the memorable outcast whom it sheltered, each was to the other a consolation, and equally afflicted and overwhelmed together, they forgave the gods?—

Non ille favore
Numinis, ingenti Superum protectus ab ira,
Vir ferus, et Romani cupienti perdere fato
Sufficiens. Idem pelago delatus iniquo,
Hostilem in terram, vacuisque mopalibus actus,
Nuda triumphati jacuit per regna Jugurthæ,
Et Pœnos pressit cineres; solatia fati
Carthago, Mariusque, tulit; pariterque Jacentes,
Ignovère Deis.*

An old French opera, of which D'Alembert speaks, on the horrible story of Atreus and Thyestes, that story on which, as on other horrible stories of the kind, the ancients were so strangely fond of dwelling, in preference, and almost to the exclusion of more interesting pathos, concludes after the banquet, with the vengeance of the gods on the contriver of the dreadful feast; and amidst the bolts that are falling around him on every side, Atreus cries out, as if exulting, "Thunder, ye powerless gods, I am avenged." To lessen that triumphant revenge, which is so sublime in this case, would be, not to produce an emotion of beauty, but to produce that disgust and contempt which we feel for petty malice. I need not allude to the multitude of other cases, to which the same remark would be equally applicable.

Whether, then, the emotions be, or be not, of a kind which may be gradually, by the omission of some circumstance, or the diminution of the vivid feeling itself, lessened down to that emotion which we ascribe to mere beauty, it is not the less sublime if it truly involves that species of vivid feeling, which we distinguish, with sufficient readiness, from the gentle delight of beauty, as we distinguish the sensation of a burn from that of gentle warmth, without being able to state in words, in what circumstance or circumstances the difference of the feelings consists. It is the vain attempt to define what cannot be defined that has led to all

the errors and supposed mysteries, in the theory of sublimity, as it has led to similar errors in the theory of beauty. Sublimity is not one emotion, but various emotions, that have a certain resemblance,—the sublime in itself is nothing; or, at least, it is only a mere name, indicative of our feeling of the resemblance of certain affections of our mind, excited by objects, material or mental, that agree perhaps in no other circumstance but in that analogous undefinable emotion which they excite. Whatever is vast in the material world, whatever is supremely comprehensive in intellect, whatever in morals implies virtuous affections or passions far beyond the ordinary level of humanity, or even guilt, that is ennobled, in some measure, by the fearlessness of its daring, or the magnitude of the ends to which it has had the boldness to aspire—these, and various other objects, in mind and matter, produce certain vivid feelings, which are so similar as to be classed together; and, if we speak of sublimity merely in reference to the various objects which excite these analogous feelings, so as to make the enumeration of the objects a sort of definition of the species of emotion itself, there can be no risk of mistake, more than in saying that sweetness is a word expressive of those sensations, which sugar, honey, and various other substances that might be named, excite. But, if we attempt to define sweetness itself as a sensation, or sublimity itself as an emotion, we either state what is absolutely nugatory, or what is still more probably false in its general extent, however partially true; because our attention, in our definition, will be given to some particular emotions of the class, not to any thing common to the class, since there is truly no common circumstance, which words can adequately express. Hence it happens, that by this singling out of particular objects, we have many theories of sublimity, as we have of beauty; all of them founded on the supposition of an universal sublimity *a parte rei*, as the theories of beauty were founded on a universal beauty *a parte rei*. Sublimity, says one writer, is the terrible; according to another writer, it is magnitude or amplitude, which is essential to the emotion; according to another, it is mighty force or power; according to another, it is the mere suggestion of images of feelings directly connected with that elevation in place, which has given sublimity its name; according to another, it arises from a wider range of associations, all, however, centring in some prior affections of the mind as their direct source. It is very true that terror, vastness of size, extraordinary force, high elevation, and various associate images, do produce feelings of sublimity; but it is not equally true that any one of these feelings is itself all the other feel-

* Lucan, *Pharsalia*, lib. ii. v. 85—93.

ings. Great elevation, for example, may excite in me the emotion to which it has given the distinctive name, and it is even possible that many great virtues may, by a sort of poetic analogy, suggest the notion of local elevation, as snow suggests the notion of spotless innocence, or the shadow that follows any brilliant object, the notion of envy pursuing merit. But even though, in thinking of heroic virtue, the analogy of local elevation were excited, which it surely is only in very rare cases, this would be no reason for believing that the heroic virtue itself is incapable of exciting emotion, till it have previously suggested height, and the feelings associated with height. It is the same with magnitude or power; they are causes of sublime feelings, not causes of the sublime, which has no real existence, nor of those other sublime feelings which have no direct relation to magnitude or power. Power itself, for example, is not magnitude; nor magnitude power. The contemplation of eternity or infinity of space, is instantly, and of itself, as a mere object of thought, productive of this emotion, without any regard to my power of conceiving infinity, which may, indeed, be a subsequent cause of astonishment, but which certainly does not precede the emotion as its cause. In like manner, any great energy of mind, either in acting or bearing, though it may suggest, by analogy, magnitude, as it may suggest many other analogies, does not depend, for the emotion which it excites, on the previous suggestion of the analogous amplitude of size. The two primary errors, as I have already said, in all these various theories, which may be considered as confutations of each other, consist in supposing, first, that sublimity is one,—the sublime, to use the language of theory,—which, therefore, as suggested by one object, may be precisely the same with the emotion suggested by other objects; and, secondly, the belief that because certain objects have an analogy, so as to be capable, by the mere laws of association, of suggesting each other, they therefore do uniformly suggest each other, and excite emotion only in this way;—that because any generous sacrifice, for instance, may suggest the notion of magnitude or elevation in place,—which, if it suggests them at all, it suggests only rarely,—it therefore must at all times suggest them, as if it were absolutely impossible for us to see an object, without thinking of any analogous object,—to look on snow without thinking of innocence, or on a shadow, without thinking of envy.

I trust, after the remarks already made, that it is unnecessary for me to repeat any arguments in confutation of the error as to one universal sublime; an error of precisely the same kind as that which would contend

that, because the fragrance of a violet, and the simplicity of a comprehensive theorem, are both pleasing, the theorem comprehends the fragrance, or the fragrance the mathematical demonstration. As there are many pleasures excited by many objects, but not the pleasing; many emotions of beauty excited by many objects, but not the beautiful; so are there many emotions of sublimity excited by many objects, but not the sublime. The emotion which I feel, when I think of all the ages of eternity, that, however indefinitely multiplied are as nothing to the ages that still remain,—that which I feel, when I think of a night of tempest on the ocean, when no light is to be seen, but the flash of guns of distress from some half-wrecked vessel; or the still more dreadful light from the clouds above, that gleams only to show the billows bursting over their prey, and nothing to be heard but the shriek that rises loudest, at the very moment when it is lost at last and for ever, in one continued howl and dashing of the storm and the surge,—these feelings, though both classed as sublime, and having some resemblance, which leads to this classification, are yet, in their most important respects, very different from each other; and how different are they both from the emotion with which I regard some moral sublimity,—the memorable action of Arria, when she presented the dagger to her lord, or the more tranquil happiness of the elder Pætus, when, on being ordered by the tyrant to death, as in the accustomed rites of some grateful sacrifice, he sprinkled his blood as a libation to Jove the deliverer! It is in the moral conduct of our fellow-men that the species of sublimity is to be found, which we most gladly recognise as the character of that glorious nature which we have received from God,—a character which makes us more erect in mind than we are in stature, and enables us, not to gaze on the heavens merely, but to lift to them our very wishes, and to imitate in some faint degree, and to admire at least, where we cannot imitate, the gracious perfection that dwells there. It is to mind, therefore, that we turn, even from the sublimest wonders of magnificence, which the material universe exhibits.

Look then abroad through Nature, to the range
Of planets, suns, and adamantine spheres,
Wheeling unshaken through the void immense;
And speak, O man, does this capacious scene,
With half that kindling majesty, dilate
Thy strong conception, as when Brutus rose
Refulgent from the stroke of Cæsar's fate,
Amid the crowd of patriots!—and his arm
Aloft extending, like eternal Jove,
When Guilt brings down the thunder, call'd aloud
On Tully's name, and shook his crimson steel,
And bade the father of his country, hail!
For lo! the tyrant prostrate on the dust,
And Rome again is free.*

* Pleasures of Imagination, B. i. v. 487—500.

Yet, though mind exhibits the sublimities on which we love most to dwell, we must not on that account, suppose, that material objects are incapable of exciting any kindred feeling; that, but for the accident of some mental association, the immensity of space would be considered by us with the same indifference as a single atom; or the whole tempest of surges, in the seemingly boundless world of waters, with as little emotion as the shallow pool that may chance to be dimpling before our eyes.

The remarks which I made on beauty might, however, of themselves, have been sufficient to save you from this mistake; and, indeed, after those remarks, it was perhaps superfluous in me to repeat, in the case of sublimity, any part of the argument which I employed on the former occasion. The further applications of it, which I have not made, you can have no difficulty in making for yourselves.

LECTURE LVIII.

I. IMMEDIATE EMOTIONS, NOT NECESSARILY INVOLVING ANY MORAL FEELING.—RETROSPECT OF THE DISCUSSION OF THE EMOTIONS OF BEAUTY AND SUBLIMITY.—4. LUDICROUSNESS, THE OPPOSITE OF SUBLIMITY.—SOURCES OF THE LUDICROUS.—HOBBS' THEORY ERRONEOUS.—LUDICROUSNESS ARISES FROM UNEXPECTED CONGRUITIES OR INCONGRUITIES IN LANGUAGE, IN THOUGHT, OR IN OBJECTS OF PERCEPTION.—EXCEPTIONS.

GENTLEMEN, after the remarks which I had made on the varieties of the emotion of beauty, it was not necessary for me to dwell at so much length on the kindred emotions of sublimity, to the elucidation of which I proceeded in my last lecture; the principal inquiries which had engaged us, with respect to the nature of beauty, being only another form of inquiries which we might have pursued, indeed, in like manner, in the case of sublimity, but which it would have been tedious and profitless to repeat.

Opposed as the sublime and beautiful usually are, by a sort of antithetic arrangement, in our works of rhetoric, or of the philosophy of taste, they are far from being essentially distinct, but, at least in the greater number of instances, shadow into each other; the sublime, in these cases, being only one portion of a series of feelings, of which the beautiful, as it has been termed, is also a part. The emotions of sublimity may, indeed, be excited by objects which no diminution of the attendant circumstances, or of intensity of quality, could render beautiful; but which, on the contrary, when thus diminished, are

disgusting or ridiculous, rather than agreeable. Yet, though there are, unquestionably, cases of this sort; as when guilt becomes sublime by the very atrocity with which it dares and executes what other bosoms might shudder even to conceive, or the mean wretchedness of some sterile waste acquires a kind of dignity from extent of that very desolation, which, in a less degree, made it meanly wretched, the greater number of cases are, as unquestionably, of a different sort; in which, by gradual increase, or diminution of qualities, or alteration of the attendant circumstances, the emotion is progressively varied, till, by change after change, what was merely beautiful, becomes grand, and ultimately sublime; the extremes seeming, perhaps, to have no resemblance, but this very difference of the extremes resulting only from the number of successive feelings in the long scale of emotion, in each sequence of which, compared with the feelings immediately preceding, there may have been a shadowing of the closest resemblance. How very natural a process this is, I showed you, by examples of progressive beauty, grandeur, and sublimity, in different aspects, both of matter and of mind.

Since beauty, then, by a gradual change of circumstances, can thus rise into sublimity, it is not wonderful that phenomena, which are parts of a series, should be, in many important respects, analogous; so that properties or relations, which are found to belong to one portion of the series, should be found to belong also to the other; that, for example, as we diffuse, unconsciously, our delightful feeling of beauty, in the object which excites it, we should diffuse, in like manner, our feelings of sublimity in the objects which we term sublime, and imagine some awful majesty to hang around them, even when there is no eye to behold them, and consequently no heart to be impressed with their overwhelming presence. The tendency which this continued incorporation of our feeling in those sublime objects on which we gaze, or of which we think, produces, to the belief of a permanent sublimity in objects, may very naturally be supposed to flow into the illusion, which imagines the existence of something that, independently of our feelings, is common to all the objects which thus powerfully impress us, and which may of itself be termed the sublime; as something common to all beautiful objects, independently of our feeling of their beauty, was, in like manner, imagined and termed the beautiful. It was necessary for me, therefore, to expose the fallacy of these last lingering universal essences of the schools, and to show, that, as we have not one emotion of beauty, but a multitude of emotions, which, from their analogy, are comprehended under that one general term, so we have not one feeling of sublimity, but various analogous

feelings, arising from various objects that agree perhaps in no circumstance, but that of the analogous emotions which they excite.

Of feelings which are not the same, then, in every respect, it cannot surprise us, that we should not always find on analysis the elements to be the same. Beauty, as we have seen, is an emotion of vivid delight referred to the object which excites it; and sublimity, as we have also seen, in tracing the progressive emotion through gradual changes of circumstances, is often only this very beauty, united with a feeling of vague indefinable grandeur in its object, and a consequent impression of delightful astonishment, intermediate between mere admiration and awe. In relation to moral actions, it is often a combination of the pleasing emotion of beauty, with admiring astonishment and love, or respectful reverence. In many cases, however, there is no vivid delight of beauty intermingled in the compound feeling, but only astonishment, and a certain vague impression of unmeasurable greatness or power, which is more akin to terror, than to any emotion which can be said to be positively pleasurable. In some cases, indeed, there can be no question that images of terror contribute the chief elements of the emotion,—images, however, not of terror in that direct form in which it assails us, when danger is close and imminent, but of terror softened either by distance as long past, or by mixed feelings of security, that fluctuate with it in rapid alternation, when the danger is only contingently or remotely possible. Different as the elements may be in many cases, and different as the resulting emotions may also be, the different results of the different elements may yet, as complex feelings, be sufficiently analogous to be classed under one rank of emotions; though, in giving one common name to the whole, we must always be aware, that it is only a certain analogy of the feelings which we mean to express, and not one common quality which can be considered as strictly the same in all; and that it is not the sublime, therefore, which we are philosophically to seek, but the sublimities, if I may venture so to term them; the various objects which, in various circumstances, excite emotions, that, in all their diversity, are yet of such resemblance, as to admit of being classed together under one common appellation.

The species of emotion to which I am next to direct your attention, is that which, in the common realism of the language of philosophers, is said to be occasioned by the ludicrous,—an emotion of light mirth, which may be considered as opposite to that of sublimity, though not opposite in the strict sense in which beauty and ugliness are opposed. There are, indeed, some feelings of this kind,

which may be said to arise from qualities that are truly the reverse of those on which sublimity depends, and in which, accordingly, the opposition is as complete as that of ugliness and beauty. In the composition of works of fancy, for example, a mere excess or diminution of the very circumstances which renders a thought sublime, produces either bombast or inanity, and a consequent emotion of ridicule or gay contempt; as in the human countenance, an increase or diminution of any beautiful feature may convert into deformity what was beauty before, and produce a corresponding change in our emotions. In this peculiar species of disproportion, when the sublime is intended, but when the images, from the inability of the author to produce and distinguish sublimity, are either overstrained or mean, consists what has been termed *bathos*, as rhetorically opposed to those peculiar emotions, to which, indeed, the very etymology of the term marks the opposition that has been felt.

Of the ludicrousness which arises from this species of actual opposition of the mean or bombastic fancies of the writer to the sublimity which he wished to produce, it would, indeed, scarcely be necessary to say any thing after the remarks that have been made on sublimity itself, any more than it would be necessary to dwell on illustrations of ugliness after a full discussion of the opposite emotions of beauty. But the gay mirthful feeling is not always of this kind. The same species of emotion, or an emotion very nearly similar, may be felt where there is no accompanying belief of imperfection, and where, on the contrary, as in the sprightly sallies of wit, a very high admiration is mixed with our feeling of what is laughable,—an admiration which is much more than mere astonishment, and which, for the moment, though only for the moment, is perhaps as great as that, which, in our hours of reflection, we give to the highest efforts of meditative genius. It will therefore deserve a little fuller consideration, what the nature of the emotion is, or rather to state, what is more within the power of philosophy, what are the circumstances in which the emotion arises.

Before entering on the minuter inquiry, however, I may remark, in the first place, that every theory which would make our feelings of this kind to depend on some modification of mere pride in a comparison of ourselves and others to our advantage, and to the disparagement, therefore, of the person supposed to be compared with us, is founded on a false and very limited view of the phenomena; since the feeling is as strong, where there is the highest admiration of the wit of the speaker, and, consequently, where any comparison, like that which is supposed to be essential to the production of the emotion, would be to our disadvantage. It is in vain,

for example, that Hobbes defines laughter to be "a sudden glory, arising from a sudden conception of some eminency in ourselves, by comparison with the infirmity of others, or with our own formerly;" for we laugh as readily at some brilliant conception of wit, where there are no infirmities of others displayed, as where they are displayed in any awkward blunder. We often laugh, too, as this very definition indeed asserts, in thinking of our own mistakes of this sort, when we surely cannot feel any great glory, nor any eminence in ourselves, more than if we had never been guilty of the mistake; the effect of our discovery of our mistake being merely to raise us to that level of ordinary excellence at which we imagined ourselves before; not to raise us in the slightest degree above it. If the theory of Hobbes, or any theory, which converts our mere feeling of ludicrousness into a proud comparison of ourselves and others, were just, it would then follow, as has been often objected to this theory, that a man who was very self-conceited and supercilious, would be peculiarly prone to mirth, when, on the contrary, it happens that children, and, if persons in advanced life, those whose temper is most social, are the most readily excited to laughter; while the proud, to whom their superiority most readily recurs, are usually very little disposed to merriment. "Seldom they smile," may be said of them, as was said of Cassius; and when they do smile, their smile, like his, so admirably described by Shakspeare, has little in it of the full glorying and eminency of laughter, but is

of such a sort,
As if they mock'd themselves, and scorn'd their spirit,
That could be moved to smile at any thing.*

The mere stupidity of any one, when there is no vanity of pretension to contrast with it, does not make us laugh; yet, if laughter arose from the mere triumph of personal superiority, there would surely, in this case, be equal reason for selfish exultation; and a company of blockheads should be the gayest of all society. In any brilliant piece of wit, it is to the images or thought suggested, in ready eloquence, that we look, without regard to him who is its author; unless, indeed, in those cases in which the very character or situation of the speaker may of itself produce a sort of ludicrousness, by its incongruity with the gravity or levity of what is said. There is scarcely any thing which is more ludicrous than a happy parody; and though the author of the parody may be allowed to feel some triumph over the original author, if even his playful metamorphosis of what is dignified and excellent can be termed a triumph, which is rather an amusement

than a victory; this triumph certainly cannot be felt by the mere hearers, since their pleasure is always greater in proportion, not to the infirmity of which Hobbes speaks, but to the excellence of the original, without great merit in which, or supposed great merit, the parody itself could not be felt as having any claim to our laughter or our praise. A parody on any dull verses would, indeed, be still duller than the dullness which it ridicules.

It is not any proud comparison, therefore, which constitutes what is termed the ludicrous; but, even in the proudest of such comparisons, some other circumstance or circumstances. It is the combination of general incongruity with partial and unexpected congruity of the mere images themselves, which may indeed, in some cases, lead to this triumph as an auxiliary pleasure, but which has an immediate and independent pleasure of its own,—a pleasure arising from the discovery of unsuspected resemblance in objects formerly conceived to be known to us, or unsuspected difference in objects formerly regarded as highly similar.

Nothing is felt as truly ludicrous, in which there is not an unexpected congruity developed in images that were before supposed to be opposite in kind, or some equally unexpected incongruity in images supposed to be congruous; and the sudden perception of these discrepancies and agreements may be said to be that which constitutes the ludicrousness; the gay emotions being immediately subsequent to the mere perception of the unexpected relation.

The congruities and incongruities which give rise to this emotion may be either in mere language or in the thoughts and images which language expresses, or, in many cases, in the very objects of our direct perception.

On the first of these, the resemblance of mere sounds, in puns, and other trifling verbal analogies of the same class, it is unnecessary for me to dwell at present, as they before came under our review, when I treated of the influence of verbal similarities on the spontaneous suggestions of our trains of thought. How truly the ludicrousness of the pun consists in the unexpected similarity of discrepant images, is shown by the greater or less pleasure which it affords, in proportion as the images themselves are more or less discrepant; being greatest, therefore, when there is a complete opposition, with the exception of that single tie of similar sound which is found unexpectedly to connect them. When the images themselves are congruous, so as to seem capable of being suggested by their own congruities, the pun is scarcely felt, or rather there is nothing felt to which the name of pun can be given.

But though the unsuspected connexion of objects, by their resemblances of mere sound,

* Julius Cæsar, Act I. Scene 2.

as in puns, and all the small varieties of verbal and literal wit, may be uniformly ludicrous, this is far from being the case with the other species of unsuspected resemblance, in relations of thought to thought, or of existing things. It is necessary, therefore, to form some limitation of the general proposition as to the ludicrousness of relations which we perceive suddenly and unexpectedly, the only circumstance which as yet we have supposed to be necessary to the rise of the emotion.

In the first place, an exception must be made in the case of scientific truths. When it is discovered in chemistry, or in any other physical science, that there truly have been relations of objects or events, which were not suspected by us before, there is no feeling of ludicrousness, though the substances found to have some common property should be opposite in every other respect. What could be more unexpected, or more incongruous with our previous conceptions of the specific gravity of metals, than the discovery that the lightest of all substances, which are not in the state of an aerial fluid, is a metal, the base of another substance with which we had been long acquainted? Yet, though we were astonished at such a discovery, we felt no tendency whatever to laugh. The relation, in short, did not seem to us to involve any thing ludicrous.

Why then do we not laugh, in such a case, at the discovery of the resemblance of objects or qualities, which were before regarded by us as not less incongruous than any of the unsuspected relations which are exhibited to us in the quaintest conundrum, that excites our laughter almost in the very instant in which the strange relation is pointed out? The principal reason of this difference, I conceive, is the importance of the physical relation. The interest attached by us to the discovery of truth occupies the mind too seriously, to allow that light play of thought which is essential to the rise of the gay emotion. In this respect, there is a very striking analogy to a species of animal action, which resembles our emotions of this kind also, in some other striking circumstances, particularly in the tendency to laughter, which is an equal and very curious result of both. If the palm of the hand be gently tickled, when the mind is vacant, the influence of the mechanical operation in this way is very powerful; but, if the faculties be exerted on any interesting subject, the same action on the palm of the hand may take place without any consequent laughter, and even perhaps without any consciousness of the process which has been taking place. A new phenomenon, or a new discovered relation in former phenomena, engages the mind too closely to allow any feeling of ludicrousness, and consequent laughter to arise,—in the same way as those

very circumstances would probably be sufficient to prevent the laughter of tickling, if the mechanical cause were applied at the very moment at which we learn the important discovery, and applied precisely in the same manner as when the strange feeling and the laughter were before the result.

There is another circumstance, that, in the case of a law of nature, however strange and apparently incongruous with our former conceptions its phenomena may be, must have considerable effect in occupying the mind more fully with the discovery;—that it is impossible for the mind to rest in the simple discovery, without rapidly passing in review the various circumstances that seem to us likely to be connected with it in the analogous phenomena,—a state of mind which is of itself most unfavourable to the mirthful emotion. There are, unquestionably, states of mind, during the prevalence of affliction, or any strong passion, in which there is no point in the jest, as there is no pleasure in the very aspect of joy. To the friend returning from the funeral of his friend, we of course do not think of uttering any of those common expressions of merriment, in which at other times we might occasionally indulge; the natural respect which we feel for sorrow, being sufficient to check the gaiety, or at least the appearance of gaiety. But, even though in violation of that respect which the sorrowful claim, the happiest effusions of wit were to be poured out on such an occasion, there would be no answering mirth in that heart which at other times would have felt and returned the gaiety. What grief thus manifestly does, other strong interests, that absorb, in like manner, the general feelings of the mind, may well be supposed to do; and we may therefore listen to facts, the most seemingly incongruous with our prior knowledge, when our curiosity is awake to their importance, as objects of science, without the slightest disposition to those light emotions, which almost every other incongruity, or fancied incongruity, would have produced.

It may accordingly be remarked, that to those who have not sufficient elementary knowledge of science, to feel any interest in physical truths, as one connected system, and no habitual desire of exploring the various relations of new phenomena, many of the facts in nature, which have an appearance of incongruity, as first stated, do truly seem ludicrous. If the vulgar were to be told, that they do not see directly the magnitude, or place or distance of bodies, with their eyes alone, but, in some measure, by the indirect influence of other senses, on which light has no effect whatever, that the feelings of cold and heat proceed from the same cause, and that there is a great deal of heat in the coldest ice, they would not merely disbelieve what we might

say, but they would laugh at what we tell them, as if it were absolutely ridiculous. The gravest truths of science would be to them what the pleasantries of wit are to us.

I may remark, too, as a circumstance of some additional influence, that those who have been conversant with physical inquiries, are always prepared, in some degree, for the discovery of new properties, even in objects the most familiar to them. With their full impression of the infinite variety of the powers of nature, there is scarcely any thing, indeed, which can be said to be truly incongruous with any thing. They are, in some degree, with respect to the physical relations of things, in the same situation as the professed wit, with respect to all the lighter analogies, who is too much accustomed to these in his own gay exercise of fancy, to feel much of the ludicrousness of surprise, when these slight and seemingly incongruous relations are developed in the pleasantries of others. It is not from envy or jealousy,—certainly not always from envy or jealousy,—that he does not laugh in such a case; but because the relation exhibited is of a kind with which he is too familiar, to share the astonishment that has animated the laughter of all the rest of the circle. The newly discovered congruities or incongruities of wit, in short, are to him, in a great measure, what some strange newly discovered property of material substance is to the chemist, or general experimental inquirer.

But whatever may be the cause of the difference of feeling, in this case of seeming anomaly, there can be no question as to the fact itself, that the discovery of a new relation in physics, and even of a relation apparently most incongruous with the relations formerly known, does not produce, in the mind of the scientific observer, or general lover of science, a feeling of any ludicrousness in the discovery itself. The fact, indeed, seems to be reducible, without much difficulty, to the common laws of mind; but still it must be admitted to form an important limitation to the general doctrine of the influence of unexpected and apparently incongruous relations, in producing the emotions referred to ludicrousness in their objects.

Even this limitation, however, is not sufficient. Every metaphor, simile, or other figure of speech, implies some unexpected relation presented to the mind; and, in many cases, a relation of objects, which were before regarded as having no congruity whatever;—and, therefore, it may be urged, the figures, in all such cases, should be felt as ludicrous,—not, indeed, those similes of ancient and well-accredited usage, which form a part of the constant furniture of epic nar-

rative,—similes that, comparing heroes and lions, as heroes and lions have often been compared before, give us no new image, but remind us only that Homer has made the same comparison. These, of course, since they do not present to us any relation which we did not know before as well as after the tiresome similitude has been again unfolded to us in its full detail of circumstances, may be allowed to pass without our laughter, and without even being counted as an anomaly. But every original simile, however just the relation may be which it expresses, and with whatever beauty of language it may be conveyed to our mind, must present to us an unsuspected resemblance in objects formerly known to us, and probably familiar. Why, then, do we feel no tendency to laugh in such a case?

That we do not feel any tendency to laugh in such a case, arises, I think, from this circumstance. It is the art of the poet, in the management of his comparisons, to bring before us only the analogy on which his simile is founded, or at least such circumstances only as harmonize with the sentiment which he wishes to excite, and to keep from us, therefore, every circumstance discordant with it. Accordingly, when he is successful in this respect, the beauty of the similitude itself is all which we feel,—a delight which occupies us sufficiently, to prevent the rise in the mind of any feeling of the opposite qualities of the objects compared, such as I suppose to be necessary to constitute ludicrousness. When, however, the opposition, as may frequently be the case, is too remarkable not to be instantly felt, a certain degree of ludicrousness will as instantly be felt, in spite of all the magnificent language of the poet. Hence, it sometimes happens, that similes, which in one country or age excite no emotion but that of beauty, may yet, in another age or country, excite an emotion of a very different kind, in consequence of the different sentiments with which, in different times and places, the same objects may be viewed. Whatever estimate the Greeks may have more justly formed of the many excellent qualities of the ass, the very name of that animal is with us combined with notions so disparaging, that it has become by this degradation quite unsuitable to be introduced as a subject of laudatory comparison in a poem that treats of gods and heroes. To those, indeed, who had the happiness of listening to the great Rhapsodist himself, the comparison might seem sufficiently dignified, as well as just; but I presume that there are few of our own countrymen, with the exception of those who admire whatever is in the *Iliad*, because it is in the *Iliad*, who have not felt some little tendency to smile, on reading the simile, in which Homer compares one of the most undaunted of his war-

riors to that ill-used and much-enduring animal, which, by a very common aggravation of injustice, we have first oppressed, and then despised because we have oppressed it.

In this way, accordingly, I conceive the feeling of beauty, as precluding, in ordinary cases, in which there is no very remarkable opposition of general qualities, the rise in the mind of the circumstances of opposition essential to the feeling of ludicrousness, may account sufficiently for the absence of any light emotion, when new and unsuspected similitudes are developed to us in a comparison. Mere novelty of relation is not sufficient of itself to constitute what is termed the ludicrous; that is to say, for the ludicrous is only a more general term, does not, of itself, give rise to any of those feelings of light emotion, which we comprehend under that general term. There are similes which are sublime, similes which are beautiful, similes which are ludicrous. A newly perceived relation, therefore, is not always ludicrous in itself, but only certain relations. What, then, are these relations, as distinguished from the others, which are felt without any tendency to this gay surprise?

The relations which are ludicrous, and which, as ludicrous, in every instance involve some unsuspected resemblance of objects or qualities before regarded as incongruous, or some equally unsuspected diversity, when the resemblance was before supposed to be complete, admit, perhaps, of being referred to three classes: in the first place, to the class of those in which objects are brought together that are noble and mean, or the forms of language commonly employed in treating subjects high and low, are transferred from one to the other. Such a transfer, as you well know, gives rise in the one case to the burlesque, in which objects, noble in themselves, are made ridiculous by the meanness of phrases and figures; in the other case, to the mock-heroic, in which, by a contrary process, the mean is rendered ridiculous by the magnificent trappings of rhetoric with which it is invested.

In these instances of artificial combination of the very great, and the very little, there can be no question as to the ludicrousness of the emotion which such piebald dignity excites; and there are circumstances which occur in nature, exactly of the same kind, and productive, therefore, of the same emotion; the incongruities being not in mere thought and image, but in objects directly perceived. When any well-dressed person, walking along the street, falls into the mud of some splashy gutter, the situation, and the dirt, when combined with the character and appearance of the unfortunate stumbler, form a sort of natural burlesque or mock-heroic,

in which there is a mixture of the noble and the mean, as much as in any of the works of art, to which those names are given. He who amuses us by his fall, is, in truth, for the moment, an unintentional buffoon, performing for us, unwillingly, what the buffoon, with his stately strut, and his paper crown, and other trappings of mock royalty, strives to imitate, with less effect, because there is wanting in him that additional contrast of the lofty state of mind, with the ridiculous situation which forms so important a part of the laughable whole in the accidental fall. It is the contrast of the state of mind with that which we feel that it would be, if the circumstances were known to him, that forms the principal ludicrousness of the situation of any one who has the misfortune of being in a crowded company, with his coat accidentally torn, or with any other imperfection of dress that attracts all eyes, perhaps, but his own. In the rude pastimes of the village, in like manner, it is because the swain is

Mistrustless of his smutted face,
That secret laughter titters round the place.
Goldsmith.

A second class of relations, which are ludicrous, are those which derive their ludicrousness, not from the objects themselves, but from the mind of the hearer or reader, which has been previously led to expect something very different from what is presented to it. To take a very trite example of this sort: If the question be asked, what wine do you like best? One person, perhaps, answering Champagne, another Burgundy, a third says, the wine which I am not to pay for. We laugh, if we laugh at all, chiefly because we expected a very different answer; and the incongruity which is felt has relation, therefore, to our own state of mind more than to the question itself. It is this previous anticipation of an answer, with which the answer received by us is partially incongruous, that either forms the principal delight of many of the bons mots of conversation, or at least aids their effect most powerfully; and by the contrast which it produces, it adds, in a most mortifying manner, to the painful keenness of an unexpected sarcasm. Thus, to take an instance from a story which Dr. Arbuthnot tells us, "Sir William Temple, and the famous Lord Brouncker, being neighbours in the country, had frequently very sharp contentions; like other great men, one could not bear an equal, and the other would not admit of a superior. My Lord was a great admirer of curiosities, and had a very good collection, which Sir William used to undervalue upon all occasions, disparaging every thing of his neighbour's, and giving something of his own the preference. This, by no means pleased his

lordship, who took all opportunities of being evened. One day, as they were discoursing together of their several rarities, my lord very seriously and gravely replied to him, 'Sir William, say no more of the matter, you must at length yield to me, I having lately got something which it is impossible for you to obtain; for, sir,' said his lordship smiling, 'my Welch steward has sent me a flock of geese, and those are what you can never have, since all your geese are swans.' " In this case, there can be no doubt that the keenness of the sarcasm would be far more severely felt, in consequence of the previous anticipation of an answer of a very different kind.

The feeling of ludicrousness is the same, when our previous anticipation is disappointed by agreement, where we expected difference, as when it is disappointed by difference where we expected agreement. Such is the case in the game of cross purposes, where, in a series of questions and answers, the answers are paired with questions to which they were not given. In what are termed the cross readings of newspapers, where, without paying regard to the separation into columns, we read what is in the same line of the page, through the successive columns, as if continuous, there is little agreement of sense to be expected, and we smile accordingly at the strange congruities which such readings may sometimes discover. Many of you are probably acquainted with the ingenious fictions of this sort of coincidence that appeared originally in the Public Advertiser, with the happily appropriate signature of Papyrius Cursor; and which were well known to be the production of the late Mr. C. Whiteford. I quote a few specimens for the sake of those among you who may not be acquainted with them.

"The sword of state was carried ———
Before Sir John Fielding, and committed to Newgate.

Last night, the princess royal was baptized ———
Mary, *alias* Moll Hacket, *alias* Black Moll.

This morning the Right Honourable the Speaker ———
Was convicted of keeping a disorderly house.

A certain commoner will be created a peer.
* * * No greater reward will be offered.

Yesterday the new Lord Mayor was sworn in,
Afterwards tossed and gored several persons.

When the honour of knighthood was conferred on him,
To the great joy of that noble family.

A fine turtle, weighing upwards of eighty pounds
Was carried before the sitting alderman.

His said the ministry is to be new modell'd;
The repairs of which will cost the public a large sum annually.

This has occasion'd a cabinet-council to be held
At Betty's fruit shop in St. James's street.

One of his Majesty's principal Secretaries of State
Fell off the shafts, being asleep, and the wheels went over him.

He was examined before the sitting alderman,
And no questions asked.

Genteel places in any of the public offices,
So much admired by the nobility and gentry.

This morning, will be married, the lord viscount,
And afterwards hung in chains, pursuant to his sentence."

A third set of relations of this kind derive their ludicrousness from our consideration of the mind of the speaker, or writer, or performer of the action. When our mirth is excited at any awkward effort, for example, we laugh, because we are aware of that which the effort was intended to perform, and are struck with the contrast of the performance itself. We laugh, in short, at the awkward failure, not at the motion or attitude itself, considered simply, without relation to some higher end, as a mere motion or attitude; and we laugh at the failure, because we compare, as I have said, the awkward result with the grace which was intended, or which, at least, we imagine to have been intended.

It is as might be supposed, on a similar principle, that our mirth is excited by every appearance of mental awkwardness. We laugh, for example, when we discover in a work any very visible marks of constraint and difficulty on the part of an author, as in far-fetched thoughts, or stiff and quaint phraseology; and we laugh, not merely on account of the incongruity of the thoughts or phrases themselves, which are thus strangely brought into union, though this, perhaps, may form the chief element of the ludicrousness, but in some degree also, at the contrast of the labour which we discover, with the ease which the writer is supposed by us to assume and affect. That composition of every sort involves difficulty on the part of the composer, we know well; but we still require that the difficulty should be kept from our sight. We must not see him biting his nails, and torturing himself to give us satisfaction. His great aim accordingly is to present to us what is excellent, but to present it, so free from any marks of the toil which it has cost, as to seem almost to have risen in the mind by the unrestrained course of spontaneous suggestion. Any appearance of constraint, therefore, presents to us a sort of incongruity, almost as striking as when the noble and the mean are blended together. Even when we think, in reading any of the extravagant conceits that abound so much in the works of our older writers, that we are smiling merely at the images which are brought together, and which nature seems to have intended never to meet, we are, in truth, smiling in

* Miscellaneous, 2d edit. vol. i. p. 113.

† Preserved in one of the volumes of the "New Foundling Hospital for Wit."

part at the very feelings of the writer, when he was so laboriously and painfully absurd. If the feelings that succeed each other, in the mind even of the sublimest poet, in the weary hour of composition, could, by any process, be made distinctly visible to us, there is no small reason to apprehend, that, with all our reverence for his noble art, and for his own individual excellence in that art, our emotions would be of the ludicrous kind, or at least that some portion of the ludicrous would mingle with our admiration. There can be no question that he would seem to have performed more labour, if we could be thus conscious of his feelings, before his labour was half accomplished, than if we were only to have exhibited to us the beautiful results of the whole long-continued exercise of his thought. This labour, which a skilful writer knows so well how to conceal from us, a writer who is fond of astonishing us with extravagant conceits, forces constantly upon our view; and there is hence scarcely any image which he presents to us so ludicrous as that picture which he indirectly gives us of himself.

Another set of examples, in which the consideration of the mind of the speaker forms an essential part of the ludicrousness, are those which are commonly termed bulls or blunders; in which there is no ludicrousness unless we are able to distinguish what the speaker meant, and thus to discover some strange agreement of his real meaning, with that opposite or contradictory meaning which the words seem to convey. A bull must, therefore, be genuine, or for the moment supposed to be genuine, before it can divert with its incongruity. As mere nonsense, it would be as little amusing as any other nonsense. We must have before us, in conception at least, the speaker himself, and contrast the well-meaning seriousness of his affirmation with the verbal absurdity which he utters, of which we are at the same time able to discover the unsuspected tie.

Such I conceive to be the chief varieties of mixed congruity and incongruity which operate in producing this emotion. But, though I have considered these varieties separately, you are not on that account to suppose, that the varieties themselves are not frequently combined in different proportions; thus heightening what would be ludicrous in one respect, by ludicrousness of another species. The images themselves, the mind of the speaker or writer who presents them, the disappointed expectation of the hearer or reader, may all present to us a strange mixture of discrepancy and agreement, and afford elements, therefore, that are to be jointly taken into account in explaining the one complex emotion, which is the equal result of all.

It is not then, every newly-discovered relation of objects that excites in us emotions

of the ludicrous class, but only certain relations, which present to us peculiar incongruities. In all these, however, the unexpectedness is an important element; since, when we have become completely familiar with the relation, we cease to have the emotion which it before instantly excited. We still, however, call the objects or images ludicrous, though they excite no emotion of this sort in our mind any more perhaps than the gravest reasoning; but we retain the name, because we speak of them, or think of them, in reference to other minds, in which we know that they will excite the same emotion that was originally excited by them in ourselves. In thinking of the laughter which may thus be produced in others, we are not unfrequently affected with the emotion as before; but it is an emotion of sympathy, not of mere ludicrousness; or, if there be any thing directly ludicrous, it is in this very consideration of incongruity in the minds of others, when we think of their expectation while they read, as contrasted with the surprise that is to follow. To know the relation, in short, as far as the relation consists in the mere images themselves, is to feel, that the object of which we know the relations will be ludicrous to others, not to feel it ludicrous to ourselves.

LECTURE LIX.

I. IMMEDIATE EMOTIONS, NOT INVOLVING NECESSARILY ANY MORAL FEELING.—USES OF LUDICROUSNESS.—GENERAL REMARKS ON CLOSING THE FIRST SUBDIVISION OF OUR EMOTIONS.—SUBDIVISION II. IMMEDIATE EMOTIONS IN WHICH MORAL FEELING IS NECESSARILY INVOLVED.—1. FEELINGS DISTINCTIVE OF VOICE AND VIRTUE.—2. EMOTIONS OF LOVE AND HATE.

My last Lecture, Gentlemen, was devoted to the consideration of the phenomena of our emotions, of that species of which the objects are distinguished by the name of ludicrous; emotions which we found to originate always in some mixture of congruity and incongruity, suddenly and unexpectedly perceived. In establishing this general law, I stated, at the same time, some apparent exceptions to the rise of the mirthful emotion in such cases, of the discovery of unsuspected agreement, and endeavoured, I hope successfully, to show that all these seeming anomalies are such as might naturally have been anticipated, as consequences of the operation of other well-known laws of the mind.

The varieties of such mixtures of congruity and incongruity, as constitute what is termed ludicrousness, were considered by us

in order; first, in the mere arbitrary signs of language, and next in the relations of thoughts and existing things,—whether in the discrepancy of the images themselves, as noble and mean,—in the disappointed anticipations of the hearer or reader, or in the difference of the obvious meaning of the expression of the speaker or writer, or performer of some action, compared with that real meaning which we know him, in his awkward blunder, to have intended.

The emotion is not a simple feeling, but the analysis of it does not seem very difficult. The necessary unexpectedness of the congruity or incongruity that is remarked, seems of itself to point out one element, in the astonishment which may naturally be supposed to arise in such a case; and the other element, which nature has made as quick to arise on the perception of the ludicrous object, as astonishment itself, is a vivid feeling of delight, one of the forms of that joy or gladness which I comprehended in my enumeration of the few primary constituents of our emotions. Astonishment, combined with this particular delight, is the mirthful emotion that has been the subject of our inquiry; and Akenside, therefore, in giving it the name of “gay surprise,”* seems to have expressed, with the analytic accuracy of a philosopher, the complex feelings which he was poetically describing.

In considering the delight that is combined with astonishment in the mirthful emotion, we are apt to consider it as more different from other species of gladness than it truly is, because we think of more than what is strictly mental. The laughter is a phenomenon of so particular a kind, and so impressive to our senses, that we think of it as much as of the feelings which it indicates; but the laughter, it should be remembered, is a bodily convulsion, which might or might not be combined with the internal merriment, without altering the nature of the inward emotion itself. This spasmodic muscular action, therefore, however remarkable it may be as a concomitant bodily effect, and even the oppressive feeling of fatigue to which that muscular action, when long continued, gives rise, we should leave out in our analysis of the mere emotion,—that is all with which the physiologist of mind is concerned,—and leaving out what is bodily in the external signs of merriment, we discover only the two internal elements which I have mentioned; that may, in certain cases, be more complicated by a mixture of contempt, but to which, as mere mirth, that third occasional element is far from being essential.

The advantages which we derive from our susceptibility of this species of emotion, are, in their immediate influence on the cheerfulness, and therefore on the general happiness of society, sufficiently obvious. How many hours would pass wearily along, but for these pleasantries of wit, or of easier and less pretending gaiety, which enliven what would have been dull, and throw many bright colours on what would have been gloomy. We are not to estimate these accessions of pleasure lightly, because they relate to objects that may seem trifling, when considered together with those more serious concerns, by which our ambition is occupied, and in relation to which, in the success or failure of our various projects, we look back on the past months or years of our life, as fortunate or unfortunate. If these serious concerns alone were to be regarded, we might often have been very fortunate and very unhappy, as in other circumstances we might often have had much happiness in the hours and days of years, which terminated at last in the disappointment of some favourite scheme. It is good to travel with pure and balmy airs and cheerful sunshine, though we should not find, at the end of our journey, the friend whom we wished to see; and the gaieties of social converse, though they are not, in our journey of life, what we travel to obtain, are, during the continuance of our journey at once a freshness which we breathe, and a light that gives every object to sparkle to our eye with a radiance that is not its own.

Such are the immediate and obvious influences of this emotion. But it is not of slight value in influences that are less direct; though capable of being sometimes abused, and far from being always so exactly coincident with moral impropriety, as to furnish a criterion of rectitude, it must be allowed to be, in its ordinary circumstances, favourable to virtue, presenting often a check to improprieties, on which, but for such a restraint, the heedless would rush without scruple,—a check, too, which is, by its very nature, peculiarly suited to those who despise the more serious restraints of moral principle, and the opinion of the virtuous. The world's dread laugh, which even the firm philosopher is said to be scarcely able to scorn, cannot be scorned by those to whom the approbation of the world is what conscience is to the wise and virtuous; and though that laugh is certainly not so unerring as the voice of moral judgment within the breast, it is still, as I have said, in far the greater number of cases, in accordance with it; and when it differs, differs far more frequently in the degree of its censure or its praise, than in actual censure of what is praiseworthy, or praise of what is wholly censurable. It is often, too, of importance, that we should regulate our

* The expression in the original seems to be “gay contempt.” See *Pleasures of Imagination*, B. iii. v. 260,—and second form of the poem, B. ii. v. 524.

conduct with regard to relations, which all mankind cannot have leisure for analyzing, and which very few, even of those who have leisure, have patience to examine. The vivid feeling of ridicule, in such cases, as more instant in its operations, may hence be considered as a glorious warning from that benignant Power, who,

conscious what a scanty peuse
From labours and from care, the wider lot
Of humble life affords for studious thought,
To scan the maze of nature, therefore stamp'd
The glaring scenes, with characters of scorn,
As broad, as obvious, to the passing clown,
As to the letter'd sage's curious eye.*

Having now then finished my remarks on the phenomena of beauty, sublimity, and wit, I close with them my view of the emotions that are the object of the species of judgment, which is denominated taste. I have already stated my reasons for dividing and arranging the phenomena of taste, under two distinct heads, as they are either emotions or feelings of the aptitudes of certain images or combinations of images for producing those emotions. To feel the emotion, which a beautiful, or sublime, or ludicrous object excites, is one state of mind; to have a knowledge of the aptitude of different means of exciting these emotions, so as to discern accurately what will tend to produce them, and what will have no tendency of this sort, is another state or function of the mind, to which the former indeed is necessary, but which is itself far from being implied, in the mere susceptibility of the pleasing emotion. That power by which, from the inductions of former observations of the mechanic powers, we predict the effects of certain combinations of wheels and pulleys in machinery, of certain mixtures in the chemical arts, and, in legislation or general politics, of certain motives, that are to operate on the minds of a people, is not supposed by us to be a different power, merely because the relations which it discerns are different. In all, and in all alike, it is termed judgment, reason, discernment, or whatever other name may be used, for expressing the same discriminating function. The knowledge necessary for the predictions in mechanics, chemistry, and politics, is indeed different; but the power which avails itself of this knowledge is in kind the same. In like manner, the knowledge which the discriminating function of taste supposes, is very different from that which is necessary in mechanics, chemistry, politics, though not more different from them, than these various species of knowledge are relatively different. But in taste, as in those sciences when the knowledge is once acquired, it is the same capacity of feeling the relation of means and ends, which avails itself

of this knowledge of the past, in determining the various aptitudes of objects for a desired effect, whether for producing or retarding motion, as in mechanics; for forming compositions or decompositions, as in chemistry; for augmenting and securing the happiness of nations, as in politics; or for inducing various delightful emotions, as in taste. If we do not give different names in all these cases to the capacity of feeling the relation of means and ends, when the means and ends are in different cases different, why should we suppose a new faculty to be exercised, and invent a new name in one alone? The politician, who judges of the reception which the multitude will give to certain laws, and the critic, who judges of the reception they will give to certain works of art, have, for their subject, the same mind; and both determine the aptitude of certain feelings of the mind, for inducing certain other feelings. The general power by which we discover the relation of means and ends, of states of mind or circumstances which are prior, and states of mind or circumstances which are consequent to these, is that which is exercised in both; the function to which I have given the name of relative suggestion, from which we derive our feeling of this as of every other relation. Without the emotions of beauty and sublimity, there would, of course, be no taste to discern the aptitude of certain means for producing these emotions, because there would not be that series of feelings, of which the relative antecedence and consequence are felt. On the other hand, without the judgment which discerns this order, in the relation of means and ends, there might, indeed, still be the emotions rising precariously, as nature presented to us certain objects that excite them, but no voluntary adaptation of the great stores of forms, and sounds, and colours for producing them; none of those fine arts,—the results of our knowledge of the relations which certain feelings bear to certain other feelings,—arts which give as much happiness as embellishment to life, and which form so essential a part of our notion of civilization, that a nation of philosophers, if incapable of any of the conceptions and resulting emotions of this kind, would stand some chance of being counted by us, only a better order of reasoning savages.

In no part of our nature is the pure benevolence of Heaven more strikingly conspicuous than in our susceptibility of the emotions of this class. The pleasure which they afford is a pleasure that has no immediate connexion with the means of preservation of our animal existence; and which shows, therefore, though all other proof were absent, that the Deity, who superadded these means of delight, must have had some other object in view, in forming us as we are, than the mere continuance of a race of beings who

* *Pleasures of Imagination*, book ii. v. 271—277.

were to save the earth from becoming a wilderness. In consequence of these emotions, which have made all nature "beauty to our eye, and music to our ear," it is scarcely possible for us to look around, without feeling either some happiness or some consolation. Sensual pleasures soon pall even upon the profligate, who seeks them in vain in the means which were accustomed to produce them; weary, almost to disgust, of the very pleasures which he seeks, and yet astonished that he does not find them. The labours of severer intellect, if long continued, exhaust the energy which they employ; and we cease, for a time, to be capable of thinking accurately, from the very intentness and accuracy of our thought. The pleasures of taste, however, by their variety of easy delight, are safe from the languor which attends any monotonous or severe occupation, and instead of palling on the mind, they produce in it, with the very delight which is present, a quicker sensibility to future pleasure. Enjoyment springs from enjoyment; and, if we have not some deep wretchedness within, it is scarcely possible for us, with the delightful resources which nature and art present to us, not to be happy as often as we will to be happy. In the beautiful language of a poet, of whose powerful verse I have already frequently availed myself, in illustration of the subjects that have engaged us, nature endows us with all her treasures, if we only will deign to use them.

Oh blest of Heaven, whom not the languid songs
Of Luxury the syren, nor the bribes
Of sordid Wealth, nor all the gaudy spoils
Of pageant Honour, can seduce to leave
Those ever-blooming sweets, which, from the store
Of nature, fair Imagination culls
To charm the enliven'd soul!—What though not all
Of mortal offspring can attain the heights
Of envied life,—though only few possess
Patrician treasures, or imperial state,
Yet Nature's care, to all her children just,
With richer treasures, and an simpler state
Endows, at large, whatever happy man
Will deign to use them. His the city's pomp,
The rural honours his.—What'er adorns
The princely dome,—the column and the arch,
The breathing marble, and the sculptured gold,
Beyond the proud possessor's narrow claim
His tuneful breast enjoys.—For him the Spring
Distills her dews, and from the silken gem
Its lucid leaves unfolds:—for him the hand
Of Autumn tinges, every fertile branch
With blooming gold, and blushes like the morn.
Each passing hour sheds tribute from her wings,
And still new beauties meet his lonely walks,
And loves unfeint attract him. Not a breeze
Flies o'er the meadow,—not a cloud imbres
The setting sun's effulgence—not a strain
From all the tenants of the warbling shade
Ascends,—but whence his bosom can partake
Frosh pleasure, unimproved.*

Such is that universal possession of nature which the susceptibility of the emotions of taste conveys to us,—a possession, extending to an infinity of objects, which no earthly power can appropriate, and which enjoys even objects that have been so appropriated,

with a possession more delightful than that which they afford, in many cases, to the listless eyes of their proud but discontented master.

After these remarks on that order of our immediate emotions, which do not involve necessarily any moral feeling, I proceed to that other order of the same class, in which some moral feeling is necessarily involved.

The first of these, according to the arrangement formerly submitted to you, are those emotions which constitute, as I conceive, the feelings distinctive of vice and virtue,—emotions that arise on the contemplation of certain actions observed or conceived.

It is not my intention, however, in this part of my course, to enter on the discussion of the great questions connected with the doctrine of obligation, as either presupposed or involved in our consideration of such actions. The moral affections which I consider at present, I consider rather physiologically than ethically, as parts of our mental constitution, not as involving the fulfilment or violation of duties.

In this point of view, even the boldest sceptic, who denies all the grounds of moral obligation, must still allow the existence of the feelings which we are considering, as states or affections of the mind indicative of certain susceptibilities in the mind, of being so affected. Whether we have reason to approve and disapprove, or have no reason whatever, in the nature of their actions, to regard with a different eye those whom, by some strange illusion, but by an illusion only, we now feel ourselves almost necessitated to love or abhor; though it be an error of logic to consider the parricide, who, in preparing to plunge his dagger, could hold his lamp unmoved, and with no other apprehension than of the too early waking of his victim, look fixedly on the pale and gentle features of him, whose very sleep was, at the moment, perhaps, made happy by some dream of happiness to his murderer, as less worthy, even in the slightest respect of our esteem, than the son who rushes to inevitable death in defence of the grey hairs which he honours; though it be not less an error of logic to extend our moral distinctions, and the love or hate which accompanies them, to those who make not a few individuals only, but whole millions wretched or happy; to consider the usurping despot, who dares to be a tyrant, in the land on which he was born a freeman, as a less glorious object of our admiration, than the last assertor of rights which seemed still to exist, while he existed to assert them; who, in that cause which allows no fear of peril, could see nothing in guilty power which a brave man could dread, but every thing which it would be a crime

* Pleasures of Imagination, book iii. v. 668—598.

to obey, and who ennobled with his blood the scaffold from which he rose to liberty and heaven, making it an altar of the richest and most gratifying sacrifice which man can offer, to the great Being whom he serves; even though we should be unfortunate enough to look on the tyrant with the same envy as on his victim, and could see no reason for those distinctive terms of vice and virtue, in the two cases, the force of which we should feel equally, though we had not a word to express the meaning that is constantly in our heart; still the fact of the general approbation and disapprobation, we must admit, even in reserving for ourselves the privilege of indifference. They are phenomena of the mind, to be ranked with the general mental phenomena, as much as our sensations or remembrances,—illusions to be classed with our other illusions,—or truths to be classed with our most important truths.

This distinctive reference would be equally necessary, though our emotions of this kind did not arise immediately from our contemplation of actions, in the very moment in which we contemplate them simply as actions, but from processes of reasoning, and regard to general rules of propriety, formed gradually by attention to the circumstances in which man is placed, and all the good which, in such circumstances, he is capable of feeling or occasioning to others. The vivid distinctive regard, at whatever stage it began, would not the less be an affection of the mind, referable to certain laws, that guide its susceptibilities of emotion; but the truth is, that the moral feeling arises without any consideration, except that of the action itself and its circumstances. The general rules of propriety may, indeed, seem to confirm our suffrage, but the suffrage itself is given before their sanction. The rules themselves are ultimately founded, as Dr. Smith very justly remarks, on these particular emotions: "We do not originally approve or condemn particular actions," to use his words, "because, upon examination, they appear to be agreeable or inconsistent with a certain general rule. The general rule, on the contrary, is formed, by finding, from experience, that all actions of a certain kind, or circumstanced in a certain manner, are approved or disapproved of. To the man who first saw an inhuman murder, committed from avarice, envy, or unjust resentment; and upon one, too, who loved and trusted the murderer, who beheld the last agonies of the dying person, who heard him, with his expiring breath, complain more of the perfidy and ingratitude of his false friend, than of the violence which had been done to him,—there could be no occasion, in order to conceive how horrible such an action was, that he should reflect that one of the most sacred rules of conduct

was what prohibited the taking away the life of an innocent person, that this was a plain violation of that rule, and consequently a very blameable action. His detestation of this crime, it is evident, would arise instantaneously and antecedent to his having formed to himself any such general rule. The general rule, on the contrary, which he might afterwards form, would be founded upon the detestation which he felt, necessarily arising in his own breast, at the thought of this, and every other particular action of the same kind."

Of the universality of these moral emotions, which attend our mere perception of certain actions, or our reasonings on the beneficial or injurious tendency of actions, what more convincing proof can be imagined, than the very permanence of these feelings, in the breast of those whose course of life they are every moment reproaching; who, even when they are false to virtue, are not false to their love of virtue, and whose secret heart, if it could be laid open to those whom they are endeavouring to seduce, and who can listen only to the voice of the lips, would proclaim to them the charms of that innocence which the lips are affecting to deride, and the slavery of that licentiousness which the lips are proclaiming to be the glorious privilege of the free?

"What law of any state," says an eloquent Roman moralist, "has ever ordered the child to love his parents, the parents to love their child, each individual to love himself? It would be not more idle to order us to love virtue, which by its own nature has so many charms, that it is impossible for the wicked to withhold from it their approbation. Who is there that, living amid crimes, and in the practice of every injury which he can inflict on society, does not still wish to obtain some praise of goodness, and cover his very atrocities, if they can by any means be covered, with some veil, however slight, of honourable semblance? No one has so completely shaken off the very character of man, as to wish to be wicked for the mere sake of wickedness. The very robber, who lives by rapine, and who does not hesitate to strike his dagger into the breast of the passenger who has any plunder to repay the stroke, would still rather find what he takes by violence, only because he cannot hope to find it. The most abandoned of human beings, if he could enjoy the wages of guilt without the guilt itself, would not prefer to be guilty. It is no small obligation," he continues, "which we owe to nature, that Virtue reveals her glorious light, not to a few only, but to all mankind. Even those who do not follow her, still see the splendid track along which

she moves." "*Placet suapte natura: adeoque gratiosa virtus est, ut insitum sit etiam malis, probare meliora. Quis est, qui non beneficis videri velit,—qui non, inter scelera et injurias, opinionem bonitatis affectet,—qui non ipsis quae impotentissime fecit, speciem aliquam induat recti? Quod non facerent, nisi illos honesti, et per se expetendi, amor cogeret, moribus suis opinionem contrariam quaerere, et nequitiam abdere, cujus fructus concupiscitur, ipsa vero odio pudoreque est. —Maximum hoc habemus naturae meritum, quod virtus in omnium animos lumen suum permittit: etiam qui non sequuntur, illam vident.*"

And it is well, surely, even the most sceptical will admit, that nature, if we are deceived by this delightful vision, does permit us to be deceived by it. Though virtue were only a dream, and all which we admire as fallacious as the imaginary colours which shine upon our slumber in the darkness of the night, who could wish the slumber to be broken, if, instead of the groves of Paradise, and the pure and happy forms that people them, we were to awake in a world in which the moral sunshine was extinguished, and every thing on which we vainly turned our eye were to be only one equal gloom? Though the libertine should have hardihood enough to shake, or at least to try to shake, from his own mind, every feeling of moral admiration or abhorrence, he still could not wish, that others, among whom he is to live, should be as free as himself. For his own profit he would wish all others to be virtuous, himself the single exception; and what would profit each individually, must profit all. If he were rich, he could not wish the multitude that surrounded him to approve of the rapine which would strip him of all the sources of his few miserable enjoyments, and to approve, too, perhaps, of murder, as the shortest mode of separating him from his possessions; if he were in want, he could not wish those, whose charity he was forced to solicit, to see in charity nothing but a foolish mode of voluntarily abridging their own means of selfish luxury; if he were condemned for some offence to the prison or the gibbet, he would not wish mercy to be regarded as a word without meaning. What noble and irresistible evidence is this of the excellence of virtue, even in its worldly and temporary advantages, that, if all men were, what all individually would wish them to be, there would not be a single crime to pollute the earth!

When we reflect how many temptations there are to the multitudes who live together in social society,—temptations that, wherever they look around them, would lead

them, if they had not been rendered capable of moral affections, as much as of their sentient enjoyments and passions, to seek the attainment of the objects within their view, and almost within their reach, and to seek it as readily by force or by falsehood, as by that patient industry which could not fail to seem to them more tedious, and therefore less worthy of their prudent choice; when we think of all the temptations of all these objects, and the facilities of attaining them by violence or deceit, and yet observe the security with which man in society spreads out his enjoyments, as it were to the view of others, and delights in the number of the gazers and enviers that are attracted by them, it is truly as beautiful as it is astonishing, to think of the simple means on which so much security depends. The laws which men have found it expedient, for their common interest, to make and to enforce, are, indeed, the obvious pieces of machinery by which this great result is brought about. But how much of its motion depends on springs that are scarcely regarded by those who look only to the exterior wheels, as they perform their rotation in beautiful regularity! The grosser measures of fraud or force may be prevented by enactments, that attach to those measures of fraud or force a punishment, the risk of which would render the attempt too perilous to obtain for it the approbation even of selfish prudence. But what innumerable actions are there, over which the laws, that cannot extend to the secret thoughts of man, or to half the possibilities of human action, must have as little control as it is in our power physically to exercise over the unseen and unsuspected elements of future storms, which, long before the whirlwind has begun, are preparing that desolation which it is afterwards to produce. The force of open violence the laws may check; but they cannot check the still more powerful force of seduction,—the frauds of mere persuasion, which are never to be known to be frauds but by the conscience of the deceiver, and which may be said to steal the very assent of the unsuspecting mind, as they afterwards steal the wealth, or the worldly honours, or voluptuous enjoyments, for which that assent was necessary. It is in these circumstances that He who formed and protects us, has provided a check for that injustice which is beyond the restraining power of man, and has produced, what the whole united strength of nations could not produce,—by a few simple feelings,—a check and control as mighty as it is silent and invisible,—which he has placed within the mind of the very criminal himself, where it would most be needed; or rather in the mind of him who, but for these feelings, would have been a criminal, and who, with them, is virtuous and happy. The voice

* Seneca de Beneficiis, lib. iv. c. 17.

within, which approves or disapproves,—long before action, and before even the very wish, that would lead to action, can be said to be fully formed,—has in it a restraining force more powerful than a thousand gibbets; and it is accompanied with the certainty, that, in every breast around, there is a similar voice, that would join its dreadful award to that which would be for ever felt within. The feelings of moral approbation and disapprobation are thus at once the security of virtue and its avengers; its security in the happiness that is felt, and the happiness that is promised to every future year and hour of virtuous remembrance; its avengers in that long period of earthly punishment when its guilty injurer is to read in every eye that gazes on him, the reproach which is to be for ever sounding on his heart.

I have already said, however, that it is merely as a part of our mental constitution that I at present speak of our distinctive feelings of the moral differences of actions; as states or affections, or phenomena of the mind, and nothing more. The further illustration of them, in their most important light, as principles of conduct, I reserve for our future discussions of the nature and obligation of virtue.

The moral emotions, to which I next proceed, are those of love and hate,—words which, as general terms, comprehend a great variety of affections, that have different names, according to their own intensity, and the notion which they involve of the qualities on which the love is founded, as when we speak of love or affection simply, or of regard, esteem, respect, veneration, and which have different names also, according to the objects to which they are directed, as love, friendship, patriotism, devotion, to which, or at least to far the greater part of which, there are corresponding terms of the varieties of the opposite emotion of hatred, which I need not waste your time with attempting to enumerate. Indeed, if we were to compare the two vocabularies of love and hate, I fear that we should find rather a mortifying proof of our disposition to discover imperfections, more readily than the better qualities, since we are still richer in terms of contempt and dislike than in terms of admiration and reverence.

The analysis of love, as a complex feeling, presents to us always at least two elements,—a vivid delight in the contemplation of the object, and a desire of good to that object. To love, then, it is essential that there should be some quality in the object which is capable of giving pleasure, since love, which is the consequence of this, is itself a pleasurable emotion. There is a feeling of beauty, external, moral, or intellectual, which affords the primary delight of loving, and continues

to mingle with the kind desire which it has produced. In this sense, indeed, but in this sense only, the most disinterested love is selfish, though it is a sense in which selfishness may be said to be as little sordid as the most generous sacrifices which virtue can make. It loves, not because delight is to be felt in loving, but because it has been impressed with qualities which nature has rendered it impossible to view without delight. It must therefore have felt that delight which arises from the contemplation of objects worthy of being loved; yet the delight thus felt has not been valued for itself, but as indicative, like some sweet voice of nature, of those qualities to which affection may be safely given. Though we cannot, then, when there is no interfering passion, think of the virtues of others without pleasure, and must, therefore, in loving virtue, love what is by its own nature pleasing, the love of the virtue which cannot exist without the pleasure, is surely an affection very different from the love of the mere pleasure existing, if it had been possible for it to exist, without the virtue,—a pleasure that accompanies the virtue only as the soft or brilliant colouring of nature flows from the great orb above,—a gentle radiance, that is delightful to our eyes, indeed, and to our heart, but which leads our eye upward to the splendid source from which it flows, and our heart, still higher, to that Being by whom the sun was made.

The distinction of the love of that which is pleasing, but which is loved only for those intrinsic qualities which the pleasure accompanies, and of the love of mere pleasure, without any regard to the qualities which excite it, is surely a very obvious one; and it is not more obvious, as thus defined, than in the heart of the virtuous,—in the generous friendships which he feels, and the generous sacrifices to which he readily submits. If, as is sometimes strangely contended, the love that animates such a heart be selfishness, it must be allowed, at least, that it is a selfishness which, for the sake of others, can often prefer penury to wealth,—which can hang, for many sleepless nights, unwearied and unconscious of any personal fear, over the bed of contagion,—which can enter the dungeon, a voluntary prisoner, without the power even of giving any other comfort than that of the mere presence of an object beloved, or fling itself before the dagger which would pierce another breast, and rejoice in receiving the stroke. It is the selfishness which thinks not of itself—the selfishness of all that is generous and heroic in man—I would almost say, the selfishness which is most divine in God.

Obvious as the distinction is, however, it has not been made by many philosophers, or, at least, by many writers who assume that honourable name; the superficial but dazzl-

ing lovers of paradox, who prefer to truths that seem too simple to stand in need of defence, any errors, if only they be errors, that can be defended with ingenuity; though, in the present case, even this small praise of ingenuity scarcely can be allowed; and the errors which would seduce men into the belief of general selfishness, from which their nature shrinks, are fortunately as revolting to our understanding as they are to our heart. The fuller discussion of these, however, I defer, till that part of the course which treats of virtue as a system of conduct. At present, I merely point out to you the fallacy which has arisen from the pleasing nature of the emotions in which love consists, or which precede love, as if the pleasure in which love is necessarily presupposed were itself all to which the love owes its rise, and for the direct sake of which the love itself is felt.

I may remark, however, even now, the unfortunate effect of the poverty of our language in aiding the illusion. The word selfishness, or at least, self-love, has various meanings, some of which imply nothing that is reprehensible, while, in other senses, it is highly so. It may mean either the satisfaction which we feel in our own enjoyment, which, when there is no duty violated, is far from being, even in the slightest degree, unworthy of the purest mind; or it means that exclusive regard to our own pleasures, at the expense of the happiness of others, which is as degrading to the individual as it is pernicious to society. All men, it may indeed be allowed, are selfish, in the first of these meanings of the term; but this is only one meaning of a word, which has also a very different sense. The difference, however, is afterwards forgotten by us, because the same term is used; and we ascribe to self-love in the one sense what is true of it only in the other.

Much of the obscurity and confusion of the moral system of Pope, in his *Essay on Man*, arises from this occasional transition from one of the senses of the term to the other, without perceiving that a transition has been made. It is impossible to read some of the most beautiful passages of that poem, without feeling the wish that we had some term to express the first of these senses, without any possibility of the suggestion of the other. It is not self-love, for example, which gives us to make our neighbour's blessing ours; it scarcely even can be called self-love which first stirs the peaceful mind—it is simply pleasure; and the enjoyment may or must accompany all the delightful progress of our moral affections; it is not any self-love, reflecting on the enjoyments that are thus to be obtained.

Self-love but serves the virtuous mind to wake,
As the small pebble stirs the peaceful lake;

The centre moved, a circle straight succeeds;
Another still, and still another spreads:
Friend, parent, neighbour, first it will embrace,
His country next, and next all human race.
Wide and more wide—the o'erflowings of the mind
Take every creature in of every kind.
Earth smiles around, with boundless bounty blest,
And Heaven beholds its image in its breast.*

In all these cases there is a diffusion of love indeed, but not of self-love,—a pleasure attending in every stage the progressive benevolence, but attending it only, not producing it; and without which, if it were possible for benevolence to exist without delight, it would still, as before, be the directing spirit of every generous breast.

LECTURE LX.

I. IMMEDIATE EMOTIONS, IN WHICH SOME MORAL FEELING IS NECESSARILY INVOLVED.
—2. LOVE, HATE, CONTINUED.—RELATIONS WHICH THEY BEAR TO THE HAPPINESS OF MAN, AND TO THE BENEVOLENCE OF GOD.

In my last Lecture, Gentlemen, I began the consideration of that order of our emotions in which some moral relation is involved; and considered, in the first place, those vivid feelings which arise in the mind on the contemplation of virtuous or vicious actions, and which, as we shall afterwards find, are truly all that distinguish these actions to our moral regard, as vice or virtue. At present, however, they are not considered by us ethically, in their relation to conduct,—for in this light they are to be reviewed by us afterwards,—but merely as mental phenomena—feelings or affections indicative of certain susceptibilities in the mind of being thus affected.

Next to these, in our arrangement, are the emotions of love and hatred; to the consideration of which, therefore, I proceeded. The remarks which I made were chiefly illustrative of a distinction which is of great importance in the theory of morals, with respect to the pleasure excited by the objects of our regard,—a pleasure which is indeed inseparable from the regard, and without which therefore, of course, no regard can be felt, but which is not itself the cause or object of the affection. My wish, in these remarks, was to guard you against the sophistry of many philosophers, who seem to think that they have shown man to be necessarily selfish, merely by showing that it is delightful for him to love those whom it is virtue to love, and whom it would have been impossible for him not to love, even though no happiness had attended the affection; as it is impossible for him not to

* Ep. iv. v. 363—372.

despise or dislike the mean and the profligate, though no pleasure attends the contemplation. A little attention to this opposite class of feelings, which are not more essential to our nature than the others, might have been sufficient to show that the delight of loving is not the cause of love. We despise, without any pleasure in despising, certainly, at least, not on account of any pleasure that can be imagined to be felt in despising. We love, in like manner, not for the pleasure of loving, but on account of the qualities which it is at once delightful for us to love, and impossible for us not to love. We cannot feel the pleasure of loving, unless we have previously begun to love; and it is surely as absurd an error, in this as in any other branch of physics, to ascribe to that which is second in a progressive scale, the production of that very primary cause of which itself is the result.

The pleasure which accompanies the benevolent affections, that has been thus most strangely converted into the cause of those very benevolent affections which it necessarily presupposes, is a convincing proof how much the happiness of his creatures must have been in the contemplation of him who thus adapted their nature as much to the production of good as to the enjoyment of it. We are formed to be malevolent in certain circumstances, as in other circumstances we are formed to be benevolent; but we are not formed to have equal enjoyment in both. The benevolent affections, of course, lead to the actions by which happiness is directly diffused; there is no moment at which they may not operate with advantage to society; and the more constant their operation and the more widely spread, the greater, consequently, is the result of social good. The Deity, therefore, has not merely rendered us susceptible of these affections; he has made the continuance of them delightful, that we may not merely indulge them, but dwell in the indulgence.

Thus hath God,
Still looking to his own high purpose, fix'd
The virtues of his creatures; thus he rules
The parent's fondness and the patriot's zeal,
Thus the warm sense of honour and of shame,
The vows of gratitude, the faith of love,
The joy of human life, the earthly Heaven.

Abenide.

The moral affections which lead to the infliction of evil, are occasionally as necessary as the benevolent affections. If vice exist, it must be loathed by us, or we may learn to imitate it. If an individual have injured another individual, there must be indignation to feel the wrong which has been done, and a zeal to avenge it. The malevolent affections, then, are evidently a part of virtue as long as vice exists; but they are necessary only for the occasional purposes of nature, not for her general and permanent interest

in our welfare. If all men were uniformly benevolent, the earth, indeed, might exhibit an appearance, on the contemplation of which it would be delightful to dwell. But a world of beings universally and permanently hating and hated, is a world that fortunately could not exist long; and that, while it existed, could be only a place of torture, in which crimes were every moment punished and every moment renewed; or rather, in which crimes, and the mental punishment of crimes, were mingled in one dreadful confusion.

In such circumstances, what is it which we may conceive to be the plan of Divine Goodness? It is that very plan which we see at present executed in our moral constitution. We are made capable of a malevolence that may be said to be virtuous when it operates; for the terror of injustice, that otherwise would walk, not in darkness, through the world, but in open light, perpetrating its iniquities without shame or remorse, and perpetrating them with impunity. But, that even this virtuous malevolence may not outlast the necessity for it, it is made painful for us to be malevolent even in this best sense. We require to warm our mind with the repeated image of every thing which has been suffered by the good, or of every thing which the good would suffer in consequence of the impunity of the wicked, before we can bring ourselves to feel delight in the punishment even of the most wicked, at least when the insolence of power and impunity is gone, and the offender is trembling at the feet of those whom he had injured. There are gentle feelings of mercy that continually rise upon the heart in such a case, feelings that check even the pure and sacred resentment of indignation itself, and make rigid justice an effort, and perhaps one of the most painful efforts, of virtue.

"To love, is to enjoy," it has been said; "to hate, is to suffer;" and, in conformity with this remark, the same writer observes, that "though it may not be always unjust, it must be always absurd to hate for any length of time, since it is to give him whom we hate the advantage of occupying us with a painful feeling. Of two enemies, therefore, which is the more unhappy? He, we may always answer, whose hatred is the greater. The mere remembrance of his enemy is an incessant uneasiness and agitation; and he endures, in his long enmity, far more pain than he wishes to inflict."

The annexation of pain to the emotions that would lead to the infliction of pain is, as I have said, a very striking proof, that he who formed man did not intend him for purposes of malignity,—as the delight, attached to all our benevolent emotions, may be considered as a positive proof that it was for purposes of benevolence that man was formed,—purposes which make every generous

exertion more delightful to the active mind itself than to the individual whose happiness it might have seemed exclusively to promote. By this double influence of every tender affection, as it flows from breast to breast, there is, even in the simplest offices of regard, a continual multiplication of pleasure, when the sole result is joy; and, even when the social kindnesses of life do lead to sorrow, they lead to a sorrow which is so tempered with a gentle delight, that the whole mingled emotion has a tenderness which the heart would be unwilling to relinquish, if it were absolute indifference that was to be given in exchange.

Who that bears

A human bosom, hath not often felt
How dear are all those ties, which bind our race
In gentleness together, and how sweet
Their force, let Fortune's wayward hand the while
Be kind or cruel? Ask the faithful youth,
Why the cold urn of her whom long he lov'd,
So often fills his arms, so often draws
His lonely footsteps, silent and unseen,
To pay the mournful tribute of his tears?
O! he will tell thee, that the wealth of worlds
Should ne'er seduce his bosom to forego
Those sacred hours, when, stealing from the noise
Of care and envy, sweet remembrance soothes,
With virtue's kindest looks, his aching breast,
And turns his tears to rapture.*

Such, then, are the comparative influences on our happiness and misery, of the emotions of love and hatred; and it cannot, after such a comparison, seem wonderful, that we should cling to the one of these orders of emotions, almost with the avidity with which we cling to life. It is affection in some of its forms which, if I may use so bold a phrase, animates even life itself, that, without it, scarcely could be worthy of the name. He who is without affection may exist, indeed, in a populous city, with crowds around him wherever he may chance to turn; but even there, he lives in a desert, or he lives only among statues that move and speak, but are incapable of saying any thing to his heart. How pathetically, and almost how sublimely, does one of the female saints of the Romish Church express the importance of affection to happiness, when, in speaking of the great enemy of mankind, whose situation might seem to present so many other conceptions of misery, she singles out this one circumstance, and she says, "How sad is the state of that being condemned to love nothing!" "If we had been destined to live abandoned to ourselves, on Mount Caucasus, or in the deserts of Africa," says Barthelemi, "perhaps nature would have denied us a feeling heart; but, if she had given us one, rather than love nothing that heart would have tamed tigers and animated rocks."† This, indeed, I may remark, strong as the expression of Barthelemi may seem, is no more than what man

truly does. So susceptible is he of kind affection, that he does animate with his regard the very rocks, if only they are rocks that have been long familiar to him. The single survivor of a shipwreck, who has spent many dreary years on some island, of which he has been the only human inhabitant, will, in the rapture of deliverance, when he ascends the vessel that is to restore him to society and his country, feel, perhaps, no grief mingling with a joy so overwhelming. But, when the overwhelming emotion has in part subsided, and when he sees the island dimly fading from his view, there will be a feeling of grief, that will overcome, for the moment, even the tumultuous joy. The thought that he is never to see again that cave which was so long his home, and that shore which he has so often trod, will rise so sadly to his mind, that it will be to him, before reflection, almost like a momentary wish that he were again in that very loneliness, from which to be freed, seemed to him before, like resurrection from the tomb. He has not tamed tigers, indeed, but he will find, in his waking remembrances, and in his dreams, that he has animated rocks, that his heart has not been idle, even when it had no kindred object to occupy it, and that his cave has not been a mere place of shelter, but a friend.

"If," says the author of *Anacharsis*, "we were told, that two strangers, cast by chance on a desert island, had formed a union of regard, the charms of which were a full compensation to them for all the rest of the universe which they had lost; if we were told, that there existed anywhere a single family, occupied solely in strengthening the ties of blood with the ties of friendship; if we were told, that there existed in any corner of the earth, a people who knew no other law than that of loving each other, no other crime than that of not loving each other sufficiently, who is there among us that could dare to pity the fate of the two strangers, that would not wish to belong to the family of friends, that would not fly to the climate of that happy people? O mortals, ignorant and unworthy of your destiny," he continues, "it is not necessary for you to cross the seas to discover the happiness. It may exist in every condition, in every time, in every place, in you, around you, wherever benevolence is felt."‡

After these remarks, on the emotions of love and hatred in general, it will not be necessary to prosecute the investigation of them with any minuteness, at least through all their varieties. The emotions, indeed, though classed together under the general name of love, are of many varieties; but the

* Pleasures of Imagination, second form of the poem, book ii. v. 609—624.

† Voyage de Jeune Anacharsis, chap. lxxviii.

‡ Voyage du Jeune Anacharsis, chap. lxxviii.

difference is a difference of feeling too simple to be made the subject of descriptive definition. I have already, in my general analysis of the emotion, stated its two great elements, —a vivid pleasure in the contemplation of the object of regard, and a desire of the happiness of that object; and in the contemplation of various objects, the pleasure may be as different in quality as the corresponding desire is different in degree. The love which we feel for a near relation, may not then, in our maturer years, be exactly the same emotion as that which we feel for a friend; the love which we feel for one relation or friend of one character, not exactly the same as the love which we feel for another relation perhaps of the same degree of propinquity, or for another friend of a different character; yet, if we were to attempt to state these differences in words, we might make them a little more obscure, but we could not make them more intelligible.

I shall not attempt, therefore, to define what is really indefinable. The love which we feel for our parents, our friends, our country, is known better by these mere phrases, than by any description of the variety of the feelings themselves; as the difference of what we mean by the sweetness of honey and the sweetness of sugar is known better by these mere names of the particular substances which excite the feelings, than by any description of the difference of the sweetnesses; or rather, in the one way it is capable of being made known to those who have ever tasted the two substances; in the other way, no words which human art could employ, if the substances themselves are not named, would be able to make known the distinctive shades. Who is there who could describe to another the sensations of smell which he receives from a rose, a violet, a sprig of jessamine, or of honeysuckle, though, in using these names, I have already conveyed to your mind a complete notion of this very difference?

It is not my intention, then, to give you any description of the varieties of emotion, comprehended under the general terms of love and hate, or, to speak more accurately, it is not in my power. To your own mind, the greater number of these must already be sufficiently familiar. A few very brief remarks on the general guardianship of affection, under which man is placed, and on the happiness of which it is productive, are all which I shall attempt to offer to you.

The helplessness of man at birth, and for the first years of life, is what must have powerfully impressed every one, however unapt to moralize on the contrasts of the present, and the past, and the future; those contrasts which nature is incessantly exhibiting, not more strikingly, in what we term the accidents of individual fortune, or the dreadful

revolutions of nations, which occur only at distant intervals, than in the phenomena which form the regular display of her power in every generation of mankind, and every individual of every generation. That glorious animal who is to rule all other animals, to invade their deepest recesses, to drive the most ferocious from their dens, and to make the strength of the strongest only an instrument of more complete subjection, what is he at his birth? A creature that seems incapable of any thing but of tears and cries, as Pliny so forcibly pictures him in a few words, "*Fleus animal caeteris imperaturum*."* If we were to consider him, as abandoned to himself, we might indeed say, to use a still stronger phrase of Cicero, that man is born not of a mother, but of a stepmother. "*Hominem, non ut a matre sed a noverca natum, corpore rudi, fragili et infirmo, animo autem anxio ad molestias, in quo tamen inesset obrutus quidam divinus ignis.*" Is the divine spark, which seems scarcely to gleam through that feeble frame, to be quenched in it for ever? It is feebleness, indeed, which we behold: but the creator of that which seems so feeble, was the Omnipotent. That Power, which is omnipotent to bless, has thrown no helpless outcast on the world. Before it brought him into existence, it provided what was to be strength, and more than strength, to the weakness which was to be intrusted to the ready protection. There are beings, who love him, before their eyes have seen what they love, who expect, with all the affection of long intimacy, or rather with an affection, to which that of the most cordial friendship is indifference and coldness, that unsuspecting object of their regard, who is to receive their cares, without knowing of whom they are the cares; but who is to reward every labour and anxiety, by the mere smile, that almost unconsciously answers their smile, or the unintentional caress, to which their love is to affix so tender a meaning. How beautiful is the arrangement, which has thus adapted to each other, the feebleness of the weak, and the fondness of the strong, in which the happiness of those who require protection, and of those who are able to give protection, is equally secured; and man, deriving from his early wants the social affections, which afterwards bind him to his race, is made the most powerful of earthly beings, by that very imbecility, which seemed to mark him as born only to suffer and to perish!

The suddenness of the change which at this interesting period takes place, in many instances, in the whole character and mode of conduct of the mother, is as remarkable as the force of the fondness itself. The affec-

* Lib. vii. proem.
2 C

tion which the child requires, is not an affection of a passive sort; it is one which must watch and endure fatigues, and the privation of many accustomed pleasures. But nature, who, in adaptation to the wants of the new animated being, has provided for it the food best suited for its little frame, by a change in the very bodily functions of the mother, has provided equally for that corresponding change which is necessary in the maternal mind. "How common is it," says Dr. Reid, "to see a young woman, in the gayest period of life, who has spent her days in mirth, and her nights in profound sleep, without solicitude or care, all at once transformed into the careful, the solicitous, the watchful nurse of her dear infant; doing nothing by day but gazing upon it, and serving it in the meanest offices; by night, depriving herself of sound sleep for months, that it may lie safe in her arms. Forgetful of herself, her whole care is centred in this little object. Such a sudden transformation of her whole habits, and occupation, and turn of mind, if we did not see it every day, would appear a more wonderful metamorphosis than any that Ovid has described."*

Such is that species of love which constitutes parental affection,—an affection, however, that is not to fade with the wants to which it was so necessary; but is to extend its regard, with delightful reciprocities of kindness, over the whole life of its object; or rather, is not to terminate with this mortal life, but only to begin then a new series of wishes, that extend themselves through immortality. Affection is not a task that finishes, when the work which it was to accomplish is done. The dead body of their child, over which the parents bend in anguish, is not to them a release from cares imposed on them. It awakes in them, love not less, but more vivid. It speaks to them of him who still exists to their remembrances, and their hopes of future meeting, as he existed before, to all the happiness of mutual presence. On their own bed of death, if he is the survivor, they have still some anxieties, even of this earth, for him. They look with devout confidence to that God, who is the happiness of those who are admitted, after the toils of life, to his divine presence; but they look to him also, as the happiness of those, whose earthly career is not yet accomplished; the averter of perils, to which they can no longer be exposed; the source of consolation in griefs, which they can no longer feel. The heaven of which they think, is not the heaven that is at the moment at which they ascend to it, but the heaven which is to be, when at least one other inhabitant is added to it.

These are the delightful emotions of parental regard, which far more than repay every parental anxiety. But does the child enjoy their protecting influence without any return of love? His little heart,—the heart of him who is perhaps afterwards to have the same parental feelings, is not so cold and insensible. His love, indeed, has not the intensity of interest, far less the reasoning foresight, which distinguishes the zealous fondness of that unwearied guardianship on which he depends. But it is a reflection from the same blessed sunshine to his own delighted bosom. It is this which, in childhood, makes even obedience,—the most powerful, perhaps, of all things, when the reason of the command is not known,—almost as delightful as the freedom which is restrained; and which, in maturer life, continues a reverence, which the proud mind of man refuses to every other created being. It is to the feeling of this sacred and paramount regard, that we are to trace the peculiar horror attached in every nation to parricide. Murder, indeed, in every form, is horrible to our conception; but the murder of a parent is a crime, of which we mark the occurrence with the same astonishment with which we mark and record some fearful prodigy of nature.

The fraternal affection is, in truth, in its origin, only another form of that general susceptibility of friendship with which nature has endowed us. We cannot live long with any one, in the constant interchange of social offices, without forming an attachment, which is altogether independent of the expectation of the benefits that may arise from a continuance of the intercourse; and what we feel for every other playmate, with whom we meet only occasionally, must surely be felt still more for those who have partaken almost of every pleasure which we have enjoyed since we entered into life, and who, in all the little adventures, of years that have relatively, as many, or even more important incidents, than the years which are occupied only with a few great projects, have been the companions of our toils, and perils, and successes. In the case of fraternal friendship, too, there is the strong additional circumstance, that, in loving a brother, we love one who is dear to those to whom our liveliest affections have been already given. We cannot love a friend without taking some interest in whatever may befall the friends of our friends; and we cannot love our parents, therefore, without feeling some additional sympathy with those whose happiness we know would be happiness to them, and whose distresses misery. This reflection from our filial fondness, however, is but a circumstance in addition; the great source of the fraternal regard, as I have already said, is in that general susceptibility of our nature, to which we owe all our friendships; that suscepti-

* On the Active Powers, Essay iii. c. 4.

lity which has made brothers of mankind, at least of all the nobler individuals of mankind, though their common passions might seem to oppose them in endless rivalries. The same affection which, in the nursery, attracted its two little inhabitants, to look on the same objects, to mix in the same sports, to form the same plans,—not indeed for the next year or month, but for the next hour or minute, is that which, in a different period of life, augments, and perpetuates, and extends to others, the same feelings of social regard,—a regard which,

Push'd to social, to divine,
Gives thee to make thy neighbour's blessing thine.
Is this too little for thy boundless heart?
Extend it—let thy enemies have part.
Grasp the whole worlds of reason, life, and sense,
In one close system of benevolence :—
Happier as kinder, in whate'er degree,
And height of bliss, but height of charity.*

Such is man, the parent, the child, the brother, the citizen, the member of the great community of all who live. There is still another aspect, however, in which our susceptibilities of the emotions of love may be considered; and that which has, in common language, almost absorbed the name,—the affection which the sexes bear to each other,—an affection on which, in its mere physical relation to the preservation of the species, all our other emotions may be said indirectly to depend, and of which the moral relations that alone are to be considered by us, are as powerful in their influence on the conduct, as they are general in their empire, and not more productive of hope or misery, than they are of virtue or of vice.

In considering the influences of this relation on human happiness, we are not to have regard merely to those emotions which are excited in the individuals who feel that exclusive delight in each other's society, and that reciprocal admiration and confidence, the charm of which constitutes the moral part of what is called love. These feelings, indeed, are truly valuable in themselves, as a part of the happiness of the world, and would still be most valuable, even though no other beneficial influence were to flow from them. But, precious as they are in this respect, we are not to regard them as extending only to the individuals themselves, and beginning and ceasing with their enjoyments. The chief value of this relation is diffused over all mankind. It is to be traced in that character of refinement which it has given to society, and with which love extends its delightful and humanizing influence, even to those who may pass through life, without feeling its more direct and immediate charms. It is, in this respect, like that sunshine, which even the blind enjoy, in the warmth which it produces,

though they are incapable of distinguishing the light from which it flows.

The system of gentler manners once produced in this way, may diffuse the influence in a great degree without a renewal of the cause which gave rise to it; and yet, even at present, when men live long together without much intercourse with the gentler sex, we are soon able to discover some proof of the absence of that influence which is not necessary only for raising man from savage life, but for saving him from relapsing into it.

That the female character, however, may have its just influence, it is necessary that the female character should be respected. When woman is valued only as subservient to the animal pleasures of man, or to the multiplication of his race, there may be as much fondness as is involved in sensual profligacy, there might be a dreadful mixture of momentary tenderness with habitual tyranny and servility; but this is not love, and therefore not the moral influence of love—not that equal and reciprocal communication of sentiments and wishes,

When thought meets thought, ere from the lips it
start,
And each warm wish springs mutual from the heart.
Pope.

"The empire of women," says an eloquent foreigner, "is not theirs because men have willed it, but because it is the will of nature. Miserable must be the age in which this empire is lost, and in which the judgments of women are counted as nothing by man. Every people in the ancient world that can be said to have had morals has respected the sex—Sparta, Germany, Rome. At Rome, the exploits of the victorious generals were honoured by the grateful voices of the women; on every general calamity their tears were a public offering to the gods. In either case, their vows and their sorrows were thus consecrated as the most solemn judgments of the state. It is to them that all the great revolutions of the republic are to be traced. By a woman Rome acquired liberty; by a woman the Plebeians acquired the consulate; by a woman, finished the decemviral tyranny; by women, when the city was trembling with a vindictive exile at its gates, it was saved from that destruction which no other influence could avert. To our eyes, indeed, accustomed to find in every thing some cause or pretence for mockery, a procession of this sort might seem to present only a subject of derision; and, in the altered state of manners of our capitals, some cause of such a feeling might perhaps truly be found in the different aspect of the procession itself. But compose it of Roman women, and you will have the eyes of every Volscian, and the heart of Coriolanus."†

* Essay on Man, Ep. iv. v. 353—360.

† Rousseau.
2 C 2

In the whole progress of life in its permanent connexions, and even in the casual intercourse of society, so much of conduct must have relation to the other sex, and be regulated in a great measure by the views which we have been led to form with respect to them, that there is scarcely a subject on which just views seem to me of so much importance to a young and ingenuous mind. In such a mind, a respect for the excellencies of woman is, in its practical consequences, almost another form of respect for virtue itself.

In estimating the character of the other sex, we are too apt to measure ourselves with them only in those respects in which we arrogate an indisputable superiority, and to forget the circumstances from which chiefly that superiority is derived, if even there be as great a superiority as we suppose, in the respects in which we may, perhaps falsely, lay claim to it. We think, in such an estimate, not so much of the peculiar merits which they possess, as of peculiar merits which we flatter ourselves with the belief of possessing. We forget those tender virtues, which are so lovely in themselves, and to which we owe half the virtue of which we boast. We forget the compassion, which is so ready to sooth our sorrows, and without which, perhaps, to awaken and direct our pity to others, we should scarcely have known that the relief of misery was one of our duties, or rather one of the noblest privileges of our nature. We forget the patience, which bears so well every grief but those which ourselves occasion, and which feels these deepest sorrows with intenser suffering, only from that value, above all other possessions, which is attached to our regard. We forget those intellectual graces, which are the chief embellishment of our life, and which, shedding over it at once a gaiety and a tenderness, which nothing else could diffuse, soften down the asperities of our harsher intellect. But, forgetting all these excellencies which are the excellencies of others, we are far from forgetting the scholastic acquisitions of languages or science, which seem to us doubly important, because they are our own,—acquisitions, that, in some distinguished instances, indeed, may confer glory on the nature that is capable of them, but that, in many cases, leave no other effect on the mind than a pride of sex, which the inadequacy of these supposed means of paramount distinction, should rather have converted into respect for those who, almost without study, or at least with far humbler opportunities, have learned from their own hearts what is virtuous, and from their own genius whatever is most important to be known.

Even with respect to those studies, which we have reserved almost as an exclusive pri-

vilage of our sex, we should remember, that the privation, on the part of woman, is a sacrifice that is made to a system of general manners, which, whether truly essential or not, we have at least chosen to regard as essential to our happiness. We impose on them duties that are, perhaps, incompatible with severe study; we require of them the highest excellence in many elegant arts, to excel in which, if we too were to attempt it, would be the labour of half our life; we require of them even the charm of a sort of delicate ignorance, as if ignorance itself were a grace; and then, with most inconsistent severity, we affect to regard them with contempt, because they have fulfilled the very duties imposed on them, and have charmed us with all the excellencies, and perhaps, too, with some of the defects, which we required. If they err, in being as ignorant of the choral prosody of the Greeks, and of the fluxionary calculus of the moderns, as the greater number even of the well-educated of our own sex, let us at least allow them the privilege of speaking of anaapests and infinitesimals, without forfeiting our regard,—before we smile at ignorance which ourselves have produced, and which, if we could remove with a wish, there are few, perhaps, even of those who affect to despise it, who would not tremble at the comparative light in which they would themselves have to appear.

In the course of your life, you must often mingle with the frivolous of our own sex, who, knowing little more, know at least, and can repeat, as their only literature, some of the trite traditionary sarcasms which have been tediously repeated against women,—though they have had no difficulty in forgetting the far more numerous sarcasms which even men have pointed against the vices of men. But, though minds, which women would despise and blush to resemble, may speak contemptuously of excellence which they cannot hope to equal,—it is only from the contemptible, in such a case, that you will hear the expression of contempt; and the real or affected disdain of such minds is, perhaps, not less glorious to the character of the sex which they deride, than the respect which that character never fails to obtain, from those who are alone qualified to appreciate it, and whose admiration alone is honour.

To the dissolute, indeed, who are fond of associating with the lowest of the sex, and who, in their conception of female excellence, can form no brighter pictures in their mind, than of the inmates of a brothel, or of those whom a brothel might admit as its inmates,—woman may seem a being like themselves, and be a subject of insulting mockery in the coarse laughter and drunkenness of the feast; but the mockery, in such a case, is descrip-

tive of the life and habits of the deriders, more than of the derided. It is not so much the expression of contempt as the confession of vice.

The respect which he feels for the virtues of woman, may thus be considered almost as a test of the virtues of man. He is, and must be, in a great measure, what he wishes the companions of his domestic hours to be—noble, if he wish them to be dignified—frivolous, if he wish them to be triflers—and far more abject than the victims of his capricious favour, if, with the power of enjoying their free and lasting affection, he would yet sacrifice whatever love has most delightful, and condemn them to a slavery of the dismal and dreary influence, of which he is himself to be the slave.

LECTURE LXL

I. IMMEDIATE EMOTIONS, INVOLVING NECESSARILY SOME MORAL FEELING.—2. LOVE AND HATE, CONCLUDED.—3. SYMPATHY WITH THE HAPPINESS AND SORROW OF OTHERS.

In my last Lecture, Gentlemen, I considered the various affections comprehended under the general names of love and hatred, both with respect to their nature as emotions, and to the relations which they bear to the happiness of man, and consequently to the provident benevolence of that mighty being who has created us to be happy,—who, in rendering us susceptible of these opposite emotions, has not merely blessed us, but protected also the very blessings which he gave, bestowing on us the kind affections, as the source of our enjoyment, and the affections of hatred, as our security against aggression.

Of the benevolent affections, in the first place, we saw how largely they contribute to happiness, by the pleasure which they directly yield, and, still more, by the pleasure which they diffuse over every other enjoyment, or with which they temper even affliction itself, till it almost ceases to be an evil. The most sensual, who despise the pleasures of the understanding, and those delights, which have been so truly called “the luxury of doing good,” must still, in their petty luxuries, have an affection of some sort, or at least the semblance of affection, to diffuse over their indulgences, the chief part of the little pleasure which they seem to yield. To give a taste to their costly food, they must collect smiles around the table, even though there be at the heart a sad conviction, that the smiles are only the mimicry of kindness. So essential, however, is kindness to happi-

ness, that even this very mimicry of it is more than can be abandoned; and, if all the gay faces of the guests around the festive board could, in an instant, be converted into statues, in that very instant, the delight of him who spread the magnificence for the eyes of others, and caught a sort of shadowy gaiety from that cheerfulness, which had at least the appearance of social regard, would cease, as if he too had lost even the common sensibilities of life. He would still see, on every side, attendants ready to obey a word, or a very look,—the same luxurious delicacies would be before him, but there would no longer be the same appetite, that could feel them to be luxuries; and the enjoyment received, if any enjoyment were received, would be far less than that of the labourer, in his coarser meal, when there is only simple fare upon the board, but affection in every heart that is round it, and social gladness in every eye.

So consolatory is regard, and so tranquilizing, in all the agitations of life, except the very horrors of guilty passion, and the remorse by which these are pursued, that he who has one heart to share his affliction, though he may still have feelings to which we must continue to give the name of sorrow, cannot be miserable; while he who has no heart that would care whether he were suffering or enjoying, alive or dead, and who has himself no regard to the suffering or enjoyment, even of a single individual, may be rich, indeed, in the external means of happiness, but he cannot be rich in happiness, which external things may promote, but are as little capable of producing as the incense on the altar of giving out its aromatic odours, where there is no warmth to kindle it into fragrance. The blind possessor of some ample inheritance, who is led through groves and over lawns where he sees no part of that loveliness which every other eye is so quick to perceive, and who, as he walks in darkness amid the brightest colours of nature, has merely the pleasure of thinking that whatever his foot has pressed is his own,—enjoys his splendid domains with a gratification very nearly similar to that of the haughty lord of possessions perhaps still more ample, who, without any mere visual infirmity, is able to walk unled amid his own groves and lawns, which he measures with a cold and selfish eye; but who walks among them unloving and unloved, blind to all that sunshine of the heart which is for ever diffusing, even on earth, a celestial loveliness,—a loveliness to which there are hearts and spirits as insensible as there are eyes that are incapable of distinguishing the common radiance of heaven. “Poor is the friendless master of a world,” it has been truly said; and there is, perhaps, no curse so dreadful as that which would render man wholly insensible of affec-

tion, even though it were to leave him all the cumbrous wealth of a thousand empires:—

Vivat Pacuvius, quæso, vel Nestora totum:
Possideat quantum rapuit Nero: montibus aurum
Exæquet; nec amet quemquam, nec ametur ab ullo.*

It is a bold, but a happy expression of St. Bernard, illustrative of the power of affection, that the soul, or the principle of life within us, may be more truly said to exist when it loves, than when it merely animates. "Anima magis est ubi amat, quam ubi animat." The benevolent affections expand and multiply our being; they make us live with as many souls as there are living objects of our love, and, in this diffusion of more than wishes, confer upon a single individual the happiness of the world. If there be any one, whose high station, and honour, and power, appear to us covetable, ambition will tell us to labour, and to watch, and to think neither of the happiness nor unhappiness of others; or at least to think of them only as instruments of our exaltation, till we arrive at last at equal or superior dignity. This it will tell us loudly; and to some minds it will whisper, that there are means of speedier advancement; that they have only to sacrifice a few virtues, or assume a few vices, to deceive, and defame, and betray; or that, if they cannot rise themselves by these means, they can at least bring down to their own level, or beneath it, the merit that is odious to them. The dignity which we thus covet, and for the attainment of which Ambition would urge us to so many anxieties and struggles, and perhaps too, to so much guilt, nature confers on us by a much simpler process, and a process which, far from leading into vice, is itself the exercise of virtue. She has only to give us a sincere and lively friendship for him who possesses it, and all his enjoyments are ours. Our soul, to use St. Bernard's phrase, exists when it loves; and it exists in all the enjoyments of him whom it loves.

If the benevolent affections be so important, as sources of happiness, the malevolent affections, we found, were not less important parts of our mental constitution, as the defence of happiness against the injustice which otherwise would every moment be invading it; the emotions of the individual injured being to the injurer a certainty that his crime will not be without one interested in avenging it; and the united emotions of mankind, as concurring with this individual interest of retribution, being almost the certainty of vengeance itself. If vice can perform these ravages in the moral world which we see at present, what would have been the desolation, if there had been no motives of terror to restrain the guilty arm; if frauds

and oppressions, which now work in secret, could have come boldly forth into the great community of mankind, secure of approbation in every eye, or at least of no look of abhorrence, or shuddering at their very approach. It is because man is rendered capable of hatred, that crimes, which escape the law and the judge, have their punishment in the terror of the guilty. "Fortune," it has been truly said, "frees many from vengeance, but it cannot free them from fear. It cannot free them from the knowledge of that general disgust and scorn which nature has so deeply fixed in all mankind, for the crimes which they have perpetrated. Amid the security of a thousand concealments, they cannot think themselves sufficiently concealed from that hatred which is ever ready to burst upon them; for conscience is still with them, like a treacherous informer, pointing them out to themselves."—"Multos fortuna poena liberat, metu neminem. Quare? quia infixa nobis ejus rei aversatio est, quam natura damnavit. Ideo nunquam fides latendi fit, etiam latentibus, quia coarguit illos conscientia, et ipsos sibi ostendit."†

The emotions to which I am next to direct your attention, are those by which, instantly, as if by a sort of contagion, we become partakers of the vivid feelings of others, whether pleasing or painful. They are general affections of sympathy; a term which expresses this participation of both species of feelings, though, in common language, it is usually applied more particularly to the interest which we take in sorrow. By some philosophers, indeed, we have been said to be incapable of this participation, except of feelings of that sadder kind; though the denial of this sympathy with happiness,—a denial so unfavourable and so false to the social nature of man,—is surely the result only of narrow views and imperfect analysis. Nor is it difficult to discover the circumstances which may have tended to mislead them. The state of happiness is a state which we are so desirous of feeling, and so readily affect to feel, even when we truly feel it not, that our participation of it becomes less remarkable, being expressed merely in the same way as the common courtesies of society require us to express ourselves, even when we are feeling no peculiar satisfaction. If the face must, at any rate, be dressed in smiles at meeting, and retain a certain number of these smiles, with an occasional smile more or less, according to the turn of the conversation, during the whole of a long interview, the real complacency which is felt in the pleasures of others is not marked, be-

* Juvenal, Sat. xii. v. 128—130.

† Seneca, Epist. 97.

seem the air of complacency had been assumed before. All this is so well understood, in that state of strange simulation and dissimulation which constitutes artificial politeness, that a smile of welcome is as little considered to be a certain evidence of gratification at heart, as the common forms of humility, which close a letter of business, are understood to signify truly, that the writer is the very humble and most obedient servant of him to whom the letter is addressed. Joy, then,—that is to say, the appearance of joy,—may be regarded as the common dress of society, and real complacency is thus as little remarkable as a well-fashioned coat in a drawing-room. Let us conceive a single ragged coat to appear in the brilliant circle, and all eyes will be instantly fixed on it. Even Beauty itself, till the buzz of astonishment is over, will for the moment scarcely attract a single gaze, or Wit a single listener. Such, with respect to the general dress of the social mind, is grief. It is something, for the very appearance of which we are not prepared. A face of smiles is what we meet constantly; a face of sorrow, the fixed and serious look, the low or faltering tone, the very silence, the tear, are foreign, as it were, to the outward scene of things in which we exist. We see evidence, in this case, that something has happened to change the general aspect; while the look, and the voice of gaiety, as they are the look and the voice of every hour, indicate to us only the presence of the individual, and not any peculiar affection of his mind. It is not wonderful, therefore, that the appearance of grief, as the more unusual of the two, should absorb to itself, in common language, a name which may have been originally significant alike of the participation of grief and joy. It must be remembered, too, that joy, though delighting in sympathy, does not stand in need of this sympathy so much as sorrow. In diffusing cheerfulness, we seem rather to give to others than to receive; while, in the sympathy of grief which we excite, we feel every look and tone of kindred sorrow as so much given to us. It is as if we were lightened of a part of our burden; and we cannot feel the relief without feeling gratitude to the compassionate heart that has lessened our affliction, by dividing it with us. It is not merely, therefore, because the appearance of grief is more unusual, that we have affixed to this appearance a peculiar language, or at least apply to it more readily the terms that are significant also of other appearances; but in some degree also because the sympathy of those who sorrow with us, is of far more value than the sympathy of those who merely share our rejoicing, and therefore dwells more readily and lastingly in our remembrance.

It is not more true, however, that we

weep with those who weep, than that we rejoice with those who rejoice. There is a charm in general gladness, that steals upon us without our perceiving it; and if we have no cause of sorrow, it is sufficient for our momentary happiness that we be in the company of the happy. Who is there, of such fixed melancholy, as not to have felt innumerable times this delight, that arises, without any cause but the delight which has preceded it; when we are happy for hours, and, on looking back on these hours of happiness, can discover nothing but our own happiness, and the happiness of others, which have been reflected back, and again, from each to each? So strong is this sympathetic tendency, that we not merely share the gaiety of the gay, but rejoice also with inanimate things, to which we have given a cheerfulness that does not and cannot belong to them. There are, in the changeful aspects of nature, so many analogies to the emotions of living beings, that in animating poetically what exhibits to us these analogies, we scarcely feel, till we reflect, that we are using metaphors; and that the clear and sunny sky, for example, is as little cheerful as that atmosphere of fogs and darkness through which the sun shines only enough to show us how thick the gloom must be which has resisted all the penetrating splendours of his beams. When nature is thus once animated by us, it is no wonder, if we sympathize with the living, that we should, for the moment, sympathize with it too as with some living thing. It is this sympathy, with a cheerfulness which we have ourselves created, that constitutes a great part of that "moral delight and joy," which is so well described, as "able to drive all sadness but despair." In the poem of the Seasons, accordingly, the influence of spring is, with not less truth than poetic beauty, supposed to be felt chiefly by those whose moral sympathies are the most lively.

When Heaven and Earth, as if contending, vie
To raise his being, and serene his soul,
Can *Man* forbear to join the general smile
Of Nature?—Can fierce passions vex his breast,
When every gale is peace, and every grove
Is melody?—Hence from the bounteous walks
Of flowing Spring, ye sordid sons of earth,
Hard, and unfeeling of another's woe,
Or only lavish to yourselves;—away!—
But come, ye generous minds, in whose wide thought,
Of all his works, creative Bounty burns
With warmest beam; and on your open front,
And liberal eye, sits,—from his dark retreat,
Inviting modest Want.—Nor, till invoked,
Can restless Goodness wait: your active search
Leaves no cold wintry corner unexplored;
Like silent-working Heaven, surprising oft
The lonely heart with unexpected good.
For you the roving spirit of the wind
Blows spring abroad; for you the teeming clouds
Descend in glad some plenty o'er the world:—
And the Sun sheds his kindest rays for you,
Ye flower of human race! In these green days,
Reviving sickness lifts her languid head,
Life flows afresh, and young-eyed Health exalts
The whole creation round. Contentment walks
The sunny glade, and feels an inward bliss
Spring o'er his mind, beyond the power of kings

To purchase. Pure serenity apace
Induces thought, and contemplation still.
By swift degrees, the love of Nature works
And warms the bosom; till, at last, sublimed
To rapture, and enthusiastic heat,
We feel the present Deity, and taste
The joy of God, to see a happy world.*

In the very pleasing Ode to May, which forms one of the few relics of the genius of West, there is a thought, in accordance with this general sympathy of nature, which expresses, with great force, that animating influence of which I speak. After invoking the tardy May to resume her reign,

With balmy breath and flowery tread,
Rise from thy soft ambrosial bed,
Where, in Elysian slumber bound,
Embowering myrtles veil thee round,

he describes the impatience of all nature for her accustomed presence, and concludes with an image, which his friend Gray justly termed "bold, but not too bold,"

Come then, with Pleasure at thy side,
Diffuse thy vernal spirit wide;
Create, where'er thou turn'st thine eye,
Peace, plenty, love, and harmony;—
Till every being share its part,
Till heaven and earth be glad at heart.†

In a fine morning of that delightful season, amid sunshine and fragrance, and the thousand voices of joy that make the air one universal song of rapture, who is there that does not feel as if heaven and earth were truly glad at heart, and who does not sympathize with nature, as if with some living being diffusing happiness, and rejoicing in the happiness which it diffuses?

We sympathize, then, even with the imaginary cheerfulness, which ourselves create in things that are as incapable of cheerfulness as of sorrow; and still more do we sympathize with living gladness, when it does not arise from a cause so disproportioned to the violence of the emotion, as to force us to pause and measure the absurdity. I have already said that we seem to sympathize less with the pleasures of others than we truly do; because the real sympathy is lost in that constant air of cheerfulness which it is a part of good manners to assume. If the laws of politeness required of us to assume, in society, an appearance of sadness, as they now require from us an appearance of some slight degree of gaiety, or at least of a disposition to be gay, it is probable that we should then remark any sympathy with gladness, as we now remark particularly any sympathy with sorrow; and we should certainly, then, use the general name, to express the former of these, as the more extraordinary, in the same way as we now use it particularly to express the feelings of commiseration.

Whatever may be the comparative tendencies of our nature, however, to the participation of the gay and sad emotions of those around us, there can be no doubt as to the double tendency. We rejoice with those who rejoice, merely because they are rejoicing; and, without any misfortune of our own, we feel a sadness at the very aspect of affliction in those around us, and shrink and shudder on the application to them of any cause of pain which we know cannot reach ourselves.

Many of the phenomena of sympathy, I have little doubt, are referable to the same laws to which we have traced the common phenomena of suggestion or association. It may be considered as a necessary consequence of these very laws, that the sight of any of the common symbols of internal feeling should recall to us the feeling itself, in the same way as a portrait, or rather as the alphabetic name of our friends recalls to us the conception of our friend himself. Some faint and shadowy sadness we undoubtedly should feel, therefore, when the external signs of sadness were before us, some greater cheerfulness on the appearance of cheerfulness in others, even though we had no peculiar susceptibility of sympathizing emotion, distinct from the mere general tendencies of suggestion. To these general tendencies I am inclined, particularly, to refer the external involuntary signs of our sympathy; the shrinking of our own limbs, for example, when we see the knife in any surgical operation about to be applied to the limb of another; the contortions of body with which the mob regard the feats of a rope-dancer, when they throw themselves into the postures that would be necessary for counteracting their own tendency to fall, if they were in the situation observed by them. Whatever state of mind, in the direction of our muscular movements, may be necessary for producing these instant postures, is associated with the feeling of peril which the mind would have in the situation observed; and this feeling is suggested by the attitude in others, that may be considered as an external sign of the feeling. That the mere conception is sufficient for producing these muscular movements, without the actual presence of any one with whose movements our own may be thought to accord, by some mysterious harmony, is shown by cases, in which ethereal communications, and vibrations, and every foreign cause of sympathy that can be imagined by the most extravagant lover of hypothesis, must be allowed to be absent, because there is no foreign object of sympathy whatever; in which we may be said, almost without absurdity, to sympathize with ourselves; when we shudder, indeed, as if sympathizing, but shudder at a mere thought. Thus, in looking down from a precipice, we shrink back as

* V. 876—903.

† Stanza ii. v. 3—6, and stanza v. preserved in letter v. of sect. iii. of *Memoirs of Gray*.—*Mulhairs' edition*.

we gaze on the dreadful abyss which would receive us if we were to make a single false step, or if the crumbling soil on which we tread were to betray our footing. The notion of our fall is readily suggested by the aspect of the abyss, and of the narrow spot which separates us from it; this notion of our fall, of course, suggests the feelings which would arise at such a dreadful moment; and these again produce, in the same manner, that consecutive state of mind, whatever it may be, on which the bodily movements of shrinking depend. We first have the simple conception of the fall; we then have, in some degree, the feelings that would attend the beginning fall; we then, having this lively image of peril, shrink back to save ourselves from that which seems to us more real, because, in harmony with the whole scene of terror before us, which presents to us the same aspect that would be present to us, if what we merely imagine were actually at that very moment taking place. Such is the series of phenomena that produce one of the most uneasy states in which the mind can exist; a state which I may suppose you all have experienced in some degree, before the frequent repetition of these giddy views, with impunity, has counteracted the giddiness itself, by rendering the feeling of security so habitual, as to rise instantly, and be a constant part of the whole complex state of mind.

But, though I conceive that a great part of what is called sympathy, is truly referable to the common laws of suggestion, that, by producing certain conceptions, produce also, indirectly, the emotions that are consequent on these; and, though it is possible that not the chief part only, but the whole may flow from these simple laws, I am far from asserting that all its phenomena depend on these alone. On the contrary, I am inclined to think that there is a peculiar susceptibility of this reflex emotion in certain minds, by which, even when the laws of suggestion, and the consequent images which rise to the mind, are similar, the sympathy, as a subsequent emotion, is more or less vivid; since there is no particular law of suggestion, unless we form one for this particular case, the force of which, in any greater degree, seems to accompany with equal and corresponding proportion the more lively compassion; but our sympathies are stronger and weaker, with all possible varieties of suggestion, in every other respect. It would be vain, however, if there truly be such a peculiar susceptibility, to attempt any nicer inquiry, in the hope of discovering original elements, which are obviously beyond the power of our analysis, or of fixing the precise point at which the influence of ordinary suggestion ceases, and the influence of what is peculiar in the tendency to sympathy, if there be any peculiar influence, begins.

One most important distinction, however, it is necessary to make, to save you from an error into which the use of a single term for two successive feelings, and, I may add, the general imperfect analysis of philosophers might otherwise lead you.

What is commonly termed pity, or compassion, or sympathy, even when the circumstances which merely lead to the sympathy are deducted from the emotion itself, is not one simple state, but two successive states of the mind; the feeling of the sorrow of others, and the desire of relieving it. The former of these is that which leads me to rank pity as an immediate emotion; the latter, which is a separate affection of the mind, subsequent to the other, and easily distinguished from it, we should rank, if it were to be considered alone, with our other desires, which, in like manner, arise from some view of good to be attained, or of evil to be removed.

After this analysis of the emotion of pity into its constituent elements, a lively feeling participant of the sorrow of others, and the desire of relief to that sorrow, a desire which, in the same circumstances, may be greater or less, as the mind is more benevolent, it can scarcely fail to occur to you, that the first of these elements is, as mere grief, an emotion of the same species with the primary grief with which we are said to sympathize, or with any other grief which we are capable of feeling,—a form, in short, of that general sadness which has been already considered by us. And, as a mere state or affection of the mind, considered without regard to the circumstances which produce it, or the circumstances which follow it, I confess that there does not seem to me any thing peculiar in the grief itself of pity, when separated, by such an analysis, from all thought of the primary sufferer, whose sorrow we feel to have been reflected on us, and from the consequent desire of affording him aid. But, though the elementary feeling itself may be similar, the circumstances in which it arises, and the circumstances which accompany it, when, without any direct cause of pain, we yet catch pain, as it were, by a sort of contagious sensibility, from the mere violence of another's anguish, are of so very peculiar a kind, that I have not hesitated to give to this susceptibility of sympathetic feeling a distinct place in our arrangement; for the same reason, as in our systems of physics, we refer to different physical powers; and, therefore, to different parts of our system, the same apparent motions of bodies, when these motions, though in themselves apparently the same which might be produced by other causes, are the results of causes that are in their own nature strikingly different. Pity, however complex the state of mind may be

which it expresses, is one of the most interesting of all the states in which the mind can exist, and affords itself an example of the advantage of treating our emotions as complex rather than elementary,—an advantage which led me to form that particular arrangement of our emotions, in the order of which they have been submitted to your consideration; when, if the mere elements had been all that were submitted to you, you would perhaps have been little able to distinguish in them the familiar complex states of mind, which alone you have been accustomed to distinguish as emotions.

Even that primary feeling of sympathy, which is a mere participation of the sufferings of another, it may perhaps be thought, is only a form of the affection of love before considered by us, since there can be no love without a participation of the sorrows and joys of the object beloved. But these sympathies are emotions arising from love, not the mere regard itself. We must not forget that the word love is often employed very vaguely to signify, not the mere affections of mind which constitute the vivid feelings of regard, but every affection of mind that has any reference to the object of this regard. We give the name of love, in this way, to the whole successive states of mind of the lover, as if love were something diffused in them all; but this, though a convenient expression, is still a very vague one; and the emotions are not the less different in themselves, for being comprehended in a single word. The emotion of sympathy is still different from the simple feeling of affection, even when the object of our sympathy is truly the object of our love. It may have arisen from it, indeed, but it is not the same as that feeling of warm regard from which, in such a case, it arose.

So different is the mere sympathy from simple love, that it takes place when there is no actual love whatever, but, on the contrary, positive dislike or abhorrence. Let us imagine, not one atrocious crime only, but many crimes the most atrocious, to have been committed by any individual; and let us then suppose him stretched upon the rack, every limb torn, and every fibre quivering. Let us imagine, that we hear the heavy fall of that instrument, by which bone after bone is slowly broken, dividing, with dreadful intervals, the groans of the victim, that cease at the moment at which the new stroke is expected, and afterwards rise again instantly in more dreadful anguish, to cease only when another more agonizing stroke is again on the point of falling, or when the milder agony of death overwhelms at once the suffering and the sufferer. Does our hatred of the criminal save us even from the slightest uneasiness at what we see and hear? Do we feel no cold shuddering at the sound of the worse

than deadly blow? no terror, increasing into agony at the moment when it pauses, as we expected it to fall again? It is enough for us that there is agony before our eyes. Without loving the sufferer,—for though the feelings that oppress us may not allow us to think of his atrocities at the moment, they certainly do not invest him with any amiable qualities, except that of being miserable,—we feel for him what it is impossible for us not to feel for any living thing that is in equal anguish. We should feel this,—if the anguish be of a kind that forces itself upon our senses in all its dreadful reality,—though his crimes were whispered to us every moment; and, when he lies mangled and groaning before us, if we were forced to inflict another stroke with our own hands, that was to break the last unbroken limb, or to receive the blow ourselves, it is not easy to say from which alternative we should shrink with a more frightful and sickly loathing.

In all this, Nature has consulted well. If our sympathy had been made to depend on our moral approbation, it would rise in many cases too late to be of profit. We are men; and nothing which man can feel is foreign to us. The friend of the Self-tormenter in Terence's comedy, when he uttered these memorable words which have been so often quoted, "*Homo sum; humani nihil a me alienum puto*,"* expressed only what the Author of our being has fixed, in some degree, in every heart, and which is as much a part of the mental constitution of the virtuous, as their powers of memory and reason.

If compassion were to arise only after we had ascertained the moral character of the sufferer, and weighed all the consequences of good and evil which might result to society from the relief which it is in our power to offer, who would rush to the preservation of the drowning mariner, to the succour of the wounded, to the aid of him who calls for help against the ruffians who are assailing him? Our powers of giving assistance have been better accommodated to the necessities which may be relieved by them. By the principle of compassion within us, we are benefactors almost without willing it; we have already done the deed, when, if deliberation had been necessary as a previous step, we should not have proceeded far in the calculation which was to determine by a due equipoise of opposite circumstances, the propriety of the relief.

Even in the case of our happier feelings, it is not a slight advantage, that nature has made the sight of joy productive of joy to him who merely beholds it. Men are to mingle in society; and they bring into socie-

* *Actus i. Scena 1, v. 25.*

ty affections of mind that are almost infinitely various,—hopes and fears, joy and sadness, projects and passions, far more contrasted than their mere external varieties of form and colour. If these internal diversities of feeling were to continue as they are, what delight could society afford? The opposition would render the company of each a burthen to the other. The gay would fly from the sullen gloom of the melancholy; the melancholy would shrink from the mirth which they could not partake, and which would throw them back upon their own sorrows with a deeper intensity of grief. Such is the confusion which society of itself would present. But the same Power which formed this beautiful system of the universe out of chaos, reduces to equal regularity and beauty this and every other confusion of the moral world. By the mere principle of sympathy, all the discord in the social feelings becomes accordant. The sad unconsciously become gay; the gay are softened into a joy, that has less perhaps of mirth, but not less of delight; and though there is still a diversity of cheerfulness, all is cheerfulness; as in a concert of many instruments, in which, though we are still able to distinguish each instrument from the others, and though the simple tones of each may be various, there is still one universal harmony that seems to animate the whole, like the presence, and the voice or inspiration of the celestial power of Music herself.

But if the bounty of our Creator be shown, in the provision which he has made for diffusing to many the joy which is felt by one, how much more admirable is the providence of his bounty, in that instant diffusion to others of the grief which is felt only by one, that makes the relief of this suffering not a duty merely, which we coldly perform, but a want, which is almost like the necessity of some moral appetite! Every individual has thus the aid of all the powers of every other individual. When some wretch is found lying bleeding on the common street, all who see him run to his assistance, as if their own immediate ease depended on their speed. The aged, the infirm, mix in the mob, with an interest as eager as if they were able to join in the common aid; the very child stops as he passes, and cannot resume his sport, till he has followed with the crowd the half-insensible object of so many cares to a place where surer relief may be procured. When, in a storm, some human being is seen, in the distant surf, clinging to a plank, that is sometimes driven nearer the shore, and sometimes carried further off, sometimes buried in the surge, and then rising again, as if itself struggling, like the half-hopeless wretch whom it supports, that looks sadly to the shore as he rises from every wave,—has nature abandoned the sufferer without aid? Is he to

find no one who will make at least one effort to save a human being that is on the point of perishing? He is not so abandoned. Nature has provided a deliverance for him in the bosom of every spectator. There are courageous hearts and strong hands, that, in the very peril of an equal fate, will rush to his succour, and that, in laying him in safety on that soil which he despaired of treading again, will feel only the joy of having delivered a human being, whose name and whose very existence were unknown to them before.

LECTURE LXII.

I. IMMEDIATE EMOTIONS, NECESSARILY INVOLVING SOME MORAL FEELING.—3. SYMPATHY CONCLUDED.—4. PRIDE AND HUMILITY.

GENTLEMEN, my last Lecture was employed in considering that principle of our nature,—whether original, or the result of other principles,—by which without any accession of advantage to ourselves, or any misfortune that can affect our own immediate interest, we enter into the happiness or the sorrows of others as if they were our own.

The reality of this species of ever-changing transmigration, by which, not after death merely, but during every successive hour of our waking existence, we pass, as it were, from one form of being to another, as the joys or sorrows of different individuals present themselves to our view, I traced and illustrated with various examples.

Of the gladdening influence of sympathy, we found sufficient proof in the cheerfulness which the society of the cheerful naturally diffuses on all who come within the circle of their gaiety; an enchantment as powerful as that by which the magician was supposed to change, at his will, the passions of all those who entered within the circle to which his influence extended. Even the melancholy, who began at first by striving, perhaps painfully, to assume an appearance, not of the mirth, indeed, which was before them, but at least of a serenity which might not be absolutely discordant with it, at last yield unconsciously to the fascination; and, when a sigh sometimes comes upon them, and forces them to pause, are astonished to look back, and to find that they have been happy.

Of the saddening influence of sympathy, the whole phenomena of pity furnish abundant evidence,—when the mere sight of grief, far from leading us to fly from a disagreeable object, leads us to form with it for the time the closest union. Our sympathy

identifies us with the sufferer with an influence so irresistible, that it would be impossible for us to feel even rapture itself, if, amid all possible objects of delight, there were only a single being in agony, that turned his eye on ours, even though it were without a groan, as he sank beneath the lash, or writhed upon the wheel.

The advantages that arise from this constitution of our nature, we found to be not unimportant in the diffusion and participation even of our gayer feelings; since those who mingle in society are thus brought nearer to one general temper, and enjoy, consequently, an intercourse, which could afford little delight if each retained his own particular emotions, that might be in absolute opposition to the emotions of those around. But it was chiefly in the other class of feelings that we found its inestimable benefits, in that instant participation of grief, and consequent eagerness to relieve it, which procures for the sufferer assistance in situations in which he is incapable even of imploring aid; which makes friendlessness itself a claim to more general friendship; and which, in any accident that befalls the obscure individual, interests in his fate whole multitudes, to whom, before the accident, he was unknown, or an object of indifference. If, at midnight, in a crowded city, a house were observed to be in flames, and at some high window, beyond the reach of any succour which could be given, were seen, by glimpses, through the darkness and the gloomy light that flashed across it, some unfortunate being, irresolute whether to leap down the dreadful height,—seeming at one moment on the point of making the attempt, and then, after repeated trials, shrinking back at last into the flames that burst over him; with what lively emotions of interest would he be viewed by the whole crowd, in which there would not be an eye that would not be fixed upon him! What agitation of hopes and fears, and what shrieks of many voices at the last dreadful moment! It would truly seem, in such a case, as if, in the peril of a single human being, the whole multitude that gazed on him were threatened with destruction, from which his escape, if escape were possible, was to be the pledge, and the only pledge of safety to all.

The emotions next to be considered by us, are those of pride and humility—the vivid feelings of joy or sadness, which attend the contemplation of ourselves, when we regard our superiority or inferiority, in any qualities of mind or body, or in the external circumstances in which we may be placed.

Pride and humility, therefore, always imply some comparison. We can as little be proud, without the consideration of an inferior, as we can be taller in stature, without

some one who is shorter; unless when by a sort of indirect comparison, we measure ourselves with ourselves, in the present and the past, and feel a delightful emotion, as we look back on the progress which we have made.

When I define pride to be that emotion which attends the contemplation of our excellence, I must be understood, as limiting the phrase to the single emotion that immediately follows the contemplation. The feeling of our excellence may give rise directly or indirectly to various other affections of the mind. It may lead us to impress others as much as possible with our superiority, which we may do in two ways, by presenting to them, at every moment, some proofs of our advantages, mental, bodily, or in the gifts of fortune; or by bringing to their mind directly, their inferiority, by the scorn with which we treat them. The former of these modes of conduct, in which we studiously bring forward any real or supposed advantages which we possess, is what is commonly termed vanity; the latter, in which we wish to make more directly felt, the real or supposed comparative meanness of others, is what is commonly termed haughtiness; but both, though they may arise from our mere comparison of ourselves and others, and our consequent feeling of superiority, are the results of pride, not the pride itself. We may have the internal emotion, which is all that is truly pride, together with too much sense to seek the gratification of our vanity, by any childish display of excellencies, substantial or frivolous; since, however desirous we may be, that these advantages should be known, we may have the certainty that they could not be made known by ourselves, without the risk of our appearing ridiculous. In like manner, we may be internally very full of our own importance, and yet too desirous of the good opinion, even of our inferiors, to treat them with the scorn which we feel, or, to make a more pleasing supposition, too humanely considerate of their uneasiness, to shock them, by forcing on them the painful feeling of their inferiority, however gratifying our felt superiority may be to ourselves. Vanity, then, and haughtiness, are not to be confounded with the simple pride, which leads to them, in some minds, but which may exist, and exists as readily without them as with them.

The mere pleasure of excellence attained, thus separated from the vanity or haughtiness that would lead to any ridiculous or cruel display of it, involves nothing which is actually worthy of censure, if the superiority be not in circumstances that are frivolous, still less in circumstances that, although sanctioned by the fashion of the times, imply demerit rather than merit. In the circumstances in which it is truly praiseworthy to

desire to excel, it must be truly noble to have excelled. It is impossible to be desirous of excelling, without a pleasure in having excelled; and where it would be culpable to feel pleasure in the attainments that have made us nobler than we were before, it must, of course, have been culpable to desire such excellence.

It is not in pride, therefore, or the pleasure of excellence, as a mere direct emotion, that moral error consists, but in those ill-ordered affections which may have led us to the pursuit of excellence that is unworthy of our desire, and that cannot, therefore, shed any glory on our attainment of it. If our desires are fixed only on excellence in what is good, it is impossible for us to feel too lively a pleasure in the gratification of these desires. We may, indeed, become ridiculous by our vanity in displaying our attainments; and, which is far worse, we may exercise a sort of cruelty in reminding others by our scorn, how inferior we consider them to ourselves; but what is morally improper, in these cases, is in the vanity and the haughtiness, not in the vivid delight which we feel in the acquisition of excellence, the attainment of which is the great end, and the glorious labour of virtue,—an excellence that renders us more useful to mankind, and a nobler image of the Power which created us.

What renders the feeling of delight in excellence attained, not excusable merely, but praise-worthy, is then a right estimate of those objects in which we are desirous of excelling. I need not say, that to be proud of being preeminent in vice, implies the deepest degradation of our moral and even of our intellectual nature,—a degradation far more complete and hopeless than the commission of the same guilt, with the consciousness of imperfection. But on this species of pride I surely need not dwell. To be proud, however, of eminence in what is frivolous only, not absolutely profligate, itself implies no slight degree of moral degradation; because it implies a blindness to those better qualities that confer the only distinctions which virtue can covet and God approve.

These distinctions are the distinctions of the understanding and of the heart; of the heart, in the noble desires of which it may be conscious; of the understanding, in that knowledge, by the acquisition of which we are able to open a wider field to our generous desires, and to promote more effectually their honourable purposes. In this preparatory scene we are placed to enjoy as much happiness as is consistent with the preparation for a nobler world, to diffuse to others all the happiness which it is in our power to communicate to them, and to offer to him who made us that best adoration, which consists in love of his goodness, and

an unremitting zeal to execute the honourable charge which he has consigned to us, of furthering those great views of good, which men, indeed, may thus instrumentally promote, but which only the divine mind could have originally conceived. In this glorious delegation, all earthly, and, I may say, all eternal excellence consists. With whatever illusion human pride may delight to flatter itself, he is truly the noblest in the sight of wisdom and of Heaven, however small his share may be of that adventitious grandeur, which, in those who are morally great, is nothing, and less than nothing, in those who are morally vile; he is the noblest who applies his faculties most sedulously to the most generous purposes, with the warmest impression of that divine goodness which has formed the heart to be susceptible of wishes so divine. If we be proud of any thing which does not confer dignity on the intellectual, or moral or religious nature of man, we may be certain that we are proud of that, which if considered without relation to objects that may be indirectly promoted by it, is in itself more worthy of contempt than of our pride. The peace and good order, and consequently the happiness of society, require, indeed, that forms of respect should be paid to mere station, and to the accidental possession of wealth and hereditary honours; but they do not require that the possessor of these should conceive himself truly raised above others, in that only real dignity, which is more than a trapping or form of courteous salutation, in the gaudy pageantries of the day. "If the great," says Massillon, "have no other glory than that of their ancestors; if their titles are their only virtues; if we must recall past ages to find in them something that is worthy of our homage, their birth dishonours them even in the estimation of the world. Their name is opposed by us to their person; we read the histories that record the great deeds of their ancestors, and we demand of their unworthy successors the virtues which formerly conferred so much glory on their country. The weight of honour which they inherit is to them but a burthen that sinks them still lower to the ground. Yet how visible on every brow is the pride of their origin. They count the degrees of their grandeur by ages which are no more; by dignities which they no longer possess; by actions which they have not performed; by ancestors of whom a little indistinguishable dust is all that remains; by monuments which the passing injuries of season after season have effaced; and they think themselves superior to the rest of mankind, because they have more domestic ruins to mark the desolation of time, and can thus produce more proofs than other men of the vanity of all earthly things." High birth, it will be readily allowed, is an illustrious pre-

rogative, to which the consent of nations, in every period of the world, has attached peculiar distinctions of honour. Yet it is a title only, not a virtue; an engagement to glory, and a domestic lesson of the means by which it may be obtained; not that which either constitutes glory or confers it. The succession of honour which it seems to convey to us perishes, and becomes extinct in us, if we inherit only the name, without inheriting also the virtues that rendered it illustrious. We sink then into the general mass of mankind, and begin, as it were, a new race. Our nobility belongs to our name only, and our person, in every thing which is truly our own, has as little ancestry as the meanest of the crowd.

*Tota licet veteres exornent undique cere
Atria, nobilitas sola est, æque unica, Virtus.
Paulus, vel Cossus, vel Drusus, moribus esto:
Hos ante effigies majorum pone tuorum:
Præcedant ipsæ illi, te consule, virgæ.
Prima mihi debes animi bona: sanctus haberi,
Justitiæque tenax, factis dictisque mereris?
Agnoceo procerem.**

These remarks, in application to the pride of rank, are equally applicable to every species of pride that is not founded on intrinsic excellence of the mental character. If it be absurd for man to feel as if he truly shared the glory of actions which were not his own,—of actions with which his own conduct, perhaps, in almost every instance, might be contrasted with far more complete opposition, than the conduct of his illustrious ancestors themselves might have been contrasted with that of the mean and ignoble of their own time, when this mere contrast with vices like those of their offspring was that which conferred on themselves distinction,—

*Si eorum Lepidis male vivitur, effigies quo
Tot bellatorum? si luditur alea pernox
Ante Numantinos? si dormire incipis ortu
Luciferi, quo signa duces et castra movebant?†*

if even this self-illusion which usurps or claims the praise of virtue in the midst of vice, be, as it most truly is, an illusion, it must at the same time be remembered, that it is one with which the general sentiment more readily accords than with any other illusion of which the mind of man is susceptible; that though, in many unfortunate cases, it may be as degrading to the individual who proudly receives the homage, as to the individuals who servilely offer it, in other cases its influence, even on the individual himself, is animating and truly ennobling by the domestic lessons and incitements which it presents; and that even in its political influence, the veneration thus attached to hereditary distinctions has, upon the whole, by the social tranquillity which it has produced, and

the counteracting powers which it has opposed to the aggressions of individual despotism, been productive of more advantage to society than many of the sublimest abstractions of political wisdom,—advantages of which those who gave, and those who received the homage, were indeed alike unconscious, and would probably have been regardless even if they had known them, but which did not the less enter into the contemplation of him who formed mankind, to feel this almost universal sentiment, for nobler purposes than the mere gratification of the arrogance of a few, and the meanness of the many. If, then, a pride which has still at least some relation to virtue, or to what was counted virtue, however distant, involve absurdity, what are we to think of those species of pride which have no relation to virtue of any kind, which are founded on every frivolity, or perhaps on every vice, as if it were the highest title to the applause of mankind to be of the least possible service to their interests? What shall we think of the mind of that man, who, endowed with a capacity of serving God by benefiting the world, in which he is placed to represent him, can derive dignity from the thought of having placed a button where a button never had been placed before, whose face glows with a noble pride as he walks the streets with this new dignity, and who derives from the consciousness of this button, I will not say as much happiness, for I will not prostitute the noble word, but at least as much self-complacency as is felt in the hour of his glorious mortality, by the expiring combatant for freedom, or the martyr?

So pleased are we with distinction, that there is nothing, however contemptible, from which it is not in our power to derive some additional vanity, when we consider it as our own; a book, a withered flower, a dead insect, a bit of hard earth, confer on us a distinction which we think that every one must envy. If the book be the only known copy of the most worthless edition, the flower, the insect, the stone, the only specimens of their kind in the country which has the honour of possessing them, we are of as rare merit in our own eyes as the worthless things themselves. Man occupies, indeed, but little room in nature, but he has the secret of spreading himself out over every thing belonging to him; our house, our gardens, our horses, our dogs, are parts of our own being. To praise them is to praise us; and, if we be very modest, and the praise very profuse, we almost blush at the panegyric, of which we are afraid of appearing vain.

*The squire is proud to see his courser strain,
And well-breath'd beagles sweep along the plain.
Say, dear Hippolytus, (whose drink is ale,
Whose erudition is a Christmas tale,
Whose mistress is saluted with a smack,
And friend received with thumps upon the back,)*

* *Juvenal*, Sat. viii. v. 19—26.

† *Juvenal*, Sat. viii. v. 9—12.

When thy sleek gelding nimbly leaps the mound,
And Ringwood opens on the tainted ground,
Is that thy praise? Let Ringwood's praise* alone;
Just Ringwood leaves each animal his own,
Nor envies when a gipsy you commit,
And shake the clumsy bench with country wit,—
When you the dullest of dull things have said,
And then ask pardon for the jest you made.†

In all these cases, it is easy to see by how ready an identification of ourselves with every thing that belongs to us, we assume a praise that belongs as little to us as to any other human being. We are, with respect to our possessions, like that soul of the world, of which ancient poets and ancient philosophers speak, that was supposed to be diffused in it everywhere, and to animate the whole. We exist, in like manner, in every thing which is ours, with a sort of omnipresent vanity; and by the transfer to others of the mere trappings of our external state, we should not merely sink in general estimation, but we should truly feel ourselves in our mortified pride, as if we had lost half or more than half of our little virtues and perfections.

To common minds, that are unsusceptible of higher pleasure, this pride of external things is at least a source of consolation; and restores in some measure that equilibrium which might seem too violently broken by the existing differences of intellectual capacity. Those who are absolutely incapable of feeling the beauties of a work of genius, are perfectly capable of deriving all the pleasure that can be derived from the possession of a volume printed by an illustrious printer, and bound by the first binder of the age. Those who cannot feel the beauty of the universe, as the manifestation of that transcendent excellence which created it, may be capable of feeling all the excellence of a tulip or carnation, that differs from other tulips or carnations by some slight stain which attracts no eye but that of a florist, but which instantly attracts a florist's eye, and fills him with rapture, if he be the fortunate possessor, and with envy and despair, if it be the property of another, of a rival perhaps, whom he had before the glory of vanquishing in a contest of hyacinths, but who is now to enjoy the revenge of a triumph so much more glorious.

To ordinary minds, these little rivalries and victories, and all the pride which is elevated by them, or depressed, may be considered as forming only a sort of feeble compensation for those greater objects of excellence which their microscopic eyes, that see the little as if it were great, but which cannot see the great itself, are incapable of appreciating, because, in truth, they are incapable of perceiving them. How much more do they strike us, however, when they exist

in minds that are unquestionably capable of higher attainments, and that, after enlightening the world, or regulating its political destinies, can stoop to be the friend of a boxer, or the rival, and, perhaps, in this rivalry, the inferior of their own coachman or groom.

Who would not praise *Patricio's* high desert,
His hand unstained, his uncorrupted heart,
His comprehensive head, all interests weigh'd,
All Europe saved, yet Britain not betrayed?
He thanks you not, his pride is in pique, in
Newmarket fame, and judgment in a bet.‡

That such misplaced pride, in which the merit of real excellence is scarcely felt, in the vanity of some trifling accomplishment, or of feats which scarcely deserve the name even of accomplishments, however trifling, exists, not in the satirical pictures of poetry only, but in real life, you must know too well from the biography of many distinguished characters, to require any proofs or exemplifications of it; and though at first, perhaps, the pride may seem a very singular anomaly, in minds in which the general power of discrimination is manifestly of a high order, it is not very difficult, I think, to detect at least the chief circumstance which tends to produce and favour it.

The pleasure of success, in any case, you must be aware, is not to be estimated only by the real value of that which is attained, but by this value combined with the doubtfulness of the attainment, when it was regarded by us merely as an object of our desire. To gain what we considered ourselves sure of gaining, is scarcely a source of any very high satisfaction; to gain what we wished to gain, but what we had little thought of gaining, is a source of lively delight. He who has long led a cabinet of statesmen, by his transcendent political wisdom, and who is sure of leading them, so as to obtain a ready sanction of every measure that may be proposed by him for the government of a nation, and thus, indirectly perhaps, for the regulation of the fortune of the world, is not, on account of his mere political wisdom, to be held as a better jockey, or speedier calculator of odds at a gaming table. With his profound knowledge of the sources of finance, and of the relations of kingdoms, he is not as sure, therefore, of Newmarket fame and judgment in a bet, as he is of saving Europe without betraying the interest of his own land; and though he may be far more skilful in making armies march and navies appear where navies most are wanted, he may not be able to bring down more birds of a convey, or have a much greater chance of being in at the death of a fox, than the stupidest of those human animals who spend their days in galloping after one. There is a more

* Fame in the original.

† Young's *Love of Fame*, Sat. i.

‡ Pope's *Moral Essays*, Ep. i. v. 81—86.

anxious suspense, therefore, in these insignificant, or worse than insignificant attempts, than in the important councils which his judgment and eloquence have been accustomed to sway ; and consequently a livelier pleasure when the suspense has terminated favourably. The superiority which he was to show in greater matters excited no astonishment, because it was anticipated by all ; but to be first when he was not expected to be first, is a delightful victory over opinion ; and it is not very wonderful, therefore, that he should be induced to repeat what is peculiarly delightful, and to be flattered by each renewal of success. It is only the contrast of his high powers of mind, which renders his exultation, in the petty triumph, so astonishing to us ; and yet it is perhaps only because his judgment and eloquence are so transcendent, as to leave no suspense whatever with respect to that political dominion which he is sure to exercise, that he is thus gratified, in so high a degree, by the petty triumphs, which are less certain, and therefore leave him the excitement of anxiety, and the pleasure of success. Had his intellectual powers been of a less high order, and less sure of their great objects, he would probably have been regardless of the little objects, which are relatively great to him, only because, from their absolute littleness, they admit of wider competition.

In defining pride, as a mere emotion, to be that feeling of vivid pleasure which attends the consciousness of our excellence, I have already remarked that the emotion, far from being blamable, where the excellence is in things that are noble, is a proof only of that desire of excelling in noble things, which is a great part of virtue ; and without which it is scarcely possible to conceive even the existence of virtue, since he surely cannot be virtuous who would willingly leave unattempted the attainment of a single possible moral excellence, in addition to those already attained ; or who would not feel mortified if he had suffered an opportunity of generous exertion to pass away in idleness. The habit of virtue is indeed nothing more than the regular conformity of our actions to this desire of generous excellence ; and to desire the excellence, without feeling delight in each step of the glorious progress to the attainment of it, is as little possible, as to feel the craving of hunger, and yet to feel no gratification in the relief of the appetite. It is only when the objects in which we have wished to excel have been unworthy of the desire of beings formed for those great hopes which ultimately await us, that the pleasure of the excellence, as we have seen in the species of ridiculous pride, to which I have alluded in the different illustrations offered to you, is itself unworthy of us.

When I say, however, that in pride, as an emotion attending the consciousness of excellence in noble pursuits, there is no moral impropriety, since it is only the name for that pleasure which the virtuous must feel, or cease to be virtuous, it may be necessary to caution you against a misconception into which you might very readily fall. The pride of which I speak is a name for the emotion itself, and is limited to the particular emotion that rises at any moment on the contemplation of some virtuous excellence attained ; with which limitation it is as praiseworthy as the humility which is only the feeling arising from a sense of inferiority or failure in the same great pursuit. But it is only as limited to the particular emotion, that the praise which I allow to pride is justly referable to it. In the common vague use of the term, in which it is applied with a comprehensive variety of meaning, not so much to the particular emotion as to a prevalent disposition of the mind to discover superiority in itself where it truly does not exist, and to dwell on the contemplation of the superiority where it does exist, with an insulting disdain, perhaps, of those who are inferior ;—pride is unquestionably a vice as degrading to the mind of the individual as it is offensive to that great being who has formed the superior and the inferior, for mutual offices of benevolence, and who often compensates, by excellencies that are unknown to the world, the more glaring disparity in qualities which the world is quicker in discerning.

The pride, then, or temporary feeling of pleasure, when we are conscious, at any moment, that we have acted as became us, is to be distinguished from pride, as significant of general character, of a character which is truly as unamiable, as the pleasure which is felt even by the most humble in some act of virtuous excellence, and which is felt, perhaps, by them still more delightfully than by others, is deserving of our approbation and our love. Strange and paradoxical, indeed, as it may seem, there can be little doubt, when we consider it, that pride, in this general sense, implies all that might be regarded as degrading in humility ; and that humility of character, on the contrary, implies what is most ennobling, or rather, what is usually considered as most ennobling in the opposite character.

Pride and humility, as I have already remarked, are always relative terms ; they imply a comparison of some sort, with an object higher or lower ; and the same mind, with actual excellence exactly the same, and with the same comparative attainments in every one around, may thus be either proud or humble, as it looks above or looks beneath. In the great scale of society, there is a continued rise from one excellence to another

excellence; internal or external, intellectual or moral. Wherever we may fix, there is still some one whom we may find superior or inferior, and these relations are mutually convertible as we ascend or descend. The shrub is taller than the flower which grows in its shade; the tree than the shrub; the rock than the tree; the mountain than the single rock; and above all are the sun and the heavens. It is the same in the world of life. From that almighty being who is the source of all life, to the lowest of his creatures, what innumerable gradations may be traced, even in the ranks of excellence on our own earth; each being higher than that beneath, and lower than that above; and thus, all to all, objects at once of pride or humility, according as the comparison may be made with the greater or with the less.

Of two minds, then, possessing equal excellence, which is the more noble? that which however high the excellence attained by it, has still some nobler excellence in view, to which it feels its own inferiority,—or that which, having risen a few steps in the ascent of intellectual and moral glory thinks only of those beneath, and rejoices in an excellence which would appear to it of little value, if only it lifted a single glance to the perfection above? Yet this habitual tendency to look beneath, rather than above, is the character of mind which is denominated pride; while the tendency to look above, rather than below, and to feel an inferiority, therefore, which others perhaps do not perceive, is the character which is denominated humility. Is it false, then, or even extravagant, to say, that humility is truly the nobler; and that pride, which delights in the contemplation of abject objects beneath, is truly in itself more abject than that meekness of heart which is humble because it has greater objects, and which looks with reverence to the excellence that is above it, because it is formed with a capacity of feeling all the worth of that excellence which it reveres?

It has, accordingly, been the universal remark of all who make any remarks whatever, that it is not in great and permanent excellence that we expect to find the arrogant airs of superiority, but in the more petty or sudden distinctions of the little great. It is not the man of science who is proud, but he who knows inaccurately a few unconnected facts, which he dignifies with the name of science, and of which he forms, perhaps, what he is pleased to dignify, by a similar misnomer, with the name of a theory, to the astonishment and admiration of others, a very little more ignorant than himself. She whose personal charms are acknowledged by a whole metropolis, and the wit who delights the wise and the learned, may have no slight pride, indeed, but they are very likely to be surpassed in pride by the wit and beauty of

a country town, as much as they truly surpass them in all the attractions on which the pride is founded.

"I have read," says Montesquieu, "in the relation of the voyage of one of our vessels of discovery, that some of the crew having landed on the coast of Guinea to purchase some sheep, were led to the presence of the sovereign, who was administering justice to his people under a tree. He was on his throne, that is to say, on a block of wood, on which he sat with all the dignity of the Mogul. He had three or four guards with wooden pikes, and a large umbrella served him for a canopy. His whole royal ornaments, and those of her majesty the queen, consisted in their black skin and a few rings. This prince, still more vain than miserable, asked the strangers if they spoke much about him in France. He thought that his name could not fail to be carried from one pole to the other; and unlike that conqueror of whom it was said, that he put all the earth to silence, he believed, for his part, that he set all the universe a talking.

"When the Khan of Tartary has dined, a herald cries out, that now all the sovereigns of the earth may go to dinner as soon as they please; and this barbarian, whose banquet is only a little milk, who has no house, and who exists but by plunder, looks upon all the kings of the world as his slaves, and insults them regularly twice a-day."

Such is the ignorance from which pride usually flows. The child, the savage, the illiterate, who in every stage of society are intellectually savages, have feelings of self-complacent exultation, which, ludicrous as they may seem to those who consider from a more elevated height the little attainments that may have given birth to those proud emotions, are the natural result of the very ignorance to which such proud emotions seem so very little suited. To him who has just quitted a goal, every step is an advance that is easily measured; but the more advanced the progress, the less relatively does every step appear. The child, at almost every new lesson which he receives, may be considered as nearly doubling his little stock of knowledge; and he is not the last himself to feel, that his knowledge is thus doubled, or, at least, that those who are but a little behind him have scarcely half as much wondrous wisdom as is heaped in his own little brain. What is true of the child in years is true of the child in science, whatever his years may be; and to increase knowledge, far from increasing the general pride of the individual, is often the surest mode of diminishing it. It is the same with all the arts and sciences, considered as one great stock of excellence. He whose whole attention has been devoted to any one of these will

run some risk of a haughty exultation, which is not felt by those, who with equal, or perhaps greater excellence in that one, are acquainted also with what is excellent in other sciences or other arts. The accomplished philosopher and man of letters, to whom the great names of all who have been eminent in ancient and modern times, in all the nations in which the race of man has risen to glory, are familiar, almost like the names of those with whom he is living in society,—who has thus constantly before his mind images of excellence of the highest order, and who, even in the hopes which he dares to form, feels how small a contribution it will be in his power to add to the great imperishable stock of human wisdom, may be proud indeed; but his pride will be of a sort that is tempered with humility, and will be humility itself, if compared with the pride of a pedant or sciolist, who thinks that in adding the result of some little discovery which he may have fortunately made, he is almost doubling that mass of knowledge, in which it is scarcely perceived as an element.

Pride, then, as a character of self-complacent exultation, is not the prevailing cast of mind of those who are formed for genuine excellence. He who is formed for genuine excellence, has before him an ideal perfection,—that *semper melius aliquid*,—which makes excellence itself, however admirable to those who measure it only with their weaker powers, seem to his own mind, as compared with what he has ever in his own mental vision, a sort of failure. He thinks less of what he has done than of what it seems possible to do; and he is not so much proud of merit attained, as desirous of a merit that has not yet been attained by him.

It is in this way, that the very religion which ennobles man, leads him not to pride, but to humility. It elevates him from the smoke and dust of earth; but it elevates him above the darkness, that he may see better the great heights that are above him. It shows him not the mere excellence of a few frail creatures, as fallible as himself, but excellence, the very conception of which is the highest effort that can be made by man; exhibiting thus constantly, what it will be the only honour worthy of his nature to imitate, however faintly, and checking his momentary pride, at every step of his glorious progress, by the brightness and the vastness of what is still before him.

May I not add to these remarks, that it is in this way we are to account for that humility which is so peculiarly a part of the Christian character, as contrasted with the general pride which other systems either recommend or allow? The Christian religion is, indeed, as has been often sarcastically said

by those who revile it, the religion of the humble in heart; but it is the religion of the humble, only because it presents to our contemplation a higher excellence than was ever before exhibited to man. The proud look down upon the earth, and see nothing that creeps upon its surface more noble than themselves. The humble look upward to their God.

LECTURE LXIII.

II. RETROSPECTIVE EMOTIONS.—SUBDIVISION OF THEM, AS THEY RELATE TO OTHERS, OR TO OURSELVES.—1. ANGER.—GRATITUDE.

GENTLEMEN, my remarks on the emotions of pride and humility, those vivid feelings which attend the belief of our excellence or inferiority, in any circumstances, internal or external,—brought to a conclusion, in my last Lecture, the observations which I had to offer on one set of our emotions,—those which I have termed immediate, that arise from the consideration of objects as present, or not involving, at least, any necessary reference to time.

The emotions which, according to the general principles of our arrangement, we are next to consider, are those which relate to objects as past; the conception of some object of former pleasure or pain being essential to the complex feeling. To this set of emotions, accordingly, I have given the name of retrospective.

These may be subdivided, as they relate to others and to ourselves.

Our retrospective emotions which relate to others are, anger for evil inflicted, and gratitude for good conferred; to which emotions, as complex feelings, in all their variety, the conception of evil, as past, or of good, as past, is, you will perceive, essential.

Those which relate to ourselves are either simple regret or satisfaction that arise from the consideration of any circumstances or events, which may have been productive of joy or sorrow, or may promise or threaten to be productive of them, or that moral regret or satisfaction which have reference to our own past conduct or desires; of the former of which, the regret that is felt by us when we look back on our moral delinquencies, remorse is the common appropriate name; while the latter, the satisfaction with which we review our past actions or wishes has no strict appropriate name corresponding with the opposite term remorse, but is sometimes called self-approbation, sometimes included in that familiar phrase of general and happy

comprehension, a good conscience. Whatever name we may give to it, however, it is easily understood, as that emotion which bears to our remembrance of our virtuous actions the relation which remorse bears to the remembrance of our actions of an opposite character.

I proceed, then, to the consideration of our retrospective emotions, in the order in which I have now mentioned them.

The first of these is anger. Anger is that emotion of instant displeasure, which arises from the feeling of injury done, or the discovery of injury intended; or, in many cases from the discovery of the mere omission of good offices to which we conceived ourselves entitled, though this very omission may itself be regarded as a species of injury. It is usually, or I may say universally,—certainly, at least, almost universally followed by another emotion, which constitutes the desire of inflicting evil of some sort in return; but this, though resulting from the feeling of instant displeasure, so immediately resulting from it, as to admit in ethics and in common discourse of being combined with it in one simple term,—is not to be confounded with it as the same in any analysis, at least in any minute philosophic analysis which we may make of our emotion. The evil felt,—the dislike,—the desire of retaliation, however rapidly they may succeed, and however closely and permanently they may continue afterwards to coexist, in one complex state of mind, are still originally distinct. The primary emotion of anger involves the instant displeasure merely with the notion of evil done or intended, and is strictly retrospective: the resentment or revenge, which is only a longer continued resentment, if we were to consider it without any regard to this primary displeasure which gives birth to it, would be referred by us to that other set of our emotions, which I have termed prospective. It is a desire as much as any other of our desires. But though in our minute philosophic analysis this distinction of the two successive states of mind is necessary, it is not necessary, in considering the feeling of resentment in its moral relations; and in the few remarks which I have to offer on it, I shall therefore consider the instant displeasure itself, and the desire of returning evil as one emotion. To estimate fully the importance of this principle of our constitution, we must consider man, not merely as he exists, in the midst of all the securities of artificial police, but as he has existed in the various stages which have marked his progress in civilization.

The existence of the race of men in society, wherever men are to be found, does not prove more powerfully the intention of our Creator, that we should form with each

other a social communion, than the mere consideration of the faculties and affections of our mind,—of all which constitutes the strength of our manhood, when each individual has treasured, in his own mind, the acquisitions of many generations preceding,—and of all which constituted the weakness of our infancy, when, but for the shelter of the society in which we were born, we could not have existed for a single day.

But though man is formed for society, born in it, living in it, dying in it, the excellence of society itself is progressive. Even in its best state of legal refinement, when offences and the punishment of offences correspond with the nicest proportion which human discernment can be supposed to measure or devise, it is scarcely possible that the united strength of the community should be so exactly adapted to every possibility of injury, as to leave no crime without its corresponding punishment; and as the social system exists at present, and still more as it has existed for ages, the injuries for which legal redress is or can be received, bear but a very small proportion in number to the injuries which might be done, or even which are done, without any means of such adequate reparation. Nature, however, has not formed man for one stage of society only, she has formed him for all its stages,—from the rude and gloomy fellowships of the cave and the forest, to all the tranquillity and refinement of the most splendid city. It was necessary, therefore, that he should be provided with faculties and passions suitable to the necessities of every stage; that in periods, when there was no protection from without that could save him from aggressions, there might be at least some protection within, some principle which might give him additional vigour when assailed, and which, from the certainty of this additional vigour of resistance, might render attack formidable to the assailant; and thus save at once, from guilt, and from the consequences of guilt, the individual who otherwise might have dared to be unjust, and the individual who would have suffered from the unjust invasion.

What human wants required, that all-foreseeing Power, who is the guardian of our infirmities, has supplied to human weakness. There is a principle in our mind, which is to us like a constant protector, which may slumber, indeed, but which slumbers only at seasons when its vigilance would be useless, which awakes, therefore, at the first appearance of unjust intention, and which becomes more watchful and more vigorous, in proportion to the violence of the attack which it has to dread. What should we think of the providence of nature, if, when aggression was threatened against the weak and unarmed, at a distance from the aid of others,

there were instantly and uniformly, by the intervention of some wonder-working power, to rush into the hand of the defenceless a sword or other weapon of defence? And yet this would be but a feeble assistance, if compared with that which we receive from those simple emotions which Heaven has caused to rush, as it were, into our mind for repelling every attack. What would be a sword in the trembling hand of the infirm, of the aged, of him whose pusillanimous spirit shrinks at the very appearance, not of danger merely, but even of the arms, by the use of which danger might be averted, and to whom, consequently, the very sword, which he scarcely knew how to grasp, would be an additional cause of terror, not an instrument of defence and safety? The instant anger which arises, does more than many such weapons. It gives the spirit, which knows how to make a weapon of every thing, or which, of itself, does, without a weapon, what even a thunder-bolt would be powerless to do, in the shuddering grasp of the coward. When anger arises, fear is gone; there is no coward, for all are brave. Even bodily infirmity seems to yield to it, like the very infirmities of the mind. The old are, for the moment, young again; the weakest vigorous.

This effect the emotion of anger produces at the very time of aggression; and though no other effect were to arise from it, even this would be most salutary; but this transient effect is trifling compared with its permanent effects. If this momentary feeling were all, the contest would be a contest of mere degrees of force; and the weaker, whatever accession of power and courage he might receive from the emotion which animated him, if the additional strength which the anger gave to his arm and to his heart, did not raise him to an equality with his unjust assailant, though he might not sink till after a longer struggle, would still sink wholly and hopelessly. It is the long remaining resentment that outlasts, not the momentary violence of emotion only, but all the evil consequences of the injustice itself, which renders the anger even of the weakest formidable, because it enables them to avail themselves, even at the most distant period, of aid, before which all the strength of the strongest individual must shrink into nothing. There is a community, to the whole force of which the injured may appeal; and there is an emotion in his breast which will never leave him till that appeal be made. Time and space, which otherwise might have afforded impunity to the aggressor, are thus no shelter for his delinquency; because resentment is of every place and of every time, and the just resentment of a single individual may become the wrath and the vengeance of a nation. He who is attacked on some

lonely plain, where no human eye is present with him, but that dreadful eye which looks only to threaten death, no arm but that dreadful arm which is lifting the dagger, has eyes and arms, which at the distance, perhaps, of many years, are to be present, as it were, at the very deed of that hour for his relief, or at least for his avengement. A crime perpetrated on the farthest spot of the globe that is subject to our sway, may have its retribution here, a retribution as dreadful as if all the multitude who assemble to witness it had been present at the very moment, on the very spot where the crime was committed; or had come, at a single call for help, with the omnipotence of a thousand arms, to the succour of the injured. It is necessary, therefore, for deterring unjust provocation that man should not feel anger merely, but should be capable of retaining the resentment till he can borrow that general aid of the community, to which, in the instant of any well-planned villany, it would, probably, be in vain to look. The wrath of a single individual, and of the weakest and most defenceless individual, may thus carry with it as much terror as the wrath of the strongest, or even of a whole army of the strong.

Such is anger as felt by the individual aggrieved. But when a crime is very atrocious, the anger is not confined to the individual directly aggrieved. There rises in the mind of others an emotion, not so vivid, perhaps, but of the same kind, involving the same instant dislike of the injurer, and followed by the same eager desire of punishment for the atrocious offence. In this case, indeed, we seldom think of applying to the emotion the term anger, which is reserved for the emotion of the injured individual. We term it rather indignation; but though the name be different, and though the accompanying notions of personal or foreign injury be also different, the emotion itself may be considered as similar. It certainly is not the mere feeling of moral disapprobation, but combined with this moral disapprobation, a vivid dislike, which all who have felt it may remember to have resembled the vivid dislike felt by them in cases in which they have themselves been injured, and a desire of vengeance on the offender as instant, and often as ardent, as when the injury was personal to themselves. The difference, as I before said, is in the accompanying conceptions, not in the mere emotion itself. In periods of revolutionary tumult, when the passions of a mob, and even, in many instances, their most virtuous passions, are the dreadful instruments of which the crafty avail themselves, how powerfully is this influence of indignation exemplified in the impetuosity of their vengeance! Indignation is then truly anger. The dema-

gogue has only to circulate some tale of oppression; and each rushes almost instantly, to the punishment of a crime, in which, though the injury had actually been committed, he had no personal interest, but which is felt by each as a crime against himself. If it was in our power to trace back our emotions through the whole long period of our life, to our boyhood and our infancy, we should find, probably, that our most vivid feelings of early resentment, if I may use that term in such a case, were not so much what is commonly termed anger, as what is more commonly termed indignation. Our deep and lasting wrath in our nursery, is not against any one who exists around us, but against the cruel tyrant, or the wicked fairy, or the robber, or the murderer, in some tale or ballad. Little generosity in after-life can be expected from him, who, on first hearing, as he leans on his mother's knee, the story of the Babes in the Wood, has felt no swell of anger, almost to bursting of the heart, against the "guardian uncle fierce," and who does not exult in the punishment which afterwards falls on that treacherous murderer, with a triumph more delightful than is felt by the most vindictive in the complete gratification of their own personal revenge.

How truly is this virtuous indignation of the youthful heart described by Beattie, in the glance of stern vindictive joy which brightened the tear of the future Minstrel when the beldame related to him that vengeance of heaven which forms the catastrophe of this tale "of woes":—

A stifled smile of stern vindictive joy
Brighten'd, one moment, Edwin's starting tear.
But why should gold man's feeble mind decoy,
And Innocence thus die, by doom severe?
O Edwin! while thy heart is yet sincere,
Th' assaults of discontent and doubt repel.
Dark, even at noon-tide, is our mortal sphere;
But let us hope;—to doubt is to rebel;
Let us exult, in hope that all shall yet be well.
Nor be thy generous indignation check'd,
Nor check'd the tender tear to misery given;
From guilt's contagious power shall that protect,
This soften and refine the soul for heaven.*

It is by such generous indignation, indeed, that virtue is protected from the contagion of guilt, or rather, without such indignation, there is already no virtue to be protected.

If the little heart, in such a case, can pause and think, this injury was not done to me, it may, with equal temptation, in maturer years, unless saved by terror of punishment, be guilty of the very crime which, as the crime of another, excites in it so little emotion.

The indignation then of mankind may be considered as co-operating with the anger of the injured individual; but, unless in very atrocious cases, the general indignation is slight and faint, in comparison with the vi-

vidness of resentment in the individual. It is always sufficient, however, to sympathize with him; and this is sufficient for that just purpose which Nature had in view. She has provided one, whose quick and permanent resentment will lead him not to let injustice escape unpunished; and she has provided, in the community, feelings which readily accord with the direction of the united power of the state, against the injurer of a single individual. If there had been no such feelings of sympathetic anger, it may very easily be supposed that compassion for the criminal, who was afterwards to suffer for his offence, would in many cases obtain for him impunity; if, on the other hand, the indignation of the community were in every case equal to the original wrath of the individual directly injured, no opportunity could be afforded for the calm defence of innocence unjustly suspected. To have the punishment of guilt, it would be enough to have appeared to be guilty. In this universal frenzy of resentment, too, it is very evident that not even a single individual in a nation could enjoy tranquillity for a moment. His whole life must in that case be a life of rage and vexation. "*Omnis illi per iracundiam moeroremque vita transibit. Quod enim momentum erit, quo non improbanda videat? Quoties processerit domo, per sceleratos illi, avarosque, et prodigos, et impudentes, et ob ista felices, incendendum erit. Nusquam oculi ejus flectentur, ut non quod indignantur inveniat.*"† The zeal of the Knight of La Mancha, who had many giants to vanquish, and many captive princesses to free, might leave him still some moments of peace; but if all the wrongs of all the injured were to be felt by us as our own, with the same ardent resentment and eagerness of revenge, our knight-errantry would be far more oppressive; and though we might kill a few moral giants, and free a few princesses, so many more would still remain, unslain and unfreed, that we should have little satisfaction, even in our few successes.

How admirably provident, then, is the Author of our nature, not merely in the emotions with the susceptibility of which he has endowed us, but in the very proportioning of these emotions, so as to produce the greatest good at the least expense even of momentary suffering. Some vivid feeling of resentment there must be, that the delays which may occur, in the infliction of vengeance, may not save the guilty from punishment; but this vivid feeling which must exist somewhere, nature, in ordinary cases, confines to the single breast of the sufferer. Some feelings of general sympathy with the resentment of the injured there must also be, that the strength of society may be readily

* Book i. stanza xlvii. and v. 1—4 of stanza xlviii.

† Seneca de Ira, lib. ii. cap. 7.

transferred to him for the punishment of the injurer; and these general feelings Nature has formed to be of such a kind as may be sufficient for the purpose which they are to answer, without being too vivid to distract the attention of the multitude from their own more important concerns. The good which Nature wills is attained; and is attained by means which are as simple as they are efficacious.

We have seen, then, the advantages which arise from that part of our mental constitution, by which individuals are capable of resentment, when personally injured, and of indignation when the injury has no direct relation to themselves. But resentment, admirable as it is, as a check even to that guilt which is not afraid of conscience or of God, may yet, in unfortunate dispositions, be a source of endless vexation to the individual who feels it, and to all those who live around him. It may arise too soon,—it may be disproportioned to the offence,—it may be transferred from the guilty to the innocent,—it may be too long protracted.

It may arise too soon; or rather, it may arise when a little reflection would have shown that it ought not to have arisen. In the intercourse of society it must often unavoidably happen that there may be apparent injury, without any real desire of injuring. We may consider that evil as intentional which was not intended; we may consider that as an insult which was said perhaps with a sincere desire of correcting, as gently as possible, some imperfection, which is not less an imperfection because we shrink from hearing of it. To distinguish what simply gives us pain, from that which was intended to give us unnecessary pain, is no easy task, in many cases, and in all cases requires some reflection. According as the emotion of anger, at least any displeasure more lasting than a single moment, precedes or follows this due reflection, it is to be viewed therefore in a very different light. The disposition which becomes instantly angry, without reflection, on the slightest semblance of injury, is in common language, as you know, termed passionate.

Another form of a passionate disposition, arising indeed from the same cause, is that which involves the next error which I have stated with respect to resentment, the disproportion of the anger and the offence. He who does not pause, even to weigh the circumstances, cannot be supposed to pause to measure the extent of injury. He feels that he is injured, and all his anger bursts out instantly on the offender. It is this disproportion, indeed, which is the chief evil of what is commonly termed passion. Some cause of slight displeasure there may be, even when anger, in its violence, would be immoral and absurd. Yet such is the infirmity of our na-

ture, that it is often no slight triumph over our weakness to forgive a trifle with as much magnanimity as that with which we have forgiven greater injuries. He who has truly pardoned in heart, as well as in profession, the political rival who has displaced him, may yet be very angry with his steward or his groom; and it is no small panegyric of woman to be mistress of herself though China fall.

To what cause, or causes, are we to ascribe this quickness of anger, on small occasions, when, if the occasion had been greater, the resentment would have been less? This apparent anomaly in our emotion, seems to me to arise chiefly, or wholly, from three causes. In the first place, any great injury is felt by us immediately as an injury, as an important event in our life, an occasion on which we have to act a part; and, if we have any virtue whatever, our whole system of practical ethics comes before us. We remember that we ought to forgive, and we think of this duty, merely because the importance of the injury makes us feel that, on such an occasion, we are heroes of a little drama, and must walk majestically across the stage.

In the second place, I may remark, that great offences seldom occur without some little warning of suspicion, which puts us on our guard, and prevents, therefore, sudden exasperation. But what warning is there that a cup is to be broken, or a pair of spectacles mislaid?

Still more important than these, however, though perhaps less obvious, seems to me the cause which I have last to mention, that any great offence is of course a great evil, and that the magnitude of the evil, therefore, occupies us as much as our resentment, and thus lessens the vividness of the mere feeling of resentment, by dividing, as it were, its interest with that of other intermingled feelings. An injury which deprives us of half our estate, presents to us many objects of thought, as well as the mere image of the injurer. But when a servant, in his excessive love of order, has laid out of our way a volume which we expected to find on our table, or has negligently suffered the newspaper to catch fire, which he was drying for us, the evil is not sufficiently great to occupy or distract us; and we see, therefore, the whole unpardonable atrocity of the neglect itself, or of that over-diligence which is often as teasing in its consequences as neglect.

Any one of these causes, operating singly, might be sufficient perhaps to explain what seems at first, as I have said, so very strange an anomaly; and their influence, as may well be supposed, is far more powerful when they operate, as they usually operate, together. The little evils which fret us most, then, we may perhaps venture to conclude, produce this seemingly disproportionate effect, as be-

ing those in which we do not feel that we have any great part to act, which are so sudden as to have given us no warning, and in which there is not sufficient injury to divert our fretfulness from the immediate object, by the sorrow which might otherwise have mingled with our wrath.

A third error, with respect to this emotion, consists in transferring it from the guilty to the innocent. The species of disposition which has this character is what is commonly termed peevish or fretful. Some trifling circumstance, of disappointed hope or mortified vanity, has disturbed that serenity which was before all smiles; and for half a day, or perhaps for many days, if the provocation have been a very little more than nothing, no smile is again to be seen. He whose unfortunate speech or action produced this change may already be at the distance of many miles; but he is represented by every person, and every thing that meets the eye of the offended; and the wrath which he deserved, or did not deserve, is poured out perhaps in greater profusion than if he were actually present. It might then, indeed, have been a thunder-shower which falls heavily for a while, but leaves afterwards a clear sky. It is now a fog which lours, and chills, and which, in lasting long and dimly, seems only to threaten a still longer and more dismal darkness. To a disposition of this sort, no voice is soft, and no look is kind; the very effort to soothe it is an insult; every delightful domestic affection is suspended; the servants tremble; the very children scarcely venture to approach, or steal past in silence, with a beating heart, and rejoice in having escaped; the husband finds business to occupy him in his own apartment, the instant and urgent necessity of which he never discovered before; and all this consternation and misery have arisen perhaps from the negligence of a waiting-maid who has placed a flower, or a feather, or a bit of lace, a quarter of an inch higher or lower than it ought to have been.

How soft is Silla! fearful to offend;
The frail-one's advocate, the weak-one's friend.
Sudden, she storms, she raves! You tip the wink,
But spare your censure; Silla does not drink.
All eyes may see from what the change arose;
All eyes may see—a pimple on her nose.*

We have seen, then, the nature of that character of anger, which is usually termed passionate, in its two varieties. We have seen also the nature of that other kindred character, which is usually termed peevish or fretful. There yet remains to be considered by us one other form or character of excess in this emotion.

This fourth moral error, with respect to resentment, of which I spoke, is when it is

too long protracted. The disposition, in that case, is said to be revengeful,—a disposition still more inconsistent with the moral excellence of man, than even that silly fretfulness of which I last spoke. The very reason of the peevish is, for the time, obscured, as much as their serenity; and, if this obscurity could be removed, so that they might see things as they are, they probably would cease to express, and even to feel, their petty displeasure. The revengeful have not, indeed, the folly of punishing the innocent for the offence of the guilty; but they punish the guilty, even when the guilt has been expiated with respect to them, by every atonement which the injurer could offer; or they punish as guilt what implied no malicious intention; and this they do, not unreflectingly and blindly, but with an understanding as quick to discern as it is vigorous to execute. Man is too frail in his wishes and actions, to measure the offences of others with a rigid hand. "*Mali inter malos vivimus.*" The very revenge which he seeks is a condemnation of himself. When he looks into his own mind, is it possible for him to say, Let there be no forgiveness for offence, but let all who have violated what is right, suffer the punishment of the wrong, in the same proportion in which I now measure out punishment? Would no lurking remembrance of evil on his part check such a general wish as this? and, if he could not venture on the general wish, which must include his own punishment, how audacious must be that arm which, exposed alike to the cloud that hangs over all, would yet call down the thunder-bolt to destroy whatever is beneath it! For man to be revengeful, is as if a criminal, confined with his accomplices, and speedily to be brought to judgment, should, in some petty malice against one of his fellow-captives, appeal to the speedier vengeance of those very laws which all had violated, and which, falling in vengeance on the head of one, must fall upon the head of all.

Nature, as I have already said, has formed man susceptible of resentment, that the wicked, who fear only man, may have something to fear; but she has formed man to be placable, because long continued resentment would be itself an evil more severe than that which it avenges. He, therefore, who knows not how to forgive,—whose gloomy heart preserves, even in age, the resentment of youth, unsoftened by the penitence of the offender, by his virtues, by his very misery, is to us like some dreadful being of another race, that walks the earth, cursing and accursed; we shun him as we would fly from some malignant spirit, who, by looking upon us, could transfuse into us the rancour which he feels; we have no sympathy for him; our only sympathies are with the object of his vengeance; with that very object on whom,

* Pope's Moral Essays, Ep. ii. v. 29, 30, and 33—36.

in other years, we could have delighted to see the vengeance fall.

Such, then, are the abuses of that emotion which, for the good of mankind, when not thus abused, Heaven has placed in every heart. The resentment, therefore, which Heaven allows only for the good that arises from it, is limited by the very nature of this good. It is, in the first place, a resentment which pauses till it have considered the circumstances in which the supposed injury has been done; in the second place, a resentment which, even when, on reflection, intentional injury is discovered, is still proportioned to the offence; in the third place, a resentment which limits its wrath to the guilty object; and, in the fourth place, a resentment which is easy to be appeased, which does not seek revenge when the good of society would not suffer by the forgiveness; and which sees in penitence, when the penitence is manifestly sincere, not an object of hatred, but an object of love.

Such is the infirmity of our nature, that there is far more reason to apprehend, in every case, that we may have erred in the excess of our resentment than in defect of it; and there can be no question which of these errors is the less dangerous to the tranquillity of the individual. He may be very happy whose resentment scarcely reaches that point to which the sympathy of those around would accompany him; but he cannot be happy whose habitual resentments go far beyond that point. It is of the utmost advantage, therefore, for our own peace, that we should learn, as much as possible, to regard the little vexations which we may, or rather must, often meet from the ill humour of others, or from the crossings and jarings of interests opposite to our own, with the same patience with which we bear the occasional fogs of our changeful sky. The caprices of man are as little at our disposal as the varieties of the seasons. Not to lay our account with these human vexations, is a folly very similar to that of expecting in winter all the flowers and sunshine of spring, and of lamenting that the snows and sleet which have fallen everywhere else should have fallen on our little garden.

I will not affirm that man can ever arrive at the stoical magnanimity of being able to say, with respect to every unjust aggression to which he may be exposed, "No one can be guilty of a crime that is great enough to be worthy of my emotion." "Nullius tanta nequitia est, ut motu meo digna sit." But we may be sure of this at least, that the more nearly we approach to that magnanimity, the more do we save from disquietude our own happiness, and very probably too the happiness of all around us.

"It is impossible for you to be injured," says a French moralist, with a sententious-

ness worthy of Seneca, "it is impossible for you to be injured, but in your property, or in your self-love. If you are injured in your property, the laws defend you, and you may say of him who has injured you, This man is unjust; he will be weaker than I. If you are hurt in your self-love, the reproaches which are directed against you must be either well or ill founded. If they are well founded, why have resentment against a man, who makes you feel the necessity of being wiser or better than you were before? If the reproaches are not well founded, your conscience reassures you; and what vexation can arise in the mind of him who looks back only on virtues that delighted him when present, and delight him still in the remembrance? The reproaches are those either of a friend or of an enemy. If they are the reproaches of a friend, say to yourselves, he is my friend; he could not mean to offend me. If they are the reproaches of an enemy, say to yourselves, this is what I should have expected; and why then should it astonish me as if it were something new? Has your enemy carried his hatred against you so far as to be guilty of a crime? You are already too well avenged."*

The emotion opposite to that of resentment is gratitude, that delightful emotion of love to him who has conferred a kindness on us, the very feeling of which is itself no small part of the benefit conferred. It is this, indeed, which mingles in almost every other species of love, and diffuses in them all additional charms. The child does not love his parent merely as possessing virtues which others around him possess perhaps equally; he loves him as his constant benefactor, the prolonger of that existence which he gave, the provider against wants which are not to be felt till the gracious provider for them be himself probably no more. When a friend thinks of his friend, what a long period of reciprocal good offices does he seem to measure in a single moment with his eye, what happiness conferred, what misery soothed! It is as if the friendship itself expanded with the length of that bright tract of enjoyment, the retrospect of which is almost a repetition of the pleasure that seems diffused over every step. In the pure reciprocations of conjugal regard all this friendship exists, and exists still more intimately and closely. The emotion is not felt as gratitude, indeed; for every interest is so much united, that a kindness conferred and a kindness received are in such a case scarcely to be distinguished. There is happiness flowing from each to each; and the gratitude which each feels, is perhaps, if we consider it only as the emotion of the object that receives pleasure, due

* De St. Lambert, tom. ii.

as much from the heart which has conferred, as from the heart which has seemed more directly to receive it. But still the remembrance of this mutual interchange of tender wishes and enjoyments, of delights and consolations that were almost delights, is no small part of the general complex emotion which renders the love of those who have long loved as permanent as it is pure.

The Seasons thus,

As ceaseless round a jarring world they roll,
Still find them happy, and consenting Spring
Sheds her own rosy garland on their heads;
Till evening comes at last, serene and mild,
When, after the long vernal day of life,
Enamoured more, as more remembrance swells
With many a proof of recollected love,
Together down they sink in social sleep;
Together freed, their gentle spirits fly
To scenes where love and bliss immortal reign.*

With what happy influence has heaven thus led mankind to benevolence, by making kindness delightful both to him who is the object of it, and to him who confers it! If no pleasure had been attached to virtue, we might still indeed have been virtuous, but we should have felt as if walking at the command of some power whom it would be guilt to disobey, along a world of darkness. The pleasure that flows around us in acts of mutual kindness, is like the sunshine, that is light and gladness to our path; and if we owed no other gratitude to our Creator, we should owe it for this at least, that he has made gratitude itself so delightful.

LECTURE LXIV.

RETROSPECTIVE EMOTIONS, HAVING DIRECT REFERENCE TO OURSELVES.—1. SIMPLE REGRET AND GLADNESS, ARISING FROM EVENTS WHICH WE CANNOT CONTROL.—2. MORAL REGRET AND GLADNESS, ARISING FROM OUR OWN ACTIONS.

IN my last Lecture, Gentlemen, I considered our emotions of anger and gratitude, those retrospective emotions which have direct reference to others. The affections of this order which are next to be considered by us, are those which relate more directly to ourselves; and, in the first place, those emotions of simple regret or gladness with which we look back on past events, as mere events of advantage or disadvantage to us, without including any notion of our own moral propriety or impropriety of conduct.

I have already, in treating of melancholy and cheerfulness, considered emotions very nearly akin to these; the great distinction being in the feeling of a particular object of

the emotion, which is essential to the complex vivid feeling in one case, and which does not exist in the other case. We are melancholy, often without knowing why we are melancholy; cheerful, without knowing why we are more cheerful at one particular time than at another. But when we feel regret, we know what it is which we regret; when we feel a joyful satisfaction, we know what it is which gladdens us; and our emotions, as felt by us, have a direct reference to their causes, the conception of which coexists with them in one complex state of mind. Melancholy, indeed, is often the result of regret, as cheerfulness is of any extraordinary joy; that is to say, we are grieved at some event, and our mind afterwards, of itself, continues in a state of sadness, without any thought of its cause; we are gladdened by some particular event, and our mind afterwards, of itself, without the remembrance of the cause of joy, continues in a state in which happiness seems to be a part of its very essence; as if not to be happy and not to exist were nearly the same. The immediate and the retrospective emotions, however, which are distinguished by the peculiar names of melancholy and cheerfulness, in the one case, regret and gladness, in the other case, are sufficiently distinguished by that reference to the past, the retrospective feeling which does or does not attend them.

As a mere vivid feeling, indeed, the regret which affects us on any unfortunate occurrence, may, on a minute analysis, be found to be the same, or at least nearly the same, as the general melancholy or sadness which we feel, without thinking of its cause; the regret differing from the melancholy, not as a mere vivid feeling of emotion, but merely as a complex state of the mind, of which sadness is a part, differs from the simpler state, in which sadness is all that constitutes the momentary feeling. If this analysis be accurate, as I conceive it to be, the terms may be truly convertible; so that regret may be said to be only melancholy combined with the conception of a cause of the melancholy; and melancholy itself to be only regret, abstracted from the conception of its cause. A similar minute analysis, by separating, in every complex emotion, that part which may be considered as peculiarly constituting the vivid feeling which is marked by that name, from the conception of the object, which may or may not accompany it, and which may be various, when the emotion itself, as a mere emotion, is the same, might be made in other cases, so as to reduce, with sufficient philosophic precision, the vocabulary of our feelings of this class, as elementary feelings, to the very few which I enumerated, in entering on the consideration of our emotions. I have preferred, however, for the reasons repeatedly stated by me, the consi-

* Thomson's Seasons, Spring, v. 1163—1173.

deration of our emotions in that complex form in which they usually present themselves, since the consideration of them in this state of complexity in which they usually exist, has many advantages, and does not preclude the analysis which may be necessary for pointing out to you, in each complex emotion, the elementary feelings that seem to compose it. There are clear and definite lines of distinction which the emotions in their complex form present, that are themselves too striking to be neglected as principles of arrangement; and there are bearings on practical ethics, which it seemed to me still more important to point out to you,—relations which the systematic review of our emotions, together with the various objects of our emotions, that give them their common distinctive names, and that, if they do not alter the very nature of the vivid feelings themselves, at least diversify them in many important aspects, affords an easy opportunity of developing, but which would be lost in the more general consideration of them, if arranged as mere elementary feelings, without regard to their objects.

Though the regret, then, which we feel in thinking of any unfortunate event, and the gladness which we feel in thinking of any event that has been, or promises to be beneficial, may, as mere vivid feelings of emotion, be the same, or nearly the same, as the more permanent feelings of joy or sadness, which we term cheerfulness or melancholy, that continue, without any reference of the mind, to the past events which may have given occasion to them, still the retrospective reference is so important a part of the complex whole, that the emotion which involves this reference, may admit with advantage of separate consideration.

The emotions which we are now considering may be regarded, in their almost infinite relations, as the great diversifiers of the happiness of our days, very nearly as light and shade, that flow over every thing around us, are the diversifiers of that physical scene of things, on which we are placed. How few events can happen, that have any direct relation to ourselves, which may not be productive of some greater or less degree of gladness or regret; and, far from being thus confined to events which primarily relate to us, our emotions of this kind do not merely extend to every thing that can happen within the wide circle of our friendship or acquaintance, but seem to diffuse themselves over the most distant ages and climes, as if we had a direct and primary interest in the happiness or misery of the whole human race. If every thing at which we rejoice or grieve in the course of a single day, could be imagined to us at once, as we gather into one wide landscape the lake and the vales and the rocky summits which we have

slowly traversed, it would be one of the most striking pictures that could be presented, of the social and sympathetic nature of man.

Even of the events by which our personal interest is more immediately affected, and in which our regret or gladness, therefore, might seem exclusively personal, how few are there, which have not some relation to others; or rather, how few are there of which others are not the immediate authors! What we term chance or fortune, in all those events of our life which we characterize as fortunate or unfortunate, is only a shorter term for expressing the actions of others in their unintended relation to us; and in the friendships and thousand rivalries of life, how much of intentional good or evil is to be added to what is casual! There is perhaps scarcely a single success, of which we give the praise to our own prudent conduct, that if others had acted differently, might not have been adverse to us, rather than prosperous.

Regret and gladness, as thus arising from events which are, in most instances, absolutely independent of our conduct, may seem at first to be themselves, in these instances, equally independent of any conduct on our part. But this is very far from being the case. Though the events may be independent, the feelings which they awake in us may depend, in a great measure, on our own former feelings. The same power of habit, which influences the particular suggestions of our trains of thought, influences also the particular emotions which arise in different individuals, from the consideration of the same events, because the train of thought itself cannot be different without a correspondent diversity of the emotions, that vary with the varying images. How few events are productive only of advantage or disadvantage! By far the greater number are productive of both, of advantage which, if it existed alone, would excite gladness, of disadvantage which, if it existed alone, would excite regret, and of which, as existing together, the resulting emotion is different, according to the preponderance of the opposing causes of regret or gladness, that is to say, according as more or fewer images of regret or gladness spontaneously arise to our mind, or according as we examine and analyze, more or less fully, the one or the other of these sources of mingled joy and sorrow. There are many advantages, of what is apparently evil, that cannot be known to us, unless we reflect on consequences which are not immediately apparent; many evils of what is apparently profitable, that may be discovered, in like manner, but discovered only after reflection. We cannot change events, indeed, in many instances; but in all of these, the aspect of events, at least, may be changed as our at-

tion is more or less turned to the consequences that may result from them. To wish is, in this case, almost to produce what we wish. Our very desire of tracing the consequences that are favourable to our happiness, will be followed by the suggestion of these, rather than of others, in the same manner as our other desires are always followed by the suggestion of images accordant with them. Our mere intention of describing a beautiful landscape, for example, which is but a desire like any other of our desires, is followed by the images of rural beauty, that rise, in succession, to our choice, when, if our intention had been to describe the horrors of some scene of ruggedness and desolation, that principle of spontaneous suggestion, to which, in such a case of picturing, we give a peculiar name, as if it were a distinct power, and term it fancy, would have presented to us, indeed, as many images as in the gayer landscape, but images of a very different kind. With what varied conceptions was the mind of Milton filled, when, after describing Pandemonium and its guilty inhabitants, he seemed to breathe, as it were, a purer atmosphere of freshness and delight, in describing the groves of Paradise, and that almost celestial pair, whose majestic innocence seemed of itself to indicate the recent presence of the God from whom they came, and without whom, to enjoy at once, and to animate it, even Paradise itself would have been a desert! In this sudden change of conceptions that crowded on his imagination, the mind of Milton was still itself the same. The images, in all their variety, arose still according to the same simple laws of suggestion. They arose variously, only because a single wish of his mind was varied. He had resolved to describe the magnificent horrors of an infernal palace; he resolved afterwards to describe the delightful magnificence of nature, as it might seem to have shone in original beauty, when it still reflected that smile of its Creator which pronounced it to be good; and all which would have been necessary to reverse the whole store of imagery, to convert Paradise, in his mind, into the burning lake, and Pandemonium itself into the bowers of Eden, would have been the change of that single wish which seemed almost to have been creative. If our desire is thus capable of modifying the whole train of suggestion, in that process in which the mind is said to invent, it is not less capable of modifying it in cases in which we never think that we are inventive. In the whole train of our thought, our conceptions, and the attendant emotions which they induce, still correspond with our prevalent wishes. When an occurrence may be productive of good and evil, the good may arise to us, because our general frame of mind is accord-

ant with wishes, and, therefore, with conceptions of good; or the evil only may arise to that gloomy spirit which does not find good, merely because it does not seek to find it. A different general character of thought, the associations, perhaps of a few years, a single prevailing notion, may in this way be sufficient, on the contemplation of the same event, to convert gladness into regret, regret itself into gladness.

Even when the same event is thus viewed by two different minds, and the same consequences, in every other respect, arise to both minds, how important a difference must there be in the general resulting emotion, according as the two minds are more or less accustomed to view all the events of nature, as a part of a great design, of which the Author is the benevolent willer of happiness, or of the means of happiness! The mere difference of the habit, in this respect, is to the individuals almost the same thing, as if the events themselves had been in their own absolute nature diversified.

The same events, therefore, in external circumstances exactly the same, may be productive to the mind of emotions that are very different, according to its constitutional diversities or acquired habits, or even according to slight accidents of the day or of the hour. We may rejoice, when others would grieve, or grieve when others would rejoice, according as circumstances arise to our reflection, different from those which would occur to them. Nor is the influence necessarily less powerful on our views of the future, than on our views of the past. We desire often, in like manner, what is evil for us upon the whole, by thinking of some attendant good; as we fear what is good, by thinking only of some attendant evil. The vanity of human wishes is, in this way, proverbial. We do not need those memorable instances which Juvenal has selected, to convince us, how destructive, in certain circumstances, may be the attainment of objects, that seem to us, when we wish for them, to comprehend all that is desirable. The gods, says that great moralist, have overwhelmed in ruin whole multitudes, merely by indulging them with every thing for which they prayed.

*Evertre domos totas optantibus ipsis
Li facies.**

What is shown, in such cases, only in the fatal result, to those whose scanty discrimination sees only what is or has been, and not what is to be, may in some respects be anticipated by more discerning minds, that would feel sadness, therefore, at events which might seem to others to be subjects only of congratulation. Sagacity, when it exists in any

high degree, is itself almost that second sight in which the superstitions of the wilder districts of this country put so much confidence. It looks far before, into the futurity that is closed to common eyes. It sees the gloom in which gaiety is to terminate, the happiness that is to dawn on affliction, as, by supposed supernatural revelation, the Scer's quick but gloomy eye views in the dance and merriment of evening the last struggles of him who is the next morning to perish in the waves, or when a whole family is weeping for the shipwrecked son or brother, beholds on a sudden, with a wild and mysterious delight that moment of joy when the well-known voice of him who is lamented with so many tears, is to be heard again, as he returns in safety to the cottage door.

It is not on the nature of the mere event, then, that the gladness or regret which it excites wholly depends, but in part also on the habits and discernment of the mind which considers it; and we are thus, in a great measure, creators of our own happiness, not in the actions merely which seem more strictly to depend on our will, but on those foreign events which might have seemed at first to be absolutely independent of us.

If even simple gladness and regret, however, depend in some measure on the peculiar tendencies of the mind, the emotions which we are next to consider depend on them still more.

These are the emotions which attend our moral retrospects of our past actions, the remorse which arises on the thought of our guilt, the opposite emotion of delight which attends the remembrances of what is commonly termed a good conscience.

I have already treated of the emotions which are distinctive to us of vice and virtue in general; but the emotions with which we regard the virtues and vices of others, are very different from those with which we regard the same vices and virtues as our own. There is the distinctive moral feeling, indeed, in both cases, whether the generous sacrifice, or the malignant atrocity which we consider, be the deed of another, or of our own heroic kindness or guilty passion; but in the one case there is something far more than mere approbation, however pleasing, or mere disapprobation, however disagreeable. There is the dreadful moral regret arising from the certainty that we have rendered ourselves unworthy of the love of man and of the approbation of our God; or the most delightful of all convictions, that but for our life the world would have been less virtuous and happy, and that we are not unworthy of that highest of privileges, the privilege of fearlessly adoring him, whom if we worship truly

with that gratitude which looks beyond the moment of suffering, to the happiness of every world and of every age, it matters but little though the place of our adoration should be a dungeon or a scaffold.

When we look to some oppressor in the magnificence of his unjust power, surrounded with those inferior tyrants, that, while they execute their portion of delegated guilt, tremble at the very glance of him whose frown can make them nothing; with armies whom victory after victory has rendered as illustrious as slaves that carry slavery with them, and spread it wherever their arms prevail, can hope to be; when we enter the chambers of state in which he gives himself to public view, and see only the festival, and listen only to voices that are either happy, or seem to be happy, does all this splendour impose upon our heart, as it would half-seduce our senses into momentary admiration? Do we think that God has reserved all punishment for another world, and that wickedness has no feelings but those of triumph in the years of earthly sway which consummate its atrocities? There are hours in which the tyrant is not seen, the very remembrance of which, in the hours in which he is seen, darkens to his gloomy gaze that pomp which is splendour to every eye but his; and that, even on earth, avenge with awful retribution, the wrongs of the virtuous. The victim of his jealous dread, who, with a frame wasted by disease, and almost about to release his spirit to a liberty that is immortal, is slumbering and dreaming of heaven on the straw that scarcely covers the damp earth of his dungeon,—if he could know at that very hour what thoughts are present to the conscience of him who doomed him to this sepulchre, and who is lying sleepless on his bed of state, though for a moment the knowledge of the vengeance might be gratifying, would almost shrink the very moment after from the contemplation of horror so hopeless, and wish that the vengeance were less severe. "Think not," says Cicerò, "that guilt requires the burning torches of the Furies to agitate and torment it. Their own frauds, their crimes, their remembrances of the past, their terrors of the future, these are the domestic furies that are ever present to the mind of the impious."—"Nolite enim putare, quemadmodum in fabulis saepenumero videtis, eos, qui aliquid impie scelerateque commiserint, agitari et perterriti Furiarum taedis ardentibus: sua quemque fraus et suus terror maxime vexat; suum quemque scelus agitat, amentiaque afficit; suae malae cogitationes conscientiaeque animi terrent. Hae sunt impiis assiduæ domesticæque Furiae."*

* *Orat. pro Sex. Roscio Amerino*, sect. 24, edit. Gruter. or 67 of others.

The instance which I have now chosen is that of a species of guilt with the conscious remembrance of which few of the great multitude of mankind can be agitated. But those who cannot oppress kingdoms may yet oppress families and individuals. There is a scale of iniquity that descends from the imperial tyrant to the meanest of the mob; and there are feelings of remorse that correspond, not with the extent of the power, but with the guilty wishes of the offender. In the obscurest hovel, on the most sordid bed, there are sleepless hours of the same sort of agony which is felt in his palace by him who has been the scourge perhaps of half the nations of the globe. There are visions around that pillow, which, in the drama or romance indeed, would form no brilliant picture, but which are not the less horrible to him whose means, but not whose wishes of iniquity, have been confined to the little frauds that have swallowed up the pittance of some widow, or seduced into the same career of guilt with himself the yielding gentleness of some innocent heart. To the remorse of such a mind, there are not even the same consolations, if I may apply the term of consolation to that dreadful relief which, in rendering horror less felt for the instant, truly aggravates its ultimate amount. The power of making armies march, though it be only to new desolation,—of altering in an instant the fate of kingdoms, though it be only to render kingdoms more wretched,—has yet something in it which, by its greatness, occupies the mind; and the tumult of war, and the glory of victory, and the very multitude of those who bow the knee and tremble as they solicit favour or deprecate wrath, afford at least a source of distraction to the mind, though they can afford no more. These sources of distraction the petty villain cannot share. His villanies present to him no other images than those of the insignificant profits which he has perhaps already squandered, and the miseries which he has made. There are no crowds of flatterers to aid the feeble efforts with which he strives to forget the past. He is left with nothing more than his conscience, and his power of doing still more evil; and he has recourse to this desperate expedient, which, desperate as it is, is still less dreadful than his horror of the past. He adds villany to villany, not so much for any new profit, as to have something which may occupy him, producing wretchedness after wretchedness around him, as far as his little sphere extends, till his sense of remorse is at last almost stupefied; and he derives thus a sort of dreadful mitigation of suffering, from the very circumstances which are afterwards to be the aggravation of his misery.

In these cases of fraud and cruelty, the

progress of guilt, in every stage of it, might have brought to the mind of the guilty the evil on which he was entering, or the evil which he was aggravating. But what deep remorse arises often to minds originally of better hopes, that, on entering on the very career which has plunged them in vice, saw no images but those of social pleasure; and that, after many years of heedless dissipation have elapsed, look back on the years which have been so strangely consumed, almost with the astonishment, though not with the comfort, of one who looks back on some frightful dream, and who scarcely knows whether he is awake.

Soft as the gossamer, in summer shades,
Extends its twinkling line from spray to spray,
Gently as sleep the weary lids invades,
So soft, so gently, Pleasure mines her way.*

At the very suggestions of fraud and cruelty, the heart shrinks instantly with a horror which saves from the guilt of injustice or oppression all those whose minds are not unworthy of better feelings; but the suggestions of pleasure present nothing to the mind, at least till indulgence have become excessive, with which any feelings of loathing and abhorrence can be associated. The corruption of the mind goes on silently, and gives no alarm, till the mind is already too corrupt to be capable of the vigorous effort which would be necessary for shaking off a power that shackles and debases it; but which seems still rather to seduce than to oppress, and which is scarcely hated by the unfortunate victim, even while it appears to him to have destroyed his happiness for ever.

O treacherous Conscience! While she seems to sleep
On rose and myrtle, lull'd with siren song;
While she seems, nodding o'er her charge, to drop
On headlong appetite, the slacken'd rein,
And give us up to licence, unrecalld,
Unmark'd—See, from behind her secret stand,
The sly informer minutes every fault,
And her dread diary with horror fills,
Not the gross act alone employs her pen;
She reconnoitres Fancy's airy band,
A watchful foe,—the formidable spy
Listening, o'erhears the whispers of our camp,
Our dawning purposes of heart explores,
And steals our wishes of iniquity.†

It is not, however, only when health, and fortune, and dignity, and the affection of those whom we love, have been completely sacrificed, that conscience comes boldly forward, and proclaims a guilt of which we were little dreaming. There are thoughts of higher objects that rise to the mind, with an accusation which it is quick to feel, but which it hastens to forget, in a repetition of the idle and profitless, and worse than profitless enjoyment. At length the accusation, which cannot be suppressed, is heard with a

* Mickle, canto l.

† Young's Night Thoughts, book ii. v. 256—269.

more painful impatience, but with an impatience which leads only to a wilder riot, in the hope of stilling murmurs which are not to be stilled.

The low

And sordid gravitation of his Powers
To a vile clod, so draws him, with such force
Resistless, from the centre he should seek,
That he at last forgets it. All his hopes
Tend downward; his ambition is to sink,—
To reach a depth, profounder still, and still
Profounder, in the fathomless abyss
Of folly, plunging in pursuit of death.
But ere he gain the comfortless repose
He seeks, and acquiescence of his soul
In Heaven renouncing exile, he endures—
What does he not, from lusts opposed in vain
And threatening[†] conscience—Riot is not loud
Nor drunk enough to drown it. In the midst
Of laughter, his compunctions are sincere,
And he abhors the jest by which he shines.†

On the happiness which attends the remembrance of a life of virtue, it would surely be unnecessary to enlarge. It is a happiness of which even the guilty, though they may be incapable of conceiving all its delight, yet know sufficiently the value to look to it with wishes that do not covet it the less for coveting it hopelessly. Strange as it may seem in a world in which vice is so abundant, there yet can be little doubt that the only object of desire, which is truly universal, is the delight of a good conscience. The pleasures of power and splendour and indolent luxury, strong as their sway is over the greater number of minds, find yet some minds to which they are objects either of indifference or contempt. But who is there, who has ever said in his own soul, in forming plans of future life, let me live and die without the remembrance of a single good action? There are crimes, indeed, conceived and perpetrated with little regard to that virtue, which is for the time abandoned. But there is still some distant vision of repentance, and better thoughts, which are to be the happiness of old age at least, that is present to the most profligate, when he ventures to look forward to old age, and to that event by which age must at last be terminated. It is not because virtue is wholly despised that guilt exists; but the great misery is, that the uncertain duration of life allows the guilty to look forward to years that are perhaps never to arrive, and to postpone every better purpose till their heart has become incapable of shaking off the passions to which it is enslaved. Yet still repentance and virtue, at some period, are delightful objects, which they never wholly exclude from their prospects of the future; and if it were possible to be virtuous without the sacrifice of vice, they would not delay the happiness for a single instant.

The happiness of having something in past years, on which to look back with delight, is then a happiness which is the wish of all; and if it were a thing that could be plundered like mere wealth, or invaded and usurped like honour and dignities, it would probably be one of the first things on which the robber would lay his violent hands, and which even the most frivolous aspirer after the most frivolous trappings of courtly honour would wish to obtain as soon, at least almost as soon, as that wand or ribbon to which his ambition is obliged to be at present limited. This, however, though it is the only possession which is safe from violence or fraud, is still safe from these. The tyrant, with all his power, cannot divest of it the most helpless of those on whom his tyranny is exercised; he cannot purchase it, even for a single moment, with all the treasures which he has amassed, with all the lands which he has desolated, with all that power which, in his hands, far from facilitating the acquisition, only renders more hopeless the attainment of those delights of conscience, to which he would still vainly aspire.

*Magne pater divùm, sævos punire tyrannos
Haud aliâ ratione velis, cum dira libidos
Moverit ingenium ferventi tincta veneno:
Virtutem videant, intabescantque relicta.
Anne magis Siculi gemuerunt aera juveni,
Et magis auratis pendens laquearibus ensis
Purpureas subter cervices terruit, Imus,
Imus præcipites, quam si sibi dicat, et intus
Palleat infelix, quod proxima nesciat uxor ??*

And it is well for the world, that the only consolation of which the virtuous stand in need cannot be forced from virtue, and usurped by vice. If the powerful could, by the promise of a reward like that which the Persian monarch offered, obtain the means of forming to themselves, or purchasing at the same cheap rate at which they purchase their other pleasures, that new pleasure of virtuous satisfaction, which nothing but virtue can give, vice would indeed have little to restrain it; and if he who can order the virtuous resister of oppression to the dungeon, or to distant exile; who can separate him—I will not say, from his home, and his domains, and external dignities, for the loss of these is comparatively insignificant, but from all those whom he loves and honours; from that conjugal, and filial, and parental, and friendly kindness, which would now be doubly valuable, when he might still have the comfort of seeing eyes, to which his own had often been turned in kindness, and of hearing voices, the very sound of which had often, in other griefs, been felt to be consolation, before the gentle meaning itself was uttered;—if the oppressor, who can strip his victim of all these present and external means of comfort, could

* Self-reproaching.—Orig.

† Cowper's Task, book v. v. 587—600, and 614—617.

‡ Persius, Sat. iii. v. 35—43.

strip him also of those remembrances, which allow him to look back on the past with satisfaction, and to the future with the confidence of one who knows, that whatever his path may be, he is to be received at the close of it, by that being whose majesty, awful as it is, is still only the majesty of a benevolence surpassing all earthly love;—if this could be done, then indeed might virtue in this world seem to be abandoned to the vengeance or the mercy of the guilty. But while these remain, what is there of which the glorious sufferer—I had almost said, if the words admitted combination, the happy sufferer—can be truly said to be bereaved? The friendships of those who are to meet again, and to meet for ever, are lost but for a moment; the dignities, the wealth, are not lost; all that is valuable in them, the remembrance of having used them as Heaven wishes them to be used, remains; there are years of happiness past, and an immortality of happiness, which is separated from the past only by a moment, and which will not be less sure, whether that moment be spent in fetters, with the pity, and gratitude, and veneration of the good, or with the same gratitude and veneration be spent, if a moment can be said to be spent, in liberty and opulence.

Man, indeed, is too frail not to yield occasionally to temptations; but he yields to temptations because he is stupefied by passion, and forgets, at the moment, the differences of the state of the vicious and the virtuous, that in calmer hours are present to him, with an influence of which he delights to feel the power. If these differences, the mere contrast of the feeling with which the pure and the guilty look back on the years of their glorious or inglorious life, could be made constantly present to the mind, there is little reason to think that all the seductions of power and momentary pleasure could prevail over him who sees what the good are, even in those adversities which the world considers as most afflicting, and what the guilty are, even in the midst of their enjoyments, without taking into account what they must be when those short and palling enjoyments have ceased:—

One self-approving hour whole years outweighs
Of stupid stagers, and of loud huzzas;
And more true joy Marcellus exil'd feels,
Than Cæsar with a senate at his heels.*

"The wicked man," says Rousseau, "fears and flies himself. He endeavours to be gay, by wandering out of himself. He turns around him his unquiet eyes, in search of an object of amusement that may make him forget what he is. Even then his only pleasure is a bitter raillery; without some contemp-

tuous sarcasm, some insulting laughter, he would be for ever sad. On the contrary, the serenity of the virtuous man is internal. His smile is not a smile of malignity, but of joy; he bears the source of it within himself; he is as gay alone as in the midst of the gayest circle; he does not derive his delightful contentment from those who approach him; he communicates his own to them."

Such are the emotions which are excited in us when we consider the past, in reference to ourselves as moral agents; and, if we knew nothing more of virtue and vice than these feelings alone, and knew, at the same time, that in a future state of existence there was a happiness destined for those who felt emotions of one or the other kind, could we hesitate for a moment in determining in which class we were to look for those by whom the happiness was to be inherited? It would not require any abstract notions of what is morally good and what is morally evil. The emotions themselves would distinguish sufficiently all that required to be distinguished. We should see in the agitation of a bad conscience, in the terror that arose in it at the very conception of futurity, and of him who presides over the future as over the past, that the misery which was anticipated was already begun; as in the tranquillity of the good, and the delight which they felt in the very contemplation of the perfection of the Divinity, we should perceive the commencement of that happiness which immortality was not to confer but to continue:—

Heaven our reward, for heaven enjoyed below.

With these remarks, I conclude my view of our retrospective emotions. The remaining series of emotions which we have still to consider, are those which relate to the future, comprehending the important class of our desires and fears, as these are diversified by all the variety of the objects on which they can be fixed, and by all the variety of degrees of probability, with which the good which we desire can be expected, or the evil anticipated and feared. In this order of our affections, as in all the emotions already considered by us, we shall find abundant proof of the wisdom and goodness of that being who has given us our passions, as he has given us our intellectual faculties, for nobler purposes than those of individual gratification,—purposes which the virtuous delight in seeing and fulfilling, and which the wicked unconsciously promote, even while they are regardless of the wisdom and goodness which protect the world, and equally regardless of that social world which is under this sublime protection.

* Pope's Essay on Man, Ep. iv. v. 255—258.

LECTURE LXV.

III. PROSPECTIVE EMOTIONS, COMPREHENDING ALL OUR DESIRES AND FEARS.—DESIRE AND FEAR MAY ARISE FROM THE SAME OBJECT.—OUR DESIRES ALWAYS HAVE FOR THEIR OBJECT SOME GOOD, AND OUR FEARS SOME EVIL.—DIFFERENCE BETWEEN THAT GOOD WHICH CONSTITUTES DESIRABLENESS, AND MORAL, OR EVEN ABSOLUTE PHYSICAL GOOD.—CLASSIFICATION OF DESIRES.—WISH, HOPE, EXPECTATION, CONFIDENCE, DIFFERENT FORMS OF DESIRE.—1. DESIRE OF CONTINUED EXISTENCE.

GENTLEMEN,—in my original arrangement of our emotions, I divided them into three orders, according as their objects were regarded by us as present, past, or future—our immediate emotions, our retrospective emotions, our prospective emotions. In my last Lecture, I concluded my remarks on the second of these orders, which, from their reference to the past, I have termed retrospective. One order still remains to be considered by us, the emotions which I have denominated prospective, from their reference to objects as future.

This order is, in its immediate consequences, the most important of all our emotions, from its direct influence on action, which our other feelings of the same class, and indeed all our other feelings whatever, influence only indirectly through the medium of these. It comprehends all our desires, and all our fears,—our desires, which arise equally from the prospect of what is agreeable in itself, or from the prospect of relief from what is disagreeable in itself,—our fears, which arise equally from the prospect of what is disagreeable in itself, and from the prospect of the loss of what is in itself agreeable. The same external object, agreeable or disagreeable, may give rise to both emotions, according as the object is or is not in our possession, or is or is not producing any present uneasiness; or when it is equally remote in both cases, according as the probability of attainment of the agreeable object, or of freedom from the disagreeable object, is greater or less. Hope and fear do not necessarily relate to different objects. We fear to lose any source of pleasure possessed by us, which had long been an object of our hope; we wish to be free from a pain that afflicts us, which, before it attacked us, was an object of our fear. We hope that we shall attain to a situation of which we are ambitious; we fear that we shall not attain to it. We fear that some misfortune, which seems to threaten us, may reach us; we hope that we shall be able to escape. The hope and the fear, in these cases, opposite as the emotions truly

are, arise, you perceive, from the same objects; the one or the other prevailing according to the greater or less probability on either side. But though they vary with different degrees of probability, they do not depend wholly on a mere comparison of probabilities. They arise, or do not arise, in some measure, also according to the magnitude of the object; our hope and our fear awaking more readily, as well as operating more permanently and strongly, when the object which we wish to attain, or of which we fear to be deprived, is very important to our happiness, though the probabilities on either side may be exactly the same as in cases of less importance, where desire and fear, if they arise at all, are comparatively feeble, and when often not the slightest emotion of either species arises:—

*Paucæ licet portas argenti vascula puri,
Nocte iter ingressus, gladium contumque timebis,
Et motæ ad lunam trepidabis arundinis umbram:
Cantabit vacuus coram latrone viator.**

The needy traveller, serene and gay,
Walks the wild heath, and sings his toil away.
Does envy bid thee crush the upbraiding joy?
Increase his riches, and his peace destroy!
Now fears in dire vicissitude invade,
The rustling brake alarms, and quivering shade;
Nor light nor darkness brings his pain relief;
One shews the plunder, and one hides the thief.

There can be no question, that he who travels in the same carriage, with the same external appearances of every kind by which a robber could be tempted or terrified, will be in equal danger of attack, whether he carry with him little of which he can be plundered, or such a booty as would impoverish him if it were lost. But there can be no question also, that though the probabilities of danger be the same, the fear of attack would, in these two cases, be very different; that, in the one case, he would laugh at the ridiculous terror of any one who journeyed with him, and expressed much alarm at the approach of evening; and that, in the other case, his own eye would watch suspiciously every horseman who approached, and would feel a sort of relief when he observed him pass carelessly and quietly along at a considerable distance behind.

That the fear, as a mere emotion, should be more intense, according to the greatness of the object, might indeed be expected; and if this were all, there would be nothing wonderful in the state of mind which I have now described. But there is not merely a greater intensity of fear, there is, in spite of reflection, a greater belief of probability of attack. There is fear, in short, and fear to which we readily yield, when otherwise all fear would have seemed absurd. The reason of this it will perhaps not be difficult for

* Juvenal, Sat. x. v. 19—22.

you to discover, if you remember the explanations formerly given by me, of some analogous phenomena. The loss of what is valuable in itself, is of course a great affliction. The slightest possibility of such an evil makes the evil itself occur to us, as an object of conception, though not at first, perhaps, as an object of what can be termed fear. Its very greatness however makes it, when thus conceived, dwell longer in the mind; and it cannot dwell long, even as a mere conception, without exciting, by the common influence of suggestion, the different states of mind, associated with the conception of any great evil; of which associate or resulting states, in such circumstances, fear is one of the most constant and prominent. The fear is thus readily excited as an associate feeling; and when the fear has once been excited, as a mere associate feeling, it continues to be still more readily suggested again, at every moment, by the objects that suggested it, and with the perception or conception of which it has recently coexisted. There is a remarkable analogy to this process, in the phenomena of giddiness, to which I have before more than once alluded. Whether the height on which we stand, be elevated only a few feet, or have beneath it a precipitous abyss of a thousand fathoms, our footing, if all other circumstances be the same, is in itself equally sure. Yet though we look down, without any fear, on the gentle slope, in the one case, we shrink back in the other case with painful dismay. The lively conception of the evil which we should suffer in a fall down the dreadful descent, which is very naturally suggested by the mere sight of the precipice, suggests and keeps before us the images of horror in such a fall, and thus indirectly the emotions of fear, that are the natural accompaniments of such images, and that but for those images never would have arisen. We know well, on reflection, that it is a footing of the firmest rock, perhaps, on which we stand, but in spite of reflection, we feel, at least at every other moment, as if this very rock itself were crumbling or sinking beneath us. In this case, as in the case of the traveller, the liveliness of the mere conception of evil that may be suffered, gives a sort of temporary probability to that which would seem to have little likelihood in itself, and which derives thus from mere imagination all the terror that is falsely embodied by the mind in things that exist around.

It is not, then, any simple ratio of probabilities which regulates the rise of our hopes and fears, but of these combined with the magnitude or insignificance of the objects. Yet, whatever may be this mixed proportion of probability and importance, the objects of desires and fears are not to be considered as essentially distinct; since these opposite emotions arise, as we have seen, from the

same objects, considered in different relations to us. There is nothing which, if it be not absolutely indifferent to us, may not excite both hope and fear, as the circumstances of our relation to it vary. This contrast of the mere circumstances, in which the opposite emotions arise, may save us from much discussion. It would be superfluous to consider all our desires in a certain order, and then to consider all our fears in a certain order, since we could only repeat, as to the one set of feelings, the observations previously made on the feelings that are contrasted with them. The consideration of our desires will be sufficient, of itself, to illustrate both sets of emotions, with a few remarks that may occasionally suggest themselves on the emotions of the opposite kind.

What, then, are our desires, or rather, what are the objects which excite our desires? for, with the mere feelings themselves I may suppose you to be fully acquainted; and any attempt to define them, as feelings, must involve the use of some word exactly synonymous, or will convey no meaning whatever.

To desire, it is essential that the object appear to us good; or rather, to appear to us good, and to appear to us desirable, are truly the same thing; our only conception of what is good, as an immediate object of desire, being that it excites in us, when considered by us, this feeling of desire. If all things had been uniformly indifferent to all mankind, it is evident that they could not have formed any classes of things as good or evil. What we do not desire may be conceived by us to be good, relatively to others who desire it, but cannot seem to be good, relatively to us. It would be as absurd to say, that we think that good which we should be very sorry to possess, or even which we should be wholly indifferent whether we possessed or not, as it would be absurd to say, that we think that object beautiful, from the sight of which we shrink with an unpleasant feeling as often as we behold it, or which, when we turn on it our most observant gaze, excites in us no emotion whatever.

When I say that to appear to us good, and to appear to us desirable, are only synonymous phrases, you cannot need to be told, that the good of which I speak, as synonymous with desirableness,—as that, in short, which immediately influences our actions, through the medium of our desires, is not to be confounded with moral good, nor even with absolute physical good. What we desire, far from being always good, in the sense in which that word corresponds with the phrases virtuous or agreeable to the divine will, is often completely opposed to it. We may feel that we are desiring what is

inconsistent with moral rectitude, and yet continue to desire it :—

*Video meliora, proboque;
Deteriora sequor.*

This is not what Medea only could say. It is the melancholy feeling of many minds that are deserters from virtue, indeed, but that have still for the calmness and holiness of virtue, all that respect which does not imply absolute obedience ; and that, in yielding to an influence, of which they feel all the seduction, are rather captivated by vice than blinded by it. Even with respect to mere physical good, without regard to moral excellence, we may desire what we know will be ultimately of injury to us, far greater than the temporary pleasure which it promises to yield ; and, though it appear to us injurious upon the whole, and would be far from being desired by us, if it had no present charms, we may yet prefer it from the influence of those present charms, which are sufficient of themselves to constitute desirableness. The good, therefore, which is synonymous with desirableness, is not necessarily and uniformly, however generally it may be, consistent with our own greatest advantage, or with moral propriety in our choice. It can be defined in no other way than simply as that which appears to us desirable, the desire itself being the only test, as it is the only proof of tendency in objects to excite desire. That immediate good, then, of whatever kind it may be, which we term desirableness, because it is instantly followed by desire, absolute physical good, moral good, are three phrases which have very different meanings ; yet, obvious as the distinction is, we are very apt to confound them, merely because we have applied to them the same term, or at least to distinguish them very loosely ; and from this confusion has arisen much of the controversy with respect to the influence of motives, and of the controversy also with respect to the universal influence of self-love in our benevolent affections,—disputations that, in the mode in which they have generally been managed, seem to me to have thrown as little light on the theory of morals as they have contributed to the advancement of practical morality.

It is not, then, the highest absolute physical advantage, nor the most undoubted moral excellence, which, as soon as perceived, is instantly followed by our choice ; that is to say, which forms necessarily the immediate good or desirableness of which I am at present treating ; the tendency of objects to excite in us emotions of desire. They may coincide with it indeed, and they may produce it, but they do not constitute it. In many instances, they may render immediately desirable what otherwise would not have

seemed to us good, or would even have seemed to us evil ; pain, for example, and privations of various kinds ; which, but for views of ultimate advantage, or of moral propriety, we should have feared rather than chosen : but though there are minds to which those greater motives can make pain and every form of present evil an object of choice, and, in some cases, of ardent desire, there are also minds to which the same views of advantage and of moral propriety will not render the pains or privations that are to produce the greatest ultimate good sufficiently desirable to influence their feeble will ; minds, that consider objects chiefly as present or future, near or remote, to which a moment is more than a distant age, a distant age but a moment ; and the pleasure of an hour, therefore, if it be the pleasure of the hour that is already smiling on them, far more precious than the happiness of immortality. Desire or choice itself, then, thus varying in different minds, is a proof only of the attraction of the object chosen ; that attraction to which, of whatever kind it may be, I have given the name of immediate desirableness, in reference to the instant desire or choice which is its consequent. But though the choice is of course a proof of the attraction which has induced the choice, it is far from being a proof of that preponderance of ultimate gain, which it might be worldly prudence to prefer, or of that moral rectitude, which is the only object of virtuous preference. That mind is most prudent, in the common sense of the term, to which the greatest amount of ultimate probable advantage is that which uniformly renders objects most desirable ; that mind is most virtuous, to which, in like manner, the moral propriety of certain preferences is that which uniformly confers on objects their prevailing attraction. But still, as I before remarked, we desire objects not merely as being morally worthy of our choice, or ultimately productive of the greatest amount of personal advantage to us, but for various other reasons, which constitute their immediate desirableness, as much, in many cases, or much more than any views of morality or calculations of selfish gain.

That we do not act always with a view to moral good, no one denies ; for, of an assertion so proud, the conscience of every one would, in this case, be a sufficient confutation ; and it is only a wretched sophistry which makes us less ready to admit that we act, in innumerable cases, with as little immediate view, at the very moment of our desire, to our selfish gain as to morality.

I shall not, however, at present enter fully on this discussion, which involves some of the most interesting inquiries in morals. But, with a view to the discussion, in which we may afterwards be engaged, I must re-

quest you to bear in mind the distinction of that good which is synonymous with desirableness, and of which the only test or proof is the resulting desire itself, from absolute physical good that admits of calculation, or from that moral good which conscience at once measures and approves. That which we desire must, indeed, always be desirable; for this is only to state, in other words, the fact of our desire. But, though we desire what seems to us for our advantage, on account of this advantage, it does not therefore follow that we desire only what seems to us advantageous; and that what is desirable must therefore imply, in the very moment of the incipient desire, some view of personal good. It implies, indeed, that satisfaction will be felt in the attainment of our desire, and uneasiness in the failure of it; but the satisfaction is the result of the attainment, not the motive to the desire itself, at the moment when the desire arose; as the uneasiness is the result of the failure, not a feeling preceding the desire, and prompting it. The desire, in short, must have existed primarily, before satisfaction could have been felt in the attainment of its object, or regret when the object was not attained. To say that we can desire only what is desirable, is then to say nothing in support of the theory, which would make our advantage the only motive of our desires; unless it could be shown by some other argument, founded on actual observation or analysis, that the feeling of our advantage, in some respects, precedes uniformly all our desires, so as to be, in truth, that which constitutes, in every case, the immediate and simple desirableness. If, on the contrary, it appear that we desire many things which, though they may contribute directly or indirectly to our advantage, are yet desired by us immediately, and without any view to this advantage, at the moment at which the desire arose, the argument, from the mere fact of the desire itself, must be absolutely nugatory. It either says nothing whatever, or by confounding the immediate desirableness with our own personal gain, it begs or it assumes the very point in question.

Desirableness, then, does not necessarily involve the consideration of any other species of good, it is the relation of certain objects to certain emotions, and nothing more; the tendency of certain objects, as contemplated by us to be followed by that particular feeling which we term desire.

I have said, that, with the feeling of desire as the mere emotion thus produced by certain objects, you must all be sufficiently acquainted. It is a feeling which is, of course, in some degree complex, as implying always, together with the vivid feeling that arises on the prospect of good, the concep-

tion of the object which seems desirable; but the vivid feeling combined with this conception, seems to me of a peculiar kind, or at least to be something more than can be reduced to any of those elementary feelings which have been considered by us. It is not mere approbation or love of an object, as capable of affording us a certain amount of enjoyment, but that which results from such love, as its effect. It is not the mere regret that is felt on the absence of a beloved object, but a prospective feeling, which may or may not attend that retrospective regret, and which, far from being painfully depressing, like regret, is, at least in many of its forms, one of the most delightful excitements of which our mind is susceptible, the embellisher of existence, and the creator of the greater portion of that happiness which it seems at the time only to present to our distant gaze. Love of an object, regret at the absence of that object, these feelings we may discover by analysis: but discovering these, we discover rather what gives birth to our wishes than what constitutes them; the sunbeams and the kindling incense from which the phoenix arises, rather than the vigorous bird itself, immortal in the very changes of its seeming mortality.

To enumerate the objects of our desire and fear, would be to enumerate almost every object which exists around us on our earth, and almost every relation of these objects, without taking into account the variety of wishes more fantastic, which our wild imagination is capable of forming. A complete enumeration of all the possibilities of human wishes, is almost as little to be expected as a complete gratification of all the wishes of man, whose desires are as unlimited as his power is bounded. The most important, however, may be considered as comprehended in the following series: First, our desire of continued existence, without any immediate regard to the pleasure which it may yield; secondly, our desire of pleasure, considered directly as mere pleasure; thirdly, our desire of action; fourthly, our desire of society; fifthly, our desire of knowledge; sixthly, our desire of power, direct, as in ambition, or indirect, as in avarice; seventhly, our desire of the affection or esteem of those around us; eighthly, our desire of glory; ninthly, our desire of the happiness of others; and, tenthly, our desire of the unhappiness of those whom we hate. On these it is my intention to offer a few brief remarks, in the order in which I have now stated them.

I must observe, however, in the first place, that each of these desires may exist in different forms, according to the degree of probability of the attainment of its object. When there is little if any probability, it con-

stitutes what is termed a mere wish ; when the probability is stronger, it becomes what is called hope ; with still greater probability, expectation ; and, with a probability that approaches certainty, confidence. This variation of the form of the desire, according to the degrees of probability, is of course not confined to any particular desire, but may run through all the desires which I have enumerated, and every other desire of which the mind is or may be supposed to be capable.

Hope, therefore, important as it is to our happiness, is not to be considered as a distinct emotion, but merely as one of the forms in which all our desires are capable of existing. It is not the less valuable on this account, however, but, on the contrary, the more truly precious, since it thus confers on us, not one delight only, but every thing, or almost every thing which it is in our power even to wish. What hour of our waking existence is there to which it has not given happiness or consolation ?

I need not speak of the credulous alacrity of our wishes, in our early years, when we had only trifles indeed to desire, but trifles which were as important to us as the more splendid baubles that were probably to occupy, with a change of follies, our maturer ambition. "Gay hope is theirs," is one of the expressions, in reference to the happiness of boyhood, in Gray's well-known Ode ; and there can be no question that even at that period, when we do not look very far forward, still a great part of the happiness that is felt, even when there is so much boisterous merriment of the present, is derived from a prospect of that little futurity which is never wholly absent from the view,—a futurity which may not, in this case, extend beyond the happy period of the next holidays, but which is still a field of hope, as much as that ampler field which is ever opening wider and wider on the gaze of manhood. In opening, indeed, thus wider and wider, it extends itself only to extend the empire of our wishes. There is, then, no happiness which hope cannot promise, no difficulty which it cannot surmount, no grief which it cannot mitigate. It is the wealth of the indigent, the health of the sick, the freedom of the captive. There are thoughts of future ease, which play with a delightful illusion around the heart of him who has been born in poverty, bred in poverty ; who, since the very hour when his arms were first capable of as much labour as could earn one morsel of his scanty meal, has spent his life, not in labour merely, but in unremitting fatigue ; to whom, since that very hour, a day of ease has been as much unknown as a day of empire, with the exception of that single day, which, in its weekly return, is a season of comfort at once to the body and to the

mind ; giving rest to him who has no other rest, and revealing to him, at the same time, that future world which is the world of those who have toiled on earth, at least as much as the world of those who have subsisted by the toils of others. On the bed of sickness, how ready is the victim of disease to form those flattering presages which others cannot form ; to see, in the tranquil looks of those who assume a serenity which they do not feel, a confident expectation of recovery, which has long in their hearts given place to despair ; and to form plans of many future years, perhaps in that very hour which is to be the last hour of earthly existence. If we could see all those wild visions of future deliverance, which rise, not to the dreams merely, but to the waking thought of the galley-slave who has been condemned to the oar for life, we should see, indeed, what might seem madness to every heart but his, to which these visions are in some measure like the momentary possession of the freedom of which he is for ever to be deprived ; and, in this very madness of credulous expectation, so admirably adapted to a misery that admits of no earthly expectation which reason can justify, we should see at once the omnipotence of the principle of hope, and the benevolence of him who has fixed that principle in our minds, to be the comfort even of despair itself, or at least of miseries, in which all but the miserable themselves would despair.

Such is the influence of hope through all the years of our existence. As soon as we have learned what is agreeable, it delights us with the prospect of attaining it ; as soon as we have lost it, it delights us with the prospect of its return. It is our flatterer and comforter in boyhood ; it is our flatterer and comforter in years which need still more to be flattered and comforted. What it promises, indeed, is different in these different years ; but the kindness and irresistible persuasion with which it makes the promise are still the same ; and while we laugh in advanced age at the easy confidence of our youth, in wishes which seem incapable of deceiving us now, we are still, as to other objects of desire, the same credulous, confiding beings, whom it was then so easy to make happy. Nor is it only over terrestrial things that it diffuses its delightful radiance. The power which attends us with consolation, and with more than consolation, through the anxieties and labours of our life, does not desert us at the close of that life which it has blessed or consoled. It is present with us in our last moment. We look to scenes which are opening on us above, and we look to those around us, with an expectation still stronger than the strongest hope, that, in the world which we are about to enter, we shall not have only remembrances of what we loved and revered

on earth, but that the friendships from which it is so painful to part, even in parting to heaven, will be restored to us there, to unite us again in affection more ardent, because unmingled with the anxieties of other cares, and in still purer adoration of that great being, whose perfections, as far as they were then dimly seen by us, it was our delight to contemplate together on earth, when it was only on earth that we could trace them, but on that earth which seemed holier, and lovelier, and more divine, when thus joined in our thought with the excellence that made it.

Hope, then, which is thus universal in its promises, and unceasing in the influence which it exercises, is not to be considered as one emotion merely, but as all our desires, however various their objects may be. We wish, we hope, we expect, we confide; or, if there were other words which could express different degrees of the probability of our attainment of what we desire, we might employ them with propriety; since every additional degree of probability, or even any greater vividness of interest in the object itself, varies in some measure the nature of the desire which we feel. It is enough for you, however, to understand, with respect to these words which express the more remarkable shades of difference, that to wish, to hope, to expect, to trust, though expressive of feelings that must always be different, whether the objects of these feelings be different or the same, yet do not form classes of feelings essentially distinct from our general emotions of desire, but are merely those emotions themselves, in all their variety, according as we conceive that there is more or less likelihood of our obtaining the particular objects which we are desirous of obtaining. In a competition of any kind, in which there are many candidates, there is perhaps some one candidate who is aware that he has very little interest, and who has, therefore, scarcely more than a mere wish of success. He canvasses the electors, and he finds, to his surprise perhaps, that many votes are given to him. He no longer wishes merely, he hopes; and, with every new vote that is promised, his hope grows more vivid. A very few votes additional convert the hope into expectation; and when a decided majority is engaged to him by promise, even expectation is too weak a word to express the emotion which he feels; it is trust, confidence, reliance, or whatever other word we may choose to express that modification of desire which is not the joy of absolute certainty, like the actual attainment of an agreeable object, and yet scarcely can be said to differ from certainty. In this series of emotions, nothing has occurred to modify them but a mere increase of probability in the successive stages; and the same scale of pro-

habililities, which admits of being thus accurately measured in an election that is numbered by votes, exists truly, though perhaps less distinctly, in every other case of desire in which we rise from a mere wish to the most undoubting confidence.

You will understand, then, without the necessity of any further illustration, that hope and the various forms of our wishes and reliances, more or less vivid, are not a separate class of emotions, but are only names of all our desires, that vary according to the prospect of attainment which their objects seem to us to present. We may wish, hope, expect, or trust in our attainment of some rattle in childhood, as we wish, hope, expect, or trust that we are to attain the scarf, or garter, or gold, which is the amusement of our riper age. Even when we think of the noblest objects that can fill our mere earthly desires, of the happiness of nations, or of the whole animated world, when the patriot rises to shake some ferocious invader from that throne, to which he had risen by trampling on the bodies of those who had rushed boldly but unsuccessfully forward in the same heroic spirit of national freedom and deliverance, or when the philosopher looks, through many ages of futurity, to the years which, as he trusts, are to perfect the great plans of heaven, in the diffusion of happiness and virtue to mankind, he wishes, hopes, expects, confides, as the triflers around him are wishing and confiding; the only difference is, that the very wishes of the patriot and of the general philanthropist, are wishes which, though they should never be realized, it is dignity to feel even as wishes; and, that the vain and sensual objects which occupy the whole heart of the idle and the profligate, are objects which it is disgraceful to desire with passion, and still greater disgrace, and still greater misery, even for those who have been capable of thus passionately desiring them, to obtain.

There is one other preliminary remark which it may be necessary to make before entering on the consideration of our separate desires. In the arrangement of our emotions, you must have observed that no peculiar place has been set apart by me for the passions; the reason of which is, that our passions are truly no separate class, but merely a name for our desires, when very vivid, or very permanent. It is impossible to state in words at what degree of vividness or permanence we cease to speak of a desire, and term it a passion. This, it is probable, that different individuals would do very variously; but all, unquestionably, would use these different terms, when there is any very remarkable difference in these respects. A slight desire of higher station, which comes upon us at intervals, and is soon forgotten in the cares or in the delightful occupations of

domestic life, no one would think of calling a passion more than the individual himself; who smiles, perhaps, sometimes at his own little dreams of ambition, as if they were the idle musings of another mind, and, on awaking, looks at the tranquillity and happiness around him with a sort of gladness that his dream was only a dream. It is when the wish of worldly power and splendour is not the emotion of a single minute, but the exclusive or almost exclusive wish of the heart, when it allows other desires occasionally to intervene, but recurs still with additional force, as if to occupy again what is its own possession, and to feed on new wishes of advancement, or new projects of obtaining what it wished before; it is then when the desire is vivid and permanent that we term it a passion, and look perhaps with pity on him who is its victim.

After these remarks, which, I flatter myself, have pointed out to you some distinctions which it may be of importance for us to remember in our subsequent discussions, I proceed to the consideration of our desires in the order stated by me.

The first of these is our desire of our own continued existence. Strong and permanent as our wishes of delight may be, it is not happiness only which we desire, nor misery only which we dread; we have a wish to exist, even without regard at the moment of the wish to the happiness which might seem all that could render existence valuable; and annihilation itself, which implies the impossibility of uneasiness of any kind, is to our conception almost like a species of misery. Nor is it only when life presents to us the appearance of pleasure, wherever we look, and when our heart has an alacrity of enjoying it, wherever it is to be found, that the desire of a continuation of this earthly existence remains. It remains, and, in many instances, is perhaps still stronger in those years when death might seem to afford only the prospect of a ready passage to a better world.

*Da spatium vite, multos da, Jupiter, annos:
Hoc recto vultu, solum hoc et pallidus optas.**

"O, my coevals!" says the author of the *Night Thoughts*, at a time when he was himself advanced in age,

*O, my coevals! remnants of yourselves
Poor human ruins, tottering o'er the grave!
Shall we, shall aged men, like aged trees,
Strike deeper our vile root, and closer cling,
Still more enamour'd of this wretched soil!†*

To explain the apparent inconsistency of the increased love of life that is so frequently observed in old age, when the means of enjoyment are diminished, we must remember, that, by the influence of the suggesting

principle, life, as a mere object of conception to the old, retains still many charms which in reality it does not possess. The life, of which they think, is the life of which they have often thought; and that life was a life full of hopes and enjoyments. The feelings, therefore, which were before associated with the notion of the loss of life, are those which still occur, on the contemplation of its possible loss, with the addition of those enjoyments which a long series of years must have added to the complex conception, and the loss of which, as one great whole, seems to be involved in the very notion of the loss of that life of which the enjoyments formed a part. It must be remembered, too, that if life be regarded as in any degree a blessing, the mere circumstance of the increased probability of its speedy termination must confer on it no slight accession of interest. This is only one of many instances of the operation of a very general principle of our nature; the likelihood of loss being itself almost a species of endearment, or at least producing, in every case, a tenderness that is soon diffused over the object which we contemplate, that seems thus to be more lovely in itself, merely because, from its precariousness, we love it more.

Absurd, however, as the desire may seem in such cases, it is, as a general feeling of our nature, a most striking proof of the kindness of that being who, in giving to man duties which he has to continue for many years to discharge in a world which is preparatory to the nobler world that is afterwards to receive him, has not left him to feel the place in which he is to perform the duties allotted to him, as a place of barren and dreary exile. He has given us passions which throw a sort of enchantment on every thing which can reflect them to our heart, which add to the delight that is felt by us in the exercise of our duties,—a delight that arises from the scene itself on which they are exercised, from the society of those who inhabit it with us, from the offices which we have performed and continue to perform.

While these earthly mitigations of our temporary exile, if I may venture to speak of exile in relation to a world which we have not yet reached, are thus bounteously-granted to us, there may indeed be a fear of death, more than is perhaps necessary for this benevolent purpose, in the breasts of those who are too abject in their sensual and sordid wishes to think of heaven, or too conscious of guilt to think of it with tranquillity. But to minds of nobler hopes, which, even in loving life and all which life presents, have not forgotten how small a part it is of that existence which it only opens to them, what objects are presented; I will not say, to reconcile them merely to the simple transition

* Juvenal, Sat. x. v. 188, 189.

† Night iv. v. 109—112.

in which death consists, but to make this very transition a change which, but for the tears of other eyes and the griefs of other hearts, they may smile tranquilly, or almost exult to see approaching ! There are minds, indeed, which may truly exult at this parting moment, which can look back on the conflicts of this fading scene, like the victor of some well-fought field, who closes his eye in the hour of some triumph, that has been the triumph of freedom more than of war, amid the blessings of nations ; and who, in the very praises and blessings that are the last sounds of life to his ear, hears rather the happiness which he has produced, than the glory which he has won.

Death is victory ;
It binds in chains the raging ills of life ;
Lust and Ambition, Wrath and Avarice,
Dragged at his chariot-wheel, applaud his power.
That ills corrosive, cares importunate,
Are not immortal too, O Death ! is thine.
And feel we, then, but dread from thought of thee ?
Death, the great Counsellor, who man inspires
With every nobler thought and fairer deed !
Death, the deliverer, who rescues man !
Death, the rewarder, who the rescued crowns !†

How admirable is that goodness which knows so well how to adapt to each other feelings that are opposite, which gives to man a love of life enough to reconcile him, without an effort, to the earth which is to be the scene of his exertions ; and which, at the same time, gives those purer and more glorious wishes which make him ready to part with the very life which he loved.

LECTURE LXVI.

III. PROSPECTIVE EMOTIONS.—1. CONSIDERATION OF THE DESIRE OF CONTINUED EXISTENCE, CONCLUDED.—2. DESIRE OF PLEASURE.

IN my last Lecture, Gentlemen, I began the consideration of that order of our emotions which, from their relation to objects as future, I distinguished from our immediate and retrospective emotions, by the name of prospective,—an order which comprehends our desires and fears, the most important of all the affections of our mind, as the immediate directors of our conduct, which our other mental affections, of whatever species, influence only indirectly through the medium of our wishes.

With respect to this order in general, I endeavoured to explain to you how the same objects, agreeable or disagreeable, may, in

different circumstances of our relation to these objects, as present or absent, give rise both to hope and to fear ; and how different the feeling of the mere desirableness of an object, which is nothing more than the relation of certain objects perceived or conceived as antecedents to our desires as consequents, is from the feeling of the greater amount of personal advantage, or of the moral propriety of certain actions ; both which considerations, indeed, may produce the tendency to desire, in some cases, but do not necessarily constitute it in all ; the clearest perception of greater advantage from certain actions which it would be worldly prudence to prefer, and of moral propriety in certain actions which it would be virtue to prefer, being often insufficient to overcome other circumstances of momentary attraction, which thus obtain our momentary preference, even though felt to be in absolute opposition to our good upon the whole, and to that virtue, which is itself, indeed, a part, and the most important part of this general good.

Since the objects of desire, which are so various to different persons, that perhaps no two objects are regarded with the same interest and choice by any two individuals, are not limited even to the infinity of existing things, but comprehend whatever the wildest imagination can conceive, I stated to you the impossibility of any exact enumeration of these objects, such as might enable us to treat compendiously of the whole boundless variety of human wishes. All which I could venture to do, therefore, was to class the principal objects that seem in their nature to involve that species of attraction which, as immediately antecedent to all our wishes, I have termed desirableness ; that is to say, the most important of those objects which cannot, in the ordinary circumstances of our nature, be contemplated by us without exciting the emotion of desire. Of these I enumerated the following :—Our desire of the mere continuation of our being ; our desire of pleasure ; our desire of action ; our desire of society ; our desire of knowledge ; our desire of power, whether of direct power, as in what is commonly termed ambition, or of indirect power, as in avarice ; our desire of the affection or esteem of those around us ; our desire of glory ; our desire of the happiness of others ; our desire of the unhappiness of those whom we hate.

All these desires, however, I stated, may exist in various forms, according to the different degrees of probability of attainment ; a simple wish, hope, expectation, confidence, being the most remarkable gradations in the scale ; though there are various intervening shades of difference, to which no name is given. They are not species of desires essentially distinct, but modes of all our desires.

* And feel I, Death ! no joy from thought of thee ?
—in the original.

† Young's Night Thoughts, Night iii. v. 495—500, 511—515.

Our wishes, when they exist with little force and permanence, are termed simply desires; when they rise more vividly, and occupy the mind more exclusively, they are termed passions. The vividness, and permanence, therefore, are the only circumstances which distinguish our passions; not any essential difference in the particular nature of the desires themselves. The slightest wish, which we scarcely feel as a very vivid emotion, becomes a passion when it affects us strongly and lastingly. The most ardent passion, which may have occupied our whole soul for half our life, if it were to rise only slightly and faintly, would be termed a mere desire.

After these general preliminary distinctions, I proceeded to the consideration of our particular desires; and, in my last Lecture, offered some remarks on the first of these, in my order of enumeration. Of the great fact of that desire of life which you must see operating universally around you, you could not need to be informed; and my observations, therefore, were chiefly illustrative of that beautiful adaptation of our nature to the scene on which we have to discharge the various duties of men, that is effected by this principle of our constitution,—a principle which renders the scene of those duties itself delightful, as the scene of our continued being,—of that life which we love in itself, and which is associated, in our conception, with the scene on which every moment of our life has passed.

Instead, therefore, of viewing, in our love of life, a principle disgraceful to our nature, we may see in it far more truly a principle which does honour to our nature, because it answers admirable purposes in our moral constitution. What happiness would it be to those who were to be confined in the most gloomy prison for a series of years, if, during all this long period of confinement, the very prison itself were to seem to them a delightful habitation, and when the hour of deliverance came, we had only to open the gate and lead the prisoner forth to sunshine and the balmy breeze, which were not to be the less delightful, then, on account of the captivity in which his former years were spent! I need not point out to you how exactly the case now imagined corresponds in every circumstance, except in the gloom and narrowness of the prisoner's dismal abode, with that which truly constitutes our situation as temporary inhabitants of this delightful earth.

It is not the mere love of life which is disgraceful in itself; but the cowardly love of it, which does not yield to nobler desires. Every wish which we can feel for objects that are apt to affect ourselves, has of course relation to the future, and therefore to some protraction of our existence, the wish of which must consequently be involved in every other per-

sonal wish, the most honourable which the mind can form. To desire the continuation of life, is to fear the loss of it; and to fear the loss of it, is to fear every thing which may bring it into danger. Even the brave man, then, will avoid danger, where no virtue would lead to the exposure; but when virtue requires exposure, he will scarcely feel that it is peril to which he is exposing himself. Glory, the good of mankind, the approbation of his own heart, the approbation of God,—these are all which the brave man sees; and he who, seeing these, can sacrifice them to the love of mere animal life, is indeed unworthy, I will not say of vanquishing in a cause which it is noble to prevail, but even of perishing in a cause in which it is noble to perish.

The next desire to the consideration of which I proceed, is our desire of pleasure; to which the fear of pain may be regarded as opposed. Annihilation indeed seems to us an evil, independently of the happiness or misery of which it may deprive us, or from which it may free us. We love the mere continuance of our being, but we love still more our well-being; and existence is valuable to us chiefly as that which can be rendered happy. He who formed us to be happy, of course formed us to be desirous of happiness. The desire, indeed, may be considered as almost involved in the very notion of happiness itself, which could scarcely be conceived by us as happiness, if it were not conceived as that which is an object of desire.

I may say of the love of pleasure what I have said of the love of life. As it is not the love or preservation of life which is unworthy of a brave and honourable man, but the love of a life that is inconsistent with nobler objects of desire; it is, in like manner, not the love of pleasure which is unworthy of us, for pleasure, in itself, when arising from a pure source, is truly as pure as the source from which it flows; but the love of pleasure that is inconsistent with our moral excellence. The delight which virtue gives, and which devotion gives, is no small part of the excellence even of qualities so noble as devotion and virtue. We love men more, we love God more, because it is impossible for us to love them more without an increase of our delight. In this sense, indeed, to borrow a beautiful line, which expresses much in a very few words,

Pleasure is nought but Virtue's gayer name.*

Even of pleasures which do not flow immediately from virtue, but of which virtue is far from forbidding the enjoyment, how many are

* Young's Night Thoughts, Night viii. v. 573.

there which nature is continually inviting us to enjoy! There are seasons, in which we cannot move a single step, or look around us, or inhale a single breath of air, without some additional happiness. To move is delightful, to rest is delightful. It seems almost as if the same sun, which is everywhere diffusing light, were diffusing everywhere happiness; and not to be happy, and not to love the sources of happiness around us, seem to us almost like ingratitude to the Author of these, and a sort of rebellion against that benevolence which so manifestly wills our enjoyment. The words with which Beattie concludes one of the most beautiful stanzas of his principal poem, express, in this respect, a sentiment with which it is impossible for us not to sympathize.

O how canst thou renounce the boundless store
Of charms which Nature to her votary yields!
The warbling woodland, the resounding shore,
The pomp of groves, and garniture of fields;
All that the genial ray of morning gilds,
And all that echoes to the song of even,
All that the mountain's sheltering bosom shields,
All that the dread magnificence of Heaven,
O how canst thou renounce, and hope to be forgiven?*

The love of pleasure, then, is far from being unworthy of man, since all which we admire in the universe, all which raises us to admiration of the Author of the universe, is accompanied with it. We cannot love virtue without loving a source of delight; we cannot love him, who has made us capable of loving virtue, without a delight still more ardent. We must love pleasure if we love whatever is worthy of being loved.

But the pleasures that attend virtue, or which virtue approves, are not the only pleasures which man is capable of feeling. He may have a sort of dreadful satisfaction in the fulfilment of the most malignant desires, or he may become the self-degraded slave of his own appetites. There are sensual gratifications, of which, though virtue may not forbid the temperate use, she forbids the intemperate excess; not because they are pleasures, but because they render us incapable of discharging duties which we have to perform; or, which is a still greater evil, deprive us even of the very wish of discharging our duties. In a former Lecture I endeavoured to describe to you the melancholy progress of a mind which has yielded itself gradually with fewer and fewer struggles, a slave to the tyranny of sensual passions,—of passions which stupify still more than they enslave. It is this stupefaction of better powers and feelings which, far more than the loss of mere fortune and health, is the most pathetic or the most dreadful image in every such description of the sacrifices of the dissolute.

Your friends avoid you. Brutishly transform'd,
They hardly know you; or, if one remains
To wish you well, he wishes you in heaven.
Despised, unwept, you fall, who might have left
A sacred, cherish'd, sadly pleasing name,
A name still to be utter'd with a sigh.†

Even if nothing more than mere sensual pleasure were to be taken into account, without comprehending, in our estimate, the miseries of shame and remorse and ruined fortune, and without any regard to those sublimer delights, which the sensual lose, and which they perhaps care not for losing, because they are incapable of conceiving them; there can be no question that in this least important part of happiness, which alone they value, they are inferior to those who enjoy indeed those external pleasures, which it is only gratitude to heaven to enjoy, but who think of their senses as the sources of instruction more than as the medium of indolent luxury. We are not to consider, in our estimate, the momentary enjoyments only; we are to consider the sensual pains, as well as the sensual delights; the languor, the satiety, the sickness, the days that in ill health hang heavily without amusement, and the nights without repose, in which the mind that has no consolation within, is still more restless than the restless body. Yet these are the disquietudes, which, if combined with a dull repetition of amusements that are amusements no more, of splendour that ceases to afford pleasure, because it is a splendour which is even more familiar to us than the want of it, and of intercourse with smiling faces and vacant hearts, which agree with our own, as truly in the listlessness and weariness that are felt as in the cheerfulness that is affected, are what, if we have unfortunately entered on such a life, we strangely term a life of gaiety.

Whom call we gay? That honour has been long
The boast of mere pretenders to the name.
The innocent are gay—The lark is gay,
That dries his feathers, saturate with dew,
Beneath the rosy cloud, while yet the beams
Of day-spring overshoot his humble nest.
The peasant too, a witness of his song,
Himself a songster, is as gay as he.
But save me from the gaiety of those
Whose headaches nail them to a noon-day bed!‡

The innocent, indeed, are the gay; and their gaiety is not sickness and vexation, but happiness. It is a gaiety which flows so readily around them, that it is not easy to distinguish how much of it is derived from without, and how much of it has its source within. All which we perceive, is that they are happy, and that their happiness is not to be obtained without the innocence which leads to it. With this purity of heart, the very senses enjoy pleasures, which require no cost to produce them, but which surpass all the enjoyments which the extravagant

* Minstrel, book i. stanza ix.

† Armstrong's Art of preserving Health, 200.
‡ Cowper's Task, book i. v. 491—600.

luxury of the sensual can devise. In the first vernal walk of the lovers of nature, the sight of a single cottage, which speaks to them of the happiness of those who dwell in a scene so beautiful, of a single wild-flower, which, at the opening of spring, seems to announce the continued care of that God who is again, as in former years, to cover the earth with all the profusion of his bounty,—gives to them a pleasure, which if the proud and luxurious could purchase by the magnificence of their richest banquets, they would not be magnificent in vain.

The desire of relief from pain may be regarded only as another form of the desire of pleasure; and in this sense, the species of emotion which we have been considering, besides its relation to every accidental pain, comprehends all the desires that are involved in our bodily appetites, as distinguished, in that analysis which we formerly made, from the mere uneasiness which gives occasion to the desire; the desire of food or drink, for example, as distinguished from the mere pain of hunger or thirst, which must exist as sensations before any such desires that are subsequent to the sensations can be felt. In the same way, the desire of relief may be thought to comprehend that emotion which is next to be examined by us, the desire of action; and, to a certain degree, it unquestionably does comprehend it; since long inaction produces a pain in our limbs, which prompts us to the necessary motion, as truly as the long want of food produces a pain of a different sort, which prompts us to have recourse to that which alone can give relief to such a pain. But the action, of which I speak at present as the object of a peculiar species of desire, is far more than this desire of relief from muscular languor; it is a continued exertion, which we do not abandon immediately after freeing our muscles from this uneasiness, which soon passes away at the very beginning of exercise, but prosecute, perhaps, till we produce in them a pain of an opposite kind, the pain of fatigue.

I am aware, indeed, that according to the system of many philosophers, who consider our own selfish enjoyment as the sole object of our wishes, to speak of other desires, after mentioning the desire of pleasure as one of our emotions, must be absolutely superfluous; since the desire of pleasure, according to them, must, in some one of its forms, be the desire of every thing which man can immediately desire. The remarks which I made on this subject in my last Lecture, have prepared you, however, I trust, for seeing the fallacy of this supposition; since, though every thing which we desire must have seemed to us desirable, as the very fact of the desire denotes; and though the at-

tainment of every such desire must be attended with pleasure, it does not therefore follow that the pleasure which truly attends this fulfilment of desire, was the primary circumstance which excited the desire itself. We may feel happiness from exertion of every kind, from society, from the discovery of truth, from the good fortune of our friends, and yet have desired these without any view at the moment of the beginning desire to this resulting happiness, and merely from the constitution of our nature, which leads us to desire knowledge, simply as knowledge, because there is something of which we are ignorant, and which we may readily learn, society simply as society. Nature, indeed, has attached pleasure to these, as she has attached pleasure to many of our functions which we do not exercise on account of that pleasure. But in considering the origin of our desires, we are to think only of what is contemplated by the mind at the very moment when the emotion arises, of the circumstances antecedent to the desire, and not of circumstances which may or may not be its consequents. The mother derives pleasure from loving her new-born infant; and a superficial thinker might say, in this case, as indeed many superficial thinkers have said, that she loves her infant for no other reason than this pleasure, and that but for her own selfish delight, she could see it perish without the slightest concern. A very little observation, however, is sufficient to show us, that the love, in this case, though accompanied with pleasure, is, in its origin, independent of the pleasure, and must have preceded it, or the pleasure could not have been felt; for if there had been no previous emotion of a peculiar love in the mother, to distinguish the infant from every other infant, where are we to find the peculiar pleasure, from which alone the peculiar love is said to be derived? What is so evidently true in this case, is true in many other cases. The emotion arises, and is attended with pleasure; but it does not arise on account of the pleasure. On the contrary, the pleasure is felt, because the emotion has previously arisen, and could not have been felt but for the previous emotion that is gratified. It is, as in journeying to some distant scene, at the call of business or of friendship; the landscape may be beautiful, and may delight us, therefore, in every stage of our journey, the very exercise itself may be pleasing. Without the journey, it is evident that we could not have enjoyed this beauty of the scene, and this pleasure of the exercise; but we do not journey on account of these delights. At the same call, we should have traversed the same road, though the landscape had been dreary and desolate on every side, and though fatigue had converted the exercise itself into uneasiness. "Whatever the mo-

tive," it has been said by a poetical defender of this doctrine,—

What'er the motive, pleasure is the mark :
For her, the black assassin draws his sword ;
For her, dark statesmen trim their midnight lamp,
To which no single sacrifice may fall :
For her, the saint abstains ; the miser starves ;
The Stole proud, for pleasure, pleasure scorn'd :
For her, affliction's daughters grief indulge,
And find, or hope, a luxury in tears :
For her, guilt, shame, toil, danger, we defy,
And with an aim voluptuous, rush on death.*

This, indeed, though in verse, is as sound philosophy as much duller philosophy of the same kind ; but powerful as it may be in poetic antithesis, it is as verse only that it is powerful, not as a statement of philosophic truth. We desire, indeed, all these objects ; and however ill-fitted some of them may appear to be productive of delight, we may perhaps feel pleasure in all these objects, as we certainly should feel pain, if we were not to obtain what we desire, whatever the object of desire may have been ; but it is not the pleasure which was the circumstance that prompted our desire when it arose, it was the desire previously awakened which was accompanied with pleasure, or was productive of pleasure, the pleasure being, in all these cases, the effect of the previous desire, and necessarily presupposing it. We desire the happiness of others, and we have pleasure in this desire ; but, with the same capacity of mere love as now, we should have desired the happiness of others, though no direct pleasure to ourselves had followed our generous wish. We desire knowledge, and we are delighted with the attainment of it ; but if the constitution of our mind had continued in every other respect the same as now, we should have felt curiosity, though it had terminated only in simple knowledge.

It is the very nature of our mind, as originally constituted with certain tendencies, that some objects should seem to it immediately desirable ; as it is its very nature that certain objects should seem to it immediately proportioned in symmetry, or related to each other in various ways. When we think of the series of numbers, two, four, eight, sixteen, we perceive that each is the double of the number preceding, and we perceive this, perhaps, without any pleasure whatever, certainly at least independently of any pleasure which may be felt. The mere conception of the numbers, as a primary feeling, gives rise to the feeling of the relation of the parts of the series, whether the discovery of the relation be or be not accompanied with the pleasure. It is, in short, the very nature of the numbers, so conceived together, to appear to us so related. It is the same with that relation of a different kind, which

I have termed desirableness. When we are assured of the particulars of any fact connected with a speculation in which we may be engaged, it is impossible for this fact to be considered by us, as something of which we are capable of obtaining more accurate knowledge without being instantly desirable, that is to say, without exciting in instant sequence our desire of knowing it fully. It seems to us desirable, as immediately as four is perceived by us to be the double of two, and eight of four ; and it seems to us desirable, merely from its very nature, as a fact illustrative of our particular speculation, as much as two, four, eight, appear to us related, instantly, and without any conception of the pleasure which we may feel in discovering the relation. Pleasure, indeed, attends the discovery ; but it is surely very evident, that there must have been curiosity before the pleasure, or no pleasure could have been felt. Pain or disquietude attends the ungratified curiosity. But, in like manner, there must have been a previous desire of knowledge, or if there was no previous desire of knowing any thing, there could be no pain in the continued ignorance. The pleasure and pain, in short, however early, presuppose always a desire still earlier, or they must have been effects that arose from neither.

The immediate desirableness of objects is then, as I flatter myself you have perceived, something very different from the pleasure which attends the fulfilment of the desire, however much the pleasure, once induced, may afterwards become itself a new circumstance of attraction ; and there is not therefore necessarily any redundancy of arrangement, in speaking of other sets of desires, after having treated of the love of pleasure, considered simply as pleasure, or as relief from pain. The very desires, indeed, which are thus separated from the desire of mere pleasure, may, when gratified, afford perhaps as much real delight as those of which pleasure was the simple object. But it is sufficient for our arrangement, that this pleasure, however lively it may be in itself, did not constitute to us the primary and instant desirableness of the object, or, in other words, was not that circumstance which we had immediately in view, at the very moment when our desire arose ; the direct antecedent, in a train of feelings, of which that other feeling which we term desire was the consequent, and the instant consequent.

I return, then, to the consideration of those desires which I have thought it necessary to add, even after the desire of pleasure.

The first of these, on the consideration of which I had scarcely entered, was the love of action. To be happy, it is necessary that we be occupied ; and, without our thinking of the happiness which results from it, na-

* Young's Night Thoughts, Night viii. v. 558—567.

ture has given us a constant desire of occupation. We must exert our limbs, or we must exert our thought; and when we exert neither, we feel that languor of which we did not think before, but which, when it is felt, convinces us how admirably our desire of action is adapted for the prevention of this very evil, of which we had not thought; as our appetites of hunger and thirst are given to us for the preservation of health, of which we think as little, during the indulgence of our appetites, as we think, during our occupation, of the languor which would overwhelm us if wholly unoccupied. How wretched would be the boy, if he were to be forced to lie, even on the softest couch, during a whole day, while he heard at intervals the gay voices of his playmates without, and could distinguish by these very sounds the particular pastimes in which they were engaged! How wretched, in these circumstances, is man himself; and what fretfulness do we perceive, even on brows of more deliberate thought; on brows, too, perhaps, that in other circumstances, are seldom overcast, if a few successive days of wet and boisterous weather have rendered all escape into the open air, and the exercises which this escape would afford, impossible!

"The sort of bodily pleasure which we derive from exercise," says the author of a very pleasing little French work on the theory of our agreeable feelings, "cannot be analyzed, indeed, without becoming almost insensible. The pleasure which accompanies a motion of the hand, escapes from us by its littleness; but it is not on that account the less real. Do not women every day save themselves from many hours of listless uneasiness, merely by a little motion of the fingers, in some slight work, to which they attach no other value than as it is a source of this very amusement to them? The charm of the particular work itself, and the general pleasure of being occupied, have need of being combined, to make any sensible impression."*

Without the knowledge of the pleasure that is thus felt in mere exertion, it would not be easy for us to look with satisfaction on the scene of human toil around us, which assumes instantly a different aspect when we consider this happy principle of our mental constitution. Though we are apt to think of those who are labouring for others as if they were not labouring for themselves also; and though unquestionably, from our natural love of freedom, any task which is imposed cannot be as agreeable as an occupation spontaneously chosen; we yet must not think that the labour itself is necessarily an evil, from which it would be happiness for

man to be freed. Nature has not dealt so hardly with the great multitude, in comparison with whom the smaller number, for whose accommodation she seems to have formed a more sumptuous provision, are truly insignificant, and would be unworthy of this seeming preference, if the provision of their means of luxury were all which is involved in the wealth she bestows on them. The wealth of the individual is valuable, chiefly as it leads to the labour of others, and presents, in the reward which it offers, an agreeable object, to mingle with the pleasure of the occupation, and to sooth and sweeten it, even when it rises to fatigue. How different would the busy scene of the world appear, if we could conceive that no pleasure attended the occupations to which so great a majority of our race would then seem to be condemned, almost like slaves that are fettered to the very instruments of their daily task! How different from that scene in which, though we perceive many labouring, and a few at rest, we perceive in the labourer a pleasure of occupation, which those who rest would often be happy to purchase from him, and which they do sometimes endeavour to purchase by the same means by which he has acquired it,—by exercises as violent and unremitted as his, and which have the distinction only of being of less advantage to the world than those toils by which he at once promotes his own happiness; and contributes to the accommodation of others! It is pleasing thus to perceive a source of enjoyment in the very circumstance which might seem most hostile to happiness,—to perceive in the labour itself, of which the necessity is imposed on man, a consolation for the loss of that very freedom which it constrains.

When we do not labour with our limbs, we must labour with our mind; and happy is it for our peace when this mental occupation can supply to us the place of bodily occupation, which, to the rich at least, must always be in a great degree dependent on the accidents of weather, and in some measure too on the society of others. He to whom a book presents occupation, scarcely can be in circumstances in which this occupation is not in some degree at his command; and it is not easy to say how much of happiness, and of that good humour which is no small part of morality, depends on the mere power of occupying ourselves agreeably with this exercise of our eyes and mind, as others, less happy in intellectual taste, are obliged to depend for occupation on exercises that require a greater number of circumstances to place them in their power.

"Choose any station in life which you may prefer," says Pascal, "combine in it every pleasure which seems capable of satisfying the desires of man; if he whom we

* *Théorie des Sentimens Agréables*, chap. ii.

imagine placed in this situation, has no occupation or amusement, his languishing felicity will not support him for an hour. He must have something to withdraw him from himself, or he is necessarily unhappy.

"Is not the royal dignity great enough of itself to content him who is the object of so much envy? I see indeed that, in other circumstances, to render a man happy, it is necessary to turn him away from the sight of his own misery, though it be only to occupy his whole mind with the anxiety of bending his knee, or pointing his toe in a dance a little better than before. But is it the same with a king? Must he too be amused like others? Would it not be a sort of insult to the joy which he must feel, to occupy his soul with the thought how he is to adapt his steps to the measure of an air, or how he is to send one billiard ball most adroitly to meet another, instead of leaving him to enjoy in repose the contemplation of that majestic glory which surrounds him? Let us make the trial. Let us leave the most magnificent sovereign without company, without occupation, to enjoy himself in all his magnificence at leisure; and the sovereign whom we have left to himself will be only a human being, that feels his miseries like other people. All this therefore is most carefully provided against; and there are never wanting, round the person of kings, a number of idle courtiers, whose only occupation is to watch the time of their leisure, that they may suggest constantly some new amusement in the intervals of public business or of other amusements, and save them from the dreadful misery of being alone, and of knowing what they are.

"Man is so wretched a being," he continues, "that he would soon be tired of himself, without any external cause of dissatisfaction by the mere feeling of what he is; and yet he is so vain and trifling a creature, that, full as he is of a thousand essential causes of disgust, the most insignificant trifle is sufficient to amuse him; so that if we were to consider him seriously, we should find far more reason to pity him for being capable of finding amusement in things so mean and frivolous, than for the distresses which truly afflict him.

"How happens it that that man who was a short time ago in such deep misery at the loss of his only son, and who, loaded with law-suits and quarrels, was this very morning fretted with so many vexations, thinks of these evils no more? Be not astonished at the change; he is now entirely absorbed in other thoughts. He is occupied, and most completely occupied, in seeing where it is that a stag is to try to get a passage,—a weary stag, which his dogs have been pursuing since six o'clock. Nothing more is necessary to account for the transformation.

Miserable as man may be, if only we can succeed in occupying him in any manner, he is no longer miserable, he is happy."*

Of the truth of the great facts which Pascal thus states in a very forcible and lively manner, there can be no question; but the conclusion which he draws from them is surely not the conclusion which is most suitable to our nature, and to the great objects of him by whom we were formed. It is much juster, as it is unquestionably far more pleasing to trace, in this necessity of occupation, the evident marks of the intention of Heaven, that man who is to exist among men, and who has powers of mind and of body capable of benefiting them in innumerable ways, is not to suffer these powers to lie idle. The languor which we feel when we cease from exertion reminds us, at every moment, that we are not formed for inactivity, that we have duties to discharge which may become to us amusement, if we only deign to avail ourselves of pleasures that are constantly in our power, and without which, all amusements and exercises, that are only the mimicry of these very duties, would soon become as wearisome almost as idleness itself, of which we are so ready to feel the misery, when it is total idleness unoccupied with a single pastime. It is not to fly the sight of ourselves, and therefore of our miseries, as Pascal says, that we busy ourselves even in trifles; but because Heaven, that has formed us for action, has formed us therefore necessarily to busy ourselves with something, and to occupy ourselves even with trifles, rather than to be wholly unoccupied. In beginning to exert ourselves, or to take interest in the exertions of others, we have no thought either of misery to be avoided, or of happiness to be attained. We are already busy before we have felt the happiness; we are already idle before we have felt the misery of being idle. Nature does not wait for our reflections and calculations. She gives us, indeed, the power of reflecting and calculating, that we may correct the abuses of our desires; but the desires which are necessary to our own well-being, and to the well-being of those around us, she prompts without our bidding. She has formed man with a nature that may suit him to every situation; the monarch, with those passions and powers which are necessary for the humblest of his subjects; the humblest peasant, with the passions and powers of those who are born of kings. The sovereign occupying himself with those voluntary labours which he denominates amusements, may feel, in these very amusements, the common nature which he shares with those who are toiling around him, in labours which they indeed term labours, and think

* *Pensées de Pascal, première partie, art. vii. sect. 1, 2.*

perhaps that they would be happy, if only they had that ease which he finds so painful, and from which he makes so many efforts to free himself, but which are to them what his amusements are to him, a source of occupation, a mode of shaking off that idleness, which, if general, would be inconsistent with the very being of society; and from which, therefore, man is warned or saved by the languor that attends it. When we look at the guards, and the palace, and the splendour, at all those crowds which seem useful only as supplying to him more speedily every thing which his wants require, it is scarcely possible for us to think that a king has any necessity of labouring; but if we look within his breast, and see the constant appetite for occupation, which this ready supply of all his wants inflames rather than mitigates, we discover the same necessity which we feel in ourselves; the same proof, that man is formed to contribute his share of service to the general labours of mankind, to be active even where this propensity of our nature can have no excitement from individual wants, and to minister, in some sort, to the happiness of others, if he does not choose to be the willing minister of his own unhappiness.

LECTURE LXVII.

III. PROSPECTIVE EMOTIONS.—4. DESIRE OF SOCIETY.—5. DESIRE OF KNOWLEDGE.

GENTLEMEN, after the desires which I examined in my last Lecture, that which is next to be considered by us is our desire of society.

Man, as I have already said, is born in society, and dependent on it, in some of its most delightful forms, for the preservation of his infant being, which, without the protection of those who love him the more for the very helplessness that is consigned to their protection, would seem thrown into the world, only to suffer in it for a few hours, and, ceasing to suffer, to cease also to exist.

If man be thus dependent on society for the preservation of his early existence, he is not less dependent on it for the comfort and happiness of his existence in other years. It is to be the source of all the love which he feels, of all the love which he excites, and therefore of almost all the desires and enjoyments which he is capable of feeling. There is not one of his actions which may not, directly or indirectly, have some relation to those among whom he lives; and I may say even, that there is scarcely a moment of his existence, in which the social affection, in some one of its forms, has not an influence on some feeling or resolution, some delight-

ful remembrance of the past, some project of future benevolence or resentment. We are born, as I have said, in society, and dependent on it for our existence; but, even if we could exist without society, we should not exist as men, not even as savage men; for savages, rude as their intercourse is, are still united together by domestic affinities and friendships, and have one common land, as dear to them, or perhaps more dear to them, than the country of the civilized is to its polished inhabitants. With our immortal spirit, and with all the glorious capacities that are developed in society, we should, but for the society that almost gives us a different soul, be only a species of wild animal, that might not yield as readily perhaps to the stronger animals around as the weak of a less noble race, but which would hold with them at best a perilous contest; miserable within the cave, and trembling to venture beyond it. "Make us single and solitary," says an eloquent Roman moralist, "and what are we? The prey of other animals and their victim, the prey which it would be most easy for them to seize, the victim which it would be most easy for them to destroy. Those other animals have, in their own strength, sufficient protection. If they be born to live apart, each has its separate arms to defend it. Man has no tusks or talons to make him terrible. He is weak and naked; but weak and naked as he is, society surrounds him and protects him. It is this which submits to his power all other living things, and not the earth merely, which seems in some measure his own by birth, but the very ocean, that is to him like another world of beings of a different nature. Society averts from him the attack of diseases, it mitigates his suffering when he is assailed by them, it gives support and happiness to his old age, it makes him strong in the great combat of human life, because it leaves him not alone to struggle with his fortune." "Fac nos singulos: quid sumus? præda animalium et victimæ, ac imbecillissimus* et facillimus sanguis; quoniam cæteris animalibus, in tutelam sui, satis virum est. Quæcunque vaga nascuntur, et actura vitam segregem, armata sunt. Hominem imbecillitas cingit: non unguium vis, non dentium, terribilem ceteris fecit. Nudum et infirmum, societas munit. Societas illi dominium omnium animalium dedit; societas terris genitum, in aliæ naturæ transmisit imperium, et dominari etiam in mari jussit. Hæc morborum impetus arcuit, senectuti adminicula prospexit, solatia contra dolores dedit; hæc fortis nos facit, quod licet contra fortunam advocare."[†]

Of a society to which man thus owes all

* Al. imbecillimus—al. vilissimus.
† Seneca de Beneficiis, lib. iv. c. 18.

his strength as well as all his happiness, it is not wonderful that nature should have formed him desirous ; and it is in harmony with that gracious provision, which we have seen realized so effectually in our other emotions, that she has formed him to love the society which profits him, without thinking of the profit which it affords ; that is to say, without regard to this benefit, as the primary source of a love that would not have arisen, but from the prospect of the selfish gain. We exist in society, and have formed in it innumerable affections, long before we have learned to sum and calculate the consequences of every separate look and word of kindness, or have measured the general advantage which this spontaneous and ready kindness yields, with the state of misery which we should have existed, if there had been no society to receive and make us happy. These affections, so quick to awake in the very moment almost of our waking being, are ever spreading in the progress of life ; because there is no moment to the heart, in which the principle of social union is cold or powerless. The infant does not cling to his nurse more readily than the boy hastens to meet his playmates, and man to communicate his thoughts to man. If we were to see the little crowd of the busy school-room rush out, when the hour of freedom comes, and, instead of mingling in some general pastime, betake themselves each to some solitary spot, till the return of that hour which forced them again together, we should look on them with as much astonishment as if a sudden miracle had transformed their bodily features, and destroyed the very semblance of men. As wonderful would it appear if, in a crowded city, or even in the scattered tents of a tribe of Arabs, or in the huts or very caves of the rudest savages, there were to be no communing of man with man, no voice or smile of greeting, no seeming consciousness of mutual presence, but each were to pass each with indifference, as if they had never met, and were never to meet again, or rather with an indifference which even those cannot wholly feel who have met once in the wildest solitudes, and to whom that moment of accidental meeting was the only tie which connects them afterwards in their mutual recognition. The mere presence of a human being, at least when there is no fear to counteract and overcome the affection, is sufficient to give him a sort of interest in our wishes ; certainly, if he be in pain or want, an interest in our compassionate wishes, as if he were not wholly a stranger ; or rather, such is our love of society, that to be, in the strictest sense of the term, a stranger, is to us a sort of recommendation, as to be a friend, or even a common acquaintance, is also a recommendation, more or less strong, to the same diffusive regard. Qualities thus seemingly op-

posite excite an interest that is similar ; because, opposite as the qualities are, they are still qualities of man ; of one who, whether a stranger or a friend, shares our nature, and who cannot be wholly indifferent to those by whom that common nature is shared.

What is every language but a proof of the agency of that feeling which makes it delightful to us to speak and to listen, because it is delightful to us to make our thoughts pass into other hearts, or to share the thoughts of those other hearts ? We use speech, indeed, in its vulgar offices, to express to each other the want of bodily accommodations, which can be mutually supplied by those who know each other's necessities ; and, as a medium by which these wants can instantly be made known, it is, in these vulgar offices, unquestionably an instrument of the highest convenience, even though it were incapable of being adapted to any other purpose. But how small a part of that language, which is so eloquent an interpreter of every thought and feeling, is employed for this humble end ! If we were to reflect on all those gracious communications, and questions, and answers, and replies, that, in a little society of friends, form, for a whole day a happiness which nothing else could give, the few words significant of mere bodily wants would perhaps scarcely be remembered in our retrospect of an eloquence that was expressive of wants of a very different kind ; of that social impulse which, when there are others around who can partake its feelings, makes it almost impossible for the heart, whether sad or sprightly, to be sad or sprightly alone ; and to which no event is little, the communication of which can be the expression of regard. In that infinite variety of languages which are spoken by the nations dispersed on the surface of the earth, there is one voice which animates the whole,—a voice which, in every country and every time, and in all the changes of barbarism and civilization, still utters a truth, the first to which the heart has assented, and the last which it can ever lose ; the voice of our social nature bringing its irresistible testimony to the force of that universal sympathy, which has found man everywhere, and preserves him everywhere, in the community of mankind.

I have said, that the mere presence of a human being is sufficient to give him a sort of interest in our wishes, except in cases where there is some fear to counteract the affection that is thus formed ; and I have made this exception to guard you against the fallacy of the theory, which, by dwelling on the cases that form the exceptions only, and omitting all notice of the happier feelings that are universal and original, would represent the natural state of man,—of him who exists only as he has been an object of affec-

tion,—as a state of mutual hostility, in which every individual is at war with every other individual. Of this theory, which, if not first stated, was at least first developed fully by Hobbes, I cannot but think that it would be idle to offer any elaborate confutation, and that the attention which has been paid to it by philosophers, is far greater than it deserves. We need but think of the state in which man is born, of the fondness of the parent for the child, of the child for the parent, of that affection which binds a whole family together, to perceive, that all individuals, who are only those very members of the families which we have been considering, cannot, in any state of society, be the foes of all, or even indifferent to their mutual interests; since, in that case, the whole race of mankind must have ceased to exist before the period at which they could be capable of existing, even in a state of war. Every one, it is said, is born to war with every one! But where are these natural combatants to be found? The army which Cadmus raised from the earth, arose indeed only to combat and to perish in mutual destruction; but they rose vigorous and ready armed. Man is not, in the circumstance of his birth, like those fabulous monsters that sprung, in his mere outward semblance, from the serpent's teeth; he is the offspring of love, and his mind is as different as his origin. If he be born to war with man, he must be preserved for years, when his warfare may be effectual; and where is he to be found in those years of weakness that intervene? In looking for the natural combatants who are to be brought upon the stage of blood, where can the sophist hope to find them, unless he look for them among those whom peace and affection have previously been nurturing? Wherever he finds hate, he must find a love that has preceded it. The state of nature, if it have reference to the infancy of each individual, has reference, therefore, to a period which, instead of enmity, exhibits perhaps the strongest and purest example which could be imagined of disinterested love; and, if it have any other meaning than as significant of those original feelings, amid which every individual of all the tribes of mankind has been bred and sustained, it must relate as much to one state of society as to another. All states in which man can exist, must be alike states that are natural to him; and if man was always what he is now, he was surely, even in the most savage state, not a foe merely; for that is only one of his relations, and an accidental one; but a child, a brother, a father, a member of a tribe, a pitier of the sorrows of others, even though he might occasionally, under the influence of some passing resentment, inflict sufferings which, if he had seen them inflicted by another, he would probably have hastened to relieve.

What, then, is the state of nature, the state of nature of parents, sons, brothers, and tribesmen, in which this enmity of all against all is supposed? It is very evident that to make it such a state as may be consistent with the false theory of society which we are considering, we must not think of man as he is; or as he has ever been known to be. We must take away all the feelings of domestic regard, which are visible wherever he is to be found. Fathers, mothers, children, must be as indifferent to each other, as if no common relation had united them; nay, they must be willing to sacrifice, without compunction, the existence of any one of these, for the most trifling personal advantage; the pity which we now feel so readily for the distress even of our very enemies must, in that case, be absolutely unknown to us, even when the sufferer is she who gave us birth. Is this a state of the nature of man? or have we not rather, as has been truly said, in making this very conception, supposed the nature of man to be destroyed? and, while we have preserved the same external form, substituted, for the mild nature of that which animates this form, the ferocious nature of some untameable beast, which makes no distinction of the hand that caresses and the hand that strikes, which breathes only carnage, and feels a sort of irritation, and almost anger, at the sight of every thing which lives? Of such a being, so animated, this may be the natural state, but it is not the state of nature of man. The feelings which nature most powerfully impresses on him,—the first impressions which she makes on his heart, are sentiments of love; and if those first and most powerful feelings, which are as universal as the race of man,—the original feelings of every individual that lives or has lived,—can be truly said to be natural feelings, to continue to exist as in this first state of nature, would be to exist with only affection in the heart, and with expressions of this affection in every look and word.

But we put bars and locks upon our gates, we carry arms, we make laws to direct the power of the state against injustice, we have prisons and executioners. Is this formidable apparatus, it will be said, a part of a system of love? or does it not rather prove that man trembles at the thought of the power of man, as he trembles at the thought of some pestilence, and takes measures of precaution for guarding against infection, and for curing it, or preventing the farther spreading of it, if infection has taken place?

It will be admitted, that these contrivances of offence and defence are not a part of the system of contrivances of universal and never-failing love; but, on the contrary, are indicative of a fear which implies th

possibility of enmity in others, or at least of injustice, which, though it may imply no personal hatred, is, in its effects on us, the same as enmity. But while these instruments of preservation from possible aggression are admitted to be proofs of one set of feelings in man,—of feelings which no defender of the general social nature of man has ever attempted to deny, as a part of that mixed constitution of good and bad for which alone he contends; it may be asked, in like manner, whether the domestic affections, and the general sympathies of our nature, which exist as widely as laws, and have in every case preceded them; whether all the institutions for the relief of the ignorant, and the poor, and the diseased, are proofs of any natural enmity of man to man? Injustice may, indeed, be prevalent, but compassion is surely not less so; and are we to find proofs of universal enmity in a love that is as universal as human sorrow?

That Virtue known
By the relenting look, whose equal heart
For others feels, as for another self;
Of various name, as various objects wake,
Warm into action, the kind sense within:
Whether the blameless poor, the nobly main'd,
The lost to reason, the declin'd in life,
The helpless young, that kiss no mother's hand,
And the grey, second infancy of age,
She gives in public families to live,—
A sight to gladden Heaven.

We are surely not to think of man as only a prisoner or a jailer; we must think of him too as one who, if he suffers, receives relief from those who have no interest in relieving him, except that of their compassion itself; or who himself, with as little expectation of personal advantage, relieves whatever sufferings may come beneath his view. The truth is, that man has desires of various kinds, malevolent as well as benevolent; that, on whatever period of society we may choose to fix, we shall always find many who are disposed to invade the rights of others, and who, in consequence of this mere possibility of aggression, render necessary all those general precautions, and the occasional punishments of which Hobbes speaks; while, at the same time, we shall be equally certain of finding many, who not merely are without the inclination of invading the rights of others, but who gladly make sacrifices of their own personal comfort for their relief. That the state of society, therefore, when there are multitudes comprehended in it, is not a state of unmixed friendship or enmity, unmixed virtue or vice, but a state that is mixed of both; that the first affections, however, the affections which, if there be any that peculiarly deserve the name of natural, have surely the highest claim to that distinction, are uniformly those of love; and that while all must, in infancy, have felt this tie, which bound them to some other breast, it is only a part of mankind over whom those

malignant passions, which can be said to be indicative of enmity, or even that injustice which is indicative of indifference to others, rather than malignity, can be said to have any sway. We have all loved, and continued to love; we have not all hated, and continued to hate; certainly, at least, we have not given way to our hatred, as we have yielded our whole soul to the delightful emotions of benevolence.

Even the most unjust and malignant of mankind, it must be remembered, do not lose their love of society. They have their friends, or at least those to whom they give that name, without any suspicion that they are using an inappropriate expression. They would hate to be alone, as much as other people, even though they had no guilty remembrances, which made it doubly necessary for them to be amused. They must still flatter themselves that they enjoy what they are not capable of enjoying, the delights of that cordial intercourse which is sacred to the good. These delights, indeed, the remembrance of consolations received, and of virtues strengthened, the mutual esteem, the mutual trust, the mutual veneration, they as little can possess as they can enjoy the pleasures of conscience, with no remembrances but those of guilt. Yet, though the reality of the social regard of others is denied to them, and though even if, in some singular instance, it were truly to be given to them, it would be impossible for them to put confidence in a friendship which they would know that they had not merited, and therefore could not fail to distrust; they can still at least have the riot and the laughter, and as much of the appearance of social affection, as is consistent with perfect indifference, or perfect hatred at heart; and the riot and the laughter they must have, or be still more miserable than they are. The love of that society which they have so deeply injured, is thus fixed in their heart, as it is fixed in every heart; and what proof could be stronger of its irresistible power? In the very prison, to which the indignation of mankind has driven them, as to the only place which their presence could not pollute, amid wretches as little worthy as themselves of a single thought of momentary affection, they still feel the influence of that principle which makes the presence of man necessary to the comfort of man, as, in better circumstances, it is necessary to his happiness. They must mingle with each other, though they have no plans of guilty co-operation to concert. It is still something in their dismal loneliness to have one, who may laugh at their blasphemies, and at whose blasphemies they may smile in return; and to him who has never known what friendship is, who has only crimes of which to speak, or crimes of which to hear, it is not a relief, but a hea-

vy additional punishment, to be separated from wretches as guilty and miserable as himself; from wretches, who would as gladly, or more gladly, assist in putting his shackles on, as they would assist in releasing him; and who, he knows well, will not laugh less loudly on that day when he is to be led forth to terminate, amid public execrations, his dreadful existence.

Such is the desire of social communion in man; a desire which no habitual penance of solitude, no perfection of virtue, no perfection of vice, if I may use that phrase, can efface from the heart; a desire, the existence of which is not more forcibly demonstrated by all that leads man to mingle with man in happy society, than by the most miserable intercourse which the wretched can form, by the feelings which continue to operate when only guilt is congregated with guilt, and which make of that very prison, to which Hobbes would lead us for a demonstration that man is born only to be regardless of man or hostile to him, the most irresistible demonstration of that great truth of social connexion, which he would vainly adduce it to disprove.

The next of our desires which we have to consider, is our desire of knowledge.

When we think of what man is, not in his faculties only, but in his intellectual acquisitions, and of what he must have been on his entrance into the world, as much in the state of society which is most civilized, as in the rudest state of savage life, it is difficult for us to regard this knowledge and absolute ignorance as states of the same mind. It seems to us almost as if we had to consider a spiritual creation or transformation, as wondrous as if, in contemplating the material universe, we were to strive to think of the whole system of suns and planets, as evolved from a mere particle of matter, or rising from nothing as when originally created. We believe that they were so created, and we know that man, comprehensive as his acquirements are, must have set out in his intellectual career from absolute ignorance; but how difficult is it for us to form any accurate conception of what we thus undoubtedly believe! The mind, which is enriched with as many sciences as there are classes of existing things in the universe, which our organs are able to discern, and which, not content with the immensity of existence, forms to itself sciences even of abstractions that do not exist as objects in nature, and that cannot exist in nature, the mind, which is skilled in all the languages of all the civilized nations of the globe, and which has fixed and treasured in its own remembrance, the beauties of every work of transcendent genius, which age after age has added to the stores of antiquity; this mind, we know well, was once as ignorant

as the dullest and feeblest of those minds, which scarcely know enough, even to wonder at its superiority.

But without taking into our consideration the rich endowments of a mind like this, let us think only of one of those humble minds to which I have alluded. How vast are the acquirements even of a mind of this humble rank, and acquirements, too, which a few years, that may be said almost to be years of infancy and apparent imbecility, have formed! Indeed, if all human science were to be divided, as Rousseau says, into two portions, the one comprehending what is common to all mankind, and the other only that stock of truths, which is peculiar to the wise and the learned, he can scarcely be regarded as delivering a very extravagant paradox, in asserting that this latter portion, which is the subject of so much pride, would seem very trifling in comparison of the other. But of this greater portion, we do not think, as he truly says, partly because the knowledge which it comprehends is acquired so very early, that we scarcely remember the acquisition of it, and still more, perhaps, because since knowledge becomes remarkable only by its differences, the elements that are common in all, like the common quantities in algebraic equations, are counted as nothing.

When we think, however, of the elements that are truly contained in this portion of knowledge, which the humblest of mankind partakes, how much is involved in the possession and mastering even of one language, in the accurate adaptation of each arbitrary sign to the thing signified, and the adaptation, not merely of the signs of things to the things themselves, but of the nicer inflections of the signs to the faint and abstract relations of objects! If we knew nothing more of the mind of man, than its capacity of becoming acquainted with the powers of so vast and so complicated an instrument as that of speech, and of acquiring this knowledge in circumstances the most unfavourable to the acquisition, without any of the aids which lessen so greatly our labour in acquiring any other language far less perfectly in after-life, and amid the continual distractions of pains and pleasures, that seem to render any fixed effort absolutely impossible, we might, indeed, find cause to wonder at a capacity so admirable. But when we think of all the other knowledge which is acquired at the same time, even by this mind, which we have selected as one of the humblest, what observations of phenomena, what inductions, what reasonings downward from the results of general observation to particular cases that are analogous, must have occurred, and been formed, almost unconsciously, into a system of physics, of which the reasoner himself, perhaps, does not think as a system, but on which he founds his prac-

tical conclusions, exactly in the same way as the philosopher applies his general principles to the complicated contrivances of mechanics or the different arts; when we think of all this, and know that all this, or at least a great part of all this, must have been done before it could be safe for the little reasoner to be trusted for a single moment at the slightest distance from the parental eye, how astonishing does the whole process appear; and if we had not opportunities of observation, and in some measure, too, the consciousness of our own memory, in our later acquisitions, to tell us how all this has been done, what a variety of means must we conceive nature to have employed for producing so rapidly and so efficaciously this astonishing result! She has employed, however, no complicated variety of means; and she has produced the effect the more surely, from the very simplicity of the means which she has employed. The simple desire of knowledge explains a mystery which nothing else could explain. She has made it delightful to man to know—disquieting to him to know only imperfectly, while any thing remains in his power that can make his knowledge more accurate or comprehensive; and she has done more than all this, she has not waited till we reflect on the pleasure which we are to enjoy, or the pain which we are to suffer. She has given us these, indeed, to stimulate our search, and in part to reward it; but she has prompted us to begin our search without reflection on the mere pleasure or pain which is to reward our activity, or to punish our inactivity. It is sufficient that there is something unknown which has a relation to something that is known to us. We feel instantly the desire of knowing this too. Begin to the child in the nursery some ballad, which involves a tale of marvellous incident, and stop in the very middle of the tale, his little heart will be almost in agony till you resume the narrative; but his eye, before you ceased, was still expressive of that curiosity, of that mere desire of knowing what is to come, which is not painful in itself, producing the pain, but not rising from it when the narrative is broken, and affording the pleasure, but not rising from the pleasure when the narrative is continued. Why is it, that in such a case we feel delight? It is because our previous curiosity has been gratified. Why do we feel pain? It is because our previous curiosity has not been gratified; and to suppose that but for the pleasure of the gratified curiosity, and the pain of the ungratified curiosity, we should have had no curiosity to afford the pleasure or the pain, is a reversal of the order of causes and effects, as absurd as it would be to suppose, that, but for the existence of the flower, we should not have had the root or the stem which supports the flower, that it is the light which

flows around us that is the cause of the existence of the sun; and that he who created the sun, and every thing which the sun enlightens, is not merely revealed to us by that world of splendour and beauty which he has formed, but that it is the beauty of the universe which is the cause of the existence of him who created it to be beautiful.

Of the lively curiosity of which I speak, with relation to the tales of our nursery, you must all have some remembrance; and, indeed, it is a curiosity which, even with respect to such tales of fiction, does not cease wholly when we are obliged to assume the airs and the dignity of manhood. We vary our tales in these graver years, and call them romances, dramas, epics; but we are equally ready in any moment of leisure, to be led away by any narrative of strange incidents, which is to us exactly what the simplest ballad was to us then. The pain which attends ungratified curiosity, is most strikingly proved by those tales which are often intentionally suspended at some most interesting moment, and printed as fragments. We feel, in such a case, a vexation that almost amounts to anger, as if the writer of the fragment were wilfully and wantonly inflicting on us pain; and there are many little injuries which we could perhaps much more readily forgive. To be forced to read a succession of such fragments would be truly to any mind which can take interest in the adventures of others, a species of torture, and of torture that, to such a mind, would be far from being the slightest which could be devised.

The curiosity which is thus strikingly exemplified in the eagerness with which we listen to fictitious narratives, is not less strikingly, as it is certainly far more usefully, exemplified in the interest which we feel in the wonders of science. How many nights of sleepless expectation would be given to the chemist, if he could be informed on authority which he could not doubt, that in some neighbouring country a discovery had been made which threw a new light, not merely on what had before been considered as obscure, but on all, or almost all the phenomena which had been considered as perfectly well known; that in consequence of this discovery, it had become easy to analyse what had before resisted every attempt of the analytic art, and to force into combination substances which before had seemed incapable of any permanent union! With what eagerness would he await the communication that was to put into his own hands this admirable power. It must be a distress, indeed, of no common sort which could at such a period withdraw his mind wholly for any length of time from that desire which every thing that met his eye would seem to him to

recall, because it would be in truth for ever present to his mind.

It is needless to extend the illustration through the variety of the sciences. We have a desire of knowledge which nothing can abate,—a desire that, in some greater or less degree, extends itself to every thing which we are capable of knowing, and not to realities merely, but to all the extravagances of fiction. We are formed to know; we cannot exist without knowledge; and nature, therefore, has given us the desire of that knowledge, which is essential not to our pleasure merely, but to our very being.

Witness the sprightly joy, when aught unknown
Strikes the quick sense, and wakes each active power
To brisker measures: witness the neglect
Of all familiar objects, though beheld
With transport once; the fond attentive gaze
Of young astonishment, the sober zeal
Of age commenting on prodigious things.
For such the bounteous providence of Heaven
In every breast implanting this desire
Of objects new and strange to urge us on,
With unremitting labour, to pursue
Those sacred stores that wait the ripening soul,
In Truth's exhaustless bosom. What need words
To paint its power? For this the daring youth
Breaks from his weeping mother's anxious arms,
In foreign climes to rove; the pensive sage,
Heedless of sleep, or midnight's harmful damp,
Hangs o'er the sickly taper; and untir'd
The virgin follows, with enchanted step,
The mazes of some wild and wondrous tale,
From morn to eve, unmindful of her form,
Unmindful of the happy dress that stole
The wishes of the youth, when every maid
With envy pin'd. Hence, finally, by night,
The village matron, round the blazing hearth,
Suspends the infant audience with her tales,
Breathing astonishment, of witching rhymes,
And evil spirits; of the death-bed call
To him who robb'd the widow, and devour'd
The orphan's portion; of unquiet souls
Ris'n from the grave, to ease the heavy guilt
Of deeds in life conceal'd; of shapes that walk
At dead of night, and clank their chains, and wave
The torch of hell around the murderer's bed.
At every solemn pause the crowd recoil,
Gazing each other speechless, and congeal'd
With shivering sighs, till, eager for the event,
Around the beldame, all erect they hang,
Each trembling heart with grateful terrors quell'd.*

If man could have been made to know that his existence depended upon certain acquisitions of knowledge, without any love of the knowledge itself, he might, perhaps, have made the acquisition that was believed to be so important. But to learn, if there had been no curiosity or pleasure in learning, would then have been a task; and like other mere tasks, would probably have been imperfectly executed. Something would have been neglected altogether, or very inaccurately examined, the accurate knowledge of which might have been essential to life itself. Nature, by the constitution which she has given us, has attained the same end, and attained it without leaving to us the possibility of failure. She has given us the desire of knowing what it is of importance for us to know; she has made the knowledge delightful in it-

self; she has made it painful to us to know imperfectly. There is no task, therefore, imposed on us. In executing her benevolent will, we have only to gratify one of the strongest of our passions, to learn with delight what it is salutary to have learned, and to derive thus a sort of double happiness from the wisdom which we acquire, and from the very effort by which we acquire it.

LECTURE LXVIII.

III. PROSPECTIVE EMOTIONS. — 6. DESIRE OF POWER.—OF DIRECT POWER, AS IN AMBITION.

GENTLEMEN, after the emotions which I considered in my last Lecture, that which is next in the order of our arrangement is the desire of power.

I do not speak at present of the desire of mere freedom from constraint, though, where any unjust restraint is actually imposed, the desire of freedom from it is, perhaps, the strongest passion which man can feel, and a passion which, in such circumstances, will always be more ardent as the mind is nobler. While it remains, the slave is not wholly a slave. His true degradation begins when he has lost, not his liberty, merely, but the very desire of liberty, and when he has learned to look calmly on himself as a mere breathing and moving instrument of the wishes of another, to be moved by those wishes more than by his own, a part of some external pomp necessary to the splendour of some other being, to which he contributes, indeed, but only like the car, or the sceptre, or the purple robe, a trapping of adventitious greatness, and one of many decorative trappings that are all equally insignificant in themselves, whether they be living or inanimate. He who can feel this, and feel it without any rising of his heart against the tyranny which would keep him down, or even a wish that he were free, may indeed be considered as scarcely worthy of freedom; and if tyranny produced only the evil of such mental degradation, without any of the other evils to which it gives rise directly and indirectly, it would scarcely merit less than at present, the detestation of all who know what man is and is capable of becoming as a freeman, and that wretched thing which he is and must ever continue to be as a slave.

There are minds, indeed, which, long habituated to corruption, can see, in the tyrannical possessor of a power unjustly arrogated, only a source of favour, and of all the partial and prodigal largesses of favour, more easy to be obtained, as requiring, in return

* Pleasures of Imagination, B. i. v. 232—270.

only that profligate subserviency to every vice, which such minds are always sufficiently ready to pay ; but what long usage of corruption does it require, before tyranny itself can cease to be hated.

If to a young audience, in those early years when they knew little more of the nature of political institutions, than that under some governments men are more or less happy, and more or less free, than under others, we were to relate the history of one of those glorious struggles which the oppressed have sometimes made against their oppressors, can we doubt for a moment to whom the sympathy and eager wishes of the whole audience would be given ? While the first band of patriots might perhaps be overthrown, and their leader a fugitive, seeking a temporary shelter, but seeking still more the means of asserting again the same great cause, with the additional motive of avenging the fallen, how eagerly would every heart be trembling for him, hoping for him, exulting as he came forth again with additional numbers, shrinking and half-despairing at each slight repulse in the long-continued combat, but rejoicing and confiding still more at each renewal of the charge, and feeling almost the very triumph of the deliverer himself, when his standard waved at last without any foe to oppose it, and nothing was to be seen upon the field but those who had perished, and those who were free. In listening to such a narrative, even he who was perhaps, in more advanced years, to be himself the ready instrument of oppression or corruption, and to smile with derision at the very name of liberty, would feel the interest which every other heart was feeling, and would rejoice in the overthrow of despotism, like that of which he was afterwards to be the willing slave, or of which he was at all times ready to become the slave if the liberties of a nation could be sold by his single voice.

Such is the instant sympathy of our nature, with all who are oppressed. We may cease to feel it, indeed, but many years of sordid selfishness must first have quenched in us every thing which is noble, and made us truly as much slaves ourselves as those whose virtue and happiness are indifferent to us. To be free, to have the mind of a freeman, is not to consider liberty as a privilege which a few only are to enjoy, and which, like some narrow and limited good, would become less by distribution ; it is to wish, and to wish ardently, that all partook the blessing. What should we think of any one who, enjoying the pleasures of vision, and the inestimable instruction which that delightful sense has yielded to him, and continues every moment to yield, could hear without pity of a whole nation of the blind ? And yet, how slight would be the cruelty of

such indifference, compared with the guilt of those who, enjoying themselves the blessings of a liberal system of government, should yet feel a sort of malignant triumph in the thought that other nations do not enjoy a liberty like that which they so justly prize,—that there are many millions of human beings, gathered together in tribes which exist still, as their ancestors have for ages existed, in a state of moral darkness, compared with which blindness to the mere sunshine is but an evil of little moment !

O Liberty ! thou goddess, heavenly bright,
Profuse of bliss, and pregnant with delight ;
Eternal pleasures in thy presence reign,
And smiling Plenty leads thy wanton train ;
Eased of her load, Subjection grows more light,
And Poverty looks cheerful in thy sight ;
Thou mak'st the gloomy face of Nature gay,
Giv'st beauty to the sun, and pleasure to the day.*

The power however which consists in mere freedom from constraint, is but a negative power. That of which we are at present to consider the desire, is the positive power which one individual may exercise over other individuals.

In a former lecture, in which we considered the desire of action, we saw the very important advantage of this desire, that prompts man incessantly to rise from the indolence in which he might otherwise lie torpid. Our desire of power may be considered as in a great measure connected with this general desire of action. We feel a pleasure of no slight kind in the consciousness of our mere animal energies, as energies inherent in our nature, and obedient to our will. This pride of exercise is one of the first pleasures which we discover in the infant, whose eye shows visible delight at all the little wonders which he is capable of producing himself, far more than at such as are merely exhibited to him. He is pleased indeed when we shake for the first time the bells of his little rattle, before we put it into his own hands ; but when he has it in his own hands, and makes himself the noise, which is then such delightful music to his ear, his rapture is far more than doubled. He repeats it instantly, as if wishing to be quite certain that he is capable of executing so marvellous a thing, and the certainty makes his pleasure still greater than before ; till, weary of a power of which he can no longer doubt, and stimulated by new objects to new exercises, he again desires something else, and enjoys, and is proud, and again grows weary of the past, to grow afterwards weary of the future. In boyhood, what competitions of this sort, what eagerness to discover how fast we can run, how far we can leap ! Every game which then amuses and occupies us, may be considered as a sort of trial of our strength, or agility, or

*Letter from Italy, by Addison.

skill, of some of those qualities in which power consists; and we run or wrestle with those with whom we are perhaps, in combats of a very different kind, to dispute in other years the prize of distinction in the various duties and dignities of life.

From what we do immediately ourselves, the transition to what we do by the agency of others, is a very natural and obvious one. As we feel the power which we possess in being the fastest runner, or the most skilful wrestler, we feel also a sort of power in having the instruments best suited to the different games in which we may have to try our skill with the skill of others. In the early exercises and contentions of the play-ground, we are proud of having the best top, or the best bat; and we look on what they do for us as what we do ourselves, since they are ours as much as our own limbs are ours,—a sort of prolongation of the hands that wield them, obeying our will with the same ready ministry as that with which our hands themselves more directly move at our bidding. We soon learn to be proud, in like manner, of having the best trained pointer, or the horse that has trotted with us the greatest number of miles in the shortest time; and when we have once learned to appropriate to ourselves the achievements of these animals, we have very little more to do in appropriating to ourselves whatever is done by others of our own species, who have done what they have done, in obedience to us as truly as the horse has proceeded in the same line, or turned, or stopped, in obedience to our bridle. Every new being who obeys us is thus, as it were, a new faculty, or number of faculties, added to our physical constitution; and it is not wonderful, therefore, that we should desire to extend the number of these adventitious faculties, more than that we should avail ourselves of the instruments of the optician for quickening our sight, or of a carriage for conveying us over distances which it would have been impossible for us to traverse with the same velocity on foot.

Such is the history of our desire of power. It begins with the pleasure of our mere bodily energies, long before we are capable of conceiving the very thought of operating on other beings like ourselves. But the passion, which is at the first so easily and so simply gratified, without the mastery or the attempted subjugation of other minds, learns afterwards to consider these minds as almost the only objects on which it is at all important to operate; they are instruments of the great game of human ambition; and in that great game, independent of all patriotic feelings, the passion which is not new, though its objects be new, takes pleasure in playing with the interests of nations, and managing whole subject multitudes, as it before took pleasure in wielding skilfully a racket at ten-

nis, or a mace at the billiard table; or as, at a still earlier period, it occupied us with a sort of proud consciousness of command in running over a field, for the mere pleasure of moving limbs that were scarcely felt by us to be our own unless when they were in motion.

So universal is the desire of power over the minds of others, that there is perhaps no one who is wholly exempt from it. Even affection itself, which is so little in need of any additional charm, derives from it some accession to the delight which it affords. That the absolute dependence of the infant renders still more vivid even the vivid emotions of parental love, no one, I conceive, can doubt; and if man, by a different constitution of his nature, could have been born intelligent as in maturer years, strong enough to be exposed to no peril from without, and fearless, therefore, not from ignorance of danger, but from superiority to all the causes of injury by which it was likely for him to be assailed; though the contemplation of the noble being to which they had given life must still have been attended with strong emotions of regard in the bosoms of those to whom the very excellence contemplated and admired by them, was almost a part of their own existence; it is not easy to imagine how very little would, in such circumstances of equality, have remained of that warm tenderness, which, in the present system of alternate feebleness and protection, connects so happily the progressive generations of mankind; when the first look of love which the parents cast on the helplessness before them, is itself a proof that the unconscious object on which they gaze is to be helpless no more; that weak as it may still be in itself, it is to be strong and powerful in the vigilant tenderness of their aid.

Such is the influence of the consciousness of a gentle and benevolent power in the exercise of parental love; and is there no influence of this sort in the exercise of other regards of every species,—no feeling of reciprocal dependence for enjoyment, or rather of reciprocal power of conferring enjoyment, that sweetens the very enjoyment itself, making it as delightful to be the source of happiness as to be the object to whom the happiness ultimately flows? It is sufficiently pleasing indeed to love and to be loved, though these feelings were all which friendship could yield; but there is likewise a pleasure in thinking that our feelings need only to be expressed, to become the feelings too of those who, loving us, can scarcely fail to love whatever we love. Nor is it to our pleasures of affection only that this moral influence of power extends; it extends in some measure also to the delightful consciousness of all our virtues. If suffering were to be relieved, it would surely be of very little consequence to the happi-

ness of the world by whom the relief was given; if vice were to be made sensible of its guilt, of little consequence from whom the purer views that enlighten it were derived; but though it would be of the same moment to the world in general, it would be very far from being so to us. We should delight in the effects, indeed, whoever might have produced them; but our delight would be very different if ourselves had been the instruments.

The difference, so great in these two cases, is not to be considered as arising wholly from the mere self-approbation of our action as virtuous; for if we had truly felt the wish of extending the same good, and the same resolute willingness to make the personal sacrifices that might be necessary to purchase the extension of it, our virtue, as far as our merit or our conscience is concerned, would be the same, not from the pride that our name would be long remembered, as connected with the remembrance of an action that had been beneficial to mankind; though the pleasure of this generous connexion of our image, or our name, may mingle, with no slight accession of joy, even in the pure and tranquil retrospects of those who have been unostentatiously good; but, in some degree at least, from the mere feeling of the action as a work of ours, as that which we have had the conscious power of producing, the feeling of the tie which connects that happiness of others, at which we rejoice with our own mind as its cause, and which, next to the certainty of having done what heaven itself approves, is perhaps the most delightful element in our remembrance of virtue.

It is the same in works of purer intellect. The gravest and most retired philosopher, who scarcely exists out of his library, in giving to the world the result of many years of meditation, delights indeed in the truths which he has discovered, and in the advantage which they may directly or indirectly afford to some essential interests of society; but though these are the thoughts on which, if his virtue be equal to his wisdom, he may dwell with greatest satisfaction, there still comes proudly across his mind, a feeling of pleasure in the thought of the power which he is exercising, or is soon to exercise over the minds of others. He is certainly far more pleased, that the truths which are to effect the general change of opinion, are truths discovered by him, than if exactly the same beneficial effect had flowed from discoveries made by any other person; and though the chief part of this pleasure may unquestionably be traced to the love of glory, and the anticipation of the glory which is loved, much of it as unquestionably flows from the internal feeling of the power which he exercises, and which he has the trust of

being able to exercise again in similar circumstances,—a power which is more delightful to him indeed when accompanied with celebrity, but of which the very secret consciousness is itself a delight that is almost like glory to his mind.

When the orator is employed in some great cause that is worthy of his eloquence; asserting, against the proud and the powerful, the right of some humble sufferer, who has nothing to vindicate his right but justice and the eloquence of his protector; or rousing a senate, too apt perhaps to think only of the privileges of a few, or of the interests or supposed interests of one people, to the consideration of the great rights of mankind, of every colour and country; forcing, as it were, upon their eyes, atrocities which they had perhaps at a distance long sanctioned or permitted, and absolving, or at least finishing, by the virtuous triumph of a single hour, the guilt of many centuries; in such cases, indeed, if the orator, while the happiness and misery, the virtue and vice, the glory and infamy of nations are depending on his voice, can think within himself of the power which he is exercising, he would be unworthy at once of the cause which he pleads, and of the eloquence with which he may be pleading it; but when the victory is won, when all the advantages which are to flow from it have been felt with delight, we may then allow some feeling of additional gratification to arise in the mind even of the most virtuous, at the thought of that energy which was so successfully exercised, before which every heart that did not gladly yield to its influence, shrunk as from something dreadful and irresistible; that had swept away all subterfuges of hypocrisy, and left nothing behind but conviction, and joy, and dismay. There are causes in which not to rejoice in the possession of eloquence would be almost to be indifferent to the blessings to which it may lead. The patriot, whom the corrupt tremble to see arise, may well feel a grateful satisfaction in the mighty power which heaven has delegated to him, when he thinks that he has used it only for purposes which heaven approves; for the freedom, and peace, and prosperity of his own land, and for all that happiness which the land that is dearest to him can diffuse to every nation that is within the sphere of its influence or example.

The power which mind exercises over mind in the cases as yet considered by us, is an intellectual or moral agency, undervived from any foreign source, and wholly personal to the individual who exercises it. But there is a power which is, for the time, far more extensive, and capable of being coveted by minds which are incapable of feeling and appreciating the intellectual or moral excellence. This is the power which high station con-

fers; the power of forcing obedience even upon the reluctant, and, in many cases, of winning obedience, from that blind respect which the multitude are always sufficiently disposed to feel for the follies as for the virtues of those above them. Much of the pleasure attached to the conception of this power, like that which attends every other species of power, arises, it must be admitted, from the glory which is supposed to attend the possession of official dignities; but the desire of the power itself would be one of the strongest of the passions of men, though this mere power were all which station conferred. To know that there are a number of beings, endowed with many energies which nature seemed to have made absolutely independent of us, who are constantly ready to do whatever we may order them to do, in obedience to our very caprice, is to us, as I have already said, very nearly the same thing, as if some extension of our faculties had been given to us, by the addition of all their powers to our physical constitution. If these instruments of power were mere machines, which subserviency to us could not in any degree debase, and which could be kept in order without any great anxiety on our part, and without occupying that room which the living instruments occupy, we should all probably feel the desire of possessing these subsidiary faculties, since not to wish for some of them at least would be like indifference whether we had two arms or only one, distinct or indistinct vision, a good or bad memory. We are not, with respect to any of our faculties, like that marvellous runner in the fairy tale, who was so very nimble as to be obliged to tie his legs that he might not run too fast. Our powers, bodily or mental, never seem to us to require any such voluntary retardation; and however well fitted they may be for the circumstances in which we are placed, we are yet desirous of being able to do more than, as individuals, we are capable of doing, and would gladly, therefore, avail ourselves of the supplemental machinery, or of such parts of it as would suit best our particular wishes and purposes. But the parts of the machinery of power are living beings like ourselves; and fond as we are of the purposes which we may be desirous of executing by means of them, we have, if we be virtuous, moral affections that preclude the wish. With these moral affections for the liberty and happiness of others, we so much prefer their freedom to our personal conveniences that we never encroach on it. We do not covet so much the pride of him who sees a whole multitude busy only in furthering his frivolous and ever-changing desires, as the serenity of him whom the world counts far humbler, who sees around him a multitude happy in their own domestic occupations, feeling for him only that friendship

which the heart spontaneously offers, and assisting him only with those social services which it is delightful to give, and which, as given with delight, it is delightful also to receive.

When I say, that a virtuous lover of mankind would desire this latter happiness more than the other, I know well that there are many minds of which I must not consider myself as expressing the choice; minds which value the power merely as power; which feel it, therefore, with more pleasure the more servile the multitude of their dependents may be; and which, in their endeavours to rise above the crowd, see no slavery too mean for themselves to endure, if they can purchase, by their own voluntary degradation, the pleasure of commanding.

He who feels within himself the talents which must render his exaltation eminently useful to mankind, and who wishes for power, that there may be more virtue and more happiness in the world, than if he had not been elevated, would indeed be guilty of criminal self-indulgence, if he were to resign himself to the enjoyments of private life, and to neglect the honourable means of rising to a station which his virtues and talents would render truly honourable. To such a mind, however, ambition presents no anxieties; because, though there may not be the happiness of attaining a more useful station, there is still the happiness of being useful in the station already possessed; and it presents no disgrace, even in failure, because the disgrace which the heart feels is only for those who have failed in dishonourable wishes, or who have sought what is honourable in itself by the use of dishonourable means.

But, of the multitude of the ambitious, how few are there of this noble class! how infinitely more numerous they who seek in power only what the virtuous man does not wish so much, as consent to bear in it for the greater good which may attend it! How many who labour perhaps through a long life of ignominy, to be a little more guilty than it is possible for them to be with the narrow means of guilt which they possess, and who die at last without attaining that wretched object for which they have crawled and prostrated themselves, and been every thing which a virtuous man would not be, even for a single moment, for all which kings, or the favourites of kings, could offer! If they fail in their ignoble ambition, it is easy to see what misery they have earned; and if even they succeed at last, what is it which they gain? There is no pleasure in what they possess, while it is inferior to something which they wish with a still more ardent appetite to acquire. "The passion which torments them," as Seneca says, "is like a flame which burns with more violence the more fuel there may have previously been

added to the conflagration." "Eo majora cupimus, quo majora venerunt: ut flammæ infinito acrior vis est, quo ex majore incendio emicuit. Aequè ambitio non patitur quenquam in ea mensura honorum conquiescere, quæ quondam ejus fuit impudens votum. Nemo agit de tribunatu gratias, sed queritur quod non est ad præturam usque perductus. Nec hæc grata est, si deest consulatus: ne hic quidem satiat, si unus est. Ultra se cupiditas porrigit, et felicitatem suam non intelligit, quia non unde venerit respicit, sed quo tendat."* The happiness enjoyed by one who has risen to power by ignoble means, is perhaps less than that of the most abject of those who depend on him; and the dignity which he has attained, and knows not how to enjoy, however splendid it may be as a mark of distinction, is in this very distinction, a mark of nothing so much as of the unworthiness of him who possesses it,—a memorial of crimes or follies, which, in another situation, would have been unnoticed or forgotten; but which are now forced on the continued execration or contempt of mankind; and in the consciousness or dread of this general feeling, are forced, too, more frequently than they would otherwise have arisen, on the shame and remorse of him who feels, that in purchasing with them every thing else, he has not purchased with them happiness.

In the great scale of power, which ascends from the lowest of the people to the sovereign, to whom all are submitted; in which the inferior, at every stage, is paying court to his superior, and receiving it, in his turn, from those who are inferior to himself, it is not easy to say at what point of the scale the pleasure of the homage is most sincerely felt. There is much truth in one of Fielding's lively pictures of this sort of homage, in which he reduces the difference of power to the different hours of the day at which we are great men. "With regard to time, it may not be unpleasant," he says, "to survey the picture of dependence like a kind of ladder. As, for instance, early in the morning arises the postillion, or some other boy, which great families no more than great ships are without, and falls to brushing the clothes, and cleaning the shoes of John the footman, who, being drest himself, applies his hands to the same labours for Mr. Secondhand, the squire's gentleman; the gentleman, in the like manner, a little later in the day, attends the squire; the squire is no sooner equipt than he attends the levee of my lord, which is no sooner over, than my lord himself is seen at the levee of the favourite, who, after the hour of homage is at an end, appears himself to pay homage to the levee of

his sovereign. Nor is there, perhaps, in this whole ladder of dependence, any one step at a greater distance from the other than the first from the second; so that to a philosopher, the question might only seem, whether you would choose to be a great man at six in the morning, or at two in the afternoon."

That there is more true happiness in the enjoyments of private life than in the pursuits of ambition, is one of those common-places of morality, which the experience of every day confirms; but which, as that very experience shows, have little effect in overcoming the passion itself, and which are thus ineffectual, because the passion does not relate only to the particular purposes of the individual, but is placed in our bosom for purposes of general advantage, which we are to execute, perhaps, without knowing that we are promoting any ends but those of our own selfish desire.

"The poor man's son," says Dr. Smith, in one of the most eloquent passages of his very eloquent work,—"the poor man's son, whom heaven, in its anger, has visited with ambition, when he begins to look around him, admires the condition of the rich. He finds the cottage of his father too small for his accommodation, and fancies he should be lodged more at his ease in a palace. He is displeased with being obliged to walk afoot, or to endure the fatigue of riding on horseback. He sees his superiors carried about in machines, and imagines that in one of these he could travel with less inconvenience. He feels himself naturally indolent, and willing to serve himself with his own hands as little as possible; and judges that a numerous retinue of servants would save him from a great deal of trouble. He thinks if he had attained all these, he would sit still contentedly, and be quiet, enjoying himself in the thought of the happiness and tranquillity of his situation. He is enchanted with the distant idea of this felicity. It appears in his fancy like the life of some superior rank of beings; and in order to arrive at it, he devotes himself for ever to the pursuit of wealth and greatness. To obtain the conveniences which these afford, he submits in the first year, nay, in the first month of his application, to more fatigue of body, and more uneasiness of mind, than he could have suffered through the whole of his life from the want of them. He studies to distinguish himself in some laborious profession. With the most unrelenting industry he labours night and day to acquire talents superior to all his competitors. He endeavours next to bring those talents into public view; and with equal assiduity solicits every opportunity of employment. For this purpose he makes his court to all mankind; he serves those whom he hates, and is obsequious to those whom he despises. Through the whole of his life, he pursues the idea of

* De Beneficiis, lib. ii. c. 27.

a certain artificial and elegant repose, which he may never arrive at; for which he sacrifices a real tranquillity, that is at all times in his power, and which, if in the extremity of old age, he should at last attain to it, he will find to be in no respect preferable to that humble security and contentment which he had abandoned for it. It is then in the last dregs of life, his body wasted with toil and diseases, his mind galled and ruffled by the memory of a thousand injuries and disappointments, which he imagines he has met with from the injustice of his enemies, or from the perfidy and ingratitude of his friends, that he begins at last to find that wealth and greatness are mere trinkets of frivolous utility, no more adapted for procuring ease of body or tranquillity of mind, than the tweezer-cases of the lover of toys; and like them too, more troublesome to the person who carries them about with him, than all the advantages they can afford him are commodious. To one who was to live alone in a desolate island, it might be a matter of doubt, perhaps, whether a palace, or a collection of such small conveniences as are commonly contained in a tweezer-case, would contribute most to his happiness and enjoyment. If he is to live in society, indeed, there can be no comparison; because in this, as in all other cases, we constantly pay more regard to the sentiments of the spectator, than to those of the person principally concerned, and consider rather how his situation will appear to other people, than how it will appear to himself. But in the languor of disease, and the weariness of old age, the pleasures of the vain and empty distinctions of greatness disappear. To one in this situation, they are no longer capable of recommending those toilsome pursuits in which they had formerly engaged him. In his heart he curses ambition, and vainly regrets the ease and the indolence of youth, pleasures which are fled for ever, and which he has foolishly sacrificed for what, when he has got it, can afford him no real satisfaction. Power and riches appear then to be what they are, enormous and operose machines, contrived to produce a few trifling conveniences to the body, consisting of springs the most nice and delicate, which must be kept in order with the most anxious attention, and which, in spite of all our care, are ready every moment to burst into pieces, and to crush in their ruins their unfortunate possessor. They are immense fabrics, which it requires the labour of a life to raise, which threaten every moment to overwhelm the person that dwells in them, and which, while they stand, though they may save him from some smaller inconveniences, can protect him from none of the severer inclemencies of the season. They keep off the summer shower, not the winter storm; but leave him always

as much, and sometimes more exposed than before, to anxiety, to fear, and to sorrow; to diseases, to danger, and to death.*

Such is the madness of ambition in the individual himself. But it is not of a single member of the social multitude, it is of the great interests of mankind that we should think; and in relation to these, what admirable general purposes does this very madness promote! The labour to which the individual submits without profit, is not profitless to the community. In far the greater number of instances, he is promoting their advantage, careless as he may seem, and careless as he truly is of it. In thinking of ambition, as it may thus operate in its relation to mankind, the moralist is too apt to dwell on the great and visible desolations to which in a few striking cases it gives rise, when the ambitious man has the power of leading armies and forcing nations to be slaves, and of achieving all that iniquity which the audacious heart of man may have had the guilt and folly of considering as greatness. We forget or neglect, merely because they are less striking than those rare evils, the immediate beneficial influence which the passion is constantly exercising in the conduct of the humbler individuals, whose power under the preventive guardianship of laws, is limited to actions that scarcely can fail to be of service to the community. All the works of human industry are, in a great measure, referable to an ambition of some sort, that, however humble it may seem to minds of prouder views, is yet relatively as strong as the ambition of the proudest. We toil, that we may have some little influence, or some little distinction, however small the number of our inferiors may be; and the toils which raise to the petty distinction, are toils of public, though humble utility; and even the means of distinction which the opulent possess, are chiefly in the support of those, who, but for the pride which supports them, while it seems only to impose on them the labour of ministering to all the various wants of their luxury, would have little to hope from a charity that might not be easy to be excited by the appearance of mere suffering in those slight and ordinary degrees in which it makes its appeal rather to the heart than to the senses. It is this silent influence of the passion, contributing to general happiness, where general happiness is not even an object of thought, which it is most delightful to trace; and it is an influence which is felt in every place, at every moment, while the ravages of political ambition, desolating as they may be in their temporary violence, pass away, and give place to a prosperity like that which they seemed wholly to overwhelm,—

* Theory of Moral Sentiments, Part iv. c. 1.

a prosperity which, as the result of innumerable labours, and therefore of innumerable wishes that have prompted these labours, rises again, and continues through a long period of years by the gentler influence of those very principles to which before it owed its destruction.

But while we perceive with gladness the happy social uses to which nature has made the passion for power in mankind instrumental, or rather, to speak with more accuracy, the uses for which nature has made us susceptible of this passion, and while we know well, that the world, therefore, never can be without those who will be moved by ambition to seek the honours and dignities which it is necessary for the happiness of the world that some should seek, it is pleasing for those whose fortune or whose wishes lead them to more tranquil and happier, though less envied occupations, to think that the happiness which so many are seeking, is not confined by nature to the dignities which so very few only are capable of attaining, that it is as wide as the situations of men, and that, while no rank is too high for the enjoyment of virtue, there is no rank that can be regarded as too low for it. It has been as truly as eloquently said, that "when Providence divided the earth among a few lordly masters, it neither forgot nor abandoned those who seemed to have been left out in the partition. These last, too, enjoy their share of all that it produces. In what constitutes the real happiness of human life, they are in no respect inferior to those who would seem so much above them. In ease of body and peace of mind, all the different ranks of life are nearly upon a level; and the beggar, who suns himself by the side of the highway, possesses that security which kings are fighting for."*

LECTURE LXIX.

III. PROSPECTIVE EMOTIONS.—6. DESIRE OF POWER.—OF INDIRECT POWER, AS IN AVARICE.

GENTLEMEN after the remarks which I made in my last Lecture on power, as an immediate object of desire, we are naturally led to consider that peculiar and very interesting modification of the desire of power, in which the object seems to be less the direct command itself, than the means by which the command may indirectly be exercised. Such is that form of ambition which is commonly denominated avarice.

By the affections which we excite,—by

our talents, whether of pure reason or of eloquence,—by the authority of public station we exercise, as you have seen, a ready dominion over the minds of others. We obtain a command over them, which, though less direct, is not less powerful, by the possession of those things which they are desirous of possessing, and for which, accordingly, they are ready to dispose of their personal services, or to transfer to us some of those means of enjoyment which they possess, and of which we in our turn are desirous. To have what all men wish to have, with the power of transferring it to them, is to have a dominion over every thing which they can transfer to us, equal to the extent of the wishes on their part.

Of the power of gratifying these wishes, wealth is the universal representative, or rather the universal instrument. To possess it, is to exercise a sway less obvious indeed, but, in its extent far more imperial than that which ever rewarded or punished the successful arms of the most illustrious conqueror,—a sway as universal as the wishes of mankind,—a sway, too, which is exercised in every case without compulsion, and even with an eagerness, on the part of him who obeys, equal to that which is felt by him who is obeyed.

What conqueror is there, who has not seen, beyond the march of his armies, some stubborn tribe that resisted still the force which had crushed whole nations in its dreadful career; beyond which, if they too had been crushed, some other tribe as stubborn would still have risen, to remind the victor of his weakness, even at the very moment in which his sway was stretched over a wider space than had ever been covered with slavery and misery before by a single individual? The empire which a rich man exercises finds no nation or tribe that wishes to resist it. It commands the services of man wherever man can be reached, because it offers to the desires of man the power of acquiring whatever objects of external enjoyment he is most eager to acquire. From the north to the south, from the east to the west, every thing that can be rendered active is put in motion by him, who remains tranquilly at home exciting the industry of those of whose very existence he is ignorant, and receiving the products of labour for his own use, without knowing from whom he receives them. It is almost as in the magic stories of romance in which the hero is represented as led from the castle-gate by hands that are invisible to him, ushered to a splendid banquet, where no one seems present, where wine is poured into the goblet before him at his very wish, and luxurious refreshment after refreshment appears upon the board, but appears as if no hand had brought it. To the rich man, in like manner, whatever he

* Theory of Moral Sentiments, Part iv. c. 1.

wishes seems to come merely because he wishes it to come. Without knowing who they are who are contributing to his idle luxury, he receives the gratification itself, and receives it from hands that operate as invisibly as the fairy hands at the banquet. He gathers around him the products of every sea and every soil. The sunshine of one climate, the snows of another are made subsidiary to his artificial wants; and though it is impossible to discern the particular arms which he is every instant setting in motion, or the particular efforts of inventive thought which he is every instant stimulating, there can be no doubt that such a relation truly exists, which connects with his wishes and with his power the industry of those who labour on the remotest corner of the earth which the enterprising commerce of man can reach.

Since the possession of wealth is thus the possession of indirect power over the labour of millions, it is not wonderful that our desire of every gratification, which the labour of millions can afford, should be attended with the desire of that by which the labour that is to minister to our gratification can be commanded. When viewed in this light, the desire of wealth is only another form of those very desires to which wealth can be rendered instrumental, by affording them the means of indulgence.

But the passion assumes a very different appearance, when it seems confined to the means of exercising an indirect command over the labours of others, without the slightest intention of exercising that sway, certainly without the least attempt to exercise it. If he who was most desirous of wealth were most desirous of obtaining with it those enjoyments, in relation to which alone wealth has any value, there would be no mystery in avarice; and we should scarcely think of giving it a name as a separate passion distinct from the passions to which it was subservient, and of which it was only representative. But it happens, that though prodigality may, in all cases, or nearly in all cases, be considered as connected with avarice, avarice very often exists, and is characterized as avarice only when it exists, without any disposition to employ for purposes of enjoyment what it is so eager to acquire. The mere gold is valued as if it were a source of every happiness, when every happiness which it truly affords, and without relation to which it is nothing, is despised as if of little value compared with that which derives from its power over the very enjoyments that are despised, all the absolute value which it possesses.

The anchorite who, to render himself more acceptable to God, retires from the society and service of man; who sleeps upon the earth; who wraps his feeble limbs in the

coarsest garments; who lives on roots and water, and sees his meagre frame waste every day, without a wish to restore its vigour by a diet of richer nourishment, is one whose superstitious weakness we may lament, while we respect the very error from which it flows. But what should we think of him, if, while he slept upon the earth, and covered himself with sackcloth, and scarcely tasted even his scanty food, he were desirous of amassing the means of acquiring the softest couches, the most splendid robes, the richest fare, the most magnificent palaces? Even this inconsistency is not all which the world exhibits. There are human beings, anchorites of a more ignoble order, who submit voluntarily to all these privations, and who feel at the same time this very desire of wealth which such privations render absolutely superfluous, who have the still greater inconsistency of desiring to possess means of luxurious enjoyments, while they already have these means in their possession,—who sleep on the earth, not because they think that God has prohibited every sensual indulgence, but because they fear that their couches, if they were to lie upon them, would be sooner worn out; who clothe themselves in rags, not from humility, but from pride, that trembles lest it should afterwards have to appear in rags; and who, in the midst of inexhaustible abundance, starve, because they do not know how soon, if a thousand improbable things should happen, they may afterwards be obliged to starve.

Poverty, it has been said, has many wants; but avarice is in want of every thing.

Desunt inoplae multa, avaritiae omnia.

"The wealth which the miser only calls his own," says Cyprian, "he guards in his coffers with the same anxiety of watchfulness, as if it were the money of another committed to his charge; he has no other possession of it, than as hindering others to possess it."—"Pecuniam suam dicunt, quam, velut alienam, domi clausam, sollicito labore custodiunt. Possident ad hoc tantum, ne possidere alteri liceat."

The picture which Pope gives us of a celebrated miser, in one of his *Moral Essays*, absurd, and almost inconsistent with human reason as the character may seem to be, is yet a picture of no small number of mankind; and when the character, in all its deformity, is not to be traced, there are still some features of it that present themselves to the observer, in many individuals who are misers only in certain circumstances, or at certain moments, and who would be astonished if we were to attach to them so disgraceful a name.

After describing the miserable flock-bed, in the worst inn's worst room, in which the Duke of Buckingham, once that "life of

pleasure, and that soul of whim," closed his wretched existence, the poet continues,—

His Grace's fate sage Cutler could foresee,
And well, he thought, advised him, "Live like me."
As well, his Grace replied, "Like you, Sir John!
That I can do when all I have is gone."
Resolve me, Reason, which of these is worse,
Want with a full, or with an empty purse?
Thy life more wretched, Cutler, was confess'd,—
Arise and tell me, was thy death more bless'd?
Cutler saw tenants break, and houses fall,
For very want—he could not build a wall.
His only daughter in a stranger's power,
For very want,—he could not pay a dower.
A few grey hairs his reverend temples crown'd;
'Twas very want that sold them for two pound.
What even denied a cordial at his end,
Banish'd the doctor, and expell'd the friend?
What but a want, which you perhaps think mad,
Yet thousands feel, the want of what he had!

I have already said, that if avarice consisted merely in the desire of obtaining the wealth by which we might command the gratification of our direct desires, there would be nothing in it at all mysterious, since it would be only another form of these very desires; and that the mystery of this strange passion arises only when the enjoyments which it could command are sacrificed to the mere possession of the means of commanding them. It then, indeed, presents phenomena truly worthy of being analysed, not merely as striking in themselves, but as illustrative of some of the most important general principles of our mental constitution.

It is, in the first place, sufficiently evident that the avarice does not arise from any essential quality of the wealth itself as a mere substance. You cannot suppose that, independent of the relative value which the comparative scarcity of these two metals has produced, a mass of gold would be much more desirable than a mass of iron. It must originally, then, in the eyes of the miser, as of every other person, have derived its high value from the command over the labour of others, or the actual possessions of others, which it was capable of transferring to every one into whose hands it might pass, or from the distinction which the possession of what is rare and universally desired always confers.

The common theory of the value attached by the miser to the mere symbol of enjoyment, is that the symbol, by the influence of the general laws of association, becomes representative of the enjoyment itself. We have so frequently considered money as that which affords us various pleasures, that the value which we attach to the pleasures themselves, is transferred to that which we know will always produce them when exchanged for the enjoyment; and there can be no question that such an association does truly take place, and must take place, though not in a

few individuals only, but in all mankind, as long as this well-known principle of the general mental constitution continues to operate. But still, it must be remembered that the mystery in this case remains very nearly the same as before. The theory accounts indeed, and accounts most satisfactorily, for a value beyond its intrinsic use, which the miser, like every one else, may attach to gold; but it does not explain the peculiar associations in his mind which form the very difficulty in question, that very high value which he alone discovers in it; a value so far surpassing that of the quantity of enjoyment which it may command, that the miser seldom thinks of spending, that is to say, of exchanging the mere symbol of enjoyment for the enjoyment itself, while he thinks with insatiable avidity of accumulating what is not to be spent. The common theory, therefore, is manifestly defective. Let us inquire, then, whether a nicer analysis may not afford us a solution.

No one, I conceive, originally, and without regard to its value in exchange, could prize a piece of gold much more than an equal bulk of any thing else that had physical properties of equal direct utility; and originally, too, I conceive, from the indisputable influence of time in all our desires, that if all other circumstances were the same, no one would prefer to a present pleasure, a pleasure of exactly the same intensity and duration at any distant period. For both these reasons, avarice, as it exists in maturer life, could not be an immediate passion, but must have required certain circumstances to produce or foster it.

The circumstances which I conceive to have most effect in heightening the value of the symbol or instrument of enjoyment above the enjoyment itself, is the comparative permanence of the one, and the very fugitive nature of the other. Before the boy lays out his penny in the purchase of an apple or orange, it appears to him valuable chiefly as the mode of obtaining the apple or orange. But the fruit, agreeable as it may have been while it lasted, is soon devoured, its value, with respect to him has wholly ceased, and the penny he knows is still in existence, and would have been still his own if the fruit had not been purchased. He thinks of the penny, therefore, as existing now, and existing without any thing which he can oppose to it as equivalent, and the feeling of regret arises,—the wish that he had not made the purchase, and that the penny, as still existing, and equally capable as before of procuring some new enjoyment, had continued in his pocket. The feeling of regret thus associated with the loss of his penny, will, by frequent repetition, be still more intimately combined with the very conception of those little purchases to which his appetites otherwise might lead him. It will seem a serious

*Pope's Moral Essays, Ep. iii. v. 315—332.

evil to part with that, the pain of having parted with which was a serious evil before. The regret of course must vary with the mode in which the boy has most frequently laid out the contents of his little purse, so as to present, or not to present to his mind, the equivalent enjoyment for which the power of obtaining afterwards a similar amount of enjoyment was resigned. If he has purchased any thing which retains a permanent value, the regret will be less likely to arise, while the pleasure received from the purchase, as frequently presented to his mind during the permanent possession, will, on the contrary, accustom him to value money only as the instrument of obtaining what he feels to be so valuable. It will be the same as if he had given it away for the relief of distress, since in this case, though nothing absolutely permanent is possessed by him, the pleasure of the thought itself, as often as the thought recurs, may almost be considered as something permanent. It is impossible for him to think of his penny without thinking of this also, not as a pleasure wholly past, like that of fruit or sweetmeats devoured, but as a pleasure still present and never-fading, and accompanied therefore with a feeling of satisfaction which precludes all regret. Our first expenses, then, like all the subsequent expenses of our maturer years, may be attended, according to circumstances, either with regret or satisfaction; and it is not easy to say how much of the future avarice of the man may depend on the nature of a few purchases made by the boy, according as these may have been of a kind to give greater or less occasion to the feeling of regret, and to the subsequent association of this feeling with the very notion of any little expense.

I may remark, by the way, the very early connexion which in this manner takes place between prodigality and avarice,—a connexion which continues to subsist, as I have already said, almost universally in maturer life.

But to return to our little miser; it must not be supposed that the regret which is early associated with expense, approaches the nature of that extreme fear of parting with money which constitutes the avarice of manhood. All that is necessary is to produce a slight terror of expense, which the habits of many years may strengthen into parsimony. In the boy it may be scarcely more than what is counted only frugality in a man, and ranked among the virtues; but a boy that is frugal as man is frugal, is a miser of other years.

When the feeling of regret has been frequently blended in a very lively manner with the conception of expense, it is of course readily suggested again in similar circumstances. In every purchase there must be

something given away, as well as something received; and, according as the mind is led more to the one or to the other of these, it will be more or less ready to make the exchange. If its thought have turned chiefly to the agreeable object which it wishes to acquire, as, where the object is very pleasing, it will naturally do, unless counteracted by opposite suggestions it will gladly make the purchase; but if, when any such wish arises, its thought be turned, in consequence of former feelings of regret, chiefly to that which it must give to obtain the object, and if the principal reflection be, "How many other things as valuable, or more valuable, could this money procure, and what regret, therefore, shall I afterwards feel if I have parted with it for this one," the very desire of making the purchase may cease altogether, from the mere suggestion of the various other agreeable objects, the acquisition of which the purchase of this one would preclude. The frequent repetition of this deliberate rejection, will of course connect more and more with the very feeling of deliberation, as to any little expense, that feeling of rejection which was its former attendant.

I may remark, in the next place, that if a guinea were significant only of one species of enjoyment, to the same amount which it might procure in exchange, its value would not be felt in so lively a manner, even by the most avaricious. But it recalls to the mind not one species of enjoyment merely which it might command, but as many species as there are objects to be purchased with it. The longer we dwell on it, therefore, the more valuable does it seem, because it suggests more of these equivalents, all of which it seems in his power of commanding them to condense within itself. Accordingly, to the miser, who is accustomed to this contemplation, a guinea is almost like a thousand; and it is not very wonderful, therefore, that any single object which a guinea could purchase, should seem to him trifling, when compared with the precious coin itself, which is felt as the equivalent of many.

In a former lecture, when treating of the influence of habit, in endearing to us, with a value far beyond its intrinsic use, the most trifling object that has been long familiar to us, I endeavoured to account for this, in a great measure, by the number of past enjoyments, that were condensed, as it were, in our very notion of the object; the loss of which, accordingly, seemed to us, by a sort of momentary illusion, to be not the loss of the trifling object alone, but the loss of those more important delights that give it an imaginary value, which it was impossible for us to separate from it. To part with it is in a great measure to part with all the pleasures that seem contained in its very nature, or of which, at least, it is representative to our

thought. An illusion of the same kind, I conceive, operates very powerfully on the miser. He has so often meditated on the worth of a guinea, in its relation to different objects, that it appears to him not a mere piece of gold, nor the representative only of one small amount of enjoyment, but the power of obtaining almost innumerable things; and the very conception of the loss of it is, therefore, like the loss, not of one of those things only, but of every thing which it might have procured. It is as if he were giving away a treasure; because it represents to his mind, in the conception of its various equivalents, as many things as a treasure would be necessary for purchasing.

There is another circumstance which I consider as having great weight with the miser, though, when first stated, it may seem to you perhaps to imply an absurdity too great even for momentary illusion; for the momentary illusion even of a mind subject to so much illusion as that of the miser must certainly be allowed to be, whatever theory we may form of its feelings. To the avaricious there are two thoughts which may be regarded as almost constantly present,—the thought of what they possess, and the thought of some enormous sum, to which perhaps they look, as to the ultimate object of their sordid ambition. Every petty gain is no sooner made than it is instantly added to the sum already possessed, and the new amount repeatedly measured with the greater sum that is only hoped. It is valued not for itself only, but as a part of these far greater products. The loss of the small sum, therefore, however insignificant in itself, is not the loss of it only, but is felt as if it were the loss of much more. It is as if the one hundred thousand pounds, or the half million, which it was before so delightful to contemplate, could no longer be contemplated with the same satisfaction,—as if it, the splendid whole, had almost ceased to exist, by the loss of that which was one of its constituent parts. The illusion is but a momentary one indeed, yet still it recurs as often as the loss itself becomes an object of thought; and a single guinea is thus regretted, almost with the same anguish of heart as if the loss of it had been actual poverty, because it is truly a part, and considered chiefly as a part of that great whole, the loss of which would, without all question, be actual poverty.

It is in this way, I conceive, that the miser, when the avarice is extreme, seriously trembles at approaching poverty, when he is forced to be at the slightest expense. It is quite evident, that he could not seriously believe this, if he discerned clearly the insignificant proportion which the expense bore to his actual wealth. But it is a part of the whole; it is intimately associated with the

conception of the whole; and the loss of it, therefore, being inconsistent with the possession of the whole, seems for the moment to take that whole from him. He thinks, with a sort of giddy terror, that he is falling into poverty, firm as his golden support may be; very nearly in the same way as one that stands on the brink of a precipice with the firmest footing, still feels every moment, in the vivid conception of the possible fall, as if he were truly tumbling down the dreadful abyss. If a small parapet had been between him and the precipice, it could not have made his footing more firm, but it would have prevented the agony of giddy terror; if the few guineas, in like manner, had not been lost, the miser scarcely could be said to be richer than after the loss, but the conception of poverty would not have been excited, that conception which rises to the mind with such increased reality when there is any real loss, however trifling, with the notion of which the imaginary loss of the whole actual wealth admits of being blended.

Whatever truth there may be in this speculation, as to the momentary illusion by which the loss of a part, in consequence of the habit of frequently dwelling on it as a part of a great whole, becomes for the moment, like the loss of that great whole itself,—an illusion which seems to me to arise very naturally from the common principles of the mind, as exemplified in many other analogous feelings, and without which, or some similar illusion, it appears to me impossible to account for all the phenomena of extreme avarice; still, whether this speculation be admitted or rejected, the remarks as to the influence of regret, in producing associations favourable to the production and growth of avarice, will not be the less just. While the laws of suggestion in the mind continue as at present, it is impossible that the feeling of regret should attend many little purchases which the child may have made, without some feeling of uneasiness in the similar purchases which he may be led to make again,—an uneasiness which those who know the growth of feelings in the mind from very small beginnings, will not be surprised to see afterwards expanded into all the anxieties, and horrors, and madness of avarice.

The chief circumstance of distinction, then, of the theory which I have ventured to propose to you, from the evident inadequacy of the common theory, is, that instead of making the passion of the miser to depend on the pleasing association of enjoyment, it founds it chiefly on an association of an opposite kind, of the painful feeling of regret. The remembrances which rise to his mind are not so much those of the few moments of some agreeable purchase, as of the more lasting wish that the purchase had not been made. It is not happiness, then, in its sha-

dowy form, which is for ever playing around his heart, even when he contemplates the very symbols of happiness. It is possible pain, not possible pleasure; fear, far more than hope; poverty itself, with all the wretched images of the wants that attend it, in the very redundancy of a wealth which it would weary every one but its never-weary possessor and calculator to compute.

This theory of avarice, as founded on suggestions of regret and not of pleasure, explains very readily some facts, which otherwise, I cannot but think, would be absolutely inexplicable. Nothing is more truly remarkable, for example, than the disproportioned vexation of the miser at losses of very different amount. The loss of a guinea, or even of a shilling, gives him frequently the same uneasiness as the loss of a thousand guineas; and he who would not give away a guinea without the most compunctious terror, has sometimes been known to give away one thousand, perhaps with less difficulty, certainly with less appearance of anxiety, than if it had been a much smaller sum. The reason of this apparent disproportion I conceive to be, that the feeling of regret, which I regard as the predominant feeling in the complex associations of the miser, has been more frequently attached to the loss of a smaller sum, such as that which is given away in common purchases, and arises, therefore, more readily to the mind, merely because it has been thus more frequently associated. A guinea has been regretted a thousand times, a thousand guineas have perhaps never once been regretted, because they have never been given away before. A large sum may, indeed, be analysed into its constituent parts, with the conception of the loss of which the painful regret might be supposed to arise as before; but this analytic reduction requires an operation of thought, which takes place less readily than the simple suggestion of feelings, attached by frequent recurrence to the petty loss itself. So much of avarice, at least of what appears most ridiculous and sordid in avarice, consists in the pitiful saving of a few shillings of those small sums which occur to the demand of every hour, and admit, therefore, of being most frequently combined with regret in some stronger or slighter degree, that it has been said, with great truth, that a very few pounds in the year, laid out as other people would lay them out, would save almost any one from being counted a miser.

It is for the same reason, I may remark, that it is very difficult for those who, in early youth, have struggled with extreme penury, and who have been suddenly raised to affluence, not to have at their heart what may seem like original constitutional avarice to those who do not reflect on its cause,—a love of money, when the love of money

seems so little necessary to them,—a terror of expense which was once only economy, but which is economy no more. They carry with them the feelings that have attended their expenses, in a situation in which any little gain was of great relative value, and any little departure from extreme frugality would have been ruin; and hence, perhaps, with every desire of doing good, when they think of their large fortune, and of the means of bounty which it affords them, they do little good in detail, because, in their actual benefactions, the feelings which they have been accustomed to attach to sums that were once great to them, continue still, by the influence of mere association, to arise, when the sums which they tremble to give away are, in relation to their ample means, truly insignificant. A few guineas in their charities, as in their expenses of every sort, seem to them a large sum, because they seemed to them a large sum for the greater part perhaps of a long life. They are misers merely because they once were poor, not because they are indifferent to distress.

When, in such circumstances of sudden change of fortune, the heart readily adapts itself to the change, it may be considered as a proof, that he who is now rich has, even in indigence, been accustomed to look to wealth chiefly as an instrument of gratifying those generous wishes which he now, therefore, delights to gratify; unrestrained in his bounty by any feeling of regret, because the chief regret which he felt before was that of not being able to bestow a relief, the power of bestowing which he now feels to be so inestimable a part of riches.

In these remarks on the growth of avarice, I have considered chiefly that part of the process which is the least obvious. There is one more obvious circumstance, which is, of course, not to be neglected in the theory of this passion; the distinction which great wealth confers, like every thing which is possessed only by a few, and which all, or nearly all, are desirous of possessing. Of the influence of this mere distinction as an object of satisfaction and desire to the miser, there can be no doubt; and it is an influence which increases always as the amount of wealth already accumulated increases. The smallest subtraction from the illustrious amount, lessens in his own eyes his own dignity. It seems to him delightful to be constantly adding to that which, at every addition, makes him more and more illustrious. To take any thing from the heap reverses this process. He feels that he is less than he was; and with this feeling, which is painful in itself, he does not pause to think how very little he is less; and how very near in glory one who possesses a hundred thousand pounds is to him who possesses a hundred thousand pounds and a shilling.

The union of all these feelings in their highest degree is probably necessary to form the perfect miser, as he exists only, in rare cases, for the admiration of the world. But in those half-misers, of whom the world is full, they exist in various degrees and proportions, producing those singular contrasts of feeling and situations, which would be ridiculous, if they were not lamentable and disgusting.

Not only the low-born and old
Think glory nothing but the beams of gold,
The first young lord, whom in the Mall you meet,
Shall match the veriest hunks in Lombard-street,
From rescued candle-ends who raised a sum,
And starves, to join a penny to a plumb.
For love, young, noble, rich Castalio dies;
Name but the fair,—love swells into his eyes.
Divine Mominia! thy fond fears lay down;
No rival can prevail—but half-a-crown.*

According as these feelings rise more or less strongly, and in a great measure, according as the notion of any particular sum, which may suggest either the enjoyment that may be afforded by it, or the regret that may attend its loss, suggests one of these rather than the other, we are to account for those sudden alternations of avarice and generosity which occasionally appear in the same character. "There is no one circumstance," says Fielding, "in which the distempers of the mind bear a more exact analogy to those which are called bodily, than in that aptness which both have to a relapse. This is plain in the violent diseases of ambition and avarice. I have known ambition, when cured at court by frequent disappointments, (which are the only physic for it,) to break out again in a contest for foreman of the grand jury at an assizes, and have heard of a man who had so far conquered avarice as to give away many a sixpence, that comforted himself at last, on his death-bed, by making a crafty and advantageous bargain concerning his ensuing funeral with an undertaker who had married his only child."

It is very evident, according to that analysis of the passion of the miser, on which I have ventured, that the mere circumstance of approaching and certain death, as in the case now quoted, could not have any great effect in lessening the delight of such a bargain; because the delight of profit to the miser does not depend on enjoyment afterwards to arise from it, but on feelings of the past, associated with the mere gain itself, or with the loss of gain. Gain is still delightful, loss still painful to him, in the same way as in emotions that agree scarcely in any other respect,—the scenes and countenances which he loves are still beautiful to him who knows that death is soon to separate him from every thing which he admires on earth, and that the loveliness, therefore, which he

still sees in all his eloquent expression of continued gentleness and kindness, is a loveliness that, in all which it expresses, must be lost to him.

It is equally evident, according to the same analysis, that an accession of wealth, however great, to that which was perhaps only a competence before, will have little chance of lessening avarice, but may, on the contrary, as we see with surprise in many cases of this strange moral anomaly, increase the very avarice that was before scarcely marked as sordid, by rendering more valuable that rich amount which it would be painful to diminish by such ordinary expenses as even frugality allows. The larger the sum possessed, the more nearly does it approach to that beautiful combination of arithmetical figures which delights the imagination as often as it rises like a dream of heaven, and which is, indeed, the only dream of heaven that does arise to the miser, in that voluntary wretchedness to which he has condemned himself,—a wretchedness that has all the mortifications of penance, without the thoughts of virtue and holiness, by which penance is more than soothed, and that must be ever miserable, because a cessation of the miseries that are thus voluntarily induced, would be itself a wretchedness still more dreadful than what is voluntarily suffered.

There are various applications of the theory, which flow from it so evidently, that it is unnecessary to occupy your time in pointing them out. One conclusion, however, of great practical importance, it may be of advantage to state particularly. If avarice, as I conceive, has its origin chiefly in the feelings of regret that attend the early expenses of the child, it must be of the utmost importance to prevent, as much as possible, these primary feelings of regret, by endeavouring to lead him to employ the little money which is at his disposal, in such a manner as may make the very remembrance of the little transfer pleasing to him. When the child hastens to throw away whatever is given to him, in the gratification of his gluttonous appetite, we think that we perceive only prodigality arising. It is future parsimony, on the contrary, which we chiefly see,—a parsimony which will be quick to regret, because it has been thoughtlessly quick to squander, or rather, it is that mixture of prodigality and avarice which almost every prodigal exhibits,—that *societas luxuriæ et sordium*, of which the younger Pliny speaks with so much detestation when he describes them as singly most unworthy of the noble nature of man, but still more wretchedly disgraceful, when combined, "*quæ cum sint turpissima, discreta ac separata, turpius junguntur.*" Even in mature life, the very necessities to which luxurious extravagance leads, preclude all possibility of being generous; and the generous

*Young's Love of Fame, Sat. iv.

desires which it is thus impossible to gratify, merely on account of selfish indulgences, soon cease to be felt at all. The prodigal is thus almost necessarily a miser, without thinking that he is so; because he is constantly throwing away the money which he obtains, he forgets the rapacity of his desires themselves; his avarice is not, indeed, the avarice of him who lives and dies in rags and wretchedness; but to borrow a very happy expression of Marmontel, it "is a mixture of all the passions which can be satisfied with gold."

LECTURE LXX.

III. PROSPECTIVE EMOTIONS.—6. DESIRE OF POWER,—OF INDIRECT POWER, AS IN AVARICE,—CONCLUDED.—7. DESIRE OF THE AFFECTION OF THOSE AROUND US.—8. DESIRE OF GLORY

My last Lecture, Gentlemen, was occupied with an inquiry into the nature of one of the most seemingly anomalous of human passions,—a passion that has for its object what is directly valuable only in relation to other desires, that disregards, however, the gratification of these very desires to which its object may be considered only as instrumental, and that yet continues, with mad avidity, to labour to accumulate what, but for the enjoyments which are despised and viewed almost with terror, is a burden, and nothing more,—a mass of cumbrous matter, which it is difficult to acquire, and anxious to keep, of no more value in itself, when stamped with the marks of national currency, than when it was buried, with other dross, in the original darkness of the mine.

In what manner the passion of avarice is most probably formed in the mind, I endeavoured to explain to you, by a retrospect of the circumstances that may be supposed most likely to diversify the early pecuniary transactions of the little barterer, who begins in his exchange of pence for toys and sweetmeats, that traffic, which, in more important purchases, is to continue through life, which renders the preservation of life itself, and the enjoyment of all its external pleasures, a sort of commerce, and makes merchants, therefore, in the strictest sense of that term, of the proudest of mankind, who may think, perhaps, that the merchandise which they exercise is dignified by the name of expense, but who, in their most luxurious and prodigal expenses, are only traders in gold and commodities, the barterers of certain sums of gold for certain quantities of other commodities, which, by mutual consent, are received as equivalents.

In this retrospect of the circumstances in

which the passion of the young miser may be supposed to originate, we found reason to ascribe it to a process different from that which is commonly assigned as its origin; and explained, I flatter myself, in conformity with the theory which we were led to form, many seeming irregularities with respect to the influence of the passion, for which it does not seem easy to account on any other principle.

In relation to the general moral character of the individual who is subject to it, it would not be easy to find a passion that strips him so completely of all that was originally noble in his constitution, as avarice in its extreme degree. Almost every other passion, however inconsistent it may be with the higher honours of our social nature, has yet some direct relation to mankind. Sensuality itself is not wholly selfish. The more refined voluptuary seeks society to enliven and embellish his pleasures; and even he who has stupefied in drunken excesses, not his intellectual faculties only, but almost the very feelings that render him a moral being, finds the madness of the maddest drunkenness a more animating pleasure when shared with some wretched half-human maniac like himself. Even the passions that are absolutely malignant, and that in separating their victim from the kind offices, and from the common courtesies of life, seem to break the very bond of social affinity, still bring the feelings, the thoughts, the emotions of living beings, as objects ever present to the mind, and thus connect man, in some measure, with man, even on appearing to throw them off with violence from each other. He who hates must at least have man before him, and must feel some common tie that connects him with the very object of his hate. But to the miser, there is no tie of human feeling. There are no propinquities to him, no friendships; but the place of these is supplied, and fully supplied, by the single passion which occupies his heart. It is not man, but a mass of inanimate matter, which is ever before his mind, and almost ever before his very eyes, or at least which would be almost ever before his eyes, if there were no fear of exposing as booty what would otherwise be the delight of his unceasing contemplation. He thinks, indeed, and toils; but he thinks only of gold, toils only for gold; and if his gold could be doubled by the annihilation of all beside, he would care little, perhaps, though no other object were to exist, but the mass which he has to measure or compute, and himself the sole happy measurer or computer of it. In his very nature, indeed, he becomes himself almost as little human as that which he adores. Where his gold is buried, his affections too are buried. The figure which Salvian uses, in speaking of this moral torpor of the miser, is scarcely too bold

a one,—that his soul assimilates itself to his treasure, and is transmuted, as it were, into a mere earthly mass. “*Mens thesaurizantis thesaurum suum sequitur, et quasi in naturam terrestris substantiæ demutatur.*”

Even if this moral torpor to every kind affection were all, the passion of the miser, contemptible as it might seem, would still be only an object of contempt, or of a mixture of disgust and pity. But with how many positive vices is avarice connected, and how difficult is it for him who values the possession of wealth as far transcending every thing beside, to respect in any of its forms, when it is opposed to his unjust gain, the restraint of that moral principle, which, in all its forms, seems so poor and insignificant in comparison with the wealth which it would preclude him from acquiring, or which it would prevent him at least from preserving in all its undiminished beauty! The miser, even though he were the most sordid of his sordid class, might, perhaps, fulfil some of the social duties of life, if these duties had no relation to gold; but the great misery of his scanty morality, when we consider him in his social connexions, is, that the gold which he loves, is, by its universality of application, as a medium of every external comfort and enjoyment, and consequently of every action by which these can be communicated to others, connected with all, or almost all the duties of life; in requiring which from him, therefore, virtue seems to make from him too extravagant and costly a demand. If no sacrifices were required of him, or if he could be benevolent at a cheaper rate, he might have no great reluctance to be benevolent. To relieve the lowest and most wretched necessities of the indigent, however, even by the pettiest alms, would be to take some few particles from the precious heap. To bring forward into public notice the genius that is still obscure, because it is beaming only in poverty, or even the patient industry that may not yet have found any one to whom its humble talent is an object of demand, would take from the heap a still greater number of particles; and to remember, in some cases, the claims of consanguinity or friendship, even without that dreadful lavishness of expense which the world would scarcely count generosity, to remember them with the most cautious sparingness in the well-measured benefaction, would be to take from the heap, perhaps, what, if the whole sum were very accurately measured, would make it almost sensibly less. In the ordinary dealings of life, in which generosity on any side is out of the question, and mere justice is all that is required, the miser may be honest; but his honesty, if he have fortitude enough to preserve it, is always in peril, and escapes only by a continual struggle. Not to be a knave is in him a sort of magnanimity. To avoid even the

meanest fraud, at least to avoid it from any other motive than a fear of law, is a sacrifice to heroic virtue of the same sort, as it would be to a very generous man to strip himself of the half, or more than the half, of all which he possessed, for the comfort of a suffering stranger.

In the contemplation of many of the passions that rage in the heart with greatest fierceness, there is some comfort in the thought that, violent as they may be for a time, they are not to rage through the whole course of life, at least if life be prolonged to old age; that the agitation, which, at every period will have some intermissions, will grow gradually less as the body grows more weak; and that the mind will at last derive from this very feebleness a repose which it could not enjoy when the vigour of the bodily frame seemed to give to the passion a corresponding vigour. It is not in avarice, however, that this soothing influence of age is to be found. It grows with our growth and with our strength, but it strengthens also with our very weakness. There are no intermissions in the anxieties which it keeps awake; and every year, instead of lessening its hold, seems to fix it more deeply within the soul itself, as the bodily covering around it slowly moulders away. What was scarcely necessary in the first fresh years of youth, when in the alacrity of health, and with senses quick to every enjoyment, it might have seemed reasonable to attach a high value to the means of providing for the long series of luxuries of a long life; what was even then scarcely necessary for this abundant provision, is desired more impatiently when a few spare meals more are all which nature seems to ask for the few remaining hours of exhausted age; and when some other disease, perhaps, in aggravation of the sure disease of age itself, is lessening even the small number of those meals, which nature scarcely can be said still to require. The heart which is weary of every thing else, is not weary of coveting more gold; the memory, which has forgotten every thing else, continues still, as Cato says in Cicero's Dialogue, to remember where its gold is stored; the eye is not dim to gold that is dim to every thing beside; the hand, which it seems an effort to stretch out and to fix upon any thing, appears to gather new strength from the very touch of the gold which it grasps, and has still vigour enough to lift once more, and count once more, though a little more slowly, what it has been its chief and happiest occupation thus to lift and count for a period of years far longer than the ordinary life of man. When the relations or other expectant heirs gather around his couch, not to comfort, nor even to seem to comfort, but to await, in decent mimicry of solemn attendance, that moment which they rejoice to view approaching, the

dying eye can still send a jealous glance to the coffer, near which it trembles to see, though it scarcely sees, so many human forms assembled; and that feeling of jealous agony which follows and outlasts the obscure vision of floating forms that are scarcely remembered, is at once the last misery, and the last consciousness of life.

Can a passion so odious, and almost so loathsome to our heart as that which I have now been describing, be subservient to any happy purposes in the general economy of life? It may seem at first as little capable of having any relation to good, as of enjoying good; and if we consider any particular case of the passion, in its extreme degree of sordid parsimony, without regard to the elementary feelings that have composed it, and that may exist in other degrees of combination, avarice would truly seem to be without any relation to good, as in like manner, it would seem, if we were to consider any particular case of the violence of revenge, or of any of the malevolent passions, that the passion which was unquestionably productive of unhappiness to the individual would be productive also in this extreme degree of injury rather than of advantage to society. Yet injurious as it may be in some cases, we have seen that the susceptibility of resentment, which Heaven has placed in our breasts for the terror of the guilty, is, while there is any possibility of aggression on the part of others, productive of good upon the whole, far surpassing all the amount of evil to which, in rarer cases of intemperate violence, it may give rise. It is the general result of the elementary feelings that may have constituted in slow growth our various passions, which we are to consider in an estimate of this kind, not their mere occasional evil in certain cases of unfortunate combinations. What we exclusively term avarice, is evil,—as that form of implacable or disproportioned resentment which exclusively we call revenge, is evil. But avarice is, as we have seen, the result, in certain peculiar circumstances, of feelings which are themselves not advantageous merely, but essential to the happiness, and almost to the very existence of society. If the analysis of the passion of the miser, which I ventured to deliver to you, be just, it is the result of early feelings of regret, that in the particular circumstances in which they arose, were reasonable feelings; and if man were, by his very nature, incapable of feeling regret, however absurd and ruinous his expense might have been, what a scene of misery would life have been continually presenting to our eyes! What reliance, amid so many temptations to inconsiderate luxury, could be placed on the fortune of any one even for a single day? And what domestic happiness could there be if the father, the wife, the son, however rich in the morning, might

be expected, almost with certainty, to be in indigence at night? Our provident Creator has arranged better the moral economy of the world. With our sensibility to external enjoyments, and our consequent possibility of being seduced into luxurious and disproportionate indulgence, he has corrected in a great measure this possible evil of what is good in itself, by rendering regret the necessary and uniform, or almost uniform attendant of any disproportionate indulgence that lessens in any considerable degree our fortune, and our consequent means of usefulness. Avarice indeed may be, as we have seen, an occasional result of this very feeling; but what is avarice in a few is frugality in all beside; and the advantages, which the general frugality is every moment affording to almost every family of mankind, are not too dearly purchased—certainly not purchased at a dearer rate than any other amount of equal good is purchased, by the small portion of evil that may be found to attend these advantages, as spread over the whole social community. The general sum of evil in the world would certainly not be lessened, if the possibility of a few cases of avarice were prevented, by the cessation of those simple feelings in which avarice and frugality alike have their rise; but would on the contrary be increased almost to infinity, if these simple feelings were suspended, that secure to every family a permanence of enjoyment, by checking the momentary desire of every individual. There is no fear that, in the multitude of individuals who form a nation, when there are so many solicitations to enjoyment, and therefore to the expense, without which enjoyment cannot be purchased, any very considerable number of them will be misers; and the wealth of the few who may be denominated misers, however closely it may be coffered for a time, is ever ready to make its escape, and seldom requires more for its deliverance than a mere change of its master.

Ask we what makes one keep, and one bestow?
The Power who bids the ocean ebb and flow;
Bids seed-time, harvest, equal course maintain,
Through reconcil'd extremes of drought and rain;
Builds life on death, on change duration founds,
And gives th' eternal wheels to know their rounds.
Riches, like insects, when conceal'd they lie,
Wait but for wings, and in their season fly.
Who sees pale Mammon pine amid his store,
Sees but a backward steward for the poor!
This year a reservoir to keep and spare,
The next a fountain, spouting through his heir,
In lavish streams to quench a country's thirst,
And men and dogs shall drink him till they burst.*

The desire which is next in order to those already considered by us, is the desire of the affection of those around us.

Of the nature of that delightful emotion which constitutes love itself, in the various relations in which it may exist, I have al-

* Pope's Moral Essays, Ep. iii. v. 163—176.

ready treated too fully, to be under the necessity of making any additional remarks on it. But though love, that feeling of affection for the object that is or seems to us amiable, cannot continue for more than a moment, or at least cannot continue long, without a desire of reciprocal affection in the object beloved, the regard which arises instantly on the contemplation of the amiable object, is itself, as a mere state of the mind, distinct from the desires which may instantly, or almost instantly, succeed it. What in common language is termed love, indeed, even without comprehending in it the desire which we are at present considering, is itself, as we have seen, a complex state of mind, including a delight in the contemplation of its object, and a wish of good to that object; and the term in its common use is a very convenient one, for expressing the various kindred feelings, whatever they may be, that are so immediately successive, or so intimately conjoined, as to admit of being briefly expressed together in a single word, without any possibility of mistake. But still it does not require any very subtle discernment to discover, that our feeling of regard, whether simple or complex, is itself different from the desire of that regard which we wish to be reciprocally felt for ourselves. We may separate them in our philosophic analysis, therefore, though in nature they may usually exist together.

In treating of this desire of the love of others as an object of happiness to ourselves, it would be idle to speak of the necessity of one of these forms of affection, for our very existence in those years, when, without the parental love which cherished us, it would have been as little possible for us to exist, as for the plant to flourish without the continued support of the soil from which it sprung. But even after we have risen to maturity, and are able to exist by our own care, or at least by those services which we can purchase or command, how miserable would it be for us to be deprived of all feelings of this happy class! How miserable, though we should still retain the pleasure that is involved in the affection and the benevolent wishes which we might continue to feel for others, to think that these very wishes of affection were not answered by any reciprocal regard; that not a being around us, not even one of those whose welfare we were eager to promote, and whose sorrows we felt almost as our own, had for us any feelings more tender than for the inanimate objects which were seen and passed without any wish of seeing them again!

I alluded, in a former lecture, to the misery we should feel, if we lived in a world of breathing and moving statues, capable of performing for us whatever man is capable of performing, but unsusceptible, by their very

nature, of any feelings which connected them with us by relations more intimate than those which connect us with the earth on which we tread, or the fruits that nourish us. Yet if these breathing and moving beings were statues only to us, and were to each other what the individuals of our race, in all their delightful charities, are to those who love them, and those by whom they are loved, how much more painful would our strange loneliness be, since we should then seem not insulated merely, but excluded, and excluded from a happiness which was every instant before our eyes! Even though the same mutual offices were to be continued, there would be no comfort in these mere forms of kindness, if we knew that every heart, however warm to others, was still cold to us. To think that services performed for us, were performed without the slightest wish for our welfare, would indeed be to feel them as something which it would rather grieve than rejoice us to receive; and perfect solitude itself, with all its inconveniences, would certainly be less dreadful to us, than the ghastly solitude of such a crowd.

So important is it to our happiness, then, that those whom we love should feel for us a reciprocal regard, that nature has, with a happy provision for this moral appetite, if I may so term it,—this want or necessity of our heart, which is scarcely less urgent than our other necessities, endowed us with a ready susceptibility of affection for all who give any demonstration of their affection for us. “*Si vis amari, ama*,”—Love, if you wish to be loved,—is a very ancient precept, of which all must have felt the force. Not to love those who love us, is to our conception a sort of ingratitude, and an ingratitude which would be attended with as much remorse as if we had sought the affection as a favour to be conferred on us. The assiduities of a lover, though in most cases arising, without any intention on his part, from the pleasure of the mere assiduities themselves, are still, in some slight degree, prompted by his knowledge of this part of our mental constitution. He knows, indeed, that the thousand attentions which he seeks every opportunity of paying are trifling in their own nature; but he knows that they are at least the expressions of affection, and with all the graces and virtues with which he may conceive himself to be adorned, it is to the sense of his affection that he trusts, as much perhaps as to his own personal endowments, for those gentler feelings which he wishes to excite. If it were possible to make a supposition, which I purposely make extravagant, that I may leave nothing but the influence of affection itself; if it were possible that, on the most distant and savage spot of the globe, which was scarcely ever visited but by some annual vessel from our island, there

could exist a human being, who felt for us an affection such as friends only feel; though this solitary being had never met our eye, and never could be expected to be seen by us; though in every thing, but in his love for us, he were as dull as the very brutes around him; if only we could know that he existed, and that he felt for us this ardent sympathy, would it be possible for us to withhold our own sympathy from him? Should we have no eagerness, at the return of the annual ship, to inquire into the fate of him to whom that vessel had so often carried tidings of us; and, whatever insensibility we might imagine ourselves to possess, is it possible for us to imagine it such, as could enable us to hear without emotion, that the friend, the unknown but faithful friend, for whom we inquired, existed no more?

Such is the influence of affection, and so happy that adaptation of nature by which love produces love. In the multitudes which exist together in society, how many are there whose amiable qualities may be considered as nearly similar; and there would therefore have been no tie to connect us, in the delightful intercourse of friendship, with one more than with another, if it had not been for the secret and incessant reaction of kindness on kindness,—a reaction that augments courtesy into regard, and warms common regard into all the ardour and devotion of the most zealous love. But for this progressive and mutual agency, the wish of reciprocal interest which attends affection, and the gratification of which is so delightful a part of affection, would, indeed, have been a cruel gift. It is a gracious boon of nature, only because she has thus happily adapted, to the love which already exists, the love that is soon to be providing for our desire of fonder regard in the bosoms in which we wish to excite it,—a tenderness which this very desire is sufficient of itself to awake, and which requires no other influence to cherish it afterwards, than a continuance of the same delightful wishes by which it was originally produced.

The desire, to the consideration of which we are next to proceed, is one akin to that wish of reciprocal affection which we have now been considering,—the desire of glory,—that passion, to the infinity of whose view the narrow circle, which contains all the objects of our affection, is scarcely a point; which connects us with every human being that exists; and not with these only, but also with every human being that is to exist in the long succession of ages. "Nature," says Longinus, "has not intended man for a low or ignoble being; but has brought us into life in the midst of this wide universe, as before a multitude assembled at some heroic solemnity, that we might be spectators of all her

magnificence, and candidates for the prize of glory which she holds forth to our emulation."

Say, why was man so eminently raised
Amid the vast creation; why ordain'd
Through life and death to dart his piercing eye,
With thoughts beyond the limit of his frame;
But that the Omnipotent might send him forth,
In sight of mortal and immortal powers,
As on a boundless theatre, to run
The great career of justice; to exalt
His generous aim to all diviner deeds;
To chase each partial purpose from his breast;
And through the mists of passion and of sense,
And through the tossing tide of chance and pain,
To hold his course unfaltering, while the voice
Of truth and virtue, up the steep ascent
Of nature, calls him to his high reward,
The applauding smile of Heaven.*

It is in this boundless theatre, with mankind for our witnesses, and God for our judge and rewarder, that we have to struggle with our fortune in that great combat, which is either glory or disgrace, and according to the result of which, life is, or is not, a blessing. We know, indeed, the awful presence of our judge, and this very thought is to us, at times, like the inspiration of some better power with which he deigns to invigorate our weakness. But he is himself unseen by us; and it is not wonderful, therefore, that while he is unseen, and his judgment on which we depend still doubtful, we should sometimes cast an anxious look to the eyes of those witnesses who surround us, that we may see, in the approbation or disapprobation which they express, not the certainty, indeed, but at least some probable omens of that high approval, without which there can be no victory, though all around approve, and with which no failure, though all around condemn.

The love of glory, it has been truly said, is "the last infirmity of noble minds," *no-vissima exiit*. It is not itself virtue, indeed, but

What other passion, virtue's friend,
So like to virtue's self appears?

"*Contempta fama, contemnuntur virtutes.*" "To despise fame," says Tacitus, "is to despise the virtues which lead to it;" and there can be no question that he who is altogether heedless whether every human being regard him as a glory to mankind, or as an object of infamy in himself, and of disgrace to that nature which he partakes, must be almost a god, and raised above the very virtues, as well as the vices of humanity, or he must be the most ignoble of the works of God. To have even our earthly being extended in everlasting remembrance; to be known wherever the name of virtue can reach; and to be known as the benefactors of every age, by the light which we have diffused, or the actions which we have performed or prompted, who is there that does not feel some desire of this additional immortality? If, to obtain the mere remembrance of his name, the fe-

* Pleasures of Imagination, B. i. v. 151—166.

rocious oppressor of millions can dare to load himself with every crime, and submit to be held in universal execration, that the world may still know, by the very hatred and curses which he continues to call forth, that there was on the earth, at a period of many ages back, some malignant being, who could exist only within a circle of misery, and who passed from kingdom to kingdom, carrying with him that desolation, the principle of which seemed inherent in him, and essential to his very existence; if even this dreadful remembrance be so valuable in the eyes of man, how much more delightful must be the certainty, that the name which we leave is never to be forgotten indeed; but is never to be forgotten, only because it is to be an object of eternal love and veneration; and that when we shall be incapable ourselves of benefiting the world, there will still be actions performed for its benefit, which would not have been conceived and performed, if we had not existed!

The desire of glory, then, far from being unworthy of a good man, is as truly worthy of him as any of those other secondary desires which minister to that primary desire, which is the only one that cannot be too vivid; the desire of rendering ourselves acceptable by our virtues to him who made us. This best wish, though it is to be the primary wish of every good heart, surely does not require that we should be indifferent to the regard of those whom it is to be our duty to benefit. If it be not wrong to wish for the affection of those around us; the loss of which would deprive us, I will not say merely of some of our highest delights, but of some of the most persuasive excitements to moral excellence; it cannot be wrong to extend this wish of affection beyond the circle that immediately incloses us, and to derive, from the greater number of those to whose approbation we look, a still stronger excitement to that excellence, on which we found our hope of their approval. God and our conscience,—these are, indeed, the awarders of our true praise; and, without the praise of these, the praise of the world is scarcely worthy of being estimated as any thing. But, insignificant as it is, when the voice of our conscience does not accord with it, it is still something when it echoes to us that voice, and when, as distinct from our own self-approval, it seems to us the presage of still higher approbation. It is enough to us, indeed, if God love us. But that great Being knew well how feeble is our nature, and what aid as well as happiness it would derive from other affections. He has not formed us, therefore, to love himself only, but to love our parents, our children, our relatives of every order, the wide circle of our friends, our country, mankind. For the same reason, he has given

us a love of glory; not as superseding our love of his favourable judgment of our actions, but as supporting us, while we scarcely dare to look with confidence to that perfect judgment; and representing it to us in some measure as the affection of the virtuous on earth, represents to us that supreme affection which is in heaven. Those who would banish the love of glory from our breast, because God is all, must remember, then, that the very same principle would make the love of a father, a wife, a child, a friend, as indifferent to us, as if they were not in existence, or were incapable of loving or being loved. Our domestic and social affections may be perverted, as our love of glory may be perverted. Both may lead to vice, but as general principles of our constitution, both are auxiliary to virtue.

It is not to love glory much, that is unworthy of us, as beings that can look to a higher judgment than that of man, and that are formed for a still higher reward than man can bestow; but to love glory for unworthy objects, or to love it even for worthy objects, more than we prize that approbation which is far nobler.

It is, in the first place, truly contemptible, when we seek to be distinguished for qualities, to excel in which, though it may be what the world counts glory, is moral infamy; that infamy which the heart in secret feels, even while it strives to comfort itself with a praise which it knows to be void of consolation. The world, that must have distinctions of some sort to which to look with astonishment, gives a distinction even to vice that transcends all other vice, and every age has follies which are fashionable. But who is there, who, in all those situations in which the heart most needs to be comforted, in adversity, in sickness, in the feebleness of old age, has ever derived comfort from the thought of having been the first in every folly, or every crime, it may have been the fashion of the idle and profligate to achieve, and of their idle and profligate imitators to regard with an admiration still more foolish or criminal than the very crime or folly which was its object?

When glory is thus sought, even by an humble individual, in unworthy objects, it is sufficiently contemptible; but how much worse than contemptible is it, how afflicting to the whole race of mankind, when the individual who thus seeks glory, is one who is incapable of feeling the excellence of true glory, and has the melancholy power of seeking, in the misery of others, a hateful celebrity, still more miserable than the misery amid which it is sought!

"If, Sire," says an orator, who was worthy, by his virtue and eloquence, of being the teacher of kings, in one of his noble addresses to the young King of France: "if

this poison infect the heart of the prince ; if, forgetting that he is the protector of public tranquillity, he prefer his own false glory to the love and the happiness of his people ; if he had rather conquer provinces than reign over hearts, and think it more illustrious to be the destroyer of every neighbouring nation than the father of that which is confided to his care ; if the lamentations of his subjects be the only song of triumph that accompanies his victories ; what a scourge has God, in his wrath, given to man, in giving him such a master ! His glory, Sire, will be ever sullied with blood. Some madmen will sing perhaps his victories, but the provinces, the cities, the villages, will weep them. Superb monuments will be erected to immortalize his conquests ; but the ashes, still smoking, of cities that once were flourishing ; the wide desolation of plains stripped of their fertility and beauty ; the ruins of the walls under which peaceable citizens lie buried ; so many public marks of calamities that are to subsist after him, will be sad monuments which are to immortalize his vanity and folly. He will have passed, like a torrent, to ravage the earth ; not like a majestic river, to bear to it joy and abundance. His name will have its place among conquerors in the annals of posterity, but it will not be to be found in the list of good kings ; and as often as the history of his reign shall be recalled, it will be only as a memorial of the evils which he has inflicted on mankind.”*

The Grecian chief, the enthusiast of his pride,
With rage and terror stalking by his side,
Raves round the globe;—he soars into a god !
Stand fast, Olympus ! and sustain his nod !
The pest divine in horrid grandeur reigns,
And thrives on mankind's miseries and pains.
What slaughter'd hosts, what cities in a blaze,
What wasted countries, and what crimson seas !
With orphan's tears his impious bowl o'erflows ;
And cries of kingdoms lull him to repose.†

Such is the melancholy influence of this passion, when it is content with that dreadful celebrity which crimes can give. The desire of glory, however, is not criminal only when it is fixed on unworthy objects ; it may err, too, even when fixed on objects that are worthy in themselves, if the praise itself be preferred to the virtues which deserve it. There are situations in life in which it is necessary to submit even to the dispraise of men for imputed vices, from which we know that we are free, rather than by the sacrifice of our duty, to appear more virtuous by being less worthy of that glorious name. “Non vis esse justus sine gloria ! At, mehercule saepe justus esse debetis cum infamia.” Such a trial of virtue is, indeed one of the hardest trials which virtue has to bear ; but it is still a trial which virtue can bear. To have the certainty, that by violating a single trust

which we have yet the fortitude not to violate, by revealing, in a few words, a secret confided to us, we should immediately appear noble in the eyes of those who look on us now with contempt, is to be in a situation of which the generous, who alone are capable of a moral triumph so exalted, alone are worthy,—a situation that is painful indeed in many respects, but the pain of which is richly remunerated by the feelings that accompany it, and by the feelings that are to be its eternal reward.

LECTURE LXXI.

III. PROSPECTIVE EMOTIONS.—8. DESIRE OF GLORY.

GENTLEMEN, after considering the desire which it is impossible for any one not to share in some degree of the affection of those for whom he himself feels regard, and with whom he has to mingle in the familiar intercourse of social life, I proceeded, in the close of my last Lecture, to consider the kindred desire of glory, the desire of those feelings of wonder and veneration that are to arise in bosoms, of which not the veneration merely, but the very existence is to be unknown to us.

We have seen how strong this desire of glory is as a passion, whatever may be the nature of the delight which the glory itself yields when attained. Let us now then consider this delight, which is evidently not a simple pleasure, as a subject of analysis, like that which we have employed in considering the happiness that attends some of our other complex emotions.

In the first place, there is involved in the complex pleasure, that pleasure of simple esteem which is an object of our desire, even though one individual only were to feel it for us ; a modification of that general desire of affection, which is most obvious and most vivid in the domestic relations of life, but which, in its wide circle, embraces all mankind.

In the next place, there is a pleasure in the approbation of others, as it confirms our own doubtful sentiments. Conscience, indeed, is the great estimator of our actions ; but we feel that even conscience may sometimes flatter us, and we seek an additional security on which to lean, while we look back on our own merits or demerits. The desire of glory, therefore, it has been truly said,

Is virtue's second guard,
Reason her first ; but reason wants an aid ;
Our private reason is a flatterer ;
Thirst of applause calls public judgment in,
To poise our own.‡

* Massillon, *Petit Carême*.

† *Young's Love of Fame*, sat. vii.

‡ *Young's Night Thoughts*, Night vii. v. 700—704.

The praise which we receive unjustly, cannot, indeed, unless where the heart is corrupted, make vice appear to us virtue; but when it is not thus unjustly given, it makes us surer that we see virtue where it is, and that we have seen it where it was; that we have done well when we trusted in our own heart that we had done well.

This then is a second, and very important element of the pleasure of glory.

A third element of the complex delight, is that which by the greater number of the lovers of glory, is felt as the most important element of the whole; the pleasure of mere distinction of a superiority attained over others, in that of which all are ambitious, or are supposed to be ambitious. Life is a competition, or a number of competitions. We are continually measuring ourselves with others in various excellencies,—in excellencies so various, that there is scarcely any thing in which one human being can differ from another that may not be a subject of internal measurement, and therefore of some degree of joy or sorrow, as the measurement is or is not in our favour. It is in the eyes of others, however, that the competitors for honour wish to distinguish themselves; and the internal measurement, therefore, when it is unfavourable, is painful chiefly because it is considered by them as representing or corresponding with that which others too will form. The voice of glory, then, the most delightful of all voices to their ear, is, at every stage of their progress, a proof that the distinction which they sought has been, to a certain extent, obtained; that they are recognised as superiors,—that they have risen above the crowd,—and that they have now among their enviers those to whom the multitude beneath are looking with envy, only because they dare not, in their very wishes, look so high as that prouder eminence which they have reached.

There is yet, I cannot but think, in the complex delight of glory, a fourth pleasure, and one which, though it may be less obvious, and founded only on illusion, is not less real in itself. The pleasure to which I allude, consists in the feeling of a sort of extension which glory gives to our being. He who thinks of us is connected with us. We seem to exist in his heart. We are no longer one, we are more than one, or at least have a wider unity, commensurate with the wideness of the applause which we receive, or flatter ourselves that we are receiving. If we could imagine at any moment, that there was not a being, in the whole multitude of mankind, whose thought was not fixed on us, and fixed with admiration, we should feel as if our own existence in this delightful moment were spread over all. It would be impossible for any one, in such cir-

cumstances, to think of himself as limited to that little point of space to which he is truly confined. He would live, as it were, along the whole nations of the globe, with a feeling of diffusive consciousness almost like omnipresence, or rather with a feeling of intimate union that is more than omnipresence. Some illusion, then, must be in the vivid interest which we attach to undeserved praise. The common theory of the illusion is, that we merely believe ourselves to be where we are praised, and to hear what is said of us. The illusion, however, appears to me to extend to something which is far more than this, to a momentary extension of our capacity of feeling, as if enlarged by that of every one in whose mind and heart we conceive our thought to arise. We have gained, as it were a thousand souls, at least we seem for the moment to live in a thousand souls; and it is not wonderful that such an extension of our being should seem to us delightful, when the emotions through which it is expanded are those of admiration and love.

Such, then, are the important elements that together form, as I conceive, the delight of contemporary glory. And the praise which we hear, or which we are capable of hearing, may, it will perhaps be allowed, be justly regarded by us as desirable. But what is posthumous glory? and how can man, who reasons at all, it will be said, give to such idle and profitless renown, a single thought that might be better employed on acquisitions which he is capable of knowing that he has made, and therefore of enjoying?

The same expansion of our being, as if it existed wherever the thought of us exists, which I conceive to form so important a part of the pleasure of contemporary praise, seems to me to furnish the chief circumstance that solves the apparent difficulty of accounting for a desire which to reason may appear so very absurd. There are some circumstances in it, however, which may require a little fuller consideration. Of the universality of the desire of a praise that is not to terminate with the life that is capable of feeling it there can be no doubt.

"Love of Fame the universal Passion," is the title which an ingenious satirist has given to a very lively series of poems; and in another poem he describes it, in a happy allegory, as the great object which, in the general voyage of life, is sought by all, though attained by few of the adventurers who seek it.

Some sink outright;
O'er them, and o'er their names, the billows close:
To-morrow knows not they were ever born.
Others a short memorial leave behind,
Like a flag floating when the bark's engulf'd;

It floats a moment, and is seen no more :
One Cæsar lives, a thousand are forgot.*

Yet, if to extinguish a passion, nothing more were necessary than to show its absolute futility, the love of posthumous glory must long have ceased to be a passion, since almost every moralist has proved, with most accurate demonstration, the absurdity of seeking that which must, by its nature, be beyond the reach of our enjoyment ; and almost every poet has made the madness of such a desire a subject of his ridicule ; though, at the same time it cannot be doubted, that if the passion could have been extinguished, either by demonstration or ridicule, we should have had fewer demonstrations, and still less wit on the subject. "Can glory be any thing," says Seneca, "when he, who is said to be the very possessor of it, himself is nothing !"—"Nulla est omnino gloria, cum is, cujus ea esse dicitur, non extet omnino."

"Thirst for glory," say Wollaston, "when that is desired merely for its own sake, is founded in ambition and vanity ; the thing itself is but a dream, and imagination, since, according to the differing humours and sentiments of nations and ages, the same thing may be either glorious or inglorious ; the effect of it, considered still by itself, is neither more health, nor estate, nor knowledge, nor virtue to him who has it ; or, if that be any thing, it is but what must cease when the man dies ; and after all, as it lives but in the breath of the people, a little sly envy, or a new turn of things extinguishes it, or perhaps it goes quite out of itself. Men please themselves with notions of immortality, and fancy a perpetuity of fame secured to themselves by books and testimonies of historians. But alas ! it is a stupid delusion, when they imagine themselves present and enjoying that fame at the reading of their story after death. And besides, in reality, the man is not known ever the more to posterity because his name is transmitted to them. He does not live because his name does. When it is said Julius Cæsar subdued Gaul, beat Pompey, changed the Roman commonwealth into a monarchy, &c. it is the same thing as to say, the conqueror of Pompey, &c. was Cæsar, that is, Cæsar and the conqueror of Pompey are the same thing ; and Cæsar is as much known by the one designation as by the other. The amount then is only this, that the conqueror of Pompey conquered Pompey, or somebody conquered Pompey ; or rather, since Pompey is as little known now as Cæsar, somebody conquered somebody. Such a poor business is this boasted immortality, and such as has been here described, is the thing called glory among us."

"What's fame?" says Pope, addressing Lord Bolingbroke,—

A fancied life in other's breath,
A thing beyond us, even before our death.
Just what you hear you have, and what's unknown,
The same, my lord, if Tully's or your own.
All that we feel of it begins and ends
In the small circle of our foes and friends ;
To all beside, as much an empty shade,
An Eugene living, as a Cæsar dead,
Alike, or when, or where, they shone, or shine,
Or on the Rubicon, or on the Rhine.†

If, then, after we are no more, the reputation of Tully and our own be, with respect to us who can enjoy neither, precisely the same, why is it that the praise which the eloquence of the Roman orator must continue to receive from the generations that are to come, affects us with no particular interest, and that we attach so very strong an interest to the praise which we flatter ourselves is to accompany our own name? The common explanation which is given of the difference in the two cases is, that we imagine ourselves still present and conscious of our own glory. But this very imagination is the difficulty to be explained, since it does not depend on any accidental caprice of fancy, but is so permanently attached to the nature of our glory, that whatever number of ages we may suppose to intervene, and though we are abundantly convinced that the praise can never reach us in the tomb, we yet cannot think of this praise for a single moment with indifference. It has thus every appearance of being an essential part of the complex notion itself ; and the explanation which I am about to submit to you, therefore, seems to me the more accurate, as it proceeds on this very circumstance. The difference of the interest felt in the two cases supposed, must, if the imaginary glory be the same in both, depend on the difference of the conceptions which we form of ourselves and others, as the subjects of the praise that is to be lavished in the distant periods of which we think ; since the imaginary glory, as combined with the conception either of ourselves or of others, forms our whole notion of posthumous reputation. What then is the difference of these two conceptions on which the whole resulting difference depends? The conception which we have of another person, is chiefly of that external form and other qualities which make him an object of our senses. The conception of ourselves, however, is very different—not different merely as our conceptions of other individuals are different, but in kind more than in degree. It is not so much the conception of our external form, as of the various feelings by which we have become sensible of our own existence ; the retrospect, in short, of that general consciousness which pervades, or ra-

* Young's Night Thoughts, Night viii. v. 195—201.

† Essay on Man, Ep. iv. v. 237—246.

ther which constitutes these feelings, and identifies them all as affections of one sentient mind. To think of the reputation of any one, however, is, as I have already remarked, to have the feeling of reputation combined with that complex notion which we have formed of the person; which is usually, when it is not of ourselves we think, little more than the conception of a certain form, or perhaps of certain works of art of which he has been the author. But the complex notion of ourselves, as I have said, is very different. Of this, consciousness forms an essential part; and to combine the reputation, as imagined, with the notion of ourselves, is therefore necessarily to combine it with the consciousness which is involved in the very notion of ourselves. We cannot think of what we call self, but as that which is the subject of the various feelings that form to us all which we remember of our life, as the living and sentient being that is capable of hearing praise, and of feeling delight in praise; and to take away this capacity of sense and enjoyment, and to substitute a total insensibility, would be to change the complex notion of that which we call self, into one as completely different from it as our complex conception of any one individual is different from our complex conception of any other individual of opposite features and form. What is recognised by us as ours, then, has been already, and must have been already, combined in our thought with this very notion of consciousness. It not enough, therefore, to say, that when we take pleasure in the contemplation of our own future glory, we imagine ourselves present and enjoying it; since we can go still farther and say, that in consequence of the very nature of our conceptions, it is impossible for us to consider future glory as our own, without imagining it as combined with that consciousness, which is an elementary and essential part of the very conception of ourselves; and without which, though the glory itself would be the same, it could not be felt by us as ours.

It is, in a great measure, from the same cause that we think with so much horror of the physical circumstances which succeed our death:—

The knell, the shroud, the mattock, and the grave,
The deep damp vault, the darkness, and the worm.

In explanation of this horror, of which it is impossible for us to divest ourselves, it is usually said that we imagine ourselves suffering what the insensibility which death produces must have rendered altogether indifferent: and it is true that we do form this imagination. But the reason of our forming this very imagination is, that the notion of consciousness, as I have now stated, is an actual component part of the complex notion of ourselves, and that, accordingly, whatever

it may be which we combine with the complex notion of ourselves, to that we must attach the consciousness which is a part of it. To think of ourselves in the grave, is not to think of a mere mass of matter, for our notion of ourselves is very different. It is to think of that which, without some capacity of feeling, is not, in our momentary illusion, recognised by us as ourself,—that self which we know only as it is capable of feelings, and which divested of feeling, therefore, would be to our conception like another individual.

In these cases, the feeling of our own reality blends itself with the ideas of imagination, and thus gives a sort of present existence to the objects of these ideas however unexisting and remote. We are present in future ages, in the same way as we are present in distant climates, when we think of our own glory as there; because, to the conception of our glory, the conception of that being whom we call self is necessary; and the being whom we call self is known to us only as that which lives and feels. We do not delight in the contemplation of our posthumous glory then because we imagine ourselves present; but considering the glory as our glory, it is impossible not to imagine ourselves present, and therefore impossible not to feel, in some degree, during the brief illusion, as if the praise itself were actually heard and enjoyed by us.

Such, then, it appears to me is glory, in the analysis of the complex delight which the attainment of it affords, and in the nature of that illusion which connects us with praise that is never to be heard by us in the most distant climate or age, converting, in the mere conception of this praise, the praise itself almost into a part of our very being, and rendering the passion for glory one of the strongest passions that influence the conduct of mankind.

The relation which this powerful passion bears to our moral character, I have already, in some measure, endeavoured to exhibit to you. I represented it to you as an affection which is far from being unworthy of man in itself, though often leading, like all the other affections of our nature, to moral improprieties, when the desire is directed on an object that is unworthy of it; as the misdirection of any other of our desires may in like manner be vice, or productive of vice. Many moralists and pious writers, undoubtedly with the purest intention of elevating above every thing earthly our love of virtue, and our love of that great Being of whom virtue is the worship, have been led to represent the love of glory as a passion that ought not to coexist with these nobler desires, and as necessarily derogating from their sublimer influence. The same argument, however, as I endeavoured to show you, which would thus render culpable, in some degree, the

wish of the esteem of mankind, would render also culpable, in some degree, the wish of the esteem of the smaller number of our relatives and friends, that portion of mankind more immediately connected with us. If it would be wrong to feel pleasure in the thought, that our virtuous use of the talents which Heaven has given us, has excited the esteem and emulation of fifty or one hundred, or hundreds of thousands, it would be wrong to feel pleasure in the thought, that the same good qualities had excited the esteem of ten or twelve, since the esteem of those ten or twelve is, in strictness of argument, as little essential to our love of virtue, and the God of virtue, as the esteem of millions. If our actions are to be governed simply by those great views, and if every other affection which coexists with these, and co-operates with them, is to be torn from our bosom, before we can aspire to the character of virtue, how many affections that foster virtue as much as they promote happiness, must instantly be torn away! Did Epaminondas love his country less, and was his courage or his conduct less formidable to its enemies, because he rejoiced, on the day of his great victory, that his parents were still alive to hear of it? and do we love our Creator less, because, in practising what he commands, we rejoice that there are hearts which sympathize with ours, which, loving the same virtue that is loved by us, feel for us the esteem which we should have felt in our turn for them, if the action had been theirs? If, indeed, Epaminondas, to gratify some vindictive feeling of those whom he honoured, had deserted to the enemy, we should then have looked on the filial affection as truly immoral in this instance, and unworthy of a mind that had the glorious sense of higher motives; and if, in our enjoyment of glory, instead of deriving pleasure from the sympathy which others feel in our virtues, we were to derive pleasure from their approbation of some vice or folly, our love of glory would, in like manner, be a passion, of which, in this instance at least, it would have been well for us to be divested.

The opponents of the love of glory, then, either say too much, or they say too little. If they were to contend that no affection should be felt but for God alone, no desire of the esteem of any other individual being, however intimately connected with us by the ties of nature or of friendship, though we might think their doctrine false in itself, and in the highest degree injurious to the happiness of the world, we should at least in the very error of their doctrine see some consistency of principle. But if they say, that in our love of approbation and esteem we may virtuously extend our wishes beyond the judgment of that supreme excellence, which, in placing us in the midst of multi-

tudes of our fellow-men, cannot have placed us there to be absolutely indifferent to their opinion, where is it that the limit is to be placed? If a line of virtue be to be drawn around us, beyond which it would be vice for a single thought of earthly approbation to look, how wide is this moral diameter to be, and how is that feeling which would be virtue if it related to one hundred, to become instantly vice, when it relates to one hundred and one?

Man should undoubtedly love mankind, though they were incapable, by their very nature, of returning his kindness. But our divine Author has not given us duties only to perform. He has made those duties delightful, by the reciprocities of affection which he has diffused from breast to breast; and we love mankind, not merely because we feel that it is morally right to love them, or because it is the will of Heaven, but from a social impulse that precedes or accompanies these views, and in some degree also because the very intercourse of good offices is a source of some of the happiest gratifications of our life. Of those secondary affections with which Heaven has graciously sweetened our duties, the esteem or veneration of mankind, of which glory is the expression, is one of the most pleasing; and though it may occasionally mislead to vice, its general direction is unquestionably favourable to that virtue which cherishes it, and delights in feeling its reciprocal support.

But still, the love of glory, though not meriting in itself disapprobation, and though powerful in the aid which it gives even to our noblest feelings, is, it must be owned, a desire only of secondary importance. It derives its high value from its concurrence with the voice within our own breast; which it reflects to us in a thousand gladdening sympathies; and when it is in opposition to these, to obey it, or even to wish to obey it, is not to be in danger of being guilty, but to have been already guilty. It is to be considered, therefore, rather as a delightful excitement, subsidiary to our weakness, than as itself a great directing principle; and either when the glory is sought in unworthy objects, or when the praise of virtue is preferred to virtue itself, it is not merely unworthy of influencing us, but, as the history of every nation shows in terrifying examples of the past, may lead to excesses which the world, whose mad admiration, or at least the hope of whose mad admiration, excited or encouraged them, may for ages lament.

"It has been often asked," says an eloquent French philosopher, "whether a sense of duty alone may not supply the place of glory. The question does honour to those who make it; but the answer to it is simple. Render all governments just, and give to all men individually elevated sentiments, and

then glory will perhaps be useless to mankind. Far be it from me to calumniate human nature. I cannot doubt that there are heroic individuals, who, in doing good, have thought of their duty, and only of their duty, and from whom great actions have escaped in silence. At Athens there was an altar erected to the Unknown God. We might erect, in like manner, an altar with this inscription, To the virtuous who are unknown. Unknown during life, forgotten after death, they were great, though they did not seek the praise of greatness, the less they sought the praise of greatness, the greater they truly were. But in doing justice to our nature, let us not flatter ourselves with too high an estimate of it. There are few of those souls which are sufficient to themselves, and which march on with a firm step beneath the eye of reason which guides them, and of God who looks upon them. The greater number of men, weak by the frailties and inconsistencies of their nature, weaker still by the examples that are every moment assailing them, and by the value which circumstances too often add to crimes and meannesses, having neither courage enough to be always virtuous, nor audacity enough to be always wicked; but embracing by turns good and evil, without the power of fixing in either, feel their virtue principally in their remorse, and their strength chiefly in the secret reproaches which they often make to themselves for their weakness. In this state of feebleness they require a support. The desire of reputation, coming in aid of their too weak sense of duty, binds them to that virtue which otherwise they might quit. They would dare, perhaps to blush to themselves; they would fear to blush before their nation and their age."

"Nor must we think," he continues, "that even those souls of a more vigorous character, which do not stand in need of glory as a support, do not require it at least as a relief and a compensation. We cry out against Athens for its proscription of great men. But the ostracism of which we complain is everywhere. There is everywhere Envy striving to sully what is beautiful, and to bring down what is elevated. It may be said that at the very moment when Merit appeared in the world, Envy too was born, and began her persecution. But Nature at the same instant created glory, and gave it to her in charge, to atone for all the miseries which that persecution was to occasion."

"It seems, indeed, as if virtue and genius, so often oppressed on earth, took refuge far from the real world, in this imaginary world of glory, as in an asylum in which justice is re-established. There Socrates is avenged, Galileo acquitted, Bacon remains a great man. There Cicero fears no longer the

sword of the assassin; nor Demosthenes the poison. There Virgil is far above that emperor whom he deified. Gold and vanity are not there to distribute places, and exalt the unworthy. Each individual, by the mere ascendancy of his genius or of his virtues, mounts, and takes his rank. The oppressed arise, and recover their dignity. Those who have been assailed and insulted during the whole progress of their life, find glory at least at the entrance of that tomb which is to cover their ashes. Envy disappears, and immortality commences."

The desire of glory, then, of which it is impossible for mankind to divest themselves, it would not be well for the happiness of mankind if it were in their power to shake off. But the desire of glory is one state of mind,—the consciousness of the glory itself, as attained, is another state; and all may feel the desire of that which only few attain. It is not the attainment of glory, accordingly, which adds to the amount of happiness in the world, so much as the mere desire itself, in its general influence on action.

In treating of the desire of power, I was led to notice how much more equally happiness is distributed than the external differences of pomp and authority would lead us to imagine; though there can be no reason to fear that any demonstration of this most important equality will ever lead mankind to give up that desire of power, which, to far the greater number of mankind, is almost an essential part of their very nature, and which it would be truly unfortunate for mankind if all should relinquish. The same remark is not less applicable to mere glory than to power. The illustrious and the obscure are indeed very different to the eyes of others; but the amount of happiness in the hearts of both, when every necessary deduction is made, is probably very little different; and is, upon the whole, perhaps, at least in many instances, likely to be greater in those breasts in which few would think of seeking it.

The love of glory resembles the love of mere power in this circumstance, too, as well as in others, that it must rise still higher, or scarcely feel the pleasure of the height which it has reached; and the tenure of the possessor, I may remark, is almost equally precarious in both cases.

Denied the public eye, the public voice,
As if he lived on others' breath he dies,
Fain would he make the world his pedestal,
Mankind the gazers, the sole figure he.
Knows he that mankind praise against their will,
And mix as much detraction as they can?
Knows he that faithless Fame her whisper has
As well as trumpet; that his vanity
Is so much tickled from not hearing all?

If all were indeed heard, the detracting

* Thomas, *Essai sur les Eloges*.

† Young's *Night Thoughts*, Night viii. v. 490—498.

whispers of Fame, as well as her clamorous applause, what lessons of humility would be taught to the vain and credulous, whose ears the whispers cannot reach; and who, therefore, listening only to the louder flatteries that are intended to reach them, consider the praise which is addressed to them as but a small part of that universal praise which is everywhere, as they believe, proclaiming their merits; and in their reputation of a few months, which is to fade perhaps before the close of a single year, regard themselves as already possessing immortality!

In our estimates of glory, however, as a source of distinction, the whispers which are not heard are to be taken into account with the praises which are heard; and then, if the real heartfelt virtues of both be the same, how very near to equilibrium will be the happiness of the obscure and the illustrious!

The most humble, to be happy, must indeed have that feeling of self-approbation, which, if a thought of the opinions of others arise, may be sufficient of itself to give the delightful conviction that, if the heart could be laid open to every gaze, no one could disapprove. There is thus a sort of purer silent glory implied in the very consciousness of moral excellence; but where this moral satisfaction truly exists, and exists in a mind that does not require to be confirmed in its own internal estimate by the opinion of others, what the world regards as renown would scarcely be felt as an accession of pleasure. As mere glory, indeed, if no evil were to attend it, that is to say, as an expression of the esteem and gratitude of a world which the virtuous had sought to benefit, it could not fail to be pleasing; but however pleasing it might be in itself, there are minds by which, when taken together with all its consequences, it would be dreaded, perhaps, rather than desired, as necessarily depriving of pleasures which are inconsistent with public eminence, and which they valued still more than the celebrity that would preclude them. In such circumstances of virtuous privacy,

How far above all glory sits*
The illustrious master of a name unknown;
Whose worth, unvalued and unwitness'd, loves
Life's sacred shades, where gods converse with men.†

Delightful, then, as glory may be in itself, and useful as the desire of it most truly is, as a general auxiliary principle of our nature, the attainment of the glory that is so generally wished is far from being necessary to happiness, which in many cases may have accessions of enjoyment from other sources that would be incompatible with the tumult

of glory, and which that tumultuous pleasure scarcely could repay. The highest happiness may indeed be that of him who is known as widely as wisdom and virtue can be known, loved universally, and revered for qualities which are worthy of universal reverence. Yet we may still not the less say, "Bene qui latuit, bene vixit." If there are many who regret that they are doomed to the shade, there are many too who repent that they have ever quitted it; or at least there are many who might so repent, if the loss of this very power of repentance were not itself an evil, and one of the worst evils of guilty distinction. "He," says Seneca, in one of the choruses of his tragedy of Thyestes,—“he feels indeed the heaviness of death, who, known too well to all the world, dies unknown to himself.”

Stet quicunque volet potens
Aulæ culmine lubrico:
Me dulcis saturet quies.
Obscuro positus loco,
Leni perfruat otio.
Nullis nota Quiritibus
Aetas per tacitum fuat.
Sic cum transierint mei
Nullo cum strepitu dies
Plebeius moriar senex.
Illi mors gravis incubat,
Qui notus nimis omnibus
Ignotus moritur sibi.‡

High renown can as little be the possession of many as high station; and if heaven had appropriated happiness to it, it must have left almost all mankind in misery. It has in this, as in every other instance, dealt more equally with those whom it has raised into glory, and those whom it has left obscure. Each has his appropriate enjoyments; and while Guilt alone can be miserable, it scarcely matters to Virtue whether it be known and happy, or happy and unknown.

LECTURE LXXII.

III. PROSPECTIVE EMOTIONS.—9. DESIRE OF THE HAPPINESS OF OTHERS.—10. DESIRE OF THE UNHAPPINESS OF THOSE WHOM WE HATE.—GENERAL REMARKS ON CONCLUDING THE CONSIDERATION OF OUR PROSPECTIVE EMOTIONS.

GENTLEMEN, the pleasure which glory affords, being evidently not a simple, but a complex pleasure, engaged us yesterday in an inquiry into the nature of the elementary feelings that compose it; and we were led, I flatter myself, into some interesting analyses, both of the complex delight of glory itself, and of that peculiar illusion of present reali-

* How far above Lorenzo's glory sits, —in the original.

‡ Last verses of the Chorus concluding the second Act.

ty, which, however far we may conceive our glory to spread over the earth, and through the ages that are to succeed us, still seems to carry with it, as if necessarily diffused in the very conception, our own ever-present feeling, our own capacity of knowing and enjoying praises which never are to reach our ears.

The two desires which remain to be considered by us, will require but little examination; since they flow so readily from some emotions before examined at length, as to appear almost parts of them, rather than any distinct emotions. The first is our desire of the happiness of others,—a desire that forms, as I have already said in my analysis of love, a part of every affection to which we commonly give that name, and that increases in vividness with every increase of the mere regard; but which, like the desire of reciprocal affection, that is also a part of what is commonly termed love, is a state of mind distinguishable from the mere admiration, respect, regard, which the sight or conception of the beloved object directly induces, admitting of a ready separation in our thought, however complex the love may be, as it usually exists in nature.

It is this desire of the happiness of those whom we love, which gives to the emotion of love itself its principal delight, by affording to us constant means of gratification. He who truly wishes the happiness of any one, cannot be long without discovering some mode of contributing to it. Reason itself, with all its light, is not so rapid, in discoveries of this sort, as simple affection, which sees means of happiness, and of important happiness, where reason scarcely could think that any happiness was to be found, and has already, by many kind offices, produced the happiness of hours, before reason could have suspected that means so slight could have given even a moment's pleasure. It is this, indeed, which contributes in no inconsiderable degree to the perpetuity of affection. Love, the mere feeling of tender admiration, would, in many cases, have soon lost its power over the fickle heart, and, in many other cases, would have had its power greatly lessened, if the desire of giving happiness, and the innumerable little courtesies and cares to which this desire gives birth, had not thus, in a great measure, diffused over a single passion the variety of many emotions. The love itself seems new at every moment, because there is every moment some new wish of love that admits of being gratified; or rather, it is at once, by the most delightful of all combinations, new, in the tender wishes and cares with which it occupies us, and familiar to us, and endeared the more, by the remembrance of hours and years of well-known happiness.

The desire of the happiness of others,

though a desire always attendant on love, does not, however, necessarily suppose the previous existence of some one of those emotions which may strictly be termed love. I already showed you, when treating of compassion, that this feeling is so far from arising necessarily from regard for the sufferer, that it is impossible for us not to feel it when the suffering is extreme, and before our very eyes, though we may, at the same time, have the utmost abhorrence of him who is agonizing in our sight, and whose very look, even in its agony, still seems to speak only that atrocious spirit, which could again gladly perpetrate the very horrors for which public indignation, as much as public justice, had doomed it to its dreadful fate. It is sufficient that extreme anguish is before us; we wish it relief before we have paused to love, or without reflecting on our causes of hatred; the wish is the direct and instant emotion of our soul in these circumstances,—an emotion which, in such peculiar circumstances, it is impossible for hatred to suppress, and which love may strengthen, indeed, but is not necessary for producing. It is the same with our general desire of happiness to others. We desire, in a particular degree, the happiness of those whom we love, because we cannot think of them without tender admiration. But, though we had known them for the first time, simply as human beings, we should still have desired their happiness; that is to say, if no opposite interests had arisen, we should have wished them to be happy, rather than to have any distress; yet there is nothing in this case which corresponds with the tender esteem that is felt in love. There is the mere wish of happiness to them,—a wish which itself, indeed, is usually denominated love, and which may, without any inconvenience, be so denominated in that general humanity which we call a love of mankind, but which we must always remember does not afford, on analysis, the same results as other affections of more cordial regard, to which we give the same name. To love a friend is to wish his happiness indeed, but it is to have other emotions at the same instant, emotions without which this mere wish would be poor to constant friendship. To love the natives of Asia or Africa, of whose individual virtues or vices, talents or imbecility, wisdom or ignorance, we know nothing, is to wish their happiness; but this wish is all which constitutes the faint and feeble love. It is a wish, however, which, unless when the heart is absolutely corrupted, renders it impossible for man to be wholly indifferent to man; and this great object is that which nature had in view. She has, by a provident arrangement, which we cannot but admire the more, the more attentively we examine it, accommodated our

emotions to our means, making our love most ardent, where our wish of giving happiness might be most effectual, and less gradually, and less in proportion to our diminished means. From the affection of the mother for her new-born infant, which has been rendered the strongest of all affections, because it was to arise in circumstances where affection would be most needed, to that general philanthropy, which extends itself to the remotest stranger, on spots of the earth which we never are to visit, and which we as little think of ever visiting as of exploring any of the distant planets of our system; there is a scale of benevolent desire which corresponds with the necessities to be relieved, and our power of relieving them; or with the happiness to be afforded, and our power of affording happiness. How many opportunities have we of giving delight to those who live in our domestic circle, which would be lost before we could diffuse it to those who are distant from us! Our love, therefore, our desire of giving happiness, our pleasure in having given it, are stronger within the limits of this sphere of daily and hourly intercourse than beyond it. Of those who are beyond this sphere, the individuals most familiar to us are those whose happiness we must always know better how to promote than the happiness of strangers, with whose particular habits and inclinations we are little if at all acquainted. Our love, and the desire of general happiness which attends it, are, therefore, by the concurrence of many constitutional tendencies of our nature; in fostering the generous wish, stronger as felt for an intimate friend than for one who is scarcely known to us. If there be an exception to this gradual scale of importance, according to intimacy, it must be in the case of one who is absolutely a stranger,—a foreigner, who comes among a people with whose general manners he is perhaps unacquainted, and who has no friend to whose attention he can lay claim, from any prior intimacy. In this case, indeed, it is evident, that our benevolence might be more usefully directed to one, who is absolutely unknown, than to many who are better known by us, that live in our very neighbourhood, in the enjoyment of domestic loves and friendships of their own. Accordingly, we find, that by a provision which might be termed singular, if we did not think of the universal bounty and wisdom of God,—a modification of our general regard has been prepared, in the sympathetic tendencies of our nature for this case also. There is a species of affection to which the stranger gives birth, merely as being a stranger. He is received and sheltered by our hospitality, almost with the zeal with which our friendship delights to receive one with whom we have lived in cordial union, whose virtues we know and re-

vere, and whose kindness has been to us no small part of the happiness of our life.

Is it possible to perceive this general proportion of our desire of giving happiness, in its various degrees, to the means which we possess, in various circumstances of affording it, without admiration of an arrangement so simple in the principles from which it flows, and at the same time so effectual,—an arrangement which exhibits proofs of goodness in our very wants, of wisdom in our very weaknesses, by the adaptation of these to each other, and by the ready resources which want and weakness find in these affections which everywhere surround them, like the presence and protection of God himself?

“O humanity!” exclaims Philocles in the *Travels of Anacharsis*, “generous and sublime inclination, announced in infancy by the transports of a simple tenderness, in youth by the rashness of a blind but happy confidence, in the whole progress of life by the facility with which the heart is ever ready to contract attachment! O cries of nature! which resound from one extremity of the universe to the other, which fill us with remorse, when we oppress a single human being; with a pure delight, when we have been able to give one comfort! love, friendship, beneficence, sources of a pleasure that is inexhaustible! Men are unhappy, only because they refuse to listen to your voice: and ye divine authors of so many blessings! what gratitude do those blessings demand! If all which was given to man had been a mere instinct, that led beings, overwhelmed with wants and evils, to lend to each other a reciprocal support, this might have been sufficient to bring the miserable near to the miserable; but it is only a goodness, infinite as yours, which could have formed the design of assembling us together by the attraction of love, and of diffusing, through the great associations which cover the earth, that vital warmth which renders society eternal, by rendering it delightful.”*

The last desire in our arrangement, that which we are next to consider, may seem, indeed, at first to be inconsistent with these delightful feelings of social regard, the importance of which I have repeatedly endeavoured to illustrate to you, though, to those who have felt them, as you all must have felt them, they do not require any argument to prove their importance. The desire which still remains to be noticed, is our desire of evil to others, a desire that bears the same relation to hatred in all its forms, which the desire of happiness to others bears to all

the diversities of love. It is an element of the complex affection, not the mere hatred itself, as the desire of diffusing happiness is only an element of the complex affection, which is usually termed love. I have already, in treating of the simple modifications of hatred itself, anticipated the remarks which it might otherwise have been necessary to offer now, on the importance to the happiness of society, of this class of our affections, while society presents any temptations to violence or fraud, that are kept in awe by individual and general resentment, and that, without those guards which protect the innocent, would lay waste all that beautiful expanse of security and happiness which forms the social world, making a desert of nature, and converting the whole race of mankind into fearful and ferocious savages worthy only of inhabiting such a wilderness. As the whole system of things is at present constituted, in other respects, therefore, it is not of less importance that man should be susceptible of feelings of malevolence on certain occasions, than that he should be susceptible of benevolence in the general concerns of life; and man, accordingly, is endowed with the susceptibility of both.

Like our other emotions, however, our malevolent wishes, important as they truly are, and relatively good as a part of our general constitution, may, as we know too well, be productive of evil when misdirected; and though they have this in common with all our desires, even with those which are essentially most benevolent, that may, in like manner, by misdirection or excess occasion no slight amount of evil to individuals and society; the misdirection, in the case which we are now considering, may be far more fatal to happiness, and therefore requires a stronger check of misery to restrain it. We may produce evil, indeed, to those whom we wish to benefit, and may produce it in consequence of our very desire of benefiting them; but at least the desire itself was one which it was happiness to feel. It was something gained to social enjoyment, though more may have been lost. In our malevolent wishes, however, when they arise where they should not arise, there is no addition to the general happiness of the world to allow even the slightest deduction from the misery that is added; but, on the contrary, there is a double evil, not merely the evil that may be inflicted on others, who are the objects of the malevolence, but that which may be said to have been already inflicted on the mind itself, which has had the painful wish of inflicting evil.

The desire of evil to others, since it is necessary to the protection of the world only in certain cases, is to be measured, then, in our moral estimates, by the nature of the brief or permanent hatred in which it may

have originated; and is allowable, therefore, only in the cases in which the hatred is truly a feeling that is necessary in such circumstances for the protection of this social scene. It is virtuous, for example, to feel indignation at oppression; and it is virtuous, therefore, to wish that the oppressor, if he continue to be an oppressor, may not finish his career without punishment, so as to present to the world the dangerous example of guilt, that seems, by its external prosperity, to defy at once humanity and heaven. To take a case of a very different sort, however, it is not virtuous to wish, even for a moment, evil to some successful competitor, who has outstripped us in any honourable career; and the desire of evil in this case is not virtuous, because there is no moral ground for that hatred in which the desire originated, when the hatred was not directed to any quality that could be injurious to general happiness, but had for its only object an excellence that has surpassed us, by exhibiting to the world qualities which are capable of benefiting, or at least of adorning it, still more than the qualities of which we are proudest in ourselves. Before we think ourselves morally justifiable, then, in any wish of evil to those whom we hate, we must be certain that the hatred which we feel is itself morally justifiable, as directed to actions or qualities which it would not be virtuous to view with complacency or even with indifference; and that, as it is the guilty frame of mind alone which is hateful in the eyes of a good man, the hatefulness must cease in the very moment of repentance, and the wish of the repentance, therefore, as the most desirable of all changes, be a wish that is ever present, to temper even that pure and gentle indignation which the virtuous feel.

There are minds, however, of which the chief wishes of evil are not to those whom it is virtuous to view with disapprobation, but to those whom it is vice not to view with emotions of esteem and veneration. We are eager for distinction in that great theatre of human life, in the wide and tumultuous and ever-varying spectacles of which we are at once actors and spectators; and when the distinction which we hoped is preoccupied by another of greater merit, our own defect of merit seems to us not so much a defect in ourselves as a crime in him. We are, perhaps, in every quality exactly what we were before; but we are no longer to our own eyes what we were before. The feeling of our inferiority is forced upon us; and he who has forced it upon us has done us an injury to the extent of the uneasiness which he has occasioned, and an injury which, perhaps, we do not feel more as it has affected us in the estimation of others, than we feel it in the mode in which it has affected us in our estimate of our-

selves. An injury, then, is done to us; and the feelings which heaven has placed within our breasts as necessary for repelling injury, arise on this instant feeling of evil which we have been made to suffer. But what were necessary for repelling intentional injury arise, where no injury was intended; and though the minds in which they thus arise must be minds that are in the highest degree selfish, and incapable of feeling that noble love of what is noble, which endears to the virtuous the excellence that transcends them, there still are minds, and many minds so selfish, and so incapable of delighting in excellence that is not their own.

The malevolent affection with which some unfortunate minds are ever disposed to view those whom they consider as competitors, is denominated jealousy, when the competitor, or supposed competitor, is one who has not yet attained their height, and when it is the future that is dreaded. It is denominated envy when it regards some actual attainment of another. But the emotion, varying with this mere difference of the present and the future, is the same in every other respect. In both cases, the wish is a wish of evil, a wish of evil to the excellent, and a wish which, by a sort of anticipated retribution, is itself evil to the heart that has conceived it.

If we were to imagine present together, not a single small group only of those whom their virtues or talents had rendered eminent in a single nation, but all the sages and patriots of every country and period, without one of the frail and guilty contemporaries that mingled with them when they lived on earth, if we were to imagine them collected together, not on an earth of occasional sunshine and alternate tempests like that which we inhabit, but in some still fairer world, in which the only variety of the seasons consisted in a change of beauties and delights, a world in which the faculties and virtues that were originally so admirable, continued still their glorious and immortal progress, does it seem possible that the contemplation of such a scene, so nobly inhabited, should not be delightful to him who might be transported into it! Yet there are minds to which no wide scene of torture would be half so dreadful an object of contemplation as the happiness and purity of such a scene, minds that would instantly sicken at the very sight, and wish, in the additional malevolence of the vexation which they felt, not that all were reduced to the mere level of earthly things, but that every thing which met the eye were unmixed weakness, and misery, and guilt.

This scene is imaginary only; but what is imaginary as thus combined, is true in its separate parts. There is happiness on earth, virtue on earth, intellectual excellence on

earth; and where these exist and are seen by it, envy is as in that imaginary world. He who has not a whole system of which to wish the physical and moral loveliness destroyed, may have wishes that would gladly blast at least whatever peculiar beauty is to be found in this mixed system. He may wish all mankind to remain in ignorance of important truths, when the most important truths that could be revealed to them were to be the discovery of any other genius than his own. He may sigh over the relief which multitudes are to receive from institutions of a sage benevolence which he was not the first to prompt. If his country be rejoicing at triumphs that have been triumphs of freedom and humanity still more than of the arms of a single state, he may add his silent consternation and anguish to the rage and grief of the tyrant whose aggressions have been successfully resisted, and may lament that he has not himself become a slave by national disasters, which, in making all slaves, would at least have lessened the glory of a rival. He may wish evil even here, as he would have wished it in that better scene; and if he wish it less, it is only because the multitude with whom he has to mix on earth have more imperfections of every sort; and being less worthy, therefore, of love or veneration, are less objects of a hatred that extends in its deadliest rancour only to what is worthy of being loved and venerated.

There is one change, indeed, which in a single moment would dissipate all the malevolence of this malevolent spirit. To convert the hatred into a feeling which might not be very different perhaps from complacency, it would be necessary only to take away every quality that is worthy of love, to make wisdom folly, kindness cruelty, heroic generosity a sordid selfishness, and the glory which was the result of all those better qualities, the execration or disgust of mankind. When the hatred of the virtuous might begin, then the hatred of the envious certainly might cease.

The wishes of evil which flow from such a breast, are, as I have said, evil, in the first place, to the breast which feels them; as the poisonous exhalation, which spreads death perhaps to others, is itself a proof of the disease of the living carcass that exhales it. Envy is truly, in its own miseries, the punishment of itself.

*Risus abest, nisi quem visio movere dolores,
Nec fruitur somno, vigilantibus excita curis;
Sed vidit ingratos, intabescitque videndo
Successus hominum; carpitque et carpitque una
Suppliciumque suum est.*

It is hence, by a sort of contradictory character, what one of the old theological writers has strongly stated it to be, "at once the justest of passions, and the most unjust;"—"ex omnibus affectibus iniquissimus simul et æ-

quissimus;" the most unjust, in the wrongs which it is ever conceiving or perpetrating against him who is its object; the justest in the punishment with which it is ever avenging on itself the wrongs of which it has been guilty.

If even in thinking of the happiness of those whom they hate, the envious saw only that happiness, as it truly is, mixed with many anxieties that lessen the enjoyment of honours and dignities to their possessor, the misery with which those dignities of others are regarded would be less. But the chief misery of a mind of this cast is, that the happiness on which it dwells is a happiness which it creates in part to its own conception, a pure happiness that seems intense in itself only because it is intensely hated, and that continually grows more and more vivid to the hatred that is continually dwelling on it. The influence of happiness, as thus contemplated by a diseased heart, is like that of light on a diseased eye, that merely, as pained by rays which give no pain to others, imagines the faint colours which are gleaming on it to be of dazzling brilliancy.

When a statue had been erected by his fellow-citizens of Thasos to Theagenes, a celebrated victor in the public games of Greece, we are told that it excited so strongly the envious hatred of one of his rivals, that he went to it every night, and endeavoured to throw it down by repeated blows, till at last, unfortunately successful, he was able to move it from its pedestal, and was crushed to death beneath it on its fall. This, if we consider the self-consuming misery of envy, is truly what happens to every envious man. He may perhaps throw down his rival's glory; but he is crushed in his whole soul, beneath the glory which he overturns.

It thus making the malevolent wishes of the envious heart a source of internal misery, Nature has shown a provident regard for the happiness of mankind, which would have suffered far more general violation, if it had been as delightful to wish evil as to wish good. Nor is this true only in cases in which the malevolent wishes are misdirected against excellence; merely as excellence. The same gentle tempering influence has been provided, as we have seen, for the virtuous malevolence of those who are malevolent only to cruelty and injustice. It is necessary, indeed, that man should be capable of feeling indignation and resentment in these cases, as of feeling benevolence in the more ordinary happy intercourse of social life. But since excess in one of these classes of feelings might lead to far more dangerous consequences than excess in the other, Nature, as I took occasion to point out to you in a former lecture, has been careful to provide against the more

hurtful excess, by rendering benevolence delightful in itself, even while its wishes exist merely as wishes, and resentment painful in itself, while its object is unattained, and unless in some very obdurate hearts, ready to be appeased by slight atonements, by the very acknowledgment of the evil done, or by the mere intervention of a few months or days between the injury and the moment of forgiveness. On the nature of these feelings it would be unnecessary however to dwell longer; my only object at present being to point out the place of their arrangement, as prospective emotions, capable of being separated by internal analysis from those immediate emotions of dislike which constitute the varieties of simple hatred.

When I began the consideration of our prospective emotions,—those emotions which regard the future, and which may regard it either with desire or fear, I stated that it would be unnecessary to discuss at length, first, all our desires, and then all our fears; that there was no object which might not, in different circumstances, be an object of hope and fear alternately, according as the good or evil was present or remote, or more or less probable, and that the discussion of one set of the emotions might therefore be considered as supplying the place of a double and superfluous discussion. When, however, any important circumstance of distinction attended the fears opposed to the desires considered by us, I have endeavoured occasionally to point these out to you. I shall not therefore at present enlarge on them.

In treating of our emotions, particularly of those which I have termed prospective, I have dwelt only on the more prominent forms which they assume; because in truth they exist in innumerable forms, as diversified by slight changes of circumstances. It is easy for us to invent generic names, and to class under these, various affections of the mind, which, though not absolutely similar in every respect, are at least analogous in some important respects. But we must not forget, on that account, that the affections thus classed together, and most conveniently classed together, are still different in themselves; that what we have termed the desire of knowledge, for example, as if we had one simple desire of this kind, is generically inclusive of complex feelings as numerous as the objects existing in the universe; and even far more numerous, since they find objects in the abstract relations of things as much as in things themselves; emotions that have stimulated, and still stimulate, and will for ever continue to stimulate, every inquiry of man, from the first gaze of the infant's trembling eye, which he scarcely knows how to direct on the little object before him, to the sublimest speculations of the philosopher, who scarcely finds

in infinity itself an object sufficient for his research. On many of our emotions that shadow into each other by gradations almost imperceptible, it would have been interesting, if my limits had permitted, to dwell at greater length, and to trace and develop them, as varied by the changes of circumstances in which they arise. Indeed, as I have before remarked, under this comprehensive and most interesting class of our mental affections, might be considered every thing which has immediate reference to the whole ample field of moral conduct,—whatever renders man worthy or unworthy of the approving and tranquillizing voice within, and of that eternal approbation of the great Awarder of happiness, of whose judgment, in its blessings or its terrors, the voice of conscience itself, powerful as it may be, is but the short and feeble presage.

The narrowness of my limits, then, I trust, will apologize sufficiently for a brevity of discussion, in many cases, which was unavoidable. In our view of those emotions, however, which by their peculiar complexity, or general importance, seemed to me worthy of nicer examination, I have endeavoured to direct your thought as much as possible to habits of minute analysis, without which there can be no advance in metaphysical science. This very minuteness of analysis, to which I wished to accustom you, as much for the sake of habit as for the nicer results of the particular inquiries themselves, may in some instances have led to distinctions, which to many of you, perhaps, may have seemed superfluous, or too subtle, as requiring from you a little more effort of thought than would have been necessary in following arrangements more familiar to you, though I conceive less accurate. You are not to suppose, however, that in analyzing our complex emotions, and arranging in different subdivisions, the various feelings that seem to me to be involved in them as elements, I object to the use of the common phraseology on the subject, which expresses in a single term many feelings that are truly in nature, either immediately consecutive, or intimately conjoined, though, in our stricter analysis, I may have found it necessary to divide them. This you are not to think, any more than you are to suppose that the chemist, who inquires into the elements of vegetable matter, which exist in a rose or a hyacinth, and who, after his decomposition of those beautiful aggregates, arranges their elementary particles in different orders, as if the aggregates themselves were nothing, and the elements all, objects to the use of the simple terms rose and hyacinth, as significant of the flowers which have been the subjects of his art, and which still continue to have a delightful unity to his senses, even while he knows them to have no real unity, and to be only a multitude of

atoms, similar, or dissimilar. What the rose and the hyacinth are to him, our complex feelings are to us. We may know and consider separately, and arrange separately, their various elements, but when we consider them as they exist together, we may still continue to give them, as complex feelings, the names by which, as complex feelings, they are familiarly and briefly expressed.

I now then conclude the remarks which I had to offer on the last order of our mental affections, the important order of our emotions, those affections of various kinds, in which almost all that is valuable in our earthly life is to be found, and many of which, we have every reason to believe, are not to be limited to those scenes in which they first were felt, but are to share the immortality of our existence, and to become more vivid as our capacity becomes quicker, for the discernment of that moral or divine excellence which inspired them here,—excellence on the contemplation of which we have delighted to dwell on earth, even amid the distraction of cares, and follies, and vices, from which, in a nobler state of being, we may hope to be exempt.

In our benevolent emotions, we have remarked what it is impossible not to remark, their obvious relation to the supreme benevolence of him who has communicated to us these delightful feelings, and who may be said to have made us after his own image, more in this universality of generous desire, with which we are capable of embracing the whole orb of being, than in our feeble intellectual faculties, which, proud as they are of their range of thought, are unable to comprehend the relations of a single atom to any other single atom. In our malevolent emotions, we have traced, in like manner, their admirable harmony with the other parts of the great system of our moral world, as necessary in the community for the punishment of evil in the guilty individual, and consequently for the prevention of evil in others, or for that equally salutary punishment of its own evil, which the mind in remorse inflicts upon itself.

This double lot

Of evil in the inheritance of man
Required for his protection no slight force,
In ceaseless watch;* and therefore was his breast
Fenced round with passions, quick to be alarm'd,
Or stubborn to oppose; with fear, more swift
Than beacons, catching flame from hill to hill,
Where armies land; with anger uncontrol'd
As the young lion bounding on his prey;
With sorrow, that locks up the struggling heart,
And shame, that overcasts the drooping eye,
As with a cloud of lightning. These the part
Perform of eager monitors, and good
The soul more sharply than with points of steel,
Her enemies to shun, or to resist.†

It is in our moral constitution, as in the

* No careless watch, in the original.

† Pleasures of Imagination, second form of the poem, book ii. v. 570—584.

physical universe. To him who knows the beautiful arrangements of the planetary motions, the very gloom of night suggests the continued influence of that orb which is shining in other climes, and which could not have carried light and cheerfulness to them, but for the darkness in which we are reposing. To him who considers our malevolent emotions only, these emotions may seem like absolute darkness in our moral day; but he who views them in their relation to the whole, perceives their necessity for the preservation of those very feelings of gentle regard to which they seem opposed. In the very resentment of individuals, and the indignation of society, he perceives at a distance those emotions of benevolence which, like the unfading sunshine, are not quenched by the temporary gloom that darkens our little portion of the social sphere, preserving, even in absence, that inexhaustible source of radiance which is speedily to shine on us as before, with all the warmth and brilliancy of the past.

LECTURE LXXIII.

GENERAL CONSIDERATIONS ON CONCLUDING THE PHYSIOLOGY OF MIND.—COMMENCEMENT OF ETHICS.—OBLIGATION, VIRTUE, MERIT, DIFFER ONLY IN THEIR RELATION TO TIME.—AN ACTION, IN MORALS, IS NOTHING ELSE THAN THE AGENT ACTING.

In my last Lecture, Gentlemen, I brought to a conclusion my remarks on the various emotions of which the mind is susceptible, and with these, consequently, my physiological view of the mind, in all the aspects which it presents to our observation; the order of our emotions being, as you will remember, the last of the orders into which I divided the mental phenomena.

We have reviewed, then, all the principal phenomena of the mind; and I flatter myself, that now, after this review, you will see better the reasons which have led me, in so many instances, to deviate from the order of former arrangements; since every former arrangement of the phenomena would have been absolutely inconsistent with the results of the minuter analysis into which we have been led. With the views of other philosophers, as to the nature and composition of our feelings, I might, indeed, have easily adhered to their plan; but I must then have presented to you views which appear to myself defective; and however eminent the names of those from whom I may have differed, it appeared to me my duty, in every instance in which I believed their opinions to be erroneous, to express to you my dissent firmly, though, I hope, always with that candour,

which not the eminent only deserve, but even the humblest of those who have contributed their wish at least, and their effort to enlighten us.

In reducing to two generic powers or susceptibilities of the mind, the whole extensive tribe of its intellectual states, in all their variety, I was aware that I could not fail at first to be considered by you as retrenching too largely that long list of intellectual faculties to which they have been commonly referred. But I flatter myself you have now seen that this reference to so long a list of powers has arisen only from an inaccurate view of the phenomena referred to them, and particularly from inattention to the different aspects of the phenomena, according as they are combined or not combined with desire, in the different processes of thought, that have thence been termed inventive, or creative, or deliberative.

In like manner, when I formed one great comprehensive class of our emotions, to supersede what appeared to me to have been misnamed, by a very obvious abuse of nomenclature, the active powers of the mind, as if the mind were more active in these than in its intellectual functions, I may have seemed to you at the time to make too bold a deviation from established arrangement. But I venture to hope, that the deviation now does not seem to you without reason. It is only now, indeed, after our comprehensive survey of the whole phenomena themselves has been completed, that you can truly judge of the principles which have directed our arrangement of them in their different classes. I know well the nature and the force of that universal self-illusion, by which analyses and classifications that have been made by ourselves, seem always to us the most accurate classifications and analyses which could be made; but if all the various phenomena of the mind admit of being readily reduced to the classes under which I would arrange them, the arrangement itself, I cannot but think, is at least more simple and definite than any other previous arrangement which I could have borrowed and adopted.

In treating of the extensive order of our emotions, which comprehends all our moral feelings, you must have remarked that I did not confine myself to the mere physiology of these feelings, as a part of our mental constitution, but intermixed many discussions as to moral duty, and the relations of the obvious contrivances of our moral frame to the wisdom and goodness of its Author,—discussions which you might conceive to be an encroachment on other parts of the course, more strictly devoted to the inquiries of ethics and natural theology. These apparent anticipations, however, were not made without intention; though, in treating of phenomena so admirably illustrative of the gracious pur-

poses of our Creator, it would not have been very wonderful if the manifest display of these had of itself, without any farther view, led to those very observations which I intentionally introduced. It was my wish, on a subject so important to the noblest feelings and opinions which you are capable of forming, to impress you with sentiments which seem to me far more necessary for your happiness than even for your instruction, and to present these to you at the time when the particular phenomena which we were considering, led most directly to these very sentiments. It was my wish too, I will confess, to accustom your minds as much as possible to this species of reflection,—a species of reflection which renders philosophy not valuable in itself only, admirable as it is even when considered in itself alone, but still more valuable for the feelings to which it may be made subservient. I wished the great conceptions of the moral society in which you are placed, of the duties which you have to perform in it, and of that eternal Being who placed you in it, to arise frequently to your mind, in cases in which other minds might think only that one phenomenon was very like another phenomenon, or very different from it; that the same name might, or might not, be given to both; and that one philosopher, who lived on a certain part of the earth at a certain time, and was followed by eight or ten commentators, affirmed the phenomena to be different, while another philosopher, with almost as many commentators, affirmed them to be the same. Of this at least I am sure, that your observation of the phenomena themselves will not be less quick, nor your analysis of them less nicely accurate, because you discover in them something more than a mere observer or analyst, who inquires into the moral affinities with no higher interest than he inquires into the affinity of a salt or a metal, is inclined to seek; and even though your observation and analysis of the mere phenomena were to be, as only the ignorant could suppose, less just on that account, there can be no question that if you had learned to think with more kindness of man, and with more gratitude and veneration of God, you would have profited more by this simple amelioration of sentiment, than by the profoundest discovery that was to terminate in the accession which it gave to mere speculative science.

I now, however, proceed to that part of my course which is more strictly ethical.

The science of ethics, as you know, has relation to our affections of mind, not simply as phenomena, but as virtuous or vicious, right or wrong.

Quid sumus, et quidnam victuri gignimur, ordo
Quis datus, aut metac quam mollis flexus, et uide;
Quis modus argento, quid fas optare, quid asper
Utile nummus habet: patriae, charisque propinquis

Quantum clargiri debeat: quem te Deus esse
Jussit, et humana qua parte locatus es in re.*

In the consideration of questions such as these, we feel indeed that philosophy, as I have already said, is something more than knowledge,—that it at once instructs and amends us,—blending, as a living and active principle, in our moral constitution, and purifying our affections and desires, not merely after they have arisen, but in their very source. It is thus, in its relation to our conduct, truly worthy, and worthy in a peculiar sense, of that noble etymology which a Roman philosopher has assigned to it as the most liberal of studies. “*Quare liberalia studia dicta sint vides; quia homine libero digna sunt. Ceterum unum studium vere liberale est, quod liberum facit: hoc sapientiae, sublimae, forte, magnanimum, caetera pusilla et puerilia sunt.*” The knowledge of virtue is indeed that only knowledge which makes man free; and the philosophy which has this for its object, does not merely teach us what we are to do, but affords us the highest aids and incitements, when the toil of virtue might seem difficult, by pointing out to us, not the glory only, but the charms and tranquil delight of that excellence which is before us, and the horrors of that internal shame which we avoid, by continuing steadily our career. Its office is thus, in a great measure, to be the guardian of our happiness, by guarding that without which there is no happiness,—

Whether, on the rosy mead,
When Summer smiles, to warn the melting heart
Of Luxury's allurement; whether, firm
Against the torrent, and the stubborn hill,
To urge free Virtue's steps, and to her side
Summon that strong divinity of soul
Which conquers Chance and Fate; or on the height
The goal assign'd her, haply to proclaim
Her triumph; on her brow to place the crown
Of uncorrupted praise; through future worlds
To follow her interminated way,
And bless Heaven's image in the heart of man. †

What then is the virtue which it is the practical object of this science to recommend?

That the natural state of man is a state of society, I proved in a former lecture, when, in treating of our desires in general, in their order as emotions, I considered the desire of society as one of these.

That man, so existing in society, is capable of receiving from others benefit or injury, and, in his turn, of benefiting or injuring them by his actions, is a mere physical fact, as to which there cannot be any dispute.

But though the physical fact of benefit or injury is all which we consider in the action of inanimate things, it is far from being all

* Persius, Satira iii. v. 67—72.

† Pleasures of Imagination, second form of the poem, book i. v. 504—515.

of which we think in the case of voluntary agents, when there is not merely benefit or injury produced, but a previous intention of producing it. In every case of this kind in which we regard the agent as willing that particular good or evil which he may have produced, there arise certain distinctive emotions of moral approbation or disapprobation, those immediate emotions, of which, as mere states or affections of the mind, I before treated, when I considered the order of our emotions in general. We regard the action in every such case, when the benefit or injury is believed by us to have entered into the intention of him who performed the action, not as advantageous or hurtful only, but as right or wrong; or, in other words, the person who performed the particular action, seems to us to have moral merit or demerit in that particular action.

To say that any action which we are considering is right or wrong, and to say that the person who performed it has moral merit or demerit, are to say precisely the same thing; though writers on the theory of morals have endeavoured to make these different questions, and have even multiplied the question still more by other divisions, which seem to me to be only varieties of tautological expression, or at least to be, as we shall find, only the reference to different objects of one simple feeling of the mind.

When certain actions are witnessed by us, or described to us, they excite instantly certain vivid feelings, distinctive to us of the agent, as virtuous or vicious, worthy or unworthy of esteem. His action, we say, is right, himself meritorious. But are these moral estimates of the action and of the agent founded on different feelings, or do we not mean simply, that he, performing this action, excites in us a feeling of moral approbation or disapprobation, and that all others, in similar circumstances, performing the same action, that is to say, willing, in relations exactly similar, a similar amount of benefit or injury, for the sake of that very benefit or injury, will excite in us a similar feeling of approbation in the one case, and of disapprobation in the other case? The action cannot truly have any quality which the agent has not, because the action is truly nothing, unless as significant of the agent whom we know, or of some other agent whom we imagine. Virtue, as distinct from the virtuous person, is a mere name, as is vice distinct from the vicious. The action, if it be any thing more than a mere insignificant word, is a certain agent in certain circumstances, willing and producing a certain effect; and the emotion, whatever it may be, excited by the action is, in truth, and must always be the emotion excited by an agent real or supposed. We may speak of the fulfilment of duty, virtue, propriety, merit, and we may

ascribe these variously to the action, and to him who performed it; but whether we speak of the action or of the agent, we mean nothing more, than that a certain feeling of moral approbation has been excited in our mind by the contemplation of a certain intentional production, in certain circumstances, of a certain amount of benefit or injury. When we think within ourselves, is this what we ought to do? we do not make two inquiries, first, whether the action be right, and then, whether we should not have merit in doing what is wrong, or demerit in doing what is right for us to do; we only consider whether doing it, we shall excite in others approbation or disapprobation, and in ourselves a corresponding emotion of complacency or remorse. According to the answer which we give to our own heart, in this respect, an answer which relates to the single feeling of moral approbation or disapprobation, we shall conceive that we are doing what we ought to do, or what we ought not to do; and knowing this, we can have no further moral inquiry to make as to the merit or demerit of doing what is previously felt by us to be right or wrong.

Much of the perplexity which has attended inquiries into the theory of morals, has arisen, I have little doubt, from distinctions which seemed to those who made them to be the result of nice and accurate analysis, but in which the analysis was verbal only, not real, or at least related to the varying circumstances of the action, not to the moral sentiment which the particular action in certain particular circumstances excited. What is it which constitutes an action virtuous? What is it which constitutes the moral obligation to perform certain actions? What is it which constitutes the merit of him who performs certain actions? These have been considered as questions essentially distinct; and because philosophers have been perplexed in attempting to give different answers to all these questions, and have still thought that different answers were necessary, they have wondered at difficulties which themselves created, and struggling to discover what could not be discovered, have often, from this very circumstance, been led into a scepticism which otherwise they might have avoided, or have stated so many unmeaning distinctions as to furnish occasion of ridicule and scepticism to others. One simple proposition has been converted into an endless circle of propositions, each proving and proved by that which precedes or follows it. Why has any one merit in a particular action? Because he has done an action that was virtuous. And why was it virtuous? Because it was an action which it was his duty, in such circumstances, to do. And why was it his duty to do it in such circumstances? Because there was a moral obliga-

tion to perform it. And why do we say that there was a moral obligation to perform it? Because if he had not performed it he would have violated his duty, and been unworthy of our approbation.—In this circle we might proceed for ever, with the semblance of reasoning, indeed, but only with the semblance; our answers, though verbally different, being merely the same proposition repeated in different forms, and requiring, therefore, in all its forms to be proved, or not requiring proof in any. To have merit, to be virtuous, to have done our duty, to have acted in conformity with obligation,—all have reference to one feeling of the mind, that feeling of approbation which attends the consideration of virtuous actions. They are merely, as I have said, different modes of stating one simple truth; that the contemplation of any one, acting as we have done in a particular case, excites a feeling of moral approval.

To this simple proposition, therefore, we must always come in our moral estimate, whatever divisions or varied references we may afterwards make. Persons acting in a certain manner, excite in us a feeling of approval; persons acting in a manner opposite to this, cannot be considered by us without an emotion perhaps as vivid, or more vivid, but of an opposite kind. The difference of our phraseology, and of our reference to the action or the agent, from which, indeed, that difference of phrase is derived, is founded chiefly on the difference of the time at which we consider the action as meditated, already performed, or in the act of performance. To be virtuous, is to act in this way; to have merit, is to have acted in this way; to feel the moral obligation or duty, is merely to think of the action and its consequences. We imagine in these cases a difference of time, as present, in the virtue of performing it—past, in the merit of having performed it—future, in the obligation to perform it; but we imagine no other difference.

Why does it seem to us virtue to act in this way? Why does he seem to us to have merit, or, in other words, to be worthy of our approbation, who has acted in this way? Why have we a feeling of obligation, or duty, when we think of acting in this way? The only answer which we can give to these questions is the same to all, that it is impossible for us to consider the action, without feeling that, by acting in this way, we should look upon ourselves, and others would look on us, with approving regard; and that if we were to act in a different way, we should look upon ourselves, and others would look upon us, with abhorrence, or at least with disapprobation. It is indeed easy to go, perhaps, a single step or two back, and to say that we approve of the action as meritorious, because it is an action which tends to

the good of the world, or because it is the inferred will of Heaven that we should act in a certain manner; but it is very obvious that an answer of this kind does nothing more than go back a single step or two, where the same questions press with equal force. Why is it virtue, obligation, merit, to do that which is for the good of the world, or which Heaven seems to us to indicate as fit to be done? We have here the same answer, and only the same answer, to give, as in the former case, when we had not gone back this step. It appears to us virtue, obligation, merit, because the very contemplation of the action excites in us a certain feeling of vivid approval. It is this irresistible approvableness, if I may use such a word, to express briefly the relation of certain actions to the emotion that is instantly excited by them, which constitutes to us, who consider the action, the virtue of the action itself, the merit of him who performed it, the moral obligation on him to have performed it. There is one emotion, and it seems to us more than one, only because we make certain abstractions of times and circumstances from the agent himself, and apply every thing which is involved in our present emotion to these abstractions which we have made; to the action, as something distinct from the agent, and involving, therefore, a sort of virtue separate from his personal merit; to his own conception of the action before performing it, as something equally distinct from himself, and involving in it the notion of moral obligation as prior to the action.

If we had not been capable of making such abstractions, the action must have been to us only the agent himself, and the virtue of the action and the virtue of the agent been, therefore, precisely the same. But we are capable of making the abstraction, of considering the good or evil deed, not as performed by one individual, in certain circumstances peculiar to him, but as performed by various individuals in every possible variety of circumstances. The same action therefore, —if that can truly be called the same action which is performed, perhaps, with very different views in different circumstances,—is, as we might naturally have supposed, capable of exciting in us different emotions, according to this difference of supposed views, or of the circumstances in which those views are supposed to have been formed. It may excite our approval in one case; or in another case be so indifferent as to excite no emotion whatever; and in another case may excite in us the most vivid disapprobation. The mere fact, however, of this difference of our approbation or disapprobation, when we consider the circumstances in which an action is performed to have been different, is evidently not indicative in itself of any thing

arbitrary in the principle of our constitution, on which our emotions of moral approbation or disapprobation depend ; by which an action, the same in all its circumstances, is approved by us and condemned ; since it is truly not the same action which we are considering, when we thus approve, in one set of circumstances, of an action, of which we perhaps disapprove when we imagine it performed in different circumstances. The action is nothing, but as is the agent himself, having certain feelings placed in certain circumstances, producing certain changes. The agent whom we have imagined, when the emotion which we feel is different, is one whom we have supposed to have different views, or to be placed in different circumstances ; and though the mere changes, or beneficial or injurious effects produced in both cases, which seem to our eyes to constitute the action, may be the same in both cases, all that is moral in the action, the frame of mind of the agent himself is as truly different as if the visible action, in the mere changes or effects produced, had itself been absolutely different. The miser, whose sordid parsimony we scorn, exhibits, in his whole life, at least as much mortification of sensual appetite as the most abstemious hermit, whose voluntary penance we pity and almost respect. The coward, when it is impossible to fly, will often perform actions which would do honour to the most fearless gallantry ; the seeming patriot who, even in the pure ranks of those generous guardians of the public who sincerely defend the freedom and happiness of the land which they love, is a patriot perhaps most unwillingly, because he has no other prospect of sharing that public corruption at which he rails, will still expose the corruption with as much ardour as if he truly thought the preservation of the liberty of his country a more desirable thing than an office in the treasury ; and he who, being already a placeman, has of course a memory and a fancy that suggest to him very different topics of eloquence, will describe the happiness of that land over the interests of which he presides, with nearly the same zeal of oratory, whether he truly at heart take pleasure in the prospect which he pictures, or think the comforts of his own high station by far the most important part of that general happiness which is his favourite and delightful theme. If we were to watch minutely the external actions of a very skilful hypocrite for half a day, it is possible that we might not discover one in which the secret passion within burst through its disguise ; yet, if we had reason before to regard him as a hypocrite, the very closeness of the resemblance of his actions, in every external circumstance, to those of virtue, would only excite still more our indignation. They excite these different feelings, however,

as I have before said, because the actions in truth are not the same ; the action, in its moral aspect, being only the mind impressed with certain views, forming certain preferences, and thus willing and producing certain changes ; and the mind, in all the cases of apparent similarity to which I have now alluded, having internal views as different as the external appearances were similar.

Obvious as the remark may seem, that an action cannot be any thing distinct from the agent, more than beauty from some object that is beautiful, and that when we speak of an action, therefore, as virtuous, without regard to the merit of the particular agent, we only conceive some other agent acting in different circumstances, and exciting in us consequently a different feeling of approbation, by the difference of the frame of mind which we suppose ourselves to contemplate ; it strangely happens that little attention has been paid to this obvious distinction, that the action has been considered as something separately existing, and that we suppose, accordingly, that two feelings are excited in us immediately by the contemplation of an action ; a feeling of right or wrong in the action, and of virtue or vice, merit or demerit, in the agent, which may correspond, indeed, but which may not always be the same ; as if the agent could be virtuous, and the action wrong, or the action right, and he not meritorious, but positively guilty. In this way, a sort of confusion and apparent contradiction have seemed to exist in the science of morals, which a clearer view of the agent and the action as one would have prevented, and the apparent confusion and contradiction, where none truly exists, have been supposed to justify in part, or at least have led in some degree to conclusions as false in principle, as dangerous in their practical tendency.

No voluntary act, intentionally productive of benefit or injury, can, as it appears to me, excite directly any such opposite sentiments of right in the action and demerit in the agent, or wrong in the action and merit in the agent. We take into account, in every case, the whole circumstances of the individual ; and his action in these circumstances is indifferent to us, or it excites an emotion of approbation or disapprobation more or less vivid. The agent, and the circumstances in which he is placed, the agent, and the changes which he intentionally produces, these are all which truly constitute the action ; and the action, thus compounded of all these circumstances, seems to us right if we approve of it, wrong if the emotion, which constitutes moral disapprobation, arise when we consider it.

We may, however, as in the instances which I have already used, after approving or disapproving a particular action, consider some other individual of different habits and

different views, or in circumstances in some other respects different, performing a similar action, that is to say, producing a similar amount of benefit or injury, in the same way as, after having seen a green hill, we can imagine a hill yellow or black exactly of the same figure; and it is as little wonderful, that the new combination of moral circumstances should excite in us a new emotion, as that a yellow or black hill should seem to us less or more beautiful than a green one. Though virtue, as different from the virtuous agent, is a mere abstraction, like greenness, yellowness, blackness, as different from objects that are green, yellow, black, it is still an abstraction which we are capable of making; and, having made it in any particular case, we can conceive multitudes to exist with different views in the situation in which the single individual existed, whose action we have considered as virtuous. The action, even though in its effects it may be precisely the same, will then, perhaps, excite in us very different feelings. It may seem to us worthy of blame rather than of praise, or scarcely worthy of praise at all, or worthy of still higher admiration; but the difference arises from the change of circumstances supposed, not from any necessary difference in the principle of our moral judgments. In this way, by imagining some other agent with different views, or in different circumstances, and in this way only, I conceive, we learn to consider actions separately from the particular agent, and to regard the morality of the one as distinct from the merit of the other; when, in truth, the action which we choose to denominate the same, is, as a moral object, completely different.

If we were present when any one, unacquainted with the nature of the different lenses of the optician, looked at any small animal through a magnifier, or a multiplier, in a piece of plane coloured glass, we should never think of blaming his sense of vision as imperfect, though he were seriously to believe that the animal at which he looked was much larger than it is, or was not one merely, but fifty, or was blue, not white. If, however, we were to conceive others, or the same individual himself, to look at the same object without the medium interposed, and to form the same opinion, we should then unquestionably ascribe to their vision what we before ascribed to the mere lense interposed; and, if we conceived our own sight to be perfect, we could not but conceive theirs to be imperfect. It is precisely the same in that distinction of the virtue of an action and the virtue of the agent, which has produced so much confusion in the theory of morals. We conceive, in the one case, the moral vision of the agent with the lense interposed, in the other case without the lense; and we make in the one case an allowance which we

cannot make in the other. But still I must repeat, that in making this very allowance, it is only on account of the difference of circumstances that we make it, and that we cannot justly extend the difference from the mere medium to the living principle on which moral vision depends.

When we speak of an action, then, as virtuous, we speak of it as separated from all those accidental intermixtures of circumstances which may cloud the discrimination of an individual; when we speak of a person as virtuous, we speak of him as acting perhaps under the influence of such accidental circumstances; and though his action, considered as an action which might have been performed by any man under the influence of other circumstances, may excite our moral disapprobation in a very high degree, our disapprobation is not extended to him. The emotion which he excites is pity, not any modification of dislike. We wish that he had been better informed; and when his general conduct has impressed us favourably, we feel perfect confidence that, in the present instance also, if he had been better informed, he would have acted otherwise.

In reducing all the various conceptions, or at least the conceptions which are supposed to be various, of duty, virtue, obligation, merit, to this one feeling which rises on the contemplation of certain actions,—a feeling which I am obliged to term moral approbation or disapprobation, because there is no other word in use to denote it, though I am aware that approbation and disapprobation, which seem words of judgment rather than of emotion, are not terms sufficiently vivid to suit the force and liveliness of the sentiment which I wish to express,—I flatter myself that I have in some degree freed this most interesting subject from much superfluous argumentation. Why do we consider certain actions as morally right; certain actions as morally wrong? why do we consider ourselves as morally bound to perform certain actions,—to abstain from certain other actions? why do we feel moral approbation of those who perform certain actions,—moral disapprobation of those who perform certain other actions? For an answer to all these, I would refer to the simple emotion, as that on which alone the moral distinction is founded. The very conceptions of the rectitude, the obligation, the approvableness, are involved in the feeling of the approbation itself. It is impossible for us to have the feeling, and not to have these; or, to speak still more precisely, these conceptions are only the feeling itself variously referred in its relation to the person and the circumstance. To know that we should feel ourselves unworthy of self-esteem, and objects rather of self-abhorrence, if we did not act in a certain

manner, is to feel the moral obligation to act in a certain manner, as it is to feel the moral rectitude of the action itself. We are so constituted, that it is impossible for us, in certain circumstances, not to have this feeling; and, having the feeling, we must have the notions of virtue, obligation, merit. It is vain for us to inquire why we are so constituted, as to rejoice at any prosperous event, or to grieve at any calamity; or why we cannot perceive any change without believing that in future the same antecedent circumstances will be followed by the same consequences. I may remark too, that, as in the case now mentioned, it is impossible for us to have the belief of the similarity of the future to the past, simple as this belief may seem to be, without having at the same time the conceptions of cause, effect, power; so, in the case of moral approbation and disapprobation, it is impossible for us to have these feelings, however simple they may at first appear, without the conception of duty, obligation, virtue, merit, which are involved in the distinctive moral feeling, but do not produce it, as our notions of power, cause, effect, are involved in our belief of the similarity of the future to the past, but are not notions which previously existed, and produced the belief; or, to speak more accurately, these notions are not involved in the feeling, which is simple, but are rather references made of this one simple feeling to different objects.

When I say, however, that it is vain to inquire why we feel the obligation to perform certain actions, I must be understood as speaking only of inquiries into the nature of the mind itself. Beyond it we may still inquire, and discover what we wish to find, not in our own nature, but in the nature of that Supreme Benevolence which formed us. We do not see, indeed, in the nature of the mind itself, any reason that the present should be considered by us as representative of the future. We know, however, that if man had not been so formed as to believe the future train of physical events to resemble the past, it would have been impossible for him to exist, because he could not have provided what was necessary for preserving his existence, nor avoided the dangers which would then, as now, have hung over him at every step; and knowing the necessity of this belief to our very existence, we cannot think of him who formed us, to exist without discovering, in his provident goodness, the reason of the belief itself. But if the existence of man would have been brief and precarious, without this faith in the similarity of the future, it would not have been so wretched as if the mind had not been rendered susceptible of the feelings which we have now been considering, the feelings of approbation and disapprobation, and the notions

and affections that originate in these. I shall not attempt to picture to you this wretchedness—the wretchedness of a world in which such feelings were not a part of the mental constitution—a world without virtue, without love of man or love of God; in which, wherever a human being met a human being, he met him as a robber or a murderer, living only to fear and to destroy, and dying, to leave on the earth a carcass still less loathsome in all its loathsomeness than the living form which had been animated but with guilt. Our only comfort in considering such a dreadful society is, that it could not long subsist, and that the earth must soon have been freed from the misery which disgraced it.

We know, then, in this sense, why our mind has been so constituted as to have these emotions; and our inquiry leads us, as all other inquiries ultimately lead us, to the provident goodness of him by whom we were made. God, the author of all our enjoyments, has willed us to be moral beings, for he could not will us to be happy, in the noblest sense of that term, without rendering us capable of practising and admiring virtue.

LECTURE LXXIV.

AN ACTION, IN MORALS, IS NOTHING BUT THE AGENT ACTING.—APPARENT EXCEPTIONS TO THIS DOCTRINE.—SOPHISTRY OF THOSE WHO CONTEND THAT MORAL DISTINCTIONS ARE ACCIDENTAL.—MISTAKES OF SOUNDER MORALISTS THAT HAVE GIVEN SOME COUNTENANCE TO THIS SOPHISTRY.—VIRTUE AND VICE MERE ABSTRACTIONS.—THE MIND SOMETIMES IS INCAPABLE OF PERCEIVING MORAL DISTINCTIONS, AS, 1. WHEN UNDER THE INFLUENCE OF EXTREME PASSION.—2. THE COMPLEXITY OF ACTIONS MAY MISLEAD US IN OUR ESTIMATE OF GOOD AND EVIL.—3. ASSOCIATION MAY ALSO MISLEAD US.

THE object of my last Lecture, Gentlemen, was to make you acquainted with the nature and source of our notions of moral excellence and moral delinquency, the primary moral notions to which, as the directors of conduct, every ethical inquiry must relate.

In this elucidation of a subject, the most interesting of all the subjects which can come under our review, since it comprehends all that is admired and loved by us in man, and all that is loved by us and adored in God, I endeavoured to free the inquiry, as much as possible, from every thing which might encumber it, particularly to explain to you the real meaning of some distinctions, which, as commonly misunderstood, have led to much superfluous disputation on the theory of virtue, and partly in con-

sequence of the inconsistencies and confusion which they seem to involve, have had the still more unfortunate effect of leading some minds to disbelief or doubt of the essential distinctions of morality itself.

The most important of these misconceptions relate to our notions of virtue, obligation, merit; for the origin of which, writers on Ethics are accustomed to have recourse to different feelings, and different sources of feeling, but which, I endeavoured to show you, have all their origin in one emotion, or vivid sentiment of the mind, that vivid sentiment which is the immediate result of the contemplation of certain actions, and to which we give the name of moral approbation. An action, though we often speak of it abstractly, is not, and cannot be, any thing which exists independently of the agent. It is some agent, therefore, real or supposed, whom we contemplate when this sentiment of approbation in any case arises; an agent placed, or imagined to be placed, in certain circumstances, having certain views, willing and producing certain effects of benefit or injury. What the agent is, as an object of our approbation or disapprobation, that his action is; for his action is himself acting. We say, indeed, in some cases, that an action is wrong, without any loss of virtue on the part of the agent in the peculiar circumstances in which he may have been placed; that it is absolutely wrong, relatively right; but in this case the action of which we speak as right and wrong in different circumstances, is truly, as I showed you, in these different circumstances, a different action; that is to say, we consider a different agent, acting with different views; in which case it is as absurd to term the moral action—that which excites our approbation or disapprobation—the same, as it would be to term a virtuous sovereign and his tyrannical successor the same, because they have both been seated on the same throne, and worn the same robes and diadem. One individual putting another individual to death, excites in us abhorrence, if we think of the murderer and the murdered as friends, or even as indifferent strangers. But we say, that the same action of putting to death implies relatively nothing immoral, if the individual slain were a robber entering our dwelling at midnight, or an enemy invading our country. It surely however requires no very subtle discernment to perceive, that the murderer of the friend, and the destroyer of the foe, being agents, acting with different views, in different circumstances, their actions, which are only brief expressions of themselves, as acting in different circumstances, are truly different; and, being different, may of course be supposed to excite different feelings in him who considers them, without any anomaly of moral judgment. The same action, in its

only true sense of sameness,—that is to say, the same frame of mind in circumstances precisely similar,—cannot then be relatively right and absolutely wrong, as if the moral distinction were loose and arbitrary. If it be relatively right, it is absolutely right; and what we call the absolute action that is wrong is a different action; an action as different, from that which we term relatively right, as a morass is different from a green meadow, which are both plains; or a clear rivulet from a muddy canal, which are both streams. We do not say that a morass, though relatively ugly, is, with all its relative ugliness, absolutely beautiful, because it would be beautiful in other circumstances,—if drained, and covered with verdure, and blooming with the wild-flowers of summer, and still gayer with the happy faces of little groups, that may perhaps be frolicing in delight, where before all was stillness and desolation. Such a meadow is indeed beautiful; but to our senses, that judge only of what is before them, not of what the immediate object might have been, or might still be in other circumstances, such a meadow is not a morass; and as little, or rather far less, is the slaughter of half an army of invaders, in one of those awful fields on which the liberty or slavery of a people waits on the triumph of a single hour, to be classed in the same list of actions with the murder of the innocent and the helpless, though with complete similarity of result in the death of others. If the effect alone could be said to constitute the moral action; both terminate equally in the destruction of human life, and both imply the intention of destroying.

An action, then, as capable of being considered by us, is not a thing in itself, which may have various relations to various agents, but is only another name for some agent of whom we speak, real or supposed; and whatever emotion an action excites, is therefore necessarily some feeling for an agent. The virtue of an action is the virtue of the agent—his merit, his conformity to duty or moral obligation. There is, in short, an approbateness, which is felt on considering certain actions; and our reference of this vivid sentiment to the action that excites it, is all which is meant by any of those terms. We are not to make separate inquiries into the nature of that principle of the mind by which we discover the rectitude of an action, and then into the nature of the moral obligation to perform it, and then into the merit of the agent; but we have one feeling excited in us by the agent acting in a certain manner; which is virtue, moral obligation, merit, according as the same action is considered in point of time, when it is the subject, before performance, of deliberation and choice, of actual performance when chosen, or of memory when already performed. It

is all which we mean by moral obligation, when we think of the agent as feeling previously to his action, that if he were not to perform the action, he would have to look on himself with disgust, and with the certainty that others would look on him with abhorrence. It is all which we mean by the virtue of the agent, when we consider him acting in conformity with this view. It is merit when we consider him to have acted in this way; the term which we use varying, you perceive, in all these cases, as the action is regarded by us as present, past, or future, and the moral sentiment in all alike, being only that one simple vivid feeling, which rises immediately on the contemplation of the action.

The approvableness of an action, then, to use a barbarous but expressive word, is at once all these qualities; and the approvableness is merely the relation which certain actions bear to certain feelings that arise in our mind on the contemplation of these actions; feelings that arise to our feeble heart with instant warning or direction, as if they were the voice of some guardian power within us, that in the virtues of others points out what is worthy of our imitation, in their vices what we cannot imitate without being unworthy of the glorious endowments of which we are conscious; and unworthy too of the love of him who, though known to us by his power, is known to us still more as the Highest Goodness, and who, in all the infinite gifts which he has lavished on us, has conferred on us no blessing so inestimable as the capacity which we enjoy of knowing and loving what is good. To say that an action excites in us this feeling, and to say that it appears to us right, or virtuous, or conformable to duty, are to say precisely the same thing; and an action which does not excite in us this feeling, cannot appear to us right, virtuous, conformable to duty, any more than an object can be counted by us brilliant, which uniformly appears to us obscure, or obscure which appears to us uniformly brilliant. To this ultimate fact, in the constitution of our nature, the principle, or original tendency of the mind, by which, in certain circumstances, we are susceptible of moral emotions, we must always come in estimating virtue, whatever analysis we may make or may think that we have made. It is in this respect, as in many others, like the kindred emotion of beauty. Our feeling of beauty is not the mere perception of forms and colours, or the discovery of the uses of certain combinations of forms; it is an emotion arising from these, indeed, but distinct from them. Our feeling of moral excellence, in like manner, is not the mere perception of different actions, or the discovery of the physical good which these may produce; it is an emotion of a very different kind, a light within our breast, from

which, as from the very effulgence of the purest of all truths,

*Is human fortune gladden'd with the rays
Of Virtue, with the moral colours thrown
On every walk of this our social scene;
Adorning for the eye of gods and men;
The passions, actions, habits of life,
And rendering earth, like heaven, a sacred place,
Where love and praise may take delight to dwell.**

That we do feel this approbation of certain actions, and disapprobation of certain other actions, no one denies. But the feeling is, by many sophistical moralists, ascribed wholly to circumstances that are accidental, without any greater original tendency of the mind to feel, in different circumstances of human action, one or other of these emotions. If man could be born with every faculty in its highest excellence, capable of distinguishing all the remote as well as all the immediate consequences of actions, but free from the prejudices of education, he would, they suppose, look with equal moral love, or rather, with uniform and equal indifference of regard, on him who has plunged a dagger in the breast of his benefactor, and on him who has risked his own life for the preservation of his enemy. There are philosophers, and philosophers too who consider themselves peculiarly worthy of that name, from the nicety of their analysis of all that is complex in action, who can look on the millions of millions of mankind, in every climate and age, mingling together in a society that subsists only by the continued belief of the moral duties of all to all, who can mark everywhere sacrifices made by the generous, to the happiness of those whom they love, and everywhere an admiration of such sacrifices,—not the voices of the timid and the ignorant only mingling in the praise, but warriors, statesmen, poets, philosophers, bearing with the peasant and the child, their united testimonies to the great truth, that man is virtuous in promoting the happiness of man: there are minds which can see and hear all this, and which can turn away, to seek in some savage island, a few indistinct murmurs that may seem to be discordant with the whole great harmony of mankind!

When an inquirer of this class, after perusing every narrative of every nation in every part of the globe, with a faith for all that is monstrous in morality, as ready as his disbelief of prodigies in physics less marvellous, which the same voyagers and travellers relate, has collected his little stock of facts, or of reports which are to him as facts, he comes forward in the confidence of overthrowing with these the whole system of public morals, as far as that system is supposed to be founded on any original moral difference of actions. He finds, indeed, everywhere else parricide

* Pleasures of Imagination, second form of the poem, book II. v. 151—157.

looked upon with abhorrence; but he can prove this to be wholly accidental, because he has found, on some dismal coast, some miserable tribe in which it is customary to put the aged to death when very infirm, and in which the son is the person who takes upon him this office. For almost every virtue which the world acknowledges as indicated to us by the very constitution of our social nature; he has, in like manner, some little fact which proves the world to be in an error. Some of these he finds even in the usages of civilized life. What is right on one side of a mountain is wrong on the opposite side of it; and a river is sometimes the boundary of a virtue as much as of an empire. "How, then, can there be any fixed principles of morality," he says, "when morality itself seems to be incessantly fluctuating?"

Morality is incessantly fluctuating; or rather, according to this system, there is no morality, at least no natural tendency to the distinction of actions as moral or immoral, and we have only a few casual prejudices which we have chosen to call virtues: prejudices which a slight difference of circumstance might have reversed, making the lover of mankind odious to us, and giving all our regard to the robber and the murderer. We prefer, indeed, at present, Aurelius to Caligula; but a single prejudice more or less, or at least a few prejudices additional, might have made Caligula the object of universal love; to which his character is in itself as well entitled as the character of that philosophic emperor, who was as much an honour to philosophy as to the imperial purple. And in what world is this said? In a world in which Caligula has never had a single admirer; in all the multitudes to whom his history has become known: a world in which, if we were to consider the innumerable actions that are performed in it at any one instant, we should be wearied with counting those which furnish evidence of the truth of moral distinctions, by the complacency of virtue or the remorse of vice; and the general admiration, or disgust and abhorrence with which the virtue, when known to others, is loved, and the vice detested, long before we should be able to discover a single action that, in the contrariety of general sentiment with respect to it, might furnish even one feeble exception.

Some apparent exceptions, however, it must still be allowed, the moral scene does truly exhibit. But are they, indeed, proofs of the absolute original indifference of all actions to our regard? Or do they not merely seem to be exceptions, because we have not made distinctions and limitations which it was necessary to make?

It often happens that, by contending for too much in a controversy, we fail to estab-

lish truths that appear doubtful, only because they are mingled with doubtful or false propositions, for which we contend as strenuously as for the true. This, I think, has taken place, in some degree in the great controversy as to morals. In our zeal for the absolute immutability of moral distinctions, we have made the argument for original tendencies to moral feeling appear less strong by extending it too far; and facts, therefore, have seemed to be exceptions which could not have seemed to be so, if we had been a little more moderate in our universal affirmation.

Let us consider, then, what the species of accordance is for which we may safely contend.

That virtue is nothing in itself, but is only a general name for certain actions, which agree in exciting, when contemplated, a certain emotion of the mind, I trust I have already sufficiently shown. There is no virtue, no voice, but there are virtuous agents, vicious agents; that is to say, persons whose actions we cannot contemplate without a certain instant emotion; and what we term the law of nature, in its relation to certain actions, is nothing more than the general agreement of this sentiment in relation to those actions. In thinking of virtue, therefore, it is evident that we are not to look for any thing self-existing, like the universal essences of the schools, and eternal like the Platonic ideas; but a felt relation, and nothing more. We are to consider only agents, and the emotions which these agents excite; and all which we mean by the moral differences of actions, is their tendency to excite one emotion rather than another.

Virtue, then, being a term expressive only of the relation of certain actions, as contemplated, to certain emotions in the minds of those who contemplate them, cannot, it is evident, have any universality beyond that of the minds in which these emotions arise. We speak always, therefore, relatively to the constitution of our minds, not to what we might have been constituted to admire if we had been created by a different Being, but to what we are constituted to admire, and what, in our present circumstances, approving or disapproving with instant love or abhorrence, it is impossible for us not to believe to be, in like manner, the objects of approbation or disapprobation to him who has endowed us with feelings so admirably accordant with all those other gracious purposes which we discover in the economy of nature.

Virtue, however, is still, in strictness of philosophic precision, a term expressive only of the relation of certain emotions of our mind to certain actions that are contemplated by us: its universality is coextensive with the minds in which the emotions arise, and

this is all which we can mean by the essential distinctions of morality, even though all mankind were supposed by us, at every moment, to feel precisely the same emotions on contemplating the same actions.

But it must be admitted, also, that all mankind do not feel at every moment precisely the same emotions on contemplating actions that are precisely the same; and it is necessary, therefore, to make some limitations even of this relative universality.

In the first place, it must be admitted that there are moments in which the mind is wholly incapable of perceiving moral differences; that is to say, in which the emotions that constitute the feeling of these moral differences do not arise. Such are all the moments of very violent passion. When the impetuosity of the passion is abated, indeed, we perceive that we have done what we now look upon with horror, but when our passion was most violent, we were truly blinded by it, or at least saw only what it permitted us to see. The moral emotion has not arisen, because the whole soul was occupied with a different species of feeling. The moral distinctions, however, or general tendencies of actions to excite this emotion, are not on this account less certain; or we must say, that the truths of arithmetic, and all other truths, are uncertain, since the mind, in a state of passion, would be equally incapable of distinguishing these. He who has lived for years in the hope of revenge, and who has at length laid his foe at his feet, may, indeed, while he pulls out his dagger from the heart that is quivering beneath it, be incapable of feeling the crime which he has committed; but would he at that moment be able to tell the square of four, or the cube of two? All in his mind, at that moment, is one wild state of agitation, which allows nothing to be felt but the agitation itself.

"While the human heart is thus agitated," it has been said, "by the flux and reflux of a thousand passions, that sometimes unite and sometimes oppose each other, to engrave laws on it, is to engrave them not on sand, but on a wave that is never at rest. What eyes are piercing enough to read the sacred characters?"

"Vain declamation!" answers the writer from whom I quote. "If we do not read the characters, it is not because our sight is too weak to discern them, it is because we do not fix our eyes on them; or if they be indistinguishable, it is only for a moment."

"The heart of man," he continues, "may be considered, allegorically, as an island almost level with the water which bathes it. On the pure white marble of the island are engraved the holy precepts of the law of nature. Near these characters is one who bends his eyes respectfully on the inscrip-

tion, and reads it aloud. He is the lover of Virtue, the Genius of the island. The water around is in continual agitation. The slightest zephyr raises it into billows. It then covers the inscription. We no longer see the characters. We no longer hear the Genius read. But the calm soon rises from the bosom of the storm. The island reappears white as before, and the Genius resumes his employment."

That passion has a momentary influence in blinding us to moral distinctions, or, which is the same thing, an influence to prevent the rise of certain emotions, that, but for the stronger feeling of the passion itself, would arise, may then be admitted; but the influence is momentary, or little more than momentary, and extends, as we have seen, even to those truths which are commonly considered as best entitled to the appellation of universal. The moral truths, it must be allowed—if I may apply the name of truths to the felt moral differences of actions—are, to the impassioned mind, as little universal as the truths of geometry.

Another still more important limitation of the universality for which we contend, relates to actions which are so complex as to have various opposite results of good and evil, or of which it is not easy to trace the consequences. An action, when it is the object of our moral approbation or disapprobation, is, as I have already said, the agent himself acting with certain views. These views, that is to say the intention of the agent, are necessary to be taken into account, or, rather, are the great moral circumstances to be considered; and the intention is not visible to us like the external changes produced by it, but is, in many cases, to be inferred from the apparent results. When these results, therefore, are too obscure or too complicated to furnish clear and immediate evidence of the intention, we may pause in estimating actions which we should not fail to have approved instantly, or disapproved instantly, if we had known the intention of the agent, or could have inferred it more easily from a simpler result; or by fixing our attention chiefly on one part of the complex result, that was perhaps not the part which the agent had in view, we may condemn what was praiseworthy, or applaud what deserved our condemnation. If the same individual may thus have different moral sentiments, according to the different parts of the complex result on which his attention may have been fixed, it is surely not wonderful that different individuals, in regarding the same action, should sometimes approve in like manner, and disapprove variously, not because the principle of moral emotion, as an original tendency of the mind, is absolutely capricious, but because the action considered, though apparently the same, is really different as an object of conception in different

minds, according to the parts of the mixed result which attract the chief attention.

Such partial views, it is evident, may become the views of a whole nation, from the peculiar circumstances in which the nation may be placed as to other nations, or from peculiarity of general institutions. The legal permission of theft in Sparta, for example, may seem to us, with our pacific habits, and security of police, an exception to that moral principle of disapprobation for which I contend. But there can be no doubt that theft, as mere theft,—or, in other words, as a mere production of a certain quantity of evil by one individual to another individual,—if it never had been considered in relation to any political object, would in Sparta also have excited disapprobation as with us. As a mode of inuring to habits of vigilance a warlike people, however, it might be considered in a very different light; the evil of the loss of property, though in itself an evil to the individual, even in a country in which differences of property were so slight, being nothing in this estimate when compared with the more important national accession of military virtue; and, indeed, the reason of the permission seems to be sufficiently marked, in the limitation of the impunity to cases in which the aggressor escaped detection at the time. The law of nature, the law written in the heart of man, then came again into all its authority; or rather, the law of nature had not ceased to have authority, even in those permissions which seemed to be directly opposed to it; the great object, even of those anomalous permissions, being the happiness of the state, the pursuit of which nature points out to our approbation in the same manner, though not with such vivid feelings, as she points out to us for approbation the endeavour to render more happy the individuals around us. It would be a very interesting inquiry to consider, in this way, all those instances which have been adduced as exceptions to natural law, and to detect the circumstances of real or supposed good accompanying the evil permitted, for which the evil itself might in many cases seem to have been permitted; or which, at least, lessened so much the result of evil, in the eyes of those who considered it in the particular circumstances of the age and country, that a very slight temptation might overcome the disapprobation of it, as we find at present in our civilized society, many evils tolerated, not because they are not considered to be evil, but because the evil seems so slight as not to imply any gross disregard of morality. This minute analysis of the instances alleged, however, though it might not be difficult to discover in every case some form of good, which, in the mixed result of good and evil, was present to the approver's mind, my limits will not allow me to

extend; but there is one general remark which may in some measure supply the place of more minute discussion, since it may almost be said to convert these very instances into proofs of that general accordance of moral sentiment, in disproof of which they are adduced.

When these supposed exceptions are tolerated, why is it that they are tolerated? Is it on account of the benefit or of the injury that coexist in one complex mixture? Is it said, for example, by the ancient defenders of suicide, that it is to be commended because it deprives mankind of the further aid of one who might still be useful to society, or because it will give sorrow to every relation and friend, or because it is a desertion of the charge which Heaven has assigned to us? It is for reasons very different that it is said by them to be allowable; because the circumstances, they say, are such as seem of themselves to point out that the Divine Being has no longer occasion for our service on earth, and because our longer life would be only still greater grief or disgrace to our friends, and a burden rather than an aid to society. When the usages of a country allow the exposure of infants, is it not still for some reason of advantage to the community, falsely supposed to require it, that the permission is given? Or is it for the mere pleasure of depriving the individual infant of life, and of adding a few more sufferings to the general sufferings of humanity? Where is the land that says, Let misery be produced or increased, because it is misery? Let the production of happiness to an individual be avoided, because it is happiness? Then, indeed, might the distinctions of morality in the emotions which attend the production of good and evil, be allowed to be wholly accidental. But if nature has everywhere made the production of good desirable for itself, and the production of evil desirable, when it is desired and approved, only because it is accompanied, or supposed to be accompanied, with good, the very desire of the compound of good and evil, on this account, is itself a proof, not of love of evil, but of love of good. It is pleasing thus to find nature in the wildest excesses of savage ignorance, and in those abuses to which the imperfect knowledge even of civilized nations sometimes gives rise, still vindicating, as it were, her own excellence,—in the midst of vice and misery asserting still those sacred principles which are the virtue and the happiness of nations,—principles of which that very misery and vice attest the power, whether in the errors of multitudes who have sought evil for some supposed good, or in the guilt of individuals, who, in abandoning virtue, still offer to it an allegiance which it is impossible for them to withhold in the homage of their remorse.

It never must be forgotten, in estimating the moral impression which actions produce, that an action is nothing in itself; that all which we truly consider in it is the agent placed in certain circumstances, feeling certain desires, willing certain changes; and that our approbation and disapprobation may therefore vary, without any fickleness on our part, merely in consequence of the different views which we form of the intention of the agent. In every complicated case, therefore, it is so far from wonderful that different individuals should judge differently, that it would indeed be truly wonderful if they should judge alike, since it would imply a far nicer measurement than any of which we are capable, of the mixed good and evil of the complex results of human action, and a power of discerning what is secretly passing in the heart, which man does not possess, and which it is not easy for us to suppose man, in any circumstances, capable of possessing.

In complicated cases, then, we may approve differently, because we are in truth incapable of distinguishing all the moral elements of the action, and may fix our attention on some of these, to the exclusion of others. Our taste, in like manner, distinguishes what is sweet and what is bitter, when these are simply presented to us; and there are substances which are no sooner put in the little mouth of the infant than he seems to feel from them pleasure or pain. He distinguishes the sweet from the bitter, as he distinguishes them in after-life. Who is there who denies that there is, in the original sensibility of the infant, a tendency to certain preferences of this kind; that there are substances which are naturally agreeable to the taste, substances which are naturally disagreeable, and that it requires no process of education, no labour of years, no addition of prejudice after prejudice, to make sugar an object of desire to the child, and wormwood of disgust? Yet in the luxury of other years, there are culinary preparations which the taste of some approves, while the taste of others rejects them; and in all of which it is difficult to distinguish the prevailing element, whether acid, austere, sweet, bitter, aromatic. If the morals of nations differed half as much as the cookery of different nations, we might allow some cause for disbelief of all the natural distinctions of right and wrong. But what sceptic is there who contends, from the approbation which one nation gives to a sauce or a ragout, which almost sickens him, that the sweet does not naturally differ from the bitter, as more agreeable, the aromatic from the insipid; and that, to the infant, sugar, wormwood, spice, are, as sources of pleasure, essentially the same?

We approve of what we know, or suppose ourselves to know, and we approve accord-

ing as we know or suppose, not according to circumstances which truly exist, but which exist unobserved by us and unsuspected. It is not contended that we come into the world with a knowledge of certain actions, which we are afterwards to approve or disapprove, for we enter into the world ignorant of every thing which is to happen in it; but that we come into existence with certain susceptibilities of emotion, in consequence of which it will be impossible for us, in after-life, but for the influence of counteracting circumstances, momentary or permanent, not to be pleased with the contemplation of certain actions, as soon as they have become fully known to us, and not to have feelings of disgust on the contemplation of certain other actions. I am astonished, therefore, that Paley, in stating the objection, "that, if we be prompted by nature to the approbation of particular actions, we must have received also from nature a distinct conception of the action we are thus prompted to approve, which we certainly have not received," should have stated this as an objection, to which "it is difficult to find an answer," since there is no objection to which the answer is more obvious. There is not a feeling of the mind, however universal, to the existence of which precisely the same objection might not be opposed. There is no part of the world, for example, in which the proportions of number and quantity are not felt to be the same. Four are to twenty as twenty to a hundred, wherever those numbers are distinctly conceived; but though we come into the world capable of feeling the truth of this proportion, when the numbers themselves shall have been previously conceived by us, no one surely contends that it is necessary, for this capacity, that we should come into the world with an accurate knowledge of the particular numbers. The mind is, by its original constitution, capable of feeling all the sensations of colour, when different varieties of light are presented to the eye; and it has this original constitution, without having the actual sensations which are to arise only in certain circumstances that are necessary for producing them, and which may never, therefore, be states of the mind, if the external organ of vision be imperfect. Even the boldest denier of every original distinction of vice and virtue must still allow, that we do at present look with approbation on certain actions, with disapprobation on other actions; and that, having these feelings, we must by our original constitution, have been capable of the feelings; so that, if the mere capacity were to imply the existing notions of the actions that are to be approved or disapproved, he would be obliged, if this objection had any weight, to allow that, on his own principles, we must equally have innate notions of right and wrong which we have

not, or that we feel certain emotions which we yet had no capacity of feeling. But on an objection which appears to me so very obviously futile, it is idle to dwell so long.

We have made, then, two limitations of that universality and absolute uniformity of moral sentiment for which some ethical writers have too strongly contended; in the first place, when the mind is, as it were, completely occupied, or hurried away by the violence of extreme passion; and, in the second place, when the action which we consider is not the simple intentional production of good as good, or of evil as evil, in certain definite circumstances, but when the result that has been willed is a mixture of good and evil, which it is difficult to discriminate, and in which the good may occur to some minds more readily, the evil to other minds; or in different stages of society, or different circumstances of external or internal situation, the good may be more or less important, and the evil more or less important, so as to have a higher relative interest than it otherwise would have possessed.

To these two limitations it is necessary to add a third, that operates very powerfully and widely on our moral estimates,—the influence of the principle of association. We are not to suppose, that because man is formed with the capacity of certain moral emotions, he is therefore to be exempt from the influence of every other principle of his constitution. The influence of association, indeed, does not destroy his moral capacity, but it gives it new objects, or at least varies the object in which it is to exercise itself, by suggesting with peculiar vividness certain accessory circumstances, which may variously modify the general sentiment that results from the contemplation of particular actions.

One very extensive form of the influence of association on our moral sentiments, is that which consists in the application to particular cases of feelings that belong to a class. In nature there are no classes. There are only particular actions, more or less beneficial or injurious. But we cannot consider these particular actions long, without discovering in them, as in any other number of objects that may be considered by us at the same time, certain relations of analogy or resemblance of some sort, in consequence of which we class them together, and form for the whole class one comprehensive name. Such are the generic words justice, injustice, malevolence, benevolence. To these generic words, which, if distinguished from the number of separate actions denoted by them, are mere words, invented by ourselves, we gradually, from the influence of association in the feelings that have attended the parti-

cular cases to which the same name has been applied, attach one mixed notion, a sort of compound, or modified whole, of the various feelings which the actions separately would have excited, more vivid, therefore, than what would have arisen on the contemplation of some of these actions, less vivid than what others might have excited. It is enough that an action is one of a class which we term unjust; we feel instantly not the mere emotion which the action of itself would originally have excited, but we feel also that emotion which has been associated with the class of actions to which the particular action belongs; and though the action may be of a kind which, if we had formed no general arrangement, would have excited but slight emotion, as implying no very great injury produced or intended, it thus excites a far more vivid feeling, by borrowing, as it were, from other analogous and more atrocious actions, that are comprehended under the same general term, the feeling which they would originally have excited. It is quite evident, for example, that in a civilized country, in which property is largely possessed, and complicated in its tenure, and as in the various modes in which it may be transferred, the infringement of property must be an object of peculiar importance, and what is commonly termed justice, in regard to it, be a virtue of essential value, and injustice a crime against which it is necessary to prepare many checks, and which is thence regarded as of no slight delinquency. The offence of the transgressor is estimated, in such a case, not by the little evil which, in any particular case, he may intentionally have occasioned to another individual, but in a great degree also by the amount of evil which would arise in a system of society constituted as that of the great nations of Europe is constituted, if all men were to be equally regardless of the right of property in others. When we read, therefore, of the tendency to theft, in many barbarous islanders of whom navigators tell us, and of the very little shame which they seemed to feel on detection of their petty larcenies, we carry along with us our own classes of actions, and the emotions to which our own general rules, resulting from our own complicated social state, have given rise. We forget, that to those who consider an action simply as it is, the guilt of an action is an object that is measured by the mere amount of evil intentionally produced in the particular case; and that the theft which they contemplate is not, therefore, in its moral aspect, the same offence that is contemplated by us. I need not trace out, in other cases, the influence of general rules, which you must be able to trace with sufficient precision for yourselves.

Such, then, is one of the modes in which

association operates. But it is not in general rules alone that the influence of the associating principle is to be traced. It extends in some degree to all our moral feelings. There is no education, indeed, which can make the pure benevolence of others hateful to us, unless by that very feeling of our own inferiority which implies in envy itself our reverence, and consequently our moral approbation of what we hate; no education which can make pure deliberate malice in others an object of our esteem. But if there be any circumstances accompanying the benevolence and malice, which tend to the disparagement of the one and the elevation of the other, the influence of association may be excited powerfully, in this way, by fixing our attention more vividly on these slight accompanying circumstances. The fearlessness which often attends vice, may be raised into an importance beyond its merit, in savage ages, in which fearlessness is more important for the security of the state, and in which power and glory seem to wait on it; the yielding gentleness of benevolence may, in such circumstances, appear timidity, or at least a degree of softness unworthy of the perfect man. In like manner, when a vice is the vice of those whom we love,—of a friend, a brother, a parent,—the influence of association may lessen and overcome our moral disapprobation, not by rendering the vice in itself an object of our esteem, but by rendering it impossible for us to feel a vivid disapprobation of those whom we love, and mingling, therefore, some portion of this very regard in our contemplation of all their actions. It is because we have the virtue of loving our benefactor, or friend, or parent, that we seem not to feel in so lively a manner the unworthiness of that vice which is partly lost to our notice, in the general emotion of our gratitude. But when we strip away these illusions, or when the vice is pure intentional malice, which no circumstance of association can embellish, it is equally impossible for us to look upon it with esteem, as it is impossible for us to turn away with loathing from him whose whole existence seems to be devoted to the happiness of others, and to rejoice, as we look upon him, that we are not what he is.

*Itē ipsi in vestrae penetralia mentis et intus
Incisae apices, et scripta volumina mentis
Inspicite, et genitum vobiscum agnoscite legem.
Quis vitilis adeo stolidē oblectatur apertis,
Ut quod agit velit ipse pati? Mendacia fallax,
Furta rapax, furiosum atrox, homicida cruentum
Damnat, et in moechum gladios dstringit adulter.
Ergo omnes una in vita cum lege creati
Venimus, et fibris gerimus quae condita libris.*

I have made these limitations, because it appears to me that much confusion on the subject of morals has arisen from inattention to these, and from the too great claims which

have sometimes been made by the assertors of what they have termed immutable morality. The influence of temporary passion,—of the complication of good with evil, and of evil with good, in one mixed result,—and of general or individual associations, that mingle with these complex results some new elements of remembered pain or pleasure, dislike or regard, it seems to me absurd to attempt to deny. But, admitting these indisputable influences, it seems to me equally unreasonable not to admit the existence of that original susceptibility of moral emotion which precedes the momentary passion, and outlasts it; which, in admiring the complex result of good and evil, admires always some form of good, and which is itself the source of the chief delights or sorrows which the associations of memory furnish as additional elements in our moral estimate.

LECTURE LXXV.

RETROSPECT OF LAST LECTURE.—THE PRIMARY DISTINCTIONS OF MORALITY IMPLANTED IN EVERY HUMAN HEART, AND NEVER COMPLETELY EFFACED.

GENTLEMEN, having traced, in a former Lecture, our notions of virtue, obligation, merit, to one simple feeling of the mind,—a feeling of vivid approval of the frame of mind of the agent, which arises on the contemplation of certain actions, and the capacity of which is as truly essential to our mental constitution, as the capacity of sensation, memory, reason, or of any of the other feelings of which our mind is susceptible, I considered in my last Lecture, the arguments in opposition to this principle, as an original tendency of the mind, drawn from some apparent irregularities of moral sentiment in different ages and countries.

For determining the force of such instances, however, as objections to the original distinctions of morality, it was necessary to consider precisely what is meant by that general accordance of moral sentiment, which the world may be considered as truly exhibiting. It is only by contending for more than the precise truth, that, in many instances, we furnish its opponents with the little triumphs which seem to them like perfect victory. We give to the truth itself an appearance of doubtfulness, because we have combined it with what is doubtful, or perhaps altogether false.

In the first place, the language which the assertors of virtue are in the habit of employing, when they speak of the eternity and absolute immutability of moral truth, might almost lead to the belief of something self-

existing, which could not vary in any circumstances, nor be less powerful at any moment than at any other moment. Virtue, however, it is evident, is nothing in itself, but is only a general name for certain actions, which excite, when contemplated by us, certain emotions. It is a felt relation to certain emotions, and nothing more, with no other universality, therefore, than that of the minds in which, on the contemplation of the same actions, the same emotions arise. We speak always of what our mind is formed to admire or hate, not of what it might have been formed to estimate differently; and the supposed immutability, therefore, has regard only to the existing constitution of things under that Divine Being who has formed our social nature as it is, and who, in thus forming it, may be considered as marking his own approbation of that virtue which we love, and his own disapprobation of that vice which he has rendered it impossible for us not to view with indignation or disgust.

Such is the moderate sense of the absolute immutability of virtue, for which alone we can contend; a sense in which virtue itself is supposed to become known to us as an object of our thought only, in consequence of certain emotions which it excites, and with which it is coextensive and commensurable; but, even in this moderate sense, it was necessary to make some limitations of the uniformity of sentiment supposed; since it is abundantly evident, that the same actions, that is to say, the same agents, in the same circumstances, willing and producing the same effects, are not regarded by all mankind with feelings precisely the same, nor even with feelings precisely the same by the same individual in every moment of his life.

The first limitation which I made relates to the moments in which the mind is completely occupied and absorbed in other feelings; when, for example, it is under the temporary influence of extreme passion, which incapacitates the mind for perceiving moral distinctions as it incapacitates it for perceiving distinctions of every sort. Virtue, though lost to our perception for a moment, however, is immediately perceived again with distinct vision as before, as soon as the agitation subsides. It is like the image of the sky on the bosom of a lake, which vanishes, indeed, while the waters are ruffled, but which reappears more and more distinctly, as every little wave sinks gradually to rest, till the returning calm shows again, in all its purity, the image of that Heaven which has never ceased to shine on it.

The influence of passion, then, powerful as it unquestionably is in obstructing those peculiar emotions in which our moral discernment consists, is limited to the short

period during which the passion rages. We are then as little capable of perceiving moral differences, as we should be, in the same circumstances, of distinguishing the universal truths of geometry; and in both cases, from the same law of the mind,—that general law, by which one very vivid feeling of any sort lessens in proportion the vividness of any other feeling that may coexist with it or, in other cases, prevents the rise of feelings that are not accordant with the prevailing emotion, by inducing, in more ready suggestion, the feelings that are accordant with it.

The next limitation which we made is of more consequence, as being far more extensive, and operating, therefore, in some degree, in almost all the moral estimates which we form. This second limitation relates to cases in which the result of actions is complicated by a mixture of good and evil, and in which we may fix upon the good, when others fix on the evil, and may infer the intention in the agent of producing this good, which is a part of the mixed result, while others may conceive him to have had in view the partial evil. The same actions, therefore, may be approved and disapproved in different ages and countries, from the greater importance attached to the good or to the evil of such compound results, in relation to the general circumstances of society, or the influence perhaps of political errors, as to the consequences of advantage or injury to society of these particular actions; and, in the same age, and the same country, different individuals may regard the same action with very different moral feelings, from the higher attention paid to certain partial results of it, and the different presumptions thence formed as to the benevolent or injurious intentions of the agent. All this, it is evident, might take place without the slightest mutability of the principle of moral sentiments; because, though the action which is estimated may seem to be the same in the cases in which it is approved and condemned, it is truly a different action which is so approved and condemned; a different action in the only sense in which an action has any meaning, as signifying the agent himself having certain views, and willing, in consequence, certain effects of supposed benefit or injury.

A third limitation, often co-operating with the former, relates to the influence of habit and association in general, whether as extending to particular actions the emotions that have been gradually connected with the whole class of actions under which they have been arranged, or as modifying the sentiments of individuals by circumstances peculiar to the individuals themselves. It is pleasing to love those who are around us; it is pleasing, above all, to love our immediate friends, and those domestic relations to whom we owe our being, or to whose society, in the

first friendships which we were capable of forming, before our heart had ventured from the little world of home into the great world without, we owed the happiness of many years, of which we have forgotten every thing but that they were delightful. It is not merely pleasing to love these first friends; we feel that it is a duty to love them; that is to say, we feel that, unless in circumstances of extraordinary prodigality on their part, if we were not to love them, we should look upon ourselves with moral disapprobation. The feeling of this very duty mingles in our estimates of the conduct of those whom we love; and it is in this way that association in such cases operates; not by rendering vice in itself less an object of disapprobation than before, but by blending with our disapprobation of the action that love of the agent, which is, as it were, an opposite duty. It is the good which is mixed with the bad that we love, not the bad which is mixed with the good; and the primary and paramount love of the good and hatred of the bad remain; though we may seem, in certain cases, to love the one less or more, to hate the other less or more, in consequence of the vivid images which association affords to heighten or reduce the force of the opposite sentiment, when the actions of which we approve or disapprove have a resemblance to the actions of those who have loved or made us happy; whose love, therefore, and the consequent happiness produced by them, arise, perhaps, to our mind at the very moment at which the similar action is contemplated by us.

These three limitations, then, we must make; limitations, the necessity of which it would have been natural for us to anticipate, though no objections had been urged to the original differences of actions as objects of moral sentiment. But, making these limitations,—to some one or other of which the apparent anomalies may, I conceive, be referred,—do we not leave still unimpaired the great fundamental distinctions of morality itself; the moral approbation of the producer of unmixed good as good, the moral disapprobation of him who produces unmixed evil for the sake of evil? Where moral good and evil mix, the emotions may, indeed, be different; but they are different, not because the production of evil is loved as the mere production of evil, and the production of good hated as the mere production of good; it is only because the evil is tolerated for the good which is loved, and the good, perhaps, in other cases, forgotten or unremarked, in the abhorrence of the evil which accompanies it. When some country is found, in which the intentional producer of pure unmixed misery is preferred, on that very account, to the intentional producer of as much good as an individual is capable of producing,—some

country, in which it is reckoned more meritorious to hate than to love a benefactor, merely for being a benefactor, and to love rather than to hate the betrayer of his friend, merely for being the betrayer of his friend,—then may the distinctions of morality be said to be as mutable, perhaps, as any other of the caprices of the most capricious fancy. But the denier of moral distinctions knows well, that it is impossible for him to prove the original indifference of actions in this way. He knows that the intentional producer of evil, as pure evil, is always hated, the intentional producer of good, as pure good, always loved; and he flatters himself, that he has succeeded in proving, by an easier way, that we are naturally indifferent to what the prejudiced term moral good and evil, merely by proving, that we love the good so very much, as to forget, in the contemplation of it, some accompanying evil; and hate the evil so very much, as to forget, in the contemplation of it, some accompanying good.

One of our most popular moralists begins his inquiry into the truth of the natural distinctions of morality, by quoting from Valerius Maximus, an anecdote of most atrocious prodigality, which, he supposes, related to a savage, who had been "cut off in his infancy from all intercourse with his species, and consequently, under no possible influence of example, authority, education, sympathy, or habit; and whose feelings, therefore, in hearing such a relation, if it were possible for us to ascertain what the feelings of such a mind would be, he would consider as decisive of the question." I quote the story as he has translated it.

"The father of Caius Toranius had been proscribed by the Triumvirate. Caius Toranius, coming over to the interests of that party, discovered to the officers who were in pursuit of his father's life, the place where he had concealed himself, and gave them a description by which they might distinguish his person. The old man, more anxious for the safety and fortunes of his son, than about the little that might remain of his own life, began immediately to inquire of the officers who seized him, whether his son was well, whether he had done his duty to the satisfaction of his generals. 'That son,' replied one of the officers, 'that son, so dear to thy affections, betrayed thee to us. By his information thou art apprehended and diest.' The officer, with this, struck a poniard to the old man's heart; and the unhappy parent fell, not so much affected by his fate, as by the means to which he owed it." *Auctore caedis quam ipsa caede miserior.**

It is necessary, for the very supposition

* Paley's Moral Philosophy.

which is made, that the savage should understand, not merely what is meant by the simple relations of son and father, and all the consequences of the treachery of the son, but that he should know also the additional interest which the paternal and filial relation, in the whole intercourse of good offices from infancy to manhood, receives from this continued intercourse. The author of our mere being is not all which a father in such circumstances is; he is far better known and loved by us as the author of our happiness in childhood and youth, and the venerable friend of our maturer years. If the savage, knowing this relation in its fullest extent, could yet feel no different emotions of moral regard and dislike, for the son and for the father, it would be easier to suppose, that a life of total privation of society had dulled his natural susceptibilities of emotion, than that he was originally void of these. But what reason is there to imagine, that, with this knowledge, he would not have the emotions which are felt by every human being to whom this story is related? It is easy to assert, that knowing every relation of a son and father, as well as the consequence of the action, the savage would not feel what every other human being feels, because it is easy to assume, by begging the question, any point of controversy. But where is the proof of the assertion? We cannot verify the supposition by exact experiment, indeed, for such a savage, so thoroughly exempted from every social prejudice, is not to be found, and could not be made to understand the story even if he were found. But, though we cannot have the perfect experiment, we may yet have an approximation to it. Every infant that is born may be considered very nearly as such a savage; and as soon as the child is capable of knowing the very meaning of the words, without feeling half the force of the filial relation, he shudders at such a tale, with as lively abhorrence, perhaps, as in other years, when his prejudices and habits, and every thing which is not originally in his constitution, may be said to be matured.

We can imagine vessels sent on voyages of benevolence, to diffuse over the world the blessings of a pure religion, we can imagine voyages of this kind to diffuse the improvements of our sciences and arts. But what should we think of a voyage, of which the sole object was to teach the world that all actions are not, in the moral sense of the term, absolutely indifferent, and that those who intentionally do good to the society to which they belong, or to any individual of that society, ought to be objects of greater regard than he whose life has been occupied in plans to injure the society in general, or at least as many individuals of it as his power could reach? What shore is there at

which such a vessel could arrive, however barren the soil, and savage the inhabitants, where these simple doctrines, which it came to diffuse, could be regarded as giving any instruction? The half-naked animal, that has no hut in which to shelter himself, no provision beyond the precarious chase of the day, whose language of numeration does not extend beyond three or four, and who knows God only as something which produces thunder and the whirlwind, even this miserable creature, at least as ignorant as he is helpless, would turn away from his civilized instructors with contempt, as if he had not heard any thing of which he was not equally aware before. The vessel which carried out these simple primary essential truths of morals might return as it went. It could not make a single convert, because there would not have been one who had any doubts to be removed. If, indeed, instead of teaching these truths, the voyagers had endeavoured to teach the natives whom they visited the opposite doctrine, as to the absolute moral indifference of actions, there could then be little doubt that they might have taught something new, whatever doubt there might justly be as to the number of the converts.

When Labienus, after urging to Cato a variety of motives, to induce him to consult the oracle of Ammon, in the neighbourhood of whose temple the little army had arrived, concludes with urging a motive which he supposed to have peculiar influence on the mind of that great man, that he should at least make use of the opportunity of inquiring of a being who could not err, what it is which constitutes that moral perfection which a good man should have in view for the guidance of his life,

Saltem virtutis amator
Quaere quid est virtus, et poce exemplar honesti,

how sublimely does the answer to this solicitation express the omnipotent divinity of virtue!

Ille Deo plenus, tacita quem mente gerebat,
Effudit dignas adytis e pectore voces.
Quid quaeri, Labiene, jubes? An liber in armis
Occubuisse velim potius, quam regna videre?
An noceat vis ulla bono? Fortunaque perdat
Opposita virtute minas? Laudandaque velle
Sit satis, et nunquam successu crescat honestum?
Seimus, et hoc nobis non altius inseret Ammon.
Haecrimus cuncti Superis, temploque taceant,
Nil facinus non sponte Dei; nec vocibus ullis
Numen eget: dixitque semel nascentibus auctor
Quicquid scire licet: sterilis nec legit arenas,
Ut caneret paucis, mensitque hoc pulvere verum.*

"Cast your eyes," says Rousseau, "over all the nations of the world, and all the histories of nations. Amid so many inhuman and absurd superstitions, amid that prodigious diversity of manners and characters,

* Lucani Pharsalia, lib. ix. v. 563—567, and 569—577.

you will find every where the same principles and distinctions of moral good and evil. The Paganism of the ancient world produced, indeed, abominable gods, who on earth would have been shunned or punished as monsters, and who offered as a picture of supreme happiness, only crimes to commit, and passions to satiate. But vice, armed with this sacred authority, descended in vain from the eternal abode: she found, in the heart of man, a moral instinct to repel her. The continence of Xenocrates was admired by those who celebrated the debaucheries of Jupiter—the chaste Lucretia adored the unchaste Venus—the most intrepid Roman sacrifice to fear. He invoked the God who dethroned his father, and he died without a murmur by the hand of his own. The most contemptible divinities were served by the greatest men. The holy voice of Nature, stronger than that of the gods, made itself heard, and respected, and obeyed on earth, and seemed to banish, as it were, to the confinement of Heaven, guilt and the guiltiness."

There is, indeed, to borrow Cicero's noble description, one true and original law, conformable to reason and to nature, diffused over all, invariable, eternal, which calls to the fulfilment of duty and to abstinence from injustice, and which calls with that irresistible voice which is felt in all its authority wherever it is heard. This law cannot be abolished or curtailed, nor affected in its sanctions by any law of man. A whole senate, a whole people, cannot dispense from its paramount obligation. It requires no commentator to render it distinctly intelligible, nor is it different at Rome, at Athens, now, and in the ages before and after; but in all ages, and in all nations, it is, and has been, and will be, one and everlasting—one as that God, its great author and promulgator, who is the common Sovereign of all mankind, is himself one. Man is truly man, as he yields to this divine influence. He cannot resist it, but by flying as it were from his own bosom, and laying aside the general feelings of humanity; by which very act he must already have inflicted on himself the severest of punishments, even though he were to avoid whatever is usually accounted punishment. "*Est quidem vera lex, recta ratio, naturæ congruens, diffusa in omnes, constans, sempiterna, quæ vocat ad officium jubendo, vetando a fraude deterreat; quæ tamen neque probos frustra jubet aut vetat, nec improbos jubendo aut vetando movet. Huic legi nec obrogari fas est, neque derogari ex hac aliquid licet, neque tota abrogari potest. Nec vero, aut per senatum aut per populum solvi hac lege possumus. Neque est quærendus explanator aut interpret ejus alius. Nec erit alia lex Romæ, alia Athenis, alia nunc, alia posthac; sed et omnes gentes,*

et omni tempore, una lex et sempiterna et immortalis continebit; unusque erit communis quasi magister, et Imperator omnium Deus ille, legis hujus inventor, disceptator, lator; cui qui non parebit, ipse se fugiet, ac naturam hominis aspernabitur, atque hoc ipso luet maximas pœnas, etiam si cætera supplicia quæ putantur effergerit."

I have already, in a former Lecture, alluded to the strength of the evidence which is borne by the guilty, to the truth of those distinctions which they have dared to disregard. If there be any one who has an interest in gathering every argument which even sophistry can suggest, to prove that virtue is nothing, and vice therefore nothing, and who will strive to yield himself readily to this consolatory persuasion, it is surely the criminal who trembles beneath a weight of memory which he cannot shake off. Yet even he who feels the power of virtue only in the torture which it inflicts, does still feel this power, and feels it with at least as strong conviction of its reality, as those to whom it is every moment diffusing pleasure, and who might be considered perhaps as not very rigid questioners of an illusion which they felt to be delightful. The spectral forms of superstition have indeed vanished; but there is one spectre which will continue to haunt the mind, as long as the mind itself is capable of guilt, and has exerted this dreadful capacity—the spectre of a guilty life, which does not haunt only the darkness of a few hours of night, but comes in fearful visitations, whenever the mind has no other object before it that can engage every thought, in the most splendid scenes and in the brightest hours of day. What enchanter is there who can come to the relief of a sufferer of this class, and put the terrifying spectre to flight? We may say to the murderer, that, in poisoning his friend, to succeed a little sooner to the estate which he knew that his friendship had bequeathed to him, he had done a deed as meritorious in itself, as if he had saved the life of his friend at the risk of his own; and that all for which there was any reason to upbraid himself was, that he had suffered his benefactor to remain so many years in the possession of means of enjoyment, which a few grains of opium or arsenic might have transferred sooner to him. We may strive to make him laugh at the absurdity of the scene, when, on the very bed of death, that hand which had often pressed his with kindness before, seemed to press again with delight the very hand which had mixed and presented the potion. But though we may smile, if we can smile, at such a scene as this, and point out the incongruity with as much ingenious pleasantry as if we were describing some ludicrous mistake, there will be no laughter on that face from which we strive to force a smile. He

who felt the grasp of that hand will feel it still, and will shudder at our description; and shudder still more at the tone of jocular merriment with which we describe what is to him so dreadful.

What, then, is that theory of the moral indifference of actions which is evidently so powerless, or which even he, who professes to regard it as sound philosophy, feels the importance as much as other men; when he loves the virtuous and hates the guilty, when he looks back with pleasure on some generous action, or with shame and horror on actions of a different kind, which his own sound philosophy would teach him to be, in every thing that relates to his own internal feelings, exclusively of the errors and prejudices of education, equal and indifferent? It is vain to say, as if to weaken the force of this argument, that the same self-approving complacency, and the same remorse, are felt for actions which are absolutely insignificant in themselves, for regular observance or neglect of the most frivolous rites of superstition. There can be no question that self-complacency and remorse are felt in such cases. But it surely requires little philosophy to perceive, that, though a mere ceremony of devotion may be truly insignificant in itself, it is far from insignificant when considered as the command of him to whose goodness we owe every thing which we value as great, and to disobey whose command, therefore, whatever the command may be, never can be a slight offence. To consider the ceremonial rite alone, without regard to him who is believed to have enjoined it, is an error as gross, as it would be to read the statutes of some great people, and paying no attention to the legislative power which enacted them, we laugh, perhaps, at the folly of those who thought it necessary to conform their conduct to a law, which was nothing but a series of alphabetic characters on a scrap of paper or parchment, that in a single moment could be torn to pieces or burnt.

Why do we smile on reading, in the list of the works of the hero of a celebrated philosophic romance, that one of these was "a complete digest of the law of nature, with a review of those 'laws' that are obsolete or repealed, and of those that are ready to be renewed, and put in force?" We feel that the laws of nature are laws which no lapse of ages can render obsolete, because they are every moment operating in every heart; and which, for the same reason, never can be repealed, till man shall have ceased to be man.

After these remarks on the general theory of the original moral indifference of actions, which considers all morality as adventitious, without any original tendencies in the mind

that could of themselves lead it to approve or disapprove, it may be necessary still to take some notice of that peculiar modification of the theory, which denies all original obligation of justice, but asserts the authority of political enactment, not as attaching merely rewards to certain actions, and punishments to certain other actions, but as producing the very notions of just and unjust, with all the kindred notions involved in them, and consequently a right, which it would be immorality as well as imprudence to attempt to violate.

Of this doctrine, which is to be traced in some writers of antiquity, but which is better known as the doctrine of Hobbes, who stated it with all the force which his acuteness could give it,—a doctrine to which he was led in some measure perhaps by a horror of the civil dissensions of the period in which he wrote, and by a wish to lessen the inquisitorial and domineering influence of the priesthood of that fanatical age, by rendering even religion itself subject to the decision of the civil power;—the confutation is surely sufficiently obvious. A law, if there be no moral obligation, independent of the law, and prior to it, is only the expression of the desire of a multitude, who have power to punish, that is to say, to inflict evil of some kind on those who resist them; it may be imprudent, therefore, to resist them; that is to say, imprudent to run the risk of that precise quantity of physical suffering which is threatened; but it can be nothing more. If there be no essential morality that is independent of law, an action does not acquire any new qualities by being the desire of one thousand persons rather than of one. There may be more danger, indeed, in disobeying one thousand than in disobeying one, but not more guilt. To use Dr. Cudworth's argument, it must either be right to obey the law, and wrong to disobey it, or indifferent whether we obey it or not. If it be morally indifferent whether we obey it or not, the law, which may or may not be obeyed, with equal virtue, cannot be a source of virtue; and if it be right to obey it, the very supposition that it is right to obey it, implies a notion of right and wrong that is antecedent to the law, and gives it its moral efficacy. But, without reasoning so abstractly, are there, indeed, no differences of feeling in the breast of him who has violated a law, the essential equity of which he feels, and of him whom the accumulated and ever-increasing wrongs of a whole nation have driven to resist a force which, however long it may have been established, he feels to be usurpation and iniquity;—who, with the hope of giving freedom to millions has lifted against a tyrant, though armed with all the legal terrors, and therefore with all the morality and virtue of despotism, that sword,

around which other swords are soon to gather, in hands as firm, and which, in the arm of him who lifts it, is almost like the standard of liberty herself? Why does the slave, who is led to the field, in which he is to combat for his chains against those who would release him and avenge his wrongs, feel himself disgraced by obedience, when to obey implicitly, whatever the power may be which he obeys, is the very perfection of heroic virtue? and when he looks on the glorious rebel, as he comes forward with his fearless band, why is it that he looks, not with indignation, but with an awful respect; and that he feels his arm weaker in the fight, by the comparison of what he morally is, and of what those are whom he servilely opposes?

"A sovereign," it has been truly said, "may enact and rescind laws; but he cannot create or annihilate a single virtue." It might be amusing to consider, not one sovereign only, but all the sovereigns of the different nations of the earth, endeavouring by law to change a virtue into a vice,—a vice into a virtue. If an imperial enactment of a senate of kings were to declare, that it was in future to be a crime for a mother to love her child,—for a child to venerate his parent,—if high privileges were to be attached to the most ungrateful, and an act of gratitude to a benefactor declared to be a capital offence,—would the heart of man obey this impotent legislation? Would remorse and self-approbation vary with the command of man, or of any number of men? and would he who, notwithstanding these laws, had obstinately persisted in the illegality of loving his parent, or his benefactor, tremble to meet his own conscience with the horror which the parricide feels? There is, indeed, a power by which "princes decree justice;" but it is a power above the mere voice of kings,—a power which has previously fixed in the breasts of those who receive the decree, a love of the very virtue which kings, even when kings are most virtuous, can only enforce. And it is well for man, that the feeble authorities of this earth cannot change the sentiments of our hearts with the same facility as they can throw fetters on our hands. There would then, indeed, be no hope to the oppressed. The greater the oppression the stronger motive would there be to make obedience to oppression a virtue, and every species of guilt which the powerful might love to exercise, amiable in the eyes even of the miserable victims. All virtue, in such circumstances, would soon perish from the earth. A single tyrant would be sufficient to destroy, what all the tyrants that have ever disgraced this moral scene have been incapable of extinguishing,—the remorse which was felt in the bosom of him who could order every thing but vice and

virtue,—and the scorn, and the sorrow, and the wrath of every noble heart, in the very contemplation of his guilty power.

Nature has not thrown us upon the world with such feeble principles as these. She has given us virtues of which no power can deprive us, and has fixed in the soul of him whom more than fifty nations obey, a restraint on his power, from which the servile obedience of all the nations of the globe could not absolve him. There may be flatterers to surround a tyrant's throne, with knees ever ready to bow on the very blood with which its steps are stained, and with voices ever ready to applaud the guilt that has been already perpetrated, and to praise, even with a sort of prophetic quickness of discernment, the cruelties in prospect which they only anticipate. There may be servile warriors, to whom it is indifferent whether they succour or oppress, whether they enslave or free, if they have only drowned in blood, with sufficient promptness, the thousands of human beings whom they have been commanded to sweep from the earth. There may be statesmen as servile, to whom the people are nothing, and to whom every thing is dear, but liberty and virtue. These eager emulators of each other's baseness may sound for ever in the ears of him on whose vices their own power depends, that what he has willed must be right, because he has willed it; and priests still more base, from the very dignity of that station which they dishonour, not content with proclaiming that crimes are right, may add their consecrating voice, and proclaim that they are holy, because they are the deeds of a vicegerent of that Holiness which is supreme. But the flatteries which only sound in the ear, or play perhaps with feeble comfort around the surface of the heart, are unable to reach that deeper-seated sense of guilt which is within.

In subjecting, for the evident good of all, whole multitudes to the sway of a few or of one, Nature then, as we have seen, has thrown over them a shelter, which power may indeed violate, but which it cannot violate with impunity; since even when it is free from every other punishment, it is forced, however reluctantly, to become the punisher of itself. This shelter, under which alone human weakness is safe, and which does not give protection only but happiness, is the shelter of virtue, the shelter of moral love and hate, of moral pity and indignation, of moral joy and remorse. Life, indeed, and many of the enjoyments which render social life delightful, may, at least on a great part of the surface of the earth, be at the mercy of a power that may seem to attack or forbear with no restraint but the caprice of its own will. Yet, before even these can be assailed, there is a voice which warns to de-

sist, and a still more awful voice of condemnation, when the warning has been disregarded. For our best enjoyments, our remembrances of virtue, and our wishes of virtue, we are not dependent on the mercy, nor even on the restraints of power. Nature has provided for them with all her care, by placing them where no force can reach. In freedom or under tyranny they alike are safe from aggression; because, wherever the arm can find its way, there is still conscience beyond. The blow, which reaches the heart itself, cannot tear from the heart what, in life, has been happiness or consolation, and what, in death, is a happiness that needs not to be comforted.

Our own felicity is then truly, in no slight degree, as Goldsmith says, consigned to ourselves, amidst all the varieties of social institutions.

In every government, though terrors reign,
Though tyrant kings, or tyrant laws restrain,
How small, of all that human hearts endure,
That part which laws or kings can cause or cure!
Still to ourselves, in every place, consign'd,
Our own felicity we make or find.
With secret course, which no loud storms annoy,
Glides the smooth current of domestic joy.
The lifted axe, the agonising wheel,
Luke's iron crown and Darnley's bed of steel,
To men remote from power but rarely known,
Leave reason, faith, and conscience all our own.*

"So far," says Cicero, "is virtue from depending on the enactment of kings, that it is as ancient as the system of nature itself, or as the great Being by whom nature was formed." "Vis ad recte facta vocandi et a peccatis avocandi, non modo senior est, quam aetas populorum et civitatum, sed aequalis illius coelum atque terras tuentis et regentis Dei:—Nec si, regnante Tarquinio, nulla erat Romae scripta lex de stupris, idcirco non contra illam legem sempernam, Sextus Tarquinius vim Lucretiae attulit. Erat enim ratio profecta a rerum natura, et ad recte faciendum impellens et a delicto avocans, quae non tum denique incipit lex esse cum scripta est, sed tum cum orta est; orta autem simul est cum mente divina."† The law, on which right and wrong depend, did not begin to be law when it was written: it is older than the ages of nations and cities, and contemporary with the very eternity of God.

LECTURE LXXVI.

OF THE SYSTEM OF MANDEVILLE; OF THE INFLUENCE OF REASON ON OUR MORAL SENTIMENTS; OF THE SYSTEMS OF CLARKE AND WOLLASTON.

GENTLEMEN, in the inquiries which have last engaged us, we have seen, what that

susceptibility of moral emotion is, to which we owe our notions of virtue and vice, in all their relative variety of aspects: we have seen, in what sense it is to be understood as an original principle of our common nature, and what limitations it is necessary to give to its absolute universality. There is a sophistry, however, the errors of which it was necessary to state to you, that confounds, in these limitations, the primary distinctions themselves; and supposes that it has shown the whole system of morals to be founded on accidental prejudices, when, in opposition to the millions of millions of cases, that obviously confirm the truth of an original tendency to certain moral preferences, it has been able to exhibit a few facts which it professes to regard as anomalous. The fallacy of this objection, I endeavoured accordingly to prove to you, by showing, that the supposed anomalies arise, not from defect of original moral tendencies, but from the operation of other principles which are essential parts of our mental constitution, like our susceptibility of moral emotion; which are not, however, more essential parts of it than that moral susceptibility itself, and which, even in modifying our sentiments of approbation and disapprobation, produce this effect, not by altering the principle which approves and disapproves, but the object which we contemplate when these emotions arise. In the conclusion of my lecture, I examined the kindred sophistry of those political moralists, who, considering right and wrong as of human institution, in their denial of every primary distinction of morals, found a sort of artificial virtue on obedience to the civil power; forgetting that their very assertion of the duty of obedience, supposes a feeling of duty antecedent to the law itself; and that there are principles of equity, according to which even positive laws are judged, and, though approved in many cases, in many cases also condemned, by the moral voice within the breast, as inconsistent with that feeling of justice which is prior and paramount to the law itself.

In some measure akin to the theory of these political moralists, since it ascribes morality, in like manner, to human contrivance, is the system of Mandeville, who considers the general praise of virtue to be a mere artifice of political skill; and what the world consents to praise as virtue in the individual, to be a mere imposition on the part of the virtuous man. Human life, in short, according to him, is a constant intercourse of hypocrisy with hypocrisy; in which, by an involuntary self-denial, present enjoyment of some kind or other is sacrificed, for the pleasure of that praise which society, as cunning as the individual self-denier, is ready indeed to give, but gives only in return

* Concluding verses of the Traveller.

† De Legibus, lib. ii. c. 4, of Gruter's notation—or c. 8, 9, 10, of the common notation—with some alterations and omissions.

for sacrifices that are made to its advantage. His system, to describe it a little more fully, as stated in the inquiry into the origin of moral virtue, prefixed to his remarks on his own Fable of the Bees, is simply this,—that man, like all other animals, is naturally solicitous only of his personal gratification, without regard to the happiness or misery of others; that the great point, with the original lawgivers or tamers of these human animals, was to obtain from them the sacrifice of individual gratification, for the greater happiness of others; that this sacrifice, however, could not be expected from creatures that cared only for themselves, unless a full equivalent were offered for the enjoyment sacrificed; that as this, at least in the greater number of cases, could not be found in objects of sensual gratification, or in the means of obtaining sensual gratification which are given in exchange in common purchases, it was necessary to have recourse to some other appetite of man; that the natural appetite of man for praise readily presented itself, for this useful end, and that, by flattering him into the belief that he would be counted nobler for the sacrifices which he might make, he was led, accordingly, to purchase this praise by a fair barter of that, which, though he valued it much, and would not have parted with it but for some equivalent or greater gain, he still valued less than the praise which he was to acquire; that the moral virtues, therefore, to use his strong expression, are “the political offspring which flattery begot upon pride;” and that, when we think that we see virtue, we see only the indulgence of some frailty, or the expectation of some praise.

Such is the very licentious system, as to moral virtue, of this satirist of man; whose doctrine, false as it is, as a general view of human nature, has, in the world, so many instances which seem to correspond with it, that a superficial observer, who is little accustomed to make distinctions, extends readily to all mankind, what is true only of a part, and because some who wish to appear virtuous are hypocrites, conceives that all virtue is hypocrisy; in the same way as such a superficial thinker would have admitted any other error, stated in language as strong, and with images and pictures as vivid.

It would be idle to repeat, in particular application to this system, the general remarks which I made in my former lectures, on the early appearances of moral emotion, as marking an original distinction of actions, that excite in us moral approbation, from those which do not excite it, and which excite the opposite feeling of moral disapprobation. I shall not even appeal to the conscience of him who has had the happiness of performing a generous action, without the

slightest regard to the praise of man, which was perhaps not an object even of conception at all, and certainly not till the action itself was performed. But we may surely ask, in this case, as much as in any other physical hypothesis, by what authority so extensive a generalization is made from so small a number of particular cases? If, indeed, we previously take for granted that all virtue is hypocrisy, every case of virtue which we perceive seeming to us a case of hypocrisy, may be regarded only as an illustration of the doctrine, to the universal truth of which we have already given our assent. But if we consent to form our general conclusion before examination, and then to adapt our particular conclusions to the previous general belief, this sort of authority may be found, for the wildest hypothesis, in physics, as much as for that moral hypothesis, the licentiousness of which is founded on the same false logic. We have only to take the hypothesis, however wild, for granted; and then the facts will be, or will be considered to be, illustrations of it. The question is not, whether, on the supposition of universal hypocrisy, all seeming virtue be imposition, for in that case there could be no doubt; but whether all virtue be hypocrisy; and for this, it is surely necessary to have some stronger proof than the mere fact that some men are hypocrites; or even the very probable inference, that there is a great deal of hypocrisy, (as there is a great deal of virtuous benevolence or self-command,) which we are not capable of discovering, and to which, accordingly, we may erroneously have given the praise of virtue. The love of praise may be a universal principle; but is not more truly universal than the feeling of right and wrong, in some one or other of their forms; and of two feelings, equally universal, it is as absurd to deny the reality of one, as the reality of the other. All actions have not one object. Some are the result of a selfish love of praise; some of a generous love of virtue, that is to say, of love of those whose happiness virtue can promote. The sacred motives of mankind, indeed, in this variety of possible objects, cannot be known; and the paradox of Dr. Mandeville, therefore, has this advantage, that it is impossible to say, in any case of virtue, “Here is virtue that has no regard to praise,” since he has still the power of answering, that there may be a desire of praise, though it is not visible to us. But, to reasoning of this sort there is no limit. If we be fond of paradoxes, it is easy to assert that there is no such state as that of health, and to prove it in exactly the same manner, by showing, that many who seem blooming and vigorous are the victims of some inward malady; and that it is, therefore, impossible for us, in pointing out any

one, to say, there is health in this young and active form; since the bloom which we admire may be only the covering of a disease that is soon to prey on the very beauty which it seemed, perhaps for the time, to heighten with additional loveliness. If it be easy to make a little system like that of Mandeville, which reduces all virtue to the love of praise, it is just as easy to reverse the system, and to make all love of praise a modification of the purest virtue. We love it, it may be said, merely that we may give delight to those who love us, and who feel a lively interest in all the honours which can be lavished on us. This theory may be false, or rather truly is so; but however false, or even absurd, it is as philosophic in every respect as the opposite theory of Mandeville, since it proceeds, exactly in the same way, on the exclusive consideration of a certain elementary part of our mixed nature, and extends universally what is only partially true. Indeed, the facts which support it, if every one were to consult his memory, in the earliest years to which he can look back on his original feelings, are stronger, in support of this false generous hypothesis, than of that false ungenerous hypothesis, to which I have opposed it. What delight did the child feel, in all his little triumphs, when he thought of the pleasure which his parents were to feel! When his lesson was well learned, and rewarded with its due commendation, there were other ears than those around, which he would have wished to have heard; and if any little prize was allotted as a memorial of excellence, the pleasure which he felt on receiving it was slight, compared with the pleasure with which he afterwards saw it in other hands, and looked to other eyes, when he returned, to his home. Such, it might be said, is the origin of that love of praise which we feel; and its growth in the progress of life, when praise is sought in greater objects, is only the growth of the same generous passion. But I will not dwell longer on an hypothesis which I have stated as false, and obviously false, though, obviously false as it is, it is at least as well founded as that of Mandeville. My only object is to show you, by this complete reversal of his reasoning, with equal semblance of probability, that his hypothesis is but an hypothesis.

But how comes it in this system, which must account for our own emotions, as well as for the emotions of others, that we do approve of certain actions, as virtuous, without valuing them for the mere love of praise, and condemn even the love of praise itself, when the good of the world is intentionally sacrificed to it? I will admit, for a moment, to Mandeville, that we are all hypocrites; that we know the game of human life, and play our parts in it accordingly. In

such circumstances, we may indeed assume the appearance of virtue ourselves, but how is it, that we feel approbation of others assuming the same disguise, when we are aware of its nature, and know virtue in all the actions which go under that well-sounding name, to be only a more or less skilful attempt at imposition? The mob in the gallery may, indeed, wonder at all the transmutations in the pantomime, and the silliest among them may believe that Harlequin has turned the clown into a fruit-stand, and himself into a fruit-woman: but, however wide the wonder, or the belief may be, he who invented these very changes, or is merely one of the subordinate shifters of the scenery, cannot surely be a partaker of the illusion. What juggler ever deceived his own eyes? Katerfelto, indeed, is described by Cowper, as "with his hair on end, at his own wonders wondering." But Katerfelto himself, who "wondered for his bread," could not feel much astonishment, even when he was fairly giving the greatest astonishment to others. It must be the same with the moral juggler. He knows the cheat; and he cannot feel admiration. If he can truly feel esteem, he feels that love of virtue, and consequently that distinction of actions, as virtuous or worthy of moral approbation, which Mandeville denies. He may be a dupe, indeed, in the particular case, but he cannot even be a dupe, without believing that virtue is something nobler than a fraud; and, if he believe virtue to be more noble, he must have feelings nobler than any which the system of Mandeville allows. In believing that it is possible for man not to be a hypocrite, he may be considered almost as proving, that he has not, uniformly, been a hypocrite himself.

Even if the belief of a system of this sort, which, as we have seen, has no force but that which it derives from the very common paralogism of asserting the universal truth of a partial conclusion; even if this miserable belief were to have no tendency directly injurious to the morals of those who admit it, the mere loss of happiness which it would occasion, by the constant feeling of distrust to which it must give rise, would of itself be no slight evil. To regard even every stranger, on whom our eyes could fall, as engaged in one unremitting plan of deceit, all deceiving, and all to a certain degree deceived, would be to look on society with feelings that would make absolute solitude comparatively pleasing; and, if to regard strangers in this light would be so dreadful, how far more dreadful would it be, to look, with the same distrust, on those in whom we had been accustomed to confide as friends—to see dissimulation in every eye—in the look of fondness of the parent, the wife, the child, the very caress and seeming innocence of in

fancy; and to think, that, the softer every tone of affection was to our ear, the more profound was the falsehood, which had made it softer, only that it might the more surely deceive! It is gratifying to find, that a system, which would make this dreadful transformation of the whole moral world, is but an hypothesis; and an hypothesis so unwarrantable, because so inconsistent with every feeling of our heart. Yet it is unfortunately a paradox, which admits of much satirical picturing; and, while few pause sufficiently to discover its logical imperfections, it is very possible that some minds may be seduced by the mere lively colouring of the pictures, to suppose, in spite of all the better feelings of which they are conscious, that the representation which is given of human life is true, because a few characters in human life are truly drawn. A rash assent may be given to the seeming penetration which such a view of the supposed artifices of morality involves; and after assent is once rashly given, the very generosity that might have appeared to confute the system, will be regarded only as an exemplification of it. I feel it the more my duty, therefore, to warn you against the adoption of a system, so false to the excellence of our moral nature; not because it is false only, though, even from the grossness of its theoretic falsehood alone, it is unworthy of a single moment's philosophic assent, but still more, because the adoption of it must poison the virtue, and the happiness still more than the virtue, of every mind which admits it. There is scarcely any action for which it is not possible to invent some unworthy motive. If our system requires the invention of one, the invention, we may be sure, will very speedily take place; and, with the loss of that amiable confidence of virtue, which believed and was believed, how much of happiness, too, will be lost, or rather, how little happiness will afterwards remain!

A slight extension of the system of Mandeville produces that general selfish system of morals, which reduces all virtue to the desire of the individual good of the agent. On this it will be necessary to dwell a little more fully, not so much for the purpose of exposing the fallacy of the system itself, important as this exposure is, as for explaining that relation of utility to virtue, of which we so frequently hear, without any very accurate meaning attached to the relation.

In the first place, however, since actions can be estimated as more or less useful, only by that faculty which analyzes and compares, it will be of advantage to make some remarks on the influence of reason on our moral sentiments, and on those theories which, proceeding beyond this indisputable influence, would reduce to mere reason, as if it were the great principle of virtue it-

self, the whole moral phenomena of our approbation of good and disapprobation of evil.

If all the actions of which man is capable, had terminated in one simple result of good or evil, without any mixture of both, or any further consequences, reason, I conceive, would have been of no advantage whatever, in determining moral sentiments that must, in that case, have arisen immediately on the consideration of the simple effect, and of the will of producing that simple effect. Of the intentional production of good, as good, we should have approved instantly; of the intentional production of evil, as evil, we should as instantly have disapproved; and reason could not, in such circumstances, have taught us to love the one more, or hate the other less; certainly not to love what we should otherwise have hated, nor to hate what we should otherwise have loved. But actions have not one simple result, in most cases. In producing enjoyment to some, they may produce misery to others, either by consequences that are less or more remote, or by their own immediate but compound operation. It is impossible, therefore, to discover instantly, or certainly, in any particular case, the intention of the agent, from the apparent result; and impossible for ourselves to know, instantly, when we wish to perform a particular action, for a particular end, whether it may not produce more evil than good, when the good was our only object,—or more good than evil, when our object was the evil only. Reason, therefore, that power by which we discover the various relations of things, comes to our aid, and pointing out to us all the probable physical consequences of actions, shows us the good of what we might have conceived to be evil, the evil of what we might have conceived to be good, weighing each with each, and calculating the preponderance of either. It thus influences our moral feelings indirectly; but it influences them only by presenting to us new objects, to be admired or hated, and still addresses itself to a principle which admires or hates. Like a telescope, or microscope, it shows us what was too distant, or too minute, to come within the sphere of our simple vision; but it does not alter the nature of vision itself. The best telescope, or the best microscope, could give no aid to the blind. They imply the previous power of visual discernment, or they are absolutely useless. Reason, in like manner, supposes in us a discriminating vision of another kind. By pointing out to us innumerable advantages or disadvantages, that flow from an action, it may heighten or reduce our approbation of the action, and consequently our estimate of the virtue of him whom we suppose to have had this whole amount of good or evil in view, in his intentional production

of it; but it does this only because we are capable of feeling moral regard for the intentional producer of happiness to others, independently of any analyses which reason may make. If we did not love what is for the good of mankind, and love, consequently, those actions which tend to the good of mankind, it would be vain for reason to show, that an action was likely to produce good, of which we were not aware, or evil, of which we were not aware. It is very different, however, when we consider the mind, as previously susceptible of moral emotion. If our emotion of approbation, when we meditate on the propriety of a particular action, depend, in any degree, on our belief of resulting good, and our disapprobation, in any degree, on our belief of resulting evil; to show that the good of which we think is slight, when compared with the evil which accompanies or follows it, is, perhaps, to change wholly our approbation into disapprobation. We should feel, in such circumstances, a disapprobation of ourselves, if, with the clearer view of consequences now presented to us, we were to continue to desire to perform the very action, to have abstained from which before, would have excited our remorse. The utility of reason, then, is sufficiently obvious, even in morality; since, in a world so complicated as this, in which various interests are continually mingling, and in which the good of one may be the evil of many; a mere blind obedience to that voice, which would tell us instantly, and without reflection, in every case, to seek the good of any one, as soon as it was in our power to be instrumental to it, might produce the misery of many nations, or of many ages, in the relief of a few temporary wants of a few individuals. By far the greater portion of political evil, which nations suffer, arises, indeed, from this very source, not so much from the tyranny of power, however tyrannical power may too frequently have been, as from its erring benevolence, in the far greater number of cases, in which it was exercised with the wish of promoting that very good which was delayed, or, perhaps, wholly impeded, by the very means that were chosen to further it. If those rulers, who were truly desirous of the happiness of their people, had only known how they could most effectually produce that happiness which they wished, there can be no question, that the earth at present would have exhibited appearances very different from those which, on the greater part of its surface, meet our melancholy view; that it would then have presented to us an aspect of general freedom and happiness, which not man only, but the great Father and lover of man might have delighted to behold. Reason, then, though it is incapable of giving birth to the notion of moral

excellence, has yet important relations to that good which is the direct object of morality.

Let none with heedless tongue from truth disjoin
The reign of Virtue. Ere the day-spring flow'd,
Like sisters link'd in concord's golden chain,
They stood before the great Eternal Mind.
Their common parent; and by him were both
Sent forth among his creatures, hand in hand,
Inseparably join'd: nor e'er did Truth
Find an apt ear to listen to her lore,
Which knew not Virtue's voice; nor, save where
Truth's
Majestic words are heard and understood,
Doth Virtue deign to inhabit. Go, inquire
Of nature; not among Tartarean rocks,
Whither the hungry vulture with its prey
Returns; not where the lion's sullen roar
At noon resounds along the lonely banks
Of ancient Tigris; but her gentler scenes,
The dove-cot, and the shepherd's fold at morn,
Consult; or by the meadow's fragrant hedge,
In spring-time, when the woodlands first are green,
Attend the linnets singing to his mate,
Couch'd o'er their tender young. To this fond care
Thou dost not Virtue's honourable name
Attribute: wherefore, save that not one gleam
Of truth did e'er discover to themselves
Their little hearts, or teach them, by the effects
Of that parental love, the love itself
To judge, and measure its officious deeds?
But man, whose eyelids truth has fill'd with day,
Discerns how skillfully to bounteous ends
His wise affections move; with free accord
Adopts their guidance; yields himself secure
To Nature's prudent impulse; and converts
Instinct to duty and to sacred law.*

Important, however, as reason is, in pointing out all the possible physical consequences of actions, and all the different degrees of probability of these, it must not be forgotten, that this is all which it truly does; that our moral sentiment itself depends on another principle of our mind; and that, if we had not previously been capable of loving the good of others as good, and of hating the production of evil as evil, to show us that the happiness of every created being depended on our choice, would have excited in us as little eagerness to do what was to be so extensively beneficial, as if we had conceived, that only a single individual was to profit by it, or no individual whatever.

These remarks will show you the inadequacy of the moral systems, which make virtue, in our contemplation of it, a sort of product of reasoning, like any other abstract relation, which we are capable of discovering intellectually; that of Clarke, for example, which supposes it to consist in the regulation of our conduct, according to certain fitnesses which we perceive in things, or a peculiar congruity of certain relations to each other; and that of Wollaston, which supposes virtue to consist in acting according to the truth of things, in treating objects according to their real character, and not according to a character or properties which they truly have not—a system which is virtually the same as that of Clarke, expressing only more awkwardly what is not very simply developed, indeed, even in Dr. Clarke's speculations.

* Akenside's *Pleasures of Imagination*, book ii.

These systems, independently of their general defect, in making incongruity,—which, as mere incongruity, bears no proportion to vice, but is often greatest in the most frivolous improprieties,—the measure of vice, assume, it must be remembered, the previous existence of feelings, for which all the congruities of which they speak, and the mere power of discovering such congruities, are insufficient to account. There must be a principle of moral regard, independent of reason; or reason may, in vain, see a thousand fitnesses, and a thousand truths, and would be warmed with the same lively emotions of indignation, against an inaccurate time-piece, or an error in arithmetical calculation, as against the wretch who robbed, by every fraud which could elude the law, those who had already little of which they could be deprived, that he might riot a little more luxuriously, while the helpless, whom he had plundered, were starving around him.

Fitness, as understood by every one, is obviously a word expressive only of relation. It indicates skill, indeed, in the artist, whatever the end may be; but, considered abstractly from the nature of the end, it is indicative of skill only. It is to the good or evil of the end that we look, and that we must always look, in estimating the good or evil of the fitness itself; and if it be the nature of the end which gives value to the fitness, it is not the fitness, but the end to which the fitness is subservient, that must be the true object of moral regard. The fitness of virtue for producing serene delight is not, as mere fitness, greater than that of vice for producing disquietude and wretchedness; and we act, therefore, as much according to the mere fitnesses of things, in being vicious as being virtuous. If the world had been adapted for the production of misery, with fitnesses opposite indeed in kind, but exactly equal in number and nicety of adjustment to those which are at present so beautifully employed in the production of happiness, we should still have framed our views and our actions according to these fitnesses; but our moral view of the universe and of its Author would have been absolutely reversed. We should have seen the fitnesses of things precisely as before, but we should have seen them with hatred instead of love.

Since every human action, then, in producing any effect whatever, must be in conformity with the fitnesses of things, the limitation of virtue to actions which are in conformity with these fitnesses, has no meaning, unless we have previously distinguished the ends which are morally good from the ends which are morally evil, and limited the conformity of which we speak, to the one of these classes. In this case, however, the theory of fitnesses, it is evident, far from accounting for the origin of moral distinctions,

proceeds on the admission of them; it presupposes a distinctive love of certain virtuous ends, by their relation to which all the fitnesses of actions are to be measured; and the system of Dr. Clarke, therefore, if stripped of its pompous phraseology, and translated into common language, is nothing more than the very simple truism or tautology, that to act virtuously, is to act in conformity with virtue.

From this doctrine of conformity to the fitness of things the theory of Wollaston, in which virtue is represented to consist in the conformity of our actions to the true nature of things, scarcely differs, as I have said, in any respect, unless as being a little more circuitous and complicated. The truth, of which Wollaston speaks, is only virtue under another name; and if we had no previous notions of moral good and evil,—no love of the happiness of others more than of their misery, it would be absolutely impossible to determine whether virtue or vice were truth or falsehood, even in the sense in which he uses these terms. If, indeed, we previously take for granted that it is the nature, the true nature, of the parent to be loved by the child, of the child to love the parent, we cannot then, it will be allowed, have any hesitation in admitting that the child, in performing offices of tenderness to the parent, treats the parent according to his true nature; and that, if he were to treat him unkindly, he would treat him not according to his true nature, but as if he were a foe to whose true nature such usage would be accordant. In taking for granted this very nature, however, the agreement or disagreement with which we have chosen to denominate truth or falsehood, is it not evident that we have taken for granted all those duties which are strangely said to depend on the perception of an agreement, that cannot even be conceived by us, till the duties themselves, as constituting the real nature or truth of our various relations, in the actions which are said to agree with it, have been previously supposed? If there were no previous belief of the different moral relations of foes and friends, but all were regarded by us as indifferent, how could any species of conduct which was true with respect to the one, be false with respect to the other? It is false indeed to nature, but it is false to nature only because it is false to that virtue which, before we thought of truth or falsehood, distinguished, with the clear perception of different moral duties, our benefactor from our insidious enemy.

The work of Mr. Wollaston, which, with all its pedantry of ostentatious erudition, and the manifest absurdity of its leading principle, has many profound reflections and acute remarks, which render it valuable on its own account, appears to me, however, I must

confess, more valuable for the light which it indirectly throws on the nature of the prejudices that pervert our judgment, than for the truths which it contains in itself. If I were desirous of convincing any one of the influence of a system in producing, in the mind of its author, a ready acquiescence in errors the most absurd, and in explanations far more necessary to be explained than the very difficulties which they professed to remove or illustrate, I know no work which I could put into his hands better suited for this purpose than *The Religion of Nature Delineated*. Who but the author of such a system could believe for a moment that parricide is a crime only for the same reason which would make it a crime for any one, (and, if the great principle of the system be just, a crime exactly of the same amount,) to walk across a room on his hands and feet, because he would then be guilty of the practical untruth of using his hands, not as if they were hands, but as if they were feet; as, in parricide, he would be guilty of the practical untruth of treating a parent as if he were not a parent, but a robber or a murderer? Even without considering guilt so atrocious, is common cruelty, in any of its forms, made hateful to us as it should be, or even hateful in the slightest degree of moral disgust by being represented only as the half-ludicrous falsehood of affirming practically, that a man is not a man capable of feeling, but an insensible post; and is it only for a similar falsehood, in this tacit proposition, which we are supposed by our negligence to affirm, that we should reproach ourselves, if we had left any one to perish, whom a slight effort on our part would have saved from destruction? "Should I find a man grievously hurt by some accident," says Wollaston, "fallen down, alone, and without present help, like to perish, or see his house on fire, nobody being near to help or call out; in this extremity, if I do not give him my assistance immediately, I do not do it at all; and by this refusing to do it according to my ability, I deny his case to be what it is; human nature to be what it is; and even those desires and expectations which I am conscious to myself I should have under the like misfortune, to be what they are."* These strange denials we certainly do not make; all which we tacitly declare is, on the contrary, a truth, and a truth of the most unquestionable kind. We affirm ourselves to be what we are, indifferent to the miseries of others: and if to affirm a truth by our actions be all which constitutes virtue, we act as virtuously in this tacit declaration of our insensibility, as if we had flown instantly to the aid of the sufferer, with the most com-

passionate declaration of our feeling; or rather, if, with the same indifference at heart, we had stooped our body, or stretched out our hand to relieve him, our very attempt to give the slightest relief, according to the theory of moral falsehood, would have been only a crime additional.

Reason, then, as distinguishing the conformity or unconformity of actions with the fitnesses of things, or the moral truth or falsehood of actions, is not the principle from which we derive our moral sentiments. These very sentiments, on the contrary, are necessary before we can feel that moral fitness or moral truth, according to which we are said to estimate actions as right or wrong. All actions, virtuous and vicious, have a tendency or fitness of one sort or other; and every action which the benevolent and malevolent perform, with a view to a certain end, may alike have a fitness for producing that end. There is not an action, then, which may not be in conformity with the fitnesses of things; and if the feelings of exclusive approbation and disapprobation that constitute our moral emotions be not presupposed, in spite of the thousand fitnesses which reason may have shown us, all actions must be morally indifferent. They are not thus indifferent, because the ends to which reason shows certain actions to be most suitable, are ends which we have previously felt to be worthy of our moral choice; and we are virtuous in conforming our actions to these ends, not because our actions have a physical relation to the end, as the wheels and pulleys of a machine have to the motion which is to result from them; but because the desire of producing this very end has a relation, which has been previously felt, to our moral emotion. The moral truth, in like manner, which reason is said to show us, consists in the agreement of our actions with a certain frame of mind which nature has previously distinguished to us as virtuous; without which previous distinction the actions of the most ferocious tyrant, and of the most generous and intrepid patriot, would be equally true, as alike indicative of the real nature of the oppressor of a nation, and of the assertor and guardian of its rights.

The fitness and the truth, then, in every case, presuppose virtue as an object of moral sentiment, and do not constitute or evolve it.

The moral use of reason, in influencing our approbation and disapprobation, is, as I before remarked, to point out to us the remote good, which we do not perceive, or the elements of mixed good and evil, which also, but for the analytic power of reason, we should be incapable of distinguishing with accuracy in the immediate compound result. If the mere discovery of greater

* *Religion of Nature Delineated*, p. 18. London, 1738, &c.

utility, however, is sufficient to affect our approbation, utility must, it is evident, have a certain relation to virtue. Utility, it is said, is the measure of virtue. Let us consider what meaning is to be attached to this phrase.

LECTURE LXXVII.

OF HUME'S SYSTEM, THAT UTILITY IS THE CONSTITUENT OR MEASURE OF VIRTUE.

In my last Lecture, Gentlemen, I examined, at as great a length as a doctrine so false in its principles requires, the system of Dr. Mandeville with respect to virtue; a system in which the actions that commonly go under that honourable name are represented as, in every instance, where any seeming sacrifice is made to the happiness of another, the result of a calculating vanity that, in its love of praise, consents to barter, for a suitable equivalent of commendation, the means of enjoyment which it would not give without a due equivalent, but which it values less than the applause that is to be offered in purchase of them. The pretender to generosity, who is a speculator in this species of traffic, is of course a hypocrite by the very quality of the moral ware in which he jobs; and the applauders of the ostensible generosity, who are as little capable of unpaid admiration as he of gratuitous bounty, are hypocrites of equal skill, in the supposed universal cheat of social life. All are impostors, or all are dupes, or rather, all are at once impostors and dupes, dupes easily deceived by impostors whom it is easy to deceive. On a system, of which, I may safely take for granted, that every one of you has in the delightful remembrances of his own breast innumerable confutations, I should not have thought it necessary to dwell, if there had been less peril in the adoption of it to happiness and virtue. As a philosophic system, it is scarcely worthy of discussion. It is an evident example of an error that is very common in hypothetical systems; the error of supposing, notwithstanding the most striking seeming contrarieties, that what is true of a few cases out of many is, therefore, necessarily true of all. Some men are hypocrites, therefore all men are hypocrites. It is not absolutely impossible, that he whom the world honours as virtuous for a life, which, from youth to old age, has had the uniform semblance of regard for the happiness of others, may have no virtue whatever at heart; therefore, it may be affirmed, with certainty, that he has no virtue whatever. Such are the two propositions, which, though not expressed in these precise terms, constitute truly the

whole logic of Mandeville. They are the very essence of his system; and unless we admit them as logically just, we must reject his system as logically false. But it is in his rhetoric that he trusts far more than in his defective logic; and if he have given us a few lively picturings of hypocrisy, he flatters himself that we shall not pause to inquire, whether pictures so lively are representations of a few only, or of all mankind.

What should we think of a moral theorist who, after painting some coarse debauch in the midnight profligacy of the lowest ale-house, or the wider drunkenness and riot of a fair or an election, should seriously exhibit to us those pictures as evidence of an universal conclusion, that all men are drunkards? We might admire the verbal painting, indeed, as we admire the pictures of Hogarth; but we should admire as little the soundness of the philosophy as we should have admired the accuracy of one of Hogarth's pictures, if he had exhibited to us the interior of a brothel as a representation of domestic life; a faithful sketch of one of those virtuous and smiling groups, that around a virtuous and delighted father, at his own parlour fire, seem to inclose him, as it were, within a circle of happiness! It is certainly not more absurd to argue that, because some men are drunkards all men are drunkards, than to contend that all men are, in every action of their life, indifferent to the happiness of every other being, because some may be hypocrites in affecting to regard any happiness but their own; and he who, in adopting this theory, can seriously believe that there is not a single parent, or wife, or child, who has any other view than the selfish one of acquiring praise, in any one office of seeming kindness to those whom they would wish us to regard as dear to them, may certainly believe with equal reason, and admire as ingenious and just, the wildest absurdity which the wildest propounder of absurdities can offer to his assent and admiration.

This system, by a little extension to all the sources of selfish enjoyment, and by a little purification of the selfishness, as the enjoyment is rendered less prominently selfish by being more remote and more connected by many direct or indirect ties with the happiness of others, assumes the form of the more general theory of selfish morals, in which the most refined virtue is represented only as disguised self-love; though the veil, which is thin in itself, so as often to afford no disguise to the passion which glows through it, is sometimes thickened in so many folds, that it is scarcely possible to guess what features of ugliness or beauty are beneath. Before considering, however, this finer system of moral selfishness, which is founded on views of remote personal advan-

tage, and therefore in a great measure on the skill that detects those elements of distant good, I conceived that we might derive some aid to our inquiry, by considering first the relations which reason, the great analyser and detector of those elements of distant good, bears to morality; and consequently, as in their fittest place, those systems which would reduce all our moral feelings to intellectual discoveries made by that power, which is supposed, in these systems, to determine the very nature of vice and virtue, in the same way as it extracts roots, measures angles, and determines specific gravities or affinities, or quantities of motion.

We considered, then, two celebrated systems of this sort that found morality on reason; one which supposes virtue to consist in the accommodation of our actions to the fitnesses of things, and another which supposes it to consist in actions that are conformable to truth. In both cases I showed you, that the systems, far from accounting for our moral feelings, or showing them to be the result of a process of ratiocination, proceed on the susceptibility of these feelings, as an essential part of our mental constitution, independent of every thing that can be resolved into reasoning. If we were not formed to love previously the happiness of others, and to have a moral approbation of the wish of producing happiness, in vain would reason tell us, after tracing a thousand consequences, that an action will be more generally beneficial than, but for this analytic investigation, we should have supposed. If we were not formed to love certain ends of moral good rather than certain other ends of moral evil, the mere fitnesses, or means of producing these ends, must be as indifferent to us as that indifferent good or evil which they tend to produce. If we have formed no previous moral conception of certain duties, as forming that truth of character to which vice is said to be false, there will be as little falsehood; and, therefore, if vice be only a want of conformity to truth, as little vice, in the most cruel and unrelenting malignity, as in the most generous benevolence. In every case in which we suppose reason to be thus morally exercised, we must, as I said, presuppose certain feelings of love and approbation that constitute all which is truly moral in our sentiments of actions; or the discovery of mere consequences of general good, mere fitnesses, mere truths, will be as powerless to affect us with moral regard, as a new combination of wheels and pulleys, or a new solution of a geometric problem.

But, though the discovery of certain fitnesses or congruities, such as those of which Clarke speaks, or of a certain conformity to truth, such as that of which Wollaston speaks, or of the beneficial and injurious

consequences of certain actions, considered as a mere series of consequences, discoverable by the understanding, like any other series of physical effects, may not be capable of giving birth to moral feeling, without some peculiar and previous susceptibility in the mind of being so affected; may they not at least indirectly give birth to it, by presenting to this original susceptibility of moral emotion its peculiar objects? Whatever may be the principle that develops it, does not the approving sentiment arise, on the contemplation of actions that are in their tendency beneficial to individuals, and thus to society in general, and only on the contemplation of actions that are thus beneficial? Is not utility, therefore, since it appears to be essential, in some greater or less degree, to the whole class of actions that are termed virtuous, the constituent or the measure of virtue itself?

The doctrine of the utility of actions, as that which constitutes them virtuous, has been delivered, with all the force of which the doctrine seems capable, by the genius of Mr. Hume, who has formed it into an elaborate system of morals. It has ever since entered largely into the vague speculations on the principles of virtue, in which minds that are rather fond of theorizing than capable of it, are apt to indulge; and we seldom hear in familiar discussion any allusion to the principle or principles of moral sentiment, without some loose reference to this relation, which that moral sentiment is supposed to bear to the utility of the actions approved. That it does bear a certain relation to it is unquestionable, though a relation which is not always very distinctly conceived by those who are in the frequent habit of speaking of it. It will be the more important, then, to endeavour to separate what is true in the common language on the subject, from the error which frequently accompanies it.

Benevolence, as the very name implies, is always a wish of good to others; and every benevolent action, therefore, must be intended to be of advantage to somebody. But if by the measure of virtue, when utility is said to be the constituent or measure of the actions that are denominated virtuous, be meant that to which the virtue is in exact proportion, increasing always as the mere physical advantage increases, and decreasing always as the mere physical advantage decreases; and if it be said that such actions only are felt to be meritorious, in which the agent is supposed to have willed directly that which appeared to him at the moment of his willing it most useful, and to have willed it with moral approbation for this reason only, because it appeared to him most useful; utility, in this general sense, is so far from being the measure of virtue, that there is comparatively but a very small number of virtu-

ous actions to which the *méasure* can be applied, and very few, indeed, in which the proportion will be found to hold with exactness.

That virtuous actions do all tend in some greater or less degree to the advantage of the world, is indeed a fact, with respect to which there can be no doubt. The important question, however, is, whether the specific amount of utility be that which we have in view, and which alone we have in view, in the approbation which we give to certain actions; since this approbation is the direct feeling of virtue itself, without which, as intervening, it will be allowed that even the most useful action could not be counted by us as virtuous; whether we love the generosity of our benefactor, with an emotion exactly the same in kind, however different it may be in degree, as that with which we love the bank-bill, or the estate which he may have given us; in short, to use Dr. Smith's strong language, whether "we have no other reason for praising a man, than that for which we commend a chest of drawers."

It may be necessary in this discussion, to remind you once more, that virtue is nothing in itself, any more than our other general terms, which we have invented to express a number of particulars comprehended in them; that what is true of virtue, then, must be true of all the particular actions to which we give that name; and that all which we have to consider in the present argument, is not the vague general term, but some particular action, that is to say, some particular agent, in certain circumstances, willing a certain effect; since the feeling which rises in the mind, on the contemplation of this particular action, is that which leads us to class it with other actions that may have excited a similar vivid sentiment, and to employ for the whole the common term virtue. The question then is, whether it be necessary to the rise of this vivid sentiment, the moral emotion of approbation or disapprobation, that we should have in immediate contemplation, as the sole object of the emotion, the utility or inutility of the action; and whether the emotion itself be always exactly proportioned by us to the quantity of usefulness which we may have found, by a sort of intellectual calculation or measurement in the action itself, or in the principle of the action. It is the vivid feeling of moral approbation alone, which leads us to distinguish actions as virtuous or vicious; and the supposed measure or standard of virtue, therefore, must relate to this vivid feeling in all its degrees, or it cannot have any relation to the virtue that in all its degrees is marked by that vivid feeling only.

If the utility of actions be their moral standard, then, it must be present to the contemplation of the agent himself, when he

morally prefers one mode of conduct to another; and to the contemplation of others, when they morally approve or disapprove of his action.

In every moral action that can be estimated by us, these two sets of feelings may be taken into account; the feelings of the agent when he meditated, and willed the action; and the feelings of the spectator, or of him who calmly contemplates the action at any distance of space or time. Let us consider, then, in the first place, the agent himself. The agent, indeed, may be under the influence of passions, from which the spectator is free, and may thus have his moral discernment less clear, so as to be hurried perhaps into actions which, with better moral vision, he would have shunned. But the principle of approbation itself is not essentially different in his mind, when the action which he contemplates is one which he meditates himself, and when he contemplates the action of another already performed; and, if it be not according to any measurement of exact utility, that the approbation and consequent moral will or resolution of the most virtuous agent is formed, it must be allowed to be a powerful presumption at least, or more than a mere presumption, that the approbation of the spectator, arising from the same principle is not the result of such a measurement of the good that is to be added, by that particular action, to the general good of the world, or of the general utility of the principle from which it flows. With respect to the views of the agent, however, there seems to be little ground for dispute. His views, even when he seems to ourselves most commendable, but rarely extend to such general interests. The exact scale of utility of an action, in short, or of the principle of the action, is not present to his mind as the standard by which he regulates his conduct. Does the mother, when she hangs sleepless, night after night, over the cradle of her sick infant, think, even for a single moment, that it is for the good of the society of mankind, that she should labour to preserve that little being which is so dear to her for itself, and the abandonment of which, though no other being in the universe were to be affected by it, would seem to her a crime of scarcely conceivable atrocity; and are we to refuse to her patience and tenderness, and watchfulness of regard, the name of virtue, because she has thought only of some little comfort that might possibly flow to the individual, and has not measured her own personal sacrifices with that general good, to which they should have been exactly adapted, nor estimated the general advantage of maternal love, as a principle of conduct which operates, and is continually to operate, in all the families of mankind? When we enter some wretched

hovel, and see that wretchedness, which is so much more dreadful to the eye of him who beholds it, than to the ear of him who is told in his splendid apartment, that there is misery upon the earth,—and who thinks that in pitying it, with the very idleness of pity, he has felt as a good man should feel; when we look through the darkness, to which there is no sunshine, on some corner, darker still,—where the father of those who have strength only to hang over him and weep, is giving to them his last blessing, which is all that remains to him to give; do we feel, on looking at this mixture of death, and sickness, and despair, and want, in dreadful assemblage, that it would be well for the world if a little relief were given to miseries so hopeless; or that compassion, as a principle of conduct, is of the highest usefulness, where there are so many sufferers on the earth, who may be objects of compassion? Of the principle of the action in its relation to general utility, we never think. We hasten to do what it is in our power to do; and we have already obtained looks of as much gratitude, as could be felt in a moment of such affliction, long before we have thought of any thing more than what was before our very eyes. In all the small courtesies of society, as well as in these higher duties, we act, not from any estimate of the principle of courtesy as a general principle, but from the temporary views of individual gratifications to those who mingle with us; and we act well. The amount of general good, which a philosopher might estimate, or attempt to estimate, by considering the relation of these particular actions to the advantage of the community, never occurs as an object of contemplation to the multitude of mankind, when they approve or disapprove, with feelings at least as vivid, as those of him who measures every action by its remotest consequences. It occurs but seldom, even to philosophers themselves, who may derive, indeed, an additional enjoyment from tracing that relation, and an additional reason to adore the goodness of him who has established it; but who, in the common transactions of life, act from the same immediate feelings of approvableness, the same immediate impulses of virtuous emotion, as those to whom ethical and political generalizations are absolutely unknown. The immediate virtuous impulse is the mere feeling of rapid approbation, that becomes still more rapidly choice or determination; a feeling which has relation only to the particular case, and which, far from pausing for any extensive view and measurement of remote consequences of utility, has arisen in the instant, or almost in the very instant in which the action was conceived.

But the feelings of the agent himself,

whom alone we have yet considered, it may perhaps be said, furnish no decisive confutation of the supposed moral measurement of the virtue of actions, by the feeling of their precise degrees of general utility; they may afford a presumption, but nothing more; and it is in the calm contemplation of the indifferent spectator, or reader, or hearer of an action only, that we are to look for the grounds of a just moral estimate of the virtue or vice which the action itself involves.

The exclusion of the feelings of the agent himself, in the moral estimate of the propriety or impropriety of the actions, which circumstances call on him to perform, and on account of which he is to be ranked with the virtuous or the guilty, may seem a very bold use of the privilege of unlimited supposition, which a theorist assumes. Let the assumption, however, be admitted. Let the feelings of the agent be left wholly out of account, and let us think only of the feelings of him who contemplates the action of another. Is the approbation of virtue, in this case, the feeling of mere utility; our indignation, disgust, abhorrence of vice, in its aspects of greatest atrocity, a feeling of nothing more than of the uselessness, or physical incumbrance and detriment to society, of that profitless thing which we call a tyrant or a parricide? The doctrine of utility, as the felt essence of virtue, is, in this case, as little in agreement with the moral facts which it would explain, as in the case of the feelings of the agent himself; as little accordant with them as any false hypothesis in mere physics, with the stubbornly resisting physical facts, which it would vainly endeavour to reconcile, or at least to force together.

If the approbation which we give to virtue be only the emotion excited in us by the contemplation of what is useful to mankind, it is very evident that such utility is to be found, not in the actions, only of voluntary agents, and in the general principles of conduct from which the particular actions flow, but in inanimate matter also; and indeed, on earth at least, it is only by the intervention of matter, that one mind can indirectly be of any utility whatever to any other mind. Let us imagine, then, not a mere chest of drawers before us,—for that may be counted of too trifling convenience,—but the most useful machine which the art of man has been able to devise,—a loom, for example, a ship, a printing-press, instruments which have certainly contributed to the happiness of the world a far greater amount of good, than any moral action of any generous benefactor, whose voluntary production of a little limited good, perhaps to a single individual only, may yet have excited in us the liveliest emotions of a regard that is almost veneration.

tion, or more than mere veneration. When we think of any one of these noble instruments, as placed before our eyes, or when any one of them is actually before our eyes, and when we trace all the contrivances of its parts, and think of the good which has for many ages resulted, and will still continue to result from the whole; does it seem to us possible that any one should assert, or almost that any one should imagine, for a moment, the sameness in kind of the intellectual admiration, if I may so express it, which we feel in such a case, with the moral admiration that is excited in us by the patriot or the martyr; or even by the humblest of those who, in their little sphere of private life, in the ordinary circumstances of peaceful society, exert, for the good of the few who are around them, an energy of active benevolence, as powerful as that which, in a more elevated station, and in a tumultuous age, ennobles the leader and the sufferer in the cause of nations and of the world? Our admiration of a steam-engine, our admiration of an heroic sacrifice of personal comfort, or of life itself, are feelings that can scarcely be said to have any greater resemblance than the brightness of scarlet and the shrillness of a trumpet; and the blind man who asserted the similarity of these two sensations, was, I cannot but think, (if our consciousness is to decide on the comparative merit of the theories,) at least as sound a theorist, as he who would convince us of the similarity of the two emotions. Indeed, if we were to strive to conceive all the possibilities of extravagant assertion, it would not be easy to imagine one less warranted by fact, than that which would affirm that we love a benefactor exactly with the same feelings as those with which we regard a house or a loaf of bread; or at least that there is no difference, but as one or the other may have been in degree more or less useful to us or to the world in general.

If, indeed, mere matter could, by the most beautiful subserviency to our happiness, become a reasonable object of moral admiration, by what means have we been able to escape an universal idolatry? How is it that we are not, at this moment, all adorers of that earth on which we dwell, or of that great luminary which renders our earth not habitable merely, but delightful? The ancient worshippers of the universe at least supposed it to be animated with a soul. It was the soul of the world which they adored. The savage, who trembles at the thunder, and bends before the whirlwind that kneel which does not bow to man, believes that there is some being greater than man who presides over the awful darkness. But, according to the system of utility, the belief of a soul of the world, or of a

ruler of the lightning and the storm, which even the savage thinks necessary, before he deign to worship, is superfluous for our more philosophic veneration. The earth, whether animated or inanimate, is alike that which supports and feeds us. The sun, whether animated or inanimate, is alike to us the source of warmth and light, and of all that infinity of blessings, which these simple words involve. The earth and the sun, then, if mere utility were to be considered as virtue, the sole standard on the contemplation of which certain moral emotions arise, and by which we measure their vividness, are the most virtuous beings that come beneath our view; and love, respect, veneration, such as we give to the virtues of the most virtuous human beings, are far too slight an offering of the heart to utilities so transcendent.

It is evidently, then, not mere utility which constitutes the essence of virtue, or which constitutes the measure of virtue; since we feel, for the most useful inanimate objects, even when their usefulness is to continue as long as the whole race of beings that from age to age are to be capable of profiting by them, no emotions of the kind which we feel, when we consider the voluntary actions of those who are capable of knowing and willing the good which they produce. A benevolent man and a steam-engine may both be instrumental to the happiness of society; and the quantity of happiness produced by the unconscious machine may be greater perhaps than that produced by the living agent; but there is no imaginary increase or diminution of the utility of the one and of the other, that can make the feelings with which we view them shadow into each other, or correspond in any point of the scale.

Though it is impossible for the theorist not to feel the irresistible force of this argument, when he strives in vain to think of some infinite accession of utility to a mere machine, which may procure for it all the veneration that is given to virtue, he can yet take refuge in the obscurity of a verbal distinction. Utility, he will tell us, is not in every instance followed by this veneration: it is only utility in the action of living beings that is followed by it; and when even all the useful actions of living beings are shown not to produce it, but only such actions as had in view that moral good which we admire, he will consent to narrow his limitations still more, and confine the utility, which he regards as the same with virtue, to certain voluntary actions of living beings. Does he not perceive, however, that in making these limitations he has conceded the very point in question? He admits that the actions of men are not valued merely as being useful, in which case they must have

ranked in virtue, with all things that are useful, exactly according to their place in the scale of utility, but for something which may be useful, or rather which is useful, yet which merely as useful never could have excited the feelings which it excites when considered as a voluntary choice of good. He admits an approvableness then, peculiar to living and voluntary agents, a capacity of exciting certain vivid moral emotions which are not commensurable with any utility, since no accession of mere utility could produce them. In short, he admits every thing for which the assertor of the peculiar and essential distinctions of virtue contends; and all which he gains by his verbal distinction of utilities is, that his admission of the doctrine which he professes to oppose, is tacit only, not open and direct.

It is indeed, by a verbal distinction of this sort that Mr. Hume himself, the most ingenious and liberal supporter of this system, endeavours to obviate the force of the objection, which may be drawn from inanimate matter, as useful and yet incapable of exciting moral emotion. He does, for the purpose of saving his theory, what is not easy to be reconciled with the acuteness of a mind so subtle as his, and so well practised in detecting, or at least so fond of detecting, what he considers as illogical in the speculations of other writers, or in the general easy faith of the half-reasoning multitude. He fairly takes for granted, as independent of any measurement of mere utility, those very moral feelings which he yet wishes us to believe to arise from the perception of mere utility; thus abandoning his theory as false in order that we may admit it as true. The utility of inanimate things, he says, does not seem to us virtuous, because it is not accompanied with esteem and approbation which are peculiar to living beings; and he states this distinction of the two utilities, without seeming to be at all aware that, in supposing a moral esteem and approbation distinct from the feeling of usefulness, he is thus presupposing the very feeling for which he professes to account; and denying that strict relation of utility to virtue, which his theory would hold out as the only standard, or rather as the only constituent of virtue. The passage is too important not to be quoted in his own words. "We ought not to imagine," he says, "because an inanimate object may be useful as well as a man, that therefore it ought also, according to this system, to merit the appellation of virtuous. The sentiments excited by utility are in the two cases very different; and the one is mixed with affection, esteem, approbation, &c. and not the other." Now it is obviously of these very sentiments alone, which are said by Hume to be mixed with the feeling of utility, and not produced by it, that the

moral theorist has to trace the origin. If the sentiments excited by the utility in the two cases be, as he most justly observes, very different, even when the amount of mere utility may be the same in both; then, most indubitably, it is not as being useful that actions are counted virtuous, and rated in different degrees of virtue according to their different degrees of usefulness; but on account of something that must be superadded to this usefulness: and if, independently of the sum of good which they may produce, and equally produce, one utility and not the other be attended with esteem and approbation, is not this a proof that the moral esteem and approbation are not commensurable with mere physical usefulness; that they are feelings of a peculiar class, which even he, who would represent actions as felt to be virtuous only because they are regarded as physically useful, is obliged to presuppose; and that there is in virtue, therefore, an independent and peculiar approvableness, or capacity of exciting "esteem and approbation," which utility is incapable either of constituting or of measuring?

In this argument, I have opposed to the actions which we feel immediately as virtuous, the utility only of inanimate matter, because this furnishes a more striking contrast; but the same argument, as you cannot fail to have perceived, might have been extended to many qualities of the mind itself, in all those varieties of original genius, or the rich endowments of science, that have progressively raised us from barbarism to civilization, with an influence on the happiness of the world, to which it is scarcely possible in our conception to fix a limit; of talents which we admire indeed, and honour with a respect of a peculiar kind; but our respect for which, even when they exist in their highest order of excellence, we feel to be of a species very different from the moral esteem which we give to an act of virtue. The inventors of the printing-press certainly did more good to the world by that mere invention, than the Man of Ross himself by all his charities; yet how different are the moral emotions with which we view them!

The mere usefulness of certain actions, then, I repeat, is not that which, as felt by us at the moment of our approbation, constitutes to us or measures their virtue; it is not that which is immediately felt by the agent; it is not that which is immediately felt by the spectator or hearer of the action; and yet utility and virtue are related, so intimately related, that there is perhaps no action generally felt by us as virtuous, which it would not be generally beneficial that all mankind in similar circumstances should imitate. This general relation, however, is one which we discover only on reflection,

and of which multitudes have perhaps never once thought during the whole course of their life; yet these have esteemed and hated like other people. The utility accompanies, indeed, our moral approbation; but the perception of that utility does not constitute our moral approbation, nor is it necessarily presupposed by it.

I may remark, by the way, as a circumstance which has probably contributed, in a great degree, to this misconception of the immediate object of moral approbation, that in cases of political legislation, the very end of which is not to look to the present only, but to the future, we estimate the propriety of certain measures by their usefulness. That which is to be injurious we do not enact; and those who contend that we should enact it, think it necessary to show that it will be for general advantage. Expediency being thus the circumstance on which the debates as to the propriety or impropriety of public measures in almost every case depend, we learn to consider it very falsely as the measure of our moral approbation in the particular cases that are constantly occurring in domestic life. We forget that the legislator is appointed for the express purpose of consulting the general good, and of looking to the future, therefore, and distant, as well as to the present or the near. His object is to see *ne quid detrimenti respublica capiat*. His relation is to the community, not to any particular individual; and in neglecting the general good for the good of a few, he would be guilty of a breach of trust, as much as the possessor of a deposit, if he were to give to the wants of some indigent sufferer the money which another had intrusted to his care.

In the general transactions of ordinary life, then, our feeling of approbation or disapprobation, we may conclude, does not depend on the mere perception of utility. The virtuous, by the very constitution of heaven, which has pre-established the connexion of virtue and happiness, will, indeed, that which is useful; but they will it, in each particular case, without regard to the general utility of the principle of conduct to which their action conforms; and, in considering the actions of others, we approve of that which is useful, but we do not approve of it because we have estimated, according to a scale of specific value, the mere usefulness of the general principle. We perceive a moral excellence, as something very different from the amount of physical advantage that flows from the particular action, or from all the similar actions of the same class; an excellence which, of itself, constitutes the approvableness; a virtue which is independent of every thing but the breast of him who conceived it; which is not ennobled by success, and which becomes more interest-

ing to us by the very misfortunes to which it may have led.

The coincidence of general good, with those particular affections which are felt by us to be virtuous, is, indeed, it must be admitted, a proof that this general good has been the object of some being who has adapted them to each other. But it was of a being far higher than man—of him who alone is able to comprehend the whole system of things; and who allots to our humbler faculties and affections those partial objects which alone they are able to comprehend, giving us still, however, the noble privilege

To join
Our partial movements with the master-wheel
Of the great world, and serve that sacred end,
Which he, the unerring reason, keeps in view.*

By this relation, of which few think or are capable of thinking, of particular good with public good, of general utility and private virtue, the public good is as effectually insured as if all were every moment thinking of the relation, and is insured with a still greater accession and profusion of delight.

"Happiness," it has been truly said, "is best provided for by the division of affection, as wealth by the division of labour. Were all men to measure their actions by utility," the same writer justly remarks, "that variety of sentiments and passions which at present renders human society so interesting, and, like a happy combination of notes in music, produces an enchanting harmony, must be reduced to the dull monotony of one tranquil sentiment. Every man, it is true, would meet his neighbour with the mild aspect of calm philosophy, and with the placid smile of perfect benevolence; but no eye must be seen sparkling with rapture or melting with tenderness, no tongue must utter words of kindness, which have not first been exactly measured on the scale of universal benevolence. In short, the moral world would become one flat unvaried scene, resembling the aspect which the natural world would assume, were all its mountains and valleys levelled, and its whole surface converted into a smooth and grassy plain."

That virtue is useful, is indeed true then; so useful that, without it, existence would not have been a blessing, but a source of misery; and a society of mankind but a combination of the miserable, labouring to become individually more wretched, by making each other more wretched. Yet it is not more true, that virtue is useful, than that this utility of the general principles of virtuous conduct is not the ground of our immediate approbation. It is not the standard of our approbation; for we have approved, long before we think of that which is

* Pleasures of Imagination, book ii.

said to have been the measure according to which we have approved. This priority of the approbation in all its degrees, to any thought of specific utility, is true even of philosophers, who know that there is such a coincidence of the relations of virtue and usefulness; but of all who feel virtue, who love and hate, who esteem and honour, and despise, how few are they who know that there is any such relation. They do not approve or disapprove the less, however, but it is because God has willed the happiness of the world, which, as a great whole, they are unconsciously promoting, not because they individually have thought of it. He, indeed, who fixed the relations of things, before the system of things itself was formed by him, established this paramount relation of our generous desires, to an aggregate of happiness far greater than that momentary benefit which was their particular aim. The good of the universe was the gracious object of his will,—his object, not more in the physical enjoyments which he has poured upon us, than in the virtues of which he gave us the noble capacity. But though it was for that universality of happiness, which the eternal Author of the universe alone could fully comprehend in his conception and design that man was rendered virtuous, our limited virtues themselves have their particular objects, which they are better able to embrace. By their joint operation, they produce that great result, of which they do not think even while they are most busy in promoting it; intent perhaps only on courtesies and kindnesses, which appear to terminate in the individual who receives them; like the sunshine, that seems to be only flowing around the blossom in soft and brilliant varieties of light, while it is slowly and silently maturing fruits that are yet unseen; or like the breeze, which seems only to flutter in the sail, or to dimple the wave before the prow, but which is at the same time wafting along the majestic vessel that is to mingle the treasures of every clime, to carry plenty to the barren soil, and the richer stores of science to the still more desolate barrenness of the mind.

LECTURE LXXVIII.

EXAMINATION OF HUME'S SYSTEM CONCLUDING; OF THE SELFISH SYSTEM.

My last Lecture, Gentlemen, was employed in considering the relation which the utility of actions bears to our approbation of them as virtuous.

That in acting, the agent himself, in cases in which no one would hesitate for a moment in terming him virtuous, except those

who deny every distinction of vice and virtue, performs the action which is approved, without any regard to the amount of general good which would flow to society, if all men were to act as he acts, that is to say, without any regard to the specific utility of such actions, is evident from the slightest examination of human conduct. Of all the virtuous actions which are performed at any one moment on the earth, from the slightest reciprocation of domestic courtesies, to the most generous sacrifices of heroic friendship, there is perhaps scarcely one, in which this thought of the supposed scale of utility, according to which his action is to be measured, is present to the mind of the agent, and is the influencing circumstance in his choice, the immediate motive which confers on his conduct the character of virtue. He is useful to the world, indeed, when he relieves the sufferings even of a single individual being. But he relieves that suffering, not because the world, if he gives the relief, will, as a whole, have less misery; or because it would be for the advantage of the world that others should imitate him in similar cases; but that the individual before him may have less misery; or, if he thinks of any thing but that particular misery and its relief, he thinks only of the manner in which he would appear to himself, if he were to abstain from giving the relief which is in his power. He bears sufferings of his own, in like manner, without lamentation; not because a single groan from him, in any case of bodily anguish, would increase the misery of the world, or lessen its happiness, but because a single groan, though it might leave the happiness of the world precisely the same as before, would degrade him in his own estimation. Whether in doing or in suffering, therefore, his virtue, if any virtue be allowed to him, does not depend on his views of the general utility which the world derives from a frame of mind like that which his conduct displays. That comprehensive usefulness is not present to his mind, as a scale or measure of his virtue.

But though it be not the precise measure of approbation and preference in his own mind, it may perhaps be the precise and sole measure of approbation, when his actions or patient sufferings are considered by other minds. In this case, too, we found that the supposed standard is far from being the real standard. We approve, not from any wide calculation of probable consequences to the world, if all were to act as the individual has acted; but from an instant feeling of moral excellence, which makes it impossible for us not to approve, as soon as the action, in all its circumstances, is known to us. If we think of the general utility of such a general mode of conduct, it is not before, but after the approbation; and it is no paradox to say,

that our approbation has, in truth, least reference to general conduct and general consequences, in cases in which the virtue of which we approve is greatest; because, in such cases, the moral excellence produces an emotion so vivid, as to preclude the consideration of every remote circumstance. The hero himself, bearing what he bore, or doing what he did, is all which our mind can see. Who is there, that, in the contemplation of Thermopylae, and of the virtues that have made that desolate spot for ever sacred to us, can think of Leonidas and his little band, without any emotion of reverence, till the thought occur, how useful it must be to nations to have defenders so intrepid! Our admiration is not so tardy a calculator. It is instant in all its fervour; and, indeed, when we begin to think of the exact point in the scale of utility at which the action may be ranked, this very thought is itself a proof that our emotion has already become less vivid. The question, indeed, is one which our consciousness may decide in a moment, if we only trust to the evidence of our consciousness a sort of trust which, simple as it may seem, is no slight intellectual effort, when our consciousness is opposed to errors that are brilliant, and that have the authority of ~~any~~ great name. Our consciousness, if we appeal to it, will tell us, that to admire what is useful, and to revere what is virtuous, are feelings as different as any two feelings which are not absolutely opposite; and that, if we class them as the same, we may, with as much reason, class as the same, and reduce under a single term, our moral veneration and our sensation of fragrance, because they are both pleasing; or our admiration of what is useful, and our notion of a circle, because they are both states or feelings of the mind. Who ever looked on his conscience precisely in the same manner as he looked upon his estate; and felt not regret merely, but all the agonies of remorse, because his acres were less productive than the richer fields of his neighbour? We may respect the inventor of a machine, but we certainly do not respect the machine itself; though it is only in reference to the instruments which he invents that the inventor, as an inventor, has any utility; and, even in respecting his intellectual talents as an inventor, though he may have contributed more by this one exercise of them, to the permanent happiness of the world, than all the virtues of all the multitude that existed around him at the time, do we feel for his new and beautiful application of the physical powers, the moral emotion which we feel for the humblest of those virtues? It is enough, as I have said, to appeal to your consciousness on this point. If your reverence for virtue appear to you, as it cannot but appear to you, a feeling essentially different from

your mere admiration of what is useful; if, in short, you perceive, that no addition of useful properties to any piece of inanimate matter could so alter it, as to make it an object of moral love; that the philosopher's stone itself, if it really existed, though capable of conferring inexhaustible wealth, and eternal youth on its possessor, would yet be incapable of producing one feeling of cordial regard; that all the stores of knowledge, and all the talents of the most vigorous intellect, unless accompanied with a generous desire of the happiness of those who profit by them, cannot excite the moral emotions that are excited so readily by the humblest benevolence; then, surely you cannot hesitate for an instant, in rejecting the theory, which supposes virtue to be felt as virtue only from its utility, from that utility which may be greater or less than the usefulness of external things or of qualities of the understanding; but which, as mere utility, is precisely the same in its relation to our emotions, as the intellectual qualities of memory or judgment; or as the house which shelters us, the coat which keeps us warm, or the watch which tells us the hour and minute of the day.

The approbation which we give to actions as virtuous, then, whether we be ourselves the agents, or merely consider the actions of others, is not given to them simply as useful. Utility, in either case, is not the measure of moral approbation, the measure to which we must previously have adjusted the particular action, before any approbation of it can have arisen; and with which, in all its exact gradations, the feeling of the rank of virtue exactly corresponds.

It may be said, indeed, that it is not mere utility which excites moral approbation, but the utility only that results from the actions of living agents. This latter species of usefulness may be verbally distinguished from the other, as being that which is accompanied with esteem and approbation; and, indeed, this very distinction we find to be that which is made by Mr. Hume, the most acute defender of the theory which we have been examining; yet it is surely very evident, that the verbal distinction thus made is an abandonment of the theory, an admission that there is, in certain actions of voluntary agents, something more than utility which is morally admired by us; since, in degrees of utility, they may be strictly commensurable with other objects of thought that excite in us no such emotion. The esteem and approbation, which Mr. Hume finds it so easy to presuppose, are all which it is of much consequence, in any theory of virtue, to consider. They are in truth the very feeling of virtue itself under another name; the very feeling, therefore, which he should have shown, not to be mixed only with our

perception of utility, but to arise from it, or to be reducible to it; and if, in accounting for our moral approbation of certain actions, as distinguished from our admiration of any useful contrivance in mechanics, or any useful qualities of natural inanimate objects, or any excellence of mere intellect,—he say, that, together with our feeling of the utility of the actions, there is a feeling of esteem and approbation, which distinguishes this usefulness from every other usefulness of the same amount; he admits, in this very supposition, that there is in certain actions an approvableness which has not its source in the feeling of utility,—an approvableness which is independent, therefore, of the mere quantity of physical good produced; and that, when an action has been useful, is still necessary to convert utility itself into virtue.

It is true, indeed, as we have seen in our review of such actions, that actions which are virtuous are actions of which the general principle is useful; but they are virtuous and useful; not felt by us to be virtuous, merely because they are of a certain rank of usefulness, as innumerable objects in external nature are in like manner useful, or many valuable qualities of the understanding. The coincidence in this respect, which the Deity, who adapted our emotions to the happiness designed by him, has, from his own universal goodness established, may be compared in some measure to that pre-established harmony of which the followers of Leibnitz speak. According to that hypothesis, of which I gave you a sketch in the early part of this course, the body and mind, you will remember, have an exact correspondence of motions and feelings, but are absolutely independent of each other, even when they seem most exactly to correspond; the limbs running of themselves when the mind wishes them to run, and running *faster or slower* exactly as the mind wishes them to be more or less fleet; but having, in consequence of their own peculiar mechanism, a tendency to run so independent of the volition of that mind which longs to escape from the enemy, that, if the soul of the coward were, by a sudden miracle, to be annihilated, his legs would not run the less. Such a harmony the Deity has established of virtue and utility. That of which we approve as virtuous is, as a general mode of conduct, useful; though it is not on account of our estimate of its general useful tendency that we give it our immediate approbation. That of which we disapprove as vice, is, as a general mode of conduct, injurious to society; though it is not on that general account we regard it with instant contempt, or indignation, or horror. By this adaptation of our emotions, however, the same advantage is obtained, as if we approved of virtue

directly as useful to the world, in the same manner as we approve of any useful mechanical contrivance; while it leaves us the enjoyment of all that far greater delight, which arises from the contemplation of the moral excellence of the individual, and from the love so infinitely surpassing every preference of mere utility, which moral excellence, and moral excellence only, can excite.

It is this independent pre-established relation of virtue and utility, which, as I conceive, has rendered less apparent the error of the theory that would reduce moral approbation itself, to the perception of this mere usefulness; and the illusion has certainly been aided in a great degree, by the circumstance which I pointed out in my last lecture; the reference to the public advantage, in the enactments of laws, and the discussion of national measures of external or internal policy. These measures, to be virtuous, must indeed always have the public good in immediate view; because the legislative and executive functions of the state are either expressly or virtually trusts for this very purpose; and a neglect of the public good in those who exercise such functions has, therefore, all the guilt of a breach of trust in addition to any other partial delinquencies that may have been added to the crime. It is not very wonderful, however, that we should thus learn to extend to all particular actions, what is true of those actions of general delegated power, which are the great subjects of temporary debate; and should erroneously suppose all men in their little sphere to be swayed, when they are virtuous, by the motives which alone we recognise as giving virtue to the actions of legislators, judges, or sovereigns, those actions about which all men speak, and which furnish so much nice casuistry to the political discourse of every day.

Though it is not from calculations of general happiness, then, that we approve or disapprove in estimating the conduct of others, or our own; in many cases it will still be admitted that general happiness bears, not an indirect relation only, but a direct relation to our moral sentiments. The good of the world is not our only moral object, but it is a moral object. The sacrifices of mere personal advantage that are made to it, excite our regard; the wilful violation of it, for purposes of personal gain, would excite our scorn or detestation; but they excite these moral feelings not in any peculiar manner, as if primary and paramount. They excite them precisely in the same manner as sacrifices to parental, or filial, or conjugal affection, made without the slightest consideration of public advantage, give immediate rise to our delightful sympathies; or, as the breach of any of the domestic duties, with circum-

stances of cruelty to the individuals injured, but without any intention of injuring the community of the world, awakes a wrath or a disgust almost as instant as the very knowledge of the injury. We should have loved our parents and our friends, though public utility had never been an object of our thought; it is not quite so certain, at least it is not so manifest, that we should have loved the good of the world, if we had never known what it is to love a parent or a friend. For my own part, indeed, I do not doubt that even in this case, if our mental constitution in other respects had remained as at present, the happiness of mankind would have been an object of our desire; and that we should have felt a moral disapprobation of any one who willfully lessened that sum of general happiness for the mere pleasure of giving pain. But still the passion for universal utility is not so manifest in every individual, certainly not so vivid in every individual, as the private affections; and if we were to judge from the feelings alone, therefore, it would seem a juster theory to derive our love of the happiness of the world from our love of the friends who first surrounded us in life, than to suppose that our early essential notions of virtue and vice, in the observance or neglect of the filial or fraternal duties, are measured by a scale of general utility which has never been present to our mind; that general utility and virtue in our estimates of actions, are in truth convertible terms; and that we should have felt no wonder or dislike, even of parricide itself, if we had not previously been enamoured of public usefulness,—enamoured of that good of the universe of which the good of a parent is a small elementary part.

When the political moralist is said to correct our moral sentiments, as he unquestionably does often correct our views of particular actions, by pointing out to us general advantages or disadvantages, which flow more or less immediately from certain actions; and when he thus leads us to approve of actions of which we might otherwise have disapproved, to disapprove of actions of which otherwise we should have approved, he does not truly alter the nature of our moral feelings; he only presents new objects to our moral discrimination. From the mixture of good and evil, in the complicated results of almost every action, and from the innumerable relations which our actions bear in their results, not to the individuals alone, of whom alone we may have thought, but to others whose interest was unknown to us at the time, or unremembered in the eager precipitancy of our benevolence; we may approve at times of actions of which we disapprove at other times, not because we hate the good which we loved before, or love the evil which before we hated; but

because the action, though seemingly the same, is truly to our conception different. It is varied, to our mental view, with every nicer analysis of its results; and, in estimating the same apparent action, the new-discovered compound of good and evil which we now love, is as different from that semblance of mere evil which we before hated, as our love itself, as a present emotion, differs from our former emotion of hatred or disgust.

Reason, then, even in analyzing compound results of good and evil, and showing us the relation which actions that are truly virtuous bear to the good of the world, is not the source from which our moral sentiments flow, that have admired and loved the virtue before its political advantages were pointed out, or even suspected. The conclusion to which we are led, therefore, with respect to utility, is, that it is not the scale which is present to the mind whenever we approve or disapprove, and according to which our moral emotions are in every case exactly graduated; that though the good of the world is an object which we cannot consider, without feeling that the wish to promote it is a moral wish, it is not the only object which it is virtuous to desire, but one of many virtuous objects; and that, if we are virtuous once, in acting with this single object in view, we are virtuous a thousand times, in acting without the slightest reference to it, with regard only to the happiness or distress of individuals, which we cannot consider without a wish to preserve the happiness, or to lessen the distress,—a wish which we should have felt in like manner, though, with the exception of the individuals of whom we think at the moment, there had been no world to be benefited by our wishes and our aid, or by the aid of those who, in similar circumstances, may act as we have done.

The most important circumstance, however, with respect to the theory of utility as the essence of virtuous actions, is that which I remarked before, in entering on this discussion,—that it does not profess to account for the origin of our moral feelings, but proceeds on our susceptibility of these as an undoubted principle of the mind. Why should I love that which may be productive of benefit to all the individuals of the world, more than that which would be productive of similar benefit only to one individual? or to put a question still stronger, why should I love that which would be of advantage even to one individual, more than that which would be of injury to every being but myself? The only answer which can be given, even according to the theory which supposes all virtue to consist in utility, is, that it is impossible for me, by my very nature, not to feel approbation of that which

is generally useful; disapprobation of that which is in its general consequences hurtful. There is a moral principle—a susceptibility of moral emotion—that is a part of my constitution, with which I can as little abstain from approving or disapproving, when I hear of certain actions, as I can abstain from simply hearing the words of that voice which relates them to me.

The error which we have been considering at so much length, as to the identity of virtue and the general utility of actions,—though I must confess that it appears to me, notwithstanding the high authorities by which it has been sanctioned, an error of no slight kind, is yet an error which is not inconsistent with the most generous virtue; since, though it assert utility to be the measure of our approbation, it does not confine this utility to our own individual advantage; but gives to us, as a great object of regard, whatever can be useful to the community of mankind. It is a very different doctrine that makes the utility according to which we measure virtue, in every case our own individual advantage. To the consideration of this doctrine, which is in truth only an extension of the principles of Mandeville, allowing less to the mere love of praise, and more to our other passions,—you may remember that I was about to proceed, after treating of the system of that licentious satirist of our nature, when I suspended this progress to make you acquainted with the general doctrines of the influence of reason on moral sentiment, and of the relation of virtue and usefulness; as I conceived that my remarks on those doctrines would render more apparent to you the futility of the selfish system of morals.

Virtue, according to this system, is the mere search of pleasure. It gives up one pleasure, indeed, but it gives it up for a greater. It sacrifices a present enjoyment; but it sacrifices it only to obtain some enjoyment which, in intensity and duration, is fairly worth the sacrifice. In every instance in which it seems to pursue the good of others as good, it is its own gratification, and nothing but its own gratification, which it seeks.

To this system which, from the days of Aristippus, has, both in ancient and modern times, been presented in various forms, the remarks which I made on the system of general utility are equally applicable. We do unquestionably love our own well-being, our bodily ease, and that pleasure which is still dearer than ease; but, loving ourselves, we as unquestionably love others; and, loving them, we cannot fail to desire their happiness, since the desire may be considered as the natural consequence of the love. In such cases, the immediate object of our desire—and it is this immediate ob-

ject alone which we have theoretically to consider—is as truly the good of others, as our own good is our immediate object, when we wish for freedom from any bodily pain, or for the possession of any object which appears to us productive of positive pleasure. All of which we think, at the moment of the action, is purely benevolent; and the action, therefore, if justly designated, must itself be regarded as purely benevolent.

There is, indeed, as I remarked in a former lecture, one very simple argument by which every attempt to maintain the disinterested nature of virtue is opposed. If we will the happiness of any one, it is said, it must be agreeable to us that he should be happy, since we have willed it; it must be painful to us not to obtain our wish; and with the pleasure of the gratification before us, and the pain of failure, can we doubt that we have our own happiness in view, however zealously we may seem to others, and even perhaps to ourselves, to have in view only some addition to another's happiness? This argument, though often urged with an air of triumph, as if it were irresistible, is a quibble, and nothing more. The question is not, whether it be agreeable to act in a certain manner, and painful not to act in that manner; but whether the pleasure and the pain be the objects of our immediate contemplation in the desire? and this is not proved by the mere assertion that virtue is delightful, and that, to be restrained from the exercise of virtue, if it were possible, would be the most oppressive restraint under which a good man could be placed. There is a pleasure, in like manner, attending moderate exercise of our limbs; and to fetter our limbs, when we wish to move them, would be to inflict on us no slight disquietude. But how absurd would that sophistry seem, which should say, that, when we hasten to the relief of one who is in peril, or in sorrow, whom we feel that we have the power of relieving, we hasten because it is agreeable to us to walk; and because, if we were prevented from walking, when we wished thus to change our place, the restraint imposed on us would be very disagreeable. Yet this is the very argument, under another form, which the selfish philosophers adduce, in support of their miserable system. They forget, or are not aware, that the very objection which they thus urge, contains in itself its own confutation,—a confutation stronger than a thousand arguments.

Why is it that the pleasure is felt in the case supposed? It is because the generous desire is previously felt; and if there had been no previous generous desire, there could not be the pleasure that is afterwards felt in the gratification of the desire. Why is it, in like manner, that pain is felt, when the

desire of the happiness of others has not been gratified? It is surely because we have previously desired the happiness of others. That very delight, therefore, which is said to give occasion to the selfish wish is itself a proof, and a convincing proof, that man is not selfish; unless we invert all reasoning, and suppose that it is in every instance the effect which gives occasion to the cause, not the cause which produces the effect. The virtuous man feels delight in the sacrifices which he makes! unquestionably he does feel this delight; a delight which he would not yield for any thing but for the knowledge that his sacrifice has been of the advantage which he desired to the friend for whom it was made,—if the loss of the pleasure which he feels could have been made a part of the sacrifice. The virtuous man is happy; and if it were necessary for proving that he is not selfish, that we should show him to be miserable for having done his duty, the cause of disinterested virtue, I confess, must be given up; and, perhaps, in that case, if the attending pleasure or pain, and not the motive, is to be considered, the name of absolute disinterestedness might be appropriated to those whom we now count selfish—to him who deceives, and plunders, and oppresses, and finds no satisfaction in his accumulated frauds and villanies of every kind. Why does it seem to us absurd to say, that a wretch, who is incapable of any generous feeling, and who never acts but with a view to some direct personal enjoyment, is not to be counted selfish, because he derives no actual enjoyment from the attainment of his sordid wishes? If it be absurd to say, that, in thinking only of his own good, he is not selfish, because no happiness has attended his selfishness; it is just as absurd to say, that the virtuous man, in thinking of the good of others, is selfish, because happiness has attended the very sacrifices which he has made. The one is selfish, though not happy, because his immediate and sole motive was his own happiness; the other is disinterested though happy, because, in acting, his immediate motive was the happiness of others. The more the benevolent live for others, the more, there can be no doubt, they live for themselves; but they live for themselves in this case without thinking of themselves. Their great object is to make man happy, wherever the happiness of a single individual is in their power; and their own happiness they safely leave to him who has not forgotten the virtuous, in the distribution which he has made of enjoyment. It comes to them without their seeking it; or rather, it does not come to them; it is for ever within their heart.

Even if virtue were as selfish as it is most strangely said to be, I may observe that it would be necessary to form two divisions of

selfish actions; one of those selfish actions, in which self was the direct object, and another of those very different selfish actions, in which the selfish gratification was sought in the good of others. He who submitted to poverty, to ignominy, to death, for the sake of one who had been his friend and benefactor, would be still a very different being, and ought surely therefore, to be classed still differently, from him who robbed his friend of the scanty relics of a fortune which his credulous benevolence had before divided with him; and, not content with this additional plunder, calumniated perhaps the very kindness which had snatched him from ruin.

A self there is,
Of virtue fond, that kindles at her charms.
A self there is, as fond of every vice,
While every virtue wounds it to the heart;
Humility degrades it, Justice robs,
Blest Bounty beggars it, fair Truth betrays,
And godlike Magnanimity destroys.*

By what perversion of language is the same term to be given to affections so different? The foreigner of whom Dr. Franklin speaks, who, on seeing the tragedy of Othello, conceived that all the emotion which the actor exhibited was for the loss of a handkerchief, did indeed form a theory as just as that of many very ingenious philosophers, when they would labour to convince us, that a little personal gratification was the only object of those who, in the dreadful ages of Roman tyranny, followed their friend into exile or imprisonment; or who, after he had nobly perished, still dared to proclaim that innocence, the very assertion of which was a crime, which the tyrant, who knew only how to pardon what was atrocious, and not what was virtuous, was, by the habits which he had wrought into the dreadful constitution of his nature, incapable of forgiving.

If virtue be nothing but personal gain, what is it which we individually can hope to acquire from the virtues of others! We surely cannot hope that all the virtues of all mankind will give us more wealth than is possessed by the wealthiest individual existing; more power than is possessed by the most powerful; more vigour of body and intellect than is possessed by the healthiest and the wisest. Let us imagine, then, all these promised to us, on the condition of our admiration; let us conceive that some human demon, a Nero, a Tiberius, a Caligula, were to show to any one of us all the kingdoms of the world, and to say, "All these thou shalt have, if thou wilt but esteem me,"—would our esteem arise at all more readily? Should we feel, in that case, for the guilty offerer of so many means of happiness, a single emotion like that which we feel for the humblest virtue of one who,

* Young's Night Thoughts, Night viii.

we know, never can be of any aid to our worldly advancement? If a virtuous action be in itself nothing, except as a source of personal gain, why, in such a case as that which I have supposed, does not our heart feel its sentiments of esteem and abhorrence vary with every new accession of happiness which is promised to us? At first, indeed, we may feel a loathing for the tyrant, not because tyranny is in itself less worthy of approbation than the mildest benevolence, but because it may be more injurious to our interest. It would require no trifling equivalent; but still, as it is only a quantity of injury which is dreaded, an equivalent may be found; and, with every new bribe for our esteem, there is of course a nearer approach to this equivalent. Our abhorrence should gradually subside into slight indignation, and this into very slight dislike, and this, again, when the bribe is increased, become at length some slight emotion of approbation, which may rise, with the still increasing bribe, through all the stages of love, through esteem, respect, veneration, till we feel ultimately for the tyrant, whose power is to us a source of so much happiness, all that devotion of the heart which we so readily yield to power that is exerted for the benefit of mankind. When we labour to think of this progressive transmutation of moral sentiment, while the guilty object of it continues the same, in every respect, but as he offers a greater or less bribe for our affection, do we not feel, by the inconsistency which strikes us at every supposed stage of the progress, that affection—the pure affection which loves virtue and hates vice—is not any thing which can be bought but by that noble price, which is the virtue itself, that is honoured by us; and that to bribe us to love what is viewed by us with horror, or to hate what is viewed by us with tenderness or reverence, is an attempt as hopeless as it would be to bribe us to regard objects as purple which are yellow, or yellow which are purple? We may, indeed, agree, by a sacrifice of truth, to call that purple which we see to be yellow, as we may agree, by a still more profligate sacrifice of every noble feeling, to offer to tyranny the homage of our adulation,—to say to the murderer of Thrasea Pætus, “Thou hast done well,”—to the parricide who murdered Agrippina, “Thou hast done more than well.” As every new victim falls, we may lift our voice in still louder flattery. We may fall at the proud feet, we may beg, as a boon, the honour of kissing that bloody hand which has been lifted against the helpless; we may do more; we may bring the altar, and the sacrifice, and implore the god not to ascend too soon to heaven. This we may do, for this we have the sad remembrance, that beings of a human form and soul have

done. But this is all which we can do. We can constrain our tongue to be false; our features to bend themselves to the semblance of that passionate adoration which we wish to express; our knees to fall prostrate; but our heart we cannot constrain. There virtue must still have a voice which is not to be drowned by hymns and acclamations; there the crimes which we laud as virtues are crimes still; and he whom we have made a god is the most contemptible of mankind; if, indeed, we do not feel perhaps that we are ourselves still more contemptible. When is it, I may ask, that the virtue of any one appears to us most amiable? Is it when it seems attended with every thing that can excite the envy even of the wicked,—with wealth, with power, with all which is commonly termed good fortune; and when, if its influence on our emotions depend on the mere images of enjoyment which it suggests, these may surely be supposed to arise most readily? It is amiable, indeed, even in such circumstances; but how much more interesting is it to us, when it is loaded with afflictions from which it alone can derive happiness. It is Socrates in the prison of whom we think—Aristides in exile, and perhaps Cato, whatever comparative esteem he might have excited, would have been little more interesting in our eyes than Cæsar himself, if Cæsar had not been a successful usurper.

It is in describing the retreat and disasters to which that last defender of Roman freedom was exposed, that Lucan exclaims, with a sympathy almost of exultation,

*Hunc ego per Syrtes, Lybiaque extrema, triumphum
Ducere maluerim, quam per Capitolia curru
Scandere Pompeii, quam frangere colla Jugurthæ.**

What proof can be imagined stronger than this, that virtue and the source of personal gain are not identical phrases; since no accession of personal interest can make that a virtue which was before a vice; nor any loss of personal interest make that a vice which was before a virtue? If, in any physical science, a similar error were maintained, there is not a philosopher who would not instantly reject it. Let us conceive, for example, some one ignorant enough, or bold enough to affirm, that the gravity of bodies depends on their quantity of heat. We should think that we had nothing more to do, for showing the absurdity of such an opinion, than to try the effect of increasing and diminishing the warmth of the gravitating bodies; and, if we found the weight to remain the same during all these changes; if we found one body to be warmer than another, and yet heavier, colder than a third body and yet heavier, we should think ourselves fairly entitled to infer, that warmth

* Lib. ix. v. 598—600.

and gravity were not the same ; that a body might gravitate and be warm, as, indeed, every body which gravitates may be said to have some heat, as every substance which is warm has some weight ; but that the gravity did not depend on the warmth, and bore no measurable proportion to it. This, in external physics, we should think a sufficient demonstration. But, in morals, the sophist finds a sort of shelter in the indistinct conceptions of those to whom he addresses himself. It is proved, as indubitable, that our admiration of virtue has no measurable proportion to our feeling of personal profit which may be reaped from it ; that the profit may be increased, indefinitely, without the slightest diminution of our abhorrence of vice ; and the loss increased indefinitely without any diminution of our admiration of virtue. But, notwithstanding this demonstration, that virtue is conceived by us as something more than a mere source of personal enjoyment to us, he still asserts that they are strictly synonymous ; and renews, with as brilliant ingenuity as before, that sly logic, which would be irresistible if an epigram were an argument, and a series of epigrams a perfect demonstration.

We have seen, then, that the admiration of actions as virtuous, is not affected by calculations of loss and gain, and must, therefore, be something more than that loss or gain which, in our calculation, we perceive to be manifestly increased or diminished. There is another demonstration which seems not less irresistible. If what we admire in the virtue of others be nothing more than its tendency, more or less direct, to our individual advantage, the relations on which this tendency depends must be perceived by us before we admire ; and the discernment of these is not a simple and easy intellectual effort. The mind that is matured by long observation of society, and by profound reflection on those ties which make the action of one man a source of profit or injury to remote individuals, may, indeed, look with esteem on certain actions, and with indignation on others. Our love of virtue and hatred of vice, if they arise from such knowledge, must be in every case progressive as the knowledge itself, from infancy to old age. To relate to a child some action of cruelty, must be to speak to an indifferent heart,—to a heart which cannot have made these nice reflections, and which cannot, therefore, feel what is not to be felt without the knowledge which those reflections give. Every nursery, then, exhibits a fair field for an experiment that may be said to be decisive ; and will the selfish moralist submit his theory to the test ? Will he take upon his knee that little creature which has, perhaps, scarcely felt a pain since it entered into life, which knows only that it has a friend in every liv-

ing being that has met its eye, and which has never thought of its own misery as a thing that is possible ? Will he watch that listening countenance, every look of which is fixed on his own, as he repeats verse after verse of the ballad which describes some act of injustice and atrocious cruelty, and will he expect to see no tear in those eyes, to hear no sobbings when the misery is extreme, to discover no demonstrations of an indignant wrath, that thinks not of itself at the time, but thinks only of the oppressed whom it would gladly succour, of the oppressor on whom it would gladly inflict vengeance ? It will be well for that child if, in the corruption of the world, he retain a sympathy with the good and the wretched, and a hatred of guilt, as ardent as he feels in those years of ignorance ; if, on learning the relations of virtue to his own happiness, he love it merely as he loved it when he had never thought of the relation.

The love of virtue, then, I conclude, is different, and essentially different, from the mere love of selfish gain. It is an affection which leads us to esteem often what is directly injurious to us ; which makes it impossible for the good man not to honour in his heart, as well as in the praise which might seem forced from him, the virtues of that rival by whom he is outstripped in the competition of public dignity, which gains from the commander of an army a respect which nothing can suppress, for the valour, and all the military virtues of the commander opposed to him ; though these very virtues have disquieted him more than the vices of half a nation, though they have robbed him of repose, and, which is still worse, have robbed him of the glory, which was his great object, by bringing on the army which he has led in vain to successive fields, disaster after disaster. It is an affection which can find objects in lands the most remote ; which makes us feel delight in the good qualities of those who lived in ages of which the remembrances of their virtues are the only relics ; and which preserves to our indignation and abhorrence, the crimes of those whom the tomb itself, already in ruins, has rendered powerless to injure us. It is an affection which is itself the truest prosperity of him who feels it ; and which, when the virtuous man does truly seem to suffer what the world calls adversity, endears to him in his very afflictions, still more, that virtue, without which he might have been what the world terms prosperous.

LECTURE LXXIX.

EXAMINATION OF THE SELFISH SYSTEM AND ITS MODIFICATIONS CONTINUED.

A GREAT part of my last Lecture, Gentlemen, was employed in considering that theory

of morals which would represent all the feelings that appear to us most disinterested, as only the results of selfish calculation; the generous sacrifices of friendship as the barter of some good which we value less for a good which we value more, without any regard to the happiness of those whom it is our policy to distinguish by the flattering term of friends, but who are merely the purchasers and sellers of the different wares of wealth, or power, or honour, or sensual pleasures, which it is our trade, as human beings, to sell and buy. In that wretched exhibition which is made to us of the social intercourse of the world, the friendship of any one, as implying, in every instance, some stratagem or invention of deceit on his part, is, therefore, in every instance, to be dreaded and shunned far more than absolute indifference, or even perhaps than avowed enmity. Nor is it only common friendship which this system would represent as the simulation, and nothing more than the simulation of the generous feelings that are professed. The virtues which gather us under the domestic roof in delightful confidence of affection, of which we never question the sincerity in others, because we feel it to be sincere in ourselves, when it prompts in us the kindnesses which we delight to receive, because we have known the delight of conferring them; these gentle virtues, which almost consecrate to us our home,—as if, in the midst of that wide scene in which the anxieties and vices of the world may rage, it were some divine and sacred place, which distrust and fear cannot enter,—would be driven, by this cold and miserable sophistry, from the roof under which they delighted to repose,—if human folly could prevail over an influence so celestial, and if man could, indeed, become that wretched thing which he would so laboriously represent himself to be. In the tenderness of connubial love, which years of affection have only rendered more vivid, how many are there who, in their chief wishes of happiness, scarcely think of themselves; or, at least, think of themselves far less as objects of exclusive interest, than as beings whose happiness is necessary to the enjoyment of those whom they delight to render happy! This seeming devotion, we are told, may indeed be a selfishness a little more refined; but it is not less the growth or development of absolute and exclusive self-regard. It is a selfishness which sees and seeks its own individual good at a little greater distance; but, since it is its own individual good which alone, at whatever distance, it is incessantly wishing to see, and as incessantly labouring to obtain, it is still selfishness, as much when it pursues the distant as when it grasps the near;—a selfishness to which the happiness of those who appear to be loved, is as the

mere happiness of another,—if we analyze our desires with sufficient subtlety,—far more uninteresting than the acquisition of the idlest gewgaw which vanity, with all its covetous eagerness, would scarcely stoop to add to its stores.

The fallacy of this system, as I endeavoured to show you, arises chiefly from the pleasure which truly attends our virtuous affections, but which, though universally attending them, it seems to require no very great nicety of discrimination to distinguish, as their consequence, not their cause. We have pleasure, indeed, in conferring a kindness; but it is because we confer the kindness, and have had the previous desire of conferring it, that we feel this pleasure of being kind; not because we feel this pleasure, that we confer the kindness; and if we had never been beneficent, we should as little have known the delight of beneficence, as we should have known what external beauty is, without the previous perception of the forms and colours of the objects which we term beautiful. It would, indeed, have been as just a theory of the primary sensations of vision, to say, that it is because we have a pleasing emotion in beholding the proportions and colours of certain forms, we see those forms and colours which excite in us the pleasing emotion, as, of our moral approbation or disapprobation, to say, that it is because we have pleasure in the performance and contemplation of virtuous actions, and pain in the contemplation and performance of vicious actions, we perceive that very virtue and vice, and form those very desires, virtuous or vicious, to which, as previously existing, we owe the pleasure and the pain that have resulted from them, not produced them, and that cannot even be conceived as pleasure and pain, without necessarily presupposing them. In acting virtuously, we do what it is pleasant to do; but it is not on account of the pleasure that we perform the action, which it is delightful for us to do, and almost as delightful to us to have done. Indeed, to destroy our pleasure altogether, nothing more would be necessary, than to impress us with the belief, that the actions were performed by us, with no other view than to the selfish gratification which we might feel in thinking of them; and with a total carelessness as to the happiness of those to whose welfare the world conceived us to be making a generous sacrifice. If conformity to selfish gain were all which constitutes virtue, why should our pleasure in this case cease? It ceases for the best of all reasons, that it arises from virtue, and can arise only from virtue; and that in such a case, as there would no longer be any virtue; there would, therefore, no longer be any thing to be contemplated with satisfaction. Such is that gross and revolting system which would

represent all the seeming moral excellences of the world,—every generous exertion, every magnanimous forbearance,—as one universal deceit,—one constant unwearied search of personal good, in which not a single wish ever wanders beyond that personal enjoyment of the individual.

There is another form in which the selfish system may be presented to us, less unjust to our nature than that which we have been considering. It may be said, that we now do truly wish for the happiness of others, without any regard to our own immediate interest; but that we have become thus disinterested, by the very influence of selfishness, only because our own interest has formerly been felt to be connected with the interest of others; diminishing and increasing with theirs in so many instances, that the love which was originally confined, and confined in the strictest sense of exclusion to ourselves, is now diffused in some measure to them, as if almost parts of ourselves; that we have learned to value their happiness, however, only on account of the relation which it has been found to bear to ours; but for which relation, as evolved to us more and more distinctly in the whole progress of social life, we should be absolutely incapable of a single wish for their happiness, of a single wish for their freedom from the severest agony, even when their agony was beneath our very view, and could be suspended by our utterance of a single word of command to him who waited in dreadful misery on the rack or on the stake; or at least, if, in such circumstances, we could have wished any relief to their torture, it must have been merely to free our ears from the noise of groans or shrieks, that, like any other noise, might be a little too loud to be agreeable to us. According to this system, the happiness of others is loved as representative of our own, in the same way as any object with which our own pleasure has been associated, becomes itself an object of pleasure to us. Our virtues, therefore, arising in every case from the discovery of some relation which the happiness of others bears to our own physical happiness, are not so much the causes of enjoyment, as the results of it; they depend, then, on circumstances that are accidental, varying as the accidental relations to our pleasure vary; and, if they seem to us to have any uniformity, it is only because the circumstances of pleasure, on which they depend, may be regarded as nearly uniform in all the nations of the earth. Everywhere the parent, the wife, the child, must have been useful to the son, the husband, the father; everywhere, therefore, these relations, as productive of happiness, or protection, or comfort, in some degree, are relations of love; and everywhere, in consequence of this factitious love, there are

corresponding factitious feelings of duty, filial, connubial, parental.

This modification of the selfish system, as distinguished from the former, has at least the comparative merit of not being in absolute opposition to almost every feeling of our nature; and since it allows us to be at present disinterested, and refers us for the period of absolute moral indifference, to a time, antecedent to that which our remembrance can reach, it is not so easy to expose its falsehood, as to expose the gross and obvious falsehood of the system which ascribes to us one lasting selfishness,—a selfishness so unremitting as to be, not for the first years of our life only, but in infancy, in youth, in mature manhood, in the last sordid wishes of a long age of sordid wishes, absolutely incompatible with any affection that is directly and purely benevolent. But though it may be less easy to show the inaccuracy of the view of the great principles of our moral nature, which such a modification of the doctrine of general selfishness presents, the view, which even this modification of the doctrine presents, is false to the noble principles of a nature that, even in the sophist himself, is far nobler than that which his degrading sophistries would represent him as possessing. There are feelings of moral approbation, independent of all views of personal interest. The happiness of others is to us more than the representation of our own; and the way in which it contributes most powerfully to our own, is by the generous disinterested wishes which it has previously excited in our breast.

I trust it is superfluous for me to say, that, in contending for the independence and originality of our moral feelings, I do not contend that we are capable of these feelings at a period at which we are incapable of forming any conception of the nature and consequences of actions; that, for example, we must feel instant gratitude, to our mother or our nurse, for the first sustenance or first cares, which we receive, before we are conscious of any thing but of our momentary pleasure or pain; and, far from knowing the existence of those kind hearts which watch over us, scarcely know that we have ourselves an existence which is capable of being prolonged. This blind virtue, it would indeed be manifestly absurd to suppose; but this no philosopher has maintained. All which a defender of original tendencies to the emotions that are distinctive of virtue and vice, can be supposed to assert, is, that when we are capable of understanding the consequences of actions, we then have those feelings of moral approbation or disapprobation, which, in their various relations to time, as present, past, or future, I suppose to constitute our moral notions of virtue, merit, obligation. It then becomes impossible for

us not to feel, that in giving pain, for the mere pleasure of giving pain, to one whose delight it has been to contribute to our happiness, we should do that which we could not contemplate without a feeling of self-reproach,—as we should have an opposite feeling of self-approbation, in every sacrifice which we might make of our own convenience, to the happiness or the comfort of a person, to whom our mutual services were so justly due. An action, I have already frequently repeated, is, as a moral object, not the mere production of good or evil, but the intentional production of good or evil. It has no moral meaning whatever, but as it is significant of the frame of mind of the agent himself, willing and producing a particular result; and where the frame of mind of the agent cannot be supposed to be known, or even guessed, it is not to be supposed that any moral feeling should arise, whatever susceptibility the mind may possess of being affected with certain moral emotions, by the contemplation of certain frames of mind of the voluntary producers of good or evil. There is a knowledge then of intention on which our moral sentiments unquestionably depend; but it is only on this knowledge they do depend; and it would be as absurd to refuse to them the appellation of original feelings, on this account, as it would be to refuse to the mind any original susceptibility of the sensations of vision, because there can be no vision till a luminous object be present, nor even then any distinct perception till we have opened our eyelids.

There was, indeed, a period at which we had no moral feelings, as there was a period at which we had no sensations of colour; but though we had not the actual feelings, from the absence of the circumstances which are necessary for producing them, we could as little be said to be blind to morality in the one case, as blind to all the splendour and beauty of light in the other.

To return, however, to that form of the selfish system of morals, which is under our review, I may remark, in the first place, that, as this theory of our affections admits them to be at present disinterested, and refers us for the period of exclusive self-regard, to a time of which the consciousness is absolutely lost to our memory, it would not be entitled to the praise of certainty, even though no objection could be urged against it. It would still be only an hypothesis,—and an hypothesis which, even by the confession of those who maintain it, supposes a state of our feelings absolutely opposite to that which they have continued to display, during all that long period of our consciousness which we are capable of remembering. It is an hypothesis, all the burthen of the proof of which must rest with the assertors of it,—an hypothesis which, even though it were just,

it would be impossible to verify,—and an hypothesis which affirms the mind to have been, with respect to the very feelings that are attempted to be explained by it, the reverse of what is at present. But is there no other objection which can be made to this system, than that it is an hypothesis only, which may, if we consent to admit it without proof, be made to tally with the phenomena; but which the phenomena themselves do not at least very obviously appear to warrant us to frame? There is still another very important inquiry: Does it correspond, even as an hypothesis, with the moral appearances, which it is invented to illustrate?

We have moral affections, it is allowed, at present which are disinterested; but they have become so, it is said, in consequence of the association of our own past pleasures with their objects; and our experience that the safety, and in some measure the comfort of others,—for whom, on their own account, we should be perfectly indifferent whether they be in health or disease, joy, or misery,—are necessary to enable them to contribute most effectually to our happiness. We at last seek their happiness for their sake, because we have been accustomed to seek it for our own; and the wilful violations of their pleasure or ease, which were regarded by us at first as inexpedient, because they might be hurtful to ourselves, are at last regarded by us as immoral, when we have been so perfectly selfish, for a sufficient length of time, as to cease to be selfish, from the very force of our habits of selfishness.

In opposition to this hypothesis, I need not repeat arguments which have been already urged by me against other false views of our moral nature; and which, as not less applicable to this view of it, I flatter myself that you will have no difficulty in remembering and applying for yourselves. The nursery, to which I referred in my last lecture as the scene of an experiment that might be considered as decisive with respect to the theory of universal selfishness, would be equally valuable for a similar experiment in the present instance, as to that selfishness, which, though not universal during the whole course of life, is said to be universal at least during childhood. Such an experiment, indeed, would be still more valuable in the present instance, as allowing us the nearest approach which we can make to the time at which the mysterious transmutation of selfishness into disinterested affection is supposed to begin to take place. If all actions which do not immediately affect our own means of physical well-being be originally indifferent to us, and if we learn only by the relations of certain actions to this physical well-being, to regard one species of conduct as virtuous, and another species of conduct as vicious, the child, whose never-failing en-

joyments have seemed to him to form a regular part of the day, almost like the hours which compose it, who expects to find to-morrow what he found yesterday, and who as little thinks that he is indebted to any one for the regular food which gratifies his appetite, or the garments which keep him warm, or the little couch on which he lies down, happy to awake happy next morning, as he thinks that he is indebted to any one of those around him for the sunny radiance which shines on him, or for the air which he breathes without knowing that he is breathing it; while he lives among smiles and caresses, and regards even these, not as marks of indulgence, but only as proofs of the mere presence of those whose very countenance is love. The little reasoner on his own comforts, and disregarder of all comforts but his own, may indeed be beginning to form the inductions which are to terminate in the belief, that the happiness of others may be instrumental to his happiness; and that the universe would suffer, and consequently himself, as a part of the universe, be in danger of suffering by the spreading and multiplying relations of guilt to guilt, if an instance of rapacity or cruelty were to occur in some obscure cottage in a distant kingdom. But though he may be beginning to make this philosophic analysis and generalization of the remote relations of things, by which crimes perpetrated in the most remote part of the world, and of a kind from which he has never suffered, may be conceived by him to have ultimately some relation to his own selfish enjoyment, he is surely only beginning to make them. His selfishness is not of sufficient growth to have ceased to be selfish; and his morality, therefore, if morality be the result of fine inductions, which show the good of others to be in some measure representative of our own, cannot have begun to be developed. When he quits his sport, therefore, to listen to the tale which his nurse has promised him, suspending not this particular exercise only, but the very activity that would be every moment urging him to new exercise, as he remains fixed at her knee in a state of quiet of every limb, that, but for the delightful horrors which he hears and expects to hear, would be too powerful to be borne; if there be no disinterested affection then, or at least only the faint dawning of such affections, the tale which is related to him, however full it may be of injustice and cruelty, cannot have any powerful influence on his feelings. His love of novelty, indeed, may be gratified by the adventures of the generous warrior, who, at the peril of his own life, attacked the castle of the giant, and opened at last, to give liberty to a hundred trembling prisoners, those dungeon gates which had never before been opened but to fling some new wretch to the

living heap of wretchedness, or out of the heap already gathered, to select some one for torture and death. He may listen to such a marvellous tale as he would listen to any thing else that is equally marvellous; but it is only as marvellous that he can be supposed to listen to it. There is no generous interest in virtue to be gratified in his little heart, because, in his state of secure and tranquil enjoyment, he has had too little experience of the relations of things to know that vice and virtue have that great difference—their only difference—which consists in their likelihood of being of greater or less advantage or disadvantage to him. In hearing of the deliverance of the good, and of the punishment of the wicked, he should have no thought but of the wonderful things which he is to hear next. In short, according to the system which would represent all virtue to be of selfish growth, he should be that cold and indifferent creature which no nursery has ever seen; and which, if every nursery saw in those who are to furnish the mature population of other years, the earth would soon be an unpeopled waste, or, at best, a prison-house of the rapacious and the cruel.

If, without having heard of any hypotheses on the subject, we were told that there is a period of the life of man in which a tale of cruelty may be related to him, and understood without exciting any emotion, and in which the intentional producer of misery, who produces it in the mere wantonness of power, only that he may have the delight of thinking that he has produced it, and the mild and unrepining sufferer whom he has made his victim, are regarded with equal indifference, is it to his early years that we all should look in making our reference? or, rather, is there not reason to think, that, at least an equal number of the estimators of different ages would look to years, when, if generous affections were the result of experience, and grew more purely disinterested, as the experience of the relations of things extended over a larger portion of life, there could not be one sordid and selfish wish remaining with its ancient dominion in the heart?

But, omitting every objection that may be drawn from the appearances of lively moral feeling, at a time when, according to the hypothesis of original insensibility to every distinction of virtue and vice, there could be no moral feeling of any kind, what, I may ask, is the nature of the change which is supposed to take place in this purification of selfish desires, and are the circumstances assigned as the cause of the purification sufficient to produce it? We are absolutely regardless of the happiness or misery of others; and the actions that would lead to their happiness or misery seem to us to have those different

physical tendencies, but are regarded by us only as physically different. Such is said to be the state of the mind at one period. Afterwards we learn to look on others with regard, in consequence of the pleasure which has flowed from them, or attended their presence; and not to look on them with disinterested regard only, and to wish their happiness, but, which is a much more important circumstance, to feel that the neglect or violation of their happiness would be attended with feelings of self-reproach on our part, essentially different from mere regret. The explanation proposed might, perhaps, be thought to account for the affection which we acquire for persons as well as for things that were previously indifferent to us; and even for our wish to add to the happiness of those whom we love, since there scarcely can be affection without such a wish. But the sense of duty is something more than this consciousness of mere affection and of kind wishes. When we have failed to act in conformity with it, we have not a mere feeling of misfortune, as when we have failed in any wish, the success of which did not depend on ourselves; but a moral feeling of self-disapprobation, for which the growth of mere affection, and of all the wishes to which affection can give rise, is insufficient to account. Here, then, is the important transition which should be explained, that by which we pass from love that is factitious, to a feeling of duty that is factitious. It is this feeling of moral approbation or disapprobation,—the difference of common regret from remorse,—of common joy from the delightful complacencies of virtue,—which is the real subject in controversy; and this feeling the selfish system, even in that best modification of it which we are considering, leaves wholly unexplained. It asserts us to be selfish, but it does not show, nor even profess to show, how we are thus selfish with notions of morality.

It must never be forgotten, in estimating any theory of morals, that it is not a mere quantity of pleasure or pain, love or dislike, for which the theorist has to account; but an order of moral notions, pleasant, indeed, in certain references to ourselves or others, painful in certain other references, yet essentially distinct from any varieties of mere physical delight or uneasiness. It is not the joy of a prosperous man for which he has to give a reason, but the complacency of a good conscience; not the regret of one who has formed wishes of dignified station or wealth that are ungratified, but the remorse of one who has formed guilty wishes, and whose chief misery, perhaps, arises from the gratification of the very wishes which he had formed. It is not the mere wish of contributing to the happiness of those whom we love, but the feeling of obligation to con-

tribute to their happiness,—and often even to contribute to the happiness of individuals for whom we feel no peculiar tenderness of regard. For these peculiar feelings, however, for all that can strictly be said to be moral in love, or even in morality itself, the assertors of the selfish system do not think it necessary to assign any reason, though it is of these only that any explanation is required: and yet they speak of their system as if it were a theory, not of mere pleasure or pain, love or dislike, but of all the phenomena of moral sentiment. They think that they have shown enough, if they have shown how we may love our friends that live around us as we love our house or our estate; and if they can account for this mere affection, they take for granted that our feelings of duty, virtue, obligation, and all the moral feelings of conscience follow of course.

Even with respect to mere affection, unimportant as this is, in a theory of morals, when considered as mere affection, exclusively of all feeling of duty or moral approbation,—the cause assigned for the production and extension of this regard is far from being shown to be adequate. It is a cause which connects us only with a few individuals, and which is yet adduced as explanatory of feelings that are extended in vivid diffusion to all mankind. The associating principle is the cause to which we are directed,—that principle, which, in a former part of the course, we found to be capable of attaching a very high interest to objects that might be considered as in themselves almost indifferent,—a snuff-box, a cane, or any other inanimate thing, which had long been our companion. But though this sort of companionship may render our own cane important to us, as if it were a symbol of our happiness, like the white wands and gold sticks that are symbols of the dignity of office, this love of our own cane does not render every other walking-stick, which we may see in a shop, or in the hands of others, of much greater value, in our conception, than if we had been in the habit of walking without any support. If then it be, as is asserted, precisely in the same manner, that we acquire our affection for the living beings around us,—who, otherwise, would have been as indifferent to our regard, as it is possible for a snuff-box or a cane to be,—why is not the effect confined, or nearly confined, to those immediately around us, with whom the associations of pleasure have been formed? Beyond the circle to which the magic of association spreads, every thing should be as before, or at least very nearly as before. For the stranger, whom we have never seen, in the same manner as for the snuff-box of another, we should retain feelings that scarcely pass beyond indifference; and should

as little look with affection on all mankind, in consequence of the pleasure which has attended our intimacy with a few—if affection be in itself foreign to our nature, and the result of factitious circumstances,—as we should look with a covetous eye on every walking-stick, because we should feel sorrow, far beyond its intrinsic worth, on the loss of our own. If, indeed, man be naturally more precious to our affection than the paltry baubles of a toyshop, we may suppose, in his case, a more extensive diffusion of every feeling of regard. But to ascribe to man any original title to our love, independent of the use which we may learn to derive from him, as from a machine that may be instrumental to our convenience, would be to abandon the very principle on which the whole strange system of moral selfishness is founded.

Even as a theory, then, of mere affection, the selfish theory is inadequate. But however widely affection may be supposed to be spread, in consequence of the association and ready suggestion of pleasures received from a few individuals only—though it were admitted, that, by the remembrance of these, we might be led to love all the individuals of mankind, and loving them, to wish their happiness, it must still be remembered, that the only influence of affection, as mere affection, is to render the happiness of others desirable, like the attainment of any other object of desire. Instead of wishing merely the gratification of our sensual appetites, of our intellectual curiosity, of our ambition, we have now other wishes to mingle with these that relate to the happiness of others; and we may regret that the happiness of others has not been produced by certain actions, in the same way as we may regret that we have not attained the objects of any of our other wishes,—that we are not the possessors of a fortunate ticket in the lottery, or have not had the majority of votes in an election to some office of honour or emolument. But joy and regret are all which we can feel, even in love itself; and obligation, virtue, merit, the self-complacency or remorse of conscience, are as little explained by the growth of mere love and hatred, as if every object of these affections had remained indifferent to us.

We have considered, then, the selfish system in two aspects: first, as it represents mankind as universally, in every hour and minute of their waking existence, intent on one sole object, their own convenience, incapable of feeling any disinterested affection for another; and therefore, when appearing to wish the happiness of a father, or wife, or son, or friend, wishing at heart only their own. We have afterwards considered that less sordid modification of the system, which supposes us, indeed, to have been originally as selfish

as the other represents us to be for the whole course of our life; but which does a little more justice to the feelings of our maturer years, by admitting that we become susceptible of affections that prompt us to act, even when our own convenience is not the immediate object before our eyes; and in our examination of both forms of the doctrine, we have seen how incapable it is of explaining those notions of obligation, virtue, merit, that constitute the moral phenomena, which a theory that professes to be a theory of morals, ought as little to omit, as a theory of light to omit all notice of the radiant fluid, the properties of which it professes to examine, while it confines its attention to the forms of the mirrors or lenses which variously reflect or transmit it.

After these two lights, in which the system commonly distinguished by the name of the Selfish System of morals has been considered by us, there remains still one other light, in which it is to be viewed; that in which the obligation of virtue is supposed to consist merely in an exclusive regard to our own individual eternity of happiness in another life; and virtue itself to consist in obedience to the will of the Supreme Being; not on account of the moral excellence of that Supreme Being, or of his bounty to us, which might seem of itself to demand compliances, that are the only possible expressions of the gratitude of dependent creatures, to him from whom their power as well as their happiness is derived, but without any such views of reverence or gratitude, at least without any such views as are in the slightest degree necessary to the virtue of their motives, merely on account of the power which the Ruler of the universe possesses, to give or withhold the happiness which is our only object. This form of the selfish system, which has been embraced by many theological writers of undoubted piety and purity, is notwithstanding, I cannot but think, as degrading to the human character, as any other form of the doctrine of absolute selfishness; or rather, it is in itself the most degrading of all the forms which the selfish system can assume; because, while the selfishness which it maintains is as absolute and unremitting, as if the objects of personal gain were to be found in the wealth or honours or sensual pleasures of this earth; this very selfishness is rendered more offensive, by the noble image of the Deity which is continually presented to our mind, and presented in all his benevolence, not to be loved, but to be courted with a mockery of affection. The sensualist of the common system of selfishness, who never thinks of any higher object in the pursuit of the little pleasures which he is miserable enough to regard as happiness, seems to me, even in the brutal stupidity in which he is sunk, a

being more worthy of esteem than the selfish of another life; to whose view God is ever present, but who view him always only to feel constantly in their heart, that in loving him who has been the dispenser of all the blessings which they have enjoyed, and who has revealed himself in the glorious character of the diffuser of an immortality of happiness, they love not the giver himself, but only the gifts which they have received, or the gifts that are promised. Yet, such is the influence of the mere admission of the being of a God, and of the images of holiness and delight which that divine name is sufficient to suggest, that while the common system of the universal selfishness of virtue has been received by the virtuous themselves, with an indignant horror, that was itself almost a confutation of the system, the equally universal selfishness of the doctrine of these theological moralists has been received, not merely without any emotion of disgust, but with the approbation and assent of no small portion of those who, in opposition to the very doctrine which they have embraced, are truly in their hearts disinterested lovers of man, and equally disinterested lovers and worshippers of God.

The doctrine of the absolute selfishness of our homage to God, and of our social virtues, considered as the mere conformity of our wills to the command of him who is the dispenser of eternal happiness and eternal misery, for the sole reason of his power of thus dispensing happiness or misery, and not on account of his own transcendent excellence, that of itself might seem to demand such a conformity, is a doctrine of very old date. But the writer who in modern times has led to the widest diffusion of this doctrine, is Archdeacon Paley, the most popular of all our ethical writers; and one of the most judicious in the mere details of ethics, however false and dangerous I consider his leading doctrines to be. Virtue, he defines to be, "the doing good to mankind, in obedience to the will of God, and for the sake of everlasting happiness."* The last part of the definition is the most important part of the whole; for, the knowledge of this everlasting happiness he supposes to be all which constitutes moral obligation; meaning by obligation, not any feeling of moral love, but the influence of happiness as an object of physical desire, and of pain as an object of physical aversion; one or other of which is to follow our obedience or disobedience to the command of the Power who is the supreme dispenser of both. The will of God is our rule, he says, but "private happiness is our motive," and therefore our obligation. In short, the inducement or temptation to be

virtuous, which is all that constitutes our obligation to be virtuous, is precisely of the same kind with the inducements or temptations to vice, which may be said in like manner to constitute an obligation to be vicious. The only difference is, that a good man—that is to say, a person whom we distinguish by the flattering title of good—is more prudent than those whom we have chosen to denominate wicked. Both act from an obligation which may be said to be moral in one case as much as in the other; since in neither is disinterestedness of affection necessary to virtue; and in both there is that desire of pleasure which is sufficient to constitute an inducement, and therefore, in his acceptance of the word, which he regards as synonymous with inducement, an obligation.

That we have a moral sentiment of obligation, virtue, merit, which is very different from the mere inducements of pleasure near or remote, I surely need not attempt to demonstrate to you, after the remarks already made on the selfish system in general. The doctrine of Paley differs, as you perceive, from the general selfish system, only by the peculiar importance which it very justly gives to everlasting happiness and misery, when compared with the brief pains or pleasures of this life. In the scale of selfish gain, it is a greater quantity of physical enjoyment which it has in view. It is a sager selfishness, but it is not less absolute selfishness which it maintains; and it is therefore subject to all the objections which I urged before at great length, and which it would now therefore be idle to repeat.

One great answer obviously presents itself to all those selfish systems which convert the whole of virtue into prudence; and make the differences of virtue and vice in every respect precisely the same in kind, as those of speculators in the market of commerce, who have employed their capital more or less advantageously, in the different bargains that have been offered to them. All those systems are, of course, intended to be faithful pictures of our feelings. The virtue which they profess to explain is the virtue which we feel; and if we felt no moral approbation of certain actions, no moral disapprobation of certain other actions, it would be manifestly absurd to speak of virtue or of vice. It is to our consciousness, then, that we must look for determining the fidelity of the picture; and what features does our consciousness exhibit? If two individuals were to expose themselves to the same peril, for the same common friend,—and if we could be made to understand, that the one had no other motive for this apparently generous exposure, than the wish of securing a certain amount of happiness to himself, at some time, either near or remote—on earth, or after he has quitted earth; the other no mo-

* Moral and Political Philosophy, book i. chap. vii.

tive but that of saving a life which was dearer to him than his own ; in which case would our feeling of moral approbation more strongly arise ? Is it the more selfish of the two whom alone we should consider as the moral hero ; or rather, is it not only in thinking of him who forgot every thing but the call of friendship, and the disinterested feeling of duty which prompted him to obey the call, that we should feel any moral approbation whatever ? It is precisely in proportion as selfish happiness is absent from the mind of the agent, or is supposed to be absent from it, in any sacrifice which is made for another, that the moral admiration arises ; and what then can we think of a theory of this very moral admiration, which asserts it to arise only when it does not arise, and not to arise only when it does arise ? We should not hesitate long in rejecting a theory of fluidity which should ascribe congelation to an increase of heat, and liquefaction to a diminution of it ; and as little ought we to hesitate in rejecting a theory of virtue that supposes the moral approbation which gives birth to our very notion of virtue, to arise only when the immediate motive of the agent has been the view of his own happiness in this or any other world ; and to be precluded, therefore, by the very generosity of the agent, in every case in which he thought only of the happiness of others which he could increase, of the misery of others which he could relieve.

That part of the system of Dr. Paley, then, which makes the sole motive to virtue the happiness of the agent himself, is false as a picture of the feelings of moral approbation and disapprobation for which it professes to account. The other part of his system of virtue, however, which resolves it into conformity to the will of God, as obeyed from this motive of personal gain, may merit a little fuller investigation.

LECTURE LXXX.

EXAMINATION OF THE SELFISH SYSTEM CONCLUDED ; EXAMINATION OF DR. SMITH'S SYSTEM.

GENTLEMEN, in the close of my last Lecture, after examining different modifications of the selfish system, I proceeded to consider one form of it which has not usually been ranked with the others, but which is not less absolutely selfish ; since it supposes the sole motive to virtue to be the view of our own personal advantage ; the only difference being, that instead of fixing its desires on the quantity of pleasure which can be enjoyed in this life, it extends them to the greater quantity of pleasure which may be enjoyed by us in

the everlasting life that awaits us ; having still, however, no other motive than the desire of this personal enjoyment, and the corresponding fear of pain, in the actions which may seem, but only seem, to arise from a disinterested love of God, or a disinterested love of those whom God has committed to our affection.

The greater or less quantity of pleasure, however, which is coveted by us, either in intensity or duration, does not alter the nature of the principle which covets it ; if the perception of the means of gratifying our own individual appetite for enjoyment, whether the pleasure be great or slight, near or remote, brief or everlasting, be all which constitutes what is in that case strangely termed moral obligation : and the system of Paley, therefore, to which I particularly alluded,—a system which defines virtue to be “the doing good to mankind, in obedience to the will of God, for the sake of everlasting happiness,” and which makes, not the love of God, nor the love of mankind, but this love of everlasting happiness the motive and sole obligation to the good which otherwise we should have had as little moral desire of producing or promoting, as of producing an equal or greater amount of evil, must be allowed to be, in its very essence, as truly selfish, as if it had defined virtue to be the pursuit of mere wealth, or fame, or of the brief dignities, or still briefer pleasures of this mortal existence.

“There is always understood to be a difference between an act of prudence and an act of duty. Thus, if I distrusted a man who owed me money, I should reckon it an act of prudence to get another bound with him ; but I should hardly call it an act of duty. On the other hand, it would be thought a very unusual and loose kind of language to say, that, as I had made such a promise, it was prudent to perform it ; or that, as my friend, when he went abroad, placed a box of jewels in my hands, it would be prudent in me to preserve it for him till he returned.”*

If the most prudent labourer after his own selfish interest, without the slightest regard for the happiness of others, unless as that happiness may be instrumental to his own, be constantly actuated by the same moral motive which influences the most generous lovers of mankind, how strange an illusion is all moral sentiment, which views with such different feelings objects that are in every moral respect precisely the same. But it is, in our emotions alone that our notions of morality have their rise : and how illusive, therefore, and radically false I should rather say, must be that system which is founded on

* Paley's Moral Philosophy, book ii. chapter iii.

the absolute similarity of feelings that are recognised by every bosom as absolutely dissimilar.

Though, I trust then, it is sufficiently evident to you, from the results of the long discussion in which we have been engaged, that the moral obligation to virtue is not, as Paley says, the mere inducement of pleasure held out to us by power which we cannot disobey, without losing the pleasure, and encountering pain, but an inducement of a nobler kind, since pleasure, though it may lead us to be virtuous, may surely, as mere pleasure, if there be no essential distinction of it, as pure or impure, right or wrong, often lead us into what we are at present accustomed to denominate vice; and though I shall therefore not repeat, in application to this enlarged selfishness, which extends its interested view through immortality, the objections previously urged against that more limited selfishness which looks only to the surface of the earth, and to the few years in which we are to be moving along it, it may be of importance to make a few remarks on that other part of the doctrine of this celebrated moralist, which makes conformity to the will of God the rule of virtue.

That virtuous actions—those actions which excite in us the feeling of moral approval, are conformable to the will of God, there can be no reason to doubt; since the very universality of this approval may be regarded as a sort of expression of the divine approbation. As little can we doubt that when the declared will of God is present to our mind, and we think of certain actions as commanded by him, of certain other actions, as prohibited by him, and when, in designing or meditating any action, we feel that it is one of those which he has prohibited, there would arise in our mind an instant feeling of disapprobation, that is to say, of vice or demerit, in the performance of the prohibited action. But the question is not, whether it be virtue to conform our will to that of the Deity, when that will is revealed to us, or clearly implied; for of this there can be no doubt. It is, whether there be not in our nature a principle of moral approbation, from which our feelings of obligation, virtue, merit, flow; and which operates, not independently of the divine will indeed, for it was the divine will which implanted in us this very principle; but without the necessary consideration, at the time, of the expression of the divine will, and consequently without any intentional conformity to it or disobedience, or which in our obedience itself, as often as we think of the divine will, is the very principle by which we feel the duty of such conformity. The mother, though she should, at the moment, forget altogether that there is a God in nature, would still turn with moral horror from the thought of murdering the little prattler

who is sporting at her knee, and who is not more beautiful to her eye by external charms and graces, than beautiful to her heart by the thousand tendernesses which every day and almost every hour is developing; while the child, who perhaps has scarcely heard that there is a God, or who at least is ignorant of any will of God, in conformity with which virtue consists, is still in his very ignorance developing those moral feelings which are supposed to be inconsistent with such ignorance, and would not have the same feeling of complacency in repaying the parental caresses with acts of intentional injury, as when he repays them with expressions of reciprocal love. Of all the mothers who, at this moment, on the earth, are exercised, and virtuously exercised, in maternal duties, around the cradles of their infants, there is perhaps not one who is thinking that God has commanded her to love her offspring, and to perform for them the many offices of love that are necessary for preserving the lives which are so dear to her. The expression of the divine will, indeed, not merely gives us new and nobler duties to perform; it gives a new and nobler delight also to the very duties which our nature prompts, but still there are duties which our nature prompts, and the violation of which is felt as moral wrong, even when God is known and worshipped only as a demon of power, still less benevolent than the very barbarians who howl around his altar in their savage sacrifice.

But for the principle of moral approbation which the divine being has fixed in our nature, the expression of his will would itself have no moral power, whatever physical pain or pleasure it might hold out to our prudent choice. It may be asked, why should we obey the divine command, with as much reason as it may be asked, why should we love our parents or our country? and our only answer to both questions, as far as morality can be said to be concerned, or any feeling different from that of a mere calculation of physical loss or gain, is, that such is our nature; that, in considering the command of God, our greatest of benefactors, or in considering the happiness of our parents, our country, mankind, which it is in our power to promote, we feel that to act in conformity with these, will be followed by our moral approbation; as to act in opposition to them will be followed by inevitable self-reproach. There is a principle of moral discrimination already existing in us, that, even when we conform our conduct to the divine will, is the very principle by which we have felt the duty of this delightful conformity; and if there be no such principle in our nature, by which we discover the duty of the conformity, it is surely very evident that there can be no such duty to be felt, any more than there can be colour to the blind, or melody to the deaf.

God may be loved by us, or feared by us. He may be loved by us as the source of all our blessings, conferred or promised. He may be feared by us as a being who has the power of inflicting on us eternal anguish. In one of these views, we may, when we obey him, act from gratitude; in the other, from a sense of the evils which we have to dread in offending him. But if it be a duty of gratitude to obey God, we must previously have been capable of knowing that gratitude is a virtue, as much as we must have been capable of knowing the power of God, before we could have known to fear his awful dominion. We consider the Deity as possessing the highest moral perfection: but in that theological view of morality which acknowledges no mode of estimating excellence beyond that divine command itself, whatever it might have been, these words are absolutely meaningless; since if, instead of what we now term virtue, he had commanded only what we now term vice, his command must still have been equally holy. If indeed the system of Paley, and of other theological moralists, were just, what excellence beyond the excellence of mere power, could we discover in that divine being whom we adore as the supreme goodness, still more than we fear him as the omnipotent? God has, indeed, commanded certain actions, and it is our virtue to conform our actions to his will; but if the virtue depend exclusively on obedience to the command, and if there be no peculiar moral excellence in the actions commanded, he must have been equally adorable, though nature had exhibited only appearances of unceasing malevolence in its author; and every command which he had delivered to his creatures had been only to add new voluntary miseries to the physical miseries which already surrounded them. In the system of Hobbes, which considers law itself as constituent of moral right, a tyrant, if his power of enacting law be sufficiently established, is not to be distinguished, in his very tyranny, from the generous sovereign of the free; because the measure of right is to be found in his will alone. In the system of Paley, in like manner, if virtue be conformity to the will of God, whatever that will may be, and there be no moral measure of the excellence of that will itself, God and the most malignant demon have no moral difference to our heart, but as the one and not the other is the irresistible sovereign of the universe.

The will of God, then, though it is unquestionably the source of virtue, in the most important sense—as it was his will that formed all the principles of our constitution, of which the principle of moral approbation is one—is not the source of virtue in the sense in which that phrase is understood by some theological writers as limited to the mere

declaration of his will, sanctioned by punishment and reward. There is an earlier law of God, which he has written in our hearts; and the desire of our mere personal happiness or misery, in this or in another world, is truly an object of our approbation, not the source of it, since the love of mere selfish enjoyment is at least as powerfully the motive to vice, in some cases, as it is in other cases the motive to virtue. We do not merely submit to the will of God as we submit to any power which it is impossible for us to resist. We feel that it would be not imprudence only, but guilt, to wish to disobey it. We seek, in the constitution of our nature, the reason which leads us to approve morally of the duty of this conformity of our will to his beneficent and supreme will; and we find, in one of the essential principles of our nature, the moral reason which we seek.

After this examination of the various systems, which may be considered as more or less directly opposed to the belief of that principle of moral feeling—the original susceptibility of moral emotion on the contemplation of certain actions—for which I have contended, there is still one system which deserves to be considered by us, in relation to this belief, not as being subversive of morality, in any one of its essential distinctions, but as appearing to fix morality on a basis that is not sufficiently firm; with the discovery of the instability of which, therefore, the virtues that are represented as supported on it, might be considered as themselves unstable; as the statue, though it be the image of a god, or the column, though it be a part of a sacred temple, may fall, not because it is not sufficiently cohesive and firm in itself, but because it is too massy for the feeble pedestal on which it has been placed.

The system to which I allude, is that which is delivered by Dr. Smith, in his *Theory of Moral Sentiments*,—a work unquestionably of the first rank in a science which I cannot but regard, as to man, the most interesting of sciences. Profound in thought, it exhibits, even when it is most profound, an example of the graces with which a sage imagination knows how to adorn the simple and majestic form of science, that is severe and cold, only to those who are themselves cold and severe, as in those very graces it exhibits, in like manner, an example of the reciprocal embellishment which imagination receives from the sober dignity of truth. In its minor details and illustrations, indeed, it may be considered as presenting a model of philosophic beauty, of which all must acknowledge the power, who are not disqualified by their very nature for the admiration and enjoyment of intellectual excellence; so dull of understanding as to shrink with a painful consciousness of incapacity at the

very appearance of refined analysis, or so dull and cold of heart, as to feel no charm in the delightful varieties of an eloquence that, in the illustration and embellishment of the noblest truths, seems itself to live and harmonize with those noble sentiments which it adorns.

It is chiefly in its minor analyses, however, that I conceive the excellence of this admirable work to consist. Its leading doctrine I am far from admitting. Indeed it seems to me as manifestly false, as the greater number of its secondary and minute delineations appear to me faithful, to the fine lights, and faint and flying shades, of that moral nature which they represent.

According to Dr. Smith, we do not immediately approve of certain actions, or disapprove of certain other actions, when we have become acquainted with the intention of the agent, and the consequences, beneficial or injurious, of what he has done. All these we might know thoroughly, without a feeling of the slightest approbation or disapprobation. It is necessary, before any moral sentiment arise, that the mind should go through another process, that by which we seem for the time to enter into the feelings of the agent, and of those to whom his action has relation in its consequences, or intended consequences, beneficial or injurious. If, by a process of this kind, on considering all the circumstances in which the agent was placed, we feel a complete sympathy with the passions or calmer emotions that actuated him, and with the gratitude of him who was the object of the action, we approve of the action itself as right, and feel the merit of the agent; our sense of the propriety of the action depending on our sympathy with the agent, our sense of the merit of the agent on our sympathy with the object of the action. If our sympathies be of an opposite kind, we disapprove of the action itself as improper, that is to say, unsuitable to the circumstances, and ascribe not merit but demerit to the agent. In sympathizing with the gratitude of others, we should have regarded the agent as worthy of reward; in sympathizing with the resentment of others, we regard him as worthy of punishment.

Such is the supposed process in estimating the actions of others. When we regard our own conduct we in some measure reverse this process; or rather, by a process still more refined, we imagine others sympathizing with us, and sympathize with their sympathy. We consider how our conduct would appear to an impartial spectator. We approve of it, if it be that of which we feel that he would approve; we disapprove of it if it be that which we feel by the experience of our own former emotions, when we have ourselves, in similar circumstances, estimated the actions of others, would excite

his disapprobation. We are able to form a judgment as to our own conduct, therefore, because we have previously judged of the moral conduct of others, that is to say, have previously sympathized with the feelings of others; and but for the presence, or supposed presence, of some impartial spectator, as a mirror to represent to us ourselves, we should as little have known the beauty or deformity of our own moral character, as we should have known the beauty or ugliness of our external features without some mirror to reflect them to our eye.

In this brief outline of Dr. Smith's system, I have of course confined myself to the leading doctrine, of which his theory is the development. If this doctrine of the necessary antecedence of sympathy to our moral approbation or disapprobation be just, the system may be admitted, even though many of his minor illustrations should appear to be false. If this primary doctrine be not just, the system, however ingenious and just in its explanation of many phenomena of the mind, must fail as a theory of our moral sentiments.

To derive our moral sentiments, which are as universal as the actions of mankind that come under our review, from the occasional sympathies, that warm or sadden us with joys and griefs and resentments which are not our own, seems to me, I confess, very nearly the same sort of error as it would be to derive the waters of an ever-flowing stream from the sunshine or shade which may occasionally gleam over it. That we have a principle of social feeling, which, in its rapid participation of the vivid emotions of others, seems to identify us in many cases with the happy or the sorrowful, the grateful or the indignant, it is impossible to deny. But this sympathy, quick as it truly is to arise, in cases in which the primary feelings are vivid and strongly marked, is not a perpetual accompaniment of every action of every one around us. There must be some vividness of feeling in others, or the display of vividness of feeling, or at least such a situation as usually excites vivid feeling, of some sort, in those who are placed in it, to call the sympathy itself into action. In the number of petty affairs which are hourly before our eyes, what sympathy is felt either with those who are actively or those who are passively concerned, when the agent himself performs his little offices with emotions as slight as those which the objects of his actions reciprocally feel? Yet, in these cases, we are as capable of judging, and approve or disapprove, not with the same liveliness of emotion indeed, but with as accurate estimation of merit or demerit, as when we consider the most heroic sacrifices which the virtuous can make, or the most atrocious crimes of which the sordid and the cruel can be

guilty. It is not the absolute vividness of our emotion, however, but its mere correspondence in degree with the emotion of others, which affects our estimates of the propriety of their actions; and it must be remembered, that it is not any greater or less vividness of our sympathetic feeling, but the accuracy of our estimation of merit and demerit, whether great or slight, by the sympathetic feelings supposed, which is the only point in question. There is no theory of our moral distinctions, which supposes that we are to approve equally of all actions that are right, and to disapprove equally of all actions which are wrong; but it is essential to one theory—that theory which we are considering—that there should be no feeling of right or wrong, merit or demerit, and consequently no moral estimation whatever, where there is no previous sympathy in that particular case. The humblest action, therefore, which we denominate right, must have awakened our sympathy as much as those glorious actions which we are never weary of extolling, in the very commendation of which we think not of the individual only with thankfulness, but with a sort of proud delight of ourselves, of our country, of the common nature of man, as ennobled by the virtue, that, instead of receiving dignity from the homage of our praises, confers dignity on the very gratitude and reverence which offer them. If we were to think only those actions right in which our sympathy is excited, the class of indifferent actions would comprehend the whole life, or nearly the whole life, of almost all the multitude of those around us, and indeed of almost all mankind. A few great virtues and great iniquities would still remain in our system of practical ethics, to be applauded or censured; but the morality of the common transactions of life, which, though less important in each particular case, is, upon the whole, more important from its extensive diffusion, would disappear altogether as morality, as that which it is right to observe, and wrong to omit, and though it might still be counted useful, would admit of no higher denomination of praise. The supposed necessary universality then, in our moral sentiments, of that which, however frequent, is surely far from universal, would of itself seem to me a sufficient objection to the theory of Dr. Smith.

Even if the sympathy for which he contends were as universal as it is absolutely necessary for the truth of his theory that it should be, it must still be admitted that our sympathy is, in degree at least, one of the most irregular and seemingly capricious of principles in the constitution of the mind; and on this very account, therefore, not very likely to be the commensurable test or standard of feelings so regular, upon the whole, as

our general estimates of right and wrong. But though it would be very easy to show the force of this objection, I hasten from it, and from all objections of this kind to that which seems to me to be the essential error of the system.

This essential error, the greatest of all possible systematic errors, is no less than the assumption, in every case, of those very moral feelings which are supposed to flow from sympathy, the assumption of them as necessarily existing before that very sympathy in which they are said to originate.

Let us allow, then, every thing which we can suppose it possible for the author of the theory to have claimed, let us admit that the sympathy of which he speaks, instead of being limited to a few cases of vivid feeling, is as universal as he contends, that it is as little variable in kind, or in degree, as our notions of right and wrong, and, in short, that it is in perfect accordance with our moral sentiments; even though, with all these admissions, we were to admit also the very process which Dr. Smith supposes to take place exactly in the manner which he supposes, it would be very evident, that still, after so many important concessions, the moral sentiments could not be regarded as having their source in the sympathy, but as preceding it; or, if no moral sentiments of any kind preceded it, the sympathy itself could not afford them more than a mirror, which reflects to us, from the opposite landscape, the sunny hill, the rock, and the trees, gleaming through the spray of the waterfall, could of itself, without any external light, produce all that beautiful variety of colours with which it delights our vision, as if it were the very scene on which we have loved to gaze.

Let us consider, then, with a little nicer analysis, the process of which Dr. Smith speaks, admitting the sympathy for which he contends, and admitting it in the fullest extent which can be conceived necessary to his theory.

In this theory, as you have seen, he has separated our feeling of the propriety or impropriety of the action from our feeling of the merit or demerit of the agent, ascribing the one to our sympathy with the emotions of the agent in the circumstances in which he was placed, the other to our sympathy with the gratitude or resentment of those who have been affected by the action. I have already endeavoured to show you, that we have only one feeling of approvableness, arising on the contemplation of an action, which, as variously referred to the agent or to the action considered abstractly, is at once the felt propriety of the action, and the felt merit of the agent. Indeed, it seems to me as absurd to suppose that we can conceive an action to be wrong, in the moral sense of that word, without any notion of the demerit of the voluntary agent,

or conceive the demerit of the voluntary agent, without any notion of the impropriety of his action, as it would be to suppose that we can imagine a circle without a centre, or a centre without a circle. But let us adopt, without objection, the supposed analysis which Dr. Smith has made of our moral sentiments, and admit, that, in the constitution of these, there are two distinct feelings that give occasion to corresponding moral notions of propriety and merit, which one of these feelings alone could not have produced; in short, let us admit, that we might have conceived an action to be morally wrong, without any demerit on the part of the agent, or have conceived the greatest demerit on his part, without any moral impropriety in his action.

The first supposed sympathy which we have to consider, is that which is said to give occasion to our moral estimates of actions as proper or improper, without regard to the merit or demerit of the agent, that are felt by us only through the medium of another sympathy.

This notion of moral propriety or impropriety, we are told, could not have been produced in us by the most attentive consideration of the action, and of all its circumstances; another process must intervene. We feel the propriety of the action, only because we sympathize with the agent. We make his circumstances our own, and, our passion being in unison with his, we regard it as suitable to the circumstances, and therefore as morally proper.

If we have, indeed, previous notions of moral right and wrong, or some other source in which they may be found, this belief of the propriety of certain feelings that accord with ours, might be sufficiently intelligible; but the most complete sympathy of feelings, the most exact accordancy, is not sufficient to constitute or give rise to the moral sentiments of which we are treating; when there is nothing more than a sympathy of feelings, without that previous moral sentiment, which, in Dr. Smith's system, we must always tacitly presuppose. In the very striking emotions of taste, for example, we may feel, on the perusal of the same poem, the performance of the same musical air, the sight of the same picture, or statue, a rapture or disgust, accordant with the rapture or disgust expressed by another reader, or listener, or spectator; a sympathy far more complete than takes place in our consideration of the circumstances in which he may have had to regulate his conduct in any of the common affairs of life; in which our secondary emotion, if it be at all excited, is excited but faintly. If mere accordancy of emotion, then, imply the feeling of moral excellence of any sort, we should certainly feel a moral regard for all whose taste coincides with

ours; yet, however gratifying the sympathy in such a case may be, we do not feel, in consequence of this sympathy, any morality in the taste that is most exactly accordant with our own. There is an agreement of emotions, a sort of physical suitableness that is felt by us of the emotions, as effects to the works of art as causes, but nothing more; and if we had not a principle of moral approbation, by which, independently of sympathy, and previously to it, we regard actions as right, the most exact sympathy of passions would, in like manner, have been a proof to us of an agreement of feelings, but of nothing more. It proves to us more, because the emotions, which we compare with our own, are recognised by us as moral feelings, independently of the mere agreement. We do not merely share the sentiments of the agent, but we share his moral sentiments, the recognition of which, as moral sentiments, has preceded our very sympathy.

Why is it that we regard emotions which do not harmonize with our own, not merely as unlike to ours, which is one view of them; but as morally improper, which is a very different view of them? It must surely be, because we regard our own emotions which differ from them as morally proper; and, if we regard our own emotions as proper, before we can judge the emotions which do not harmonize with them to be improper on that account, what influence can the supposed sympathy and comparison have had, in giving birth to that moral sentiment which preceded the comparison? They show us only feelings that differ from ours, and that are improper because ours are proper. The sympathy, therefore, on which the feeling of propriety is said to depend, assumes the previous belief of that very propriety; or, if there be no previous belief of the moral suitableness of our own emotions, there can be no reason, from the mere dissonance of other emotions with ours, to regard these dissonant emotions as morally unsuitable to the circumstances in which they have arisen. We may, perhaps, conceive them to be physically unsuitable, in the same manner as we regard the taste as erroneous, which approves of poetry as sublime that to us appears bombastic or mean; but we can as little feel any moral regard in the one case as in the other, unless we have previously distinguished the one set of emotions as moral emotions, the other set as emotions of taste.

With respect to the former of the two sympathies, then, which Dr. Smith regards as essential to our moral sentiments, the sympathy from which he supposes us to derive our notions of actions, as right or wrong, proper or improper,—that is to say, as morally suitable or unsuitable to the circumstances in which the action takes place; we

have seen that it assumes, as independent of the sympathy, the very feelings to which the sympathy is said to give rise.

Let us next consider the latter of the two sympathies, to which we are said to owe our notion of merit or demerit in the agent, as distinct from the propriety or impropriety of his action.

These sentiments of merit or demerit arise, we are told, not from any direct consideration of the agent and of the circumstances of his action, but from our sympathy with the gratitude or resentment of those who have derived benefit or injury, or at least whom he is supposed to have wished to derive benefit or injury, from that good or evil which he purposed. If, on considering the circumstances of the case, we feel that our emotions of this sort would, in a similar situation, harmonize with theirs; we regard the agent in the same light in which they regard him, as worthy of reward in the one case, or of punishment in the other, that is to say, as having moral merit or demerit.

If our sense of merit were confined to cases in which the action had a direct relation to others, with whose gratitude we might be supposed to sympathize, this theory of merit would at least be more distinctly conceivable. But what are we to think of cases in which the action begins and terminates, without a thought of the happiness of others, in the amelioration of the individual himself; of sacrifices resolutely but silently made to the mere sense of duty; the voluntary relinquishment of luxurious indulgences; the struggle, and at last the victory over appetites and passions that are felt to be inconsistent with the sanctity of virtue; and over habits, still more difficult to be subdued than the very appetites or passions which may have given them their power? In such cases, our sense of the merit of the victor in this noble strife, when we do not think of the gratitude of a single individual, because there is, in truth, no gratitude of which to think, is, notwithstanding, as vivid as if we had around us whole families and tribes of the grateful to excite our sympathy, and to continue to harmonize with it. The world, indeed, the great community of individuals, it may be said, is truly benefited by every increase of virtue in any one of the individuals who compose it; and it may be possible, in this way, to invent some species of gratitude of the whole multitude of mankind, that may be supposed to awake our sympathy, and thus to make us feel a merit even in such cases, which otherwise we should not have felt. But, though it may be possible for us, with due care and effort of thought, to invent this abstract or remote gratitude with which ours may be supposed to harmonize, can it be imagined by any one but the most obstinate

defender of a system, that this strange sympathy, of which no one perhaps has been conscious in any case, truly and constantly takes place whenever we thus approve; that we do not feel any merit whatever in the voluntary privations which virtue makes, till we have previously excited ourselves to admire them, by reflecting on a grateful world? Such a reflex thankfulness, if it occur at all, does not occur to one of many thousands, who require, for their instant perception of the merit, only the knowledge of the sacrifices of present enjoyment which have been made, and of the pure motives which led to the sacrifices. It is not only the Hercules who freed the world from robbers and monsters that we admire. We admire, at least, as much, in the beautiful ancient allegory, the same moral hero when he resisted the charms and the solicitations of Pleasure herself. The choice of Hercules, indeed, is fabulous. But the choice which he is fabled to have made, has been the choice of the virtuous of every age; and, in every age, the sacrifices internally and silently made to duty and conscience, have been ranked in merit with the sacrifices which had for their direct object the happiness of others, and for their immediate reward the gratitude of the happy. Why is it that we look with so much honour on the martyr in those early ages of persecution, which, collecting around the victim every instrument of torture, required of him only a few grains of incense to be thrown before a statue, more noble, indeed, than the imperial murderer whom it represented, but still only a statue, the effigy of a being of human form, who, under the purple which clothed him, with the diadem and the sceptre and the altar, far from being a god, was himself one of the lowest of the things which God had made! When placed thus between idolatry and every form of bodily anguish, with life and guilt before him, and death and innocence, the hero of a pure faith looked fearlessly on the cross or on the stake, and calmly and without wrath on the statue which he refused to worship, and on all the ready ministers of cruelty, that were rejoicing in the new work which they had to perform, and the new amusement which they were to give to the impatient crowd,—do we feel that there was no merit in the magnanimity, because we cannot readily discover some gratitude which we may participate? or, if we do feel any merit, is it only on account of some gratitude which we have at last succeeded in discovering? We do not think of any thankfulness of man. We think only of God and virtue, and of the heroic sufferer, to whom God and virtue were all, and the suffering of such a moment nothing.

That our feeling of merit, then, is not a reflected gratitude, but arises from the direct

contemplation of the meritorious action, might, if any proof were necessary, appear sufficiently evident from the equal readiness of this feeling to arise in cases in which it would be difficult to discover any gratitude with which we can be supposed to sympathize, and in which the individual himself, and the circumstances of his action, are all that is before us. But though this and every other objection to Dr. Smith's theory of our feeling of merit were to be abandoned, there would still remain the great objection, that the sympathy which he supposes in this case, as in that formerly examined by us, proceeds on the existence of that very moral sentiment which it is stated by him to produce.

We discover the merit of the agent in any case, it is said, by that sympathetic tendency of our nature, in consequence of which, on considering any particular action, we place ourselves in the situation of those who are benefited by the action, when, if we feel an emotion of gratitude like theirs, we of course consider the agent himself as meritorious, worthy of the reward of which they consider him to be worthy; and, in like manner, on considering any action of injustice or malevolence, we feel the demerit of the agent by sympathizing with the resentment of those whom the action has injured.

Such is the process asserted. But what is it that is truly supposed in this process, as distinguishing the sympathetic and secondary feelings, from the primary feelings of those who were directly concerned?

We place ourselves in the situation of others, or, rather, without willing it, or knowing the change till it is produced, we feel ourselves, by some sudden illusion, as if placed in their situation. In this imaginary sameness of circumstances we have feelings similar to theirs. They view their benefactor as worthy of reward. We, therefore, considering for the moment the benefit as if conferred on us, regard him likewise as worthy of reward: or if they consider him worthy of punishment, we too consider him worthy of punishment. Their gratitude or resentment is founded on real benefit received, or real injury. Our gratitude or resentment is founded on the illusive momentary belief of benefit or injury. But this difference of reality and illusion in the circumstances which give occasion to them, is the only difference of the feelings; unless, indeed, that as the illusion cannot be of very long continuance, and is, probably, even while it lasts, less powerful than the reality, our sympathetic feelings, however similar in kind, may be supposed to be weaker in degree.

The effect of the sympathy, then, being only to transfuse into our breasts the grati-

tude or resentment of those who have been immediately benefited or injured by any generous or malevolent action, if the original gratitude imply belief of merit in the object of the gratitude, and the original resentment imply belief of demerit in its object, we may, by our sympathy with these direct original feelings, be impressed with similar belief of merit or demerit. But, in this case, it is equally evident that if our reflex gratitude and resentment involve notions of merit and demerit, the original gratitude and resentment which we feel by reflection must in like manner have involved them; and must even have involved them with more vivid feeling, since the difference of vividness was the chief or only circumstance of difference in the direct and the sympathetic emotions. The sympathy, then, to which we are supposed to owe our moral sentiments of merit and demerit, presupposes those very sentiments; since the feelings which arise in us by sympathy, only from the illusion by which we place ourselves in the situation of others, must, in those who were truly in that very situation, have arisen directly with at least equal power. It is some previous gratitude with which we sympathize; it is some previous resentment with which we sympathize; and merit is said to be only that worthiness of reward which the gratitude itself implies, and demerit that worthiness of punishment which is implied in the primary resentment. If the feeling of gratitude implied no notion of any relation of worthiness, which our benefactor's generosity bears to the reward which we wish that we were capable of bestowing on him, and our resentment, in like manner, implied no notion of a similar relation of the injustice or cruelty of him who has injured us, to that punishment of his offence which we wish and anticipate, we might then, indeed, be obliged to seek some other source of these felt relations. But if the actual gratitude or resentment of those who have profited or suffered imply no feelings of merit or demerit, we may be certain, at least, that in whatever source we are to strive to discover these feelings, it is not in the mere reflection of a fainter gratitude or resentment that we can hope to find them.

After admitting to Dr. Smith, then, every thing which he could be supposed to claim, or even to wish to claim, with respect to the universality, the steadiness, and the vividness of our sympathetic feelings, we have seen, that in both the sympathies which he supposes to take place, that from which we are said to derive our moral sentiments of the propriety or impropriety of actions, and that from which we are said, in like manner, to derive our moral sentiments of merit or demerit in the agent, the process to which he ascribes the origin of these mo-

nal sentiments cannot even be understood without the belief of their previous existence. The feelings with which we sympathize are themselves moral feelings or sentiments; or if they are not moral feelings, the reflection of them from a thousand breasts cannot alter their nature.

LECTURE LXXXI.

EXAMINATION OF DR. SMITH'S SYSTEM CONCLUDED; RECAPITULATION OF THE DOCTRINES OF MORAL APPROBATION.

My last Lecture, Gentlemen, was chiefly employed in considering a theory of our moral sentiments which has been stated and defended with great eloquence by one of the profoundest philosophers whom our country and our science can boast; a theory which founds our moral sentiments, not on the direct contemplation of the actions which we term virtuous, but on a sympathy, which it is impossible for us not to feel, with the emotions of the agent in the circumstances in which he has been placed, and with the emotions also of those to whom his actions have been productive of benefit or injury; our direct sympathy with the agent giving rise to our notion of the propriety of his action, our indirect sympathy with those whom his actions have benefited or injured giving rise to our notions of merit or demerit in the agent himself. Both these supposed sympathies I examined with a more minute review than that to which they have usually been submitted; and, in both cases we found, that even though many other strong objections to which the theory is liable were abandoned, and though the process for which the theorist contends were allowed to take place to the fullest extent to which he contends for it, his system would still be liable to the insuperable objection, that the moral sentiments which he ascribes to our secondary feelings of mere sympathy, are assumed as previously existing in those original emotions with which the secondary feelings are said to be in unison. If those to whom an action has directly related are incapable of discovering, by the longest and minutest examination of it, however much they may have been benefited by it or injured, and intentionally benefited or injured, any traces of right or wrong, merit or demerit, in the performer of the action, those whose sympathy consists merely in an illusory participation of the same interest, cannot surely derive, from the fainter reflex feelings, that moral knowledge which even the more vivid primary emotions were incapable of affording, any more than we can be supposed to acquire, from the most faith-

ful echo, important truths that were never uttered by the voices which it reflects. The utmost influence of the liveliest sympathy can be only to render the momentary feelings the same, as if the identity of situation with the object of the sympathy were not illusive, but real; and what it would be impossible for the mind to feel, if really existing in the circumstances supposed, it must be impossible for it also to feel, when it believes itself to exist in them, and is affected in the same manner, as if truly that very mind with whose emotions it sympathizes.

If, indeed, we had previously any moral notions of actions as right or wrong, we might very easily judge of the propriety or impropriety of the sentiments of others, according as our own do or do not sympathize with them; and it is this previous feeling of propriety or impropriety which Dr. Smith tacitly assumes, even in contending for the exclusive influence of the sympathy, as itself the original source of every moral sentiment. The sentiments of others could not fail, indeed, in that case to appear to us proper, if they coincided with sentiments which we had before, in our own mind, recognised as proper, or morally suitable to the circumstances; improper if they differed from these. But if we have no previous moral notions whatever, the most exact sympathy of feelings can tell us only that our feelings are similar to the feelings of some other person, which they may be as much when they are vicious as when they are virtuous, or when they are neither virtuous nor vicious; the most complete dissonance, in like manner, can tell us only that our feelings are not similar to those of some other person. When another calls scarlet or green what we have previously felt to be scarlet or green, we think that his vision and ours agree; but we presuppose, in him as in ourselves, that visual sensibility which distinguished the colours, and we do not consider him an object of moral regard, because his vision coincides with ours. When he is affected with a delightful emotion similar to ours, on the contemplation of a work of art, we acknowledge mentally, and are pleased perhaps with this coincidence of taste. But the coincidence does not seem to us to be that which constitutes the emotion of taste. On the contrary, it presupposes in both an independent susceptibility of these emotions, by which we should, individually, have admired what is beautiful, and distinguished from it what is ugly, though no one had been present with us to participate our sentiments. When, in like manner, we admire, with vivid approbation, some generous action,—that is to say, according to Dr. Smith's language, when we sympathize with the feelings of any one in the circumstances in which he has been

placed, we have a coincidence of feelings, indeed, as exact, though probably not more exact, than in a case of simple vision or admiration of some work of art, in which no moral sentiment was felt; and this very coincidence, in like manner, presupposes a capacity of distinguishing and admiring what is right, without which there would have been a similarity of feelings and nothing more, precisely as in the other cases. It is not a mere coincidence of feeling, however, which we recognise in our moral sentiments, like that which we recognise in the most exact coincidence of taste. We feel not merely that another has acted as we should have done, and that his motives, in similar circumstances, have been similar to ours. We feel that, in acting as he has done, he has acted properly; because, independently of the sympathy which merely gives us feelings to measure with our own, as we might measure with our own any other species of feelings, we are impressed with the propriety of the sentiments, according to which we trust that we should ourselves have acted; so thoroughly impressed with these previous distinctions of right and wrong, that, in the opposite case of some act of atrocious delinquency, no sympathy in vice of one villain with another can make the common crime seem a virtue in the eyes of his accomplice, who is actuated by similar motives, and, therefore, by similar feelings, in a sympathy of the finest unison, when he adds his arm to the rapine and afterwards to the murder which is to conceal and to consummate the guilt.

The moral sentiments which we have as yet considered, are those which relate to the conduct and feelings of others. The same inconsistency which we found in the theory of these, is to be found, as might be supposed, in the application of the principle to other species of supposed sympathy which we have still to consider, in the sentiments which we form of our own moral conduct. That we should be capable, indeed, of forming a moral estimate of our own actions, from the direct contemplation of the circumstances in which we may have been placed, and of the good or evil which we may have intentionally produced, would evidently be subversive of the whole theory of sympathy; since, with the same knowledge of circumstances and of intention, if we could form any moral judgment of our own actions, we might be equally capable of forming some moral judgment of the actions of others. It was absolutely necessary, therefore, for Dr. Smith to maintain, that we have no power of judging of our own actions directly,—that, knowing the choice which we have made, and all the circumstances which led to our choice, and all the consequences of benefit or injury to individuals and to the world,

which our choice may have produced, it is yet absolutely impossible for us to distinguish, without the aid of the real or supposed sentiments of others, any difference of propriety or impropriety, right or wrong, merit or demerit, or whatever other names we may use to express the differences of vice and virtue; though our vice had been the atrocious fury plunging a dagger in the heart of her who had been our happiness in many connubial years, and who was slumbering beside us on the same pillow, in the calmness of unsuspecting love; or our virtue the clemency of drawing back from the bosom of the assassin whom we had laid at our feet, the dagger which we had wrenched from his murderous hand. Even of actions so different as these, it would be absolutely impossible for us, we are told, to form any moral distinction, if we were to look on them only with our own eyes, and measure them by the feelings of our own heart. Before the one can appear to us less virtuous than the other, we must imagine some witnesses or hearers of what has been done, and sympathize with their sympathy. Such is the process which Dr. Smith believes to take place. But surely, if our original feelings, on the consideration of all the circumstances of an action, involve no notion of right or wrong, the sympathy with our feelings, or our sympathy with that sympathy, or even an infinite series of reciprocal sympathies, if these should be thought necessary, cannot afford the moral notions of which the original feelings, themselves more vivid, afforded no elements. If the impartial spectator be able to discover merit or demerit, by making our case his own, and becoming conscious as it were of our feelings; our feelings, which he thus makes his own, must speak to us with the same voice of moral instruction with which, during his temporary illusion, they speak to him. If, considering our action and all its consequences, we cannot discover any merit or demerit, they, considering our action in all its circumstances as theirs, must be alike insensible of any merit or demerit: or, if they have feelings essentially different from ours, they have not made our case their own, and what is misnamed sympathy has not been sympathy. Unless we presuppose, as I before said, on their part some moral notions of what is right or wrong, meritorious or worthy of punishment, by which they may measure our conduct and feelings, all the knowledge which the most complete sympathy can afford, is merely that they have certain feelings, that we have had certain feelings, and that these feelings are similar to each other, as our feelings have coincided before in various other emotions, perceptions, judgments that involved or suggested no moral notion whatever.

We have now then considered, both in its relation to our sentiments of our own moral conduct and in its relation to our sentiments of the conduct of others, the very celebrated theory of Dr. Smith, a theory which I cannot but regard as involving in morals the same error that would be involved in a theory of the source of light, if an optician, after showing us many ingenious contrivances, by which an image of some beautiful form may be made to pass from one visible place to another, were to contend that all the magnificent radiations of that more than ethereal splendour which does not merely adorn the day, but constitutes the day, had their primary origin in reflection, when reflection itself implies, and cannot be understood but as implying the previous incidence, and therefore the previous existence of the light which is reflected. A mirror presents to us a fainter copy of external things; but it is a copy which it presents. We are in like manner, to each other, mirrors that reflect from breast to breast joy, sorrow, indignation, and all the vivid emotions of which the individual mind is susceptible; but though, as mirrors, we mutually give and receive emotions, these emotions must have been felt before they could be communicated. To ascribe original moral feelings to this mental reflection, is truly, then, as much an error, in the theory of morality, as the doctrine of the production of light by reflection without the previous incidence of light, would be an error in the theory of catoptrics.

The argument, after the fuller views of it which I have given, may be recapitulated in very brief compass.

There are only two senses in which sympathy can be understood; one having immediate relation to the feelings, the other to the situation, of him with whom we are said to sympathize. We partake his emotions directly, as if by instant contagion; or we partake them indirectly, by first imagining ourselves in the circumstances in which he is placed; the emotion, in this latter case, being similar merely because the situation, in which we imagine ourselves for the moment, is similar, and arising in us when the situation is imagined to be ours, precisely in the same manner, and according to the same principles, as it arose in the mind of him who truly existed in the circumstances in which our imagination only has placed us. In either case it is equally evident, that sympathy cannot be the source of any additional knowledge; it only gives a wider diffusion to feelings that previously exist, or that might have previously existed. If it reflect to us the very emotions of others, as if by contagion, without any intervening influence of imagination on our part, it reflects feelings that have been directly excited in them, the primary subjects of the feelings, by their

real situation; and which they would not the less have had, though no one had been present to sympathize with them, or even though the tendency to sympathy had not formed a part of the mental constitution. If, on the other hand, sympathy do not reflect to us the very emotions of others, but make us first enter, by a sort of spiritual transmigration, into their situation, and thus indirectly impress us with their feelings; it still, in making their situation ours, while the illusion lasts, excites in us only the feelings which we should have had, if the situation had been really ours; and which the same tendencies to emotion that produce them now would then have produced, though no sympathy whatever had been concerned in the process. All which is peculiar to the sympathy is, that instead of one mind only, affected with certain feelings, there are two minds affected with certain feelings, and a recognition of the similarity of these feelings; a similarity which, far from being confined to our moral emotions, may occur as readily and as frequently in every other feeling of which the mind is susceptible. What produces the moral notions, therefore, must evidently be something more than a recognition of similarity of feeling which is thus common to feelings of every class. There must be an independent capacity of moral emotion, in consequence of which we judge those sentiments of conduct to be right which coincide with sentiments of conduct previously recognised as right, or the sentiments of others to be improper, because they are not in unison with those which we have previously distinguished as proper. Sympathy, then, may be the diffuser of moral sentiments, as of various other feelings; but if no moral sentiments exist previously to our sympathy, our sympathy itself cannot give rise to them.

Such in outline, is the great objection to Dr. Smith's theory, as a theory of our moral sentiments. It professes to explain, by the intervention of sympathy, feelings which must have existed previously to the sympathy, or at least, without the capacity of which, as original feelings, in the real circumstances supposed, the illusive reality which sympathy produces would have been incapable of developing them. It is on a mere assumption then, or rather on an inconsistency still more illogical than a mere assumption, that the great doctrine of his system is founded; yet notwithstanding this essential defect, which might seem to you inconsistent with the praise that was given when I entered on the examination of it, the work of Dr. Smith is, without all question, one of the most interesting works, perhaps I should have said the most interesting work, in moral science. It is valuable, however, as I before remarked, not for the leading doctrine of which we have

seen the futility, but for the minor theories which are adduced in illustration of it, for the refined analysis which it exhibits in many of these details, and for an eloquence which, adapting itself to all the temporary varieties of its subject, familiar with a sort of majestic grace, and simple even in its magnificence, can play amid the little decencies and proprieties of common life, or rise to all the dignity of that sublime and celestial virtue which it seems to bring from heaven indeed, but to bring down gently and humbly to the humble bosom of man.

That his own penetrating mind should not have discovered the inconsistencies that are involved in his theory, and that these should not have readily occurred to the many philosophic readers and admirers of his work, may in part have arisen, as many other seeming wonders of the kind have arisen, from the ambiguities of language. The meaning of the important word sympathy is not sufficiently definite, so as to present always one clear notion to the mind. It is generally employed, indeed, to signify a mere participation of the feelings of others; but it is also frequently used as significant of approbation itself. To say that we sympathize with any one in what he has felt or done, means often that we thoroughly approve of his feelings; and in consequence of this occasional use of the term as synonymous with approbation, the theory which would identify all our moral approbation with sympathy, was, I cannot but think, more readily admitted, both by its author, and by those who have followed him; since what was not true of sympathy, in its strict philosophic sense, was yet true of it in its mixed popular sense. Indeed, if the word had been always strictly confined to its two accurate meanings, as significant either of the mere direct participation of feelings previously existing, or of the indirect participation of them in consequence of the illusive belief of similarity of circumstances, it seems to me as little possible that any one should have thought of ascribing to sympathy original feelings, as, in the analogous cases which I before instanced, of ascribing to an echo the original utterance of the voices which it sends to our ear, or the production of the colours which it sends to our eye to the mirror which has only received and reflected them.

Of all the principles of our mixed nature, sympathy is perhaps one of the most irregular, varying not in different individuals only, but even in the same individual in different hours or different minutes of the same day, and varying, not with slight differences, but with differences of promptness and liveliness, with which only feelings the most capricious could be commensurable. If our virtue and vice, therefore, or our views of actions as right or wrong, varied with our

sympathy, we might be virtuous at morning, vicious at noon, and virtuous again at night, without any change in the circumstances of our action, except in our greater or less tendency to vividness of sympathy, or to the expectation of more or less vivid sympathies in others. How absurd and impertinent seems to us, in our serious hours, the mirth that in more careless moments would have won from us not our smile only, but our full sympathy of equal laughter; and how dull, when our mind is sportive, seems to us the gravity of the sad and serious, of the venerable moralizers on years that are long past, and years that are present,—to whose chair, under the influence of any sorrow that depressed us, we loved to draw our own, while we felt a sort of comfort as we listened to them, in the slow and tranquil tone, and the gentle solemnity of their fixed but placid features. What is true of our sympathy with mere mirth or sadness, is true of every other species of sympathy. Original temperament, habit, the slightest accident of good or bad fortune, may modify in no slight degree the readiness, or at least the liveliness of moral sympathy with which we should have entered into the feelings of others, into their gratitude or anger, or common love or hate; and if, therefore, our estimate of the propriety or impropriety of actions had been altogether dependent on the force of our mere sympathetic emotion, it would not have been very wonderful if the greater number of mankind had regarded the very propriety or impropriety, as not less accidental than the sympathies from which they flowed.

Having now, then, examined all the systems of philosophers which may be considered as more or less directly opposed to the simple view which I gave you of our moral constitution; in which our notions of moral obligation, virtue, merit, were traced to a single feeling of the mind, and the susceptibility of this feeling found to be as truly original in the mind as any of its other powers or susceptibilities—its capacity, for example, of memory, judgment, love, hate, hope, fear—I flatter myself, that the evident inadequacy of every system which professes to account for the moral phenomena, without this original distinctive principle, will be regarded as at least a strong corroboration of the positive evidence of the theory which has been submitted to you. The review in which we have been engaged may, therefore, I hope, be of double value, both as giving you a sketch of the opinions of the most eminent philosophers who have written on this most interesting subject, and an exposition of the errors of those opinions, which in many instances it requires considerable minuteness of analysis to detect, and as enabling you at the same time, better to appreciate the truth of those original distinctions

of moral good and evil, the belief of which seems to me as just in philosophy as it is salutary in its practical tendencies, and delightful to the heart that loves virtue, and that, feeling in itself all the blessings which virtue diffuses, perceives with joy that the principle which gives to life all its happiness, is a principle that does not depend for its development on accidents of worldly station, or time or place, but in all regions, and ages, and circumstances of fortune, is coeval with the race of man, and present with its joys or consolations, which it is always ready to offer to our very wishes, wherever a human being exists.

The review itself, however—important as it may have been in its relation to the history of moral science, and to the great truths which it is the object of moral science to develop and illustrate—has presented to your attention so many explanations, or rather so many attempted explanations, of the same moral phenomena, that the rapid succession of these different opinions may have tended, perhaps—at least in the minds of such of you as are not accustomed to consider together and compare many discordant systems—to perplex and obscure the notions which you had derived from the view of the subject as it was originally presented to you. It may be of advantage, therefore, to take a short retrospect of our original speculation.

In surveying either our own conduct, or the conduct of others, we do not regard the actions that come under our review as merely useful or hurtful, in the same manner as we regard inanimate things, or parts even of our living mental constitution, that are independent of our will. There is a peculiar set of emotions, to which the actions of voluntary agents in certain circumstances give rise, that are the source of our moral sentiments, or rather which are themselves our moral sentiments, when considered in reference to the actions that excite them. To these emotions we give the name of moral approbation or moral disapprobation, feelings that are of various degrees of vividness as the actions which we consider are various. The single principle upon which these feelings depend, is the source of all our moral notions; one feeling of approbation, as variously regarded in time, being all which is truly meant when we speak of moral obligation, virtue, and merit, that in the works of ethical writers are commonly treated as objects of distinct inquiry; and that, in consequence of the distinct inquiries to which they have led, and the vain attempts to discover essential differences where none truly exist, have occasioned so much confusion of thought and verbal tautology as to throw a sort of darkness on morality itself. Instead, then, of inquiring first, what it is which constitutes virtue, and then what it is which constitutes merit, and then what it is which

constitutes our moral obligation to do what we have seen to be right and meritorious, we found that one inquiry alone was necessary—what actions excite in us, when contemplated, a certain vivid feeling—since this approving sentiment alone, in its various references, is all which we seek in these different verbal inquiries. If a particular action be meditated by us, and we feel, on considering it, that it is one of those which, if performed by us, will be followed in our own mind by the painful feeling of self-reproach, and in the minds of others by similar disapprobation; if a different action be meditated by us, and we feel that our performance of it would be followed in our own mind and the minds of others by an opposite emotion of approbation, this view of the moral emotions that are consequences of the actions is that which I consider as forming what is termed moral obligation, the moral inducement which we feel to the performance of certain actions, or to abstinence from certain other actions. We are virtuous if we act in conformity with this view of moral obligation; we are vicious if we act in opposition to it; virtuous and vicious meaning nothing more than the intentional performance of actions that excite, when contemplated, the moral emotions. Our action, in the one case, we term morally right, in the other case morally wrong; right and wrong, like virtue and vice, being only words that express briefly the actions which are attended with the feeling of moral approbation in the one case, of moral disapprobation in the other case. When we speak of the merit of any one, or of his demerit, we do not suppose any thing to be added to the virtue or vice; we only express, in other words, the fact, that he has performed the action which it was virtuous or vicious to perform; the action which, as contemplated by us, excites our approval, or the emotion that is opposite to that of approval. Moral obligation, virtue, vice, right, wrong, merit, demerit, and whatever other words may be synonymous with these, all denote then, as you perceive, relations to one simple feeling of the mind, the distinctive sentiment of moral approbation or disapprobation, which arises on the contemplation of certain actions; and which seems itself to be various, only because the action of which we speak or think, meditated, willed, or already performed, is variously regarded by us, in time, as future, present, past. There are, in short, certain actions which cannot be contemplated without the instant feeling of approval, and which may therefore be denominated morally right. To feel this character of approvableness in an action which we have not yet performed, and are only meditating on it as future, is to feel the moral obligation or moral inducement to perform it;—

when we think of the action in the moment of volition, we term the voluntary performance of it virtue; when we think of the action, as already performed, we denominate it merit; in all which cases, if we analyze our moral sentiment, we cannot fail to discern, that it is one constant feeling of moral approval, with which we have been impressed, that is varied only by the difference of the time, at which we regard the action as future, immediate, or past.

A great part of the confusion which has prevailed in the theory of morals, has arisen, I have little doubt, from indistinctness of conception with respect to the identity or the difference of these moral notions of obligation, virtue, merit. Much of the confusion also, I have as little doubt, has arisen from the abuse of one very simple abstraction—that by which we consider an action as stripped of circumstances peculiar to an individual agent, and forming, as it were, something of itself, which could be an object of moral regard, independently of the agent. We thus learn to speak of actions that are absolutely right and relatively wrong, or absolutely wrong and relatively right; that is to say, of actions which are right when the agent, with his particular views, is wrong; and of agents that continue as meritorious as before, when their actions, in ordinary circumstances, would have been ranked in some degree of delinquency. Convenient as these distinctions may verbally have been in some cases, where brevity was the only advantage desired, they have had an injurious tendency, in other more important respects, by leading the inconsiderate to suppose, that of actions which are thus at once right and wrong, the morality cannot be very stable and definite. I was careful, therefore, to point out to you the nature of the abstraction, and the futility of any, distinction more than what is purely verbal, of absolute and relative rectitude. What is absolutely right is relatively right, what is relatively right is absolutely right. An action cannot excite feelings different from those which an agent excites, for it is itself the agent, or it is nothing. It is the brief expression of some agent, real or supposed, placed in certain circumstances, willing and producing certain effects; and when an action, which in one set of circumstances is right, is said to be wrong in other circumstances, the action of which we speak, in the new circumstances supposed, is truly, as I showed you, a different action, in the only sense in which an action has any meaning, as significant of a living being, having certain definite views, and producing certain definite effects. A clear view of this definition of an action, as uniformly comprehending in it the notion of some agent, without whom it would be nothing—though, but for the general misconception on the subject, it would

seem to me so obvious as scarcely to require to be pointed out—is, in consequence of that general misconception, one of the most important views in the philosophy of morals which you can make familiar to your mind. It is no small progress in Ethics, as in Physics, to have learned to distinguish accurately abstractions from realities, to know that an action is only another name for an agent in certain circumstances; virtue, vice, only briefer expressions of an agent virtuous or vicious, that is to say, of an agent performing actions of which we and mankind in general approve or disapprove. Indeed, I scarcely know a single ethical writer, to whose mind the nature of these and other similar abstractions has been duly present; and who does not sometimes think, or at least speak, of virtue and vice, as beings that have certain properties, independently of all the virtuous and vicious in the universe.

Though there is not vice or virtue, however, there are virtuous or vicious agents. Certain actions, as soon as considered, excite a feeling of approbation, which leads us to class them together as virtuous; certain other actions excite a feeling of moral disapprobation, which leads us to class them together as vicious. There is, then, in the mind of each individual, a principle which leads him thus to divide actions into two great classes. But if, in the minds of different individuals, this distinction were very differently formed, so that the actions which seemed virtues to one were the very actions which seemed vices to another, it is evident that the social happiness, and even the social union of mankind, could not be preserved in this strange mixture of love and hate, of crimes and virtues, rewarded or punished, as the admirers of truth or deceit, of cruelty or benevolence, chanced to obtain a precarious superiority in numbers or power. It is necessary for general peace, even though no other relation were to be considered, that there should be some great rules of conduct, according to which all may direct their actions in one harmonious course of virtue; or according to which, at least, in any partial discord of the actions of individuals, the moral sentiment of the community may be harmoniously directed, in checking what would be generally injurious, and furthering what would be generally beneficial. There is, therefore, we found, such an accordance of sentiment—of sentiment that is directed by the provident benevolence of God to the happiness of all who live in the great social communion of mankind, even when the individual, acting in conformity with the sentiment, has no thought beyond the sufferer whose anguish he relieves, or the friend to whose happiness he feels it more than happiness to contribute, or the preservation of his own internal character of moral excellence, in cases in which pain is encour-

tered or pleasure sacrificed with no other object than that moral excellence itself. Since the world was created there have indeed been myriads of human beings on the earth; but there has been only one God, and there is only one God. There is, therefore, only one great voice of approbation in all the myriads of mankind; because He, the great approver and the great former of our moral constitution, is one. We may refrain from virtue; we may persecute virtue; but, though our actions may be the actions of hatred, there is a silent reverence which no hatred can suppress. The omnipresent Judge of human actions speaks in the cause of the wicked as in the cause of the good, and has made it impossible for us, even in the wildest abuses of our power, not to revere, at least in heart, the virtue which he has honoured with his love.

In asserting the wide accordance of this moral voice, however, it was necessary to consider the objections to the harmony of sentiment which have been drawn from some practices and institutions that seem, at least as first considered, to be proofs of discord rather than harmony. That there are instances, and many instances of such apparent anomaly, it would have been absurd to endeavour to disprove. But it might still be inquired, whether even these instances are really anomalous, or only seem so, from erroneous opinions of the nature of that modified agreement which alone is necessary to the supporter of the original tendencies,—distinctive emotions of vice and virtue.

This consideration of the species of accordance which the moral phenomena might, from our knowledge of the general nature of the mind, be expected to indicate, on the supposition of an original principle of moral feeling, led us into some very interesting trains of inquiry; of which the result was the ascertainment of certain limits, within which remains, unaffected by the sophistries opposed to it, all that uniformity for which it is wisdom to contend,—limits that do not imply any defect of original tendency to certain moral emotions, but only the operation of other causes, that concur with this original influence; and that might, *a priori*, have been expected to have this modifying effect, if, without considering any of the objections urged, we had only reflected on the analogous phenomena of other principles of the mind, that are allowed to be essential to it and universal, and that are yet capable of similar modification.

The limitations to which we were led were of three kinds,—first, the temporary influence of every feeling that completely occupies the mind, especially of any violent passion, which blinds us at the moment to moral distinctions,—that is to say, prevents, by its own vividness, the rise of the less vivid feelings of

approbation or disapprobation; in the same manner as, in similar circumstances, it would blind to the discernment even of the universal truths of science,—that is to say, would not allow us to perceive for the time the simplest and least mutable of all relations,—the proportions of number and quantity,—if an arithmetician or geometer, when we were under the influence of anger, sudden jealousy, or any other violent emotion, were to discourse to us calmly of square or cube roots, or of the properties of right angled triangles. These arithmetical or geometrical properties we discover readily, when our passion has subsided; and, in like manner, we discover readily, when our passion has wholly subsided, the moral distinctions which we were incapable of perceiving before.

A second limitation, which we found it necessary to form, arises from the complex results of good and evil, in a single action,—the difficulty of calculating the preponderance of good or evil, according to which felt preponderance alone, our approbation or disapprobation arises,—and the various degrees of importance attached, and justly attached, in different ages and nations, to parts of the complex result, which are most in harmony with the spirit of the nation or the age; that is to say, which tend, or are conceived to tend, most to the production of that particular national good, which it may have been an error in policy, indeed, to desire, but which still was the object of a policy, wise or unwise. What we esteem evil upon the whole, others may esteem good upon the whole; because there is, in truth, a mixture of good and evil, the parts of which may be variously estimated, but of which no one loves the evil as evil, or hates the good as good. It is some form of good, which is present to the mind of the agent, when he regards as morally right, that compound result of good and evil, of which we, with better discernment, appreciate better the relative amount. Even the atrocious virtues, if I may use that combination of words, of which voyagers relate to us instances in savage life, or which have sometimes prevailed even in nations more civilized, we found in our inquiry, might very naturally, without any defect, or inconsistency of moral emotion, arise from some misconception of this sort. Vices may everywhere be found prevailing as vices; but when they are generally revered as virtues, it is because there is in them something which is truly, in those circumstances, virtue, however inferior the amount of good may be to the amount of evil. It is for some prominent moral good, however, that they are approved; and the defective analysis, which does not perceive the amount of accompanying evil, is an error of judgment, not an approbation of that which is injurious to individuals or mankind, for the sake of that very injury.

The third limitation which we were led to form, is that which arises from the influence of the associating principle,—an influence that concurs with the former in almost every instance, and promotes it. When actions have complicated results, this principle may lead us to think more of one part of the result than of another part; and, by the remembrances which it yields of the virtues of those whom we have loved, adds all the force of its own lively impressions to the particular virtues that are so recommended to us, or to actions that might otherwise have been absolutely indifferent. This influence, however, far from disproving the reality of original tendencies to moral feeling, is, as I showed you, in many of the cases in which it operates most powerfully, one of the most interesting exemplifications of these very moral emotions. It is by loving those whom it is virtue to love, that we learn often to value too highly, what otherwise we should have valued with a juster estimate. The same principle we found too to operate strongly in exciting through the medium of general terms and general rules, a disproportionate emotion in some cases, in which we have learned to apply to individual cases, an emotion that has resulted from many previous analogous emotions.

Such are the limits within which alone the original tendency of our nature to certain moral emotions, and the consequent accordance of moral distinctions can be defended,—but, within these limits, it may safely be maintained. There is in our breast a susceptibility of moral emotion, by which we approve or condemn; and the principle which thus approves or condemns in us, is the noblest of the ties that connect us with the universal community of mankind.

LECTURE LXXXII.

OF THE USE OF THE TERM MORAL SENSE;
ARRANGEMENT OF THE PRACTICAL VIRTUES.

GENTLEMEN, in my Lecture yesterday, after concluding my remarks on the theory of our moral sentiments, which Dr. Smith has proposed,—the last of the theories on this subject, which required our consideration, as differing in its principles from the view which I have given you, I briefly recapitulated the general doctrines which we had previously been led to form of the phenomena of moral approbation.

All our moral sentiments, then, of obligation, virtue, merit, are in themselves, as we have seen, nothing more than one simple feeling, variously referred to actions, as future, present, or past. With the loss of the

susceptibility of this one peculiar species of emotion, all practical morality would instantly cease: for, if the contemplation of actions excited in us no feeling of approval, no foresight, that, by omitting to perform them, we should regard ourselves, and others would regard us, with abhorrence or contempt, or at least with disapprobation, it would be absurd to suppose that there could be any moral obligation to perform certain actions and not to perform certain other actions, which seemed to us, morally, equal and indifferent. There could, in like manner, be no virtue nor vice in performing, and no merit nor demerit in having performed an action, the omission of which would have seemed to the agent as little proper, or as little improper as the performance of it,—in that state of equal indiscriminate regard or disregard, in which the plunderer and the plundered, the oppressor and the oppressed, were considered only as the physical producers of a different result of happiness or misery.

It is by this one susceptibility, then, of certain vivid distinctive emotions, that we become truly moral beings, united, under the guardianship of Heaven, in one great social system, benefiting and benefited, and not enjoying the advantage of this mutual protection, only in the protection itself, that is constantly around us; but enjoying also the pleasure of affording the reciprocal benefit, and even a sort of pleasure of no slight amount, in the various wants themselves, which are scarcely felt as wants, when we know that they are to be remedied by the kind hearts and gentle hands, whose offices of aid we have before delighted to receive, and are in perfect confidence of again receiving. Such is the great system of social duties that connects mankind by ties, of which our souls do not feel the power less truly, because they are ties, which only the soul can feel, and which do not come within the sphere of our bodily perception. By that delightful emotion, which follows the contemplation of virtue, we can enjoy it, even while it is not exercised, in all its aspects as past, or future, as much as present. In our meditations on it, it is like some tranquil delight that awaits us, which, in the very act of virtue, comes like an immediate reward to actions that seem to need no other recompense, while they are thus rewarded; and to look back upon the generous toil, or the general self-privation, as among the things which have been, is at once to enjoy again the past delight, and to feel in it a sort of pledge of future returns of similar enjoyment,—increased trust of being able and worthy to perform again, whenever the opportunity of them shall recur, actions as worthy of delight, and as delightful.

It is by this unceasing delight, which Virtue is ever spreading out before us, not mere-

ly in the direct exercise of the actions which we term virtuous, but in the contemplation of them as future in our wishes, or as past, in the remembrances of a good conscience, that moral excellence is truly and philosophically worthy of the glorious distinction, by which the author of the *Essay on Man* would characterize it, of being what "alone is happiness below."

The only point, where human bliss stands still,
And tastes the good, without the fall to ill;
Where only Merit constant pay receives,
Is blest, in what it takes and what it gives;
The joy unequal'd, if its end it gain,
And, if it lose, attended with no pain;
Without satiety, though e'er so blest,
And but more relish'd, as the more distress'd;
The broadest mirth unfeeling Folly wears,
Less pleasing far, than Virtue's very tears;
Good from each object, from each place acquir'd,
For ever exercis'd, yet never tir'd;
Never elated, while one man's oppress,
Never dejected, while another's blest,
And where no wants, no wishes, can remain,
Since but to wish more virtue is to gain.

In tracing to an original susceptibility of the mind our moral feelings of obligation in the conception of certain actions as future, of virtue, in the present performance or wish to perform certain actions, and of merit, in the past performance or past resolution to perform certain actions, we may be considered as arriving at a principle like that which Dr. Hutcheson, after Lord Shaftesbury, has distinguished by the name of the Moral Sense, and of which, as an essential principle of our constitution, he has defended the reality with so much power of argument, in his various works on morals. In our moral feelings, however, I discover no peculiar analogy to perceptions or sensations, in the philosophic meaning of those terms, and the phrase moral sense, therefore, I consider as having had a very unfortunate influence on the controversy as to the original moral differences of actions, from the false analogies which it cannot fail to suggest. Were I to speak of a moral sense at present, you would understand me as speaking rather metaphorically, than according to the real place which we should be inclined to give in our arrangement, to the original principle of our nature, on which the moral emotions depend. But by Hutcheson it was asserted to be truly and strictly a sense, as much a sense as any of those which are the source of our direct external perceptions; and though this difference of nomenclature and of arrangement on his part, evidently arose from a misconception, or, at least, a very loose meaning of the word sense, different from that in which it is commonly understood, as limited to the feelings which we acquire directly from affections of our bodily organs, still this loose meaning of the term which he intended it to convey, was, in some measure, mingled and confused in the minds of others, with the stricter meaning commonly assigned to it, and the assertion of a

moral sense has been regarded almost as the assertion of the existence of some primary medium of perception, which conveys to us directly moral knowledge, as the eye enables us to distinguish directly the varieties of colours, or the ear the varieties of sounds; and the scepticism, which would have been just with respect to such an organ of exclusive moral feeling, has been unfortunately extended to the certain moral principle itself, as an original principle of our nature. Of the impropriety of ascribing the moral feelings to a sense, I am fully aware then, and the place which I have assigned to them among the moral phenomena is, therefore, very different. In the emotions, which the contemplation of the voluntary actions of those around us produces, there is nothing that seems to demand, for the production of such emotions, a peculiar sense, more than is to be found in any of our other emotions. Certain actions excite in us, when contemplated, the vivid feelings which we express too coldly when, from the poverty of language, we term them approbation or disapprobation, and which are not estimates formed by an approving or disapproving judgment, but emotions that accompany and give warmth to such estimates. Certain other objects of thought excite in us other vivid feelings that are in like manner classed as emotions,—hope, jealousy, resentment; and, therefore, if all emotions, excited by the contemplation of objects, were to be referred to a peculiar sense, we might as well speak of a sense of those emotions or of a sense of covetousness or despair as of a sense of moral regard. If sense, indeed, were understood in this case to be synonymous with mere susceptibility, so that, when we speak of a moral sense, we were to be understood to mean only a susceptibility of moral feeling of some sort, we might be allowed to have a sense of morals, because we have, unquestionably, a susceptibility of moral emotion; but, in this very wide extension of the term, we might be said, in like manner, to have as many senses as we have feelings of any sort; since, in whatever manner the mind may have been affected, it must have had a previous susceptibility of being so affected, as much as in the peculiar affections that are denominated moral.

The great error of Dr. Hutcheson, and of other writers who treat of the susceptibility of moral emotion, under the name of the moral sense, appears to me to consist in their belief of certain moral qualities in actions, which excite in us what they consider as ideas of these qualities, in the same manner as external things give us, not merely pain or pleasure, but notions or ideas of hardness, form, colour. Indeed, it is on this account that the great champion of this doctrine professes to regard the moral prin-

ciple as a sense ; from its agreement, as he says, with this definition, which he conceives to be the accurate definition of a sense, "a determination of the mind to receive any idea from the presence of an object which occurs to us independent on our will." What he terms an idea, in this case, is nothing more than an emotion considered in its relation to the action which has excited it. A certain action is considered by us—a certain emotion arises. There is no idea in the philosophic meaning of that term, but of the agent himself and of the circumstances in which he was placed, and the physical changes produced by him ; and our ideas or notions of these we owe to other sources. To the moral principle, the only principle of which Hutcheson could mean to speak as a moral sense, we owe the emotion itself, and nothing but the emotion.

In one use of the word, indeed, we may be said to owe to our susceptibility of moral emotion, ideas, because we owe to it, as the primary source, the emotions of this species which we remember ; and remembrances of past feelings are often termed ideas of those feelings ; but in this application of the word, as synonymous with a mere remembrance, every feeling, as capable of being remembered, may be a source of ideas independently of the will, and therefore, according to the definition which is given by Hutcheson, equally a sense.

There is yet another meaning of the word, however, and a still more important one, in relation to our present inquiry, in which our susceptibility of moral emotion is productive of what, in the general loose language of metaphysical writers, have been termed ideas ; and it is by his defective analysis, of what is truly meant in the phrase, moral ideas, and of the process which evolves them, that I conceive Hutcheson to have been chiefly misled, in supposing us to be endowed with a sense of moral qualities of actions. The process to which I allude, is the common process of generalization, to which alone we owe the general notions of virtue, vice, right, and wrong, which he ascribes to a particular sense that affords us these ideas. If we had never contemplated more than a single virtuous or vicious action, we should have had only the particular emotion which followed that particular contemplation, and should as little have formed the general notions of virtue and vice, as we should have formed the notion which is expressed by the word quadruped, if we had seen only a single animal with four legs. It is not by one action only of one definite kind, however, that is to say, by an agent placed only in one set of circumstances, and producing only one particular effect, that our moral emotion is excited ; nor is there only one unvarying feeling of the mind, of one exact degree of intensity, which

we denominate a moral emotion, as excited by various moral actions. There are various analogous actions which excite various analogous moral feelings of approbation or disapprobation, and it is in consequence of the feeling of the similarity of these emotions, that we learn to class together the different actions that excite these similar emotions under a single word, virtuous or right, or proper, or vicious, wrong, improper. The ideas, of which Hutcheson speaks, are these general notions only. There are virtuous agents, not virtue, as there are minds that have certain feelings approving or disapproving, not approbation or disapprobation, as one simple state, in all the varieties of these feelings. Virtue, vice, right and wrong, are in short mere general terms, as much as any other mere general terms, which we have formed to express the similarities of particular things or particular qualities. The general notions, and consequently the general terms, that denote them, we derive indeed from our susceptibility of moral feeling, since we must have the moral emotions themselves, before we can discover them to be like or unlike, and invent words for expressing briefly their similarities ; but what Dr. Hutcheson and other writers would term our ideas of virtue and vice, right and wrong,—though, in this sense, derived from our susceptibility of moral feeling, which gives us the emotions that are felt and classed as similar,—are derived from it, only as any other general notions of resemblances of any other feeling, or of the circumstances which induce in the mind certain similar feelings, necessarily presuppose the capacity of the feelings themselves whatever they may be, which are afterwards considered as having this relation of similarity. There are no two feelings, perhaps, which may not be found to have some relation to each other, as there are, perhaps, no two external things which may not be found to have some analogy ; and if, therefore, we suppose that we have a particular internal sense for every general notion of agreement of any kind, which we are capable of framing, we may be said to have as many senses as we have pairs of feeling which we are capable of comparing. There are innumerable similarities which are felt by us every hour, and consequently innumerable general notions, though we may have invented names only for a few of them. Our moral emotions, like our other emotions, and our other feelings of every kind, impress us with certain resemblances which they mutually bear ; and the importance of the actions which agree in exciting the analogous feelings of moral approbation or disapprobation, from the influence which they widely exercise on happiness as beneficial or injurious, has led, in every age and country, to the designation of them by certain general names, as virtuous

or vicious, proper or improper; but these general terms are not the less general terms, and only general terms, significant merely of the resemblance of various particular actions, which agree in exciting in the mind certain feelings that are analogous. This distinction of virtue, vice, right, wrong, merit, demerit, as mere general terms, expressive only of an analogous relation which certain actions bear to certain emotions, I conceive to be of the utmost importance for your clear understanding of the theory of morals; and I have dwelled on it, therefore, with the wish that it should become familiar to your minds. You are not to conceive, as Dr. Hutcheson's view of our moral feelings might lead you to imagine, that we discover a certain idea of right or wrong, virtue or vice, from the contemplation of any one particular action, as if there were a sense for the reception of such ideas, that flow from them like light from the sun, or fragrant particles from a rose. There is no right or wrong, virtue or vice, but there are agents whose actions cannot be contemplated by us without an emotion of approbation or disapprobation; and all actions, that is to say, all agents, that agree in exciting moral feelings which are thus analogous, we class together as virtuous or vicious, from this circumstance of felt agreement alone. The similarity of the emotions which we feel, in these particular cases, is thus all to which we owe the notions, or, as Dr. Hutcheson calls them, the ideas, of right and wrong, virtue and vice; and it is not more wonderful that we should form these general notions, than that we should form any other general notions whatever.

The error of Dr. Hutcheson with respect to qualities, in objects that excite in us what he terms moral ideas, is similar to that which led many ethical writers—as we saw in reviewing their different systems—to refer our moral sentiments to reason or judgment, as the principle which measures the fitnesses of certain actions for producing certain ends; and which approves or disapproves accordingly, as different actions seem more or less adapted for producing the desired end. The truth is, that moral approbation or disapprobation, though, from the common use of those terms, and the poverty of our language, I have been obliged to employ them in our past discussions, are terms that are very inadequate to express the liveliness of the moral feelings to which we give those names. The moral emotions are more akin to love or hate, than to perception or judgment. What we call our approbation of an action, inasmuch as the moral principle is concerned, is a sort of moral love when the action is the action of another, or moral complacency when the action is our own, and nothing more. It is no exercise of reason, discovering congruities, and determining one

action to be better fitted than another action, for affording happiness or relieving misery. This logical or physical approbation may precede, indeed, the moral emotion, and may mingle with it, and continue to render it more and more lively while we are under its influence; but even when such approbation precedes it, it is distinct from the emotion itself; and we might judge and approve of the fitness, or disapprove of the unfitness, of certain actions to produce happiness, with the same precision as we now judge and approve, or disapprove, though we had not been, as we are, moral beings, desirous of the happiness of others, and feeling a vivid delightful emotion, on the contemplation of such actions as tend to produce that happiness. However our judgment, as mere judgment, may have been exercised before, in discerning the various relations of actions to the happiness of the world, the moral principle is the source only of the emotion which follows the discovery of such fitness; and not in the slightest degree of the judgment which measures and calculates the fitness, any more than it is a source of the fitness itself. When we speak of our moral approbation of an action, we may indeed, from the convenience of such brief expressions, have some regard to both feelings, to our judgment of the fitness of an action to produce good to an individual or to the world, and to our moral love of the beneficial action which follows this discovery. But still, it is not to be forgotten, that it is the latter part only, the distinctive moral regard, that belongs to the principle which we have been considering; the discovery of the fitness is a common exercise of judgment, that differs no more from the other exercises of it than these differ from each other. It is in the order of our emotions, accordingly, that I have assigned a place to our moral feelings, in my arrangement of the phenomena of the mind; because, though we are accustomed to speak of moral approbation, moral judgments, or moral estimates of actions, the feelings which we thus comprehend under a single term are not the simple vivid feeling, which is all that truly constitutes the moral emotion, but a combination of this vivid feeling with the judgment as to the fitness or tendency of the action, which, as a mere judgment, preceded and gave rise to the emotion. What is strictly the moral part of the compound is, however, as I have already said, the emotion, and the emotion only.

There is, in this case, with respect to mere judgment, precisely the same error which we have traced in the reasons that led Dr. Hutcheson to the supposition of a moral sense. What are termed moral ideas of virtue, merit, obligation,—the consideration of which, as moral ideas, was, as his

definition and his general reasoning show, the very circumstance which led him into his error,—are merely, as I have repeatedly endeavoured to demonstrate to you, the one vivid moral emotion, referred to the actions which excite it. There are no ideas, therefore, which require the supposition of a peculiar sense for affording them, even if a sense were necessary for all those feelings which are termed simple ideas. There is only a particular emotion, indicating, of course, a peculiar susceptibility of this emotion in the mind; and, together with this vivid feeling, actions, or ideas of certain actions, and their consequences, which may be said, indeed, to be moral ideas, when combined with this vivid feeling, but which, as ideas, are derived from other sources. It is not the moral principle which sees the agent, and all the circumstances of his action, or which sees the happiness or misery that has flowed from it; but when these are seen, and all the motives of the agent divined, it is the moral principle of our nature which then affords the emotion that may afterwards, in our conception, be added to these ideas derived from other sources, and form with them compound notions of all the varieties of actions that are classed by us as forms of virtue or vice.

The reference of our moral love of certain actions and moral abhorrence of other actions to a peculiar sense, termed the moral sense, has arisen, then, we may conclude, from a defective analysis, or at least from a misconception of the nature of those moral ideas of which the defenders of this sense speak, and which seem to them falsely to indicate the necessity of such a sense for affording them. The ideas of which they speak are truly complex feelings of the mind. We have only to perform the necessary analysis, and all which we discover is a certain emotion of moral love, that, according to circumstances, is more or less lively, and the notion of certain actions, that is to say, of agents real or supposed, willing and producing certain effects. We may, for the sake of brevity, invent the general words virtue, right, propriety, as significant of all the actions which are followed in us by this emotion. But these are mere generalizations, like other generalizations; and there is no virtue in nature, more than there is quadruped or substance.

But, though Dr. Hutcheson may have erred in not analyzing with sufficient minuteness the moral ideas of which he speaks, and in giving the name of a moral sense to the susceptibility of a mere emotion akin to our other emotions, this error is of little consequence as to the moral distinctions themselves. Whether the feeling that attends the contemplation of certain actions admit of being more justly classed with our sensations or perceptions, or with our emotions, there

is still a susceptibility of this feeling or set of feelings, original in the mind, and as essential to its very nature as any other of the principles or functions, which we regard as universally belonging to our mental constitution; as truly essential to the mind, indeed, as any of those senses among which Dr. Hutcheson would fix its place.

The sceptical conclusions which some writers have conceived to be deducible from the doctrine of a moral sense, might, if they could be justly drawn from that doctrine, be equally deducible from the doctrine of moral emotions for which I have contended; since the emotions may be regarded as almost the same feelings under a different name. A very slight notice, however, of the objection which these conclusions are supposed to furnish, will be sufficient for showing the radical error in which the objection has its source. You will find it stated and illustrated at great length in Dr. Price's elaborate, but very tedious, and not very clear, Review of the principal questions of morals. It is more briefly stated by Mr. Stewart in his Outlines.

"From the hypothesis of a moral sense, various sceptical conclusions have been deduced by later writers. The words Right and Wrong, it has been alleged, signify nothing in the objects themselves to which they are applied, any more than the words sweet and bitter, pleasant and painful; but only certain effects in the mind of the spectator. As it is improper, therefore, (according to the doctrines of modern philosophy,) to say of an object of taste, that it is sweet; or of heat, that it is in the fire; so it is equally improper to say of actions, that they are right or wrong. It is absurd to speak of morality as a thing independent and unchangeable: inasmuch as it arises from an arbitrary relation between our constitution and particular objects.

"In order to avoid these supposed consequences of Dr. Hutcheson's philosophy, an attempt has been made by some later writers, in particular by Dr. Price, to revive the doctrines of Dr. Cudworth, and to prove, that moral distinctions, being perceived by reason or the understanding, are equally immutable with all other kinds of truth.*"

That right and wrong signify nothing in the objects themselves, is indeed most true. They are words expressive only of relation, and relations are not existing parts of objects, or things, to be added to objects, or taken from them. There is no right nor wrong, virtue nor vice, merit nor demerit, existing independently of the agents who are virtuous or vicious; and, in like manner, if there had been no moral emotions to arise

* Outlines of Moral Philosophy, 4th ed. 8vo. p. 132.

on the contemplation of certain actions, there would have been no virtue, vice, merit, or demerit, which express only relations to these emotions. But though there be no right nor wrong in an agent, the virtuous agent is not the same as the vicious agent,—I do not say merely to those whom he benefits or injures, but to the most remote individual who contemplates that intentional production of benefit or injury. All are affected, on the contemplation of these, with different emotions; and it is only by the difference of these moral emotions that these actions are recognised as morally different. We feel that it will be impossible, while the constitution of nature remains as it is,—and we may say, even from the traces of the divine benevolence which the universe displays, impossible, while God himself, the framer of our constitution, and adapter of it to purposes of happiness, exists,—that the lover and intentional producer of misery, as misery should ever be viewed with tender esteem; or that he whose only ambition has been to diffuse happiness more widely than it could have flowed without his aid, should be regarded with the detestation, on that account, which we now feel for the murderer of a single helpless individual, or for the oppressor of as many sufferers as a nation can contain in its whole wide orb of calamity; and a distinction which is to exist while God himself exists, or at least which has been, and as we cannot but believe will be, coeval with the race of man, cannot surely be regarded as very precarious. It is not to moral distinctions only that this objection, if it had any force, would be applicable. Equality, proportion, it might be said, in like manner, signify nothing in the objects themselves to which they are applied, more than vice or virtue. They are as truly mere relations, as the relations of morality. Though the three sides of a right angled triangle exist in the triangle itself, and constitute it what it is, what we term the properties of such a triangle do not exist in it, but are results of a peculiar capacity of the comparing mind. It is man, or some thinking being like man, whose comparison gives birth to the very feeling that is termed by us a discovery of the equality of the squares of one of the sides to the squares of the other two; that is to say,—for the discovery of this truth is nothing more,—it is man who, contemplating such a triangle, is impressed with this relation, and who feels afterwards that it would be impossible for him to contemplate it without such an impression. If this feeling of the relation never had arisen, and never were to arise in any mind, though the squares themselves might still exist as separate figures, their equality would be nothing,—exactly as justice and injustice would be nothing, where no rela-

tion of moral emotion had ever been felt; for equality, like justice, is a relation, not a thing; and, if strictly analyzed, exists only, and can exist only, in the mind, which, on the contemplation of certain objects, is impressed with certain feelings of relation;—in the same manner as right and wrong, virtue, vice, relate to emotions excited in some mind that has contemplated certain actions,—without whose contemplations of the actions, it will readily be confessed, there could be no right nor wrong, virtue nor vice, as there could be no other relation without a mind that contemplates the objects said to be related. Certain geometrical figures cannot be contemplated by us without exciting certain feelings of the contemplating mind,—which are notions of equality or proportion. Is it necessary that the equality should be itself something existing in the separate figures themselves, without reference to any mind that contemplates them, before we put any confidence in geometry? Or is it not enough that every mind which does contemplate them together, is impressed with that particular feeling, in consequence of which they are ranked as equal? And, if it be not necessary, in the case of a science which we regard as the surest of all sciences, that the proportions of figures should be any thing inherent in the figures, why should it be required, before we put confidence in morality, that right and wrong should be something existing in the individual agents? It is not easy, indeed, to understand what is meant by such an inherence as is required in this postulate; or what other relations actions can be supposed to have as right or wrong, than to the minds which are impressed by them with certain feelings. Of this, at least, we may be sure, that, if any doubt can truly exist as to relations which we and all mankind have felt, since the creation of the very race of man,—because, though, with our present constitution, we feel it impossible to consider cruelty as amiable, and greater cruelty as more amiable, we might, if the frame of our mind were altered, love the ferocity which we now detest, and fly from freedom and general benevolence, to take shelter in some more delightful waste, where there might be the least possible desire of good, and the least possible enjoyment of it, among plunderers whom we loved much, and murderers whom we loved and honoured more—if any doubt of this kind could truly be felt, the reference which Dr. Price would make, of our moral sentiments to reason, would leave the difficulty and the doubt exactly where they were before; since reason is but a principle of our mental frame, like the principle which is the source of moral emotion, and has no peculiar claim to remain unaltered in the supposed general alteration of our mental constitution.

tage, and therefore in a great measure on the skill that detects those elements of distant good, I conceived that we might derive some aid to our inquiry, by considering first the relations which reason, the great analyser and detector of those elements of distant good, bears to morality; and consequently, as in their fittest place, those systems which would reduce all our moral feelings to intellectual discoveries made by that power, which is supposed, in these systems, to determine the very nature of vice and virtue, in the same way as it extracts roots, measures angles, and determines specific gravities or affinities, or quantities of motion.

We considered, then, two celebrated systems of this sort that found morality on reason; one which supposes virtue to consist in the accommodation of our actions to the fitnesses of things, and another which supposes it to consist in actions that are conformable to truth. In both cases I showed you, that the systems, far from accounting for our moral feelings, or showing them to be the result of a process of ratiocination, proceed on the susceptibility of these feelings, as an essential part of our mental constitution, independent of every thing that can be resolved into reasoning. If we were not formed to love previously the happiness of others, and to have a moral approbation of the wish of producing happiness, in vain would reason tell us, after tracing a thousand consequences, that an action will be more generally beneficial than, but for this analytic investigation, we should have supposed. If we were not formed to love certain ends of moral good rather than certain other ends of moral evil, the mere fitnesses, or means of producing these ends, must be as indifferent to us as that indifferent good or evil which they tend to produce. If we have formed no previous moral conception of certain duties, as forming that truth of character to which vice is said to be false, there will be as little falsehood; and, therefore, if vice be only a want of conformity to truth, as little vice, in the most cruel and unrelenting malignity, as in the most generous benevolence. In every case in which we suppose reason to be thus morally exercised, we must, as I said, presuppose certain feelings of love and approbation that constitute all which is truly moral in our sentiments of actions; or the discovery of mere consequences of general good, mere fitnesses, mere truths, will be as powerless to affect us with moral regard, as a new combination of wheels and pulleys, or a new solution of a geometric problem.

But, though the discovery of certain fitnesses or congruities, such as those of which Clarke speaks, or of a certain conformity to truth, such as that of which Wollaston speaks, or of the beneficial and injurious

consequences of certain actions, considered as a mere series of consequences, discoverable by the understanding, like any other series of physical effects, may not be capable of giving birth to moral feeling, without some peculiar and previous susceptibility in the mind of being so affected; may they not at least indirectly give birth to it, by presenting to this original susceptibility of moral emotion its peculiar objects? Whatever may be the principle that develops it, does not the approving sentiment arise, on the contemplation of actions that are in their tendency beneficial to individuals, and thus to society in general, and only on the contemplation of actions that are thus beneficial? Is not utility, therefore, since it appears to be essential, in some greater or less degree, to the whole class of actions that are termed virtuous, the constituent or the measure of virtue itself?

The doctrine of the utility of actions, as that which constitutes them virtuous, has been delivered, with all the force of which the doctrine seems capable, by the genius of Mr. Hume, who has formed it into an elaborate system of morals. It has ever since entered largely into the vague speculations on the principles of virtue, in which minds that are rather fond of theorizing than capable of it, are apt to indulge; and we seldom hear in familiar discussion any allusion to the principle or principles of moral sentiment, without some loose reference to this relation, which that moral sentiment is supposed to bear to the utility of the actions approved. That it does bear a certain relation to it is unquestionable, though a relation which is not always very distinctly conceived by those who are in the frequent habit of speaking of it. It will be the more important, then, to endeavour to separate what is true in the common language on the subject, from the error which frequently accompanies it.

Benevolence, as the very name implies, is always a wish of good to others; and every benevolent action, therefore, must be intended to be of advantage to somebody. But if by the measure of virtue, when utility is said to be the constituent or measure of the actions that are denominated virtuous, be meant that to which the virtue is in exact proportion, increasing always as the mere physical advantage increases, and decreasing always as the mere physical advantage decreases; and if it be said that such actions only are felt to be meritorious, in which the agent is supposed to have willed directly that which appeared to him at the moment of his willing it most useful, and to have willed it with moral approbation for this reason only, because it appeared to him most useful; utility, in this general sense, is so far from being the measure of virtue, that there is comparatively but a very small number of virtu-

ous actions to which the *mesurée* can be applied, and very few, indeed, in which the proportion will be found to hold with exactness.

That virtuous actions do all tend in some greater or less degree to the advantage of the world, is indeed a fact, with respect to which there can be no doubt. The important question, however, is, whether the specific amount of utility be that which we have in view, and which alone we have in view, in the approbation which we give to certain actions; since this approbation is the direct feeling of virtue itself, without which, as intervening, it will be allowed that even the most useful action could not be counted by us as virtuous; whether we love the generosity of our benefactor, with an emotion exactly the same in kind, however different it may be in degree, as that with which we love the bank-bill, or the estate which he may have given us; in short, to use Dr. Smith's strong language, whether "we have no other reason for praising a man, than that for which we commend a chest of drawers."

It may be necessary in this discussion, to remind you once more, that virtue is nothing in itself, any more than our other general terms, which we have invented to express a number of particulars comprehended in them; that what is true of virtue, then, must be true of all the particular actions to which we give that name; and that all which we have to consider in the present argument, is not the vague general term, but some particular action, that is to say, some particular agent, in certain circumstances, willing a certain effect; since the feeling which rises in the mind, on the contemplation of this particular action, is that which leads us to class it with other actions that may have excited a similar vivid sentiment, and to employ for the whole the common term virtue. The question then is, whether it be necessary to the rise of this vivid sentiment, the moral emotion of approbation or disapprobation, that we should have in immediate contemplation, as the sole object of the emotion, the utility or inutility of the action; and whether the emotion itself be always exactly proportioned by us to the quantity of usefulness which we may have found, by a sort of intellectual calculation or measurement in the action itself, or in the principle of the action. It is the vivid feeling of moral approbation alone, which leads us to distinguish actions as virtuous or vicious; and the supposed measure or standard of virtue, therefore, must relate to this vivid feeling in all its degrees, or it cannot have any relation to the virtue that in all its degrees is marked by that vivid feeling only.

If the utility of actions be their moral standard, then, it must be present to the contemplation of the agent himself, when he

morally prefers one mode of conduct to another; and to the contemplation of others, when they morally approve or disapprove of his action.

In every moral action that can be estimated by us, these two sets of feelings may be taken into account; the feelings of the agent when he meditated, and willed the action; and the feelings of the spectator, or of him who calmly contemplates the action at any distance of space or time. Let us consider, then, in the first place, the agent himself. The agent, indeed, may be under the influence of passions, from which the spectator is free, and may thus have his moral discernment less clear, so as to be hurried perhaps into actions which, with better moral vision, he would have shunned. But the principle of approbation itself is not essentially different in his mind, when the action which he contemplates is one which he meditates himself, and when he contemplates the action of another already performed; and, if it be not according to any measurement of exact utility, that the approbation and consequent moral will or resolution of the most virtuous agent is formed, it must be allowed to be a powerful presumption at least, or more than a mere presumption, that the approbation of the spectator, arising from the same principle is not the result of such a measurement of the good that is to be added, by that particular action, to the general good of the world, or of the general utility of the principle from which it flows. With respect to the views of the agent, however, there seems to be little ground for dispute. His views, even when he seems to ourselves most commendable, but rarely extend to such general interests. The exact scale of utility of an action, in short, or of the principle of the action, is not present to his mind as the standard by which he regulates his conduct. Does the mother, when she hangs sleepless, night after night, over the cradle of her sick infant, think, even for a single moment, that it is for the good of the society of mankind, that she should labour to preserve that little being which is so dear to her for itself, and the abandonment of which, though no other being in the universe were to be affected by it, would seem to her a crime of scarcely conceivable atrocity; and are we to refuse to her patience and tenderness, and watchfulness of regard, the name of virtue, because she has thought only of some little comfort that might possibly flow to the individual, and has not measured her own personal sacrifices with that general good, to which they should have been exactly adapted, nor estimated the general advantage of maternal love, as a principle of conduct which operates, and is continually to operate, in all the families of mankind? When we enter some wretched

sequence of the inconsistencies and confusion which they seem to involve, have had the still more unfortunate effect of leading some minds to disbelief or doubt of the essential distinctions of morality itself.

The most important of these misconceptions relate to our notions of virtue, obligation, merit ; for the origin of which, writers on Ethics are accustomed to have recourse to different feelings, and different sources of feeling, but which, I endeavoured to show you, have all their origin in one emotion, or vivid sentiment of the mind, that vivid sentiment which is the immediate result of the contemplation of certain actions, and to which we give the name of moral approbation. An action, though we often speak of it abstractly, is not, and cannot be, any thing which exists independently of the agent. It is some agent, therefore, real or supposed, whom we contemplate when this sentiment of approbation in any case arises ; an agent placed, or imagined to be placed, in certain circumstances, having certain views, willing and producing certain effects of benefit or injury. What the agent is, as an object of our approbation or disapprobation, that his action is ; for his action is himself acting. We say, indeed, in some cases, that an action is wrong, without any loss of virtue on the part of the agent in the peculiar circumstances in which he may have been placed ; that it is absolutely wrong, relatively right ; but in this case the action of which we speak as right and wrong in different circumstances, is truly, as I showed you, in these different circumstances, a different action ; that is to say, we consider a different agent, acting with different views ; in which case it is as absurd to term the moral action—that which excites our approbation or disapprobation—the same, as it would be to term a virtuous sovereign and his tyrannical successor the same, because they have both been seated on the same throne, and worn the same robes and diadem. One individual putting another individual to death, excites in us abhorrence, if we think of the murderer and the murdered as friends, or even as indifferent strangers. But we say, that the same action of putting to death implies relatively nothing immoral, if the individual slain were a robber entering our dwelling at midnight, or an enemy invading our country. It surely however requires no very subtle discernment to perceive, that the murderer of the friend, and the destroyer of the foe, being agents, acting with different views, in different circumstances, their actions, which are only brief expressions of themselves, as acting in different circumstances, are truly different ; and, being different, may of course be supposed to excite different feelings in him who considers them, without any anomaly of moral judgment. The same action, in its

only true sense of sameness,—that is to say, the same frame of mind in circumstances precisely similar,—cannot then be relatively right and absolutely wrong, as if the moral distinction were loose and arbitrary. If it be relatively right, it is absolutely right ; and what we call the absolute action that is wrong is a different action ; an action as different, from that which we term relatively right, as a morass is different from a green meadow, which are both plains ; or a clear rivulet from a muddy canal, which are both streams. We do not say that a morass, though relatively ugly, is, with all its relative ugliness, absolutely beautiful, because it would be beautiful in other circumstances,—if drained, and covered with verdure, and blooming with the wild-flowers of summer, and still gayer with the happy faces of little groups, that may perhaps be frolicing in delight, where before all was stillness and desolation. Such a meadow is indeed beautiful ; but to our senses, that judge only of what is before them, not of what the immediate object might have been, or might still be in other circumstances, such a meadow is not a morass ; and as little, or rather far less, is the slaughter of half an army of invaders, in one of those awful fields on which the liberty or slavery of a people waits on the triumph of a single hour, to be classed in the same list of actions with the murder of the innocent and the helpless, though with complete similarity of result in the death of others. If the effect alone could be said to constitute the moral action ; both terminate equally in the destruction of human life, and both imply the intention of destroying.

An action, then, as capable of being considered by us, is not a thing in itself, which may have various relations to various agents, but is only another name for some agent of whom we speak, real or supposed ; and whatever emotion an action excites, is therefore necessarily some feeling for an agent. The virtue of an action is the virtue of the agent—his merit, his conformity to duty or moral obligation. There is, in short, an approbability, which is felt on considering certain actions ; and our reference of this vivid sentiment to the action that excites it, is all which is meant by any of those terms. We are not to make separate inquiries into the nature of that principle of the mind by which we discover the rectitude of an action, and then into the nature of the moral obligation to perform it, and then into the merit of the agent ; but we have one feeling excited in us by the agent acting in a certain manner ; which is virtue, moral obligation, merit, according as the same action is considered in point of time, when it is the subject, before performance, of deliberation and choice, of actual performance when chosen, or of memory when already performed. It

is all which we mean by moral obligation, when we think of the agent as feeling previously to his action, that if he were not to perform the action, he would have to look on himself with disgust, and with the certainty that others would look on him with abhorrence. It is all which we mean by the virtue of the agent, when we consider him acting in conformity with this view. It is merit when we consider him to have acted in this way; the term which we use varying, you perceive, in all these cases, as the action is regarded by us as present, past, or future, and the moral sentiment in all alike, being only that one simple vivid feeling, which rises immediately on the contemplation of the action.

The approvableness of an action, then, to use a barbarous but expressive word, is at once all these qualities; and the approvableness is merely the relation which certain actions bear to certain feelings that arise in our mind on the contemplation of these actions; feelings that arise to our feeble heart with instant warning or direction, as if they were the voice of some guardian power within us, that in the virtues of others points out what is worthy of our imitation, in their vices what we cannot imitate without being unworthy of the glorious endowments of which we are conscious; and unworthy too of the love of him who, though known to us by his power, is known to us still more as the Highest Goodness, and who, in all the infinite gifts which he has lavished on us, has conferred on us no blessing so inestimable as the capacity which we enjoy of knowing and loving what is good. To say that an action excites in us this feeling, and to say that it appears to us right, or virtuous, or conformable to duty, are to say precisely the same thing; and an action which does not excite in us this feeling, cannot appear to us right, virtuous, conformable to duty, any more than an object can be counted by us brilliant, which uniformly appears to us obscure, or obscure which appears to us uniformly brilliant. To this ultimate fact, in the constitution of our nature, the principle, or original tendency of the mind, by which, in certain circumstances, we are susceptible of moral emotions, we must always come in estimating virtue, whatever analysis we may make or may think that we have made. It is in this respect, as in many others, like the kindred emotion of beauty. Our feeling of beauty is not the mere perception of forms and colours, or the discovery of the uses of certain combinations of forms; it is an emotion arising from these, indeed, but distinct from them. Our feeling of moral excellence, in like manner, is not the mere perception of different actions, or the discovery of the physical good which these may produce; it is an emotion of a very different kind, a light within our breast, from

which, as from the very effulgence of the purest of all truths,

*Is human fortune gladden'd with the rays
Of Virtue, with the moral colours thrown
On every walk of this our social scene;
Adorning for the eye of gods and men
The passions, actions, habits of life,
And rendering earth, like heaven, a sacred place,
Where love and praise may take delight to dwell.**

That we do feel this approbation of certain actions, and disapprobation of certain other actions, no one denies. But the feeling is, by many sophistical moralists, ascribed wholly to circumstances that are accidental, without any greater original tendency of the mind to feel, in different circumstances of human action, one or other of these emotions. If man could be born with every faculty in its highest excellence, capable of distinguishing all the remote as well as all the immediate consequences of actions, but free from the prejudices of education, he would, they suppose, look with equal moral love, or rather, with uniform and equal indifference of regard, on him who has plunged a dagger in the breast of his benefactor, and on him who has risked his own life for the preservation of his enemy. There are philosophers, and philosophers too who consider themselves peculiarly worthy of that name, from the nicety of their analysis of all that is complex in action, who can look on the millions of millions of mankind, in every climate and age, mingling together in a society that subsists only by the continued belief of the moral duties of all to all, who can mark everywhere sacrifices made by the generous, to the happiness of those whom they love, and everywhere an admiration of such sacrifices,—not the voices of the timid and the ignorant only mingling in the praise, but warriors, statesmen, poets, philosophers, bearing with the peasant and the child, their united testimonies to the great truth, that man is virtuous in promoting the happiness of man: there are minds which can see and hear all this, and which can turn away, to seek in some savage island, a few indistinct murmurs that may seem to be discordant with the whole great harmony of mankind!

When an inquirer of this class, after perusing every narrative of every nation in every part of the globe, with a faith for all that is monstrous in morality, as ready as his disbelief of prodigies in physics less marvellous, which the same voyagers and travellers relate, has collected his little stock of facts, or of reports which are to him as facts, he comes forward in the confidence of overthrowing with these the whole system of public morals, as far as that system is supposed to be founded on any original moral difference of actions. He finds, indeed, everywhere else parricide

* Pleasures of Imagination, second form of the poem, book ii. v. 151—157.

looked upon with abhorrence; but he can prove this to be wholly accidental, because he has found, on some dismal coast, some miserable tribe in which it is customary to put the aged to death when very infirm, and in which the son is the person who takes upon him this office. For almost every virtue which the world acknowledges as indicated to us by the very constitution of our social nature; he has, in like manner, some little fact which proves the world to be in an error. Some of these he finds even in the stages of civilized life. What is right on one side of a mountain is wrong on the opposite side of it; and a river is sometimes the boundary of a virtue as much as of an empire. "How, then, can there be any fixed principles of morality," he says, "when morality itself seems to be incessantly fluctuating?"

Morality is incessantly fluctuating; or rather, according to this system, there is no morality, at least no natural tendency to the distinction of actions as moral or immoral, and we have only a few casual prejudices which we have chosen to call virtues: prejudices which a slight difference of circumstance might have reversed, making the lover of mankind odious to us, and giving all our regard to the robber and the murderer. We prefer, indeed, at present, Aurelius to Caligula; but a single prejudice more or less, or at least a few prejudices additional, might have made Caligula the object of universal love; to which his character is in itself as well entitled as the character of that philosophic emperor, who was as much an honour to philosophy as to the imperial purple. And in what world is this said? In a world in which Caligula has never had a single admirer, in all the multitudes to whom his history has become known: a world in which, if we were to consider the innumerable actions that are performed in it at any one instant, we should be wearied with counting those which furnish evidence of the truth of moral distinctions, by the complacency of virtue or the remorse of vice; and the general admiration, or disgust and abhorrence with which the virtue, when known to others, is loved, and the vice detested, long before we should be able to discover a single action that, in the contrariety of general sentiment with respect to it, might furnish even one feeble exception.

Some apparent exceptions, however, it must still be allowed, the moral scene does truly exhibit. But are they, indeed, proofs of the absolute original indifference of all actions to our regard? Or do they not merely seem to be exceptions, because we have not made distinctions and limitations which it was necessary to make?

It often happens that, by contending for too much in a controversy, we fail to estab-

lish truths that appear doubtful, only because they are mingled with doubtful or false propositions, for which we contend as strenuously as for the true. This, I think, has taken place, in some degree in the great controversy as to morals. In our zeal for the absolute immutability of moral distinctions, we have made the argument for original tendencies to moral feeling appear less strong by extending it too far; and facts, therefore, have seemed to be exceptions which could not have seemed to be so, if we had been a little more moderate in our universal affirmation.

Let us consider, then, what the species of accordance is for which we may safely contend.

That virtue is nothing in itself, but is only a general name for certain actions, which agree in exciting, when contemplated, a certain emotion of the mind, I trust I have already sufficiently shown. There is no virtue; no voice, but there are virtuous agents, vicious agents; that is to say, persons whose actions we cannot contemplate without a certain instant emotion; and what we term the law of nature, in its relation to certain actions, is nothing more than the general agreement of this sentiment in relation to those actions. In thinking of virtue, therefore, it is evident that we are not to look for any thing self-existing, like the universal essences of the schools, and eternal like the Platonic ideas; but a felt relation, and nothing more. We are to consider only agents, and the emotions which these agents excite; and all which we mean by the moral differences of actions, is their tendency to excite one emotion rather than another.

Virtue, then, being a term expressive only of the relation of certain actions, as contemplated, to certain emotions in the minds of those who contemplate them, cannot, it is evident, have any universality beyond that of the minds in which these emotions arise. We speak always, therefore, relatively to the constitution of our minds, not to what we might have been constituted to admire if we had been created by a different Being, but to what we are constituted to admire, and what, in our present circumstances, approving or disapproving with instant love or abhorrence, it is impossible for us not to believe to be, in like manner, the objects of approbation or disapprobation to him who has endowed us with feelings so admirably accordant with all those other gracious purposes which we discover in the economy of nature.

Virtue, however, is still, in strictness of philosophic precision, a term expressive only of the relation of certain emotions of our mind to certain actions that are contemplated by us: its universality is coextensive with the minds in which the emotions arise, and

this is all which we can mean by the essential distinctions of morality, even though all mankind were supposed by us, at every moment, to feel precisely the same emotions on contemplating the same actions.

But it must be admitted, also, that all mankind do not feel at every moment precisely the same emotions on contemplating actions that are precisely the same; and it is necessary, therefore, to make some limitations even of this relative universality.

In the first place, it must be admitted that there are moments in which the mind is wholly incapable of perceiving moral differences; that is to say, in which the emotions that constitute the feeling of these moral differences do not arise. Such are all the moments of very violent passion. When the impetuosity of the passion is abated, indeed, we perceive that we have done what we now look upon with horror, but when our passion was most violent, we were truly blinded by it, or at least saw only what it permitted us to see. The moral emotion has not arisen, because the whole soul was occupied with a different species of feeling. The moral distinctions, however, or general tendencies of actions to excite this emotion, are not on this account less certain; or we must say, that the truths of arithmetic, and all other truths, are uncertain, since the mind, in a state of passion, would be equally incapable of distinguishing these. He who has lived for years in the hope of revenge, and who has at length laid his foe at his feet, may, indeed, while he pulls out his dagger from the heart that is quivering beneath it, be incapable of feeling the crime which he has committed; but would he at that moment be able to tell the square of four, or the cube of two? All in his mind, at that moment, is one wild state of agitation, which allows nothing to be felt but the agitation itself.

"While the human heart is thus agitated," it has been said, "by the flux and reflux of a thousand passions, that sometimes unite and sometimes oppose each other, to engrave laws on it, is to engrave them not on sand, but on a wave that is never at rest. What eyes are piercing enough to read the sacred characters?"

"Vain declamation!" answers the writer from whom I quote. "If we do not read the characters, it is not because our sight is too weak to discern them, it is because we do not fix our eyes on them; or if they be indistinguishable, it is only for a moment."

"The heart of man," he continues, "may be considered, allegorically, as an island almost level with the water which bathes it. On the pure white marble of the island are engraved the holy precepts of the law of nature. Near these characters is one who bends his eyes respectfully on the inscrip-

tion, and reads it aloud. He is the lover of Virtue, the Genius of the island. The water around is in continual agitation. The slightest zephyr raises it into billows. It then covers the inscription. We no longer see the characters. We no longer hear the Genius read. But the calm soon rises from the bosom of the storm. The island reappears white as before, and the Genius resumes his employment."

That passion has a momentary influence in blinding us to moral distinctions, or, which is the same thing, an influence to prevent the rise of certain emotions, that, but for the stronger feeling of the passion itself, would arise, may then be admitted; but the influence is momentary, or little more than momentary, and extends, as we have seen, even to those truths which are commonly considered as best entitled to the appellation of universal. The moral truths, it must be allowed—if I may apply the name of truths to the felt moral differences of actions—are, to the impassioned mind, as little universal as the truths of geometry.

Another still more important limitation of the universality for which we contend, relates to actions which are so complex as to have various opposite results of good and evil, or of which it is not easy to trace the consequences. An action, when it is the object of our moral approbation or disapprobation, is, as I have already said, the agent himself acting with certain views. These views, that is to say the intention of the agent, are necessary to be taken into account, or, rather, are the great moral circumstances to be considered; and the intention is not visible to us like the external changes produced by it, but is, in many cases, to be inferred from the apparent results. When these results, therefore, are too obscure or too complicated to furnish clear and immediate evidence of the intention, we may pause in estimating actions which we should not fail to have approved instantly, or disapproved instantly, if we had known the intention of the agent, or could have inferred it more easily from a simpler result; or by fixing our attention chiefly on one part of the complex result, that was perhaps not the part which the agent had in view, we may condemn what was praiseworthy, or applaud what deserved our condemnation. If the same individual may thus have different moral sentiments, according to the different parts of the complex result on which his attention may have been fixed, it is surely not wonderful that different individuals, in regarding the same action, should sometimes approve in like manner, and disapprove variously, not because the principle of moral emotion, as an original tendency of the mind, is absolutely capricious, but because the action considered, though apparently the same, is really different as an object of conception in different

minds, according to the parts of the mixed result which attract the chief attention.

Such partial views, it is evident, may become the views of a whole nation, from the peculiar circumstances in which the nation may be placed as to other nations, or from peculiarity of general institutions. The legal permission of theft in Sparta, for example, may seem to us, with our pacific habits, and security of police, an exception to that moral principle of disapprobation for which I contend. But there can be no doubt that theft, as mere theft,—or, in other words, as a mere production of a certain quantity of evil by one individual to another individual,—if it never had been considered in relation to any political object, would in Sparta also have excited disapprobation as with us. As a mode of inuring to habits of vigilance a warlike people, however, it might be considered in a very different light; the evil of the loss of property, though in itself an evil to the individual, even in a country in which differences of property were so slight, being nothing in this estimate when compared with the more important national accession of military virtue; and, indeed, the reason of the permission seems to be sufficiently marked, in the limitation of the impunity to cases in which the aggressor escaped detection at the time. The law of nature, the law written in the heart of man, then came again into all its authority; or rather, the law of nature had not ceased to have authority, even in those permissions which seemed to be directly opposed to it; the great object, even of those anomalous permissions, being the happiness of the state, the pursuit of which nature points out to our approbation in the same manner, though not with such vivid feelings, as she points out to us for approbation the endeavour to render more happy the individuals around us. It would be a very interesting inquiry to consider, in this way, all those instances which have been adduced as exceptions to natural law, and to detect the circumstances of real or supposed good accompanying the evil permitted, for which the evil itself might in many cases seem to have been permitted; or which, at least, lessened so much the result of evil, in the eyes of those who considered it in the particular circumstances of the age and country, that a very slight temptation might overcome the disapprobation of it, as we find at present in our civilized society, many evils tolerated, not because they are not considered to be evil, but because the evil seems so slight as not to imply any gross disregard of morality. This minute analysis of the instances alleged, however, though it might not be difficult to discover in every case some form of good, which, in the mixed result of good and evil, was present to the approver's mind, my limits will not allow me to

extend; but there is one general remark which may in some measure supply the place of more minute discussion, since it may almost be said to convert these very instances into proofs of that general accordance of moral sentiment, in disproof of which they are adduced.

When these supposed exceptions are tolerated, why is it that they are tolerated? Is it on account of the benefit or of the injury that coexist in one complex mixture? Is it said, for example, by the ancient defenders of suicide, that it is to be commended because it deprives mankind of the further aid of one who might still be useful to society, or because it will give sorrow to every relation and friend, or because it is a desertion of the charge which Heaven has assigned to us? It is for reasons very different that it is said by them to be allowable; because the circumstances, they say, are such as seem of themselves to point out that the Divine Being has no longer occasion for our service on earth, and because our longer life would be only still greater grief or disgrace to our friends, and a burden rather than an aid to society. When the usages of a country allow the exposure of infants, is it not still for some reason of advantage to the community, falsely supposed to require it, that the permission is given? Or is it for the mere pleasure of depriving the individual infant of life, and of adding a few more sufferings to the general sufferings of humanity? Where is the land that says, Let misery be produced or increased, because it is misery? Let the production of happiness to an individual be avoided, because it is happiness? Then, indeed, might the distinctions of morality in the emotions which attend the production of good and evil, be allowed to be wholly accidental. But if nature has everywhere made the production of good desirable for itself, and the production of evil desirable, when it is desired and approved, only because it is accompanied, or supposed to be accompanied, with good, the very desire of the compound of good and evil, on this account, is itself a proof, not of love of evil, but of love of good. It is pleasing thus to find nature in the wildest excesses of savage ignorance, and in those abuses to which the imperfect knowledge even of civilized nations sometimes gives rise, still vindicating, as it were, her own excellence,—in the midst of vice and misery asserting still those sacred principles which are the virtue and the happiness of nations,—principles of which that very misery and vice attest the power, whether in the errors of multitudes who have sought evil for some supposed good, or in the guilt of individuals, who, in abandoning virtue, still offer to it an allegiance which it is impossible for them to withhold in the homage of their remorse.

It never must be forgotten, in estimating the moral impression which actions produce, that an action is nothing in itself; that all which we truly consider in it is the agent placed in certain circumstances, feeling certain desires, willing certain changes; and that our approbation and disapprobation may therefore vary, without any fickleness on our part, merely in consequence of the different views which we form of the intention of the agent. In every complicated case, therefore, it is so far from wonderful that different individuals should judge differently, that it would indeed be truly wonderful if they should judge alike, since it would imply a far nicer measurement than any of which we are capable, of the mixed good and evil of the complex results of human action, and a power of discerning what is secretly passing in the heart, which man does not possess, and which it is not easy for us to suppose man, in any circumstances, capable of possessing.

In complicated cases, then, we may approve differently, because we are in truth incapable of distinguishing all the moral elements of the action, and may fix our attention on some of these, to the exclusion of others. Our taste, in like manner, distinguishes what is sweet and what is bitter, when these are simply presented to us; and there are substances which are no sooner put in the little mouth of the infant than he seems to feel from them pleasure or pain. He distinguishes the sweet from the bitter, as he distinguishes them in after-life. Who is there who denies that there is, in the original sensibility of the infant, a tendency to certain preferences of this kind; that there are substances which are naturally agreeable to the taste, substances which are naturally disagreeable, and that it requires no process of education, no labour of years, no addition of prejudice after prejudice, to make sugar an object of desire to the child, and wormwood of disgust? Yet in the luxury of other years, there are culinary preparations which the taste of some approves, while the taste of others rejects them; and in all of which it is difficult to distinguish the prevailing element, whether acid, austere, sweet, bitter, aromatic. If the morals of nations differed half as much as the cookery of different nations, we might allow some cause for disbelief of all the natural distinctions of right and wrong. But what sceptic is there who contends, from the approbation which one nation gives to a sauce or a ragout, which almost sickens him, that the sweet does not naturally differ from the bitter, as more agreeable, the aromatic from the insipid; and that, to the infant, sugar, wormwood, spice, are, as sources of pleasure, essentially the same?

We approve of what we know, or suppose ourselves to know, and we approve accord-

ing as we know or suppose, not according to circumstances which truly exist, but which exist unobserved by us and unsuspected. It is not contended that we come into the world with a knowledge of certain actions, which we are afterwards to approve or disapprove, for we enter into the world ignorant of every thing which is to happen in it; but that we come into existence with certain susceptibilities of emotion, in consequence of which it will be impossible for us, in after-life, but for the influence of counteracting circumstances, momentary or permanent, not to be pleased with the contemplation of certain actions, as soon as they have become fully known to us, and not to have feelings of disgust on the contemplation of certain other actions. I am astonished, therefore, that Paley, in stating the objection, "that, if we be prompted by nature to the approbation of particular actions, we must have received also from nature a distinct conception of the action we are thus prompted to approve, which we certainly have not received," should have stated this as an objection, to which "it is difficult to find an answer," since there is no objection to which the answer is more obvious. There is not a feeling of the mind, however universal, to the existence of which precisely the same objection might not be opposed. There is no part of the world, for example, in which the proportions of number and quantity are not felt to be the same. Four are to twenty as twenty to a hundred, wherever those numbers are distinctly conceived; but though we come into the world capable of feeling the truth of this proportion, when the numbers themselves shall have been previously conceived by us, no one surely contends that it is necessary, for this capacity, that we should come into the world with an accurate knowledge of the particular numbers. The mind is, by its original constitution, capable of feeling all the sensations of colour, when different varieties of light are presented to the eye; and it has this original constitution, without having the actual sensations which are to arise only in certain circumstances that are necessary for producing them, and which may never, therefore, be states of the mind, if the external organ of vision be imperfect. Even the boldest denier of every original distinction of vice and virtue must still allow, that we do at present look with approbation on certain actions, with disapprobation on other actions; and that, having these feelings, we must by our original constitution, have been capable of the feelings; so that, if the mere capacity were to imply the existing notions of the actions that are to be approved or disapproved, he would be obliged, if this objection had any weight, to allow that, on his own principles, we must equally have innate notions of right and wrong which we have

not, or that we feel certain emotions which we yet had no capacity of feeling. But on an objection which appears to me so very obviously futile, it is idle to dwell so long.

We have made, then, two limitations of that universality and absolute uniformity of moral sentiment for which some ethical writers have too strongly contended; in the first place, when the mind is, as it were, completely occupied, or hurried away by the violence of extreme passion; and, in the second place, when the action which we consider is not the simple intentional production of good as good, or of evil as evil, in certain definite circumstances, but when the result that has been willed is a mixture of good and evil, which it is difficult to discriminate, and in which the good may occur to some minds more readily, the evil to other minds; or in different stages of society, or different circumstances of external or internal situation, the good may be more or less important, and the evil more or less important, so as to have a higher relative interest than it otherwise would have possessed.

To these two limitations it is necessary to add a third, that operates very powerfully and widely on our moral estimates,—the influence of the principle of association. We are not to suppose, that because man is formed with the capacity of certain moral emotions, he is therefore to be exempt from the influence of every other principle of his constitution. The influence of association, indeed, does not destroy his moral capacity, but it gives it new objects, or at least varies the object in which it is to exercise itself, by suggesting with peculiar vividness certain accessory circumstances, which may variously modify the general sentiment that results from the contemplation of particular actions.

One very extensive form of the influence of association on our moral sentiments, is that which consists in the application to particular cases of feelings that belong to a class. In nature there are no classes. There are only particular actions, more or less beneficial or injurious. But we cannot consider these particular actions long, without discovering in them, as in any other number of objects that may be considered by us at the same time, certain relations of analogy or resemblance of some sort, in consequence of which we class them together, and form for the whole class one comprehensive name. Such are the generic words justice, injustice, malevolence, benevolence. To these generic words, which, if distinguished from the number of separate actions denoted by them, are mere words, invented by ourselves, we gradually, from the influence of association in the feelings that have attended the parti-

cular cases to which the same name has been applied, attach one mixed notion, a sort of compound, or modified whole, of the various feelings which the actions separately would have excited, more vivid, therefore, than what would have arisen on the contemplation of some of these actions, less vivid than what others might have excited. It is enough that an action is one of a class which we term unjust; we feel instantly not the mere emotion which the action of itself would originally have excited, but we feel also that emotion which has been associated with the class of actions to which the particular action belongs; and though the action may be of a kind which, if we had formed no general arrangement, would have excited but slight emotion, as implying no very great injury produced or intended, it thus excites a far more vivid feeling, by borrowing, as it were, from other analogous and more atrocious actions, that are comprehended under the same general term, the feeling which they would originally have excited. It is quite evident, for example, that in a civilized country, in which property is largely possessed, and complicated in its tenure, and as in the various modes in which it may be transferred, the infringement of property must be an object of peculiar importance, and what is commonly termed justice, in regard to it, be a virtue of essential value, and injustice a crime against which it is necessary to prepare many checks, and which is thence regarded as of no slight delinquency. The offence of the transgressor is estimated, in such a case, not by the little evil which, in any particular case, he may intentionally have occasioned to another individual, but in a great degree also by the amount of evil which would arise in a system of society constituted as that of the great nations of Europe is constituted, if all men were to be equally regardless of the right of property in others. When we read, therefore, of the tendency to theft, in many barbarous islanders of whom navigators tell us, and of the very little shame which they seemed to feel on detection of their petty larcenies, we carry along with us our own classes of actions, and the emotions to which our own general rules, resulting from our own complicated social state, have given rise. We forget, that to those who consider an action simply as it is, the guilt of an action is an object that is measured by the mere amount of evil intentionally produced in the particular case; and that the theft which they contemplate is not, therefore, in its moral aspect, the same offence that is contemplated by us. I need not trace out, in other cases, the influence of general rules, which you must be able to trace with sufficient precision for yourselves.

Such, then, is one of the modes in which

association operates. But it is not in general rules alone that the influence of the associating principle is to be traced. It extends in some degree to all our moral feelings. There is no education, indeed, which can make the pure benevolence of others hateful to us, unless by that very feeling of our own inferiority which implies in envy itself our reverence, and consequently our moral approbation of what we hate; no education which can make pure deliberate malice in others an object of our esteem. But if there be any circumstances accompanying the benevolence and malice, which tend to the disparagement of the one and the elevation of the other, the influence of association may be excited powerfully, in this way, by fixing our attention more vividly on these slight accompanying circumstances. The fearlessness which often attends vice, may be raised into an importance beyond its merit, in savage ages, in which fearlessness is more important for the security of the state, and in which power and glory seem to wait on it; the yielding gentleness of benevolence may, in such circumstances, appear timidity, or at least a degree of softness unworthy of the perfect man. In like manner, when a vice is the vice of those whom we love,—of a friend, a brother, a parent,—the influence of association may lessen and overcome our moral disapprobation, not by rendering the vice in itself an object of our esteem, but by rendering it impossible for us to feel a vivid disapprobation of those whom we love, and mingling, therefore, some portion of this very regard in our contemplation of all their actions. It is because we have the virtue of loving our benefactor, or friend, or parent, that we seem not to feel in so lively a manner the unworthiness of that vice which is partly lost to our notice, in the general emotion of our gratitude. But when we strip away these illusions, or when the vice is pure intentional malice, which no circumstance of association can embellish, it is equally impossible for us to look upon it with esteem, as it is impossible for us to turn away with loathing from him whose whole existence seems to be devoted to the happiness of others, and to rejoice, as we look upon him, that we are not what he is.

*Itē ipsi in vestrae penetralia mentis et intus
Incisae apices, et scripta volumina mentis
Inspicite, et genitum vobiscum agnoscite legem.
Quis vitis adeo stolidē oblectatur apertis,
Ut quod agit velit ipse pati? Mendacia fallax,
Furta rapax, furiosum atrox, homicida cruentum
Damnāt, et in moechum gladios dstringit adulter.
Ergo omnes una in vita cum lege creati
Venimus, et fibris gerimus quae condita libris.*

I have made these limitations, because it appears to me that much confusion on the subject of morals has arisen from inattention to these, and from the too great claims which

have sometimes been made by the assertors of what they have termed immutable morality. The influence of temporary passion,—of the complication of good with evil, and of evil with good, in one mixed result,—and of general or individual associations, that mingle with these complex results some new elements of remembered pain or pleasure, dislike or regard, it seems to me absurd to attempt to deny. But, admitting these indisputable influences, it seems to me equally unreasonable not to admit the existence of that original susceptibility of moral emotion which precedes the momentary passion, and outlasts it; which, in admiring the complex result of good and evil, admires always some form of good, and which is itself the source of the chief delights or sorrows which the associations of memory furnish as additional elements in our moral estimate.

LECTURE LXXV.

RETROSPECT OF LAST LECTURE.—THE PRIMARY DISTINCTIONS OF MORALITY IMPLANTED IN EVERY HUMAN HEART, AND NEVER COMPLETELY EFFACED.

GENTLEMEN, having traced, in a former Lecture, our notions of virtue, obligation, merit, to one simple feeling of the mind,—a feeling of vivid approval of the frame of mind of the agent, which arises on the contemplation of certain actions, and the capacity of which is as truly essential to our mental constitution, as the capacity of sensation, memory, reason, or of any of the other feelings of which our mind is susceptible, I considered in my last Lecture, the arguments in opposition to this principle, as an original tendency of the mind, drawn from some apparent irregularities of moral sentiment in different ages and countries.

For determining the force of such instances, however, as objections to the original distinctions of morality, it was necessary to consider precisely what is meant by that general accordance of moral sentiment, which the world may be considered as truly exhibiting. It is only by contending for more than the precise truth, that, in many instances, we furnish its opponents with the little triumphs which seem to them like perfect victory. We give to the truth itself an appearance of doubtfulness, because we have combined it with what is doubtful, or perhaps altogether false.

In the first place, the language which the assertors of virtue are in the habit of employing, when they speak of the eternity and absolute immutability of moral truth, might almost lead to the belief of something self-

existing, which could not vary in any circumstances, nor be less powerful at any moment than at any other moment. Virtue, however, it is evident, is nothing in itself, but is only a general name for certain actions, which excite, when contemplated by us, certain emotions. It is a felt relation to certain emotions, and nothing more, with no other universality, therefore, than that of the minds in which, on the contemplation of the same actions, the same emotions arise. We speak always of what our mind is formed to admire or hate, not of what it might have been formed to estimate differently; and the supposed immutability, therefore, has regard only to the existing constitution of things under that Divine Being who has formed our social nature as it is, and who, in thus forming it, may be considered as marking his own approbation of that virtue which we love, and his own disapprobation of that vice which he has rendered it impossible for us not to view with indignation or disgust.

Such is the moderate sense of the absolute immutability of virtue, for which alone we can contend; a sense in which virtue itself is supposed to become known to us as an object of our thought only, in consequence of certain emotions which it excites, and with which it is coextensive and commensurable; but, even in this moderate sense, it was necessary to make some limitations of the uniformity of sentiment supposed; since it is abundantly evident, that the same actions, that is to say, the same agents, in the same circumstances, willing and producing the same effects, are not regarded by all mankind with feelings precisely the same, nor even with feelings precisely the same by the same individual in every moment of his life.

The first limitation which I made relates to the moments in which the mind is completely occupied and absorbed in other feelings; when, for example, it is under the temporary influence of extreme passion, which incapacitates the mind for perceiving moral distinctions as it incapacitates it for perceiving distinctions of every sort. Virtue, though lost to our perception for a moment, however, is immediately perceived again with distinct vision as before, as soon as the agitation subsides. It is like the image of the sky on the bosom of a lake, which vanishes, indeed, while the waters are ruffled, but which reappears more and more distinctly, as every little wave sinks gradually to rest, till the returning calm shows again, in all its purity, the image of that Heaven which has never ceased to shine on it.

The influence of passion, then, powerful as it unquestionably is in obstructing those peculiar emotions in which our moral discernment consists, is limited to the short

period during which the passion rages. We are then as little capable of perceiving moral differences, as we should be, in the same circumstances, of distinguishing the universal truths of geometry; and in both cases, from the same law of the mind,—that general law, by which one very vivid feeling of any sort lessens in proportion the vividness of any other feeling that may coexist with it, or, in other cases, prevents the rise of feelings that are not accordant with the prevailing emotion, by inducing, in more ready suggestion, the feelings that are accordant with it.

The next limitation which we made is of more consequence, as being far more extensive, and operating, therefore, in some degree, in almost all the moral estimates which we form. This second limitation relates to cases in which the result of actions is complicated by a mixture of good and evil, and in which we may fix upon the good, when others fix on the evil, and may infer the intention in the agent of producing this good, which is a part of the mixed result, while others may conceive him to have had in view the partial evil. The same actions, therefore, may be approved and disapproved in different ages and countries, from the greater importance attached to the good or to the evil of such compound results, in relation to the general circumstances of society, or the influence perhaps of political errors, as to the consequences of advantage or injury to society of these particular actions; and, in the same age, and the same country, different individuals may regard the same action with very different moral feelings, from the higher attention paid to certain partial results of it, and the different presumptions thence formed as to the benevolent or injurious intentions of the agent. All this, it is evident, might take place without the slightest mutability of the principle of moral sentiments; because, though the action which is estimated may seem to be the same in the cases in which it is approved and condemned, it is truly a different action which is so approved and condemned; a different action in the only sense in which an action has any meaning, as signifying the agent himself having certain views, and willing, in consequence, certain effects of supposed benefit or injury.

A third limitation, often co-operating with the former, relates to the influence of habit and association in general, whether as extending to particular actions the emotions that have been gradually connected with the whole class of actions under which they have been arranged, or as modifying the sentiments of individuals by circumstances peculiar to the individuals themselves. It is pleasing to love those who are around us; it is pleasing, above all, to love our immediate friends, and those domestic relations to whom we owe our being, or to whose society, in the

first friendships which we were capable of forming, before our heart had ventured from the little world of home into the great world without, we owed the happiness of many years, of which we have forgotten every thing but that they were delightful. It is not merely pleasing to love these first friends; we feel that it is a duty to love them; that is to say, we feel that, unless in circumstances of extraordinary profligacy on their part, if we were not to love them, we should look upon ourselves with moral disapprobation. The feeling of this very duty mingles in our estimates of the conduct of those whom we love; and it is in this way that association in such cases operates; not by rendering vice in itself less an object of disapprobation than before, but by blending with our disapprobation of the action that love of the agent, which is, as it were, an opposite duty. It is the good which is mixed with the bad that we love, not the bad which is mixed with the good; and the primary and paramount love of the good and hatred of the bad remain; though we may seem, in certain cases, to love the one less or more, to hate the other less or more, in consequence of the vivid images which association affords to heighten or reduce the force of the opposite sentiment, when the actions of which we approve or disapprove have a resemblance to the actions of those who have loved or made us happy; whose love, therefore, and the consequent happiness produced by them, arise, perhaps, to our mind at the very moment at which the similar action is contemplated by us.

These three limitations, then, we must make; limitations, the necessity of which it would have been natural for us to anticipate, though no objections had been urged to the original differences of actions as objects of moral sentiment. But, making these limitations,—to some one or other of which the apparent anomalies may, I conceive, be referred,—do we not leave still unimpaired the great fundamental distinctions of morality itself; the moral approbation of the producer of unmixed good as good, the moral disapprobation of him who produces unmixed evil for the sake of evil? Where moral good and evil mix, the emotions may, indeed, be different; but they are different, not because the production of evil is loved as the mere production of evil, and the production of good hated as the mere production of good; it is only because the evil is tolerated for the good which is loved, and the good, perhaps, in other cases, forgotten or unremarked, in the abhorrence of the evil which accompanies it. When some country is found, in which the intentional producer of pure unmixed misery is preferred, on that very account, to the intentional producer of as much good as an individual is capable of producing,—some

country, in which it is reckoned more meritorious to hate than to love a benefactor, merely for being a benefactor, and to love rather than to hate the betrayer of his friend, merely for being the betrayer of his friend,—then may the distinctions of morality be said to be as mutable, perhaps, as any other of the caprices of the most capricious fancy. But the denier of moral distinctions knows well, that it is impossible for him to prove the original indifference of actions in this way. He knows that the intentional producer of evil, as pure evil, is always hated, the intentional producer of good, as pure good, always loved; and he flatters himself, that he has succeeded in proving, by an easier way, that we are naturally indifferent to what the prejudiced term moral good and evil, merely by proving, that we love the good so very much, as to forget, in the contemplation of it, some accompanying evil; and hate the evil so very much, as to forget, in the contemplation of it, some accompanying good.

One of our most popular moralists begins his inquiry into the truth of the natural distinctions of morality, by quoting from Valerius Maximus, an anecdote of most atrocious profligacy, which, he supposes, related to a savage, who had been "cut off in his infancy from all intercourse with his species, and consequently, under no possible influence of example, authority, education, sympathy, or habit; and whose feelings, therefore, in hearing such a relation, if it were possible for us to ascertain what the feelings of such a mind would be, he would consider as decisive of the question." I quote the story as he has translated it.

"The father of Caius Toranius had been proscribed by the Triumvirate. Caius Toranius, coming over to the interests of that party, discovered to the officers who were in pursuit of his father's life, the place where he had concealed himself, and gave them a description by which they might distinguish his person. The old man, more anxious for the safety and fortunes of his son, than about the little that might remain of his own life, began immediately to inquire of the officers who seized him, whether his son was well, whether he had done his duty to the satisfaction of his generals. 'That son,' replied one of the officers, 'that son, so dear to thy affections, betrayed thee to us. By his information thou art apprehended and diest.' The officer, with this, struck a poniard to the old man's heart; and the unhappy parent fell, not so much affected by his fate, as by the means to which he owed it." *Auctore caedis quam ipsa caede miserior.**

It is necessary, for the very supposition

* Paley's Moral Philosophy.

which is made, that the savage should understand, not merely what is meant by the simple relations of son and father, and all the consequences of the treachery of the son, but that he should know also the additional interest which the paternal and filial relation, in the whole intercourse of good offices from infancy to manhood, receives from this continued intercourse. The author of our mere being is not all which a father in such circumstances is; he is far better known and loved by us as the author of our happiness in childhood and youth, and the venerable friend of our maturer years. If the savage, knowing this relation in its fullest extent, could yet feel no different emotions of moral regard and dislike, for the son and for the father, it would be easier to suppose, that a life of total privation of society had dulled his natural susceptibilities of emotion, than that he was originally void of these. But what reason is there to imagine, that, with this knowledge, he would not have the emotions which are felt by every human being to whom this story is related? It is easy to assert, that knowing every relation of a son and father, as well as the consequence of the action, the savage would not feel what every other human being feels, because it is easy to assume, by begging the question, any point of controversy. But where is the proof of the assertion? We cannot verify the supposition by exact experiment, indeed, for such a savage, so thoroughly exempted from every social prejudice, is not to be found, and could not be made to understand the story even if he were found. But, though we cannot have the perfect experiment, we may yet have an approximation to it. Every infant that is born may be considered very nearly as such a savage; and as soon as the child is capable of knowing the very meaning of the words, without feeling half the force of the filial relation, he shudders at such a tale, with as lively abhorrence, perhaps, as in other years, when his prejudices and habits, and every thing which is not originally in his constitution, may be said to be matured.

We can imagine vessels sent on voyages of benevolence, to diffuse over the world the blessings of a pure religion, we can imagine voyages of this kind to diffuse the improvements of our sciences and arts. But what should we think of a voyage, of which the sole object was to teach the world that all actions are not, in the moral sense of the term, absolutely indifferent, and that those who intentionally do good to the society to which they belong, or to any individual of that society, ought to be objects of greater regard than he whose life has been occupied in plans to injure the society in general, or at least as many individuals of it as his power could reach? What shore is there at

which such a vessel could arrive, however barren the soil, and savage the inhabitants, where these simple doctrines, which it came to diffuse, could be regarded as giving any instruction? The half-naked animal, that has no hut in which to shelter himself, no provision beyond the precarious chase of the day, whose language of numeration does not extend beyond three or four, and who knows God only as something which produces thunder and the whirlwind, even this miserable creature, at least as ignorant as he is helpless, would turn away from his civilized instructors with contempt, as if he had not heard any thing of which he was not equally aware before. The vessel which carried out these simple primary essential truths of morals might return as it went. It could not make a single convert, because there would not have been one who had any doubts to be removed. If, indeed, instead of teaching these truths, the voyagers had endeavoured to teach the natives whom they visited the opposite doctrine, as to the absolute moral indifference of actions, there could then be little doubt that they might have taught something new, whatever doubt there might justly be as to the number of the converts.

When Labienus, after urging to Cato a variety of motives, to induce him to consult the oracle of Ammon, in the neighbourhood of whose temple the little army had arrived, concludes with urging a motive which he supposed to have peculiar influence on the mind of that great man, that he should at least make use of the opportunity of inquiring of a being who could not err, what it is which constitutes that moral perfection which a good man should have in view for the guidance of his life,

Saltem virtutis amator

Quaere quid est virtus, et posce exemplar honesti,

how sublimely does the answer to this solicitation express the omnipotent divinity of virtue!

Ille Deo plenus, tacita quem mente gerebat,
Effudit dignas adytis e pectore voces.
Quid quaeri, Labiene, jubes? An liber in armis
Occubuisse velim potius, quam regna videre?
An noceat vis ulla bono? Fortunaeque perdat
Opposita virtute minas? Laudandaque velle
Sit satis, et nunquam successu crescat honestum?
Scimus, et hoc nobis non altius inseret Ammon.
Haeremus cuncti Superis, templaque tacent,
Nil facimus non sponte Dei; nec vocibus ullis
Numen eget: dixitque semel nascentibus auctor
Quicquid scire licet: sterilis nec legit arenas,
Ut caneret paucis, mersitque hoc pulvere verum.*

"Cast your eyes," says Rousseau, "over all the nations of the world, and all the histories of nations. Amid so many inhuman and absurd superstitions, amid that prodigious diversity of manners and characters,

* Lucani Pharsalia, lib. ix. v. 563—567, and 569—577.

you will find every where the same principles and distinctions of moral good and evil. The Paganism of the ancient world produced, indeed, abominable gods, who on earth would have been shunned or punished as monsters, and who offered as a picture of supreme happiness, only crimes to commit, and passions to satiate. But vice, armed with this sacred authority, descended in vain from the eternal abode: she found, in the heart of man, a moral instinct to repel her. The continence of Xenocrates was admired by those who celebrated the debaucheries of Jupiter—the chaste Lucretia adored the unchaste Venus—the most intrepid Roman sacrifice to fear. He invoked the God who dethroned his father, and he died without a murmur by the hand of his own. The most contemptible divinities were served by the greatest men. The holy voice of Nature, stronger than that of the gods, made itself heard, and respected, and obeyed on earth, and seemed to banish, as it were, to the confinement of Heaven, guilt and the guilty.”

There is, indeed, to borrow Cicero's noble description, one true and original law, conformable to reason and to nature, diffused over all, invariable, eternal, which calls to the fulfilment of duty and to abstinence from injustice, and which calls with that irresistible voice which is felt in all its authority wherever it is heard. This law cannot be abolished or curtailed, nor affected in its sanctions by any law of man. A whole senate, a whole people, cannot dispense from its paramount obligation. It requires no commentator to render it distinctly intelligible, nor is it different at Rome, at Athens, now, and in the ages before and after; but in all ages, and in all nations, it is, and has been, and will be, one and everlasting—one as that God, its great author and promulgator, who is the common Sovereign of all mankind, is himself one. Man is truly man, as he yields to this divine influence. He cannot resist it, but by flying as it were from his own bosom, and laying aside the general feelings of humanity; by which very act he must already have inflicted on himself the severest of punishments, even though he were to avoid whatever is usually accounted punishment. “*Est quidem vera lex, recta ratio, naturæ congruens, diffusa in omnes, constans, sempiterna, quæ vocet ad officium jubendo, vetando a fraude deterreat; quæ tamen neque probos frustra jubet aut vetat, nec improbos jubendo aut vetando movet. Huic legi nec obrogari fas est, neque derogari ex hac aliquid licet, neque tota abrogari potest. Nec vero, aut per senatum aut per populum solvi hac lege possumus. Neque est querendus explanator aut interpres ejus alius. Nec erit alia lex Romæ, alia Athenis, alia nunc, alia posthac; sed et omnes gentes,*

et omni tempore, una lex et sempiterna et immortalis continebit; unusque erit communis quasi magister, et Imperator omnium Deus ille, legis hujus inventor, disceptor, lator; cui qui non parebit, ipse se fugiet, ac naturam hominis aspernabitur, atque hoc ipso luet maximas poenas, etiam si cætera supplicia quæ putantur effugerit.”

I have already, in a former Lecture, alluded to the strength of the evidence which is borne by the guilty, to the truth of those distinctions which they have dared to disregard. If there be any one who has an interest in gathering every argument which even sophistry can suggest, to prove that virtue is nothing, and vice therefore nothing, and who will strive to yield himself readily to this consolatory persuasion, it is surely the criminal who trembles beneath a weight of memory which he cannot shake off. Yet even he who feels the power of virtue only in the torture which it inflicts, does still feel this power, and feels it with at least as strong conviction of its reality, as those to whom it is every moment diffusing pleasure, and who might be considered perhaps as not very rigid questioners of an illusion which they felt to be delightful. The spectral forms of superstition have indeed vanished; but there is one spectre which will continue to haunt the mind, as long as the mind itself is capable of guilt, and has exerted this dreadful capacity—the spectre of a guilty life, which does not haunt only the darkness of a few hours of night, but comes in fearful visitations, whenever the mind has no other object before it that can engage every thought, in the most splendid scenes and in the brightest hours of day. What enchanter is there who can come to the relief of a sufferer of this class, and put the terrifying spectre to flight? We may say to the murderer, that, in poisoning his friend, to succeed a little sooner to the estate which he knew that his friendship had bequeathed to him, he had done a deed as meritorious in itself, as if he had saved the life of his friend at the risk of his own; and that all for which there was any reason to upbraid himself was, that he had suffered his benefactor to remain so many years in the possession of means of enjoyment, which a few grains of opium or arsenic might have transferred sooner to him. We may strive to make him laugh at the absurdity of the scene, when, on the very bed of death, that hand which had often pressed his with kindness before, seemed to press again with delight the very hand which had mixed and presented the potion. But though we may smile, if we can smile, at such a scene as this, and point out the incongruity with as much ingenious pleasantry as if we were describing some ludicrous mistake, there will be no laughter on that face from which we strive to force a smile. He

who felt the grasp of that hand will feel it still, and will shudder at our description; and shudder still more at the tone of jocular merriment with which we describe what is to him so dreadful.

What, then, is that theory of the moral indifference of actions which is evidently so powerless, or which even he, who professes to regard it as sound philosophy, feels the importance as much as other men; when he loves the virtuous and hates the guilty, when he looks back with pleasure on some generous action, or with shame and horror on actions of a different kind, which his own sound philosophy would teach him to be, in every thing that relates to his own internal feelings, exclusively of the errors and prejudices of education, equal and indifferent? It is vain to say, as if to weaken the force of this argument, that the same self-approving complacency, and the same remorse, are felt for actions which are absolutely insignificant in themselves, for regular observance or neglect of the most frivolous rites of superstition. There can be no question that self-complacency and remorse are felt in such cases. But it surely requires little philosophy to perceive, that, though a mere ceremony of devotion may be truly insignificant in itself, it is far from insignificant when considered as the command of him to whose goodness we owe every thing which we value as great, and to disobey whose command, therefore, whatever the command may be, never can be a slight offence. To consider the ceremonial rite alone, without regard to him who is believed to have enjoined it, is an error as gross, as it would be to read the statutes of some great people, and paying no attention to the legislative power which enacted them, we laugh, perhaps, at the folly of those who thought it necessary to conform their conduct to a law, which was nothing but a series of alphabetic characters on a scrap of paper or parchment, that in a single moment could be torn to pieces or burnt.

Why do we smile on reading, in the list of the works of the hero of a celebrated philosophic romance, that one of these was "a complete digest of the law of nature, with a review of those 'laws' that are obsolete or repealed, and of those that are ready to be renewed, and put in force?" We feel that the laws of nature are laws which no lapse of ages can render obsolete, because they are every moment operating in every heart; and which, for the same reason, never can be repealed, till man shall have ceased to be man.

After these remarks on the general theory of the original moral indifference of actions, which considers all morality as adventitious, without any original tendencies in the mind

that could of themselves lead it to approve or disapprove, it may be necessary still to take some notice of that peculiar modification of the theory, which denies all original obligation of justice, but asserts the authority of political enactment, not as attaching merely rewards to certain actions, and punishments to certain other actions, but as producing the very notions of just and unjust, with all the kindred notions involved in them, and consequently a right, which it would be immorality as well as imprudence to attempt to violate.

Of this doctrine, which is to be traced in some writers of antiquity, but which is better known as the doctrine of Hobbes, who stated it with all the force which his acuteness could give it,—a doctrine to which he was led in some measure perhaps by a horror of the civil dissensions of the period in which he wrote, and by a wish to lessen the inquisitorial and domineering influence of the priesthood of that fanatical age, by rendering even religion itself subject to the decision of the civil power;—the confutation is surely sufficiently obvious. A law, if there be no moral obligation, independent of the law, and prior to it, is only the expression of the desire of a multitude, who have power to punish, that is to say, to inflict evil of some kind on those who resist them; it may be imprudent, therefore, to resist them; that is to say, imprudent to run the risk of that precise quantity of physical suffering which is threatened; but it can be nothing more. If there be no essential morality that is independent of law, an action does not acquire any new qualities by being the desire of one thousand persons rather than of one. There may be more danger, indeed, in disobeying one thousand than in disobeying one, but not more guilt. To use Dr. Cudworth's argument, it must either be right to obey the law, and wrong to disobey it, or indifferent whether we obey it or not. If it be morally indifferent whether we obey it or not, the law, which may or may not be obeyed, with equal virtue, cannot be a source of virtue; and if it be right to obey it, the very supposition that it is right to obey it, implies a notion of right and wrong that is antecedent to the law, and gives it its moral efficacy. But, without reasoning so abstractly, are there, indeed, no differences of feeling in the breast of him who has violated a law, the essential equity of which he feels, and of him whom the accumulated and ever-increasing wrongs of a whole nation have driven to resist a force which, however long it may have been established, he feels to be usurpation and iniquity;—who, with the hope of giving freedom to millions has lifted against a tyrant, though armed with all the legal terrors, and therefore with all the morality and virtue of despotism, that sword,

around which other swords are soon to gather, in hands as firm, and which, in the arm of him who lifts it, is almost like the standard of liberty herself? Why does the slave, who is led to the field, in which he is to combat for his chains against those who would release him and avenge his wrongs, feel himself disgraced by obedience, when to obey implicitly, whatever the power may be which he obeys, is the very perfection of heroic virtue? and when he looks on the glorious rebel, as he comes forward with his fearless band, why is it that he looks, not with indignation, but with an awful respect; and that he feels his arm weaker in the fight, by the comparison of what he morally is, and of what those are whom he servilely opposes?

"A sovereign," it has been truly said, "may enact and rescind laws; but he cannot create or annihilate a single virtue." It might be amusing to consider, not one sovereign only, but all the sovereigns of the different nations of the earth, endeavouring by law to change a virtue into a vice,—a vice into a virtue. If an imperial enactment of a senate of kings were to declare, that it was in future to be a crime for a mother to love her child,—for a child to venerate his parent,—if high privileges were to be attached to the most ungrateful, and an act of gratitude to a benefactor declared to be a capital offence,—would the heart of man obey this impotent legislation? Would remorse and self-approbation vary with the command of man, or of any number of men? and would he who, notwithstanding these laws, had obstinately persisted in the illegality of loving his parent, or his benefactor, tremble to meet his own conscience with the horror which the parricide feels? There is, indeed, a power by which "princes decree justice;" but it is a power above the mere voice of kings,—a power which has previously fixed in the breasts of those who receive the decree, a love of the very virtue which kings, even when kings are most virtuous, can only enforce. And it is well for man, that the feeble authorities of this earth cannot change the sentiments of our hearts with the same facility as they can throw fetters on our hands. There would then, indeed, be no hope to the oppressed. The greater the oppression the stronger motive would there be to make obedience to oppression a virtue, and every species of guilt which the powerful might love to exercise, amiable in the eyes even of the miserable victims. All virtue, in such circumstances, would soon perish from the earth. A single tyrant would be sufficient to destroy, what all the tyrants that have ever disgraced this moral scene have been incapable of extinguishing,—the remorse which was felt in the bosom of him who could order every thing but vice and

virtue,—and the scorn, and the sorrow, and the wrath of every noble heart, in the very contemplation of his guilty power.

Nature has not thrown us upon the world with such feeble principles as these. She has given us virtues of which no power can deprive us, and has fixed in the soul of him whom more than fifty nations obey, a restraint on his power, from which the servile obedience of all the nations of the globe could not absolve him. There may be flatterers to surround a tyrant's throne, with knees ever ready to bow on the very blood with which its steps are stained, and with voices ever ready to applaud the guilt that has been already perpetrated, and to praise, even with a sort of prophetic quickness of discernment, the cruelties in prospect which they only anticipate. There may be servile warriors, to whom it is indifferent whether they succour or oppress, whether they enslave or free, if they have only drowned in blood, with sufficient promptness, the thousands of human beings whom they have been commanded to sweep from the earth. There may be statesmen as servile, to whom the people are nothing, and to whom every thing is dear, but liberty and virtue. These eager emulators of each other's baseness may sound for ever in the ears of him on whose vices their own power depends, that what he has willed must be right, because he has willed it; and priests still more base, from the very dignity of that station which they dishonour, not content with proclaiming that crimes are right, may add their consecrating voice, and proclaim that they are holy, because they are the deeds of a viceregent of that Holiness which is supreme. But the flatteries which only sound in the ear, or play perhaps with feeble comfort around the surface of the heart, are unable to reach that deeper-seated sense of guilt which is within.

In subjecting, for the evident good of all, whole multitudes to the sway of a few or of one, Nature then, as we have seen, has thrown over them a shelter, which power may indeed violate, but which it cannot violate with impunity; since even when it is free from every other punishment, it is forced, however reluctantly, to become the punisher of itself. This shelter, under which alone human weakness is safe, and which does not give protection only but happiness, is the shelter of virtue, the shelter of moral love and hate, of moral pity and indignation, of moral joy and remorse. Life, indeed, and many of the enjoyments which render social life delightful, may, at least on a great part of the surface of the earth, be at the mercy of a power that may seem to attack or forbear with no restraint but the caprice of its own will. Yet, before even these can be assailed, there is a voice which warns to de-

sist, and a still more awful voice of condemnation, when the warning has been disregarded. For our best enjoyments, our remembrances of virtue, and our wishes of virtue, we are not dependent on the mercy, nor even on the restraints of power. Nature has provided for them with all her care, by placing them where no force can reach. In freedom or under tyranny they alike are safe from aggression; because, wherever the arm can find its way, there is still conscience beyond. The blow, which reaches the heart itself, cannot tear from the heart what, in life, has been happiness or consolation, and what, in death, is a happiness that needs not to be comforted.

Our own felicity is then truly, in no slight degree, as Goldsmith says, consigned to ourselves, amidst all the varieties of social institutions.

In every government, though terrors reign.
Though tyrant kings, or tyrant laws restrain,
How small, of all that human hearts endure,
That part which laws or kings can cause or cure!
Still to ourselves, in every place, consign'd,
Our own felicity we make or find.
With secret course, which no loud storms annoy,
Glides the smooth current of domestic joy.
The lifted axe, the agonising wheel,
Luke's iron crown and Damien's bed of steel,
To men remote from power but rarely known,
Leave reason, faith, and conscience all our own.*

"So far," says Cicero, "is virtue from depending on the enactment of kings, that it is as ancient as the system of nature itself, or as the great Being by whom nature was formed." "*Vis ad recte facta vocandi et a peccatis advocandi, non modo senior est, quam aetas populorum et civitatum, sed aequalis illius coelum atque terras tuentis et regentis Dei:—Nec si, regnante Tarquinio, nulla erat Romae scripta lex de stupris, idcirco non contra illam legem sempiternam, Sextus Tarquinius vim Lucretiae attulit. Erat enim ratio profecta a rerum natura, et ad recte faciendum impellens et a delicto advocans, quae non tum denique incipit lex esse cum scripta est, sed tum cum orta est; orta autem simul est cum mente divina.*"† The law, on which right and wrong depend, did not begin to be law when it was written: it is older than the ages of nations and cities, and contemporary with the very eternity of God.

LECTURE LXXVI.

OF THE SYSTEM OF MANDEVILLE; OF THE INFLUENCE OF REASON ON OUR MORAL SENTIMENTS; OF THE SYSTEMS OF CLARKE AND WOLLASTON.

GENTLEMEN, in the inquiries which have last engaged us, we have seen, what that

susceptibility of moral emotion is, to which we owe our notions of virtue and vice, in all their relative variety of aspects: we have seen, in what sense it is to be understood as an original principle of our common nature, and what limitations it is necessary to give to its absolute universality. There is a sophistry, however, the errors of which it was necessary to state to you, that confounds, in these limitations, the primary distinctions themselves; and supposes that it has shown the whole system of morals to be founded on accidental prejudices, when, in opposition to the millions of millions of cases, that obviously confirm the truth of an original tendency to certain moral preferences, it has been able to exhibit a few facts which it professes to regard as anomalous. The fallacy of this objection, I endeavoured accordingly to prove to you, by showing, that the supposed anomalies arise, not from defect of original moral tendencies, but from the operation of other principles which are essential parts of our mental constitution, like our susceptibility of moral emotion; which are not, however, more essential parts of it than that moral susceptibility itself, and which, even in modifying our sentiments of approbation and disapprobation, produce this effect, not by altering the principle which approves and disapproves, but the object which we contemplate when these emotions arise. In the conclusion of my lecture, I examined the kindred sophistry of those political moralists, who, considering right and wrong as of human institution, in their denial of every primary distinction of morals, found a sort of artificial virtue on obedience to the civil power; forgetting that their very assertion of the duty of obedience, supposes a feeling of duty antecedent to the law itself; and that there are principles of equity, according to which even positive laws are judged, and, though approved in many cases, in many cases also condemned, by the moral voice within the breast, as inconsistent with that feeling of justice which is prior and paramount to the law itself.

In some measure akin to the theory of these political moralists, since it ascribes morality, in like manner, to human contrivance, is the system of Mandeville, who considers the general praise of virtue to be a mere artifice of political skill; and what the world consents to praise as virtue in the individual, to be a mere imposition on the part of the virtuous man. Human life, in short, according to him, is a constant intercourse of hypocrisy with hypocrisy; in which, by an involuntary self-denial, present enjoyment of some kind or other is sacrificed, for the pleasure of that praise which society, as cunning as the individual self-denier, is ready indeed to give, but gives only in return

* Concluding verses of the Traveller.

† De Legibus, lib. ii. c. 4, of Gruter's notation—or c. 8, 9, 10, of the common notation—with some alterations and omissions.

for sacrifices that are made to its advantage. His system, to describe it a little more fully, as stated in the inquiry into the origin of moral virtue, prefixed to his remarks on his own *Fable of the Bees*, is simply this,—that man, like all other animals, is naturally solicitous only of his personal gratification, without regard to the happiness or misery of others; that the great point, with the original law-givers or tamers of these human animals, was to obtain from them the sacrifice of individual gratification, for the greater happiness of others; that this sacrifice, however, could not be expected from creatures that cared only for themselves, unless a full equivalent were offered for the enjoyment sacrificed; that as this, at least in the greater number of cases, could not be found in objects of sensual gratification, or in the means of obtaining sensual gratification which are given in exchange in common purchases, it was necessary to have recourse to some other appetite of man; that the natural appetite of man for praise readily presented itself, for this useful end, and that, by flattering him into the belief that he would be counted nobler for the sacrifices which he might make, he was led, accordingly, to purchase this praise by a fair barter of that, which, though he valued it much, and would not have parted with it but for some equivalent or greater gain, he still valued less than the praise which he was to acquire; that the moral virtues, therefore, to use his strong expression, are “the political offspring which flattery begot upon pride;” and that, when we think that we see virtue, we see only the indulgence of some frailty, or the expectation of some praise.

Such is the very licentious system, as to moral virtue, of this satirist of man; whose doctrine, false as it is, as a general view of human nature, has, in the world, so many instances which seem to correspond with it, that a superficial observer, who is little accustomed to make distinctions, extends readily to all mankind, what is true only of a part, and because some who wish to appear virtuous are hypocrites, conceives that all virtue is hypocrisy; in the same way as such a superficial thinker would have admitted any other error, stated in language as strong, and with images and pictures as vivid.

It would be idle to repeat, in particular application to this system, the general remarks which I made in my former lectures, on the early appearances of moral emotion, as marking an original distinction of actions, that excite in us moral approbation, from those which do not excite it, and which excite the opposite feeling of moral disapprobation. I shall not even appeal to the conscience of him who has had the happiness of performing a generous action, without the

slightest regard to the praise of man, which was perhaps not an object even of conception at all, and certainly not till the action itself was performed. But we may surely ask, in this case, as much as in any other physical hypothesis, by what authority so extensive a generalization is made from so small a number of particular cases? If, indeed, we previously take for granted that all virtue is hypocrisy, every case of virtue which we perceive seeming to us a case of hypocrisy, may be regarded only as an illustration of the doctrine, to the universal truth of which we have already given our assent. But if we consent to form our general conclusion before examination, and then to adapt our particular conclusions to the previous general belief, this sort of authority may be found, for the wildest hypothesis, in physics, as much as for that moral hypothesis, the licentiousness of which is founded on the same false logic. We have only to take the hypothesis, however wild, for granted; and then the facts will be, or will be considered to be, illustrations of it. The question is not, whether, on the supposition of universal hypocrisy, all seeming virtue be imposition, for in that case there could be no doubt; but whether all virtue be hypocrisy; and for this, it is surely necessary to have some stronger proof than the mere fact that some men are hypocrites; or even the very probable inference, that there is a great deal of hypocrisy, (as there is a great deal of virtuous benevolence or self-command,) which we are not capable of discovering, and to which, accordingly, we may erroneously have given the praise of virtue. The love of praise may be a universal principle; but is not more truly universal than the feeling of right and wrong, in some one or other of their forms; and of two feelings, equally universal, it is as absurd to deny the reality of one, as the reality of the other. All actions have not one object. Some are the result of a selfish love of praise; some of a generous love of virtue, that is to say, of love of those whose happiness virtue can promote. The sacred motives of mankind, indeed, in this variety of possible objects, cannot be known; and the paradox of Dr. Mandeville, therefore, has this advantage, that it is impossible to say, in any case of virtue, “Here is virtue that has no regard to praise,” since he has still the power of answering, that there may be a desire of praise, though it is not visible to us. But, to reasoning of this sort there is no limit. If we be fond of paradoxes, it is easy to assert that there is no such state as that of health, and to prove it in exactly the same manner, by showing, that many who seem blooming and vigorous are the victims of some inward malady; and that it is, therefore, impossible for us, in pointing out any

one, to say, there is health in this young and active form; since the bloom which we admire may be only the covering of a disease that is soon to prey on the very beauty which it seemed, perhaps for the time, to heighten with additional loveliness. If it be easy to make a little system like that of Mandeville, which reduces all virtue to the love of praise, it is just as easy to reverse the system, and to make all love of praise a modification of the purest virtue. We love it, it may be said, merely that we may give delight to those who love us, and who feel a lively interest in all the honours which can be lavished on us. This theory may be false, or rather truly is so; but however false, or even absurd, it is as philosophic in every respect as the opposite theory of Mandeville, since it proceeds, exactly in the same way, on the exclusive consideration of a certain elementary part of our mixed nature, and extends universally what is only partially true. Indeed, the facts which support it, if every one were to consult his memory, in the earliest years to which he can look back on his original feelings, are stronger, in support of this false generous hypothesis, than of that false ungenerous hypothesis, to which I have opposed it. What delight did the child feel, in all his little triumphs, when he thought of the pleasure which his parents were to feel! When his lesson was well learned, and rewarded with its due commendation, there were other ears than those around, which he would have wished to have heard; and if any little prize was allotted as a memorial of excellence, the pleasure which he felt on receiving it was slight, compared with the pleasure with which he afterwards saw it in other hands, and looked to other eyes, when he returned, to his home. Such, it might be said, is the origin of that love of praise which we feel; and its growth in the progress of life, when praise is sought in greater objects, is only the growth of the same generous passion. But I will not dwell longer on an hypothesis which I have stated as false, and obviously false, though, obviously false as it is, it is at least as well founded as that of Mandeville. My only object is to show you, by this complete reversal of his reasoning, with equal semblance of probability, that his hypothesis is but an hypothesis.

But how comes it in this system, which must account for our own emotions, as well as for the emotions of others, that we do approve of certain actions, as virtuous, without valuing them for the mere love of praise, and condemn even the love of praise itself, when the good of the world is intentionally sacrificed to it? I will admit, for a moment, to Mandeville, that we are all hypocrites; that we know the game of human life, and play our parts in it accordingly. In

such circumstances, we may indeed assume the appearance of virtue ourselves, but how is it, that we feel approbation of others assuming the same disguise, when we are aware of its nature, and know virtue in all the actions which go under that well-sounding name, to be only a more or less skilful attempt at imposition? The mob in the gallery may, indeed, wonder at all the transmutations in the pantomime, and the silliest among them may believe that Harlequin has turned the clown into a fruit-stand, and himself into a fruit-woman: but, however wide the wonder, or the belief may be, he who invented these very changes, or is merely one of the subordinate shifters of the scenery, cannot surely be a partaker of the illusion. What juggler ever deceived his own eyes? Katerfelto, indeed, is described by Cowper, as "with his hair on end, at his own wonders wondering." But Katerfelto himself, who "wondered for his bread," could not feel much astonishment, even when he was fairly giving the greatest astonishment to others. It must be the same with the moral juggler. He knows the cheat; and he cannot feel admiration. If he can truly feel esteem, he feels that love of virtue, and consequently that distinction of actions, as virtuous or worthy of moral approbation, which Mandeville denies. He may be a dupe, indeed, in the particular case, but he cannot even be a dupe, without believing that virtue is something nobler than a fraud; and, if he believe virtue to be more noble, he must have feelings nobler than any which the system of Mandeville allows. In believing that it is possible for man not to be a hypocrite, he may be considered almost as proving, that he has not, uniformly, been a hypocrite himself.

Even if the belief of a system of this sort, which, as we have seen, has no force but that which it derives from the very common paralogism of asserting the universal truth of a partial conclusion; even if this miserable belief were to have no tendency directly injurious to the morals of those who admit it, the mere loss of happiness which it would occasion, by the constant feeling of distrust to which it must give rise, would of itself be no slight evil. To regard even every stranger, on whom our eyes could fall, as engaged in one unremitting plan of deceit, all deceiving, and all to a certain degree deceived, would be to look on society with feelings that would make absolute solitude comparatively pleasing; and, if to regard strangers in this light would be so dreadful, how far more dreadful would it be, to look, with the same distrust, on those in whom we had been accustomed to confide as friends—to see dissimulation in every eye—in the look of fondness of the parent, the wife, the child, the very caress and seeming innocence of in

fancy; and to think, that, the softer every tone of affection was to our ear, the more profound was the falsehood, which had made it softer, only that it might the more surely deceive! It is gratifying to find, that a system, which would make this dreadful transformation of the whole moral world, is but an hypothesis; and an hypothesis so unwarrantable, because so inconsistent with every feeling of our heart. Yet it is unfortunately a paradox, which admits of much satirical picturing; and, while few pause sufficiently to discover its logical imperfections, it is very possible that some minds may be seduced by the mere lively colouring of the pictures, to suppose, in spite of all the better feelings of which they are conscious, that the representation which is given of human life is true, because a few characters in human life are truly drawn. A rash assent may be given to the seeming penetration which such a view of the supposed artifices of morality involves; and after assent is once rashly given, the very generosity that might have appeared to confute the system, will be regarded only as an exemplification of it. I feel it the more my duty, therefore, to warn you against the adoption of a system, so false to the excellence of our moral nature; not because it is false only, though, even from the grossness of its theoretic falsehood alone, it is unworthy of a single moment's philosophic assent, but still more, because the adoption of it must poison the virtue, and the happiness still more than the virtue, of every mind which admits it. There is scarcely any action for which it is not possible to invent some unworthy motive. If our system requires the invention of one, the invention, we may be sure, will very speedily take place; and, with the loss of that amiable confidence of virtue, which believed and was believed, how much of happiness, too, will be lost, or rather, how little happiness will afterwards remain!

A slight extension of the system of Mandeville produces that general selfish system of morals, which reduces all virtue to the desire of the individual good of the agent. On this it will be necessary to dwell a little more fully, not so much for the purpose of exposing the fallacy of the system itself, important as this exposure is, as for explaining that relation of utility to virtue, of which we so frequently hear, without any very accurate meaning attached to the relation.

In the first place, however, since actions can be estimated as more or less useful, only by that faculty which analyzes and compares, it will be of advantage to make some remarks on the influence of reason on our moral sentiments, and on those theories which, proceeding beyond this indisputable influence, would reduce to mere reason, as if it were the great principle of virtue it-

self, the whole moral phenomena of our approbation of good and disapprobation of evil.

If all the actions of which man is capable, had terminated in one simple result of good or evil, without any mixture of both, or any further consequences, reason, I conceive, would have been of no advantage whatever, in determining moral sentiments that must, in that case, have arisen immediately on the consideration of the simple effect, and of the will of producing that simple effect. Of the intentional production of good, as good, we should have approved instantly; of the intentional production of evil, as evil, we should as instantly have disapproved; and reason could not, in such circumstances, have taught us to love the one more, or hate the other less; certainly not to love what we should otherwise have hated, nor to hate what we should otherwise have loved. But actions have not one simple result, in most cases. In producing enjoyment to some, they may produce misery to others, either by consequences that are less or more remote, or by their own immediate but compound operation. It is impossible, therefore, to discover instantly, or certainly, in any particular case, the intention of the agent, from the apparent result; and impossible for ourselves to know, instantly, when we wish to perform a particular action, for a particular end, whether it may not produce more evil than good, when the good was our only object,—or more good than evil, when our object was the evil only. Reason, therefore, that power by which we discover the various relations of things, comes to our aid, and pointing out to us all the probable physical consequences of actions, shows us the good of what we might have conceived to be evil, the evil of what we might have conceived to be good, weighing each with each, and calculating the preponderance of either. It thus influences our moral feelings indirectly; but it influences them only by presenting to us new objects, to be admired or hated, and still addresses itself to a principle which admires or hates. Like a telescope, or microscope, it shows us what was too distant, or too minute, to come within the sphere of our simple vision; but it does not alter the nature of vision itself. The best telescope, or the best microscope, could give no aid to the blind. They imply the previous power of visual discernment, or they are absolutely useless. Reason, in like manner, supposes in us a discriminating vision of another kind. By pointing out to us innumerable advantages or disadvantages, that flow from an action, it may heighten or reduce our approbation of the action, and consequently our estimate of the virtue of him whom we suppose to have had this whole amount of good or evil in view, in his intentional production

of it; but it does this only because we are capable of feeling moral regard for the intentional producer of happiness to others, independently of any analyses which reason may make. If we did not love what is for the good of mankind, and love, consequently, those actions which tend to the good of mankind, it would be vain for reason to show, that an action was likely to produce good, of which we were not aware, or evil, of which we were not aware. It is very different, however, when we consider the mind, as previously susceptible of moral emotion. If our emotion of approbation, when we meditate on the propriety of a particular action, depend, in any degree, on our belief of resulting good, and our disapprobation, in any degree, on our belief of resulting evil; to show that the good of which we think is slight, when compared with the evil which accompanies or follows it, is, perhaps, to change wholly our approbation into disapprobation. We should feel, in such circumstances, a disapprobation of ourselves, if, with the clearer view of consequences now presented to us, we were to continue to desire to perform the very action, to have abstained from which before, would have excited our remorse. The utility of reason, then, is sufficiently obvious, even in morality; since, in a world so complicated as this, in which various interests are continually mingling, and in which the good of one may be the evil of many; a mere blind obedience to that voice, which would tell us instantly, and without reflection, in every case, to seek the good of any one, as soon as it was in our power to be instrumental to it, might produce the misery of many nations, or of many ages, in the relief of a few temporary wants of a few individuals. By far the greater portion of political evil, which nations suffer, arises, indeed, from this very source, not so much from the tyranny of power, however tyrannical power may too frequently have been, as from its erring benevolence, in the far greater number of cases, in which it was exercised with the wish of promoting that very good which was delayed, or, perhaps, wholly impeded, by the very means that were chosen to further it. If those rulers, who were truly desirous of the happiness of their people, had only known how they could most effectually produce that happiness which they wished, there can be no question, that the earth at present would have exhibited appearances very different from those which, on the greater part of its surface, meet our melancholy view; that it would then have presented to us an aspect of general freedom and happiness, which not man only, but the great Father and lover of man might have delighted to behold. Reason, then, though it is incapable of giving birth to the notion of moral

excellence, has yet important relations to that good which is the direct object of morality.

Let none with heedless tongue from truth disjoin
The reign of Virtue. Ere the dayspring flow'd,
Like sisters link'd in concord's golden chain,
They stood before the great Eternal Mind,
Their common parent; and by him were both
Sent forth among his creatures, hand in hand,
Inseparably join'd: nor e'er did Truth
Find an apt ear to listen to her lore,
Which knew not Virtue's voice; nor, save where

Truth's
Majestic words are heard and understood,
Doth Virtue deign to inhabit. Go, inquire
Of nature; not among Tartarean rocks,
Whither the hungry vulture with its prey
Returns; not where the lion's sullen roar
At noon resounds along the lonely banks
Of ancient Tigris; but her gentler scenes,
The dovecot, and the shepherd's fold at morn,
Consult; or by the meadow's fragrant hedge,
In spring-time, when the woodlands first are green,
Attend the linnet singing to his mate,
Couch'd o'er their tender young. To this fond care
Thou dost not Virtue's honourable name
Attribute: wherefore, save that not one gleam
Of truth did e'er discover to themselves
Their little hearts, or teach them, by the effects
Of that parental love, the love itself
To judge, and measure its officious deeds?
But man, whose eyelids truth has fill'd with day,
Discerns how skillfully to bounteous ends
His wise affections move; with free accord
Adopts their guidance; yields himself secure
To Nature's prudent impulse; and converts
Instinct to duty and to sacred law.*

Important, however, as reason is, in pointing out all the possible physical consequences of actions, and all the different degrees of probability of these, it must not be forgotten, that this is all which it truly does; that our moral sentiment itself depends on another principle of our mind; and that, if we had not previously been capable of loving the good of others as good, and of hating the production of evil as evil, to show us that the happiness of every created being depended on our choice, would have excited in us as little eagerness to do what was to be so extensively beneficial, as if we had conceived, that only a single individual was to profit by it, or no individual whatever.

These remarks will show you the inadequacy of the moral systems, which make virtue, in our contemplation of it, a sort of product of reasoning, like any other abstract relation, which we are capable of discovering intellectually; that of Clarke, for example, which supposes it to consist in the regulation of our conduct, according to certain fitnesses which we perceive in things, or a peculiar congruity of certain relations to each other; and that of Wollaston, which supposes virtue to consist in acting according to the truth of things, in treating objects according to their real character, and not according to a character or properties which they truly have not—a system which is virtually the same as that of Clarke, expressing only more awkwardly what is not very simply developed, indeed, even in Dr. Clarke's speculations.

* Akenside's *Pleasures of Imagination*, book ii.

These systems, independently of their general defect, in making incongruity,—which, as mere incongruity, bears no proportion to vice, but is often greatest in the most frivolous improprieties,—the measure of vice, assume, it must be remembered, the previous existence of feelings, for which all the congruities of which they speak, and the mere power of discovering such congruities, are insufficient to account. There must be a principle of moral regard, independent of reason; or reason may, in vain, see a thousand fitnesses, and a thousand truths, and would be warmed with the same lively emotions of indignation, against an inaccurate time-piece, or an error in arithmetical calculation, as against the wretch who robbed, by every fraud which could elude the law, those who had already little of which they could be deprived, that he might riot a little more luxuriously, while the helpless, whom he had plundered, were starving around him.

Fitness, as understood by every one, is obviously a word expressive only of relation. It indicates skill, indeed, in the artist, whatever the end may be; but, considered abstractly from the nature of the end, it is indicative of skill only. It is to the good or evil of the end that we look, and that we must always look, in estimating the good or evil of the fitness itself; and if it be the nature of the end which gives value to the fitness, it is not the fitness, but the end to which the fitness is subservient, that must be the true object of moral regard. The fitness of virtue for producing serene delight is not, as mere fitness, greater than that of vice for producing disquietude and wretchedness; and we act, therefore, as much according to the mere fitnesses of things, in being vicious as being virtuous. If the world had been adapted for the production of misery, with fitnesses opposite indeed in kind, but exactly equal in number and nicety of adjustment to those which are at present so beautifully employed in the production of happiness, we should still have framed our views and our actions according to these fitnesses; but our moral view of the universe and of its Author would have been absolutely reversed. We should have seen the fitnesses of things precisely as before, but we should have seen them with hatred instead of love.

Since every human action, then, in producing any effect whatever, must be in conformity with the fitnesses of things, the limitation of virtue to actions which are in conformity with these fitnesses, has no meaning, unless we have previously distinguished the ends which are morally good from the ends which are morally evil, and limited the conformity of which we speak, to the one of these classes. In this case, however, the theory of fitnesses, it is evident, far from accounting for the origin of moral distinctions,

proceeds on the admission of them; it presupposes a distinctive love of certain virtuous ends, by their relation to which all the fitnesses of actions are to be measured; and the system of Dr. Clarke, therefore, if stripped of its pompous phraseology, and translated into common language, is nothing more than the very simple truism or tautology, that to act virtuously, is to act in conformity with virtue.

From this doctrine of conformity to the fitness of things the theory of Wollaston, in which virtue is represented to consist in the conformity of our actions to the true nature of things, scarcely differs, as I have said, in any respect, unless as being a little more circuitous and complicated. The truth, of which Wollaston speaks, is only virtue under another name; and if we had no previous notions of moral good and evil,—no love of the happiness of others more than of their misery, it would be absolutely impossible to determine whether virtue or vice were truth or falsehood, even in the sense in which he uses these terms. If, indeed, we previously take for granted that it is the nature, the true nature, of the parent to be loved by the child, of the child to love the parent, we cannot then, it will be allowed, have any hesitation in admitting that the child, in performing offices of tenderness to the parent, treats the parent according to his true nature; and that, if he were to treat him unkindly, he would treat him not according to his true nature, but as if he were a foe to whose true nature such usage would be accordant. In taking for granted this very nature, however, the agreement or disagreement with which we have chosen to denominate truth or falsehood, is it not evident that we have taken for granted all those duties which are strangely said to depend on the perception of an agreement, that cannot even be conceived by us, till the duties themselves, as constituting the real nature or truth of our various relations, in the actions which are said to agree with it, have been previously supposed? If there were no previous belief of the different moral relations of foes and friends, but all were regarded by us as indifferent, how could any species of conduct which was true with respect to the one, be false with respect to the other? It is false indeed to nature, but it is false to nature only because it is false to that virtue which, before we thought of truth or falsehood, distinguished, with the clear perception of different moral duties, our benefactor from our insidious enemy.

The work of Mr. Wollaston, which, with all its pedantry of ostentatious erudition, and the manifest absurdity of its leading principle, has many profound reflections and acute remarks, which render it valuable on its own account, appears to me, however, I must

confess, more valuable for the light which it indirectly throws on the nature of the prejudices that pervert our judgment, than for the truths which it contains in itself. If I were desirous of convincing any one of the influence of a system in producing, in the mind of its author, a ready acquiescence in errors the most absurd, and in explanations far more necessary to be explained than the very difficulties which they professed to remove or illustrate, I know no work which I could put into his hands better suited for this purpose than *The Religion of Nature Delineated*. Who but the author of such a system could believe for a moment that parricide is a crime only for the same reason which would make it a crime for any one, (and, if the great principle of the system be just, a crime exactly of the same amount,) to walk across a room on his hands and feet, because he would then be guilty of the practical untruth of using his hands, not as if they were hands, but as if they were feet; as, in parricide, he would be guilty of the practical untruth of treating a parent as if he were not a parent, but a robber or a murderer? Even without considering guilt so atrocious, is common cruelty, in any of its forms, made hateful to us as it should be, or even hateful in the slightest degree of moral disgust by being represented only as the half-ludicrous falsehood of affirming practically, that a man is not a man capable of feeling, but an insensible post; and is it only for a similar falsehood, in this tacit proposition, which we are supposed by our negligence to affirm, that we should reproach ourselves, if we had left any one to perish, whom a slight effort on our part would have saved from destruction? "Should I find a man grievously hurt by some accident," says Wollaston, "fallen down, alone, and without present help, like to perish, or see his house on fire, nobody being near to help or call out; in this extremity, if I do not give him my assistance immediately, I do not do it at all; and by this refusing to do it according to my ability, I deny his case to be what it is; human nature to be what it is; and even those desires and expectations which I am conscious to myself I should have under the like misfortune, to be what they are."* These strange denials we certainly do not make; all which we tacitly declare is, on the contrary, a truth, and a truth of the most unquestionable kind. We affirm ourselves to be what we are, indifferent to the miseries of others: and if to affirm a truth by our actions be all which constitutes virtue, we act as virtuously in this tacit declaration of our insensibility, as if we had flown instantly to the aid of the sufferer, with the most com-

passionate declaration of our feeling; or rather, if, with the same indifference at heart, we had stooped our body, or stretched out our hand to relieve him, our very attempt to give the slightest relief, according to the theory of moral falsehood, would have been only a crime additional.

Reason, then, as distinguishing the conformity or unconformity of actions with the fitnesses of things, or the moral truth or falsehood of actions, is not the principle from which we derive our moral sentiments. These very sentiments, on the contrary, are necessary before we can feel that moral fitness or moral truth, according to which we are said to estimate actions as right or wrong. All actions, virtuous and vicious, have a tendency or fitness of one sort or other; and every action which the benevolent and malevolent perform, with a view to a certain end, may alike have a fitness for producing that end. There is not an action, then, which may not be in conformity with the fitnesses of things; and if the feelings of exclusive approbation and disapprobation that constitute our moral emotions be not presupposed, in spite of the thousand fitnesses which reason may have shown us, all actions must be morally indifferent. They are not thus indifferent, because the ends to which reason shows certain actions to be most suitable, are ends which we have previously felt to be worthy of our moral choice; and we are virtuous in conforming our actions to these ends, not because our actions have a physical relation to the end, as the wheels and pulleys of a machine have to the motion which is to result from them; but because the desire of producing this very end has a relation, which has been previously felt, to our moral emotion. The moral truth, in like manner, which reason is said to show us, consists in the agreement of our actions with a certain frame of mind which nature has previously distinguished to us as virtuous; without which previous distinction the actions of the most ferocious tyrant, and of the most generous and intrepid patriot, would be equally true, as alike indicative of the real nature of the oppressor of a nation, and of the assertor and guardian of its rights.

The fitness and the truth, then, in every case, presuppose virtue as an object of moral sentiment, and do not constitute or evolve it.

The moral use of reason, in influencing our approbation and disapprobation, is, as I before remarked, to point out to us the remote good, which we do not perceive, or the elements of mixed good and evil, which also, but for the analytic power of reason, we should be incapable of distinguishing with accuracy in the immediate compound result. If the mere discovery of greater

* *Religion of Nature Delineated*, p. 18. London, 1738, 4to.

utility, however, is sufficient to affect our approbation, utility must, it is evident, have a certain relation to virtue. Utility, it is said, is the measure of virtue. Let us consider what meaning is to be attached to this phrase.

LECTURE LXXVII.

OF HUME'S SYSTEM, THAT UTILITY IS THE CONSTITUENT OR MEASURE OF VIRTUE.

In my last Lecture, Gentlemen, I examined, at as great a length as a doctrine so false in its principles requires, the system of Dr. Mandeville with respect to virtue; a system in which the actions that commonly go under that honourable name are represented as, in every instance, where any seeming sacrifice is made to the happiness of another, the result of a calculating vanity that, in its love of praise, consents to barter, for a suitable equivalent of commendation, the means of enjoyment which it would not give without a due equivalent, but which it values less than the applause that is to be offered in purchase of them. The pretender to generosity, who is a speculator in this species of traffic, is of course a hypocrite by the very quality of the moral ware in which he jobs; and the applauders of the ostensible generosity, who are as little capable of unpaid admiration as he of gratuitous bounty, are hypocrites of equal skill, in the supposed universal cheat of social life. All are impostors, or all are dupes, or rather, all are at once impostors and dupes, dupes easily deceived by impostors whom it is easy to deceive. On a system, of which, I may safely take for granted, that every one of you has in the delightful remembrances of his own breast innumerable confutations, I should not have thought it necessary to dwell, if there had been less peril in the adoption of it to happiness and virtue. As a philosophic system, it is scarcely worthy of discussion. It is an evident example of an error that is very common in hypothetical systems; the error of supposing, notwithstanding the most striking seeming contraries, that what is true of a few cases out of many is, therefore, necessarily true of all. Some men are hypocrites, therefore all men are hypocrites. It is not absolutely impossible, that he whom the world honours as virtuous for a life, which, from youth to old age, has had the uniform semblance of regard for the happiness of others, may have no virtue whatever at heart; therefore, it may be affirmed, with certainty, that he has no virtue whatever. Such are the two propositions, which, though not expressed in these precise terms, constitute truly the

whole logic of Mandeville. They are the very essence of his system; and unless we admit them as logically just, we must reject his system as logically false. But it is in his rhetoric that he trusts far more than in his defective logic; and if he have given us a few lively picturings of hypocrisy, he flatters himself that we shall not pause to inquire, whether pictures so lively are representations of a few only, or of all mankind.

What should we think of a moral theorist who, after painting some coarse debauch in the midnight profligacy of the lowest ale-house, or the wider drunkenness and riot of a fair or an election, should seriously exhibit to us those pictures as evidence of an universal conclusion, that all men are drunkards? We might admire the verbal painting, indeed, as we admire the pictures of Hogarth; but we should admire as little the soundness of the philosophy as we should have admired the accuracy of one of Hogarth's pictures, if he had exhibited to us the interior of a brothel as a representation of domestic life; a faithful sketch of one of those virtuous and smiling groups, that around a virtuous and delighted father, at his own parlour fire, seem to inclose him, as it were, within a circle of happiness! It is certainly not more absurd to argue that, because some men are drunkards all men are drunkards, than to contend that all men are, in every action of their life, indifferent to the happiness of every other being, because some may be hypocrites in affecting to regard any happiness but their own; and he who, in adopting this theory, can seriously believe that there is not a single parent, or wife, or child, who has any other view than the selfish one of acquiring praise, in any one office of seeming kindness to those whom they would wish us to regard as dear to them, may certainly believe with equal reason, and admire as ingenious and just, the wildest absurdity which the wildest propounder of absurdities can offer to his assent and admiration.

This system, by a little extension to all the sources of selfish enjoyment, and by a little purification of the selfishness, as the enjoyment is rendered less prominently selfish by being more remote and more connected by many direct or indirect ties with the happiness of others, assumes the form of the more general theory of selfish morals, in which the most refined virtue is represented only as disguised self-love; though the veil, which is thin in itself, so as often to afford no disguise to the passion which glows through it, is sometimes thickened in so many folds, that it is scarcely possible to guess what features of ugliness or beauty are beneath. Before considering, however, this finer system of moral selfishness, which is founded on views of remote personal advan-

tage, and therefore in a great measure on the skill that detects those elements of distant good, I conceived that we might derive some aid to our inquiry, by considering first the relations which reason, the great analyser and detector of those elements of distant good, bears to morality; and consequently, as in their fittest place, those systems which would reduce all our moral feelings to intellectual discoveries made by that power, which is supposed, in these systems, to determine the very nature of vice and virtue, in the same way as it extracts roots, measures angles, and determines specific gravities or affinities, or quantities of motion.

We considered, then, two celebrated systems of this sort that found morality on reason; one which supposes virtue to consist in the accommodation of our actions to the fitnesses of things, and another which supposes it to consist in actions that are conformable to truth. In both cases I showed you, that the systems, far from accounting for our moral feelings, or showing them to be the result of a process of ratiocination, proceed on the susceptibility of these feelings, as an essential part of our mental constitution, independent of every thing that can be resolved into reasoning. If we were not formed to love previously the happiness of others, and to have a moral approbation of the wish of producing happiness, in vain would reason tell us, after tracing a thousand consequences, that an action will be more generally beneficial than, but for this analytic investigation, we should have supposed. If we were not formed to love certain ends of moral good rather than certain other ends of moral evil, the mere fitnesses, or means of producing these ends, must be as indifferent to us as that indifferent good or evil which they tend to produce. If we have formed no previous moral conception of certain duties, as forming that truth of character to which vice is said to be false, there will be as little falsehood; and, therefore, if vice be only a want of conformity to truth, as little vice, in the most cruel and unrelenting malignity, as in the most generous benevolence. In every case in which we suppose reason to be thus morally exercised; we must, as I said, presuppose certain feelings of love and approbation that constitute all which is truly moral in our sentiments of actions; or the discovery of mere consequences of general good, mere fitnesses, mere truths, will be as powerless to affect us with moral regard, as a new combination of wheels and pulleys, or a new solution of a geometric problem.

But, though the discovery of certain fitnesses or congruities, such as those of which Clarke speaks, or of a certain conformity to truth, such as that of which Wollaston speaks, or of the beneficial and injurious

consequences of certain actions, considered as a mere series of consequences, discoverable by the understanding, like any other series of physical effects, may not be capable of giving birth to moral feeling, without some peculiar and previous susceptibility in the mind of being so affected; may they not at least indirectly give birth to it, by presenting to this original susceptibility of moral emotion its peculiar objects? Whatever may be the principle that develops it, does not the approving sentiment arise, on the contemplation of actions that are in their tendency beneficial to individuals, and thus to society in general, and only on the contemplation of actions that are thus beneficial? Is not utility, therefore, since it appears to be essential, in some greater or less degree, to the whole class of actions that are termed virtuous, the constituent or the measure of virtue itself?

The doctrine of the utility of actions, as that which constitutes them virtuous, has been delivered, with all the force of which the doctrine seems capable, by the genius of Mr. Hume, who has formed it into an elaborate system of morals. It has ever since entered largely into the vague speculations on the principles of virtue, in which minds that are rather fond of theorizing than capable of it, are apt to indulge; and we seldom hear in familiar discussion any allusion to the principle or principles of moral sentiment, without some loose reference to this relation, which that moral sentiment is supposed to bear to the utility of the actions approved. That it does bear a certain relation to it is unquestionable, though a relation which is not always very distinctly conceived by those who are in the frequent habit of speaking of it. It will be the more important, then, to endeavour to separate what is true in the common language on the subject, from the error which frequently accompanies it.

Benevolence, as the very name implies, is always a wish of good to others; and every benevolent action, therefore, must be intended to be of advantage to somebody. But if by the measure of virtue, when utility is said to be the constituent or measure of the actions that are denominated virtuous, be meant that to which the virtue is in exact proportion, increasing always as the mere physical advantage increases, and decreasing always as the mere physical advantage decreases; and if it be said that such actions only are felt to be meritorious, in which the agent is supposed to have willed directly that which appeared to him at the moment of his willing it most useful, and to have willed it with moral approbation for this reason only, because it appeared to him most useful; utility, in this general sense, is so far from being the measure of virtue, that there is comparatively but a very small number of virtu-

ous actions to which the *mesurée* can be applied, and very few, indeed, in which the proportion will be found to hold with exactness.

That virtuous actions do all tend in some greater or less degree to the advantage of the world, is indeed a fact, with respect to which there can be no doubt. The important question, however, is, whether the specific amount of utility be that which we have in view, and which alone we have in view, in the approbation which we give to certain actions; since this approbation is the direct feeling of virtue itself, without which, as intervening, it will be allowed that even the most useful action could not be counted by us as virtuous; whether we love the generosity of our benefactor, with an emotion exactly the same in kind, however different it may be in degree, as that with which we love the bank-bill, or the estate which he may have given us; in short, to use Dr. Smith's strong language, whether "we have no other reason for praising a man, than that for which we commend a chest of drawers."

It may be necessary in this discussion, to remind you once more, that virtue is nothing in itself, any more than our other general terms, which we have invented to express a number of particulars comprehended in them; that what is true of virtue, then, must be true of all the particular actions to which we give that name; and that all which we have to consider in the present argument, is not the vague general term, but some particular action, that is to say, some particular agent, in certain circumstances, willing a certain effect; since the feeling which rises in the mind, on the contemplation of this particular action, is that which leads us to class it with other actions that may have excited a similar vivid sentiment, and to employ for the whole the common term *virtue*. The question then is, whether it be necessary to the rise of this vivid sentiment, the moral emotion of approbation or disapprobation, that we should have in immediate contemplation, as the sole object of the emotion, the utility or inutility of the action; and whether the emotion itself be always exactly proportioned by us to the quantity of usefulness which we may have found, by a sort of intellectual calculation or measurement in the action itself, or in the principle of the action. It is the vivid feeling of moral approbation alone, which leads us to distinguish actions as virtuous or vicious; and the supposed measure or standard of virtue, therefore, must relate to this vivid feeling in all its degrees, or it cannot have any relation to the virtue that in all its degrees is marked by that vivid feeling only.

If the utility of actions be their moral standard, then, it must be present to the contemplation of the agent himself, when he

morally prefers one mode of conduct to another; and to the contemplation of others, when they morally approve or disapprove of his action.

In every moral action that can be estimated by us, these two sets of feelings may be taken into account; the feelings of the agent when he meditated, and willed the action; and the feelings of the spectator, or of him who calmly contemplates the action at any distance of space or time. Let us consider, then, in the first place, the agent himself. The agent, indeed, may be under the influence of passions, from which the spectator is free, and may thus have his moral discernment less clear, so as to be hurried perhaps into actions which, with better moral vision, he would have shunned. But the principle of approbation itself is not essentially different in his mind, when the action which he contemplates is one which he meditates himself, and when he contemplates the action of another already performed; and, if it be not according to any measurement of exact utility, that the approbation and consequent moral will or resolution of the most virtuous agent is formed, it must be allowed to be a powerful presumption at least, or more than a mere presumption, that the approbation of the spectator, arising from the same principle is not the result of such a measurement of the good that is to be added, by that particular action, to the general good of the world, or of the general utility of the principle from which it flows. With respect to the views of the agent, however, there seems to be little ground for dispute. His views, even when he seems to ourselves most commendable, but rarely extend to such general interests. The exact scale of utility of an action, in short, or of the principle of the action, is not present to his mind as the standard by which he regulates his conduct. Does the mother, when she hangs sleepless, night after night, over the cradle of her sick infant, think, even for a single moment, that it is for the good of the society of mankind, that she should labour to preserve that little being which is so dear to her for itself, and the abandonment of which, though no other being in the universe were to be affected by it, would seem to her a crime of scarcely conceivable atrocity; and are we to refuse to her patience and tenderness, and watchfulness of regard, the name of virtue, because she has thought only of some little comfort that might possibly flow to the individual, and has not measured her own personal sacrifices with that general good, to which they should have been exactly adapted, nor estimated the general advantage of maternal love, as a principle of conduct which operates, and is continually to operate, in all the families of mankind? When we enter some wretched

hovel, and see that wretchedness, which is so much more dreadful to the eye of him who beholds it, than to the ear of him who is told in his splendid apartment, that there is misery upon the earth,—and who thinks that in pitying it, with the very idleness of pity, he has felt as a good man should feel; when we look through the darkness, to which there is no sunshine, on some corner, darker still,—where the father of those who have strength only to hang over him and weep, is giving to them his last blessing, which is all that remains to him to give; do we feel, on looking at this mixture of death, and sickness, and despair, and want, in dreadful assemblage, that it would be well for the world if a little relief were given to miseries so hopeless; or that compassion, as a principle of conduct, is of the highest usefulness, where there are so many sufferers on the earth, who may be objects of compassion? Of the principle of the action in its relation to general utility, we never think. We hasten to do what it is in our power to do; and we have already obtained looks of as much gratitude, as could be felt in a moment of such affliction, long before we have thought of any thing more than what was before our very eyes. In all the small courtesies of society, as well as in these higher duties, we act, not from any estimate of the principle of courtesy as a general principle, but from the temporary views of individual gratifications to those who mingle with us; and we act well. The amount of general good, which a philosopher might estimate, or attempt to estimate, by considering the relation of these particular actions to the advantage of the community, never occurs as an object of contemplation to the multitude of mankind, when they approve or disapprove, with feelings at least as vivid, as those of him who measures every action by its remotest consequences. It occurs but seldom, even to philosophers themselves, who may derive, indeed, an additional enjoyment from tracing that relation, and an additional reason to adore the goodness of him who has established it; but who, in the common transactions of life, act from the same immediate feelings of approvableness, the same immediate impulses of virtuous emotion, as those to whom ethical and political generalizations are absolutely unknown. The immediate virtuous impulse is the mere feeling of rapid approbation, that becomes still more rapidly choice or determination; a feeling which has relation only to the particular case, and which, far from pausing for any extensive view and measurement of remote consequences of utility, has arisen in the instant, or almost in the very instant in which the action was conceived.

But the feelings of the agent himself,

whom alone we have yet considered, it may perhaps be said, furnish no decisive confirmation of the supposed moral measurement of the virtue of actions, by the feeling of their precise degrees of general utility; they may afford a presumption, but nothing more; and it is in the calm contemplation of the indifferent spectator, or reader, or hearer of an action only, that we are to look for the grounds of a just moral estimate of the virtue or vice which the action itself involves.

The exclusion of the feelings of the agent himself, in the moral estimate of the propriety or impropriety of the actions, which circumstances call on him to perform, and on account of which he is to be ranked with the virtuous or the guilty, may seem a very bold use of the privilege of unlimited supposition, which a theorist assumes. Let the assumption, however, be admitted. Let the feelings of the agent be left wholly out of account, and let us think only of the feelings of him who contemplates the action of another. Is the approbation of virtue, in this case, the feeling of mere utility; our indignation, disgust, abhorrence of vice, in its aspects of greatest atrocity, a feeling of nothing more than of the uselessness, or physical incumbrance and detriment to society, of that profitless thing which we call a tyrant or a parricide? The doctrine of utility, as the felt essence of virtue, is, in this case, as little in agreement with the moral facts which it would explain, as in the case of the feelings of the agent himself; as little accordant with them as any false hypothesis in mere physics, with the stubbornly resisting physical facts, which it would vainly endeavour to reconcile, or at least to force together.

If the approbation which we give to virtue be only the emotion excited in us by the contemplation of what is useful to mankind, it is very evident that such utility is to be found, not in the actions only of voluntary agents, and in the general principles of conduct from which the particular actions flow, but in inanimate matter also; and indeed, on earth at least, it is only by the intervention of matter, that one mind can indirectly be of any utility whatever to any other mind. Let us imagine, then, not a mere chest of drawers before us,—for that may be counted of too trifling convenience,—but the most useful machine which the art of man has been able to devise,—a loom, for example, a ship, a printing-press, instruments which have certainly contributed to the happiness of the world a far greater amount of good, than any moral action of any generous benefactor, whose voluntary production of a little limited good, perhaps to a single individual only, may yet have excited in us the liveliest emotions of a regard that is almost veneration.

tion, or more than mere veneration. When we think of any one of these noble instruments, as placed before our eyes, or when any one of them is actually before our eyes, and when we trace all the contrivances of its parts, and think of the good which has for many ages resulted, and will still continue to result from the whole; does it seem to us possible that any one should assert, or almost that any one should imagine, for a moment, the sameness in kind of the intellectual admiration, if I may so express it, which we feel in such a case, with the moral admiration that is excited in us by the patriot or the martyr; or even by the humblest of those who, in their little sphere of private life, in the ordinary circumstances of peaceful society, exert, for the good of the few who are around them, an energy of active benevolence, as powerful as that which, in a more elevated station, and in a tumultuous age, ennobles the leader and the sufferer in the cause of nations and of the world? Our admiration of a steam-engine, our admiration of an heroic sacrifice of personal comfort, or of life itself, are feelings that can scarcely be said to have any greater resemblance than the brightness of scarlet and the shrillness of a trumpet; and the blind man who asserted the similarity of these two sensations, was, I cannot but think, (if our consciousness is to decide on the comparative merit of the theories,) at least as sound a theorist, as he who would convince us of the similarity of the two emotions. Indeed, if we were to strive to conceive all the possibilities of extravagant assertion, it would not be easy to imagine one less warranted by fact, than that which would affirm that we love a benefactor exactly with the same feelings as those with which we regard a house or a loaf of bread; or at least that there is no difference, but as one or the other may have been in degree more or less useful to us or to the world in general.

If, indeed, mere matter could, by the most beautiful subserviency to our happiness, become a reasonable object of moral admiration, by what means have we been able to escape an universal idolatry? How is it that we are not, at this moment, all adorers of that earth on which we dwell, or of that great luminary which renders our earth not habitable merely, but delightful? The ancient worshippers of the universe at least supposed it to be animated with a soul. It was the soul of the world which they adored. The savage, who trembles at the thunder, and bends before the whirlwind that knee which does not bow to man, believes that there is some being greater than man who presides over the awful darkness. But, according to the system of utility, the belief of a soul of the world, or of a

ruler of the lightning and the storm, which even the savage thinks necessary, before he deign to worship, is superfluous for our more philosophic veneration. The earth, whether animated or inanimate, is alike that which supports and feeds us. The sun, whether animated or inanimate, is alike to us the source of warmth and light, and of all that infinity of blessings, which these simple words involve. The earth and the sun, then, if mere utility were to be considered as virtue, the sole standard on the contemplation of which certain moral emotions arise, and by which we measure their vividness, are the most virtuous beings that come beneath our view; and love, respect, veneration, such as we give to the virtues of the most virtuous human beings, are far too slight an offering of the heart to utilities so transcendent.

It is evidently, then, not mere utility which constitutes the essence of virtue, or which constitutes the measure of virtue; since we feel, for the most useful inanimate objects, even when their usefulness is to continue as long as the whole race of beings that from age to age are to be capable of profiting by them, no emotions of the kind which we feel, when we consider the voluntary actions of those who are capable of knowing and willing the good which they produce. A benevolent man and a steam-engine may both be instrumental to the happiness of society; and the quantity of happiness produced by the unconscious machine may be greater perhaps than that produced by the living agent; but there is no imaginary increase or diminution of the utility of the one and of the other, that can make the feelings with which we view them shadow into each other, or correspond in any point of the scale.

Though it is impossible for the theorist not to feel the irresistible force of this argument, when he strives in vain to think of some infinite accession of utility to a mere machine, which may procure for it all the veneration that is given to virtue, he can yet take refuge in the obscurity of a verbal distinction. Utility, he will tell us, is not in every instance followed by this veneration: it is only utility in the action of living beings that is followed by it; and when even all the useful actions of living beings are shown not to produce it, but only such actions as had in view that moral good which we admire, he will consent to narrow his limitations still more, and confine the utility, which he regards as the same with virtue, to certain voluntary actions of living beings. Does he not perceive, however, that in making these limitations he has conceded the very point in question? He admits that the actions of men are not valued merely as being useful, in which case they must have

ranked in virtue, with all things that are useful, exactly according to their place in the scale of utility, but for something which may be useful, or rather which is useful, yet which merely as useful never could have excited the feelings which it excites when considered as a voluntary choice of good. He admits an approvableness then, peculiar to living and voluntary agents, a capacity of exciting certain vivid moral emotions which are not commensurable with any utility, since no accession of mere utility could produce them. In short, he admits every thing for which the assertor of the peculiar and essential distinctions of virtue contends; and all which he gains by his verbal distinction of utilities is, that his admission of the doctrine which he professes to oppose, is tacit only, not open and direct.

It is indeed, by a verbal distinction of this sort that Mr. Hume himself, the most ingenious and liberal supporter of this system, endeavours to obviate the force of the objection, which may be drawn from inanimate matter, as useful and yet incapable of exciting moral emotion. He does, for the purpose of saving his theory, what is not easy to be reconciled with the acuteness of a mind so subtle as his, and so well practised in detecting, or at least so fond of detecting, what he considers as illogical in the speculations of other writers, or in the general easy faith of the half-reasoning multitude. He fairly takes for granted, as independent of any measurement of mere utility, those very moral feelings which he yet wishes us to believe to arise from the perception of mere utility; thus abandoning his theory as false in order that we may admit it as true. The utility of inanimate things, he says, does not seem to us virtuous, because it is not accompanied with esteem and approbation which are peculiar to living beings; and he states this distinction of the two utilities, without seeming to be at all aware that, in supposing a moral esteem and approbation distinct from the feeling of usefulness, he is thus presupposing the very feeling for which he professes to account; and denying that strict relation of utility to virtue, which his theory would hold out as the only standard, or rather as the only constituent of virtue. The passage is too important not to be quoted in his own words. "We ought not to imagine," he says, "because an inanimate object may be useful as well as a man, that therefore it ought also, according to this system, to merit the appellation of virtuous. The sentiments excited by utility are in the two cases very different; and the one is mixed with affection, esteem, approbation, &c. and not the other." Now it is obviously of these very sentiments alone, which are said by Hume to be mixed with the feeling of utility, and not produced by it, that the

moral theorist has to trace the origin. If the sentiments excited by the utility in the two cases be; as he most justly observes, very different, even when the amount of mere utility may be the same in both; then, most indubitably, it is not as being useful that actions are counted virtuous, and rated in different degrees of virtue according to their different degrees of usefulness; but on account of something that must be superadded to this usefulness: and if, independently of the sum of good which they may produce, and equally produce, one utility and not the other be attended with esteem and approbation, is not this a proof that the moral esteem and approbation are not commensurable with mere physical usefulness; that they are feelings of a peculiar class, which even he, who would represent actions as felt to be virtuous only because they are regarded as physically useful, is obliged to presuppose; and that there is in virtue, therefore, an independent and peculiar approvableness, or capacity of exciting "esteem and approbation," which utility is incapable either of constituting or of measuring?

In this argument, I have opposed to the actions which we feel immediately as virtuous, the utility only of inanimate matter, because this furnishes a more striking contrast; but the same argument, as you cannot fail to have perceived, might have been extended to many qualities of the mind itself, in all those varieties of original genius, or the rich endowments of science, that have progressively raised us from barbarism to civilization, with an influence on the happiness of the world, to which it is scarcely possible in our conception to fix a limit; of talents which we admire indeed, and honour with a respect of a peculiar kind; but our respect for which, even when they exist in their highest order of excellence, we feel to be of a species very different from the moral esteem which we give to an act of virtue. The inventors of the printing-press certainly did more good to the world by that mere invention, than the Man of Ross himself by all his charities; yet how different are the moral emotions with which we view them!

The mere usefulness of certain actions, then, I repeat, is not that which, as felt by us at the moment of our approbation, constitutes to us or measures their virtue; it is not that which is immediately felt by the agent; it is not that which is immediately felt by the spectator or hearer of the action; and yet utility and virtue are related, so intimately related, that there is perhaps no action generally felt by us as virtuous, which it would not be generally beneficial that all mankind in similar circumstances should imitate. This general relation, however, is one which we discover only on reflection,

and of which multitudes have perhaps never once thought during the whole course of their life; yet these have esteemed and hated like other people. The utility accompanies, indeed, our moral approbation; but the perception of that utility does not constitute our moral approbation, nor is it necessarily presupposed by it.

I may remark, by the way, as a circumstance which has probably contributed, in a great degree, to this misconception of the immediate object of moral approbation, that in cases of political legislation, the very end of which is not to look to the present only, but to the future, we estimate the propriety of certain measures by their usefulness. That which is to be injurious we do not enact; and those who contend that we should enact it, think it necessary to show that it will be for general advantage. Expediency being thus the circumstance on which the debates as to the propriety or impropriety of public measures in almost every case depend, we learn to consider it very falsely as the measure of our moral approbation in the particular cases that are constantly occurring in domestic life. We forget that the legislator is appointed for the express purpose of consulting the general good, and of looking to the future, therefore, and distant, as well as to the present or the near. His object is to see *ne quid detrimenti respublica capiat*. His relation is to the community, not to any particular individual; and in neglecting the general good for the good of a few, he would be guilty of a breach of trust, as much as the possessor of a deposit, if he were to give to the wants of some indigent sufferer the money which another had intrusted to his care.

In the general transactions of ordinary life, then, our feeling of approbation or disapprobation, we may conclude, does not depend on the mere perception of utility. The virtuous, by the very constitution of heaven, which has pre-established the connexion of virtue and happiness, will, indeed, that which is useful; but they will it, in each particular case, without regard to the general utility of the principle of conduct to which their action conforms; and, in considering the actions of others, we approve of that which is useful, but we do not approve of it because we have estimated, according to a scale of specific value, the mere usefulness of the general principle. We perceive a moral excellence, as something very different from the amount of physical advantage that flows from the particular action, or from all the similar actions of the same class; an excellence which, of itself, constitutes the approvableness; a virtue which is independent of every thing but the breast of him who conceived it; which is not ennobled by success, and which becomes more interest-

ing to us by the very misfortunes to which it may have led.

The coincidence of general good, with those particular affections which are felt by us to be virtuous, is, indeed, it must be admitted, a proof that this general good has been the object of some being who has adapted them to each other. But it was of a being far higher than man—of him who alone is able to comprehend the whole system of things; and who allots to our humbler faculties and affections those partial objects which alone they are able to comprehend, giving us still, however, the noble privilege

To join
Our partial movements with the master-wheel
Of the great world, and serve that sacred end,
Which he, the unerring reason, keeps in view.*

By this relation, of which few think or are capable of thinking, of particular good with public good, of general utility and private virtue, the public good is as effectually insured as if all were every moment thinking of the relation, and is insured with a still greater accession and profusion of delight.

"Happiness," it has been truly said, "is best provided for by the division of affection, as wealth by the division of labour. Were all men to measure their actions by utility," the same writer justly remarks, "that variety of sentiments and passions which at present renders human society so interesting, and, like a happy combination of notes in music, produces an enchanting harmony, must be reduced to the dull monotony of one tranquil sentiment. Every man, it is true, would meet his neighbour with the mild aspect of calm philosophy, and with the placid smile of perfect benevolence; but no eye must be seen sparkling with rapture or melting with tenderness, no tongue must utter words of kindness, which have not first been exactly measured on the scale of universal benevolence. In short, the moral world would become one flat unvaried scene, resembling the aspect which the natural world would assume, were all its mountains and valleys levelled, and its whole surface converted into a smooth and grassy plain."

That virtue is useful, is indeed true then; so useful that, without it, existence would not have been a blessing, but a source of misery; and a society of mankind but a combination of the miserable, labouring to become individually more wretched, by making each other more wretched. Yet it is not more true, that virtue is useful, than that this utility of the general principles of virtuous conduct is not the ground of our immediate approbation. It is not the standard of our approbation; for we have approved, long before we think of that which is

* Pleasures of Imagination, book ii.

said to have been the measure according to which we have approved. This priority of the approbation in all its degrees, to any thought of specific utility, is true even of philosophers, who know that there is such a coincidence of the relations of virtue and usefulness; but of all who feel virtue, who love and hate, who esteem, and honour, and despise, how few are they who know that there is any such relation. They do not approve or disapprove the less, however, but it is because God has willed the happiness of the world, which, as a great whole, they are unconsciously promoting, not because they individually have thought of it. He, indeed, who fixed the relations of things, before the system of things itself was formed by him, established this paramount relation of our generous desires, to an aggregate of happiness far greater than that momentary benefit which was their particular aim. The good of the universe was the gracious object of his will,—his object, not more in the physical enjoyments which he has poured upon us, than in the virtues of which he gave us the noble capacity. But though it was for that universality of happiness, which the eternal Author of the universe alone could fully comprehend in his conception and design that man was rendered virtuous, our limited virtues themselves have their particular objects, which they are better able to embrace. By their joint operation, they produce that great result, of which they do not think even while they are most busy in promoting it; intent perhaps only on courtesies and kindnesses, which appear to terminate in the individual who receives them; like the sunshine, that seems to be only flowing around the blossom in soft and brilliant varieties of light, while it is slowly and silently maturing fruits that are yet unseen; or like the breeze, which seems only to flutter in the sail, or to dimple the wave before the prow, but which is at the same time wafting along the majestic vessel that is to mingle the treasures of every clime, to carry plenty to the barren soil, and the richer stores of science to the still more desolate barrenness of the mind.

LECTURE LXXVIII.

EXAMINATION OF HUME'S SYSTEM CONCLUDED; OF THE SELFISH SYSTEM.

My last Lecture, Gentlemen, was employed in considering the relation which the utility of actions bears to our approbation of them as virtuous.

That in acting, the agent himself, in cases in which no one would hesitate for a moment in terming him virtuous, except those

who deny every distinction of vice and virtue, performs the action which is approved, without any regard to the amount of general good which would flow to society, if all men were to act as he acts, that is to say, without any regard to the specific utility of such actions, is evident from the slightest examination of human conduct. Of all the virtuous actions which are performed at any one moment on the earth, from the slightest reciprocation of domestic courtesies, to the most generous sacrifices of heroic friendship, there is perhaps scarcely one, in which this thought of the supposed scale of utility, according to which his action is to be measured, is present to the mind of the agent, and is the influencing circumstance in his choice, the immediate motive which confers on his conduct the character of virtue. He is useful to the world, indeed, when he relieves the sufferings even of a single individual being. But he relieves that suffering, not because the world, if he gives the relief, will, as a whole, have less misery; or because it would be for the advantage of the world that others should imitate him in similar cases; but that the individual before him may have less misery; or, if he thinks of any thing but that particular misery and its relief, he thinks only of the manner in which he would appear to himself, if he were to abstain from giving the relief which is in his power. He bears sufferings of his own, in like manner, without lamentation; not because a single groan from him, in any case of bodily anguish, would increase the misery of the world, or lessen its happiness, but because a single groan, though it might leave the happiness of the world precisely the same as before, would degrade him in his own estimation. Whether in doing or in suffering, therefore, his virtue, if any virtue be allowed to him, does not depend on his views of the general utility which the world derives from a frame of mind like that which his conduct displays. That comprehensive usefulness is not present to his mind, as a scale or measure of his virtue.

But though it be not the precise measure of approbation and preference in his own mind, it may perhaps be the precise and sole measure of approbation, when his actions or patient sufferings are considered by other minds. In this case, too, we found that the supposed standard is far from being the real standard. We approve, not from any wide calculation of probable consequences to the world, if all were to act as the individual has acted; but from an instant feeling of moral excellence, which makes it impossible for us not to approve, as soon as the action, in all its circumstances, is known to us. If we think of the general utility of such a general mode of conduct, it is not before, but after the approbation; and it is no paradox to say,

that our approbation has, in truth, least reference to general conduct and general consequences, in cases in which the virtue of which we approve is greatest; because, in such cases, the moral excellence produces an emotion so vivid, as to preclude the consideration of every remote circumstance. The hero himself, bearing what he bore, or doing what he did, is all which our mind can see. Who is there, that, in the contemplation of Thermopylae, and of the virtues that have made that desolate spot for ever sacred to us, can think of Leonidas and his little band, without any emotion of reverence, till the thought occur, how useful it must be to nations to have defenders so intrepid! Our admiration is not so tardy a calculator. It is instant in all its fervour; and, indeed, when we begin to think of the exact point in the scale of utility at which the action may be ranked, this very thought is itself a proof that our emotion has already become less vivid. The question, indeed, is one which our consciousness may decide in a moment, if we only trust to the evidence of our consciousness a sort of trust which, simple as it may seem, is no slight intellectual effort, when our consciousness is opposed to errors that are brilliant, and that have the authority of any great name. Our consciousness, if we appeal to it, will tell us, that to admire what is useful, and to revere what is virtuous, are feelings as different as any two feelings which are not absolutely opposite; and that, if we class them as the same, we may, with as much reason, class as the same, and reduce under a single term, our moral veneration and our sensation of fragrance, because they are both pleasing; or our admiration of what is useful, and our notion of a circle, because they are both states or feelings of the mind. Who ever looked on his conscience precisely in the same manner as he looked upon his estate; and felt not regret merely, but all the agonies of remorse, because his acres were less productive than the richer fields of his neighbour? We may respect the inventor of a machine, but we certainly do not respect the machine itself; though it is only in reference to the instruments which he invents that the inventor, as an inventor, has any utility; and, even in respecting his intellectual talents as an inventor, though he may have contributed more by this one exercise of them, to the permanent happiness of the world, than all the virtues of all the multitude that existed around him at the time, do we feel for his new and beautiful application of the physical powers, the moral emotion which we feel for the humblest of those virtues? It is enough, as I have said, to appeal to your consciousness on this point. If your reverence for virtue appear to you, as it cannot but appear to you, a feeling essentially different from

your mere admiration of what is useful; if, in short, you perceive, that no addition of useful properties to any piece of inanimate matter could so alter it, as to make it an object of moral love; that the philosopher's stone itself, if it really existed, though capable of conferring inexhaustible wealth, and eternal youth on its possessor, would yet be incapable of producing one feeling of cordial regard; that all the stores of knowledge, and all the talents of the most vigorous intellect, unless accompanied with a generous desire of the happiness of those who profit by them, cannot excite the moral emotions that are excited so readily by the humblest benevolence; then, surely you cannot hesitate for an instant, in rejecting the theory, which supposes virtue to be felt as virtue only from its utility, from that utility which may be greater or less than the usefulness of external things or of qualities of the understanding; but which, as mere utility, is precisely the same in its relation to our emotions, as the intellectual qualities of memory or judgment; or as the house which shelters us, the coat which keeps us warm, or the watch which tells us the hour and minute of the day.

The approbation which we give to actions as virtuous, then, whether we be ourselves the agents, or merely consider the actions of others, is not given to them simply as useful. Utility, in either case, is not the measure of moral approbation, the measure to which we must previously have adjusted the particular action, before any approbation of it can have arisen; and with which, in all its exact gradations, the feeling of the rank of virtue exactly corresponds.

It may be said, indeed, that it is not mere utility which excites moral approbation, but the utility only that results from the actions of living agents. This latter species of usefulness may be verbally distinguished from the other, as being that which is accompanied with esteem and approbation; and, indeed, this very distinction we find to be that which is made by Mr. Hume, the most acute defender of the theory which we have been examining; yet it is surely very evident, that the verbal distinction thus made is an abandonment of the theory, an admission that there is, in certain actions of voluntary agents, something more than utility which is morally admired by us; since, in degrees of utility, they may be strictly commensurable with other objects of thought that excite in us no such emotion. The esteem and approbation, which Mr. Hume finds it so easy to presuppose, are all which it is of much consequence, in any theory of virtue, to consider. They are in truth the very feeling of virtue itself under another name; the very feeling, therefore, which he should have shown, not to be mixed only with our

perception of utility, but to arise from it, or to be reducible to it; and if, in accounting for our moral approbation of certain actions, as distinguished from our admiration of any useful contrivance in mechanics, or any useful qualities of natural inanimate objects, or any excellence of mere intellect,—he say, that, together with our feeling of the utility of the actions, there is a feeling of esteem and approbation, which distinguishes this usefulness from every other usefulness of the same amount; he admits, in this very supposition, that there is in certain actions an approvableness which has not its source in the feeling of utility,—an approvableness which is independent, therefore, of the mere quantity of physical good produced; and that, when an action has been useful, is still necessary to convert utility itself into virtue.

It is true, indeed, as we have seen in our review of such actions, that actions which are virtuous are actions of which the general principle is useful; but they are virtuous and useful; not felt by us to be virtuous, merely because they are of a certain rank of usefulness, as innumerable objects in external nature are in like manner useful, or many valuable qualities of the understanding. The coincidence in this respect, which the Deity, who adapted our emotions to the happiness designed by him, has, from his own universal goodness established, may be compared in some measure to that pre-established harmony of which the followers of Leibnitz speak. According to that hypothesis, of which I gave you a sketch in the early part of this course, the body and mind, you will remember, have an exact correspondence of motions and feelings, but are absolutely independent of each other, even when they seem most exactly to correspond; the limbs running of themselves when the mind wishes them to run, and running faster or slower exactly as the mind wishes them to be more or less fleet; but having, in consequence of their own peculiar mechanism, a tendency to run so independent of the volition of that mind which longs to escape from the enemy, that, if the soul of the coward were, by a sudden miracle, to be annihilated, his legs would not run the less. Such a harmony the Deity has established of virtue and utility. That of which we approve as virtuous is, as a general mode of conduct, useful; though it is not on account of our estimate of its general useful tendency that we give it our immediate approbation. That of which we disapprove as vice, is, as a general mode of conduct, injurious to society; though it is not on that general account we regard it with instant contempt, or indignation, or horror. By this adaptation of our emotions, however, the same advantage is obtained, as if we approved of virtue

directly as useful to the world, in the same manner as we approve of any useful mechanical contrivance; while it leaves us the enjoyment of all that far greater delight, which arises from the contemplation of the moral excellence of the individual, and from the love so infinitely surpassing every preference of mere utility, which moral excellence, and moral excellence only, can excite.

It is this independent pre-established relation of virtue and utility, which, as I conceive, has rendered less apparent the error of the theory that would reduce moral approbation itself, to the perception of this mere usefulness; and the illusion has certainly been aided in a great degree, by the circumstance which I pointed out in my last lecture; the reference to the public advantage, in the enactments of laws, and the discussion of national measures of external or internal policy. These measures, to be virtuous, must indeed always have the public good in immediate view; because the legislative and executive functions of the state are either expressly or virtually trusts for this very purpose; and a neglect of the public good in those who exercise such functions has, therefore, all the guilt of a breach of trust in addition to any other partial delinquencies that may have been added to the crime. It is not very wonderful, however, that we should thus learn to extend to all particular actions, what is true of those actions of general delegated power, which are the great subjects of temporary debate; and should erroneously suppose all men in their little sphere to be swayed, when they are virtuous, by the motives which alone we recognise as giving virtue to the actions of legislators, judges, or sovereigns, those actions about which all men speak, and which furnish so much nice casuistry to the political discourse of every day.

Though it is not from calculations of general happiness, then, that we approve or disapprove in estimating the conduct of others, or our own; in many cases it will still be admitted that general happiness bears, not an indirect relation only, but a direct relation to our moral sentiments. The good of the world is not our only moral object, but it is a moral object. The sacrifices of mere personal advantage that are made to it, excite our regard; the wilful violation of it, for purposes of personal gain, would excite our scorn or detestation; but they excite these moral feelings not in any peculiar manner, as if primary, and paramount. They excite them precisely in the same manner as sacrifices to parental, or filial, or conjugal affection, made without the slightest consideration of public advantage, give immediate rise to our delightful sympathies; or, as the breach of any of the domestic duties, with circum-

stances of cruelty to the individuals injured, but without any intention of injuring the community of the world, awakes a wrath or a disgust almost as instant as the very knowledge of the injury. We should have loved our parents and our friends, though public utility had never been an object of our thought; it is not quite so certain, at least it is not so manifest, that we should have loved the good of the world, if we had never known what it is to love a parent or a friend. For my own part, indeed, I do not doubt that even in this case, if our mental constitution in other respects had remained as at present, the happiness of mankind would have been an object of our desire; and that we should have felt a moral disapprobation of any one who wilfully lessened that sum of general happiness for the mere pleasure of giving pain. But still the passion for universal utility is not so manifest in every individual, certainly not so vivid in every individual, as the private affections; and if we were to judge from the feelings alone, therefore, it would seem a juster theory to derive our love of the happiness of the world from our love of the friends who first surrounded us in life, than to suppose that our early essential notions of virtue and vice, in the observance or neglect of the filial or fraternal duties, are measured by a scale of general utility which has never been present to our mind; that general utility and virtue in our estimates of actions, are in truth convertible terms; and that we should have felt no wonder or dislike, even of parricide itself, if we had not previously been enamoured of public usefulness,—enamoured of that good of the universe of which the good of a parent is a small elementary part.

When the political moralist is said to correct our moral sentiments, as he unquestionably does often correct our views of particular actions, by pointing out to us general advantages or disadvantages, which flow more or less immediately from certain actions; and when he thus leads us to approve of actions of which we might otherwise have disapproved, to disapprove of actions of which otherwise we should have approved, he does not truly alter the nature of our moral feelings; he only presents new objects to our moral discrimination. From the mixture of good and evil, in the complicated results of almost every action, and from the innumerable relations which our actions bear in their results, not to the individuals alone, of whom alone we may have thought, but to others whose interest was unknown to us at the time, or unremembered in the eager precipitancy of our benevolence; we may approve at times of actions of which we disapprove at other times, not because we hate the good which we loved before, or love the evil which before we hated; but

because the action, though seemingly the same, is truly to our conception different. It is varied, to our mental view, with every nicer analysis of its results; and, in estimating the same apparent action, the new-discovered compound of good and evil which we now love, is as different from that semblance of mere evil which we before hated, as our love itself, as a present emotion, differs from our former emotion of hatred or disgust.

Reason, then, even in analyzing compound results of good and evil, and showing us the relation which actions that are truly virtuous bear to the good of the world, is not the source from which our moral sentiments flow, that have admired and loved the virtue before its political advantages were pointed out, or even suspected. The conclusion to which we are led, therefore, with respect to utility, is, that it is not the scale which is present to the mind whenever we approve or disapprove, and according to which our moral emotions are in every case exactly graduated; that though the good of the world is an object which we cannot consider, without feeling that the wish to promote it is a moral wish, it is not the only object which it is virtuous to desire, but one of many virtuous objects; and that, if we are virtuous once, in acting with this single object in view, we are virtuous a thousand times, in acting without the slightest reference to it, with regard only to the happiness or distress of individuals, which we cannot consider without a wish to preserve the happiness, or to lessen the distress,—a wish which we should have felt in like manner, though, with the exception of the individuals of whom we think at the moment, there had been no world to be benefited by our wishes and our aid, or by the aid of those who, in similar circumstances, may act as we have done.

The most important circumstance, however, with respect to the theory of utility as the essence of virtuous actions, is that which I remarked before, in entering on this discussion,—that it does not profess to account for the origin of our moral feelings, but proceeds on our susceptibility of these as an undoubted principle of the mind. Why should I love that which may be productive of benefit to all the individuals of the world, more than that which would be productive of similar benefit only to one individual? or to put a question still stronger, why should I love that which would be of advantage even to one individual, more than that which would be of injury to every being but myself? The only answer which can be given, even according to the theory which supposes all virtue to consist in utility, is, that it is impossible for me, by my very nature, not to feel approbation of that which

is generally useful; disapprobation of that which is in its general consequences hurtful. There is a moral principle—a susceptibility of moral emotion—that is a part of my constitution, with which I can as little abstain from approving or disapproving, when I hear of certain actions, as I can abstain from simply hearing the words of that voice which relates them to me.

The error which we have been considering at so much length, as to the identity of virtue and the general utility of actions,—though I must confess that it appears to me, notwithstanding the high authorities by which it has been sanctioned, an error of no slight kind, is yet an error which is not inconsistent with the most generous virtue; since, though it assert utility to be the measure of our approbation, it does not confine this utility to our own individual advantage; but gives to us, as a great object of regard, whatever can be useful to the community of mankind. It is a very different doctrine that makes the utility according to which we measure virtue, in every case our own individual advantage. To the consideration of this doctrine, which is in truth only an extension of the principles of Mandeville, allowing less to the mere love of praise, and more to our other passions,—you may remember that I was about to proceed, after treating of the system of that licentious satirist of our nature, when I suspended this progress to make you acquainted with the general doctrines of the influence of reason on moral sentiment, and of the relation of virtue and usefulness; as I conceived that my remarks on those doctrines would render more apparent to you the futility of the selfish system of morals.

Virtue, according to this system, is the mere search of pleasure. It gives up one pleasure, indeed, but it gives it up for a greater. It sacrifices a present enjoyment; but it sacrifices it only to obtain some enjoyment which, in intensity and duration, is fairly worth the sacrifice. In every instance in which it seems to pursue the good of others as good, it is its own gratification, and nothing but its own gratification, which it seeks.

To this system which, from the days of Aristippus, has, both in ancient and modern times, been presented in various forms, the remarks which I made on the system of general utility are equally applicable. We do unquestionably love our own well-being, our bodily ease, and that pleasure which is still dearer than ease; but, loving ourselves, we as unquestionably love others; and, loving them, we cannot fail to desire their happiness, since the desire may be considered as the natural consequence of the love. In such cases, the immediate object of our desire—and it is this immediate ob-

ject alone which we have theoretically to consider—is as truly the good of others, as our own good is our immediate object, when we wish for freedom from any bodily pain, or for the possession of any object which appears to us productive of positive pleasure. All of which we think, at the moment of the action, is purely benevolent; and the action, therefore, if justly designated, must itself be regarded as purely benevolent.

There is, indeed, as I remarked in a former lecture, one very simple argument by which every attempt to maintain the disinterested nature of virtue is opposed. If we will the happiness of any one, it is said, it must be agreeable to us that he should be happy, since we have willed it; it must be painful to us not to obtain our wish; and with the pleasure of the gratification before us, and the pain of failure, can we doubt that we have our own happiness in view, however zealously we may seem to others, and even perhaps to ourselves, to have in view only some addition to another's happiness? This argument, though often urged with an air of triumph, as if it were irresistible, is a quibble, and nothing more. The question is not, whether it be agreeable to act in a certain manner, and painful not to act in that manner; but whether the pleasure and the pain be the objects of our immediate contemplation in the desire? and this is not proved by the mere assertion that virtue is delightful, and that, to be restrained from the exercise of virtue, if it were possible, would be the most oppressive restraint under which a good man could be placed. There is a pleasure, in like manner, attending moderate exercise of our limbs; and to fetter our limbs, when we wish to move them, would be to inflict on us no slight disquietude. But how absurd would that sophistry seem, which should say, that, when we hasten to the relief of one who is in peril, or in sorrow, whom we feel that we have the power of relieving, we hasten because it is agreeable to us to walk; and because, if we were prevented from walking, when we wished thus to change our place, the restraint imposed on us would be very disagreeable. Yet this is the very argument, under another form, which the selfish philosophers adduce, in support of their miserable system. They forget, or are not aware, that the very objection which they thus urge, contains in itself its own confutation,—a confutation stronger than a thousand arguments.

Why is it that the pleasure is felt in the case supposed? It is because the generous desire is previously felt; and if there had been no previous generous desire, there could not be the pleasure that is afterwards felt in the gratification of the desire. Why is it, in like manner, that pain is felt, when the

desire of the happiness of others has not been gratified? It is surely because we have previously desired the happiness of others. That very delight, therefore, which is said to give occasion to the selfish wish is itself a proof, and a convincing proof, that man is not selfish; unless we invert all reasoning, and suppose that it is in every instance the effect which gives occasion to the cause, not the cause which produces the effect. The virtuous man feels delight in the sacrifices which he makes! unquestionably he does feel this delight; a delight which he would not yield for any thing but for the knowledge that his sacrifice has been of the advantage which he desired to the friend for whom it was made,—if the loss of the pleasure which he feels could have been made a part of the sacrifice. The virtuous man is happy; and if it were necessary for proving that he is not selfish, that we should show him to be miserable for having done his duty, the cause of disinterested virtue, I confess, must be given up; and, perhaps, in that case, if the attending pleasure or pain, and not the motive, is to be considered, the name of absolute disinterestedness might be appropriated to those whom we now count selfish—to him who deceives, and plunders, and oppresses, and finds no satisfaction in his accumulated frauds and villainies of every kind. Why does it seem to us absurd to say, that a wretch, who is incapable of any generous feeling, and who never acts but with a view to some direct personal enjoyment, is not to be counted selfish, because he derives no actual enjoyment from the attainment of his sordid wishes? If it be absurd to say, that, in thinking only of his own good, he is not selfish, because no happiness has attended his selfishness; it is just as absurd to say, that the virtuous man, in thinking of the good of others, is selfish, because happiness has attended the very sacrifices which he has made. The one is selfish, though not happy, because his immediate and sole motive was his own happiness; the other is disinterested though happy, because, in acting, his immediate motive was the happiness of others. The more the benevolent live for others, the more, there can be no doubt, they live for themselves; but they live for themselves in this case without thinking of themselves. Their great object is to make man happy, wherever the happiness of a single individual is in their power; and their own happiness they safely leave to him who has not forgotten the virtuous, in the distribution which he has made of enjoyment. It comes to them without their seeking it; or rather, it does not come to them; it is for ever within their heart.

Even if virtue were as selfish as it is most strangely said to be, I may observe that it would be necessary to form two divisions of

selfish actions; one of those selfish actions, in which self was the direct object, and another of those very different selfish actions, in which the selfish gratification was sought in the good of others. He who submitted to poverty, to ignominy, to death, for the sake of one who had been his friend and benefactor, would be still a very different being, and ought surely therefore, to be classed still differently, from him who robbed his friend of the scanty relics of a fortune which his credulous benevolence had before divided with him; and, not content with this additional plunder, calumniated perhaps the very kindness which had snatched him from ruin.

A self there is,
Of virtue fond, that kindles at her charms.
A self there is, as fond of every vice,
While every virtue wounds it to the heart;
Humility degrades it. Justice robs,
Blest Bounty beggars it, fair Truth betrays,
And godlike Magnanimity destroys.*

By what perversion of language is the same term to be given to affections so different? The foreigner of whom Dr. Franklin speaks, who, on seeing the tragedy of Othello, conceived that all the emotion which the actor exhibited was for the loss of a handkerchief, did indeed form a theory as just as that of many very ingenious philosophers, when they would labour to convince us, that a little personal gratification was the only object of those who, in the dreadful ages of Roman tyranny, followed their friend into exile or imprisonment; or who, after he had nobly perished, still dared to proclaim that innocence, the very assertion of which was a crime, which the tyrant, who knew only how to pardon what was atrocious, and not what was virtuous, was, by the habits which he had wrought into the dreadful constitution of his nature, incapable of forgiving.

If virtue be nothing but personal gain, what is it which we individually can hope to acquire from the virtues of others! We surely cannot hope that all the virtues of all mankind will give us more wealth than is possessed by the wealthiest individual existing; more power than is possessed by the most powerful; more vigour of body and intellect than is possessed by the healthiest and the wisest. Let us imagine, then, all these promised to us, on the condition of our admiration; let us conceive that some human demon, a Nero, a Tiberius, a Caligula, were to show to any one of us all the kingdoms of the world, and to say, "All these thou shalt have, if thou wilt but esteem me,"—would our esteem arise at all more readily? Should we feel, in that case, for the guilty offerer of so many means of happiness, a single emotion like that which we feel for the humblest virtue of one who,

* Young's Night Thoughts, Night viii.

we know, never can be of any aid to our worldly advancement? If a virtuous action be in itself nothing, except as a source of personal gain, why, in such a case as that which I have supposed, does not our heart feel its sentiments of esteem and abhorrence vary with every new accession of happiness which is promised to us? At first, indeed, we may feel a loathing for the tyrant, not because tyranny is in itself less worthy of approbation than the mildest benevolence, but because it may be more injurious to our interest. It would require no trifling equivalent; but still, as it is only a quantity of injury which is dreaded, an equivalent may be found; and, with every new bribe for our esteem, there is of course a nearer approach to this equivalent. Our abhorrence should gradually subside into slight indignation, and this into very slight dislike, and this, again, when the bribe is increased, become at length some slight emotion of approbation, which may rise, with the still increasing bribe, through all the stages of love, through esteem, respect, veneration, till we feel ultimately for the tyrant, whose power is to us a source of so much happiness, all that devotion of the heart which we so readily yield to power that is exerted for the benefit of mankind. When we labour to think of this progressive transmutation of moral sentiment, while the guilty object of it continues the same, in every respect, but as he offers a greater or less bribe for our affection, do we not feel, by the inconsistency which strikes us at every supposed stage of the progress, that affection—the pure affection which loves virtue and hates vice—is not any thing which can be bought but by that noble price, which is the virtue itself, that is honoured by us; and that to bribe us to love what is viewed by us with horror, or to hate what is viewed by us with tenderness or reverence, is an attempt as hopeless as it would be to bribe us to regard objects as purple which are yellow, or yellow which are purple? We may, indeed, agree, by a sacrifice of truth, to call that purple which we see to be yellow, as we may agree, by a still more profligate sacrifice of every noble feeling, to offer to tyranny the homage of our adulation,—to say to the murderer of Thræsea Pætus, “Thou hast done well,”—to the parricide who murdered Agrippina, “Thou hast done more than well.” As every new victim falls, we may lift our voice in still louder flattery. We may fall at the proud feet, we may beg, as a boon, the honour of kissing that bloody hand which has been lifted against the helpless; we may do more; we may bring the altar, and the sacrifice, and implore the god not to ascend too soon to heaven. This we may do, for this we have the sad remembrance, that beings of a human form and soul have

done. But this is all which we can do. We can constrain our tongue to be false; our features to bend themselves to the semblance of that passionate adoration which we wish to express; our knees to fall prostrate; but our heart we cannot constrain. There virtue must still have a voice which is not to be drowned by hymns and acclamations; there the crimes which we laud as virtues are crimes still; and he whom we have made a god is the most contemptible of mankind; if, indeed, we do not feel perhaps that we are ourselves still more contemptible. When is it, I may ask, that the virtue of any one appears to us most amiable? Is it when it seems attended with every thing that can excite the envy even of the wicked,—with wealth, with power, with all which is commonly termed good fortune; and when, if its influence on our emotions depend on the mere images of enjoyment which it suggests, these may surely be supposed to arise most readily? It is amiable, indeed, even in such circumstances; but how much more interesting is it to us, when it is loaded with afflictions from which it alone can derive happiness. It is Socrates in the prison of whom we think—Aristides in exile, and perhaps Cato, whatever comparative esteem he might have excited, would have been little more interesting in our eyes than Cæsar himself, if Cæsar had not been a successful usurper.

It is in describing the retreat and disasters to which that last defender of Roman freedom was exposed, that Lucan exclaims, with a sympathy almost of exultation,

*Hunc ego per Syrtas, Lybiæque extrema, triumphum
Ducere maluerim, quam ter Capitola curru
Scandere Pompeii, quam frangere colla Jugurthæ.**

What proof can be imagined stronger than this, that virtue and the source of personal gain are not identical phrases; since no accession of personal interest can make that a virtue which was before a vice; nor any loss of personal interest make that a vice which was before a virtue? If, in any physical science, a similar error were maintained, there is not a philosopher who would not instantly reject it. Let us conceive, for example, some one ignorant enough, or bold enough to affirm, that the gravity of bodies depends on their quantity of heat. We should think that we had nothing more to do, for showing the absurdity of such an opinion, than to try the effect of increasing and diminishing the warmth of the gravitating bodies; and, if we found the weight to remain the same during all these changes; if we found one body to be warmer than another, and yet heavier, colder than a third body and yet heavier, we should think ourselves fairly entitled to infer, that warmth

* Lib. ix. v. 598—600.

and gravity were not the same; that a body might gravitate and be warm, as, indeed, every body which gravitates may be said to have some heat, as every substance which is warm has some weight; but that the gravity did not depend on the warmth, and bore no measurable proportion to it. This, in external physics, we should think a sufficient demonstration. But, in morals, the sophist finds a sort of shelter in the indistinct conceptions of those to whom he addresses himself. It is proved, as indubitable, that our admiration of virtue has no measurable proportion to our feeling of personal profit which may be reaped from it; that the profit may be increased, indefinitely, without the slightest diminution of our abhorrence of vice; and the loss increased indefinitely without any diminution of our admiration of virtue. But, notwithstanding this demonstration, that virtue is conceived by us as something more than a mere source of personal enjoyment to us, he still asserts that they are strictly synonymous; and renews, with as brilliant ingenuity as before, that sly logic, which would be irresistible if an epigram were an argument, and a series of epigrams a perfect demonstration.

We have seen, then, that the admiration of actions as virtuous, is not affected by calculations of loss and gain, and must, therefore, be something more than that loss or gain which, in our calculation, we perceive to be manifestly increased or diminished. There is another demonstration which seems not less irresistible. If what we admire in the virtue of others be nothing more than its tendency, more or less direct, to our individual advantage, the relations on which this tendency depends must be perceived by us before we admire; and the discernment of these is not a simple and easy intellectual effort. The mind that is matured by long observation of society, and by profound reflection on those ties which make the action of one man a source of profit or injury to remote individuals, may, indeed, look with esteem on certain actions, and with indignation on others. Our love of virtue and hatred of vice, if they arise from such knowledge, must be in every case progressive as the knowledge itself, from infancy to old age. To relate to a child some action of cruelty, must be to speak to an indifferent heart,—to a heart which cannot have made these nice reflections, and which cannot, therefore, feel what is not to be felt without the knowledge which those reflections give. Every nursery, then, exhibits a fair field for an experiment that may be said to be decisive; and will the selfish moralist submit his theory to the test? Will he take upon his knee that little creature which has, perhaps, scarcely felt a pain since it entered into life, which knows only that it has a friend in every liv-

ing being that has met its eye, and which has never thought of its own misery as a thing that is possible? Will he watch that listening countenance, every look of which is fixed on his own, as he repeats verse after verse of the ballad which describes some act of injustice and atrocious cruelty, and will he expect to see no tear in those eyes, to hear no sobbings when the misery is extreme, to discover no demonstrations of an indignant wrath, that thinks not of itself at the time, but thinks only of the oppressed whom it would gladly succour, of the oppressor on whom it would gladly inflict vengeance? It will be well for that child if, in the corruption of the world, he retain a sympathy with the good and the wretched, and a hatred of guilt, as ardent as he feels in those years of ignorance; if, on learning the relations of virtue to his own happiness, he love it merely as he loved it when he had never thought of the relation.

The love of virtue, then, I conclude, is different, and essentially different, from the mere love of selfish gain. It is an affection which leads us to esteem often what is directly injurious to us; which makes it impossible for the good man not to honour in his heart, as well as in the praise which might seem forced from him, the virtues of that rival by whom he is outstripped in the competition of public dignity, which gains from the commander of an army a respect which nothing can suppress, for the valour, and all the military virtues of the commander opposed to him; though these very virtues have disquieted him more than the vices of half a nation, though they have robbed him of repose, and, which is still worse, have robbed him of the glory, which was his great object, by bringing on the army which he has led in vain to successive fields, disaster after disaster. It is an affection which can find objects in lands the most remote; which makes us feel delight in the good qualities of those who lived in ages of which the remembrances of their virtues are the only relics; and which preserves to our indignation and abhorrence, the crimes of those whom the tomb itself, already in ruins, has rendered powerless to injure us. It is an affection which is itself the truest prosperity of him who feels it; and which, when the virtuous man does truly seem to suffer what the world calls adversity, endears to him in his very afflictions, still more, that virtue, without which he might have been what the world terms prosperous.

LECTURE LXXIX.

EXAMINATION OF THE SELFISH SYSTEM AND ITS MODIFICATIONS CONTINUED.

A GREAT part of my last Lecture, Gentlemen, was employed in considering that theory

of morals which would represent all the feelings that appear to us most disinterested, as only the results of selfish calculation ; the generous sacrifices of friendship as the barter of some good which we value less for a good which we value more, without any regard to the happiness of those whom it is our policy to distinguish by the flattering term of friends, but who are merely the purchasers and sellers of the different wares of wealth, or power, or honour, or sensual pleasures, which it is our trade, as human beings, to sell and buy. In that wretched exhibition which is made to us of the social intercourse of the world, the friendship of any one, as implying, in every instance, some stratagem or invention of deceit on his part, is, therefore, in every instance, to be dreaded and shunned far more than absolute indifference, or even perhaps than avowed enmity. Nor is it only common friendship which this system would represent as the simulation, and nothing more than the simulation of the generous feelings that are professed. The virtues which gather us under the domestic roof in delightful confidence of affection, of which we never question the sincerity in others, because we feel it to be sincere in ourselves, when it prompts in us the kindnesses which we delight to receive, because we have known the delight of conferring them ; these gentle virtues, which almost consecrate to us our home,—as if, in the midst of that wide scene in which the anxieties and vices of the world may rage, it were some divine and sacred place, which distrust and fear cannot enter,—would be driven, by this cold and miserable sophistry, from the roof under which they delighted to repose,—if human folly could prevail over an influence so celestial, and if man could, indeed, become that wretched thing which he would so laboriously represent himself to be. In the tenderness of connubial love, which years of affection have only rendered more vivid, how many are there who, in their chief wishes of happiness, scarcely think of themselves ; or, at least, think of themselves far less as objects of exclusive interest, than as beings whose happiness is necessary to the enjoyment of those whom they delight to render happy ! This seeming devotion, we are told, may indeed be a selfishness a little more refined ; but it is not less the growth or development of absolute and exclusive self-regard. It is a selfishness which sees and seeks its own individual good at a little greater distance ; but, since it is its own individual good which alone, at whatever distance, it is incessantly wishing to see, and as incessantly labouring to obtain, it is still selfishness, as much when it pursues the distant as when it grasps the near ;—a selfishness to which the happiness of those who appear to be loved, is as the

mere happiness of another,—if we analyze our desires with sufficient subtlety,—far more uninteresting than the acquisition of the idlest gewgaw which vanity, with all its covetous eagerness, would scarcely stoop to add to its stores.

The fallacy of this system, as I endeavoured to show you, arises chiefly from the pleasure which truly attends our virtuous affections, but which, though universally attending them, it seems to require no very great nicety of discrimination to distinguish, as their consequence, not their cause. We have pleasure, indeed, in conferring a kindness ; but it is because we confer the kindness, and have had the previous desire of conferring it, that we feel this pleasure of being kind ; not because we feel this pleasure, that we confer the kindness ; and if we had never been beneficent, we should as little have known the delight of beneficence, as we should have known what external beauty is, without the previous perception of the forms and colours of the objects which we term beautiful. It would, indeed, have been as just a theory of the primary sensations of vision, to say, that it is because we have a pleasing emotion in beholding the proportions and colours of certain forms, we see those forms and colours which excite in us the pleasing emotion, as, of our moral approbation or disapprobation, to say, that it is because we have pleasure in the performance and contemplation of virtuous actions, and pain in the contemplation and performance of vicious actions, we perceive that very virtue and vice, and form those very desires, virtuous or vicious, to which, as previously existing, we owe the pleasure and the pain that have resulted from them, not produced them, and that cannot even be conceived as pleasure and pain, without necessarily presupposing them. In acting virtuously, we do what it is pleasant to do ; but it is not on account of the pleasure that we perform the action, which it is delightful for us to do, and almost as delightful to us to have done. Indeed, to destroy our pleasure altogether, nothing more would be necessary, than to impress us with the belief, that the actions were performed by us, with no other view than to the selfish gratification which we might feel in thinking of them ; and with a total carelessness as to the happiness of those to whose welfare the world conceived us to be making a generous sacrifice. If conformity to selfish gain were all which constitutes virtue, why should our pleasure in this case cease ? It ceases for the best of all reasons, that it arises from virtue, and can arise only from virtue ; and that in such a case, as there would no longer be any virtue, there would, therefore, no longer be any thing to be contemplated with satisfaction. Such is that gross and revolting system which would

represent all the seeming moral excellences of the world,—every generous exertion, every magnanimous forbearance,—as one universal deceit,—one constant unwearied search of personal good, in which not a single wish ever wanders beyond that personal enjoyment of the individual.

There is another form in which the selfish system may be presented to us, less unjust to our nature than that which we have been considering. It may be said, that we now do truly wish for the happiness of others, without any regard to our own immediate interest; but that we have become thus disinterested, by the very influence of selfishness, only because our own interest has formerly been felt to be connected with the interest of others; diminishing and increasing with theirs in so many instances, that the love which was originally confined, and confined in the strictest sense of exclusion to ourselves, is now diffused in some measure to them, as if almost parts of ourselves; that we have learned to value their happiness, however, only on account of the relation which it has been found to bear to ours; but for which relation, as evolved to us more and more distinctly in the whole progress of social life, we should be absolutely incapable of a single wish for their happiness, of a single wish for their freedom from the severest agony, even when their agony was beneath our very view, and could be suspended by our utterance of a single word of command to him who waited in dreadful misery on the rack or on the stake; or at least, if, in such circumstances, we could have wished any relief to their torture, it must have been merely to free our ears from the noise of groans or shrieks, that, like any other noise, might be a little too loud to be agreeable to us. According to this system, the happiness of others is loved as representative of our own, in the same way as any object with which our own pleasure has been associated, becomes itself an object of pleasure to us. Our virtues, therefore, arising in every case from the discovery of some relation which the happiness of others bears to our own physical happiness, are not so much the causes of enjoyment, as the results of it; they depend, then, on circumstances that are accidental, varying as the accidental relations to our pleasure vary; and, if they seem to us to have any uniformity, it is only because the circumstances of pleasure, on which they depend, may be regarded as nearly uniform in all the nations of the earth. Everywhere the parent, the wife, the child, must have been useful to the son, the husband, the father; everywhere, therefore, these relations, as productive of happiness, or protection, or comfort, in some degree, are relations of love; and everywhere, in consequence of this factitious love, there are

corresponding factitious feelings of duty, filial, connubial, parental.

This modification of the selfish system, as distinguished from the former, has at least the comparative merit of not being in absolute opposition to almost every feeling of our nature; and since it allows us to be at present disinterested, and refers us for the period of absolute moral indifference, to a time, antecedent to that which our remembrance can reach, it is not so easy to expose its falsehood, as to expose the gross and obvious falsehood of the system which ascribes to us one lasting selfishness,—a selfishness so unremitting as to be, not for the first years of our life only, but in infancy, in youth, in mature manhood, in the last sordid wishes of a long age of sordid wishes, absolutely incompatible with any affection that is directly and purely benevolent. But though it may be less easy to show the inaccuracy of the view of the great principles of our moral nature, which such a modification of the doctrine of general selfishness presents, the view, which even this modification of the doctrine presents, is false to the noble principles of a nature that, even in the sophist himself, is far nobler than that which his degrading sophistries would represent him as possessing. There are feelings of moral approbation, independent of all views of personal interest. The happiness of others is to us more than the representation of our own; and the way in which it contributes most powerfully to our own, is by the generous disinterested wishes which it has previously excited in our breast.

I trust it is superfluous for me to say, that, in contending for the independence and originality of our moral feelings, I do not contend that we are capable of these feelings at a period at which we are incapable of forming any conception of the nature and consequences of actions; that, for example, we must feel instant gratitude, to our mother or our nurse, for the first sustenance or first cares, which we receive, before we are conscious of any thing but of our momentary pleasure or pain; and, far from knowing the existence of those kind hearts which watch over us, scarcely know that we have ourselves an existence which is capable of being prolonged. This blind virtue, it would indeed be manifestly absurd to suppose; but this no philosopher has maintained. All which a defender of original tendencies to the emotions that are distinctive of virtue and vice, can be supposed to assert, is, that when we are capable of understanding the consequences of actions, we then have those feelings of moral approbation or disapprobation, which, in their various relations to time, as present, past, or future, I suppose to constitute our moral notions of virtue, merit, obligation. It then becomes impossible for

us not to feel, that in giving pain, for the mere pleasure of giving pain, to one whose delight it has been to contribute to our happiness, we should do that which we could not contemplate without a feeling of self-reproach,—as we should have an opposite feeling of self-approbation, in every sacrifice which we might make of our own convenience, to the happiness or the comfort of a person, to whom our mutual services were so justly due. An action, I have already frequently repeated, is, as a moral object, not the mere production of good or evil, but the intentional production of good or evil. It has no moral meaning whatever, but as it is significant of the frame of mind of the agent himself, willing and producing a particular result; and where the frame of mind of the agent cannot be supposed to be known, or even guessed, it is not to be supposed that any moral feeling should arise, whatever susceptibility the mind may possess of being affected with certain moral emotions, by the contemplation of certain frames of mind of the voluntary producers of good or evil. There is a knowledge then of intention on which our moral sentiments unquestionably depend; but it is only on this knowledge they do depend; and it would be as absurd to refuse to them the appellation of original feelings, on this account, as it would be to refuse to the mind any original susceptibility of the sensations of vision, because there can be no vision till a luminous object be present, nor even then any distinct perception till we have opened our eyelids. There was, indeed, a period at which we had no moral feelings, as there was a period at which we had no sensations of colour; but though we had not the actual feelings, from the absence of the circumstances which are necessary for producing them, we could as little be said to be blind to morality in the one case, as blind to all the splendour and beauty of light in the other.

To return, however, to that form of the selfish system of morals, which is under our review, I may remark, in the first place, that, as this theory of our affections admits them to be at present disinterested, and refers us for the period of exclusive self-regard, to a time of which the consciousness is absolutely lost to our memory, it would not be entitled to the praise of certainty, even though no objection could be urged against it. It would still be only an hypothesis,—and an hypothesis which, even by the confession of those who maintain it, supposes a state of our feelings absolutely opposite to that which they have continued to display, during all that long period of our consciousness which we are capable of remembering. It is an hypothesis, all the burthen of the proof of which must rest with the assertors of it,—an hypothesis which, even though it were just,

it would be impossible to verify,—and an hypothesis which affirms the mind to have been, with respect to the very feelings that are attempted to be explained by it, the reverse of what is at present. But is there no other objection which can be made to this system, than that it is an hypothesis only, which may, if we consent to admit it without proof, be made to tally with the phenomena; but which the phenomena themselves do not at least very obviously appear to warrant us to frame? There is still another very important inquiry: Does it correspond, even as an hypothesis, with the moral appearances, which it is invented to illustrate?

We have moral affections, it is allowed, at present which are disinterested; but they have become so, it is said, in consequence of the association of our own past pleasures with their objects; and our experience that the safety, and in some measure the comfort of others,—for whom, on their own account, we should be perfectly indifferent whether they be in health or disease, joy, or misery,—are necessary to enable them to contribute most effectually to our happiness. We at last seek their happiness for their sake, because we have been accustomed to seek it for our own; and the wilful violations of their pleasure or ease, which were regarded by us at first as inexpedient, because they might be hurtful to ourselves, are at last regarded by us as immoral, when we have been so perfectly selfish, for a sufficient length of time, as to cease to be selfish, from the very force of our habits of selfishness.

In opposition to this hypothesis, I need not repeat arguments which have been already urged by me against other false views of our moral nature; and which, as not less applicable to this view of it, I flatter myself that you will have no difficulty in remembering and applying for yourselves. The nursery, to which I referred in my last lecture as the scene of an experiment that might be considered as decisive with respect to the theory of universal selfishness, would be equally valuable for a similar experiment in the present instance, as to that selfishness, which, though not universal during the whole course of life, is said to be universal at least during childhood. Such an experiment, indeed, would be still more valuable in the present instance, as allowing us the nearest approach which we can make to the time at which the mysterious transmutation of selfishness into disinterested affection is supposed to begin to take place. If all actions which do not immediately affect our own means of physical well-being be originally indifferent to us, and if we learn only by the relations of certain actions to this physical well-being, to regard one species of conduct as virtuous, and another species of conduct as vicious, the child, whose never-failing en-

joyments have seemed to him to form a regular part of the day, almost like the hours which compose it, who expects to find to-morrow what he found yesterday, and who as little thinks that he is indebted to any one for the regular food which gratifies his appetite, or the garments which keep him warm, or the little couch on which he lies down, happy to awake happy next morning, as he thinks that he is indebted to any one of those around him for the sunny radiance which shines on him, or for the air which he breathes without knowing that he is breathing it; while he lives among smiles and caresses, and regards even these, not as marks of indulgence, but only as proofs of the mere presence of those whose very countenance is love. The little reasoner on his own comforts, and disregard of all comforts but his own, may indeed be beginning to form the inductions which are to terminate in the belief, that the happiness of others may be instrumental to his happiness; and that the universe would suffer, and consequently himself, as a part of the universe, be in danger of suffering by the spreading and multiplying relations of guilt to guilt, if an instance of rapacity or cruelty were to occur in some obscure cottage in a distant kingdom. But though he may be beginning to make this philosophic analysis and generalization of the remote relations of things, by which crimes perpetrated in the most remote part of the world, and of a kind from which he has never suffered, may be conceived by him to have ultimately some relation to his own selfish enjoyment, he is surely only beginning to make them. His selfishness is not of sufficient growth to have ceased to be selfish; and his morality, therefore, if morality be the result of fine inductions, which show the good of others to be in some measure representative of our own, cannot have begun to be developed. When he quits his sport, therefore, to listen to the tale which his nurse has promised him, suspending not this particular exercise only, but the very activity that would be every moment urging him to new exercise, as he remains fixed at her knee in a state of quiet of every limb, that, but for the delightful horrors which he hears and expects to hear, would be too powerful to be borne; if there be no disinterested affection then, or at least only the faint dawning of such affections, the tale which is related to him, however full it may be of injustice and cruelty, cannot have any powerful influence on his feelings. His love of novelty, indeed, may be gratified by the adventures of the generous warrior, who, at the peril of his own life, attacked the castle of the giant, and opened at last, to give liberty to a hundred trembling prisoners, those dungeon gates which had never before been opened but to fling some new wretch to the

living heap of wretchedness, or out of the heap already gathered, to select some one for torture and death. He may listen to such a marvellous tale as he would listen to any thing else that is equally marvellous; but it is only as marvellous that he can be supposed to listen to it. There is no generous interest in virtue to be gratified in his little heart, because, in his state of secure and tranquil enjoyment, he has had too little experience of the relations of things to know that vice and virtue have that great difference—their only difference—which consists in their likelihood of being of greater or less advantage or disadvantage to him. In hearing of the deliverance of the good, and of the punishment of the wicked, he should have no thought but of the wonderful things which he is to hear next. In short, according to the system which would represent all virtue to be of selfish growth, he should be that cold and indifferent creature which no nursery has ever seen; and which, if every nursery saw in those who are to furnish the mature population of other years, the earth would soon be an unpeopled waste, or, at best, a prison-house of the rapacious and the cruel.

If, without having heard of any hypotheses on the subject, we were told that there is a period of the life of man in which a tale of cruelty may be related to him, and understood without exciting any emotion, and in which the intentional producer of misery, who produces it in the mere wantonness of power, only that he may have the delight of thinking that he has produced it, and the mild and unrepining sufferer whom he has made his victim, are regarded with equal indifference, is it to his early years that we all should look in making our reference? or, rather, is there not reason to think, that, at least an equal number of the estimators of different ages would look to years, when, if generous affections were the result of experience, and grew more purely disinterested, as the experience of the relations of things extended over a larger portion of life, there could not be one sordid and selfish wish remaining with its ancient dominion in the heart?

But, omitting every objection that may be drawn from the appearances of lively moral feeling, at a time when, according to the hypothesis of original insensibility to every distinction of virtue and vice, there could be no moral feeling of any kind, what, I may ask, is the nature of the change which is supposed to take place in this purification of selfish desires, and are the circumstances assigned as the cause of the purification sufficient to produce it? We are absolutely regardless of the happiness or misery of others; and the actions that would lead to their happiness or misery seem to us to have those different

physical tendencies, but are regarded by us only as physically different. Such is said to be the state of the mind at one period. Afterwards we learn to look on others with regard, in consequence of the pleasure which has flowed from them, or attended their presence; and not to look on them with disinterested regard only, and to wish their happiness, but, which is a much more important circumstance, to feel that the neglect or violation of their happiness would be attended with feelings of self-reproach on our part, essentially different from mere regret. The explanation proposed might, perhaps, be thought to account for the affection which we acquire for persons as well as for things that were previously indifferent to us; and even for our wish to add to the happiness of those whom we love, since there scarcely can be affection without such a wish. But the sense of duty is something more than this consciousness of mere affection and of kind wishes. When we have failed to act in conformity with it, we have not a mere feeling of misfortune, as when we have failed in any wish, the success of which did not depend on ourselves; but a moral feeling of self-disapprobation, for which the growth of mere affection, and of all the wishes to which affection can give rise, is insufficient to account. Here, then, is the important transition which should be explained, that by which we pass from love that is factitious, to a feeling of duty that is factitious. It is this feeling of moral approbation or disapprobation,—the difference of common regret from remorse,—of common joy from the delightful complacencies of virtue,—which is the real subject in controversy; and this feeling the selfish system, even in that best modification of it which we are considering, leaves wholly unexplained. It asserts us to be selfish, but it does not show, nor even profess to show, how we are thus selfish with notions of morality.

It must never be forgotten, in estimating any theory of morals, that it is not a mere quantity of pleasure or pain, love or dislike, for which the theorist has to account; but an order of moral notions, pleasant, indeed, in certain references to ourselves or others, painful in certain other references, yet essentially distinct from any varieties of mere physical delight or uneasiness. It is not the joy of a prosperous man for which he has to give a reason, but the complacency of a good conscience; not the regret of one who has formed wishes of dignified station or wealth that are ungratified, but the remorse of one who has formed guilty wishes, and whose chief misery, perhaps, arises from the gratification of the very wishes which he had formed. It is not the mere wish of contributing to the happiness of those whom we love, but the feeling of obligation to con-

tribute to their happiness,—and often even to contribute to the happiness of individuals for whom we feel no peculiar tenderness of regard. For these peculiar feelings, however, for all that can strictly be said to be moral in love, or even in morality itself, the assertors of the selfish system do not think it necessary to assign any reason, though it is of these only that any explanation is required: and yet they speak of their system as if it were a theory, not of mere pleasure or pain, love or dislike, but of all the phenomena of moral sentiment. They think that they have shown enough, if they have shown how we may love our friends that live around us as we love our house or our estate; and if they can account for this mere affection, they take for granted that our feelings of duty, virtue, obligation, and all the moral feelings of conscience follow of course.

Even with respect to mere affection, unimportant as this is, in a theory of morals, when considered as mere affection, exclusively of all feeling of duty or moral approbation,—the cause assigned for the production and extension of this regard is far from being shown to be adequate. It is a cause which connects us only with a few individuals, and which is yet adduced as explanatory of feelings that are extended in vivid diffusion to all mankind. The associating principle is the cause to which we are directed,—that principle, which, in a former part of the course, we found to be capable of attaching a very high interest to objects that might be considered as in themselves almost indifferent,—a snuff-box, a cane, or any other inanimate thing, which had long been our companion. But though this sort of companionship may render our own cane important to us, as if it were a symbol of our happiness, like the white wands and gold sticks that are symbols of the dignity of office, this love of our own cane does not render every other walking-stick, which we may see in a shop, or in the hands of others, of much greater value, in our conception, than if we had been in the habit of walking without any support. If then it be, as is asserted, precisely in the same manner, that we acquire our affection for the living beings around us,—who, otherwise, would have been as indifferent to our regard, as it is possible for a snuff-box or a cane to be,—why is not the effect confined, or nearly confined, to those immediately around us, with whom the associations of pleasure have been formed? Beyond the circle to which the magic of association spreads, every thing should be as before, or at least very nearly as before. For the stranger, whom we have never seen, in the same manner as for the snuff-box of another, we should retain feelings that scarcely pass beyond indifference; and should

as little look with affection on all mankind, in consequence of the pleasure which has attended our intimacy with a few—if affection be in itself foreign to our nature, and the result of factitious circumstances,—as we should look with a covetous eye on every walking-stick, because we should feel sorrow, far beyond its intrinsic worth, on the loss of our own. If, indeed, man be naturally more precious to our affection than the paltry baubles of a toyshop, we may suppose, in his case, a more extensive diffusion of every feeling of regard. But to ascribe to man any original title to our love, independent of the use which we may learn to derive from him, as from a machine that may be instrumental to our convenience, would be to abandon the very principle on which the whole strange system of moral selfishness is founded.

Even as a theory, then, of mere affection, the selfish theory is inadequate. But however widely affection may be supposed to be spread, in consequence of the association and ready suggestion of pleasures received from a few individuals only—though it were admitted, that, by the remembrance of these, we might be led to love all the individuals of mankind, and loving them, to wish their happiness, it must still be remembered, that the only influence of affection, as mere affection, is to render the happiness of others desirable, like the attainment of any other object of desire. Instead of wishing merely the gratification of our sensual appetites, of our intellectual curiosity, of our ambition, we have now other wishes to mingle with these that relate to the happiness of others; and we may regret that the happiness of others has not been produced by certain actions, in the same way as we may regret that we have not attained the objects of any of our other wishes,—that we are not the possessors of a fortunate ticket in the lottery, or have not had the majority of votes in an election to some office of honour or emolument. But joy and regret are all which we can feel, even in love itself; and obligation, virtue, merit, the self-complacency or remorse of conscience, are as little explained by the growth of mere love and hatred, as if every object of these affections had remained indifferent to us.

We have considered, then, the selfish system in two aspects: first, as it represents mankind as universally, in every hour and minute of their waking existence, intent on one sole object, their own convenience, incapable of feeling any disinterested affection for another; and therefore, when appearing to wish the happiness of a father, or wife, or son, or friend, wishing at heart only their own. We have afterwards considered that less sordid modification of the system, which supposes us, indeed, to have been originally as selfish

as the other represents us to be for the whole course of our life; but which does a little more justice to the feelings of our maturer years, by admitting that we become susceptible of affections that prompt us to act, even when our own convenience is not the immediate object before our eyes; and in our examination of both forms of the doctrine, we have seen how incapable it is of explaining those notions of obligation, virtue, merit, that constitute the moral phenomena, which a theory that professes to be a theory of morals, ought as little to omit, as a theory of light to omit all notice of the radiant fluid, the properties of which it professes to examine, while it confines its attention to the forms of the mirrors or lenses which variously reflect or transmit it.

After these two lights, in which the system commonly distinguished by the name of the Selfish System of morals has been considered by us, there remains still one other light, in which it is to be viewed; that in which the obligation of virtue is supposed to consist merely in an exclusive regard to our own individual eternity of happiness in another life; and virtue itself to consist in obedience to the will of the Supreme Being; not on account of the moral excellence of that Supreme Being, or of his bounty to us, which might seem of itself to demand compliances, that are the only possible expressions of the gratitude of dependent creatures, to him from whom their power as well as their happiness is derived, but without any such views of reverence or gratitude, at least without any such views as are in the slightest degree necessary to the virtue of their motives, merely on account of the power which the Ruler of the universe possesses, to give or withhold the happiness which is our only object. This form of the selfish system, which has been embraced by many theological writers of undoubted piety and purity, is notwithstanding, I cannot but think, as degrading to the human character, as any other form of the doctrine of absolute selfishness; or rather, it is in itself the most degrading of all the forms which the selfish system can assume; because, while the selfishness which it maintains is as absolute and unremitting, as if the objects of personal gain were to be found in the wealth or honours or sensual pleasures of this earth; this very selfishness is rendered more offensive, by the noble image of the Deity which is continually presented to our mind, and presented in all his benevolence, not to be loved, but to be courted with a mockery of affection. The sensualist of the common system of selfishness, who never thinks of any higher object in the pursuit of the little pleasures which he is miserable enough to regard as happiness, seems to me, even in the brutal stupidity in which he is sunk, a

being more worthy of esteem than the selfish of another life; to whose view God is ever present, but who view him always only to feel constantly in their heart, that in loving him who has been the dispenser of all the blessings which they have enjoyed, and who has revealed himself in the glorious character of the diffuser of an immortality of happiness, they love not the giver himself, but only the gifts which they have received, or the gifts that are promised. Yet, such is the influence of the mere admission of the being of a God, and of the images of holiness and delight which that divine name is sufficient to suggest, that while the common system of the universal selfishness of virtue has been received by the virtuous themselves, with an indignant horror, that was itself almost a confutation of the system, the equally universal selfishness of the doctrine of these theological moralists has been received, not merely without any emotion of disgust, but with the approbation and assent of no small portion of those who, in opposition to the very doctrine which they have embraced, are truly in their hearts disinterested lovers of man, and equally disinterested lovers and worshippers of God.

The doctrine of the absolute selfishness of our homage to God, and of our social virtues, considered as the mere conformity of our wills to the command of him who is the dispenser of eternal happiness and eternal misery, for the sole reason of his power of thus dispensing happiness or misery, and not on account of his own transcendent excellence, that of itself might seem to demand such a conformity, is a doctrine of very old date. But the writer who in modern times has led to the widest diffusion of this doctrine, is Archdeacon Paley, the most popular of all our ethical writers; and one of the most judicious in the mere details of ethics, however false and dangerous I consider his leading doctrines to be. Virtue, he defines to be, "the doing good to mankind, in obedience to the will of God, and for the sake of everlasting happiness."* The last part of the definition is the most important part of the whole; for, the knowledge of this everlasting happiness he supposes to be all which constitutes moral obligation; meaning by obligation, not any feeling of moral love, but the influence of happiness as an object of physical desire, and of pain as an object of physical aversion; one or other of which is to follow our obedience or disobedience to the command of the Power who is the supreme dispenser of both. The will of God is our rule, he says, but "private happiness is our motive," and therefore our obligation. In short, the inducement or temptation to be

virtuous, which is all that constitutes our obligation to be virtuous, is precisely of the same kind with the inducements or temptations to vice, which may be said in like manner to constitute an obligation to be vicious. The only difference is, that a good man—that is to say, a person whom we distinguish by the flattering title of good—is more prudent than those whom we have chosen to denominate wicked. Both act from an obligation which may be said to be moral in one case as much as in the other; since in neither is disinterestedness of affection necessary to virtue; and in both there is that desire of pleasure which is sufficient to constitute an inducement, and therefore, in his acceptance of the word, which he regards as synonymous with inducement, an obligation.

That we have a moral sentiment of obligation, virtue, merit, which is very different from the mere inducements of pleasure near or remote, I surely need not attempt to demonstrate to you, after the remarks already made on the selfish system in general. The doctrine of Paley differs, as you perceive, from the general selfish system, only by the peculiar importance which it very justly gives to everlasting happiness and misery, when compared with the brief pains or pleasures of this life. In the scale of selfish gain, it is a greater quantity of physical enjoyment which it has in view. It is a sager selfishness, but it is not less absolute selfishness which it maintains; and it is therefore subject to all the objections which I urged before at great length, and which it would now therefore be idle to repeat.

One great answer obviously presents itself to all those selfish systems which convert the whole of virtue into prudence; and make the differences of virtue and vice in every respect precisely the same in kind, as those of speculators in the market of commerce, who have employed their capital more or less advantageously, in the different bargains that have been offered to them. All those systems are, of course, intended to be faithful pictures of our feelings. The virtue which they profess to explain is the virtue which we feel; and if we felt no moral approbation of certain actions, no moral disapprobation of certain other actions, it would be manifestly absurd to speak of virtue or of vice. It is to our consciousness, then, that we must look for determining the fidelity of the picture; and what features does our consciousness exhibit? If two individuals were to expose themselves to the same peril, for the same common friend,—and if we could be made to understand, that the one had no other motive for this apparently generous exposure, than the wish of securing a certain amount of happiness to himself, at some time, either near or remote—on earth, or after he has quitted earth; the other no mo-

* Moral and Political Philosophy, book i. chap. vii.

tive but that of saving a life which was dearer to him than his own; in which case would our feeling of moral approbation more strongly arise? Is it the more selfish of the two whom alone we should consider as the moral hero; or rather, is it not only in thinking of him who forgot every thing but the call of friendship, and the disinterested feeling of duty which prompted him to obey the call, that we should feel any moral approbation whatever? It is precisely in proportion as selfish happiness is absent from the mind of the agent, or is supposed to be absent from it, in any sacrifice which is made for another, that the moral admiration arises; and what then can we think of a theory of this very moral admiration, which asserts it to arise only when it does not arise, and not to arise only when it does arise? We should not hesitate long in rejecting a theory of fluidity which should ascribe congelation to an increase of heat, and liquefaction to a diminution of it; and as little ought we to hesitate in rejecting a theory of virtue that supposes the moral approbation which gives birth to our very notion of virtue, to arise only when the immediate motive of the agent has been the view of his own happiness in this or any other world; and to be precluded, therefore, by the very generosity of the agent, in every case in which he thought only of the happiness of others which he could increase, of the misery of others which he could relieve.

That part of the system of Dr. Paley, then, which makes the sole motive to virtue the happiness of the agent himself, is false as a picture of the feelings of moral approbation and disapprobation for which it professes to account. The other part of his system of virtue, however, which resolves it into conformity to the will of God, as obeyed from this motive of personal gain, may merit a little fuller investigation.

LECTURE LXXX.

EXAMINATION OF THE SELFISH SYSTEM CONCLUDED; EXAMINATION OF DR. SMITH'S SYSTEM.

GENTLEMEN, in the close of my last Lecture, after examining different modifications of the selfish system, I proceeded to consider one form of it which has not usually been ranked with the others, but which is not less absolutely selfish; since it supposes the sole motive to virtue to be the view of our own personal advantage; the only difference being, that instead of fixing its desires on the quantity of pleasure which can be enjoyed in this life, it extends them to the greater quantity of pleasure which may be enjoyed by us in

the everlasting life that awaits us; having still, however, no other motive than the desire of this personal enjoyment, and the corresponding fear of pain, in the actions which may seem, but only seem, to arise from a disinterested love of God, or a disinterested love of those whom God has committed to our affection.

The greater or less quantity of pleasure, however, which is coveted by us, either in intensity or duration, does not alter the nature of the principle which covets it; if the perception of the means of gratifying our own individual appetite for enjoyment, whether the pleasure be great or slight, near or remote, brief or everlasting, be all which constitutes what is in that case strangely termed moral obligation: and the system of Paley, therefore, to which I particularly alluded,—a system which defines virtue to be “the doing good to mankind, in obedience to the will of God, for the sake of everlasting happiness,” and which makes, not the love of God, nor the love of mankind, but this love of everlasting happiness the motive and sole obligation to the good which otherwise we should have had as little moral desire of producing or promoting, as of producing an equal or greater amount of evil, must be allowed to be, in its very essence, as truly selfish, as if it had defined virtue to be the pursuit of mere wealth, or fame, or of the brief dignities, or still briefer pleasures of this mortal existence.

“There is always understood to be a difference between an act of prudence and an act of duty. Thus, if I distrusted a man who owed me money, I should reckon it an act of prudence to get another bound with him; but I should hardly call it an act of duty. On the other hand, it would be thought a very unusual and loose kind of language to say, that, as I had made such a promise, it was prudent to perform it; or that, as my friend, when he went abroad, placed a box of jewels in my hands, it would be prudent in me to preserve it for him till he returned.”*

If the most prudent labourer after his own selfish interest, without the slightest regard for the happiness of others, unless as that happiness may be instrumental to his own, be constantly actuated by the same moral motive which influences the most generous lovers of mankind, how strange an illusion is all moral sentiment, which views with such different feelings objects that are in every moral respect precisely the same. But it is, in our emotions alone that our notions of morality have their rise: and how illusive, therefore, and radically false I should rather say, must be that system which is founded on

* Paley's Moral Philosophy, book ii. chapter iii.

the absolute similarity of feelings that are recognised by every bosom as absolutely dissimilar.

Though, I trust then, it is sufficiently evident to you, from the results of the long discussion in which we have been engaged, that the moral obligation to virtue is not, as Paley says, the mere inducement of pleasure held out to us by power which we cannot disobey, without losing the pleasure, and encountering pain, but an inducement of a nobler kind, since pleasure, though it may lead us to be virtuous, may surely, as mere pleasure, if there be no essential distinction of it, as pure or impure, right or wrong, often lead us into what we are at present accustomed to denominate vice; and though I shall therefore not repeat, in application to this enlarged selfishness, which extends its interested view through immortality, the objections previously urged against that more limited selfishness which looks only to the surface of the earth, and to the few years in which we are to be moving along it, it may be of importance to make a few remarks on that other part of the doctrine of this celebrated moralist, which makes conformity to the will of God the rule of virtue.

That virtuous actions—those actions which excite in us the feeling of moral approval, are conformable to the will of God, there can be no reason to doubt; since the very universality of this approval may be regarded as a sort of expression of the divine approbation. As little can we doubt that when the declared will of God is present to our mind, and we think of certain actions as commanded by him, of certain other actions, as prohibited by him, and when, in designing or meditating any action, we feel that it is one of those which he has prohibited, there would arise in our mind an instant feeling of disapprobation, that is to say, of vice or demerit, in the performance of the prohibited action. But the question is not, whether it be virtue to conform our will to that of the Deity, when that will is revealed to us, or clearly implied; for of this there can be no doubt. It is, whether there be not in our nature a principle of moral approbation, from which our feelings of obligation, virtue, merit, flow; and which operates, not independently of the divine will indeed, for it was the divine will which implanted in us this very principle; but without the necessary consideration, at the time, of the expression of the divine will, and consequently without any intentional conformity to it or disobedience, or which in our obedience itself, as often as we think of the divine will, is the very principle by which we feel the duty of such conformity. The mother, though she should, at the moment, forget altogether that there is a God in nature, would still turn with moral horror from the thought of murdering the little prattler

who is sporting at her knee, and who is not more beautiful to her eye by external charms and graces, than beautiful to her heart by the thousand tendernesses which every day and almost every hour is developing; while the child, who perhaps has scarcely heard that there is a God, or who at least is ignorant of any will of God, in conformity with which virtue consists, is still in his very ignorance developing those moral feelings which are supposed to be inconsistent with such ignorance, and would not have the same feeling of complacency in repaying the parental caresses with acts of intentional injury, as when he repays them with expressions of reciprocal love. Of all the mothers who, at this moment, on the earth, are exercised, and virtuously exercised, in maternal duties, around the cradles of their infants, there is perhaps not one who is thinking that God has commanded her to love her offspring, and to perform for them the many offices of love that are necessary for preserving the lives which are so dear to her. The expression of the divine will, indeed, not merely gives us new and nobler duties to perform; it gives a new and nobler delight also to the very duties which our nature prompts, but still there are duties which our nature prompts, and the violation of which is felt as moral wrong, even when God is known and worshipped only as a demon of power, still less benevolent than the very barbarians who howl around his altar in their savage sacrifice.

But for the principle of moral approbation which the divine being has fixed in our nature, the expression of his will would itself have no moral power, whatever physical pain or pleasure it might hold out to our prudent choice. It may be asked, why should we obey the divine command, with as much reason as it may be asked, why should we love our parents or our country? and our only answer to both questions, as far as morality can be said to be concerned, or any feeling different from that of a mere calculation of physical loss or gain, is, that such is our nature; that, in considering the command of God, our greatest of benefactors, or in considering the happiness of our parents, our country, mankind, which it is in our power to promote, we feel that to act in conformity with these, will be followed by our moral approbation; as to act in opposition to them will be followed by inevitable self-reproach. There is a principle of moral discrimination already existing in us, that, even when we conform our conduct to the divine will, is the very principle by which we have felt the duty of this delightful conformity; and if there be no such principle in our nature, by which we discover the duty of the conformity, it is surely very evident that there can be no such duty to be felt, any more than there can be colour to the blind, or melody to the deaf.

God may be loved by us, or feared by us. He may be loved by us as the source of all our blessings, conferred or promised. He may be feared by us as a being who has the power of inflicting on us eternal anguish. In one of these views, we may, when we obey him, act from gratitude; in the other, from a sense of the evils which we have to dread in offending him. But if it be a duty of gratitude to obey God, we must previously have been capable of knowing that gratitude is a virtue, as much as we must have been capable of knowing the power of God, before we could have known to fear his awful dominion. We consider the Deity as possessing the highest moral perfection: but in that theological view of morality which acknowledges no mode of estimating excellence beyond that divine command itself, whatever it might have been, these words are absolutely meaningless; since if, instead of what we now term virtue, he had commanded only what we now term vice, his command must still have been equally holy. If indeed the system of Paley, and of other theological moralists, were just, what excellence beyond the excellence of mere power, could we discover in that divine being whom we adore as the supreme goodness, still more than we fear him as the omnipotent? God has, indeed, commanded certain actions, and it is our virtue to conform our actions to his will; but if the virtue depend exclusively on obedience to the command, and if there be no peculiar moral excellence in the actions commanded, he must have been equally adorable, though nature had exhibited only appearances of unceasing malevolence in its author; and every command which he had delivered to his creatures had been only to add new voluntary miseries to the physical miseries which already surrounded them. In the system of Hobbes, which considers law itself as constituent of moral right, a tyrant, if his power of enacting law be sufficiently established, is not to be distinguished, in his very tyranny, from the generous sovereign of the free; because the measure of right is to be found in his will alone. In the system of Paley, in like manner, if virtue be conformity to the will of God, whatever that will may be, and there be no moral measure of the excellence of that will itself, God and the most malignant demon have no moral difference to our heart, but as the one and not the other is the irresistible sovereign of the universe.

The will of God, then, though it is unquestionably the source of virtue, in the most important sense—as it was his will that formed all the principles of our constitution, of which the principle of moral approbation is one—is not the source of virtue in the sense in which that phrase is understood by some theological writers as limited to the mere

declaration of his will, sanctioned by punishment and reward. There is an earlier law of God, which he has written in our hearts; and the desire of our mere personal happiness or misery, in this or in another world, is truly an object of our approbation, not the source of it, since the love of mere selfish enjoyment is at least as powerfully the motive to vice, in some cases, as it is in other cases the motive to virtue. We do not merely submit to the will of God as we submit to any power which it is impossible for us to resist. We feel that it would be not imprudence only, but guilt, to wish to disobey it. We seek, in the constitution of our nature, the reason which leads us to approve morally of the duty of this conformity of our will to his beneficent and supreme will; and we find, in one of the essential principles of our nature, the moral reason which we seek.

After this examination of the various systems, which may be considered as more or less directly opposed to the belief of that principle of moral feeling—the original susceptibility of moral emotion on the contemplation of certain actions—for which I have contended, there is still one system which deserves to be considered by us, in relation to this belief, not as being subversive of morality, in any one of its essential distinctions, but as appearing to fix morality on a basis that is not sufficiently firm; with the discovery of the instability of which, therefore, the virtues that are represented as supported on it, might be considered as themselves unstable; as the statue, though it be the image of a god, or the column, though it be a part of a sacred temple, may fall, not because it is not sufficiently cohesive and firm in itself, but because it is too massy for the feeble pedestal on which it has been placed.

The system to which I allude, is that which is delivered by Dr. Smith, in his *Theory of Moral Sentiments*,—a work unquestionably of the first rank in a science which I cannot but regard, as to man, the most interesting of sciences. Profound in thought, it exhibits, even when it is most profound, an example of the graces with which a sage imagination knows how to adorn the simple and majestic form of science, that is severe and cold, only to those who are themselves cold and severe, as in those very graces it exhibits, in like manner, an example of the reciprocal embellishment which imagination receives from the sober dignity of truth. In its minor details and illustrations, indeed, it may be considered as presenting a model of philosophic beauty, of which all must acknowledge the power, who are not disqualified by their very nature for the admiration and enjoyment of intellectual excellence; so dull of understanding as to shrink with a painful consciousness of incapacity at the

very appearance of refined analysis, or so dull and cold of heart, as to feel no charm in the delightful varieties of an eloquence that, in the illustration and embellishment of the noblest truths, seems itself to live and harmonize with those noble sentiments which it adorns.

It is chiefly in its minor analyses, however, that I conceive the excellence of this admirable work to consist. Its leading doctrine I am far from admitting. Indeed it seems to me as manifestly false, as the greater number of its secondary and minute delineations appear to me faithful, to the fine lights, and faint and flying shades, of that moral nature which they represent.

According to Dr. Smith, we do not immediately approve of certain actions, or disapprove of certain other actions, when we have become acquainted with the intention of the agent, and the consequences, beneficial or injurious, of what he has done. All these we might know thoroughly, without a feeling of the slightest approbation or disapprobation. It is necessary, before any moral sentiment arise, that the mind should go through another process, that by which we seem for the time to enter into the feelings of the agent, and of those to whom his action has relation in its consequences, or intended consequences, beneficial or injurious. If, by a process of this kind, on considering all the circumstances in which the agent was placed, we feel a complete sympathy with the passions or calmer emotions that actuated him, and with the gratitude of him who was the object of the action, we approve of the action itself as right, and feel the merit of the agent; our sense of the propriety of the action depending on our sympathy with the agent, our sense of the merit of the agent on our sympathy with the object of the action. If our sympathies be of an opposite kind, we disapprove of the action itself as improper, that is to say, unsuitable to the circumstances, and ascribe not merit but demerit to the agent. In sympathizing with the gratitude of others, we should have regarded the agent as worthy of reward; in sympathizing with the resentment of others, we regard him as worthy of punishment.

Such is the supposed process in estimating the actions of others. When we regard our own conduct we in some measure reverse this process; or rather, by a process still more refined, we imagine others sympathizing with us, and sympathize with their sympathy. We consider how our conduct would appear to an impartial spectator. We approve of it, if it be that of which we feel that he would approve; we disapprove of it if it be that which we feel by the experience of our own former emotions, when we have ourselves, in similar circumstances, estimated the actions of others, would excite

his disapprobation. We are able to form a judgment as to our own conduct, therefore, because we have previously judged of the moral conduct of others, that is to say, have previously sympathized with the feelings of others; and but for the presence, or supposed presence, of some impartial spectator, as a mirror to represent to us ourselves, we should as little have known the beauty or deformity of our own moral character, as we should have known the beauty or ugliness of our external features without some mirror to reflect them to our eye.

In this brief outline of Dr. Smith's system, I have of course confined myself to the leading doctrine, of which his theory is the development. If this doctrine of the necessary antecedence of sympathy to our moral approbation or disapprobation be just, the system may be admitted, even though many of his minor illustrations should appear to be false. If this primary doctrine be not just, the system, however ingenious and just in its explanation of many phenomena of the mind, must fail as a theory of our moral sentiments.

To derive our moral sentiments, which are as universal as the actions of mankind that come under our review, from the occasional sympathies, that warm or sadden us with joys and griefs and resentments which are not our own, seems to me, I confess, very nearly the same sort of error as it would be to derive the waters of an ever-flowing stream from the sunshine or shade which may occasionally gleam over it. That we have a principle of social feeling, which, in its rapid participation of the vivid emotions of others, seems to identify us in many cases with the happy or the sorrowful, the grateful or the indignant, it is impossible to deny. But this sympathy, quick as it truly is to arise, in cases in which the primary feelings are vivid and strongly marked, is not a perpetual accompaniment of every action of every one around us. There must be some vividness of feeling in others, or the display of vividness of feeling, or at least such a situation as usually excites vivid feeling, of some sort, in those who are placed in it, to call the sympathy itself into action. In the number of petty affairs which are hourly before our eyes, what sympathy is felt either with those who are actively or those who are passively concerned, when the agent himself performs his little offices with emotions as slight as those which the objects of his actions reciprocally feel? Yet, in these cases, we are as capable of judging, and approve or disapprove, not with the same liveliness of emotion indeed, but with as accurate estimation of merit or demerit, as when we consider the most heroic sacrifices which the virtuous can make, or the most atrocious crimes of which the sordid and the cruel can be

guilty. It is not the absolute vividness of our emotion, however, but its mere correspondence in degree with the emotion of others, which affects our estimates of the propriety of their actions; and it must be remembered, that it is not any greater or less vividness of our sympathetic feeling, but the accuracy of our estimation of merit and demerit, whether great or slight, by the sympathetic feelings supposed, which is the only point in question. There is no theory of our moral distinctions, which supposes that we are to approve equally of all actions that are right, and to disapprove equally of all actions which are wrong; but it is essential to one theory—that theory which we are considering—that there should be no feeling of right or wrong, merit or demerit, and consequently no moral estimation whatever, where there is no previous sympathy in that particular case. The humblest action, therefore, which we denominate right, must have awakened our sympathy as much as those glorious actions which we are never weary of extolling, in the very commendation of which we think not of the individual only with thankfulness, but with a sort of proud delight of ourselves, of our country, of the common nature of man, as ennobled by the virtue, that, instead of receiving dignity from the homage of our praises, confers dignity on the very gratitude and reverence which offer them. If we were to think only those actions right in which our sympathy is excited, the class of indifferent actions would comprehend the whole life, or nearly the whole life, of almost all the multitude of those around us, and indeed of almost all mankind. A few great virtues and great iniquities would still remain in our system of practical ethics, to be applauded or censured; but the morality of the common transactions of life, which, though less important in each particular case, is, upon the whole, more important from its extensive diffusion, would disappear altogether as morality, as that which it is right to observe, and wrong to omit, and though it might still be counted useful, would admit of no higher denomination of praise. The supposed necessary universality then, in our moral sentiments, of that which, however frequent, is surely far from universal, would of itself seem to me a sufficient objection to the theory of Dr. Smith.

Even if the sympathy for which he contends were as universal as it is absolutely necessary for the truth of his theory that it should be, it must still be admitted that our sympathy is, in degree at least, one of the most irregular and seemingly capricious of principles in the constitution of the mind; and on this very account, therefore, not very likely to be the commensurable test or standard of feelings so regular, upon the whole, as

our general estimates of right and wrong. But though it would be very easy to show the force of this objection, I hasten from it, and from all objections of this kind to that which seems to me to be the essential error of the system.

This essential error, the greatest of all possible systematic errors, is no less than the assumption, in every case, of those very moral feelings which are supposed to flow from sympathy, the assumption of them as necessarily existing before that very sympathy in which they are said to originate.

Let us allow, then, every thing which we can suppose it possible for the author of the theory to have claimed, let us admit that the sympathy of which he speaks, instead of being limited to a few cases of vivid feeling, is as universal as he contends, that it is as little variable in kind, or in degree, as our notions of right and wrong, and, in short, that it is in perfect accordance with our moral sentiments; even though, with all these admissions, we were to admit also the very process which Dr. Smith supposes to take place exactly in the manner which he supposes, it would be very evident, that still, after so many important concessions, the moral sentiments could not be regarded as having their source in the sympathy, but as preceding it; or, if no moral sentiments of any kind preceded it, the sympathy itself could not afford them more than a mirror, which reflects to us, from the opposite landscape, the sunny hill, the rock, and the trees, gleaming through the spray of the waterfall, could of itself, without any external light, produce all that beautiful variety of colours with which it delights our vision, as if it were the very scene on which we have loved to gaze.

Let us consider, then, with a little nicer analysis, the process of which Dr. Smith speaks, admitting the sympathy for which he contends, and admitting it in the fullest extent which can be conceived necessary to his theory.

In this theory, as you have seen, he has separated our feeling of the propriety or impropriety of the action from our feeling of the merit or demerit of the agent, ascribing the one to our sympathy with the emotions of the agent in the circumstances in which he was placed, the other to our sympathy with the gratitude or resentment of those who have been affected by the action. I have already endeavoured to show you, that we have only one feeling of approbateness, arising on the contemplation of an action, which, as variously referred to the agent or to the action considered abstractly, is at once the felt propriety of the action, and the felt merit of the agent. Indeed, it seems to me as absurd to suppose that we can conceive an action to be wrong, in the moral sense of that word, without any notion of the demerit of the voluntary agent,

or conceive the demerit of the voluntary agent, without any notion of the impropriety of his action, as it would be to suppose that we can imagine a circle without a centre, or a centre without a circle. But let us adopt, without objection, the supposed analysis which Dr. Smith has made of our moral sentiments, and admit, that, in the constitution of these, there are two distinct feelings that give occasion to corresponding moral notions of propriety and merit, which one of these feelings alone could not have produced; in short, let us admit, that we might have conceived an action to be morally wrong, without any demerit on the part of the agent, or have conceived the greatest demerit on his part, without any moral impropriety in his action.

The first supposed sympathy which we have to consider, is that which is said to give occasion to our moral estimates of actions as proper or improper, without regard to the merit or demerit of the agent, that are felt by us only through the medium of another sympathy.

This notion of moral propriety or impropriety, we are told, could not have been produced in us by the most attentive consideration of the action, and of all its circumstances; another process must intervene. We feel the propriety of the action, only because we sympathize with the agent. We make his circumstances our own, and, our passion being in unison with his, we regard it as suitable to the circumstances, and therefore as morally proper.

If we have, indeed, previous notions of moral right and wrong, or some other source in which they may be found, this belief of the propriety of certain feelings that accord with ours, might be sufficiently intelligible; but the most complete sympathy of feelings, the most exact accordancy, is not sufficient to constitute or give rise to the moral sentiments of which we are treating; when there is nothing more than a sympathy of feelings, without that previous moral sentiment, which, in Dr. Smith's system, we must always tacitly presuppose. In the very striking emotions of taste, for example, we may feel, on the perusal of the same poem, the performance of the same musical air, the sight of the same picture, or statue, a rapture or disgust, accordant with the rapture or disgust expressed by another reader, or listener, or spectator; a sympathy far more complete than takes place in our consideration of the circumstances in which he may have had to regulate his conduct in any of the common affairs of life; in which our secondary emotion, if it be at all excited, is excited but faintly. If mere accordancy of emotion, then, imply the feeling of moral excellence of any sort, we should certainly feel a moral regard for all whose taste coincides with

ours; yet, however gratifying the sympathy in such a case may be, we do not feel, in consequence of this sympathy, any morality in the taste that is most exactly accordant with our own. There is an agreement of emotions, a sort of physical suitableness that is felt by us of the emotions, as effects to the works of art as causes, but nothing more; and if we had not a principle of moral approbation, by which, independently of sympathy, and previously to it, we regard actions as right, the most exact sympathy of passions would, in like manner, have been a proof to us of an agreement of feelings, but of nothing more. It proves to us more, because the emotions, which we compare with our own, are recognised by us as moral feelings, independently of the mere agreement. We do not merely share the sentiments of the agent, but we share his moral sentiments, the recognition of which, as moral sentiments, has preceded our very sympathy.

Why is it that we regard emotions which do not harmonize with our own, not merely as unlike to ours, which is one view of them; but as morally improper, which is a very different view of them? It must surely be, because we regard our own emotions which differ from them as morally proper; and, if we regard our own emotions as proper, before we can judge the emotions which do not harmonize with them to be improper on that account, what influence can the supposed sympathy and comparison have had, in giving birth to that moral sentiment which preceded the comparison? They show us only feelings that differ from ours, and that are improper because ours are proper. The sympathy, therefore, on which the feeling of propriety is said to depend, assumes the previous belief of that very propriety; or, if there be no previous belief of the moral suitableness of our own emotions, there can be no reason, from the mere dissonance of other emotions with ours, to regard these dissonant emotions as morally unsuitable to the circumstances in which they have arisen. We may, perhaps, conceive them to be physically unsuitable, in the same manner as we regard the taste as erroneous, which approves of poetry as sublime that to us appears bombastic or mean; but we can as little feel any moral regard in the one case as in the other, unless we have previously distinguished the one set of emotions as moral emotions, the other set as emotions of taste.

With respect to the former of the two sympathies, then, which Dr. Smith regards as essential to our moral sentiments, the sympathy from which he supposes us to derive our notions of actions, as right or wrong, proper or improper,—that is to say, as morally suitable or unsuitable to the circumstances in which the action takes place; we

have seen that it assumes, as independent of the sympathy, the very feelings to which the sympathy is said to give rise.

Let us next consider the latter of the two sympathies, to which we are said to owe our notion of merit or demerit in the agent, as distinct from the propriety or impropriety of his action.

These sentiments of merit or demerit arise, we are told, not from any direct consideration of the agent and of the circumstances of his action, but from our sympathy with the gratitude or resentment of those who have derived benefit or injury, or at least whom he is supposed to have wished to derive benefit or injury, from that good or evil which he purposed. If, on considering the circumstances of the case, we feel that our emotions of this sort would, in a similar situation, harmonize with theirs; we regard the agent in the same light in which they regard him, as worthy of reward in the one case, or of punishment in the other, that is to say, as having moral merit or demerit.

If our sense of merit were confined to cases in which the action had a direct relation to others, with whose gratitude we might be supposed to sympathize, this theory of merit would at least be more distinctly conceivable. But what are we to think of cases in which the action begins and terminates, without a thought of the happiness of others, in the amelioration of the individual himself; of sacrifices resolutely but silently made to the mere sense of duty; the voluntary relinquishment of luxurious indulgences; the struggle, and at last the victory over appetites and passions that are felt to be inconsistent with the sanctity of virtue; and over habits, still more difficult to be subdued than the very appetites or passions which may have given them their power? In such cases, our sense of the merit of the victor in this noble strife, when we do not think of the gratitude of a single individual, because there is, in truth, no gratitude of which to think, is, notwithstanding, as vivid as if we had around us whole families and tribes of the grateful to excite our sympathy, and to continue to harmonize with it. The world, indeed, the great community of individuals, it may be said, is truly benefited by every increase of virtue in any one of the individuals who compose it; and it may be possible, in this way, to invent some species of gratitude of the whole multitude of mankind, that may be supposed to awake our sympathy, and thus to make us feel a merit even in such cases, which otherwise we should not have felt. But, though it may be possible for us, with due care and effort of thought, to invent this abstract or remote gratitude with which ours may be supposed to harmonize, can it be imagined by any one but the most obstinate

defender of a system, that this strange sympathy, of which no one perhaps has been conscious in any case, truly and constantly takes place whenever we thus approve; that we do not feel any merit whatever in the voluntary privations which virtue makes, till we have previously excited ourselves to admire them, by reflecting on a grateful world? Such a reflex thankfulness, if it occur at all, does not occur to one of many thousands, who require, for their instant perception of the merit, only the knowledge of the sacrifices of present enjoyment which have been made, and of the pure motives which led to the sacrifices. It is not only the Hercules who freed the world from robbers and monsters that we admire. We admire, at least, as much, in the beautiful ancient allegory, the same moral hero when he resisted the charms and the solicitations of Pleasure herself. The choice of Hercules, indeed, is fabulous. But the choice which he is fabled to have made, has been the choice of the virtuous of every age; and, in every age, the sacrifices internally and silently made to duty and conscience, have been ranked in merit with the sacrifices which had for their direct object the happiness of others, and for their immediate reward the gratitude of the happy. Why is it that we look with so much honour on the martyr in those early ages of persecution, which, collecting around the victim every instrument of torture, required of him only a few grains of incense to be thrown before a statue, more noble, indeed, than the imperial murderer whom it represented, but still only a statue, the effigy of a being of human form, who, under the purple which clothed him, with the diadem and the sceptre and the altar, far from being a god, was himself one of the lowest of the things which God had made! When placed thus between idolatry and every form of bodily anguish, with life and guilt before him, and death and innocence, the hero of a pure faith looked fearlessly on the cross or on the stake, and calmly and without wrath on the statue which he refused to worship, and on all the ready ministers of cruelty, that were rejoicing in the new work which they had to perform, and the new amusement which they were to give to the impatient crowd,—do we feel that there was no merit in the magnanimity, because we cannot readily discover some gratitude which we may participate? or, if we do feel any merit, is it only on account of some gratitude which we have at last succeeded in discovering? We do not think of any thankfulness of man. We think only of God and virtue, and of the heroic sufferer, to whom God and virtue were all, and the suffering of such a moment nothing.

That our feeling of merit, then, is not a reflected gratitude, but arises from the direct

contemplation of the meritorious action, might, if any proof were necessary, appear sufficiently evident from the equal readiness of this feeling to arise in cases in which it would be difficult to discover any gratitude with which we can be supposed to sympathize, and in which the individual himself, and the circumstances of his action, are all that is before us. But though this and every other objection to Dr. Smith's theory of our feeling of merit were to be abandoned, there would still remain the great objection, that the sympathy which he supposes in this case, as in that formerly examined by us, proceeds on the existence of that very moral sentiment which it is stated by him to produce.

We discover the merit of the agent in any case, it is said, by that sympathetic tendency of our nature, in consequence of which, on considering any particular action, we place ourselves in the situation of those who are benefited by the action, when, if we feel an emotion of gratitude like theirs, we of course consider the agent himself as meritorious, worthy of the reward of which they consider him to be worthy; and, in like manner, on considering any action of injustice or malevolence, we feel the demerit of the agent by sympathizing with the resentment of those whom the action has injured.

Such is the process asserted. But what is it that is truly supposed in this process, as distinguishing the sympathetic and secondary feelings, from the primary feelings of those who were directly concerned?

We place ourselves in the situation of others, or, rather, without willing it, or knowing the change till it is produced, we feel ourselves, by some sudden illusion, as if placed in their situation. In this imaginary sameness of circumstances we have feelings similar to theirs. They view their benefactor as worthy of reward. We, therefore, considering for the moment the benefit as if conferred on us, regard him likewise as worthy of reward: or if they consider him worthy of punishment, we too consider him worthy of punishment. Their gratitude or resentment is founded on real benefit received, or real injury. Our gratitude or resentment is founded on the illusive momentary belief of benefit or injury. But this difference of reality and illusion in the circumstances which give occasion to them, is the only difference of the feelings; unless, indeed, that as the illusion cannot be of very long continuance, and is, probably, even while it lasts, less powerful than the reality, our sympathetic feelings, however similar in kind, may be supposed to be weaker in degree.

The effect of the sympathy, then, being only to transfuse into our breasts the grati-

tude or resentment of those who have been immediately benefited or injured by any generous or malevolent action, if the original gratitude imply belief of merit in the object of the gratitude, and the original resentment imply belief of demerit in its object, we may, by our sympathy with these direct original feelings, be impressed with similar belief of merit or demerit. But, in this case, it is equally evident that if our reflex gratitude and resentment involve notions of merit and demerit, the original gratitude and resentment which we feel by reflection must in like manner have involved them; and must even have involved them with more vivid feeling, since the difference of vividness was the chief or only circumstance of difference in the direct and the sympathetic emotions. The sympathy, then, to which we are supposed to owe our moral sentiments of merit and demerit, presupposes those very sentiments; since the feelings which arise in us by sympathy, only from the illusion by which we place ourselves in the situation of others, must, in those who were truly in that very situation, have arisen directly with at least equal power. It is some previous gratitude with which we sympathize; it is some previous resentment with which we sympathize; and merit is said to be only that worthiness of reward which the gratitude itself implies, and demerit that worthiness of punishment which is implied in the primary resentment. If the feeling of gratitude implied no notion of any relation of worthiness, which our benefactor's generosity bears to the reward which we wish that we were capable of bestowing on him, and our resentment, in like manner, implied no notion of a similar relation of the injustice or cruelty of him who has injured us, to that punishment of his offence which we wish and anticipate, we might then, indeed, be obliged to seek some other source of these felt relations. But if the actual gratitude or resentment of those who have profited or suffered imply no feelings of merit or demerit, we may be certain, at least, that in whatever source we are to strive to discover these feelings, it is not in the mere reflection of a fainter gratitude or resentment that we can hope to find them.

After admitting to Dr. Smith, then, every thing which he could be supposed to claim, or even to wish to claim, with respect to the universality, the steadiness, and the vividness of our sympathetic feelings, we have seen, that in both the sympathies which he supposes to take place, that from which we are said to derive our moral sentiments of the propriety or impropriety of actions, and that from which we are said, in like manner, to derive our moral sentiments of merit or demerit in the agent, the process to which he ascribes the origin of these mo-

nal sentiments cannot even be understood without the belief of their previous existence. The feelings with which we sympathize are themselves moral feelings or sentiments; or if they are not moral feelings, the reflection of them from a thousand breasts cannot alter their nature.

LECTURE LXXXI.

EXAMINATION OF DR. SMITH'S SYSTEM CONCLUDED; RECAPITULATION OF THE DOCTRINES OF MORAL APPROBATION.

My last Lecture, Gentlemen, was chiefly employed in considering a theory of our moral sentiments which has been stated and defended with great eloquence by one of the profoundest philosophers whom our country and our science can boast; a theory which founds our moral sentiments, not on the direct contemplation of the actions which we term virtuous, but on a sympathy, which it is impossible for us not to feel, with the emotions of the agent in the circumstances in which he has been placed, and with the emotions also of those to whom his actions have been productive of benefit or injury; our direct sympathy with the agent giving rise to our notion of the propriety of his action, our indirect sympathy with those whom his actions have benefited or injured giving rise to our notions of merit or demerit in the agent himself. Both these supposed sympathies I examined with a more minute review than that to which they have usually been submitted; and, in both cases we found, that even though many other strong objections to which the theory is liable were abandoned, and though the process for which the theorist contends were allowed to take place to the fullest extent to which he contends for it, his system would still be liable to the insuperable objection, that the moral sentiments which he ascribes to our secondary feelings of mere sympathy, are assumed as previously existing in those original emotions with which the secondary feelings are said to be in unison. If those to whom an action has directly related are incapable of discovering, by the longest and minutest examination of it, however much they may have been benefited by it or injured, and intentionally benefited or injured, any traces of right or wrong, merit or demerit, in the performer of the action, those whose sympathy consists merely in an illusory participation of the same interest, cannot surely derive, from the fainter reflex feelings, that moral knowledge which even the more vivid primary emotions were incapable of affording, any more than we can be supposed to acquire, from the most faith-

ful echo, important truths that were never uttered by the voices which it reflects. The utmost influence of the liveliest sympathy can be only to render the momentary feelings the same, as if the identity of situation with the object of the sympathy were not illusive, but real; and what it would be impossible for the mind to feel, if really existing in the circumstances supposed, it must be impossible for it also to feel, when it believes itself to exist in them, and is affected in the same manner, as if truly that very mind with whose emotions it sympathizes.

If, indeed, we had previously any moral notions of actions as right or wrong, we might very easily judge of the propriety or impropriety of the sentiments of others, according as our own do or do not sympathize with them; and it is this previous feeling of propriety or impropriety which Dr. Smith tacitly assumes, even in contending for the exclusive influence of the sympathy, as itself the original source of every moral sentiment. The sentiments of others could not fail, indeed, in that case to appear to us proper, if they coincided with sentiments which we had before, in our own mind, recognised as proper, or morally suitable to the circumstances; improper if they differed from these. But if we have no previous moral notions whatever, the most exact sympathy of feelings can tell us only that our feelings are similar to the feelings of some other person, which they may be as much when they are vicious as when they are virtuous, or when they are neither virtuous nor vicious; the most complete dissonance, in like manner, can tell us only that our feelings are not similar to those of some other person. When another calls scarlet or green what we have previously felt to be scarlet or green, we think that his vision and ours agree; but we presuppose, in him as in ourselves, that visual sensibility which distinguished the colours, and we do not consider him an object of moral regard, because his vision coincides with ours. When he is affected with a delightful emotion similar to ours, on the contemplation of a work of art, we acknowledge mentally, and are pleased perhaps with this coincidence of taste. But the coincidence does not seem to us to be that which constitutes the emotion of taste. On the contrary, it presupposes in both an independent susceptibility of these emotions, by which we should, individually, have admired what is beautiful, and distinguished from it what is ugly, though no one had been present with us to participate our sentiments. When, in like manner, we admire, with vivid approbation, some generous action,—that is to say, according to Dr. Smith's language, when we sympathize with the feelings of any one in the circumstances in which he has been

placed, we have a coincidence of feelings, indeed, as exact, though probably not more exact, than in a case of simple vision or admiration of some work of art, in which no moral sentiment was felt; and this very coincidence, in like manner, presupposes a capacity of distinguishing and admiring what is right, without which there would have been a similarity of feelings and nothing more, precisely as in the other cases. It is not a mere coincidence of feeling, however, which we recognise in our moral sentiments, like that which we recognise in the most exact coincidence of taste. We feel not merely that another has acted as we should have done, and that his motives, in similar circumstances, have been similar to ours. We feel that, in acting as he has done, he has acted properly; because, independently of the sympathy which merely gives us feelings to measure with our own, as we might measure with our own any other species of feelings, we are impressed with the propriety of the sentiments, according to which we trust that he should ourselves have acted; so thoroughly impressed with these previous distinctions of right and wrong, that, in the opposite case of some act of atrocious delinquency, no sympathy in vice of one villain with another can make the common crime seem a virtue in the eyes of his accomplice, who is actuated by similar motives, and, therefore, by similar feelings, in a sympathy of the finest unison, when he adds his arm to the rapine and afterwards to the murder which is to conceal and to consummate the guilt.

The moral sentiments which we have as yet considered, are those which relate to the conduct and feelings of others. The same inconsistency which we found in the theory of these, is to be found, as might be supposed, in the application of the principle to other species of supposed sympathy which we have still to consider, in the sentiments which we form of our own moral conduct. That we should be capable, indeed, of forming a moral estimate of our own actions, from the direct contemplation of the circumstances in which we may have been placed, and of the good or evil which we may have intentionally produced, would evidently be subversive of the whole theory of sympathy; since, with the same knowledge of circumstances and of intention, if we could form any moral judgment of our own actions, we might be equally capable of forming some moral judgment of the actions of others. It was absolutely necessary, therefore, for Dr. Smith to maintain, that we have no power of judging of our own actions directly,—that, knowing the choice which we have made, and all the circumstances which led to our choice, and all the consequences of benefit or injury to individuals and to the world,

which our choice may have produced, it is yet absolutely impossible for us to distinguish, without the aid of the real or supposed sentiments of others, any difference of propriety or impropriety, right or wrong, merit or demerit, or whatever other names we may use to express the differences of vice and virtue; though our vice had been the atrocious fury plunging a dagger in the heart of her who had been our happiness in many connubial years, and who was slumbering beside us on the same pillow, in the calmness of unsuspecting love; or our virtue the clemency of drawing back from the bosom of the assassin whom we had laid at our feet, the dagger which we had wrenched from his murderous hand. Even of actions so different as these, it would be absolutely impossible for us, we are told, to form any moral distinction, if we were to look on them only with our own eyes, and measure them by the feelings of our own heart. Before the one can appear to us less virtuous than the other, we must imagine some witnesses or hearers of what has been done, and sympathize with their sympathy. Such is the process which Dr. Smith believes to take place. But surely, if our original feelings, on the consideration of all the circumstances of an action, involve no notion of right or wrong, the sympathy with our feelings, or our sympathy with that sympathy, or even an infinite series of reciprocal sympathies, if these should be thought necessary, cannot afford the moral notions of which the original feelings, themselves more vivid, afforded no elements. If the impartial spectator be able to discover merit or demerit, by making our case his own, and becoming conscious as it were of our feelings; our feelings, which he thus makes his own, must speak to us with the same voice of moral instruction with which, during his temporary illusion, they speak to him. If, considering our action and all its consequences, we cannot discover any merit or demerit, they, considering our action in all its circumstances as theirs, must be alike insensible of any merit or demerit: or, if they have feelings essentially different from ours, they have not made our case their own, and what is misnamed sympathy has not been sympathy. Unless we presuppose, as I before said, on their part some moral notions of what is right or wrong, meritorious or worthy of punishment, by which they may measure our conduct and feelings, all the knowledge which the most complete sympathy can afford, is merely that they have certain feelings, that we have had certain feelings, and that these feelings are similar to each other, as our feelings have coincided before in various other emotions, perceptions, judgments that involved or suggested no moral notion whatever.

We have now then considered, both in its relation to our sentiments of our own moral conduct and in its relation to our sentiments of the conduct of others, the very celebrated theory of Dr. Smith, a theory which I cannot but regard as involving in morals the same error that would be involved in a theory of the source of light, if an optician, after showing us many ingenious contrivances, by which an image of some beautiful form may be made to pass from one visible place to another, were to contend that all the magnificent radiations of that more than ethereal splendour which does not merely adorn the day, but constitutes the day, had their primary origin in reflection, when reflection itself implies, and cannot be understood but as implying the previous incidence, and therefore the previous existence of the light which is reflected. A mirror presents to us a fainter copy of external things; but it is a copy which it presents. We are in like manner, to each other, mirrors that reflect from breast to breast joy, sorrow, indignation, and all the vivid emotions of which the individual mind is susceptible; but though, as mirrors, we mutually give and receive emotions, these emotions must have been felt before they could be communicated. To ascribe original moral feelings to this mental reflection, is truly, then, as much an error, in the theory of morality, as the doctrine of the production of light by reflection without the previous incidence of light, would be an error in the theory of catoptrics.

The argument, after the fuller views of it which I have given, may be recapitulated in very brief compass.

There are only two senses in which sympathy can be understood; one having immediate relation to the feelings, the other to the situation, of him with whom we are said to sympathize. We partake his emotions directly, as if by instant contagion; or we partake them indirectly, by first imagining ourselves in the circumstances in which he is placed; the emotion, in this latter case, being similar merely because the situation, in which we imagine ourselves for the moment, is similar, and arising in us when the situation is imagined to be ours, precisely in the same manner, and according to the same principles, as it arose in the mind of him who truly existed in the circumstances in which our imagination only has placed us. In either case it is equally evident, that sympathy cannot be the source of any additional knowledge; it only gives a wider diffusion to feelings that previously exist, or that might have previously existed. If it reflect to us the very emotions of others, as if by contagion, without any intervening influence of imagination on our part, it reflects feelings that have been directly excited in them, the primary subjects of the feelings, by their

real situation; and which they would not, the less have had, though no one had been present to sympathize with them, or even though the tendency to sympathy had not formed a part of the mental constitution. If, on the other hand, sympathy do not reflect to us the very emotions of others, but make us first enter, by a sort of spiritual transmigration, into their situation, and thus indirectly impress us with their feelings; it still, in making their situation ours, while the illusion lasts, excites in us only the feelings which we should have had, if the situation had been really ours; and which the same tendencies to emotion that produce them now would then have produced, though no sympathy whatever had been concerned in the process. All which is peculiar to the sympathy is, that instead of one mind only, affected with certain feelings, there are two minds affected with certain feelings, and a recognition of the similarity of these feelings; a similarity which, far from being confined to our moral emotions, may occur as readily and as frequently in every other feeling of which the mind is susceptible. What produces the moral notions, therefore, must evidently be something more than a recognition of similarity of feeling which is thus common to feelings of every class. There must be an independent capacity of moral emotion, in consequence of which we judge those sentiments of conduct to be right which coincide with sentiments of conduct previously recognised as right, or the sentiments of others to be improper, because they are not in unison with those which we have previously distinguished as proper. Sympathy, then, may be the diffuser of moral sentiments, as of various other feelings; but if no moral sentiments exist previously to our sympathy, our sympathy itself cannot give rise to them.

Such in outline, is the great objection to Dr. Smith's theory, as a theory of our moral sentiments. It professes to explain, by the intervention of sympathy, feelings which must have existed previously to the sympathy, or at least, without the capacity of which, as original feelings, in the real circumstances supposed, the illusive reality which sympathy produces would have been incapable of developing them. It is on a mere assumption then, or rather on an inconsistency still more illogical than a mere assumption, that the great doctrine of his system is founded; yet notwithstanding this essential defect, which might seem to you inconsistent with the praise that was given when I entered on the examination of it, the work of Dr. Smith is, without all question, one of the most interesting works, perhaps I should have said the most interesting work, in moral science. It is valuable, however, as I before remarked, not for the leading doctrine of which we have

seen the futility, but for the minor theories which are adduced in illustration of it, for the refined analysis which it exhibits in many of these details, and for an eloquence which, adapting itself to all the temporary varieties of its subject, familiar with a sort of majestic grace, and simple even in its magnificence, can play amid the little decencies and proprieties of common life, or rise to all the dignity of that sublime and celestial virtue which it seems to bring from heaven indeed, but to bring down gently and humbly to the humble bosom of man.

That his own penetrating mind should not have discovered the inconsistencies that are involved in his theory, and that these should not have readily occurred to the many philosophic readers and admirers of his work, may in part have arisen, as many other seeming wonders of the kind have arisen, from the ambiguities of language. The meaning of the important word sympathy is not sufficiently definite, so as to present always one clear notion to the mind. It is generally employed, indeed, to signify a mere participation of the feelings of others; but it is also frequently used as significant of approbation itself. To say that we sympathize with any one in what he has felt or done, means often that we thoroughly approve of his feelings; and in consequence of this occasional use of the term as synonymous with approbation, the theory which would identify all our moral approbation with sympathy, was, I cannot but think, more readily admitted, both by its author, and by those who have followed him; since what was not true of sympathy, in its strict philosophic sense, was yet true of it in its mixed popular sense. Indeed, if the word had been always strictly confined to its two accurate meanings, as significant either of the mere direct participation of feelings previously existing, or of the indirect participation of them in consequence of the illusive belief of similarity of circumstances, it seems to me as little possible that any one should have thought of ascribing to sympathy original feelings, as, in the analogous cases which I before instanced, of ascribing to an echo the original utterance of the voices which it sends to our ear, or the production of the colours which it sends to our eye to the mirror which has only received and reflected them.

Of all the principles of our mixed nature, sympathy is perhaps one of the most irregular, varying not in different individuals only, but even in the same individual in different hours or different minutes of the same day, and varying, not with slight differences, but with differences of promptness and liveliness, with which only feelings the most capricious could be commensurable. If our virtue and vice, therefore, or our views of actions as right or wrong, varied with our

sympathy, we might be virtuous at morning, vicious at noon, and virtuous again at night, without any change in the circumstances of our action, except in our greater or less tendency to vividness of sympathy, or to the expectation of more or less vivid sympathies in others. How absurd and impertinent seems to us, in our serious hours, the mirth that in more careless moments would have won from us not our smile only, but our full sympathy of equal laughter; and how dull, when our mind is sportive, seems to us the gravity of the sad and serious, of the venerable moralizers on years that are long past, and years that are present,—to whose chair, under the influence of any sorrow that depressed us, we loved to draw our own, while we felt a sort of comfort as we listened to them, in the slow and tranquil tone, and the gentle solemnity of their fixed but placid features. What is true of our sympathy with mere mirth or sadness, is true of every other species of sympathy. Original temperament, habit, the slightest accident of good or bad fortune, may modify in no slight degree the readiness, or at least the liveliness of moral sympathy with which we should have entered into the feelings of others, into their gratitude or anger, or common love or hate; and if, therefore, our estimate of the propriety or impropriety of actions had been altogether dependent on the force of our mere sympathetic emotion, it would not have been very wonderful if the greater number of mankind had regarded the very propriety or impropriety, as not less accidental than the sympathies from which they flowed.

Having now, then, examined all the systems of philosophers which may be considered as more or less directly opposed to the simple view which I gave you of our moral constitution; in which our notions of moral obligation, virtue, merit, were traced to a single feeling of the mind, and the susceptibility of this feeling found to be as truly original in the mind as any of its other powers or susceptibilities—its capacity, for example, of memory, judgment, love, hate, hope, fear—I flatter myself, that the evident inadequacy of every system which professes to account for the moral phenomena, without this original distinctive principle, will be regarded as at least a strong corroboration of the positive evidence of the theory which has been submitted to you. The review in which we have been engaged may, therefore, I hope, be of double value, both as giving you a sketch of the opinions of the most eminent philosophers who have written on this most interesting subject, and an exposition of the errors of those opinions, which in many instances it requires considerable minuteness of analysis to detect, and as enabling you at the same time, better to appreciate the truth of those original distinctions

of moral good and evil, the belief of which seems to me as just in philosophy as it is salutary in its practical tendencies, and delightful to the heart that loves virtue, and that, feeling in itself all the blessings which virtue diffuses, perceives with joy that the principle which gives to life all its happiness, is a principle that does not depend for its development on accidents of worldly station, or time or place, but in all regions, and ages, and circumstances of fortune, is coeval with the race of man, and present with its joys or consolations, which it is always ready to offer to our very wishes, wherever a human being exists.

The review itself, however—important as it may have been in its relation to the history of moral science, and to the great truths which it is the object of moral science to develop and illustrate—has presented to your attention so many explanations, or rather so many attempted explanations, of the same moral phenomena, that the rapid succession of these different opinions may have tended, perhaps—at least in the minds of such of you as are not accustomed to consider together and compare many discordant systems—to perplex and obscure the notions which you had derived from the view of the subject as it was originally presented to you. It may be of advantage, therefore, to take a short retrospect of our original speculation.

In surveying either our own conduct, or the conduct of others, we do not regard the actions that come under our review as merely useful or hurtful, in the same manner as we regard inanimate things, or parts even of our living mental constitution, that are independent of our will. There is a peculiar set of emotions, to which the actions of voluntary agents in certain circumstances give rise, that are the source of our moral sentiments, or rather which are themselves our moral sentiments, when considered in reference to the actions that excite them. To these emotions we give the name of moral approbation or moral disapprobation, feelings that are of various degrees of vividness as the actions which we consider are various. The single principle upon which these feelings depend, is the source of all our moral notions; one feeling of approbation, as variously regarded in time, being all which is truly meant when we speak of moral obligation, virtue, and merit, that in the works of ethical writers are commonly treated as objects of distinct inquiry; and that, in consequence of the distinct inquiries to which they have led, and the vain attempts to discover essential differences where none truly exist, have occasioned so much confusion of thought and verbal tautology as to throw a sort of darkness on morality itself. Instead, then, of inquiring first, what it is which constitutes virtue, and then what it is which constitutes merit, and then what it is which

constitutes our moral obligation to do what we have seen to be right and meritorious, we found that one inquiry alone was necessary—what actions excite in us, when contemplated, a certain vivid feeling—since this approving sentiment alone, in its various references, is all which we seek in these different verbal inquiries. If a particular action be meditated by us, and we feel, on considering it, that it is one of those which, if performed by us, will be followed in our own mind by the painful feeling of self reproach, and in the minds of others by similar disapprobation; if a different action be meditated by us, and we feel that our performance of it would be followed in our own mind and the minds of others by an opposite emotion of approbation, this view of the moral emotions that are consequences of the actions is that which I consider as forming what is termed moral obligation, the moral inducement which we feel to the performance of certain actions, or to abstinence from certain other actions. We are virtuous if we act in conformity with this view of moral obligation; we are vicious if we act in opposition to it; virtuous and vicious meaning nothing more than the intentional performance of actions that excite, when contemplated, the moral emotions. Our action, in the one case, we term morally right, in the other case morally wrong; right and wrong, like virtue and vice, being only words that express briefly the actions which are attended with the feeling of moral approbation in the one case, of moral disapprobation in the other case. When we speak of the merit of any one, or of his demerit, we do not suppose any thing to be added to the virtue or vice; we only express, in other words, the fact, that he has performed the action which it was virtuous or vicious to perform; the action which, as contemplated by us, excites our approval, or the emotion that is opposite to that of approval. Moral obligation, virtue, vice, right, wrong, merit, demerit, and whatever other words may be synonymous with these, all denote then, as you perceive, relations to one simple feeling of the mind, the distinctive sentiment of moral approbation or disapprobation, which arises on the contemplation of certain actions; and which seems itself to be various, only because the action of which we speak or think, meditated, willed, or already performed, is variously regarded by us, in time, as future, present, past. There are, in short, certain actions which cannot be contemplated without the instant feeling of approval, and which may therefore be denominated morally right. To feel this character of approvableness in an action which we have not yet performed, and are only meditating on it as future, is to feel the moral obligation or moral inducement to perform it;—

when we think of the action in the moment of volition, we term the voluntary performance of it virtue; when we think of the action, as already performed, we denominate it merit; in all which cases, if we analyze our moral sentiment, we cannot fail to discern, that it is one constant feeling of moral approval, with which we have been impressed, that is varied only by the difference of the time, at which we regard the action as future, immediate, or past.

A great part of the confusion which has prevailed in the theory of morals, has arisen, I have little doubt, from indistinctness of conception with respect to the identity or the difference of these moral notions of obligation, virtue, merit. Much of the confusion also, I have as little doubt, has arisen from the abuse of one very simple abstraction—that by which we consider an action as stripped of circumstances peculiar to an individual agent, and forming, as it were, something of itself, which could be an object of moral regard, independently of the agent. We thus learn to speak of actions that are absolutely right and relatively wrong, or absolutely wrong and relatively right; that is to say, of actions which are right when the agent, with his particular views, is wrong; and of agents that continue as meritorious as before, when their actions, in ordinary circumstances, would have been ranked in some degree of delinquency. Convenient as these distinctions may verbally have been in some cases, where brevity was the only advantage desired, they have had an injurious tendency, in other more important respects, by leading the inconsiderate to suppose, that of actions which are thus at once right and wrong, the morality cannot be very stable and definite. I was careful, therefore, to point out to you the nature of the abstraction, and the futility of any, distinction more than what is purely verbal, of absolute and relative rectitude. What is absolutely right is relatively right, what is relatively right is absolutely right. An action cannot excite feelings different from those which an agent excites, for it is itself the agent, or it is nothing. It is the brief expression of some agent, real or supposed, placed in certain circumstances, willing and producing certain effects; and when an action, which in one set of circumstances is right, is said to be wrong in other circumstances, the action of which we speak, in the new circumstances supposed, is truly, as I showed you, a different action, in the only sense in which an action has any meaning, as significant of a living being, having certain definite views, and producing certain definite effects. A clear view of this definition of an action, as uniformly comprehending in it the notion of some agent, without whom it would be nothing—though, but for the general misconception on the subject, it would

seem to me so obvious as scarcely to require to be pointed out—is, in consequence of that general misconception, one of the most important views in the philosophy of morals which you can make familiar to your mind. It is no small progress in Ethics, as in Physics, to have learned to distinguish accurately abstractions from realities, to know that an action is only another name for an agent in certain circumstances; virtue, vice, only briefer expressions of an agent virtuous or vicious, that is to say, of an agent performing actions of which we and mankind in general approve or disapprove. Indeed, I scarcely know a single ethical writer, to whose mind the nature of these and other similar abstractions has been duly present; and who does not sometimes think, or at least speak, of virtue and vice, as beings that have certain properties, independently of all the virtuous and vicious in the universe.

Though there is not vice or virtue, however, there are virtuous or vicious agents. Certain actions, as soon as considered, excite a feeling of approbation, which leads us to class them together as virtuous; certain other actions excite a feeling of moral disapprobation, which leads us to class them together as vicious. There is, then, in the mind of each individual, a principle which leads him thus to divide actions into two great classes. But if, in the minds of different individuals, this distinction were very differently formed, so that the actions which seemed virtues to one were the very actions which seemed vices to another, it is evident that the social happiness, and even the social union of mankind, could not be preserved in this strange mixture of love and hate, of crimes and virtues, rewarded or punished, as the admirers of truth or deceit, of cruelty or benevolence, chanced to obtain a precarious superiority in numbers or power. It is necessary for general peace, even though no other relation were to be considered, that there should be some great rules of conduct, according to which all may direct their actions in one harmonious course of virtue; or according to which, at least, in any partial discord of the actions of individuals, the moral sentiment of the community may be harmoniously directed, in checking what would be generally injurious, and furthering what would be generally beneficial. There is, therefore, we found, such an accordance of sentiment—of sentiment that is directed by the provident benevolence of God to the happiness of all who live in the great social communion of mankind, even when the individual, acting in conformity with the sentiment, has no thought beyond the sufferer whose anguish he relieves, or the friend to whose happiness he feels it more than to happiness to contribute, or the preservation of his own internal character of moral excellence, in cases in which pain is encoun-

tered or pleasure sacrificed with no other object than that moral excellence itself. Since the world was created there have indeed been myriads of human beings on the earth; but there has been only one God, and there is only one God. There is, therefore, only one great voice of approbation in all the myriads of mankind; because He, the great approver and the great former of our moral constitution, is one. We may refrain from virtue; we may persecute virtue; but, though our actions may be the actions of hatred, there is a silent reverence which no hatred can suppress. The omnipresent Judge of human actions speaks in the cause of the wicked as in the cause of the good, and has made it impossible for us, even in the wildest abuses of our power, not to revere, at least in heart, the virtue which he has honoured with his love.

In asserting the wide accordance of this moral voice, however, it was necessary to consider the objections to the harmony of sentiment which have been drawn from some practices and institutions that seem, at least as first considered, to be proofs of discord rather than harmony. That there are instances, and many instances of such apparent anomaly, it would have been absurd to endeavour to disprove. But it might still be inquired, whether even these instances are really anomalous, or only seem so, from erroneous opinions of the nature of that modified agreement which alone is necessary to the supporter of the original tendencies,—distinctive emotions of vice and virtue.

This consideration of the species of accordance which the moral phenomena might, from our knowledge of the general nature of the mind, be expected to indicate, on the supposition of an original principle of moral feeling, led us into some very interesting trains of inquiry; of which the result was the ascertainment of certain limits, within which remains, unaffected by the sophistries opposed to it, all that uniformity for which it is wisdom to contend,—limits that do not imply any defect of original tendency to certain moral emotions, but only the operation of other causes, that concur with this original influence; and that might, *a priori*, have been expected to have this modifying effect, if, without considering any of the objections urged, we had only reflected on the analogous phenomena of other principles of the mind, that are allowed to be essential to it and universal, and that are yet capable of similar modification.

The limitations to which we were led were of three kinds,—first, the temporary influence of every feeling that completely occupies the mind, especially of any violent passion, which blinds us at the moment to moral distinctions,—that is to say, prevents, by its own vividness, the rise of the less vivid feelings of

approbation or disapprobation; in the same manner as, in similar circumstances, it would blind to the discernment even of the universal truths of science,—that is to say, would not allow us to perceive for the time the simplest and least mutable of all relations,—the proportions of number and quantity,—if an arithmetician or geometer, when we were under the influence of anger, sudden jealousy, or any other violent emotion, were to discourse to us calmly of square or cube roots, or of the properties of right angled triangles. These arithmetical or geometrical properties we discover readily, when our passion has subsided; and, in like manner, we discover readily, when our passion has wholly subsided, the moral distinctions which we were incapable of perceiving before.

A second limitation, which we found it necessary to form, arises from the complex results of good and evil, in a single action,—the difficulty of calculating the preponderance of good or evil, according to which felt preponderance alone, our approbation or disapprobation arises,—and the various degrees of importance attached, and justly attached, in different ages and nations, to parts of the complex result, which are most in harmony with the spirit of the nation or the age; that is to say, which tend, or are conceived to tend, most to the production of that particular national good, which it may have been an error in policy, indeed, to desire, but which still was the object of a policy, wise or unwise. What we esteem evil upon the whole, others may esteem good upon the whole; because there is, in truth, a mixture of good and evil, the parts of which may be variously estimated, but of which no one loves the evil as evil, or hates the good as good. It is some form of good, which is present to the mind of the agent, when he regards as morally right, that compound result of good and evil, of which we, with better discernment, appreciate better the relative amount. Even the atrocious virtues, if I may use that combination of words, of which voyagers relate to us instances in savage life, or which have sometimes prevailed even in nations more civilized, we found in our inquiry, might very naturally, without any defect, or inconsistency of moral emotion, arise from some misconception of this sort. Vices may everywhere be found prevailing as vices; but when they are generally revered as virtues, it is because there is in them something which is truly, in those circumstances, virtue, however inferior the amount of good may be to the amount of evil. It is for some prominent moral good, however, that they are approved; and the defective analysis, which does not perceive the amount of accompanying evil, is an error of judgment, not an approbation of that which is injurious to individuals or mankind, for the sake of that very injury.

The third limitation which we were led to form, is that which arises from the influence of the associating principle,—an influence that concurs with the former in almost every instance, and promotes it. When actions have complicated results, this principle may lead us to think more of one part of the result than of another part; and, by the remembrances which it yields of the virtues of those whom we have loved, adds all the force of its own lively impressions to the particular virtues that are so recommended to us, or to actions that might otherwise have been absolutely indifferent. This influence, however, far from disproving the reality of original tendencies to moral feeling, is, as I showed you, in many of the cases in which it operates most powerfully, one of the most interesting exemplifications of these very moral emotions. It is by loving those whom it is virtue to love, that we learn often to value too highly, what otherwise we should have valued with a juster estimate. The same principle we found too to operate strongly in exciting through the medium of general terms and general rules, a disproportionate emotion in some cases, in which we have learned to apply to individual cases, an emotion that has resulted from many previous analogous emotions.

Such are the limits within which alone the original tendency of our nature to certain moral emotions, and the consequent accordance of moral distinctions can be defended,—but, within these limits, it may safely be maintained. There is in our breast a susceptibility of moral emotion, by which we approve or condemn; and the principle which thus approves or condemns in us, is the noblest of the ties that connect us with the universal community of mankind.

LECTURE LXXXII.

OF THE USE OF THE TERM MORAL SENSE;
ARRANGEMENT OF THE PRACTICAL VIRTUES.

GENTLEMEN, in my Lecture yesterday, after concluding my remarks on the theory of our moral sentiments, which Dr. Smith has proposed,—the last of the theories on this subject, which required our consideration, as differing in its principles from the view which I have given you, I briefly recapitulated the general doctrines which we had previously been led to form of the phenomena of moral approbation.

All our moral sentiments, then, of obligation, virtue, merit, are in themselves, as we have seen, nothing more than one simple feeling, variously referred to actions, as future, present, or past. With the loss of the

susceptibility of this one peculiar species of emotion, all practical morality would instantly cease: for, if the contemplation of actions excited in us no feeling of approval, no foresight, that, by omitting to perform them, we should regard ourselves, and others would regard us, with abhorrence or contempt, or at least with disapprobation, it would be absurd to suppose that there could be any moral obligation to perform certain actions and not to perform certain other actions, which seemed to us, morally, equal and indifferent. There could, in like manner, be no virtue nor vice in performing, and no merit nor demerit in having performed an action, the omission of which would have seemed to the agent as little proper, or as little improper as the performance of it,—in that state of equal indiscriminate regard or disregard, in which the plunderer and the plundered, the oppressor and the oppressed, were considered only as the physical producers of a different result of happiness or misery.

It is by this one susceptibility, then, of certain vivid distinctive emotions, that we become truly moral beings, united, under the guardianship of Heaven, in one great social system, benefiting and benefited, and not enjoying the advantage of this mutual protection, only in the protection itself, that is constantly around us; but enjoying also the pleasure of affording the reciprocal benefit, and even a sort of pleasure of no slight amount, in the various wants themselves, which are scarcely felt as wants, when we know that they are to be remedied by the kind hearts and gentle hands, whose offices of aid we have before delighted to receive, and are in perfect confidence of again receiving. Such is the great system of social duties that connects mankind by ties, of which our souls do not feel the power less truly, because they are ties, which only the soul can feel, and which do not come within the sphere of our bodily perception. By that delightful emotion, which follows the contemplation of virtue, we can enjoy it, even while it is not exercised, in all its aspects as past, or future, as much as present. In our meditations on it, it is like some tranquil delight that awaits us, which, in the very act of virtue, comes like an immediate reward to actions that seem to need no other recompense, while they are thus rewarded; and to look back upon the generous toil, or the general self-privation, as among the things which have been, is at once to enjoy again the past delight, and to feel in it a sort of pledge of future returns of similar enjoyment,—increased trust of being able and worthy to perform again, whenever the opportunity of them shall recur, actions as worthy of delight, and as delightful.

It is by this unceasing delight, which Virtue is ever spreading out before us, not mere-

ly in the direct exercise of the actions which we term virtuous, but in the contemplation of them as future in our wishes, or as past, in the remembrances of a good conscience, that moral excellence is truly and philosophically worthy of the glorious distinction, by which the author of the *Essay on Man* would characterize it, of being what "alone is happiness below."

The only point, where human bliss stands still,
And tastes the good, without the fall to ill;
Where only Merit constant pay receives,
Is blest, in what it takes and what it gives;
The joy unequal'd, if its end it gain,
And, if it lose, attended with no pain;
Without satiety, though e'er so blest,
And but more relish'd, as the more distress'd;
The broadest mirth unfeeling Folly wears,
Less pleasing far, than Virtue's very tears;
Good from each object, from each place acquir'd,
For ever exercis'd, yet never tir'd;
Never elated, while one man's oppress,
Never dejected, while another's blest,
And where no wants, no wishes, can remain,
Since but to wish more virtue is to gain.

In tracing to an original susceptibility of the mind our moral feelings of obligation in the conception of certain actions as future, of virtue, in the present performance or wish to perform certain actions, and of merit, in the past performance or past resolution to perform certain actions, we may be considered as arriving at a principle like that which Dr. Hutcheson, after Lord Shaftesbury, has distinguished by the name of the Moral Sense, and of which, as an essential principle of our constitution, he has defended the reality with so much power of argument, in his various works on morals. In our moral feelings, however, I discover no peculiar analogy to perceptions or sensations, in the philosophic meaning of those terms, and the phrase moral sense, therefore, I consider as having had a very unfortunate influence on the controversy as to the original moral differences of actions, from the false analogies which it cannot fail to suggest. Were I to speak of a moral sense at present, you would understand me as speaking rather metaphorically, than according to the real place which we should be inclined to give in our arrangement, to the original principle of our nature, on which the moral emotions depend. But by Hutcheson it was asserted to be truly and strictly a sense, as much a sense as any of those which are the source of our direct external perceptions; and though this difference of nomenclature and of arrangement on his part, evidently arose from a misconception, or, at least, a very loose meaning of the word sense, different from that in which it is commonly understood, as limited to the feelings which we acquire directly from affections of our bodily organs, still this loose meaning of the term which he intended it to convey, was, in some measure, mingled and confused in the minds of others, with the stricter meaning commonly assigned to it, and the assertion of a

moral sense has been regarded almost as the assertion of the existence of some primary medium of perception, which conveys to us directly moral knowledge, as the eye enables us to distinguish directly the varieties of colours, or the ear the varieties of sounds; and the scepticism, which would have been just with respect to such an organ of exclusive moral feeling, has been unfortunately extended to the certain moral principle itself, as an original principle of our nature. Of the impropriety of ascribing the moral feelings to a sense, I am fully aware then, and the place which I have assigned to them among the moral phenomena is, therefore, very different. In the emotions, which the contemplation of the voluntary actions of those around us produces, there is nothing that seems to demand, for the production of such emotions, a peculiar sense, more than is to be found in any of our other emotions. Certain actions excite in us, when contemplated, the vivid feelings which we express too coldly when, from the poverty of language, we term them approbation or disapprobation, and which are not estimates formed by an approving or disapproving judgment, but emotions that accompany and give warmth to such estimates. Certain other objects of thought excite in us other vivid feelings that are in like manner classed as emotions,—hope, jealousy, resentment; and, therefore, if all emotions, excited by the contemplation of objects, were to be referred to a peculiar sense, we might as well speak of a sense of those emotions or of a sense of covetousness or despair as of a sense of moral regard. If sense, indeed, were understood in this case to be synonymous with mere susceptibility, so that, when we speak of a moral sense, we were to be understood to mean only a susceptibility of moral feeling of some sort, we might be allowed to have a sense of morals, because we have, unquestionably, a susceptibility of moral emotion; but, in this very wide extension of the term, we might be said, in like manner, to have as many senses as we have feelings of any sort; since, in whatever manner the mind may have been affected, it must have had a previous susceptibility of being so affected, as much as in the peculiar affections that are denominated moral.

The great error of Dr. Hutcheson, and of other writers who treat of the susceptibility of moral emotion, under the name of the moral sense, appears to me to consist in their belief of certain moral qualities in actions, which excite in us what they consider as ideas of these qualities, in the same manner as external things give us, not merely pain or pleasure, but notions or ideas of hardness, form, colour. Indeed, it is on this account that the great champion of this doctrine professes to regard the moral prin-

ciple as a sense ; from its agreement, as he says, with this definition, which he conceives to be the accurate definition of a sense, "a determination of the mind to receive any idea from the presence of an object which occurs to us independent on our will." What he terms an idea, in this case, is nothing more than an emotion considered in its relation to the action which has excited it. A certain action is considered by us—a certain emotion arises. There is no idea in the philosophic meaning of that term, but of the agent himself and of the circumstances in which he was placed, and the physical changes produced by him ; and our ideas or notions of these we owe to other sources. To the moral principle, the only principle of which Hutcheson could mean to speak as a moral sense, we owe the emotion itself, and nothing but the emotion.

In one use of the word, indeed, we may be said to owe to our susceptibility of moral emotion, ideas, because we owe to it, as the primary source, the emotions of this species which we remember ; and remembrances of past feelings are often termed ideas of those feelings ; but in this application of the word, as synonymous with a mere remembrance, every feeling, as capable of being remembered, may be a source of ideas independently of the will, and therefore, according to the definition which is given by Hutcheson, equally a sense.

There is yet another meaning of the word, however, and a still more important one, in relation to our present inquiry, in which our susceptibility of moral emotion is productive of what, in the general loose language of metaphysical writers, have been termed ideas ; and it is by his defective analysis, of what is truly meant in the phrase, moral ideas, and of the process which evolves them, that I conceive Hutcheson to have been chiefly misled, in supposing us to be endowed with a sense of moral qualities of actions. The process to which I allude, is the common process of generalization, to which alone we owe the general notions of virtue, vice, right, and wrong, which he ascribes to a particular sense that affords us these ideas. If we had never contemplated more than a single virtuous or vicious action, we should have had only the particular emotion which followed that particular contemplation, and should as little have formed the general notions of virtue and vice, as we should have formed the notion which is expressed by the word quadruped, if we had seen only a single animal with four legs. It is not by one action only of one definite kind, however, that is to say, by an agent placed only in one set of circumstances, and producing only one particular effect, that our moral emotion is excited ; nor is there only one unvarying feeling of the mind, of one exact degree of intensity, which

we denominate a moral emotion, as excited by various moral actions. There are various analogous actions which excite various analogous moral feelings of approbation or disapprobation, and it is in consequence of the feeling of the similarity of these emotions, that we learn to class together the different actions that excite these similar emotions under a single word, virtuous or right, or proper, or vicious, wrong, improper. The ideas, of which Hutcheson speaks, are these general notions only. There are virtuous agents, not virtue, as there are minds that have certain feelings approving or disapproving, not approbation or disapprobation, as one simple state, in all the varieties of these feelings. Virtue, vice, right and wrong, are in short mere general terms, as much as any other mere general terms, which we have formed to express the similarities of particular things or particular qualities. The general notions, and consequently the general terms, that denote them, we derive indeed from our susceptibility of moral feeling, since we must have the moral emotions themselves, before we can discover them to be like or unlike, and invent words for expressing briefly their similarities ; but what Dr. Hutcheson and other writers would term our ideas of virtue and vice, right and wrong,—though, in this sense, derived from our susceptibility of moral feeling, which gives us the emotions that are felt and classed as similar,—are derived from it, only as any other general notions of resemblances of any other feeling, or of the circumstances which induce in the mind certain similar feelings, necessarily presuppose the capacity of the feelings themselves whatever they may be, which are afterwards considered as having this relation of similarity. There are no two feelings, perhaps, which may not be found to have some relation to each other, as there are, perhaps, no two external things which may not be found to have some analogy ; and if, therefore, we suppose that we have a particular internal sense for every general notion of agreement of any kind, which we are capable of framing, we may be said to have as many senses as we have pairs of feeling which we are capable of comparing. There are innumerable similarities which are felt by us every hour, and consequently innumerable general notions, though we may have invented names only for a few of them. Our moral emotions, like our other emotions, and our other feelings of every kind, impress us with certain resemblances which they mutually bear ; and the importance of the actions which agree in exciting the analogous feelings of moral approbation or disapprobation, from the influence which they widely exercise on happiness as beneficial or injurious, has led, in every age and country, to the designation of them by certain general names, as virtuous

or vicious, proper or improper; but these general terms are not the less general terms, and only general terms, significant merely of the resemblance of various particular actions, which agree in exciting in the mind certain feelings that are analogous. This distinction of virtue, vice, right, wrong, merit, demerit, as mere general terms, expressive only of an analogous relation which certain actions bear to certain emotions, I conceive to be of the utmost importance for your clear understanding of the theory of morals; and I have dwelled on it, therefore, with the wish that it should become familiar to your minds. You are not to conceive, as Dr. Hutcheson's view of our moral feelings might lead you to imagine, that we discover a certain idea of right or wrong, virtue or vice, from the contemplation of any one particular action, as if there were a sense for the reception of such ideas, that flow from them like light from the sun, or fragrant particles from a rose. There is no right or wrong, virtue or vice, but there are agents whose actions cannot be contemplated by us without an emotion of approbation or disapprobation; and all actions, that is to say, all agents, that agree in exciting moral feelings which are thus analogous, we class together as virtuous or vicious, from this circumstance of felt agreement alone. The similarity of the emotions which we feel, in these particular cases, is thus all to which we owe the notions, or, as Dr. Hutcheson calls them, the ideas, of right and wrong, virtue and vice; and it is not more wonderful that we should form these general notions, than that we should form any other general notions whatever.

The error of Dr. Hutcheson with respect to qualities, in objects that excite in us what he terms moral ideas, is similar to that which led many ethical writers—as we saw in reviewing their different systems—to refer our moral sentiments to reason or judgment, as the principle which measures the fitnesses of certain actions for producing certain ends; and which approves or disapproves accordingly, as different actions seem more or less adapted for producing the desired end. The truth is, that moral approbation or disapprobation, though, from the common use of those terms, and the poverty of our language, I have been obliged to employ them in our past discussions, are terms that are very inadequate to express the liveliness of the moral feelings to which we give those names. The moral emotions are more akin to love or hate, than to perception or judgment. What we call our approbation of an action, inasmuch as the moral principle is concerned, is a sort of moral love when the action is the action of another, or moral complacency when the action is our own, and nothing more. It is no exercise of reason, discovering congruities, and determining one

action to be better fitted than another action, for affording happiness or relieving misery. This logical or physical approbation may precede, indeed, the moral emotion, and may mingle with it, and continue to render it more and more lively while we are under its influence; but even when such approbation precedes it, it is distinct from the emotion itself; and we might judge and approve of the fitness, or disapprove of the unfitness, of certain actions to produce happiness, with the same precision as we now judge and approve, or disapprove, though we had not been, as we are, moral beings, desirous of the happiness of others, and feeling a vivid delightful emotion, on the contemplation of such actions as tend to produce that happiness. However our judgment, as mere judgment, may have been exercised before, in discerning the various relations of actions to the happiness of the world, the moral principle is the source only of the emotion which follows the discovery of such fitness; and not in the slightest degree of the judgment which measures and calculates the fitness, any more than it is a source of the fitness itself. When we speak of our moral approbation of an action, we may indeed, from the convenience of such brief expressions, have some regard to both feelings, to our judgment of the fitness of an action to produce good to an individual or to the world, and to our moral love of the beneficial action which follows this discovery. But still, it is not to be forgotten, that it is the latter part only, the distinctive moral regard, that belongs to the principle which we have been considering; the discovery of the fitness is a common exercise of judgment, that differs no more from the other exercises of it than these differ from each other. It is in the order of our emotions, accordingly, that I have assigned a place to our moral feelings, in my arrangement of the phenomena of the mind; because, though we are accustomed to speak of moral approbation, moral judgments, or moral estimates of actions, the feelings which we thus comprehend under a single term are not the simple vivid feeling, which is all that truly constitutes the moral emotion, but a combination of this vivid feeling with the judgment as to the fitness or tendency of the action, which, as a mere judgment, preceded and gave rise to the emotion. What is strictly the moral part of the compound is, however, as I have already said, the emotion, and the emotion only.

There is, in this case, with respect to mere judgment, precisely the same error which we have traced in the reasons that led Dr. Hutcheson to the supposition of a moral sense. What are termed moral ideas of virtue, merit, obligation,—the consideration of which, as moral ideas, was, as his

definition and his general reasoning show, the very circumstance which led him into his error,—are merely, as I have repeatedly endeavoured to demonstrate to you, the one vivid moral emotion, referred to the actions which excite it. There are no ideas, therefore, which require the supposition of a peculiar sense for affording them, even if a sense were necessary for all those feelings which are termed simple ideas. There is only a particular emotion, indicating, of course, a peculiar susceptibility of this emotion in the mind; and, together with this vivid feeling, actions, or ideas of certain actions, and their consequences, which may be said, indeed, to be moral ideas, when combined with this vivid feeling, but which, as ideas, are derived from other sources. It is not the moral principle which sees the agent, and all the circumstances of his action, or which sees the happiness or misery that has flowed from it; but when these are seen, and all the motives of the agent divined, it is the moral principle of our nature which then affords the emotion that may afterwards, in our conception, be added to these ideas derived from other sources, and form with them compound notions of all the varieties of actions that are classed by us as forms of virtue or vice.

The reference of our moral love of certain actions and moral abhorrence of other actions to a peculiar sense, termed the moral sense, has arisen, then, we may conclude, from a defective analysis, or at least from a misconception of the nature of those moral ideas of which the defenders of this sense speak, and which seem to them falsely to indicate the necessity of such a sense for affording them. The ideas of which they speak are truly complex feelings of the mind. We have only to perform the necessary analysis, and all which we discover is a certain emotion of moral love, that, according to circumstances, is more or less lively, and the notion of certain actions, that is to say, of agents real or supposed, willing and producing certain effects. We may, for the sake of brevity, invent the general words virtue, right, propriety, as significant of all the actions which are followed in us by this emotion. But these are mere generalizations, like other generalizations; and there is no virtue in nature, more than there is quadruped or substance.

But, though Dr. Hutcheson may have erred in not analyzing with sufficient minuteness the moral ideas of which he speaks, and in giving the name of a moral sense to the susceptibility of a mere emotion akin to our other emotions, this error is of little consequence as to the moral distinctions themselves. Whether the feeling that attends the contemplation of certain actions admit of being more justly classed with our sensations or perceptions, or with our emotions, there

is still a susceptibility of this feeling or set of feelings, original in the mind, and as essential to its very nature as any other of the principles or functions, which we regard as universally belonging to our mental constitution; as truly essential to the mind, indeed, as any of those senses among which Dr. Hutcheson would fix its place.

The sceptical conclusions which some writers have conceived to be deducible from the doctrine of a moral sense, might, if they could be justly drawn from that doctrine, be equally deducible from the doctrine of moral emotions for which I have contended; since the emotions may be regarded as almost the same feelings under a different name. A very slight notice, however, of the objection which these conclusions are supposed to furnish, will be sufficient for showing the radical error in which the objection has its source. You will find it stated and illustrated at great length in Dr. Price's elaborate, but very tedious, and not very clear, Review of the principal questions of morals. It is more briefly passed by Mr. Stewart in his Outlines.

"From the hypothesis of a moral sense, various sceptical conclusions have been deduced by later writers. The words Right and Wrong, it has been alleged, signify nothing in the objects themselves to which they are applied, any more than the words sweet and bitter, pleasant and painful; but only certain effects in the mind of the spectator. As it is improper, therefore, (according to the doctrines of modern philosophy,) to say of an object of taste, that it is sweet; or of heat, that it is in the fire; so it is equally improper to say of actions, that they are right or wrong. It is absurd to speak of morality as a thing independent and unchangeable: inasmuch as it arises from an arbitrary relation between our constitution and particular objects.

"In order to avoid these supposed consequences of Dr. Hutcheson's philosophy, an attempt has been made by some later writers, in particular by Dr. Price, to revive the doctrines of Dr. Cudworth, and to prove, that moral distinctions, being perceived by reason or the understanding, are equally immutable with all other kinds of truth."

That right and wrong signify nothing in the objects themselves, is indeed most true. They are words expressive only of relation, and relations are not existing parts of objects, or things, to be added to objects, or taken from them. There is no right nor wrong, virtue nor vice, merit nor demerit, existing independently of the agents who are virtuous or vicious; and, in like manner, if there had been no moral emotions to arise

on the contemplation of certain actions, there would have been no virtue, vice, merit, or demerit, which express only relations to these emotions. But though there be no right nor wrong in an agent, the virtuous agent is not the same as the vicious agent,—I do not say merely to those whom he benefits or injures, but to the most remote individual who contemplates that intentional production of benefit or injury. All are affected, on the contemplation of these, with different emotions; and it is only by the difference of these moral emotions that these actions are recognised as morally different. We feel that it will be impossible, while the constitution of nature remains as it is,—and we may say, even from the traces of the divine benevolence which the universe displays, impossible, while God himself, the framer of our constitution, and adapter of it to purposes of happiness, exists,—that the lover and intentional producer of misery, as misery, should ever be viewed with tender esteem; or that he whose only ambition has been to diffuse happiness more widely than it could have flowed without his aid, should be regarded with the detestation, on that account, which we now feel for the murderer of a single helpless individual, or for the oppressor of as many sufferers as a nation can contain in its whole wide orb of calamity; and a distinction which is to exist while God himself exists, or at least which has been, and as we cannot but believe will be, coeval with the race of man, cannot surely be regarded as very precarious. It is not to moral distinctions only that this objection, if it had any force, would be applicable. Equality, proportion, it might be said, in like manner, signify nothing in the objects themselves to which they are applied, more than vice or virtue. They are as truly mere relations, as the relations of morality. Though the three sides of a right angled triangle exist in the triangle itself, and constitute it what it is, what we term the properties of such a triangle do not exist in it, but are results of a peculiar capacity of the comparing mind. It is man, or some thinking being like man, whose comparison gives birth to the very feeling that is termed by us a discovery of the equality of the squares of one of the sides to the squares of the other two; that is to say,—for the discovery of this truth is nothing more,—it is man who, contemplating such a triangle, is impressed with this relation, and who feels afterwards that it would be impossible for him to contemplate it without such an impression. If this feeling of the relation never had arisen, and never were to arise in any mind, though the squares themselves might still exist as separate figures, their equality would be nothing,—exactly as justice and injustice would be nothing, where no rela-

tion of moral emotion had ever been felt; for equality, like justice, is a relation, not a thing; and, if strictly analyzed, exists only, and can exist only, in the mind, which, on the contemplation of certain objects, is impressed with certain feelings of relation;—in the same manner as right and wrong, virtue, vice, relate to emotions excited in some mind that has contemplated certain actions,—without whose contemplations of the actions, it will readily be confessed, there could be no right nor wrong, virtue nor vice, as there could be no other relation without a mind that contemplates the objects said to be related. Certain geometrical figures cannot be contemplated by us without exciting certain feelings of the contemplating mind,—which are notions of equality or proportion. Is it necessary that the equality should be itself something existing in the separate figures themselves, without reference to any mind that contemplates them, before we put any confidence in geometry? Or is it not enough that every mind which does contemplate them together, is impressed with that particular feeling, in consequence of which they are ranked as equal? And, if it be not necessary, in the case of a science which we regard as the surest of all sciences, that the proportions of figures should be any thing inherent in the figures, why should it be required, before we put confidence in morality, that right and wrong should be something existing in the individual agents? It is not easy, indeed, to understand what is meant by such an inherence as is required in this postulate; or what other relations actions can be supposed to have as right or wrong, than to the minds which are impressed by them with certain feelings. Of this, at least, we may be sure, that, if any doubt can truly exist as to relations which we and all mankind have felt, since the creation of the very race of man,—because, though, with our present constitution, we feel it impossible to consider cruelty as amiable, and greater cruelty as more amiable, we might, if the frame of our mind were altered, love the ferocity which we now detest, and fly from freedom and general benevolence, to take shelter in some more delightful waste, where there might be the least possible desire of good, and the least possible enjoyment of it, among plunderers whom we loved much, and murderers whom we loved and honoured more—if any doubt of this kind could truly be felt, the reference which Dr. Price would make, of our moral sentiments to reason, would leave the difficulty and the doubt exactly where they were before; since reason is but a principle of our mental frame, like the principle which is the source of moral emotion, and has no peculiar claim to remain unaltered in the supposed general alteration of our mental constitu-

tion. What we term reason, is only a brief expression of a number of separate feelings of relation, of which the mind might or might not have been formed to be susceptible. If the mind of man remain as it is, our moral feelings, in relation to their particular objects, are as stable as our feelings of any other class; and if the mind of man be altered in all its functions, it is absurd for us to make distinctions of classes of feelings in the general dissolution of every thing which we at present know,—absurd even to guess at the nature of a state which arises from a change that is imaginary only, and that by our very supposition is to render us essentially different in every respect from the state with which we are at present acquainted.

It is a very powerless scepticism, indeed, which begins by supposing a total change of our nature. We might, perhaps, have been formed to admire only the cruel, and to hate only the benevolent; as in spite of an axiom, that now seems to us self-evident, we might all have been formed to think with the lunatic, that the cell in which he is confined is larger than the whole earth, of which it is a part. What the mind of a single madman is, the minds of all men might certainly be; and we might no longer feel the same moral relations, as we might no longer feel the same geometrical relations of space. But if the moral distinctions be as regular as the whole system of laws which carry on in unbroken harmony the motions of the universe, this regularity is sufficient for us while we exist on earth; and when we leave this earth, we carry with us a conscience which can have little fear, that the virtues which Heaven has made it so delightful for us to practise below, and which have been the chief instruments of producing a happiness which, when the universe was formed with such innumerable adaptations to the enjoyment of all who live, was surely not foreign to the intention of its Author, will, in that immortality, which is only a prolongation of this mortal life, be regarded with abhorrence by that great Being, whose perfections, however faintly, we have endeavoured to image, and who has here been so lavish to us of a love as constant in its approbation of moral good as the moral excellence which it has made happy.

We have now, then, examined very fully the great question, as to the distinctions which we find man everywhere to have made of actions, as morally right or wrong; and I trust, for the sake of your happiness in life at least, as much as for the accuracy of your philosophy, that you are not inclined to withhold your logical assent from the doctrine of the moral distinction of vice and virtue; a doctrine which seems to me to have every character of truth as a faithful picture

of the phenomena of the mind, and which it would therefore be as erroneous as it would be miserable to deny.

Certain actions then excite, when considered by us, certain emotions of moral regard. But what are those actions, and how are they to be arranged?

In this inquiry, which involves the whole doctrine of practical ethics, philosophers have been very generally misled by that spirit of excessive simplification, of which, in the course of the various discussions that have occupied us together, we have had occasion to remark many striking instances, and in part, too, by the influence of another error, which also we have had frequent occasion of remarking, the error of considering mere abstractions as realities.

In considering the emotion, or rather the various emotions excited by the various objects which are termed beautiful, we observed the constant tendency of inquirers into these interesting phenomena, to suppose that there is one universal Beauty, which is diffused in all the objects that are termed beautiful, and forms, as it were, a constituent part of themselves.

One Beauty of the world entire,
The universal Venus,—far beyond
The keenest effort of created eyes,
And their most wide horizon,—dwells enthroned
In ancient silence. At her footstool stands
An altar burning with eternal fire,
Unallied, unconsumed. Here, every hour,
Here, every moment, in their turns arrive
Her offspring;—an innumerable band
Of sisters, comely all, but differing far
In age, in stature, and expressive mien,
More than bright Helen from her new-born babe.
To this maternal shrine, in turns they come
Each with her sacred lamp; that, from the source
Of living flame, which here immortal flows,
Their portions of its lustre they may draw
For days, for months, for years, for *ages* some,
As their great Parent's discipline requires.
Then to their several mansions they depart,
In stars, in planets, through the unknown shores
Of yon ethereal ocean. Who can tell,
Even on the surface of this rolling earth,
How many make abode? The fields, the groves,
The winding rivers, and the azure main,
Are rendered solemn by their frequent feet,
Their rites sublime. There each her destin'd home
Informs with that pure radiance from the skies
Brought down, and shines throughout her little sphere
Exulting.*

This universal Venus, from the undecaying flame of whose altar has been derived whatever warms us with delight, in the myriads of myriads of objects that are lovely in nature, is indeed one of the most magnificent personifications of poetry. But philosophy has in truth been as fond of this personification as poetry itself, and is for ever seeking in objects that are beautiful the charm of this universal Beauty. It has been not less fond of personification in its ethical inquiries, and has for ever been employed in the search of one universal Virtue,—of something that is capable of existing, as it were,

* Pleasures of Imagination, book I.

in various forms, and that may be supposed to form a part of all the actions which are denominated virtuous. There is no virtue, however, as I have already repeatedly said; there are only virtuous actions; or, to speak still more correctly, only virtuous agents: and it is not one virtuous agent only, or any number of virtuous agents, acting in one uniform manner, that excite our moral emotion of regard; but agents acting in many different ways—in ways that are not less different in themselves, on account of the real or supposed simplicity of the generalizations and classifications which we may have made.

By some, all virtue has been said to consist in benevolence; as if temperance, patience, fortitude, all the heroic exercises of self-command, in adversity and every species of suffering, were not regarded by us with moral love, till we had previously discovered in the heroic sufferer some benevolent desire, which led him thus to endure without a single murmur, or rather, in all the circumstances of the case, with choice, an amount of physical evil, from which others would have shrunk with cowardly feebleness. By another sect of philosophers, the virtues of self-command have been exalted even above the gentler virtues of benevolence. By others, the calm exercise of justice has been said to involve all moral excellence; and almost every ethical writer has had some favourite virtue, to which he has built his altar, and ascribed to it a sort of omnipresence in all the other virtues that are adored; and that, but for the presence of this, as the inherent divinity, would have been objects of a worship that was idolatrous.

From this very circumstance, indeed, of the different favourite virtues of different philosophers, some sophistical writers have endeavoured to draw conclusions subversive of the very distinctions of virtue and vice. They forget that even those who form their little exclusive systems, are still thus exclusive in their systems only; that in their hearts they feel the same regard for every virtue as if they had never entered into ethical controversy, and that the assertors of benevolence, as all which constitutes moral worth, did not, on that account, deny a moral difference of patience and impatience; they only laboured to prove, though they might not be very successful in their demonstration, that to be patient was but a form of being benevolent, and was valued by us for nothing more than the benevolence which it implied.

Of these too narrow systems it would be useless however to enter into any examination at present. Their error will be best seen by considering the virtues which they would exclude. The classification of these virtues, that may be regarded as the most

convenient, is that which considers them as duties, in their relation to different individuals; and, in the first place, as the most comprehensive of all classification,—the arrangement of them as duties which relate primarily to others, and duties which relate directly to ourselves.

LECTURE LXXXIII.

DIVISION OF THE PRACTICAL VIRTUES INTO THREE CLASSES—DUTIES THAT RELATE PRIMARILY TO OTHERS—DUTIES THAT RELATE DIRECTLY TO OURSELVES—AND DUTIES TO GOD.

GENTLEMEN,—after the discussions in which we have been of late engaged, of the theory of morals, we are now to enter on the consideration of those practical duties of which we have been investigating the source. Man is not formed to know only; he is formed still more to avail himself of his knowledge, by acting in conformity with it. In the society in which he is placed, he is surrounded with a multitude, to almost every one of whom some effort of his may be beneficial; who, if they do not require the aid of his strenuous and long-continued exertions, which are necessary only on rare occasions, require, at least in the social intercourse of life, those little services of easy courtesy, which are not to be estimated as slight, from the seeming insignificance of each separate act; since they contribute largely to the amount of general happiness by the universality of their diffusion, and the frequency of the repetition. While his actions may thus have almost unremitting usefulness, Nature has, with a corresponding provision, made it delightful to man to be active; and, not content with making it delightful to him to be merely active,—since this propensity to action, which of itself might lead him sometimes to benefit others, might of itself also lead him to injure as well as to benefit,—she has, as we have seen, directed him how to act, by that voice of conscience which she has placed within his breast; and given still greater efficacy to that voice by the pain which she has attached to disobedience, and the pleasure that is felt in obeying it, and remembering it as obeyed. Of this moral pleasure it is, indeed, the high character, that it is the only pleasure which no situation can preclude; since it is beyond the reach of all those external aggressions and chances which can lessen only the power of diffusing happiness, not the wish of diffusing it; and which, even in robbing the virtuous of every thing beside, must still leave with them the good which they have done, and the good which they would wish to do.

Human life, then, when it is such, as not impartial spectators only, but the individual himself can survey with pleasure, is the exercise, and almost the unremitting exercise, of duties. To have discharged these best, is to have lived best. It is truly to have lived the most nobly, though there may have been no vanities of wealth in the simple home, which was great only because it contained a great inhabitant; and no vanities of heraldry on the simple tomb, under the rude stone of which, or under the turf which is unmarked by any memorial, or by any ornament but the herbage and the flowers which nature everywhere sheds, the ashes of a great man repose. What mere symbols of honour, indeed, which man can confer, could add to the praise of him who possesses internally all which those symbols, even when they are not falsely representative of a merit that does not exist, can only picture to the gazer's eye, to the praise of him who has done every thing which it was right for him to do; who has abstained, in his very desires, from every thing which it would have required a sacrifice of virtue to possess; and who, in suffering the common ills of our nature, has suffered them as common ills, not repining at affliction, nor proud of enduring it without a murmur, but feeling only that it is a part of a great system which is good, and that it is that which it is easy to bear?

Human life, then, when it is worthy of the name of life, is, as I have said, the exercise of duties.

In treating of our practical virtues, I shall consider, first, those which directly relate to our fellow-creatures, and afterwards those which immediately relate to ourselves. Besides these two classes of duties, indeed, there are others of a still higher kind—the duties which we owe to the great Being who formed us; duties which, though they do not absolutely produce all the others, at least add to them a force of obligation, which more than doubles their own moral urgency; and with the wilful violation or neglect of which, there can be as little moral excellence of character in the observance of other duties, as there would be in the virtue of any one who, after boasting of a thousand good deeds, should conclude by confessing, that he had never felt the slightest affection for the parent to whom he owed existence, and wisdom, and worldly honour, or for some generous benefactor who had been to him like a parent. These duties of gratitude and reverence which we owe to God, will admit, however, of more appropriate illustration, after the inquiries on which we are to enter in another part of the course, with respect to the traces of the divine perfections, that are revealed to us in the frame and order of the universe.

At present, then, the practical virtues which we have to consider, are those that relate immediately only to our fellow-creatures and ourselves.

Of these two great classes of duties, let us consider, in the first place, the duties that primarily relate to others.

Of the living multitude in the midst of which we are placed on this earth, which is our common home, by far the greater number have no other relation to us than simply as they are human beings; who may, indeed, sometimes come within the sphere of our usefulness, and who, even when they are far beyond this sphere of active aid, are still within the range of our benevolent affection, to which there are no limits even in distance the most remote, but to whom this benevolence of mere wishes is the only duty which, in such circumstances, is consigned to us. There are others, with whom we feel ourselves connected by peculiar ties, and to whom, therefore, we owe peculiar duties, varying in kind and importance with the nature of the circumstances that connect us with them. The general duties which we owe to all mankind may be treated first, before we enter on the consideration of the peculiar duties which we owe to certain individuals only of this wide community.

The general offices which we owe to every individual of mankind, may be reduced to two great generic duties—one negative, the other positive; one leading us to abstain from all intentional injury of others, the other leading us to be actively beneficial to them. With the former of these, at least with the greater number of the specific duties which it generically comprehends, justice is very nearly synonymous; with the other set of specific duties, benevolence; which, though it may, in truth, be made to comprehend the negative duties also, since, to wish to benefit, is at the same time to wish not to injure, is usually confined to the desire of positive increase of good, without including mere abstinence from injury.

I proceed, then, to the consideration of the former set of duties, which are negative only,—as limited to abstinence from every thing which might be injurious to others.

These duties, of course, are specifically as various as the different sorts of injury which it is in our power to occasion, directly or indirectly. Such injuries, if man were wicked enough, and fearless enough both of individual resentment and of the law, to do whatever it is in his power to do, would, in their possible complication and variety, be almost beyond our power of numbering them, and giving them names. The most important, however, if arranged according to the objects which it is the direct immediate inten-

tion of the injurer, at the moment of his injury, to assail, may be considered as reducible to the following general heads: They are injuries which affect the sufferer directly in his person—in his property—in the affections of others—in his character—in his knowledge or belief—in his virtue—in his tranquillity. They are injuries, I repeat, which are intended to affect the sufferer directly in his person—in his property—in the affections of others—in his character, &c.

Let us now then proceed to the consideration of these subdivisions of our merely negative duty, in the order in which I have now stated them. Of injuries to the person of another, the most atrocious, I need not say, is that which deprives him of life; and as it is the only evil which is absolutely irreparable by us, and is yet one to which many of our most impetuous passions might lead us, jealousy, envy, revenge, or even sudden wrath itself, without taking into account those instances of violence in which murder is only the dreadful mean of accomplishing a sordid end; the Creator and Preserver of man has provided against the frequency of a crime to which there might seem so many fearful inducements and facilities, by rendering the contemplation of it something, from which even the most abandoned shrink with a loathing, which is, perhaps, the only human feeling which still remains in their heart; and the commission of it a source of a wilder agony of horror than can be borne, even by the gloomy heart which was capable of conceiving the crime. "*Homo homini res sacra.*" When we read or hear of the assassin, who is driven by the anguish of his own conscience to reveal to those whom most he dreaded, the secret which he was most anxious to hide, addressing himself to the guardians, not of the mere laws, which he has offended, (for of the laws of man he does not think, except that he may submit himself to that death which they only can award,) but to the guardians of the life and happiness of those whose interests have been assigned to them, the guardians of the individual whom their protection at that moment, which is ever before his memory, was too powerless to save; when we think of the number of years that in many instances of this kind have elapsed since the mortal blow was given; and of the inefficacy of time, which effaces all other sorrows, to lessen that remorse which no one suspected to be the cause of the wasting of the cheek, and the gloomy melancholy of the eye, can we fail to regard a spectacle like this, as an awful testimony to the goodness of that Almighty Protector of the world, who proportions the internal restraints of conscience to the iniquity that needs to be restrained, and to the amount of evil which would flow

from it, if unrestrained, and who, seeming to leave the life of every individual at the mercy of every arm, has secured for it a defence in the very bosom of him whose watchful glance had already marked its victim, and whose hand was already almost raised to give the blow? The reign of superstition, its wide and general reign, is now over, at least in our land. We do not need to have recourse to volumes of philosophy to convince us that the ghost which haunts the murderer, is but an image of his own fancy. This, now, the very children will tell us, while they laugh not so gaily, perhaps, as at other tales, but still with a laughter which, though mixed with some little horror, is sincere, at the spectres which their predecessors in the same nursery, a single generation back, would, on hearing the same story, have seen before their eyes for more than half the night. There is no fear then now that we should be tempted to suppose any peculiar supernatural visitation, in the shape that seems for ever rising to the eye of the murderer. It is to the influence of his strong conception alone that all will agree in ascribing it; and if it be, as it most certainly is, the result only of conception that is awfully vivid, how strongly does it mark the horror, so far surpassing the horror of every other offence which must have given to the imagination this agonizing sensibility. The robber may plunder, the traitor may betray, without any moral superstition of this sort; but let one human being give his last gasp beneath the dagger of another human being, and though superstition had before been banished from the earth, there is at least one individual to whom this single crime would be sufficient to call it back.

The species of injury which I have placed next in order, is that which relates to the property of others.

Were we to consider for the first time the unequal distribution of property in society, without reflecting on the amount of general happiness to which that unequal distribution is subservient, we should scarcely know, in our astonishment at the seeming rapacity of the few and the acquiescence of the many, whether the boldness of such an usurpation, at least of that which on such a first unreflecting view would seem usurpation, or the strange submission by all the plundered, to an usurpation which they might have prevented, were the more wonderful. It would not be easy to represent this first aspect of society in a more lively manner than has been done by Paley.

"If you should see a flock of pigeons in a field of corn; and if (instead of each picking where and what it liked, taking just as much as it wanted, and no more,) you should see ninety-nine of them gathering all they got into a heap; reserving nothing for themselves

but the chaff and the refuse ; keeping this heap for one, and that the weakest, perhaps worst pigeon of the flock ; sitting round, and looking on all the winter, whilst this one was devouring, throwing about, and wasting it ; and if a pigeon, more hardy or hungry than the rest, touched a grain of the hoard, all the others instantly flying upon it, and tearing it to pieces : if you should see this, you would see nothing more than what is every day practised and established among men. Among men, you see the ninety-and-nine toiling and scraping together a heap of superfluities for one, (and this one, too, oftentimes the feeblest and worst of the whole set, a child, a woman, a madman, or a fool ;) getting nothing for themselves all the while, but a little of the coarsest of the provision, which their own industry produces ; looking quietly on, while they see the fruits of all their labour spent or spoiled ; and if one of the number take or touch a particle of the hoard, the others joining against him, and hanging him for the theft.”*

“ There must, indeed, as this author adds, be “ some very important advantages to account for an institution which, in this view of it, is so paradoxical and unnatural,” and such advantages it is very easy to discover. The gross inequality of property, strange as it may seem to be at any one moment, is, it is evident, only the effect of that security and absolute command of property, which allow the continual accumulation of it by continued industry ; and without such security, and absolute command of the profits of exertion, the arm of the strong would soon have been weary of the little toil which was necessary for mere subsistence ; and the ingenuity of the wise would have contented itself with enjoying, rather than augmenting, its scanty but precarious acquisitions. If all things had been common to all, that common all would truly have been of little worth to the individuals, who would have seen nothing appropriated, indeed, but nothing enjoyed. Instead of that beautiful and populous earth which we behold,—where cities pour wealth on the fields, and the fields, in their turn, send plenty to the cities,—where all are conferring aid and receiving aid, and the most sensual and selfish cannot consume a single luxury, without giving however unintentionally, some comfort, or the means of comfort, to others,—instead of this noble dwelling-place of so many noble inhabitants, we should have had a waste or a wilderness, and a few miserable stragglers, half famished on that wide soil which now gives abundance to millions. Nor would the loss of mere external convenience and splendour have been the chief evil. The intellectual sciences, and

arts, and systems of moral polity, which distinguish the civilized from the savage, by differences far more important than any which the eye can perceive, never would have arisen on such a scene. It was property, that very exclusive property, which is now better secured by the civilization to which it gave rise, that was itself, at a still earlier period, the great civilizer of man.

If, indeed, in considering these comforts of society, which flow from the distribution of property, that could not be secure without becoming soon unequal, we considered only the comfort of the few who possess the greater share, the happiness of the few might seem, and, it will be allowed, would truly be comparatively, an object of too little value, to be set against any great loss of comfort on the part of the multitude. But it requires only a very slight reflection on the circumstances of society, as it is at present before us, to discover, that, even if the few have gained more, the many have gained much ; and perhaps to a very nice observer and estimator of the situation of both,—of the enjoyment that is involved in mere occupation, and of the misery that is involved in the total want of it,—it might seem necessary to reverse the scale, and to ascribe the greater gain to the many rather than to the few. They profit by the results of every science and art, which they enable the studious, whom they support, to prosecute at their leisure ; the speculations of the sage, whom they perhaps count idle,—speculations that teach new processes, mechanical or chemical, to the innumerable busy hands that are every moment producing, almost blindly, the beautiful results, of which they know little more than that they are of their own producing,—may be found at last embodied, as it were, in some humble implement or humble luxury, in the obscure cottage ; and even the wretch who, in the common prison, earns a part of his subsistence by the meanest operations to which, in the division of manufacturing labour, the human hand can be put, has accommodations which, miserable as they are, compared with the luxuries of the rich and the free, are yet themselves luxuries, compared with the far more miserable accommodations which, if there never had been any inequality of property among mankind, would, in that system of sloth, and consequent imbecility, have been the common lot of all. This influence of wealth and of the division of labour in the enjoyments of the lowest of the people, is very strongly pictured by Dr. Mandeville in one of the most striking passages of his work.

“ A man would be laughed at, that should discover luxury in the plain dress of a poor creature that walks along in a thick parish gown and a coarse shirt underneath it ; and yet what a number of people, how many dif-

* Paley's Moral Philosophy, 21st edit. 8vo, vol. i. p. 106.

ferent trades, and what a variety of skill and tools, must be employed to have the most ordinary Yorkshire cloth. What depth of thought and ingenuity, what toil and labour, and what length of time must it have cost, before a man could learn from a seed to raise and prepare so useful a product as linen. Must that society not be vainly curious, among whom this admirable commodity, after it is made, shall not be thought fit to be used, even by the poorest of all, before it is brought to a perfect whiteness; which is not to be procured but by the assistance of all the elements, joined to a world of industry and patience? I have not done yet: Can we reflect, not only on the cost laid out upon this luxurious invention, but likewise on the little time the whiteness of it continues, in which part of its beauty consists; that every six or seven days at farthest it wants cleaning, and while it lasts, is a continual charge to the wearer; can we, I say, reflect on all this, and not think it an extravagant piece of nicety, that even those who receive alms of the parish, should not only have whole garments made of this operose manufacture, but likewise that, as soon as they are soiled, to restore them to their pristine purity, they should make use of one of the most judicious as well as difficult compositions that chemistry can boast of; with which, dissolved in water by the help of fire, the most detersive and yet innocent lixivium is prepared, that human industry has hitherto been able to invent?*

The feeling of a breach of duty in the violation of the property of another, though uniformly attendant on the notion of property, requires, of course, this notion as antecedent to the moral feeling; and property is, in a great measure, the creature of the public law, not because our moral feelings are arbitrary results of the arbitrary institutions of man, but because, as soon as we are acquainted with the nature of social ordinances, and the advantages to which they give rise, these ordinances become themselves an object of that moral regard, the susceptibility of which, as an essential principle of the mind, preceded all law, and transfer this regard which themselves excite to forms of succession and transfer, which might otherwise have been arbitrary and indifferent. It is not in such cases, however, the social ordinance which is loved merely as an ordinance, but the good to which it is perceived that such ordinances, upon the whole, tend to give rise; and this obedience to that which is an evident source of good upon the whole, and which, in the particular case of property, is obviously productive of the greatest good, as a standard to which, in cases of doubtful right, all might

be obliged to bend, and peace be thus preserved, when otherwise there could not fail to be hostility, is the circumstance that has extended to artificial arrangements of property, those moral emotions which originally had a narrower field, but which still have the same great object as before, when they embrace the widest plans of legislative wisdom.

The writers who attempt to prove justice to be a virtue wholly adventitious, and not the result of any original moral tendency of our nature, because in different stages or circumstances of society there are different views of property, forget that justice, as a moral virtue, is not the creation of property, but the conformity of our actions to those views; that though all men in every part of the earth, and in every age since the earth was peopled, had, without even the exception of a single monstrous individual, united in their notions of what is termed property, there might still have been the most complete injustice,—a desire of invading this property, not merely as frequent as in the present circumstances of mankind, but equally universal with the notion of property itself. There might then, the mere notion of property remaining in every respect precisely the same, have been either perfect justice or perfect injustice, or such a mixture of both as the present order of society presents. It is justice not to invade that which is recognised as belonging to another; and though law cannot produce justice, it may present to it new objects, by the standard which it fixes of transfers and successions, that otherwise might have been arbitrary; and may present these new objects to our justice, without any breach of moral principle; since, though law, as mere law, or the expression of the will of many individuals, can never be felt by us to be morally obligatory on this account alone, obedience to a system of laws, of which the evident tendency is to the public good, is itself an object of our moral regard, as soon as we are capable of knowing what law is, and what are its general beneficial tendencies. In the different rights of property, then, in different nations and ages, as variously sanctioned in various systems of jurisprudence, I perceive no inconsistency of the moral principle. I perceive everywhere, on the contrary, a moral principle which, among the rude and the civilized, and in all the innumerable gradations of civilized life, and of systems of law more or less sage and refined, feels that there are certain things which it would be wrong to invade; in savage life, perhaps only the objects which are in the immediate occupation of another, or on which he has exercised his labour for purposes of utility to himself; in more civilized society, innumerable objects which the circumstances of that society have rendered essential to the

* Fable of the Bees, vol. i. p. 182. Lond. 1728.

comfort of their possessor, and which law, with a view to the preservation and furtherance of general happiness, has allotted in various ways. Till it can be shown, therefore, that this regard for social ordinances that are manifestly, upon the whole, productive of good, and consequently the regard for that good of which they are productive, are inconsistent with the moral principle, of which the great object is that very good; the sophist, who would represent the varying rights of property as proofs of a varying morality, has no argument in showing the mere influence of such ordinances, that teach us to respect what otherwise might have been indifferent. It is the same moral principle of justice still, though directed to new objects; as it is still the same power of vision that traces the stars of the firmament, though, but for the nice contrivances of the optician, and the labours of all the ruder artificers who have furnished him with the materials of his beautiful art, eye after eye might for ages have gazed upon the great vault above, without knowing the very existence of brilliant multitudes of worlds, which, with the aid of this skilful but simple contrivance, it is now impossible for the rudest observer not to perceive. Who is there that, on this account, will deny to the mind its original visual sensibility? That mental sensibility is the same, the bodily organ of sight is the same; yet how different in power and extent is our vision itself! at least as different as the wider and narrower influence of justice that respects in one state of society a thousand objects which are unknown to it in a state of ruder polity.

In contending for essential principles of morals, no one asserts that, in circumstances which are absolutely different, the moral sentiment should be the same; more than that an eye, with and without a telescope, should form the same views of the nature that is before it. In savage life, the notions of property are few, because there are, in truth, in such a state, few objects that can be useful to the individual. It is luxury, which, creating new objects and new wants, creates also new objects to be appropriated. It is probable, if we are to suppose man ever to have been absolutely savage, without the exercise of a single art, that mere occupancy was then the only title. Indeed, what other title to the common gifts of nature could there in such circumstances be? When his labour, however, had been employed in rendering useful what in itself had no use, he would not merely feel the work of his art to be his own; but the work would be respected as his by those who knew the labour which he had employed, and the purposes of personal advantage to which it was meant to be instrumental; or at least, if in such circumstances of temptation it were an object

of rapine to others, there would still, unless in circumstances of mutual enmity, be a feeling of conscious wrong in the aggressor. This species of property we accordingly find recognised wherever man is to be found; and is it wonderful that other species of property, which could not even be conceived in savage life, however useful in the circumstances of refined society, should not be regarded as sacred by those to whom the possession of it would seem to confer no utility on the possessor; who would rather have the trouble of excluding others, than the pleasure of enjoying that from which he excluded them?

The mere history of property, then, interesting as it is in the illustrations which it affords of many beautiful phenomena of our moral nature, and of the advantages which man receives from the social government, to the force of which his own individual power has contributed as an element, like the other elements that mingle with it, is yet valuable only as illustrative. The moral principle which, in the various stages of society, in all the varieties of property which social ordinances have made or secured, impresses on us the duty of respecting the various objects which are property, that is to say, which are objects that, in these particular circumstances of society, could not be violated without a feeling of self-reproach in the invader, is all which, ethically, we have to consider. That such a feeling does arise in the breast of him who invades what, in the general circumstances of the society, is regarded as property, even the sophist who would found so much on the varying circumstances in which it arises does not dispute; and it is this feeling, in whatever circumstances, and in whatever manner it may have arisen, from which the duty flows. Whether the object be of a kind which, even in the fabled state of nature, we should have felt it right to respect, as the property of him who had won and occupied it with his own unwearied labour, or of a kind which we respect as property, because we respect that social good which arises from the laws that have declared it to be property, it is not wonderful that our feeling of respect for it should seem, in these two cases, to be the same; since the respect is only that feeling of moral duty, the object of which, that is always some form of good to others, is in both cases truly the same.

Justice, then, I repeat, and the distinction is one which is of great importance, is not what constitutes property; it is that virtue which presupposes property, and respects it; however constituted. It may vary, therefore, with all the ordinances of different social states, but it is still the same virtue, if it respect what, in those different states, is legally assigned to individuals; and, as the same virtue, in all these cases, directed to the same

object of abstaining from what is previously affirmed or recognised as property, it does not vary in the variations of human policy, that may assign to individuals in one state, what, from different views of general good, would not be assigned to them in a different state; but which still, in every case, points out to justice what is to be understood as the property which that unvarying virtue does not fail to respect.

To point out to you the advantages which flow from the general observance of this duty, that leads us to abstain from the property of others, however much it might seem capable of contributing to our own gratification, would surely be a superfluous labour. Indeed, in picturing to you the advantages which flow from the very inequality of property itself, I have sufficiently exhibited to you the benefit of the principle which respects property, and of the duty which consists in our conformity to this principle; a duty, without which, indeed, the mere acknowledgment of the various things possessed, as things of which the possession ought not to be violated, would be of no avail. The general feelings of mankind, with respect to the importance of this duty, are indeed sufficiently shown in the laws which they have established for punishing the breach of it. Even under our own excellent legal system, in which death is appointed to him who premeditates and executes the death of another, it is appointed also to him who has assailed the property only, not the person; and politically and morally erroneous as this equal allotment of punishment to offences so unequal most truly is, it still marks sufficiently the general feeling of the evil which would arise to society from the frequent violation of this simple duty, that such an allotment of punishment should still continue in such a nation, and in such an age.

When we consider the multitude who are in possession of means of enjoyment, that are to them the means only of selfish avarice or of profligate waste; in both cases, perhaps, productive rather of evil than of good to the individual possessor; and when, at the same time, we consider the multitudes, far more numerous, to whom a small share of that cumbrous and seemingly unprofitable wealth would, in an instant, diffuse a comfort that would make the heart of the indigent gay in his miserable hovel, and be like a beam of health itself to that pale cheek which is slowly wasting on its wretched bed of straw, in cold and darkness, and a famine that is scarcely felt, only because appetite itself is quenched by disease; it might almost seem to the inconsiderate, at least for a moment, in contemplating such a scene, that no expression of the social voice could be so beneficial as that which should merely say, Let there be no restraint of property, but let

all the means of provision for the wants of mankind be distributed according to the more or less imperious necessity of those wants which all partake. It requires only the consideration of a moment, however, to perceive that this very distribution would itself be the most injurious boon that could be offered to indigence; that soon, under such a system of supposed freedom from the usurpations of the wealthy, instead of the wealth which supports, and the industry which is supported, the bounty which relieves, and the penury that is relieved, there would only be one general penury, without the possibility of relief; and an industry that would be exercised, not in plundering the wealthy, for there could not then be wealth to admit of plunder, but in snatching from the weaker some scanty morsel of a wretched aliment that would scarcely be sufficient to repay the labour of the struggle to him who was too powerful not to prevail. The vices that would tyrannize uncontrolled in such an iron age I do not attempt to picture. I speak only of the mere physical wants of man, and of the means which different states of society afford for the gratification of those wants according as possession is more or less secured, though no other original difference were supposed, than of the simple right of property. There would be no palaces, indeed, in such a system of equal rapine, and this might be considered as but a slight evil, from the small number of those who were stripped of them; but when the chambers of state had disappeared, where would be the cottage, or rather the whole hamlet of cottages that might be expected to occupy its place? The simple dwellings of a happy peasantry might be the last, indeed, to be invaded; but when the magnificent mansion had been stripped by the first band of plunderers, these, too, would soon find plunderers as rapacious. No elegant art could be exercised, no science cultivated, where the search of a precarious subsistence for the day would afford us no leisure for studies or exercises beyond the supply of mere animal wants; and man, who, with property, is what we now behold him, and is to be, in his glorious progress even on earth, a being far nobler than we are capable, in our present circumstances, of divining, would, without property, soon become, in the lowest depth of brutal ignorance and wretchedness, what it is almost as difficult for our imagination to picture to us, as it would be for it to picture what he may become on earth, after the many long ages of progressive improvement. Such is the state to which we should be reduced, if all men were to do what the robber individually does. He contributes whatever a single heart and a single arm can contribute, to make of the social and happy world around us, that un-

social and miserable world which we vainly labour to conceive. His crime is not perpetrated against an individual only, but against the very union that binds society together; and the abhorrence with which his crime is considered, is not the mere wrath that is felt by the aggrieved individual, it is the sympathizing resentment of all mankind.

LECTURE LXXXIV.

OF OUR NEGATIVE DUTIES TO OTHERS—ABSTAINING FROM ROBBING THEM OF THE AFFECTIONS OF OTHERS—OF ABSTAINING FROM INJURING THE CHARACTER OF OTHERS—OF VERACITY.

GENTLEMEN,—in treating of the general duties which we owe to all mankind, I considered these, in my last Lecture, as of two classes, negative and positive; the one set leading us to abstain from injuring others, the other set leading us to be actively useful to them.

An individual, it is evident, may be injured by us in various ways, with which, of course, in the obligation to abstain from the different forms of injury, there is a co-extensive variety of duty. He may be injured directly in his person, in his property, in those affections of others which are almost a species of property, in his character, in his knowledge or belief, in his virtue, in his tranquillity.

Of these various modes of injury we have considered two. I proceed then, now, to the third in order, the injury which we may do to any one, by robbing him of the affections of those whose love may, perhaps, be to him the most precious of his possessions.

Affection, I have said, may be considered almost as a form of wealth possessed; and the most delightful affection which can be given to us, is truly, if I may apply the cold terms of merchandise to the pure commerce of the heart, a species of property for which the price of similar affection has been paid, and to which the laws of wedlock have given a legal and holy title. It is to the robbery of conjugal affection, therefore, as the most important, that I shall confine the few remarks which I have to offer on this species of injury.

If the guilt of the robber were to be estimated in proportion to the quantity of evil which he knowingly produces, where is it that our most indignant hatred of the crime should be fixed? Not surely on him whom alone we are accustomed to denominate a robber. The wretch who perishes on the scaffold for his sordid thefts, unpitied, perhaps, by a single individual in the whole crowd of gazers, that mark the last faint convulsion of his limbs, only to wonder when

the quiverings are to cease, may deserve the horrors of that ignominious punishment under which he sinks. But does he truly rank in villany with the robber of another class,—with him who would be astonished, perhaps, to have a place assigned to him among common pilferers, but who is in guilt the basest of them all, however noble he may be in titles, and splendid with all that pomp which can be alike the covering of vice and of virtue? There may pass in some stately carriage, while the crowd are still gazing on the body that hangs lifeless before them, some criminal of far deeper iniquity, whose eye too may turn where all other eyes are fixed, and who may wonder at the increase of crimes; and moralize on their causes, and rejoice at their punishment, while the carriage, in which he reclines and moralizes at his ease, is bearing him to the house of his friend, by a secret appointment with her who is the mistress of it; whom months of incessant falsehoods and treacheries were unable to subdue, but whom, by the influence of some finer simulation, he is at last to carry off, as a noble booty, from the virtue and happiness to which she never is to return.

The common thief, who steals or forces his way into the house at midnight, has never been treated with kindness and confidence by him whose property he invades; and all which he carries off may usually be repaired without very much difficulty, or may perhaps be of a kind which is scarcely of sufficient importance to our convenience to be replaced by the easy efforts that might replace it. But what is to repair the plunder of him whose robbery is of that which exists only within the heart; who steals not the object of regard only, but the very capacity of feeling affection and confidence again, and who, by a single crime, converts, in the eyes of the sufferer, that world of social harmony, which God has made so beautiful, into a world of deceivers and the deceived! of pleasures that are but illusion, and of misery that is reality!

Let us imagine one of those domestic groups, which form, to the lover of happiness, one of the loveliest spectacles with which the earth is embellished—a family, in the small circle of which there is no need of distracting and noisy gaieties without, because there are constant tranquillity and enjoyment within; in which the pleasure of loving is, in the bosom of the wedded pair, a delight that, as blending in one uniform emotion with the pleasure of being loved, is scarcely to be distinguished from that affection which is ever flowing around it,—a delight that grows not weaker but more intense by diffusion to the little frolickers around, who as yet know little more than the affection which they feel, and the affection of which they are the objects, but

who are rising into virtue amid the happiness which virtue sheds. In considering such a scene, would it require any very long and subtle effort of reflection to determine what would be the greatest injury which human malice could devise against it, if it were in the power of malice to execute every atrocity which it might conceive? It would be that very injury which the adulterer perpetrates,—the crime of him who can see all this happiness, and can say in his heart, this happiness shall exist no longer. A time may indeed come, when, if his artifices be successful, this happiness will exist no more; when she, who was once as innocent as she was happy, shall have been consigned to that remorse which is to hurry her, too slowly for her own wishes, to the grave; and when the home which she has deserted shall be a place of wretchedness and desolation; where there is one miserable being who knows his misery, and others who still smile, while they inquire anxiously, with a sort of fearful wonder, for the presence of her whose caresses they no longer enjoy, and are as yet ignorant that a time is to arrive when they are to blush at the very name of her, to whose knee and embrace of fondness they are longing to return.

When Milton describes the leader of the fallen spirits as witnessing, on his entrance into paradise, the happiness of the first pair, he knew well how necessary it was to the poetic interest which he wished us to feel in the character and enterprise even of this audacious rebel, that, in the very prospect of executing his infernal purpose, he should have some reluctance to disturb that beautiful happiness which was before his eyes.

O hell! what do mine eyes with grief behold?
 Into our room of bliss thus high advanc'd
 Creatures of other mould, earth-born perhaps,
 Not spirits, yet to heavenly spirits bright
 Little inferior; whom my thoughts pursue
 With wonder, and could love, so lively shines
 In them divine resemblance, and such grace
 The hand that form'd them on their shape hath pour'd.
 Ah, gentle pair! ye little think how nigh
 Your change approaches, when all these delights
 Will vanish and deliver ye to woe,
 More woe, the more your taste is now of joy.—
 Ill-fenc'd your heaven to keep out such a foe
 As now is enter'd; yet no purpos'd fore
 To you, whom I could pity thus forlorn,
 Though I unpitied: league with you I seek,
 And mutual amity.—Hell shall unfold,
 To entertain you two, her widest gates,
 And send forth all her kings; there will be room,
 Not like these narrow limits, to receive
 Your numerous offspring; if no better place,
 Thank him who puts me, loath, to this revenge
 On you who wrong me not, for him who wrong'd.
 And should I at your harmless innocence
 Melt, as I do, yet public reason just,
 Honour and empire with revenge enlarg'd,
 By conqu'ring this new world, compels me now
 To do what else, though damnd, I should abhor.*

It is similar happiness which the adulterer invades. But he has not the compunc-

tion of the fiend in invading it. He enters into paradise, eager to destroy. He invades it, because it is happiness. In many cases it is his vanity which he seeks to gratify, far more than his sensual appetite. The beauty with which the eye is most attractive to him, is the love with which it is already beaming on another; and if there were less previous conjugal affection to be overcome, and therefore less wretchedness to be produced, by the conquest which he is ambitious of achieving, he would often forbear his seductions, and reserve them for those who may afford to his insatiable wishes of moral desolation a greater harvest of misery.

Such is the adulterer; and of all this mass of wretchedness which he produces, and of all the iniquity which can calmly meditate and plan such wretchedness, what is the palliation which he assigns? It is the violence of his love alone which he pleads. He is not aware what aggravation there is of his guilt, in that which he regards, or professes to regard, as the apology of it. If by love he mean mere sexual appetite, his excuse is of the same kind as that of the common robber, who should think that he had given a moral justification of his rapacity by describing the debaucheries which it enabled him to pursue, and the difficulty which, without his thefts, he should feel in visiting as frequently the tavern and the brothel. And if by the love which is asserted, he meant an affection more worthy of the name, what are we to think of the sincerity of his love, who, to gratify his own lust, is eager to plunge into guilt and wretchedness the very being whom he professes to regard with an interest which should have led him, if sincere, to expose himself to every thing but guilt, to save her from misery like that which he is intentionally preparing for her? To speak of affection, therefore, or of feelings to which he dares to give the name of affection, is on his part to double his crime. It is to confess, that while he is not merely regardless of the happiness of the husband whom he robs, but equally regardless of the happiness of her of whom he robs him, he is as completely and brutally selfish in his love, as he could be in his indifference or his hatred; and that the peace, and honour, and virtue of the being whom he professes to regard as the dearest to him in existence, are therefore as nothing, when he must either sacrifice them, or make a sacrifice, which is far more painful to him, of one of his own desires.

In the present state of manners, in which at least among the higher orders of society, there is so very little of what was once considered as domestic life, and, in the place of its simple unpretending enjoyments, such

* Paradise Lost, book iv. line 358—392.

constant and close succession of almost theatrical exhibitions, on stages on which each is to each mutually spectacle and spectator, to perform gracefully their part is as much an object of ambition to the unpaid actors and actresses, in this voluntary and unremitting drama, as it is to the actors and actresses on another stage, whose livelihood, as well as glory, depends on the number of hands which they can render by their best efforts most noisy in applause. That there is a very powerful charm in elegant manners, and in the lighter eloquence of conversation, which can adapt itself readily to every subject, from the statesmanship of the day to the flower or the feather, I am far from denying, and that, even in a moral view, from the influence which it gives to the opinions of the individual, and the easy happiness which it spreads to all around him, this excellence, frivolous as it may seem, is not to be despised; however humble and comparatively insignificant it must always be rated, when placed in the scale of merit with nobler wisdom, or still nobler excellence of the heart. One great evil of this system of universal display, however, and of the familiar and sprightly levities which it involves, is, that where this gay excellence is of high value, the praise of it must be sought from all. To all alike must be paid those gallantries of manners which all alike are to admire. The wedded and the unwedded may thus be said to live in a constant interchange of symbols of affection, which, though understood to be mere symbols, may yet, as symbols, excite that very affection which they were never seriously intended to awake. Nor is this all. In the eagerness for general admiration, there may be a wish to excite feelings that, without amounting to love, may approach love, in the heart that is already the property of another; an assiduity of attention which, though there may be no thought of leading the way to absolute infidelity, has a great portion of the guilt of adultery itself, and may almost be considered as a minor species of it; since its object is to excite a peculiar admiration, which cannot be felt without some estrangement, or tendency to estrangement, of conjugal regard. In this way, indeed, I have no doubt that more disquietude of domestic happiness has been produced upon the whole, than by adultery itself, and produced in bosoms that would have shrunk indignantly from the solicitations of the adulterer.

The next species of general duty, to which we have to proceed, is that which relates to the character of others.

The extent of the injury which we may occasion to any one, by wounding his reputation, is not to be estimated merely by the advantages which a pure and honourable cha-

acter directly affords. It is necessary to take into account also the value, above even its high intrinsic excellence, which every individual, from the very constitution of our common nature, as explained to you in a former part of the course, when I treated of the desire of fame, is led to attach to it. The conscience of the virtuous is, indeed, in one sense of the word, sufficient to itself. It cannot be unhappy, while afflictions are all from without, and there is no self-reproach within to lay open the bosom to their cruel power; yet, even to the virtuous, the approving voice of those who are moving along with them in their earthly path, is one of the most pleasing accessions which their happiness can receive; and to rob them of this voice, or to convert it into murmurs or whispers of reprehension, is to do all the evil which malice, that cannot rob them of the consciousness of merit itself, is able to effect. The consciousness itself, indeed, is happily not within the power of the calumniator. But, if it were within his power, who can doubt that that power would be gladly exercised; that he who defames, at the risk of detection, would, if the virtues of others were submitted to his will, prevent all peril of this kind, by tearing from the heart every virtue, of which he must now be content with denying the existence, and thus at once consign his victim to ignominy, and rob him of its only consolation? So hateful, indeed, to the wicked, is the very thought of moral excellence, that, if even one of the many slanderers with whom society is filled, had this tremendous power, there might not be a single virtue remaining on the earth.

The evil, however, which calumny can do to those whose virtue is scarcely in need of any support from public approbation, is slight, when compared with the evil which it may produce to those whose weaker virtue is mixed with much imperfection, that affords an easy pretext for censure, even when censure is unmerited; while the loss of the encouraging regard of others is more injurious, when withheld from frailty, than, even when it wishes to do what is worthy of praise, is too ready to fall, without the support to which it clings. The real imperfections of mankind are, therefore, delightful to the heart of the slanderer, who sees in them only a warrant for all those additional charges of guilt or error which it may be his interest to add to the real amount. They are the elements of the poison which he prepares, without which, he would have as little power to cloud the moral scene, as the enchantresses of ancient fable would have had to obscure the sun, or bring down the moon from the sky, without the baleful herbs that were essential to the incantation.

It is our duty, I will not say only to love the good, but even with our indignation

against the wicked, to mix some portion of pity, that pity which would lead us always to wish, that even their names could still be added to the list of the virtuous. If such be our duty then, what are we to think of those, who, far from pitying the wicked, would gladly double all their atrocities, and who, still farther from loving the good, would point them out, as the wicked, to public execration? There is one species of atrocity, indeed, which such malignant industry does not fail to render clear, but it would be well for him who exhibits it, if that guilt were the guilt of others.

"He of whom you delight to speak evil," says a sententious French moralist, "may become acquainted with what you have said, and he will be your enemy; he may remain in ignorance of it, and, even though what you have said were true, you would still have to reproach yourself with the meanness of attacking one who had no opportunity of defending himself. If scandal is to be secret, it is the crime of a coward; if it is to become known, it is the crime of a madman."* The moral dilemma in this argument is, indeed, addressed to one who may be supposed to have still a love of virtue in general, and a detestation of that which it would be cowardly to do; but even those who are insensible to the better motive, may feel at least the force of the selfish one; and if the secret history of the hearts of all the malignant were known, and the feelings also known, with which they are universally regarded,—it would appear, in the estimate of all which is gained and all which is lost, that detraction is truly madness or folly, as much as it is guilt.

But, if the tale which we love to whisper be just, can it be a crime to lament over guilt that is real? It is not a crime to lament over guilt, if we do lament over it. But if we do truly lament over the probable appearances of it, we shall not be very eager to circulate a doubt that may be injurious, till we have reason ourselves, not to doubt merely, but to believe. I do not wish to recommend that weakness of humanity, which, in the world, often passes current for virtue, though it implies rather a defect of moral feeling, than any refinement of it,—or which at least, if it be virtue, is a virtue that can bear of oppression, and even witness it, without feeling indignation against the oppressor; and which rather would see a thousand repetitions of the injury, than give to the wicked the name and the odium which he deserves. When crimes are walking secretly in darkness, as much as when they present themselves proudly in the very sunshine of day, it is our duty, to the innocent who have

suffered, to give them the consolation of our sympathy, in the indignant feeling of their wrongs, as it is our duty to the innocent who may suffer, to call them to beware. Even in denouncing guilt, however, the office which we exercise is an office of duty, not of pleasure. It is to be exercised, not with the eagerness of one who rejoices in discovering something which he may condemn, but with the sorrow of a lover of humankind, who is forced to add another moral ill to the catalogue of human delinquencies. Such are the feelings of a generous spirit, even when the vice which it discovers is of a species that implies more than ordinary moral turpitude; and when it discovers only such foibles as are not inconsistent with the ordinary proportion of human virtue, it will love rather to speak of the virtue than of the failing; it will think not of what the individual is only, but of what human nature is; and will not withhold from one the indulgence which it must extend to all, and of which it must, even on some occasions, have too good reason for wishing the extension to itself.

When the propagators of tales of scandal think that they have completely justified themselves, by declaring that all which they have said is true, they forget that there are virtues of which they are silent that are true, as well as the defects of which they speak with such minute and exact remembrance; and that, if they were to omit all notice of what is excellent in a character, and to cull only what is defective, the most illustrious of mankind, without any positive violation of biographic truth, might soon cease to be illustrious.

When detraction arises from envy, malice, or motives of sordid interest, it is evident that it can be cured only by the cure of the passions from which it springs. But though these, at first sight, might seem to be the common sources of defamation, it is to another source that it is chiefly to be traced; to the mere flippancy of the gay and the idle, and the necessity of filling up with amusement of some sort a conversation that would flag but for this ever ready resource. In these circumstances, nothing is so quick to present itself as the fault of another, even though we may have fairly begun with speaking of his virtues. "What pleasure, it has been truly said, can two or three persons have together, who have no mutual esteem, whose hearts are as void of feeling as their heads are void of ideas! What charm could their conversation possess without the aid of a little scandal! The sacrifice of a third person is almost always the chief pleasure of a tête-à-tête. A vain idler, who would otherwise be as wearisome to every body as he is weary of himself, speaks to men and women of the same character. He flatters, at the expense of the absent, their vanity and their

* De St. Lambert, *Œuv. Philosophiques*, tome ii. p. 251.

envy; he thus animates their languor, and they pay him in the same coin. If he is gifted with some imagination, and can express agreeably the flattering things which he wishes to appear to think of you, and the evil which he thinks of others, he is treated and caressed, becomes the favourite of every circle, and will continue for his whole life to cultivate the talent of slandering gracefully.*

There is considerable truth in a remark of another French writer, to the same purport, "That there is now-a-days less scandal than there was formerly, because there is more play. Cards, he says, have saved more reputations than a whole host of itinerant preachers could have done, though their only business had been to preach against evil-speaking. But we cannot play always; and, therefore, we must sometimes amuse ourselves with a little defamation."

The moral conclusion to be drawn from this remark is, that what cards may thus have tended in part to do, may be effected by other better means. If scandal arise in a great measure from poverty of conversation, it will diminish in proportion as minds become more cultivated, so as not to have every subject of discussion exhausted, when the health of the visitor and of the visited, having once been ascertained, cannot again with any decency be made a subject of inquiry, and when the meteorology of the day and of the season has, after a little debate, been settled in all its physical exactness. It is to this general increase of mental cultivation that the lessening of scandal is to be attributed, far more than to mere card-playing; which, even when the use of cards was more prevalent than now, could afford only a suspension of hostilities, that were ever ready to begin again with new violence when the game was finished, with perhaps a little additional bitterness on the part of the losers, against the vices of the wicked, and the frailties of the weak. The only true and permanent source of peace and amity with the faults of the absent, is that interest in better subjects which enables the present to animate their conversation, and to sustain it in rich variety, without the necessity of wandering to that resource which marks the folly of the head still more than the uncharitableness of the heart. It is pleasing to trace in this, as in all its other influences, the connexion of intellectual culture with the virtues which it not merely embellishes but invigorates; to perceive that philosophy which, in senates and councils, teaches purer humanity to statesmen and kings, extend its gentle influence to the private circle, and diffuse a

more amiable cheerfulness on the very pleasures of the gay.

The next duty of which we have to treat is that of veracity, which relates to the knowledge or belief of others, as capable of being affected by the meanings, true or false, which our words or our conduct may convey; and consists in the faithful conformity of our language, or of our conduct when it is intended tacitly to supply the place of language, to the truth which we profess to deliver, or, at least, to that which is at the time believed by us to be true.

So much of the happiness of social life is derived from the use of language, and so profitless would the mere power of language be, but for the truth which dictates it, that the abuse of the confidence which is placed in our declarations, may not merely be in the highest degree injurious to the individual deceived, but would tend, if general, to throw back the whole race of mankind into that barbarism from which they have emerged, and progressively ascended through still purer air and still brighter sunshine to that noble height which they have reached. It is not wonderful, therefore, that veracity, so important to the happiness of all, and yet subject to so many temptations of personal interest in the violation of it, should, in all nations, have had a high place assigned to it among the virtues.

That, in the case of a virtue, so essential to the commerce of life, man should have been led instinctively to the practice of it, would not of itself appear absurd, or even very wonderful, to those who consider the other instructive tendencies in our constitution; and since all, in uttering falsehood, are conscious of an effort which represses the truth that seems to start of itself to the lips, and all seem to believe what is told them, till the experience of frequent deceit have induced some degree of doubt in the young listener, who begins to be a sceptic; it has been supposed, by many philosophers, that there are, in our nature, two instinctive tendencies adapted to each other,—a tendency to speak truth, and a tendency to believe what is spoken.

On this subject it is perhaps not very easy to decide with absolute confidence; since it must be admitted by all, that, whether there were, or were not, such original tendencies in the mind, they now do truly form a part of it,—that we have a disposition to speak truth, as often as we speak, without any positive motive to be deceitful; and a disposition to believe what is related to us, if in the circumstances of the relater there be no obvious interest in falsehood, and in the circumstances of the narrative itself no apparent improbability. But since principles are not to be multiplied without urgent necessity, I confess that I do not see,

* De St. Lambert, Œuv. Phil. tome ii. p. 250.

in the phenomena of veracity and belief, sufficient reason to assert peculiar instincts, as concerned in the production of them, since they admit of a sufficient explanation by other more general principles.

That there is a love of society in man, and a desire of sympathetic feeling in the society that is loved, I am far from denying; and if this general love of sympathy with our feelings, to which truth contributes, were all which is meant by the assertion of instinctive veracity, it would be absurd to object to the principle. But this is not what is meant by the assertors of the doctrine. The tendency of which they speak is an instinct additional; and it is to this additional instinct only that the remarks which I have to offer are meant to be applied.

If in our inquiry we are to go back to the very origin of language, it may be presumed that some want, or wish, would be felt when words were uttered. The very motive, therefore, which led to the use of speech, would lead to the truth of it; since no wish could be attained by the use of language, unless the wish were truly expressed. It surely cannot seem wonderful that the expression of wants should be sincere; though it might, indeed, have seemed very wonderful if, with the wish of obtaining food from a brother savage, the savage had employed his power of utterance only to declare that he was not hungry. He might speak falsehoods on some occasion, indeed, on the same principle as that which led him on ordinary occasions to be sincere; that is to say, from the influence of a powerful desire. He would have some secret wish to gratify by the deceit, and, having this wish, he might say what was not, as he was before in the habit of saying what was.

What is true of the savage is true of the child. He too has wishes to gratify; and he speaks truth, because the expression of his wishes must be truth. Nor is this all: The simple laws of suggestion, on which the use of arbitrary signs depend, have themselves an obvious relation to veracity, that connects the utterance of the tongue with the emotions of the heart. Language, as a mere series of symbols, is associated with certain feelings. The feeling of warmth, for example, is more closely associated with the verbal sign that expresses it, than with any other of the various signs of which language is composed; and when we think of this feeling, the word 'warmth' will occur more readily than any other. It is the same with all our other feelings. They suggest, of themselves, by mere association, the corresponding phrases expressive of them; and truth is the result of this very suggestion. We are conscious of an effort in speaking falsehood, because, but for this effort, our feelings would of themselves suggest their

corresponding signs; and we have thus to repress the truth that rises spontaneously, and to invent laboriously the combinations of words that are in discord with our belief. What wonder is there that, when we walk through a meadow in a sunny evening of autumn, there should arise to the mind, and thus to ready utterance, phrases expressive of the real feelings—how beautiful is this scene, and how happy these cattle appear—rather than phrases which have no connexion with the real feelings, and which cannot be supposed, therefore, to be readily uttered, because they are not readily suggested; phrases which would say, what a scene of ruggedness and sterility is this before us, and how terrible are those wolves and tigers! When the common laws of association are reversed, by which things signified suggest their signs, as conversely signs suggest the objects or feelings which they signify,—then, indeed, it may be necessary, in accounting for the accordance of words and sentiments, to have recourse to a peculiar instinct of veracity.

There seems, then, no necessity for a peculiar instinct to account for the general tendency to speak truth rather than falsehood, independently of all moral consideration of the difference of truth and falsehood; though this moral feeling in aid of the common principle of association, and of the general love of sympathy, is certainly an important element in the habitual production of truth. As little reason does there appear to be for the supposition of a peculiar corresponding instinct of credulity. All which seems necessary to account for this, is the influence of common experience.

If there be, as we have seen, some very obvious reasons to account for the tendency to speak truth, those who hear must, for the same reasons, be hearers of truth; and they who are in the constant, or almost constant, habit of hearing truth, will of course, from the same principle which directs their reasoning in other cases, soon learn to draw the conclusion, that what is said may be regarded almost with certainty to be true. It would be as wonderful that they should not draw this conclusion as to general truth, from the general concurrence of the phenomena, as that they should not draw a similar general conclusion with respect to any of the laws of nature in which a similar concurrence was discovered. If all men had universally spoken truth, all men would universally, in consequence of this uniform connexion, have believed truth; or if we deny this consequence, it would really be difficult for us to explain why we do not put our hand as readily in the fire as in water, or jump down a precipice with as little fear as we walk along a plain. But all men do not speak truth as certainly as fire burns; and there-

fore we believe in the one case with some little doubt, in the other with certainty. It seems to us more probable that what is said to us is true, than that it is untrue; the probability increasing, in our estimation, according to the circumstances in which we have previously found truth to be most exactly conformable to the declarations made, and in many cases making a near approximation to absolute certainty; because in cases of the same sort, we have rarely, if ever, discovered any disagreement of the fact and the assertion. That, even if we possess the instinctive credulity supposed, we yet do not believe every thing which is told us, must be admitted by those who contend for the principle. And why do we not believe whatever is told us? The only answer which can be given by them is, that we do not believe every thing because we have occasionally been deceived: and if the doubt can be explained by the experience of the small number of instances in which we have been deceived, why may not the tendency to the moderate assent, that is tempered by this little mixture of doubt, be admitted to arise, in like manner, from our experience of the greater number of instances in which we have not been deceived?

That we should be more credulous in childhood than in mature life, is not wonderful, when we consider that the probabilities of truth are always far greater than the probabilities of falsehood; that the discovery of many of the possible motives to falsehood, on which our doubt in after-life is founded, requires an analysis much nicer than children can be supposed to perform; and that it is the very nature of the mind, when untrained to habits of reflection, to think only of the majority of cases when the number is very greatly superior, and to forget the few exceptions. The general analogies of a language are, in this way, made absolutely universal by a child, as they are in many instances, too, so regarded by the vulgar, who understand, indeed, the irregular inflections when pronounced, but continue, in their own discourse, to employ the more general forms of termination in the particular substantives and verbs, in which grammatical usage requires a departure from the ordinary rules of inflection. The child will learn to doubt better as he will learn to speak more idiomatically; but still the too regular language which he uses does not flow from any peculiar instinct, nor does the too regular belief.

The only original principle that seems to me to be truly concerned in the phenomena of veracity, at least the only principle in addition to the general social propensity by which we delight in the sympathy of others, is the susceptibility of moral emotion, to the influence of which, in aiding habits of truth,

I have already alluded. We feel that in injuring another in his belief we are guilty of what is morally wrong; as we feel that we are guilty of moral wrong in injuring any one, however slightly in his person or his property. We abstain from the one species of injury, therefore, as we abstain from the other; and though I cannot think that we speak truth, from an instinctive propensity that is independent of all experience or reflection, I have no doubt that we speak it, in many cases, from a moral disapprobation of deceit, which is itself the result of a tendency as truly original as any of our instincts.

LECTURE LXXXV.

OF OUR NEGATIVE DUTIES CONTINUED;—OF ABSTAINING FROM INJURING THE VIRTUE OF OTHERS—EITHER DIRECTLY BY OUR SEDUCTIONS—OR INDIRECTLY BY OUR EXAMPLE; OF ABSTAINING FROM INJURING THE MENTAL TRANQUILLITY OF OTHERS.

In my last Lecture, Gentlemen, in prosecution of the inquiry on which we had entered into the great class of negative duties, I considered those which relate to our power of injuring others in three very important respects: in the affection of those whom they love—in their general reputation—and in their knowledge or belief, as affected by the confidence which they attach to our false declarations. There still remain two other modes of injury to be considered by us, in the two corresponding negative duties to which they give rise.

Of these, the next in order is the dangerous power which we may exercise over the virtue of another.

This power over the virtues of others may be exercised in two ways; directly by our seductions, indirectly by our example.

The very name seduction excites immediately the thought of one particular form of allurements to guilt, to which that name is peculiarly affixed; and which deserves this peculiar distinction, by the amount of irreparable injury that may thus be produced by the persuasion of a few fatal moments. The remarks, however, which I made in my last Lecture on the crime of adultery, are in many respects so applicable to this, as to render superfluous any long discussion of the evil which the seducer perpetrates, and of the selfishness which must be in the heart before it could meditate so much evil. There is not, indeed, in simple seduction, the theft of affection belonging to another, of which the adulterer is guilty; but there is the theft of the affection of the individual herself, the fraudulent acquisition of it by falsehoods and

artifices, which in every other species of intercourse would be universally considered as lasting disgrace ; and which are surely not less disgraceful, when the wretchedness produced by the fraud is far greater than any other fraud could produce, and is the wretchedness of one of whom man, who betrays her fondness, was appointed the protector. Whatever other consequences may attend the treachery of the seducer, there is, as in adultery, at least in almost every case, the production of misery to more than the individual directly betrayed ; to a whole family perhaps, that lose in a single moment, as if by some sudden desolation or total change of scene, whatever was delightful in the thought of the past, or a promise of delight in the thought of the future ; and that must either cease to love one whom it would be agony to abandon, or retain a love that involves more intense and lasting anguish, because it is the love of one who never can be happy. But, though there were no parent or friend to share her sufferings, and to aggravate them to her by this very participation, there is still the great sufferer herself, the production of present guilt, and future shame and misery, that admit almost as little of consolation as of remedy, to one, for whom the producer of all this moral depravation and anguish of heart professes feelings which he honours with the name of love, and who, in the dreadful sacrifices which she has made, has shown too strongly the force of that attachment of which he has availed himself to render her his victim. If it be justly considered as adding tenfold horror to the crime of murder, that he on whom death was inflicted was a friend and benefactor of the assassin, and forgave the deadly blow even while he recognised the arm from which it came, what weight of guilt does the very love which, even after ruin, still lingers in her gentle heart that was betrayed, add to the atrocious selfishness of him who rejoiced to perceive the tenderness of love, only as a proof that his artifices had not been wasted ; who, in abandoning her afterwards to all her misery, regretted only the difficulty which he might have in shaking off a love so obstinate ; and on receiving, perhaps, one of those letters of upbraiding, in which, in the very vehemence of indignation, it is still evident that it is love which upbraids,—could see those gleams of tenderness, with no other thought than that of gratified vanity, —a conscious pride of attractions, which might succeed with other hearts, as they had succeeded with that heart, over which they still retained so lasting a hold.

The period which intervenes between the first artifices of the seducer, and the misery to which he is ultimately to give occasion, surely does not lessen his guilt, as a moral agent, deliberately planning those very means

of wretchedness. Let us imagine, then, gathered into one terrible moment, all this amount of wretchedness,—the distraction of parents, the tears of sisters, the shame and remorse of the frail outcast ; or perhaps, in the dreadful progress of depravation of what once was shame and remorse, a wild excess of guilt, that seeks only to forget the past, and that scarcely knows, in the distraction of many acquired vices, what it is which constitutes at the moment the anguish which it feels : if all this combination of miseries could be made visible as it were to the very eyes of the seducer in a single moment, and the instant production of it were to depend on a single word of renewed solicitation on his part ; what love, I will not say, but even what passion that calls itself love, in any human breast, can we conceive to be so unmoved by such a sight, as to utter calmly a word so destructive ? And if a single moment of the miserable result be so dreadful to be contemplated, how much more terrible is it when regarded as the misery of years—of years that, after their course of earthly wretchedness is finished, consign to immortality a spirit, that, but for the guilt of him who rendered it what it is, might have looked back upon the earth, with the calm pleasure of those who turn their eyes on a scene which their acts of virtue have rendered delightful, and quit it only for scenes which they are to render delightful, by the continuance of similar acts, or wishes of virtue.

It is this species of seduction of the purity of female love, as I have said, to which the name is usually attached. But there are vicious seductions of as many kinds as there are vicious objects to be obtained by vicious means. He who knowingly and wilfully lessens a single virtue in the heart of another, or introduces into it a single vice, or increases the power of any guilty passion, is a seducer ; guilty himself to the extent at least, or more than the extent, of the guilt which he occasions. The flatterer is a seducer ; and, in thinking of flattery, we are not to think only of the courts of kings, and of the palaces of those who have almost the splendour of kings. There is a scale, which comprehends in it all mankind ; a scale of the great, who are great to those beneath them, as they are little to those above them ; and everywhere there are flatterers, because at every point of the scale there is some little power or patronage, which can gratify some little desire, that corresponds with the gifts which the flatterers of flatterers can offer to those who pay to them a similar homage. As it would be difficult to find any one too great to be the subject of adulation, it would be difficult also to find one too little to be the subject of it, if only we could find one still meaner, who might look to him with hope. Of the various corruptions, therefore, with

which virtue may be assailed, flattery is not merely one of the most powerful, but the most general of all; because it is at once the most easy to be offered, and the surest to be received. "We believe that we hate flattery," says La Rochefoucault, "when all which we hate is the awkwardness of the flatterer." It is the very nature of this species of blandishment, as has been truly remarked, to please even when rejected; and however frequently refused admission, to be admitted at last. "*Habent hoc in se naturale blanditiæ: etiam cum rejiciuntur placent; sæpe exclusæ, novissime recipiuntur.*"

Flattery, then, the fosterer of vanity, and often of affections more degrading, implies, in whatever station the flatterer and the flattered may be, a disregard of the virtue of others, which in itself is no slight vice. But the sly bribery of praise is not the only bribery with which human selfishness would strive to seduce human selfishness. There are grosser bribes, which those who count themselves honourable men, and are aspiring to stations of still higher honour, have no hesitation in employing for the furtherance of useful vice. A little perjury, real or implied, is all which they require; and they are content to pay for it its fair market price, or even to raise a little the market price, if perjury should have grown more reluctant than before, or more skilful in the calculation of its own exact value. It is painful to think, that an offence against public morals, of such serious import, should be so lightly estimated by those who strive to forget their own delinquency, in the equal and familiar delinquency of others; as if the very wideness of guilt were not an additional reason for ceasing to contribute to that which has been already so extensively baneful;—and that the first step to the legislation of the freest and most virtuous nation on the earth, to the noblest of all the trusts which a nation can bestow,—that of enacting the means by which its own tendencies to guilt may be lessened,—should, in so many instances, be the purchase of a crime, or of many crimes.

If, however, the purchase even of a few crimes be an offence so worthy of reprehension, not merely for the encouragement which it gives to the venal barterers of their conscience, but still more for the corruption of moral principle which it tends to diffuse through the whole community, what deeper reprobation belongs to those to whom this general debasement of a people is itself an object of desire; who can see millions sunk in ignorance, and in all the vices of ignorance, and know the means which might have accelerated their moral progress, and rejoice with a secret triumph that they have been instrumental in withholding them. How many nations are there on the earth,

in which nothing is so much feared by those who have the miserable charge of the general servitude, as that man should become a little nobler than it is possible for him to be, when he has to bow his head at the feet of the oppressor; and in which the diffusion of knowledge is dreaded, as the diffusion of that which the slave cannot feel long, and continue to be a slave. To withhold, for purposes of selfish gain, the means by which the moral condition of a state might be ameliorated, is to be guilty of an injury to virtue, compared with the atrocity of which, the guilt of seducing to vice a single individual, is as insignificant as would be the crime of a single assassination, compared with the butchery of millions in the massacre of a whole nation, of which none were to survive but the murderers themselves, and those by whom the murder was sanctioned and applauded.

The various species of seduction which we have been considering, have had some object of direct personal gain in view. The betrayer of female innocence has previously yielded himself to the control of appetites and passions, that are to him what reason and morality are to the good, and that must be gratified, though he seek the gratification of them in misery itself. The flatterer seeks the favour of him whom he flatters, and seeks it usually for interests, without which the mere favour would be of little value to him. The briberies of money, or place, or pension, present or future, near or remote, or whatever else can be offered to the rapacity of avarice or ambition, or of all the passions which avarice and ambition can gratify, are not gifts or promises that are gratuitous, but expect a return of profit of some sort to the passions of the briber. Even those who delight in keeping nations in ignorance and servility, and who care not how many vices may accompany or flow from these, still see the connexion of servility as an effect, with ignorance as a cause; and, perhaps, would have no great objection to allow a little more wisdom to a people, if they were to become more obsequious by their wisdom, or to remain even as truly slaves in heart as before. There is one species of corruption, however, which is exercised from a love of the corruption itself, or at least from the mere pleasure of companionship in guilt,—a spirit of malicious proselytism, which forms the last dreadful stage of vice; when the grey-headed veteran of debaucheries, that began in youth, and have been matured by a long life of unceasing excess in all that is gross and depraved, till he have acquired a sort of oracular gravity of profligacy among gayer profligates, collects around him his band of youthful disciples, whom he has gathered wherever his watchful eye could mark out another victim; relates to them the tales of merriment of

other years, as an excitement to present passions; observes in each the few virtues which will need even yet to be repressed, the irrelative vices that will require to be strengthened; and, if on some ingenuous cheek a blush should still arise, marks it with a sort of joy, that almost calculates the moment of triumph when that blush shall have been washed away, to appear again no more. If there be a being on this earth whom it is permitted to us to hate with full and absolute detestation, it is surely a human demon like this; and, if we could trace through all its haunts the licentiousness of a single great city,—from the splendid gaming-house of the rich to the obscure chambers of vulgar riot, in which the dissolute of another order assemble to plan the frauds or robberies of the night, or to turn to the only uses to which they know how to turn them, the frauds or robberies of the preceding day,—of how many demons of this class should we trace the horrible power, in the lessons which they are giving, and the results of lessons which have been given!

With these circumstances, which lead to the intentional and wilful corruption of others, is unfortunately often joined the vanity of a display of profligacy, surpassing the conception of ordinary profligates, or the equally hurtful vanity of an audacious wit, that can dare to jest, where others, if they do not revere as the pure revere, are at least accustomed to tremble as the superstitious tremble. How many are there who assume the appearance of this audacity which they do not feel, shuddering perhaps with a secret horror of conscience at the very epigram in which they seem to have been gaily impious, when they poured out their merry obscenities, or still merrier blasphemy. There are other minds, which have a due abhorrence of all such blasphemy, when the blasphemy is in verse; who require most rigidly that it be in prose, and have too great regard for the virtue and holiness of man, to allow them to be corrupted by the licentious iniquity of rhyming. If, however, they can invent an argument which may logically make man miserable by mood and figure,—an argument that, to those who are not very nice distinguishers of truth, and the semblance of truth, may seem to prove God to be only a sort of poetic personification, and virtue and immortality to be words as meaningless,—they have no hesitation in supposing that the happiness of mankind, which the credit of an epigram should not be allowed to outweigh, is yet too light in the scale to be poised against the credit of any acute sophistry that can be wrought into the form of a philosophic dissertation. They are too wise not to discern that the evident tendency of that which they value only as acute, is to corrupt human virtue, and extinguish the best hopes and con-

solutions of human suffering. But it is sufficient comfort to them, that if they render miserable those whose virtue they corrupt, they have at least not corrupted them, without the observance of some of the most exact technicalities of logic.

Such are various forms of direct corruption, in which we are seducers to vice. It is not by direct and intentional corruption only, however, that we produce injury to the virtue of others. There is an indirect influence, which, in some situations, is not less injurious,—the influence of example.

We are formed to live together in society; and in those who are to live together, it is necessary for happiness and almost for social union, that there should be some resemblance of manners, and agreement of sentiment, at least in the general subjects in which the interests of all are equally involved. To this agreement the various humours of mankind, and the very different circumstances in which different individuals of the same society are placed, would seem indeed to oppose causes of division that are almost insuperable. By one principle of the mind, however,—the principle of suggestion, or, as it is commonly termed, the principle of association,—nature has in a great measure softened down the most prominent and offensive peculiarities. What we have seen done in one situation, is recalled to us by the very feeling of this situation, when we are placed in it; and, as it arises to us thus more readily, and is sometimes, perhaps, the only mode of conduct which arises clearly to our mind, we proceed on it without farther reflection, and act in a certain manner, because others have acted in a certain manner, and because we have seen them act, or heard of their action. It is evident, that in resolving to act in a certain manner, on any occasion, we must have had a previous conception of the manner in which the action may be performed; and that we may, therefore, often prefer one mode of action, from the advantages which it seems to present; when it would not have been preferred in competition with other modes of action, still more advantageous, but not conceived at the time. The wise, indeed, on this very account, even when they see good that may flow from one mode of conduct, pause to consider various possibilities, and appreciate the differences of the good and the better; but how few are the wise! and how much more numerous they who, when any immediate good presents itself, do not wait to consider whether a better may not be found. The first conceptions that arise, are the conceptions which regulate half their conduct; and these first conceptions, when the circumstances of the case are similar, are, by the natural influence of association, the conceptions either of what they have themselves

done before, or of what others were observed to do in those similar circumstances. It is impossible to will any particular action, without having previously conceived that particular action; and the various consequences of various modes of conduct have seldom entered into the contemplation of the multitude. They see what others do; and their thought has scarcely wandered beyond what is commonly before their eyes, or what is the subject of common discourse. As soon, therefore, as similar circumstances recur, the image recurs of what has been thus familiar to them; and it recurs more strongly and vividly, because its influence is not lessened by that of any other accompanying image. They act, therefore, as others have acted, not so much from a feeling of respect for general sentiment, as from mere ignorance, and the absence of any other conception that might give a different momentary impulse. They see only one path, and they move on, accordingly, in that only path which their dim and narrow glance is capable of perceiving.

How powerfully the conduct is influenced by any vivid conception, is shown very strikingly in those phenomena of panic terror to which I have more than once alluded for illustration, because they throw light on many of the most perplexing phenomena of the mind. When astonishment is once produced in any very lively degree, however rich in knowledge a mind may have been, it is, for the moment, like the ignorant minds around. It cannot deliberate and choose, because no objects of choice occur to it. What is called presence of mind, is only such a state of mastery of the feeling of astonishment, and other lively emotions, as allows the conceptions to arise which would have arisen if there had been no circumstances productive of lively emotion; and the want of presence of mind is the temporary want of such conceptions, from the overwhelming influence of one lively emotion. The image of what others are doing, is therefore the only image before the mind; and each individual thus augments and multiplies the panic, by presenting to others the ready image of that flight, which, as presented to him by those who were first to fly, had made him for the moment that cowardly thing which, in hours of freer choice, he would have conceived it impossible for him to become.

In every case of this species of moral sway, then, it is to the similar influence of mere suggestion, in presenting to us a clear image of one mode of conduct out of many possible modes, that are not conceived so distinctly, because they have never been seen, that I am inclined to ascribe the chief part of that power which is attributed, and justly attributed, to example; though to

this direct influence of the principle must be added various indirect and auxiliary influences of it, in the notions of moral worth, or dignity of character, of those who performed the action before; or the remembrance even of accidental circumstances of pride or pleasure, that may have been connected with it. When all the direct and indirect influences of the suggesting principle, then, are added together, it cannot seem wonderful that there should be such a propensity in the great imitator, man, to moral imitation; and that the conduct of him who is born to-day, should depend almost as much on the nature of the minds of those who are to surround him hereafter, as on the nature of the mind that is animating his own little frame.

In considering the influence of example on national virtue, we are too apt to think only of the authority of those who are placed in eminent stations; and to forget the more direct influence of domestic examples on those individuals, who must always indeed be ranked as individuals, but whose virtues or vices united are the virtues or vices of the nation. The example of the great may give the primary impulse, but the force descends progressively from rank to rank; and each is affected chiefly by those who are around him, or a very little above him. The parents who hang over our cradle, thinking for us, before we have formed what can be called a thought, and who continue, during life, to be viewed by us with a peculiar sort of tender veneration, which no other created being seems to us entitled to possess,—the comrades of our pastimes in boyhood, and the friends who partake with us the graver occupations, and graver pastimes of our maturer years,—these are they who transfuse into us their feelings, and from whom, without thinking of them as examples, we derive all that good or evil which example can afford; and yield ourselves more completely to the influence, because we are not aware that we are yielding to any influence whatever. To be frequently with the good is to know, on almost every occasion, how the good would act in the situation in which we are placed, and to feel, at the same time, that reverence for the action itself as it seems to us recommended by their choice, which we must have felt for those whom we imagine as performers of it. Whatever impresses on us strongly the image of the virtuous, therefore, cannot be indifferent to our virtue. The very meeting of a great man, as Seneca strongly says, may be of lasting advantage to us; and we derive instruction from his very silence. “Nulla res magis animis honesta induit, dubiosque et in pravum inclinabiles revocat ad rectum, quam bonorum virorum conversatio. Paulatim enim descendit in pectora; et vim præceptorum obtinet frequenter audiri, adspici frequenter. Occursus mehercule ipse sapientium juvat;

et est aliquid, quod ex magno viro, vel tante, proficiat.”*

It is this universal radiation of example, reflecting light upon example, which forms the moral splendour of an age, without some portion of the light of which good laws are powerless, and with which it is almost a matter of little moment, at least to the existing generation, how few the laws may be under which good men are living in peace. “When a citizen is inspired by the genius of virtue,” says an eloquent declaimer on morals, “he feels no embarrassment in those cases for which the law has made no provision. His own heart is his legislator. He has there a species of instinct, less likely to err than even reason itself. A good man divines, as it were, good laws, that, as laws, are yet unexisting. It is not so much in the head, indeed, that the true genius of legislation has its seat, as in the heart; and wise as Solon and Lycurgus were, who can doubt that they had still more virtue than wisdom? When Rome was in peril, what was her resource? She did not form new laws. She ordered the laws to be silent, and gave herself up to the guidance and example of a single good man. The conscience of Camillus was, for a long time, all the legislation of Rome. That Rome, which had scarcely begun to exist, was already almost expiring under the assault of the Gauls. But what is there which a great man cannot do, when he is sure of the courage and of the virtue of his fellow-citizens! Rome, delivered by his arm, had no longer a foe to dread; and with her proud morals, and but a handful of laws, rose from the very brink of the grave, to march like a Queen to the conquest of the universe. The firmness of Brutus, the good faith of Regulus, the moderation of Cincinnatus, the calm probity of Fabricius, the chastity of the Lucretias and Virginias, the disinterestedness of Paulus Æmilius, the patience of Fabius,—these were the best laws of Rome. A virtuous man is a living law,—he is more: precepts can only point to us what tract we should pursue, but examples hurry us along. What a difference there is between a law that speaks but once, and Cato ever acting! This Cato was to Rome its thirteenth table of laws; and without the thirteenth, how defective would the twelve other have been!”

The influence of moral feeling is, indeed, what this author considers it to be, the supplement of the deficiencies of law; the thirteenth table of the early laws of Rome, and many volumes of statutes, where laws are more voluminous. The direct power of example, then, in those who surround us, and whose conduct is the first to rise to our con-

ception, in all the similar circumstances in which ourselves are placed, is a power which the unreflecting can scarcely fail to obey. But though chiefly to be traced to those who mingle with us in the familiar scenes and occurrences of domestic life, the influence is yet referable in part also directly, and indirectly in a very high degree, to the smaller number, who do not so much surround us, as shine upon us from a distance, the eminent of every class, whose real dignity of merit, or even whose accidental dignity of station, has raised them to a height which brings their image frequently before us; and presents it associated with all the respect which the heart readily pays to the one species of dignity, and which, for the peace and good order of states, it is necessary to pay in some degree to the other also—at least when the dignity of mere rank is not so dishonoured by the profligacy of its possessor, as to cover, in our detestation of the profligacy, the feebler titles of the rank itself.

It is this moral or immoral influence, in promoting or injuring the virtues of others, an influence of which it is impossible for them to divest themselves, that gives to those who are in any way distinguished above the crowd a fearful responsibility with which they are unfortunately not always sufficiently impressed. It is not their own conscience only for which they are answerable, they are answerable also, in some measure, for the consciences of others.

Componitur orbis

Regis ad exemplum: nec de infectore sensus
Humanos edicta valent, ut vita regentis;
Mobile martatur semper cum principe vulgus.

“Princeps optimus,” says Paterculus, with a forcible brevity of expression, “faciendo docet; et licet sit imperio maximus, exemplo major est.”

In the life of a sovereign, then, there is nothing private. His friendships, his very amusements, are not friendships and amusements only: they are public virtue or public guilt. If he think more of the trappings of his state than of its duties, if the splendour of some courtly festival be more important to him, than that noblest of spectacles which is to be found in the general happiness of a peaceful and virtuous land, if the favourites of his private confidential hours, whom he thus offers to his people, as models of the conduct that is worthiest of being honoured, be those who are known to the world only by superior profligacy, and whom every virtuous father of a family would exclude from the dwelling of those for whose innocence he would tremble if the corrupters were admitted, there may be virtue still in that state; but it is only because there are in it principles of virtue too powerful to be overcome by the vicious authority even of the most

* Senecæ Epist. xcliv.

powerful. The guilt of the sovereign, however, in such circumstances, is to be estimated, not by the vices which have spread among his people, but by the vices which his own conduct has authorized; and would not be increased in the amount of its moral delinquency, though all mankind had become, what he has said, by his example and his favour, that it is noble to be. If, however, a prince be indeed what a prince should be, he has the comfort of knowing, that he is not enjoying only the happiness of virtue, but diffusing it; that, since his actions must be lessons, they are lessons of good; and that if, by his example, he exercise a sway more extensive than that of his laws or his arms, it is a sway which, like that of his laws and his arms, is exercised only for the happiness of the world.

An influence so extensive, indeed, belongs only to a few of mankind; but even the humble must not think, on this account, that they have no influence. It is indirectly, I have already said, as spreading through them, that the influence of the powerful is chiefly exercised. In their homes, among their friends, on all those who come within their little sphere, they exercise power over the vice or virtue of others, and thus indirectly an influence on the amount of moral good and evil in the world, in every future generation,—an influence which it is as little possible for them to shake off, as for the sovereign of many states to abdicate his moral sway, and to be a sovereign only with his sceptre or his sword.

From this inevitable influence of example, by which every moral or immoral action that is performed by us may have consequences that never entered into our design or our wish when we planned or performed it, arises one very important duty,—the duty of attending to the appearances of our actions. It is not enough for us to have willed what is virtuous, and to have executed it by means that in themselves imply no immorality, if they have been such as might lead others to suspect the purity of what was truly pure. The loss which we might ourselves suffer in this way, in our character and authority, is not the only evil, nor, in many cases, the greatest evil, of such seeming improprieties. We may, without due care as to appearances, act virtuously, and yet give all the authority of our station and character to vice,—misleading those to whom our example may have the force of precept, and, perhaps, by some of the most generous sacrifices of which our nature is capable, inducing the inconsiderate, who suppose that they are imitating us, to quit that moral good which we truly sought, for the evil which we only seemed to them to pursue.

The only remaining species of injury to others, the duty of abstaining from which we

have still to consider, is that which relates to their mental tranquillity.

This indeed, all the other species of injury already considered by us, tend indirectly to disturb. But the injury of which I speak at present, is the direct violation of the peace of others, by our immediate intentional influence on their feelings.

In treating of the emotions of pride, particularly in the form of that haughtiness which the proud are so apt to assume, I have already treated of one of the most injurious influences of this sort, my remarks on which it would be unnecessary now to repeat. You must be sufficiently aware, that the aim of the haughty is to excite in others the mortifying feeling of their abject inferiority; and that, if they could always produce the feelings which they wish to excite, they would not merely have all the guilt of a cruel tyranny,—for that they have, even in their most powerless wishes, but would truly, in their very effects, be the most severe of human tyrants.

It is not the insolence of the haughty, however, which is the only intentional disquiet of others. There is a power in every individual, over the tranquillity of almost every individual. There are emotions latent in the mind of those whom we meet, which a few words of ours may at any time call forth; and the moral influence which keeps this power over the uneasy feelings of others under due restraint, is not the least important of the moral influences, in its relation to general happiness.

There are minds which can delight in exercising this cruel sway; which rejoice in suggesting thoughts that may poison the confidence of friends, and render the very virtues that were loved, objects of suspicion to him who loved them. In the daily and hourly intercourse of human life, there are human beings who exert their malicious skill in devising what subjects may be most likely to bring into the mind of him with whom they converse, the most mortifying remembrances; who pay visits of condolence that they may be sure of making grief a little more severely felt; who are faithful in conveying to every one the whispers of unmerited scandal, of which, otherwise, he never would have heard, as he never could have suspected them; though, in exercising this friendly office, they are careful to express sufficient indignation against the slanderer, and to bring forward as many grounds of suspicion against different individuals as their fancy can call up; who talk to some disappointed beauty of all the splendid preparations for the marriage of her rival; to the unfortunate dramatic poet, of the success of the last night's piece, and of the great improvement which has taken place in modern taste; and who, if they could have the pecu-

liar good fortune of meeting with any one whose father was hanged, would probably find no subject so attractive to their eloquence as the number of executions that were speedily to take place.

Such power man may exercise over the feelings of man; and as it is impossible to frame laws which can comprehend injuries of this sort, such power of man may exercise over man with legal impunity. But it is a power of which the virtuous man will as little think of availing himself, for purposes of cruelty, as if a thousand laws had made it as criminal as it is immoral; a power which he will as little think of exercising, because it would require only the utterance of a few easy words, as of inflicting a mortal blow, because it would require only a single motion of his hand.

The true preservative against this power, is that which is the protector of the virtuous from all other injury—their own purity of conscience. It is not easy to excite permanently any unpleasant images in the mind of one who, in the retrospect of life, has only virtuous actions or virtuous desires to remember—who has wished to keep nothing secret from the world, but the benefactions that provided as carefully for the virtuous shame, as for the very wants of poverty; and who, therefore, if his whole mind could become visible, would be not less, but more beloved. The tranquillity of such a mind may indeed be disturbed for a moment by the petty malice that would strive to awake in it disagreeable remembrances; but even when it may be thus disturbed, there is no painful feeling so likely to arise in it, as regret for that malice itself which it disdains, indeed, but which it cannot disdain without some accompanying pity.

LECTURE LXXXVI.

OF OUR POSITIVE DUTIES; OF THE DUTIES OF BENEVOLENCE.

In my last Lecture, Gentlemen, I concluded my remarks on the order of our general duties, which are negative only; that is to say, which consist in abstinence from the different sorts of injury which it is in our power, directly or indirectly, to occasion to others.

These we considered under seven heads: as our actions may be injurious to others, in their person, in their property, in the affection of those whom they love, in their general character, in their knowledge or belief, as affected by the confidence which they place in the truth of our declarations; in their virtue, as subject to the influence of our intentional seductions, or to the unintended

influence of our mere example; and lastly, in their peace of mind, which, as liable to be disturbed by mortifying reflections, that are in most cases easy to be excited, is in some measure under our control, from the power which the principle of suggestion gives us over the trains of thought of others, and consequently over the general emotions, pleasing or unpleasing, which result from those trains of thought, or form a part of them.

To abstain, however, from every species of injury which it is in our power to occasion to others, though it is an important part of virtue, is but a part of it. Even in our most scrupulous forbearance from all the evil which we might produce, if this abstinence, however complete, were all, the world would still be only as if we had not been. There might be before our very eyes misery, which, though not produced by ourselves, was not the less an evil, and which a slight effort on our part—a word, a very look expressive of a wish, might have been sufficient to remove. There might, in like manner, be means of easy happiness to individuals or whole families, which required only the same simple wishes on our part to convert them into happiness itself, but which would be wholly unproductive without us; and yet, if we had no feelings which led us to be more than passively and negatively good, the misery would remain unrelieved, and the happiness be unproduced or unpromoted.

Nature then, when she conferred on us, in so many noble powers of mind and body, such abundant facilities of usefulness, did not leave us destitute of the wishes which alone could make these facilities valuable. She has given us a benevolence that desires the good of all, and a principle of moral feeling, which, when we allow an opportunity of being widely beneficial to escape, speaks to us with a voice of reproach which it is not easy for us to still. By the one we merely desire the happiness of mankind; by the other we feel that to promote this happiness of mankind is a duty.

It is in this latter aspect that we are at present to consider our power of being beneficial, as giving occasion to a duty, or set of duties, corresponding with the particular species of good, which any exertion on our part can occasion or further.

So important is this duty of benevolence, that, as I formerly mentioned, some very eminent moralists have been led to maintain, that whatever is felt by us to be virtuous, is felt to deserve that name merely as involving some benevolent desire; an opinion which is evidently founded on a partial view of the phenomena; since the experience of every one, if he attend sufficiently to his own feelings, without regard to any system, must convince him that he has a simi-

lar emotion of moral regard, in cases in which the thought of personal duty, as in many of the noblest efforts of self-command, was all which could have been present to the mind of the agent; or in which, though it might be possible to invent some benevolent motive, as what might influence the fortitude of the heroic sufferer, the moral admiration was at least far more rapid than the tardy invention of the benevolence. The doctrine of virtue, as consisting in benevolence, false as it is when maintained as universal and exclusive, is yet, when considered as having the sanction of so many enlightened men, a proof at least of the very extensive diffusion of benevolence in the modes of conduct which are denominated virtuous. It may not, indeed, comprehend all the aspects under which man is regarded by us as worthy of our moral approbation, but it comprehends by far the greater number of them,—his relations to his fellow-men, and to all the creatures that live around him, though not the moral relations which bind him to the greatest of all beings, nor those which are directly worthy of our approbation, as confined to the perfection of his own internal character.

That benevolence, the moral link which connects man with man, is in itself virtuous, may indeed appear to some very rigid questioners of every feeling to require proof; but it can appear to require it only to those who deny altogether the very moral distinction of virtue and vice, in that general scepticism which has been already fully considered by us. Of those who allow virtue to be more than a name, there is no one who will refuse to benevolent exertions the praise of this excellence—no one who can read the history of any of those heroes of the moral scene whose life has been one continued deed of generosity to mankind, without feeling that if there be virtue on earth, there has been virtue in that bosom, which has suffered much, or dared much, that the world might be free from any of the ills which disgraced it. The strong lines with which the author of the *Botanic Garden* concludes his praise of one of the most illustrious of these heroes of benevolence, scarcely express more than we truly feel on the contemplation of such a character. It does seem as if man, when he acts as man should act, is a being of some higher order than the frail erring creatures among whom we ourselves pass a life that, with all its occasional acts of generosity and self-command, is still, like theirs, a life of frailty and error.

And now, Philanthropy, thy rays divine
Dart round the globe, from Zembla to the line;
O'er each dark prison plays the cheering light,
Like northern lustrous o'er the vault of night.
From realm to realm, with cross or crescent crown'd,
Where'er mankind and misery are found;
O'er burning sands, deep waves, or wilds of snow,
Thy Howard, journeying, seeks the house of woe.

Down many a winding step to dungeons dank,
Where anguish wails aloud, and fetters clank,
To caves bestrew'd with many a mouldering bone,
And cells, whose echoes only learn to groan;
Where no kind bars a whispering friend disclose,
No sunbeam enters, and no zephyr blows,
He treads, inemulous of fame or wealth,
Profuse of toil, and prodigal of health;
With soft assuasive eloquence expends
Power's rigid heart, and opens his clenching hands;
Leads stern-eyed Justice to the dark domains,
If not to sever, to relax the chains;
Or guides awakened Mercy through the gloom,
And shows the prison, sister to the tomb;
Gives to her babes the self-devoted wife,
To her fond husband liberty and life.
The spirits of the good who bend from high,
Wide o'er these earthly scenes, their partial eye,
When first, array'd in Virtue's purest robe,
They saw her Howard traversing the globe,
Mistook a mortal for an angel-guest,
And ask'd, what seraph foot the earth imprint.
Onward he moves. Disease and death retire,
And murmuring demons hate him and admire.*

The benevolent spirit, as its object is the happiness of all who are capable of feeling happiness, is as universal in its efforts as the miseries which are capable of being relieved, or the enjoyments which it is possible to extend to a single human being, within the reach of its efforts, or almost of its wishes. When we speak of benefactions, indeed, we think only of one species of good action; and charity itself, so comprehensive in its etymological meaning, is used as if it were nearly synonymous with the mere opening of the purse. But "it is not money only which the unfortunate need; and they are but sluggards in well-doing," as Rousseau strikingly expresses the character of this indolent benevolence, "who know to do good only when they have a purse in their hand." Consolations, counsels, cares, friendship, protection, are so many resources which pity leaves us for the assistance of the indigent, even though wealth should be wanting. The oppressed often continue to be oppressed, merely because they are without an organ to render their complaints known to those who have the power of succour. It requires sometimes but a word which they cannot say, a reason which they know not how to state, the opening of a single door of a great man, through which they are not permitted to pass, to obtain for them all of which they are in need. The intrepid support of a disinterested virtue is, in such cases, able to remove an infinity of obstacles, and the eloquence of a single good man in the cause of the injured can appal tyranny itself in the midst of its power.

If indeed there be in the heart those genuine wishes of diffusive good which are never long absent from the heart of the virtuous, there will not long be wanting occasions of exertion. It will not be easy for an eye that has been accustomed to the search of objects of generous regard, to look around without the discovery of something which may be

* *Botanic Garden*, part ii. canto ii. line 439—472.

remedied, or something which may be improved; and in relieving some misery, or producing or spreading some happiness, the good man will already have effected his delightful purpose, before others would even have imagined that there was any good to be done.

It would be a waste of time to attempt to examine with any minuteness of analysis the various ways in which benevolence may be usefully exerted. In considering the species of injury that give rise to our duties of a negative order, I have in some measure considered our positive duties also; since, to abstain from injuring, and to wish to promote the good which we have thus forborne to lessen, are in spirit results of the same species of benevolent regard, and of the same moral principle, that commands us to further the happiness which it would be vice, by any conduct of ours, to diminish.

To pass slightly over these objects of social regard, then, in the order in which they were before considered, the benevolent man will be eager to relieve every form of personal suffering. Public institutions arise, by his zeal, for receiving the sick, who have no home, or a home which it is almost sickness to inhabit, and for restoring them, in health, to those active employments of which they would otherwise have been incapable. In the humblest ranks of life, when no other aid can be given by the generous poor, than that which their attendance and sympathy administer, this aid they never hesitate to afford. When their own toils of the day are over, they often give the hours of a night that is to terminate in a renewed call to their fatiguing occupations,—not to the repose which their exhausted strength might seem to demand, but to a watchful anxiety around the bed of some feverish sufferer, who is scarcely sufficiently conscious of what is around him, to thank them for their care, and whose look of squalid wretchedness seems to be only death begun, and the infection of death, to all who gaze upon it. The same benevolence which prompts to the succour of the infirm, prompts to the succour also of the indigent. Though charity is not mere pecuniary aid, pecuniary aid, when such aid is needed, is still one of the most useful, because one of the most extensive in its application, of all the services of charity. Nor is it valuable only for the temporary relief which it affords to sufferings that could not otherwise be relieved. It has a higher and more comprehensive office. It brings together those whose union seems necessary for general happiness, and almost for explaining the purposes of Heaven in the present system of things. There are everywhere the rich, who have means of comfort which they know not how to enjoy, and scarcely how to waste; and everywhere some who are poor without guilt on their

part, or at least rather guilty because they are poor, than poor because they are guilty. All which seems necessary for the comfort of both, is, that they should be brought together. Benevolence effects this union. It carries the rich to the cottage, or to the very hovels of the poor; it allows the poor admission into the palaces of the rich; and both become richer in the only true sense of the word, because to both there is an accession of happiness. The wealthy obtain the pleasure of doing good, and of knowing that there are hearts which bless them; the indigent obtain the relief of urgent necessities, and the pleasure of loving a generous benefactor.

Such are the delightful influences of positive benevolence, in their relation to the personal sufferings and to the pecuniary wants of those who, if they have no property to be assailed by injustice, have at least necessities, the disregard of which is equal in moral delinquency to injustice itself. In its relation to the affections of those around, who are connected with each other by various ties of regard, benevolence is not less powerful as a producer or fosterer of good. Wherever there are causes of future jealousy among those who love each other at present, it delights in dispelling the elements of the cloud, when the cloud itself, that has not yet begun to darken, scarcely can be said to have arisen. If suspicions have already gathered in the breast of any one who thinks, but thinks falsely, that he has been injured, it is quick, with all the ready logic of kindness, to show that the suspicions are without a cause. If it find not suspicion only, but dissension that has burst out, in all the violence of mutual acrimony, it appears in its divine character of a peace-maker, and, almost by the influence of its mere presence, the hatred disappears and the love returns; as if it were as little possible that discord should continue where it is, as that the mist and gloom of night should not disappear at the mere presence of that sun which shines upon them.

"The virtuous man," it has been beautifully said, "proceeds without constraint in the path of his duty. His steps are free; his gait is easy; he has the graces of virtue. He moves along in benevolence, and he sees arising in others the benevolence which is in him. Of all our virtuous emotions, those of kind regard are the most readily imitated. To feel them is to inspire them; to see them is to partake them. Are they in your heart? They are in your looks, in your manners, in your discourse. Your presence reconciles enemies; and hatred, which cannot penetrate to your heart, cannot even dwell around you."*

* De St. Lambert, *Œuvres Philosophiques*, tome iii. p. 179.

If benevolence is eager to preserve the affection of those who love each other, it cannot fail to be careful of their character, on which so much of affection depends. The whispers of insidious slander may come to it as they pass, with a secrecy which has nothing in it of real secrecy but mere lowness of tone,—from voice to voice in eager publication; but if there be no other voice to bear them farther, they will cease and perish when it is benevolence which has heard. It is not indeed that senseless and indifferent praise of all actions, which cannot be said to applaud any thing, when it does not know what it is right to condemn. Benevolence itself can despise, can hate, can raise a voice of terrible indignation, when cruelty has been inflicting bodily tortures, or oppression torturing the soul. It is love, however, which is the principle of its very hatred. It hates the oppressors of those whom it loves, and it hates oppression everywhere, because it loves all humankind.

In loving all humankind, and wishing their happiness, it is impossible that the benevolent should not love also the diffusion of knowledge and virtue to humankind; since to wish permanent happiness without these, would be almost to wish for warmth without heat, or colours without light. In my last lecture I considered the motives which lead men to desire that the multitude of their fellow-men should be kept down in a state of intellectual and moral darkness; and the motives which lead to the corruption of individuals,—those who have selfish passions to gratify, by the debasement of some pure and holy principle in some ingenious heart, or at least in some heart not wholly corrupted, that, if suffered to remain, would be inconsistent with the selfish gratification which they seek. Such motives benevolence cannot feel. The objects which it seeks are of a kind which it would be wisdom to pursue, and virtue to pursue; and wishing, therefore, the universality of such pursuits, it cannot fail to wish, in like manner, the universality of the knowledge and virtue which would see happiness where it is best to be found; and would not seek it therefore where it is often sought, in misery itself, or in the certain causes of misery. It is not easy to imagine a mind that is truly desirous of the good of the world, which can sincerely, in its very desire of this good, recommend ignorance as a purifying principle, essential to the moral civilization of man, who, according to this strange system, is a savage only because he knows too much. It is not easy to give credit to the sincerity of this desire; because one who is desirous of public good, must have felt how often, in his own actions, he has injured when he wished to benefit, merely from the want of some better light which he has

since received; and must have seen, in the history of legislation, still more striking proofs of the insufficiency of mere virtuous wishes, for the purposes of virtue, when a very little truth additional might have convinced the planner of much social improvement, that he was ignorantly retarding that very improvement which the individual interests of society itself would have produced far sooner, but for the erring patriotism that laboured to urge it on; and that could not employ its too forcible efforts without breaking some of the delicate springs on which the beautiful mechanism of its seemingly spontaneous progress depended. He who feels in himself, then, the importance of knowledge, even to his more enlightened efforts, to be beneficial, cannot patriotically wish its light to be obscured, or resist the communication of any additional light to those few gleams which, on the greater portion of the surface of the earth, even in nations which we term civilized, show the multitude how to use their hands, indeed, in offices of labour, but scarcely serve to show them more. The virtue of mankind, and the general knowledge which invigorates that virtue, and renders it more surely useful—these are the greatest objects which benevolence can have in view; and a benevolence that professes not to value them, and to look only to the quantity of manual labour which the hand can most expeditiously perform, and the bodily comforts which that more active labour may purchase, even though these objects could be obtained as well without mental light as with it, is a benevolence that is almost as little worthy of the name, as it can ever hope to be worthy of the more useful distinction of beneficent.

These forms of benevolent desire, in their relation to various means of happiness or comfort, lead us naturally to the wish of preserving that tranquillity of mind in others, the violation of which we considered last, in treating, in corresponding order, of the negative duties.

The power which nature has given us over the trains of thought and emotion which we may raise more or less directly, in the minds of others, the benevolent man will employ as an instrument of his gracious wishes, not as an instrument of cruelty. It will be his care to awake in the mind of every one who approaches him, the most delightful feelings which he can awake, consistently with the permanent virtue and happiness of him whom he addresses. He will not flatter, therefore, and speak of faults as if they were excellencies; for this would be to give a little momentary pleasure at the expense of the virtuous happiness of years. But without flattery he will produce more pleasure, even for the time, than flattery itself could give; in the interest which he

seems to feel, he will show that genuine sincerity which impresses with irresistible belief, and of which the confidence is more gratifying to the virtue, I had almost said to the very vanity of man, than the doubtful praises to which the heart, though it may love to hear them, is incapable of yielding itself.

Benevolence, in this amiable form, of course excludes all haughtiness. The great, however elevated, descend, under its gentle influence, to meet the happiness and the grateful affection of those who are beneath them; and in descending to happiness and gratitude which themselves have produced, they do not feel that they are descending. Whatever be the scene of its efforts or wishes, to do good is to the heart always to rise; and the height of its elevation is therefore always in proportion to the quantity of good which it has effected, or which, at least, it has had the wish of effecting.

Politeness,—which is, when ranks are equal, what affability is, when the more distinguished mingle with the less distinguished—is the natural effect of that benevolence which regards always with sympathetic complacency, and is fearful of disturbing, even by the slightest momentary uneasiness, the serenity of others. A breach of attention in any of the common offices of civility, to which the arbitrary usages of social life have attached importance, even when nothing more is intended, is still a neglect, and neglect is itself an insult; it is the immediate cause of a pain which no human being is entitled, where there has been no offence, to give to any other human being. Politeness then,—the social virtue that foresees and provides against every unpleasant feeling that may arise in the breasts around, as if it were some quick-sighted and guardian Power, intent only on general happiness, is something far more dignified in its nature than the cold courtesies which pass current under that name, the mere knowledge of fashionable manners, and an exact adherence to them. It is in its most essential respects what may be possessed by those who know little of the varying vocabulary and varying usages of the season. The knowledge of these is, indeed, necessary to such as mingle in the circles which require them; but they are necessary only as the new fashion of the coat or splendid robe, which leaves him or her who wears it the same human being, in every respect, as before; and are not more a part of either, than the ticket of admission, which opens to their ready entrance the splendid apartment from which the humble are excluded. The true politeness of the heart is something which cannot be given by those who minister to mere decoration. It is the moral grace of life, if I may venture so to term it; the grace of the mind, and what the world counts

graces, are little more than graces of the body.

Such is benevolence in the various forms in which it may be instrumental to happiness; and, in being thus instrumental to the happiness of others, it has truly a source of happiness within itself. It may not feel, indeed, all the enjoyment which it wishes to diffuse—for its wishes are unlimited—but it feels an enjoyment that is as wide as all the happiness which it sees around it, or the still greater and wider happiness of which it anticipates the existence. The very failure of a benevolent wish only breaks its delight, without destroying it; for when one wish of good has failed, it has still other wishes of equal or greater good that arise, and occupy and bless it as before.

In considering the various ways in which benevolence may be active, we have seen how extensive it may be as a feeling of the heart. If wealth, indeed, were necessary, there would be few who could enjoy it, or at least who could enjoy it largely. But pecuniary aid, as we have seen, is only one of many forms of being useful. To correct some error, moral or intellectual—to counsel those who are in doubt, and who in such circumstances require instruction, as the indigent require alms—even though nothing more were in our power to show an interest in the welfare of the happy, and a sincere commiseration of those who are in sorrow; in these, and in innumerable other ways, the benevolent, however scanty may be their means of conferring what alone the world calls benefactions, are not benevolent only, but beneficent; as truly beneficent, or far more so, as those who squander in loose prodigalities to the deserving and the undeserving, the sufferers from their own thoughtless dissipation, or the sufferers from the injustice or dissipation of others, almost as much as they loosely squander on a few hours of their own sensual appetites.

Even in pecuniary liberalities, benevolence does not merely produce good, but it knows well, or it learns to know, the greatest amount of good which its liberalities can produce. To be the cause of less happiness or comfort that might be diffused at the same cost, is almost a species of the same vice which withholds aid from those who require it. The benevolent, therefore, are magnificent in their bounty, because they are economical even in bounty itself. Their heart is quick to perceive sources of relief where others do not see them; and the whole result of happiness produced by them, seems often to have arisen from a superb munificence which few could command, when it may, perhaps, have proceeded only from humble means, which the possessor of similar means, without similar benevolence, would think scarcely more than necessary for his

own strict necessities. How beautifully, in Pope's well-known description of an individual, whose simple charities have made him as illustrious as the most costly profusion of charity in other circumstances could have done, is this quick tendency to minister to every little comfort marked, in the provision which he is represented as making, not for gross and obvious miseries only, but for the very ease of the traveller or common passenger.

But all our praises why should lords engross!
 Rise, honest muse, and sing the Man of Ross!
 Pleased Vaga echoes through her winding bounds,
 And rapid Severn hoarse applause resounds.
 Who hung with woods yon mountain's sultry brow?
 From the dry rock who bade the waters flow?
 Not to the skies in useless columns tost,
 Or in proud falls magnificently lost,
 But clear and artless, pouring through the plain
 Health to the sick and solace to the swain.
 Whose causeway parts the vale with shady rows?
 Whose seats the weary traveller repose?
 Who taught that heaven-directed spire to rise?
 The Man of Ross, each lisping babe replies.
 Behold the market-place with poor o'erspread!
 The Man of Ross divides the weekly bread.
 He feeds yon almshouse, neat, but void of state,
 Where Age and Want sit smiling at the gate.
 Him portion'd maids, apprenticed orphans blest,
 The young who labour, and the old who rest.
 Is any sick? The Man of Ross relieves,
 Prescribes, attends, the medicine makes and gives.
 Is there a variance? enter but his door,
 Balked are the courts, and contest is no more.*

What is it which makes this picture of benevolence so peculiarly pleasing? It is not the mere quantity of happiness produced, even when taken in connexion with the seemingly disproportionate income, the few hundred pounds a-year which were so nobly devoted to the production of that happiness. It is pleasing, chiefly from the air of beautiful consistency that appears in so wide a variety of good, the evidence of a genuine kindness of heart, that was quick, as I have said, to perceive, not the great evils only which force themselves upon every eye, but the little comforts also which might be administered to those, of whom the rich, even when they are disposed to extend to them the indolent succour of their alms, and sometimes, too, the more generous succour of their personal aid, are yet accustomed to think only as sufferers who are to be kept alive, rather than as human beings who are to be made happy. We admire, indeed, the active services with which the Man of Ross distributed the weekly bread, built houses that were to be homes of repose for the aged and indigent, visited the sick, and settled amicably the controversies of neighbours and friends, who might otherwise have become foes in becoming litigants; but it is when, together with these prominent acts of obvious beneficence, we consider the acts of attention to humbler, though less obvious wants, that we

feel, with lively delight and confidence, the kindness of a heart which, in its charitable meditations, could think of happiness as well as of misery, and foresee means of happiness, which the benevolent, indeed, can easily produce, but which are visible only to the benevolent. It is by its inattention to the little wants of man, that ostentation distinguishes itself from charity; and a sagacious observer needs no other test, in the silent diadim or eager reverence of his heart, to separate the seeming benevolence, which seeks the applauding voices of crowds, from the real benevolence, which seeks only to be the spreader of happiness or consolation. It is impossible for the most ostentatious producer of the widest amount of good, with all his largesses, and with all his hypocrisy, to be consistent in his acts of seeming kindness; because, to be consistent, he must have that real kindness which sees what the cold simulator of benevolence is incapable of seeing, and does, therefore, what such a cold dissembler is incapable even of imagining.

LECTURE LXXXVII.

OF THE POSITIVE DUTIES WHICH WE OWE TO CERTAIN INDIVIDUALS ONLY—ARISING FROM AFFINITY, FRIENDSHIP, BENEFITS RECEIVED, CONTRACT.

IN my last Lecture, Gentlemen, I concluded the remarks which I had to offer on the duties, negative and positive, which we owe to all the individuals of mankind; on the species of injury from which we are under a moral obligation to abstain, whoever he may be whom it is in our power to injure, and on the good which we are under a similar obligation to produce to every one who comes within the sphere of our usefulness.

After the consideration of these general duties, then, I proceed to the class of additional duties which we owe to certain individuals only, with whom we are connected by peculiar ties.

These may be considered by us under five heads; as the duties which arise from affinity, from friendship, from benefits received, from contract, from citizenship. The duties of this class, as I have said, are additional duties, not duties exclusive of any of the former. We owe to our relations, to our friends, to our benefactors, to those with whom we have entered into engagements of any sort, to our fellow-citizens, all which we owe to others who are connected with us only as human beings; but we owe them more; and it is this accession of duty which we have now to consider.

If the only moral offices, of which we had been formed by nature to feel the obligation,

* Moral Essays, Epistle iii. v. 219—272.

were those which connect us alike with every individual of our race, whose happiness we should, in that case, as now, have felt it to be our duty to augment when it was in our power to augment it, and when there was no opportunity of this accession, at least not to lessen its amount, it might perhaps seem to the unreflecting, that a provision as ample would have been made for the happiness of the world, as that which is now so abundantly made for it, under the reciprocal kindness of a system of relative duties that vary in force as the peculiar relation is nearer or more remote, but, in all, add to the general feelings of humanity some new influence of benevolent regard. There have, indeed, even in our own time, been philosophers or moral writers that assume the name, who have contended for this equal diffusion of duty, or at least for a gradation of duty that varies only with the absolute merits of the individual, independently of all particular relationship to the agent,—asserting, in consequence, that every preference to which the private affections lead, is vicious on this very account, as being inconsistent with that exact conformity to the scale of absolute merit, in which alone they conceive virtue to consist. It is right, indeed, on some occasions, according to this system, to do good to a parent or a benefactor, or rather, it is not absolutely impossible that a case should occur, in which it may not be guilt to do good to a parent or a benefactor; but it is only in rare cases that the choice implied in the singling out of such an object, is proper or allowable, in those rare cases, in which it would have been right to prefer to every other individual of mankind, the same individual, though unconnected with us by any tie but our knowledge of his virtues; and when he, with whom we consider ourselves as peculiarly connected, by the mere accident of our birth, or of kindnesses conferred on us, is not the individual whom, in other circumstances, it would have been, in like manner, our duty thus to prefer, it does not become more our duty, on account of these accidental circumstances. Far from being virtuous, therefore, in bestowing on him any limited good which it is in our power to bestow only on one, we are guilty, with no slight degree of delinquency, in the very action which we may strive to cover with the seemingly honourable name of gratitude or filial duty. These names, indeed, are honourable only in sound or semblance; for, to those who are capable of appreciating them ethically, they are as void of moral meaning, as the words tall or short, fat or thin; which, in like manner, express qualities of human beings, whom it may be right to prefer, or wrong to prefer, but not the more right, nor the more wrong, to prefer them on account of any of these physical qualities to those who may be

of greater merit, though fatter, or thinner, taller, or shorter.

The errors of this system of sole universal duty I have already endeavoured to point out to you, when I explained the importance to happiness, of all the private affections;—the great accession to the general good which is every moment flowing from the indulgence of a regard that, in thinking with a more lively interest of the individual loved than it would be possible to think of a community, is then, perhaps, the most effective contributor to the happiness of mankind, when the happiness of mankind is most forgotten by it, in the happiness of one or of a few of the number. The human race, as distinguishable from families and individuals, is but a mere abstraction, and expresses truly nothing more than the very individuals who are thus at every moment gratifying and gratified. What produces the greatest amount of good to all, in the enjoyment of the private affections, is not that which we can readily suppose the framer of a world that is blessed by this very production, to have formed every individual to regard as vice; and to regard as virtue only the disregard of that with which the world would be more happy. We find, accordingly, the universal feelings of mankind accordant with the system of particular duties, that is so largely productive of happiness. In every region of the earth, and in all circumstances of society, the indulgence of the private affections is considered not as allowable merely, but as obligatory, so obligatory on all, that the guilt which would produce everywhere the most general abhorrence, would be, not the forgetfulness of the good of the world,—for, of this, the thousands that live around us, in the continued exercise of many virtues, seldom if ever think,—but the violation of some one of these private duties, the injury done to a friend, a benefactor, a parent, or even without positive injury, the mere neglect of them, in circumstances of want or of suffering of any kind, which our bounty, or exertions of active aid, could relieve.

We are to prefer to the happiness of our parent or benefactor, it is said, the happiness of a stranger, who, without any particular relation to us, is a degree or two higher in the scale of absolute merit. But why are we to seek his happiness, and why is it immoral to disregard it? In this system, as in every other system of vice and virtue, there must be some source of the distinctive feelings. It is to our moral emotions, as they rise on the contemplation of certain actions, that the theorist must look; or, if he disregard these, he must allow that vice and virtue are words without a meaning; and if virtue and vice have their sole origin in these moral emotions, is there an observer of our nature who can have the boldness to main-

tain, that, in relation to these feelings, in which all that is morally obligatory is to be found, gratitude to a benefactor is a vice, and the disregard of the sufferings of a parent a virtue, whenever, without the power of relieving both, we see before us, at the same time, a suffering stranger, who is capable of doing a little more good to the world?

The very feeling of duty, then, has its source, and its only source, in the very moral emotions by which the private affections are particularly recommended to us. To exclude therefore from a system of duty, the exercise of the private affections in those preferences which are only the private affections becoming active, and, in excluding these, to maintain at the same time that there is a system of duty, a virtue in certain preferences, a vice in certain other preferences, is to be guilty of inconsistency, far more illogical than the licentiousness which denies all virtue and vice whatever. To prove that there is some truth in moral obligation, this universalist, as we have seen, must necessarily appeal to those moral feelings of which we are conscious, without which it would be vain for him to speak of moral distinction of any sort. For his sole proof, then, of the virtue of disregarding wholly every personal relationship and affection, he appeals to feelings, that, if they establish any obligation whatever, establish none so firmly as that of the private relative duties, which they are every moment sanctioning and approving; and his system, therefore, if we trace its principles to their source, in the approving and disapproving principle within us, is precisely the same in import, as if its radical doctrine were, that it is right for us to do certain actions, because it is wrong for us to do them, or wrong for us to do certain other actions, because to do them would be right.

It is surely, I repeat, by a very strange paralogism, that he would found an assertion of an exclusive universal duty on the moral feelings of our heart, which alone enable us to distinguish what is virtuous from what is vicious, and would yet contend that these very feelings of our heart, which are rising at every moment in the very conception of our parents, our friends, our country, are at every moment to be disregarded. But, even though this radical objection were omitted, and though we were to concede to the universalist, that the private affections are not recommended to us, by nature, on their own account; that to our moral feelings, the equal sufferings of our benefactor, and of a stranger of equal general merit, are exactly of the same interest; and that all which is truly an object of interest to us, is the amount of public happiness of the great community of mankind; still, if we regard the general happiness, are not the means of the greatest

amount of general happiness to be valued at least as means? And if the indulgence of the private affections tend, upon the whole, to a greater amount of good, is not our calculating virtue, which should prefer always what is to contribute most largely to the great sum of happiness, to rank as virtuous what is so extensively beneficial?

In treating of our emotions of love, as they vary in relation to their different objects, I endeavoured to exhibit to you that beautiful arrangement, with which, in all these varieties, Heaven has adapted the vividness of our affections, to our power of being beneficial; the love being most lively in those moral connexions, in which the opportunities of usefulness are most frequent, and capable of being most accurately applied, in relation to the peculiar wants of him who is to be benefited. The scale of duty, which corresponds with this scale of affection, and of probable usefulness, the ethical destroyers of private affection of course exclude. We are not to think more of those whom it is in our power, almost at every instant, to make happier than they were, than of those who are at the remotest distance from our sphere of usefulness. We are to view them according to their individual merits, as human beings only; the parent as the stranger, the stranger as the parent; and, when we strive thus to view them with equal affection, it is not difficult to discover which metamorphosis of feeling will be the more probable, in this one equalized emotion. It will be impossible for us to look on a stranger with the emotions of vivid regard, of which we are conscious, as often as we think of those from whom we derived existence, and whatever has made existence a gift of value. It is far from impossible, however, that, by frequently considering these earliest benefactors, as possessing no higher moral claim to our regard and good offices, than those who stand in the same relationship to any other person, we may learn, at least, to make an approximation to this indifference; and to regard a parent with the affection which we now feel for a stranger, more nearly than we regard a stranger with the affection which we now feel for a parent.

In the wide communion of the social world, each individual is, as it were, the centre of many circles. Near him, are those from whom he has derived most happiness, and to whom, reciprocally, it is in his power to diffuse most happiness, in continual interchange of kindness. In the circle beyond, are they who have had less opportunity of such mutual benefits than those who are nearer, but more than the widening number in the circles that progressively enlarge, as the distance from the centre increases, and enlarge in expansion and distance, with a corresponding inverse diminution of benefits

conferred, and of the capacity of being benefited. It would have been a system of very different adaptation for the production of happiness, if the scale of regard had been reversed; so that our benevolent wishes had been more and more vivid, in opposite progression, for those whom it was less and less in our power to serve. In such a case, it is very evident, that the general amount of happiness would have been reduced in two ways, by the omission of many opportunities of doing good to those immediately around us, of which, with livelier affection, we should not have failed to avail ourselves; and still more by the painful wish of relief to sufferers at a distance, to whose miseries this very distance deprived us of all power of contributing even the slightest means of alleviation. The evil of such a reversal of the present scale of affection and duty, is scarcely more than the evil that would arise to the world, from the equalization of regard in the system of universal duty, that excludes from its moral estimate every private affection. I do not speak at present of the impossibility of such a system, as inconsistent with some of the strongest principles of our nature. I proceed on the supposition of its possibility, and consider its influence on the happiness of the world, in comparison with the system on which we at present act. If we are to regard mankind, only according to their individual excellence, as members of one great society, and to sacrifice, therefore, all private feelings to one great public feeling that has this society of mankind for its object, the equal diffusion of our love to all, whose absolute merit is precisely the same, must, if produced at all, be produced in one of two ways; either by increasing, in a very high degree, the liveliness of our regard for those who are strangers to us, at a distance, or by lessening, in an equal degree, the liveliness of our regard for those who surround us in our immediate neighbourhood, and under the very shelter of our domestic roof. If the equality be produced by levelling these kinder feelings, so that, when an opportunity of doing good occurs to us, we think not of those who are beside us, and who may be speedily profited by it, but of some one at a greater distance, whom our action, if deferred, may never profit; if, with a constant moral fear of erring in the allotment of our expressions of benevolence, we look coldly on every one, on whom our eye is every moment falling in the domestic intercourse of the day, and reserve our courtesies, our smiles, our very tones of kindness, for some one of greater absolute merit, whom we expect to see before the day is closed, or whom we have at least a chance of seeing before we quit the world, it is evident that far more than half of the happiness of every day would be destroyed to every bosom, by this calculating

appreciation of kindness. It is not a mere faint desire of good to any one, that is quick to find the good which it desires. It is the lively benevolence that sees, in almost every thing, some relation to the happiness of the object loved; because the happiness of the object loved is constantly in the mind of him who feels that liveliness of benevolence. Opportunities of producing good, therefore, are never wanting to him who is strongly desirous of producing it; and to lessen the liveliness or our kind wishes for those who are around us, would, therefore, be to render ineffectual a thousand occasions of enjoyment or relief.

Such would be the evil of reducing the force of the peculiar interest which we feel, in the happiness of our relations, of our friends, of all who are connected with us by any of the closer bonds of social union. But the evil that could not fail to arise in this way, would be slight, compared with that which would arise, in the other circumstances supposed, if our affection for the most distant stranger were raised, so as to correspond in intensity with the liveliness of our feeling for those immediately around us. If it be our duty to wish in as lively a manner the happiness of the natives of some African tribe as of our friend or our father, we must either feel very little interest in the happiness of our friend or our father, or we must have a strong wish of benefiting that tribe of Africans, which, as such a wish must be wholly ineffectual on the part of the greater number of mankind, cannot fail to be a source of continued uneasiness. This would be the case, even though we were to think only of accessions to happiness, without taking into account the absolute misery of those in whose evils of every sort we are to sympathize, with all the quickness of commiseration, which transfers instantly to our own bosom a share of every evil that is suffered by those whom we love. Let us imagine a single individual, who, in accordance with such a system, feels for every wretchedness of every victim of disease, or captivity, or want, in every nation of the globe, a thousandth part of the agony which he would feel, if that victim were his parent, or his dearest friend; and let us then think, what the state of man would be, if all the sympathies of his nature had been thus arranged, in adaptation to a system of duties that excluded every local and accidental influence, and estimated human beings only as human beings. It would, indeed, be no slight evil, if we could learn to look with total disregard on the sorrows of others. But while there was misery in the world, if the misery of all individuals of all nations were to be equally felt by us, or not felt by us at all, an universal indifference would probably be less destructive to general happiness, than the anguish

of sharing 40 many miseries at the distance perhaps of half the earth, which it would be almost as vain for us to think of relieving, as of relieving the sufferings of the inhabitants of another planet. In proportioning our duties with our affections, to our facilities of affording aid to the miserable, and of affording happiness to the few whom it is most easy to render happy, nature has consulted best for general happiness; all are everywhere most active in administering relief or enjoyment, where activity may be most useful; and the beautiful result of the moral excellence of a state is thus produced in the same way as the political wealth and power of a state are produced, by innumerable little efforts, that individually increase the general amount, which is, at the time, no object of conception, but which, as it rises at last from the efforts of all, attracts the admiration of those who unconsciously contributed to it, and who, in admiring it when it has risen, are scarcely aware that the efforts which raised it were their own. To hope to produce greater virtue and happiness, by the exclusion of every particular duty, is in truth a speculation as wild, as it would be to hope to augment the political resources of an empire, by urging individuals to regard not their own profit in any case, but the profit of their thousand competitors, in the equal market of industry.

It is not evil, then, for man-upon the whole, that, in wishing the happiness of all mankind, he should wish, in an especial manner, the happiness of those who are connected with him by peculiar ties,—by those ties of additional duty which I have already enumerated. To the first of these I now proceed.

Of the ties of relationship, and the duties of which that relationship is the source, we may consider, in the first place, those under which man enters into life,—the ties which bind together with reciprocal duties, the parent and the child.

If we consider merely the powers of the individual, in relation to the evils to which he is exposed, man is born the most helpless of all created things. But if we consider the affection that exists in the bosoms to which he is for the first time pressed; the moral principle which, in those bosoms, would render the neglect of his wants one of the most atrocious of crimes; and the eager tendency to anticipate, with the necessary relief, the slightest expression of these wants,—a tendency which is instant of itself, and which requires no moral principle to call it into action,—must, we may truly say, is born as powerful as he is to be in years, when his own wisdom and the vigour of his own arm are to be to him what he may count a surer protection. He may afterwards speak with a voice of command to

those whose services he has purchased, and who obey him, because, in the barter which they have made of their services, it is their trade to obey; but he cannot, even then, by the most imperious orders which he addresses to the most obsequious slaves, exercise an authority more commanding than that which, in the first hours of his life, when a few indistinct cries and tears were his only language, he exercised irresistibly over hearts, of the very existence of which he was ignorant.

This feeling of regard is so strong in every breast, and so simple in its relation to the mere sustenance and protection of the little object of so many cares, that it would be a waste of time to treat of the primary obligation under which the parents lie, to save from perishing that human creature to which they have given existence, and which could not fail to perish, but for the aid which it is in their power to give to it. It is only with respect to the more complicated duties of the relation, in maturer years, that any difficulty can be felt.

These duties relate to the education of the child, to the provision which is made for his mere worldly accommodation, and to the expression of that internal love which should accompany all these cares, and without which it would be impossible to feel them as acts of kindness.

That such an education is to be given in every case, as is suitable to the pecuniary circumstances of the parents, and to the rank which the child may be expected afterwards to fill, there is probably no one who would deny, however much individuals may differ as to the meaning of the term education. In the lowest ranks of life, at least in far the greater part even of civilized Europe, it means nothing more than the training of the hands to a certain species of motion, which forms one of the subdivisions of mechanical industry. In the higher ranks, it implies, in like manner, a certain training of the limbs to series of motions, which are however not motions of mere utility, like those of the artisan, but of grace; and, in addition to those bodily movements, a training of the mind to a due command of certain graceful forms of expression, to which, in a few happier cases, is added the knowledge, more or less extensive and accurate, of the most striking truths of science. When all this is performed, education is thought to be complete. To express this completion by the strongest possible word, the individual is said to be accomplished; and if graceful motions of the limbs, and motions of the tongue, in well-turned phrases of courteous elegance, and a knowledge of some of the brilliant expressions of poets, and wits, and orators, of different countries, and of a certain number of the qualities of the masses or atoms which

surround him, were sufficient to render man what God intended him to be, the parent who had taken every necessary care for adorning his child with these bodily and mental graces, might truly exult in the consciousness that he had done his part to the generation which was to succeed, by accomplishing at least one individual for the noble duties which he had to perform in it. But, if the duties which man has to perform, whatever ornament they may receive from the corporeal and intellectual graces that may flow around them, imply the operation of principles of action of a very different kind; if it is in the heart that we are to seek the source of the feelings which are our noblest distinction,—with which we are what even God may almost approve, and without which we are worthy of the condemnation even of beings frail and guilty as ourselves; and if the heart require to be protected from vice, with far more care than the understanding itself, fallible as it is, to be protected from error, can he indeed lay claim to the praise of having discharged the parental office of education, who has left the heart to its own passions, while he has contented himself with furnishing to those passions the means of being more extensively baneful to the world than, with less accomplished selfishness, they could have been?

How many parents do we see, who, after teaching their sons by example every thing which is licentious in manners, and lavishing on them the means of similar licentiousness, are rigid only in one point—in the strictness of that intellectual discipline which may prepare them for the worldly stations to which the parental ambition has been unceasingly looking for them, before the filial ambition was rendered sufficiently intent of itself!—how many, who allow to the vices of the day full liberty, if the lesson of the day be duly meditated, and who are content that those whose education they direct should be knaves and sensualists, if only they be fitted by intellectual culture to be the leaders of other knaves, and the acquirers of wealth that may render their sensuality more delicately luxurious! To such persons, the mind of the little creature whom they are training to worldly stations for worldly purposes, is an object of interest only as that without which it would be impossible to arrive at the dignities expected. It is a necessary instrument for becoming rich and powerful; and if he could become powerful, and rich, and envied, without a soul,—exhibit the same spectacle of magnificent luxury, and be capable of adding to the means of present pomp, what might furnish out a luxury still more magnificent, they would scarcely feel that he was a being less noble than now. In what they term education, they have never

once thought that the virtues were to be included as objects; and they would truly feel something very like astonishment if they were told that the first and most essential part of the process of educating the moral being whom Heaven had consigned to their charge, was yet to be begun in the abandonment of their own vices, and the purification of their own heart by better feelings than those which had corrupted it; without which primary self-amendment, the very authority that is implied in the noble office which they were to exercise might be a source not of good but of evil to him who was unfortunately born to be its subject.

*Corrumpunt vitiorum exempla domestica, magnis

Sed peccaturo obſtet tibi filius infans.**

Though the enjoyments of this world, which so many seek as all, were truly all, and we ceased to exist when our mortal existence terminated, it would still be the duty of the parent to consult the happiness of the child, more than those circumstances of accidental happiness which may sometimes lead to it, but often, perhaps as often, are productive of misery; and, even of the short happiness of this short life, how large is the part which we have to ascribe to our virtuous affections, or rather, how very little is there of pure happiness which we can ascribe to any other source. But when we think how small a portion of our immortal existence is comprised in this earthly life; when, amid sensual pleasures that fade almost in the moment in which they are enjoyed, and wealth and dignities that are known more in their rapid changes, as passing from possessor to possessor, than as truly possessed by any one of the multitude, who, in their turns, obtain and lose them, we feel that, amid so many perishable and perishing things, virtue, the source of all which it is delightful to remember, is the only permanent acquisition which can be made,—how completely must he seem to have neglected the duty of a parent, who has thought only of a few years that are as nothing, and neglected that immortality which is all. If we had a long voyage to undertake, it would be but a cruel kindness that should pour forth its bounty on a single day, and

* Juvenal, Sat. xiv. v. 32—49.

provide for us only one repast, however costly. It is surely a kindness not less cruel which, in the common offices of education, thinks but of a single day, and makes provision only for its comfort in that endless course, not of years, but of ages, on which we enter in entering into life.

In giving to society another individual, we owe to it every care, on our part, that the individual, thus given to it, may not be one whose existence may be counted by society, among the evils that have oppressed it.

*Gratum est, quod patriae civem, populoque dedisti, Si facias, ut patriae sit idoneus.**

Nor is it only to the country to which we give a new citizen, that our gift is to be estimated, as a blessing or an injury, according to the nature of the living offering that is presented to it. To that very citizen himself the gift of existence is the greatest of all blessings, or the greatest of all injuries, only as his character is to be virtuous or vicious; and whether the character is to be virtuous or vicious, may often depend on circumstances which were almost at the disposal of him by whom the doubtful gift of mere existence was bestowed. "It is not a blessing," says an ancient philosopher, "to live merely, but to live well. Life in itself, if life without wisdom be a good, is a good that is common to me with the meanest reptiles; and he who gave me nothing more than life, gave me only what a fly or a worm may boast. If, in the love and hope of virtue, I have employed that life which my parents conferred on me, in studies that were to render me more noble in the sight of heaven, I have paid back to them more than I have received. My father gave me to myself rude and ignorant, I have given him a son, of whom it may delight him to be the father." "*Non est bonum vivere, sed bene vivere. Si vitam imputas mihi, per se, nudam, egentem consilii, et id ut magnum bonum jactas, cogita te mihi imputare muscarum ac vermium bonum. Deinde, ut nihil aliud dicam, quam bonis artibus me studuisse, ut cursum ad rectum iter vitae dirigerim; in ipso beneficio tuo majus quam quod dederas, receperisti. Tu enim me mihi rudem et imperitum dedisti: ego tibi filium, qualem genuisse gauderes.*"†

The neglect of parental duty, in the comparative inattention to the moral discipline of the mind, may indeed be considered only as a continuation to the offspring of the errors which influence the parent in conduct that relates wholly to himself. He seeks for them what he seeks for himself; and as he is ambitious to be rich or powerful, ra-

ther than happy, he wishes to enable them, in like manner, to be rich or powerful, and leaves their happiness, as he has left his own, to be the casual result of circumstances that may or may not produce it.

The importance attached by parents to the mere temporary circumstances of earthly splendour, which leads to one most fatal species of violation of parental duty in the sort of culture which they are most anxious to bestow, aggravates, in a very high degree, the second species of violation of it to which I alluded in enumerating the parental duties, that which consists in inadequate provision of those very means to which they attach so much importance. I do not speak at present of the extreme prodigality of those who think only of themselves, and who scarcely think even of themselves beyond an hour; the prodigality which leaves in indigence those who have been brought up in habits of luxury, that have rendered luxury, like that of their extravagant parents, almost an object of necessity to them. I allude to the intentional deliberate sacrifice which is made of the comforts of many children to the wealth of one,—a sacrifice which has usually, or at least often, tended only to make one less virtuous than he would have been, and many less happy. The national consequences of the privileges of primogeniture and of sex, belong to inquiries in political jurisprudence. At present, it is not of these that I speak. It is only of the wants of the children, and the affection and duty of the parent. These wants are obviously equal in all; and if the merits of all be equal, the affection of the parent should be the same, and his duty equal to all, who, with equal wants and equal merits, are consigned to his equal love. It is vain now to look for a justification of breaches of this equal duty, to periods of violence, in which it was necessary, for the happiness of all, that inequality of distribution should take place, that there might be one sufficiently powerful to protect the scantier pittance of the many. These circumstances of violence are now no more subsisting in the regular politics of Europe. The affections are allowed without peril to exercise themselves freely. The father of many virtuous children may safely be to all what he is to one; and if he lay aside this equal character, and sheltering himself in the forced manners of barbarous and tumultuous ages, make many poor that he may make one rich, he is guilty of a gross violation of his duties as a parent; and the more guilty, in exact proportion to the value which he attaches to the possession of the wealth so unequally distributed. Nor is it only to those whom he directly wills to impoverish, that he is guilty of a breach of duty; he is equally guilty of

* Juvenal, Sat. xiv. v. 70.

† Seneca de Beneficiis, lib. iii. cap. xxxi.

it, in many cases, to the single individual whom he exclusively enriches, if, in estimating what he confers, we consider the virtue and happiness, or vice and misery, that may arise from it, and not the mere wealth, which in itself is nothing. The superiority which is thus bestowed on a single individual, is a superiority that may, indeed, like every possession of power, lead to the exercise of corresponding virtues; to the generous mind it may present, as it has often presented, only wider occasions of generosity: yet beautiful as such examples may be, it is not what the general circumstances of our nature authorize us to expect; and the power of being thus generous, when, without that dubious generosity, those who have been made dependent on it may suffer what perhaps it was not intended that they should suffer, is a power of too great peril to human virtue to be rashly imposed upon human weakness.

Such are two of the great duties of parents:—those which relate to provision for the mental culture and temporal accommodation of their offspring. I have mentioned, as a third duty, that of tempering the parental authority with all the kindness of parental love, which, even in exacting obedience only where obedience is necessary for the good of him who obeys, is still the exacter of sacrifices which require to be sweetened by the kindness that demands them. This duty, indeed, may be considered as in some degree involved in the general duty of moral education; since it is not a slight part of that duty to train the mind of the child to those affections which suit the filial nature, and which are the chief element of every other affection that adorns in after-life the friend, the citizen, the lover of mankind. The father who has no voice but that of stern command, is a tyrant to all the extent of his power, and will excite only such feelings as tyrants excite; a ready obedience perhaps, but an obedience that is the trembling haste of a slave, not the still quicker fondness of an ever ready love; and that will be withheld in the very instant in which the terror has lost its dominion. It is impossible to have, in a single individual, both a slave and a son; and he who chooses rather to have a slave, must not expect that filial fondness which is no part of the moral nature of a bondman. In thinking that he increases his authority, he truly diminishes it; for more than half the authority of the parent is in the love which he excites, in that zeal to obey which is scarcely felt as obedience when a wish is expressed, and in that ready imitation of the virtues that are loved, which does not require even the expression of a wish, but without a command becomes all which a virtuous parent could have commanded.

LECTURE LXXXVIII.

OF THE DUTIES OF AFFINITY—PARENTAL DUTIES; FILIAL DUTIES; FRATERNAL DUTIES; CONJUGAL DUTIES.

In my last Lecture, Gentlemen, I arranged the duties which we owe to particular individuals, under five heads: as arising from affinity; from friendship; from benefits received; from contract; from the general patriotism which connects together all the citizens that live on the same soil, or under the protection of the same system of polity.

In considering the duties of affinity, we entered on our inquiry with those which belong to the first relationship of life,—the relationship that connects together, with a tie as delightful as it is indissoluble, the parent and the child. We begin to exist under the protection of the duties of others; the objects of a moral regard, of which we are soon ourselves to share the reciprocal influence; and, from the moment at which we are capable of understanding that there are beings around us who have benefited us, or to whom it is in our power to give a single enjoyment, our duties too commence, and life itself may be said to be a series of duties fulfilled or violated.

We are the objects of duty, however, before we are capable of feeling its force, or of knowing that we have ourselves duties to fulfil; and the nature of this primary obligation of the parent, of which we are the objects as soon as we have begun to breathe, and which death only can dissolve, was considered fully in my last Lecture. The preservation of the mere animal existence of the child is an office of parental obligation too obvious, however, and too simple to require elucidation. Our attention, therefore, was given to the other duties which the parental relation involves:—in the first place, the duty of giving to him, whose wisdom or ignorance, virtue or vice, happiness or misery, may depend in a great measure on the nature of the instruction and example which he may receive, such education as, while it trains him for all the honour and usefulness which his rank in life may seem to promise to the reasonable expectation of the parent, may not forget that this life is but the commencement of immortality, and the thoughts and feelings, therefore, which it is most important to cultivate, not those which have relation only to worldly wealth and dignity, but those to which the proudest honours of earthly life are but the accidents of a day. In the second place, even with respect to the short period of earthly exist-

ence, which, short as it is when compared with immortality, still admits of many enjoyments, which we may supply, or withhold, or lessen, and of many evils which we might have prevented; the duty of affording to the child such a provision of the means of worldly comfort and usefulness, as is suitable to the circumstances of the parent, and of affording this provision to the different members of a family, not in the manner which may seem best fitted to gratify the personal vanity of the provider, but in the manner that is best fitted to contribute to the happiness of all who, with a relationship that is precisely the same, if their merits and wants be equal, have a moral claim to equal regard, in the distribution that is to provide for those wants. In the third place, the duty of exercising with kindness the parental power; of imposing no restraint which has not for its object some good, greater than the temporary evil of the restraint itself, of making the necessary obedience of the child in this way not so much a duty as a delight; and of thus preparing him to be, in other years, the grateful and tender friend of a parent whose authority, even in its most rigid exactions, he has felt only as the watchful tenderness of friendship, that was rigid in withholding only what it would have been dangerous to grant.

Having considered, then, the duties of the parent, in all their relations to the being to whom he has given existence, let us now proceed to consider the reciprocal duties of the child. These arise from two sources,—from the power of the parent, and from his past kindness. As morally responsible, to a certain degree, for the happiness of the child, it is evident that he must have over it an authority of some sort, without which there could be no power of guarding it from the greatest of all dangers, the dangers of its own ignorance and obstinacy. It is equally evident, that, as the author of all the benefits which a parent can confer, he has a just claim to more than mere authority. From the salutary and indispensable power of the parent flows the duty of filial obedience; from the benevolence of the parent the duty of filial love, and of all the services to which that love can lead. Obedience, then, is the first filial duty,—a duty which varies in the extent of obligation at different periods of life, but which does not cease wholly at any period. The child must obey, with a subjection that is complete, because he is incapable of judging what would be most expedient for him, without the direction of another; and no other individual can be supposed so much interested, in directing to what is expedient for him, as the parent, who must reap an accession of happiness from his happiness, or suffer in his sufferings. The man should obey in every thing, indeed,

in which the obedience will not involve the sacrifice of a duty, but only some loss of comfort on his part; yet he is not, like the child, to obey blindly: for the reason which required the blindness of obedience does not exist in his case. He is capable of weighing accurately duty with duty, because he is capable of seeing consequences which the child cannot see. He is not to obey, where he could obey only by a crime; nor, even where the evil to be suffered would be only a loss of happiness to himself, can he be morally bound to make himself miserable for the gratification of a desire that, even in a parent, may be a desire of caprice or folly. Where the duty of obedience, in such cases, should be considered as terminating, it would not be easy to define by words; since the limit varies, not merely with the amount of the sacrifice required, but with the extent of former parental favour, that may have required a greater or less return of grateful compliance from the tenderness of filial obligation. I need not add, that, in any case of doubtful duty, a virtuous son will always be inclined to widen in some degree, rather than to narrow, the sphere of his obedience.

As the duty of obedience flows from the necessary power of the parent, in relation to the ignorance and weakness of those who are new to life, and therefore need his guidance, the filial duties of another class flow from the benefits conferred by the parent, benefits greater than can be conferred by any other; since to them is due the very capacity of profiting by the benefits of others. Of how many cares must every human being have been the subject, before he could acquire even the thoughtless vigour of boyhood; and how many cares additional were necessary, then, to render that thoughtless vigour something more than the mere power of doing injury to itself! They whose constant attention was thus necessary to preserve our very being, to whom we owe the instruction which we have received, and, in a great measure too, our very virtues, may have sometimes, perhaps, exercised a rigour that was unnecessary, or abstained from affording us comforts which we might have enjoyed without any loss of virtue. But still the amount of advantage is not to be forgotten on account of some slight evil. We owe them much, though we might have owed them more; and, owing them much, we cannot morally abstain from paying them the duties of those who owe much. They should have no wants while we have even the humblest superfluity; or rather, while want is opposed to want, ours is not that of which we should be the first to think. In their bodily infirmities, we are the attendants who should be most assiduous round their couch or their chair; and even those

mental infirmities of age which are more disgusting, the occasional peevishness which reproaches for failures of duty that were not intended, the caprice that exacts one day what it would not permit the day before, and what it is again to refuse on the succeeding day, we are to bear, not as if it were an effort to bear them, and a sacrifice to duty, but with that tenderness of affection which bears much because it loves much, and does not feel the sacrifices which it occasionally makes, because it feels only the love which delights in making them.

Lovely as virtue is in all its forms, there is no form in which it is more lovely than in this tender ministry of offices of kindness, where the kindness, perhaps, is scarcely felt, or considered less as kindness than as the duty which might have been fairly demanded, and which there is no merit, therefore, in having paid. Though we have often the gratification of seeing, in the progress of life, many beautiful examples of age that is not more venerable for its past virtues, than amiable with a lasting and still-increasing gentleness, which softens the veneration, indeed, but augments it even while it softens it, it is not always that the last years of life present to us this delightful aspect; and when the temper is, in these last years, unfortunately clouded,—when there is no smile of kindness in the faded eye, that grows bright again for moments, only when there is fretfulness in the heart,—when the voice that is feeble, only in the utterance of grateful regard, is still sometimes loud, with tones of a very different expression,—the kindness which, in its unremitting attention, never shows by a word or look, the sadness that is felt on these undeserved reproaches, and that regards them only as proofs of a weakness that requires still more to be comforted, is a kindness which virtue alone can inspire and animate, but which, in the bosom that is capable of it, virtue must already have well rewarded. How delightful is the spectacle, when, amid all the temptations of youth and beauty, we witness some gentle heart, that gives to the couch of the feeble, and, perhaps, of the thankless and repining, those hours which others find too short for the successive gaieties with which an evening can be filled, and that prefers to the smile of universal admiration the single smile of enjoyment, which, after many vain efforts, has at last been kindled on one solitary cheek!

If filial love be thus ready to bear with bodily and moral infirmities, it is not less ready to bear with intellectual weakness. There is often, especially in the middle classes of life, as great a difference of mental culture in the parent and the child as if they had lived at the distance of many centuries. The wealth that has been acquired by pa-

tient industry, or some fortunate adventure, may be employed in diffusing all the refinement of science and literature to the children of those, to whom the very words, science and literature, are words of which they would scarcely be able, even with the help of a dictionary, to understand the meaning. In a rank of life still lower, there are not wanting many meritorious individuals, who, uninstructed themselves, labour indefatigably to obtain the means of liberal instruction for one whose wisdom, in after-years, when he is to astonish the village, may gratify at once their ambition and love. It would, indeed, be painful to think, that any one, whose superiority of knowledge has cost his parents so much fatigue, and so many privations of comforts, which, but for the expense of the means of his acquired superiority, they might have enjoyed, should turn against them, in his own mind, the acquirements which were to them of so costly a purchase, despising them for the very ignorance which gave greater merit to their sacrifice, and proud of a wisdom far less noble, when it can thus feel contempt, than the humble ignorance which it despises.

He who, in the fulfilment of every filial duty, has obeyed as a son should obey, and loved as a son should love, may not, indeed, with all his obedience and affection, have been able to return an amount of benefit equal to that which he has received; but, in being thus virtuous, he has at least made the return that is most grateful to a virtuous parent's heart. He has not been unsuccessful in that contest of mutual love, in which, as Seneca truly says, it is happy to conquer and happy to be overcome. "*Alia ex aliis exempla subeunt*,"—he remarks, after citing many instances of filial duty,—"*eorum qui parentes suos periculis eripuerunt, qui ex infimo ad summum protulerunt, et e plebe acervoque ignobili nunquam tacendos saeculis dederunt. Nulla vi verborum, nulla ingenii facultate exprimi potest, quantum opus sit, quam laudabile, quamque nunquam a memoria hominum exiturum, posse hoc dicere. Parentibus meis parvi, cessi: imperio eorum, sive aequum, sive iniquum ac durum fuit, obsequentem submissumque me prae-bui: ad hoc unum contumax fui, ne beneficiis vincerer. Felices qui vicerint: felices qui vincuntur. Quid eo adolescente praeclearius, qui sibi ipsi dicere poterit (neque enim fas est alteri dicere) Patrem meum beneficiis vici! Quid eo fortunatus senex, qui omnibus ubique praedicabit, a filio suo beneficiis victum!?"*

Such is that beautiful arrangement of Heaven, to which I have already so often alluded, that, in adapting the weakness of

* De Beneficiis, lib. iii. cap. xxxviii.

one generation to the strength of the generation which preceded it, and to the love which finds an object of increasing regard in the very wants which are every moment relieved or prevented, has made that which might seem to common eyes a provision only for the continued existence of the race of man, a source of more than half the virtues of mankind. It is thus truly, as Pope says, that he

Who framed a whole, the whole to bless,
On mutual wants built mutual happiness.
So, from the first, eternal order ran,
And creature link'd to creature, man to man.
Whatever of life all-quickenng ether keeps,
Or breathes through air, or shoots beneath the deeps,
Or pours profuse on earth, one nature feeds
The vital flame, and swells the genial seeds.
Thus beast and bird their common charge attend,
The mothers nurse it, and the sires defend;
The young dainties'd to wander earth or air,
There stops the instinct, and there ends the care,
The link dissolves, each seeks a fresh embrace,
Another love succeeds, another race.
A longer care Man's helpless kind demands;
That longer care contracts more lasting bands.
Still as one brood, and as another rose,
These natural love maintained, habitual those.
Reflection, reason, still the ties improve,
At once extend the interest and the love;
And still new needs, new helps, new habits rise,
That graft benevolence on charities.*

Next in order to the relationship of the parent and child, may be considered the relation which the child bears to those who are united with him by the same tie, to the same parental bosoms. If friendship be delightful, if it be above all delightful to enjoy the continued friendship of those who are endeared to us by the intimacy of many years, who can discourse with us of the frolics of the school, of the adventures and studies of the college, of the years when we first ranked ourselves with men in the free society of the world, how delightful must be the friendship of those who, accompanying us through all this long period, with a closer union than any casual friend, can go still farther back, from the school to the very nursery which witnessed our common pastimes, who have had an interest in every event that has related to us, and in every person that has excited our love or our hatred, who have honoured with us those to whom we have paid every filial honour in life, and wept with us over those whose death has been to us the most lasting sorrow of our heart. Such, in its wide unbroken sympathy, is the friendship of brothers, considered even as friendship only, and how many circumstances of additional interest does this union receive from the common relationship to those who have original claims to our still higher regard, and to whom we offer an acceptable service, in extending our affection to those whom they love. In treating of the circumstances that tend peculiarly to strengthen this tie, Cicero ex-

tends his view even to the common sepulchre that is at last to enclose us: "*Sanguinis conjunctio devincit caritate homines. Magnum est enim, eadem habere monumenta majorum, iisdem uti sacris, sepulchra habere communia.*" It is, indeed, a powerful image, a symbol, and almost a lesson of unanimity. Every dissension of man with man excites in us a feeling of painful incongruity. But we feel a peculiar incongruity in the discord of those whom one roof has continued to shelter during life, and whose dust is afterwards to be mingled under a single stone.

On the fraternal duties, however, I need not dwell, because they may be considered very nearly in the same light as the duties of that friendship to which I have already compared them, the duties of a cordial intimacy rendered more sacred by relationship to the parents from whom we have sprung, and to whom we owe common duties, as we have been objects of common cares. By the peculiar domestic attachments of this sort, and the mutual services thence arising, the world is benefited with the accession to its general happiness, of the reciprocal enjoyments of a regard that has already found friends, before it could have thought of seeking them. Surrounded by the aged, or at least by those who are aged in relation to his first years of boyhood, the child would have learned only to respect and obey. With the little society of his equals around him, he learns that independence and equality of friendship, which train him to the affections that are worthy of a free and undaunted spirit, in the liberty and equal society of maturer years. As a son, he learns to be a good subject; as a brother, he learns to be a good citizen.

The duties which we owe to more distant relations, vary, as might naturally be supposed, with the circumstances of society, according to the varying necessity of mutual aid. Where the protection of law is feeble, and it is necessary therefore for many to unite, in common defence, the families that spring from one common stock continue to cling to each other for aid almost as if they lived together under the same roof; it is truly one wide family rather than a number of families; the history of the tribe, in its most remote years of warfare and victory is the history of each individual of the tribe; and the mere remembrance of the exploits of those who fought with one common object, around the representative of their common ancestor, is, like the feeling of the fraternal or filial relation itself, prolonged from age to age; while the affection thus flowing from the remembrance of other years is continually strengthened by the important services which each individual is still able to perform for the whole, on occasions of similar peril. In

* Essay on Man, Ep. iii. v. 111, &c.

other circumstances of society, the necessity of this mutual aid is obviated by the happier protection of equal law ; and objects of new ambition, separating the little community into families that have their own peculiar interests, with little, if any necessity, for reciprocations of assistance, the duty of giving such assistance is at once less important, and no longer receives any aid from the powerful circumstances of association, which, in a different state of manners, rendered the most distant relative an object of almost sacred regard.

"It is not many years ago," says Dr. Smith, "that, in the Highlands of Scotland, the chieftain used to consider the poorest man of his clan as his cousin and relation. The same extensive regard to kindred is said to take place among the Tartars, the Arabs, the Turkomans, and, I believe, among all other nations who are nearly in the same state of society in which the Scots Highlanders were about the beginning of the present century.

"In commercial countries, where the authority of law is always perfectly sufficient to protect the meanest man in the state, the descendants of the same family, having no such motive for keeping together, naturally separate and disperse, as interest or inclination may direct. They soon cease to be of importance to one another ; and, in a few generations, not only lose all care about one another, but all remembrance of their common origin, and of the connexion which took place among their ancestors. Regard for remote relations becomes, in every country, less and less, according as this state of civilization has been longer and more completely established. It has been longer and more completely established in England than in Scotland ; and remote relations are, accordingly, more considered in the latter country than in the former, though, in this respect the difference between the two countries is growing less and less every day. Great lords, indeed, are, in every country, proud of remembering and acknowledging their connexion with one another, however remote. The remembrance of such illustrious relations flatters not a little the family pride of them all ; and it is neither from affection, nor from any thing which resembles affection, but from the most frivolous and childish of all vanities, that this remembrance is so carefully kept up. Should some more humble, though perhaps much nearer kinsman, presume to put such great men in mind of his relation to their family, they seldom fail to tell him that they are bad genealogists, and miserably ill-informed concerning their own family history. It is not in that order, I am afraid, that we are to expect any extraordinary extension of what is called natural affection."*

The duties to which I next proceed, are those which flow from an affection that is one of the most powerful indeed of the affections which nature prompts, but to which she does not point out any particular individual as demanding it, without our choice. The only influence which she exercises is on our choice itself.

It is the conjugal relation of which I speak, — a relation of which the duties, like the duties of all our other reciprocal affinities, however minutely divided and subdivided, are involved in the simple obligation to make those who are the objects of it as happy as it is in our power to make them.

In these few simple words, however, what a complication of duties is involved, of duties which it is less easy for the ethical inquirer to state and define, than for the heart which feels affection to exercise them all with instant readiness. He who loves sincerely the object of any one of those relations which bind us together in amity, and who is wise enough to discern the difference of conferring a momentary gratification which may produce more misery than happiness, and of conferring that which is not merely present happiness, but a source of future enjoyment, needs no rule of duty, as far at least as relates to that single individual, for the direction of a conduct, of which love itself, unaided by any other guidance, will be a quick and vigilant director.

The husband should have, then, as his great object and rule of conduct, the happiness of the wife. Of that happiness, the confidence in his affection is the chief element ; and the proofs of this affection on his part, therefore, constitute his chief duty, — an affection that is not lavish of caresses only, as if these were the only demonstrations of love, but of that respect which distinguishes love as a principle, from that brief passion which assumes, and only assumes the name, — a respect which consults the judgment, as well as the wishes of the object beloved, which considers her who is worthy of being taken to the heart, as worthy of being admitted to all the counsels of the heart. If there are any delights, of which he feels the value as essential to his own happiness, if his soul be sensible to the charms of literary excellence, and if he consider the improvement of his own understanding, and the cultivation of his own taste, as a duty and one of the most delightful duties of an intellectual being ; he will not consider it as a duty or a delight that belongs only to man, but will feel it more delightful, as there is now another soul that may share with him all the pleasure of the progress. To love the happiness of her whose happiness is in his affection, is of course to be conjugally faithful ; but it is more than to be merely faithful ; it is not to allow room

* Theory of Moral Sentiments, vol. ii. p. 70—72. 10th edition.

even for a doubt as to that fidelity, at least for such a doubt as a reasonable mind might form. It is truly to love her best, but it is also to seem to feel that love which is truly felt.

As the happiness of the wife is the rule of conjugal duty to the husband, the happiness of the husband is in like manner the rule of conjugal duty to the wife. There is no human being whose affection is to be to her like his affection, as there is no happiness which is to be to her like the happiness which he enjoys. All which I have said of the moral obligation of the husband, then, is not less applicable to her duty; but, though the gentle duties belong to both, it is to her province that they more especially belong, because she is at once best fitted by nature for the ministry of tender courtesies, and best exercised in the offices that inspire them. While man is occupied in other cares during the business of the day, the business of her day is but the continued discharge of many little duties that have a direct relation to wedlock, in the common household which it has formed. He must often forget her, or be useless to the world: she is most useful to the world by remembering him. From the tumultuous scenes which agitate many of his hours, he returns to the calm scene, where peace awaits him, and happiness is sure to await him, because she is there waiting, whose smile is peace, and whose very presence is more than happiness to his heart.

Here Love his golden shafts employs, here lights
His constant lamp, and waves his purple wings—
Here reigns and revels.*

The vows, which constitute a solemn part of the matrimonial engagement, give to this duty of reciprocal love the sanction of an additional authority; but they only give an additional sanction, and increase the guilt of violating duties, which, without these vows, it would still have been guilt to violate.

The husband is to seek the happiness of his wife, the wife to seek the happiness of her husband. This rule is sufficiently simple and efficacious, where affection is sufficiently strong, as in the domestic scenes of harmony and delight which I have pictured. But there may be cases of occasional disagreement, and then what is the duty? In such cases, it is obviously necessary, that, for mutual peace, the will of one should be submitted to the will of the other; and, if a point so important as this were left to the decision of the individuals themselves, without any feeling of greater duty on either side, the disagreement, it is evident, would still be continued, under a different name; and, instead of combating who should concede, the controversy would be, of whom it was the

duty to make the concession. It is of most important advantage, therefore, upon the whole, that there should be a feeling of duty to be called in for decision, in such unfortunate cases; and since, from various circumstances, natural and factitious, man is everywhere in possession of physical and political superiority, since his education is usually less imperfect, and since the charge of providing for the support of the family, in almost every instance, belongs to him, it is surely, from all these circumstances, fit, upon the whole, that, if the power of decision, in doubtful matters, should be given to one rather than to the other, it should be with man that it is to rest, whatever number of exceptions there may be, in which, but for the importance of the general rule, it would have been of advantage that woman, in those cases the wiser and more virtuous, were the decider.

The power of decision therefore, which, for the sake of peace, must be understood as resting somewhere, should rest with man; but though it rest with him, it is only in unfortunate cases, as I before said, that the power of authoritative decision should be exercised. In the general circumstances of conjugal life, there should be absolute equality, because, where love should be equal, there should be that equal desire of conferring happiness, which is implied in equality of love; and he who, from the mere wish of gratifying his feeling of superiority, can wilfully thwart a wish of her whose wishes, where they do not lead to any moral or prudential impropriety, should be to him like his own, or even dearer than his own, if they did not truly become his wishes, when known to be hers, would deserve no slight punishment, as the violator of conjugal obligation, if he were not almost sufficiently punished in the very want of that better affection, the delightful feeling of which would have saved him from his tyranny of power.

"The husband, it has been said, should decide in affairs of importance; the wife in smaller matters. But the husband should decide, in consulting his wife, the wife in seeking what is to please her husband. Let them learn often the pleasure of mutual concessions. Let them say often, I wish this because it is right; but let them say sometimes, too, I wish this much, because I love you."†

The great evil, in matrimonial life, is the cessation of those cares which were regarded as necessary for obtaining love, but which are unfortunately conceived to be less necessary when love is once obtained. The carelessnesses of a husband are not less severely felt, however, because they are the neglects of one whose attentions are more

* *Paradise Lost*, book iv. v. 763—765.

† *De St. Lambert*, *Œuv. Phil.* tome iii. p. 38.

valuable, as he who offers them is more valued; and frequent inattentions, by producing frequent displeasure, may at last, though they do not destroy love wholly, destroy the best happiness of love. No advice can be more salutary for happiness, than that which recommends an equal attention to please, and anxiety not to offend, after twenty years of wedlock, as when it was the object of the lover to awake the passion, on which he conceived every enjoyment of his life to depend. We gain at least as much in preserving a heart as in conquering one.

The cessation of these cares would be, of itself, no slight evil, even though love had originally been less profuse of them than it usually is, in the extravagance of an unreflecting passion. She who has been worshipped as a goddess, must feel doubly the insult of the neglect which afterwards disdains to bestow on her the common honour that is paid to woman; and with the ordinary passions of a human being, it will be difficult for her to retain, I will not say love, for that is abandoned, but the decorous and dignified semblance of love, for him who has cared little for the reality of it. It is not easy to say by how insensible a transition, in many cases, this conjugal resentment, or forced indifference, passes into conjugal infidelity; though it is easy, in such a case, to determine to whom the greater portion of the guilt is to be ascribed.

But it will perhaps be said, love is not dependent on our mere will, and how can we continue to love one whom no effort of ours can prevent us from discovering to be unworthy of our continued affection? But by whom is this objection usually made? Not by those who, in engaging to love, and honour, and cherish during life, have been careful in considering who it was to whom they entered under this solemn engagement. It is, in almost every instance, the objection of those who, when they formed the engagement, made a vow, of the real import of which they were regardless; and who afterwards dare to plead one crime as the justification of another. There are duties of marriage which begin before the marriage itself, in the provision that is made for matrimonial virtue and happiness; and he who neglects the means of virtuous love, in a state of which virtuous love is to be the principal charm, is far more inconsiderate and far more guilty than the heedless producer of misery, who forms a matrimonial connexion without the prospect of any means of subsistence for one who is to exist with him, only to suffer with him in indigence, and for the little sufferers who are afterwards to make indigence still more painfully felt. He who has vowed to love one to whom he pledges love, only because he knows that she is worthy of such a pledge, will not af-

terwards have reason to complain of the difficulty of loving the unworthy.

If, however, it be necessary for man to be careful to whom he engages himself by a vow so solemn, it is surely not less necessary for the gentler tenderness of woman. She, too, has duties to fulfil, that depend on love, or at least that can be sweetened only by love; and when she engages to perform them where love is not felt, she is little aware of the precariousness of such a pledge, and of the perils to which she is exposing herself. It is truly painful then to see, in the intercourse of the world, how seldom affection is considered as a necessary matrimonial preliminary, at least in one of the parties, and in the one to whom it is the more necessary; and how much quicker the judgment of fathers, mothers, friends, is to estimate the wealth or the worldly dignity than the wisdom or the virtue which they present as a fit offering to her, whom wealth and worldly dignity may render only weaker and more miserable, but whom wisdom might counsel and virtue cherish. It is painful to see one who has, in other respects, perhaps, many moral excellences, consent, as an accomplice in this fraud, to forego the moral delicacy which condemns the apparent sale of affection that is not to be sold,—rejoice in the splendid sacrifice which is thus made of her peace,—consign her person to one whom she despises, with the same indifference as she consigns her hand,—a prostitute for gold, not less truly because the prostitution is to be for life, and not less criminally a prostitute, because to the guilt and meanness of the pecuniary barter, are added the guilt of a mockery of tenderness that wishes to deceive man, and the still greater guilt of a perjury that, in vows which the heart belies, would wish to deceive the God on whom it calls to sanction the deceit.

When marriages are thus formed, it is not for the sufferer to complain, if she find that she has acquired a few more trappings of wealth, but not a husband. She has her house, her carriage, and the living machines that are paid to wait around her and obey her; she takes rank in public spectacles, and presides in her own mansion, in spectacles as magnificent; she has obtained all which she wished to obtain; and the affection and happiness which she scorned, she must leave to those who sought them.

"There is a place on the earth," it has been said, "where pure joys are unknown, from which politeness is banished, and has given place to selfishness, contradictions, and half-veiled insults. Remorse and inquietude, like furies that are never weary of assailing, torment the inhabitants. This place is the house of a wedded pair who have no mutual love, nor even esteem. There is a place on the earth to which vice has no entrance,

where the gloomy passions have no empire, where pleasure and innocence live constantly together, where cares and labours are delightful, where every pain is forgotten in reciprocal tenderness, where there is an equal enjoyment of the past, the present, and the future. It is the house too of a wedded pair, but of a pair who, in wedlock, are lovers still.”*

LECTURE LXXXIX.

OF THE DUTIES OF FRIENDSHIP; DUTIES OF GRATITUDE.

GENTLEMEN, in our arrangement of the duties which we owe to particular individuals, as reducible to five orders,—those which arise from affinity, you will remember, constituted the first division.

The particular duties, as yet considered by us, have all belonged to this first division, the duties of relationship, parental, filial, fraternal, conjugal; in the exercise of which, and in the reciprocal enjoyment of them as exercised by others, is to be found that gracious system of domestic virtue, under the shelter of which man reposes in happiness, and resting thus, in the confidence of affection and delight, becomes purer of heart, and more actively beneficent, by the very happiness which he feels.

It is of these domestic virtues that we must think, when we think of the morals of a nation. A nation is but a shorter name for the individuals who compose it; and when these are good fathers, good sons, good brothers, good husbands, they will be good citizens; because the principles which make them just and kind under the domestic roof, will make them just and kind to those who inhabit with them that country which is only a larger home. The household fire, and the altar, which are coupled together in the exhortations of the leaders of armies, and in the hearts of those whom they address, have a relation more intimate than that of which they think, who combat for both. It is before the household fire, that every thing which is holy and worthy of the altar is formed. There arose the virtues that were the virtues of the child, before they were the virtues of the warrior or the statesman; and the mother who weeps with delight at the glory of her son, when a whole nation is exulting with her, rejoices over the same heroic fortitude, that at a period almost as delightful to her, in the little sacrifices which boyish generosity could make, had already often gladdened her heart, when she thought only of the gentle virtues before her, and was not

aware of half the worth of that noble offering which she was speedily to make to her country and to the world.

From the domestic affinities, the transition is a very easy one, to that bond of affection which unites friend to friend, and gives rise to an order of duties almost equal in force to those of the nearest affinity.

We are formed to be virtuous, to feel pleasure in contemplating those parts of our life which present to us the remembrance of good deeds, as we feel pain in contemplating other portions of it, which present to us only remembrances of moral evil; and the same principle which makes us love in ourselves what is virtuous, renders it impossible for us to look with indifference on the virtues of another. The principle of moral emotion alone would thus be sufficient to lead to friendship, though there were no other principle in our nature that could tend to make a single human being an object of our regard.

But we are not lovers of virtue only; we are lovers of many other qualities, which add to our happiness, not so much as our own virtues indeed, but often as much as we could derive, in the same space of time, from the mere virtue of those with whom we mix in society. We love gaiety, and we therefore love those who can render us gay, by their wit, by the fluency of their social eloquence, by those never-ceasing smiles of good humour, which are almost, to our quick sympathy of emotion, like wit and eloquence; we hate sorrow, and we love those who, by the same powerful aid, can enable us to shake off the burthen of melancholy, from which our own efforts are, as we have too often found, unable of themselves to free us; we have plans of business or amusement, and we love those whose co-operation is necessary to their success, and who readily afford to us that co-operation which we need; we are doubtful, in many cases, as to the propriety of our own conduct, and if all others acted differently, we should be driven back to the uncertainty or the reproach of our own conscience, without any consolation from without; we therefore love those who, by acting as we act, seem to say to us that we have done well; or who, at least, when it is impossible for us to flatter ourselves with this illusion, comfort us with the only palliation which our conscience can admit, that we are not more reprehensible than others around us. Even without regard to all these causes of love, it is miserable to us to be alone. The very nature of all our emotions leads them to pour themselves out to some other breast; and the stronger the emotion, the more ardent is this propensity. We must make some one know why we are glad, or our gladness will be an oppression to us, almost as much as a delight. If we are

* De St. Lambert, Œuv. Phil. tome ii. p. 63.

in wrath, our anger seems to us incomplete, till not one only, but many, share our resentment. The sovereign would feel little pleasure in all the splendour of his throne, if he were to sit upon it for ever, with subjects around him to whom he was to be always a sovereign, and only a sovereign; and the very misanthrope, who abandons the race of mankind, in his detestation of their iniquity, must still have some one with whom he may give vent to his indignation, by describing the happiness which he feels, in having left the wicked to that universal wickedness which is worthy of them, and which he almost loves, because it enables him to hate them more thoroughly.

Thus lavish has nature been to us of the principles of friendship. With all these causes, that, singly, might dispose to cordial intercourse, and that exert in most cases an united influence, it is not wonderful that the tendency to friendship of some sort should be a part of our mental constitution, almost as essential to it as any of our appetites. It is scarcely a metaphor, indeed, which we employ, when we term it an appetite, an appetite arising from our very nature as social beings; and, if our appetites, like our other desires, bear any proportion to the amount of the good which is their object, it must be one of the most vivid which it is possible for us to feel; because it relates to a species of happiness, which is among the most vivid of our enjoyments; in many cases approaching the delight of the most intimate domestic relations, and scarcely to be counted inferior to the delight arising from any other source, unless when we think of that virtue which is essential to the enjoyment of all. To take friendship from life, says Cicero, would be almost the same thing, as to take the sun from the world. "*Solem a mundo tollere videntur, qui amicitiam e vita tollunt.*" It is, indeed, the sunshine of those who otherwise would walk in darkness; it beams with unclouded radiance on our moral path, and is itself warmth and beauty to the very path along which it invites us to proceed. He knows not how poor all the splendours of worldly prosperity are in themselves, who enjoys them with that increase of happiness which friendship has given to them; and he who is still rich enough to have a friend, cannot know what extreme poverty and misery are; because the only misery which is truly misery, is that which has no one to comfort it.

Celestial Happiness! when'er she stoops
To visit earth, one shrine the goddess finds,
And one alone, to make her sweet amends
For absent Heaven,—the bosom of a friend;
Where heart meets heart, reciprocally soft,
Each other's pillow to repose divine.*

* Night Thoughts, Night ii.

"Quantum bonum est, ubi sunt præparata pectora, in quæ tutò secretum omne descendat, quorum conscientiam minus quam tuam timeas, quorum sermo solitudinem leniat, sententia consilium expediat, hilaritas tristitiam dissipet, conspectus ipse delectet." How great a blessing is it, to have bosoms ever ready for receiving and preserving faithfully whatever we may wish to confide; whose conscious memory of our actions we may fear less than our own, whose discourse may alleviate our anxiety, whose counsel may fix our own doubtful judgment, whose hilarity may dissipate our sorrow, whose very aspect may delight.

There is unquestionably, in the very presence of a friend, a delight of this sort, which has no other source than the consciousness of the presence of one who feels for us the regard which we feel for him. "When I ask myself," says Montaigne, after a very lively description which he gives of his affection for his friend,—"*When I ask myself whence it is that I feel this joy, this ease, this serenity, when I see him,—it is because it is he, it is because it is I, I answer; and this is all which I can say.*"

On the delight which friendship affords, however, it would be idle to expatiate. There is no subject, scarcely even with the exception of love itself, on which so much has been written, by philosophers and declaimers of all sorts, in prose and poetry. I might repeat to you innumerable commonplaces on the subject, and prove to you logically, by many arguments, that what you have all felt to be delightful, is delightful. For the evidence of this, however, I may safely leave you to your own consciousness. You have many friendships, and perhaps your most important and permanent friendships still to form; but if you have never yet felt what friendship is, there is little reason to think that you will ever feel it; and if you have felt it, though you may not yet have been in situations that might enable you to derive from it all the advantages which it is capable of yielding, the very consciousness of the regard itself will enable you to anticipate them all. He who has never been in poverty, in long and almost hopeless disease, in any deep distress of any sort, may yet know what consolation the attentions of friendship would administer to the sorrow which he has never felt; and if he ever feel the sorrow and the consolation, will not acquire any new knowledge of the extent of the delightful influence which he had long known how to appreciate, but only a new cause of gratitude to him, who, in doing much, had done only what it was expected of his ready tenderness and generosity to do. "There is, indeed," as it has been truly said, "only one species of misery which friendship cannot comfort,—the misery of atro-

cious guilt; but hearts capable of genuine friendship, are not capable of committing crimes. Though it cannot comfort guilt, however, which ought not to be comforted, friendship is still able to console at least the too powerful remembrance of our faults and weaknesses; its voice reconciles us to ourselves; it shows us the means of rising again from our fall; and our fall itself it leads others to forget, in the same manner as it leads us to forget it, by recalling to us and to others our estimable qualities, and prompting us to the exercise of them. Friendship repairs every thing, remedies every thing, comforts every thing.*

Friendship, however, is not a source of pleasure only; it is also a source of duty; and it is chiefly in this respect that we are now to regard it.

The duties that relate to friendship may be considered in three lights; as they regard the commencement of it, the continuance of it, and its close.

Our first duties are those which relate to the choice of a friend.

If we were sufficiently aware how great a command over our whole life we give to any one whom we admit to our intimacy; how ready we are to adopt the errors of those whom we love; and to regard their very faults, not merely as excusable, but as objects of imitation, or at least to imitate them without thinking whether they ought to be imitated, and without knowing even that we are imitating them; we should be a little more careful than we usually are, in making a choice, which is to decide in a great measure whether we are to be virtuous or vicious, happy or miserable; or which, in many cases, if we still continue happy, upon the whole, must often disturb our happiness, and, if we still continue virtuous, make virtue a greater effort. "The bandage which, in our poetic fictions, we give to Love," says the Marchioness de Lambert, "we have never thought of hanging over the clear and piercing eyes of Friendship. Friendship has no blindness: it examines before it engages, and attaches itself only to merit."†

The picture is a beautiful one; but it is a picture rather of what friendship ought to be, than of what friendship always is. The bandage, indeed, is not so thick as that which covers the eyes of Love, and it is not so constantly worn; but when it is worn, though it admits some light, it does not admit all. We must tear it off before we see clearly; or we must be careful at least what hands they are which we permit to put it on.

It is before we yield ourselves, then, to the

regard, that we should strive to estimate the object of it, and to estimate his value, not by the gratification of a single day, but by the influence which he may continue to exercise on our life. If friendship, indeed, were a mere pastime, that ended with the amusement of some idle hours, it might be allowed to us to select, for our companions, those who might best amuse our idleness; it would be enough to us then that our friend was gay, and had the happy talent of making others gay. If it were a mere barter of courtesies, for a little wealth or distinction, it might be allowed to us, in like manner, to select those whose power and opulence seemed to promise to our ambition and avarice the best return of gain; it would then be enough if our friend possessed a station that might enable him to elevate us, not perhaps to his own rank, but at least a little higher than we are. Then, indeed, the propriety or impropriety of friendship might be estimated as readily, and almost in the same manner, as we estimate the worth of any common marketable commodity. But if it be an alliance of heart with heart,—if, in giving our sorrows or projects to be shared by another, we are to partake, in our turn, his sorrows or designs, whatever they may be,—to consider the virtue of him whom we admit to this diffusion with us of one common being, and to yield our affection, only as we discover the virtue which alone is worthy of it, is almost the same thing as to consult for our own virtue. The vice of him whom we love,—the vice which we must palliate to every censurer, and which we strive to palliate even to our own severe judgment, will soon cease to appear to us what it is; and it will require but a little longer habit of palliation, and a little longer intercourse of cordial regard, to win from us that occasional conformity which, with us too, may soon become a habit. Even though we escaped from the vices of the wicked, however, it would be impossible for us to escape from their misery. We must share the embarrassments and vexations, the fear and the disgrace, to which their moral errors must inevitably lead them; and though the friendship of the virtuous had no other superiority of attraction than this one, it would still be enough to determine the choice of the wise,—that, in becoming the friends of the good, they would have nothing to fear but misfortunes, which require pity only and consolation, not shame; that, if they had no reason to blush for themselves, they would have no reason to blush for those whom, by their selection, they had exhibited to the world as images of their own character; nor to feel, in the very innocence of their own heart, by the moral perplexities in which their sympathies involved them, if not what is hateful in guilt, at least all which is wretched in it.

* De St. Lambert, *Œuvres Philosophiques*, tome iii. p. 82.

† De St. Lambert, *Œuvres*, tome i. p. 236. Paris, 1763.

A single line of one of our old poets conveys, in this respect, a most sententious lesson, in bidding us consider what sort of a friend he is likely to prove to us, who has been the destroyer, or at least the constant disquieter, of his own happiness.

See if he be
Friend to himself, who would be friend to thee.

The necessity of virtue, then, in every bosom of which we resolve to share the feelings, would be sufficiently evident, though we were to consider those feelings only; but all the participation is not to be on our part. We are to place confidence, as well as to receive it; we are not to be comforters only, but sometimes, too, the comforted; and our own conduct may require the defence which we are sufficiently ready to afford to the conduct of our friend. Even with respect to the pleasure of the friendship itself, if it be a pleasure on which we set a high value, it is not a slight consideration whether it be fixed on one whose regard is likely to be as stable as ours, or on one who may in a few months, or perhaps even in a few weeks, withhold from us the very pleasure of that intimacy which before had been profusely lavished on us. In every one of these respects, I need not point out to you the manifest superiority of virtue over vice. Virtue only is stable, because virtue only is consistent; and the caprice which, under a momentary impulse, begins an eager intimacy with one, as it began it from an impulse as momentary with another, will soon find a third, with whom it may again begin it, with the same exclusion, for the moment, of every previous attachment. Nothing can be juster than the observation of Rousseau on these hasty starts of kindness, that "he who treats us at first sight like a friend of twenty years standing, will very probably, at the end of twenty years, treat us as a stranger, if we have any important service to request of him."

If, without virtue, we have little to hope in stability, have we, even while the semblance of friendship lasts, much more to hope as to those services of kindness which we may need from our friends? The secrets which it may be of no importance to divulge, all may keep with equal fidelity; because nothing is to be gained by circulating what no man would take sufficient interest in hearing, to remember after it was heard; but if the secret be of a kind which, if made known, would gain the favour of some one whose favour it would be more profitable to gain than to retain ours, can we expect fidelity from a mind that thinks only of what is to be gained by vice, in the great social market of moral feelings, not of what it is right to do? Can we expect consolation in our affliction from one who regards our adversity

only as a sign that there is nothing more to be hoped from our intimacy; or trust our virtues to the defence of him who defends or assails as interest prompts, and who may see his interest in representing us as guilty of the very crimes with which slander has loaded us? In such cases, we have no title to complain of the treacheries of friendship; for it was not friendship in which we trusted: the treachery is as much the fault of the deceived as of the deceiver: we have ourselves violated some of the most important duties of friendship, the duties which relate to its commencement.

When friendship has commenced, after all those necessary cautions which form its first set of duties, a new set of duties begins their obligation. We have chosen cautiously, and we are now to confide: we have chosen one whom it is virtuous to love, and we are to perform to him all the services of love.

We are to confide, in the first place, not with that timid irresolute communication of our plans and wishes, which almost provokes to the very infidelity that appears to be suspected, but with that full opening of the heart, without which there is no confidence, and therefore none of the advantages of confidence. "If you think any one your friend," a Roman moralist says, "in whom you do not put the same confidence as in yourself, you know not the real power of friendship. Consider long, whether the individual whom you view with regard, is worthy of being admitted to your bosom; but when you have judged, and found him truly worthy, admit him to your very heart. You should so live, indeed, as to trust nothing to your own conscience which you would not trust to your enemy; but, at least to your friend, let all be open. He will be the more faithful, as your confidence in his fidelity is more complete. *Si aliquem amicum existimas, cui non tantundem credis quantum tibi, vehementer erras, et non satis nosti vim verae amicitiae. Tu vero omnia cum amico delibera, sed de ipso prius. Post amicitiam credendum est, ante amicitiam judicandum. Isti vero praepostere officia permiscunt, qui, contra praecepta Theophrasti, cum amaverint judicant, et non amant cum judicaverint. Diu cogita, an tibi in amicitiam aliquis recipiendus sit; cum placuerit fieri, toto illum pectore admitte. Tam audacter cum illo loquere quam tecum. Tu quidem ita vive, ut nihil tibi committas, nisi quod committere etiam inimico possis; sed quia interveniunt quaedam, quae consuetudo fecit arcana, cum amico omnes curas, omnes cogitationes tuas misce. Fidelem si putaveris, facies."*

He who is worthy of our confidence is

* Seneca, Epist. lii.

worthy of our kindness; and, therefore, of all the aid which our kindness can bestow. I need not say that we are guilty of a breach of duty, if, with the power of furthering his advancement in life, we withhold our assistance. If he be in want, we should consider it not as a favour on our part, but as an additional value which he has conferred on our wealth, that he has given us an opportunity of making a more delightful use of it than any to which we could have known how to apply it in any other circumstances. If he be in grief, we have an affection that knows how to diffuse a tender pleasure over sadness itself; and that, if it cannot overcome affliction, can thus at least alleviate it. If he be suffering unmerited ignominy, we have a heart that knows his innocence, and a voice that can make itself be heard, wherever virtue is allowed to speak. These duties are easy to be performed. The only duty which is not easy, but which is still more necessary than the others, is that which relates to moral imperfections that may truly arise in him, or may become visible in him, only after our friendship has been given and received;—imperfections which, slight as they may be at first, may, if suffered to continue, vitiate that whole character, which it is so delightful to us to love; and which, in every important respect, is still so worthy of being loved. The correction of these is our chief duty; and every effort which it is in our power to use for this moral emendation, is to be employed sedulously, anxiously, urgently; but with all the tenderness which such efforts admit. If, in presenting to him that form of perfect virtue, to the imitation of which we wish to lead him, we make him feel more his own imperfection than the tenderness of that regard which seeks his amendment above every other object, the error is not his alone.

The duty which leads us to seek the moral reformation of our friend, wherever we perceive an imperfection that requires to be removed, is, as I have said, the highest duty of friendship, because it is a duty that has for its object the highest good which it is in our power to confer; and he who refrains from the necessary endeavour, because he fears to give pain to one whom he loves, is guilty of the same weakness which, in a case of bodily accident or disease, would withhold the salutary potion, because it is nauseous, or the surgical operation which is to preserve life, and to preserve it with comfort, because the use of the instrument, which is to be attended with relief and happiness, implies a little momentary addition of suffering. To abstain from every moral effort of this sort, in the mere fear of offending, is, from the selfishness of the motive, a still greater breach of duty, and almost, too, a still greater weakness. He whom we truly offend by

such gentle admonitions as friendship dictates, admonitions of which the chief authority is sought in the very excellence of him whom we wish to make still more excellent, is not worthy of the friendship which we have wasted on him; and, if we thus lose his friendship, we are delivered from one who could not be sincere in his past professions of regard, and whose treachery, therefore, we might afterwards have had reason to lament. If he be worthy of us, he will not love us less, but love us more; he will feel that we have done that which it was our duty to do; and we shall have the double gratification of witnessing the amendment which we desired, and of knowing that we have contributed to an effect which was almost like the removal of a vice from ourselves, or a virtue added to our own moral character.

The last set of duties, in relation to friendship, are those which regard its close.

When friendship has been fixed where alone it should be fixed, the close of friendship is only the termination of the existence of those who feel it. But, with all the caution which it is possible for the best and the wisest to employ in selection, it is still possible that they may be deceived, even as to important defects of character; or, though they may not be deceived as to the essential virtues of the character, they may at least have failed to remark unfortunate circumstances of temper or general disposition, which may frustrate afterwards all the care that can be used to avoid what might lead to irritations and fretful suspicions, incompatible with permanent confidence. Friendship, then—that is to say, the cordial intimacy of friendship—may cease, while those still live who were its subjects; but, when it ceases, from causes that would render it impossible to be renewed with the same interest as before, or that would render the renewal of it unwise, even though it were possible, it should be a cessation of intimacy, and nothing more. The great duty of fidelity still remains; and, in some measure too, unless where there has been the provocation of injustice that cancels the past, because it shows the seeming affliction of the past, even when affection was credited, to have been deceit, there remains still the duty of an interest stronger than we should feel in the welfare of a stranger who had never been connected with us by any tie of peculiar regard. Even when there has been such a discovery of guilt, as would render immoral this remaining interest, the duty of fidelity, as I have said, remains in all its force. What was confided to us in years of confidence, should still be as safe in our bosom as before. The only dispensation by which it can be morally allowable for us to violate the trust, is the slander of our reputation by the confider.

himself, if he dare to assail our character, when the disclosure of the secret which he has trusted to us, would render manifest our innocence. His very attack, in that case, may be considered as a sort of tacit intimation to us that his trust is at an end.

When friendship, after continuing uninterrupted through life, not merely without diminution, but with perpetual accessions of confidence and happiness, is at last broken by the death of one of the parties, its duties do not terminate to the survivor. He has a source of new duties in the remembrances of the past, in the glory of his friend, which is ever present with him, and in the expectation of that future life in which he hopes to rejoin him, and which, by this very hope, presents a new motive to his own virtues.

"Some persons," says the Marquise de Lambert, "believe that there are no longer any duties to be fulfilled beyond the tomb; and there are but few who know how to be friends to the dead. Though the most magnificent funeral pomp be the tears and the silent sorrow of those who survive, and the most honourable sepulture be in their hearts, we must not think that tears which are shed from the sensibility of the moment, and sometimes too from causes which in part at least relate to ourselves, acquit us of all our obligation. The name of our friends, their glory, their family, have still claims on our affection, which it would be guilt not to feel. They should live still in our heart by the emotions which subsist there; in our memory, by our frequent remembrance of them; in our voice, by our eulogiums; in our conduct, by our imitation of their virtues."*

After our consideration of the duties of friendship, which necessarily involve in them many feelings of gratitude for kindnesses received, it cannot require any long discussion to convince you of the duty of gratitude to our benefactors in general.

Of this, indeed, I have already treated so fully in a former part of the course, when, in examining our moral emotions, I considered the emotion of gratitude itself as one of these, that it would be almost superfluous to make any further remarks on it.

It is one of the most pleasing proofs of the benevolence of Heaven, that the very production of good by one human being to another, is not attended with delight only to him who receives the favour, but with equal delight to him who confers it; and with respect to the future also, that the desire of new beneficent exertions is not more deeply impressed on the mind of the beneficent, by every repetition of his kindness, than on the mind of him who is the object of the kind-

ness. Both are made happier; both are made more eager to render happy. Our first emotion, on receiving good, is love of him from whom we receive it; our second emotion is the wish of being able to render to him some mutual service; and he whose generous life is a continued diffusion of happiness, may thus delight himself with the thought that he has not diffused happiness only, but that in diffusing it he has been, at the same time, the diffuser of virtue,—at least, of wishes which were virtue for the time, and required nothing to convert them into beneficence, but the means of exercising them.

So ready is gratitude to arise in almost every mind, that ingratitude to a benefactor, in every age of the world, has been regarded almost with the same species of abhorrence as the violation of the dearest duties of consanguinity itself. He who could plunge a dagger into the heart of one who had conferred on him any signal service, would be viewed by us almost with the same fearful astonishment with which we gaze on the parricide who plunged his dagger into the heart that gave him life.

The tie which connects the benefactor with him on whom he has conferred a kindness, does not, however, give its whole duties to one party, though its principal duties belong to one. It is the duty of one, to love him from whom he has received important kindnesses, to study the interests of him by whom his own have been promoted, and, in every service which requires only zeal, and not a sacrifice of virtue, to be assiduous in repaying what can be repaid, not from an eager wish to shake off the obligation, which is truly in itself a species of ingratitude, but from the sincere desire of increasing the happiness of one who is sincerely loved, and who has given so much reason to love him.

These are the duties of the obliged. But though we are not much accustomed to think of the duties of benefactors, the obliger too has moral obligations to fulfil, and obligations which, while they are as truly incumbent as the duties of the obliged, are far more difficult to be fulfilled; the duty of making his benefits press as lightly as benefits to the same amount can press, by unfailing attentions to him whom he has obliged,—a condescension that makes itself felt, however, not as condescension which would recall the obligation more powerfully, but only as kindness which seems to rise without any thought of former benefits, from the overflowing goodness of a benevolent heart. It would be manifestly cruel to repeat to any one, on whom we had conferred an important favour, "Remember the favour which I have conferred upon you;" but since it is not in the direct words only that such a meaning can

* De St. Lambert, *Œuvres*, tome I. p. 248.

be conveyed, it is cruel also, by excessive and ill-placed forms of ostentatious civility, to seem constantly to say to him, that we are thus very kind, and that we have never forgotten the generosity which we showed him, at the distance, perhaps, of many years.

When a benefactor forgets his duties, and makes a cruel use of the favours which he may have conferred, there is no tyrant whose cruelty is more oppressive, because it is the tyranny of one whom we cannot oppose like other tyrants. They may, indeed, shackle our arms; but the iron clasp of this moral oppressor is placed where it is most powerfully felt, upon the heart itself, that may feel the worthlessness, but that is deprived of all power of rising against it. There are beings of this kind who use the means of beneficence only for purposes the most malevolent, whose very gifts are snares, who oblige, that they may afterwards be malicious with impunity, exacting ever after, from their unfortunate victim, assiduities and services which it is unreasonable to pay, and rejoicing, if he fail in them, that they may have the still greater pleasure of proclaiming his ingratitude.

"Ingratitude, indeed," as Rousseau justly observes, "would be far rarer than it is, if the benefactor were less frequently a usurer. What has done us good, is dear to us, by the very sentiment of our nature. Ingratitude is not in the heart of man; but interest is there; and the obliged who are ungrateful, are far fewer in number than the obligers, who are interested, and who have sold what they have only feigned to give. When is it," he continues, "that we see any one who is forgotten by his benefactor, forget him? A benefactor who can thus forget, the obliged never fail to remember; he speaks of him with pleasure, as he thinks of him with tenderness. If an opportunity occur in which he can show, by any unexpected service, that he remembers the service which was before conferred upon himself, with what internal delight does he then satisfy his gratitude, with what expression of joy does he make himself recognised, with what transport does he say, My turn is come! Such is the genuine voice of nature. A kindness, that was truly a kindness, never yet found a bosom that was ungrateful.*"

The expression, if it were meant to be understood strictly, would certainly be a little too strong; since there may be ingratitude, even to the most generous, as there may be any other atrocious offence. But it is only in the bosoms of the most atrocious that such ingratitude can arise: and of this, at least, we may be sure, that the best preserv-

ative against a failure of duty on the part of the obliged, is for the obliger himself to fulfil all the duties of a benefactor.

LECTURE XC.

OF THE DUTIES OF CONTRACT; OF THE DUTIES OF CITIZENSHIP.

GENTLEMEN, we have now considered the nature of the duties which arise from our peculiar connexion with certain individuals, as our relatives in consanguinity or wedlock, our friends, our benefactors. There remain still to be considered by us two species of duties, that arise from connexions of a more general kind; the duties of contract, which, of course, vary with the nature of our particular arrangements; and the duties of citizenship, or of patriotic regard, which extend to all the individuals that are comprehended with us under one system of government.

Though the practical rules of morality, which regard contracts, strictly as contracts, are all founded on the great principle, that each party in the contract is under a moral obligation to fulfil what he has undertaken to perform, in the manner in which he had reason to believe the engagement to be understood by the party with whom he contracted, it may be of advantage to consider, separately, the contracts which relate to objects of commercial barter, and those which relate to personal service. Some personal services, indeed, are truly objects of barter, as much as any of the articles of daily sale, of which we usually think when we speak of commerce; but still there are so many other circumstances of moral influence connected with the contracts of service, that they may very fairly, at least the most important of them, which connects the master and the servant, and admits a stranger into the general system of domestic relationships, be regarded, in ethics, as constituting a species apart.

The command which mere barter gives us, even when the objects of the barter are present objects exchanged for present objects, is no slight accession to the comfort of mankind. What is useless to ourselves is thus instantly invested with utility, by becoming the medium of acquiring for us what is directly useful. But such direct barter, of present objects for present objects, would be only a small part of the commerce from which our wants might receive aid, if no more than the possessions of the present moment were allowed to enter into the mutual transference. We may have present wants, which the superfluities of others might gratify, though we may be, at present,

* *Emile*, liv. iv. *Œuvres de Rousseau*, tome vii. p. 50. Paris, 1819.

without the possession of any thing which can purchase them as a fair equivalent; and we may have this inability of present purchase, with the certainty, that we shall, at some period more or less near, have that which, if possessed by us now, would be gladly purchased from us, by the cession of those articles of use or luxury, which our wants of the moment require. A contract is truly, in its moral operation, such a transfer of the future for the present, or of some future object which we value less, for a future object which we value more. Its effect is to free us, in a great measure, from the influence of time, as far as our mere commerce is concerned; to render every thing which our power, in any moment of our life, may command, present, as it were, at the very hour in which we make our purchase; enabling us thus to form, of all the property which we are ever to possess, and of all the energies which we are ever to be capable of exerting, one great fund, which we may employ with equal and ready command, for all the purposes that seem to us, at any one moment, most essential to our happiness.

If that power, by which we are thus enabled to bargain for the future, be so important an instrument of public convenience, the breach of the contracts, on the stability of which, that is to say, on the good faith of which, the power is founded, we may well suppose, will be regarded by the community as an injury to its essential interests; and the individual guilty of it, should feel, not merely the self-disapprobation which arises from the thought of having deceived, for purposes of selfish profit, any one member of the community, but that also which arises from the thought of having contributed to weaken the great support of public confidence, and to reduce the whole power of society to those few exertions which it is capable of making at any one instant, or the few immediate objects of barter which are at any one instant absolutely possessed.

Of that most useful power, which the general system of contracts gives us over time itself, he does all which an individual can do to deprive us; for he does that which, if all other individuals did in like manner, the power of bargaining for the future, which exists only by mutual confidence, would cease instantly in mutual distrust. From a command over every moment of our life, we should be reduced to a single moment of it, the moment in which we could give with one hand, while we received with the other.

Man, therefore, is morally bound to perform the engagements which he has undertaken to fulfil, whether there be or be not, in the individual with whom the contract was made, any power of enforcing the fulfilment. In this obligation, where it has been voluntarily made, there are truly no limits but the

physical power of the individual, and the independent morality of that which is undertaken to be performed. Where we have undertaken to perform what no exertions on our part, however active and unremitting, could accomplish, we cannot feel remorse at not having done what we were unable to do; whatever moral disapprobation we may feel of our engagement itself, as undertaken rashly, and as tending to excite expectations in others, which, as they were beyond our power of gratifying them, we had no title to excite. In like manner, when the action which we have undertaken to perform is one which, as affecting the happiness or means of happiness of others whose happiness we have no title to disturb, it would be immoral in us to perform, if we had not entered into the engagement, the performance of it would be immoral still, though we may have entered into the most solemn engagement; for there is no form of words, no promise, no oath, which can render just, what was injustice to others before. In such a case it cannot excite our remorse, that we have not done what it would be remorse to have done: our moral disapprobation of ourselves may arise indeed, and should arise; but it arises at the remembrance of the engagement itself, not at the thought of the failure in the engagement. We have now to regret one delinquency. But if we had performed what we had engaged to do, we should then, instead of one species of moral regret, have been subject to two feelings of that sort. We should have had to repent, as now, of the guilt of engaging to do what was morally wrong, and to repent also of the continued guilt of wilfully persisting in an action which we feel to be iniquitous.

When that which we have engaged to do is truly within our power, when it is undertaken voluntarily, and when the performance involves no violation of moral duty, it would be a violation of moral duty not to perform it; or, though perhaps with more verbal exactness, to perform it less fully than we know to have been understood and intended, in the spirit of the mutual convention. The contract may, indeed, if we consider the mere words of it, often imply more or less than was understood by the parties at the time; and though, in some cases, it may be legally expedient, for the advantage of the general rule, as applicable to cases in which the discovery of the intended meaning would not be easy, and in which, notwithstanding, it is necessary that some exact meaning should be presumed,—that that meaning should be presumed to be what the strict grammatical or technical construction of the language bears,—it is legally only, not morally, that this forced interpretation in the particular case is put on words which, in that particular case, were intended to convey a different

sense; and he who, with perfect certainty of the intended meaning, shelters himself under the mere forms of legal construction, and does only what the law, in its necessary limitation to general rules and general forms of expression, obliges him to do, is, in every important respect, as truly a violator of the duty of contract, as if the construction of the law had exactly corresponded with that real meaning of the parties at the time of their mutual engagement, which, after entering into the engagement, he has refused to fulfil.

The contract of personal service, even of that domestic service which is the most complete of all voluntary servitudes, is, I have said, as a mere contract, precisely of the same nature as our other contracts. The servant who engages to obey the will of the master, that is to say, of one who, on his part, engages to furnish the servant with maintenance, and a pecuniary remuneration corresponding with the nature of the services performed, makes a barter of advantage for advantage. He gives up his liberty, for the time bargained, to receive, in return, what he values still more than liberty.

That the master and the servant are mutually bound to discharge to each other the peculiar offices which they have engaged to discharge, is a moral truth which flows from the very nature of a contract, and which needs no peculiar elucidation. But as, in the fulfilment of this particular contract, individuals are brought together who may be mutually benefited, in various ways, which the contract itself cannot strictly be understood as comprehending, and benefited, without injury to him who confers the benefit, nature has not allowed this power of doing good to be wasted in unproductive idleness.

By various beautiful processes which take place in the mechanism of the moral universe,—by the influence of the associating principle, and by all those emotions of regard which the presence of familiar objects, merely as familiar objects, excites,—still more by that moral esteem, which it is impossible not to feel for the virtues that are frequently before us, whatever the rank may be which those virtues adorn, she has provided a source of peculiar duties, which make man, who lives with man, in the intercourse of mutual services, an object of a deeper interest than that which begins and ends with the few services which were reciprocally bartered.

That it is the duty of the servant, independently of the cold fulfilment of the mere drudgery which he executes for us—as he would have executed it for any other who paid the same price for each motion of his arm—to feel, too, some interest in our prosperity and general happiness; in our sickness, for example, not merely to watch around our bed, and to wish for his own

sake that we were again enjoying health and easy slumbers as before, but to form that wish with sincere regret for the parched lip, and burning eye, and the feverish lassitude, that robs us of rest, even in rendering us incapable of action; that he should rejoice at our recovery, before he thinks that our recovery will restore him to the less fatiguing duties that are comparatively freedom; all this, though it formed no part of our original contract with him, we are sufficiently ready to claim, or at least to expect, because the duties of affection which we claim are duties which are to be profitable to ourselves. We are not quite so ready to admit, however, that our own duties to him are more than those for which we directly contracted, and that, without violating the obligation which the law would discover in the very words or implied conditions of our bargain, we may yet violate the moral obligation which truly subsists in it, according to that only just interpretation which our own hearts, if we consulted them, would afford.

There are duties, then, which we owe to the lowest of those who serve us, that are not fulfilled by the most bountiful allotment of wages, and lodging, and sustenance. Of these duties, which are not duties of supererogation, but flow from the very nature of the bond which connects the master and the servant by reciprocal benefits, the surest rule is to be found in that brief direction, which Seneca, in the spirit of the noble Christian precept of morals, has so happily given us in one of his Epistles, in which he treats of the cruelty and the contumely of Roman masters. “So live with your inferior, as you would wish your superior to live with you. *Sic cum inferiore vivas, quemadmodum tecum superiorem velles vivere.*”—“In a servant,” says Marivaux, “I see a man; in his master I see nothing more. Every one has his office to perform; one serves at the table, one serves at the bar, one in the council, another in the field; and he whom we call a servant, is perhaps the least a servant of the whole band of menials.”

Those who serve us, it is impossible even for the haughtiest pride to deny, are indeed men like ourselves, differing from us, originally at least, only in the circumstances of their external condition, and differing, even in these, only for a period, that, in relation to the immortality of which it is a part, is scarcely more lasting than that short voluntary transformation of character, in which, for the amusement of a few hours, the richest and mightiest sometimes condescend to assume a servile garb, and act the part which their servants on the stage of life are acting in a drama a very little longer. They are masquers, whose masquerade does not finish in an evening; but will finish when a few evenings are over, and when all will re-

turn to their original state of man. But without insisting on this similarity of state, the human equality which is soon to level the distinctions that at present are regarded by us with so much pride, it will be enough to insist on the similarity of the principles on which their feelings and ours depend. They are capable, like us, of many pleasures, and of more than pleasure in receiving approbation; they have passions that mislead them as we have, and from us those passions may derive mitigation, or additional violence. On these considerations our duties to them are founded.

They are capable of enjoyment like ourselves; and there are many enjoyments of which we may legally deprive them, by the constraints to which they have submitted themselves, according to the common usage of such personal contracts; but which are not incompatible with the fulfilment of all their duties to us; and which it would therefore, morally, be as wrong to prevent, as it would be to prevent a similar amount of enjoyment, when the power of preventing it was not legally ours. He who, to the utmost of his power, converts the freedom of domestic service into slavery, who allows no liberty, no recreation, no pleasure which he can interdict, has all the guilt of a tyrannical master of a slave; or rather, has a guilt that exceeds the guilt of such oppression, because it is an oppression that is exercised in a land of freemen. Every indulgence, therefore, which does not interfere with the domestic duties, and which does not tend to vitiate the character, is a duty which the master owes.

As beings capable of pleasure, then, servants are to us the objects of this duty of reasonable indulgence. There is a certain moral pleasure, however, which we particularly owe to them.

They may do well; and in doing well, they have the same title to our praise which our best actions have to the glory with which we expect the world to be ready to reward us. If we withhold the approbation which is due, we take from them one powerful incentive to continuance of that species of conduct which rendered them worthy of approbation; and, at the same time, we take from them one of the most delightful feelings of which he who has sold his freedom is still capable—the feeling, that he has done something, which was not actually sold with the very labour of his hands—that in the additional duties performed by him, he has been free still—and that our praise is something, which, as it was not an actual condition, like the livery and the daily bread, is an offering to his own gratuitous virtue.

The duty of approbation, then, when approbation is due, is another of the duties which the master owes to the servant, and

a duty which, though he may legally withhold it, he is not entitled morally to withhold.

But servants, as I have said, share not our love of praise only, but passions of a less commendable kind. They are assailed by temptations like those which assail us; and they sometimes fall as we too fall. They neglect to do what we have desired; and they often do what is positively injurious to us. In such cases, they might deserve all our severity of punishment, if we were not men, and they were not men. Our reproof they unquestionably deserve, not merely because they have failed in their part of our mutual contract, but also because our reproof may, even to them, be attended with moral advantage. Yet though our reproof of any gross inattention is not excusable only, but, if we consider all its consequences, an act of humanity, it is not to be the reproof of one who seems almost pleased with the offence itself in the eagerness which is shown to reprehend it. In censuring, we are silently to have in mind the human weaknesses of our own moral nature; and to remember, that if even we, with better light and nobler recreations, err, the ignorant who, by their very ignorance, are incapable of seeing many of the consequences of actions, and who have few recreations but those which seduce them from what is good, may still more naturally be imagined to err. In condemning them, therefore, we condemn ourselves; or we declare that we are frail creatures, of whom less knowledge and less virtue are to be expected than of them. There are beings with gentle voices, and still gentler eyes, and with smiles that seem never to be wiled, and scarcely even to fade and brighten again, but to be almost the native character of the countenance, like the very lustre that is ever blooming on the cheek and on the lip. There are beings who seem to exist thus only in a perpetual moral atmosphere of radiance and serenity, that on the sight of a single particle of dust on a book, or a table, or a chair, as if in that particle a whole mountain of misery were before them, can assume in an instant all the frowns and thunders of all the furies, whose delicate frame is too weak to bear the violent opening of a door, but not too weak, after the door is opened, to shake the very floor with the violence of their own wrath on the unfortunate opener of it.

Indulgence to the lighter imperfections of servants is then an important part of our moral obligation in that temporary domestic relationship which we have contracted. But, though it is a duty which we owe to them, it is as least as much a source of tranquillity to ourselves. A life of constant upbraiding is very far from being a life of happiness. When we make them miserable, they have

had already too good a revenge in the very fretfulness of the anger that is wreaked on them.

If the mere human tendency to evil that exists in the bosom of the servant, as it exists in his master's bosom, be a sufficient cause for the duty of indulgence, when indulgence would not be attended with hurtful consequences, as much to him whose offences are suffered to pass unrebuked, as to him who is directly injured; this tendency to evil is a source also of another duty, which is, in truth, the most important of all the duties that attend this domestic relation; the duty of not corrupting the virtue of him whose services only we have purchased; and whose moral part, which was not, and could not be sold to us, we are not to enfeeble, if we do not strengthen it. He who, after living under the same roof with us for years, quits our door without the amiable qualities with which he first entered it,—every pure wish polluted, and new habits of licentiousness formed, while all that remains of early habits is a little remorse that is soon overwhelmed in the turbulence of vulgar dissipation, though he may be far better skilled than before in all the fashionable frivolities of his craft, and though he may have acquired, in our service, by plunder, not by economy, what would enable him to rise to a better station, if it were not soon to be exhausted by the vices which he gathered at the same time, quits us poorer upon the whole, and, as a mere human being, far lower in the scale of dignity than when, with all his clownish awkwardness, he had virtues which it has been our misfortune, or rather our guilt, to destroy.

The only remaining set of duties to particular individuals or classes of individuals which we have to consider, are those which connect us with our fellow-citizens.

That we should love the land of our birth, of our happiness, of that social system under which our happiness has been produced and protected, the land of our ancestors, of all the great names and great deeds which we have been taught most early to venerate, is surely as little wonderful as that we should feel, what we all truly feel, a sort of affection for the most trifling object which we have merely borne about with us for any length of time. Loving the very land of our birth, we love those who inhabit it, who are to us a part as it were of the land itself, and the part which brings it most immediately home to our affection and services. It is a greater recommendation to our good will, indeed, to be a relative, or a friend, or a benefactor; but it is no slight recommendation, even without any of these powerful titles, to be a fellow-countryman, to have breathed the same air, and trod the same soil, and lent vigour to the same political in-

stitutions, to which our own aid has actively or passively contributed. While all are fellow-citizens around us, indeed, we scarcely feel the force of the tie which binds us to each, because we are bound equally to all. But, let our relative situation be changed: place us on some shore at a distance, in a society as civilized as that which we have left with a brighter sky and warmer air, and all the occupations which business can give, or all the amusements with which elegant frivolity can render days and evenings short to us;—in the very hurry of pleasure, that scarcely allows us time to think of home, let but a single accent be heard of the native dialect familiar to our ear; and, if we have been long absent from our country, what benefactor or friend is there, or almost I may say, what relative, however near to us in consanguinity and affection, who is for the moment or the hour so interesting to our heart as the stranger of whom we know nothing, but that he comes from the land which we love above every other land, and is to us almost the representative of that land itself?

Affection, though not the direct and exclusive source, is at least, by the bountiful provision of Heaven, the great accompaniment of duty; and where affection so strong is universally felt, there must be duties of no slight obligation.

Our countrymen may be considered by us individually, or as constituting one great community, in which the obligations due by us to all the separate individuals are concentrated, so as to form together an amount of obligation which those who would think but little of their duties to a single member of the community, cannot, with all their indifference, wholly disregard.

As individuals, their claim to our services is the same in kind, however weaker in degree, as that which a common descent gives to those who are connected with us by remote affinities of blood. We are not merely to abstain from injuring, and to wish and endeavour to promote their happiness when means of promoting it are in our power; for these duties we owe to all mankind; but when there is a competition of interests, and no obligations of more important duty are concerned, which should influence our choice, we are to prefer them to others who compete with them, our country being to us as it were a parent, and they, with us, its common offspring.

Beside this general interest in the happiness of all who live with us under the same government,—an interest in which you perceive the same beautiful relation of our affections to our means of readiest and most frequent usefulness, which we have traced in all the other species of peculiar regard,—there are patriotic duties which we owe to

some of our countrymen only; though, in truth, when we trace even these duties to their source, we find them too to have their origin in that equal regard for the happiness of all, which we owe to all our fellow-citizens. The duties to which I allude are the offices of external respect which we pay to those who are invested with high stations; offices of respect which the multitude pay, without any very nice analysis of the obligation, and which it is of the highest importance to public order, and to public happiness, that they should be ready thus to yield to the external symbols of authority; and which a wise and good man pays with the same readiness as the multitude, because he knows at once how important they are to national tranquillity, and how very little it is which, in the external forms of respect, is paid to the real happiness of the individual.

Such are the civic duties which we owe to individuals. The duties which we owe to our fellow-citizens, as constituting one great community, may be considered as reducible to three: first, the duty of obedience to the system of laws under which we live, the benefit of which all enjoy, and according to which all regulate their plans and expectations; secondly, the duty of defending that social system of which we are a part, from violent aggressions, foreign or internal; and, thirdly, the duty of endeavouring, as far as we possess any power that can be beneficially exerted, to increase the means of public prosperity; and above all, where political evils exist, to ameliorate a system of polity, which, though it produce much happiness, may still, by reformations, as far as these are practicable, be capable of producing more.

Our first patriotic duty of this general kind, is the duty of obedience.

Why is it that we term obedience a duty; what circumstances are there in the nature of a system of government, by which, under certain limitations, it has a claim to our submission, merely because it already exists and has long existed?

The answer to this question was, for a long time, even in our own land, a very simple one,—that power established was established by God, and that disobedience to the individual whom he had established to exercise this power, would be a rebellion against right divine.

Who first taught souls enslav'd, and realms undone,
The enormous faith of many made for one;
That proud exception to all Nature's laws,
To invert the world, and counterwork its cause!
Force first made conquest, and that conquest law,
Till Superstition taught the tyrant awe,
Then shared the tyranny, then lent it aid,
And Gods of conquerors, slaves of subjects made.*

The argument for the right divine of

established power, which is in logic little better than any other argument for the right divine of any thing that exists, whether good or evil, merely as existing,—for the prevalent system of manners, virtuous or vicious, or even, as has been truly said, for the right divine of a wide-spread fever or any other pestilence,—is as wretched in its moral consequences, as it is ridiculous in logic; and it is painful to peruse the writings on the subject which at one period, and that not a very distant one, were so prevalent, and in some cases were the works of authors whom we are accustomed to venerate, not merely as philosophers, but as men who have given undoubted proofs of the most benevolent interest in the human race. Berkeley, the author of the *Theory of Vision*,—Berkeley, the generous possessor of “every virtue under heaven,” is the same Berkeley who endeavours to demonstrate to us, that it is as much our duty to submit to the most ferocious tyrant as to submit to the supreme benevolence of God; or rather, that to obey such a tyrant, is to obey Supreme Benevolence.

That God, the equal God of all mankind, has not formed us to be the slaves of any one, individual, and in furnishing our minds with so many principles that insure our progress in less important sciences, has not abandoned us, in the most important of all, to the selfishness of a power which may prefer the present misery of its own despotic sway to all that can be offered for its reformation, because the reformation would abridge an authority which it is more convenient for the possessor of it to exercise with no limit but that of will, I surely need not now attempt to prove to you. On the right divine of authority, whatever vague allusions to it we may sometimes find in courtly flatterers of the day, we have no writers now who require to be confuted.

There is, indeed, one species of right divine which established authority does possess,—its tendency to the peace of those who submit to it, and, consequently, in that respect to their happiness, which, as the object of our Creator, has the sanction of divine will. But it possesses this right divine, only as tending to public happiness; it is secondary only, not primary: and when the public happiness, instead of being, upon the whole, promoted by obedience, would, upon the whole, when every consequence, indirect as well as direct, is taken into account, be promoted, by shaking off that power which is inconsistent with its great object, remonstrance, even rebellion itself,—if that name can justly be given in such circumstances of dreadful necessity to the expression of the public will,—has as truly its right divine, as established authority, even in its best state, could be said to have it, when,

* Pope's Essay on Man, Ep. iiii. 241—248.

as exercised with happier tendencies, it was productive of that good in which alone the divinity of its right is to be found.

We have no need, then, of all those fictions to which political writers, in periods in which the true source of political obligation was less distinctly perceived, were obliged to have recourse, in asserting the rights of the governed, as paramount to the claims of mere possession in the tyrannical governor. We have no need to speak of original compacts of those who obey with those who command, understood as prior to the existing forms of social institutions, and the violation of which by one party might be considered as a warrant to the other party for resuming the original rights of which they had consented, through their ancestors, to divest themselves. Such compacts never existed, and could not, independently of the good that might flow from them, be of obligation on the new individuals who form the present race of mankind, though they had truly taken place at some remote period. The only reason for which we could conceive it necessary for men at present to pay the obedience which another number of men, at any other period, paid to a certain number of their fellow-creatures who lived in their time, is, that a failure in this obedience, of the propriety of which the existing generation are equally capable of judging, or better capable, if political knowledge have made the slightest progress, would seem to be injurious to the society in which they live; and if this reason be valid, it is valid without the necessity of the compact supposed. It is our duty to obey, because mankind, at least that large part of mankind which we term our country, would suffer, upon the whole, if we were not to obey. This is the powerful hold which even imperfect governments possess on the obedience of the wise and good; and the stronger holds which they may seem to have, by corruption, or by mere usage of unreflecting veneration, on the profligate and the ignorant, is truly not half so strong. The profligate supporter of a system, for which he cares only as it ministers to his vices, may see perhaps some more tempting promise of wealth and power in a rebellion against that very authority, the slightest attempt to ameliorate which he has been accustomed to represent as a species of treason. The ignorant, who fall on their knees to-day, merely because something is passing which is very magnificent, and before which other knees are bent or bending, may, to-morrow, when other arms are lifted in tumultuous rebellion, join their arms to the tumult and the dreadful fury of the day. It is only in the bosom of the wise and good, as I have said, that any security of obedience is to be found. He

who is worthy of those honourable names; who is wise to consult for the public weal, which his goodness wishes, has no object but the happiness of the community; and though he may see imperfections in government which tend to lessen this happiness, he yet knows how much is to be hoped from the calm influence of diffusive knowledge, and how very little is to be hoped from the exercise of force, which would be opposed not by mere force of arms, but by the force of as many bad passions as could be summoned to resist it; and which would too often, also, be obliged to call to its own aid passions, as little worthy of the sacred cause in which they might be engaged, as the very passions that were opposed to him. He weighs good with good, evil with evil; and the oppression must indeed be severe and the prospect of relief from it by other means be truly gloomy, before he will lift his voice to call his fellow-citizens to arm against their fellow-citizens. "The speculative line of demarcation, where obedience ought to end, and resistance must begin, is," as Mr. Burke truly says, "faint, obscure, and not easily definable. It is not a single act, or a single event, which determines it. Governments must be abused and deranged, indeed, before it can be thought of; and the prospect of the future must be as bad as the experience of the past. When things are in that lamentable condition, the nature of the disease is to indicate the remedy to those whom nature has qualified to administer, in extremities, this critical, ambiguous, bitter potion to a distempered state. Times, and occasions, and provocations, will teach their own lessons. The wise will determine from the gravity of the case; the irritable, from sensibility to oppression; the high-minded, from disdain and indignation at abusive power in unworthy hands; the brave and bold, from the love of honourable danger in a generous cause;—but, with or without right, a revolution will be the very last resource of the thinking and the good."

A revolution, indeed, even in such circumstances, as this eloquent writer well says, should be, and will be, the last resource of the thinking and good. But, though it will be the last resource, it still is a resource; a resource in those miserable circumstances, in which times, and occasions, and provocations, teach their terrible lesson. When the rare imperious cases do occur, in which the patriotism that before made obedience a duty, allows it no more, to him who feels that he has now another duty to perform,—when he sees, with sorrow, that a cause which is good in itself, will demand the use of means from which, with any other motives, he would

* Burke's Works, vol. v. p. 73. Lond. 1803, 8vo.

have shrunk with abhorrence, he will lift his voice, sadly indeed, but still loudly,—he will lift his arm with reluctance, but, when it is lifted, he will wield it with all the force which the thought of the happiness of the world, as perhaps dependent on it, can give to its original vigour; he has made that calculation in which his own happiness and his own life have scarcely been counted as elements. If he survive and prevail, therefore, though in anticipating the prosperity which he has in part produced, he may sometimes look back on the past with melancholy, he cannot look back on it with regret; and if he fall, he will think only of the aid which his life might have given to that general happiness which he sought,—not of his life itself, as an object of regard, or even as a thing which it would have been possible for him to preserve.

LECTURE XCI.

OF THE DUTIES OF CITIZENSHIP—OBEDIENCE
TO THE LAWS—DEFENDING OUR COUNTRY
—AUGMENTING THE GENERAL HAPPINESS.

IN the close of my last Lecture, Gentlemen, I had begun the consideration of those duties which we owe to the community of our fellow-citizens, the duties understood as comprehended under the single term patriotism.

These duties of man, as a citizen, are considered as referable to three heads; first, the duty of obedience to the particular system of laws under which he may live; 2dly, the duty of defending the social system under which he lives, from every species of violent aggression; and, 3dly, the duty of increasing, to the best of his power, the means of public happiness in the nation, by every aid which he can give to its external or internal resources, and especially, as the most important of all ends, by every amelioration which it can be nationally prudent to attempt, of any existing evils, in its laws and general forms of polity.

In examining the first of these duties, we were, of course, led to inquire into the nature of that principle, from which existing institutions derive a moral authority. Of the divine right, to which it was long the easy and courtly practice of almost all the writers on this subject, to refer what, as divinely constituted, was therefore, they contended, to be deemed sacred from all human interference of the governed, as truly sacred as religion itself, I did not think it necessary to occupy your time with any long and serious confutation. "The right divine of kings to govern wrong" cannot be a right derived from the Divinity. He who attached the delightful feeling of moral approbation

to every wish of diffusing happiness, cannot give the sanction of his own pure authority to crimes which, as established, have nothing to distinguish them from other crimes that have not been established, except that their atrocious oppression has been more lastingly and extensively injurious. When a whole nation is bowed down in misery and intellectual and moral darkness, which, by the length of its uniform and dreary continuance, marks only what principles it contains of a servitude that may be perpetuated for ages as uniformly wretched, if a single effort, the elevation of a single standard, the utterance of a single word, were all which was necessary to give to millions that exist, and millions of millions that are afterwards to exist, not the happiness of freedom only, but with freedom all that light of thought and purity of generous devotion, which liberty never fails to carry along with it; would it indeed be virtue to keep down that standard, to refrain from uttering that word so productive, and rather to say calmly to the world, be miserable still? The God who is the God of happiness and truth and virtue, could not surely in such circumstances have made it guilt in the patriot to wish the single effort made; or guilt in him, if he wish it made, to give his own heart, and arm, or voice, to that effort which he wished.

It is vain for us, when our object is to discover, not what man has done, but what man ought to do, to think of the origin of power, as if this were sufficient to determine the duty of our present acquiescence. Where all were not equal in every physical energy, one individual must soon have begun to exercise authority over other individuals. If we consider a number of children at play, where all may at first have the appearance of the most complete equality, we shall soon be able to discover how the stronger, in any period of life, or in any circumstances of society, might, in some cases, assume dominion which, in some other cases, might be given to superior skill. But, in whatever way power may have begun among mankind, it has usually, at least for many ages in countries that suffer under despotism, been perpetuated by the submission on the part of the slave to the mere might of its hereditary or casual possessors: the history of power is, therefore, the history of that to which men have, generally or individually, considered it expedient to submit; but it is not on that account necessarily the history of that to which it was the duty of man to submit. It leaves to the race of man, in every age, and in all the varying circumstances of their external and internal condition, to consider the duties of mankind in the same manner as they would have considered them in any former age; and the duty of man as a citizen, is not to prefer the hap-

piness or supposed happiness of one to the happiness or supposed happiness of many, but the happiness of many to the happiness of one, when these are opposed and incompatible. The happiness of many may, indeed, be best consulted, and truly is best consulted, by distinctions and honours, which may seem to the inconsiderate as if existing only for the happiness of one or of a few. But still it is of the wider happiness produced by them which the patriot is to think, when he establishes these very distinctions, or wishes them to be prolonged.

It is vain, then, to have recourse to any fictions to prove the duty either of obeying the sovereign power of the state in ordinary circumstances, or, in rare and unfortunate circumstances, of occasional resistance to it; since these duties must always be reducible to the paramount obligation on the citizen, to consult the good, not of a few of his fellow-citizens, but of all, or the greater number; an obligation, without which the fiction would be worse than absurd, and with which it is unnecessary.

The theory of a social contract of the governed and their governors, for example, in which certain rights were supposed to be abandoned for certain purposes of general advantage, we found to be, even when considered as a mere fiction, (and it is only as a mere poetic fiction, that it can be considered,) but an awkward circuitous mode of arriving at a truth, without the previous belief of which, the very contract supposed would be absolutely nugatory. It assumes, in this contract, original rights of the community, which, but for the contract, it would have been unjust in the governors to arrogate to themselves; and if these be assumed as inherent in the very nature of man, independently of all social institutions, we must still, as men, have the rights which mankind, simply as mankind, originally possessed. The feigned contract adds nothing, it presupposes every thing. The power which we obey, is a power which exists by our will, as much as the power which our earliest ancestors obeyed, existed only by the will of the subjects, who at once formed it, and gave it their obedience.

The fiction of a social contract, then, as I have before said, is only a circuitous mode of asserting the original rights, which that very contract takes for granted in the contractors. Equally false is the supposed analogy, by which political writers would argue, from mere prescription in cases of property, for a similar prescriptive right to sovereign power, as implied in the long-continued possession of it. There still remains the inquiry why prescription itself is legally recognised. It is for the good of the state, and only for the general good, to prevent the evil of insecure possession,

and frequent litigation, that such a bar to judicial scrutiny is allowed; and if it were for the good of all the citizens, that prescription should not operate, even in cases of property, there can be little doubt that it would not have been legally established. The legal authority of prescription then, when we trace it to its source, is not a proof of the moral right of the exerciser of hereditary tyranny, to continued violation of public happiness, and therefore, to unlimited submission, from the nation of slaves, the offspring of a nation of slaves. It is, on the contrary, a proof of the paramount obligation of that general good, which in the right of prescription, as in every other legal right, has been professedly the great object of legislation, and which, in some circumstances, may render resistance a duty, as, in the ordinary circumstances of society, it renders obedience a duty, and resistance a crime.

That the power of the sovereign exists by our will, however, is not enough of itself to confer on us the right of disobeying it; and this, for a very plain reason, that, even when the government obeyed is not, like that of our own noble constitution, one which is a source of greater happiness to him who obeys than to him who governs, the disobedience may be productive of misery, which even the slave of a bad government has no right to produce. Our duties are not all dependent on our mere power or our mere will. If I learn that my benefactor is in indigence, it depends on my will whether I afford any relief to his wants; but it does not therefore follow that I have a moral right to refuse relief. In like manner, I have no moral right to produce that wild disorder, which mere disobedience to law, if general, would occasion; still less to produce the bloodshed and the desolation, and the bad passions, worse than mere bloodshed and desolation, which would be the inevitable consequence of long-protracted civil dissensions. This general tendency of obedience to power and happiness is, as I remarked in my last Lecture, the true right divine of authority; a right which is divine, because the virtue which loves the peace and happiness of all, is itself of divine obligation.

Since the duty of political obedience, however, important as it is in the list of moral duties, is still a duty which derives its force from our general regard for the happiness of the community, this happiness of the community, which, in ordinary circumstances, gives obligation to the claim of mere power to our obedience, in other circumstances limits the obligation, and produces a moral duty that is altogether opposite. On the duties of the citizen, in circumstances so different from those in which our inestimable constitution has placed us, we may still ethically speculate, as in our systems of meteo-

rology we treat, under our own temperate sky, of the sultry heats and hurricanes of a tropical climate.

The cases, however, in which it is morally right to resist, by other means than those which the established constitution itself affords, the tyranny of a government, are, in any situation of society, but of rare occurrence; since it is not tyranny alone which justifies rebellion, but tyranny in circumstances in which rebellion against its cruel and degrading power affords a prospect of success, not merely in the removal of a single tyrant, but in the establishment of a happier system. In every insurrection against the most cruel despot, a certain quantity of evil must be produced; and the evil is sure, while the good that is hoped is doubtful. If the insurrection fail, the evil is produced, and produced without any compensation, or rather, perhaps, serves only to render oppression more severe, and the hearts of the oppressed more fearful. The tyrant, after he has crushed all the little virtue that existed within the sphere of his dark dominion, may do, in the insolence of his triumph, what before he would have feared to do: he may destroy at once what, by a little longer continuance, could scarcely have failed to diffuse a wider virtue, which his efforts would have been powerless to crush. The increased severity of the oppression, then, is one evil of such unsuccessful attempts; and it is not less an evil, that they render for ever after, as I have said, the oppressed more fearful. The image of past defeat rises with an enfeebling influence on those who otherwise would have lifted a far stronger arm; while the remembrance of the treacheries which probably attended that defeat, and sometimes of the treacheries of those whose enthusiasm in the cause seemed most generous and daring, diminishes the confidence which man might otherwise be inclined to place in man. The resistance which might speedily have been successful, but for a rash attempt in unfortunate circumstances, may thus prove unsuccessful, merely because others had essayed and failed. Without the high probability, therefore, of a great preponderance of good, it cannot be morally right, in any circumstances, even of the most afflicting tyranny, to encourage a disobedience which the good that is to flow from it alone can justify. In the despotisms of the East, and in all the savage despotisms in which men, accustomed to look on power only as something that is to be endured, obey as brutally as they are brutally governed, what virtue could there be in rousing a few wretches to attempt what could not but fail in their hands, even if their number were comparatively greater, and in thus producing a few more murders, and a little more ter-

ror than would have existed, but for the foolish effort?

True fortitude is seen in great exploits,
Which justice warrants, and which wisdom guides;
All else is towering phrenzy and distraction.*

In ages of extreme luxurious profligacy, it would be, in like manner, vain to call to those who have no virtues, to arm themselves, from a virtuous hatred of oppression, against a tyrant whom other tyrants would speedily replace. Truth in the one case, in the other case virtue, must be previously diffused; and if truth and virtue be diffused, their own silent operation may gradually succeed in producing that very amendment, which mere force, with all the additional evils which its violence produces, would have failed to effect. They form, indeed, the only useful, because the only permanent force, operating on the mind, in which all real strength is, and operating on it for ever.

The great evil is, that for the diffusion of truth and virtue, a certain portion of freedom is necessary, which may not everywhere be found; but, where there is not the truth or virtue, nor so much freedom as would allow the diffusion of them, what lover of the temperate liberty of mankind could hope, by mere violence, to produce it! A single tyrant, indeed, may be hurled from his throne; for this the very ministers of his power, by whom he has been what he was, themselves may do, while they bow the knee the very moment after to some new tyrant of their own number; but it is tyranny which the patriot hates, and if that still subsist, the murder of a thousand tyrants would make tyranny an object only of more sickly loathing.

It is enough, then, to find in the source of political authority, a justification of disobedience to it, in the extreme cases, in which alone it is morally allowable, or rather morally incumbent on the oppressed to disobey. It is in extreme cases only, that this sanction can be required; and, in all the ordinary circumstances of society, to yield to the authority which all have concurred in obeying, when every constitutional method of obviating or mitigating the evil has been exerted, is at once the most virtuous, as it is the simplest mode of conduct that can be pursued.

The next patriotic duty which I mentioned, was the duty of defending the state against every aggressor.

This duty of defending the land which we love, may indeed be considered as implied in the very love which we bear to it. It is not necessary that we should think of what we have personally to lose before we con-

* Tragedy of Cato.
2 Q 2

sider the invader of our country as our enemy. It is not necessary even that we should image to ourselves the desolation which he is to spread, the miseries of blood and rapine by which his conquest would be perpetrated, and the deeper miseries of oppression which would follow it. It is enough for us to think of him as the invader of our land; and in thus thinking of him, we have already felt the duty of opposition. We may indeed afterwards trace in our imagination the sad series of consequences to those whom we directly love, and to those whom we love with a sort of indirect and borrowed affection, when we know nothing more of them than that they are our countrymen. We may think more abstractly of the excellences of our frame of laws which would be broken down, and feel an indignation at the outrage, as if this very frame of beautiful mechanism which we admire were itself a living thing. But though our indignation may thus be more fully developed, as we develop new causes of indignation, the strong emotion itself existed before. If the foot of an enemy, with an enemy's purpose, be pressing our soil, we feel in the very moment in which we learn it, if our hearts be not thoroughly corrupt, that he who has presumed thus to advance, must either retreat or perish.

In states in which the citizens themselves are trained to habits of military defence, the emotion of course is stronger, because the importance of individual exertions is there most powerfully felt. But the feeling is one which exists in some degree in every people. Even under the most wretched system of government, which has united men as a nation, only to make the congregated multitude of slaves an easier instrument of tyrannic power than if they existed as individuals apart, there is still some patriotic reluctance felt to allow the ingress of a foreign tyrant, though only a tyrant of the same species with him who is obeyed with ready submission, merely because he is a part of the country itself; and he who in such a case has calmly suffered the march of the invader, which he might have assisted in repelling, will, in seeing him take possession of a land which he can scarcely make more desolate than its own sovereign had allowed it to continue, feel some little portion of that self-disapprobation which the inhabitant of a land of freedom would have felt, if, in similar circumstances of aggression, he had given the aggressor as little reason to know, that the land which he was invading was not a land of slaves, but the birth-place of men, and the dwelling-place of men.

The citizen, then, is to obey the laws and to defend them. These two duties relate to the political system that exists. He has still one other great duty, which relates not to things as they are, but to things as they may

be. He is not to preserve the present system only; he is to endeavour, if it require or admit of amelioration of any sort, to render it still more extensively beneficial to those who live under it, and still more worthy of the admiration of the world than with all its excellence it yet may be.

He is justly counted a benefactor to his nation, who has been able to open to its industry new fields of supply, and to open to the products of its industry new distant markets of commercial demand. He too is a benefactor to the community who plans and obtains the execution of the various public works that facilitate the intercourse of district with district, or give more safety to navigation, or embellish a land with its best ornaments, the institutions of charity or instruction. In accomplishing, or contributing our aid to accomplish these valuable ends, we perform a part of the duty which we are considering, the duty of augmenting to the best of our ability the sum of national happiness. But important as such exercises of public spirit are, they are not so important as the efforts of him who succeeds in remedying some error in the system of government; some error, perhaps, which has been, in its more remote influence, the retarding cause, on account of which those very public plans, which otherwise might have been carried into effect many ages before, were not even conceived as possible, till they were brought forward by that provident wisdom and active zeal which have obtained, and justly obtained, our gratitude.

The reform of a single political grievance may, in its ultimate effects, be the producer of all which we admire in the thousand acts of individual patriotism,—the opener of fields of industry,—the diffuser of commerce,—the embellisher of a land,—the enlightener and blessing of those who inhabit it.

It is not possible, indeed, to estimate how valuable an offering he makes to society, who gives it a single good law. There are but a few words, perhaps, that compose it, but, in those few words may be involved an amount of good, increasing progressively with each new generation; which, if it could have been made known, in all its amplitude, to the legislator at the time when he contrived his project, would have dazzled and overwhelmed his very power of thought. What is true of a new law that relates to some positive institution is, as may be supposed, equally true of those laws which merely repeal and remedy the past; since a single error in policy may, in its long continuance, produce as much evil as a single wise enactment may, in its long continuance, produce of good.

He, then, is not a true lover of the society to which he belongs, nor faithful to those duties which relate to it, who contents

himself with admiring the laws which he might amend; and who, far from wishing to amend them, regards perhaps, or professes to regard, every project of reformation, not as a proposal which is to be cautiously weighed, but as a sort of insult to the dignity of the whole system, which is to be rejected with wrath, and treated almost as a subject of penal censure. This blind admiration is not patriotism, or, if it be patriotism, it is, at least, only that easy form of it which the most corrupt may assume, without any diminution of their own political profligacy. He who does not feel, in his whole heart, the excellence of a wise and virtuous system of polity, is indeed unworthy of living under its protection. But he who does feel its excellence, will be the swiftest to discern every improvement that can be added to it. It is the same in the humbler concerns of private life. It is not the indifferent stranger, who on seeing any one suffer from inconvenience of any kind, perceives most quickly the first involuntary intimation of uneasiness, and discovers, too, most quickly, what may be the best remedy. It is he who loves best the sufferer, and who sees best every noble endowment possessed by him. It is the mother watching her child,—the friend visiting his friend,—the son, the lover, the husband. The very nature of affection is to render us quick to imagine something which may make still better what is good; and though he who admires least a system, may innovate most extensively, there can be no question that the most continued tendency to innovate, in some slight degree, is in him who admires most, upon the whole, what he therefore wishes most ardently to improve.

If such be, as I cannot but think, the tendency of affection, the loud and haughty patriotism of those who profess to see in any of the systems of human policy, which as human, must share in some degree the general frailty of humanity, no evil which can require to be remedied, and even no good which can by any means be rendered still more ample in extension or degree, seems to me, for this very reason suspicious; at least as suspicious as the loud and angry patriotism of those who profess to see in the whole system, nothing which is not a fit subject of instant and total alteration. If they loved truly what they praise so highly, they would not praise it less indeed, but they would wish, at least, to see it still more worthy of praise; there would be a quickness, therefore, to discover what would make it more worthy; and, though they might be fearful of innovating, they would yet have many wishes of innovating, which nothing but the value of the subject of experiment, as too noble to be put in peril, could operate to suppress.

It is this high importance of the subject

of experiment, which is the true check on the innovating spirit, that, but for such a check, would be constantly operating in man, though there were no other inducement than the mere eagerness of curiosity, which wishes to see constantly new results, and is therefore constantly employed in placing objects in new circumstances. If the happiness and misery of nations were not dependent on the varying movements of the political machinery, or were dependent only for a few moments, so that, by the mere will of replacing all things in their former situation, we could truly replace them without any diminution of good or increase of evil, the game of legislation would indeed be the most magnificent game which could amuse our idleness or activity. But since happiness, which has once been injured, cannot be easily, if at all repaired, nor misery, once produced, be immediately dissipated, with the same ease with which we can shuffle kings, and queens, and knaves, and all the more insignificant cards, from the top to the bottom of the pack, or from the bottom to the top, and find the whole, after these successive changes, the same cards as before, with the same gaudy colouring and insignia of distinction, the game is too costly a one for human benevolence to wish to play.

The same principle, I may remark, directs the patriot in the reformations which he wishes to produce, without departing from the regular usages of the constitution, that directs him in those rare and dreadful cases, in which it becomes to him a question of virtue, whether he is not to throw off the whole entanglement of usage, and reduce society again for a time to a state of barbarous contention of man with man, that, from this temporary disorder, a better and more regular system may arise. The directing principle, in both cases, is the love of the good of the state and of mankind, that total and ultimate result of good on which it may be reasonable to calculate, after every deduction has been made of the evil that may, directly or indirectly, flow from the trial. It is not enough, then, that there is a great and manifest defect in any part of the political system; a source of evil as manifest perhaps as the evil itself. This may be sufficient to the demagogue, whose only object is to produce popular discontent with a system in which he has no part to act; and who is, therefore, rather pleased to discover the evil that may give a few animated periods to his eloquence, than grieved at the miseries on which so much of his logic and rhetoric depends. But, to the sincere lover of the happiness of the community, there must be not only the certainty of existing evil, but an obvious facility, or at least a very high probability of amendment; and a probability of this, without an amount of accompanying

evil equal, or even nearly equal, to the evil which he wishes to remove, before he will attempt a reformation that may be so perilous to the very happiness which it is his great ambition to promote. In calculating the results of good and evil, he will be careful too to make allowance for the influence of habit itself; and will consider an evil that is new, such as his wished reformation might possibly produce, as when all other circumstances are the same, a greater evil than that which already exists, and to which the mind of the sufferer has learned, by long usage, to accommodate itself. Above all, he will make allowance for the possible fallacies of his own judgment. That others have not before regarded as evil, that which appears to him to be evil, though not enough to alter his judgment, will at least be felt by him as a circumstance which should render caution in this case more necessary than it would have been, if there had before been no existing government; but all was to be the instant result of one act of legislation.

The remarks which Dr. Smith has made on the peculiar danger of the reforming spirit in princes, in reference to this deduction from the amount of incitement to innovate, which the possible fallacy of our opinion should produce,—a possibility which they who are accustomed to constant obsequiousness and adulation of all around, are not very ready to suspect,—are fully justified by the history, with very few exceptions, of all such attempts of royal or imperial reformers.

"It is upon this account," he says, "that of all political speculators, sovereign princes are by far the most dangerous. This arrogance is perfectly familiar to them. They entertain no doubt of the immense superiority of their own judgment. When such imperial and royal reformers, therefore, condescend to contemplate the constitution of the country which is committed to their government, they seldom see any thing so wrong in it as the obstructions which it may sometimes oppose to the execution of their own will. They hold in contempt the divine maxim of Plato, and consider the state as made for themselves, not themselves for the state. The great object of their reformation, therefore, is to remove those obstructions, to reduce the authority of the nobility, to take away the privileges of cities and provinces, and to render both the greatest individuals, and the greatest orders of the state, as incapable of opposing their commands, as the weakest and most insignificant."*

In these cases, however, it is not, I conceive, the mere arrogance of opinion of which Dr. Smith speaks, that renders princes such rash and rapid innovators. Much of the

tendency, I have no doubt, arises from the facility which they have found in executing the smaller matters, which they are in the hourly habit of willing and producing; a facility which they naturally extend to other matters, in which they suppose that all things will arrange themselves as readily, according to their will, as the actions and looks of those whose courtly ministry it is to do and look as they are ordered. They do not merely think themselves better movers of the machinery than others, but the machinery of national happiness seems to them more simple and easy of management than it is; because they have been able, in innumerable cases, to produce the very object which they desired, in all the circumstances which they desired, or to prevent what they considered as an evil to themselves or others, in the very way in which it seemed to them necessary or most expedient to prevent it. They innovate, therefore, with a more fearless spirit, because they think that the political machine will readily produce whatever they wish it to produce; or, at any rate, that the touch of a single spring, or the application of a weight to a single pulley, will be sufficient to put the machine in its former state, if the movement which they have attempted should be found ineffectual to produce that particular equilibrium, or disturbance of equilibrium, which they desired to effect by it.

The reformations which alone a sincere patriot will think of attempting, must be preceded, then, by much cautious examination of all the evils which the very desire of producing good, and good only, may often tend to occasion, almost as certainly as if the desire had had in view evil, and nothing more. I need not surely add, since it is of a moral duty I am treating, that the patriotic reformer will not be influenced by his own private views of ambition or factious dislike; though these, it must be confessed, are the great movers of far more than half of that declamatory eloquence on public abuses, which, as we cannot see the heart, is often honoured with the name of patriotism. "Arsaces," says Montesquieu, in his political romance of that name, "Arsaces loved so much to preserve the laws and ancient customs of the Bactrians, that he trembled always at the very name of reform of abuses: for he had often remarked, that every one called that law, which was conformable to his personal views, and called an abuse whatever was likely to thwart his own interests."

It is this hypocrisy of patriotism, which has been the most fatal of all evils to the reformation of a country. It is so easy to declaim against abuses, and so many personal objects may be attained by the declamation, that, to the unreflecting, it seems almost a sort of logical victory for the defender of

* Theory of Moral Sentiments, vol. ii. p. 96.

real abuses to ascribe to such ambitious or sordid or factious motives the genuine hatred of corruption, and genuine love of man, in those who oppose the evils by which the defender of them exists. This imputation of unworthy designs or wishes is one of the greatest, or rather, is truly the greatest evil which a patriot, who is at heart a patriot, has to dread. But it is an evil which, like all other evils that are personal to himself, he is to brave, in that calm and temperate course of public virtue, in which he feels himself called to move. He loves, indeed, the esteem of mankind much, but there is something which he loves still more; and he will not suffer the world to be miserable, that he may run a little less risk of being accounted a hypocrite.

I now, then, conclude the remarks which I had to offer on all the duties which we owe to others; whether they relate to mere abstinence from injury, or to positive beneficence; and whether they relate to all the individuals of mankind, or merely to a limited number of them that are connected with us by peculiar ties.

I have treated, as you must have perceived, of our moral duties, with only few remarks on what are commonly denominated rights; for this best of reasons, that the terms right and duty are, in the strictest sense, in morality at least, corresponding and commensurable. Whatever service it is my duty to do to any one, he has a moral right to receive from me: there is one moral emotion, one simple feeling of approvableness which constitutes to our heart, in the consideration of any action, the right or the duty, according as we view the agent, or him to whom his action relates. I do not speak at present, it is to be remembered, of the additional force of law as applied to particular moral duties, a force which it may be expedient variously to extend or limit, but of the moral duties alone; and in these, alike in every case, the moral duty implies a moral right, and the moral right a moral duty. When I say that it is my duty to perform a certain action, I mean nothing more than that if I do not perform it, I shall regard myself, and others will regard me, with moral disapprobation. When I say that any one has a moral right to my performance of a certain action, do I mean any thing more than was said by me, in the former case; or rather, do I not simply mean still, that if I do not perform the action, the feeling of moral disapprobation will arise in myself and others?

The laws, indeed, have made a distinction of our duties, enforcing the performance of some of them, and not enforcing the performance of others; but this partial interference of law, useful as it is in the highest degree to the happiness of the world, does not alter

the nature of the duties themselves, which, as resulting from the moral nature of man, preceded every legal institution.

The facility of determining certain duties in all their circumstances, and the impossibility of determining others which vary with circumstances that cannot be made the subjects of judicial inquiry, and into which, for the general tranquillity of a state, it would not be expedient to make a nice inquiry, even though they could be made subjects of it, have been, of course, the great reason for which certain duties only are enforced by law, and others left to the morality of individuals themselves. It is easy, at least in most cases, and in all cases comparatively easy, to ascertain the obligation to the duties ranked together under the name justice,—the duties of abstaining from positive injury of every sort, and of fulfilling precise conventional engagements. It would not be easy to ascertain, in like manner, what number of injuries, on the part of a benefactor, lessened, and perhaps destroyed altogether, the obligation to a grateful return of services for some early benefit received; and an inquiry into such circumstances, as it might extend to many of the most delicate and confidential transactions of a long life, would, as inquisitorial, be productive of more evil, than it could be productive of good, as judicial. Gratitude, therefore, is left, and wisely left, to the free moral sentiments of mankind: justice is enforced by the united power of the state.

On this very simple distinction of duties which the law enforces, and of those which, for obvious reasons, it does not attempt to enforce, and on this alone, as I conceive, is founded the division of perfect and imperfect rights, which is so favourite a division with writers in jurisprudence, and with those ethical writers whose systems, from the prevailing studies and habits of the time, were in a great measure vitiated by the technicalities of law. The very use of these terms, however, has unfortunately led to the belief, that in the rights themselves, as moral rights, there is a greater or less degree of perfection or moral incumbency, when it is evident that morally there is no such distinction; or, I may say even, that if there were any such distinction, the rights which are legally perfect would be often of less powerful moral force than rights which are legally said to be imperfect. There is no one, I conceive, who would not feel more remorse, a deeper sense of moral impropriety, in having suffered his benefactor, to whom he owed all his affluence, to perish in a prison for some petty debt, than if he had failed in the exact performance of some trifling conditions of a contract, in the terms which he knew well that the law would hold to be definite and of perfect obligation.

It is highly important, therefore, for your

clear views in ethics, that you should see distinctly the nature of this difference, to which you must meet with innumerable allusions, and allusions that involve an obscurity, which could not have been felt, but for the unfortunate ambiguity of the phrases employed to distinguish rights that are easily determinable by law, and therefore enforced by it, from rights which are founded on circumstances less easily determinable, and therefore not attempted to be enforced by legal authority.

It is, as I have said, on the one simple feeling of moral approvableness, that every duty, and therefore every right, is founded. All rights are morally perfect; because, wherever there is a moral duty to another living being, there is a moral right in that other; and where there is no duty, there is no right. There is as little an imperfect right in any moral sense, as there is in logic an imperfect truth or falsehood.

Actions of which the right is clearly determinable in all its circumstances, or may be imagined at least to be clearly determinable, the law takes under its cognizance. But, into the greater number of our virtues or vices, it makes no judicial inquiry. And though it might seem, on first reflection, to be more advantageous, if all which is morally due to us, might have been judicially claimed, it is well that so many virtues are left at our own disposal. But for this freedom from legal compulsion, there could be no virtue, at least no virtue which could to others be a source of delight, however gratifying the conscious disinterestedness might be to the breast of the individual. What pleasure could we derive from the ready services of affection, if the failure of one of them would have subjected the delinquent to personal punishment; if we could not distinguish, therefore, the kindness of the heart, from the selfish semblance of it which it was prudence to assume, and if the delightful society under the domestic roof had thus been converted into a college of students of domestic law, calculating smiles and proportioning every tone of tenderness to the strict requisitions of the statute-book?

LECTURE XCII

OF THE EXISTENCE OF THE DEITY.

My last Lecture, Gentlemen, brought to a conclusion my remarks on the various moral relations which connect every individual of mankind with every other individual, some by ties of peculiar interest, but all by the obligation of benevolent wishes and of benevolent efforts, when it is in our power to free even a stranger from suffering, or to afford

him any gratification which he could not have enjoyed but for us.

The ethical inquiries which have of late engaged us, may be considered, then, as developments of one great truth, which it is impossible for man to consider too often; that he does not enter life to be an idle spectator of the magnificence of the universe, and of the living beings like himself that dwell with him on that globe which is his temporary home, but that he has duties to perform as well as pleasures to enjoy and pains to avoid; that he has it in his power to relieve the sufferings of others and to augment their happiness, and that, having this power, he must be an object of approbation to himself, if he use it for those noble purposes, or of disapprobation to himself, if he neglect to use it; still more, if, instead of merely neglecting the happiness of others, he exert himself, intentionally, to lessen it, and add to the sufferings that exist in the world, independently of him, the sufferings which it is in his power to inflict on others, and the more dreadful sufferings of remorse and despair that must be felt by his own guilty heart.

I should now, in regular order, proceed to the consideration of that propriety of conduct with respect to the individual which constitutes what has been termed our duty to ourselves. But, as this inquiry involves chiefly the consideration of happiness, and as so much of human happiness has relation to our notions of the Divinity and our prospects of immortal life, it seems to me better, upon the whole, to deviate in a slight degree from our regular plan, and to give our attention, first, to those great subjects, before entering on the inquiry which must have relation to them.

We have already considered man in various aspects; as a sensitive being, capable of being affected by the things around him, and deriving from them not pleasure, and pain, and sustenance merely, but the elements of his knowledge; as an intellectual being, capable of discovering the relations of things, comparing, generalizing, forming systems of truth, and almost creating worlds of fiction that arise with the semblance of truth at the mere will of his fancy; and, lastly, as a moral agent, connected with other moral agents, by ties that are innumerable as the living objects to whom they relate. We have now to consider the more important relation, which, as a created and dependent, but immortal being, he bears to that supreme being, who is the great source of all existence.

On this subject, that comprehends the sublimest of all the truths which man is permitted to attain, the benefit of revelation may be conceived to render every inquiry superfluous, which does not flow from it. But to those who are blessed with a clear-

er illumination, it cannot be uninteresting to trace the fainter lights, which in the darkness of so many gloomy ages, amid the oppression of tyranny in various forms, and of superstition more afflicting than tyranny itself, could preserve, still dimly visible to man, that virtue which he was to love, and that Creator whom he was to adore. Nor can it be without profit, even to their better faith, to find all nature thus concurring, as to its most important truths, with revelation itself; and every thing living and inanimate announcing that high and holy one, of whose perfections they have been privileged with a more splendid manifestation.

We have to consider, then, not the tie which connects man with his parents only, and with that race of mortal ancestors by whom a frail existence has been successively transmitted from those who lived for a few feeble years, to those who lived afterwards for a few feeble years, but that far nobler principle of union, by which he is connected with him who has existed for ever, the Creator of the universe, and the Preserver of that universe which he has created. The inquiry into the existence of the noblest of beings, into the existence of him to whom we look as the source of every thing which we enjoy and admire, is itself surely the noblest of all the inquiries on which man can enter; and the feelings with which we enter on it should be of a kind that is suitable to the contemplation of a nature so noble, even as possibly existing. "*Si intramus templa compositi,*" says an eloquent pagan writer when beginning an inquiry into some of the mere works of God, "*si ad sacrificium accessuri vultum submittimus, si in omne argumentum modestiæ fingimur; quanto hoc magis facere debemus, cum de sideribus, de stellis, de deorum natura disputamus, ne quid temere, ne quid impudenter, aut ignorantes affirmemus, aut scientes mentiamur.*"

The universe exhibits indisputable marks of design, and is therefore not self-existing, but the work of a designing mind. There exists, then, a great designing mind. Such is the first truth with respect to the indication of divinity in the universe, to which I would direct your attention.

If the world had been without any of its present adaptation of parts to parts, only a mass of matter, irregular in form, and quiescent,—and if we could conceive ourselves, with all our faculties as vigorous as now, contemplating such an irregular and quiescent mass, without any thought of the order displayed in our own mental frame, I am far from contending that, in such circumstances, with nothing before us that could be considered as indicative of a particular design,

we should have been led to the conception of a Creator. On the contrary, I conceive the abstract arguments which have been adduced to show that it is impossible for matter to have existed from eternity, by reasonings on what has been termed necessary existence, and the incompatibility of this necessary existence with the qualities of matter, to be relics of the mere verbal logic of the schools, as little capable of producing conviction as any of the wildest and most absurd of the technical scholastic reasonings on the properties or supposed properties of entity and nonentity. Eternal existence, the existence of that which never had a beginning, must always be beyond our distinct comprehension, whatever the eternal object may be, material or mental; and as much beyond our comprehension in the one case as in the other, though it is impossible for us to doubt that some being, material or mental, must have been eternal, if any thing exists.

Had there e'er been nought, nought still had been;
Eternal these must be.†

In the circumstances supposed, however, it is very probable that if we formed any thought at all upon the subject, we should have conceived the rude quiescent mass to have been itself eternal, as, indeed, seems to have been the universal opinion of the ancient philosophers, with respect to the matter of the universe, even though they admitted the existence of divine beings as authors of that beautiful regularity which we perceive. The mass alone would have been visible,—creation, as a fact, unknown to our experience,—and in the mass itself, nothing which could be regarded as exhibiting traces of an operating mind.

But though matter, as an unformed mass, existing without relation of parts, would not, I conceive, of itself have suggested the notion of a Creator,—since in every hypothesis, something material or mental must have existed uncaused, and mere existence, therefore, is not necessarily a mark of previous causation, unless we take for granted an infinite series of causes,—it is very different when the mass of matter is considered as possessing proportions and obvious relations of parts to each other, relations which do not exist merely in separate pairs, but many of which concur in one more general relation, and many of these again, in relations more general still. In short, when the whole universe seems to present to us, on whatever part of it we may look, exactly the same appearances as it would have presented if its parts had been arranged intentionally, for the purpose of producing the results which are

* Seneca, *Naturales Quaestiones*, lib. vii. cap. xxx.

† Night Thoughts, Night ix.

now perceived,—when these appearances of adaptation are not in a few objects out of many, but in every thing that meets our view, and innumerable, therefore, as the innumerable objects that constitute to us the universe, we feel an absolute impossibility of supposing that so many appearances of design exist without design; an impossibility against which it may not be difficult to adduce words in the form of argument, but which it would be as difficult to endeavour not to feel, as to divest ourselves of that very capacity of reasoning to which the negative argument must be addressed. It would be absurd to attempt to state how many proportions may coexist, and yet be imagined by us not to imply necessarily any design in the production of them. A few types, for example, may be thrown loosely together, and some of them may form a word. This we can believe, without any suspicion of contrivance. If many such words, however, were to be thrown together, we should suspect contrivance, and would believe contrivance, with the most undoubting conviction, if a multitude of types were to be found, thus forming one regular and continued poem. This instance, I may remark by the way, is one which is used by Cicero; though it is one which we should little have expected to find in an ancient writer, in ages when the blessing of the art of printing was unknown. In speaking of the opinion of those who contend that the universe was formed by a fortuitous concourse of atoms, he says, “*Hoc qui existimat fieri potuisse, non intelligo, cur non idem putet, si innumerabiles unius et viginti formae literarum, vel aureae vel qualeslibet, aliquod conjiciantur, posse ex his in terram excussis, annales Ennii ut deinceps legi possent effici; quod nescio, an, ne in uno quidem versu, possit tantum valere fortuna.*”*

Such is our nature, then, that it would seem as truly impossible that a number of types thrown together, should form the *Iliad* or *Odyssey*, as that they should form *Homer* himself. We might assert, indeed, that it was by chance that each type had found its way into its proper place; but, in asserting this, our understanding would belie our sceptical assertion. A certain continued series of relations is believed by us to imply contrivance, as truly as the sensations produced in us are conceived to imply the existence of corresponding sensible qualities in the object without; or as any conclusion in reasoning itself is felt to be virtually contained in the premises which evolve it. The great question is, whether, in the universe, there be any such continued series of relations?

Strange as it may seem, that, by knowing more and more fully all the uses which the different parts of the universe fulfil, we should be less disposed to think of the contrivance which those concurring uses indicate, the fact is certain. As often as we do think of them, indeed, in relation to their origin, and say within ourselves, is this admirable seeming arrangement fortuitous or the work of design? we feel more profoundly, that there must have been contrivance, in proportion as we have discovered more traces of harmony in the disposition of the parts subservient to certain uses. But still we think of these less frequently, merely because they have often been before us. We have all some particular objects on which we are intent, of pleasure, or business, or what at least we take to be business. It requires some astonishment, therefore, to make us pause and suspend our thoughts, which we have already given to some other object; and astonishment requires, that the object which excites it should be new. If it had been possible for the generations of mankind to have existed in society in a world of darkness, and that splendid luminary, by the regular appearances of which we now date our existence, had suddenly arisen on the earth, how immediately would it have suspended every project and passion, all those projects, and passions, and frivolities, which fill our hearts at present with their own petty objects, so as scarcely to leave room for a single better thought. The gayest trifler would, for an instant, have ceased to be a trifler. The most ambitious courtly sycophant, who had been creeping for years round the throne, labouring to supplant rivals whom he never had seen, with the same assiduity as that with which competitors for royal favour, in a world of sunshine, labour to supplant rivals whom they have seen, would have thought of something more than of himself and them at such a moment. The very atheists of such a world, whose chief amusement, in their blindness, had been the ingenuity of proving that the world must have existed for ever, as it existed then, would almost have felt, on such an appearance, that there is a Power which can create, and would have been believers in that power, for some moments at least, though they might have hastened, as soon as their superstitious fear permitted them, to accommodate the new phenomenon to their system. The sudden appearance, then, of the sun, as it rose in all its magnificence, on beings who had never before enjoyed a single ray of its profusion of splendour, would have led every heart to think of some mighty Power that had formed it. It would have produced that great effect, which *Lucretius* and *Petronius*, taking a casual concomitant for the cause, very falsely ascribe to fear, but which is, in truth,

* *De Natura Deorum*, lib. ii. p. 509. Ernest. Lond. 1819.

the effect of that admiration of the great and new, which may be combined with fear, though not necessarily, as it may be combined with feelings of a very different kind.

*Primus in orbe Deos fecit timor; ardua coelo
Fulmina quum cadent, discussaque moenia flammis,
Atque ictus flagrant Aethra.*

Fear of supernatural power, in such a case, it is very evident, must be the effect of previous belief of the existence of that Power which is feared, for no one can fear that which he does not conceive to exist. It was not the fear, therefore, but the previous admiration of the new phenomenon, which, in Petronius's sense, "made the Gods;" and but for this admiration of what was new and great, the fear of the thunderbolt could as little have produced fear of a Divine Being, before unknown and unsuspected, as the fear of being burnt to death when our house was on fire, could, of itself, have suggested the notion of a Divinity.

The sudden appearance of the sun, then, in a case like that which I have supposed, would have led every mind to some thought as to its origin. It would have indicated power of some sort. But the sun would have gone down; and, though there might be some little hope that what had once appeared might reappear, it could have been only a slight hope. The night once passed, however, it would return in its former magnificence; and, after a few successions of days and nights, its regularity would add to the previous conception of power, some conception of corresponding order, in the power whatever it might be, which sent it forth with so much regularity. Such would have been our feelings, if we had not known the sun ever since we remember existence. Its rising and setting are now, as it were, a part of our own life. We arrange the labours of the day, so as to bring them to a conclusion before the darkness with which evening is to close; and we lie down at night full of projects for the morning, with perfect reliance that the light which guided us during the past day, will guide us equally in that which is soon to shine upon us. Yet this very circumstance, the regularity with which the sun has appeared to distribute to us its innumerable blessings, a regularity which gives to the splendid phenomenon itself more indubitable marks of the power which is its source, is the circumstance that prevents us from thinking of this divine source. "*Sed assiduitate quotidiana,*" says Cicero, "*et consuetudine oculorum, assuescunt animi, neque admirantur, neque requirunt rationes earum rerum, quas semper vident; proinde quasi novitas nos magis quam magnitudo rerum, debeat ad exquisitas causas excitare.*"*

Even if, when we first beheld the wonderful appearances of nature, our faculties had been such as they are when matured in after-life, though the phenomenon must, of course, have become equally familiar to us, we should still have retained some impression of those feelings which the aspect of the universe must have excited in us when we first entered into this world of glory. "The miracles of nature," says Diderot, "are exposed to our eyes, long before we have reason enough to derive any light from them. If we entered the world with the same reason which we carry with us to an opera, the first time that we enter a theatre,—and if the curtain of the universe, if I may so term it, were to be rapidly drawn up, struck with the grandeur of every thing which we saw, and all the obvious contrivances exhibited, we should not be capable of refusing our homage to the Eternal power which had prepared for us such a spectacle. But who thinks of marvelling at what he has seen for fifty years? What multitudes are there, who wholly occupied with the care of obtaining subsistence, have no time for speculation: the rise of the sun is only that which calls them to toil, and the finest night in all its softness, is mute to them, or tells them only that it is the hour of repose."†

When we read, for the first time, the account which Adam gives to the angel of his feelings, when, with faculties such as we have supposed, and every thing new before him, he found himself in existence in that happy scene of Paradise which Milton has described, we are apt to think that the poet has represented him as beginning too soon to reason with respect to the power to which he must have owed his existence; and yet, if we deduct the influence of long familiarity, and suppose even a mind less vigorous than that of Adam, but with faculties such as exist now only in mature life, to be placed in the first moment of existence in such a scene, we shall find, the more we reflect on the situation, that the individual scarcely could fail to philosophize in the same manner.

As new wak'd from soundest sleep,
Soft on the flow'ry herb I found me laid,
In balmy sweat, which with his beams the sun
Soon dry'd, and on the reeking moisture fed:
Strait toward heaven my wond'ring eyes I turn'd,
And gaz'd awhile the ample sky, till rais'd
By quick instinctive motion, up I sprung,
As thitherward endeavouring, and upright
Stood on my feet. About me round I saw
Hill, dale, and shady woods, and sunny plains,
And liquid lapse of murmuring streams: by these
Creatures that liv'd and mov'd, or walk'd or flew,
Birds on the branches warbling: all things smil'd;
With fragrance, and with joy my heart o'erflow'd:
Myself I then perus'd, and limb by limb
Survey'd, and sometimes went, and sometimes ran,
With supple joints, as lively vigour led:
But who I was, or whence, or from what cause,
Knew not; to speak I tried, and forthwith spake.
My tongue obey'd, and readily could name

* De Natura Deorum, lib. ii. p. 510.

† Œuvres de Diderot, tome i. p. 100. Amst. 1775, 12mo

What'er I saw. Thou sun, said I, fair light !
 And thou, enlighten'd earth, so fresh and gay,
 Ye hills and dales, ye rivers, woods, and plains,
 And ye that live and move, fair creatures, tell,
 Tell, if ye saw, how came I thus, how here ;
 Not of myself ; by some great Maker then,
 In goodness and in power pre-eminent ;
 Tell me how may I know him, how adore,
 From whom I have, that thus I move and live,
 And feel that I am happier than I know.*

Refined as this reasoning may seem in such circumstances of new existence, it seems to us refined only because, on imagining the situation of our first Parent, it is difficult for us to divest ourselves of long-accustomed feelings, and to suppose in his vigorous mind the full influence of that primary vivid admiration which we have never felt, because our minds had become accustomed to the sublime magnificence of the world before they were capable of feeling the delightful wonder which, if it had been felt by us as he who is so poetically described must have felt it, would have led us too to reason in the same manner, and to feel perhaps that instant gratitude to which his tongue was so ready to give utterance.

All the impression then, which the wonders of nature would produce upon us, as new, is of course lost to us now. What would have forced itself upon us, without reflection, requires now an effort of reflection. But, when we make the reflection, the contrivance does not appear to us less irresistibly marked. We have, indeed, many more proofs of such contrivance, than we could possibly have had, but for that experience which has been adding to them every day.

If a multitude of parts, all manifestly relating to each other, and producing a result which itself has as manifest a relation to the results of other proportions, cannot be observed by us without an irresistible impression of design ; if it is impossible for us to conceive that nine millions of alphabetic characters could fall of themselves into a treatise or a poem ; that all the pictures, I will not say in the whole world, but even the few which are to be found in a single gallery, were the product of a number of colours thrown at random from a brush upon canvass ; that a city, with all its distinct houses, and all the distinct apartments in those houses, and all the implements of domestic use which those apartments contain, could not have existed without some designing mind, and some hands that fashioned the stone and the wood, and performed all the other operations necessary for erecting and adorning the different edifices ; if it be easier for us to believe that our senses deceived us in exhibiting to us such a city,—and that there was truly nothing seen by us,—than to believe that the houses existed of themselves without any

contrivance ; the only question, as I have already said, is, whether the universe itself exhibits such combinations of parts relating to each other, as the poem, the picture, the city, or any other object for which we find it necessary to have recourse to designing skill. It is quite evident that, in such a case as this, all abstract reasoning is superfluous. We have not to investigate the relation which harmony of parts bears to design, or to enter into nice disquisitions on the theory of probabilities. We are addressing men, and we address therefore beings to whom doubt of such a relation is impossible, who require no abstract reasoning to be convinced that the *Iliad* of Homer, or Euclid's *Elements* of Geometry, could not be formed by any loose and casual apposition of alphabetic characters after characters, and who, for the same reason, must believe that any similar order implies similar design. If this connexion of a regular series of relations with some regulating mind, is not felt, there is at least as much reason to suspect that any abstract reasoning on probabilities will be as little felt, since every reasoning must assume a principle itself unproved, and as little universal as such belief in such circumstances. Still more superfluous must be all those reasonings with respect to the existence of the Deity, from the nature of certain conceptions of our mind, independent of the phenomena of design, which are commonly termed reasonings *a priori*,—reasonings that, if strictly analyzed, are found to proceed on some assumption of the very truth for which they contend, and that, instead of throwing additional light on the argument for a Creator of the universe, have served only to throw on it a sort of darkness, by leading us to conceive that there must be some obscurity in truths which could give occasion to reasoning so obscure. God, and the world which he has formed—these are our great objects. Every thing which we strive to place between these is nothing. We see the universe, and, seeing it, we believe in its Maker. It is the universe, therefore, which is our argument, and our only argument ; and, as it is powerful to convince us, God is, or is not, an object of our belief.

If proportion, order, subserviency to certain uses that are themselves subservient to other uses, and these to others, in a regular series, be then what it is impossible for us to consider, without the belief of design, what is the universe but a spectacle of such relations in every part ? From the great masses that roll through space, to the slightest atom that forms one of their imperceptible elements, every thing is conspiring for some purpose. I shall not speak of the relations of the planetary motions to each other ; of the mutual relations of the various parts of our globe ; of the different animals of the

* *Paradise Lost*, book viii. v. 255—282.

different elements, in the conformity of their structure to the qualities of the elements which they inhabit; of man himself, in all the nice adaptations of his organs, for purposes which the anatomist and physiologist may explain to us in more learned language, but which even the vulgar, who know only the thousandth part, or far less than the thousandth part, of the wonders of their own frame, yet see sufficiently, to be convinced of an arrangement which the physiologist sees more fully, but does not believe more undoubtably. To these splendid proofs, it is scarcely necessary to do more than to allude. But, when we think of the feeblest and most insignificant of living things—the minutest insect, which it requires a microscope to discover; when we think of it, as a creature, having limbs that move it from place to place, nourished by little vessels, that bear to every fibre of its frame some portion of the food which other organs have rendered fit for serving the purposes of nutrition,—having senses, as quick to discern the objects that bear to it any relative magnitude, as ours, and not merely existing as a living piece of most beautiful mechanism, but having the power which no mere mechanism, however beautiful, ever had, of multiplying its own existence, by the production of living machines exactly resembling itself, in all the beautiful organic relations that are clustered as it were in its little frame; when we think of all the proofs of contrivance which are thus to be found in what seems to us a single atom, or less than a single atom, and when we think of the myriads of myriads of such atoms which inhabit even the smallest portion of that earth which is itself but an almost invisible atom, compared with the great system of the heavens, what a combination of simplicity and grandeur do we perceive! It is one universal design, or an infinity of designs: nothing seems to us little, because nothing is so little as not to proclaim that omnipotence which made it; and, I may say too, that nothing seems to us great in itself, because its very grandeur speaks to us of that immensity before which all created greatness is scarcely to be perceived.

On particular arguments of this kind, that are as innumerable as the things which exist, I feel that it is quite idle to dwell. Those whom a single organized being, or even a single organ, such as the eye, the ear, the hand, does not convince of the being of a God,—who do not see him, not more in the social order of human society, than in a single instinct of animals, producing unconsciously a result that is necessary for their continued existence, and yet a result which they cannot have foreknown,—will not see him in all the innumerable instances that might be crowded together by philosophers

and theologians. If, then, such be our nature, that regularity of parts subservient to certain uses, impresses us necessarily with a feeling of previous contrivance, we speak against the conviction of our own heart as often as we affect to shelter ourselves in the use of a frivolous word, and say, of all the contrivance of the universe, that it is only the result of chance,—of chance to which it would seem to us absurd to ascribe the far humbler traces of intellect that are to be found in a poem, or a treatise of philosophy. What should we think of any one who should ascribe to chance the combinations of letters that form the *Principia* of Newton! and is the world which Newton described less gloriously indicative of wisdom than the mere description? The word chance, in such a case, may be regarded as expressive only of unwilling assent. It is a word easily pronounced, but it is nothing more.

“How long,” says Tillotson, in one of his Sermons, “might twenty thousand blind men, which should be sent out from the several remote parts of England, wander up and down before they would all meet upon Salisbury Plains, and fall into rank and file in the exact order of an army? And yet this is much more easy to be imagined, than how the innumerable blind parts of matter should rendezvous themselves into a world. A man that sees Henry the Seventh’s chapel at Westminster, might, with as good reason, maintain, (yea, with much better, considering the vast difference betwixt that little structure and the huge fabric of the world,) that it was never contrived or built by any man, but that the stones did by chance grow into those curious figures into which they seem to have been cut and graven; and that upon a time (as tales usually begin) the materials of that building, the stone, mortar, timber, iron, lead, and glass, happily met together, and very fortunately ranged themselves into that delicate order in which we see them now so close compacted, that it must be a very great chance that parts them again. What would the world think of a man that should advance such an opinion as this, and write a book for it? If they would do him right, they ought to look upon him as mad; but yet with a little more reason than any man can have to say that the world was made by chance.”*

The world, then, was made: there is a designing Power which formed it,—a Power whose own admirable nature explains whatever is admirable on earth, and leaves to us, instead of the wonder of ignorance, that wonder of knowledge and veneration which is not astonishment, but love and awe.

“The impious,” says an eloquent French

* Tillotson’s Works, vol. I. sermon i. p. 12. Lond. 1752, folio.

writer, "are struck with the glory of princes and conquerors that found the little empires of this earth; and they do not feel the omnipotence of that hand which laid the foundations of the universe. They admire the skill and the industry of workmen, who erect those palaces which a storm may throw down; and they will not acknowledge wisdom, in the arrangements of that infinitely more superb work which the revolutions of ages have respected, and must continue to respect till he who made it shall will it to pass away. In vain, however, do they boast that they do not see God; it is because they seek him, who is perfect holiness, in a heart that is depraved by its passions. But they have only to look out of themselves, and they will find him everywhere: the whole earth will announce to them its maker; and if they refuse still their assent, their own corrupted heart will be the only thing in the universe which does not proclaim the author of its being."*

So completely do we feel this universal assent of nature, in acknowledging the existence of its author, that we enter readily into those poetic personifications which animate every object, and call on them to mingle as it were in worship with mankind.

To Him, ye vocal gales
Breathe soft, whose spirit in your freshness breathes!
O talk of Him in solitary glooms,
Where, o'er the rock, the scarcely waving pine
Fills the brown shade with a religious awe.
And ye, whose bolder note is heard afar,
Who shake the astonish'd world, lift high to Heaven
The impetuous song, and say, from whom you rage.
His praise, ye brooks, attune, ye trembling rills,
And let me catch it, as I muse along.
Ye headlong torrents, rapid and profound;
Ye softer floods, that lead the humid maze
Along the vale;—and thou, majestic main,
A secret world of wonders in thyself,
Sound His stupendous praise, whose greater voice
Or bids you roar, or bids your roarings fall.†

To that power which we thus call on them to attest, they all truly bear witness. We assign to them feelings which they have not, indeed, as much as we assign to them a voice which they have not; but, so strong is the evidence of mind which they bear, that it seems as if we merely give them a voice expressing, in our language, what they mutely feel.

LECTURE XXIII.

OF THE EXISTENCE,—THE UNITY,—THE OMNISCIENCE,—THE OMNIPOTENCE,—AND THE GOODNESS OF THE DEITY.

My last Lecture, Gentlemen, was employed in considering the evidence which the

frame of nature exhibits, of the being of its divine Author.

Of this there appears to me to be only one argument which can produce conviction, but that an argument so irresistible, as to correspond, in its influence on the mind, with the power of him whose existence it forces even the most reluctant to acknowledge. The arguments commonly termed metaphysical, on this subject, I have always regarded as absolutely void of force, unless in as far as they proceed on a tacit assumption of the physical argument; and, indeed, it seems to me no small corroborative proof of the force of this physical argument, that its remaining impression on our mind has been sufficient to save us from any doubt as to that existence, which the obscure and laborious reasonings a priori, in support of it, would have led us to doubt rather than to believe.

The universe is that which shows the existence of the Author of the universe. It exhibits a harmony of relations, to perceive which is to perceive design; that is to say, it is impossible for us to perceive them without feeling immediately, that the harmony of parts with parts, and of their results with each other, must have had its origin in some designing mind. I did not conceive it necessary to occupy much of your time in tracing the various relations of this sort which the universe presents, in the small as in the great, in the simple as in the complicated, for there is no need to exhibit a multitude of contrivances to prove a contriver. "Nec avis pennulam," says St. Austin, "nec herbae flosculum, nec arboris folium, sine partium suarum convenientia reliquit." It is pleasing, indeed, to trace, in every part of the creation, the wisdom by which it was created, as often as any new proof of beneficent intention is discovered by us, in some part, of which the uses were before unknown; but it is pleasing, only from the accession which is thus made to our physical knowledge, and from the interest which we feel in contemplating the works of a Power which we love, not from any stronger faith which we thence derive in the existence of that Power. He who can examine anatomically, I will not say the whole frame of a single organized being, but even a single organ, and not perceive design,—who can look, for example, at the different parts of the eye, and believe that they exist as they are, without any adaptation to the light which they reflect, and to the sentient mind; who can see the bony socket which defends so precious an organ from external violence, the flexible covering in the lid, which can be raised or depressed at pleasure, that preserves it from injuries of a different kind, the apparatus for preparing a due quantity of moisture to lubricate the ball, and the conduit for car-

* Massillon. † Thomson, Hymn on the Seasons.

rying away all superfluous moisture, the muscles that enable us to vary at our pleasure the field of vision, by giving ready motion to the visual orb, and the soft cushion on which it rests, that these motions, however swift, may be performed without injury,—who, after observing these various provisions that are merely external to it, considers what it is which is to be found within the little orb itself, the wonderful apparatus, by which the rays of light from a wide field, that comprehends in it objects at many distances, are all made to converge, so as to form one distinct image on the small expansion of the optic nerve, and the apparatus as wonderful, by which the quantity of light admitted or excluded is tempered to the delicate sensibility of the nerve, and this, not tardily at our bidding, since the injury might then be done before we were able to know the danger, but instantly, without our volition, and even without our knowledge that any such process is taking place,—he who can consider the small compass within which so many wonders are condensed, and ascribe to chance, what, if invented by a human being, he could not fail to regard as the noblest instrument which wisdom, in all its ingenuity, had ever invented, may indeed be an atheist; but such an atheist would continue an atheist, though the whole wonders of the living and inanimate universe were exhibited in succession to his view.

To such a being, if such a denier of the slightest intentional adaptation of parts to parts in the frame of the universe were truly to exist, it would, indeed, be as difficult to prove the existence of God, as to prove the truths that are evolved from any process of arithmetical or geometrical reasoning, to one who denied in words the elementary relations which the separate propositions of the reasoning involve; but we do not rely the less on those truths of demonstration, on account of the mere verbal sophistry which denies them, or professes to deny them; and, notwithstanding the similar profession of scepticism as to design, it is equally impossible for us to consider a single organ like the eye, without believing that there was some one by whom the beautiful apparatus was contrived. We cannot read a poem or a treatise, without believing that it is a work of human art; nor read the characters of divinity in the universe, without thinking of its divine Author.

The manifest order of the universe, in the relation of parts to parts, and of their joint results to other joint results of other parts, is a proof then of some designing power, from which all this magnificent order took its rise: and the great Being, to whom, in discovering design, we ascribe the designing power, is the Being whom we denominate God. The harmony which is the proof of design,

is itself a proof of the relative unity of that design. This designing power is one then, in the only sense in which we are entitled to speak either of divine unity or plurality, as indicated by the frame of nature before us; for it is only from the phenomena of the universe that we are capable of inferring the existence of any higher being whatever; and, therefore, as we have no traces of any other being, than the universe, directly or indirectly, exhibits to us, the designing power is not to our reason more than one; since in every thing which we behold, there is unity of that design, from which alone we have any reason to infer a designer. The laws of motion which prevail on our earth, prevail equally wherever we are capable of discovering motion. On our own earth, where our observation is so ample in the infinity of objects around us, there is no irregularity or opposition of contrivances, but all have proportions or analogies which mark them as the result of one harmonious design. There may be many spiritual beings of greater or less excellence, though there is no evidence of them in nature; for where there is no evidence whatever, it is as absurd to deny absolutely as to affirm. But there is, as I have said, no evidence of any such beings; and the designing power then, as marked to us by all which we perceive in nature, is one, in the only sense in which the unity of the Supreme Being can be demonstrable, or even at all conceivable by us. The power of which we speak, exists to our reason, only as the author of the design which we trace; and the design which we trace, various as it may be in the parts to which it extends, is all one harmonious contrivance.

This designing unity, that is relative to what we see, is all, however, which we are logically entitled to infer from the phenomena; for the absolute and necessary unity of the divine Power, as attempted to be proved by metaphysical arguments *a priori*, that are at best only a laborious trifling with words which either signify nothing or prove nothing, is more than, in our state of ignorance, independently of revelation, we are entitled to assert. The unity, which alone, from the light of nature, we can with confidence assert, is hence not strictly exclusive, but wholly relative to that one design which we are capable of tracing in the frame of the universe.

This one designing Power, we are accustomed to say, is omniscient; and, in the only sense in which that phrase can have any meaning, when used by creatures so ignorant as ourselves, to signify our impossibility of discovering any limits to the wisdom which formed the magnificent design of the world, the phrase may be used as expressive only of admiration that is justly due to wisdom so sublime. He who formed the universe,

and adapted it, in all its parts, for those gracious purposes to which it is subservient, must, of course, have known the relations which he established; and knowing every relation of every thing existing, he may truly be said to be omniscient in his relation to every thing which exists. But it is in this definite sense only that the phrase has any meaning, as used by creatures, whose knowledge is itself so very limited. Beyond this universe, it is presumptuous for man to venture, even in the homage which he offers. The absolute wisdom of the Deity, transcendent as it may be, when compared even with that noble display of it which is within us, and without us wherever we turn our eyes, we are incapable even of conceiving; and admiring what we know, an awful veneration of what is unknown is all that remains for us. Our only meaning of the term omniscience, then, does not arrogate to us any knowledge of those infinite relations which we assert the Deity to know. It is merely that the Supreme Being knows every relation of every existing thing, and that it is impossible for us to conceive any limit to his knowledge.

His omnipotence, in like manner, as conceived by us, whatever it may be in reality, is not a power extending to circumstances, of which, from our own ignorance, we must be incapable of forming a conception; but a power which has produced whatever exists, and to which we cannot discover any limit. It may be capable of producing wonders, as far surpassing those which we perceive, as the whole fabric of the universe surpasses the little workmanship of mortal hands; but the relation of the Deity to these unexisting or unknown objects, is beyond the feebleness of our praise, as it is beyond the arrogance of our conception.

God, then, the Author of the universe, exists. He exists, with a wisdom which could comprehend every thing that fills infinity in one great design; with a power which could fill infinity itself with the splendour of wonders that are, wherever we endeavour to extend our search. We know no limit to his wisdom, for all the knowledge which we are capable of acquiring flows from him as from its source; we know nothing which can limit his power, for every thing of which we know the existence, is the work of his hand.

God, then, thus wise and powerful, exists, and we are subject to his sway. We are subject to his sway: but, if all which we knew of his nature were his mere power and wisdom, the inquiry most interesting to us would still remain. The awful power, to which we perceive no limit, may be the sway of a tyrant, with greater means of tyranny than any earthly despot can possess, or it may be the sway of a father, who has

more than parental fondness, and a power of blessing far more extensive than any parental power, which is but a shadow, and a faint shadow, of the divine goodness that has conferred it. If we were suddenly carried away into captivity, and sold as slaves, how eager should we be to discover whether our taskmaster was kind or cruel, whether we could venture to look to him with hope, or only with the terror which they feel, who are to see constantly above them a power which is to be exercised only in oppression, or whose kindness of a moment is the short interval of hours of tyranny! But I will not use such an illustration in speaking of God and man. The paternal and filial relation is the only one which can be considered as faintly representing it; and to what son can it be indifferent whether his father be gentle or severe? The goodness of God is, of all subjects of inquiry, that which is most interesting to us. It is the goodness of him to whom we owe, not merely that we exist, but that we are happy or miserable now, and, according to which we are to hope or fear for a future that is not limited to a few years, but extends through all the ages of immortality. Have we, then, reason to believe that God is good? that the designing power, which it is impossible for us not to perceive and admit, is a power of cruelty or kindness? Of whom is this the question? Of those whose whole life has been a continued display of the bountiful provision of Heaven, from the first moment at which life began.

It is the inquiry of those who, by the goodness of that God whose goodness they question, found, on their very entrance into this scene of life, sources of friendship already provided for them, merely because they had wants that already required friendship; whose first years were years of cheerfulness almost uninterrupted, as if existence were all that is necessary for happiness; to whom, in after-life, almost every exertion which they were capable of making was a pleasure, and almost every object which met their eye, a sense of direct gratification, or of knowledge, which was itself delightful; who were not formed to be only thus selfishly happy, but seemed called, by some propitious voice of nature, to the diffusion of happiness, by the enjoyment which arose from that very diffusion, and warned from injuring others, by the pain which accompanied the very wish of doing evil, and the still greater pain of remorse, when evil had at any time been intentionally inflicted. Nor is it to be counted a slight part of the goodness of God; that he has given us that very goodness as an object of our thought, and has thus opened to us, inexhaustibly, a pure and sublime pleasure in the contemplation of those divine qualities, which are themselves the source of all the pleasures that we feel.

Such is the goodness of God, in its relation to mankind, in infancy, in manhood, in every period of life. But we are not to think that the goodness of God extends only to man. The humblest life, which man despises, is not despised by him who made man of nothing, and all things of nothing, and "whose tender mercies are over all his works."

Has God, thou fool, work'd solely for thy good,
Thy joy, thy pastime, thy attire, thy food?
Who for thy table feeds the wanton fawn,
For him as kindly spread the flow'ry lawn.
Is it for thee the lark ascends and sings?
Joy tunes his voice, joy elevates his wings.
Is it for thee the linnet pours his throat?
Loves of his own and raptures swell the note.
The bounding steed you pompously bestride,
Shares with his lord the pleasure and the pride.
Is thine alone, the seed that strews the plain?
The birds of heaven shall vindicate their grain.*

In vain do we strive to represent to ourselves all nature as our own, and only our own. The happiness which we see the other races around us enjoying, is a proof that it is theirs as well as ours; and that he, who has given us the dominion of all things that live on earth, has not forgotten the creatures which he has intrusted to our sway. Even in the deserts, in which our sway is not acknowledged, where the lion, if man approached, would see no lord before whom to tremble, but a creature far feebler than the ordinary victims of his hunger or his wrath,—in the dens and the wildernesses there are pleasures which owe nothing to us, but which are not the less felt by the fierce hearts that inhabit the dreadful recesses. They, too, have their happiness; because they too were created by a Power that is good, and of whose beneficent design, in forming the world, with all its myriads of myriads of varied races of inhabitants, the happiness of these was a part.

"Nor," as it has been truly said, "is the design abortive. It is a happy world after all. The air, the earth, the water, teem with delighted existence. In a spring noon, or a summer evening, on whichever side I turn my eyes, myriads of happy beings crowd upon my view. 'The insect youth are on the wing.' Swarms of new-born flies are trying their pinions in the air. Their sportive motions, their wanton mazes, their gratuitous activity, their continual change of place without use or purpose, testify their joy, and the exultation which they feel in their lately discovered faculties. A bee amongst the flowers in spring, is one of the most cheerful objects that can be looked upon. Its life appears to be all enjoyment; so busy and so pleased: yet it is only a specimen of insect life, with which, by reason of the animal being half-domesticated, we happen to be

better acquainted than we are with that of others."[†]

Such is the seemingly happy existence of that minute species of life which is so abundant in every part of the great scene in which we dwell. I shall not attempt to trace the happiness upward, through all the alacrity and seeming delight in existence, of the larger animals,—an ever-flowing pleasure, of which those who have had the best opportunities of witnessing multitudes of gregarious animals feeding together, and rejoicing in their common pasture, will be the best able to appreciate the amount. All have means of enjoyment within themselves; and, if man be the happy sovereign of the creation, he is not the sovereign of miserable subjects.

Ask for what end the heavenly bodies shine,
Earth for whose use? Pride answers, 'tis for mine.
For me, kind nature wakes her genial power,
Suckles each herb, and spreads out every flower;
Annual for me, the grape, the rose renew
The juice nectareous, and the balmy dew;
For me, the mine a thousand treasures brings;
For me, health gushes from a thousand springs;
Seas roll to waft me, suns to light me rise:
My footstool earth, my canopy the skies.‡

All these sources of blessings that are infinite as the living beings that enjoy them, were made, indeed, for man, whose pride makes the arrogant exclusive assumption; but they were also made for innumerable beings, whose very existence is unknown to man, and who know not in their turn, the existence of him who supposes that all these means of happiness are for himself alone. There is at every moment an amount of happiness on the earth, of which the happiness of all mankind is an element, indeed, but only one of many elements, that perhaps bears but a small proportion to the rest; and it is not of this single element that we are to think, when we consider the benevolence of that God who has willed the whole.

It is this element of the universal happiness, however, with which we are best acquainted; and when man is the inquirer, it is to this human part of course that we may suppose his attention to be chiefly turned. But man the enjoyer is very different from man the estimator of enjoyment. In making our estimate of happiness, we think only or chiefly of what is remarkable, not of what is ordinary; as, in physics, we think of the rarer phenomena far more than of the appearances of nature, which are every moment before our eyes. There are innumerable delights, therefore, of the senses, of the understanding, of the heart, which we forget, because they are delights to which we are every hour accustomed, and which are shared with us by all mankind, or the greater

* Pope's Essay on Man, Ep. iii. v. 27—38.

† Paley's Natural Theology, p. 392.

‡ Essay on Man, Ep. i. v. 131—140

number of mankind. It is what distinguishes us from our fellows that we consider; and this, the very circumstance of distinction necessarily limits to a few; not what is common to us with our fellows, which, by the very wideness of the participation, is of an amount that is incomparably greater. We think of the benevolence of the Author of the whole race of mankind, therefore, as less than it is, because it is a benevolence that has provided for the whole race of mankind; and if the amount of good provided for every living being had been less in the extent of its diffusion, we should, in our erring estimate, have regarded it as more, at least if ourselves had been of the number of the privileged few, who alone enjoyed those general blessings of nature which now are common to all.

"Non dat Deus beneficia?—unde ergo ista quæ possides, quæ das, quæ negas, quæ servas, quæ rapis? unde hæc innumerabilia, oculos, aures, animum mulcentia? unde illa luxuriam quoque instruens copia? Neque enim necessitatibus tantummodo nostris provisum est: usque in delicias amamur.—Si pauca quis tibi donasset jugera, accepisse te diceres beneficium: immensa terrarum latè patentium spatia negas esse beneficium!"* It is truly, as this eloquent writer says, the possession of the common glories of the earth, the sky, of all nature that is before us and above us, which is the most valuable possession of man; and the few acres which he enjoys, or thinks that he enjoys exclusively, compared with that greater gift of heaven to all mankind, are scarcely worthy of being counted as a proof of divine beneficence.

But though life to man, and to his fellow-inhabitants of earth, be a source of happiness upon the whole, it is not always, and in every instance, a source of happiness. There is not a moment, indeed, in which the quantity of agreeable sensation felt by myriads of creatures, may not be far greater than all the pain which is felt at the same moment. But still there is no moment in which pain, and a very considerable amount of pain, is not felt. Can he be good, then, under whose supreme government, and therefore almost, it may be said, at whose bidding, pain exists? Before entering on this inquiry, however, it may be necessary to obviate an objection that arises from the mere limitation of our nature as finite beings.

Many of the complaints of those who are discontented with the system of the universe, arise from this mere limitation of our faculties and enjoyments; a limitation in which ingratitude would find an argument, in whatever state of being short of absolute divinity

it might be placed; and even though possessing all the functions of divinity from the moment at which it was created, might still look back through eternity, and complain with the same reason, that it had not been created earlier to the exercise of such sublime functions.

It surely is not necessary, for the proof of benevolence on the part of the divine Being, that man should be himself a god; that he should be omniscient or omnipotent, any more than that he should have existed from eternity. His senses, with all his other faculties, are limited, because they are the faculties of a created being; as even his immortality may, in one sense of the word, be said to be limited, when considered in relation to the eternity that preceded his existence. But how admirably does even the limitation of his nature demonstrate the gracious benevolence of Heaven, when we consider the innumerable relations of the universe that must have been contrived, in adaptation to the exact degree of his capacity, so as to be most productive of good in these particular circumstances. If we think only how very slight a change in the qualities of external things, though perfectly suitable, perhaps, to a different degree of sensitive and intellectual capacity, might have rendered the existence of man absolutely miserable, how sublimely benevolent seems that wisdom, in the very minuteness of its care, which, by proportioning exactly the qualities of atoms to the qualities of that which, in the world of spirits, may be considered as scarcely more than what an atom is in the material world, has produced, amid so many possibilities of misery, this result of happiness.

You are probably all acquainted with the lines of Pope, so often quoted on this subject, that express briefly, and with great poetic force, the reasoning of Mr. Locke on this subject, which, perhaps, suggested them.

The bliss of man, could pride that blessing find,
Is, not to act or think beyond mankind;
No powers of body or of soul to share,
But what his nature and his state can bear.
Why has not man a microscopic eye?
For this plain reason, Man is not a fly.
Say, what the use, were finer optics given,
To inspect a mite, not comprehend the heaven?
Or touch, if tremblingly alive all o'er,
To smart and agonize at every pore:
Or, quick effluvia darting through the brain,
Die of a rose in aromatic pain?
If Nature thundered in his opening ears,
And stunn'd him with the music of the spheres,
How would he wish that heaven had left him still
The whispering zephyr and the purling rill!†

We see, then, the advantage of the adaptation of our limited powers to the particular circumstances of nature.

But appearances of evil unquestionably exist, that are not to be ascribed to the mere

* Seneca de Beneficiis, lib. iv. cap. v. vi.

† Essay on Man, Ep. I. v. 183—204.

limitation of our faculties, in relation to the finite system of things in which they are to be exercised. Let us now, then, proceed in part to the consideration of the question, as to the compatibility of these appearances with benevolence in the contriver of the universe.

The objection to the goodness of the supreme Being, involved in this question, of course proceeds on the supposition that the Deity had the power of forming us differently; a power, therefore, which I need not stop to attempt to prove, since, unless this be taken for granted by the objector, the objection would be nugatory.

But if the Deity had the power of forming us differently—if, for example, he could have so constituted our nature, that every object amid which we were placed must have been a source of pain—that habit, instead of lessening the sense of pain, had continually increased it—that, instead of an almost constant tendency to hope, we had had an equally constant tendency to the most gloomy apprehension—that we had felt pleasure in inflicting pain gratuitously, and remorse only if we had inadvertently done good,—if all this had been, it would surely have been a conclusion as just as obvious, that the contriver of this system of misery was, in his own nature, malevolent; and any happiness which seemed slightly felt at times—especially if the happiness was the manifest result of a contrivance that, upon the whole, tended far more frequently to the production of pain—might, without any violation of the principles of sound philosophy, have been ascribed to an intention purely malevolent, as indicated by the general contrivance obviously adapted for the production of pain. If, in such a system of things, any one had contended for the benevolence of the Deity from these few instances of pleasure, it would have been counted, as I cannot but think, a satisfactory answer, to have proved that the ordinary result of the contrivance must be pain; and to have pointed out the manifest subserviency of the different parts of the contrivance to this cruel purpose.

If this answer would be held valid, in the case now supposed, the opposite answer cannot be less valid, in the opposite circumstances in which we exist. I need not repeat, how much gratification we receive from the objects around us, nor fill up that antithesis to the former statement, which would probably occur to yourselves, while I imagined and stated its various circumstances. I shall dwell only on the pain, that is the occasional result of the system of things as it is. Is this the result of a contrivance, of which pain seems to be the manifest object, or of a contrivance which is manifestly, in its general and obvious appearances, adapted for purposes of utility, and consequently of

goodness? "Evil, no doubt, exists," says Paley, "but is never, that we can perceive, the object of contrivance. Teeth are contrived to eat, not to ache; their aching now and then is incidental to the contrivance, perhaps inseparable from it; or even, if you will, let it be called a defect in the contrivance; but it is not the object of it. This is a distinction which well deserves to be attended to. In describing implements of husbandry, you would hardly say of the sickle, that it was made to cut the reaper's hand; though, from the construction of the instrument, and the manner of using it, this mischief often follows. But, if you had occasion to describe instruments of torture, or execution, this engine, you would say, is to extend the sinews; this to dislocate the joints; this to break the bones; this to scorch the soles of the feet. Here pain and misery are the very objects of the contrivance. Now, nothing of this sort is to be found in the frame of nature. We never discover a train of contrivance to bring about an evil purpose. No anatomist ever observed a system of organization calculated to produce pain and disease; or, in explaining the parts of the human body, ever said, this is to irritate, this to inflame, this duct is to convey the gravel to the kidneys, this gland to secrete the humour which forms the gout. If, by chance, he come to a part of which he knows not the use, the most he can say is, that it is useless; no one ever suspects that it is put there to incommode, to annoy, or to torment."

When the direct object of all the great contrivances of nature, then, is so manifestly for beneficial purposes, it would be reasonable, even though no advantage could be traced, as the consequence of the occasional evils of life, to ascribe these rather to purposes unknown to us, than to purposes that were malevolent. If the inhabitant of some other planet were to witness the kindness and solicitude of a father for his child in his long watchfulness of love, and were then to see the same parent force the child, notwithstanding its cries, to swallow some bitter potion, he would surely conclude, not that the father was cruel, but that the child was to derive benefit from the very potion which he loathed. What that benefit was, indeed, it would be impossible for him to conceive, but he would not conceive the less that the intention was benevolent. He would feel his own ignorance of the constitution of things on earth, and would be confident, that if he knew this constitution better, the seeming inconsistency of the affection, and the production of suffering, would be removed.

Such a presumption would be reasonable,

even though we were incapable of discovering, in many cases, the advantage to which the seeming evil is subservient. It is very evident, that he only who knows all the relations of the parts of the universe, can justly appreciate the universe, and say with confidence of any part of it, it were better that this had not been. In our state of partial and very limited knowledge, if we say this of any part of the wonderful mechanism, we may perhaps say it of that, which not being, the happiness of millions would have been destroyed; we may say it even of that, the loss of which would be the confusion of all the systems of the universe.

*Let earth unbalanced from her orbit fly,
Planets and suns run lawless through the sky;
Let ruling angels from their spheres be hurled,
Being on being wrecked, and world on world;
Heaven's whole foundations to their centre nod,
And nature tremble to the throne of God.
All this dread order break, for whom? for thee?
Vile worm! Oh! madness, pride, impiety!*

What should we think of him, who, fixing his whole attention on the dim figures in the background of a great picture, should say, that the artist had no excellence, because these figures had little resemblance to the clear outline of the men and horses that seemed intended to be represented by them! All which would be necessary to vindicate the artist, would not be to make the slightest alteration in these figures, but to point out to the observer the foreground, and to bid him comprehend the whole picture in a glance. The universe is, if I may so express it, such a picture, but a picture far too large to be comprehended in our little gaze; the parts which we see have always some relation to parts which we do not see; and, if all these relations could be seen by us, there can be no doubt that the universe would then appear to us very different, as different, perhaps, as the picture seems to him who has looked only on the background, and who afterwards surveys the whole.

All reasoning of this kind, however, that is founded merely on our impossibility of accurate knowledge, is, I am aware, and am ready to admit, of little weight, unless where there is so decided a superiority of good or evil in the parts that may be conceived to be in a great measure known, as to leave no reasonable doubt as to the nature of the parts or relations of parts that are unknown. It is on this account, and on this account only, I consider it as of peculiar force in the present instance; for I surely need not say, after the remarks already made, how strong are the appearances of benevolent intention in the system of the universe, in all those manifest contrivances, of which we are able clearly to discover the object.

The divine Being who has contrived a system, that must thus, on every hypothesis, be allowed to be productive of much good to man, must be benevolent, malevolent, or indifferent, or capriciously benevolent and malevolent. That he is not indifferent, every contrivance itself shows. That he is not capricious, is shown by the uniformity of all the laws of nature, since the world has been a subject of human observation. That he is not malevolent, the far greater proportion of the marks of benevolent intention sufficiently indicates; and since his benevolence, therefore, is not capricious, the only remaining supposition is, that it is the permanent character of the divine mind.

The presumption, then, as to the goodness of God; even in the apparent evils of the system in which man is placed, would be a reasonable presumption, though, with our limited comprehension, we were incapable of discovering the advantages that flow from these particular seeming evils. What we see clearly might be regarded as throwing light on other parts of the immense whole, which are too dim for our feeble vision.

When a fair estimate, then, has been made of all the indications of the moral character of its author, which the universe exhibits, it is logically wise to infer, in many cases, a goodness that is not immediately apparent in the particular results. But, feeble as our faculties are, they are not so weak of vision and comprehension as to be incapable of distinguishing many of the relations of apparent evil to real good. There are many evils, that is to say, qualities productive of uneasiness, which the ignorant, indeed, might wish removed, but which those who have a little more knowledge would wish to continue, though the continuance or the disappearance of them depended on their mere will; and every discovery of this sort which we make, adds new force to that general presumption of goodness, which, even though we had been incapable of making any such discovery, would have been justified by the general character of benevolent intention, in the obvious contrivances of the universe. In treating of our appetites, I took occasion to explain to you the importance of the uneasy feelings which form a part of them. The ignorant, perhaps, might wish these removed, merely because they are uneasy feelings, though it is only as uneasy feelings they are valuable. The evils which we too might wish removed, are, perhaps, as important in their general relations, which we do not perceive, as hunger and thirst are in those relations, of which the vulgar do not think, and may almost be said, from their habits, to be incapable of thinking.

The analogy of many of the ills of life in their beneficial relation to our pains of appe-

tite, is, indeed, very striking. Without the uneasiness of ungratified desire in general, how feeble, in many cases, would be the delight of the gratification itself! He, certainly, would not consult well for human happiness, by whom every human desire, if it were in his power, would be rooted from the breast.

It is, in its relation to the enjoyments of conscious moral agency, however, that the existence of so much seeming evil in the world finds its best solution. To this I shall proceed in my next Lecture.

LECTURE XCIV.

OF THE GOODNESS OF THE DEITY—OBJECTIONS OVIATED.

In my last Lecture, Gentlemen, I considered the evidence which the universe exhibits of the goodness of its Author,—a goodness which, limited in its extent only by the limits of the universe itself, is present with us wherever we turn our eyes; since there is not a result of the wisdom and power of God which is not, in its consequences, direct or indirect, an exhibition of some contrivance, for the moral or physical advantage of his creatures.

Though every thing which we behold, however, may, in its general relations, tend to this benevolent purpose, good, or at least what seems to be good, is far from being in every case the immediate result. There is misery in the world, as truly as there is happiness in the world; and he who denies the one, as a mere phenomenon of the living scene in which he is placed, might with as much reason deny the other. Whence, then, is this evil, has been the question of every age, that has been capable of inquiries beyond those which originate in mere animal necessity.

That eternal mind,
From passions, wants, and envy, far estranged,
Who built the spacious universe, and decked
Each part so richly with what'er pertains
To life, to health, to pleasure,—why bade he
The viper evil, creeping in, pollute
The goodly scene; and, with insidious rage,
While the poor inmate looks around and smiles,
Dart her fell sting, with poison to his soul?

Such has been the question of ages; and if, for answer to it, in accordance with belief of the goodness of the Deity, it be necessary that the particular advantage of each particular seeming evil be precisely demonstrated, it must be confessed that no answer has yet been given to it by philosophy; and that, in this sense, probably the question must continue unanswered, as long at least

as man is a creature of this earth. To be able to answer it in this sense, indeed, would imply a knowledge of all the relations of all existing things, which is possible only to a being that can look upon the future still more clearly than man with his dim memory is permitted to look upon the past. But though we cannot state precisely a particular advantage of each seeming evil, we can at least infer, from the general appearances of nature, and the more minute and intimate contrivances which it exhibits, the moral character of that Power which has formed us; so as to know of any particular contrivance, the particular effects of which we may be incapable of tracing, whether he who designed it as a part of a system was one who willed, or did not will, the happiness of mankind. We may infer it certainly with as great accuracy, or far greater, than that with which we infer the benevolent or malevolent disposition of our friends or foes; and, if it be reasonable in the case of a friend, whose kindness has been the source of the chief happiness of our life, to infer, in some cases, in which we might have doubted of the intentions of others,—that his intentions might have been friendly to us, even when we suffer by the immediate results of his actions; that confidence which we should blush not to feel in the case of an earthly friend, who, though known to us by long intimacy of mutual regard, may yet have been influenced by rivalries of interest or momentary passion, is surely not less reasonable, when he, in whom we confide, is the only friend that cannot have with us any rival interests,—a friend to whom we are indebted for every thing which we possess, even for the delights of those cordial intimacies, and for that very confidence which we think it the baseness of dishonour to withhold from any friend, but from that one who alone deserves it fully. It is surely not too much to claim for God, what, in the ordinary circumstances of society, we should regard as in some measure ignominious to deny to man; or at least, if it seem too much for human gratitude to extend this trust to its first of benefactors, let us not have the selfish inconsistency of daring to claim from our own friends a confidence, which, in circumstances of far less equivocal obligation, we consider it only as wise and virtuous to deny to God.

That, in all the innumerable contrivances of nature, in the wonderful mechanism of the living frame, there is not one of which the production of injury seems to have been the direct object, whatever occasional evil may indirectly arise from it; and that there are innumerable contrivances, of which the direct object is manifestly beneficial, may be regarded as a sufficient proof of the general disposition and gracious intention of him, to

* Pleasures of Imagination, book iii.

whose power and wisdom we ascribe these contrivances. In my lecture yesterday, I endeavoured to picture to you a constitution of things, exactly the opposite of that which at present subsists; in which the evident direct object of every contrivance was the production of misery,—in which, in this misery, man, instead of the constant tendency to hope which now comforts him in affliction, had an equally constant tendency to despair, and become more keenly sensible to pain, the more he had been habituated to it; and as, in that case, where the direct object of every contrivance was manifestly injurious, no one would infer benevolence from any occasional tendency of the laws of that contrivance, to produce some slight gratification to the sufferer, when the incidental pleasure flowed from the same principle which produced the general anguish; so, in the present constitution of things, in which the direct object of every contrivance is beneficial to man, there is surely as little reason to infer any malevolent desire, from evils that arise in consequence of a general provision, which is, in all those general circumstances, to which it manifestly relates, decidedly productive of good.

The supreme orderer of the frame of nature, as I have said, is not capricious; for the laws which now regulate the universe, are the same which have been observed since man was an observer. He is not indifferent to the happiness or misery of man, for man exists as a being capable of happiness or misery; and every relation, or almost every relation, which connects man with the living or inanimate objects around him, is productive to him, directly or indirectly, of some pleasure or pain. Equally evident is it, that He, whose general arrangements are all directly indicative of purposes of utility, that are only incidentally combined with any seeming evil, is not one who has willed, as the object of those arrangements, the misery of his living creatures; and if he be not malevolent, indifferent, nor capricious, he is and must be permanently benevolent, and the seeming evil has not been willed as evil. We are bound, therefore, not more by gratitude than by sound philosophy, to confide in the gracious intentions of Heaven, even when the consciousness of those intentions is to be determined, not by a particular result, that of itself,—if it had existed alone,—might not have seemed indicative of it, but by the general indications of moral character which the system, as a whole, exhibits.

An inference and extension of this kind, I have admitted, would not be reasonable, however, unless when the indications of gracious intention prevailed with indubitable superiority. But of this superiority, in the physical relations of things, who can doubt, who estimates the beneficent arrangements

of the Author of the universe with half the candour with which he estimates the conduct and the character of a common earthly friend?

The operations of nature are not arbitrary, so as to vary with the particular circumstances of the individual and of the moment; and if it be of importance for man to be a designing agent, to have the noble consciousness of acting according to his own desire, and not to be the mere passive subject even of pleasure itself,—which he who can doubt is scarcely worthy of the name of man,—it is evidently of importance that the phenomena of nature should thus take place, according to general laws, that, by his foresight of their results, he may regulate his conduct in adaptation to them. The law, or regular arrangement of the sequences of events in nature, which produces good upon the whole, is not to be suspended, because it may, to an individual in particular circumstances, be productive of evil; since, if it were thus variable, no one could even guess what the result could be in any combination of circumstances; and the evil which would arise from this uncertainty to the whole race of mankind, would unquestionably be far greater than the evil that might arise to a single individual, from the uniformity in cases in which it might, to that particular individual, at that particular moment, have been profitable that the law were suspended.

Think we, like some weak prince, the Eternal Cause,
Prone for his favourites to reverse his laws?
Shall burning *Ætna*, if a sage requires,
Forget to thunder and roar her fires?
On air or sea, new motions he impress,
O-blameless Bethel, to relieve thy breast?
When the loose mountain trembles from on high,
Shall gravitation cease, if you go by?*

It is quite evident that even Omnipotence itself, which cannot do what is contradictory, cannot combine both advantages,—the advantage of regular order in the sequences of nature, and the advantage of an uniform adaptation of the particular circumstances of the moment, to the particular circumstances of the individual. We may take our choice, but we cannot think of a combination of both; and if, as is very obvious, the greater advantage be that of uniformity of operation, we must not complain of evils to which that very uniformity, which we could not fail to prefer if the option had been allowed to us, has been the very circumstance that gave rise. You cannot fail to perceive of yourselves how much of that which we term evil is referable to this circumstance alone,—a circumstance which, in every instance, occasions to us momentary suffering indeed, but which, in every instance, leaves to us, or rather confers on us, the glorious privilege

* Essay on Man, Ep. iv. v. 121—126.

of conscious agency, of that agency with design, which implies a foreknowledge of certain events, as the consequents of certain other antecedent events. That the phenomena of nature should take place, then, according to general laws, and should not be various according to the particular circumstances of the individuals, to whom a temporary accommodation of them might seem more advantageous in some particular cases, is so obvious, if man is to be at all a reflecting and conscious agent, that I conceive it unnecessary to dwell at any length on the demonstration of it.

But general laws, it will be said, might have been framed, possessing all the advantages of regularity, and productive of less suffering. Is there any advantage, then, of suffering itself, that may reconcile it, more readily at least, with that divine goodness, the reality of which, as a quality of him to whose sway we are subject, it is so delightful to believe?

There are such relations of occasional suffering to lasting advantage, which, in many most important respects, could not exist but for the suffering, and for which all the suffering itself is not too dear a price.

The great advantage is to be found in the exercise of virtues, to which suffering, or the risk of suffering, is essential, and in all the enjoyment that flows from the consciousness of these virtues in ourselves, and from our admiration of them as displayed by others.

But, though this relation to moral character is unquestionably the chief advantage, and that which might of itself be sufficient to account, in a great measure, for the mixture of apparent evil in the universe, it is not perhaps all. I cannot but think likewise, that, independently of such moral advantages, some estimate is to be made of the relation which many of our physical evils bear to our mere mortality, as necessary for the production of successive races of mankind. On this relation, therefore, inconsiderable as it is, when compared with the moral advantage which we are afterwards to examine, a few remarks may not be absolutely unimportant.

It is of advantage, upon the whole, if the earth, in either way, were to support exactly the same number of inhabitants, that there should be a succession of races, rather than one continued race. In the case of man, for example, of which we can best speak,—though we omit all consideration of the multitude of beings who are thus transmitted, after what is perhaps a necessary preparation, to a scene of higher existence, and think merely of the circumstances of this earth, how much of human happiness would be destroyed, but for such a provision of alternate weakness to be sheltered, and love to be the

guardian of weakness. Where there is no succession of races, all filial and parental and consanguineal relations of every sort are, of course, out of the question; and, consequently, all the happiness which such relations bestow. Indeed, in a long life of this kind, all the associations which are now productive of so much delight, would probably be wholly powerless. The home of fifty or a hundred years would cease perhaps to be our home; and be succeeded by so many other homes of the same period, that the effect on our feelings, thus divided among so many scenes, would be the same as if we had no country or home whatever. As things are at present, there is not a moment in which thousands of our kind are not deriving pleasure from an infinity of objects, that, to an immortal race of beings similar to us in every respect but mortality, would long have ceased to afford gratification. There is a constant succession of new spirits, full of all the alacrity of new existence, and enjoying the delight of new objects; and the contemplation of this very scene, so beautifully diversified with the quick hopes of youth, and the slower deliberative wisdom of manhood, is one of the chief pleasures which the universe, as an object of thought, affords. But, though nothing more were gained than the mere relations of consanguinity, to which the present system gives rise, who could hesitate for a moment in determining by which of the two systems the greater good would be produced,—by an almost immortal earthly existence, coeval with the whole system of earthly things, or by that shorter mortality which allows, therefore, room for successive generations, and for all the kind affections which these generations, as they successively arise, evolve? To remove from life that tenderness which flows from the protection and instruction of infancy, and that tenderness which is reflected back from the little smiler who is the object of it, to all who are smiling around him, would be, in its ultimate effects on the maturer feelings of manhood, to destroy not the happiness merely, but half the virtue of mankind.

The very briefness of life, afflicting as it is in many cases, is, in some cases,—which, comparatively few as they may be, are not to be neglected in our general estimate,—essential to comfort. There are situations in which hope, that is so little apt to desert the afflicted, scarcely arises, unless when it speaks of other scenes, and in which death, the opener of immortality, is hailed as that gracious comforter who receives the combatant when the warfare of life is over; and, preparing for him at once the couch and the laurel, leads him to glory in leading him to repose.

I need not pause, however, to state the various advantages arising from a succession

of races on earth, rather than an unvarying number. I may very safely consider you as taking this for granted.

If it be of advantage, then, that one generation of mankind should successively yield its place to another generation, the question comes to be, in what manner it is most expedient that death should take place? That, in whatever way it take place, it is most expedient, upon the whole, that it should occur according to some general law, and not capriciously, I may consider as already proved; and the question therefore is, what general provision for this great change would be most advantageous?

It is evident, in the first place, that if life had followed a certain exact proportion in point of time,—if, like a clock for example, that is wound up so as to tell the hour for a certain number of days, and then to cease wholly its motion, human life had ceased at a certain exact beat of the pulse, and could not cease but at that particular moment; all the advantage which arises from the uncertainty of the period of death must have been lost. Till the moment approached there could be no fear, and consequently no restraint, which fear alone imposes; and when the period approached, life, if its continuation were at all an object of desire, could be only the sad calculation of the condemned criminal, who makes miserable every moment that passes, by the thought that he is on the point of losing it; though to lose such a moment, or at least a succession of such moments, is itself no slight gain. By that provision which has made death uncertain in its period, man does not suspend his labours, and consequently withdraw his portion of service from mankind, till the last moment in which he can be useful. “*Sepulchri immemor, struit domos.*” He may toil for himself, indeed, in executing these vain projects; but, in toiling for himself he toils also for society.

It is of no slight importance, then, for the happiness both of the individual himself, and of those around him, and thus of society in general, that the moment of death should not be exactly foreseen. It must be made to depend, therefore, on circumstances in the physical constitution of individuals, which may arise or be readily induced at any time. It becomes a question, accordingly, whether these circumstances should be agreeable, indifferent, or disagreeable,—in short, whether there should be any malady preceding death.

If the train of symptoms that constitute what we now term disease were indifferent or agreeable, I need scarcely say how much of the salutary fear of death itself would be removed. It is not a mere separation from

life, which is commonly considered under that name, but a combination of many images, which produce a far more powerful effect than the single image of death. The brave man, in the most perilous field of battle, it has hence often been remarked, is a coward, perhaps, on the bed of sickness. There was death, indeed, or the very near prospect of death, before him in both cases; but in the one case, death was combined with images that made it scarcely terrible; in the other case, with images more terrifying than itself. If, by exposure to the common causes of disease at present, we were to expose ourselves only to a succession of delightful feelings, how rash would those be, who are even at present rash; and, even when the series of delightful feelings had begun, how little power comparatively would these have in exciting to the exertion that might be necessary for suspending their course. If hunger had been pleasing, who would have hastened as now to satisfy the appetite?—and, with respect to mortality, all the slight maladies resulting from exposure to causes of injury, may be considered as resembling the pain of hunger, that points out approaching evil, and warns how to obviate it. It is necessary, indeed, for the welfare of society, that death should not be exactly foreseen; but it is necessary for its welfare also, that it should not be so very sudden and frequent, as to prevent a sufficient reliance on the continued co-operation of others, in the ordinary business of the world. The present constitution of things seems, even when considered only in its civil relations, admirably adapted for such a medium as is requisite; giving to the circumstances that precede death that moderate terror which is necessary for saving from rash exposure to them, and still leaving death itself as an event, which it is in our power to avert perhaps for a time, but not wholly to avoid.

All the advantage, however, which is thus produced by the painful maladies of life, I readily confess, would be too slight to put in the balance with the amount of pain which arises from these maladies. But it is still a circumstance, and an important one, to be placed in the scale, though it be not sufficient to produce a preponderance or an equipoise. The true preponderating weight, compared with which every other circumstance seems almost insignificant, is that which I have next to consider—the relation of pain to moral character.

It is of advantage to the moral character in two ways; as warning from vice by the penalties attached to vicious conduct, and as giving strength to virtue, by the benevolent wishes which it awakes and fosters, and by the very sufferings themselves which are borne with a feeling of moral approbation

That pain, in many instances, warns and saves from vice, I scarcely stop to prove. It is in this way, indeed, that our bodily ailments become morally so important. How much of temperance arises from them! The headach, the sickness, the languor, the more lasting disease, may, indeed, have little effect in overcoming habits of confirmed debauchery; but, which is of far more importance, how many slight and temporary indulgences in vice do they prevent from being confirmed into habits! How many ingenuous and noble minds are there, which, at a period of life when it is so difficult to resist example that offers itself in the seductive form of pleasure, would pass from excess to excess, and lose gradually all capacity of better wishes, but for those ailments which may be considered almost as a sort of bodily conscience—a conscience that reproaches for the past, and that, in reproaching for the past, calls to beware of the future! In addition to this, however, as warning not from temperance merely, but from every species of vice, is the conscience which most truly deserves that name—the sense of self-degradation, when we have acted in a manner unworthy of a being so nobly gifted; that dreadful voice which it is impossible to fly, because it is with us wherever we may fly, and which we can still only in one manner—by acting so as to merit, not its silence only, but its applause.

Such, independently of the beneficial influence of the fears of futurity which religion superadds, are the advantages of pain, as warning from vice. By the kindness of our Creator there is a connexion established between that bodily indulgence, which does not merely occupy the time of virtue, but renders us incapable of virtue, and a bodily uneasiness, that reminds us for what more important purposes we were formed; and, by a still more salutary provision, there is a connexion still more permanent, by which the commission of a single crime is to us for ever after, in the painful remorse that is felt by us, an exhortation to virtue, and an exhortation that is more urgent and efficacious as the painful remorse itself is more severe.

The advantage of suffering, then, as a warning from vice, is sufficiently obvious; at least in that constitution of things in which man is capable of vice and virtue.

But, in such a constitution of things, is it less necessary for the formation of virtue itself; of that noble virtue which alone is worthy of man—a virtue that feels for the sorrows of others, and that bears its own, that can see a thousand pleasures tempting it from duty, and can look on them with as little desire as it would feel to quit its path when hastening to discharge some high office, merely to gather a few wild-flowers that

were blooming at a distance—a virtue, to which there may be peril but not fear, that sees nothing truly worthy of being dreaded but vice, and that counts no suffering above its strength which has conscience for its support, and God for its approver?

When we look on some father of a family on his bed of sickness, what is it that we see? There are, indeed, the obvious characters of suffering. On his own countenance there is that paleness which seems as if it scarcely knew how to smile, and there is, perhaps, in his eye a sadness of more than disease; a sadness which has its cause, not in his own heart, but in the hearts of others. On the faces of those around him there is no look but of grief; for the hope that may rise at times is but the feeling of a moment, and is not sufficiently lasting to alter the fixed character of the melancholy countenance. All that our mere eyes behold then is grief. But do our hearts, when our eyes are thus occupied with an aspect of evil, see nothing more? Do they not look beyond the moment, and perceive virtue present as truly as sorrow, and diffusing her better influence, which is not to be lost even when the grief has passed away? The little bosoms around that bed have already acquired a benefit of which they are not conscious; and, even when this hour is not present to them, the gentleness of this hour will still remain. There will be a quicker disposition to feel for others what they have themselves suffered, a warmer love for those who have wept with them together, a patience more ready to endure, from the remembrance of that venerable form, who, in resigning his spirit to God, resigned with meek submission, to the same almighty care, the happiness of many, whose happiness, far dearer to him than his own, was the last object which earth presented to his thought.

If the kind affections be blessings to the heart which feels them—blessings, of which the heart must be unworthy, indeed, that would divest itself of them, for all the happiness of another kind with which the most sensual would decorate to themselves a world of gaudy felicity, in which passive pleasure was all that was to be known, without one virtue to be felt, and consequently, without one virtuous act to be remembered,—if the kind affections be so inestimable, that also must be inestimable, by which these affections are best promoted. The grief of one, it must be remembered, may be the pity of many, and may foster, therefore, the benevolence of many,—so careful is nature to produce what is good in itself, at the least expense of individual suffering. But there must be grief if there be pity, and without occasional feelings of pity there is comparatively little regard. For which child is it, that the heart of the mother, who strives to

divide her attentions equally, feels in secret, notwithstanding every effort to equalize her love, the warmest attachment? It is for that one which has been feeble from infancy, which has existed only by her continued care, which has deprived her of most hours of occupation or amusement abroad, of most hours, at night, of repose. This single instance might be sufficient to show the relation of pity to the growth of benevolent affection in general. There is not a house of suffering, which is not, by the very suffering which it presents, a school of virtue; and we do not distinguish the influence on our moral character which such lessons produce, merely because the influence is the result of innumerable lessons, the effect of each of which is slight, though, without the whole, there could be little affection of any sort. It is like the influence of the dew on the plant. We do not trace the operation of a single drop of moisture; but we know that, without the cherishing influence of many such drops, there could not be that flower which is at once so beautiful and so fragrant.

If we love, then, the benevolent affections, we must not repine that there exists, in nature, that which gives birth to those affections, and which calls them into exercise.

Vain are thy thoughts, O child of mortal birth,
And impotent thy tongue. Is thy short span
Capacious of this universal frame?
Thy wisdom all-sufficient? Thou, alas?
Dost thou aspire to judge between the Lord
Of nature and his works? To lift thy voice
Against the sov'reign order he decreed
All good and lovely?—To blaspheme the bands
Of tenderness innate, and social love,
Holiest of things!—by which the general orb
Of being, as by adamantine links,
Was drawn to perfect union, and sustain'd
From everlasting! Hast thou felt the pangs
Of softening sorrow, of indignant zeal
So grievous to the soul, as thence to wish
The ties of nature broken from thy frame,—
That so thy selfish, unrelenting heart
Might cease to mourn its lot,—no longer then
The wretched heir of evils not its own?
O fair benevolence of generous minds!
O man, by nature form'd for all mankind.*

Such is the influence of suffering, in producing, or at least cherishing into far greater vividness of affection, the virtues of benevolence, and consequently its influence in increasing the delight which the benevolent affections, so richly, or rather so inexhaustibly, afford. But if its influence be decidedly favourable to this class of virtues, it is far more essential to the virtues of self-command. It is adversity in some one of its modifications which alone teaches us what we are. We must be in situations in which it is perilous to act, before we can know that we have the courage which is necessary for acting; we must engage with fortune before we know that we have the power of being its

victor. It is for this reason that Seneca accounts him the most unhappy of mankind, whom the gods have not honoured with adversity, as worthy of subduing it. "*Nihil infelicius mihi videtur eo, cui nihil unquam evenit adversi. Non licuit enim illi se experiri: ut ex voto illi fluxerint omnia, ut ante votum; male tamen de illo dii judicaverunt. Indignus visus est, a quo vinceretur fortuna.*"†

There are griefs which we pity, and which it is virtue to pity. But who is there that has ever dared to pity Mutius Scaevola, when he placed his hand in the flame; Regulus, when he returned to torture; Arria, when she fixed the poniard in her breast, and said so truly, *Non dolet*? Should we not feel, in presuming to pity what common minds might shrink to behold, or shrink even to conceive, that we were guilty of a sort of insult to the magnanimity which we admired? There is a voice within us which would say, how enviable is that glorious spirit! and cowardly as our souls are, there is only the feeblest of mankind that could think of classing virtue victorious over every sorrow which assails it, as on a level even with the empire of the world, if that empire were to be possessed by one, who could inflict torture, indeed, on thousands, but who would tremble at the thought of suffering one of the evils which he inflicts, though that evil were the slightest which could be inflicted, and the moral object for which he was called to suffer it, the noblest for which man could suffer.

In vain, therefore, do we strive to say that God, if he be good, should produce happiness only. He should indeed produce happiness; but if he should produce happiness, that is to say, what the world counts happiness, he should still more produce that which even the world itself regards with an admiration still greater than prosperity itself in its most flattering form. The very throbbing of our heart, at the tale of fortitude, confutes our querulous impiety. It tells us, that even we esteem it nobler to be placed in situations in which we may exercise virtue with the consciousness that we are acting as becomes man, and with the approbation of all who are themselves worthy of approbation, than to be placed in situations in which we have envy, indeed, but the envy only of those who think of our fortune, and not of ourselves. Our hearts then tell us, that the world in which man is best placed, is a world like that in which he is placed—a world in which, though he may occasionally have to struggle with affliction, he may in that very struggle have the delight of knowing, that he is more virtuous to-day than he was yesterday; that

* Pleasures of Imagination, book ii.

† De Providentia, cap. iii.

he is rising in excellence; that there are multitudes whom his example will animate to similar victory over that evil within the heart, which is the only evil that deserves our detestation or our fear; and that he has become less unworthy of admission into the presence of that God, whose presence, when virtue is admitted to it, is at once immortal and joy.

If, in contrast with such a character, we were to strive to form to ourselves a picture of life without one suffering, but without one benevolent feeling, or one joy of conscience, why is it that we should blush to ourselves, in preferring such a life, and that we join internally with such conscious approbation in that great prayer, which Juvenal offers to us as all that is worthy of man?

*Fortem posce animum, mortis terrore carentem;
Qui spatium vite extremum inter munera ponat
Naturæ, qui ferre quosq; quoscunque labores,
Nesciat frangi, cupiat nihil, et potiora
Herculis ærumnas credat sæviorque labores,
Et venere, et cœcis, et plumâ Sardanapali-æ*

"Ask thy own heart," says Akenside, after describing, in one of the most splendid passages of his poem, the admiration with which we still enter into the fortunes of the heroic states of antiquity, and the sorrow and indignation which we feel in thinking of the tyranny before which they sunk:

Thus defac'd,
Thus widely mournful, when the prospect thrills
Thy beating bosom, when the patriot's tear
Starts from thine eye, and thy extended arm
In fancy hurls the thunderbolt of Jove
To fire the Impious wreath on Philip's brow,
Or dash Octavius from his trophied car;
Say, does thy secret soul repine to taste
The big distress? Or would'st thou then exchange
Those heart-ennobling sorrows for the lot
Of him who sits amid the gaudy herd
Of mute barbarians bending to his nod,
And bears aloft his gold-invested front,
And says within himself, "I am a king,
And wherefore should the clamorous voice of woe
Intrude upon mine ear?" The baleful dregs
Of these late ages, this inglorious draught
Of servitude and folly, have not yet,
Blest be the Eternal Ruler of the world!
Defil'd to such a depth of sordid shame
The native honours of the human soul;
Nor so effac'd the image of its sire.†

We feel, in such a case, that man is formed for something more than pleasure; that the afflictions of this world are sources of all that is noble in us; and that, what it is for the dignity of man to feel, it could not be unworthy of God to bestow.

LECTURE XCV.

OF THE GOODNESS OF THE DEITY—OBJECTIONS OBJAIATED; DUTIES TO THE DEITY.

My last Lecture, Gentlemen, was employed in considering the objection commonly

urged against the goodness of God, from the existence of suffering in the universe.

If to suffer were indeed all, and no advantage flowed from it to the individual himself, or to those around him, then might its existence be a proof that he who willed it as a part of the great system of things, without relation to other parts of the system, was, at least to the extent of the suffering which it was possible for him not to produce, defective in benevolence. It is a conclusion which we might be unwilling to admit, indeed, because our hearts are too strongly impressed with that divine goodness which we feel in the constitution of our own internal frame, as much as in that magnificent display of it which is everywhere around us, not to shrink from such a belief, if expressed in words, as impiety and ingratitude. But, if to suffer be all, the belief, from the expression of which we should still perhaps shrink with a feeling of reluctant assent, must not the less be, in our heart, irresistible.

The question which is of so much importance for us then is, whether to suffer be the whole of suffering? or, whether there do not flow from it consequences which so far overbalance the temporary evil, as to alter its very nature? since, in that case, the existence of what is essential to so much good, far from being inconsistent with divine benevolence, would be a proof of that very benevolence. If, in such circumstances of greater resulting advantage, man had not been formed capable of suffering, God would then have been less good.

This question it was the object of my last Lecture to consider; and if the observations which I then made were satisfactory, they must have shown that, if virtue be excellent, the capacity of suffering by which virtue is formed or perfected, must, when this great relation of it is considered, be allowed to have itself an excellence that is relative to the excellence produced by it. Without it, we might, indeed, have been what the world, in its common language, terms happy; the passive subjects of a series of agreeable sensations: but we could not have had the delights of conscience; we could not have felt what it is to be magnanimous, to have the toil and the combat and the victory, to exult that we have something within us which is superior not to danger only, but which can vanquish even pleasure itself; to feel that we are not merely happier than we were, but nobler than we were, worthy of being admitted to other exercises of virtue, in which we are conscious of a power that may hope to prevail in them, and worthy almost of the approving glance of that God who sees every secret conflict, and who is its judge and rewarder, as well as its witness.

When I say, that without virtue we might be, perhaps, what the world terms happy, I

* Sat. x. v. 357—362.

† Pleasures of Imagination, book ii.

do injustice even to the sordid sentiments of those, whom, in opposition to the better part of mankind, we commonly designate by the name of the world. The very lowest of the mob may wish, indeed, for the grandeur which he sees in the palace and the equipage of the indolent voluptuary. But his highest admiration is not for him. It is, if his country was ever oppressed, for some hero, whose adventures in struggling to resist that oppression, have become traditional in the very tales and ballads of the cottage,—who, in the whole course of his struggle, had difficulty after difficulty to encounter, and whose life of peril at last, perhaps, was terminated with the triumph of conscience, indeed, but in all the bodily torture which a tyrant could inflict. If a religious persecution have ever raged in his land, his admiration is in like manner kept for those whom he feels a sort of pride in considering as martyrs of his faith, who are known to him, not as rich or powerful, but as sufferers, poor, perhaps, like himself, and distinguished only by that heroic suffering which endears them to his reverence. There is not a peasant of the rudest order, who would think for a moment, of comparing to such men the indolent and careless possessor of half the land which he has ever seen. If the choice were given to him of either situation, and if he were to prefer, as, under the influence of sensual desire, he might prefer, the passive ease and luxury of the one to the active virtue of the other, his own heart would say to him that he had made an unworthy choice; it would tell him that he had preferred the less to the more noble; he would have remorse even in entering on the possession of what he before regarded as happiness, and the martyr or the hero would haunt his memory like the remembrance of a crime.

Even the world, then, in their estimation of excellence, look to something more than a succession of passive sensations; and it is surely a singular misconception of benevolence, which would require of God that he should make man no nobler than that species of being, which even common minds feel to be less noble than the being which man is capable of becoming, in the present system of things;—that it should be an imperfection in the divine goodness to have rendered us susceptible of heroic virtue,—that is to say, to have placed us in circumstances without which there can be no heroic virtue,—and that it was incumbent on him, from the very excellence of his own nature, to have made us such, as the best and noblest of us would blush to be.

Count all the advantage prosperous Vice attains,
'Tis but what Virtue flies from and disdains.*

* Essay on Man, Ep. iv. v. 89, 90.

There is an ambiguity in the term happiness, like that which, on a former occasion, it seemed to me of so much importance to point out to you, in the analogous word desire, as giving rise to much of the sophistry on this and on other kindred questions, in which it furnished the declaimer against pure disinterested virtue with the appearance of a deceitful triumph, when a clearer analysis of a single word, explanatory of its double meaning, might have shown the fallacy on which the triumph was founded. Happiness is sometimes used as synonymous with all that is desirable; in which case, to a good mind, that can perceive all the relations of suffering, and feel the important moral advantages which result from it, it may be said to include, in certain circumstances, in which pleasure could not be enjoyed without a sacrifice of virtue, even suffering itself. At other times it is used to signify only what is immediately pleasurable, and therefore in this sense excludes suffering. What is pleasurable, and what is desirable, are not to be accounted words of exactly the same import, if we attend to all the variety of our desires. I have shown, in some of my former Lectures, that in many cases, indeed in the greater number of cases, if we analyze with sufficient minuteness the whole mental process, so as to discover what it is which is directly present to the mind at the very moment of the desire, it is not pleasure which we thus directly desire, but some other immediate object, which pleasure may indeed accompany, but to which pleasure is only an accompaniment. That the immediate object of our desire, for example, in rushing to the relief of one who is in danger, is not the pleasure of giving relief, but the relief itself, the subsequent contemplation of which is, indeed, by a bountiful provision of heaven, associated with delight; as the failure in the attempt to afford it is accompanied with pain; but which we desire instantly, without regard to our own personal delight that would follow it, or the pain that would be felt by us if the relief were not given. The same constitution of our nature which has made pleasure directly desirable, has made many other objects of our thought directly desirable, and among the rest virtue; not for the single reason that virtue is pleasant, any more than we desire pleasure as pleasure, merely because it may be consistent with virtue, but because it is the very nature of virtue, and the very nature of pleasure, as contemplated by us, to be desirable, whether separate or combined. These different objects, which in many cases coincide as desirable, in many cases may be balanced against each other, and we may, when both are incompatible, according as one or the other is to certain minds, or in certain circumstances, an object of great or less desire,

sacrifice a mere pleasure for a virtue,—a virtue for a mere pleasure. We may not always, then, in the competition of two objects, desire what is immediately the more pleasing, in the strict sense of that term; for pleasure, as mere pleasure, we have seen, is far from being the sole direct object of desire; but it is very evident that whatever be the direct object of desire, we must always desire that which has seemed to us the more desirable, since this is only another mode of expressing the very fact of the superior desire itself; and the double sense of the term desirable, in expressing this prevailing influence, and consequently of happiness, which is regarded as synonymous with the gratification of our desires, has led to the supposition that pleasure, which is thus often used as synonymous with that which is desirable, is truly the uniform object of our desire. It seems, therefore, in this sense, when desirableness is falsely limited to mere pleasure, that to exclude suffering is necessary to our happiness, and therefore to the goodness of that Being who wills our happiness. But if happiness be understood more generally as the attainment of that which, in all the circumstances in which we may be placed, is regarded by us as most desirable; then suffering itself is in many situations essential to it, when to suffer is to be more virtuous; and not to have produced the capacity of that virtuous suffering, which in many cases we prefer to pleasure, would in those cases have contributed less to our happiness, in this best sense, and consequently been less benevolent, than not to have produced the pleasure, which even we regard as inferior to the suffering.

*Ipsa quidem virtus pretium sibi; solaque late
Fortunae secunda nitet, nec fascibus ullis
Erigitur plausuque petit clarescere vulgi,
Nil opis externae cupiens, nil indiga laudis,
Divitiis animosa suis.*

It is for its own sake, indeed, as indicative of the moral excellence of our nature, that virtue truly is to us of richest value. Even though all preference of it, however, were a mere balancing of pleasures, without any regard to its own intrinsic excellence as an object of noblest desire, the capacity of suffering, as essential to the highest pleasures of conscience, might be truly a gift of divine bounty. At present, with all the distraction of earthly things, and earthly passions, there is perhaps no pleasure so delightful as the remembrance of our own heroic conduct, in any occasion that admitted of heroism; and in a state of purer being, the remembrance of that heroism may be still more elevating and delightful. If, with all the notions which it involves, of our virtue and the approving regard of God, it constitute the

highest pleasure of which a created being is capable, it is no impeachment of any divine perfection, to suppose that the Deity, though with the power of making his creatures happy in various ways, could not give to a finite and dependent being any happiness greater than that which is by its very nature the greatest which the constitution of a finite and dependent being admits, any more than even he could make a circle triangular, or form a line larger than an infinite one. The joys of conscience, as they extend through our immortal existence, might thus, even in a barter of pleasures and pains, be very cheaply purchased by the short sufferings of earth; and God, therefore, be benevolent, in placing us in circumstances which enable us to make the purchase.

This might be the case, even though the most heroic generosity were to be valued only as an instrument of pleasure, and though we were to omit in our estimate of virtue all for which it is most precious in the eyes of the virtuous. “*Prospera in plebem ac vilia ingenia deveniunt; at calamitates terroresque mortalium sub jugum mittere, proprium magni viri est. Magnus es vir; sed unde scio, si tibi fortuna non dat facultatem exhibendae virtutis. Descendisti ad Olympia; si nemo praeter te, coronam habes, victoriam non habes.*” Think not, I beseech you, says the same eloquent writer, that the calamities with which the gods may have favoured us, as occasions of virtue, are to be dreaded as terrible. They rather are to be esteemed wretched, who lie torpid in luxurious ease, whom a sluggish calm detains on the great voyage, like vessels that lie weltering on a sea without a gale. The bravest of the army are they whom the commander selects for the most perilous service. They do not repine against their general when they quit the camp. They say only, with a consciousness of their own strength of heart, He has known well how to choose. Such, too, be our feelings when we are required to suffer what is terrible only to the coward that shrinks from it. Let us exult in the thought that Heaven has counted us worthy of showing what the noble nature of man can overcome. “*Nolite, obsecro vos, expavescere ista, quae dii immortales, velut stimulos, admovent animis. Calamitas virtutis occasio est. Illos merito quis dixerit miseros, quos, velut in mari lento, tranquillitas iners detinet. Deus quos probat, quos amat, indurat, recognoscit, exercet. Quare, in castris quoque, periculosa fortissimis imperantur. Dux lectissimos mittit, qui nocturnis hostes aggrediantur insidiis, aut explorent iter, aut praesidium loco dejiciant. Nemo eorum qui exeunt dicit, Male de me Imperator meruit; sed, Bene judicavit. Idem dicant, quicumque jubentur. Pati timidus ignavisque flebilis: Digni visi*

sumus Deo, in quibus experiretur, quantum humana natura possit pati.”*

When we see then what the world calls the sufferings of the virtuous, let us not think of the sufferings only,—for this would be as absurd as to count all the fatigues of the husbandman without thinking of the harvest. Let us think of the suffering only, as it is regarded by the sufferer himself; as that which proves to him what he is,—which gives him the opportunity of knowing that he is so constituted as to be capable, not of pleasure merely, but of that which is far dearer to him than pleasure itself, and of which he would not resign the noble consciousness for all the sluggish delights of all the luxurious. Let us think of him as the inhabitant of another world, to which his virtues, those virtues which he is now maturing, are all that can attend him from this earth,—when the luxuries of earth must have long perished, or be remembered only from their relation to those moral feelings which are the only feelings that are immortal.

“The opulence of a wicked man,” says an ingenious French writer, “the high posts to which he is elevated, the homage which is paid to him, excite your chagrin. What! say you, is it for such men that wealth and dignities are reserved? Cease your unjust murmurs! If what you regret as good were substantially good, the wicked would not enjoy it; you would be the possessor. What would you say of a great man, a Turenne, or a Condé, who, after having saved his country, should complain that his services had been ill requited, because, in his presence, some sugar-plumbs had been distributed to children of which he had not got his share? Your complaint is not better founded. Has God, then, nothing with which to recompense you but a few pieces of coin, and honours that are as perishable as they are frivolous!”

Weak, foolish man! will Heaven reward us there
With the same trash mad mortals wish for here?
Oo, like the Indian, in another life
Expect thy dog, thy bottle, and thy wife;
As well as dream such trifles are assign'd
As toys and empires for a godlike mind!†

“O God!” exclaims the Persian poet Sadi, have pity on the wicked! for thou hast done every thing for the good, in having made them good.”

In giving to the good that nature by which they are capable of virtuous progress, God has indeed done every thing for the good,—far more, unquestionably, than if he had placed them in a world such as those who at present object to his benevolence, would have counted perhaps worthy of his creation,—a world of such indolence and passive

pleasure as the most worthless, perhaps, are capable of enjoying here,—a world from which, if the option were given, a noble spirit would gladly hasten into that better world of difficulty, and virtue, and conscience, which is the scene of our present exertion. It is good to have given us pleasure, but it is better to have given us that which even ourselves feel to be nobler than pleasure.

I have dwelt the longer on this point, because it seemed to me the most important on which I could have dwelt. Our relation to God, to our Creator, Preserver, Rewarder, is surely the relation which deserves most to be considered by us; and I am anxious that your minds should not, with respect to that great Being, acquire habits of unworthy suspicion, which, as I endeavoured to illustrate yesterday, by an allusion to the slighter relationships of earthly intimacy, we should blush to feel in the case of man. If, when any kindness was conferred on us by a friend, we were to sit down and deliberately consider whether he was kind in conferring it on us, whether it was not possible for him to have done for us a little more, and whether we ought not, therefore, to complain of him as selfishly penurious, rather than to feel gratitude to him as beneficent; if we were to do this in the case of an earthly friend, should we look upon ourselves with the same approbation? And is God, indeed, less worthy of our confidence than the creature whom he has made?

It is when we rely fully on his goodness that we truly enjoy that goodness, it is then that adversity disappears, as adversity, that there is no evil which we may not convert into a source of advantage; because what is most afflicting is only the lesson, or the trial, or the consummation of our virtue; that all nature is embellished to us by the divine presence, as the scene of actions which it is noble to perform, or of sufferings which, when borne with the feelings with which the virtuous bear them, it would scarcely be too strong an expression to term delightful.

God, then, who has poured on us so much enjoyment, of which it is virtuous to partake, in the whole system of nature, and in the frame of our mind, is manifestly benevolent in calling to us to enjoy; and though less manifestly, he is not less truly benevolent in the evils which he has given to our virtue to bear,—the common wants, by the influence of which the whole multitudes of our race are formed into a society active in the reciprocation of mutual services, and the greater occasional sufferings, or voluntary perils, which excite the compassion or the veneration of others, and cherish, in the heroic sufferer himself, a spirit of gentle or sublime virtue, without the consciousness of which, the moral scene would scarcely be an

* Seneca de Providentia, cap. iv.

† Essay on Man, Ep. iv. lines 173—180.

object of delightful interest, even to human regard.

If the system of things has thus been framed by a God of benevolence, it is under the moral government of a benevolent God that the world subsists, under the government of a God, who has shown too clearly, by the universal feelings which he has given to all his moral creatures, his love of virtue, and his disapprobation of vice, to leave any doubt as to the nature of his own high estimate of human actions. If it be impossible for ourselves not to feel the approvableness of certain actions, and the delinquency that is implied in certain other actions, it is impossible for us not to extend these feelings to other minds, which we suppose to consider with the same freedom from passion, and the same accurate knowledge of every circumstance, the same actions that are approved or condemned by ourselves. To believe, that pure generosity and pure malice which every human being loves in the one case and hates in the other case, as soon as he contemplates them, as if pointed out to his love and hatred, by the author and enlightener of the heart, are, to that very author and enlightener of the heart, the same in every respect, except as he has chosen to distinguish them in our judgment, would be as difficult for us, or almost as difficult, as to believe that a circle and a triangle have different properties, only as conceived by us, and appear to involve exactly the same proportions and relations to that perfect intelligence, whom some of the Greek philosophers have distinguished by the title of the Supreme Geometer.

What we regard with moral approbation or disapprobation, we are led then by our very nature to regard as objects of approbation or disapprobation, not to all mankind only, but to every being whom we imagine to contemplate the actions; and especially to him, who, as quickest to perceive and to know, must, as we think, by this very superiority of discernment, be quickest also to approve and condemn.

It is of this moral approbation or disapprobation in the divine nature, that we speak, when we speak of what is commonly termed the justice of God. The merit or demerit, which it is impossible for us not to feel, we consider as felt by him who has thus distinguished them to our heart, and who has the power of making happy what he approves, and of verifying to the wicked the anticipations of their own remorse. The divine justice, as it is an object of conception to human beings, is nothing more than the ampler development of these human feelings, feelings that are human indeed, in our transient love or hatred, but the reference of which to the Deity depends on a principle

of our nature, as universal as that which leads us to the very conception of the Deity as a Power existing now and existing before the world was made. It is by the analogy of human design, that we infer in the universe the operation of a mightier designer; by the analogy of human sentiment, we infer, in like manner, in the Creator and Ruler of the universe, those moral feelings by which he is not the creator and ruler only of mankind, but their judge,—a judge whose approbation is already felt in the conscience of the good, as his disapprobation is already not less felt in the gloomy and trembling conscience of the guilty.

Such are the views of the nature of the Divine Being to which we are led, from those traces of his character which the universe, as formed by him, and especially our own spiritual frame, which is to us the most important part of the universe, exhibit. The most interesting of all inquiries terminates in the most pleasing of all results. Whatever power it might have been that created us, benevolent or cruel, to that power we must have been subject, without any means of shelter, because there was no superior sovereign of nature, who might protect and avenge us. We might have been, in misery, what our imagination, after bringing together all the forms of torture which the oppressions of this earth can afford, would be too poor of images to represent. Instead of a tyrant, however, in the heavens, we discover a power from which we have no need to fly for succour; since, whatever might be the kindness to which we might wish to fly, it would be a kindness less than that from which we fled,—a kindness far less than that which created for us this glorious abode, and which gave us the means of rising, with the consciousness of virtue, from all that is excellent on earth, to sublimer and happier excellence, in progressive stages of immortality.

In this view of the wisdom, and power, and benevolence of the Supreme Being is involved, what is commonly termed our duty to God. In one sense of the word, indeed, all our duties are duties which we owe to him, who has endowed us with every gift which we possess, and who has commanded these duties, by that voice of conscience which speaks in every breast. But the duties to which I now allude, are those which have their divine object more immediately in view, and which consider him in those gracious characters in which his works reveal him to us. It is our duty to love the benevolence to which we owe so much, to feel pleasure in tracing every display of that benevolence in the happiness of every thing that lives, and, in all that we value most in ourselves, to rejoice in feeling its relation to the goodness from which it was derived, and

in expressing our dependence, not as if the expression of it were a task enjoined, but with the readiness of love, that overflows in acknowledgments of kindness received, only because it overflows with gratitude for the kindness. If a mere earthly friend, whose affection we have delighted to share, is separated from us, for any length of time, by the ocean or a few kingdoms that lie between, how delightful to us is every memorial of his former presence. Our favourite walks and favourite seats continue still to be favourite walks and favourite seats, or rather they acquire new beauty, in the thought that they were beautiful to other eyes that now are absent. There is no conversation so pleasing to us, as that of which his virtues are the subject; and even the rudest sketch of his drawing, or the verses which he may have left unfinished, are regarded by us with far more delightful admiration, than paintings and poems, which surpass them in every charm, but that which friendship alone could give. We not merely feel all this affection for our friend, but we feel too, that it would be a sort of crime against friendship, to regard with indifference any thing which related to him; and if this be a crime with respect to earthly friendship, it is surely not less a crime, when its object is the friendship that has been the source of all the happiness which we have felt. To be surrounded with the divine goodness, and yet to feel no joy in contemplating the magnificent exhibition of it; to admire any works rather than those of God, and, far from delighting to speak or think of his moral perfections, to give our thoughts and our conversation in preference to the virtues, or still more gladly, to the vices of those of whom the name is perhaps almost all that is known to us; this is to fail, with respect to the noblest of beings, in a duty which, if that noblest of beings could divest himself of his perfections, and become, with far less kindness to us, a creature like ourselves, we then should blush to violate to our mortal benefactor.

Our first duty, then, to the Deity, is to dwell with delight on the contemplation of his perfections, to cultivate our devout feelings as the happiest and noblest feelings of which our nature is capable, and to offer that worship of the heart, which is the only offering that can be made by man to his Creator. "Primus est deorum cultus deos credere; deinde reddere illis majestatem suam, reddere bonitatem, sine qua nulla majestas est: scire, illos esse qui praesident mundo, qui universa vi sua temperant, qui humani generis tutelam gerunt, interdum curiosi singulorum. Hi nec dant malum nec habent; ceterum castigant quosdam, et coercent; et irrogant poenas, et aliquando specie boni puniunt. Vis deos propitiare? bonus esto. Satis illos coluit quisquis imi-

tatus est."* Would you propitiate the Gods? Be good. Whoever has imitated them, has already offered to them the most acceptable worship.

Next, in order, to the duties of veneration and devout acknowledgment of the divine goodness, is the duty of that unrepining submission to his will, without which there can be no real belief of the providential goodness, which the lips, indeed, may have professed to believe, but the lips only. If it would be our duty to give ready obedience to the arrangements which an earthly sovereign makes, for the security and general happiness of his little state, in some season of peril, though it involve the sacrifice of many of our personal comforts; to quit, perhaps, our peaceful homes, and expose ourselves, in the band of our fellow-citizens, to the inconveniences and dangers of a protracted warfare, that is foreign to all our tranquil habits; or to send to the same perilous warfare, those whose life of rising virtues is the only earthly thing to which we have been accustomed to look for the happiness of our own declining years; if we should feel it guilt and disgrace to withhold the offering, when the happiness of a single state is the object, and when he who requires the sacrifice is but a fallible being like ourselves, how much greater guilt and moral disgrace must it be to hesitate in making those sacrifices, or to repine when they are made, which are demanded by wisdom that is owned by us to be incapable of error, for purposes which, as our own hearts have declared, must be purposes beneficial to mankind. Shall the warrior rejoice in dying in battle for his country, or even for his prince! and shall we feel no joy in finishing a life that has been accordant with the divine will, in whatever manner the same divine will may require it of us; or, if the easy offering of life be not that which is required, in bearing a little longer for the whole community of mankind, any of those evils which we should never shrink from bearing, for that small portion of the community which our country comprehends? "Shall others say, O beloved city of Cecrops," exclaims Marcus Aurelius, "and shall I not rather say, O beloved city of our God!"

These views of the Divinity, the habitual love of his perfections, and ready acquiescence in the dispensations of his universal providence, are not more suitable to the divine nature than productive of delight and consolation to him who entertains them. They distinguish, indeed, the virtuous from the rest of mankind, in serenity of happiness, as much as in the purity of heart from which that delightful serenity is derived.

* Seneca, Epist. xcv.

He sees with other eyes than theirs. Where they
Behold a sun, he views a Deity:
What makes them only smile, makes him adore.
Titles and honours, if they prove his fate,
He lays aside, to find his dignity:
Himself too much he prizes to be proud;
And nothing thinks so great in man, as man.
Too dear he holds his interest, to neglect
Another's welfare, or his right invade:
Their interest, like a lion, lives on prey.
They kindle at the shadow of a wrong:
Wrong he sustains with temper, looks on heaven,
Nor stoops to think his injurer his foe.
Nought but what wounds his virtue wounds his peace.
His joys create, theirs murder future Miss.
To triumph in existence his alone;
And his alone triumphantly to think,
His true existence is not yet begun.*

The true existence of man is, indeed, scarcely begun on earth. There is an immortality awaiting him, and all which is most worthy of being prized in a short period of his mortal life, is the relation which it may have to those endless ages that are to follow it. In my next Lecture, I shall inquire into the grounds of our belief in this future state of continued existence.

LECTURE XCVI.

OF THE IMMORTALITY OF THE SOUL.

IN my last Lecture, Gentlemen, I finished the remarks which I had to offer on the relation which man, in his earthly existence, bears to that greatest of beings, from whom every thing which exists has derived its origin. We found, in the phenomena of the universe, abundant proof of a designing Power, that arranged them in their beautiful regularity; and, in the happiness which they tend to produce, a proof not less strong, of the benevolence which has arranged them for purposes so gracious.

When we consider the relation of man to his Creator, however, do we consider only a relation that terminates with the few years of our mortal life? When every thing external fades upon our eye, does the spirit within, that almost gave its own life to every thing external, fade likewise? or is there not something over which the accidents that injure or destroy our mortal frame have no power; that continues still to subsist, in the dissolution of all our bodily elements, and that would continue to subsist, though not the body only, but the earth, and the sun, and the whole system of external things, were to pass into new forms of combination, or to perish, as if they had never been, in the void of the universe?

There is within us an immortal spirit. We die to those around us, indeed, when the bodily frame, which alone is the instrument of communion with them, ceases to be an in-

strument by the absence of the mind which it obeyed. But, though the body moulders into earth, that spirit which is of purer origin returns to its purer source. What Lucretius says of it is true, in a sense far nobler than that which he intended:

*Cedit item retro, de terrâ quod fuit ante,
In terram; sed quod missum est ex ætheris oris,
Id rursus, oculi fulgentia templa receptant.†*

That we do not die wholly, is a belief so consolatory to our self-importance,—to which annihilation seems more than a mere privation of enjoyment, and rather itself a positive evil,—that our hope of immortality may be supposed, like every other hope, to render us as credulous of that which we are eager to believe. There is a principle, too, which I pointed out to you when I attempted to explain the peculiar vividness of our love of glory as a mere emotion, that may aid this credulity,—a principle by which the very thought of our name, as our name, at the most distant period, seems to us to involve the reality of the existence of those very feelings which are all that seems to us in our conception to constitute ourselves. To think of any thing as ours at any particular period, is, as I then explained to you, to feel as if we were truly existing at that particular period; because it is to have combined the conception of the particular object, whatever it may be, with the conception of that self which is known to us by some conscious feeling, and which, as conceived by us, therefore, must always carry with it the notion of consciousness; and the frequency of this illusion, by which, in thinking of our name, or of other objects connected with us, we extend into futurity the conception of our consciousness, though it might not be sufficient to produce the belief of immortality, must be allowed at least to strengthen the belief, if once existing. It is necessary, therefore, in entering on an inquiry in which we are so deeply concerned, to divest ourselves as much as possible of the influence of our wishes; and, if we cannot inquire with the impartiality of absolute indifference, to inquire at least with the caution of those who know their own partial wishes, and, knowing these, know in what manner they are likely to be influenced.

The change which death produces is the most striking of all the changes which we can witness, even though we should not believe it to imply the dissolution of the principle that felt in life, and thought. It is at least to our senses the apparent cessation of every thought and feeling. There is no bloom on the cheek, no motion in the limb, no lustre in the eye. Even these are but

* Night Thoughts, Night viii.

† De Rerum Natura, lib. ii. v. 298—1000.

the slightest changes. There is no voice or look of reflection, no apparent consciousness, nothing but a little quicker tendency to decay, to distinguish him, who, but a few moments before, was perhaps wise and cheerful, and active, full of remembrances and hopes, from the insensible statue which has been dug from the quarry, and slowly fashioned into the semblance of his shape. With such a change before our eyes, it is unquestionably allowable to doubt, at least, whether any thing have truly survived this change; or whether thought and feeling have not ceased wholly by the injury of that mechanism, in connexion with which alone they become objects of our knowledge.

It is unquestionably allowable, as I have said, to those who have never made the phenomena of the mind, and the nature of the substance which exhibits these phenomena, objects of their reflection, to doubt whether all the functions of life may not be destroyed in that moment which destroys the more obvious functions, that alone come under the survey of our senses. If the phenomena of thought be phenomena that consist only in the play of certain organs, the destruction of those organs must be the destruction of the thought itself. It would then be as absurd to speak of the continuance of consciousness, when there are no conscious organs, as to speak of the continuance of musical vibrations, without a single elastic body.

If there be nothing, then, distinct from the material frame, which is manifestly subject to decay, our doubt may be converted into certainty, or at least may almost be converted into certainty. We may say then, that death which destroys the organization, destroys the capacity of feeling, because it destroys that in which feeling consists. The elements of that which once thought may subsist in a different form, and may perhaps, even at some remote period, become again elements of a similar organization, and again constitute propositions or passions, as they before constituted some truth or error, or emotion of love or hate; but they must meet again, by some new arrangement, before they can thus become feelings; and, in the mean time, they may have been blown about by the winds, or become a part of these very winds, or formed elements of various bodies, solid, liquid, or gaseous, as little sentient as the other insensible elements with which they mingled, in all the play of chemical compositions and decompositions.

This conclusion, as to the absolute mortality or chemical decomposition of that which feels and thinks, seems irresistible, if our reasonings and passions, and whatever forms our consciousness, be only certain particles variously mingled, and variously adhering or changing their place, according to the new play of chemical affinities, as new ele-

ments may be added to disturb the particles of thought, or certain other elements subtracted from the thinking compound. But, on this supposition of particles of thought, the whole force of the conclusion from the change in decomposition of the other bodily particles, depends. If our material frame be not thought itself, but only that which has a certain relation to the spiritual principle of thought, so as to be subservient to its feelings and volitions, and to perform the beautiful functions of life, as long as the relation, which he who established it made to depend on a certain state of the corporeal organs, remains, it is as little reasonable to conclude from the decay or change of place of the particles of the organs essential to the mere state of relative subserviency, that the spirit, united with these organs, has ceased to exist, as it would be to conclude, that the musician to whom we have often listened with rapture, has ceased to exist when the strings of his instrument are broken or torn away. It no longer, indeed, pours on our ear the same delightful melodies; but the skill which poured from it those melodies, has not perished with the delightful sounds themselves, nor with the instrument that was the organ of enchantment. The enchanter himself, without whom the instrument would have been powerless, exists still, to produce sounds as delightful; and in the intervals of melody, the creative spirit, from which the melody originally flowed, can delight itself with remembered or imagined airs, which exist only as remembered or imagined, and are themselves as it were a part of the very spirit which conceives them.

It is on the nature of the principle of thought, then, as mere matter, or as something distinct from matter, that the chief force of the argument seems to me to depend. If matter be all, and that which thinks and feels, decay like every other part of the body, though the cause of immortality may even then not be absolutely hopeless, it must be allowed to have many difficulties not easy to be removed. If matter be not all, or rather, if matter have nothing in common with thought, but be absolutely and wholly distinct from the thinking principle, the decay of matter cannot be considered as indicative of the decay of mind, unless some other reason can be shown for the mental dissolution, than the mere external decay itself; still less can it be considered as indicative of such mental decay, if every notion which we are led to form of the mind, imply qualities inconsistent with the very possibility of such a change of decomposition as the body exhibits.

The great inquiry then is, whether our thoughts and feelings be, in the strictest sense of the term, particles of matter; a certain number of particles affected in a certain

manner in that which we term an organ, forming half a hope, a different number of particles forming half a fear; or the quarters and halves of our hopes and fears, being formed not merely of different numbers of sentient particles, but perhaps too of particles that are themselves in their absolute nature, or in their specific affection at the moment, essentially different.

In the whole course of our inquiries into the phenomena of the mind, I abstained from allusion to the great controversy of the materialists and immaterialists, or at least made only very slight allusion to it, because the analysis and arrangement of the mental phenomena, considered simply as phenomena that succeed each other in a certain order and are felt to bear to each other certain relations, are independent of any views which we may be led to form of the nature of the substance itself, which exhibits these various but regular phenomena of thought; and I was desirous of accustoming you to fix your attention chiefly on those simpler and more productive investigations. But though the materialist and the immaterialist may unite in the results of their analytical inquiries into the complex phenomena of thought, and though they may form similar arrangements of those phenomena, simple or compound, their different opinions as to the nature of the substance which displays these phenomena, cannot be regarded as unimportant, in a question which relates to the mere permanence of the substance itself; a permanence which is to be admitted or rejected, very nearly, according as one or other of those opinions is itself to be admitted or rejected.

Is there any principle of thought and feeling, then, distinct from that extended, divisible mass, which we term the corporeal frame?

If our consciousness were to be trusted, as to the indivisibility of the sentient principle, it would scarcely be necessary to make any inquiry beyond it. The savage, indeed, in the lowest form of savage life, who is too much occupied with bodily necessities, to think of himself in any other light than as that which requires food, and feels pain from the want of a necessary supply of it, or as that which is capable of inflicting or receiving a deadly blow, may never have put the question to his own mind, what he is, and may die, without having ever believed or disbelieved in a state of after-existence. The philosopher, who has reflected enough to discover the folly of half the vulgar creed, which is far from being the most difficult part of philosophy, but who has not reflected and discriminated enough to discover the truth of the other half of a system, which he finds it easier to condemn as a whole, yet which may be true in part, though false too

in part, may leave the existence of an immaterial spirit, to be believed by the believers of witchcraft and second sight; and giving his whole attention to the corporeal process, of which he is able to trace series of changes that are wholly unknown to the vulgar, may think that in thus tracing series of motions unobserved by them, he is detecting the principle of life itself. But all mankind, the mob, the sage inquirer, the very sceptic himself, when they speak or think of themselves, feel a sort of unity, in which there are no parts, the unity of a sentient being, which, if they think of organs at all, is that which sees in the eye, hears in the ear, smells in the nostrils, itself one in all, and not merely sentient, in the strict meaning of that term, but the subject of various other feelings of different classes, remembrances, comparisons, hopes, fears, love, indignation. The verbal proposition may never have been formed in the mind—*It is one being which has been the subject of all the feelings of life*—and merely because the proposition never may have been framed in words, or clearly developed, the multitude may be regarded as not having felt the truth itself. Yet if we were to ask of any one, however little accustomed to philosophic inquiries, whether he was the same thinking being at the end of the year as at the beginning of it, he would smile at our question; and would not smile less if we were to speak to him of the difference of three-fourths of a joy and half a joy; or of the many coexisting happinesses in the many coexisting atoms that form the happy organ; the simplicity and sameness of the thinking principle, of that principle of which we speak as essentially one, whenever we use the word I, having been felt by him tacitly, without the application of those technical terms, the employment of which might, perhaps, render obscure to him what had no obscurity till it was darkened with language.

What am I, whence produc'd, and for what end?
Whence drew I being, to what period tend?
Am I the abandon'd orphan of blind chance,
Dropp'd by wild atoms in disorder'd dance?
Or from an endless chain of causes wrought,
And of unthinking substance, born with thought—
Am I but what I seem, mere flesh and blood,
A branching channel with a mazy flood?
The purple stream that through my vessels glides,
Dull and unconscious flows, like common tides,
The pipes, through which the circling juices stray,
Are not that thinking I, no more than they:
This frame, compacted with transcendent skill,
Of moving joints, obedient to my will;
Nurs'd from the fruitful glebe, like yonder tree,
Waxes and wastes—I call it mine, not me.
New matter still the mould'ring mass sustains;
The mansion chang'd, the tenant still remains;
And from the fleeting stream repair'd by food,
Distinct, as is the swimmer from the flood.

Arbutnot.

Such would be our belief if we were to attend to our consciousness alone. It would tell us, that what we term I is not many but one; that it is the same being which hears and sees, compares and remembers, and that

the very notion of plurality and division is as inconsistent with the notion of self, as the notions of existence and nonexistence. This our mere consciousness would tell us. But does not reason, in this case, aid rather than lessen the force of this unreflecting belief?

If any lover of paradoxes were to assert, that fragrance is a sound, music a brilliant colour, hope or resentment a sensation of touch, he surely could not expect a very ready assent from those whom he addressed; and yet, void of proof as all these propositions would be, and opposite to our experience, and therefore relatively absurd, they would imply no absolute absurdity. The same great being who has made the sensations of fragrance, and colour, and melody, to result from affections of certain organs, might have made them to arise from causes reciprocally different. The affection of the organ of smell might, under a different arrangement, have been followed by the sensation which we now ascribe to sound; the affection of the ear, by the sensation which we now ascribe to fragrance; and the propositions that are now absurd, relatively to our present arrangement, would then have been relatively true. The asserter of materialism, however, is the asserter of a doctrine not relatively absurd only, but, as it appears to me, absolutely absurd; a doctrine which does not state agreements of qualities, of which there is no proof, but agreements of qualities which are absolutely incompatible. In affirming the principle of thought to be material, he makes an affirmation very nearly the same in kind, or at least as contradictory, as if he were to pronounce of a whole, that it is essentially different from its constituent parts, or of one, that it is seven hundred and fifty.

So much of the fallacy of the arguments of the materialist, in endeavouring to reconcile with his system the simplicity of thought, arises from the false supposition of unity, which he ascribes to the thinking organ, as if it were one substance, because he has given one name to a multitude of substances, that it will be necessary to recall to your attention the inquiries which engaged us in a very early part of the course, when we considered the objects of physical investigation, and especially that department of physical science which relates to objects as coexisting in space.

We then found, you will remember, that what we are accustomed to term a body as if it were one, is not one in nature, but one only in relation to our inability of distinguishing the space, or, if there be in any case actual contact, the lines of contact which separate the corpuscles, that are, on account of this inability of perception, which is relative to our weak organs, included by us in a single term, with an imaginary unity which our-

selves alone have made; and that what we term the properties of the mass, are the properties not of one substance, but of these coexisting atoms, which are in themselves, and must always be, substances separate and independent.

What the materialist may be pleased to term the organ of thought, whether it be the whole brain and nerves, or only a part of the brain, or any other part of the corporeal frame which he may choose to consider as intelligent, is not one, then, but a multitude of particles, which exist near to each other, indeed, but which are as little one, as if they existed in the different planets of our system, or in the planets or suns of different systems. The unity which we give to the organ, by considering its separate atoms in a single glance, is a unity which it does not possess; and we must not deceive ourselves, therefore, by imagining that we have discovered a unity which may correspond with the simplicity of our feelings, because we have discovered a number of independent corpuscles, to the multitude of which we have chosen to give a single name. An organ is not one substance, but many substances. If joy or sorrow be an affection of this organ, it is an affection of the various substances which, though distinct in their own existence, we comprehend under this single term. If the affection, therefore, be common to the whole system of particles, it is not one joy or sorrow, but a number of joys and sorrows, corresponding with the number of separate particles thus affected; which, if matter be infinitely divisible, may be divided into an infinite number of little joys and sorrows, that have no other relation to each other in their state of infinitesimal division than the relations of proximity, by which they may be grouped together in spheres or cubes, or other solids, regular or irregular, of pleasures or pains; but by which it is impossible for them to become one pleasure or pain, more than any particle of insentient matter can become any other particle of insentient matter, or any mass of such matter become any other mass. We can conceive the particles of the moon to be mingled with the particles of our earth, and to cohere with them in actual contact; but the number of particles that form the moon, cannot become the very particles that now form the earth, however intimately mingled. Each particle has still its own independent affections, and these affections of a myriad of particles are still only the affections of a myriad of particles. It is vain to say, then, in the hope of obviating this irresistible objection, from the felt unity of the being which we term self, that our thoughts and feelings are not qualities of the particles as they exist simply, but of the whole congeries of particles as existing in one beautiful piece of living mechanism; for

this is only to repeat the very difficulty itself, and to assign the insuperable difficulty as a deliverance from the insuperable difficulty. The whole of which materialists speak, whether they term it a congeries, an organ, or a system of organs, is truly nothing in itself. It is, as I have said, a mere word invented by ourselves, a name which we give to a plurality of coexisting objects, not a new object to be distinguished from the heap. A thousand atoms, near to each other or remote, are only a thousand atoms, near or remote; and are precisely the same atoms, with precisely the same qualities, whether we consider them singly, or divide them, in our conception, by tens, fifties, hundreds, or give to the whole one comprehensive name, as if a thousand were but a greater unit. There is no principle of unity in them: it is the mind considering them that gives to them all the unity which they have, or can have.

In considering the result of a combination of parts, we are too apt to confound the multitude of separate effects with that single great result to which we give a particular name. Thus, melody is the result of a few impulses, which a bow gives to the strings of a violin; and we consider this melody as one effect, when in truth it is one only as a feeling of our mind, that is simple and indivisible, not as a state of compound and divisible matter. All that is not mental, is a multitude of effects, a multitude of particles of the sounding body, of the interposed air, of the vibratory organ, alternately approaching and receding. A multitude of those was necessary, indeed, to produce in the mind, by their concurring influence, the musical delight. But each corporeal effect may be distinguished, in our conception at least, from every other effect that coexists with it. In the instrument, the air, the organ, the particles are all separate and independent. The material phenomenon is truly, therefore, as long as it is wholly material, a multitude of phenomena; the concurrence of a multitude of states of a multitude of particles of the musical instrument; the elastic medium; the organ of sense; the brain, without any unity whatever. The properties of the coexisting atoms, in this great whole, are the properties of the parts; and if the qualities, states, or affections of the parts were laid out of estimation, nothing would remain to be estimated as a quality, state, or affection of the whole.

The distinction which I have now made, is one with which it seems to me peculiarly important, that your minds should be fully impressed; because it is to indistinct analogies of this sort, that the materialist, when he has no other retreat, is accustomed to fly for shelter. The very analogy of melody to which I have now alluded, is a favourite ex-

ample. It is one effect, though resulting from the state of a number of particles; and if music flow from a material organ, it is said, why may not thought? If, indeed, what alone is properly termed music, the sensations or series of sensations that follow certain affections of the sensorial organ, that which is felt at every moment as one and indivisible, were itself one organic result, a state of the divisible organ and not of a substance that is by nature indivisible, then indeed every thought might likewise be material. But in asserting this, the materialist begs the very point in question, assuming without proof what he yet professes to attempt to prove. It is evident, as we have seen, that what alone is one in all that multitude of effects from which melody results, the musical delight itself, is not the state of the musical instrument, nor of the vibrating air, and as little is it proved to be a state of any number of particles of the brain. It is one result, indeed, but it is one only, because it is an affection of that which is in its own nature simple; and till we arrive at the sentient principle itself, there is no unity whatever but a multitude of states of a multitude of vibrating particles. When the materialist, then, adduces this or any other example of resulting unity, as illustrative of organic thought, all which you will find to be necessary is simply to consider what it is which is truly one, in the result that is adduced as one, and you will find in every instance that the point in dispute has been taken for granted in the example adduced to prove it; that there is no real unity in all the material part of the process, and that the unity asserted is truly a mental unity, the unity of a mental feeling, or the unity of a mere name for expressing briefly the many coexisting states of many separate and independent particles which we have chosen to denominate a single mass.

In the Letter of the Society of Freethinkers to Martinus Scriblerus, of which I before read to you a part, the argument of those who consider thought as a quality of many particles is stated ludicrously indeed, but with as much real force as in the reasoning of which it is a parody.

“To the learned Inquisitor into Nature, Martinus Scriblerus; the Society of Freethinkers greeting.

“*Grecian Coffee-House, May 7.*

“It is with unspeakable joy we have heard of your inquisitive genius, and we think it great pity that it should not be better employed, than in looking after that theological nonentity, commonly called the Soul; since, after all your inquiries, it will appear you have lost your labour in seeking the residence of such a chimera, that never

had being but in the brains of some dreaming philosophers. Is it not Demonstration to a person of your sense, that, since you cannot find it, there is no such thing? In order to set so hopeful a genius right in this matter, we have sent you an answer to the ill-grounded sophisms of those crack-brained fellows, and likewise an easy mechanical explication of Perception or Thinking.

"One of their chief arguments is, that Self-consciousness cannot inhere in any system of matter, because all matter is made up of several distinct beings, which never can make up one individual thinking being.

"This is easily answered by a familiar instance. In every jack there is a meat-roasting quality, which neither resides in the fly, nor in the weight, nor in any particular wheel of the jack, but is the result of the whole composition; so, in an animal, the self-consciousness is not a real quality inherent in one being, (any more than meat-roasting in a jack,) but the result of several modes or qualities in the same subject. As the fly, the wheels, the chain, the weight, the cords, &c. make one jack, so the several parts of the body make one animal. As perception or consciousness is said to be inherent in this animal, so is meat-roasting said to be inherent in the jack. As sensation, reasoning, volition, memory, &c. are the several modes of thinking, so roasting of beef, roasting of mutton, roasting of pullets, geese, turkeys, &c. are the several modes of meat-roasting. And as the general quality of meat-roasting, with its several modifications as to beef, mutton, pullets, &c. does not inhere in any one part of the jack, so neither does consciousness, with its several modes of sensation, intellection, volition, &c. inhere in any one, but is the result from the mechanical composition of the whole animal.

"Just so, the quality or disposition of a fiddle to play tunes, with the several modifications of this tune-playing quality in playing of preludes, sarabands, jigs, and gavottes, are as much real qualities in the instrument, as the thought or the imagination is in the mind of the person that composes them."

"It is well known to anatomists, that the brain is a congeries of glands that separate the finer parts of the blood called animal spirits; that a gland is nothing but a canal of a great length, variously intorted and wound up together. From the arietation and motion of the spirits in those canals, proceed all the different sorts of thoughts."

"We are so much persuaded of the truth of this our hypothesis, that we have employed one of our members, a great virtuoso at Nuremberg, to make a sort of an hydraulic engine, in which a chemical liquor resembling blood is driven through elastic channels resembling arteries and veins, by the force

of an embolus like the heart, and wrought by a pneumatic machine of the nature of the lungs, with ropes, and pulleys, like the nerves, tendons, and muscles; and we are persuaded that this our artificial man will not only walk, and speak, and perform most of the outward actions of the animal life, but (being wound up once a week) will perhaps reason as well as most of your country parsons."

If, instead of asserting thought to be the result of the affection of many particles, in which case it must evidently partake the divisibility of the organ itself, and be not one but innumerable separate feelings, the materialist assert it to be the affection of a single particle, a monade, he must remember that if what he chooses to term a single particle, be a particle of matter, it too must still admit of division; it must have a top and a bottom, a right side and a left; it must, as is demonstrable in geometry, admit of being cut in different points, by an infinite number of straight lines; and all the difficulty of the composition of thought, therefore, remains precisely as before. If it be supposed so completely divested of all the qualities of matter, as not to be extended, nor consequently divisible, it is then mind which is asserted under another name, and every thing which is at all important in the controversy is conceded; since all which can philosophically be meant by the immaterialist, when the existence of mind is asserted by him, is the existence of an invisible subject of all those affections which constitute the variety of our thoughts and feelings. If the materialist be unwilling to admit the word mind, in allowing the reality of a simple, unextended, and consequently indivisible subject of our various feelings, he may be allowed any other word which may appear to him preferable; even the word atom or particle, if he choose still to retain it. But he must admit, at least, that in this case, in the dissolution of the body, there is no evidence, from the analogy of this very bodily dissolution itself, of the destruction of any such simple particle as that which he finds to be necessary for the explanation of the phenomena of thought.

In whatever manner, therefore, the materialist may profess to consider thought as material, it is equally evident that this system is irreconcilable with our very notion of thought. In saying that it is material, he says nothing, unless he mean that it has those properties which we regard as essential to matter; for without this belief he might as well predicate of it any barbarous term that is absolutely unintelligible, or rather might predicate of it such a barbarous

* Pope's Works, vol. v. p. 57—61. London, 1812, 18vo.

term with more philosophic accuracy ; since, in the one case, we should merely not know what was asserted ; in the other case we should conceive erroneously that properties were affirmed of the principle of thought which were not intended to be affirmed of it. Matter is that which resists compression, and is divisible. Mind is that which feels, remembers, compares, desires. In saying of mind that it is matter, then, we must mean, if we mean any thing, that the principle which thinks is hard and divisible ; and that it will be not more absurd to talk of the twentieth part of an affirmation, or the quarter of a hope, of the top of a remembrance, and the north and east corners of a comparison, than of the twentieth part of a pound, or of the different points of the compass, in reference to any part of the globe of which we may be speaking. The true answer to the statement of the materialist, the answer which we feel in our hearts, on the very expression of the plurality and divisibility of feeling, is, that it assumes what, far from admitting, we cannot even understand ; and that, with every effort of attention which we can give to our mental analysis, we are as incapable of forming any conception of what is meant by the quarter of a doubt or the half of a belief, as of forming to ourselves an image of a circle without a central point, or of a square without a single angle.

With respect to this possible geometry of sensations, as divisible into parts, I cannot but think that the too great caution of Mr. Locke, by giving the sanction of his eminent name to the possibility, at least, of the superaddition of thought as a mere quality, to a system of particles, which, as a number of particles, have no thought, and yet have, as a whole, what they have not as parts of that whole, has tended in a great degree to shelter the manifest inconsistency of the doctrine of the materialist. He was unwilling to limit the divine power ; and from the obscurity of our notion of the connexion of the feelings of the mind, in any manner, with the changes induced in the bodily frame, he conceived that the annexation of thought to the system of particles itself, would be but a slight addition to difficulties that must at any rate be admitted. He forgot, however, that a system of particles is but a name for the separate particles which alone have any real existence in nature ; that the affirmation of what is contradictory, like plurality and unity, simplicity and complexity, is very different from the mere admission of ignorance ; and that, though we may not know any reason for which the Deity has been pleased, at least during our mortal state, to render sensations of our mind dependent on affections of our nervous system, there is no more absurdity in the affirmation of such a dependence, than in the assertion of any other physical

connexion of events,—of material phenomena with material phenomena, or of mental phenomena with other phenomena of mind. If the presence of the moon, at the immense distance of its orbit, can affect the tendencies of the particles of water in our ocean, it may be supposed with equal readiness to produce a change in the state of any other existing substance, whether divisible into parts, that is to say, material,—or indivisible, that is to say, mind. But when thought is affirmed to be a quality of a system of particles, or to be one result of many coexisting states of particles, which separately are not thought, something more is affirmed than that of which we are merely ignorant of the reason. A whole is said to be different from all the separate and independent parts of a whole : this is one absurdity ; and that which is felt by us as in its very nature simple and indivisible, is affirmed to be only a form of that which is, by its very nature, infinitely divisible. It is no daring limitation of the divine power to suppose, that even the Omnipotent himself cannot confound the mathematical properties of squares and hexagons ; and it would be no act of irreverence to his power, though it were capable of doing every thing which is not contradictory, to suppose that he cannot give to a system of organs a quality wholly distinct from the qualities of all the separate parts ; since the organ itself is only a name which we give to those parts, that are all which truly exist as the organ, and have all an existence and qualities that are at every moment independent of the existence and qualities of every other atom, near or remote.

Our sensations we know directly,—matter we know only indirectly, if we can be said to know its nature at all, as the cause of our sensations. It is that which, in certain circumstances, affects us in a certain manner. When we have said this, we have said all that can be considered as truly known by us with respect to it ; and in saying this, it is to our own feelings that the reference is made. Of the two systems, therefore,—the system which rejects all matter, and the system which rejects all mind,—there can be no question which is the more philosophic. The materialist must take for granted every feeling for which the follower of Berkeley contends ; he must admit, that it is impossible for us to know the absolute nature of matter, and that all which we know of it is relative to ourselves, as sentient beings capable of being affected by external objects ; that our sensations are known to us directly, the causes of our sensations only indirectly ; and his system, therefore, even though we omit every other objection, may be reduced to this single proposition,—that our feelings which we know, are the same in nature with that, of which the absolute nature, as it exists independently of our feel-

ings, is, and must always be, completely unknown to us.

From all the remarks which have now been made, I cannot but think that it is a very logical deduction, that our feelings are states of something which is one and simple, and not of a plurality of substances, near or remote; that the principle of thought, therefore, whatever it may be, is not divisible into parts; and that hence, though it may be annihilated, as every thing which exists may be annihilated by the will of him who can destroy as he could create, it does not admit of that decay of which the body admits, —a decay that is relative to the frame only, not to the elements that compose it.

When the body seems to us to perish, we know that it does not truly perish; that every thing which existed in the decaying frame, continues to exist entire as it existed before; and that the only change which takes place, is a change of apposition or proximity. From the first moment at which the earth arose, there is not the slightest reason to think that a single atom has perished. All that was is. And if nothing has perished in the material universe; if even in that bodily dissolution, which alone gave occasion to the belief of our mortality as sentient beings, there is not the loss of the most inconsiderable particle of the dissolving frame, the argument of analogy, far from leading us to suppose the destruction of that spiritual being which animated the frame, would lead us to conclude that it too exists as it before existed; and that it has only changed its relation to the particles of our material organs, as these particles still subsisting have changed the relations which they mutually bore. As the dust has only returned to the earth from which it came, it is surely a reasonable inference from analogy, to suppose that the spirit may have returned to the God who gave it.

*Non secus ac quondam, tenebris et carcere rupto
Immitis caveas, volucrum regina repente
Dat plausum coelo ingentem, nubesque repente
Linqunt, et adverso defigit lumina Phoebus,
Seque auras intra liquidas et nubila condit.**

The belief of the immateriality of the sentient and thinking principle, thus destroys the only analogy on which the supposition of the limitation of its existence to the period of our mortal life could be founded. It renders it necessary for those who would contend that we are spiritually mortal, to produce some positive evidence of a departure, in the single case of the mind, from the whole analogies of the economy of nature; and it renders doubly strong all the moral arguments which can be urged for its own independent immortality.

LECTURE XCVII.

OF THE IMMORTALITY OF THE SOUL.

GENTLEMEN, the inquiry to which I directed your attention in my last Lecture, was that which relates to our prospect of immortality.

The appearances which death exhibits, seem, when we first consider them, to mark so strongly the termination of every feeling which connected us with the once living object, that the continuance of these feelings, when every external trace of them is lost, may well be supposed to be viewed with disbelief by some, and with doubt by many. During their life, our direct communication with those who lived around us, was carried on by the intervention of bodily organs; in thinking of their very feelings, we have been accustomed to think of this bodily intervention, in what they looked, or said, or did; and from the mere influence of the laws of association, therefore, it is not wonderful, that, when they can no longer look, or speak, or act, the kindness, which before could not exist without these corporeal expressions of it, should be regarded as no longer existing, at least should be so regarded by those who are not in the habit of any very nice analyses of complicated processes or complex phenomena.

Whatever other effects death may have, it is at least evident, that when it has taken place the bodily organs moulder away, by the influence of a decomposition more or less rapid. What was once to our eyes a human being, is a human being no more; and when the organization is as if it had never been, every feeling and thought, if states of mere organs, must be also as if they had never been. The most interesting of all questions, therefore, with respect to our hopes of immortality, is whether thought be a state of the mere organs, which decay thus evidently before our very eyes, or a state of something which our senses, that are confined to the mere organs, cannot reach; of something which, as it is beyond the reach of our senses, may therefore subsist as well, when every thing which comes under our senses, exists in any one state, as in any other state.

With the examination of this point, my last Lecture was almost wholly occupied; and the arguments, which I then offered, seemed to me to show decisively, that our sensations, thoughts, desires, are not particles of matter, existing in any number, or any form of mere juxtaposition; that the sentient and thinking principle, in short, is essentially one, not extended and divisible, but incapable by its very nature of any subdivision into integral parts, and known to us only as the subject of our consciousness, in all the variety of suc-

* Heinsius de Contemptu Mortis, lib. I.

cessive feelings, which we comprehend under that single name.

When we have learned clearly to distinguish the organization from the principle of thought, the mere change of place of the particles of the organic frame, which is all that constitutes death relatively to the body, no longer seems to imply the dissolution of the principle of thought itself, which is essentially distinct from the organic frame, and, by its very nature, incapable of that species of change which the body exhibits; since it is very evident, that what is not composed of parts, cannot, by any accident, be separated into parts.

To the mind which considers it in this view, then, death presents an aspect altogether different. Instead of the presumption, which the decaying body seemed to afford, of the cessation of every function of life, the very decay of the body affords analogies that seem to indicate the continued existence of the thinking principle; since that which we term decay, is itself only another name of continued existence, of existence as truly continued in every thing which existed before, as if the change of mere position, which alone we term decay, had not taken place. The body, though it may seem to denote a single substance, is but a single word invented by us to express many coexisting substances: every atom of it exists after death as it existed before death; and it would surely be a very strange error in logic to infer, from the continuance of every thing that existed in the body, the destruction of that which, by its own nature, seemed as little mortal as any of the atoms which have not ceased to exist, and to infer this annihilation of mind, not merely without any direct proof of the annihilation, but without a single proof of destruction of any thing else, since the universe was formed. Death is a process in which every thing corporeal continues to exist; therefore, all that is mental ceases to exist. It would not be easy to discover a link of any sort that might be supposed to connect the two propositions of so very strange an enthymeme.

The possibility of such annihilation of the mind, no one who admits the corresponding power of creation will deny, if the Deity have given any intimation, tacit or expressed, that may lead us to believe his intention of destroying the spirit, while he saves every element of the body. But the question is not, whether it be possible for him who created the mind, to annihilate it; it is, whether we have reason to believe such annihilation truly to take place; and of this some better proof must be offered, than the continuance, even amid apparent dissolution, of all that truly constituted the body, every atom of which it was, without all question, equally possible for divine power to destroy.

We surely have not proved that the whole frame of suns and planets will perish to-morrow, nor even given the slightest reason to suspect the probability of this event, because we may have shown beyond all dispute, that the Deity may, if such be his will, reduce to-morrow, or at this very moment, the whole universe to nothing.

The very decay of the body then, as I have said, bears testimony, not to the destruction, but to the continuance of the undying spirit, if the principle of thought be truly different from the material frame. The mind is a substance, distinct from the bodily organ, simple, and incapable of addition or subtraction; nothing which we are capable of observing in the universe has ceased to exist, since the universe began; these two propositions, as far as analogy can have weight, and, since the mind of any one is incapable of being directly known to us as an object, it is the analogy of the bodily appearances alone that can have any weight, these two propositions, instead of leading by inference to the proposition, The mind, which existed as a substance before death, ceases wholly to exist after death, lead rather, as far as the mere analogy can have influence, to the opposite proposition, The mind does not perish in the dissolution of the body. In judging according to the mere light of nature, it is on the immaterialism of the thinking principle that I consider the belief of its immortality to be most reasonably founded; since the distinct existence of a spiritual substance, if that be admitted, renders it incumbent on the asserter of the mortality of the spirit to assign some reason, which may have led the only being who has the power of annihilation, to exert his power in annihilating the mind which he is said in that case to have created only for a few years of life.

If, therefore, but for some direct divine volition, the spiritual substance, we have every reason to suppose, would continue to subsist as every thing else continues to subsist, the only remaining question in such a case is, whether, from our knowledge of the character of the Deity, as displayed in his works, especially in the mind itself, we have reason to infer, with respect to the mind, this peculiar will to annihilate it,—without which, we have no reason to suppose it to be the only existing thing that is every moment perishing in some individual of our kind. The likelihood of such a purpose in the Divinity may be inferred, if it can be at all inferred, in two ways—from the nature of the created mind itself, as exhibiting qualities which seem to mark it as peculiarly formed for limited existence, and from our knowledge of the Creator, as displaying to us in his works indications of such a character, as of itself might lead us to infer such a peculiar intention.

That, in the nature of the simple indivisible mind itself, there is nothing which marks it as essentially more perishable than the corpuscles to which we give the name of masses, when many of them are in close juxtaposition, but which are themselves the same, whether near or remote, than the unperishing atoms of the leaf, that continues still entire in every element, while it seems to wither before us, or of the vapour, in which all that truly existed exists as before, while it is only to our eyes that it seems to vanish into nothing. I need not use any arguments to show. Mind, indeed, like matter, is capable of existing in various states, but a change of state is not destruction, in one more than in the other. It is as entire in all its seeming changes as matter in all its seeming changes. There is no positive argument then, that can be drawn from the nature of the thinking principle, to justify the assertion, that while matter does not perish even in a single atom, it, and it only, ceases to exist; and it would be enough that no positive argument could be drawn from it in support of an opinion that is inconsistent with the general analogy of nature, and unsupported by any other proof of any kind, though no negative arguments could be drawn from the same source. Every argument, however, which can be derived from it is of this negative sort, indicating in mind a nature, which of itself, if there be any difference of degree, might seem not more but less perishable than those material atoms which are acknowledged to continue as they were, entire in all the seeming vicissitudes of the universe.

I am aware, indeed, that in judging from the mind itself, a considerable stress has often been laid on the existence of feelings which admit of a very easy solution, without the necessity of ascribing them to any instinctive foreknowledge of a state of immortal being. Of this sort, particularly, seems to me an argument, which, both in ancient and modern times, has been brought forward as one of the most powerful arguments for our continued existence, after life has seemed to close upon us for ever. I allude to the universal desire of this immortal existence. But, surely, if life itself be pleasing, and, even though there were no existence beyond the grave, life might still, by the benevolence of him who conferred it, have been rendered a source of pleasure, it is not wonderful that we should desire futurity, since futurity is only protracted life. It would indeed have been worthy of our astonishment, if man, loving his present life, and knowing that it was to terminate in the space of a very few years, should not have regretted the termination of what he loved, that is to say, should not have wished the continuance of it beyond the period of its melancholy close.

The universal desire then, even if the desire were truly universal, would prove nothing but the goodness of him who has made the realities of life, or if not the realities, the hopes of life so pleasing, that the mere loss of what is possessed or hoped, appears like a positive evil of the most afflicting kind.

Equally powerless I consider the argument for the reality of a state of higher gratification, which is often drawn from the constant renewal and constant disappointment of every earthly hope; from that eager and unremitting wish of something better, which even the possession of delights, that are counted inestimable by all but their possessor, is insufficient to suppress.

Old Rome consulted birds. Lorenzo, thou
With more success the flight of hope survey,
Of restless hope, for ever on the wing.
High-perch'd o'er every thought that falcon sits,
To fly at all that rises in her sight;
And never stooping but to mount again,
Next moment she betrays her aim's mistake,
And owns her quarry lodged beyond the grave.*

The mere activity of hope, however, as we thus pass ceaselessly from wishes that have been gratified to other wishes, proves only, as I before showed in treating of this principle, that the Deity has, with a gracious view to the advantage of society, formed us for action, and, forming us for action, has given us a principle which may urge us to new pursuits, when otherwise we might, in the idleness of enjoyment, have desisted from exertions which required to be sustained in their vigour by new desires. Though nothing were to exist beyond the grave, hope, in all its variety of objects, would still be useful for animating to continued, though varied exertion, and, as thus beneficial to the successive races of mortal beings, would have been even then a gift not unworthy of divine benevolence.

The sublime attainments which man has been capable of making in science, and the wonders of his own creative art in that magnificent scene to which he has known how to give new magnificence, have been considered by many as themselves proofs of the immortality of a being so richly endowed. When we view him, indeed, comprehending in his single conception the events of ages that have preceded him, and, not content with the past, anticipating events that are to begin, only in ages as remote in futurity as the origin of the universe is in the past, measuring the distance of the remotest planets, and naming in what year of other centuries the nations that are now gazing with astonishment on some comet are to gaze on it in its return, it is scarcely possible for us to believe that a mind, which seems equally capacious of what is infinite in space

* Night Thoughts, Night vii.

and time, should be only a creature, whose brief existence is measurable by a few points of space and a few moments of eternity.

*Nonne hanc credideres mentem, quae nunc quoque
coelum
Astragae pervolvit, delapsam coelitus, illuc
Unde abiit remeare, susque revivere sedes?*

Look down on earth. What seest thou? Wond'rous things,

Terrestrial wonders that eclipse the skies,
What lengths of labour'd lands! What lorded seas;
Lorded by man, for pleasure, wealth or war.
Seas, winds, and planets, into service brought,
His art acknowledge, and promote his ends.

Nor can the eternal rocks his will withstand.
What level'd mountains, and what lifted vales!
O'er vales and mountains, sumptuous cities swell,
And gild our landscape with their glittering spires.
How the tall temples, as to meet their Gods,
Ascend the skies! The proud triumphal arch
Shows us half heaven, beneath its ample bend.
High through mid air, here streams are taught to flow;
Whole rivers there, laid by in basons, sleep:
Here plains turn oceans; there vast oceans join,
Through kingdoms, channel'd deep from shore to shore.

How yon enormous mole, projecting, breaks
The mid-sea's furious waves! Their roar amidst,
Out-speaks the Deity, and says, "O main,
Thus far, nor farther!" Measured are the skies,—
Stars are detected in their deep recess,—
Creation widens, vanquished Nature yields;
Her secrets are extorted. Art prevails!
What monument of genius, spirit, power!

And now, if justly raptur'd at this scene,
Whose glories render heaven superfluous, say,
Whose footsteps these? Immortals have been here;
Could less than souls immortal this have done!*

These glorious footsteps are indeed the footsteps of immortals! Yet it is not the mere splendour of the works themselves, on which this argument insists so much, that seems directly to indicate the immortality of their authors. Man might be mortal, and yet perform all these wonders, or wonders still more illustrious. It is not by considering the relation of the mind to the monuments of its art, as too excellent to be the work of a perishable being, but by considering the relations of a mind capable of these to the being who has endowed it with such capacities, and who is able to perpetuate or enlarge the capacities which he has given, that we discover in the excellence which we admire, not a proof indeed, but a presumption of immortality; a presumption at least, which is far from leading us to infer any peculiar attention in the preserver of the body to annihilate the mind. That God has formed mankind for progressive improvement, is manifest from those susceptibilities of progress which are visible in the attainments of every individual mind; and still more in the wider contrast, which the splendid results of science in whole nations, that may be considered almost as nations of philosophers, now exhibit, when we think, at the same time, of the rude arts of the savage, in his hut or in the earlier cave, in which he seemed almost of the same race with the wild animal with which he had struggled for

his home. But, if God love the progress of mankind, he loves the progress of the different individuals of mankind; for mankind is but another name for these multitudes of individuals; and if he love the progress of the observers and reasoners, whom he has formed with so beautiful an arrangement of faculties, capable of adding attainment to attainment in continual progress, is it possible for us to conceive that, when the mind has made an advance which would render all future acquisitions even on earth proportionately far more easy, the very excellence of past attainments should seem a reason for suspending the progress altogether; and that he, who could have no other wish than the happiness and general excellence of man in forming him what he is, should destroy his own gracious work, merely because man, if permitted to continue longer in being, would be more happy and excellent? If the progressive faculties of man afford no proof that the Deity wills his continued progress, they surely afford no evidence of a divine unwillingness to permit it; and we must not forget that the mind has been shown to be not more truly mortal of itself than the decaying elements of the body; that if there be truly a substance mind, the annihilation of this substance is in itself as difficult to be conceived as the annihilation of any other substance; and that, before we believe in the miraculous exclusive annihilation of it, some reason is to be found, which might seem to influence the Deity, who spares every thing corporeal, to destroy every thing mental. We have, therefore, to conceive the mind at death matured by experience, and nobler than it was when the Deity permitted it to exist, and the Deity himself, with all those gracious feelings of love to man which the adaptation of human nature to its human scene displays; and in these very circumstances, if we affirm without any other proof the annihilation of the mind, we are to find a reason for this annihilation. If even we, in such a moment, abstracting from all selfish considerations, would feel it a sort of crime to destroy with no other view than that of the mere destruction, what was more worthy of love than in years of earlier being, are we to believe that he, who loves what is noble in man more than our frail heart can love it, will regard the improvement only as a signal of destruction? Is it not more consonant to the goodness of him who has rendered improvement progressive here, that, in separating the mind from its bodily frame, he separates it to admit it into scenes in which the progress begun on earth may be continued with increasing facility?

*Quare sume animum; neque enim sapientia dia
Frustra operam impendit; neque mens arcebitur istis
Linitibus, quibus hoc perituum corpus; at exors
Terrenae labis viget, aeternumque vigebit;*

* Night Thoughts, Night vi.

*Atque ubi corporeis emissas, ut carcere, vindictas,
Libera cognatum repetet, vetus innoxia, coelum,
Nectareos latices Vori de fonte perenni
Hauriet, aetheriumque perennis carpet amomum.**

In this light, in which the Deity is considered as willing the happiness of man, and the intellectual and moral progress of man, which is surely the character that is most conspicuous in the arrangements even of this earthly life, we find in this very character, in its relation to the separated spirit, not motives to destroy, which we must presume at least that we have found, before we take for granted that what now has existence is to cease to exist; but, on the contrary, motives to prolong an existence which as yet has fulfilled only a part of the benevolent design of creation. It may be only a slight presumption which we are hence entitled to form, but at least whatever presumption we are entitled to form, is not unfavourable to our hopes of immortality. There is another moral character in which the Deity may be considered at such a moment—the character of justice, or at least of a moral relation analogous to that which in man we term justice. In this too may be found equal, or still stronger presumptive evidence, that the years of our earthly joy or sorrow are not the whole of our existence.

The force of the argument consists in the unequal distribution of happiness on earth, as not proportioned to the virtues or the vices of those to whom it is given.

Virtue, indeed, cannot be very miserable, and Vice cannot permanently be very happy. But the virtuous may have sorrows, from which the vicious are free, and the vicious have enjoyments not directly accompanied with vice,—enjoyments which the virtuous, who seem to us to merit them better, do not possess. Increase of guilt, even by stupifying the conscience, may occasion less rather than more remorse; and the atrocious profligate be less miserable than the timid and almost penitent victim of passions, which overpower a reluctance that is sincere, even when it is too feeble to make adequate resistance to the overwhelming force. It is to futurity, therefore, that we must look for the equalizing, if any equalizing there be, of the present disproportions.

I am aware of an argument which may be adduced to obviate the force of the reasoning that is founded on the prospect of such moral retribution. If, in the present state of things, the virtuous are rewarded, and the vicious punished, we do not need a future state for doing what has been done already; and if the virtuous are not rewarded, nor the vicious punished, in that only scene of which we have any experience, what title have we to infer, from this very disorder, qualities

in the Supreme Ruler of the world, which the present scene of his government does not itself display?

The argument would indeed be, I will readily admit, most forcible, if we had no mode of discovering the moral sentiments of the Sovereign of nature, unless in the pain or pleasure which he bestows; and if no advantages were to flow from the unequal distribution of happiness on earth, that could reconcile these with a high moral character of the Governor of the universe. But, if such advantages do truly arise from the temporary disproportion as compensated afterwards by the distributions of another life, and if the moral character of God be discoverable by us in other ways, the argument which supposes us to have no other mode of inferring the divine character than by the mere distribution of pleasure and pain, must lose its weight. If the temporary disproportion be of advantage upon the whole, he who is benevolent cannot fail to will that very disproportion, which is thus by supposition advantageous; and he who has all the sources of happiness in his power, through every future age, can have no difficulty in accommodating a little temporary and necessary disproportion to justice the most exact. These important points will deserve a little fuller elucidation.

In the first place, then, the moral sentiments of the Ruler and Judge of the world are discoverable in other ways, as well as by the temporary allotments which he has made of pain or pleasure. He who has placed conscience in every bosom, to approve or condemn, speaks to every one in that voice of conscience. What every human being is forced to detest, cannot be regarded by us as indifferent to him who has rendered hatred of it inevitable in us. What every bosom is taught, as if by some internal awarder of love, to regard with veneration, must be regarded too as acceptable in the eyes of him who has made us feel it as a species of crime to withhold our love. God, then, approves of virtue; he loves the virtuous; he has the power of giving happiness to those whom he wills to render happy; and if, having this power, he do not make happy for the few moments of life those whom we cannot but consider him as loving, it must be for a reason which is itself a reason of benevolence.

Such a reason, I may remark in the second place, is easily discoverable, and indeed has been already treated by me at such great length, as to render it unnecessary for me now to dwell on it. If the virtuous were necessarily happy here, and happy in proportion to their virtue, there could not be those noble lessons by which occasional suffering strengthens the virtue which it exercises. There could not, for the same rea-

* J. Hawkins Browne.

son, be those gentle services of compassion which cherish virtues of another class. If the guilty were the only sufferers, pity would be feeble, and might even perhaps be morally unsuitable in some measure, rather than praiseworthy. In the case of vice itself, we see a reason, and a most benevolent reason, why the pain of remorse should often be more severe, in the slightest delinquencies of those who are only novices in guilt, than in the fearless cruelties and frauds of the hardened and impenitent sinner. It is in the early stages of vice, before the influence of habit is formed, that the heart may be most easily led back to better feelings; and it is then, accordingly, when it may be most efficacious, that the voice which calls to desist, speaks with its loudest expostulations and warnings.

The present system of temporary disproportion then is not, when the general character of the divine estimator of human actions is sufficiently marked in another manner, inconsistent in the slightest degree with supreme moral excellence; but, on the contrary, when all its relations, especially those most important relations to the virtue that is awakened by it and fostered, are taken into account, may be said to flow from that very excellence. But still, important as the temporary advantages may be, for producing that consciousness of virtue which could not be known without opportunities of trial, and the very virtues themselves that imply sufferings which are not the necessary result of guilt, it is only by its relation to the moral advantage, that the disproportion is even at present reconcilable with the justice and goodness which we delight to contemplate in our maker, and preserver, and judge. That conscience which he has placed within us, as if to bear his own authority, and to prompt us as his own benevolence would prompt us, to the actions which it may be as delightful to remember as to perform; that very distinguisher of good and evil, by which, and by which only, we learn to love even the benevolence which formed us; the benevolence, to whose just and bounteous regard we look with confidence through all the ages of eternity; this principle of all equity, by which alone we know to be just ourselves, and to reproach ourselves for any failure in justice, seems, in the very language with which it calls on us to make compensation for our own disproportionate awards, to reveal to us the compensations of another world, as flowing necessarily from the very goodness and power of him, to whose comprehensive and equal view of all the ages of the universe, and of all that, in those ages, is to be felt or done, futurity itself may almost be said to be constantly present. The distinction of life and death at least, which to our eye is so important, is to him

but the distinction of a moment; and if that brief moment of mortal life, though it be a moment of suffering, can give to the immortal spirit everlasting remembrances of virtue, he who makes it, for important purposes, a moment of suffering, can assign to the sufferer that immortality, to which the remembrance of the heroic disregard of peril, or of the equally heroic patience that disdained to repine even in torture itself, may be a source of happiness, which, in such circumstances, it would not have been benevolence to have withheld.

These considerations of the Deity, as manifestly willing the intellectual and moral progress of his creatures, which death suspends, and as a just estimator of the actions of mankind, whose awards may be considered as proportioned to the excellence which he loves,—these two views of the relation of man and his Creator, might lead us to some presumptive expectation of future existence, even though we had no positive proof of any spiritual substance within us, that might remain entire, in the mere change of place of the bodily elements; a change which is the only bodily change in that death which we are accustomed to regard as if it were a cessation of existence, but in which every thing that existed before, continues to exist with as perfect physical integrity as it before existed.

Even in this view of man, his future existence as a living being, though not so obvious and easy of conception, might still seem a reasonable inference from the character of the Divinity, in its relation to the earthly progress and earthly sufferings of a creature whom it would be impossible for us to regard as an object of indifference to the Power that marked him out for our own admiration. But, in this view the argument for immortality would be comparatively feeble. We are not to forget, as I have already repeated, that mind is itself a substance distinct from the bodily elements; that when death itself is only a change of the mutual relations of atoms, all of which exist as before, with all their qualities, there is no reason of analogy that can lead us to suppose the mind, as a substance, to be the only thing which perishes; that in such a case, therefore, positive evidence is necessary, not to make us believe the continued existence of the mind, when nothing else is perishing, but to make us believe that the Deity, who destroys nothing else, in death destroys those very minds, without relation to which the whole material frame of the universe, though it were to subsist for ever, would be absolutely void of value. It would not be a little, then, to find merely that there is no positive evidence which can lead us to suppose such exclusive annihilation of spiritual existence. But how much more is it to find, in-

stead of such positive evidence of destruction, presumptions of the strongest kind, which the character of the Deity, as made known to us in his works, and especially in our hearts, can afford, that the life which depended on his goodness on earth, will be a subject of the moral dispensations of his goodness and justice, after all that is truly mortal about us has not perished indeed, but entered into new forms of elementary combination. "Cum venerit dies ille qui mixtum hoc divini humanique discernat corpus, hoc, ubi inveni relinquam: ipse me diis reddam. Nec nunc sine illis sum; sed gravi terrenoque detineor. Per has mortalis aevi moras, illi meliori vitae longiorque proluditur. Quemadmodum novem mensibus nos tenet maternus uterus, et prae parat non sibi sed illi loco in quem videmur emitti, jam idonei spiritum trahere, et in aperto durare; sic per hoc spatium, quod ab infantia patet in senectutem, in alium maturescimus partum. Alia origo nos expectat, alius rerum status. Nondum coelum nisi ex intervallo pati possumus. Quicquid circa te jacet rerum, tanquam hospitalis loci sarcinas spectata transeundum est. Excutit redeuntem natura, sicut intrantem. Dies iste, quem tanquam extremum reformidas, aeterni natalis est."^a

The day which we falsely dread as our last, is indeed the day of our better nativity. We are maturing on earth for heaven; and even on earth, in those noble studies which seem so little proportioned to the wants of this petty scene, and suited rather to that state of freedom in which we may conceive our spirit to exist when delivered from those bodily fetters which confine it to so small a part of this narrow globe, there are presages of the diviner delights that await us,—marks of that noble origin from which the spirit was derived. These indications of its celestial origin are beautifully compared by Heinsius, in his very pleasing poem *De Contemptu Mortis*, to the gleams of the spirit of other years with which a gallant courser, condemned to the drudgery of the plough, seems still to show that it was formed for a nobler office.

Ut cum fortis equus Pisaeae victor olivae,
Aut quem sanguineus saeva ad certamina Mavors
Deposuit, fremitusque virum, lituosque tubasque,
Nunc micro datus agricolae, pede creber inerte
Pulsat humum, patriamque domum testatur et ignem
Naribus, et curvum collo aversatur aratrum.†

The continuance of our existence, in the ages that follow the few years of our earthly life, is not to be regarded only in relation to those ages. Even in these few years which we spend on earth, comparatively insignificant as they may seem when we think at the same time of immortality, it is, to him who

truly looks forward to the immortality, as that for which human life is only a preparation, the chief source of delight, or of comfort, in occasional afflictions. If this life were indeed all, the sight of a single victim of oppression would be to us the most painful of all objects, except the sight of the oppressor himself; and though we might see sufficient proofs of goodness, to love him by whom we were made, the goodness would, at the same time, appear to us too capricious in many instances, to allow us to rest on it with the confidence which it is now so delightful to us to feel, when we think of him in whom we confide. In the sure prospect of futurity, we see that unalterable relation, with which God and virtue are for ever connected,—the victim of oppression, who is the sufferer, and scarcely the sufferer of a few moments here, is the rejoicer of endless ages; and all those little evils which otherwise would be so great to us, seem scarcely worthy even of our regret. We feel that it would be almost as absurd, or even more absurd, to lament over them and repine, as it would be to lament, if we were admitted to the most magnificent spectacle which human eyes had ever beheld, that some few of the crowd through which we passed had slightly pressed against us, on our entrance.

All now is vanish'd. Virtue sole survives
Immortal, never-falling friend to man,
His guide to happiness on high. And see,
'Tis come, the glorious morn, the second birth
Of heaven and earth. Awakening Nature hears
The new-creating word, and starts to life
In every heighten'd form, from pain and death
For ever free. The great eternal scheme,
Involving all, and in a perfect whole
Uniting, as the prospect wider spreads,
To Reason's eye refined clears up apace.
Ye vainly wise, ye blind presumptuous, now
Confounded in the dust; adore that power
And wisdom oft arraign'd: see now the cause,
Why unassuming worth in secret lived
And died neglected; why the good man's share
In life was gall and bitterness of soul;
Why the lone widow and her orphans pined
In starving solitude, while luxury
In palaces lay straining her low thought
To form unreal wants: why heaven-born truth
And moderation fair wore the red marks
Of superstition's scourge. Ye good distress'd,
Ye noble few, who here unbending stand
Beneath life's pressure, yet bear up a while,
And what your bounded view, which only saw
A little part, deem'd evil, is no more.
The storms of wintry time will quickly pass,
And one unbounded Spring encircle all ‡

LECTURE XCVIII

RETROSPECT OF THE ARGUMENT FOR THE IMMORTALITY OF THE SOUL; OF OUR DUTY TO OURSELVES.

My last two Lectures, Gentlemen, have been devoted to the very interesting inquiry

^a Seneca, *Epist. cii.*

† *Liber ii.*

‡ Thomson's *Seasons*, conclusion of Winter.

into the grounds which reason, without the aid of revelation, affords, for our belief of the immortality of the sentient and thinking principle,—of that principle which is the life of our mortal frame, but which survives the dissolution of the frame which it animated. The importance of the subject will justify, or rather demand, a short retrospect of the general argument.

It is from the dissolution of the body, that the presumption as to the complete mortality of our nature is derived; and it was therefore necessary, in the first place, to consider the force of this presumption as founded on the organic decay. If thought be only a state of those seemingly contiguous particles which we term organs, the separation of these particles may be the destruction of the thought; but if our sensations, thoughts, emotions, be states of a substance which itself exists independently of the particles, that by their juxtaposition obtain the name of organs, the separation of these particles to a greater distance from each other, (which is all the bodily change that truly takes place in death,) or even the destruction of these particles, if what we term decay, instead of being a mere form of continued existence, were absolute destruction, would not involve, though it might or might not be accompanied by the annihilation of the separate principle of thought.

The result of this primary and most important examination was, that far from being a state of any number of particles, arranged together in any form, thought cannot even be conceived by us to be a quality of number or extension; that it is of its very essence not to be divisible; and that the top or bottom of a sentiment, or the half or quarter of a truth or falsehood, or of a joy or sorrow, are at least as absurd to our conception as the loudness of the smell of a rose, or the scarlet colour of the sound of a trumpet.

An organ is not one substance, because we term it one. It is truly a multitude of bodies, the existence and qualities of each of which are independent of the existence and qualities of all the others; as truly independent as if instead of being near to each other they were removed to distances relatively as great as those of the planets, or to any other conceivable distances in the whole immensity of space. If any one were to say, the Sun has no thought, Mercury, Venus, the Earth, Mars, Jupiter, Saturn, and all their secondaries, have no thought; but the solar system has thought,—we should then scarcely hesitate a single moment in rejecting such a doctrine; because we should feel instantly that there could be no charm in the two words solar system, which are of our own invention, to confer on the separate masses of the heavenly bodies what, under

a different form of mere verbal expression, they had been declared previously not to possess. What the sun and planets have not, the solar system, which is nothing more than that sun and planets, has not; or, if so much power be ascribed to the mere invention of a term, as to suppose that we can confer by it new qualities on things, there is a realism in philosophy far more monstrous than any which prevailed in the logic of the schools.

If, then, the solar system cannot have properties which the sun and planets have not, and if this be equally true, at whatever distance near or remote they may exist in space, it is surely equally evident that an organ, which is only a name for a number of separate corpuscles, as the solar system is only a name for a number of larger masses of corpuscles,—cannot have any properties which are not possessed by the corpuscles themselves, at the very moment at which the organ as a whole is said to possess them; nor any affections as a whole, additional to the affections of the separate parts. An organ is nothing, the corpuscles to which we give that single name are all; and if a sensation be an organic state, it is a state of many corpuscles, which have no more unity than the greater number of particles in the multitudes of brains which form the sensations of all mankind. Any one of the particles in any brain has an existence as complete in itself, and as independent of the existence of the other particles of the same brain, which are a little nearer it, as of the particles of other brains, which are at a greater distance. Even though it were admitted, however, in opposition to one of the clearest truths in science, that an organ is something more than a mere name for the separate and independent bodies which it denotes, and that our various feelings are states of the sensorial organ, it must still be allowed, that, if two hundred particles existing in a certain state form a doubt, the division of these into two equal aggregates of the particles, as they exist in this state at the moment of that particular feeling, would form halves of a doubt; that all the truths of arithmetic would be predicable of each separate thought, if it were a state of a number of particles; and the truths of geometry be in like manner predicable of it, if it depended on extension and form. In short, if joy or sorrow, simple and indivisible as they are felt by us to be, be not one, but a number of corpuscles separate and divisible into an infinite number of little joys and sorrows, that may be variously arranged in spheres and parallelopipeds, any thing may, with equal probability, be said to be any thing, however apparently opposite and contradictory.

When sensation is said to be the result of organization, the vagueness of the term re-

sult throws a sort of illusive obscurity over the supposed process, and we more readily admit the assertion with the meaning which the materialist would give to it; because, however false it may be in his sense, it is true in another sense. Sensation is the result of organization,—a result, however, not in the organs themselves, but in a substance of which the Deity has so arranged the susceptibilities, as to render the variety of that class of feelings which we term sensations, the effects of certain states of the particles which compose the organ. The result, therefore, is one and simple, because the mind, that alone is susceptible of the state which we term sensation, is one and simple, though the bodily particles of the state of which the one sensation is the result are many. A sound, for example, is one, because it is an affection of the mind which has no parts, and must always be one in all its states, though the mental affection may have required, before it could take place, innumerable motions of innumerable vibratory particles, which have no unity but in their joint relation to the mind, that considers them as one, and is affected by their concurring vibrations. In like manner, in the phenomena of chemical agency to which the phenomena of thought and feeling, as simple results, are by the materialists most strangely asserted to be analogous, it surely requires no very subtle discernment to perceive, that, though we may speak of the result of certain mixtures, as if the result were one of simple combustion, deflagration, solution, precipitation, and the various other terms which are used to denote chemical changes, it is in the single word alone, that all the unity of the complex phenomenon is to be found,—that the solution of salt in water, or the combustion of charcoal in atmospheric air, expresses not one fact, but as many separate facts as there are separate particles dissolved or burnt;—that the unity, in short, is not in the chemical phenomena as facts, but in the mind, and only in the mind, which considers all these facts together; and that the mere words combustion and solution either signify nothing, or signify states of innumerable particles, which are not the less innumerable because they are comprehended in a single word.

Sensation, then, which is not more truly felt by us in any case, as a pleasure or a pain, than it is felt to be one and incapable of division, is not a state of many particles, which would be as many separate selves, without any connecting principle that could give them unity, but a state of a single substance, which we term mind, when we speak of it generally, or self, when we speak of it with reference to its own peculiar series of feelings.

There is mind, then, as well as matter, or rather, if there be a difference of the degrees

of evidence, there is mind, more surely than there is matter; and if at death not a single atom of the body perishes, but that which we term dissolution, decay, putrefaction, is only a change of the relative positions of those atoms, which in themselves continue to exist with all the qualities which they before possessed, there is surely no reason, from this mere change of place of the atoms that formed the body, to infer, with respect to the independent mind, any other change than that of its mere relation to those separated atoms. The continued subsistence of every thing corporeal cannot, at least, be regarded as indicative of the annihilation of the other substance, but must, on the contrary, as far as the mere analogy of the body is of any weight, be regarded as a presumption in favour of the continued subsistence of the mind, when there is nothing around it which has perished, and nothing even which has perished, in the whole material universe, since the universe itself was called into being.

The Deity, however, though he have not chosen to annihilate a single atom of matter, since he created the world, may, it will be admitted, have chosen to annihilate every spiritual substance. But with the strong analogy of matter, which is the only substance that is capable of being perceived by us, in favour of the continued existence of the mind, it would be necessary, for the proof of the supposed spiritual mortality, to show some reason which may be believed to have influenced the Supreme Being to this exclusive annihilation. The asserter of the soul's immortality,—if the existence of the soul as a separate substance be previously demonstrated,—has not so much to assign reasons for the belief of its immortality, as to obviate objections which may be urged against that belief. At the moment of death, there exists the spirit; there exist also the corporeal atoms. At that moment, the Deity allows every atom to subsist as before. The spirit, too, if he do not annihilate it, will subsist as before. If we suppose him to annihilate it, we must suppose him to have some reason for annihilating it. Is any such reason imaginable, either in the nature of the spirit itself, or in the character of the Deity?

Instead of any such reason for annihilation, that might be supposed to justify the assertion of it, we found, on the contrary, reasons which might of themselves lead us to expect the continued existence, far more probably than the destruction of the soul. If the Deity will, as it is evident from the whole frame of our minds that he most truly wills, the progress of mankind, he must will the progress of the individuals of mankind; since mankind is but a name for the individuals who compose it; and if he will the

progress of individuals, there can be no reason that he should love that progress less, when the individual is capable of making greater advances, and that, merely on account of that greater capacity, he should destroy what he sustained with so much care for that partial progress which he now delights to suspend. In the state of the spirit, then, at the moment of death, there is nothing which seems to mark it out for exclusive annihilation.

Are we to find a reason for this, then, in the character of the Deity himself? On the contrary, would not his annihilation of the soul, when every motive for continuing its existence, as far as we may presume to think of the motives of the Deity, in accordance with the general design exhibited by him, in the more obvious appearances of the universe, seems rather stronger than weaker, imply a sort of capricious inconsistency in the divine character which the beautiful regularity of his government of the world leaves us no room to infer? Nay more, may we not almost venture to say, that a future state of retribution is revealed to us in those divine perfections which the universe so manifestly exhibits, and in those moral feelings which are ever present to our heart? Every seeming irregularity in the sufferings of the good, and in the unequal distributions of happiness, admits, in this way, of being reconciled with those high moral perfections which the voice of conscience within us, by its uniform approbation of virtue and disapprobation of vice, proclaims to belong to him who has made it a part of our very nature, thus to condemn and approve. The temporary inequalities are, in the mean time, evidently of moral advantage. But still, these supposed irregularities of suffering and enjoyment, though in the highest degree useful, as we found, for the production and fostering of virtue, and of all the delights of conscience which may attend the virtuous through immortality, and therefore justly a part of the benevolent dispensations of God on earth, are reconcilable with his moral perfections, only by the immortality of the spirit, which, after suffering what virtue can suffer for a few years of life, may rejoice for ever in the presence of that God, in devout submission to whose will, what the world counted suffering was scarcely what required an act of fortitude to endure it.

In whatever light then, at the moment of death, we consider either the soul itself or its Creator, we discover reasons rather of continuing its existence than of annihilating it. The evidence of this sort may be strong, or it may be weak; but, weak or strong, it is at least favourable to the affirmative side of the question. We have not merely then the powerful presumption, for the continued existence of the spirit, which arises from the

continuance, even in what we term decay, of every thing corporeal; but we have, to strengthen this presumption still more, every argument which can be drawn from our knowledge of the divine character, to which alone we are to look for the evidence of his intention to annihilate or preserve, as we have seen, from the inadequacy of mere matter to account for the phenomena of thought. If there be a spiritual substance existing at the moment of death, which would continue to subsist but for the divine will, which alone can annihilate, as it alone can create, we find not merely that it is impossible to assign any positive reason, which may be supposed to influence the Deity to annihilate what he had formed, but that there are positive reasons which might lead us to expect his continued preservation of it. We have, in short, for the immortality of the soul, from the mere light of nature, I will not say evidence that is demonstrative and irresistible, for that was left to be revealed to us by a more cloudless light, but at least as strong a combination of presumptive evidence, negative and positive, as we can imagine such a subject, in the obscurity of human reason, to possess.

The objections sometimes urged against the immortality of the thinking principle, from the influence of disease, or of age, which is indeed itself a species of disease, but an incurable one, on the mental faculties, are of no force when urged against the system of those who admit the existence both of matter and mind, and the connexion which the Deity has in so many relations established, of our bodily and mental part. Our sensations are as much states of the mind, as any other of our mental affections. That the slightest puncture of our cuticle by the point of a pin, or the application of a few acrid particles to our nostrils, should alter completely, for the time, the state of the thinking principle, might as well be urged in disproof of the immortality of the soul, as the same sort of connexion of mind and body which the imbecility of disease exhibits. If the nervous system were to continue long, in precisely the same state as that which is produced by the puncture of a pin, it is evident that the mind would be as little capable of reflection as in dotage or madness; and in dotage or madness, the nervous system is not disordered for a few moments, but continues to exist in a certain state for a length of time, with which, of course, during that length of time, the state of the mind continues to correspond. If the momentary nervous affection arising from the puncture, then, be no proof of the soul's mortality, and prove only its susceptibility of being affected by the body to which its Creator has united it, I do not see how the more lasting influence of the more lasting

nervous affection can be a proof of any thing more. "Suppose a person," says Cicero, "to have been educated from infancy in a chamber, in which he could see objects only through a small chink in the window-shutter, would he not be apt to consider this chink as essential to his vision, and would it not be difficult to persuade him, that his prospect would be enlarged by the demolition of the walls of his temporary prison?" In such a case as that which Cicero has supposed, if the analogy may be extended to the present objection, it is evident, at least, that, if the aperture were closed for years, or if the light transmitted through it, for the same length of time, were merely altered in tint, by the interposition of some coloured transparent body, these changes would as little imply any blindness or defect of vision, as if the darkening or tinging of the light in its passage through the aperture had occurred only for a few moments. The longest continued disorder of the nervous system then, I repeat, whatever corresponding mental affections it may induce, proves nothing more with respect either to the mortality or the immortality of the sentient and thinking principle, than the shorter affection of the nerves and brain, which is followed in any of our momentary sensations by its corresponding mental change. If the mind were, during our earthly existence, absolutely independent of the body during its union with it, it would indeed be wonderful that any bodily disease should be found to affect it; but if it have susceptibilities of affection that are, in many respects, accommodated to certain states of the bodily organs, the real wonder would be, if a disordered state of the bodily organs were not followed by any corresponding change in the state or affections of the mind.

The result of this long disquisition will, I hope, be a deeper conviction in your minds of the force of the evidence, which even human reason affords, of the great truth for which I have contended. "*Quicquid est illud, quod sentit, quod sapit, quod vult, quod viget, coeleste et divinum est,*" says Cicero, "*ob eamque rem aeternum sit necesse est.*" It is of celestial origin, he says, because in its remembrance of the past, and foresight of the future, and wide comprehension of the present, there are characters of the divinity, which nothing that is of the gross mixture of earth can partake.

"*Hinc sese*" says the author of one of the noblest modern Latin poems on this noble subject, *De Immortalitate Animi*,

*Hinc sese in vita supra sortemque situmque
Evehit humanum; nunc coelo devocat astra,
Intima nunc terrae reserat penetralia victrix;
Quaque oculos fugiunt tenuissima corpora promit
In lucem, panditque novi miracula mundi.
Equid enim per se pollet magis, aut magis haustus
Indicat aethereo, genus et divinitus ortum?
Atque adeo dum corporis stant foedera nexus,*

*Exit saepe foras tamen, effugioque parat se;
Ac veluti terrarum hospes, non incola, sursum
Fertur, et ad patrios gessit remeare penates.**

After these observations on the doctrines of natural theology, with respect to the being and perfections of God, the services of duty which it is not so much the obligation as it is the privilege and highest glory of our nature to pay, in the devotion of our heart, to a Being so transcendent, and the prospect of that immortal existence in which, after the scene of earthly things is closed upon our view, we are still to continue under the guardianship of the same provident goodness which sustained us during the years that are termed by us our life, as if exclusively constituting it, though they are only the infancy as it were, or the first few moments of a life that is everlasting; I return now to the only subdivision of our moral conduct which remained to be considered by us, that which relates immediately to our own welfare, the duty, as it has been termed, which we owe to ourselves. The phrase is not a very happy one; but it is sufficiently expressive of that direct relation to self, which is all that is meant to be understood in the conduct to which the phrase is applied. The consideration of this, you will remember, I postponed, till we had considered those doctrines of religion to which, in their relation to our happiness, and in a great measure to our virtue also, this part of our moral conduct particularly refers.

Our duty to ourselves, to retain then the common form of expression, may be considered in two lights, as it relates to the cultivation of our moral excellence, and to the cultivation of our happiness, in the sense in which that term is commonly understood, as significant of continued enjoyment, whatever the source of the enjoyment may be. It may be thought, indeed, that these two views exactly coincide; but though it is certain that even on earth they usually coincide, and must coincide still more exactly when our immortal existence is considered, they are yet, in reference to our will or moral choice, distinct objects. We will to be virtuous, not because virtue is productive of most happiness, and is recognised by us as its purest and most permanent source, but without any view at the moment to that happiness, and simply with a view to the moral excellence, without which we should feel ourselves unworthy, not of happiness merely, which we value much, but of our own self-esteem and of the approbation of God, which we value more. The attachment of happiness to the fulfilment of duty, arises only from the gratuitous goodness of Heaven. The same benevolent Being who has made it delightful to us to give and to

have given relief, has placed in our bosom a principle of compassion that is of earlier operation; by which we hasten to relieve, and have already perhaps given the relief, before we have paused to think of the delight which the generous feel. It is the same in our contemplation of every duty. We have already desired to be what we can esteem, before we have thought of any thing more in the particular case, than of the duty and of the esteem itself. The happiness may, indeed, follow the desire of moral excellence, but the happiness was not the object of thought at the very moment when the moral excellence was desired. He who counts only the pleasure which the offices of virtue are to yield, and who acts as virtue orders therefore, only because vice does not offer to her followers so rich a salary, is unworthy, I will not say merely of being a follower of virtue, but even of that pleasure which virtue truly gives only to those who think less of the pleasure than of the duty which the pleasure attends. "What calculation," says Seneca, "is so basely sordid as that which computes the price at which it may be advantageous to be a good man?—*Inveniuntur qui honesta in mercedem colant, quibusque non placet virtus gratuita; quae nihil habet in se magnificum, si quidquam venale. Quid enim est turpius, quam aliquem computare, quanti vir bonus sit?*"*

The duty which consists in the desire of rendering ourselves morally more excellent, and the cultivation, accordingly, of all those affections which render us more benevolent to others, and more firm in that heroic self-command which rests alike the influence of pleasure and of pain, is then, in its direct object, different from that other branch of the duty to ourselves which regards our happiness as its immediate end. It is unnecessary, however, to enlarge on the former of these, since the desire of our moral excellence is the desire of excellence in all those virtues which have been already under our review. It would be needless, therefore, to repeat, in any minute detail, with respect to the mere desire of cultivating these virtues, remarks which have been anticipated in treating of the virtues themselves. The only observations which it is still of importance to make, relate to the effect which every separate breach of duty may have in lessening the tendency to virtue, and, consequently, in derogating from the general excellence of the moral character. It thus acquires a sort of double delinquency; first, as a breach of some particular duty; and, secondly, as an additional breach of that duty, which should lead us to confirm our moral excellence as much as possible, by every act of virtue which the circumstances of our si-

tuation will allow us to perform; and, at least, by abstinence from vice, in situations in which no opportunity of positive virtue is allowed to us.

It is this relation of present actions to the future character, indeed, which forms, to the reflecting mind, the chief element in its moral consideration of far the greater part of human conduct,—of all that part of it which comprehends the little actions of ordinary life. It is but rarely that we are assailed with temptations to great evil; and when we are so assailed, the evil itself, and the seductive circumstances that would tempt us to it, are too prominent and powerful not to absorb the whole attention of the mind, distracting it in a sort of conflict, or hurrying it along, according to the force of the moral hatred of guilt that overcomes or is overcome. In such cases, then, we think of the present, and scarcely of more than of the present. But how few are the cases of this kind, and how much more frequently are we called to the performance of actions in which, if the circumstances of the particular moment alone be considered, the virtue has little merit, or the vice little delinquency. It is of many such little delinquencies, however, that the guilt is ultimately formed, which is afterwards to excite the indignant wrath of every breast, except of that one in which the horrors of remorse, stilled, perhaps, in the dreadful moments of active iniquity, are all that is to be felt in the still more dreadful intervals from crime to crime. It is not of base perfidy then, nor of atrocious cruelty, that it is necessary to bid the ingenuous mind beware, but of offences, in which that ingenuous mind, untaught as yet to discern the future in the present, sees only the little frailties that, as proofs of a common nature, are pitied by those who contemplate them, rather than condemned; and attract, perhaps, in this very pity, an interest which is more akin to love than to hate. It is in these circumstances only, or at least chiefly in these circumstances, that the moral character is in peril. There is not a guilty passion from which the heart would not shrink, if that passion were to present itself instantly, with its own dreadful aspect. But while the pleasures and the less hideous forms of vice mingle together, in what may almost be termed the sport or pastime of human life, we pass readily and heedlessly from one to the other, till we learn at last to look on the passion, when it introduces itself among the playful band, only as we gaze on some fierce masquer in a pageant that assumes features of darker ferocity only to delight us the more, or which we approach at least with as little apprehension as if it were the gentle form of virtue herself that was smiling on us. It is from the beginnings of vice that we are to be sav-

* De Beneficiis, lib. iv. cap. i.

ed then, if we are to be saved from vice itself. Were it given to us to picture the future, as we can paint what is before our eyes; and could we show to the boy, as he returns blooming and scarcely fatigued, from the race or other active game in which he has been contending with his playmates, some form of feeble age, the few gray hairs, the wrinkled front, the dim eye, the withered cheek, the wasted limbs, that cannot bear, without additional support, even that thin frame which bends over them to the earth that is soon to receive all that is not yet wholly dead and consumed in the half-living skeleton; could we say to him, as he gazes almost with terror on this mixed semblance of death and life, the form on which you are now looking is your own, how incredulous would be his little heart to our prophetic intimation! It would seem to him scarcely possible that any number of years should convert what he then felt and saw in his own vigorous frame, into that scarcely breathing thing of feebleness and misery, which, when a few of those years had passed over him, he was truly to become. It would be the same with the moral futurity as with that of the mere animal being. Could we foresee and exhibit, in like manner, the future heart; could we show to him who has dormant passions, that have not yet been awakened by any temptation, and who is, therefore, full of the confidence of virtue,—to him who loves, perhaps, the happiness of others, which has never interfered with his own, and is eager, therefore, to confer on them all those enjoyments which cost no sacrifice of enjoyment on his part; to such a mind, and, in some cases, even to a mind far nobler, could we present the moral picture of some deceiver, and plunderer, and oppressor, some reveller in the luxury of riches fraudulently usurped, and even of the scanty rapine of poverty itself, that had still something which could be torn from it by exactions, which it was too friendless to know how to resist, and, in presenting this picture, could we say, the guilt at which you shudder, is the guilt of the very bosom that is shrinking from it with indignation, how difficult would it be, or rather how impossible, to convince the criminal of other years, of his own horrible identity with all the villainies which he loathed. Yet there can be no question that there are cases in which the moral progression is as regular, from innocence to mature and hoary iniquity, as the mere corporeal progress, from the beauty and muscular alacrity of youth, to the weakness and pale and withered emaciation of age.

It is the knowledge of this fatal progression then, from less to greater vice, which far more than doubles the obligation of abstaining from those slight immoralities, which might seem trifling if it were not for

this progressive tendency. No evil is slight which prepares the heart for greater evil. The highest duty which we owe to ourselves, is to strengthen, as much as it is in our power to strengthen, every disposition which constitutes or forms a part of moral excellence; and we err against this high duty, and prepare ourselves for erring against every other duty, as often as we yield to a single seduction, whether it be to do what is positively unworthy, or to abstain from the humblest act of virtue which our duty calls to us to perform. In yielding once to any vicious desire, we lose much more than the virtue of a single moment; for while the desire, whatever it may be, is increased by indulgence, the mere remembrance that we have once yielded, is to us almost like a licence to yield again. The second error seems to save us from the pain of thinking, that the temptation which we before suffered to vanquish our feeble virtue, was one which even that feeble virtue was capable of overcoming; and our present weakness is to us as it were a sort of indistinct and secret justification of the past.

The virtuous man then, who loves as he should love the noble consciousness of virtue, and who feels, therefore, that no gain of mere sensual pleasure or worldly honour would be cheaply purchased by a sacrifice of moral excellence, will think often, when such a purchase might be made by a sacrifice so slight, that to others it might seem scarcely a diminution of virtue, rather of the whole moral excellence which he endangers, than of the little portion of it with which he is called to part. He will not say within himself, how inconsiderable and how venial would be this error; but, to what crimes may this single error lead! He will thus be saved from the common temptations, by which minds less accustomed to a sage foresight are at first gently led where they gladly consent to go, and afterwards hurried along where it is misery to follow, by a force which they cannot resist,—by a force which seemed to them at first the light touch of the gentle hand of a grace or a pleasure, but which has expanded progressively at every step, till it has become the grasp of a giant's arm.

The duty that is exercised in resisting the solicitations of evils that can scarcely be said to be yet vices, though they are soon to become vices, and are as yet, to our unreflecting thought, only forms of gaiety and social kindness, is truly one of the most important duties of self-command. It is not the endurance of pain, that is the hardest trial to which fortitude can be exposed; it is the calm endurance, if I may so term it, of the very smiles of pleasure herself,—an endurance that is easy only to the noble love of future as well as present virtue, that can resist what it is delightful to crowds to do, as it resists the less terrible forms of evil, from

which every individual of the crowd would shrink ; and the courage of those who have strength only to resist what is commonly termed fear, is a courage that is scarcely worthy of the name,—as little worthy of it as the partial courage of the soldier on his own element, if on a different element he were to tremble when exposed to a shipwreck ; or of the seaman, if he were in like manner to tremble at any of the common perils to which life can be exposed on land. The most strenuous combatants in the tumult of warfares, may be cowards, or worse than cowards, in the calm moral fight.

They yield to pleasure, though they danger brave,
And show no fortitude but in the field.

His is the only genuine strength of heart, who resists not the force of a few fears only, to which even in the eyes of the world it is ignominious for man to yield ; but the force of every temptation, to which it would be unworthy of man to yield, even though the world, in its capricious allotments of honour and shame, might not have chosen to regard with ignominy that peculiar species of cowardice.

By pleasure unsubdued, unbroke by pain,
He shares in that Omnipotence he trusts ;
All-bearing, all-attempting, till he falls ;
And, when he falls, writes *Vici* on his shield.*

The duty which we owe to ourselves, as it leads us to value our own moral purity, leads us then to resist the solicitation of pleasures that would debase us, as it leads us to endure pain itself. To endure pain is however in like manner a part of this duty, not merely from those high motives that have been already considered by us, the motives of grateful submission, which are drawn from the contemplation of the moral government of the world, by that wisdom and goodness under whose gracious dispensation the capacity of suffering itself has been arranged, so as to minister to the highest purposes which supreme benevolence could have in view, but also from the subordinate motives that regard only ourselves. To be querulously impatient, is but to add another evil, that might be avoided, to evil that already exists, and at the same time to throw from us one of the most powerful consolations which even that amount of existing evil admitted,—the consolation of knowing that we are able to bear what it is virtue to bear, and of trusting that we shall be able in like manner to endure, without repining, whatever other ills it may be our mortal allotment to encounter, and our duty to overcome, in the only way in which such ills can be overcome, by the patience that sustains them. By yielding to habits of cowardly discontent, we continually

lessen more and more that internal vigour which might save us from the miserable cowardice that makes almost every act of virtue a painful effort, till we become at last the moral slaves of every physical evil, and therefore of every human being who is capable of inflicting on us any one of those ills. He never can be the master of his own resolutions, who does not know how to endure what it may be impossible to avoid without the sacrifice of virtue. When we hear of the usurper and oppressor of Roman liberty, who, when a whole world was prostrate before him, had subdued every thing but the inflexible spirit of a single heroic scorner of slavery, and of the inflicter of slavery,

Et cuncta terrarum subacta,
Praeter atrocem animum Catonis—†

we do not need to be told, that he who could thus dare to offer to liberty its last homage, was not one whom mere suffering could appal.

Iustum et tenacem propositi virum
Non civium ardor prava jubentium,
Non vultus instantis tyranni
Mente quatis solida :—neque Auster,
Dux iniqui turbidus Adriæ,
Nec fulminantis magna Jovis manus.
Si fractus illabatur orbis,
Impavidum ferient ruinae.‡

LECTURE XCIX.

OF OUR DUTY TO OURSELVES.

In my last Lecture, Gentlemen, I began the consideration of that minor species of moral obligation which constitutes the propriety of certain actions, considered merely as terminating in the individual who performs them,—the duty, as it has been termed, which we owe to ourselves.

This duty I represented as having two great objects ; in the first place, the moral excellence of the individuals, and in the second place, his happiness when any enjoyment, or the acquisition of the means of future enjoyment, is not inconsistent with that moral excellence, the cultivation of which is, in every case, even with respect to the mere personal duty, of primary obligation.

In my last Lecture, accordingly, I considered the former of these divisions of our duty to ourselves—illustrating especially the relation which a single action may bear to the whole moral character in after-life, by the increased tendency which it induces to a repetition of it, and a corresponding diminution of the abhorrence with which the action, if vicious, was previously viewed ; and, en-

* Night Thoughts, Night viii.

† Horat. Carm. lib. ii. ode 1.
‡ Id. lib. iii. ode iii.

deavouring, therefore, to impress you strongly with the importance of habits of self-command, by which alone, as enabling us to resist alike the gayer seductions of luxury, and the terror of personal suffering, we may be masters of our own moral resolutions, in circumstances in which vice might seem attended only with present pleasure, and virtue only with present pain.

After considering that division, then, which regards the cultivation of our moral excellence, I proceed now to consider the other branch of our duty to ourselves, of which our happiness is the immediate object.

When happiness is to be attained without the breach of any duty, it becomes a positive duty to pursue it; as, in like manner, though no other duty were to be violated than that which we owe to ourselves, it would still be a violation of this duty to act in such a manner as to lessen our own happiness, or to occasion to ourselves actual distress. It is a virtue, in short, to be prudent, a vice to be imprudent; or if prudence and imprudence should be considered as implying rather the knowledge or the ignorance of actions that may be advantageous to us or hurtful, than the performance of actions which we know to be advantageous to us or hurtful,—it is a virtue to act in such a manner as seems to us most prudent, a vice to act in such a manner as seems to us imprudent.

That there is not merely a satisfaction or regret, as at some piece of good or bad fortune, but a moral duty observed or violated, in these cases, is evident from the conscience of the agent himself, and from the feelings of those who contemplate his action. He who suffers from acting in a manner which he had reason to consider as imprudent, feels that he is justly punished; and all who consider his action and its consequences, agree in this reference of demerit to the agent, and in the feeling of propriety in the punishment which he has received, or rather, which he may be said to have inflicted on himself. Nor can we wonder that the Deity, who willed the happiness of his creatures, and who made virtue, upon the whole, the most efficacious mode of contributing even to happiness in this life, should have made the wilful neglect of that which was in so many important respects the great object of moral feeling, an object itself of a species of moral disapprobation. If every individual of mankind were in every respect perfectly careless of his own happiness, every individual of mankind would be unhappy; and mere imprudence, if universal, would thus have the same injurious consequences as the universal oppression of all by all. From the harmony which the Deity has pre-established of virtue and utility, that conduct alone can be

most virtuous, which, if universally adopted, would contribute most to the good of the universe; and the imprudent, therefore, are, to the extent of their wilful violation of the happiness of one individual, violators of the universal system of good.

Our own happiness, then, is a moral object, as the happiness of others is a moral object. There is much more reason, however, upon the whole, to fear that individuals will be neglectful of the happiness of others rather than of their own, when opportunities of furthering either may have occurred to them; since, with respect to each personally, his own desire of pleasure, and consequently of all the means of pleasure, may be considered as so powerful as scarcely to require the aid of any mere feeling of moral duty, to call on him to be prudent. It is accordant, therefore, with the gracious benevolence of the Power who has arranged our susceptibilities of feeling, in relation to the circumstances in which we are placed, that the sentiment of moral obligation should there be strongest, where the additional influence is most needed; and that, while it is of our own happiness we are, at least in ordinary circumstances, most desirous, it should yet seem to us, in the very privacy of our own conscience, a greater moral delinquency to invade any enjoyment possessed by another, than to sacrifice, by any rash folly, the means of similar enjoyment possessed by ourselves.

It is still, however, more than mere regret which we feel on considering any such imprudent sacrifice. There is truly a feeling of moral disapprobation—a feeling that in thus injuring the happiness of one individual of mankind, we have violated a part of the general system of duty, which in the actions that relate to himself only, as well as in the actions which relate directly to others, a wise and virtuous man should have constantly before him for the direction of his conduct.

It is morally fit, then, that every individual should endeavour to acquire and preserve the means of happiness, when the happiness is to be acquired or preserved without the breach of any of the duties of still stronger obligation which he may owe to communities or to other individuals.

But if the acquisition of happiness be his duty, in what manner is he to seek it? that is to say, in what objects is he to hope to find it?

O Happiness! our being's end and aim!
Good, pleasure, ease, content, whatever thy name!
That something still which prompts th' eternal sigh,
For which we bear to live, or dare to die!
Which still so near us, yet beyond us lies,
O'erlook'd, seen double, by the fool and wise.
Plant of celestial seed! if drop below,
Say, in what mortal soil thou deign'st to grow?
Fair op'ning to some court's propitious shine,
Or deep with diamonds in the flaming mine;

Twin'd with the wreaths Parnassian laurels yield,
 Or reap'd in Iron harvests of the field?
 Where grows? where grows it not? If vain our toll,
 We ought to blame the culture, not the soil;
 Fix'd no spot is happiness sincere,
 'Tis nowhere to be found, or everywhere.*

Happiness, considered as mere happiness, may be defined to be, a state of continued agreeable feeling, differing from what is commonly termed pleasure only as a whole differs from a part. Pleasure may be momentary; but to the pleasure of a moment we do not, at least in common language, give the name of happiness, which implies some degree of permanence in the pleasure.

As happiness, however, is only a more lasting state of pleasure or agreeable feeling, it is evident that every object, the remembrance, or possession, or hope of which is agreeable, is a source of happiness; one of many sources, because there are innumerable objects which, as remembered, possessed, or hoped, are agreeable. Some of these may indeed exclude others, and the objects excluded may be sources of purer or more lasting pleasure, which it would be imprudent therefore to abandon for a less good. But all are still sources of happiness, if happiness be agreeable feeling; and the only moral question relates to the choice.

It is evident too, that this choice of happiness, as far as it depends on the intensity and duration of enjoyment, must be various in its objects in different individuals, according to their original constitution, education, habits, rank in life, or whatever else may be conceived to modify the desires of mankind. The saving of a few guineas, which, to the greater number, of the rich at least, would afford no gratification, may be a source of very great delight to those whose circumstances of humbler fortune condemn them to be necessarily frugal; or even to the possessor of many thousand acres, if he have the misfortune to be a miser. With every variety of taste, in whatever manner induced, there is a corresponding happiness of possession; a gem, a painting, a medal, which many would rank with the mere baubles of a toyshop, are treasures to a few. The loss of a single book of difficult acquisition, which may be a serious evil to a man of letters, is scarce felt as a loss by one who sees books before him, as mere pieces of gay and gilded furniture, without the slightest desire of opening them, and whose library is perhaps the only room of his house which he never thinks of entering, or which he uses at least only for such purposes as any other room, with any other furniture, might serve as well. What is true of these sources of enjoyment, is true of every object of desire which some value much, while others perhaps regard it

as insignificant, or at least regard it as comparatively of far less value. In thinking of what is to give delight, we must think at least as much of the mind that is to be delighted, as of the object we may choose to term delightful. There are, probably, not two individuals to whom the acquisition of exactly the same objects would afford exactly the same quantity of happiness; and in a question of mere happiness, therefore, without regard to duty, it is as absurd to inquire into one universal standard, as to think of discovering one universal stature, or universal form of the infinitely varied features of mankind.

This inquiry, however, into one sole and exclusive standard of happiness, which seems so absurd when we consider the ever-varying tastes and fancies of mankind, was the great inquiry of the ancient philosophers. Happiness was to them not so much a generic name of many agreeable feelings, as a sort of universal *a parte rei*,—something which was one and simple, or which at least excluded any great diversity of the objects that corresponded with it. Instead, therefore, of sage calculations on the comparative amount of pleasure, which different classes of objects might be expected to afford to the greater number of mankind, they have left to us a bold assertion of one species of happiness, as if it were the sole,—and many vain refinements, by which they would endeavour to reduce to it every other form of delight, and where they could not so reduce them, to disprove the existence of enjoyments so obstinately unaccommodating; of enjoyments, however, as real and as independent in themselves, as that for the sole existence of which they contended.

The two principal sects opposed to each other in this inquiry into happiness, were the followers of Epicurus and Zeno; the former of whom regarded sensual pleasure as primarily the only real good, and every thing that was not directly sensual, as valuable only in relation to it; while the other sect contended, that there was no good whatever but in rectitude of conduct; that, but for this rectitude of choice, pleasure was not a good, pain not an evil.

The slightest consideration of the nature of the mind, as susceptible of various species of enjoyment, might seem sufficient to disprove the doctrine of both these rival sects. That our chief happiness, the happiness of far the greatest portion of our life, has no direct reference to the senses, is abundantly evident, and is admitted even by Epicurus himself; though he would still labour vainly to refer them remotely to that source; and, though the virtues and intellectual acquirements which adorn our nature infinitely more than any superior quickness of sensation, may be so traced through all their conse-

* Essay on Man, Ep. iv. v. 1—16.

quences, as to be found ultimately to contribute to the amount even of the pleasures of the senses, this influence on the senses is certainly the least part of their influence on happiness. The love of the parent for the child, of the child for the parent, all the delightful charities which render home a scene of perpetual joy, and which extend themselves beyond the domestic roof, with so wide a growth of affection; the sublime or tender remembrances of virtue; or in mere science, the luxury of truth itself, as an object of desires that may almost be said to be intellectual passions; the pleasure of the astronomer, in contemplating those seeming sparks of light, which to his senses are truly mere sparks of light, and which are magnificent orbs only to the intellect that comprehends and measures their amplitude; the pleasure of the mathematician, in tracing relations of forms which his senses are absolutely incapable of presenting to him; of the poet, in describing scenes of beauty which his eyes never are to see;—all these pleasures, intellectual and moral, are pleasures, whether they tend or do not tend to heighten mere sensual enjoyment; and if nothing were to be left of them but this influence on the senses, human life would scarcely be worthy even of the brutal appetites that might still strive to find on earth the objects of their grovelling and languid and weary desire.

So false, then, even as a mere physical exposition of happiness, is the system of Epicurus. But if his philosophy err more grossly, the philosophy of the Stoical school, though it err more sublimely, is still but a sublimer error. The moral excellence of man is unquestionably what Zeno and his followers maintained it to be, a devout submission to the will of the Supreme Being, by the exercise of those virtues for which every state in which we can be placed, allows an opportunity of exercise. It never can be according to the real excellence of his nature to act viciously, nor a violation of his real excellence to act virtuously; but though all pleasure which is inconsistent with virtue is to be avoided, the pleasure which is consistent with virtue is to be valued, not merely as being that which attends virtue, but as being happiness, or at least an element of happiness. Between mere pleasure and mere virtue, there is a competition, in short, of the less with the greater; but though virtue be the greater, and the greater in every case in which it can be opposed to mere pleasure, pleasure is still good in itself, and would be covetable by the virtuous in every case in which the greater good of virtue is not inconsistent with it. Pain is, in like manner, an evil in itself; though to bear pain without a murmur, or without even any inward murmurs, be a good,—a good depend-

ent on ourselves, which it is in our power to add at any moment to the mere physical ill that does not depend on us, and a good more valuable than the pain in itself is evil.

It is, indeed, because pleasure and pain are not in themselves absolutely indifferent, that man is virtuous in resisting the solicitations of the one, and the threats of the other; and there is thus a self-confutation in the principles of Stoicism, which it is truly astonishing that the founder of the system, or some one of the ancient and modern commentators on it, should not have discovered. We may praise, indeed, the magnanimity of him who dares to suffer every external evil which man can suffer, rather than give his conscience one guilty remembrance; but it is because there is evil to be endured, that we praise him for his magnanimity in bearing the evil; and if there be no ill to be endured, there is no magnanimity that can be called forth to endure it. The bed of roses differs from the burning bull, not merely as a square differs from a circle, or as flint differs from clay, but as that which is physically evil; and if they did not so differ, as good and evil, there could be as little merit in consenting, when virtue required the sacrifice, to suffer all the bodily pain which the instrument of torture could inflict, rather than to rest in guilty indolence on that luxurious couch of flowers, as there could be in the mere preference, for any physical purpose, of a circular to an angular form, or of the softness of clay to the hardness of flint. Moral excellence is, indeed, in every case preferable to mere physical enjoyment; and there is no enjoyment worthy of the choice of man, when virtue forbids the desire. But virtue is the superior only, not the sole power. She has imperial sway; but her sway is imperial, only because there are forms of inferior good, over which it is her glory to preside.

It was this confusion as to the distinction of moral excellence, which is one object, and of mere happiness, which is another object, that led to all the extravagant declamations of the Porch, as to the equal happiness of every situation in which man can exist. Nor is it only in their sublime defiance of pain, that the inconsistency which I have pointed out is involved; it is involved equally in the scale of preferences which they present to us in our very virtues. We are to love, for example, health rather than sickness; but we are thus to love it, not because health is in itself a greater good than sickness, but only because it is the will of Heaven that we should love it more than the pain and imbecility of disease. And why do we infer it to be the will of Heaven that we should prefer health to sickness? It

is not easy to discover any reason for this inference, but the absolute good of that which is declared in itself to be neither good nor evil. If health and sickness be in themselves, without regard to the will of Heaven, absolutely indifferent, they must still continue absolutely indifferent, or we must require some divine revelation to make known to us the will which we are to obey.

It is this tacit assumption of the very circumstances denied, which forms indeed the radical fallacy of the system of Zeno; a sort of fallacy which, in the course of our inquiries, we have had frequent opportunities of tracing, in the systems of philosophers of every age. The will of the gods, as directing the choice, when there was a competition of many objects, seemed to furnish a reasonable ground of preference; a ground of preference which was felt to be the more reasonable, because every one had previously, in his own mind, felt and silently admitted those distinctions of physical good and evil which the Stoics ostensibly denied, but which corresponded exactly with the divine intimations of preferableness, that were only these very distinctions, under a more magnificent name. To obey the will of the gods, in preferring wealth to poverty, was in truth to have made the previous discovery, that wealth, as an object of desire, was preferable to poverty; and to have inferred, from this previous belief of the physical distinction, that supposed will of Heaven, which it would have been impossible to ascertain if the objects had been indifferent in themselves. If all external things were in themselves absolutely equal, then was it impossible to infer from them that divine preference on which our own was to depend; and if that divine preference could, in any way, be inferred from the physical differences of things, as essentially good and evil, then was it not to the divine intimation, as subsequently inferred, that we were to look for the source of that distinction, from which alone, as previously felt, we inferred the intimation itself.

The same erroneous notion, as to the absolute indifference with respect to mere happiness of all things external, which were not in themselves either good or evil, but as pointed out by the gods for our choice, led naturally, and, as I cannot but think, necessarily, to the strange stoical paradox of the absolute equality in merit of all virtuous actions, and the absolute equality in demerit of all vicious actions. This, indeed, with many of the other paradoxes maintained by the sect, Dr. Smith is inclined to consider as not forming a part of the system of Zeno and Cleanthes, but rather as introduced with other mere dialectic and technical subtleties, by their disciple and follower Chrysippus.

Yet I confess that, absurd as the paradox is, and discordant with all our moral feelings, it yet seems to me so completely involved in the fundamental doctrine of the school, that it must have occurred, or at least may naturally be supposed to have occurred, to the very founders of the school, as an obvious and inevitable consequence of their doctrine; and if it did so occur to them, we certainly have no reason to imagine that the assertors of so bold a paradox as that which stated the absolute physical indifference as to the happiness of rapture and agony, would be very slow of maintaining a paradox additional, if the assertion of it were necessary to the maintenance of their system. It is an error, I may remark by the way, which is not, in principle at least, confined to Stoicism, but is radically involved in all those theological systems of Ethics, which make the very essence of virtue to consist in mere obedience to the will of God. If all actions be equal, except as they are ordered or not ordered by Heaven, which makes them objects of moral choice, simply by pointing them out to us as fit or unfit to be performed; then is there only one virtue, and only one vice,—the virtue of doing as Heaven commands, the vice of not doing as Heaven commands. Whatever the action may be, there may be this moral difference, but, in the stoical or theological view of virtue and vice, there can be this difference only. To suppose that certain actions, merely by being more widely beneficial, are more obligatory than others; that certain other actions, merely by being more widely injurious, are of greater delinquency than others,—would be to suppose, in opposition to the fundamental tenet of the whole system, that what we term a benefit is a good in itself, what we term an injury an evil in itself, independently of that will which intimates to us what is fit or unfit to be done. The most beneficial action, an action that confers the greatest amount of happiness on our nearest relative, or on our most generous benefactor, is good only because it is divinely commanded; and this character of virtue it must share in common with every action, however comparatively unimportant in itself, that is so commanded; the most injurious action, of which the injury, too, may have been directed against those whom we were especially called to love, is evil only because it is divinely indicated to us as unworthy of our choice; and this character of vice it must share in common with all the actions that are marked to be evil by this prohibition, and by this prohibition only. We are astonished, indeed, that offences which we regard as trifling should be classed by the Stoics with crimes that appear to us of the most aggravated iniquity; but we are astonished only because we assume another estimate of virtue and

vice, and have not adopted their general doctrine, that virtue is mere obedience to the will of the gods, and vice disobedience to it. The paradox is repugnant, indeed, to every feeling of our heart, but still it must be allowed to be in perfect harmony with the system; as it must be allowed also to be necessarily involved in every system that reduces virtue and vice to mere obedience or disobedience to the will of Heaven.

The whole errors of the stoical system, or at least its more important errors, may be traced then, I conceive, to that radical mistake as to the nature of happiness, which we have been considering; a mistake that, if truly allowed to influence the heart, could not fail to lessen the happiness of the individual, and in some measure too, his virtue, in all the relations which personal happiness and virtue bear to private affection. If, indeed, it had been possible for human nature to feel what the Stoics maintained,—an absolute indifference as to every thing external, unless from some relation which it bore, or was imagined to bear, to the will of the Divinity, how much of all that tenderness which renders the domestic and friendly relations so delightful would have been destroyed by the mere cessation of the little pleasures and little exercises of kindness and compassion which foster the benevolent regard. It is in relation to these private affections only, however, that I conceive the stoical system to have been practically injurious to virtue, however false it may have been in mere theory, either as a physical system of the nature of man, or as a system of ethics adapted to the circumstances of his physical constitution. In every thing which terminated in the individual himself, the virtue which it recommended was what man perhaps may never be able to attain, but what it would be well for man if he could even approach; and the nearer his approach to it, the more excellent must he become. Pain is, indeed, an ill, and we must err physically whenever we pronounce that to endure this ill is not an affliction to our sensitive nature; but it would be well for us in our moral resolutions, at least in those which regard only sufferings which ourselves may have to overcome, if we could be truly what a perfect Stoic would require of us to be.

The error of the philosophy of the Porch, then, in relation to the physical ills of life, was at least an error of minds of the noblest character of moral enthusiasm. "If," says Montesquieu, "I could for a moment cease to think that I am a Christian, I could not fail to rank the destruction of the sect of Zeno in the list of the misfortunes of human kind. It was extravagant only in feelings which have in themselves a moral grandeur,—in the contempt of pleasures and afflictions. It alone knew how to make great citizens;

it alone made great men; it alone made Emperors worthy of being called great. While the Stoics regarded as nothing, riches, grandeur, pleasures, and vexations, they occupied themselves only with labouring for the happiness of others in the discharge of the various social duties. It seemed as if they regarded that holy spirit—the portion of the divinity—which they believed to be in man, as a sort of bountiful providence that was watching over the human race. Born for society, they considered it as their office thus to labour for it; and they laboured at little cost to the society which they benefited, because their reward was all within themselves: their philosophy sufficed for their happiness; or rather, the happiness of others was the only accession which could increase their own."^{*}

Hi mores, haec duri immota Catonis
Secta fuit, servare modum, finemque tenere,
Naturamque sequi, patriaeque impendere vitam;
Nec sibi, sed toti genitum se credere mundo.
Huic epulae, viciis famem: magnique penates,
Submovisse hyemem tecto: pretiosaque vestis,
Hirtam membra super Romani more Quiritis
Induxisse togam: Venerisque huic maximus usus,
Progenies: Urbi pater est, Urbique maritus:
Justitiae cultor, rigidi servator honesti.
In commune bonus: nulloque Catonis in actus
Subrepsit, partemque tulit sibi nata voluptas.†

In the peculiar circumstances of the ages in which the stoical doctrines chiefly flourished,—the servile and wretched ages in which, with that intellectual light, in a few individuals, which leads when there is virtue, to grandeur of soul, and almost leads to virtue itself,—there was everywhere around a cold and gloomy despotism, that left man only to gaze on misery, or to feel misery, if he did not strive to rise wholly above it; it is not wonderful that a philosophy which gave aid to this necessary elevation above the scene of human suffering and human ignominy, should have been the favourite philosophy of every better spirit; of all those names which, at the distance of so many centuries, we still venerate as the names of some more than mortal deliverers of mankind:

"Among the different schools," says Apollonius, in the sublime eulogy of the Emperor M. Aurelius, "among the different schools he soon discovered one which taught man to rise above himself. It discovered to him, as it were, a new world,—a world in which pleasure and pain were annihilated, where the senses had lost all their power over the soul, where poverty, riches, life, death, were nothing, and virtue existed alone. Romans! it was this philosophy which gave you Cato and Brutus. It was it which supported them in the midst of the ruins of liberty. It extended itself afterwards, and multiplied under your tyrants. It seemed as if it had be-

^{*} De l'Esprit des Loix, liv. xxiv. chap. x.
[†] Lucan! Pharsalia, lib. ii. v. 380—391.

come a want to your oppressed ancestors, whose uncertain life was incessantly under the axe of the despot. In those times of disgrace alone, it preserved the dignity of human nature. It taught to live; it taught to die; and, while tyranny was degrading the soul, it lifted it up again with more force and grandeur. This heroic philosophy was made for heroic souls. Aurelius marked as one of the most fortunate days of his life, that day of his boyhood in which he first heard of Cato. He preserved with gratitude the names of those who had made him, in like manner, acquainted with Brutus and Thraseas. He thanked the gods that he had had an opportunity of reading the maxims of Epicuretus."

That great emperor, who thus looked with veneration to others, was himself one of the noble boasts of Stoicism, and it must always be the glory of the philosophy of the Porch, that, whatever its truths and errors might be, they were truths and errors which animated the virtues and comforted the sufferings of some of the noblest of mankind.

With all the admiration, however, which it is impossible for us not to feel, of the sublimer parts of this system, it is still, as I said, founded on a false view of our nature. Man is to be considered not in one light only, but in many lights, in all of which he may be a subject of agreeable feelings, and consequently of happiness, as a series of agreeable feelings. He is a sensitive being, an intellectual being, a moral being, a religious being, and there are species of happiness that correspond with these varieties.

Though it would be unnecessary then to enter on any very minute details of all the varieties of agreeable feeling, of which happiness, as a whole, may be composed, a few slight remarks may still be added, on these chief specific relations of our happiness, sensitive, intellectual, moral and religious.

That the pleasure, which may be felt by us as sensitive beings, is not to be rejected by us as unworthy of man, I need not prove to you, after the definition of happiness which I have given you. Happiness, however, though only a series of agreeable feelings, is to be estimated not only by the intensity and duration of those agreeable feelings which compose it, but by the relations of these, as likely to produce or not to produce, to prevent or not to prevent, other series of agreeable feelings, and to cherish or repress that moral excellence which, as an object of desire, is superior even to pleasure itself. It is according to these relations chiefly that the pleasures of the senses are to be estimated. In themselves, as mere pleasures, they are good, and if they left the same ardour of generous enterprise, or of patient self-command, if they did not occupy time, which should have been employed in higher offices, and if,

in their influence on the future capacity of mere enjoyment, they did not tend to lessen or prevent happiness which would otherwise have been enjoyed, or to occasion pain which otherwise would not have arisen, and which is equivalent, or more than equivalent, to the temporary happiness afforded, it would, in these circumstances, I will admit, be impossible for man to be too much a sensualist; since pleasure, which in itself is good, is evil, only when its consequences are evil.

He who has lavished on us so many means of delight, as to make it impossible for us, in the ordinary circumstances of life, not to be sensitively happy in some greater or less degree, has not made nature so full of beauty that we should not admire it. He has not poured fragrance and music around us, and strewn with flowers the very turf on which we tread, that our heart may not rejoice as we move along, but that we may walk through this world of loveliness with the same dull eye and indifferent soul, with which we should have traversed unvaried scenes, without a colour, or an odour, or a song.

The pleasures of the senses, then, are not merely allowable, under the restrictions which I stated, but to abstain from them with no other view than because they are pleasures, would be a sort of contempt of the goodness of God, or a blasphemy against his gracious bounty, if we were to assert that such abstinence from pleasure, merely as pleasure, can be gratifying to infinite benevolence.

It is very different, however, when the solicitations of pleasure are resisted on account of those circumstances which I have mentioned as the only reasonable restrictions on enjoyment, circumstances which give to temperance its rank as one of the virtues, and as one which is far from being the humblest of the glorious band.

Even though excessive indulgence in sensual pleasures had no other evil than the pains and lessening of enjoyment to which they give occasion, this reduction of the general amount of happiness would afford an irresistible reason for curbing the sensual appetite. The headach, the languor, the long and miserable diseases of intemperance, are themselves sufficient punishments of the luxurious indulgences which produced them. But, without taking these into account, how great is the loss of simpler pleasure, of pleasure more frequently and more universally acquirable, but which the habit of seeking only violent enjoyments for an inflamed and vitiated appetite, has rendered too feeble to be felt. They do not lose little who lose only what the intemperate lose. To enjoy, perhaps, a single luxury, which, even though they were truly to enjoy it, would not be worth so costly a purchase,

they give up the capacity of innumerable delights. Though it were pleasing rather than painful to gaze for a few moments on the sun, the pleasure would surely be too dearly bought, if it were to leave the eyes for hours dazzled and incapable of enjoying the beautiful colours of that wide expanse of nature with which the same radiance, when more moderately shed, refreshes the very vision which it delights.

The influence of intemperance, in lessening the amount of general enjoyment, injurious as it is, even in this way, to a being who loves happiness, is slight, however, when compared with its more fatal injury to every virtuous habit. He who has trained his whole soul to sensual indulgences, has prepared for himself innumerable seductions from moral good, while he has, at the same time, prepared in his own heart a greater weakness of resisting those seductions. He requires too costly and cumbrous an apparatus of happiness to feel delight at the call of virtue, which may order him where he cannot be accompanied by so many superfluities, but to him necessary things; and he will learn, therefore, to consider that which would deprive him of his accustomed enjoyments, as a foe, not as a guardian or moral adviser. It is mentioned of a friend of Charles I. in the civil war of the parliament, that he had made up his mind to take horse and join the royal party, but for one circumstance, that he could not reconcile himself to the thought of being an hour or two less in bed than he had been accustomed in his quiet home; and he therefore, after duly reflecting on the impossibility of being both a good subject and a good sleeper, contented himself with remaining to enjoy his repose. Absurd as such an anecdote may seem, it states only what passes innumerable times through the silent heart of every voluptuary, in similar comparisons of the most important duties with the most petty, but habitual pleasures. How many more virtuous actions would have been performed on earth, if the performance of them had not been inconsistent with enjoyments, as insignificant in themselves as an hour of unnecessary, and perhaps hurtful slumber!

In one of the most eloquent of the ancient writers there is a striking picture of this contrast, which the virtuous and the dissolute present almost to our very senses. "*Altum quiddam est virtus, excelsum, regale, invictum, infatigabile; voluptas, humile, servile, imbecillum, caducum, cujus statio ac domicilium fornice et popinae sunt. Virtutem in templo invenies, in foro, in curia, pro muris stantem, pulverulentam, coloratam, callosas habentem manus; voluptatem latitantem saepius, ac tenebras captantem, circa balnea ac sudatoria, ac loca aedilem metuentia, mollem, enervem, mero atque un-*

guento madentem, pallidam, aut fucatam et medicamentis pollutam."*

From this tendency of excessive indulgence in mere sensual pleasure to weaken and debase the mind, and thus to expose it an easy prey to every species of evil, Epicurus, the great assertor of sensual pleasures, as the sole direct good in life, was led to maintain the importance of temperance, almost with the same appearance of rigid severity as the teachers of a very different school. In mere precepts of virtue, indeed, that is to say, in every thing practical, the schools, the most opposite to each other in their views of the nature of good, were nearly similar. Both set out from principles that might have seemed to lead them far from each other; yet both arrived at the same conclusions, on the points on which it was most important to form a judgment. It is gratifying to find the loose freedom of the most licentious system of immorality, thus forced, for its own happiness, to submit itself to the moral restraints which it seemed to boast of throwing off, and pleasure herself compelled, as it were, to pay homage to that virtue from which she vainly endeavoured to withdraw the worship of mankind.

LECTURE C.

OF OUR DUTY TO OURSELVES—CULTIVATION OF INTELLECTUAL, MORAL, AND RELIGIOUS HAPPINESS.

GENTLEMEN, the greater part of my last Lecture was occupied with an examination of the erroneous opinions as to happiness, entertained by some sects of ancient philosophers, and particularly of the doctrines of one memorable sect, whose general system, false as it was in many respects, had yet so much in it of the sublimity of virtue, and was so eminently fitted to produce or to attract to it whatever was morally great, that, when we read of any noble act of patriotism, in the ages and countries in which the system flourished, we almost take for granted that he who dared heroically, or suffered heroically, was of the distinguished number of this school of heroes.

The error of the ancient inquirers into happiness consisted, as we found, in excessive simplification—in the belief that happiness was one and simple, definite, and almost self-subsisting, like an universal essence of the schools,—in the assertion, therefore, of one peculiar form of good, as if it were all that deserved that name, and the consequent exclusion of other forms of good that could

* Seneca de Vita Beata, cap. vii.

not be reduced to the favourite species. He who had confined all happiness to the pleasure of the senses, was of course under the necessity of denying that there was any moral pleasure whatever, which had not a direct relation to some mere sensual delight; while the assertor of a different system, who had affirmed virtue only to be good, was of course under an equal necessity of denying that any pleasure of the senses, however intense or pure, could be even the slightest element of happiness. Both were right in what they admitted, wrong in what they excluded; and the paradoxes into which they were led, were necessary consequences of the excessive simplification.

A wider and more judicious view of our nature would have shown, that human happiness is as various as the functions of man; that the Deity, who has united us by so many relations to the whole living and inanimate world, has, in these relations, surrounded us with means of varied enjoyment, which it is as truly impossible for us not to partake with satisfaction, as not to behold the very scene itself, which is for ever in all its beauty before our eyes; that happiness is the name of a series of agreeable feelings, and of such a series only, and that whatever is capable of exciting agreeable feelings, is, therefore, or may be, to that extent, a source of happiness.

Man is a sensitive being, an intellectual being, a moral being, a religious being. There are agreeable feelings which belong to him in each of these capacities; a happiness, in short, sensitive, intellectual, moral, and religious; and though we may affect, in verbal accordance with some system, to deny any of these various forms of good, it is only in words that we can so deny them. As mere feelings, or phenomena of the mind, admitting of analysis and arrangement, these forms of pleasing emotion were considered by us, in former parts of the course, when their general relations to our happiness were pointed out; but as objects of moral choice they may, perhaps, still admit of a few additional practical remarks.

The remarks in my last lecture were limited to the happiness which we are capable of enjoying in the first of these capacities, as sensitive beings. I proceed then now to the happiness of which we are intellectually susceptible.

That pleasure does attend the sublime operations of intellect in the discovery of truth, or the splendid creations of fancy, or the various arts to which science and imagination are subservient, every one, I presume, will readily admit, to whom these operations are familiar. But the great masters in science and art are few, and the pleasure which they feel in their noblest inventions, therefore, would be but a slight ele-

ment in the sum of human happiness. The joy, however, is not confined to the productive functions, which have the pride of contemplating these great results as their own. It exists to all who have the humbler capacity of contemplating them merely as results of human genius. It is delightful to learn, though another may have been the discoverer; and perhaps the pleasure which a mind truly ardent for knowledge feels in those early years in which the new world of science is opened, as it were, to its view, and every step, and almost every glance, affords some new accession of admiration and power, may not be surpassed, even by the pleasure which it is afterwards to feel, when it is not to be the receiver of the wisdom of others, but itself the enlightener of the wise.

The peculiar and most prominent advantage of the intellectual pleasures, however, in relation to general happiness, regards as much what they prevent as what they afford. It is what I had before occasion to point out to you, when treating of the common causes of fretfulness of temper to which mere want of occupation leads perhaps as frequently as any positive cause. This advantage is the ready resource which these pleasures afford, in cases in which the hours would be slow and heavy without them. One of the most valuable arts of happiness, to those who are not privileged, if I may so express it, with the necessity of labour, is to know how to prepare resources that may be readily at hand, in the dreary hours that are without employment of any other kind. It is not always in the power of the idler to command the company of other idlers, with whom he may busy himself in labouring to forget that he is not busy; and, delightful as it may be for a while, it is but a weary occupation after all, to walk along the pavement or the field, and to count faces or trees, for the pleasure of being a little more, and but a very little more active, than if the same time had been spent on the same quiet seat, with folded arms, and drowsy eyelids, that have the dulness of beginning slumber, without its repose. In bad weather, and slight indisposition, when even these feeble resources are lost, the heavy burden of a day is still more insupportable to him who has nothing on which to lean, that may aid him in supporting it; and who, when an hour is at last shaken off, still sees other hours hanging over him, that are to weigh him down as drearily and heavily. In such circumstances, how much does he add to happiness, who can give the mind a resource that is ready at its very call, in almost all the circumstances in which it can be placed; and such a resource does the power of deriving pleasure from a book afford. The consolation which this yields, is indeed next in value to the consolation of virtue itself.

It would not be easy to form a conception adequate to the amount of positive pleasure enjoyed, and still more of positive pain prevented, which, in civilized life, is due to works that are perhaps of no value, but as they serve this temporary purpose of filling up the vacuities of empty days, or empty hours even of days that in part are occupied.

I need not quote to you the very beautiful passage of Cicero on this universality of the delights of literature, in youth, in old age, at home, and abroad, which has been so often quoted by every body that it must be familiar to you all. There is a beautiful passage, however, of another Roman philosopher, to the same purport, with which you are probably less acquainted, that expresses in a manner as striking the advantages of study, in the power which it gives us, not merely of occupying our hours of leisure, but of extending our existence through all the ages that have preceded us, and enjoying the communion of the noblest minds with which those ages were adorned. "*Soli omnium otiosi sunt, qui sapientiae vacant: soli vivunt. Nec enim suam tantum aetatem bene tuentur: omne aevum suo adiungunt. Quidquid annorum ante illos actum est, illis acquisitum est. Nisi ingratus sumus, illi clarissimi sacrarum opinionum conditores nobis nati sunt, nobis vitam praeparaverunt. Ad res pulcherrimas, ex tenebris ad lucem erutas, alieno labore deducimur: nullo nobis saeculo interdictum est: in omnia admittimur: et si magnitudine animi egredi humanae imbecillitatis angustias libet, multum per quod spatium temporis est. Disputare cum Socrate licet, dubitare cum Carneade, cum Epicuro quiescere, naturam cum Stoicis vincere, cum Cynicis excedere, cum rerum natura in consortium omnis aevi pariter incedere.*" "What happiness," he continues, "and how beautiful an old age awaits him who has betaken himself to the communion of those great minds; who has constantly with him those with whom he may deliberate on every thing which concerns him; whom he may consult daily as to his own moral progress, and hear truth from them without contumely, praise without adulation; to whose very similitude, by this intercourse, he may learn at last to form even his own feeble nature. We are often in the habit of complaining that our parents, and all the circumstances of our birth, are not of our choice, but of our fortune. We have it in our power, however, to be born as we please in this second birth of genius. Of the illustrious minds that have preceded us, we have only to determine to whom we wish to be allied; and we are already adopted, not

to the inheritance of his mere name, but to the nobler inheritance of every thing which he possessed."

Such, in importance, is intellectual happiness, considered merely as happiness, and such, consequently, the practical duty of cultivating it. Still more important, however, is the happiness of which we are susceptible as moral beings.

This moral happiness may be considered, practically, in two lights,—as relating to things, and as relating to persons; to the objects of our covetous desires of every sort, and to the living objects of our affections of love and hate, in all their varieties.

With respect to the former of these divisions, in the competition of the many objects that may attract us, a most important practical rule for happiness, is to give our chief consideration, so as to produce, indirectly, a corresponding tendency of desire to the advantages of those objects which are attended with least risk of disappointment, and attended, too, with fewest entanglements of necessary obsequiousness to the powerful, and enmities of competitors that, even though our pursuit should be ultimately successful, may disturb our peace, almost as much as if we had wholly failed. It is most important, then, for our general happiness, to have associated the notion of happiness itself with objects that are of easy attainment, and that depend more upon ourselves than on the accidents of fortune. If it is not easy for him who has many wishes to be tranquil, it must be still less easy for him to be happy who has many disappointments; and the ambitious man must be fortunate, indeed, who has not frequently such disappointments to encounter. Did we know nothing more of any two individuals of moderate fortune, than that they had associated the image of supreme felicity, the one with the enjoyments of benevolence and literature and domestic tranquillity, and the other with the acquisition of all the tumultuous grandeur of elevated place, could we hesitate for a moment to predict, to whose lot the greater sum of pleasure would fall, and the less of miserable solicitude? "How, indeed, can he be happy," to borrow the language of one who had many opportunities of witnessing that ambition which he so well described, "how can he be happy, who is ever weary of homage received, and who sets a value on nothing but what is refused to him? He can enjoy nothing, not his glory, for it seems to him obscure; not his station, for he thinks only of mounting to some greater height; not even his very repose, for he is wretched in proportion as he is obliged to be tranquil."

It would be well, indeed, for those who have the misfortune of thinking that happiness is only another name for the possession

* Seneca de Brevitate Vitae, cap. xiv.

of wealth and power, if they could trace the whole series of feelings that have constituted the life of far the greater number of the wealthy and the powerful.

If all, united, thy ambition call,
From ancient story learn to scorn them all.
There, in the rich, the honour'd, fam'd, and great,
See the false scale of happiness complete :
In hearts of kings, or arms of queens who lay,
How happy those to ruin, these betray !
Mark by what wretched steps their glory grows,
From dirt and sea-weed as proud Venice rose !
In each, how guilt and greatness equal ran,
And all that rais'd the hero, sunk the man.
Now Europe's laurels on their brows behold,
But stain'd with blood, or ill exchang'd for gold :
Then see them broke with toils, or sunk in ease,
Or infamous for plunder'd provinces !
O wealth ill-fated ! which no act of fame
Ere taught to shine, or sanctified from shame !
What greater bliss attends their close of life ?
Some greedy minion, or imperious wife,
The trophied arches, storied halls invade,
And haunt their slumbers in the pompous shade.
Alas ! not dazzled with their noontide ray,
Compute the morn and evening to the day,—
The whole amount of that enormous fame,
A tale that blends their glory with their shame.*

Of kindred character with moderation in our wishes, which regards the future only, is the habit of considering the cheerful rather than the gloomy appearances of things, which allows so much delight to be felt in things possessed, as scarcely to afford room for that discontent with the present, in which the greater number of our wishes of the future, and especially of those aimless and capricious wishes which it is most difficult to satisfy, have their origin. How many are there who, surrounded with all the means of enjoyment, make to themselves a sad occupation of extracting misery from happiness itself; and who labour to be wretched, as if for no other purpose than to show the insufficiency of fortune to confer what it seems to promise. Good and evil are so mingled together in this system of things, that there is scarcely any event so productive of evil, as not to have some good mixed with it, direct or indirect; and scarcely any so good as not to be attended with some proportion of evil, or, at least, of what seems to us for the time to be evil. As we dwell more on one or on the other, we do not indeed alter the real nature of things, but we render them in their relation to us very nearly the same, as if their nature were really altered. If we look on them with a gloomy eye, all are gloomy. But there is a source of light within us, an everlasting sunshine, which we can throw on every thing around, till it reflect on us what has beamed from our own serene heart; like that great luminary which, ever moving through a world of darkness, is still on every side surrounded with the radiance which flows from itself; and cannot appear without converting night into the cheerfulness of day.

One other practical rule with respect to our wishes, it is of still greater importance to render familiar to us,—that, in estimating the different objects which we obtain, and those which we see obtained by others, we should accustom ourselves to consider, not merely what each has acquired, but what has been given by each in purchase for it,—the time, the labour, the comfort, perhaps the virtue; and that we do not repine, therefore, when objects which we should have wished to acquire, are possessed by those who, in the great barter of happiness, or what seems to be happiness, have paid for them more than we should have consented to pay. All which we wish to attain in life is so truly a matter of purchase, that I know no view so powerful as this for preventing discontent in occasional failure, and I cannot urge it more forcibly to you than has been done by one of the first female writers of the age, in a very eloquent moral Essay against Inconsistency in our Expectations. From this Essay of Mrs. Barbauld, which is confessedly founded, in its great argument, on a very striking paragraph of Epictetus, I quote a few passages :

"We should consider this world as a great mart of commerce, where fortune exposes to our view various commodities, riches, ease, tranquillity, fame, integrity, knowledge. Every thing is marked at a settled price. Our time, our labour, our ingenuity, are so much ready money which we are to lay out to the best advantage. Examine, compare, choose, reject; but stand to your own judgment; and do not, like children, when you have purchased one thing, repine that you do not possess another which you did not purchase. Such is the force of well-regulated industry, that a steady and vigorous exertion of our faculties, directed to one end, will generally insure success. Would you, for instance, be rich? Do you think that single point worth the sacrificing every thing else to? You may then be rich. Thousands have become so from the lowest beginnings, by toil, and patient diligence, and attention to the minutest articles of expense and profit. But you must give up the pleasures of leisure, of a vacant mind, of a free unsuspicious temper. If you preserve your integrity, it must be a coarse-spun and vulgar honesty. Those high and lofty notions of morals which you brought with you from the schools must be considerably lowered, and mixed with the baser alloy of a jealous and worldly-minded prudence. You must learn to do hard, if not unjust things; and for the nice embarrassments of a delicate and ingenuous spirit, it is necessary for you to get rid of them as fast as possible. You must shut your heart against the Muses, and be content to feed your understanding with plain household

* Essay on Man, Ep. iv. v. 285—308.

truths. In short, you must not attempt to enlarge your ideas, or polish your taste, or refine your sentiments; but must keep on in one beaten track, without turning aside either to the right hand or to the left. 'But I cannot submit to drudgery like this—I feel a spirit above it.' 'Tis well: be above it then; only do not repine that you are not rich.

"Is knowledge the pearl of price? That too may be purchased, by steady application and long solitary hours of study and reflection. Bestow these, and you shall be wise. 'But, (says the man of letters,) what a hardship is it, that many an illiterate fellow, who cannot construe the motto of the arms on his coach, shall raise a fortune and make a figure, while I have little more than the common conveniences of life.' Et tibi magna satis! Was it in order to raise a fortune that you consumed the sprightly hours of youth in study and retirement? Was it to be rich that you grew pale over the midnight lamp, and distilled the sweetness from the Greek and Roman spring? You have then mistaken your path, and ill employed your industry. 'What reward have I then for all my labours?' What reward! A large comprehensive soul, well purged from vulgar fears, and perturbations, and prejudices; able to comprehend and interpret the works of man—of God. A rich, flourishing, cultivated mind, pregnant with inexhaustible stores of entertainment and reflection. A perpetual spring of fresh ideas; and the conscious dignity of superior intelligence. Good heaven! and what reward can you ask besides?

"But is it not some reproach upon the economy of Providence that such a one, who is a mean dirty fellow, should have amassed wealth enough to buy half a nation? Not in the least. He made himself a mean dirty fellow for that very end. He has paid his health, his conscience, his liberty for it; and will you envy him his bargain? Will you hang your head and blush in his presence because he outshines you in equipage and show? Lift up your brow with a noble confidence, and say to yourself, I have not these things, it is true; but it is because I have not sought, because I have not desired them; it is because I possess something better. I have chosen my lot, I am content and satisfied.

"You are a modest man, you love quiet and independence, and have a delicacy and reserve in your temper, which renders it impossible for you to elbow your way in the world, and be the herald of your own merits. Be content then with a modest retirement, with the esteem of your intimate friends, with the praises of a blameless heart and a delicate ingenuous spirit; but resign the splendid distinctions of the world to those who can better scramble for them."

"The man whose tender sensibility of conscience, and strict regard to the rules of morality, make him scrupulous and fearful of offending, is often heard to complain of the disadvantages he lies under in every path of honour and profit. 'Could I but get over some nice points, and conform to the practice and opinion of those about me, I might stand as fair a chance as others for dignities and preferment.' And why can you not? What hinders you from discarding this troublesome scrupulosity of yours which stands so grievously in your way? If it be a small thing to enjoy a healthful mind, sound at the very core, that does not shrink from the keenest inspection; inward freedom from remorse and perturbation; unsullied whiteness and simplicity of manners; a genuine integrity

Pure in the last recesses of the mind;

if you think these advantages an inadequate recompence for what you resign, dismiss your scruples this instant, and be a slave-merchant, a parasite, or what you please."*

Bring then these blessings to a strict account;
Make fair deductions; see to what they mount:
How much of other each is sure to cost;
How each for other oft is wholly lost;
How inconsistent greater goods with these;
How sometimes life is risk'd, and always ease;
Think; and if still the things thy envy call,
Say, wouldst thou be the man to whom they fall †

With respect to the living objects of our affections, whom we voluntarily add to those with whom nature has peculiarly connected us, the most important, though the most obvious of all practical rules, is, to consider well in every instance what it is which we are about to love or hate, that we may not love with any peculiar friendship, what it may be dangerous to our virtue to love; or, if not dangerous to our virtue, at least dangerous to our peace, from the vices or follies which all our care may be vain to remedy, and of which much of the misery and disgrace cannot fail to overflow upon us. In the emotions of an opposite kind, before we consent to submit our happiness to that disquietude which we must endure as often as we feel hatred, or anger, or lasting indignation of any sort, it is, in like manner, necessary to pause, and consider whether it may not have been still possible for us to have been deceived, as to those supposed facts which appear to us to justify our malevolent feelings. We must not imagine, as they who err in this respect are very apt to imagine, that too quick a wrath is justified by

* Miscellaneous Pieces in prose, by John Aikin, M. D. and Anna Letitia Barbauld. 3d edit. pp. 62—69. Lond. 1792.

† Essay on Man, Ep. iv. v. 260—276.

the avowal that our temper is passionate; for it is the inattention to this very quickness of feeling resentment, which a passionate disposition denotes, that constitutes the chief moral evil of such exacerbations of unmerited anger, that are converted into a passionate habit by the inattention only. Our duties arise often from our dangers, and increase with our dangers. The adulterer does not think of justifying himself by the confession of the violence of his adulterous desires: the liveliness of feelings which he knows to be unworthy of him, as they show him the greater peril to which his virtue is exposed, should render him more eager to strive to repress them; and he who feels himself most readily irritable, instead of regarding his irritability as an excuse, should, in like manner, look upon it only as an additional reason to avoid, most sedulously, every occasion of anger, and to consider the first slight beginning emotion, therefore, as a warning to beware.

I have already spoken of the advantage of looking to the bright sides of things; and it is not of less advantage to have acquired the habit of looking to the bright sides of persons. In our just resentment against a few, we are not to lose our admiration and love of the whole human race. We may have been deceived; but it does not therefore follow that all around us are deceivers. How much happiness does he lose who is ever on the watch for injustice, and to whom the very unsuspecting confidence of friendship itself is only something that will require a more careful and vigilant scrutiny.

Farewell to virtue's peaceful times:
Soon will you stoop to act the crimes
Which thus you stoop to fear.
Guilt follows guilt; and where the train
Begins with wrongs of such a stain,
What horrors form the rear!

Thron'd in the sun's descending car,
What power unseen diffuseth far
This tenderness of mind?
What genius smiles on yonder flood?
What God, in whispers from the wood,
Bids every thought be kind?

O thou, whate'er thy awful name,
Whose wisdom our upward frame
With social laws restrains;
Thou, who by fair affection's ties
Giv'st us to double all our joys,
And half disarm our pains;

Let universal candour still,
Clear as yon heaven-reflecting rill,
Preserve my open mind;
Nor this nor that man's crooked ways
One sordid doubt within me raise,
To injure human kind.*

On the general happiness which virtue, considered as one great plan of conduct, tends to afford, it would be idle to add any remarks, after the full discussions of the

whole doctrine of virtue with which we were so long occupied. Where it is, there is no need of effort to appear happy; and, where it is not, the effort will be vain. Nothing, indeed, can be juster than the observation of Rousseau, that "it is far easier to be happy than to appear so." What inexhaustible sources of delight are there in all those ready suggestions which constitute the remembrances of a life well spent, when there is not a familiar place or person that does not recall to us the happiness which attended some deed of virtue, or at least some benevolent wish! "The true secret of happiness," says Fontenelle, "is to be well with our own mind. The vexations which we must expect to happen to us from without, will often throw us back upon ourselves; it is good to have there an agreeable retreat."

The delights of virtue, of course, lead me to those delights of religion with which they are so intimately connected. Even these, too, are to a certain extent, subjects of practical deliberation. We must, if we value our happiness, be careful in determining what it is which we denominate religion, that we may not extend its supposed duties to usages inconsistent with our tranquillity; and still more, that we may not form to ourselves unworthy notions of him on whom we consider our whole happiness to depend. It is not enough to believe in God, as an irresistible power that presides over the universe; for this a malignant demon might be; it is necessary for our devout happiness, that we should believe in him as that pure and gracious being who is the encourager of our virtues and the comforter of our sorrows.

Quantum religio potuit suadere malorum,

exclaims the Epicurean poet, in thinking of the evils which superstition, characterised by that ambiguous name, had produced: and where a fierce or gloomy superstition has usurped the influence which religion graciously exercises only for purposes of benevolence to man, whom she makes happy with a present enjoyment, by the very expression of devout gratitude for happiness already enjoyed, it would not be easy to estimate the amount of positive misery which must result from the mere contemplation of a tyrant in the heavens, and of a creation subject to his cruelty and caprice. It is a practical duty then, in relation to our own happiness, to trace assiduously the divine manifestations of goodness in the universe, that we may know with more delightful confidence the benevolence which we adore. It is our duty, in like manner, to study the manifestations of his wisdom in the regular arrangement of the laws of the universe, that

* Akenside.

we may not ignorantly tremble at superstitious imaginary influences, which we almost oppose to his divine power. How often have we occasion to observe in individuals, who think that they are believers and worshippers of one omnipotent God, a species of minor superstition, which does not indeed, like the more gigantic species, destroy happiness at once, but which, in those who are unfortunately subject to it, is almost incessantly making some slight attack on happiness, and is thus as destructive of tranquillity as it is dishonourable to the religion that is professed. There is scarcely any thing, however insignificant and contemptible, which superstition has not converted into an oracle. Spectres and dreams, and omens of every kind, have made cowards even of the bravest men; and though we no longer stop an expedition, or suspend an important debate, at the perking of a chicken, or the flight of a crow, the great multitude, even in nations the most civilized, are still under the influence of imaginary terrors that scarcely can be said to be less absurd. Of how much sorrow might the same account be given, as that which Gray ascribes to the farmer's wife :

Alas! you know the cause too well,
The salt is spilt!—to me it fell;
Then, to contribute to my loss,
My knife and fork were laid across;
On Friday too! the day I dread!
Would I were safe at home in bed!
Last night—I vow to heaven 'tis true—
Bounced from the fire, a coffin flew.
Next post some fatal news shall tell;
God send, my Cornish friends be well!*

The difficulty of distinguishing casual successions of events from the unvarying sequences of causation, gives unfortunately to the ignorant too much room for such disquieting associations, which nothing but juster views of philosophy can be expected to prevent or dissipate. The cultivation of sound opinions in science is thus, in more senses than one, the cultivation of happiness.

When religion is truly free from all superstition, there can be no question that the delights which it affords are the noblest of which our nature is capable. It surrounds us with every thing which it is delightful to contemplate; with all those gracious qualities, that even in the far less degrees of excellence in which they can be faintly shadowed by the humble nature of man, constitute whatever we love and venerate in the noblest of our race. We cannot be surrounded, indeed, at every moment by patriots and sages,—by the human enlighteners and blessers of the world, for our own existence is limited to a small portion of that globe, and a few hours of those ages which they successively enlightened and blessed; but we can be sur-

rounded, and are every moment surrounded, by a wisdom and goodness that transcend far more whatever patriots and sages could exhibit to us, than these transcended the meanest of the multitude, whom their generous efforts were scarcely able to elevate to the rank of men. If we but open our heart to the benevolence that is shining on it, as we open our eyes to the colours with which the earth is embellished, we have nature constantly before us; and the God of nature, whose goodness is everywhere, like the unfading sunshine of the world.

When other joys are present, indeed, the pleasures of religion, it may be thought, are superfluous. We are happy; and happiness may suffice. Yet he knows little of the grateful influence of devotion, who has never felt it as a heightener of pleasure as well as a comforter of grief. "O speak the joy," says Thomson, after describing a scene of parental and conjugal happiness :

O speak the joy, ye whom the sudden tear
Surprises often, while you look around,
And nothing strikes your eye but sights of bliss.†

The tear which thus arises, is a tear of gratitude to him who has given the happiness which the parental heart is at once sharing and producing,—the overflowing tenderness of one who feels in the enjoyment of that very moment, that the Power which blesses him will be the blesser too, in after-life, of those whom he loves.

It is in hours of affliction, however, it will be admitted, that the influence is most beneficial; but how glorious a character is it of religion, that it is thus most powerful when its influence is most needed, and when it, and the virtues which it has fostered, are the only influences that do not desert the miserable, and the only influences that can relieve. Religion is most powerful in affliction. It is powerful, because it shows that even affliction itself can make man nobler than he was; and that there is a gracious eye which marks the conflict, and is ever ready to smile with more than approbation on the victor. To the indignant, to the oppressed, to the diseased, while life has still a single sorrow to be borne, it flings on the short twilight a portion of the splendour of that immortality into which it is almost dawning; and when life is closing, it is itself the first joy of that immortality which begins.

The devout enjoyments of a grateful and confiding heart, then, are truly the noblest enjoyments of which that heart is capable,—not more from the purity, and vividness, and permanence of the direct pleasures themselves, than from the influence which they diffuse on every other pleasure, and on every

* Fables, fab. xxxvii.

† Seasons,—conclusion of Spring.

pain of life. When we have accustomed our minds to the frequent contemplation of his perfections, who, in requiring of virtue the little temporary sacrifices which it may be called to make to duty, has not abandoned the virtue which he is training by such voluntary sacrifices, for excellence, to which every thing that can be sacrificed on earth is comparatively insignificant, it is then that we learn to enjoy with a delight which no others can feel, and to suffer almost as others enjoy, that even the aspect of nature itself appears doubly beautiful in our eyes, and that every thing which it presents becomes, in one sense of the word, our own, as the work of our God, and the dwelling of those whom we love.

"He," says Cowper, speaking of such a mind,

He looks abroad into the varied field
Of Nature, and though poor, perhaps, compared
With those whose mansions glitter in his sight,
Calls the delightful scenery all his own.
His are the mountains, and the vallies his,
And the resplendent rivers. His to enjoy,
With a propriety that none can feel
But who, with filial confidence inspir'd,
Can lift to Heaven an unpresumptuous eye,
And smiling say, "My Father made them all."
Are they not his, by a peculiar right,
Whose eye they fill with tears of holy joy,

Whose heart with praise, and whose exalted mind,
With worthy thoughts of that unwearied love
That plann'd and built, and still upholds, a world,
So cloth'd with beauty, for rebellious man ?*

Of all that extensive variety of subjects, which in my first Lecture I represented to you as belonging to my academic department, we have now, with the exception of the single division of Political Economy, considered the whole with as attentive examination as the narrow limits of such a course will admit. That one division, which, from the multiplicity of our subjects, that were more intimately related to each other, I have been obliged to omit, has been reserved by me as the subject of a separate course. Its doctrines are far too extensive to be treated in a few lectures; and the time, therefore, which could only have been wasted in a superficial and frivolous sketch of principles, that require to be analyzed before they can be understood, or at least understood with conviction and profit, I preferred to give to a little fuller elucidation of doctrines that were more immediately under our review.

THE END.

INDEX.

- ABELARD**, influence of, in the dissemination of nominalism, . . . Page 297
- ABSENCE**, mental, explained, . . . 201
- ABSTRACTION**, mistakes regarding, detrimental to the progress of philosophy, . . . 9, 38
- , supposed power of, reduced to relative suggestion, . . . 335
- ABTRUSENESS** of certain discussions, beneficial, and how, . . . 258
- ACTION**, the desire of, a distinct emotion of the mind, . . . 442
- , analysed and illustrated, . . . 443
- , benevolent ends, for which implanted, . . . 445
- , in morals, nature and meaning of, . . . 486, 492, 497, 529, 548
- ACTIONS**, complexity of, a source of moral error, . . . 495, 549
- , virtuous,—moral equality of, refuted, . . . 665
- ADANSON**, trivial circumstance by which led to the study of natural history, . . . 283
- ADDISON**, quoted, . . . 224, 611
- ADORATION** of the Deity, promoted by the study of intellectual philosophy, . . . 19
- , duty of, . . . 640
- ADULTERY**, infamous and sinful nature of, . . . 564
- AFFECTION**, mental,—precise meaning of the term, . . . 101
- AFFECTIONS**, benevolent and malevolent, great ends of, . . . 399, 406
- , benevolent, happy influence of, illustrated in the various relations of man, . . . 401, 405
- AFFECTION**, conjugal,—moral obligation to hold it sacred, . . . 564
- , of others, desire of, discriminated from simple love, . . . 469
- , its influence and importance, . . . 469
- AFFLICTION**, absorbing nature of, . . . 387
- , benign influence of religion, in, . . . 674
- AGENT**, moral,—real motives by which actuated, . . . Page 515
- AKENSIDE**, quoted, 11, 62, 96, 103, 113, 120, 194, 201, 219, 223, 237, 243, 251, 269, 286, 287, 314, 342, 350, 353, 358, 374, 375, 383, 392, 393, 394, 400, 452, 454, 470, 486, 493, 510, 556, 629, 634, 635
- ALEMBERT**, D', quoted, . . . 65, 284
- ALISON**, Mr. his theory of beauty examined, . . . 370
- ALLITERATION**, suggestive influence of, . . . 229
- , instances of, . . . 229, 230
- , charm of, whence derived, . . . 229
- , rules for the proper use of, . . . 230
- AMBITION**, wonderful effects of, on the moral character, . . . 286
- , virtuous and ignoble, characterized, . . . 456
- , gracious purposes answered by, . . . 458
- AMPLIFICATION**, excessive,—system of Dr. Reid and others charged with, . . . 213
- ANALOGY**, pleasure derived from the perception of, considered, . . . 225
- , *See also Resemblance.*
- ANALYSIS**, intellectual, little practised by the ancients, . . . 2
- , advantages accruing to physical science from, . . . 11
- , origin of, to be found in the imperfection of our powers, . . . 28, 65
- , physical, laws of, equally applicable to mental phenomena, . . . 31, 60
- , intellectual, definition and laws of, . . . 60
- , importance and prospective advantages of, . . . 62
- , whole process of reasoning may be reduced to, . . . 312
- ANGER**, emotion of, analysed, . . . 419
- , beneficial and baneful influence of, illustrated, . . . 419

- ANGER**, quickness of, in certain tempers, accounted for, . . . Page 422
 —, excess of, to be studiously avoided, . . . 424
- ANIMALS**, inferior,—indubitable signs of reason exhibited by, . . . 292
- ANNIHILATION** of the soul, instinctive and insuperable aversion to, . . . 438
 —, power of God adequate to, . . . 649
 —, presumptions against, from its own nature, and that of the Deity, . . . 651, 656
- ANTECEDENCE**, invariable, the only conceivable definition of power, . . . 35
- ANTICIPATION**, disappointment of, a source of the ridiculous, . . . 389
- ANTITHESIS**, pleasure derived from, accounted for, . . . 234
- APOLLONIUS**, quoted, . . . 666
- APPARITIONS**, dread and belief of, whence derived, . . . 559
- APPEARANCES**, in conduct, to be regarded, and why, . . . 576
- APPETITE**, affections of, analysed, . . . 106
 —, pains of,—subservient to important ends, . . . 108
- APPROBATION**, moral,—fluctuating nature of, accounted for, . . . 489, 492
 —, an original emotion of the mind, . . . 547
- APPROVABLENESS**, the sole test and constituent of virtue in actions, . . . 487, 547
- ARISTOTLE**, opinions of regarding association, closely allied to those of Mr. Hume, . . . 219
 —, quoted, . . . 219
 —, doctrines of, absurdly proscribed in France at one time, . . . 284
- ARNAULD**, opinions of, regarding perception, mistaken by Dr. Reid, . . . 173
- ARRANGEMENT**, systematic, impossibility of adhering to in all cases, . . . 203
- ARRIA**, sublime devotion of, . . . 383, 634
- ARTICLE**, the indefinite,—improperly used by the Conceptualists, . . . 304
- ARTS**, fine, beauty of, on what founded, 358
 —, sublimity of, to what referable, . . . 381
- ASSASSIN**, the, enduring remorse and fearful superstitions of, . . . 559
- ASSOCIATION**, influence of, in producing ideas usually referred to simple vision, 183, 185, 186
 —, of ideas,—reasons for rejecting the term, 215, 222, 254, 259, 262, 277, 279
 —, reference to the principles of, in the works of Aristotle and others, . . . 219
 —, Hume's theory of, stated and examined, . . . 220
 —, principles of, may be resolved into the simple circumstance of contiguity or co-existence, . . . 222
- ASSOCIATION**, primary laws of, classified and illustrated, . . . Page 222
 —, common theory of, refuted, 253
 —, Hartley's theory of, refuted, . . . 279
 —, influence of, on the moral and intellectual character, . . . 281
 —, influence of, on our notions of physical and moral beauty, . . . 365, 371
 —, influence of, in blinding the mind to moral distinctions, . . . 498, 550
- ASTONISHMENT**.—See *Wonder and Surprise*.
- ASTRONOMY**, of the blind, a sort of Chemistry, . . . 7
- ATHEIST**, the, when beyond the reach of argument, . . . 178
- ATHENIANS**, peculiar associations in which the intellectual character of, originated, . . . 285
- ATOMS**, the only real substances existing, 87
- ATTENTION**, supposed intellectual power of, reduced to perception and desire, . . . 197
- ATREUS**, sublime exclamation of, . . . 382
- AUGUSTINE**, St. quoted, . . . 23, 263
 —, high character of, as a metaphysician in Catholic countries, . . . 195
- AURELIUS**, M. saying of, . . . 640
 —, sublime moral character of, . . . 667

- COMPLEXITY** of actions, a source of moral error, 495, 549
- COMPOSITION**, analysis of the functions of the imagination during, 271
- COMPREHENSION**, a principle of relative suggestion, 290
- , various classes of relations may be reduced to, 290, 311, 315
- , suggestive principle of, examined, 311
- CONCEPTION**, supposed power of, reduced to simple suggestion, 261, 268
- , vague use of the word by the Conceptualists, 304
- CONCEPTUALISTS**, theory of generalization held by, explained and proved, 301
- , theory of, misapprehended, and why, 303, 309
- CONDEMNINE**, singular savage tribe mentioned by, 308
- CONDILLAC**, quoted, 48, 209, 198
- , objections to the philosophical theory of, 199, 209, 210
- , theory of, opposed to that of Locke, 208
- , errors of, to what source attributable, 210, 212
- , not chargeable with materialism, 210
- , instances of undue simplification in, 207, 212
- CONFIDENCE**, feeling of, considered, 436
- CONFIDENCE** essential to lasting friendship, Page 599
- CONGRUITY** and its opposite, the foundation of the ludicrous, 386
- , various species of, classified and illustrated, 390
- , insufficiency of, as a moral test, 510, 513
- CONSCIENCE**, distinguished from consciousness, 70
- , definition and power of, 70
- , salutary influence of, 233, 396, 406, 503
- , dreadful and delightful emotions of, illustrated, 428, 503
- CONSCIOUSNESS**, not a distinct faculty of the mind, 67
- , Dr. Reid's definition and opinions of, refuted, 67
- , unity of the mind, indicated by, 643
- CONSTITUTION**, primary laws of suggestion modified by the diversity of, 237
- COUNTENANCE**, beauty of, how far dependent on association, 363
- CONTIGUITY**, influence of, as a primary suggestive principle, 234, 235
- , suggestive power of, illustrated in the feelings of the Crusaders, 235
- CONTRACT**, moral duties of, their source and extent, 602
- , social, political theory of, refuted, 609
- CONTRAST**, singular inconsistency of Mr. Hume regarding, 220
- , suggestive principle of, examined and illustrated, 232, 255
- , important ends to which subservient, 232
- COOK**, Captain, quoted, 308
- COUNTRY**, strong and enduring love of, 606
- , duty of defending, 611
- , duty of augmenting the happiness of, 612
- COURAGE**, virtuous, characteristics of, 661
- COWLEY**, quoted, 262
- COWPER**, quoted, 109, 137, 161, 341, 354, 430, 441, 675
- CREDULITY** accounted for without the supposition of any peculiar instinct, 569
- , especial, of childhood, reason of, 570
- CRITICISM**, knowledge of, defined, 16
- , just, reasons for the paucity of, 16
- CROSS-BEADINGS**, source of the ludicrous in, 390
- CRUSADERS**, feelings of, illustrative of the force of local connexions, 235
- CUDWORTH**, quoted, 132
- , argument of, against the political origin of virtue, 504
- CURTIVUS**, Q. quoted, 127
- CYPRIAN**, quoted, 460
- CROUSAZ**, De, quoted, 174

CROUSAZ, De, similarity between the opinions of, and those of Dr. Reid regarding perception, . . . Page 174

D

DACIER, absurd poetical criterion of, . . . 284
DANTE, sarcasm of Voltaire against, . . . 284
