ftetropolis and its Ficimitp.
Stoppage of Westminster Bridge.-On Monday morning, in consequence of the rapid sinking of the arches of thlocked up from the public by order of the committee. Notwithstanding the sum that has been already expended on the repairs of this bridge, near 100,000 . in ten years, it appears that it will be necessary before it can be opened
again to expend some thousands more, and the repairs now in contemplation are expected to occupy several months.
Colonial Bishoprics.-On Tuesday a meeting convened by the Archbishop of Canterbury was held at Willis's
Rooms, for the purpose of originating a fund for the foundation of Colonial Bishoprics. At the hour appointed, the great room was crowded to excess, and numbers were wholly unable to obtain admittance. The majority of the assembly consisted of clergymen, among whom were the Bishops of London, Winchester, Durham, Salisbury, Lichrield, \(H\) ereford, Chichester, and sereral noblemen and gentlemen of all parties. The Bishop of London commenced the proceedings of the day with prayer. The Archbistop of Canterbury, who and addressed the meeting. He said that he felt very great gratifiction in seeing so large an assembly. He could regard it in no other light than as a manifestation of the deeply-felt importance of the subject which they nial possessions of their country. It must be evident, he said, to every reflecting mind, that there were many
causes operating to the prejudice of the interests of reliion in newly-formed colonies. Those prejudices had been in operation for a great length of time, and had, he could not but conceive, been considerably gggravated by a bishop he considered might truly be said to be undeserving of the name of an episcopal church. When he was Bishop of London, he had a nominal authority over the colonies, but he found himself perfectly helpless, for that kind would be remored when there was a bishop on the spot, and such an appointment would, he thought, gious kind upon the people. His object was to supply the colonies with as many bishops as might be necessary, and colonies now in course of formation. There were, however, other dependencies of the British Crown which did
not come under the denomination of colonies. He would merely refer to the Levant. Now in those possessions there were many persons resident who were serving in va-
rious military capacities. Those persons ought not to be deprived of the spiritual benefits which, as members of our church, they would enjoy at home. Our indifference to the interests of our own religion was, he said, a blot diterranean brought us into contact with the Eastern church, once so celebrated, but now in a state of deprescalled a church by the establishment of bishoprics in the Mediterranean, which, he conceived, would tend greatly to the benefit of the church aniversal. There could not be an opportunity more favourable thas the present time for seat of the bishopric having been all but deternined apor by the erection of a splendid church at Malta, at the expense of an illustrious lady (the Queen Dowager), who was not more esalted in her rank and station than respected
for her virtue and piety. The object was to promote harmony and good will among all Cbristian churches, and while pursuing this object they must feel great additional
pleasure if they could gratify the feelings of the illustrious plady he had alluded to by a steady but sure promotion o the great ends in view. His Grace concluded by express ing a wish that the bishops who might be appointed should be enabled to maintain a decent rank-have the means of defraying the expense of journeys, and of exercising that could not be dipensed with; and having effected this, they would leave the realisation of their designs in the hands of Divine Proridence. The mueeting was then addressed at great length by the Bishop of London, who concluded by moving "that the Church of England, in endeavouring religious wants of her menbers in foreign lands, is bound to proceed upon her own principles of apostolical order to proceed upon her own principles of apostolical order
and discipline." This resolution, haring been seconded by the Earl of Ilchester, was carried unanimously. Mr. Jus tice Coleridge proposed the second resolution-viz,
'That the want of episcopal superintendence is a great and acknowledged defect in the religious provisions hither to made for many of the colonies and dependencies of the British Crown:" and which, having beea seconded by the Bishop of Winchester, was also carried. Mr. J. Labouof new colonies and the formation of British communities in various parts of the world render it necessary that an immediate effort should be made to impart to them the full benefit of the church in all the completeness of he conded by Archdeacon Mauning, and having been carriea. Mr. W. E. Gladstone moved -" That a fund be risec towards providing for the endowment of bishoprics in such of the foreign possessions of Great Britain as shail be te-
termined upon by the archbishops and bishops of the anited Church of England and Ireland, that their lordahips the fund, and to name a treasurer and such other officers may be required for conducting the necessary details."

Archdeacon Robinson seconded this motion, which was
carried unanimously. Alist of the subscriptions which carried unanimously. A list of the subscriptions which
had been received during the meeting, and which amonnted had been received uring the meeting, and which amounted from the Archbishop of Canterbury, expressing his satis faction with the result of the meeting, the assembly sepsated.
Charge against a Middlesex Magistrate.-An an nouncement has appeared in some of the public journals stating that a magistrate of Middlesex has been accused of
having offered, for a gratuity of 3,0006 , to obtain the discharge of a prisoner confined under a sentence of impri sonment in the House of Correction, Coldbath-fields, and has created a great sensation throughout the metropolis and the metropolitan county. It is not positively stated who the prisoner was, or who the justice of peace allege to be implicated, the greatest secrecy, it appears, having the person whose liberation Mr. F. H. Medhurst, it will be recollected, victed at the sessions of April, 1839, of manslaughter, having, by stabbing a fellow-pupil at Hayes, near Uxbridge ccasion his death, and mprisonment without hard labour, of which term tw years expired on the 7 th inst. At the time of the trial was mentioned that Mr. Medhurst wonld, at the demise o
his grandfather, come into the possession of considerable property. That event took place shortly before Christma last, and Mr. Medhurst consequently has command over funds to a large amount. It is further stated that Mr. Medhurst's liberation was not to be effected by an escap c as had been reported, but by a remission of his sentence. Another Female in Disguise.-On Sunday morning, police-constable, on duty in the New Road, Hammersmith iscorered in one of the unfinish in a corner, what he took to be a boy his side was a bundte, which he said was his own properts His answers to questions put by the constable being evaive, he was convoyed to the station-house, where hi bundse was exa hed and found to contain a loaf, a basin bottle of water, and one penny only was found in his pos session. He said his name was Joseph Taylor, that he was 13 years of age, and resided with his mother at Thomas street, Grosvenor-square. It was noticed by the inspector that his hair had been recently cut, that his features were handsome, and that in figure he more resembled a girl than a boy; and on telling him his suspicion, he acknowledged that he was right as respected his sex, and that his lor. She stated that her object in adopting the disguise was to walk to the residence of her uncle in Sussex. She hen she reached Hammersmith, she went into the new building for sheiter. She Was sent home to her mother in charge of a policeman, said that she wras her eldest child ; and on Satorday har ing to go out to work, she left her at home to take care of the other children ; and it appeared that, having got her brothers and sisters out of the way, she rent to the bakers and got the loaf, then went to a hairdresser's, to whom she offered to give her hair, which was very fine, if he wonl cut it short. her journey. On being asked the reason of her doing so, she replied that, being an intelligent child, a neighbour frequently lent her novels to read, and she had read the case of "Romance in Real Life" which appeared in the papers a few days since, which seemed greatiy to interest milar adventure

Singular Delusion.-On Wedresday afternoon, about 3 o'clock, the visitors in the enclosure in St. James's Park were much astonished at seeing a respectably-attirtd person ump into the canal, nearly opposice hitehall, and swim his approach. Several of the attendants at the park wera speedily on the spot, and the intruder swam to the island in the centre, from whence he was dislodged by Lock, one of the park-keepers, by whom he was conveyed to Bonstreet police-office. The only reason he could allege for aing wo the and he wished to remove them. It was evident that t, he unfortunate gentleman, who proved to be a barrister, was labouring under an aberration of intellect,
ivered up to his brother, who was sent for.
Robbery. - On Monday the description of a femal who has recently, by false representations and assumin the title of "La Baroune Malleval," obtained from rarious tradesmen in the reighbourheod of Oxford-street and Bond-street property to a great amount in value, was received at the various police-stations. On Saturdar it appears she obtained from a watchmaker and jeweller in gold guard-chain, with swivel attached. The police are actively engaged has yet heernobtained for her detection.
Fires.-On Tuesday afternoon, a fire broke out on the premises of Mr. Gibbins, shipbuilder, Rotherhithe. It the occasioned by the boing ner, the fior ond communicated to a a lity apread wivarin and in alarn being given, the five was subdued, but not until consideratle damage had been done.-Last night a destructive fire broke ont in the St George's Hotel, Albemarle-street, in oue of the upper bed-roons. The hotel was entirely de one of the upper bed-rooms. The hotel was entirely de-
stroyed, and scarcely any property was saved. The great-
est alarm prevailed in the neighbourhood, but fortunately no lives were lost.
Suicides.-On Sunday afternoon a Thames police constable found the body of a man floating on the water, be tween St. Olare s, nouthwark, and the Tower. It wa that of a well-drexsed man. ahout 3.5 years of age, and
appeared to have been in the water a fortnight. On appeared to have been in the water a fortnight. On
searching the pockets a letter mas fount, aud on inquiry at the address named on it, it was ascertained that deceased was named Welford, and had been in the employ of Mr. Watts, Charlotte-street, Mitzroy-stuare, as butter, caused by illo tweelss past had been affected in his mind ago he attended and severe menta andely. A few days his master into his carriage, and immediately afterwards ran down the street without his hat, and had not been seen or heard of since until his body was found in the \(\therefore\) Fou An inquest has been held, and a rerdict returned Found Drowned."- On Tuesday afternoon a young lady was seen to walk to and fro in an excited state alons the bank of the ormamental water in the enclosura of St James's-park, when she was suddenly missed, and a splast being heard in the water, search was made, and soen to rise to the surface, when a gentleman plunged int the water; but it being very deep at the spot, and being anable to swim, he was fearful of advancing farther, bue others came to his assistance, and having juined hands, they succeeded in reaching her, and bronght her to the side in an apparently lifeless state. A surgeon baving used active remedies for two liours, succeeded in restoring the young lady so as to enable her to give an account of herseir, when she gave her name Emily Winter, residing Majesty's Gentleman Porters, to whose honse she conveyed.-In the course of an inquest held at Islington, before Mr. Wakley, on the body of a female who wa found dead in bed, there being no reason to entertain any other opinion but that death had occurred in the course natural death, when the coroner said that in a case like that he had s particular objection to record such a verdict He recollected, some short time after he had been in office, holding an inquest in that parish on the body of a lady who was found dead in bed, and in which a verdict of natural death was returned. Atter the inquest, papers weased had taken poison, and on the borly being opened ceased had taken poison, and on the bory being opened a quantity of arsenic was detected in the stomark. perty, but her funds being nearly exh rusted, she was afraid of being reduce, ty poverty, and resolved upon destroying herself. From holding an inguest upon her ap procedcu, in the same neighbourhood, o hongin bimself the onty renson astimned for which was his having come into possession of \(200,1001 \%\). In all cases like the one then at issue, he deemed it unt isable to return a ver which was in strict comiomite with the evidence. With respect to the commission of suicile, he would just re mark that he was of opinion one case was followed as an example by others, in proof of which he would instance the following:-Some months ago a gentleman terminated his existence by shooting himself. One morning a lady called upon him und was told by the serrant that he ha not left his bei-room. It being past his usual hour, an entered, and he was found on the bed dead, and in a pool of blood havg blown his head to pieces, for which par pose he had used two pistols. The next morning the lady Who had called upon him was found dead, having, by from her body. On another occasion, while holding an inquest in the country on the body of a gentleman who groom said to his wife, "I don't see why great folk should have it all their own way," and went into the ban and hung himself.
Accident. -The following accident happened on Tues day afternoon at the new Gothic church, now nearly comengaged in placing the interior fittings, and one of them, who was at work in the belify of the tower, by some means slipped and fell down into the body of the church, a grea height. The nature of the injuries he received by the fail was such that it was deemed advisable to have him at once conveyed to St. Thomas's Hospital, where he lies in a very dangerous state
Inquesk. - In the course of an inquest held on Tuesday, before Mr. Wakley, at camten Town, on the body of a
 ceased's widow and famity should have been mounded by an inquisition being held on his body, when the case evidentiy did not require such a proceeding. He thought that the inquest had been held in opposition to the crite
rion which Mr. Wakley bimself lad laid down. The Coroner's clerk said, the information received from the constable was, that deceased had been taken suddenly in a state of insensibility, and had continued so for several
hours, until his death. Witness aill this was not tae fact; be had rot been so until wikhin a fers hours of his me tion. If a person was suddenly taken insensible, and lingered in that state thirty or forty hours, or even a week, to his state, it we cialy a cose ad inasmuch as the party was morally dead from the monsent
he was first attacked. He made a great distinction between ill in the day, and who were afterwards in some measure
conscions. Suppose, for instance, a person were seen by conscions. Suppose, for instance, a person were seen by shop-door, and the next morning he heard that he was dead:
what would be said if, an inquest were not hell upon his what would be said if au inquest were not iestupon to
body? The coroner's inquisition was an iustitution to protect the living, and not the dead; and in cases of the present description, it was not held because there was a sus-
picion that there was anything wrong, but because it was in accordance with the law as applied to coroners' inquests. Coroners' inquests were frequently held in consequence of the extraordinary conduct pursued by the friends of deceased person towards the proper authority applying for an inquest on a gentleman in consequence of his friends two or three times shutting their door in the summoning officer's face, who was in the performance of his duty, applying for information. The result was, that a suspi-
cion was created in the neighbourhool, and the officer had no alternative but to send to the coroner. The present case was one of sudden death, although it did not pre-
cisely fall in with the rule he had laid down to guide him cisely fall in with the rule he had laid down to guide him
as a criterion in sumh cases..()n Wednesday an inquest as as criterion in surh cases.- R. F. Eusdon, alias, Elmy, Professor of the French and English labguages and of general literature, and author of "Tableau de la Prononciation Fran-
caise," \&cc. The body was found on Sunday last in the caise, \&c. The body was found on sunday last in that since has been discovered merely relates to deceased's identity, and nobody could prove how he got intothe water; but, on account of his
having been in destitute circumstances, and latterly of
atrange manner, the probability appears to be that he drowned himself. Several pawnbrokers' ticketz were found in his pockets. Ife had latterly lodged at Brompton, and left there suddenly, and without explanation, on brother. He knew nothing of the circumstances connected with his death; never heard him talk of self-destruction; was the last man he should suspect of that and varied attainments. Verdict-"Found dead in the waters of the Regent's

\section*{Plrobincial Tebos}

Liverpool.-A very melancholy occurrence hins taken place in this town, of which the following are the particulars :-On Wednesday morning Mr. Jenner, a cottonlife of his two children, his wife, and it is feared his own. It appears that he has recently been onserved to recal prosperous condition. and the remembrance seemed to prey greatly apon his spirits; and in a fit of despair he
discharged a pistol at one of his children, which took effect, and killed the boy on the spot. He then discharged another at his wifte, the contents of whi. It lodged, it is
said, in ber head, but she is stillalive, and it is the opinion of the surgeon that she may possibly rewoer. He then endeavoured to bring his s.ther boy to hinn. by speakiny in from the house. givins the alaran to the police, who tool his father into custorls. Mr. Jeuner gave himself up very
quietly, and a douale-harelled pistol was taken from him, quietly, anda doumle-harrefled pistol was taken from him, been noticed by all who knew him as an affectionate husband; and the only explanation of his conduct is derived to utter, that he would rather see his wife and family dead than afflictea by poverty. Ife was noticed the evening previous to be in a very excited state of mind, aod talked likely to make a deep impression on his mind, from his having been many years since engaged in a very lucrative quently to this be becane unfortunate, and commenced business in Charleston, where he realised a considerable sum of money, which was lost in the panic of 182.5. He then establisued hinseli here as a cotton-broker with con-
siderable success, unill his health gare ray, and his congequent iuactivity cuused the gradual loss of his connexions. It is thought that his atteehment to his wife and children has induced him to cummit this rash act, from a mistaken feeling that be could not see them reduced to starvation and want: he is about \(5 J\) years of age. An inquest has
since been heid on the chill who was killed. A very afcourt on Mr. Jenner meeting his eldeat son, who had mate his escape from him. As som as he recognised him, he held out his land and aproached bim. The boy walked toxatds him, and they st ook hands together. The father then tirew hls arms round his son's neek and burst into tears. They emtinu. lin each other's Is your mother hikety to recurer ; is she sensille "." The "Is your mother hiseiy to recurer; io she sensille" "The
boy said, " Yes;" whereupon the tather observen, "I'm
sure shell never recorer." Thie eoroner taen jeekoned to sure she'll ne ver recorer." The torober taen beckoned to threw himself on his knees in the middle of the floor,
clasped his hands together, and implored the coroner not clasped his hands together, and implored the ontoner not
to take away from him his son. The boy was then cunducted to the side of the coroner, where he was examiaed. The prisoner iaquired of one of the femaie witnesses hew hood of her recovering. On ascertaining that she was better, and likeiy to become convalescent, be seemed pleased and became composed. There was nothing in the what was previously known. As soon as his evidence had
been concluded, the father requested his solicitor to apply
op the coroner for permissiun to have his son to sit beside him ; which being allowed, the lad went round to where ais father sat. They then embraced each other, and the
fathur again gave vent to his feelings in tears. Until the fathor againgave vent to his felings in tears. Until the cluse of the inyuest, a period of three hours, the father
hicpt his arm round the lad's neck, with the lad's hand clasped in his. They conversed freely together in an under tone with reference to the scene whicu had so recently
transpired. After the examination of witnesses, the cororanspired. After the examo witnesses, the coro inl murder." The prisoner heard the verdict with compusure, and was removed to Kirkdale to await his trial a the next assizes. - The lapse of another week without any intelligence whatever of the missing steam-ship President has reduced to a very 10 w ebb indeed what little hope rerect arrival from Bermuda, we learn by the shipping news in the New York papers, brought hy the Britisit Qued, lork on the 7 th inst. in eight days, haviny sailed from Pe the 31st Barch. Conention is made of the President hy her; aud it is therefore certain that she ha leaving vew York. By the arrival of the West India packet Lyra at Falmouth on Thursday, we are also in re but nothing was known of her in those islands at that date. The most gloomy forebodings are, therefore, now
entertained of her fate. Thourh various rumours have again been current during the week, it would be idle to epeat them, as they have all proved unfounded; and dis pears now to be little reasonable pround for entertaining any longer with respect to her safety.
Birmingham.-A summons for a church-rate having been Istely dismissed at the police-office in this town, on application for the rate, an eminent legal authority has been consulted on the subject, and his opinion as to the law on the point is, that the churchwarden is not bound to receive the rate in person, and that any parishioner who may be satisfied that the person demanding the rate has competent authority to receive it, cannot be legaliy justified
in with holding the payment of the sum for which he may in withholding the paym
Brissob, - A very serions fire broke out on Wednesda night on the works of the Great Western Railway Com pany, in Temple-meads, in this city, by which property to a great amount, probably from 15.000 \%. to 20,0006 ., has been destroyed. It originated in a large iron reservoir of coal-tar, employed for the purpose of applyin 5 the creosote principle (a substitute for the process of kyanising) to the timber used for bearers on the line, and was the by a candle having been accidentally let fall ine combustible material. The resury to a large proporin every direction whe creosote had been applied, the fire spread with great rapidity, and in little more than an hour, besides the immense stnck of coal-tar, oil, \&e., from 800 to 10 min loads of timber were on hire. An the engines in the city were on the spot, but all attempts o
subdue the flames in the parts with which they had comsubdue the Hames in the parts with which they had communicated were useless. and had not great exertions been used to clear away the piles of unburnt timber, so as to the due communicatson with the orher parts orthe woat extended. The property is insured, but still it is thought there must be considerable loss to the comprany, even if the opening of the line to Bridgewater be not retarded. It has been since stated that the fire wan caused by the described. But it is at present impossible to ascertain any correct particulars in this respect.

Willinton:-A given in our last Number, have been received of the serious explosion that tonk place at the colliery last week. In a short time after the acoulent, two men, named Ranson and Dunn, and a boy named Chartoon, were assisted vut alive, and but little hurt; and afterwards three other men wiere got out alive, hut so mirch injured that they died in the course of the evening. The bodies of for ore got out, but they were quite dead. Towards night, the state of the pit precluded the possibility of farther search being made. in the course of Tuesuay the men worked incessantly, and contrived to get at the bodies of 22 of the sufferers, who had apparently been working at no great distance from each other, and not far from the spot where the explosion took place. Some were very much burnt, and others scarcely touched: they had died from the effects of the "sfter-damp," which had overtaken several as they were making for the shaft. One young man was from benea a large she fist; another had taken time to put on his clothes, amd had stuffed his nightcap into his mouth when he felt the atter-damp coming upon him. On Tuesday afternoon, an old galloway was found alive in a part of the pit where the men were work-
ing which escaped unhurt ; the after-damp nust have lost its destructive potency before it reached that mine. The poor animal had been given up for lust, and a supply of oats and hay was immediately sent down to it.
On Wednesdar afternoon there were still three bodies which had not been found; but on Thursday they were recovered, but all dead. As to the origin of this calamity, nothing certain, it would seem, can ever be known : it is supposed, after a close inspection of the workings, that it charge of one of the three doors, which were at no great charge of one of trom each other. It is conjectured that ho had
pr.pped his dour open and gone to play with twi, of his oistructed, and the gas accumulated to such a degree as to explode on a condle coming in coutact welh it. in inquest has been held on the hodies, and a verdict of ent, gen gas," returned.
Steam Packet Co On Weduesilay the Calpe, Cummercial between this port and Havre, encountered a very severe gale, during which she was struck by a heavy sea, carrying away one of the paddle-boxes, and the steward's room, in the loeker of which were deposited the whole of the Havre letters. They were all washed overboard and lost. The mercantile in the north.
- There is now to be seen in the gardens of the Earl of Lonsdale, at Wistehaven Castle, near this town, quantities of fine ripe strawberries, growing in full perfection: as they are pulled, they are rapidy succeeded It others, many of them weighing nearly an ounce each. and an eripe the ripe fruit and the blossom, a regular supply is now depended on during the season.-A speeimen of grass grown in a garth at Chester-le-Street has been shown ia this town upwards of twelve inches long. It has grown green as if it had been produced by the influence of the summer's sun.

Tynemouth.-A monument to Lord Collingwood is destal 40 feet high, and the top of the figure will be 70 feet from the ground.
Ascot. - The extensive stabling and coach-houses at this place for Her Majesty's carriages and horses, when the of erection for some time, will be finished by the end of nest week. The slating of the roofs is completed, and nothing is now required but the fitting up of the interior, The builing are \(i\) the a The buildings are western side of the Royal stand a 14 id ranges of stabling, each 176 ft . im length and 14 wide, and capable of affording accommodation for upwards of 100 horses. The coach-bouse is between the two lives of stahling, with and 16 wide, and will hold more than 20 carriages. Ther is an entrance at each end, but the principal one (on either side of which are small lodges for the accommodation of the coachmen, postilios, eastern side, nearest to the Royal stand. It is not intended to fit up the stables with either raciss or mangers, as Her Majesty, when the Court visits the course during the races, starcely ever remains more than two or three hours. A well, within the enclusure, has been sunk, and spring of water, flowing profusely, lias been discovered at the depth of nearly 80 feet. The buildings are a space of lofitit. long and st wide. It is compute three or four yeals by the sasing which will accrue in the解 hitherto incurred by the temporary stables and coach-houscs that have to be ereeted for the the Royal currioges and horses during the races. These buillios eovered with tarpmuling, and the cost of their erection generally exceeded 150. every year.

Ruilueays.-The line between ('irencester and \(S\) windon, ane Cheltenhan and Great Western Union Ralway, Wir be opened on Monday next--Me openiog ore on the 21 st ult. The trains carried about loon passengers, and the whole prouedings went off with complete succese. -The engineer of the Edinburch and Glasmoo Railway intends to open it throughout on the lst of August - On Saturday a prisate view took place at the Zinc Works, Partiment-street of a contrivance called the "Patent Railway Train Controller," the object of which is to promote safety in railway travelling, by establishing in a greater degree than is at present possessed a contro mechanical arrangements. by means of which trains may be brought to a stand-still without the agency, and inue pendently of the will, of the engine-driver, or any other person connected with their guidance. To effect this, an apparatus is affixed to the roadway, which, when piaced in a certaia position, so acts upon a combination of to the attached to the steam cylinders of the engine, and they imultane well of the engine as of the carriag, alarums, and bring the breaks down upon the wheel. The apparatus is very simple, and can be reatily worked by a policeman or other person on the line. It is prees prosed that the ayparatus shall be fixed at certain distane of (say every halt-mile) upon a railway, so that misant of danger alieat. It is further proposed that it shall be fitted up at the distance of a certain number of yards from htted up at the and so manaped as to be rendered permenently seli-acting, so that the train shall of necessity be brought to a slop at the station. This word appent be by no means an unnecessary precanco, from a line, accident, terminating fatally, on the Great wetcre where the diver having either fallen aslecp orsed incapacitated through sudden iliness, the train parable through the walls of a station and dia sensid of the damage. - The following facts in relation to seve great means of commanication to develop the resources of a
country, Before the opening of the Stockton and Darlington Railway, the export trade in coals might be said say was originated chiefly in order to supply the wants of the district it traverses in reference to fuel ; and the estimate then made of the probable quantity of coals which would pass along the line was, that there would be 80,000 ally. The number of tons now carried by the Company , for the neighbouring districts, In the mean time, the Clarence Railway, terminating on the Tees, has been brought into operation, and contributes to the coals exported not less than 150,000 tons per annum. At a later period the Marquis of Londonderry constracted his Sunderland: it is difficult \(\qquad\) bly exceeds 300 , At a still more recent period, the ancient fishing-town of Hartlepool has become the scene of the export of a still larger quantity. The amount of money annually received within 30 miles of Darlington, for coals alone, may be roughly stated at four millions sterling, this area embracing Newcastle and its vicinity ; but a large proportion of this enormous revenue flows into the county of Durham. Birmingham and Gloucester Railway, by which one of the chief guards, named Dudiey, lost his life. It appears that e came up with the six-o clock train from Gloucester and on reaching Eckington station, he ascended from his seat on to the roof of one of the carriages, and was in the hief part of the trains passed oser his body and kilted chief part of the trains passed over his body and killed im on the spot. A coroner's inquest has been held, and it heing proved that no blame was attached to any person,
but that the accident was the result of his own imprubut that the accident was the result of his own imp
dence, a verdict of "Accidental death" was retarned.

\section*{SCOTLAND.}

Edinburgh.-A good deal of sensation has been exeited n this city by the abrupt departure of a public functionary Who held several public offices of considerable emolumen and responsibility. It is said that the individual in ques-
tion, in intromitting with the funds committed to his tion, in intromitting with the funds committed to his
charge, has proved a defaulter to the amount of about \(0,000 l\). which Government will be compelled to mak good ont of his personal estate, which, however, is said to greaty inadequate to meet his numerous other liabistance that the party in question has been for a long series years in the receipt of an annual income of not less than 2000l., derived from the various offices he beld. I is said that there will be some effort to hush up the affair, ome detailed explanations.
Glasgov..-The adjourned meetinis of the committee of the Wellington testimonial was held on Wednesday, when, Alison to give the commission to Baron Marochetti was greed to. Ameadments were propos M.P., in favour of Mr. Gibson, and by Mr. M'Lellan in favour of Sir F. Chantrey. The former was negatived by
a majority of 12 to 7 , and the latter by 12 to 5 . The trial of Doolan, Redding, and Hickie, for the murder of Green one of the gausers on the Edinburgh and Glasgow Rail way in Dec. last, the particulars of which we have detailed before the Lord Justice Clerk and Lord Moncrief. Thie evidence was of the most conclusive deseription as to the guilt of the prisoners. The trial lasted 12 hours, and the oners, recommending Hiekiry sgainst all the priGeneral has written to thé Lord Adrocate on the subject a commatation to transportation for hife in his case be successful ; but for the other two prisoners there appears to be no hope.
Drumeldrie. - On Sunday morning the inhabitants of his hamlet were greatly alarmed in conserguence of the suicide of Margaret Bronie, an aged unmarried female Deceased, who was upwards of r, ilved with her brother also aged, and both were on the best terms with each other. On Saturday night both supped together, and the
brother went to bed, leaving his sister sitting by the fire brother went to bed, leaving his sister sitting by the fire. It would appear that deceased had also gone to bed, but without undressing, and that towards morning she hai left the house and gone over the wall at a little distance, , she had cut her thr clothes laid out in preparation. There is no cause assigned for the deed, save that of late she had been complaining and appeared unsettled in her mind.

Dublin.-Lord Ebrington hasconsented to become patron of the Agricultural Improvement Society of Ireland, and expressed his liigh approval of the objects and proceedings the society
Queen's County.-It is stated that the murder of Edware Byrne, which took place in this country last week, was oramitted in view of ex-Judge Moore, whe. when standing heard the represt, and perceived three fellows running from, the place where the murdered man fell. The judge's \(\mathrm{c}_{\text {arriage }}\) being at that time in readiness before his door,
ordered the horses to be taken from the velicle, and sent two men, with others on foot, in chase of the fugi tivea. The pursuit, however, proved vain.
 scene of amusement. My companion settled with the oficers, and I climbed a ladder; but the gallery was too full to gain a good position. I sat down on the first sea I could hind with my cap on ; but thinking after a while would take it off, by way of compliment to the company 1 attempted to remwve if, unperceived, if possible. This however, did not escape notice, but was applauded by a mavimur that ran in all directions around me-so alive are these people to the least act of respect thet is paid them by the foreigner. I found that report had not ex aggerated in reference passed all praise or description. The firat acene was intended to represent the happiness and splendone of beings who inhabit the upper regions, with the sun and moon and the elements curiously personified playing mund who phe the she the part of the Moon had a crescent is her ho the pars tol hore to 80 as to mic hen. The and opposition of those heavenly bodies as they revolve round in their apparent orbs. The thunderer wielded an ase, and leaped and dashed about in a variety of extra ordinary movements. Aftor a few turns, the monarch who had been so highly bonoured as to find a place, through the partianty of a mountain nymph, in the abode of the happy, begins to feel that no height of good fortune can secure a mortal againat the common calamities of thi frail life. A wicked courtier disguises himself in a tiger' skin, and in this garb imitates the animal itself. He rushes into the retired apartments of the ladies, frighten them out of their wits, and throws the heir-apparent into the moat. The sisters hurry into the Royal presence, and, casting themselves upon the ground, divulge the sa intelligence that a tiger has borne off the young prince who, aforesuid. This loss the bereaved monarch takes so much about the . a crafty woman, he selects a young man who has just sense enough to know that he is a fool. The settlemen of the crown is scarcely finishet when the unhappy King dies, and the blockhead is presently invested with the golden round.' But iastead of exulting in his new preferment, he bemoans his lot in most sad strains of la mentation. He feels his incompetency, and eries, ' Oh dear! what shail 1 do? with such pitfous action, and yet withal so truy ludicrous, that the spectator is at who had taken off the heir, and broken the father's heart finds the new King an easy tool for prosecuting his traitorous purposes, and the state is plunged into the depths, of Such appears to ide the conglumeration of events Chinese dramatic plot It seems also that the in effects of their theatre are very deficient, though the resses are at times, suterbly elogant, and the acting oc casiunally far above woediocrity; but, nevertheless, the mora!s of their stage, wheli would seem to be the great point to be attained in all their dramatic performances, are very good.
among the ( 35 th Ede (ine March; Agnes, Countesse de Pembrippa, Countesse de C. untesse de Atholl. In the preceding year also, there had been writs tested at Ruynton, ou the Jth of April, issued to divers Earis, Bishops, and to four Albesses, requiring their attendanee at 1 estminster, on the morrow of the Trinity, for the purpose of treating of an aid for the mahing of the King's eidest son a knight, \&ec. In other and niore modern phraseulogy, they were summoned to con however, that any ladies ever actoally "took their seats" Parliament by virtue of these summonses; but there re numerous instances on record of hath squires and knights having sat in the House of Lords in right of their uives.

Filtration.-A system of filtration has recently been invented upon a novel scale, by the medium of which any quantity of dirty or discoloured water may be rendered an gallons per days. In order to hundreds and thoosands the rapid and certain effect of this newly-discovered system, the following experiments may be named:-The sweeping of a dirty yard aad the cleansing of a coal-cellar were cast into one of these filters, and the water which Howed from it, at the rate of six galions per minute, was as pure and clear as if it had been freshly drawn from a spring. One of these filters has been latel ereeted on board the Dreadnought vossel, lying off Greenwich. The filter supplies pure water for the whoie of the patients on board the ressel. It acts in a duuble capacity, that of cistern as filtercu. It only requires cleaning once every six monthe which can be dune in less than half an bour withent inconvenience of the filter being taken away from the ves el. To ships going to sea this invention would be of the most beneficial advantage, as a filter of eight inches in diameter, occupying such a small space, would supply on gallos pur day or pure water, and it could be cleanel of boiling water. In addition to the above, this fitter will purify oils, wines, spirits, whotut their sustaining th purify ons, wines, spirits, withour chair

The Oriler of Jomils.-It has been colcuiaterl that the Jesuits, before the sippression of their erher. Monssessed in various parts of the world a revenue of \(27 .\), , 9,0, , of 0 . The scciety comprised 22,589 individuals. They had 340 different resilences, and 24 proflssed houses, an's, at Rome, a seneral, who directed (as he still directs) all these establishments, whose existence hail, and still has, and even kingloms.

Sark Siluer Mines.-The existence of a silver mine, likely to be productive. in the Island of Sark, appears to be no longer a matter of doubt. Very satisfactory and published, and these have since been confirmed by the published, and these have since been confirmed by the depth yet attained) prolucing 6.39 oz . of rine silver to the ton of ore. It appears the ore improres both in quality and quantity as the works descend, and althongh mines is but rery tritfing, opwards of \(15,000 \mathrm{nz}\). of silver have been raised, besides naby tons of lead. There is a silver mine now working in Brittany which has been pro-
ducing a profit of 50,1006 , per aunum for some time past, the characters of whict 1 are known to resemble that of Sark; and from the direction it bears is not unlikely to be a continuation of the same vein, as mineral reins have been traced to a much greater distance than that between Sark and Brittany. The Herm Copper Me carried on with increased visour. Both these undertakings, if attended with success, will be of great importance to the Channel Islands, as well as to the importance
ton of tha vito . tion of the visitors in the ornamental gardens of St. James's Park was called to a large carrion crow hovering over the lake, Jynareatly with the intention of attacking some of
the birds. After contemplatins an Euytian the birds. After contemplating an Egyptian goose for some time, he soared to a great height, from whence he
descenderl with great velocity, pouncing upon a duck which was at the time seeking inseets in the grass, surrounded by a numerous brood of young ones. The large yellow bill of the crow penetrated the neck of the duck, but did not kill it; the crow then soared aloft again, and came down rapidly, striking his prey again in the neck, and killing it. He then seized the duck in his month, and fuently in the direction of cartand retired to a more secluded spot, the rookery at Spring Gardens, to enjoy

Hong Kong.-The following account of Hong Kong is ritten by a French art1it of the name of luorget, who spent some time in China, and who has several Chinese landscapes, sketched from nature, in the Frencit exhibition
now open at the Louvre:- "The island of Hong Kong now open at the Louvre:leagues to the south-east of (anton. It is separated from the continent by an arm of the sea, which is so narrow, that at three different points the distance is less
than a quarter of a league. Its length is of three small than a quarter of a league. Its length is of three small
leagrus, at least as well as can be juiged from one of the highest mountains. It is about a league in breadth on its western side, and a league-and-a-half on its eastern, where two tongues of laml adrance into the open sea, and form a quantity of small bays. I was told that there was a rather extensive villige in one of these bays, but as 1 only saw the southern part of the island, from the top of the side wich looks, and as cuntinent and in which is he harhour I will not sneak of it. The island is very mountainous, and is scantily furnished with wood. The mountains are, in several places, studded with blocks of rocks which rise above the soil. They are also covered with exceilent pasturage, whach the Chinese, who know so well how to make use of everything, stil cannot
utilize. Every year they get fire to the drimal grass of these beautiful meadows. On the side which looks towards the contiment, that is, the eastern, the island contains several small valleys, not very large, but in which everything that can be cultitated is admirabiy so, and with that care which the Chinese alone are capable of. The bills which surround these valleys are generally barren; but as soon as the inhabitants can get a little water, they set to work and diside it, with such a rare sagacity, and in sucis just propartions, that they soon chanare bur renress into fertile nelds. Ihe in ot inpurtant filley is that which faces the bay, then the the contiment, and which I bave risited. This ated upon the contiment, and which iowe gorced, formed by a small hul placed at the end of the valles, and upon which pines and some other trees scantily grow. This vailey is certainly the most popmlens, the most micdoubesque, and there meat soon be Eusliah souses and villas in it. Nevertheless. On this pat of the island, for it is t.o far from the bay. part is, Fithout esception, that of the west. But thore also is the bay, one of the most vast and macnificent I have ever suen in Ctina. It can contain a great namier a sure shelter against the northeast wind and against the riolent fink on' which desolate the coast during the sonth-east monsoon from July to October. During my sojourn in the bay there was a very wiolent one, which we
scarcely perceived. The bay is formed to the south by the western shore of the island, to the north by the conof the island is very high, on the west by the mountains land which separates Hong Kong from Cowloon. It is to this tongue lif land the lum adopition of the anchorase of llong hong by the smur-
gling vescels; they built a fews cabins and establinhed gling vessels; they buit a fen eabins and established to the English and Americans. During the war the Mandarins burnt the cabins, destroyed the establishment, and expelled the Chinese in order to prevent their holding ang relations with the barbarians, or to punish them for
having beld them before. As this was the point that was nearest to the anchorage, the captains made it their place of rendezrous, but they rarely absented themselves order to go to Cowloon, and I found alternate valley cultivated with rice, and bills covered with tombs. most npposite the place where the ressels anchor, there is in the island a spring where the boats take in water. actories will be built there. It will be necessary to make some works there, for the smallest boats cannot approach he shore on account of the little depth of the water. But these works will be excessively easy, beuause the se sand, and because the island furnishes a great quantity of material for building. At all erents, in the bay of Cowloon a point very near llong Kong, there are magnificent I will say nothing of Hong Kong as a military point ; for the Chinese consider the least European lortitications as impregnable. Whatever may be the stipulations of the reaty concluded between the English and Chinese, all (o)reign commerce will soon be transferred to Hong Kong Canton and Ihampoa will be abandoned on account of the expense of pilotage, which is excessive. The mer ther rendezvous in the Eaglish comptoir. Should the even be allowed to reside at Canton, 1 duubt if they would profit by it. I do not think many British subjects wil expose themselves to the dangers they have already run and which they must remember: for whatevor mat been said since it was past, there certainty was real dan themselves very ungrateful towards Cupt. Elliot, whose firmness and resolution alone have perhans saved their Vives. Our worthy and excellent missionaries will also undoubtedly seek from the English a protection which has often been refused them at Macao. Nany themes establishment, and have only been allowed there through the generous benevolence of Capt. Elliot; and when w think that their principal danger was from the ridiculuus jealousy of the Portuguese, who pretended to have the never send any! The English only adopted the anchor age of Hong Kong after having been driven from that of Cap. eing-moon, three leagues to the north of Macao, beere the Chmese had constructed forts. commenced, and aiter numerous refusals, only quitted When they heard of the arrival of Commissioner Lin a new governor, they all came into the roads of Macao, under the French flag.

SATURDAY, MAY 8, 1841.
Wridendertinge in The enduing week.
\(W_{E}\) are no great admirers of discussions about matters of taste in gardens, except so far as important principles are concerned; for they are frequently founded upon one-sided views, are often conducted in a dogmatical spirit, and rarely convince anybody except their authors: besides, they relate to trifles about which people are unlikely to agree, every person's per ception of the beautiful being influenced by mental peculiarities which all the talk in the world will not alter, in the absence of evidence, not assertions, that it is erroneous. Proved facts, however, no one can safely neglect; and wherever they are ascertained, it becomes desirable that they should be understood by all whom they concern. Suppose it should prove that black next grey invariably made the latter seem paler, while the black itself became deeper, the mode of lowering the tone of the one, or of heightening that of the other, is obvious ; and what is true of tones of black is also true of tones of other colours placed in contrast, as deep blue and pale blue, deep crimson and pale crimson. Suppose it were a question of the misture of colours, and it had been ascertained that the effect of placing blue by the side of rose were to destroy the latter by making it look yellow; or if it could be shown that to place white by the side of black would be to render the black more intense, and the white more pure, not in reality, but in appearance; such discoveries would be the basis of essential changes in the use of colours, wherever they are employed for decoration. To the lovers of beautiful flowers such facts would be of much interest, for they would affect al their arrangements in forming flower-beds, if the object is to obtain the greatest possible effect. That some such laws do exist is well known to artists, or should be; but it is only within a few years that the subject has been investigated in any detail ; now, by the experiments of a French chemist, they have been determined with what appears to \(l\) w the refinement of ccuracy.
M. Chevreul has demonstrated, in an ingenious Essay upon the subject, that the contrast of colours is of the greatest consequence, whether for good or for evil ; and that if to dress a brunette in sky-blue makes her sallow, or a blonde in orange makes her ghastly, or a fresh-coloured girl in white makes her red, so to place discordant colours near each other produces just as disagreeable effects, though not quite so personal, in a bed of fiowers. We shall not just now fatigue our readers with the philosophy of this matter, for which we refer them to Carson, and other divinities of the toilette; it will be sufficient to point out what the gardening results are to which M . Chevreul's inquiries have led. He says that what are called complementary colours always suit each other. Now the complementary colour of red is grees; of orange, sky-blue; of yellow, violet ; of indigo, orange-yellow; and consequently blue and orange-coloured flowers, yellows and violets, may be placed together, while red and rosecoloured flowers harmonise with their own green leaves White suits blues and oranges, and better still reds and roses; but it tarnishes yellows and violets. In all cases, however, where colours do not agree, the placing white between them restores the effect. The following combinations are also said to be good: orange yellow with pale blue, greenish yellow with deep rose, deep red with deep blue, and orange with violet; white suiting all these combinations more or less. On the contrary, we should always separate rose from scarlet or orange, orange from orange-yellow, yellows from yellowgreens, blue from violet-blue; and even red from orange, rose from violet, and blue from violet.
Applying these conclusions to the Dahlia, which is now about to be planted out, the following arrangement of colours is recommended:-
In lines, the following succession; viz., white, red-dish-scarlet, white, rose-lilac, yellow, violet or purple, crange, white, reddish-scarlet, purple tinged with
green, rose-lilac, yellow, violet or purple, orange, white, red scarlet, deep purple, rose-lilac, white, yellow, violet or purple, orange, white, \&c.

To produce the best effect in patches of "seven ar-

\section*{ranged thus-}
we may have, 1. Six orange
with a purple or violet centre; 2. Six purple or violet with a yellow centre; 3. Six yellow with a purple or violet centre; 4. Six scarlets with a white centre; 5 . Six white with a scarlet centre; 6. Six rose with a white centre; 7. Six blackish green purple with an orange centre : these seven patches forming a straight border, may be then repeated in an inverted order, which would give 13 patches; and there should be a patch of seven whites at each end. If the border is circular, without any central point of view, the foregoing arrangement should be repeated ad infinitum without inverting the order after the 7 th patch.
Another advantageous disposition would be the following:

In this arrangement violet may be substituted for purple.
These are points that richly deserve the consideration of those who are now about to plant out beds of Verbenas, Pelargoniums, and other tender annuals, for they will be found to affect essentially the display of agreeable colours. It may be difficult to apply them at first, but the attempt should be made at once, and such notes prepared during the flowering season as will enable the principles to be carnied out another year. In dressing and adjusting the stands of flowers in a Florist's exhibition, the harmonious contrast of colour can aiways be kept in view, and the importance of attending to the effect of complementary colours observed advantageously. The ground colour of such stands should be most especially consulted; and it should be remembered that the nearer colours are brought together, the more decided is their mutual effect.

People may smile at these observations, but they may depend uponit aflower can be dressed becomingly just as much as a face, and that a flower-bed requires to be "got up" well, no less than a gentlewoman. Let us hope that some of our correspondents will apply themselves to the examination of the principles laid down by M. Chevreul, to which we shall frequently have occasion to advert.

Scarcely a year elapses without some crafty foreigner coming to London to gather in a harvest from the rich frequenters of the metropolis; and even gardening is not free from this nuisance. Such people, of course, deal in marvels, and offer their buyers the most wonderful productions, among Roses, Dahlias, Camellias, Pæonies, and similar flowers that are general favourites. Yellow Moss Roses, Blue Pronies, and Dahlias, petals striped with golden yellow, flamecolour, and black, are as plentiful as blackberries with these gentry, who will give their buyers fragrance as well as colour to any extent that may be demanded. We have now before us one of these lists, put forth by some people from Paris, in which are Roses with purple, black, and violet borders - with red, scarlet, and yellow-with brown and violet and red stains-with light purple and yellow spots, all with fine new names, -and quantities of herbaceous Pæonies redolent of Roses. We caution our readers against being deceived by such representations; for they may rely upon it they will get nothing but old and common things under these grand descriptions. Buy nothing unknown of an unknown dealer, is our advice. Our Paris letter of last week gives a pretty exposure of the cheating that is going forward on the Continent in the Camellia trade.

\section*{FORCING CHERRIES.}

IT is generally ecknowledged that there is no froit more difficult to force under glass than the Cherry, owing to the defectire distribution of the pollen, occasioned by the want of a fres circulation of air and the absence of winged insects, well-known auxiliaries in the proeess of setting. means, and have obtained abundant crops under glass in a high temperature, the inves being 起 yots and under the shade of vines.

Por accelerating the ripening of Cherries I prefer the open-flued wall, described in the Gardener's Magarine, Vol. VIII. p. 676 ; and I have been successfal with it for several years, obtaining early and abundant crops of fruit even in our cold northern climate, the (herries setting ont without artificial assistance, and ripening in succession from the latter end of April till the latter ead of June or beginning of July, and with sufficient rapidity to supply a family with a dish daily during that period.
flued than upon an anflued wall mhich better on a the genial heat, aided by the wall, which I ascribe to the genial heat, aided by the covering of a single woollen net, or double herring-net, to protect the blossoms from
frost and sharp winds, and which slso shades them from frost and sharp winds, and which slso shades them from
the bright sunshine; and I am also inclined to attach some importance to the last circumstance from having witnessed the success attending this practice in the forcing of Cher ries under glass in the Royal Gardens at Kew in 1806 and 1807-the practice there being to shade the blossom from the direct rays of the sun.
The system of heating employed here is simple :-About the middle of February, or when the buds naturally begin to swell, a little fire-heat is applied in the evenings, and in dull, cloudy weather kept up during the day; but in bright sunshine the fire is stopped about 9 or 10 A.M., and set on again about 2 P.M. : this practice is followed until the middle or latter end of May, when the fire-heat is discontinued. A little before the expansion of the blossom, which is about the beginning of March, the net is put over the tree by fixing the upper side of it on nails fastened in the joints of the coping near the edge, and the under side is tied to temporary stakes about three feet in height, placed three feet from the wall, and the blossom thus protected is never injured by the severity of the weather. About the middle of April the woollen net, or double her-ring-net, together with the staken, are taken away, and a single herriog-net put close over the tree to protect the ripening fruit from birds. I may here remarls that the trees subjected to artificial heat have progressively vegetated earlier than formerly, and consequently some variation has been occasioned in the time of applying the heat but now a more regular system of training the bearing shoots between the principal branches is adopted. The trees are trained in the fan form, with lateral bearing branches of from one to three feet in length, according to Ineir strength, trained in between the principal branches In all parts of the tree these are allowed to continue several years; when they become bare of spurs, or inclined to get toi hururiant, they are cut out-young shoots to sup-
piy their place being previously prepared. The border is composed of rich loam, three feet deep at the wall upon bottom of rock; and to the extent of five feet from the wall the surface is forked over, and a mulching put over it wall spring. Under this system, and with an extent of nace, with a damper to regulate the heat, I have been enabled to obtain annually abundant crops of fruit in regular succeasion. The continued succession is owing to ghe buds on the young bearing-branches \(\pi\) hich are close to the wall being brought to blossom mucls earlier than those apon spurs not so closely attached; indeed, a part of the fruit on the former is ripe some seasons before the flower on the latter expand, so that there is ripe fruit and blossom upon the tree at the same time : and it is owing to the circumstance of the fruit ripening in succession that
the trees are able to bear such abundant blossom. Previonsly to the year 1833 I did not apply fire-heat to the Cherry-wall until the fruit was stoned; but in that year the frst heat was given at an early period; the crop of fruit on one tree weighed tolbs., the first having been gathered on the 22 d May. In 1834 the crop weighed \(9 \mathrm{lbs.}\), first on 12th May. in 1337 I1\% bs. I think it was about the 8th of May this year that I sent a sample to the Horticultural Society of London, and from that period the annual produce has been upwards of 120 lbs . I consider that this produce from one tree is greater than would be obtained time the succession is longer and better kept the same pense for fuel trifling (not above 20s. annually), and little pense for fuel trifing (not above 20s. annually, and little
attention is required except in the thinning of the fruit and stopping the shoots, and without much risk of losing the crop. Last year I gathered from the above-mentioned tree a small dish of ripe Cherries fur the table on the \({ }^{2}\) th and another on the 25 th of April. This year, on April rop is most abundant, and the tree vigorous and heaithy. Double the quantity of fruit usualig sets to what is allowed to remain.-G. Shiells, Erskine House Gardens, Glasyour.

Tae "soda" of commerce is, as will be readily supposed, not the pure alkali soda, but is a carbonate, and, The the carbnnate of potash. posely for the procared by briming sea-reed the ashes of rhe mat part a large quantity of carbonate of soda. and in..... nue , unntities of sea-weed were annualis collected .ind inent for the purpose of obtaining ween-ash. kelp, or har:..a, as the rude salt was called. Of late rears, however, means have been discovered of obraining the carbunat of sods
by decomposing common salt; from which it is now manufactured so cheaply, that it has not only surersedel the use of kelp or barilla for all purposes where carbunate of soda is required, bat has 莱o from irs low cost been substituted to a great extent for putash and peariash, and hence the carbonate of soda, or "soda" as it is commonly cailed, is very largely used in the arts of glass and aoap making, and other processes where an alkali is employed. In order to obtain carbonate of soda by the de-
composition of common salt, it is first of all necessary to
convert the salt, which is a muriate of soda, into a sulconvert the salt, which is a muriate of soda, into a gul-
phate: this is done by mixing it in certain proportions with oil of vitriol or sulpharic acid, and heating the mixture in a furnace. The muriatic acid is expelled, and the the soda, combines with it and forms sulphate of soda. The second process is to mix the sulphate of soda thus Tormed with chalk and pounded coal, and strongly heat the formed with chalk and pounded coal, and strongly heat the high heat by the charcoal or carbon of the coal, and a carbonate of soda is produced, which is of course impure, containing charcoal and an insoluble compound of lime, so that by pouring water on the crude salt after being taken out of the furnace, a clear colourless solution is
procured, which on evaporation yields a clean and nearly pure carbonate of soda. This "soda" contains a large quantity of water, alchough apparently dry; and when left exposed to the air, it dues not, like the carbonate of potash, attract water from the air, but, on the contrary, parts with it and becomes drier, at the same time crumbling down to a fas before it underwent this change. The reason of this is, that when the carbonate of soda, by exposure to the air, parts with a quantity of water, and consequently becomes much lighter, it at the same time combines with a second dose of carbonic acid, which it obtains from the
air, and its caustic qualities become more fully neutralised than they are in the common carbonate.
The salts of soda are for the most part white, and easily soluble in water; and, like the compounds of potash, are widely diffused throughout nature. The nitrate of soda is in most respects very similar to the nitrate of potash; but it unfortunately possesses, in a slight degree, the property of attracting moisture from the air, and hence, being the manufacture of gunpowder. For other purposes, such as the preparation of nitric acid, where this property does not signify, it is very advantageously substituted for the sait of potash, which it likewise resembles in appearing to exert a powerful influence on the growth of certain plants and the fertulity of the land. The sulphate of soda is also found native, and is frequently met with in mineral waters; it is the principal ingredient in the mineral springs of Cheltenham.
The third alkali, ammonia, has already been before us: in its pure state it is a colourless, invisible, and very pun-gent-smelling gas; but, like potash and soda, it has a very strong affinity for acids, and is therefore hardly ever met with in its free state, but always in combination with carbouic, or some other acid. It is far less abundant or common than the other alkalies, potash and soda, for its principal source is the decay of animal and regetable substances of ammonia are the carbonate and the muriate, the carbonate, which is the salt produced during the decay of organic, matters, was formerly called salt of hartshorn, organic matters, was formerly called salt of hartshorn,
because it was mostly procured by burning horn ; it because it was mostly procured by burning hom; it
is now, however, principally obtained from the combustion of coal, which contains a small quantity nitrogen, and therefore during burning gives off a small quantity of ammonia, which cumbines with a portion of the carbonic acid formed by the burning of the carbon of gredient of soot. Carbonate of ammonia is largely obtained from the refuse matters of gas-works, where immense quantities of coal being decomposed, the salts of ammonia collect in large quantity. Carbonate of ammonia possesses the peculiar pungent smell of pure ammonia, though far less powerfully. The muriate of ammonia, commonly tained by burning, which used alses, is now procured from the refuse of the gas-works, which contain carbonate and other saits of ammonia. They are first of all conrerted into a sulphate by the action of oil of vitriol, which expels the carbonic and other weaker acids, and the sulphate thus obtained is decomposed by mixing it with common salt and heating the misture. Muriate of ammonia, like many other of the salts of ammonia, is volatile at a certain heat; that is to say, it becomes a vapour, and reassumes the solid form when cooled again: in the process for obtaining the muriate of ammonia, therefore, it is converted into vapour by the heat applied to the mixture, and is condensed in the solid form again in the upper part of the vessel in which it is heated, which is kept cool on purpose. The uses of sal-ammoniac in the arts are numerous and well known; its principal consumers are the dyers and workers in metals.
Ammonia often seems to combine with substances for which it really has no affinity : this is merely a mechanical effect; such substances have the power of absorbing a large quantity of the gas, which is condensed or packed \(u p\) in the pores of the substance, but not combined with it, and is ready to be given off again on the application of heat, or any acid. Thus charcoal, and, indeed, most porous substances, absorb or conden a large volume of this

\section*{ENTOMOLOGY.}

No. VII.-The Black and Clif-colocaed Tine Weevils. - The high northerm latitude of this country seems to protect us from the hosts of insects that infest the Vines on the Costinent; and even in France the vineand destroz those in the more sonthern prorinces and in Germany. The Grape may be considered as a luxury in Entance to that country, producing an annaal revenue of portance to that country, prodacing an annal revenue of
\(760,000,400 \mathrm{fr}\)., or about \(31,000,000 \%\). sterling a and this
has led that scientific nation to a careful investigation of the insects noxious to the Vine, and to the publication notices several Weevils that feed upon the foliage, one of which is the Carculio picipes, Fab. ; and we have another, the Curculio sulcatus, Fabo, which is quite as destructive, both in its larva and perfect states, and as it is aboundant in France and Germany, it is remar
Curculio sulcatus (fig. 1) is a dull black Weevil with a short stout proboscis, at the extremity of which is the nouth i* \(^{*}\) the thorax is granulated and the elytra are
rough, with several elevated lines and minute ochrerough, with several dots placed somewhat transversely; it has no wings. The period for the appearance of these Weevils depends upon temperature, for May is mentioned by some and June by others, as the months when they are mis E. Edous in gardens, and in hothouses much earier. Mine E. Edwards says that he has seen them in an early Vinery make and from that time until the end of April they feed upon the buds and leaves, always high up, and are never seen in the day. They will also eat the leaves of the Peach, and have been known to attack the fruit. The eggs are produce white margots, like figs, 2 and 3 , and these live produe wise of the vine reng the plats weak sickly: some say that about June the maggots change to pupre (fig. 4), whilst others state that they live through the winter, and undergo their metamorphoses in the chrysalis state only 14 days. These maggots also do great mischief to succulent and other plants in pots, as well as in the border, such as Sedums, Saxifragas, the Trollius, Auricuins, and Primroses, eating round the tops of the roots and detaching them from the crown.
The other species, Curculio picipes (fig. 5) is a most destructive insect in the linery as well as in the garden. This beetle is very similar in figure to C . sulcalis, bous species, alike in sculptare, but vary in tint, C . picipes being of a clay-colour, the wing-cases more or less clouded with darker-coloured spots, and altogether it so much resembles in tone the clods and which this insect secretes itself by day, that it is with difficulty detected. In the night these Weevils sally forth to feed upon wall-fruit trees and the vines in hothouses, either attacking the stems of the new wood in April, which soon becomes black, or feeding near the tips of the shoots. It has been suggested that these insects may be introduced into hothouses with the leaves employed to fill the pits, which is by no means improbable; but as every crevice in old garden-walls often swarms with these W eevis, they can easily gain access by crawling between loose perambulatiou glass, and chinks, during their noc deck to their inerense than stopping all crevices or holes in walls with mortar, plaster-of-Paris, or Roman cement; and the interior of hothouses should be annually washed with lime : the old bark of the Vines, under which they lurk, should be stripped off early in the spring, and the roots examined in October, when they exhibit any unhealthy and as soon as the beetles appear, sieves should be held at night under the branches and leaves, when by shaking them the beetles will readily fall into the sieves, but as they drop down when approached, this operation must be proceeded with gently and quietly; multitudes may be thus collected both in and out of doors, and if the person who carries the light has a pail or jug of water, the sieves can be emptied into them as occasion may require; but when the beetles are eventually destroyed, boiling, not warm water, must be used, as the hardness of their horny covering will resist a considerable degree of heat. When the larva are ascertained to reside at the base of a wall, salt might be freely sprinkled, which will kill them as readily as it will the maggots in nuts; strong infusions of tobacco-water, aloes, and quassia are also recommended
but if poured down at the roots, I should fear they might but if poured down at the roots, I should fear they might taint the flavour of the fruit. [No fear of this.] Where the blood of animals can be obtained, it might be beneficially applied, as it would coagulate over the tender larva and pupx, and set them fast in the earth. Other species of the same genus which destroy Strawberries, Raspberries, the above twis whemils, I shall return to this subect soon as I furnished with the necessary materials to illustrate their economy.
The lines and fig. 2 show the dimensions of the living animals.-Ruricola.

COTTAGE GARDENS.-No. XVI.
The Raspberry bushes will now require to be gone
wood of uext year selected from those which have sprung
up from each stool. For this purpose leave sir or eight of up fromeachiestool. straggling suckers from between the rows. Keep watch ful eye upon your Gooseberry and Currant bushes, as it in generally about this time, or a little earlier, when the caterpillars begin to make their appearance. This is one of the most troublesome pests with which a garden can be infested ; and although various recipes have been given and numerous plans resorted to, we are not aware of any to recommend as an effectual remedy against it. The preparation mentioned at p. 132 of the Gardeners Chronicle is very simple one, and will probably be found useful. It con-
sists of half a pound of soda, half a pound of salt, and histsdul of sool, put into three gallons of hot soap-suds. When the mixture is cold the bushes are to be syringe with it in a still day after the sun is off them; and in about half an hour afterwards some clean water is to be dashed over them. Powdered hot lime thrown among the leaves has been recommended, as well as syringing with strong lime-water ; but after all, perhaps there is no better metho of checking their progress than by examining the bushe frequentiy, and as soon as any caterpiliars are perceived on the leaves, picking themron, crubbing them between tho finger and thumb, so as to destroy the eggs and such of the Ths as are any way advanced.
Those who have Vines against their cottages should go ver the branches, and where the eyes have put forth couple of
See now that the flower-beds and borders are kept neat and elean. Wherever there are any plants in need of support, let them be staked and tied up before they are broken or rendered unsightly by wind or heavy rains,
Should the surface of the ground be hard and crusted, Should the surface of the ground be hard and crusted, move it with a fork or hoe in the same manner as was dithe patco done among the regetables. of those formeri sown have failed. and you have any seed remaining, tura up and renew the soil and sow again.
Bees. -This may be considered in some respects as the busiest month in the year with Bees. The drones will to doubt have made their appearance before this time, and in most cases the several colonies will be greatly increased, so that if the weather should be warm and favourable, the swarming of the hives may be soon anticipated. According to Dr. Bevan and others who have studied the remarkable labour and workings of the Bee, the most advantageous time for a swarm to be thrown off is from the middle of May to the middle of June. Swarms that ismue mach earlier are apt to be small and weak, at cass bad weather will probably require to be fed. Late swarms again, though large, are nearly as uncertaiu of succeeding on account of their not being able to store up a sufficiency of food to support them during the ensuing winter and spring. The usual symptoms which precede swanair hapg: ing in large bodies under the stool, or crowding round the entrance so as almost to prevent the working bees from relax their activity, whilst the drones, on the contrary, become more numerous and appear in great commotion, especially in the afternoon. In this state they often continue for a considerable time ; but when they remaia out all night, it is an indication that they are near swarming, and preparations should be made so that there may be no delay in brushing them into the hive immediately after the warm has settled.-M. E. H.

THE PROPERTIES OF THE POLYANTHUS. The pip of the Polganthus should be large, and the nearer the outline approaches a circle the better; it stould edge must be smooth, and the divisions in the corola, which form it into heart-shaped segments, should reach the eqe, but not cut into it. The segments should be well rounded, making the diisions between them small and shallow. The yue must be of a fine yellow, round and clearly defined, well filed wing anthers, and terminating
in a narrow ridge saised slightly above the surface of the eye. The eye should
 be of a bright rich yellow colour, of a uniform width round the tube. The ground colour must be entire, free from specks or blemishes, of a dark or rich crimson, not paler at the edges, and uniform in every division. The dge should form a narrow and well-defined rim passing perfectly regular, bordering each segae it is essential that the edge and the eye be of a uniform yellow. These qualities in the pips, and the flowers forming a compact truss, standing well above the foliage, on Polyanthus. The following are a few of the best varieties:Pearson's Alexander Buck's George th

HOME CORRESPONDENCE.
31 r . Penn's Heating. - I haped there weuld have been an end before this to the proionged discussion on the ing occasion to advert to the subject again; for willeas.
determination to continue to agitate it. I shall conclade this subject by saying a few words in reply to G. S. Having a personal regard for Mr. Penn, I have no desire or motive to disparage his system, neither have I anything to do with its working at other places, but confine myself entirely to my own experience here, which I consider, as Mr. Penn was thorougbly uncontronted be perfect, as far as his system is concerned. It is not necessary to discuss the merits of the coal used here, but I may say, that it is the slack or
small of strong Derbyshire coal. I do not consider I said too much when I calculated 50 per cent. of loss in heating the drains, masonry, external walls, and what escapes by the chimney-flue, which does not enter the piss; for one-third the quantity of fuel consumed with nearer what they should have required, from the advantages they possess, which I stated before. Another is cylindrical, being 8 feet long by 3 wide, and in my opinion badly adapted for hot water; but this was also Mr. Penn's affair. I am positive the heat consumed by the drains and the outside masonry is never given out to the house; for although they consume a great deal of therefore contribute nothing to the circulation, but coutinue to withdraw heat from it: and even through a mass of masonry upon which the thatched roof runs, the con-
fined heat passes from the chamber and warms the external earth, which may bear some analogy to what your correspondent describes as being the Russian method. Whatever effect it might have in drying dwellings, is very and, I am sure, it is never in this instance evolved again for the benefit of the house, nor does it economise fuel. A grecessary ing materials have to be heated, which is quite useless as soon as the solar heat in the day restores equilibrium. Will Mr. Crowley maintain that there is no loss from these materials, or that it is reserved for the next night? I have been for this reason induced to discontinue firing sooner than I would otherwise have done. As a sunall fire
has little or no effect upon the pits, to have a sufficient cirhas little or no effect upon the pits, to have as suficient circulation to raise the thermometer, the pipes must be lost, what becomes of it? for they cool in the day. That motion commences as soon as the pipes become warmer
than the surrounding air, is unquestionably true ; but in the pits here this motion does not extend beyond the chamber until the pipes become, as I said, hot. It is nut for me to account for the small quantity of fuel consumed by Mr. Crowley's pits, unless they are filled with make a cousiderable difference. Perhaps the removal of the air-chimneys may make some; but the pits here are teresting to some of your readers, especially those desirous of trying new systems, if i state the cost of erecting Mr. after-keeping should be considered, for or against a system, and the benefits supposed or known to be derived from it. As the whole of the work was executed by measure, I am enabled to state the precise amount expended.
I give an end section of the pits, showing the internal arrangements, with the thatched roof \(a, b b\) is the mass of masonry upon which this roof runs, and the arrows
indicate the currents to the drains, of which there are eleven in each pit opening alternately.

First, then, Mr. Penn's bill for boiler and its appurtenances of cocks, altitude pipe, \&cc., fire \&c., is , bars, damper, sockets, labour, journeys Mr. Walker's bill for 700 ft . of cast-metal piping, iron cement for joints, elbows, assistance of
labour, \&c., is . . .

Difference - . . \(130 \quad 2\)
Or, in plain words, Mr. Penn's apparatus has cost 1301.
2s. 5 d . more than heating by hot water would have done besides the extra consumption of coal complained of. As Mr. Penn's heating has cost nearly as much as the erection as well as heating should have cost, allow me as a
summary to repeat, that Mr. Penn was allowed to plan and ix his apparatus without interference or control in any way whatever, except in placing the pipes at the sides, in-
stead of the middle of the house, as I stated before; and the stead of the middle of the hóuse, as I stated before; and the
issue clearly is, that the pits have cost in the heating conissue clearly is, that the pits have cost in the heating considerably more than double what they would have done by double the quantity of fuel I conceive they ought, and they require in moderate weather nearly as much as in winter, a small fire being useless in them. Before next winter I shall have to lay the pipes bare, and probably substitute a five-feet saddle boiler for Mr. Penn's. All his expense has been incurred for the questionable advan tage of circulating the air more rapilly during winter a mong the be any benefit to them; and I now believe that plants of any kind may be grown in houses heated by a good hot-water apparatus in every degree as well as by Mr. Penn's, if even a rapid circulation could be maintained without the disadvantages I have pointed out ; but Ido not deny it is agreeable to persons entering the houses, although for greenhouses, and all other temperate strnctares, this circulation may not in mild seasons be required ten times : therefore, to the plants the benefits, njoy, would be "few and far between, and by persons the o a considerable current would be so sellannot conclude this to me very unpleasant subject, without saying as an apology for myself, for trasting to another, that this is the firat instance in which I have erected any structure or apparatus since I have lived at Chatsworth, without being first cognisant of its ultimate cost ; but I gave Mr. Penn a carte blanche in this case, telling him I should publish an impartial account of its working. I need handly add, that for life 1 am effectually cured of trying novelties of undecided utility, of any magnitude.-Joseph Paxton, Chatsworth, May 4
Rool-Grafing.-The tree Mr. Beaton saw growing with ause uriance amongst its cankered companions has caused him (in p. 179) to arrive at an erroneous conclumake all the others healthy likewise. But if the experiment was proved. Mr. Beatou would find amongst the trees several affected with canker. The fact already noticed in . 97 , that a proper scion will resture to vigour the most hopeless stock, entirely disproves his cheory, aad shows that of grafting as is generally imagined. I mention the subject to notice a case that occurred under my own eyes. In 1837 I planted a healthy plant of the scarlet Nonpareil and in pruning it reserved a few shoots as scions which, a a proper season, I put upon a stock which had gradually dwindled until, in the preceding autumn, it had not single leaf. The result is a luxuriant tree without a single speck of canker, bearing foliage, and fruit at least onethird larger than the parent tree, which is, however, in good condition. During last autumn I pointed out these rees, which are side by side, to every gardener that came in my way, not only as a proof of the power of the scion over the stock, but of the superiority of one stock over another; as well as to show that disease often arises from discrepancies between the scion and stock, which is often dropoly teributed to the soil after carefully con rron. conclusion differing from Mr. Beaton, inasmuch as I did not conceive that all the sorts of cankered Apples in the garden conceive that all the sorts of cankered the bealthy by grafting them apocks siwould be rendered heatth thy graning theils upon such stock would prove healthy in most soils. Having thas acciden tally found a good stock for one sort, I would try to find a better, and ascertain whether these would prove alike beneficial in different soils. Should this be the case, hal our task is done, as we then need only find out a stock for any other sort that is worth our notice. There is muck to so differently constituted, can succeed equally well upon the same Lind of stock, which may be too gross for some, too fine for others- too early for this, or too late for that. Mr. Beaton's therry of the influence of the soil upon the stock may do something, but in my opinion the the scion, will be of more value, and I hope Mr. Beaton will direct his artention to buth.-J. M., Kent.
Burk Monopuly.-I do nut profess a practical know ledge of the bark trale, but as you have invited you readers to communicate their opinions upon this alude, in I make no apology for offering you mine. I allude, in asserts that the price of English Oak Bark has, decrease within the last ten years in a greater proportion than the price of tanned hides, and illustrates bis argument by tables of the prices of each for each year, whereby we are shown that white English Oak Bark has decreased from 86. in 1933 to 4l. 9s. in 1r.39, tanued 1839. Now it is easy to pre ins in in nine to perceive that the rate of about 36 per cent., and that of
tanned hides but about 20 per cent., at least, according to Mr. Paxton's thbles; but I think they will be found to be incorrect, aince Oak Bark realised generally from 5. 103. to 66 . in 1839 ; and in 18401 received 61 . 5 s. per ton for a very large quantity from a respectable tanner, who, Iknow, wak ruled in his price by the decision of this private meeting against which Mr. Paxton is so much determined. Then this throws a very different feature apon the case, and we find the depreciation to be but at the rate of about 25 per cent., very little more than that est raed hides ; and this, mark you, without the slightest reduction in the price of green hides. I think it is 1831, and home Bark \(3: 1\). in the same year, they would very soon seek a level in price, and this at once accounts for the fact of the depreciation of the former being slower than that of the latter. Yet, eved supposing Mr. Paxton's statements to be correct, he seems utterily to have lost sight of the fact, that other and more forcible tanning materials have been discovered within the period spoken of, which very much cheapen the process, and render the consumption of so great a proportion of Bark unne cessary; added to which, the proportionate consumption of leather in late years has not been so great as it wa during the last wars. If Mr. Parton has not obtained so great a price as other sellers have, it affords no reasonable grounds for him to attack the whole body of tanners, than who rist. With regard to the communication of "P., Berks," annot see that such a plan would be of benefit, if applied since plenty of good tanning material can, and would be,
imported; and it would be the public who would suffer imported; and it would be the public who would suffer am quite convinced that the tanner's profits are no more than they were in 1830, and I cannot see that there exists any necessity for a combination of the bark-sellers: but if necessary, it would be imprudent, by forcing a foreign and inferior material into the market. Again, 30 far from the price being fixed at a private meeting, it is generally decided at the largest sales in the kingdom (sometimes in the Forest of Dean, where annual sales of Government timber take place); and it is here that a greater price should be demanded. Every reasonable person will ses that there is ne monopoly in the largest purchasers ruling the price of che smaner one. 1 am asi secing, as I do, that the price of Bark has only decreased in about the same proportion as the price of tanmed hides, I cannot comprehend where, or how, the tanner's monopoly exists. Supposing there is an unfair advantage taken on the part of the tanners, we must not attempt to overcome it by exaggerated, or even isolated, statements else we shall rather injure or increase the evil than check it.-A Young Foresict, Kidderminster.
Study of Natural History.-There is no atudy which eems so worthy of engagiag the attentiox of a rationa which is equally within the reacti of all tanks and chases the objects of which are spread around us, and at our feet as if to invite us to their contemplation. Indeed, we may be considered as under the necessity of studying it. The animal, the vegetable, and the mineral kingdons may bo viewed as so many great storehouses spread before us by the great Author of nature; from which we may derive all same time thaty ther foon, clotaing, things hurtful and poisame time that they contain many chings hurtrui and poithat instinct by whicb other animals are enabled to discriminate between what is good aud what is bad for them But in its place he has the faculty of reason-a faculty which, thongh at first it appears inferior to instinct, is capable (even here) of vising immeasurably above it. To what height it may hereatter attain we cannot tell ; but it seems destined to continue for ever improving. The study of natural history has a tendency to open and enlarge the mind, to produce habits of reffection, to call off from low and debasing pleasures. It may also serve to humble our pride when we behold the wisdom and ingenuity which have been displayed in what we are accustomed to call the mean est of creatures, and consider ourselves but as a link in that great chain of existence in which

\section*{Each shell, each crawling insect holds a rank, \\ This scale of beings; holds a rank which, lost \\ This seate uf beings: hulds a rank which, lost,
Would break the chain, and leave behind a gap
Which Vature's self would rue.}

The field which natural history embraces is so vast, and its objects so numberless, that there is no fear of ever exhausting them. All that could be learned in the longest life would be but as a beginning when compared with what must remain uninown. It may serve to place the endiens variety of the works of nature in a stronger light, if we consider that net only are the species of plants and animals so numerous, that after ages of investigation we are continually discovering new ones ; but that probably no wo indivicuals of a species were ever fornd exacty to agree in all their parts. Thus, of all the millions of men Who now inhabit this globe, and of all the myriads who life and disappearel, no two have been found exactly alike. This rule apphed to the vegetabie or the mineral kowdom vould hold equally true. Nor are the objects of natura history less varied in their daration and economy than in their appearance. Thus, we have the ( \()\) ik, which hraves
the storms of many centuries, and the fungus of a day And in the animal kingdom, we have the elephant, whict short space of a few hours comes into existence, enjoys the short period of life allotted to it, and departs. One word on the pleasure which maybe derived from a knowiedge of natural ubjects: there are feim who ara not capable of

Now, as I said in my last letter, Mr. Walker, of Man chester, had brought piping to heat the pits by hot water but gave up the job readily at my wish to Mr. Penn, for aino by mese, was 93\%. If to this is added \(3 \%\). 10 J . for set
receiving pleasure from the sight of a plant or flower; but
how much greater is the degree of pleasure to him who only knows the name of the plant he sees than to him who knows nothing about it ! and how is the pleasure enhanced to him who has a physiological knowledge of the plant-who understands the structure of its several parts, their mutua dependance on one another, and the part they are deaigned dent of natural history need never feel solitary; he may dent of natural history meed never feel solitary; he may
always find company in the Daisy or the Moss "growing at his feet, or in the little insect which flits past him. In the wild solitude of nature he may exclaim, with Byron,
To sit on rochs, to muse o'er flond and fell;

To sit on rochs, to muse o'er flood and fell;
Where things that own not man's dominion dwell
And mostal font hath ne'er or rarely been;
Aur mortal foot hath ne er or rarely been;
To climat than trackleas mountain all unseen,
Wirh the waln tock that never needs a fold,
Alone, o'er steeps, and foaming falls to lean :
Converse with Nature's chatms, and view her atores purollyd.
Clintonia pulchella.-As many find it dificult to get the seeds of this beautiful little flower to germinate, I recommend the following treatment as both easy and certain. Let the seeds be sown on fine woil in a shallow pan, and after about a week water them through a fine syringe till the water rises to the surface, which leep up to the mark, and the plants will rise freely without heat.-W. Dumbrill, Gardens, Brechland

Gypsum. - We some weeks since (p. 215) inserted a paragraph, taken from a contemporary, in which it was recomnsended that gypsum should be burnt before being complaining of the statement, and asserting that to burn gypsum is to destroy it. It was in vain that we told the writers, in our Notices to Correspondents, that they were will be satisfied with the following note from Mr. Johnson, whose authority. apon such a point they will hardly dis-prate:-" The conclusion to which some of your correspondents have arrived with regard to the ill effects produced by calcining gypsum intended for manare, is certainly erroneous. The application of heat to sulphate of
lime merely drives of about 20 per cent of its water of lime merely drives off about 20 per cent. of its water of crystallisation, and reduces it more easily to a and by thus being reduced to a state of minute division, it becomes much more readily soluble in water. It is in vain, therefore, that some of the nearly insoluble, roughly powdered, crystallised specimens of sulphate of lime are applied to the soil, for the grass crops for which it is chiefly adapted are unable to absorb what is not even in a state of solution."-H. Johnson.

Local Horticultural Shows. - Permit me to suggest to Fou the desirableness of publishing on the Saturday the horticultoral shows that will take place in the following week, similar to the manner in which notice is given of meetings of hounds, sce, all Eagland over. It will take some time, no doubt, before the communications will be regularly forwarded by the different secretaries, but I should think they will do so if requested by you. Had such a list appeared, I should have attended the Dorking meeting. - Edward Beck. [If such notices are sent us in time, we will insert them with pleasure.]

PROCEEDINGS OF SOCIETIES.
ROYAL AGRICULTCRAL SOCIETY OF ENGLAND.
Wednesday, April 2 Sth. - The Hon. R. H. Clive, MP., in the Chair. The Rev. W. L. Rham read a communication which he
had received from J. Rodwell, Esq. of Alderton-hall, Sutfolk, on
the effects of nitrate of soda on the white clover which had been the effects of nitrate of soda on the white clover which had been
sown with barley the last year. Mr. Rodwell found that where the nitrate had been used, the white clover had almost entirely
failed. Mr. Rham observed that accounts of failures should be noticed, in order to lead to the real practical otility of any proposed manure. Col. Challoner and the Rev. W. L. Rham were eppointed a deputation to the Horticuitural soctety, for the purence to the joint operation of the two societies in promoting the
cultivation of agricultural plants. Mr. Roberts, of King street, euntivation of agricuitural plants.
Westminster, summitted to the counci a new, glass frame for
plants, with an adaptation, first applied by himself, for examaining plants, with an adaptation, first applied by himself, for examining and inspecting the plant or soil, by means of a portion of the HORTICLLTTVRAL SOCIETY.
May 1, 1801. -The amictursary meeting of the Society wres held
this day, Sir C. Lemon, Bart., M.P., one of the Vles-Fresidents, this day, Sir C. Lemon, Bart., M.P., one of the Vice-Fresidents,
in the chair. From the report of the Andiftors it appeared that the income of the Society had last year exceeded ita ordinary expendi-
ture by the sumn of 1578 l . 16 s . Id., and that its sources of revenue nere stendily becoming more productive. The report of the Auof the progress of the Society during the Fear just elapsed. We cannot find room for extracts from it, but it will be satisfactory sum as \(5254 l .6 \mathrm{~s}\). 6d, has been laid out in the two last years in the form of \(1417 \% .25 .10 d\). It was stater! that 10,341 risitors had attended the been awarded in medais. Which makes the actual outlar under this heaut of expense, alone \(15.5 i\) lisk tor the last ten years.
Sir O. Mosler, Bart., Mr. Barnard, and Mr. Pepys were elected , Bart., Mr. Barnard, and Mr. Pupys were elected President: Mr. Edgar, Treasurer, and Dr. Henderson, secretary nimousl roted to the Council for the skill and care with which
they had conducted the affars of the Snciety.
May \(4 t h\). Sir. C Lemon, Bart., VP., in the chair. C. D.
 were elected. In consequence of the approach-
zarisens, the plants exhibited were not so nume-
gin meethnas: ont this was ampiy raade up hy the

genistortes. A noble specimen or Diosma unifbra, covered with
Wriete sweet-scented flowers; the curious Binksia ericifólia, with
grenish-yellow tufts: Eutaxia mytifolia, loaded with yellow

 Lavertoninsil, white centre with a purpie border, the habit of
both plants is compact and dwarf. A handsome seedling Epiphyl.
lum, G. canlescens, of a remarkable size, were exhibited by Sir E.
Antrobus; the Epphytlium was rasised between \(\mathbf{E}\). ckeemanini
and Cereus speciosissimus-it produces large scarlet flowers
and
red Indian Azalea whas sent ons . Wells, Esg.o and its large medal. Mr. J. D. Parks exhibited several seeding Cineranas;
and W. Happer, Eq...sent Acacia verticillita, and a white Indian
Azalea that haul heen srown in a horsse heated during the winter
 Hower or another, much superiur frum its remarkable property of
opening nearly tat, and the inner peatal havug a volt tunge, a
certificate of merit was awarded to it: with these was sent a spike of Cattleya. Moss ze, which is almost unrivalled for delieacy sepals are of a heautiful lilac colour. From Messis. Lucombe and and a new Acacia frem swau River, of Callistachys longifolia appearance of a Weeping Willow. Flowers of the white variety
of Coryanthes macrantha, and Epidendrum Schombirgkii of a red vermilion colour, were exhibited by T. Brocklehurst, Esq.
the former ganed a certificate of merit, and is trulv one of the
most extraordinarily-formet tlowers in nature; its labellum is like a bucket, and capable of containug a quantity of honey secretell by two horns or pumps placed on each side of it; the honey pro-
bably forms the food of zome insect. A fine raceme of the Epipetals, and Brassia maculáta, were sent by J. Bateman, Esq.; and
 duke Cherries and some Figs were exhitited by O. F. Meyrick,
Esq. The principal objects of interest from the garden of the
sociect which, however, are not as yet produced in such abundance as in
its native country; a new Pultenæe, called brachytropis, with its native country; a nhew from their dimmess of colour are not very attractive; Hottia japonica, a, plant with the Meadow-sweet, but prettier; the Madeira stock, with conspicucidium divaricaturn. Cut tiowers of that most beautiful of all raised from seed obtained from Messrs. Schertzer and Sons, of Haarlem, and distributed as a long green, but which pro.
the Russian Cucumber, were also sent from the garden.

\section*{floricultural society}

May 4th.-Mr. Joyce in the Chair. Messrs. Brooks, Brown, ables, E. Groom, -Mooy, - Peacock, - Rollison, R. Webb,
 elected.-Mr. Fairbairn exhibited some handsome specimens of
Heaths; the sorts were the deliciously-scented suaveolens, Blandfordia, depressa, ventita fibe and cocctuea, and nigrita. Mr. tion. Mr. Bowler invited the members of the Society and their
friends to inspect his bed of Tulips next week.
Hay sth.-Dr. Brown in the Chair -
ther animals, illustrative of the Zoology of talys of birds and by Charles Lucien Bonaparte, Prince de Caning. -D. C.E. Von

 plants found in Brazil. Those first described belonged to
ley's group Epigynose and the order Melastomacee. 1. A pe.
cies of Lasiandra, remarkable for its decurrent bracts, which ciermed a hood similar to the calyptra of mostres. In some points and in other characters approached more nearly Lasiandra. It is a benatifil shrub, with splendid purppe inowers. 2, Lasiandra perhaps, a variety of L. fonteneniana. It is however, a much more slender plant, with leaves narrower and smaller, calyx less
hairy, and the filaments of the stamens less bearded. In bocth plants the upper surface of the leaves is covered with shan racterises more or less all Lasiandras. L. fissinervia is an arbo. rescent plant growing to the height of 30 feet, with a white wood, thin medullary rays, and indistinct concentric zones. 3. Le pro-
teaformis: the specimens' of this plant differed from the descrip tion of De Candolle in many points, but more especially in the great hength or the petioles. It attains a heiggt of four or
feember
comber and Janary. cthickets - very frequent near Rio Janeiro. The plant is extermally Itiscid, exhaling a strong resinous odour. \({ }^{\text {Is }}\). C. Mongibarbis, D.C. It is covered with long bristly hairs, giving the whole plant a shaggy apparamce, It has white flowis with dark purple and Howers in November. 6. C. labiata: in the colour of its
fowers 1t is like C. violacea, and in the form of its corolla and caly it difers much. In the arrangement of its flowers it agrees
 some ro uncescrrbed. some respects it approacnes cidcemia urceolata. it gives out a
very powerful resinous odour. It was only once found in Brazil.
The meat meeting of the socioty will be the axniversary.
Neweastle and Darham Horticultural Society, Aprii 23.-The following is the result of this meeting, which whas a good one
considering the season:- For the best dish of baling Apples, of
sorts-the bronze Medla to Mr. . Stephenson, sorts-the bronze Medal to Mr. J. Stephenson, gardener to W. J.
Chariton, Esq., Hesleyside. For the best dish of dessert Apples, of sorts- the second silver Medal to Mr. A Hedley, Eardener to
Sir J. Tevelyan, Bart., Wallingon. For the betdish of dessert
Pears, of sorts- the second silver Medal to

 the second-best variegated Auricula, in flower-the second silver
Medal to Mr. H. Langlands, florist, Bedlington. For the third-

\section*{MISCELLANEOUS.}

Regent's Park Garden. - We are glad to see that the garden in the Regent's Park. The grand entrance gates and the principal promenade are almost finished, and pleting the ground-work, nuder the inspection of Mr. Decimus Burton and Mr. Marnock. With money and good taste this mabl
St. James's Park.-Will any of our friends inform us upon what principle Elm trees in full leaf, from 10 to 12 feet high, have just been planted in St. James's Park? towards perfection, but we did not before know that it had rendered planters independent of seasons. We shall watch the progress of these trees with some interest.
The Patagonian is a new Gourd with fruit elongated like the Barbary Grurd, which its thick yellow flesh re-
sembles in quality. It is very remarkable for its dark-green colour, and for having deep and regular longitudinal furrows, which divide the sarface into numerous straight ribs symmetrically arranged.-Bon Jardinier.
The Scenery of the River Vesdre in Belgium.-Nothing can be more seducing than the ground that has been laid out on the borders of the Vesdre; the ever-changing scenery of the riser's bank's on oue side, and the road to Eupen on the other, against the great rocks that overreside residences. Here is what is called an English garden, with winding walks, greensward, aud thick parterres; but
the trees are all cut, pruned, and trained. They have not the trees are all cut, pruned, and trained. They have not prospered under the influence of full and entire liberty it is the saw and the pruning-knife that here hold sway
Remarkable Trees near Verviers.-Near Mazures, in Belgium, there is a Hornbeam some centuries old, whose branches at some feet from the ground bave been trained living branches of this tree descend as it mere a staircase, and accommodate themselves to it, as they also do to some dead branches stuck in the ground and fixed to the larger branches of the tree. Twelve persons may be protected under the thickest shade. It is the most extraordinary Tancremont, the neighbonring residence of M. Sirard. This tree has been cut into an artificial sculpture, though, according to the tradition of the country, it naturally took dry, and when the agriculturists wished rain, they worshipped this tree, which was found in the middle of a heath; but one fine year when the inhabitants of Cheny, a neighbouring village, wished rain, they remored the tree into their church, when it rained so much that they feared the universal deluge was come, and they were forceat habitation, where it is still to be seen. This country also contains one of the most curious examples of the strange rocks. On an elevation near Marures, near the entrance of the Grotto des Lottois, mar be seen three oaks of most remarkable form, the trunks of which have grown flat against the rock, and covered its uneven surface with expansions of bark in such a manner, that it looks like the skin of a tiger thrown negligently over a sota in a drawing. room. M. Dutrochet could never have found a better
subject to explain the interlacing of the cortical system in exogens.
Mode of Destroying Worms and Moles.-"A. B. says, "The agricultural papers of the metropolis teem at this moment with the best mode of destroying rats ; can you favour me with some mode of destroying worms and moles ?" We would advise our correspondent not to interfere with the moles till they have destroyed the worms, which form their principal food. Steeping worms in \(n u x\) vomica and other poisonons mistures and placing them in mole-runs is useless, for the moles skin their worms before eating them as carefully as our correspondent skins his potatoes. When nearly all the worms are destroyed, but not before, let A. B. not kill the moles, which may do a good turn to a neighbour after having served bim, but drive them away. le may do this effectually by remoring a mole-bill with the spade, placing a lighted match or two in the hole and covering them in so as not to let the vapour escape.-Mridatone Gazette.
Touds: Utility of, in Gurdens.-Practical men have been long aware that to ads live chiefly on insects, particularly beetles. Some persons have even mave is a point to place them on their hot-beds, for the purpise of destroying wood-lice, ear-wiss, *e. Mr. Reere, an inge nious horticatcurist. Who haz long employed foads as guardiaas of his melou and cucumber trames. fult corroborates all that has been said respecting their usefulness in such situations; and is so attentive to them, that, when they have cleared his beds of insects, and he finds them uneasy in their confinement, he actually feeds them. in order to keep them there. He offers them the diferen insects which are considered nozious in gardens, all of which they devour: even slugs are eaten br them. Taus we see that this despised reptile is a beneficial assistaut to the gardener. - Slaffordehire Gawette.

\section*{Rebiéms.}

The Orchideces of Mearico and Guatematio. By James Bateman, Esq., F.R.S., \&c.-Part 5 The last new Part of this magnificent work contaim figures and descriptions of five handsome Orchidacete. The first is Oncidium Insleáyi, which in "the colouring of the flowers is not unlike O . papilio, as also in the singular processes which are attached to the column, and which closely resemble the antenne of various insects." The next figure is Brássia verrucossa, which though " not so brilliant in its colours as B. Lanceána or B. macrostrichya, is superior to either in the elegance of its babit." It is singular as being the first of the genus imported from heavtiful vigached "o the letter-press of tors (or foetion gardens) of Merico, of which Humboldt, in his 'Persons! Narrative,' has given such an interesting account. They occur in the River Chalco, about 10 miles from the capital, and owe their singular appellation to the circumstance of their having been formed upon what were originally drifting masses of reeds, ronts of trees, \&cc., which acquiring consistency by degreez, were at length compact enoug support a fresh vegetation of their own. The third plate is the "Lovely" Laelia majailis, which "abounds in the temperate parts of Merico, where its exquisite beauty has rendered it a prime favourite \({ }^{3}\) and is is there called "Flor de Maia." The fiowers are large, and borte upon e from six inches to a foot high; their coloar is rich streaks and dots, and has a rosy edge. It was "collected by Mr. Hartweg in San Bartulo m situations an eleprated that the temperiture sometimes falis butbw ti.e freezingpoint." It in said to have detied the attemprs of cultavators, and has only been figwered by Mr. D. Leewelyn, of Penllergare, who says, "it was purchawed a amot three yearb since, and soon afterwards pottel ia very rough until its new buls hegan to swell. when it was removed to Water was regularly given untul it.s butbs had aequired their foll size, when it was discontinued by degrees, and ment has been repeated, and the entine gran way on
thrive." The fourth figure represents the singular Odontoglossum gránde, which "must be placed at the
head of the vast group of South American Vandere, curious head of the vast group of South American Vandere, curious
and beautiful though they be." It is found in situations where the mean temperature does not exceed \(60^{\circ}\), though it soon accommodates itself to the routine of culture that its tribe receive in England." The pseudo-bulbs of this species so much resemble Oncídium Insleáyi, and have the same glaucous character, that they were at first upposed identical. The fifth and last plate is Epidéudrum loifolium, which is one of the most singular plants of the geners. The leaves are exceedingly fleshy, lanceolate, about a foot and a half long, and out of their axils proceed from three to five flowers, with green petals and a white labellum.
CALENDAR OF OPERATIONS for the ensuing Week. the epiantings vut of every description of half- hardy plants, whether ing drying, garders stacking arainst conservative wails, and
in planting out tender or half-hardy plants from glass struc. ures, a week later thant this, geterally speaking, will be found no delay, particularly it dry weather prevails. The phants should not
be put out in the middle of the day; for if they suffer and get disthey recover; certainly a greater locss than in likel, to occur in
waiting for a favemrable opportunity. Ou the other hand, if wet or showery weather occur, let there be no delay. We presume
the situatiun of every platu or plants Is arranged betore hand,
and the gardener who puts one out without first huowing its a great deal to blame himself for; he will be taught his want of his plants.
In setting up Oak-bark, choose a high and dry situation in case gether are preferable; for if on the ground, continued wet weather will deteriorate its value, by atitering the colour of which tanners are always ready to take advantage. It should remain unstacked housime in sheds is to be preferred, but if this cannot be, the stacks should not be made large, and thatched immediately.

Pinwer. - Any plants beginning to swell oft their fruit, of which saikers will not the required for stock, shou a pointed iron ; this will by drilling out their hearts with a piece of pointed iron; this will fruiters will require water twice, or even three times a week, one of which may be with manure-water. Syringe all the plants, over-
head on fine mornings, except any that may be in thower, or
 gradua
CIMREP.-Tie in carefully the adrancing shoots, which are readily broken if neglected even for a day; do not stop all the la-
terals at one time of strong growing vines, or they will probably break come of their main eyen, but liet a few days intervene, that the buds designed to break may be started; as soon as this is the ase some more may be safely stopped, and thus working upwards Continue to thin Grapes as before. Preserve a moist atmosphere, except where the frut is ripes or ripening. Give air according to the state of the weather, ang, iepossible earres under the trees, to catch any fruit that may fail; make the netting-beg by having one folls, by coming in contact with those already caustt, they Bot loruised. Keep the branches nently thed in, and dust with Syringe well every fine morning, except where the frait is ap pronching pansurity, nd give abundance of airo is ripe, and any pintio in tabs which ha
Fic-movse - Maintain a moist atmosphere, but do not syringe over-head where fruit
Mzlons and Cucumbrs. - As soon as the first crop of early fruit is ripening ofr, and if it is dexirable to have a second crop couraged to cut back to. The second crop often surpasses the crst. In ridging out the late and large sorts of Melons, a good
depth or soil should be allowed; say 15 or 18 inchos, and made arman ; this prevents the necessity of so much watering, which is calculated to deteriorate the quality of the fruit. Frequently aprinkle the plants nver-head, maintain a good heat by timings,
and cover up accorduvg to the state of the weather. Cuttings of Cuwmbers may be put in for sate-bearing. Continue to stop, every favpurable opportuidt, and watery often, but pot too much Musencow-meus, -Maintain a humid atmomphere by lightiog sentle fires, ayd danoteming the it during rain the better.
inister to all advancing crops due supplies of water, bat Erly Potatocs, should have none after their tops cease growing and adtopt meanss to destroy insects as soon as they malke their арреагансе.

Out-door Department.
From the beantiful weather expenienced, crops of all kinds are ployed among them. The draw-hoe is by far the most soitatie for the kitchen-garden, where it is inportant to loosen the eanth sinfested with sy or siags. rop the earliest as soon as they show fower eartiest.
CAVLEPLOERR-Make wide basins of earth ronnd the stems of the earriest, and water them regularly and copionsly. Sow an boik, and itt it be deeply tug out, choose the ugatest and riche bed for euriy use may be planted out. Sow lmythid ar Grimd Adociral Cabbage, and white and green Ontons.-Hoe and thing anis
Pnat, -If the exrient be tupped ws saom ion in bloom, they wil pod much soone: carth-up and stick as they advance. y bown

SALADNG. - Keep ap a succoedion, trees of all kinds; and where the fruit is irmily set use the engine to them freely. The wover dity whather wender it meenssary.
II.-FLOWER-GARDEN AND SHRUBBERY

Srove.-Any Orchidaceous plants that may not require fresh potting will be greatly benefited by a surfacing of fresh peat
removing the old carefully without breaking the roots. The pot should be thoroughly cleaised from the filth too often seen coverng those in uhich Orchidacear are grown. Continue to shade,
and use water liberally in warm weather ; attend to the shifting of fast-growing stave-plants intended for large specimens, an
also to the propagation of any desirable species. Grekruow- - - As thic hones will he thinned by the remova
of plants to the flower-garden, if the weather prove faveurable or their transter, where there are not stone stages, put, if prac-
ticable, a layer of sand an inch thick for the pots to stand upon through the summer. By wetting this morning and evening, it
will continue to give out moisture to support the plants and malerially assist thieir well-doing. Be still cautious in admoitting
large currents of cold drying air; but when the weather is mild large currents of cold drying air, but when the weather is mild
and warm, leave air all night. PTss AND Fave args.- Malke preparations for turning out, by
anposing the plants as much as possible both day and night. exposing the plants as much as possible both day and night.
Tender and half-hardy annuals should be thinned out, and some
kinds potted as a reserve for autumn. Po and remove to the
 plants should be kept in pots, their flowers pinched off, and the

FLowrr-an Rosn.-Make cuttings from the runners of Nea politan Violets for new plantations. Attend regularly to creepers
of all kinds: much time will be saved by early training. Remove uckers from standard Roses; prepare beds and borders for thei ammer occupants; sow biennials, if not done before, and propa
 Forest and Coppice wombs.- A finer barking season rarely
occurs adopt means as recommended for dry ing it without de-
creasing its value.- \(J\) oseph Puztun.
AptBr the rain, the fran small gardens.
ar offer; also most half-hardy plants intended for the borders may e put out : they should, however, be sheltered by a mat or have a pot placed orer them at night, till there is no longer any fear o
frost. Lawns will require frequent mowing, and they should by no means be neglected by continual mowing weeds are de troyed. Constant attention must be paid to borders, as weed as they grow will require support. Give air and water freely to greenhouses and frames, and keep those plants that require it sitable for small greenhouses given iu the Chronicle of put nont ave menticned Heaths; perhaps from the esupposed difficulty o n high, dry situations; the principal conditions beins neve to allow them to suffer for want of water, and at every opporcunity to give them air. With about 30 or 40 different linds
of Heaths, which might be grown in a frame out of doors, and merely protected in the winter.time by a mat, flowers might be ensured during every month in the year. Among the kinds that re easily cultivated, and best adapted for small gardens, are
Erica ignescens, Persolata and its varieties, ventricosa, regerminans, gracilis, pubescens and hybrida.

\section*{entomological notices}

Alour the beginning of the present month a small grey moth baving a large reddish-brown mark on the fore wings, may be boserved busily depositing its eggs either on the calyx or in the t apparently prefers the former. In a few days the small ; bub are hatched. they are white with a block head, and have fon rows of black duts rumning from the head to the abdomen. When
fully prown, which generall bappensin three weeks, it eats its way fully grown, which generaliy lappensin three weeks, it eats its way
outof the fruit and forms a cocoon under the rough bark of the tree; nd in the fruit in the manner or the first generation. Th over the voung fruit in May and June, and remore all those having Caterpillars winn, wis are easly huown by their being pierced on one side, and having a yellowish appearance. By
takiug away the infected fruit now, which would never ripen, the second generation of Moths will' be rendered much less numerous, and consequently a prettry good crop obtained; which As the insect makes its cocoon under the loose harlk of the tre ome advantage pright be derived from scraping it off, though
his must of course be done before the Motu appears.

Fig tree may be now partly reduced to order by pruning, and
finally so in the course of the summer and autumn. There is no fnally so in the course of the summer and autumn. - There is no
doubt a difference in the quantity of seeds produced by the same plant in different soils, probably owing to premical dieferences in soils; nevertheless, some seeds may generally be obtained in any
soil, from common kitchen-sarden land. It is, however, a baid soil, from common kitchen-garden land. It is, however, a baid
plan for private individuals to save their own seets. They will aways buy them oi better quality from the seedsmen, for reasous
we have not room to give in this place. they do, they are raised freely, by sowing the seed about Febraary, in any gond soil, and treating themlilike those of haif-hardy perennials; they will not filower before the second setson. Rho.
dodendrons are also raised from seed, but require a greatt deal of
care while yon care while young: they should be sown early in spring, in pans
or wide-mouthed pots, filded with sandy pat and well drained,
and be placed and be placed in iny close house or pit, with ben- glasses over
them. As soon as possible after they come up, they should be Mricked offinto other pots filled with the same sort of soil, and by artincial heat is used. The most essential point to observe is, never to let them get dry: fir on that more depends than on any other circumstance, while they are young.
C. \(\boldsymbol{D}\). Will find an answer to his question berry Caterpillar in p. 132. The larvee of the Magpie ging the GoseNematus Ribesii are the usual pests of Gooseberiv. bushend bat Senes. - The raver inses of the Brichictus plsi and granárius are not enaily stopped. It is better to sacrifce one crop to save the others,
\(\left.\begin{aligned} & \text { plants infested. If the spaces between the rows are kept finely } \\ & \text { raked, there will be but little harbour near the Peas for the beeties } \\ & \text { to retire to at night, and a drill drawn at the end of the row } \\ & \text { filled with loose materials, such as old barik, will form a trap in }\end{aligned} \right\rvert\,\) filled with loose materials, such as old bark, will form a trap in
which they will collect, Late in the evening boiling water
poured in the drill will destroy all that are init. To mulcha tree
is to place hitter ror rubbish on the surface of the soill ronnd the
tree, to protect the roots from the wind and sum. tree, to protect the roots from the wind and sun.
S. B. inquires the best mode of treatment for Philibertia grandi-
 place. Procure, frrt of all, a healthy plant: keep pt nearly dory in
winter in a temperature not exceding \(50^{\circ}\) or \(55^{\circ}\); examine the winter in a temperature not erceeding \(55^{\circ}\) or \(55^{\circ}\); examine the
roots in spring, when it begins to grom, and repot it if neecssary;
then water freely, and train the young shoots-which will grow then water freely, and traim the young shoots-which will grow
very fastin any manner pou please. In summer it will grow
well and tlower in the greenhouses; but lareer and finer plants will be obtained if kept in a temperature a little higher. ] He also
wishes to know if there is any mode of treatment by which
plants which have been bumt by the sum ent course the leaves which have been blotched in this mannner never can be reeorered, but certain kinds of plants are much more in-
jured by this than others. Sueh plants as Pelargoniums or CuI cumbers will soon form fresh leaves; the burnt ones call be gra.
dually removed and the plants slightly shaded until the young wooded plants -uffer in a greater degree, and take a longer time to cure, because the leaves will eventually drop of ex and leave a
bare stem behind. In this case the plants must either be "cut in," or by kind treatment forced to send out branches and leaves
from the old dtemo . It will be seen, therefore, that different plants
require difrerent treatment require diriferent treatment. We have no room fur an answer to
the remainder of "s. B's" letter, but will revert to it next week. Incertås plant is Filigo germánica. The scales of the involucre

hausted. Nert week they shall be disposed of; we trust none are hansted. Nert week they shall be disposed of; we
missed to which immediate answers are required.

\section*{}

\section*{NEWS OF THE WEEK}

The arrival of the Overland Mail from India has brought us important intelligence from the East. At the date of our Indian news, the Government was preparing a large force on the frontiers of the Punjaub, in consequence of the disturbed state of that country. The settlement of Affghanistan was proceeding satisfactorily, although some conflicts had taken place, in which some British officers had been killed. The army in Scinde had been nuecessful in several movencenta; and on the whole the prospects of the campaign were improving. The news from Khiva is satisfactory; and in Central India the late hostile outbreaks had been put down, and tranquillity was again restored. The intelligence from China is not encouraging the trade had not been re-opened on the 2d February, and at that period it was not considered safe for British subjects to proceed to Canton. Captain Elliot bad issued proclamations, declaring the island of Hong Kong to be part of the British dominions, and guaranteeing to the Chinese residing in the island the privilege of heing governed by their own laws and customs. In Canton a general impression prevailed that the Chinese Commis. sioner was vacillating and disinclined to fulfil his engage ments, and that hostile operations would very probably be again necessary. - The same mail has brought Levant news to a recent date, from which we learn that France has united with the other Powers in stipulating for certain concessions to the Pacha of Egypt, and that much anviety prevailed both in Constantinople and Alexandria in regard to the resalt. There appears, however, no doubt that the Sultan will act on the recommendation of the Allies, and modify the recent firman so as to prevent the necessity of further interference.-Our European news is not of very general interest. The Paris Papers are occupied with the details of the baptism of the Count de Paris, which are chiefly interesting to English readers in consequence of dresses on the occasion, that the peace of Europe will not be disturbed.-In Spain, the Regency Queation still remains unsettied, though a more general accord seems to exist between parties than at the date of our last advices. It is comsidered by the best authorities in Madrid that the Duke de Victoria will be nominated sole Regent, and it in stated that several members of both Chambers have resolved to merge private feelinga for the purpose of bring ing the question to an immediate settlement.-The most recent advices from the United States inform us that the acts and opinions of Mr. Tyler, the new President, have given general satisfaction, and that full confidence is felt in his character and measures.
At home, Ministers in both Houses of Parliament have more explicitly stated their views in regard to the important question of the Corn Laws. In the House of Peery Lord Melbourne has declared that the mensure will be based on the principle of protection, and that its introduction is rendered necessary by the financial exigencies of the country. In the Commons, last night, Lord John Ruesell stated the amount of the fixed duty proposed, particulars of which will be found under our Parliamentary Report. The discussion of the Sugar Duties was resumed on several occasions during the week, and the debate on Lord Sandon's motion against their alteration has beea ad-journed.-After a long debate, Mr. Kelly's motion for the abolition of punishment by death has been virtually defeated; nearly all the separate clauses were negatived and the bill was withdrawn until the Government measure is introduced. - In regard to the affairs of China, detailed under our foreign news, Lord J. Russell has stated that the arrangements entered into with the Emperor are disapproved of by Government ; that Captain Elliot has consequently been recalled, and that it may be necessary to renew hostilities.

\section*{Thome NTebs.}

The Courr.-Her Majesty, Prince Abert, and the Princess Royal left town, on Saturday afternoon, for Windsor Castle, and returned to Buckingham Palace yesthe Prince, has taken daily exercise during the week in the parks and gardens of the Castle.-A rumour bas been afloat for the last few days in reference to the health of His Royal Highness, stating that it is considered necessary that he should visit the Continent in consequence
of being threatened with cousumptive symptoms; but happily the most decided contradiction has been given, on authority, to this report.-CoL. Wylde has succeeded Col.
Bouverie in the duties of Equerry in Waiting on H. R.H. Bouverie in th.
Prince Albert.

Parkiomentery. - It is said thet in the event of a general election Alderman Pirie will allow his name to be offered to the electors of the City of London.-It is stated tion of Dundalk, in order to represent county Galway, on the first opportunity : in which case, it is added, Mr. that borough.-It is now settled that Mr. H. H. Lindsey will start on the Conservative interest for the borough of Sandwich in the roum of Sir R. Donkin, deceensed; ond
miniaterial paper surs that Col. Fou is a cundidate on the Libersal interest for the meme borough, it ia cive atatod
that Commodore Napier will certainly come forward as a
candidate for Marylebone.-Mr. W. Knight has consented
to come forward for the Western Division of Worcestersbire.

Official Appointmenis-Major-Gen. Sir John Harvey Henry Pottinger has been appointed Chief Superintendent of the English Trade in China, in the roum of Capt.
Elliot, who has been recalled; and the Earl of Belfast has Elliot, who has been recalled; and the Earl
been appointed Lord Lieutenant of Antrim.

The Bishopric of Woreester, according to the ministerial journals, will be conferred on Dr. Pepys, brother of the Lord Chancellor, who will be translated to that see rumoured, will be given to Dr. Short, the Rector of Bloomsbury.
Secretaryship of the Treasury.-It is stated that Mr. Gordon, one of the Secretaries of the Treasury, has resigned his appointment; and Mr. Parker, one of the Lords of the Treasury, is mentioned as his successor. for Windsor
Trede of British Possessions Abroad.-Wroma a recent retura made to the House of Commons, it appears that the total declared value of the several articles of Britisi Apoduce or manufacture imported into the ind indies in the year 1839, on which, if of foreign produce or manufacture and imported from foreigu conantries, a deen chargeable, was \(2,957,0931\)., and that the total declared value of foreign manufacture imported into the above countries in 1839 ,
subject to the above duties of 30 or 20 per cent. resubject to the above
spectively, was \(\% 0,024 l\).
Revenue.-From a return recently moved for in the House of Commons, it appears that the payments into the
Exchequer of British revenue from 1800 to 1841 amounted in that period to \(1,956,049,661 \%\). and that the payments into the Exchequer of Irish revenue, during the same period, amounted to \(150,189,340\) /.

\section*{fforeign.}

Trance. - Baptism of the Count de Paris.-This cerremony took place, with all due magnificerrice, on Sun-
day. For the first fime, the heads of the French clergy, being three Cardinal Archbishops, gave the full countemance and sanction of the Church to the dynasty of Louis-
Philippe. No political feeling whatever was displayed by the population, and no attempt to disturb the public peace took place, although something of the kind appears to have been apprehended. The Archbishop of Paris made a suitable address to the King, who responded to the religious sentiments expressed in the name of the clergy. and the edmother. The King and Queen of the Belgians and all the Royal Family were present, except the Duke de Nemours and the Duke d'Aumale, who are in Africa. The Monitetur, in an official account of the ceremony, tates with amusing gravity that everybody remarked the graceful deportment of the Count de Paris. "The Royal old ; at the baptism the Municipal Council presented the sword uffered by the c.ty; the Count admired the sword exceedingly, and made his maiden speech on the occasion,
saying to the Prefect of the Seine, 'Merci,' which deeply affected the metropolitan municipals." In the evening the public amusements took place. There was a concert in
the gardens of the Tuileries, at which the "Marseillaise" was demanded twice, and played by the orchestra. The fireworks were let off at nine o'clock, after which the people went off quietly to their homies. Congratulatory adaresses were, as usual, delivered to his Majesty on this and the Chamber of Deputies; and the King made to each suitable replies. From the answer of the King to the address presented by the Prefect of the Seine, it wonld appear that the peace of Europe is not likely to be dis-
turbed. His Majesty on this occasion pardoned 1.55 convicts, commuted the penalties of 23 , and remitted in three instances the accessory penalty of exposure in the pillory.

The Budoct.-Very animated debates have taken place of the Chamber of Deputies on the first day s discussion public debt and dotations ; being \(353,051,018\) f. for the debt, and \(10,225,100 \mathrm{f}\). for dotations. The ministerial budgets came next; the first being that of the Minsters of Justice and Worship. C pon this last item there was a arm discussion relative to Ministerial interference at elections, in which the Molé Cabinet and Thiers Ministry tere strongly attacked. The items were voted, after some objections to the expenses allotted to the Mnistry of Worship.
Trial of Lan France.-The affair of the letters of LouisPhilippe is still agitated, with unabated vinleoce. in jour-
mals of all shades of opinions. Private letters assert that the Council of Ministers have recommended to his Maesty that a prosecution should be commenced against the Contemporazine at Lotdon, snd that his Mujesty, atter protesting witir much emotion that he bad never written any letters of the kind attributen to him by the Frame nod having expressed his disapprosation of the want of dret Wires the prosecusion of that journal was conMidisters. Ti, Cuart of Assizes of the Srine have senteaced. by default. the editor of the Gaxette de France to 5 ,00wf. fine. fur having published an anfaithfol account Ithe trial of La France, in the case of these letters. He

Paris.
The Difference between France and Morocco.-It is said that the termination of this difference has been obtained by mutual cuncessions. The Emperor dismisses M. Laporte. The Emperor agrees to acknowledge as French suijects all tlyerians, whether Jews or Mussulmans, and to allow them the same privileges in his uomi-
nions as natives of Fratice. Trial of Madame Laffirge.-Affair of the Diamonds the purpose of procteding with this trial. The curiosity of the public, with respect to this extrandinary case, appeared to have rather subsided, eithwr from its interest report having gone abroad that the prisoner would not Cosurt had met and the proceedings had commencel, the counsel for the prisoner muved an adjournment, on the could nut attend the court without danger. It was urged on the other side that the alleged illness was merely feigned ion, during which one of the audience, whose mind had been turned by the extraordinary interest of the case, of the trial was adjourned for three days.
cussing the subject of the terms under which the loan, about to be raised by the Minister of Finance, ought to be contracted, and consider that the preference should be tage of contrncting a loan on those terms, they give statement of the national debt of France as it stood on the st Jan. \(1841:-134.565,019 \mathrm{f}\). rentes at 5 per cent., with nominal capital of \(2,691,310,380 \mathrm{f}, 845,302 \mathrm{f}\). rentes at \(4 \frac{1}{2}\), With a nominal capital of \(19,895,600 \mathrm{f}\), ; \(6,611,1199 \mathrm{f}\). rentes
at 4 per cent., with a nominal capital of \(165,25 \%, 725 \mathrm{f}\). 23.3., 8 - 1 f . rentes at 3 per cent., wion a somisal capital \(79,691,233 \mathrm{f}\)., making the total amnunt of the nomina \(1,835,9096\) iebt \(3,656,167,9381\)., with 2 sinking fund o that it would be more advantareous for the nation to create a new stock, paying a rate of between 3 and 4 per cent.
Slave Emancipation in the French Colonies.- The mission plans and suggestions preliminary to a financia institution, the object of which is the practical emancipation of the negro slaves and vast operations in colonisation and maritume commerce. The plan, which has been submitted to Government, rests upon a combination re presenting the interests of the labourers who will be hiber ated from slavery, those of the commerce or the wother country, and those of the owners of property in the colonies. Nie execution of the plas is further calcula o meet the present financial exigencies of the first ex reriments be made in Guiana, and confine their demands for this year to the sending out of a special commission omposed of engineers, men of practical be sent to the culony by the end of July, in order to study the means of carrying the system into execution with suc cess. It is probable that the colonial commission will be called upon to commence the investigation of the propoition immediately after the present fetes.
Carlist Refugees in France. - The report of the com mittee on the grant of a supplementary credit of \(1,400,000\) or support of foreign retugees has appended to it a state ment of the number of Spanish refugees now in france and receiving assistance from the Government. They archbishops and bishops, 4 ; priests and monks,
employés, 234 ; geueral officers, 0. ; superior officers, 915 ; inferior officers, 4172 ; sub.officers and soldiers, 151 ; women, 646 ; children, 932 . Total, 7816 ; subsidies paid to the above per month, 203,656 f
Enylish and French Fisheries.-A Breton paper states that some English fishing-boats having again appeared on the ogster-grounds near St Brieux, the Bodine warcutter gave them chase and fired on them, by which one o the English fishermen was killed. No further particulars, however, are given.
th ult. the Rhone again overbetween banks, destoying the fourth time since November, the country around those two towns, and the territory adjoining . Aries, and destroying the whole of the crons.
SpAin:-The health of Queen Isabella continues delicate. It is said that she will take up her residence at the Roval Palace, at Aranjuez, and perhapis mahe a tour in Andalusia, to try the sulphur baths. The Regency question still remains unsettled, though the last accounts from Madrid represent that dissension had given way to a much better and more general arcord between parties in the Cortes than was at all anticipated. The mixed comnitssion of deputies and senators had drawn up a report containing fifteen articles regulating the form of electing the Regent or Regents. If the senate and deputies shonld confirm this report. the debates would at last commence as to the person or persons composing it. It might, humever, tee stull sume days befure the two chambers agreed as to the form of proceeding. In respect to the result, it was stull thought by the best-informed persons in Madrid, be appointed the sole Regent, if not by the Cortes, at least be appointed the sole Regent, if not by the Cortes, at least
by the army. The decision upos this question wan not
expected before the middle of this month. It is affirmed disconcerted the advocates for a triumvirate, by a positive refusal to form portion of the Regency, whether with or the guardianship of Queen Isabella. Which is claimed by the intante Don Franciaid de lauto as a risht,--subsequent accounts from Madrid sate that the senate has many senators have declared that they wili saurnice their personal opinions, to settle speedily the question of the
Regency. On the 29th it was expected that the chan her rorald meet and decide as to the number of thae kesency the Regent or Rugats mould he taken. The annmersary of Queen Christina was celebrate? in Ma hid with great rejoicings. A stringent manifero Mad been adures efit to the Pope's allocution. ()fficial orders had been given to published a chapge in \(f\), vour of the Pound see, for having stated that the Gevernment were becomming alarmed at the aspect of the secret societies in various parts of the
country. It appears that it is the Carlist Chief Tristany, and not Cabrera, who has entered Catalonia
Portugal. - By the weekly packet arrived at Falmouth,
we have received intelligence from Lishon to the It is not of much interest. Accounts from the Algarve give a melancholy report of the disturbed state of that pro. vince. It appears that the Cuerilla- are now numerically tronger, better orgauised, and more formidabie than they chido in 1436 ; notwithstandme, dissensions exist among their leaders. They are paid regularly 811 reis per diem payments. Spanish duabloons and Portuguese go'd pieces are changed at Odemira, and other districts. Gangs of them, varying from 50 to \(10: 1\) in number, are constantiy roving about in various parts, pilloging and robbing with
the utmost impunity. The high roads from Maita aud Val de Zebro to St. Ľ bes are so infested with predatory bands, that all persons whopassed there during the last weel were plundered even to a state of nudity. -The finance
committee had been reduced to seven members, the res having gone to their respective homes in the provines nevertheless they continued their labours, which it was departmo proposed indisidual senators and depaties had also retired from the capital, under the conviction that the Cortes would immediately after their being opened on the 2ith of next munth, be dissolved. Meetings of the Ministirial partisans had been of late frequently held for the purpose of tryin doubtful whether they could reckon upon a majority.
Germany.- 1 Potsilam shall be demotishent hy the Kimes order, whic will open to the town the fine gardens and grounds in the environs. It is consitered prol fole that the ralls of Berlin will soon share the samie fate, to be changed ine Britaind.-The recrnt and cation of the navigation laws, conceded by (ireat Britain to Hamburgh, has given general satisfaction, and the measure, it is thoug \(t\), will have a farourahle operation upon the commence of the Elbe. The treaty betwen in London, on the 2nd March, but not yet ratitied, stipalates that ships belonging to Prussia and the states of the prohibited goods, and conning the Elu or the Elbe. or any other river between the the and sall
Meuse conneeting the German states with the sea, shal be admitted into British pussessions with all the facilities and advantages granted to vessels sailing ports. The shipping of the Prussian League is thu placed on the same footing as Austrian ships by the late treaty, which allows such ships to convey Austrian produce from ports on the Danube, though the port of exsia league engares to plan. By the sammerce on the footing the most faroured nation, as regards the importation of rice and sugar. Dr. Huisgen, the general viear of Cologne, hav ing died, the Cologne question has become nure dititienl to ettle : the general vicar was by right the administrato of the diocese in the prelate's absence.-We learn from Hungary that the Papal Court is much annoyed at the turn given to the mixed marriage question in protestat There a mired marriage performed hy the Protestas clergyman alone is valid. The p.ppution, whe educa not wish to make any engagement reapecting che ctestant tion of chiliren, content culls in Fain upon the Austrian Guvernment to intertere.

Italy.-It iss nit that some difference has arisen between the Britisin Embassy and the King of J Tples. respecting the arrangement of the Sulphur question, wi.c. is feared may histurb the friendy understanding exis, and France. It appears that Mr. Temple, the English Anmbassador at Naples, had addressed a note to the Neapolitan Cubinet lately, to which the Government returned no answer, but forwarded an extraordinary courier to Londonst with orders to the Neapwhean Ambassauve which proto negotiate directly with Lord pannersion, where have ceeding gave mach offence to Mr. Temple.- Te serious ss oeen several earthquakes in Calsers of this Journal.
those described in formere nambeen received from Athens,
atating the Sir E. Lyone, in connoquance of inetruetions
from London, had remitted to the Greek Government two
notes. One was to demand the payment of the balance notes. One was to demand the payment of the balance
due to England by the terms of the loan, and in case of the Government not doing so immediately, declaring
that Greek ships in British ports would be put under that Greek ships in British ports would be put under
sequestration. The second note was to urge the Government to prevent Greek malcontents from passing into
Candia; and the reply of the Government was, that it was impossible to exercise a sufficient degree of surveil lance for this. The answer to the first note is not men-
tioned, but the demand is asserted to have put the Cabinet in a state of great embarrassment.
Russia.-Intelligence received from St. Petersburgh announces that on the 15th ult. the Neva was free from ice down to the sea. On the 17 th, at ten in the morning, a salute of artillery announced the opening of the narigation of the river, and Isaac's-bridge was replaceu.-
been reported that the Princess Mary of Darmstadt, the bride of the Grand Duke Alexander, had been attacked with the small-por, and that her face was so disfigured that she was hardly to be recognised. It was further pre-
tended that the intended marriage might be broken off in tended that the intended marriage might be broken oft in
consequence. The report, however, has simce been stated to be entirely without foundation; and a day is even mentioned for the celebration of the marriage.
Sweden. - The discussion on the proposal for a change in the representative system has come to a close. The proposal of the committee; the chamber of peasants has agreed to it. After a debate of three days, the chamber of nobles rejected the proposal by a majority of 155 to 62 . Ant the fate of the projected measure is thereby deferred for fuil ten years, unless an extraordinary diet should be convoked; for even if the proposal should be brought for ward again in the next diet, the final decision could not take place even in the most farourable case till the following diet. Some of the opposition papers speals in rather
Turiey.-Accounts from Con English courier had brought Constantinople state that an dors at that capital two protocols, one containing the last resolutions of the Conference at London on the TurcoEgyptian question, and the other the preliminaries relative to the Dardanelles. The first is said to result from the alfirs of the East, although she has determined not to enter into any of the deliberations which may end in to demand that two concessions (the She is further said not transpired) be granted to the family of the Pacha, as M. de Pontois, the Freach ambassador, was again in communication with the other ministers, but expressed himTaher Pacha, the new Capitan Pacha, who held that office under Sultan Mahmoud, and was deprived, has since visited the Grand Vizier and his successor, Rifaat Pacha,
by both of whom he was received with much honour. The by both of whom he was received with much honour. The
opinion that he will soon obtain a foreiga mission gained ground. His enemies, however, were not idle; they especially taunted him on account of the reproach which Mahometanism, the foundation of which he has shaken by his reforms.-Admiral Walker, it is stated, has given in his resignation to the Porte.

\section*{Egypt.-We have received no intelligence of import-} The from Alezandria by the arrival of the Levant mail. portion of the hatti-scheriff which requires him to abolish monopolies. The determination of the Porte had not reached Alexandria. The different European consuls were expected to arrive there in a few days for the final ar-
rangement of the Egyptian question. The plague continued in Alezandria, but not serionsly, the cases averaging from 10 to 15 per day. A military force of nearly 30,000 men was in the immediate vicinity.-The Pacha, it is said, had not relaxed in his preparations for defenoe, and the artillerymen and labourers in the arsenal and forts were even lept at work at night secretly to complete the defences of the existing fortifications. Ibrahim still con-
Candia.-Affairs in Crete, it is said, are going on extremely well for the Greeks, the whole island baving risen to a man; and the Turks, confined to the towns, surgents. The insurrection has a perfectly different character to that of the year 1821. At that period it was a war of extermination and retribution between religions and people-political interests are now the element and
soul of the approaching struggle.-Strange reports were afloat as to the first incitement given to the insurrection. The Governor, Mustapha Pacha, and the English consul on the island, are said to have attacked each other in recriminations of an astonishing natare in the presence of Other witnesses, and with the attentation on both sides of Written documentary papers.- The last adrices brought resolved on attacking the insurgenta, who are represented to have set up their government in Crete, and are determined to administer the civil affairs of at least the Christian population. They have sent their wives and children to Greece, and are resolved to carry on the warfare to the last.
INDIA.-By the amival of the overland mail, on Wer nesday, we have recent intelligence from Iudia, which, although not of striking interest, is of high importance. In the Panjaub all was confusion, for the soldiers were masters
of the country under Shere Singh. The European officers were detained thare by force. The Governor-General of

India was preparing a large force on the frontiers; for it
appeared merely a question of time whether the British army was to enter that country. The season was too far advanced; so that it was probable nothing would be done until October. The Commander-in-Chief of the Bengal
Presidency was about to go to the gorth-west provinces; but it was not known if it was to take the command of
the army on its going fato Lahore. The Ranee, widow of Kurruk Singh, had had her paramour murdered before her eyes. She was wounded in the attempt to save him.-
The settlement of Afghanistan was progressing, notwithstanding various petty conflicts. Schah Soojah was said to be looking out for future prospects. While some described him as anxious to get rid of his foreign auxiliaries, there were others who fancied that be was desirous again annexing the Peshawur to his dominions-which is considered a highly probable event in case the British shawur is considered as necessary for the consolidation of the Affghan monarchy. Two British officers, viz., Capt. Douglas and Lieut. Pigou, had been killed in one of the actions. - The Bombay army in \$cinde had made a partial movement into the provinces around Quetta. 5000 had
passed through the Bolan, and 4000 remained in the Scinde provinces. In a late attack on the fort of Sebbee, belonging to the Kujjuks, three European officers and 50 sepoys mere killed or severely wonnded (Lient, -Col. Wilson event, the pacification of the bill tribes of Beloochistan was advancing. The Murrees and other tribes had come in, and willingly made terms ander the care of Capt Brown, well known for the late gallant defence of Kahom, and whose good condnct had gained him the confidence of even his enemies. His services have been acknowledged by promotion. The British authorities in the midst of future. Attock was to be speedily fortified, and also the future. Attock was to be speedily fortified, and also the
monnain passea of Kyher, the Bolan, and Gundawa. The news from Khiva is satisfactory, Capt. Conolly, who was surprised to hear the Khan expatiate on the British expedition against China, had gone to Kokhan, in order to make peace between the Governments of Khiva and Kokhan. British influence, it is thought, will thereby become considerabie in Central Asia, and even from the north would soon control the King of Bokhara. Nothing appeared to be feared now from the approach of the Russians. - In the interior of India tranquillity prevailed. The late hostile movement at Napaunee, in the Carnatic, was speedily put down. In Birmah, Tharawaddie was atill attempt at attacking his neighbours on the frontiers. The Napaulese were watching the progress of the British expedition against China.
. Th.-The state of Persia is represented as alarming. The present Schah was in delicate health, and in.
capable of managing his troops, who were unruly from want of pay. Russia, it is stated, had guaranteed the succession to the throne; and, notwithstanding, two of
the Schah's uncles were ready to dispute it with his chilthe Schah's uncles were ready to dispute it with his chil
dren and with each other: ore of them was stationed near Bagdad, and the other on the frontiers of Affghanistan. Considerable anxiety had arisen respecting the proceedings of Yar Mahomed at Herat. This Vizier, who governs that country for his chief, Kamram, being eager tn get a large sum of money, persuaded Major Todd, the British agent, that the Persians were gning to attack Herat. He and after having excited alarm by his reports in India, got leave to retire in all haste to Ghirisk, whence he entered into a parley with Yar Mahomed, who seized all the
friends of the British and put them to the torture, in order to force them to surreader their money. Major Todd's negotiations and his fears, it is said, have called down the displeasure of Lord Auckland, who has displaced that officer, and sent him to do duty with his
regiment. Preparations, howerer, were going forward in order to counteract the plan of Yar Mahomed.
China. - By the overland mail we are in the receipt of news to the 1-th Feb. It is not of a satisfactory nature. The trade had not been re-opened on the 2nd Feb. On the 27th of the previons month, Capt. Elliot, accompanied by the depaty superintendent, the Prench Vice-Consal, and several naval and military officers, landed at the Second Bar Pagoda, and had an interview with the Imperial Commissioner Keshen, by whom they were most courteously received. Keshen was attended by the principal officers of the province and two Hong merchants. When of his suite had been completed, Keshen invited them to partake of a banquet which had been prepared for the occasion, after which her Majesty's Plenipotentiary and his attendants re-embarked. On the 30th Jan. Capt. Elliot issued a circular stating that negotiations were proceeding satisfactonly, but at the same time intumating that visable for British subjects to proceed to Canton. On the 1st Feb . the Commodore and Plenipotentiary issued conjointly a proclamation to the inhabitants of Hong Kong. dominiog them that the place had become a part of the dominions of the Queen of England, and that natives re her Britannic Majesty. It also guaranteed to the Chinese the free exercise of their religions and social customs, and the preservation of their private property. On the ?th of Ellione month another proclamation was made by Capt Eliot, in virtue of authonty vested in him unter the great
seal of the Eaited Kiagdom, reserving her Majesty's rights, royalties, and privileges over the island; vesting the Government pending her Majesty's pleasure in the
pernon holding the offiee of Chief Superintendent, and
declaring that the Chinese within the jarisdiction should be governed by their own laws and castoms. It was,
however, understood in Canton on the 7 th Feb. that the however, understood in Canton on the 7 th Feb. that the
conduct of Keshen appeared vacillating, and that he conduct of Keshen appeared vacillating, and that he
seemed distnclined to fulfil his engarements. it was seemed distnctined to fulfil his engagements. It was
further reported, that an imperial edict had arrived from Pekin, in reply to the report of the capture of the forts of Tycocktow and Chuenpee, the import of which was decidedly hostile to the English. A very general impression exists that recourse must aqain be hat to hastule operasuperseded. The troops at Chasan still continued sickly and the mortality is said to be alarming.
United States.- By the arrival, at Liverpool, of the royal mail steam-ship Acadia, we have recerived paperg from New York to the 17 th ult. The intelligence they contain is not of great importance. The acts of the new breen yet Mr. Myler, and wis opinions, so far as they had faction. A large meeting had been held at New York on the 15th, at which men of all political parties were present and at which a number of resolutions were adopted, al expressive of their deep regret at the sudden and afflicting
death of General Harrison; of unqualified approval of his acts during his brief official term, and at the same time ppeaking in strong terms of the high character of the new President, for personal integrity and honour, and in full assurance that he would carry out the messures and purPresident Tyler upon the chief respect to the opinions on sion, it appears he has published several letters, containing a complete exposition of his principles, and which coinoide entirely with those of the late President. Nothin new is stated respecting Mr. M'Leod
trovinces, which to the only subject of public interest mentioned, appear party. In Lower Cur of the Government or constitutional party. In Lower Canada the French party had a majority
of 6, but in the United Legislature they were in a minority of 1 .. The whole number of members returned was it. Lord Sydenham had, by proclimation, rogued the Parliament from the sth April to the 20th May. He had been seriously ill on the 5 th inst., but on the 7 th his health was improving. Col. Foster had been appointed to the command of the forces in the room of Sir
G. Arthur, who has been made a baronet for his services.

\section*{斿arliament.}

Honday. - The Duke of Be OF LINGAM availed bimself of the
 Viscount MELBovaNB whether he still adhered, under exire of
circumstances, to the dectaration he had formerly made on the
subject? The noble Duke then read an extract from the spech allideil to. Mrlbournr admitted that unquestionably he had changed his opinion, thounghit it shound be recoltectionably he said hed that
he had never pledged himself as to the measure itself, but only as to the time at which he thought it orght to be discussed. That
time, in his opinich, had now come, when it was
in order to meet the exigencies of the country, to adopt wide and extensive financial measures-measures which, to adfected every other interest in the country, when, he owned, it appeared impossible
to him to leave that, the master grievance, unt. Whelec. Inder he had agreed to take that course which the noble Dute com-
plained of, still holding the opinion which he formerly held,
which was grounded on temporary circumstances, as to the time Which was grounded on temporary circumstances, as to the time
When it might be proper to bring forward this question. That
opinion was entirely based and gronnded on pricula opinion was entirely based and grounded on particular and temof the meassure ittelf.

inctly and fully the intention of Government-whether they inIndividuals, he certainly could have no hesitation whatever in to the subject to enable him to hold out the prospect of his俍
proposing any legislative measure. - The Earl of ABpect of his en-
dearoured to show by a reference to the Act of Parliament that had made the church of scotland the established church of that country, as well as by their anthorised Confession of Faith, that to interpose his authortty, ior the preservation of peace and union promise to support the law in future, when it had already heen attacked by the General Assembly, though declared by the Court
of Session, and solemnly contirmed by the House of Lords on an appea!
eserve the chair of biblical criticism for Mr. Candlish, but abs, tained from making the appointment, because he thought the Melviles pressed the Government to take some immediate step to vindicate the law, as that wourd be more satisfactory than their
mere promise to do so. -The Earl of Rouss nade a few observaThe Earl of GiLEveath proceeded to move the resolutions of
which he had given notice, declaratory of the fact that Mr Stanley, lately Secretary to the Poor-law Commissioners in Ire
land, had been guilty of contempt of the authorty of the House and ordering that the attend at the bar on the in Mr Stanley's representation by the Maryuis of normanty, that in Mr. Stanleys
state of nervous excitement it might have xerious consequences
if he were compelled to be personally present, Lord Enenborvugh suggested that the ecoond resolution be altered so as to state the
reason why further measures were not adopted in Mr. Stauleg's ingly and passed. - The Earl of GuEscall then moved for a copy
of Mr. Stanley's resignation, and of the minute of the board accepting it.
Tuesdayy.-Several petitions were presented. One was from a body of socialists, complaning that their opinions were misunderstood; and was presented by the Earl ithzwhen an, who exhis care. Drainage of Towns Bill having been read a third time, their Lordships pruceeded to consider the amendments, of which no-
tice has been given.- A proposal by the Earl of HADDINoros to substitute the words "Committee of ", "mmiss soners of Supply" cermed, was opposed by Viscount Mriviluk, and negatived without a division.-The Earl of Riron moved that Birmingham be
placed in the schedule, among the other places to be excepted placed in the schedule. among the other places to be excepted
fromo the operation of the bill, on the ground that there already
existed in that town a most efficient board of commissioners under a local Act. The amendment was carried in the affirmative, on a division, by 69 to 36 .
The Duke of Welincatov required that the city of Oxford should be exempted from the operation of the measure, as its
provisions could be carricd into efficet by the civic authorities under a local act as well as by the commissioners to be appointed
 sisted a clause was ultimately introduced io exctude such towns
as had aready local acts from the operation of the bill. One or
two other ammendments were afterwards made, and the bill was then read a third time and passed.
Similar amendments were made in the Boroughs Improvement Bill, which was also passed.
Viseount Dexcavion laid on the table certain ordinapces by the Governor and Council of Lower Canada.
Thursday.-Lord WHABN LIPEP presented some petitions praying for a revision of the law relating to marriage.
said he hail prepared a bill on the suljeet, but whether he should introduce it depended on circumstances. At all events he woold The Lurd Chave Elsor stated, in reply to some questions put
 rules wouid be ready to be laid before the House. Which he had given notice, on the subject of the church of Settland. His trace entered into a review of the history of the ties, though without a provision for the aiolition of lay patronage, about which so much agitation had for some time past taken place. The noble Duke said that he did not believe any general
diesire existed for the abolition, and that the passing of the bill now
 -The Earl of Abskngse thoupht the bill a mere atterapt to le. galise the veto, and to legalise it under circumstances more obitself had been conceived. - The Earl of Hapmivarov expressed his belief that the recent agitation had originated exclusively
with the clergy, and was unworthy their station and clerical character. His Lordship depr ecated discussion on the introduction of a bill. - The Marquis of Masmasay concurred in this remark, and forbore to give any opinion on the merits of the measure.-
The bill was then read a first time. titions br the Earl of Harewood against any alteration in the sugar duties.
Viscount M elbocravz stated, in reply to a question put by Lord Ellenborough, that an intimation had been sent out to China, that no treaty concluded in the spirit of the preliminary articles sent to this country would be ratified. The noble vis-
connt afterwards stated, that the island of Hong-Kong had been then possession of by the Bntish forces, and that orders had be-occupied.
Several desultory conversations arose on the presentetion of petitions connected with the Corn Laws, in which Eari Fitznoble Lords took part. Lord ELLENBuRocin asked on what day Ministers would
originate a measure for the modification of the Corn Laws, The Marquess of Lasw Dowse did not thinis himself hound to
give any answer to uch a question: but he would say that the resolation had not heen atuped till after repeat.
nox hadit been adopted at a very recent period.

HOUSE OF COMMONS.
Monday.-A new writ was ordered for the borough of Saniinquired whether it were true, as generaliy reported, that Mro
Gordon. Seeretary of the Treasury, Had resigned? Also, whether Gordor. Seeretary of the Treasury, had resigned. Also, wether
it were the intention of the Government to proceed that evening with the civil contingencies?
and with regardto the second, it was mot the intention of GovenaMr W. S. O'BREEV asked the noble lord the Member for North
 said that it ras not his intention to proceed with the Ein on Wed. and he would take care that gentlemen on both sides of the Honse it fonward. The order was then read and pootponed or a fort-
on Friday on the subject of the corn laws had been so completely
misrepreseated hy the Mor nixy Chrominle, that toset tumelf right
with his constituents and with the public, he hadd no alternative with his constituents and with the public, he hirad no alternative
but to treat the matter as a breach of privilege, and move that the printer of that journal be summoned to attend at ste bar of the
house. The hon. member, however, afterwards stated that he had made this motion only in compliance with the necessary accordingly withdrew it.
In answer to a question by Mr. Cartwright, Lord J. Russsul said that on Friaay he would ropose on corn.
the durt whill he meant to prill for the Aboli-
The Howe then weat into committee on the bill tion of Punishment by Death. The conimittee was successively

 took the same view, and insisted on the falibility of all human
tribunals, and the irrerocablity of capital punishment. He was shocked, he said, at the infiction of deah in a recent case, whent
the condemped man, under an and
state, died solemnily persisting in the deelaration of his innocence. Mre, de. T.LLFouRy observed, that such declarations, if suffered to come common in the mouths of malefactors.- Mr. Ewa Rr argued
that crime was rather increased than diminished by capial punish. clause , which, upon a division, was nepatived.
On the clause for aholishing the capital penalty of rape, Sir C .
Docches proposed to retain the extreme punishment, wherever Docclas proposed tio retain the extreme punishment, whierever who, under the many difficulties of the case, considered it most reasonable to abolish the capital punishment in all instances of
rape.-Sir R. INc.1s could not consent to give up the existing law
without better experience than yet existed of any effectual secondwithout better experience than yet existed of ally ctifectual second-
ary punishment. - Lord De ex.ivxo also held it sarest to preserve the existing law, leaving it to the judge's discretion to mi-
tigate the sentence in particular cases - Mr. O'CRNEM, thought and to exclude conspiracies for the purpose of extortion. Impri
sonment, indeed, if long continuel, would amount to death ; but sonment, indeed, if long continued, would amount to ection of per jury or mistake.-Lord Darliverins wished the leave a discretion
with the judge.-Mr.Hobiocs adrocated the principle of second. ary punishments, as diminishing the temptation to murder the
victim, for the sake of destroving her tentimony. - Mr. Golsow victim, for the sake or destroyng her eceath, grounding himself
argued for a milder punisment than deal
upon some instances in which juries had acquitted men really and apon some instanees in which juries hat acquited old be risited
clearly guilts, from unwillingness that they should opposed sir C. Douglas's amendment.--Sir R. Pers was of oppinion that it would not be expedient to abolish capital ptuish.
ment in cases of rape.-Mr. C. BCLLER was for mitikation of the law affecting the crime. It was one, he sain, wherenf the proon
was suspiciuns; aud public opinion was much divided as to the expediency of the punishment now armexed to it. - Capt. Poo..HitL
 affirmed the exemption of rape from the punishnient of dealy
The clause abolishing capital punishnient for the offinces poisoning and wounding with intent to murder was opposed by was retained as the punishment of actual murder. there was no
occasion to retain that punishment for the mere attempt; for he who wounded wih iatent to murder showed theretre, him from the attempt. To retain the capital punishment for the attempt was to check all remorse between the
commen malefactors convicted of this crime, only one, on an average, had
been execnted. This uncertainty was itself a great encouragebeen exechted: and
ment to crime: and jurors were now become less and less will-
ing ney to prisoner guilty of the minor offence, the wounding with intent to do some grievous, badily harm, - Lord Divgs.vis and sir R. value on the chance of repentance after the blow first innticted.
He thought that the final result niight be safily intrusted to the existing law, and the ctiscretion of the existing judyes.- Atrer
little further discussion the committee divided, rejecting the
clause. Rerssell opposed the clause for abolishing capital punishment in cases of burglary accompanied by assault with intent to murier.
for this offence; and he had heard nothing to persuare him
thet

\section*{Aletropolis and its Vicinity}

Severe Stom.-On Sunday afternoon the metropolis was visited by two severe storms. Both were, however, of short duration, neither having lasted more than a quar-
ter of an hour or twenty minutes. The firat was chiefly confined to heavy rain, with squalls from the south-west, and a distant peal of thander. Dering the short contimuance of the second, which was more violent, the rain, mingled with large bailstones, fell in torrents, secompanied by violent gusts of wind. Serious damage has been done to young plants and glass-houses. In the eastern and numervus pleasure-partics in small boats in the river got completely frenched; but no further injury was experienced. At the commencement of the second
the thermometer in the L.ondon Docks stuod at \(89^{\circ}\).
Heeting of Anerment in London.-A very numerous meeting of the eitizens of the United States in London Was held at the residence of the American Minister, on
Saturday, in consequence of the death of the late PresiSaturday, in consequence of the death of the late Presi-
deato The American Minister presided, and zasolutions
were unanimously adopted, declaring, that the citizens of the United States then present had received with feelings of deep sensiblity the painful intelligence of the
sudden death of W. H. Harrison, their late President; and that as a mark of respect for his memory, they would wear badges of mourning for three months: that it be
recommended to their countrymen abroad to do the recommended to their countrymen abroad to do the
same: and that copies of these resolutions and proceedngs be transmitted to Mrs. Harrison, with their since condolence in the late afflicting bereavement by Divine Providence.

Meeting of the Church Missionary Society.-On Monday the annual meeting of this society took place at Exeter Hall, at which the Earl of Chichester presided with ladies. The business of the day having commenced by prayer, the noble chairman, in a speech of considerable length, alluded particularly to the late meeting for the purpose of establishing bishoprics for the colonies, and also to a proposal emanating from his Grace the Arch-
bishop of Canterbury, for nominating a council of bishops to decide on ecclestastical points that might possibly cause any difference between that șociety and the Society for Propagating the Gospel, and thereby enable them to colonists. The report stated that the affairs of the 80 ciety were in a most promising state, particularly at Sierra Leone, New Zealand, and the Island of Malta, the Arabic and Turkish languages, were circulated over the East by the missionaries, who would he most valuable aids to that intrepid party forming the Niger expedition. It also alluded in terms of satisfaction to the nexion between the Indian states and idolatry. The income of the society during the past year (in which 77 new associations had been formed) was \(90,604 l\). (fs. \(2 d\) d which was exceeded by the expenditure by \(8,026 \mathrm{l}\). 13 s . id The Bishop of Winchester moved the adoption of the re port, conjointly with some other resolutions, which wa carried unanimously. The meeting was afterwards ad dressed by several gen
Sudden Death_-On Monday evening a man of reapect able appearance, accompanied by a female, hired a cab in the Westminster-road, and gave directions to be driven to a public-house, where they alighted. They both go driven to another public house, where they again got out, and had more to drink ; and in this manner they were driven from one public-honse to another, at each of which they had something to drink, until at length the female said that she should get out and go home. She accordingly Princes-square Kernington, telling the cobman the Princes-square, Kenning th, telling the that he lived in that place, but did not mention the number of
the house. The cabman, on arriving in Princes-square, opened the door gentleman ; but not being able to arouse him, he called a policeman to assist him. When, however, they had lifted him out, they discovered that he was dead. Deceased linen was marked with the name of "John Skinner" in appears, from the cabman's account, that he had been in the vehicle between sir and weven hours altogether.
Deaths by Drowning in the Thames. -The number of deaths by drowning which occur in the river Thames between Richmond and Graresend is calculated to amount to the large number of 500 annually, of which about one-third occur in the Pool, principally among seafaring persons.

The Royal Academy.-The seventy-third annual ex hibition of the Royal Academy was opened on Monday to the public; and, taken as a whole, it is considered to be a good one. Many of the older artists have contributed works fully equal to any of their former productions ; and there are some from younger artists which give promise of future excellence. In sculpture, the exhibition is much richer than it has been on many previous occasions. It abounds with meritorious worke, some of which are of the highest character of art. Sir D. Wikie has not contributed many pietures this year, but they have all the excellence of his earlier days. Mr. Edwin Landseer has been, from indisposition, unable to be a contributor Messrs. Stanfeld, Roberts, Eastlake, and Etty bea away the palm of art. Mr. Meclise has some fine pic tures; and Mr. Turner has contributed several works.
Atterapled Incendiarism.-Two attemptshave been made to set fire to the house of a Mr. Dix, cormchandler, residing in Red Cross-street, Borough. The first attenyt was made late on Friday night, but was fortmately discorered before the combustible matter had time to ignite. It ap-
pears that after the place was closed some of the family pears that after the place was closed some of the family quantits of body of fire. Mr. Dix remored the fire, which turned ou to be some ropeyarn, small pieces of wood, and rag steeped in some combustible matter, enreloper in an old piece of stocking. Tie missile had evidentiy been trough the sky-ight, a portion or which wh tifís caused Mr. Dix to keep a look-nut, and Saturday night he visited this part of his premises repeatedly. At attempt to fire them had been made, a similar body of an inflammable natare, and lighted, being in the midst of the straw. An inspector of police has visited the place and made a minute examination, and, from all the cir was left on his mind that the attempt was made by some
persor or persons having access to the premizes. Ha discovery was made, discovery was made, the most fatal results, it is thought,
would have easued, as the houses are extremely old, and densely inhabited by a number of poor farnilies.
nquasto-On Monday an inquest was held on Philip Meyer, aged 36. The wife of deceased stated, that on Tuesday morning, whilst chopping wood, he cut off his fore finger at the top joint. He went to St. Thomas s Hospital, where he was kept waiting an hour before he saw a medical officer, and when he did, his finger was dressed with common strapping, and he was told to call again on the following morning. He again went, and the same species of dressing was repeated. Om the following morning he was seized with violent internal pains, and soon after his jaws became firmly locked. A neigh bouring surgeon tried all the remedies he could, but deceased died the same day. The surgeon said that deceased died of lock-jaw caused by the injury to the finger. If he had consulted him in the first instance, he should hare poulticed the wound, and not strapped it with adiesive plaster. In answer to the foreman, deceased's wif said she thought the length of time her husband was kept waiting at the hospital before his wound was dressed was in jurious to him. The surgeon was of a contrary opinion, a there was no immediate danger from hæmorthage. The jury considered that hospitals were left too much to the care of house-pupis, and they hoped soon to see a legislative enactment passed that would enforce the residence in hospitals of well-qualified and experienced practitioners. Verdict, Accidental death, and that seedingly that deceased had not red On Tuesdar an inquest weld werminter Charlote Furneans, 16 monthe who was burnet to deat in the fow, 16 hatic who San death in the following unaccountable way. On Saturday forenoon suddenly the eldest sam flames burst from her bosom. She screamed in alarm, and a gentleman ran to her succour, and put the flames out. The child, it is atated, had no locifer matches nor any other combustiblea on her person, and at the time there was no one near Weagh to set her clothes on fire. The house-surgeon of Weatminster Hospital said that he found her severely burned on the right arm, the chest, and face. Every remedy was tried, but she died the morning after her admission. The coroner said the case was one of the most unaccountable he had ever met with, and hore bustible substance at the child. The jury were of the same opinion, but al there was no evidence to substan diate it, they retarned the follo of severe burns, but how caused there was no evidence to
Accidents,-On Sunday afternoon a fatal accident oc curred under one of the arches of Waterloo-bridge, to a young gentleman, at present unknown. It appears that he had hut a few minutes previously hired a boat for an excursion on the river, and on reaching the arch of the bridge a gust of wind came on, which npset the boat, and being unable to swim, he was drowned. Several watermen put oft to his assistance, but were too late to save him. The drags were procured and every effort made to obtain the body, but in vain.--On Monday afternoon a carman to Mr. Charles, fishmonger, Pimlico, was driving a horse and cart along Piccadilly, when a portion of the drivers either broke or got so loosened as to preve flue great speed and the diver was pitched out of the cath and anem hetine mate jifficulty, ho bords. The from his dangerous position. He was conveyed to St. George's Hoapital where he expired in a few minutes -On Monday afternoon an accident occurred in the Strand, occasioned by the reckless conduct of the driver of a cabriolet, who in passing the bottom of Wellington street, pulled directly across another vehicle, belonging to a Mr. Waterman of Shacklewell, at the time turning into the Strand. One of the fore legs of Mr. Waterman horse, slipping under the wheel of the cabriolet, was fractured, and it was deemed necessary to have the horse killed on the spot.-On Tuesday an accident occurred on the river, between Hammersmith and Kew, which proved fatal to one, belonging to the Royal College of Civil Engineers, Potney. It appenrs that in che course of the forenoon, three young gentlemen, whose names were Sharpe, Scott, and Jones, without the knowledge of Col. Hatchinson, the resident director, hired a small sailing-boat to go to hichond. On their ro a strong southerty wind. Hiving be the cirde of the boat on the sheet, hey, and about fuur o'clock, when off Mortlake, they were met by a sudiden squall, and being Two boats put oft their assistance, and succeeded in pirking up Messrs, Scott and Jones, and they were conveyed ashore in a
state of great exhaustion. The drazs were then used, and in about eight or ten minutes the bedy of Mir. Sharpe was found, and every means for restoring animation of the occurrence haviny heen contrevel to) the: College Col. Hutchimoo hasten: \% M inthate to see so che surbut the other being twi) weat: \(r=\) mareat it Mortlake until Wednesday morning. Deceased, who was much beloved years of age, an orphan, but highly connected.
Fires.-A fire, attended with the loss of two lives,
broke out on Monday night, on the premises of Mr, Bur-
ling, Church-lune, Whitechapel. From the progress
made by the fire previously to its discovery, all chance made by the fire previously to its discovery, all chance
of escape for the inmates by the street-door was impossible. Mr. Burling alarmed his family, and called on them to fothow him and drop from the front and back
windows. Mrs. Burling, her daughter, anil the lodigers followed the advice given by Mr. Burlina, who from his fall has broken both ancles and his right thish; his wife and other inmates (with the exception of two of Mr. Bur ling's sons, one aged eight and the other thirteen years got under, but no portion of the property could he preserved. After the rains were cooled, the firemen began their search after the lost ehildren, who were found under a portion of their bedding. It appears that the previous
night the family retired to rest about eleven o'clock, at which time everything appeared perfectly safe.
quest has since been held on the bodies of the two children. Nothing was elicited to show what was the canse of the fire. One of the jury complained of the inattention of those who had the care of the parish engine, in never attending with either the engine or the fire-escape ladwho receives a salary from the parist of Whitechapel as engine-man, had also a situation in the dochs, and ano ther in the County Fire-office, and scarcely ever attended that had Wright attended to his duty as engine-man to the parish, and brought the escape-ladiders, which were kept not 300 yards from the spot, to the fire, the lives of
the two boys might have been saved. The coroner said the two boys might have been saved. The coroner saic might be done to prevent such negligence for the future. The coroner then summed up the evidence, and the jury retursed a verdict of accidental death in both cases. quepes of the serious injuries he received. - The following are some additional particulars of the late fire in Albemarle-street, which we could only briefly notice in our last Namber, in consequence of its having occurred originated in the bedroom of Mrs. Harcourt, a lady lodging in the hotel, few minutes after her maid had gone down to her supper, and it was first detected by one of the chambermaids secing a body of smoke issuing from the landing above where she was engaged. She immediately gave an alarm, and two of the waiters rushed into the
room and panially tore down the bed-hangings, which roos and parially tore down the bed-hangings, which the fire, and there being no water in either the kitchen or area cistern, they could only get the trifling supply from the several jugs in the bedroams adjoining, which was inadequate to quench the fire. It soon caught the partition and stairease, whence it ran with fary uipwards, and in a few minutes the upper floor was on fire, Several engines had by this time arrived, and no water was in half an hour ouly zuticient to supply three engine could be obtimed. Inspector Baker direcied a large bindy of police, and Mr. Fogo at the rak of his lite ran unt stairs, and endeavoured to bring some valuables from the first-floor room, but was prevented. Ther dinection was then to secure from the private house adjoining all the furniture and lurgaze belonging to the fumilies staving there The tutal amount of loss is estimated at from
\(10,000 \%\), to \(12,000 \%\). \(10,000 \%\) to \(12,004 \%\).

\section*{flabincial 7 Titos}

Liverpool.-On Friday eveaing a meeting of American merchants was held in this cirt, for the purpose of adoptpress their grief at the medath of Geemed appropriate to exprident of Trited States. The chair was oceupied by Mr. F. Ogden, of New York, and the meeting was very numerously attended. The chairnaan opened the proing had been convened. He said there was no distinction of party on the present occasion, but that they were assem-
bled in a foreign country, as Americans, to resivive upon the proper mode nf expressing their respect for the memory of
their deceased President. Sereral resolutions were then proposed and carried unanimously, expressing their deep regret at the death of dreeased; and that as a tribute of the President of the [nited States, they would adope the badge of mourniner whech hat heen chosen be their tellow citizens at home, and waar crape on the left arm for the period of 00 days trum the diar of his death, considering mourners: that at the samse time thery lowked with the most implicit confidere umn the aritar lieside:at who had assumed the ravant office, in c -mpliance with the constitution, for the earrying out to the letter those principles and thuse sentimants in rchana t.) all maters
connected with the iatereats of the country, whin were so distinctly avoweci by the decuasd President. The chairman then expressed ins sfartication at t:e unantmry and good feeling which prevanied on the oration. - No intellianxiety still ielt for the unfortunate miosing steam-simip President. She bas now been out 58 days, since leaung she was sen by the Orphers, the day after she sailed. The Ruyal Mail steam-ship Acuria, from America, has arher: it is. howerer, thought by some, that the absence of any fluating wreek, which, should the worst fears have been realised, would probably have been found, may be
regarded as a favourable omen. We do not fad from the
papers brought by the steamer thet there had been any March. There may be therefore some hope of her safety, until later accounts are received from that port. Ay the Tyrian ppeket, which arrived on Tuesday, from the West tidings had been received at those islands respecting the Presilent, and the chances in favour of her safety are thus dimunished.
Bradford. - A public meeting of mill-owners, manufacturers, de., has been held in this town to consider the proprety of petitioning Parisment to shorten the hours of employed in nills and factories. The meeting was numerously attended, and a great number of speeches were delivered, which it would be impossible to give at length,
but the unanimous feeling of those assembled was fully demonstrated in regard to the expediency of restricting the

\section*{Birmingham.-The following case came under the sur-}
reillance of the police-officers of this town last weel Some three years ago, a man of respectability, residing in Somersetshire, went to America with his wife, where the hairdresser, who formerly lived in this town. Circumstances rendering it necessary that the gentleman and his lady should return to England, they left America, the forthe latter had contracted. Parsuant, however, to arrangement, Peurman followed them to England, and made his way to Somersetshire, where he resumed the intimacy with the lady, and ultimately arranged for their departare for
America. In accordance with the plan, the wife asked America. In accordance with the plan, the wife asked her mother at Bath. During her absence a circumstance occurred which rendered it necessary that her husband from his mother-in-law that she had not been at Bath. Suspicion was created, and it was ascertained that goors and money to the amount of 1,00 ar his house. He immediately mstituted inquiries, and of goods, from thence to Gloucester under the name of Smith, and from thence to this town by railway, and to and sub-inspector \(M^{\prime}\) Intyre accompanied him to Liverpool. After snme difficulty they obtained a clue to Pearman' place of remort, and went to the house, where they wakked in, in company with another man. He no sooner saw the husband than he rushed out of the house into the street. The officer pursued, and at last captured him. tor the to hio loding, whe the lady 1 m rica. M'Intyre baving secured the property, took Pearman before the commissioner of police, where, at the request of the gentleman he had injured, he was liberated, and the lady, who is very young, consented to return home.
Setlle.-For three or four months past two men, armed बithguns, lave been prowhing about amongst the hills on beries and outrages of a very audauious kind. They are belleved to be two well-krown poachers from the neighbourbond of Bolton-by-Bowland, near Clitheroe, and are suspected to have committed the robberies near Bacup, an account of which we gave in a recent Number; and niore
revently they appear to be carrving on their proceedings in the northern part of the West Riding of Yorkshire. It appears that a few days since as Mr. J. Wignall was on his road to Hawes market, about 6 or \(f\) in the marning, he came in company (when crossing the Stake, a solitary with him sume distance, although Mr. Wignall was horseback; and when they came to a certain part of the road, a gun was fired at him from behind a wall. The piece had been loaded with hail-shot, about half-a-dozen of which penetrated his head and face, but without doing him much injury. He immediately put his horse to full speed, and so escaped. There were carts not more than a quarter of a mile behind at the time, and some people not far before, whom Mr. Wignall soon overtool, and related to them
what had happened. The circumstance soon became known in the neishbourhood, their services to go in pursuit. It fell to the lot of one party, consisting of a constable and anuther man, to track them towards Horton, near this town, where, stepping into a farm-house to make inquiries, they beheld the persons of whom they were in search; they seized them. when a senftle took place, and they all roiled on the floor together, in which positicn the constable had his hand and cheek severely hitten hy one of them. One of the rubhers his suceeded indiawing a pistol. When the constabie and his man retreated to this place. Hitherto the rob'jers have nut hern apnrehended, are known. it is thought they cannot long escape the pursuit which is now mating after them in all directions
Rhyl.-A young man named Hickson, whose father Is a respectable baker in Chester, became enamoured, it appears. some time since, of the daughter of a small
farmer, residing at this place. He had not quite finished his apperent:ceship, and his intentions of marrying her beco:n ing known to his parents. they strongly opposed the ahiasce. The young man however resulped on it, and marre overtures that she should return home for a given period, nutil her husband could provide a habitation for her. This was agreed upon, and he left with his wife for the following day, Mr. Hickson and his wife retired to kitcher, no one else being present. At this moment he
took up a gun belonging to his father-in-law, and no
being aware that it was loaded, held it towards his wife, saying, "He her head, and she expired in three minutes atterwards. An inquest has been held on the body, the jury returning a verdict of "Accidental death," and exonerating
her husband from any wilful intention of doing decoand harm.

Bath-Mr. H. L. Stebbing, a young man of reapectable connerions, and well versed in the science of heraldry, as engaged about two years since in this city, in obtain "Britain's Historical Drama." About the ith Feb. he left his lodgings to proceed to Bristol, and has never since As no reason whatever can be assigred for his absconding, and as he left valuable papers at his lodgings, to which he expressed his intention to return in a few days, all who are acquainted with the circumstances have come to the timely end.
Gloucester.-On Thursday a person named George Comley took places ior himself and family by the railway train from this city to Birminghama. Soon after the tric at the station-house, in the hope of intercepting Mr. Comley, who, he stated, had executed a forgery upon him to the amount of \(41 \%\), and had also committed other fraudulent delinquencies, and was then on his way to passage for America. After a short consultation with Mr. Walker, police-superintendent, a parsuit was resolved upon, and for a payment of 10 . an engine was got ready.
with which Mr. Gillman and Walker started, in the hope of overtaking the train, which by that time had had the advan sight of the train at Ashchurch, and followed close in its whe spechley station, where, to the surprise of mainder , his pursuers came up with him. The rethe company of Mr. Grillman, who, on arriving in that town, gave him into custody on the charge of forgery On Mr. Walker's return, he found that the prisoner s
landlord had sent a distress, in the hope of laying an he had been carrying on the business of a clothier at North Nibley, till he suddenl decamped. He hes sine been bronght to this city, and will be conveyed before alleged to have heen committer?

Ilminster.-On Friday, as the Subscription Cosch which was filled with passengers inside and out, was enter ing this town, on its journey westward, one of the wheels ever, all escaped unhurt, with the excention of I. Sparkes Esq., of Crewkerne, who was thrown under the coach, and sustained a compound fracture of the leg, and severe injurifs of the \(f \cdots t\) and ancle, which rendered amputation necessary : but he died on Tuesday. this ahout one o'dock in the morning by a noise as of some persort being in the house. Immediately afterwards three men, with their fares blackened, rushed into Mr. Bayman's bedroom. He jumped out of bed, when tbe dirst in the other, presented the pistol at him, and threatened M. Mr. Bayman finding resistance hopeless, gave them ten guard over bim, while the two others proceeded to the bedroom of Miss Bayman, of whom they demanded money; and upon her telling them she had not any, they used the most violent language, and broke open every bos and drawer ine thon. Wey thens were employed in ransacking the house. When they had packed up a quantity of valuable property. they again prod the bed or hr. Babman, abre of the produced his gun, which he had brought from the lower part of the houre, and loaded it in his presence, and told
him that they would fire it off as a signal when they bad leit the premises. They told him that if he went down stairs or give any alarm before the morning, they would return and murder him. They then decamped, but Mr, Bryman and the family were so alarmed at their threan they found every drawer and cupboard had been force open, and a quantity of valuable property abstracted. Mr. Buyman then gare information of what had occurred and the cmonstable of this place made inquiries, and haviog had been seen soing in a direction from where the robbery was committed towards ("iesham, he obtained the assist ance of another ennstable and proceeded in pursuit. fornd three men answering the descrintion the thieves and took them into custody. when they found nearly seven pounds in gold and silver, and several articles day the stolen property, in their possession. The next day they were taken before a masistrate, whe Johu Reeve The above facts were then giren in endence. and Mr. Bayman also stated that, atthouga the men ood oppor blackened and otherwise disguised, the a contiden tunity of discovering their features, and he was co identified the articles found in their possession as being part of
the stolen property. After a long investigation, the
prisoners, who merely denied the charge, were comuitted prisoners, who mer
to take their trial.

Stuke Goldingtom.-In inquest has been taken at this place, before the coroner for the northern division of Bucks, on Samuel Cowler. ayed one year and a half, wh..
came by his death from drinking lauduum br nuistahe. It appeared the grandfather of deceased had pirchased a pennyworth of laudanam, for the purpose of applying to bed he placed the cup by the side of his bed, and on the following morning left it in the same situation. His wife and, daughter, it appeared, did not observe it: about
eleven n'clock, whilst the daus hiter and deceased were upstairs, the latter drank what remained in the cup, which was supposed to be about half a teaspoonful. Antidotes were administered, but to no purpose-he survived about
twelve hours. The jury returned a verdict, "Poisoned twelse hours. The jury returned a verdict, "Pomoned admonished by the coroner for their carelessness in the use of so dangerous a narcotic.
hipperham.-An attempt to poison has been detected at Grittleton-house, the seat of Joseph Neeld,
Esq. M.. It. appears that some wine had been
decanted at lunch. a verr decanted at lunch, a very small portion of which had been gentleman. The remainder of the wine was introduced at the dinner-table; but it had undergone such an alteration in its appearance and taste, that suspicions were at large quantity of and ysed, and discoveren to contain between the time of lunch and dinner. The circumstance has occasioned considerable excitement in the neighbourIt is not yet known by whom it was done, or whose life was intended to have been sacriticed.
Great Cnggeshall.-A very serious aceident has happened to Mr. and Mrs. Jackson and daughter, of Horrell's Farm, near this place. Mr. Jackson, it seems, was re-
turning from Hightields, driving a four-wheeled chaise, and had not proceeded more than a hundred yards when the pony became unmanageable. On arriving at the turre ing into the high-road to Braintree, such was the speed it ran against and the shafts penetrated throurh the wan of a cottage nearly opposite the turning. The inmates, who had retired to rest, nere alarmed at the shock, but made haste to renter asslstance. The party were thrown her jaw being bruktn in two I haces, an! one rib fractured, stumed and bruised, but they sustained no material inary, and are now gradu t!y recovering.
Briyhton. -On Sutur
Briyhton.-On Saturday evening no fewer than three quarter past ten a boy knocked at the door of Mr. Martin, North-street, with a basket in his hand, whech he said was for Mr. Martin, but there was nothing to pay. The
servant girl went to call her mistress, and on her return he bashet was in the pa-sage, but the boy had left opening the parcel, they found a boy, about sis weeks old, wrapped in flannel, and neatly clothed. He was taken were brought int, the porrhouse the same night, which had been left at dours in the Western Road.-Greatexcite report tiat the long missing steam-ship President was off he coast, and had sent her letters on shore by a pilotand it soon got known that a bag of letters "per Presiant had reached the post-office. Inquiries were ansiously made, wheli the report was ascertained to hare
been founded on error, and, to the disappointment of every one who had been indulying in hope, it was announced that the letters were received through her Majesty's ship President, which was coming round from a pointed to the station to protect the fishery on the coast The French fishermen are continually breaking the convention and trespassing within our limits. The Rapil has run along the ceast and warned them of by firing her guns. The inhabitants of this town were taken
Bristol.- At the police-court in this city, on Saturday, charged with the following assault on a young woman in Mr. Smith's service. The complainant stated, that she had been hard at work, and after it was over took a glass
of spirits and water, which pruduced intoxication ; she of spirits and water, which pruduced intoxication; she
was carred up stairs and laid upon the bed, when Mr. was carred up stairs and laid upon the bed, when Mr. they would make her remernber being drunk. Mr, Arnold then lighted a squib and put it under her clothes, which he forcibly kept down with his bands to keep the fire-work over her molin, and smith emptied jugs of cold water surgeons stated, that the wounds inflicted were serious. The defendants said they hal offered to compensate the tempth 30s, but she asked 30 , from each ; they then atheld to bail in 20pl. each to appear at the sessions, the Magistrates refusing to decide so serious a case.
heltenham,-A correspundent, Mr. R. Arnott, of the Cambrian Narsery, Charlton Kilgs, informs us that at a the village of Wittington, near this town, a cottager took us of the old proverb "A swarm in May is worth a load of hay
Railzays.-On Saturday a very serious aecident

Patchan, to a labourer empl.oyed in levellug part of the
line. It appears that he had just deposited a barrow-load of earth on the summit of tire embankment. and was koing down a plank with the barrow, when he was jerhed off
and thrown to the ground with great violence, and received -uch injuries that it became necessary to take him to the Sussex County Hospital, where he hes in a very precarious
state. The accident is attributahe effecting the work in question, by a horse being employed to avsist in dragging up the load, the slightest jerk of the rope being sufficient to throm the labourer off the plank. The plan was persisted in on the London and Birmingham Railroad, at the sacrifice of many lives; but on the above railroad most of the contractors have adopted the safer mode of having the earth drawn up in skids.-Another Surrey, to Surrey, to two young men, about is years of age, who were run over by one of the trains laden with earth. It appears that they were standing incautiously near the
rails, and were knocked down: one of them was killed on the spot, and the other had one of his feet severed, and ines in a hopeless state.-A serious accident occurred on Monday morning, at the Wootton Bassett station of the Great Western Railway, to an engine-stuker, who sustained great injury in the head by being jammed between the buffers of two engines which met before he had time to get out of the way. He was conveyed to Reading by the luggage-train, and immediately taken to the Royal
Berks Hospital, and his death is daily expected.

\section*{IRELAND}

Dublin.-A general meeting of the committee of the Repeal Association has been held, and the following extraordinary resolution, which is to be brought forward for adoption at the next meeting, passed with acelannation: ginally carried by Castlereagh, nor the opimion of Lori P'unkett and of Lurd Chief Justice Bushe, that it is no binding upon Ireland, nor the coercion bill, nor the scor pion bill, nor Lord Ebrington's contemptible menace of corrupt influence, nor all of these put together, produce conviction more decisive of the necessity of the restoration of our domestic legislature than the vote on the amend ment of Lord Howick, for the following reason-that his Lordship actually giounded his claim to the support of the Imperial House of Comarons to hifs amendment, and ob ained it, by an ostentatious voluntary disclaiuer of man of knowledge of Ireland." - On Monday the usual weekly meteting was held at the Corn Exchange, Mr. Dillon acting as chairman. A sum of 846 . was acknowledged as rent
for the past week, and a lonz letter from Mr. O'Connell was read by the secretary; after which the meeting sepa rated.- The fullowing are sail to be the heads of a plan to the Honse of Commons by Lord Morpet
of capitalists, providing funds for the intended linee of
from the net revenue, and dividing any surplus thereon that with the counties through which the lines shall pass. . A guarantee for that interest from the counties per plus profits. 3. A Government commission to execute and manage the railways. 4. A board of control, consisting of counties, to settle the principl influence in the resilective lay and charges, and to protect all parties.

\section*{SCOTLAND}

Edinburgh.-A short time since George Matt, a la ourer, was carried to the Royal Infirmary, ill of fever, o which he died nest morning. Mark lodged with a labourer in the Cowgate, named M'Dermid, who had the key of his chest, in which was a deposit receipt frum the
Savings Bank for upwards of \(25 /\). This receipt Mron mid presented at the Bank on the Monday atternoon as he owner of it, and pretending not to be able to write, pi: his mark to it as a discharge. The other day, however, a relative of Mark arrived from Ireland, and called on Dermid, who asoured him there was no muney left by triend, and that he had pawned the deceased's clothes defray the expenses of the finneral. Mark's friend, howto the Savings Barli discovered the truch, when MiDermid was apprehended, and identified by the clerks in the office. Mis wife was alsu appreliended, and \(24 l\). of the money found concealed on lier person. M•Dermid has since been committed on a charge of forgery.
Glasgote- - OnSaturday the Marquis of Breadalbane was installed Lord Rector of the University in this city, in
presence of the principal, professors, students, and a represence of the principal, professors, students, and a re-
spectable company of ladies and gentlemea. - Oa the 3 rd ult., a man's pany of ladres and gentlemer.- in furen furnd in Rosswood, on the banhs of the Cly: anout two milies from this place, a rumour b,ecame pretty general throughout the town, that the individal to tiom the artioles belonged. and whose name was upon the box, had iruwned the surmise, and on Monday the matter was pat beyond doubt, by the body ining found in the river, within a few yards of the place where the clothes, de.., had been discovered previously. The man's name was Weir, and at he time be destroyed bimself, be was a urdegroum, havong been proclazmed the two previous sumdays and the assignell as the a respectable uidow. Several reasons are assigned as the cause of the fatal act, but nuthing certain is known on the subject.-Considerable seasation was a few days since created in this place by a report which prevailed of an English gentleman having put a period to his existence in his room in Leith's Caledonian hotel. On
described as about 30 years of age, of gentlemanly manners and appearance, and suffering consideraijly from lowness of spirits. had arrived from Orhney the previous TuesThure and been attended by Dr. Hendersin until Edinbuy, when that genteman was obliged to leave for lad bee: left with the erran directions for their use, such had been prirtially made use of. It would seem that deceased had retired to his bed-ruom about 1 or 2 o'clock in the forenoon, and as there was no appearance of his puitting it at 5 in the afternoon, though Mrs. Leith had alled and whe made open it, when btaining entrance, deceased was found extended on the Boor, with arms, at the liends of the and razor in the wuund. lay stretched by his side. \(O\) n the wan a surgeon stated that the death of deceased was occasioned by the wounds inflicted on his arms and throat, and he must have been dead three or four hours before his arrival. Ars. Sheppard, sible, near Halstead Write my motherthorities have seen that care is taken of his property and moner ; of the latter, there was about 40l. It is stated that he had been resident for some months in Orkney, and intended to bave proceeded south

Greenock. - On Munday, as Mr. Grant, manager of the new cutton-mill, was in the wheel-house, showing a party of gentlemen from Glasgow the water-wheel employed in propelling the machinery of the mill, a small bit of stone fell at their feet. Mr. Grant stooped down and picked up the stone ; but the Glasgow gentleman being alarmed, ran to the west side of the wheel, and in a moment afterwards the east side of the whel-house gave way and fell with a great erash, and Mr. Grant and another man, a mason, named M. Leod, were uuried in the ruins. As it was known that a number of other individuals were also lying under the ruins, neasures were instantly taken to rescue them. In taken corst of two hours, two labourers and a clerk taken out alive; but it was about 20 clock before the they were Mr. Grant and Mr. M•Leod were dug they boldead. The cuuse of the aceider is under prouf brick arched fan the immense pressure of areagainst the arched vauts for cotton stores which rested against the wall of the wheel-house. A deal of rubbish affording them protection from the weather, and the weight had thereby become greater than the wall could support.

\section*{fatiscillaneous.}

City Antipuities. -The workmen in excarating for part of the sise of the new Exchange have found several Ro\(3 \pm\) feet wide, and 13 feet deep. Amongst the ea antiquities are a Roman wall and pedestal, articles of pottery ware, writing, a!d a strigil, smit as had becn used in the baths of Pompeii The la, 1 as had bech used in the baths bones and horns of stags have also been discovered in the seavation.
Toltuire. - When the English and French were disputing as to their respective rights to certain territories in America, Voltaire happily remarked that they were quite
agreed upon one point, viz., that the natires had no right agreed upon one point, siz.,
Jomathun IVill.--A mongst the old manuscript petitions in the Tuwn Clerk's office, where all the ancient records are undergoing examination at the present time, is the following from the notorious Jonathan Wild. It will be observel that in the document, of which the fullowing is a reneatimet luteration copy, the name of the petitioner is spelt in three different ways. The petition was probably written by the petitioner's clerk, and the list of the names of the thieves who returned from transportation by some other assistant, and the signature to the petition by the man himself :-" To the Right Hon. the Lord Mayor and the Court of Aldermen.-The humble petition of Jonathan Wild showeth, that your petitioner has been at great troable and charge in apprehending and convicting dirers felons mamerning from transportation since names of whom are mentioned in an account hereto anward or gratuity for suelh his service; that he is very desirous to become a freeman of this honourable city, wherefore your petitioner most humbly prays that your Honours will (in conideration of his said serviees) be pleaste to admit hin into the freedom of this honourable city, and fourpetitiunershall pray, de.-Josathas hide. Aa for returning persous apprehenuled, taken, anacon WY yo since October 172i, for which he has received nu reward, viz: : -Jhn Fi.ewood alias Violett, Whliam
Bond, Charles Hinchman, Samuel Whitio, Marten Gray, Juwes Daitos Rochan, Jamuel was Pukioe, Oldi Harry alias Henry Williams, Henery Woulford, J.nn Mo:or. Se. veral others liave been taken by him, and aterxands sent auruad-viz., Moll King, Juhn Jowe, de, who gere notorious street-robbers in the city of Lanilua." On the baek of the petition were the official words "Mr. Jona-
than Wid's petition to befree, redit 2 J Jan. liza."
Effects of Liuhtuinu. - A perma writiug from Dorchester, Lower Mills. in tawertea, sys that the effects of Fhiage un Friday everime the 2d wit. The ahumer was very severe in that veluity, the lightsing remarkably in, and in sereral igstances followed almost instantly oy the report, leading every one to suppose it streck near bytrees, from one foot to 18 inches in dismeter, standing
about 16 feet from each other in a grove of woods owned by General Moses Whitney，were struck apparently by a horizontal shaft of the lightoing，and from the height of 15 fert to the roots were literally torn into basket stuff； the tops of the trees were thrown upon the ground en－ tirely aninjared．From the hase of the trees it spread in foar different directions，two of which were from east to west，throngh two ledges of rocks，one of which is about three rods in thickness；a small rent is visible where it entered the ledge，and a very large one where it passed out－large fragments of rock having been broken off and thrown to a distance．From the ledge it passed on seven or eight rods，tearing up the ground，and forming a furrow rarying from six to twelve inches in depth：Where trees and came out again on the other side． and came out agin one other side．
Int has lately been liscovered amongery ctrious docm－ ment has lately been discovered amongst the ancient re－ cords at Guildhall．It is a contract made between Cbarles I．and his Privy Council on one part，and the corporation of the City of London on the other，in which the King
makes over in mortyage to the corporation several large tracts of Crown lands in the counties of Northumberland， Durham，Yorl，\＆e．，for certain loans of money to him， amounting to more than \(300,000 l\) ．of the then currency． But the unfortunate monarch never having had the power of redeeming these lands，they became legally part of the City estates；and several years afterwards，finding that from their remoteness，and the rough unproductive nature of the soil，they were not very productive or profitable，the corporation disposed of the City interest in them to the an－ cestors of the present great coal－field proprietors，not，of course，having the slightest idea that they were throwing out of their hands the richest and most proitable soil in
England，which would long since have produced them a net protit of above 400,000 ．per annum．The document is quite perfect，and is very well written．The King＇s signature，＂Cbarles R．，＂is in a fine free hand，and the signature of the members of his Council at the foot of the deed are easily deciphered，but are remarkable for the di－ versity of the handwriting．That of Buckingham＇s is quite different from the others；it is very free，but in good taste．The Royal seal is affixed to the deed，and the seals of the signing Privy Councillors are appended likewise．

Geooogy．－In removing the superstrata，consisting of an upper thick deposit of sandy gravel，with the clay， shale，coal，sc．．，in the quarry a ittle west from the rail－ 25 feet deep，exhibits marks of powerful volcanic action． Above the rock the strata in one part is thrown into nearly the form of a circle，for the space of 12 feet，from the centre of which there appears a radiation，until the combustible materials had exhausted their force；to the west the convulsion appears to have also been consider－ able．The appearance was just observed when about sesen yards north from the place where the workmen are now engaged．
Importont disenvery of Platima．－Recent accounts from Australia state，that Mr．Neville，of the Customs，has discovered a metal，supposed to be platina，in the fissure of a rock about is miles distance from Melborrae．It is heavier than iron，being eleven tinues more weighty than water．Several chemists have been attempting to analyse load several ships with it，in such quantities had he seen it．It is somewhat singular that Mr．Neville discovered the same metal，but not of so pure a quality，on the Sid－ ney side of the country，some months ago；and as the chemists could not analyse it there，he sent it home to England，but has not yet heard of the result of his specn－ sion．
Statistics of the Consumption of Meat．－During the debate in the Chamber of Peers on Wednesday on the Customs Duties Bill，the Minister of Commerce and Agriculture，M．Cunin Gridaine，stated some remarkable facts relative to the consumption of butchers＇meat in Great Britain and France，which may not be uninterest－ ing．＂In England one－half of the land is devoted to pasture，or to produciag food for cattle intended for con－ sumption．In France one－fifth only of the soil is allo－ cated for that purpose．In England the individual con－ umption of butchers＇meat is 134tbs．；in France it is only \(281 b s\). ．，to which may be added lylbs．of pork．In 1789 the individual consumption of meat in Paris was the aggregate consumption is diminished．In Eagland each ox brought to market averages 800lbs．，in France not more than from 400 tbs ，to 6001 bs ．

more would restore him to health．It also appeared that the pro－ secutor，for some time past，hatb been on duty of an easy kind a
the station－house．Mr．Chambers then entered into the case at considerable lenget on behalf of the prosecutor；and was followed by Sir P．Pollock，who aldresed the Court for Capt．Duff，aned
Mr．Thesi fer for Lord Waldegrave．Mr．Justice Patteson summed up，and concluded a very long speech by addressirg the daefenh
ants as follows：－＂＂The affidarits made by both of you state that ants as follows：－The amidaatits made by both or you state that
you were，at the time，under the intuence of tiquor，and is is
impossible for this Court，or any other persons before whom these atfidavits are brought，made by persons who state themselves that they were under the inlluence of liquor when the facts to
which they speak took place－it is impossible that these aff which they speak took place－it is，impossible that these affi－
davits can be treated，as to details，as containing accurate in formation．Further，that circumstance or your being under the
infuence of liouor is put foward as an extenuation．I would infuence of liquor is put forward as an extenuation．I would
wish you，and all other persons，to understand that the law o this land does not recognize that as an excuse for any offence
On the contrary，it is entirely an agkravation；it is not to be On the contrary，it is entirely an aggravation；it is not to be
allowed that any man who has put himself by a voluntary act o intemperance into a condition to be unable t
sions，or mow clearly what he is about，should，when mischie arises from his not being able to control his passions
to say．＇I am not answerable for my act because I was in a state till I am far from saying it nuight not alter，in some measurc，the character of an offence．Again，the persons who are standing before me to receive the sentence of the Court being persons of
rank and station in the country，we are asked that we shoul rakk and station in the country，we are asked that we should reat this case as one of aygravation upon that account，and so
it is，in some respect；but still we must deal with this case as with any other case brought before us－as though other persons in 2 different rank and station had committed an offence of this art，not allowing rak and station to exempt him from puraish
ment，but certainly not making it necessary to inflict upon him ment，but certainly not making it necessary to inflict upon him at persons in the rank and station you occupy for examples on decency and qood order，and rightly so ；for they are seldom dis appointed．but when such a disappointment does when unhappily persons indulging in violence and disorder fin in the conduct of those who have the advantares of rank and for－ tune a genera bad example set，one cannot but feel the proba－
bility that many other persons of inferior education and poor persons may be induced，by the influence of the money of those in higher rank，to join thens in actso of rioleuce and grossness such as the present．It is most fmportant that persons in your
station should be taught that you must take care not to set so evil an example as you have done on this occasi
unfrequently cases in which persons of low rank and station，an of very little，or perhaps hardly any，eduration whatever，ar brought before us for punishment for outrages and offences of
violent character committed under the influence of liquor－sue violent character committed under the intluence of liquor－such obliged，for the sake of example，and for the sake of prevention， to punish those persons sometimes with considerable severity，
but we cannot butfeel very frequently in thoie cases some degre of pity for the offenders，and cannot but feel a wioh to make some allowance for their misconduct，which very likely har arisen from up，left much to themselves，and fallen into such habits，which is no fault of their own that they oriminally contracted．But whe
we see persons who are in pussession of all the advantares birth，education，and of fortune，wantonly lowering and deyrad ing themselves to the level of such persons as I have described
it is imposible that we can make any allowance for such conduet －it is imposible we can but feel，if they disregard the adran tages which property has put under their command，that it dis－ entitles them altugether to any pity or cemmiseration on our
parts，and it is necessary，for the safety of the peaceable mha parts，and it is necessary，for the afety of the peaceable mha bitants of the country，for the protection of police－oficers，and
others whose uuty it in to preserve the public peace，that all per－
sons sons should understand fully that it is no light matter to attac
any man musuch acoase，and more particularly that venus men

 Teekly record of everything that bears upon Horticulture o
arden Botany, and to introduce such Natural History as
has elation to Gardenıng, together with Notices and Criticisms of appea AAR OF GARDENING OPERATIONS, giveuin great detail, an ance to the memory-Foreign and Domestic Correspondenc pon Horticultural subjects-Reports of Horticultural Exhibitions and Proceedines-Notices of Novelties; in shart, everything tha the workman, or which may conduce to the pleasure of his em ployer. Thus the Gardinkr, the Forestra, the Ruralarcil have the improvements in their respective pursuits recorded. GARDENING is in many respects the art of creating an Anry found: evidence, however, regarding the real nature of climate, as concerns vegeration, is greatly wanted.
PHYSIOLOGICAL INQUIRIES, and all those interestiog topics the various parts of the creation emch on the other, will also form subject of discussion.
Another peculiar feature will be the introduction of informa ion relating to FORESTING, or ARBORICLLTCRE. This is one ic can be directed; for it is often little understood by those who have occasion to practise it, although the amount of property offected by the management of timber stands second only to tha ber and regulate its growth, the value of it, the extent to which cies grown in different places, are all points to whica same spe-
will be given. We shall endeavour that very important but much-neglected sinbject, the diseases of ew species, which promise to increase either the beauty or value
 Although it is not intended to occupy our columns with the Farming, it would be imposible, even if it were desirable, to ex clude the general principles which relate to the cultivation of be constantly reported. only becanse ererything relating to those rare and beautiful pro ductions which are his peculiar care will be constantly treated of In sach a manner as to make him thoronghy tequainted with of cultivation, but also because we shall take care that such IN THE SECOND PLACE, we shall introduce that description of
domestic and political News which is usually found in a weekly paper. We consider it unnecessary to dwell on this head furthe banners of any party; on the contrary, our best endeavours wil be to make THE GARDENBRS Chronicle a full and comprehen-
sive Recurd of Fucts only-a Neuspaper in the true sense of the
aord-leaving the reader to form his own conclusion and opinions; our object being the elucidation and discussion of the
laws of nature, not of man. The reader will thus be provided, in addition to the peculiar feature of the Journal, with such a variet of information concerning the events of the day as will supersed the necessity of providing himself with any other Journal.
The proprietors are happy to announce that they have already friends and supporters: amons whom the following may be mor particularly named

SATURDAY, MAY 15, 1841.

 DAY next, May \(19 t h, 1841\), A select Badd of wind instruments
will attend. \(\quad *^{*} *\) Open from One till Seven.-Admission, 1 s .
HIGHGATE HORTICLLLURAL SOCIETY.
THE FIRST EXHIBITION will take place in Fitzroy-
park, Highgate, on Saturday, the \(22 d\) May
THE FIRST EXHIBITION will take place in Fitzroyopened to Visitors at One o'clock. Ticrets, at 2 s . \(6 \mathrm{~d} .\), may be
obtained on or before the 21 st inst., at Hishrate; also at Hornsey, Hampstead, Kentish Town, and Camden Town; or at the fol
lowing places in London:-Messrs. Warner and Co's., Cornhill Mr. Flanagan's, Mansion-house street; Mr. Charlewood's, Covent Garden; Mr.Ken
Hall, Piccadilly.

The Coldstream Band will attend.
SHEFFIELD FLORAL AND HORTICULTURAL GARDENS, under the Patronage of
His Grace the Duke of Nor-! The Rt. Hon. Lord Wharnclife
His Grace the Duke of Devon.
The Rt. Hon. the Earl of Surre;
shire
The Right Hon. Earl Fitzwilliam
The Hon. John Stuart Wortley
The Committee of the Sheffield Botanical and Horticultura Society respectfully announce to the Nobility, Gentry, and Floral
and Horticultural Amateurs, that they intend having Exhibitions of Plants, Flowers, Fruitrs, and Vegetables, in having Exhibitions Society's Gar dens, Sheffield, on Wednesdat, Juns 16 th, and on Wrdnsiday Saptramer 1 sth, 1841 ; to be open to all England; when valu-
able Prizes will be awarded to the best apecimens in each de-
Schedules may be obtained on application (post-paid) to Mr
Ebnr. Smith, Secretay, Harer Pool, or to Curator, at the Gardens.
MANCHESTER BOTANICAL AND HORTICULFlowers, Fruits, and Vegetables for this season, win be held in One o'clock at noon to Six o'clock in the evening, when Prizes men, and Cottagers. Hereditary Members, Annual Subscribers, and all resident members of their Families, will be admitted by Theket, not transferable, at One Shilling each, if purchased from
the Secretary before the day of exhibition, otherwise they will be charged \(2 s\). 6 d . each. Non-subscribers will be admitted at 2 s .6 d . 1s. each person. Specimens may be exhibited from any part o the kingdom, either for sale or competition, free of any charge
for admission. Specimens for exhibition or competition forto the Secretary, with instructions, he will see that they are propeecimens must be at the Town Hall not later than Half-past
Nine o'clock on the mornine of the exhibition dar The succens. ful Exhibitor may recelve the amnunt of his Prize in Money being to reward the skilfui Gardeser, and to promnte more ex in all its various departments.-sianiven E. Corran, Secreting 28, Brazennose-street, Manchestor.
COX'S REVENGE.-The Norfolt and Norwich Hor would be given by Mr. Cox, of Tooting, for the best single bloom
of Cox's Revinge, to be exhibited at the open Dahlia Show at Norwich, on the 15 th September next, feels it due to the Public to announce that Mr. C. hes dsclimsi to fulfit his promise. Norwich, 12th May, 1811. C. S. GILMAN, Hon. Sec. \(\mathrm{D}^{\text {AHLASS.-The Committee of the SAITsBury Pain }}\)

\section*{Cye Gavomers Cbronicle.}

SATURDAY, MAY 15, 1841.
上
Althocge it is probable that grafting, as an operation, is now as well understood as it ever will be, there is certainly ground for expecting that its application is capable of some extension. All gardeners can perform it, but none of us know what may be the consequence of variations in the performance: this is a subject still to be investigated.
There are those who maintain that the stoek and scion are incapable of producing any influence upon each other re-pectively, and that each retains to the last its own peculiar quality. This seems to be true, so far as their visible organisation is concerned; for when grafted trees are cut down, the timber of the stock and scion remains just what it is in cases where no grafting has taken place, and the shoots that proceed from them manifest in like manner exactly their original nature. The budiding a peach on a plum does not affect the foliage of the plum, nor does the reverse occur. But although the visible organisation of plants does not seem affected by this process, we must admit that the quality of the produce of a scion is affected by the nature of the stock on which it grows. Pears are grafted in Switzerland on the Mountain-ash, and are thus rendered more vigorous and hardy. In this country, Pears, when grafted on Quinces, become more high-coloured; while on the Mountain-ash stock they bear earlier. Peaches on Plum-stocks are coarser than on Peaches, and much inferior in quality. Apples are more highly coloured on the Siberian bitter-sweet Apple than on the crab. Thus far we are sure of our data, for they are the result of often-repeated experiments.
Now if the quality of fruit is affected by the stock that bears it, one would infer that the goodness of all our cultivated fruits is deteriorated by their being uniformly worked upon stocks whose fruit is worthless; for example, the Almond of the austere Plum can only injure the Peaches they are made to bear, the Crab the Apple, and so on. On the other hand, if trees of excellent quality were used for stocks, they ought to improve the fruit of the scion that is worked upon them. We see that some German writers, proceeding upon some such reasoning as this, have been recommending Gardeners to practise the art of "ennobliug" fruit-trees, by taking the best varieties for stocks instead of the worst; and they assert that, by such means, the excellence of fruit is greatly increased. Treffz is represented by Meyer, as translated in Taylor's. Maguzine, to have made known as long ago as 1803 several instances of ennobling, from which it appears that Apple-trees twice ennobled bore fruit of distinguished excellence; Currants and Gooseberries improved after one ennobling, and much more so after the operation had been repeated three and four times. An Apricot is said to have been worked on a Greengage Plum, and a Quince upon the autumn Hergamot Pear: the Apricot beeame as juicy as the Greengage, and far more delicate; the Quince was much more tender, and less gritty. It is now too late to repeat these experiments by grafting, but the operation may be practised in the ensuing budding season, and is, we think, worth the attention of Gardeners.
It is also certain that the quality of a stock is affected, in certain coses at least, by the scion. There is an experiment that illustrates this. some of the old writers on Gardening asserted thatif you bud a yellow variegated Jasmine or a green one, the whole stock will become variegated; an assertion which is denied by Duhamel, who, howerer, misunderstood the nature of the experiment, imagining it to relate to the colour of the flowers, and not of the leares. No doubs it in improbable in the highest degree that a white Jasmine will bear yellow flowers if budded with a yellow Jasmine, for the two plants so called are distinet species, and we cannot conceive the possibility of the opera-
colour of the leaves it is different, and the possibility has been demonstrated. Some years ago, Mr. Wm. Anderson, of the Physic Garden, Chelsea, budded the variegated white Jasmine upon one branch of a fine plant of the revolute Jasmine, the leaves of which were green. The bud adhered to the bark of itsstock, but never pushed. The succeeding year a slight appearance of variegation came out upon the leaves of the revolute Jasmine. The next year a workman cut out the branch which had been budded; so that the revolute Jasmine was thus apparently deprived of all influence from the variegated bod. Nevertheless, the variegation in the remainder of the plant continued to increase, and at the present time the leaves and branches are all variegated, eveni more than the white Jasmine whose bud was originally inserted. This proves that, under some circumstances, the scion will affect the quality, although not the organisation, of the stock; and if a taint producing variegation can be thus communieated, why not some other quality, such as smell? We think this fact should lead to some interesting experiments. Why not, for instance, as one of our correspondents suggests, obtain a variegated Irish Ivy by budding it with the variegated common Ivy? It is very probable that such a result would follow the operation.
ON THE PRODUCTION, DISTRIBUTION, AND PRESERVATION GOF HEAT, WITH REFERENCE PARTICULARLY TO THE IMITATION OF CLIMATE IN CONSERVATORIES.-NO.III. Ir will be a convenient, thowgh not perkaps a natural order, to commence the investigation of water-heating by
conaidering the best medes of arranging, the pipes, either within or without the house, pootponing to a future period our inquiries into the construction of fornates and boilers, and the disposition of the pipes with regard to efficlent ciroulation.
My object in the preceding papers has not been to prore that in a properly-heated building the air does not become warmed in any degree, bot to show that the distinction between the heat of the air and that of the ra-
diatiog surfaces has been too litrle consequence more has been ascribed to the air than is probably due to it. That the atnoosphere of an inhabited building, even in the absence of fres, does become somewhat warmer than the outer sit, was proved by the attempt made a few years sinee to relieve the Sheffeld drygrinders from the ill effeets of inhaling the dust of their
grindstones, by causing them to breathe the external air grindstones, by causing them to breathe the external air
instead of that in which they were at work. This scheme was, I believe, found to produce disease in the workmen, even more rapidly than the dust from which it aimed to
protect them. protect them.
So far from conteading that the air of warmed buildings does not become also warmed, the ultimate hortiealtaral argument I have had in view is founded on the inevitable tendency of confined atmospheres to become heated, and therefore to be unlike free atmospheres. I am of opinion that the heat which the air acquires incidentally under the most farourable circumstanced, thone namely which impart to it the smallest quantity, is quite sufficient it more than this we do wrong, ever in a dwelling-house, and atill more wrong in a conservatory, which in intended expressly to imitate, as nearly as possible, the climate of regions in which the wind blows as it lifts; sometimes sweeping acrons the summits of szow-clad mountains,
very often traversing the surface of a relatively cool ocean, and in which, nevertheless, a high temperature is maintained by the direct force of solar radiation.
Captain Basil Hall, in his amusing volumes of "Patehwork" has a remark which illustrates, in some measure, the nature of the difficulty I feel in regard to the production of artificial climates. He says, "I have been roasted under the vertical sun of Calcatta, baked in the clone land-winds of Madras, and been boiled in the swampy some, special cases, the sort of cooking we require for the plants of warm latitudes is the roasting, rather than the baking or the boiling; while the obvious tendency of a confined hot atmosphere is to become like the sultry land-winds of Madras; or, if freely supplied with moisture, to represent the swampy vapours of Batavia.
If it were possible so to regulate the supply of mois tare to heated air, as to command regularly and infallibly a due medium between these extremes, it might still be objectionable to effect the given amount of temperature by proportions of air-heat and radiant heat different from caose employed by nature; and if not objectionable, if changing these proportions, it would still be desirable to do this knowingly and advisedly, rather than as the result of accident and ignorance. Bat it is not easy, on the
contrary it is extremely difiealt, to control the hygrometric condition of a heated atmosphere; it becomes therefore doubly important to ascertain in what proper
tious the effects of tropical temperatures are divided betions the effects of tropical tetaperatures are divided bedevise artificial means of imitating those proportions.
Although I do not know whether the adrocates for airheating hare founded their views on the opinion which has been frequently put forth, that the force of solar radiation bocomer greater as we ascead from the equator
tained, and as Professor Daniell has himself expressed an opinion that in our latitude the effect of suiar radiation is less than might be expected, it may be useful to refe o the observations made with reference to this point
Mr. Daniell found that, in the hottest part of a clondless day in June, a thermometer covered with black wool and exposed to the sum indicated a temperature of \(140^{\circ}\), while a similar thermometer in the shade stood at \(75^{\circ}\) leaving \(65^{\circ}\) as the effect due to the direct influence of the sun; and he adds, as an infereuce from this and other similar observations, "As the mean effect of the sun's radiation apon the earth falls so much short of the im-
pression which it is capable of producing, in what way is its energy spent?
In answer to this question, it appears to me that the sun \({ }^{\circ}\) s power is underrated,
1. In assuming that \(75^{\circ}\), shown by the thermometer in the shade, is the temperature of the ais, when it is in fact the result of the balance between the radiations from and to the earth and surrounding objects, those objects being exposed to a fierce sunshine.

In omitting to take into account that the same thermometer, which is a good absorber, is also a good radiato of heat, and that therefore it parts rapidly with its heat on both sides of the balb, from one side too without re-
ceiving the sun's rays in return. 3. In neglecting to consider
3. In reglecting to consider the effect of the air, which acting as a cooler in both cases is more efficiently so in reference to that thermometer which is exposed to the sun.
From thene considerations I see no reason to suppose that any mexplained obstacle exists to the force of solar radiation in this, or in warmer climates. The evidence derived from the observed radiant effects in high notthern latitudes, and which appears to confirm the imaginary increase of solar power as we recede from the equator, is principally that of Captain Parry'; whn noticed at Melville Island, in March, a difference of \(55^{\circ}\) between two ther monaters, one in the sun and one in the shade, while no greater difference than 4 I \(^{\circ}\) had heen in the same month
produced near London. I think, however, that this fact by no means warrants the inference drawn from it, but rather the contrary. If a marked difference between a sun-lit and a sheltered thermometer is to be expected anywhere, it must be in the midat of ice and ice-cold water. These materials, absorbing and rendering insensible all the heat they receive from the sun, are not in condition to supply anything to set off against the effects of the sur upon the thermometer. If solar radiation is to be deemed more powerful at Melville Island than in London, merely becuuse a difference of \(55^{\circ}\) was observed at the former, and temperature at London being at the same time \(50^{\circ}\) higher than that at Melville Island? Evidently by the circumstance by the earth and surrounding objects; an aid which is equally afforded to the thermometer in shade, and on which the terrestrial radiation is relatively more efficient while the shaded thermometer exposed to the ice receives no assistance of the sort.
The fallacy, which I with great difidence believe to lis at the bottom of all the rtasonings as to the effects of solar radiation, consists in the assumption before alhuded to, that a thermometer in the shade indicates the temperature of the air. It is perfectly impossible that a permanently elastic fluid,-largely affected in specific gravity by change its bulk becomes greater, and being freely at liberty to ex pand,-it is impossible that such a fluid can, in froe space, be a rapid or a powerful instrument of heating or cooling, except, as formerly mentioned, when it acts upon, or by means of, vapour or vaporizable fluids. Then, however, it is not the effect of teroperature in the air, any more than the heat of a fire is an effect of the temperature of the air
so mach of the heat or cold as is produced by changes in the state of a vaporizable fluid absorbed by, or deposited from, the air, is as purely a chemical effect as combustion itself; and the same dry east wind which sweeping over a rain-moistened earth produces a great degree of cold been sprinkled the temperatare nabearably
To return, hotever, to the ubservation supposed inferiority of solar radiation near which the has been inferred. The reports priacipally relied on are thase of Captain Sabine, who noticed at Bahia in July, that the greatest difference between the exposed and the shaltered thermometer was \(47^{\circ}\); and at Jamaic, in Angust, the greatest difference was \(36^{\circ}\); while a difference of \(0 ; 0\) open to the former remark, that a good receiving thermometer is aloo a sood radiator ; that the thermometer in the sun and that in shade are both acted upon by the same air, and the first most powerfolly 80 , by reason of its relatively higher temperature; and finally, that the thermo meter in shade is still exposed to the influence of sumwarmed objects.
On the other hand, an observation made by Captain Scoresby, on the supposed greater efficiency of the solar radiation in high latitudes, and quoted by Professor Daniell,
bus been much insisted on, particularly by the author the artiele "Hothouse", in the Penny Cyclopzedia. Capt of his alip, while on the other side the thermon one slde
 thermometerin shade would be perfectly uninutuensed by any tended surface of black pitch, laid on a substrathme \(u\) Wood, is nearly the most perfect arrangement that could be to produce heat is the a son connterpart of that employed
in the tropics to produce cold: the pans of water laid on rushes in ladia to collect ice are as complete evidence as
possible that there is no serious obstacle to radiation in warm latitudes. We do not therefore need the explanation which has ascribed the diminished effect of solar radiation in low latitudes to the humidity of the atmosphere, and this explanation, if any were required, would be unsatisfactory; because the mere humidity of the air, that is to to do with its power of obstructing radiant heat. The vapour becomes obstructive only when its quantity is great in proportion to its temperature; a state of things which of necessity exists much more constantly in high latitudes,
supplied as they are with moisture-laden air from lower supplied
The only fact in support of the alleged greater clearness of circumpolar atmospheres which appears difficult to
explain, is that mentioned in the recently-published expedition of Von Wrangel ; where it is stated that a native of the shores of one of the polar seas could with the naked eye detect the immersions of Jupiter's satellites
described as a big star swallowing a little one.
This, however, wants a little confirmation; and, if true might be ascribed perhaps to the far-seeing habits of savage life in a barren climate, or to the greater depression of the sun below the horizons, or to the greater expansibility of the pupil acquired during a long polar night-or, lastly,
it might be a case of peculiar organisation in the individual. The rapid regetation of the short summer in higa latitudes, which has also been quoted as proof of great solar power, has been explained in Dr. Lindley's "Theory of
Horticulture," by the fact that a long period of repose Horticulture," by the fact that a long period of repose
fornishes vegetables with a large accumulation of available matter ready to be assimilated as soon as the temperature will permit. I must notice, however, that even Dr. Lindley adopts the common language, and calls temperatures taken casually in the air, almospheric temperatures; for which reason I think that the series of comparisons between the observed temperatures of certain soils, and the so-cailed temperatures of the superincumbent air, which are given in the "Theory of Horticulture," will admit of a more decided inference in favour of soil-warming, and therefore When it is said that in a certain situation the temperature of the soil was 520 , and that of the air a few feet above it \(50^{\circ}\), there can be little doubt that the air was in fact less than \(50^{\circ}\), because the thermometer, though in the air, ter had been cut off by Dr. Wollaston's concave reflector the air would have been found, quite unable to maintain the previous temperature.

In temperate latitudes we experience at and about the equinoses a difference of \(20^{\circ}\) between the temperatures of day and ig. and both being called the temperatures of the air. Now, though it be certain, as previously shown, that these temit must be admitted that the air is hotter by day than by night, and that it contains those relative quantities of heat as a mere consequence of radiant heat supplied to, or withheld from, the earth and the plants; because the heat of the atmosphere cannot become great by day and small by night in regular alternations, except as a consequence of The earth and the plants, therefore, in regard to the change between day and night, so far from receiving their warmsh from the air, are themselves the sole instruments of its warmth; and although it should turn out that this process may be reversed without injury or even with advantage, it
must be for the benefit of science that the change be made with full consciousness of its existence.
The variations of temperature due to latitude are also caused primarily by radiant heat acting upon the surface of the earth and the vegetation. The air partakes of this change in some, but evidently in an inferior, degree, and always as a receiver rather than as an imparter of heat. As we approach the equator, the difference between the land
and sea atmospheres becomes greater, and the chances of the breeze coming from a colder quarter are evidently increased. It is notorious indeed that warm latitudes are, for the most part, fanned by cooling winds ; and it is clear that even when there is little or no wind, the heated air has a constant tendency to displacement, solely by reason of
its reduced specific gravity, which, as is well known, is its reduced specific gravity, which, as is
largely affected by change of temperature.
Nothing, then, can be more certain than that in warm cli-
mates the air is not the heating agent. The winds which have traversed a burning desert, or come loaded with the vapours of a boiling swamp, are occasional exceptions; but we do not often require conservatories for the plants which thrive under such influences. The air, on the contrary, is by day the moderator of the sun's radiant heat, Which would otherwise perhaps be unbearable by any species of vegetation, and the same air returns to the plants at
night, the heat which it had abstracted during the day ; renight, the heat which it had abstracted during the day; rethis the more abundantly as the clearness and consequent coldness of the night make it necessary. Without this the extremities of trees and tall shrubs might possibly become reduced in temperature below that which is indispensable to
vitality-a catastrophe which is averted bv what have been vitality-a catastrophe which is averted by what have been
called, more poetically than philosophically, the "cooling

\section*{HTW called mor}

47 y greta rapie el plants in a climate formed artificially within meteorologist would be the dificalty of preseatiag the air foom becoming unduly heated, and the certainty that the upper strata would be the hottest;
latively cool, the warmest being in contact with the warm soil, and remaining there to absorb heat even under the
worst circumstances, that is to say, in a perfect calm, only worst circumstances, that is to say, in a perfect calm, only
till its acquired levity is sufficient to overcome the friction

\section*{of displacement}

Supposing this view of the case to be correct, what would the supposed philosopher say to the proposal to make the air itself the instrument of imparting all the artificial heat, to introduce it at the summit of the enclosed space, which has, in spite of every endeavour to prevent it, an unnatu small streams on particular portions of particular plants, leaving it toexhaust what Captain Basil Hall calls its baking influence upon them, before it is allowed to slake its thirst with less costly moisture

COTTAGE GARDENS.-No. XVII
IT is generally about this time that those Cottagers who are fond of Cucumbers begin to make preparations for
reariog them, without any other artificial aid, perhaps, than the little heat from the dung which composes the ridge they are intended to occupy. One of the warmest corners of the garden is usually selected for them; and although it is necessary that it sbould be well sheltered, ought at the same time to have a free exposure to the noonday sun. The space need not be of any great extent, as a few plants properly managed will produce an abun dant supply of fruit during the season. When the spot has been fixed on, let two or three circular holes be made, three feet across, and about 18 inches deep. Fill these with any long grass or weeds, mixed with littery dung from the pig-sty. Shake them well together with a fork, so that the mass may settle equally, and cover it about eight or ten inches deep with some of the rich-
est and best of the soil that was thrown out of the holes then in the centre sow four or five seeds an inch deep, and protect them from wet with a flower-pot, or any simila covering, until they have vegetated. The same process must be followed by those who are desirous of cultivating the Pumpkin and Vegetable Marrow, either of which, but especially the latter variety of gourd, is to be preferred to any other, and will be found more serviceable to Cottagers generally than Cucumbers, its fruit being particularly soft and rich, approaching in some degree the flavour of mar row, if dressed when about half grown. It may indeed be cooked in a variety of ways by every cottager at any stage
of its growth ; even the tender tops of the shoots are excellent when boiled as greens or spinage, and will probably be esteemed by many as a more delicate vegetable than the fruit itself. For these reasons we are desirous of seeing it assume a prominent station in every Cottage Garden, believing that it is not at present so extensively cultivated as it deserves to be. The seeds are easily obtained, and we would now recommend a few to be sown and treated in the same way as directed above for Cucumbers. Be particular in attending to the advancing crops, and see that such as require it are cleaned and properly earthed up. The Peas and Early Potatoes should on no account be neglected in this respect, as no crops are more benefited by frequent earthings than they are. Weed and thin the seed-beds, and prick outany of the kinds that are
of sufficient size to be remored. Dull weather or the evening should be selected for performing this operation and when completed, a litule water may be given to settle the earth about the roots.-M.E.H.

\section*{THE HYACINTH}

The Hyacinth is so generally admired, that a descrip tion of its cultivation will not be uninteresting to many amateurs. The following has been the treatment adopted by my father and myself successfully for 30 years, and
we have improved Hyacinths gradually both in bloom and habit:-They require a sandy soil, free from lumps or stones, and not mised with any vegetable matter ; neither ought the ground to have been used long for different shrubs or trees, as we have found that to be injurious to the heaith of the roots and to increase the diseases they are subject to. We are always particular in observing that the situation where we purpose planting our Hyacinths is such as to let the superfluous water pass away if required ; and, at the same time, it should not be too high, as the roots will be injured from the want of moisture this is considered an important point in their cultivation, and the neglect of it will lead to disappointment.
The roots are planted in October, the soil being prepared by having pure cow-dung mixed with it one year previously to the time of planting. We use a barrowful of dung per Dutch roede (a square of ten yards). The ground being measured into beds, the soil is taken out of the first to the depth of five inches, and the bulos are plaund irmly on it, so that the under part is well surrover ihe earth the of the to the same depth, which is then ready to be planted, and this is pursned until the whole of the beds are completed
As soon as severe weather commences, all the beds are covered over about eight inches deep with reeds, so as to prevent the frost penetrating them; as it would, by lifting up the surface-soil, pull off the roots from the bulbs. As soon as the frost is gone, the reeds are taken off, and the beds are coated with a mixture of cow-dung and water, to prevent the light sandy soil being blown away by the young tops of the Hyacinths; for which purpose also fences are made round the fields, of the reeds with which they have made round th

The flowers having opened, and being in perfection, are all cut off to give greater strength to the baibs, and to
make them sooner large enough for exportation. In July the bulbs are taken up, and the leaves being pulled off,
they are laid down regularly, each bulb on the side, to prevent the roots growing each bulb on the side, so as to prevent the roots growing again; after this they are
covered over with dry soil, one inch above the bulbs and remain in this state for about a fortnight, to separate the roots and loose skins easily from the bulbs. Great care must be taken during this time that no injury is done to the bulbs by the sun; attention should, therefore, be paid to keep them well covered over. When taken from this situation, the bulbs are exposed for a few hours to the sun, and kept continually moving with a large brush, to prevent their being scorched ; by which means they get that glossy appearance always observed in imported bulbs.

After this management the bulbs require a few weeks' drying in the warehouse; for which purpose they are laid which enables us to look them over occasionally, though this is done principally that they may have a good circula. tion of air between them. The windows are opened every day on both sides of the warehouse,-for the more air and wind we are able to give the better,--that they may be dried and ready to be packed. The neglect of this not unfrequently causes the bulbs to get damp; and, though they may have been sent off in good condition, many of them are found to be spoiled when they arrive.

The Hyacinth is increased by offsets ; but to multiply the number of offsets, cuts are made in the under part of the bulb, which, by proper management and a little care, The Hyacinth is subject to tro different
Caused by a fermentation of the sap at the the first is caused by a fermentation of the sap at the time when the bulb is in its full growth, and it changes the bulb into a slimy substance. The second disease is of a cancerous habit; it rises from the bottom of the root, and destroys all the vital parts. Though these diseases have shown to the grower their destructive properties, no general remady
 yor preventing them has
yeen found out; we
are, ho are, however, endeavoarand spare no tronble to improve this splendid flower, and have not been Mnsuccessful. \({ }^{\text {Mooy, Haarlem, at Mr. }}\). Groom's Nursery, Wal. worth.
We subjoin from another correspondent the properties of a good Hyacinth: cinth should be of a com. pact pyramidal form, with a strong, tall, and upright stem, supportiog numerous large belis, each stalk in a horizontal position to the stem. The bells should be perfectly double, composed of broad, thick, waxy petals, with
the centre of the fower raised, rendering the form convex. The bells should occupy about one-half the length of the stem, with the uppermost ball erect whole-coloured or striped, whould be clear and bright; those having a contrast of colour in the centre are most esteemed.

\section*{HOME CORRESPONDENCE.}

Effects of the Winter on Roses.-Roses have suffered less than in 1838, owing to their being kept in a dormant state by the frosts of last November. In Dec. 1837, the weathes was so mild that most of the Noisette, and many March China, and Damask Roses had pushed forth, as to a gren in ordinary seasons, consequentiy Chiaas, with the excep. tion the King of Roses, a most luxuriant grower, have all escaped without injury, as have also the varieties of Damask Roses, Rúsa sempervírens, and all the perpetuals. Bourbon, China, Noisette, and Tea-scented Roses, their own roots, protected by branches of furze, are also uninjured, having only their late autumnal shoots killed these are on raised beds, on a cold clayey soil, souther exposure. The same varieties on a dry, sandy, southeastern slope, planted against low 4 -inch brich wall killed. Owing to the warmth of the soil and situation, they were evidently kept in a growing state till the severe frost a once checked and killed them. The past winter has gieties Rose-growers some severe hints as to the proper vanne to grow as standards; many bitherto grown in that I may are unfit, and only lead to disappointmorbons, China, Nolwith safety assert that none of the Boarbons,
sette, or Tea-scented Roses, can be depended upon as permanent standards, uuless well protected; for if we hare mild growing autumn and only a moderately severe winter afterwards, all the rarieties of those Roses are sure suffer. The following standard Bourbons were killed het by the past winter, stending in the quarters unprotected -Philemon, Marshal Villars, Antinöus, Ninon de l Enclos Faustine, Armosa, Phoenix, Gloire de Guérin ; these kind are all of more delicate growth tham many others of the
family, and are not at all adapted for standards. Standards of Gloire de Rosomène were also totally destroyed. Au gustine Teliem, Latifolia, Madame Desprez, Queen,
Madame Nerard, Emile Courtier, Duc d'Aumale, and several other varieties of equally robust habits, suffered but little, being only, to use a technical phrase, "killed down;" still I consider this the result of our last cold antumn. If we had had a mild December, and a serere winter afterwards, all our standard Bourbon Roses unprotected would have been destroyed. Standard Roses of the four above-mentioned families must con sequently be always avoided when planting rows or
avenues, as their uniformity will be destroyed by severe avenues, as their uniformity will be destroyed by severe
winters. Still, although standards of these families must winters. Still, aithough standards of these families must a place in every flower-garden, where they can be planted in beds or groups, or singly in prominent places, as they produce flowers in such abundance, and often much larger than when on their own roots. Nothing can be easier than their culture, which is simply to "lift" them in the begin ning of December, and place their roots in the ground one foot from a north wall or fence, and let their heads rest gainst the wal. At the commencement of frost, a mat January ; if the following month is mild it may be re moved to give the branches air, and again placed over them on return of frost. About the end of March, or beginning of April, they may be planted out for the summer, loom much finer than if suffered to stany. They wil borders unprotected, as the winter, although it does not kill, often injures them severely. Little room is required for their winter quarters, as a space 20 feet in length of wall will hold 100 Rose-trees packed close; if the wall is ijure them The thes killed here sor stand Tea and Ching Rose, and all the Noisettes, Lamarque and Jaune Desprez, left in the borders unprotected; but out of a great number of these varieties, placed against the north wall of a greenhouse in the above manner, not on was in the least injured. I have before recommended open sheds for the protection of these Roses as standards, ce the air too dry, so that their shoot have becone shrivelled and exhausted. The improvement that has taken place in hardy and free blooming antumnal Roses is so great, that we shall in futare have no occasio to plant standard Bourbons or Noisettes in our rows and avenues, as their places will be taken by the new race o,
autumnal Roses, by some called "Hybrid Perpetuals." These are of the most luxuriant "ion the common Damasic Rose; they are seedlings from Hy rid China Roses, which by repeated cross last taken the habit of one of their parents, the China Rose, and bloom continually from June till November What adds to their value, and must bring them into ge of them have. As this race is at present but little known I will describe a few of the leading varieties, with their characters and habits. It is rather remarkable that each cultivator seems to have a peculiar breed; thus M produced sereral of first-a to this family of Roses, has riant habit the of first-rate quaiity and pecuilarly laxuin 1837. I the first of this family of his raising bloomed Carronse saw him in June of that year on the Place du Carrousel with a bouquet of its flowers, going to "lay named the Rose. This is a first-rate Rose, very hardy and vigorous in its habit ; Mr. Laffay has since then' given us Marshal Soult, Reine Victoria, and Edward Jesse, all good roses, but in colour and habit too closely resembling the Princesse. These were followed by Madame Laffay and Comte de Paris, two fine varieties, different in thei more to the Hybrid four first mentioned, and approachin Allard, with the desirable quality of giving ahundance of flowers in the autumn. They are both excellent varietie with fragrant flowers, and are only surpassed by the las new variety from M. Laffay, Prince Albert. I observe you have noticed it in p. 262 as being like Comte de Paris but the flowers then exhibited were forced from buds formed in the preceding autumn, and I can only say that in its natural state, when sam it in Paris in 1839 its colour Was daric ss that of George the 4th, and I believe Mr Laffay will be borne out in his assertion that it is the finest perpetual Rose known. M. Laffay has also a new perpetual Rose of the habit of Brennus ; fame size and colour. A plant of it growing here in forcing-house is remarkable for the beauty and luxuriance of its foliage. Among these luxuriant-growing perpetual Roses, I had nearly forgotten to mention Fulgorie, a most free-growing and beautiful variety, well calculated, with all I have thus far noticed, to form permanent and fine standards. I will now notice a few other Hybrid Perpetuals raised by M. Duval, of a totally different character ; these are all of dwarf compact growth, with flowers not so large as those I have described, but of extreme beauty, and the habit of the plants neatness itself. Owing to their dwarf habits they do not make good and permanent tall standards; on short stems they grow and flower freely, but it is for small beds on their own roots that these Roses are so well adapted. For a group no Rose, perhaps, is so well calculated as Clementine Duval, with its compact dwarf habit and pretty rose-coloured flowers. General Merlin, also raised by M. Duval, is a beantitul dwarf Rose; and then from the same cultivator we have Coquetre de Montmorency and Aubernon, dwarf and compact-growing crimson Roses, every shoot producing abundance of howe As grouping well also with the above, may be mentioned Sisley, which, on its own roots, is a charming dwarf Bose; it is too dwarf for a standard, and is short-lived
when worked on the Dog Rose. Of the above fine varieties Aubernon will be the best for the central plants of Neuilly, on its own root, is also an admirable Rose for grouping, as its habit is compact, and its fowers large fragrant, and constantly produced; this Rose should never be budded, as its flowers in many soils seldom open well I beliere this new race of Roses will, in a short time, form one of the most prominent features in our autumnal Rose gardens, as fragrance, luxuriance of habit, and hardiness are most desirable qualities in autumnal Roses.
tended in this to have given some directions for planting and grouping the Bourbon, China, and other Roses generally planted during this month, and to have also given a method of arranging the plants so as to be protected in winter with great facility, but 0 wing to the length of this paper I must postpone it.-T. Rivers, jun., Sawbridge sooth, Herls
Slate Cisterns.-I am often surprised when visiting conservatories, greenhouses, \&c., to see a person laboriously engaged fetching water from a distant pump, when the plants might be so much better supplied by the clouds i the eaves-pipes were but introduced into a cistern placed under the stage, or some more convenient place, which would receive the valuable soft water now so often allowed to run useless into a neighbouring drain or dead well. Beside the saving of libour and the superiority of soft water over spring, there is the advantage of having a supply kept at the temperature of the hoase, and by a little judicions arrangement as respects the covering of the tank the surface of the water may be more or less exposed to the process of evaporation, the value of which is wel known to every practical caitivator. Tanks may be con structed of wood, brick and cement, or stone-but slate is superior to these, from its neatness and durability, and the absence of offensiveness in the rain-water; in fact, neighbour of mine, whose Heath-house contains beneath the stand a large slate reservoir, which has kept him supplied the gear round, had occasion to rinse it out but once in that time, and never found the least unpleasant smel arise from it. I recommend their being made long and wide, not very deep, and with a well of sufficient size to dip a garden-pot into. Accompanying are a sketch and section to be sunk at any convenient depth into the ground and the supply and waste-pipes to be fixed at any desirable point.-N. [We quite agree with oar corresponden in regarding slate as the beat of all materials for tanks. We are of opinion that no horticulturist can possibly be doing himself justice that allows the rain to pass into the earth, and then fetches it back filtered from the pump, and spoiled by the soluble salts it becomes impregnated with Yet, where every attention is paid to soil we very frequently observe quality and temperature of water are thought unimportant and totally neglected.]

Nitrate of Soda, and its Effects on the Dahlia.-In the beginning of June 1840, I planted a piece of ground with Dahlias, the soil of which was very poor and light; in August they flowered freely, but small, and open in th centre when full-blown. I then dissolved 1 lb . nitrate o soda, in 12 galls. of soft water, and applied it liberally all over the soil with a watering-pan, and repeated it wheneve watering was necessary ; in the course of a fortnight its effects were truly astonishing; the plants became a fin healthy green-the tlowers much larger, very brilliant and perfect; some of which, exhibited in a stand in the ama teur class, obtained a second prize at a prơvincial Dahlia show, notwithstanding there were 24 competitors.-A husmble Amatour.

The Cannon-hall Muscat Grape.-This variety usually sets badly, and it is difficult to get berries placed regularl over the bunch, notwithatanding that there is a greate number of flowers produced than on any other variety excepting the Black Damascus. In order to get the Cannonhall Muscat to set properly, I with a pair of grape-scissors cut out the flowers by threes and fours, at the small shoulders, where they are clustered by dozens, Ieaving room for swelles the for two ber fieny, her the bexh hell duted with pollen In bur the the In order fully to test this experiment, 1 letc bu ben on eack spur, till the berries were set, being thinned; and though all were alike dusted, yet here was a considerable difference in their setting. . bunches set well, and the berries swelled regulariy, whil the unthinned ones set irregularly and swelled bady. Tit temperature of the house was at the time of flowerin \(85^{\circ}\), and the floor and paths were watered in the morning
and when the house was shut up with a syringe; but the vines overbead were mever wetted at this time. Can the that the pollen is defective, the anthers so placed as that the pollen is defective, or the anthers so placed as it is that thinning the bunches is of great service.-G. G. Watson, Norton, Slockton-on-Tees
hurt) belong to the order Orts (Blattoe, from \(\beta \lambda a \pi T N\), to the ancients by the app Ortoptera, and were known to Be orientalis, which was imported from the East into Europe through the commerce in the Levant, being brought over in shipcargoes. Your correspondent notices fully their destructiveness and place of abode; but in addition to their voracity they possess the noxious quality of leaving an offensive解 like their foreign congeners, ther make use of their winge when occasion requires, although on account of their nocturnal movements they are seldom seen to do so Rennie mentions another species (B. lapponica) which he states is occasionally met wita in London, and which ap pears to be as destructive as the former. The Blatta have enemies of the insect tribe, which in some measure reduce their number ; they are selected by a parasite-fiy (Evania appendigaster) as a receptacle for depositing and hatching its eggs, in the same manner as the Ichneumon ay deposits its eggs in larva and perfect insects.-(Grif fith's Cavier-Rennie's Insects.) The best method to catch them is to have a small oblong square box, about the size of a mouse-trap, into the top of which a glass funnel is inserted the aperture at the top of the fannel being smaller than that at the bottom. A little flour or meal must then be strewed at the bottom of the box, which will entice them to enter, and from which they will find it inpossible to escape on account of the slipperiness of the glass. There must be a side-door to the box; when morning comes, let the cockroach-catcher take the box, and holding it over a he will soon find that the deaired object has been attained. \(-B\).
The Double Yellow Rose.-Miller, quoting old Parkinson, says of the yellow Rose, "The flower is so thick and double, that very often it breaketh out on one side or nother, but a few of them abiding whole and fair in our country; being fair and blown, it doth scarce give place or largeness, thickness, and doubleness unto the great Provence or Holland Rose." Now, I conceive that G. B. by only allowing four buds to remain, threw all the zourishment into them, and thus increased that disposition to indeed, I latel whin Parkinson and athers complawn to the greatest perfection against the cottages in Suffolk, where they are saffered to run perfectiy wild, and that he had observed that they are very impatient of the knife.

Acolimatising Esotic Plants.-I planted ont into the open border here four large plants of Agapanthus umbel \({ }_{d}\) litus, early in the spring of 1825 , in different places, an aspect, and are all thriving well. At approach of winter, I put some leafy mould, moss, or decayed barls, over the I put some leafy mould, moss, or decayed bark, over the surface, and stick firm over all some evergreen branches of
Red Cedar or Cypress, which is cleared away in ApriI. They flower every year from July to October or November. In 1835, one plant set deeply in rich earth, with a clayey subsoil, at about 170 feet above the level of the sea, produced 12 stems, which bore 891 flowers. Anthy'lis erinacea, a native of Spain, was planted in the open border, continues well ; it flowers in May and June, and some years produces a few seeds. At the approach of winter, some old tan or leafy mould is put over the root. It is a dwarf tough little plant, only 8 or 9 inches high, and I took off a slip with some root on it, and planted it in a sandy loam, and it struck well. Anchúsa capénsis ripened seeds in the open border, near a south wall. in 1839, and several self-sown plants appeared late in the spring of
18n, which flowered freely for sereral weeks, and produced seeds: a few survived last winter. Cálla æthíupica, in pots, produces ripe seeds here, some of which were sown in the open ground, on a hill, in the end of March 1822 . They were protected with an old broken frame, and in about 6 or 7 weeks fifteen seedlings appeared. In the autumn they were taken up with some earth about them, put then into pots, and kept in a glass-hoase during the winter, and one of them fowered at about 13 months old. In the spring of 1823, a seedling was planted out under a high arm sect where the sun cannot shine on it antil mid-day, in an argillaceous soil, on a decayed rocky substratum ; this plant continued to grow and flowe freely every year at the end of May, and in June it generally produced 4 flowers. In June 1528 , it produced
flowers and perfected a few seeds. In 1824 and \(18: 3\) found 8 seeds in one berry. This plant remained usdisturbed till the spring of 1338 ; it was then dug up, and a large
mass of roollets was found, which would inave made a great number of plants. It was replanted in the sdm place, and is now going on well; at the appruacin of
winter it is covered over with old tan or leatr moull, and early in the spring the earth about it is stirred up. There are here seeding plants arowsic in uther situatuns, whic I expect will blum the scosun. The latitade of this place is \(55^{\circ} .55^{\prime}\). - the uttrude form 150 to \(1 / 0\) feet, and having so many Cailas in pots, and in the open ground as well as in seseral degrees of temperature, they are in floribunda was planted in the open border, rather deep it surrived the last two winters well, and begins to dower in

June, continning till December, but it has not yet produced seeds. It is now (Aprit 15) springing up healthily. that the frost was severe. I have resided here 26 years, and have only observed two or three sonthern-like springs here, of which trestonkirk.
Weeping Willons-When reading the Chronide of the 7th, I was sarprised to think that the whole of England should be condemned by your correspondent " \(S\)." as un ent informed us what the length of the Coatinental twigs is that art so "gracefully pendent," any one would be betof the Continent. But certanly there are naany places in the character of "perfect looseness," for the breath of a zephyr will move them; and as for "perpendicularity," planted over an urn. The soil in which I have seen them grow best was a moist sandy peat, transported by water
from Bagshot-heath, and sheltered from the north and east. I believe many of your correspondents could refer grows in such luxuriance as would soothe the most pungent sorrow that ever sought relief beneath its shade-Peter Mackenzie.

\section*{Melon-growing.- Perceiving in your paper of May 1} swer to "Rusticus." on growing Melons, advising him to allow only one to set on a plant at a time, which method is quite at rariance with that adopted by most gardeners I am acquainted with, perhaps you will allow me to state the plan I have adopted for some years with invariable
success. One of the most essential things in Melongrowing is to have the dung properly prepared (if dungbeds be made use of) ; and for that purpose it ought to be surned every four days for three weeks or a month, and if it appear rank, a mixing with leaves will moderate its vioyou have assured yourself that the dung is in a suitable state, and sweet. I have had dang-beds so prepared in
February retain their heat very little impaired until June when it was no longer necessary, without any lining what ever, although usually a lining of hot dung is required in the cold weather, which so often happens in April. A be wanted or not. Supposing the bed made, and the
lights put on (for 1 prefer the old-fashioned method of growing Melons in two or three light bozes), after the lapse of a week or ten days at farthest the soil may be put
in, which should consist of hard cloddy lumps of clayey soil, dry, and almost as hard as bricks, mised up with an equal quantity of good fresh loam and rotten dung, preriously prepared. My reason for using the hard impene trable substunce alluded to is to act as drainage, and like-
wise it retards the growth of the plants, and makes them more fruitful, by checking the tendency their roots have to run through a finer and richer soil. Only a small quantity of it is put in at first. merely sufficient to make a little gileam in the bed it is not advisable to cover it be much After the plants have been planted on the hills, care mus be taken that no steam or unpleasant smell arises, which is detrimental to other young plants as well as Melons
Presuming all went on right, they will, in a fortnight, require an additional quantity of soil, which it is better only to give in small quantities at a time, and a week afterwards a little more, always examining the hills to ascertain if now begin be approaching the ore properly stopped before they were planted out, their lateral shoots will most likely produce male blossom, and the sub-laterals fruit blomom. It is the usmal practice to thin out the vine very much, and stop the ends of such shoots as show fruit-blos nom at two eyes before it; but if they be planted in the soil above alluded to they will scarcely require it. As soon as
three or four frut-blossoms appear expanded together set them all, and not one at a time, as recommended to "Rusticus:" for I have invariably observed that when one fruit gets in advance of the others the rest seldom come to anything. One of the most essential things, therefore, is mean the plants to ripen, which will vary according to growth and other circumstances. Csually gardeners think light, six feet by three, of 1 lb . or 1 l lb . less mumber of a heavier sort. I have had 29 ripe fruit in a two-light frame of the old green Egrptim Melon, averaging 1 lb . each and well-llavoured. I have had still more or a scarlet-ileshed Melon; but six, eight, or ten, or somewater until the fruit is a orer the soll to prevent iosects infesting them. After the fruit is set, I give a copious watering, and it the weather be at full sive, whe werings aterwards, until the fruit be nearl they have water within tho more; as by no wore ripening water spoiling the flavour of the frait and rendering many that one of the thipid and tasteless. I am of opinion have them all set together, and have a fair start, as when roibect of that nourishment which other, the latter ar vancement of the first-formed fraitvancement of the first-formed frait.-S. N. V. [In the it should have been farther explainet that the succession
ahould be obtained, not by the same pluat bearing fruit in different stayes of growth, but by different plants ; one fruit being set, as it were, now on one plant, akother nome
time hence on another plant, and so on. When the fruit
thus set are fall grown, a succession is then allowed to come forward; and a third sometimes in like manner thus, according to Mils's systern, each plant bears two or three fruits at long intervals ; but the one fruit is always beginning to ripen before another is allowed to grow on the sime plant.-Corresp.]
Hed Spuder in Cucumber and Molon Frames.-Get some leaves of the common Laurel, and having bruised them, place them on the mould immediately under the leaves of the plants infested with Red Spider. Shut the frame up closs, and let it have the full influence of the over the glass, so as just to shade the plants a little. always found a warm day the best ; next morning you will thare your plants perfectly free from the Red piaer, and tion of seeing your plants grow vigorously; the Red Spider haring been the only thing that prevented their doing so before. I am aware that this method is by ao lately seen one or two communications on the subject, in my opinion by no means so effectual.
some years ago when Ifirst entered the profession, and was quite delighted when, a few years atter, having the management of Cucumbers and Melons, I made a trial of the plan and found it succeed perfectly.-J. T.
that from time to time have been recommended for thi sore pest of the urchard, all of which seem to have again fallen into disuse, either on account of their inefficacy, their noxious qualities, or from the continual painstaking and trouble required in their constant application. The disease is occasioned by an insect, the Aphis lanigera which presents the appearance of cotton wool on the bark or branches of the tree affected. I last year saw an orchard which was so overrun by this blight, that the proprietor had, in despair, cut down two trees, and was about to de stroy three more. trecommended coal-tar to be applied made its appearance. This was very easily done by mean of the long-sbafted brush used by sailors in tarring their ships. It is simply a small round-headed brush, apout the size of the palm of the hand, with hair two or three inches ong, the shaft being about two yards in length. The ex periment was completely successful; a second application, with the exception of but one tree, was in no case required. Wherever the disease showed itself, the part was immediately well rubbed with the tarred brush. For the last three or four years the trees had almost ceased to bear fruit. I am happy, however, to say that, at the present time, they look in a vigorous healthy state, and are literally covered with blossom. Should the disease again appear, as it is far from impossible that some of the insects, or their osa, should hase escaped the first year's application-so thoroughly infested were the trees -I have the strongest confidence, from the effects seen that it will be but in a very slight degree, if at all, and will be, this second year, effectually and tinally eradicated. But, from the present healthy-looking condition of the is every reason to conclude that the pest is already got rid The coal-tar can be readily obtained at any gas-house
6d. gallon.-F. \(R\). Horner, M. D. Ery'simum Peroffskyánum.-J. W. says that his plants ory'simum Peroffsk yánum, which have stood the winter, tioned by a subscriber in p. 165 . lost their fine bright orange colour, and degenerated into pale yellow; and he remarks, that if the plant generally be comes so, it had better be treated and described as an annual. LAt Strood, in Kent, in a yery exposed situation the Erysimum has stood uninjured, and its Howers are Whan colo 1
grainst a south-east wall vay; the branches instead of ber wriou shoots should be, are becoming quite flat, and growing more like the Cock's-comb than anything I am acquainted with. One branch is now about two inches wide at the extremity, and there is every appearace of its becomin wider and wider. This flattened extremity is covered with leaves, which are much crowded. What is the cause of this curious development? I have seen many instances of flattened footstalks and an increased number of lowers amongst our indigenous plants this year; for instance Bellis perennis, Primula valgaris, Anemon nemorosa, and the Crown Imperials, have had a strong tendency to have their stems flattened. Has the heat of the season anything to do with the abnormal appearanc of the last-mentioned plants? It could not have affected the Cotonenater, as that has been growing so for some time--S. Buckland. [These stems are what botanists mentioned fasialed, carious example of which was appearances, as is well knowm, occur in other parts be sides the stem, as in the fruit of the Strawberry, and in the flower-branch which formest frne of the Pine-apple. De Candolle suggests that all these instanceas are owing to the union of contignous branches, which, touching each other at the sides, form natural grafts, and in some caser this is doubtless the fact ; but no one, that ve know of has ever thought of showing what causes the tendency branches to grow constantly side by side, instead of standing in their asual relation to each other.]
Different habit of Trees.-In a former Chronicle there is a query as to the cause why, of two trees of the same kind planted together, one comes into foliage some time before the other? It is worth while to raise two ches neta or ants at distant times; to put one now into a
hot-bed, and amother into the open ground later, and to cording to its first vegetane did not wake every jar, to son for suggesting others io try this experiment in, that Iam-Senes.
Sea Kale. -1 observe, in a late nomber of the Chronicle, that oue of your correspondents states his baving found
Crambe maritina (Sea Kale) growing in stiff clay. It is very unusual for it to nccur in that sonl. It grows in the greatest abundance on the samuly beach at Calshot Castle, Hampshire, where it covers the ground to a considerable exteat, growing among the shingle and saad. I have never seen it growing wild anywhere but on . sandy stony beach.-G. \(\boldsymbol{K}\). [A nother correspondent finds it on the chalk cliffs, between Broadstairs and Gumsgate, in the 1sle of Thanet. in "Cowell's Floral Guide for East Kent," it is mentioned an growing on the cliff at St. Margaret's, and under the South Foreland clifif, on the shore at Whitstable, and on the cliff between Westgate and Aple.
Loveal Measures.-A correspondent suggests, that as it is obvions from the first article under the head "Home quantity of land contained in a Rood varies in different districts, it would be desirable to obtrin a list for the United Kingdom, adapted for future refereace. [If our gladly prepare such a table.
Instrance Companies.-I have seen in your paper the advertisement of a company (the Australasian Colonial, \&c.) Which professes to give much more favourable terms to the purchasers of an annuity than can generally be obtained; and I see by the prospectus of this company that it finds itself able to do so in consequence of investing its funds in New Holland or Australia (which circumstance has, I suppose, induced it to take the title of Australasian, \&c.). Not being myself a competent judge of how far this company may be abie by sach in. vestments to fulfil the contracts which it offers to the public, I take the liberty of asking your opinion-first, as to the interest which can be obtained for money iavested in Australia is high enough to enable the company to make such bargains; second, whether money may be nvested in Australia with safety ; third, whether you heieve this Australasian Company to be stable, respectable, and rustworthy. Your answer to these questions will be a gret for or or or tiously trusted their money to some of the fraudulent London insurance compauies has, in this neighbourhood at least (Edinburgh), been lameatable. At a distance from London we have no means of getting at the truth of such matters, and our anxiety to make a good investment of Reader [W too to make as incaucious.-A Constand With every wish to oblige sort. Nevertheless, as it is of great importance to gerdeners to know where to place their hard-earned savinge indery and to adyantage, and as such dreadful consen quenees have lately followed imprudence in this respect, we have no objection to say that we know the socioty to be a bona Jubse-that the names of the diroctur genuine and of persons of high character and stnadiag and that a very high rate of interest may undoubtedily 60 obtained in the Australasian colonies with safety, provided only the iavestments are made by prudent men well acquainted with their business.
Thouilts on Rotany.-A young student lately put to me the question, What is Botany? I told him it was Greek word signifying, a knowledge of plants: that originally it implied an acquaintance, not only with their external forms, but also, and more especially, with their asture and qualities, their uses in medicine and the and in domestic economy : that such were the quairea tions formerly considered necessary to entitle any one io the appellation of botanist; and that such a kuowiedge was, with reason, regarded as among the most 1 could not apply such a dee sciences. the science of Botany : for, at this time, any one is called a botanist who pays attention to the form of the flowers, fruit, and leaves of plants. The rout is now mostly disregarded, and seldom becomes a matter of notice in botanical descriptions, although this part is endowed, not unfrequentiy, with the most important and think, matter of serion regret that so little regard is paid by modera botanase the properties and uses of plants. It is not, howevt with the botanist alone that is it to be lamented that professors of medicine more is it to be lamented that professors ores of the healing art; although, indeed, many honourable excep tions might be mentioned. But what seems moss repre hensible, is the general neglect of the valuable remears indigenous to the country, which, by many pharmacologists, are passed unnoticed, or oniy mentioned, perhaps, as "useiess incumbrances of the materia medica, this, as is often evident, withuut any actual knowled of pharmacr too plainiy exhibit the disregard of the valuable treasury of the soil: they present us, indeed, as Dr. Paris sajg, with a mery meagre bill of fars. Theme wortame chieffy taken up with useless speculations on the che whilst affections and composition of mineral subukies, remariks. he vegetables are dismissed with a few briel reatries How insignificant are these manuals and dispensaw nech when compared with the works of the old anthes, Mesne, or as those of Dioscorides, Theophrastes, Gaten, Maskineon,

Hoffmann, and others ! Those, indeed, who would acquire 8 tolerable knowledge of meedicinal plants, must peruse the old authors, which are now thrown aside ss empirical and "as an apology for the neglect into which the works of the older pharmacologists have fallen, that their observaions on the employment of remedies are altogether empirical. This, although to some extent true, apphes no than to those of our owi time. The suggrestions even of the oldest writers on this branch of medicine are ex tremely usefal, and calculated to lead to many valuabie
results. These are also much fuller and more diversified, results. These are also much fuller and more diversified,
and often more judicious, than the equally enopirical notions contained in many modern works; in proof of Which, let the reader turn to the "ritings of Mesue,
Serapion, Galen, \&c., and aiterwards to our own dispensatories and other manuals, and then judge for himself. As long as the nature of disease remains but imperfectly understood, and whilst the physiological operation of they can, at least, lay claim to no higher grade of merit than rational empiricism. - J. Hancock, M.D. Bark Monopoly. - "A Young Forester, Kidderminthe person who took up the bark paid for the labour of peeling. I shall feel obliged if he will state this, when I chall probably be enabled to throw a little more light upon the subject.-Joseph Paxtom.

Abies Deodára.-In the unpublished journal of an Indian traveller is the following passage :-A bout six miles from Fargoo the traveller enters a forest of the Abies Deodd́ra. The trees are sruly superb specimens of Himalaya timber; liard cue, and from 15 ft . to 18 ft . in circumference, withont a single side branch until within a few feet of the top. These trees were met with on an expedition to the Borinda pass On an expedition to the suminit of the Choor mouptain, the same person says, "The first pay of the journey to day was through swn. tered of the largest and most magnificent Deodara Cedar ever saw ; their size was truly wonderful, and I am certain there were thousands together 200ft. high and 20 ft . to 25 ft . in girth. I measured one that was 30 ft , and I be-
lieve many more were quite as large. Numbers had fallen heve many more were quite as large. Numbers had fallen
down, and their bare trunks as they lay on the ground were as high as one's head, and it required considerable exertion to get over them." - Viola.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.
CGelo'Gve crista't. stove Epiphyte. - A most beautiful species, fragrant, free thowering, and having large blossoms of
the purest hite, ercept the lip, which in its centre is decorated
with bright yellow fringes and plates. It has recently flowered with oright yetlow ringes and plates. It has recently flowered
with George Barker, Es, of Birmingham, and was exhbitited
a meeting of the Horticultural Society in Regent-street, where it gained a Knightian medal. - Bot. Rej.

 Bhrubby plant, but it may be regarded as an anniail so far as
English pardensare concened. The best aray to manage it is
to raise it anmually from seeds sown on a hotbed in March. It

 be reearded as quite an a cquisitiun to the collections of plants
requiring high temperaturqe. It is a native of Cuba, whence
Messrs. Loddices imported 1t, and with whom it flowered in

 by the Coart of Directors of the East India Company. It requires
cactuly the same treatment as the commum arden Baisam, and
grows to as large a size The paper that coutained the seed was mark eed "Woully podded Balsam, found growing on old ruins.",
The leaves are from six to eight inches long, linear lanceolate,
more tapering to the base than to the point, bordered with fine sore tapering to the base than to the point, bordered with fine
saw-teeth, each of which is tiped with a minte sharc callosity
The fowwers appear in clnsters, from the arils of the leaves, all
 point, while the front one has a suort greeu horn abruptly turned
upwards. The petals are much larger and paler than the sepals.
and of the two lobes. of which they consits the smaller are
rounded and erect, while the larger are half oblong, and hang down like a double lip in frent of the thower.
loiga, and covered with white wool,- - Bot. Res.

\section*{MISCELHANEOUS.}

The Hygrometer.-Gardeners are now so sensible of the importance of regulating the moisture as well as temperature of their hothouses, that we believe we shall be complying with the wish of many, besides those who have asked us to do so. if we introduce a short notice of the hygrometer. It is impossible for any one to know whas without an instrument by which to measure it ; that instrument is the hygrometer, which might as well be called the "water-gauge," which is wiat the irst word really means. all practical purposes, is Daniell's hygrometer ; of which the annesed cut exhibits the general appearance. not subject to get out of urder. The air we breathe is a permanently eldstic fuid, containing watery vapour in mixture, its power of retaining which is greater when tem perature is high than whien low. It may be compared \(t\) a sponge; if this substance, when dry, is soagked in water again dipped withou: squeezing, and before it has had time to dry, no additional quantity of water will be taken up by it, because the first immersion saturated it; and When air has taken up as much moisture as it can cortain, when thus saturated a reduction of temperature takes place the capacity of the air for moisture is diminished, and pre cipitation ensuag When air, in the contrary, is in an mbatancen with which it comen in contact. If moist air
is brought into contact with a substance sumficiently colder, a part of the mointure is oondensed, and is so converted from a state of invisible rapour into water. If, for instance, a cold wine-glass is brought into a warm room, the int of the glass become coverad with densed on the cold glase, is changed into water. The effect, therefore, of bringing warm moist air into contact with a cold surface is to rob the air of a part of its moistare. Thus, in a cold night, the glase roof of a greenhouse may be seen streaming with water, which runs down and forman ared dra in this often unsuspected manner air is rendered dry, notwithstanding the operations of syringing,
steaming, \&\&c. Daniell's hygrometer is canatructed with reference to this circumastance. The figure represents two hollow glass balls, contnining ether, and commanicating by the glass tube which rests on the support. The ball which forms the termination of the longer leg is of black glaes, in order that the formation of dew on its surface may be themore perceptible; if includes the bubb of a delicate thermometer, dipping in the ether, its scale being inclosed in the tube abore the ball, and whatever change takes place in the temperature of the ether is indicated by this thermometer. The other ball is covered with muslin. In making an observation, it is first necessary ta note down the temperature of the air, next turn the instrament so that when the muslin-covered ball is held in the hand the ether may escape into the blackened ball; and it should also be held till the included thermometer rises a few degrees sbove the temperature of the air, when it should be replaced on the support. Then drop, or gently pour, a little ether on the muslin; the evaporation of this extremely volatile aubstance produces cold, and attention must be instantly directed to the black glass ball and included thermometer the latter will be seen falling rapidy, and at length a ring of dew will appear at the line which runs across the black ball,-quickly if the air is very moist, slowly if the sir is dry. If the air is in a very dry state no moisture will be thas deposited till the thermameter falls to perhaps ever temperature the dew forms that temperature shonid ever temperature the den forms that temperature should be noted as the dew-point; and the difference between it and the temperature of the air at the time is the degree of dryness according to the indications of this bygrometer thus, in a moderately diy day, let it be supposed that the temperature of the air is 65 in the shade, and that the muntin requires to be kept moist, before dow is formed, till the blacrened ball containing the ether las its tempersmometer supposing the temperature is \(85{ }^{\circ}\), and the der-point found, as before, to be \(70^{\circ}\), the degree of dryness is still expressed by \(15^{\circ}\); but the quantity of moistare diffused in the air is, notwithstanding, samewhat greater in the latter case than in the former. If 1000 represent com plete saturation, the quantity of maisture when the temperature is \(65{ }^{\circ}\), and the dem-point \(50^{\circ}\), will be 609 ; but When the temperature is \(85^{\circ}\), and the dew-point \(700^{\circ}\), the
moisture will be represented by 623 ; these number being ascertained hy tables prepared for the purpose. The difference, however, in such a case, is so manall that it is not worth taring into accoupt in a horticultaral point of riew. But as thene certained can calculation it is more convenient to reckon by the degrees of dryness, bearing in mind that the dryness of the air
in indicated by the dilerence between the temperature of the air and of the
dew-point. Thus, if the ring of dew is formed as and only 10 of difference is observable, the air is nearly saturated; if the difference is \(5^{\circ}\) to \(10^{\circ}\), the while 150 to 200 of difference indicate excensive dryness, and beyond thia the air is parching.

New Botavia Gardese at Norvich and Shrewsbury. We learn with much pleasure that it is in contemplation to establish Botanical and Horticultoral Gardens at both these placeg, and that sctiva mansuras have already be in taken for the purpose. In Norwich the Garder is to , and to be for the encouragement of Botany Floriculture, and Horticulture, and for the recreation and amusement of the inhabitants. Periodical meetings are to be held for the exhibition of flowers, \&c, and to award prizes. The Garden is also to distribute cuttinge. seeds, ture, and Horticulture. The plan has met with, consider ture, and Horticulturc The plan has met with considerable patroaage, and by the zeal and valuable assistance of
Mr. Gilman, the honorary secretary is likely to be speedily realised.
Onion Crop.-A correspondent informe us that a per on in the neighbourhood of Whiteharen, finding the Onion crop much infested, and, in fact, perishing from the attacks of the maggot, thought of dreaching the beds with recorered and thi neighbourhood, or person had the only good crop in the of the ouly few crops that neighbourhood, or
Brasilian Growlocue Plantin-We learn from Mr.

Claussen, a distinguished Danish traveller, that he has succeeded in bringing to Europe in a living atate some of the most beautiful plants of Brazil, from the province of renders it probable that they will all, or for the most part, renders it probable that they will all, or for the most part, Gomphrena, with large brilliant-coloured heads like those of the Globe Amaranth; several charming species of Microlícia and Marcétia, little Melastomaceous bushes ; some of the woolly-leaved Echítes, with large flowers; Gaylassticias, plants gearly allied to the Vaccinium ; Wittelsbáchia; Diptúsodon; Keilméyera, which may be called the Brazilian Camellia; Laplácens; Vochysias; Salver tias; and Erythrochiton, which may be regarded as the with the wine-bearing Mauritia, a Palmo of very large size, ith leaves as large as those of the Talipot.
Botanical News.-We regret to hear from Geneva that M. De Candolle has again been seriously ill; he was however, recovering, and it is expected that his son, M. Alphonse De Candolle, will be able to publish another rolume of the Prodromus in the course of the present year.
Vienna letters state that Endlicher intends to stop him Iconographia with the 10 th part.
Batatas, or Sweet Potatoe.-M. Sageret has Iately succeeded in ripening perfectly at Paris seeds of the Batatas ; some interest attaches to this fact, becanse it is only by seeds that we can hope to obtain varieties suited to not, however, answer this expectation; they were generaily vigorous in branches and leaves, but did not produce raily vigoroas in branches and leaves, but did not produce tubers in proportion. On the other hand, however, the
facility with which they produce flowers and seeds is in itself a result of considerable importance, from the hopes they presented of future success. Among the plants raised in 1840 from the second generation, one has produced short swollen tabers, and promises to become a good variety; another also remarkable for its good qualities has long rose-coloured tubers.-Bon Jardinior

\section*{GARDEN MEMORANDA.}

Pontey's Nursery, Plymouth.- The Geranimms are in a healthy condition, but not so large as about London. Among the plants
in fiowerare fie specimens of Chorovema Henchminni, Boronia
serrulata, Gloxinia máxima, and a serruláta, Gloxinia máxima, and a seedling Fuchsia called Tri-
color, after the way of Standishiii, but the colours are quite distinct. In the arboretum a prominent object is the Bierberis
daluci, a specimen of which is eight feet high, and corered with
fowers. Amethod is adopted here of dowers. A method is adopted here of protecting the Pansy from
 mouth; and t may be shid of the prerrioond and garder that Nature has done her best for them. In the Italian garden is an OOrange-
house containing some fine specimen of the Myrtle.leaved Orange. There is also a pretto French garden, kept in the best
order. Amoug the plants that stand this climate without protecthe Pittosporum Tobira. The erounds contain Ane specimens of
 Onk). and a speciroen of the sweet Bay, 40 feet fin height-J. A. Lee's Nursery, Hammorsmith, -One of the most interesting obare planted out. The tub has an uncommon appearance, and
 pand, and loam, and are found to make large plants quicker than by any other method. A beautiful Ipomer ahas been raised here,
between I. Horsfilhze and Sellowii ; it has the habit of the former and bears a profusion of rich rosy-purple fliowers. In the
Orchidaceous-house the pretty Onediam punmilum, with spikes
of yellow blossom, and the curious Plenrothillis Lodditessip with of yellow blossom, and the curious Pleurothallis Loddigésii, with
brownish racemes, were the only things worthy of note, it being the period of rest, for this class of plants. On the front wall of
this house a specimen of Clematis montana was covered with its Ane large white flowers: this plant shnould be in every collection. on account of its showy appearance and hardiness. In the open
ground, the different varieties of Tree Peonies are exceedingly down with the weight of their towers. The different varieties Belgian Azaleas will in a short time make a gorgeous show, the
brilliancy of the numerous shades of orange and scarlet conoriliancy of the numerous shades of orange and scarlet con-
trasting well with the whites and pinks. Among those now in orange; mirabilis, bright pink, white pontica thicolor, buif and licea, rich orange. The other objects of interest were lagge white flowers with the outar petals slightly tinted having pure
and a Lilac called Charles the Tenth; and a Lilac called Charles the Tenth; the latter is admirably
suited for a small garden, on account of its dwarf compact habit, and the freedom with which it produces its fine rosy clusters of among them we noticed the pretty O O Pobus várius, which though May 10 th.
Pwethpoon, aemr Ryde, Inte of Wight.-An athumpt has been made zbly above Kalmias, and Andromedas. The situation is considerit; and although the spray seriously injures que young plantations bordering upon the shore, yet the flower garden is so sumk anad
sheltered by the surrounding flourishing Evergreens, consistaheltered by the surrounding, flourishing Evergreens, consist-
fag of Evergeeen oaks, Laurets, Laurestinus, Phillyreas, Bays,
and Arbutuses, that no spray can reach it. The garden is not exposed to any of the prevaling wind or the mid-day sun, and it
is ruther indinine toa norther aspect. The soil is shallow, upon
deep bed of mived clar, and there is scarcely any bor or peat s deep bed of mixed clay, and there is scarcely any bog or peat-
mould to b procured within a great distance, or indeed in the
 part of white sumd frof an old wood-stact, and about the tenth some deeaved turf-mould. well turned and mixed several times.
The plants wers pmserred frmm Southampton, and pianted the fillowny urinz: they ail tinwered, and for some time showed no
symptom of failure, But in the foll of the last year the Ledums, Kalrias, and Daplones, drooped and dhed and many of the others

\section*{Rebietm.}

A History of the Vegetable Niagdonk, amorracing the Physiology. Classiffection, and Crulture of Planke,
By William Rhind. Glasgow: Blackie and Son. The idea of this book is good; we wish we could add that
its execution is good also. Upon looking over the first three numbers we find it a compilation of truth and error cuts, and disfigured by scandalous typographical errors In the compass of one page we see of the latter perichse lium for perichætium, bigrum for bryum, junaria for fa naria, polytrichimm for polytrichum. The engravings, with one of which each number in illustrated, are far too good for such a work
CALENDAR OF OPERATIONS for the ensuing Week. In re-arranging the greenhouse, or planting out in the flowerwill brend or harmonise with one another, or, in other words,
contrat ; this will assist in producing an agreable and beanadeatroyed. But of this the leading article of lant week's Pape deatroyed. But or nutions than ang thing we could say; ; yet, being
will convey juster not
convinced of its importance and value to all connected with gar dens, we urgently advise its attentive perusal and adoption, as
far as circumstances will permit, and the resalt will convince many how contracien their whicus ideas or taste have been, and dening should have been hitherto so little stadied by gardeners or scientific men. 1 - - ITTCHEN-GARDEN AND ORCHARD.
Pringry. - In houses where Vines are trained up the rafters, precautions should be taken to prevent the Pine leaves being
broken, or the plants disturbed in their pots, in thinning the
berries, stopping, and tying in. This cannot he atoided if the berries, stoppig, and these operations are allowed to step in
persons performing the the
among them ; several plans have been published to remedy this among them; several plans have been published to remedy this,
though, as houses vary so much, it is impossible to recommend successfully; but as great mischief is sure to accrue if practised,
ready means of aroiding it will suggest themseves, according to
circumet circumstances. Keep the houses moist by sprinkling the surface of the tan-beds and paths frequently. Syringe the plants over-
head lighty in the morning, and water at the roots according to
the state of the weather nad bottom-heat. Shut up the houses thasty.

fNDES OF THE PRINCLPAL HORTICULTURAL SUBJECTS IN

NEWS OF THE WEEK
Tex important question of the Spanish Regency has at length been decided by the resolution of the Chambersin favour of a single Regent, and by the election of the Duke de Victoria to that high office, by a majority of 76 : the Duke is, consequently, in possession of supreme power over the destinies of Spain.-The chief topic of interest in the French Papers is the Report of the Committee of the House of Peers on the affair of Darmes, the regicide, as a preliminary measure to his trial. It appears, from this Report, that he was connected with the secret societies, which have latterly increased to a great extent, and that he was accompanied by accomplices when he fired at the King. The committee, from the evidence adduced, have arrived at the conclusion that these secret societies not only aim at a political revolution, but contemplate a social revolution also, by the division of property. The prorogation of the Chambers is expected to take place shortly after the conclusion of a commercial treaty now pending between France and Holland. We learn from Germany that the communications between the King of Prussia and the provincial diets have defeated the expectations enter tained in regard to a representative government, the King having declared that it is not his intention to con stitute a body representing the nation, but that he reserves to himself the right of calling the diets together, and of deciding on what measures they shall deliberate; a result which appears to have produced general disappointment -In Switzerland, the suppression of the convents is now considered to be settled, and the decree of the Diet in opposition to the measures of the Argau Government is not likely to be enforced, since parties are so nicely balanced that it is impossible to interfere with any chance of ultimate success.-In Italy, the chief event recorded during the week is the conversion of the Grand Duke of Lucca to the Protestant faith. It appears also by advices from Naples, that the negotiations with this country on the Sulphur Question are embarrassed by fresh difficulties in consequence of a recent alteration of the Exit Duties.-From the Levant intelligence has reached town, through Vienna, that the Sultan has modified his recent firman, and has granted to the Pacha all the concessions demanded by the Allied Powers: this important event may be considered the final settlement of the Eastern question on terms satisfactory to all parties. We also learn that a dis turbance has broken out in the Bulgarian Provinces of Turkey among the Christian population, who have risen in rebellion against the Turkish Governors. It appears that the revolt was not intended to oppose the authority of the Sultan, but to resist the oppression of his agents ; the insurgents bave since been put down by a large body of Albanian troops, whose excesses are said to be tnore se rious than the rebellion they were intended to suppress.
At home, public attention is entirely absorbed by the proceedings in the House of Commons, which will be found by our Parliamentary report to be of surpassing interest, The adjourned debate on Lord Sandon's resolution against the reduction of the duty on foreign sugar was resumed on Monday, and has continued to occupy the House during every night of the week. The great length of the debate and the number of the speakers are sufficient proofs of the interest taken in the question, and in the important financial and political measures associated with it. The principal arguments advanced in favour of the reduction are, that the supply of sugar to be expected from our colonies is not adequate to the present increase of population; that the fiaancial position of the country has brought it to the verge of a great commercial crisis, which demands an extensive reform; that it is more desirable to supply financial deficiency by a modification of existing duties than by the imposition of new ones, and that the measure proposed will relieve the embarrassments of the country without adding to the burdens of the people. On the other hand, it is urged by the opponents of the measure, that it will be the means of introducing slave-grown produce, and thus operate as an encouragement to those countries in which sla very exists in its worst forms ; that the benefit to the con sumer will be imperceptible, and that it will throw away all the fruits of the great experiment now in progress for the improvement of our colonies, and be an abandonment of a principle dearly purchased in the abolition of slavery - o division has ye taken place, and the debate is still adjourned.

\section*{7hame Néns.}

Cocrt.-Her Majesty. Prince Aibert, and the Princess Royal are well, and continue at Buckingham Palace. On
Wednesday afternoon the Queen held a levee at \(S\). James's Wednesday afternoon the Queen held a levee at St. James's Palace, which was numerously attended; and last night Her Albert honoured the City with his presence on Tharsday, to attend the anniversary of the sons of the Clergy, and of the festival will be found under our Metropolitan news. - Lord Poltimore and the Hon. W. Cowper bave sac--Lord Poltimore and the Hon. W. Cowper have succeeded the Earl of Listowel and Sir F.
and Groom in Waiting on her Majesty.

Parliamentary. - Mr. Lindsay, the Couservative can didate, has been returned for the borough of Sandwich, by
a majority over Col. Pox of 407 to 360 . Sir Joseph
Douglas, it is said, will come forward as a second Conserrative candidate at the next election. - In the event of a
dissolution of Parliament, it is stated to be the intention of Mr. J. N. Wigney again to offer himself as a candidate for the honour of representing the borough of Brightou. It is rumoured that Sir J. Campbell will not again present himself for the suffrages of the electors of Ediuburgh, have resolved to support Mr. Gibson Crais, who, it is added, will not again stand for the countr of Mid Lothian
It is further stated that there is no doubt Mr. Macaulay It is further stated that there is no doubt Mr. Macaulay
will again appear as a candidate for the city of Ediuburgh. New Peers.-It is stated that Lord Palmerston and Sir J. C. Hobhouse will be raised to the British Peerage. The Bishopric of Sodor and Man.-It is stated that
pr. Shurt has been appointed to this yacant see. The new right reverend divine will not be entitiled, by virtue of
his prelacy, to a seat in the House of Peers, as is the case his prelacy, to a seat in the House
with all the other English bishops.

Oftcial Appointments,-Rear-Admiral R. Thomas has been appointed to succeed Rear-Admiral C. B. H. Ross,
C.B., as Commander-in-Chief on the Pacific station. The C.B., as Commander-in-Chief on the Pacific station. The Dublin, 50 , is ordered to be commissioned for Admiral
Thomas's tlag. -The report that Governor Prescott had been recalled from Newfoundland on account of misconduct is ssid to be untrue. It seems that he resigned his government of that isiand some time ag.

\section*{Forrign.}

France.-We have received but little newa from the Paris journals of this week, which are filled almost exclusively with speculations on the present crisis of the Government in this country. Public attention appears to House of Commons, and the situation of parties in England so much so that the important matters before the French Chambers, and the present state of Pramee, soem either not to be thought of, or to be regarded with perfect apathy.
The Regicide Darmés.-The report of M. Girod de 1'Ain to the Court of Peers, on the affair of Darmés and his alleged accomplices, relative to the attempt on Louis Philippe's life in October last, was read on Monday, with closed doors. It is of considerable lacts contained in it have already been laid before the public. It appears that Darmés has made no confeasions of any importance; and yet, from the report, it would seem that he must have had some accomplices The documents found in his abode are of a very curious the secret societies of France during the last six years. The report, which consists of 76 printed pages, con-
cludes with expressing a conviction that the Chambers will probably consider it eatablished that the attempt of the 15 th Oct. cannot be the crime of an isolated fanatic, that Darmés has had accomplices, and they belong, as ten others, as having been connected with this person prior to the attempt, are specified. These men were operatives, but there seems little circurastantial evidence connect them with the atterapt itsel, although ther, the time he fired at the King. The repor cites immense mass of revolutionary writings, but throws very little additional light on the workings of the secret societies. Amongst other documents is a report read at the Democratic Society (French) in London, Nov. i8, 1839 "on the measures to be adopted and means to be employed to place France in a revolutionary way, the day after any
rictorious insurrection." The conclusions of this report were adopted by the Society, after discussion, Sept. 14 1840. The committee of Peers are of opinion that it is net only a political revolution that the Propagandists are conapiring for, but that a social revolution by the division of property is also contemplated. It is stated that only two persons will be tried with Darmés; and that sixty persons arrested on suspicion have been set at liberty that there were sufficient grounds for charging Darmés as a principal in an attempt apon the life of the King on October 15, and Duclos and Considere as accomplices in
that attempt; that there were no grounds for charging the other prisoners. In consequence of this decree, the Court ordered Borel to be discharged, and the rept to be left at the disposal of the Procureur-General, to be proceeded against in another court; that Darmes, Duclos, and Considere shall be arraigned before the Court of Pecrs, and shall be confined in such prison as the by the president and 145 peers. The day for oommencing the trial is not yet fired, but it will probably begin before the end of the month.
Army Estimates. -The Chamber of Depaties on Tues day were occupied with the army estimates, and a smart
debate betweea MM. Thiers and Dupin took place. The linter was very severe upon the creation of the twelve new regiments which 3 . Thiers had called into existence without the previous consent of the Chamber. In reply, M. Taiers pleaded the necessities of the time; to which M. Passy replied by showing that the new legions, assembled by the ex-minister, were found now to be of a most serious incunvenience to the country, because, in the first place. they cost \(28.010,000 \mathrm{f}\). per ananam; secoadiy, they and, tinally, they take 50,000 workmen away from their labour.

Algeria.-We learn, by a telegraptio inspath from Toulon, that General Bugeaud's expedition, which warched froum Blidath on the 27 th ulto, renched Medanh on the

30th without firing a shot, and on the lat inst. had marciaed to revictual Mileanah. The weather was pro-
pitious, and the troops in good condition. The question pitious, and the troops in good pondition. The question made by France to evacuate it, continues to be a, leading topic in the Paris journals.
Prorogation of the Chambers. - It is expected, in the diplomatic circles, that the Chambers will be almost im ing for discussion being the commercial treaty lately con thambers grantesl a credit of \(2: 38,000 f\)., intended for the nicres the Municipal Guand of Paris, and another of 1. \(100.1100 f\)., which are to be applied to the support
forei gn refugees, in addition to a sum of \(2,150,000\)., al orei gn refugees, in addition to a sum of \(2,150,000\)., al
ready carried down in the budget of 1841 . Trial of Madame Lafiarge.-The Correctional Tri bunal of Talle met on the 3 d inst., to decid days' pleading by the Procureur du Roi, and the respectiv connsel of Madame Laffurge and the Léotaud family during which some violent altercation took place between he two counsel, who, after mutual recriminat delivered their decision, declaring the tribunal competent and ordering that the trial should be renewed on the first Thursday in August. The Procureur du Roi having asked Madame Laffarge's counsel whether he found the delay either too long or too short, or had any other observatio to make upon the decision, received a negative answer itting accordingly. Madame Laffarge was conducted back to her prison under charge of two gendarmes, and accompanied by her physician. A great crowd was colthe Court of Cassation for a r verstends
Levant Fleet.-Private letters from Toulon state, that is the intention of the French Government to send a fresh squadrom of sis ships of the line and frigates into the waters of the Levant, under the command of RearAdmiral Lay Snase; ' but the object of this squadrpa is no stated.
Queen Christina.-It is said that her Majesty, to whom the Elysée Bourbon was assigned as a residence, has bee forbidden to engage in any political intrigue daring her stay in Paris, that she might not give the least cause of umbrage to the Spanish Government. Her Majesty, while stopping at Macon a few days since, narrowly escaped being burnt. The curtains of her bed took fire, but the flames were promptly extinguished by the persons of her suite, who fortunately had not retired to rest. It is reported in Paris, that the eldest daughter of the Infan Don Francisco de Paula oloped on Tueaday morning with a Polish nobleman. Orders were immediately forwarded by telegraph to stop the fagitives, who were believed to have proceeded in the direction of Brussels.
spain.- We have received from Madrid the importan intelligence that on the 8th inst. the Cortes assembled When the first rote for a sole Regency passed by a majorit of 163 axainst 136 . The second vote was for the Duke de Vietoria, 179 ; for Señor Arguelles, 103 ; Lost votes, 8 The Duke de Victoria is, consequently, sole Regent of Spain. He took the oaths on the 10th, and Madrid was perfectly quiet. -The Chamber of Depaties had previously appounted a committee for the purpose of coming to an anderstanding with the commitioe of subject of the oath to be taken by the Regent or Regents. The Senate had amitted the mention of a clause for the Regeney to declare that it wonld resign its functions the moment the Queen attained her majority.-On the 2nd inst. both Chambers suspended their important occupation, to joir in celebrating the anniversary of tac way of lade pendence in 1808. The anniversary passed off quietly, the national guards and troops beiug under arms; and the day, which was particularly fine, gave an additional charm to the brilliant spectacle. Letters from Bayonne, of the 6th, mnounce the arrival there of the Bishop of Pampeluna and suite, that prelate having been banished from Spain by a decree of the Regency. -Some disturbances had taken place in Jaen, the populace having destroyed the town gates, in consequence of complainto is to the opera tion of the municipal dues and taxes.
Pogtugal. - We have intelligence from Lisbon to the Ind inst. The ministerial changen, expected last week, had not taken place, and seemed likely to be postponed for the present.-Another berions question has, it appears, arisen with the English Government, in consequence of the demur of Col. Barreiros, the Portuguese commissioner sent to London to settle the dispated claims of the Pedroite officers and soldiers, to abide by the decision of the arbitrator, M. Van de Weyer, that decision being, it is said, entirely in farour of the claimants on the points rehad, in consequence, been compelled to addrass a strong remonstrance on the subject, and that there was no reason to doubt bat that the Government at Lisbon would at once repadiate the reaponsibility of making itself an complice in the conduct of its agent, and would abide by the decision of its chowen arbitrator.-The municipal elections were going on with various success; that of Oporto At Santarem the Chartists had succeeded. The Lishon election had not yet been decided.

Gramany. - The Prusian State Gazette continues to give the separate answers of the King to each of the prorincial diets on the subject of the permanent committees proposed by himself, and which excited such great expectato hare bees leas important than was expected. The
estates of Prussia had alone fully expressed the sentiments explicit; these to the other diets being little more than repetition of the principal heads contained in this. In all the King declares it not to be his intention to constitute \begin{tabular}{l} 
body representing the nation, with the right of boing \\
consulted important occasions. He reserves the righ \\
\hline
\end{tabular} of assembling the permanent committees into one body, may demand such step, and of the affairs which he shail submit to their cognizance. He has, morenver, pubhished decree approving of the Ministers' proposed budget for existence, or submitting the various items to their con-
 the north-western league nothing certain was known, but the continual discnssions which the prospect of such change has given rise in the German papers evince tho portance which all parties ascribe to the even

\section*{ew constitution of Lucerne has been voted by that the} of 16,732 votes to 6,292 . It is said to be of a more Radiconvents than the con one. line afuir of the Argovim formity with the decision of the Federal Diet, which is again to meet on the 15 th inst. to consider the reply of the convents is now considered settled, and without remedy; and it is said that the diet could not, if the Vorort was even inclined to do so, enforce the execution of it decree. The Grand Council of Argau met on the sth to
discuss the matter, and adjourned to the loth, to examine the propositions of the petty council. The latter, it i said, proposes to maintain the suppression of the convents, but to give up to those of Fahr and Guadental the property which belongs to them, in order to enable them from Lausanne furnishes us with the following account of a lamentable catastrophe which lately took place on Mount saint Gothard. A large partv of travellers haviag persevered in attempting to cross the mountain, in spite of a threatening state of weather, and finding themselves an veloped in a snow-storm, took shelter in a amall building by the road-side near Airolo. While promising themselves security, fate was impending over them, for avalanche fell, and crushed their frail dwelling upon them. Six were deprived of life, and it was with the at most labour and dificiculty the rest were saved.
Hquland.- Private letters from the Hague state thet a general subject of conversation there is the discovery of highiy-important state papers, which throw an entirely new light on preceding eventa, and which have come by chang ine posceasion of the Government. The for months ago a Frenchman died in lodgings at Brussels who had resided a long time at the Hague, where he was considered a respectable character Mriends were so uneasy about his health that they leq one of his servants accompany him to Paris. Tais was done, bet he could not go farther than Brussels. It was even necme sary to stop at Dordrecht and Antwerp, and the disene increased so much that on his arrival at Brussela the phy sician declared that death was imminent. Feeling tha his death was approaching, he desired the servant wio accompanied him to open a trupk, in order to take on important papers which he wished to dispose of hefore his death. The servant tried in vain to open the trunk; last the key broke in the lock, and before a smith conld be procured the sick man became insensible, and died shortly afterwards, without having been able to give any kind o information respectiog the papers, which to the Hague. Some weeks ago apy agent of the fumil came to Brussels to receive his effects from the lodging house keaper. On this occasion the trunk was opeaed written (ia Frepch), "To be delivered after my death to the Government of his Majesty the King of Holland." a note added to this packet, in deceased han writing, it would seem that the papers had arrived at the Hague since his departare, and had been sent after him Rotterdam, Dordrecht, or Antwerp. However, it sema importance. The pergon in whose possession they were had for farts years an exterisive correspondence with the most distinguished persons in Europe, and had the clue to the pricival er por times There appeara to bo no indication of the manner in which they came into his possession, but it in said that they contain facts of high

Belgrum. - On the 4th inst. great damage was done in various places by a violent thunder-storm, accompanied in deluge of hail and rain. At Binche the hailstones as large as pigeons' eggs ; several sheep were bil.er. Namar and the environs the roads in rariaus and com were inundated, so ass to be wholly impassable; and cule Mnch damare was done in some places to the fron railmay, and several buildings were struck by lightning.
Italy.-The long-pending Neapolitan sulphan ques appears to have provoked fresh misunderstandingso in which he had decreed that the sulpure be redaced from 20 to 8 carlins. His lidjesty, howe that taking into consideration the immense quantity of arest article recently exported from Sicily, and wishing to ateriff all commercial disasters, had ordered that the new thas hould onily come iuto operation ont the articles manuiactura into which that substanca enters, to diapose
of them without loss. This settlement, however, had
much annoyed the English and French merchants, who complain of the bad faith of the Neapolitan Government. By private letters we are informed that the Grand Duke of converted to Protion and throughout Italy.-The papers announce the death of Galvini, the musical professor, at the age of 1114 . He was a son of the celebrated singer Galvini, who died at Rume in \(1820^{\circ}\), having reached the patriarchal age of \(138 .-A\).
valuable quarry of calcareous stone, fit for all the purposes valuable quarry of calcareous stune, fit for all the purposes
of lithography, and as good as that of Munich, has just been discovered in Sicily. It had been long worked for
building-stones, but its application to lithography liad not building-stones, but its application to lithography lad not
been thought of until it was accidentally visited by a German naturalist.

Russt. - Accounts from St. Petersburgh announce that on the oth ult. the ceremony of the marriage of the here-
ditary Grand Duke Alexander Nicholaiewitsch, with her Imperial Highness the Grand Duchess Maria Alexanthe Winter Palace, in the presence of their Majesties, the memuers of the Imperial Family, and of the fureign princes now at st. Petersburgh. - We learn from Warsaw that the inhabitants of that city were alarmed on the eve of the
day on which the marriage was to be celebrated by the sudden explosion of a great quantity of feeworks collected for the purpose of the rejoicings on that occasion, and Which were deposited in an outbuilding belonging to the
Chàteau de Lazienski. The shock was so violent that, although at a great distance, it was felt at the centre of the city with all the effect of a thunder-clap. The chateau was much damaged, and the windows of the houses around were shattered. The precise cause of the accident is not known ; but it is attributed to a Cussack artilleryman, who, having quarrelled with his own brother, fired a pistol at him in the middle of these combustibles, and thus fell himself a victim.-The report that Russia will send this year a coneancasus is stated to be entirely groundless, the nature of the country rendering the development of great masses of troops wholly impossible. The contest will continue this year, it is said, as heretofore, in the only way that can be successful. Forts will be erected at certain intervals,
and by that means new ground is expected to be gained from the enemy.
we are informed that correspondence from Christiana city was burnt down on the 2 th of April during a violent storm : 314 houses were destroyed, and 4000 persons were a carpenter, is said to have been broke out in the house of of a servant maid. The sum for which the buildings were insured is 600,000 specie dollars ( 150,0006 . sterling)
Turkey.- We learn throught Vienna, that the Porte has listened to the representations of the Powers who
signed the July treaty, and has granted Mehemet Ali the hereditary government in the direct line, a diminution of the tribute, and a right to appoint his own naval and military officers up to the rank of colonel. This affair has thus Great Powers. Intelligence has been received of disturbances which have broken out amongst the Christian population in Bulgaria. A letter, it seems, had been received, addressed to the Prince of Servia, signed by about sion of the Turkish chiefs had reached a point which they could no longer support ; that they were resolved, since the remonstrances addressed to the governors of the provinces had no effect, to take up arms against their oppressors,
and await the decision of the Sublime Porte; that they were far from thinking of revolt against the authority of the Sultan, their lawful sovereign, but, on the contrary, tion of the hatti-scheriff of Gulhané, which hitherto, instead of terminating their distresses, had only aggravated their lot and increased the oppression under which they groaned. Immediately upon the receipt of this intelligence, nate. In chis assembly it of his ministers, and of the seto this address, to strengthen the cordom on the fronswer the pachalic of Leskowatz, and to proclaim publicly, and to notify to the neighbouring pachas and governors, that Servia would observe the strictest neutrality in this conflict, and was determined to preserve tranquillity upon its territory ; that every one, whether Turk or Christian, that should take refuge upon Servian ground would find an asy-
lum, and after laying down their arms would be consigned lum, and after laying down their arms would be consigued to the quarantine to await, under "surveillance," the orgrade, when informed of this disposition by the Prince of courier was sent to C' apphtatio to bear the intelligen, of these events, and to demand instruetions.- Later accounts, to the 24 th A April. announce that the disturbances of Leskowatz bad spread to the neighbouring districts of
Vranga, Prekupea, Nissa, Pirut, or Sharkoi, and VerkoVranga, Prekupea, Nissa, Pirot, or Sharkoi, and Verko-
vatz, in the pachalic of Widdin. It was feared that the vatz, in the pachalic of Widdin. It was feared that the
insurrection stretched to Kitoglia in Macedonia. An action is said to have tahen place on the 20 th April near
Widdin, in which the Turks were beaten from the field with a loss of six men, and the ansurgents bad taken th little fortress of Akpalanka by surprise, in which they found two small pieces of cannon. A chief named Mladen. Who served under Czerny George, was said, with a priest
from Leskowatz, to be the leader of the rising. It is forther auded, that the Rayahs had offered the Pacha of amait tranquilly the decision of the Porte, but that the Pacha had deelined the proponal. Tranquillity prevailed
in Servia. Official intelligence has since been received,
that Mustapha Pacha of Nissa, haring collected a reinforcement of 1,200 Albanians, attacked the camp of the and put them to flight. They fled in the direction of the Servian frontier. Measures had been taken to re-establish the communications between Beigrade and Constaninople. Another communication states, that after the rout of the insurgents, the whole country about Alexi-
netza was devastated by the victorious Albanians with fire and sword, and that great excesses were committed. Egypt.-Letters from Alexandria inform us that the
Pacha continued to have frequent conferences with the Count de Rohan Chabot, to whom he lately presented a fiue horse richly caparisoned. The English war-steamer Gorgon had arrived there from Malta, being sent by Adships. She brought a letter to his highness from the admiral, informing him that as certain of the conditions in the Hatti Scheriff of Feb. 13th were contrary to the spirit of the convention entered into with him, he approved of the Pacha's refusal to accept them. The Viceroy continued to reside at his country house, on account of the plague having made its appearance in the environs of his palace of Raso el Tin. This scourge continued to afflict
the country, without, however, making any great ravages although the season was favourable to its great ravages, although the season was favourable to its progress. It
also prevailed in several villages of Lower Egypt as well as at Cairo, where eight or ten persons died daily. - The last accounts from Syria are not interesting. The roads remained insecure for travellers, and the Druses claimed their ancient privileges, which kept them in some measure in hostility with the new government. The government of the Hedjaz was divided between two chiefs, Mohamet Ben Han, scheriff of Mecca, and Aour Teke; and although they appeared to be on a good understanding, one was endeavouring to overthrow the other. If the latter of the two should triumph, it was thought that the pilgrims and travellers to Abyssinia would be liable to great risks.
United States.-We have received New York papers to the 18th ult. inclusive, by the ship Fairfield, arrived at Liverpool, bringing two days' later intelligence than our last advices. The principal news brought by this arrival is, that Mr. M'Leod still remains in prison, and there appears not to have been any forther steps talsen in his case up to the time of the departure of the Fairfield. She brings no intelligence of the steam-ship President. Accounts from Baltimore announce the destruction, by fire, of the residence of the late President, General Harrison. at North Bend, which took place on Sunday night, the 11th April.-On the 4th April, an express arrived at Pilatka, from Fort King, stating that the Floridd Indians had exhibited a hostile attitude within one mile of Fort King. A party of seven warriors, suddenly emerging who had been out hunting, fired upon them, and killed a private. This occurrence took place at noon. A dein parsuit.
Texas. -The steam-ship Neptune arrived at New Orleans on the 10th ult. from Galveston, and brought papers to the 1st April, which state that Major Howard and reported that the from San Antonio, on the 30th alt. and reported that the Mexicans were making preparations
for another campaign, for the invasion of Texas for another campaign, for the invasion of Texas. Eight
thousand troops, with a train of twenty pieces of artillery thousand troops, with a train of twenty pieces of artillery,
were at Mier and Camargo, making preparations for campaign, under the pretext of chastising the Indians, who had been committing depradations on the Mexican frontier. He had the information from Dr. Book, who had been in the Federal army, and it had been confirmed by a Mexican deserter. Canales is attached to the expeintelligent cition troops under his command. Tie that the expedition is intended to operate against Texas.
British Indies.- The last accounts state, that four large British steam-frigates, fully armed and equipped, hau in close proximity of the fort harber, and fleet was not known, and was even kept a profound secret, it is said, from the island authorities. From recent demonstrations and movements, however, it was thought probable that an attempt would shortly be made to wrest the island of Cuba from the government of Spain.
 Monday.-After some courversation between Mr. O'ConNglL
 SANDos's resolution against the reduction of the Duty on Foreign
Sugar was resumed by Mr. EwA RT, who made it matter of reSugar was resumed by Mr. EwA RT, who made it matter of repof the fo the oppposition that they resisted the financial measures
of of the frivernment withont affordme any hint of the policy to be
substituted m their stead The hron. . .entieman denied the statements put tor the by the other side of ehe House, respecting the large supply of sugar to be expected \(m\) the eesuing year. To
show ths be enteral into a variety or details, from which he drew
the result that the result that the sapply of sugar to be looked for from our pre
sent sources sent sources would, at most, nut exceed the supply of 12 years
ago, whereas the population. in the mean tme, haad increased
per cent. - Mr. G. Hestucors said, that on the Corn tuestion he per cent. - Mr. G. . . mathcome sald, that on the Corn question he
would hear of no compromise. He could not even think Lord J
Russell to have been Russell to have been eerious in proposing such a sum as 8 s. by
way uf protection. With respect to timber, he thought posal but a bad return to the loyal subjects who had perilled to sugar, this was not a time to deranqe the great experiment now 1 p progress for the improvement of our colonial populetiva.
-Mr. Lavielles thought that Ministers, if they tound them. selves unable to carry these important measures, ought to have paused belore they put forth such a bone of contention. To the
principles assent- - Mr. Giroms expressed tis unquallieti apprubation of the scheme of supplying tunancial deticiency by mudification of exist.-
ing duties rather than by imposition of new ones. On the sub.
ject ject of corn, he felt the proposal of Gorermment as a moss imp
porter trade unencumbered with any ppotection at all, As to sugar,
how far was it intended to go: produce as as in abonded to go: Stere we to reject all slave-grown
ground, we must be content ground, we must be content to look at the question as one of pra-
derce and expedieucy. Wee had made great efforts to suppress
slavery, but so little had heen odr slavery, but so little had heen our success that it had actually in remove all protection, the question was merely whether the 30 per cent. proposed were not protection enough. He wondered
tat the shipowners did not see the advantage they would gain by any considerable extension or commerce. It was an advantage
which he felt too Giovermment. - Mr. Cowqu not to sive his vate for the plan of the
the admisnot the arguments by which the admisson of slave-grown produce was now urged were the
same as those by which, so years ago, the abolition of the slave trade was resisted. The best way, he thuught, to retrieve the
financial dimiculties power those under whome admuistration the finances had hecome so embarrassect. Ife made it matter of reproaces to Ministers
that they had converted areat commerciai
 first time, to propose their principles of free trade-Mr. G×sk
hoped that as the Retorm Bll, when framed compreheusively,
had effected all the minor measres had effected all the minor measures which, when separately
proposed, had been rejected by Parliament, so this large measure of tree trade would be adopted by the people of England acceptance. There was a close connexion, he conceived, between saries was a preliminary to the command of luxuries. dispensable, theretore, he thought, to increase the supply of corn
by an alteration in the Corn-laws. Mr. WabTer nin by an alteration in the Corn-laws.-Mr. WALTER naintained that of the plan proposed for the regulation of the sugar Duties. The the colonies, owing to the greater quantity of saccharine matter
contained in the foreigm sugar. He shonld vote for the resointion of the nuble Viscount, though he could have wished that it had
contained some expression of sympathy for the labouring classies. He believed that the result of an election in which he had lately produced an mifuence on both sides which it would be well if it Tov admitted that the interest of the East or West Indies was mater of sechidary interest as compared wath the interests ut given that the measures proposed would realt browet it the
sumer. The prce of sugar, it had been calcuiated, wuth not reduced more than by is od. a cwt. wnich woth hot quve a

 mas pecular to sugar. Coffee, for instance, was cultivated by mothe sugar reinen, hat reanery dia no for sugar. At this very trade, because it opened no fresh demauder, consuming on an average 1,000 human lives a-day; but, even if humanity were to be put out of the question, let not this country, he said, expose herself so loftily, and paid for so dearly, not only in sterling millions, but to his own party for exclusive humanity. If that were the case, their guilt was so much the greater in deserting the cause of hudaced the Ministers to submit this measure to the House, unless it were that infatuation which whe often foumd attendment upon Iarity of principle.-At the close
Tuenday.-A namber of petitions were presented, praying for an alteration in the Corn-laws, and for the abol.tion of Church-
rates. Of the latter 124 were presentol by Mr. EASTHOpE, whose rates. Of the latter 124 were presented by Mr. EAstaopk, whose notice for a motion on the subject of cuurch-rates stood first upon
the paper. He commenced by saying that he felt how inconthe paper. He commenced by saying that he felt how incon-
venient must be any interference with the debate adjourned on the preceding evening; bunt after the many petitions that had been presented on the subject, he could not postpone his motion, but would sugrest that he might be allowed to bring in his bill,
and to take the discussion on the second reading: and concluded by moring for leave to bring in a bill to abolish Church-rates in and maintenance of churches.
Lord J. Ressiril said that he had no objection to allow the bill to be laid on the table, that he might see what it was.-Dr. Nrcarols thought that was not the proper way to bring in a mea-
sure of such importance. He should move, by way of amendment, the order of the day, that the adjourned debate be resumed. -Mr. EA-THOPE thought such treatment of the petitioners unfair, and said he should press his motion to a division.- Some
conversation followed, in the course of which Mr. Heme advised conversation followed, in the course of which Mr. Hcme advised spect To this suggestion Mr. Easthope acceded, and gave notice of a renewal of his motion for that day fortnight. Leave was given to Mr. Hoskins to bring in a buile toxempt a bill for the more easy recovery of arrears of composition in tithes from persuns of the persuasion of the people called Qualsers, in Ireland. The order of the day having been read for resuming the adjourned debate on the Sngar Duties, Mr. Macaulay rose for the purpose of making sume remarks on an attack from Mr. Gladand he was glad that he had not leamed till that moming the remabled to come down to the Howse without any feeling of irritation remaming on his nund. He had not intended originally to taike any part in this debate. We was content to leave the general princuptes of the measure tread. and to leave details to his right hon. friend the Chancellor of the Exchequer. To the resolution of the noble
Lord, the member for Liverpooi, he looked in vain for the declagation of any great prnciple at ail ; he saw in it merely a skilfullycontnved party mution, intendedt to displace the adsisers of the coming down on some future occasion with a precisely similar proposition. He denied most positively that the budget had been its most material parts; tor he had expected that among those on the other side there would have been patnotic men, who, withont thern their assistance in a plan to prop the revenue without add ing to the burdens of the people: nor hadi he renounced this expectation, thil he had seen the notice given by the noble Lord the become the law of the land. They when these reforms would oecupe the same benches as now, bat they would remain true to
the great prmeivies of ther party, and it would not be the first the great prmat that that party had been proud to yieid the harvest to those who had nut sown the seed.-Sir G. I exas remunded the measure, the

conamer and Mr. A. Chapman in support of Lord Sandon's reso-
deprecated such proceedings, which amounted to a viola-
tion of the public right; and recommended that a deputa tion of the public right; and recommended that a deputa
tion should be appoiated to wait upon the Commissioners of Woods and Forests, and call upon them to compel the re-opening of the public footway, so that the inhabitants
of Marylebone, Paddington, and Kilbura might be able, as formerly, to cross the hill without going a circuitous route. Several gentlemen having addressed the meeting in favour of the proposed resistance to what was considered an encroachment on a public right, the report was unanimously adopted, and a deputation Was appointed to wait
upon the Commissioners of Woods and Forests accordingly. upon the Commissioners of Woods and Forests accordingly. St. Marylebone took place for the purpose of confirming the resolution of Saturday. The Vestry Clerk said, that he had received two communications from Lord Dun-
gannon, the first \(\$\) 'answer to an inquiry as to whether the Commissioners of Woods and Forests had purchased Primrose-hill for the use of the public in perpetuity; and the other, as to when it would be convenient for them to receive the deputation; upon the obstruction to the right of way. The reply to the first was, that the Commissioners were in treaty for as much of Primrose-sill but that the arrangements were not yet completed, although expected speedily to be so. The second suggested that, inasmuch as the arrangements were not completed, the Commissioners of Woods and Forests had at present no power to interfere, and that it was more a matter for the vestry themselves. After some discussion, Mr. Gibson
gave notice that on Saturday he should move that the gave notice that on Saturday he should move that the
parochial boys be marched to the spot, and up the path to the boundary stone; and that all other peremptory steps and proper measures be forthwith taken to protect the right of way, and secure it to the public.

Public Meeting of Friends of the Church of Scotland. Rooms, for the purpose of hearing the deputation from Scotland explain the intentions of the church relative to the proposed measure of the Duke of Argyle. The Earl the proposed measure of the Duke of Argyle. The Earl
of Mountcashel took the char. He stated himself in general terms favourable to the principle of non-intrusion. Aeneral terms favourable to the principle of non-intrusion. moderator of the General Assembly, the Rev. Mr. Candmoderator of the General Assembly, the Rev. Mr. Candintentions of the charch. The great principle, he said, of non-intrusion to which the church was pledged, and which it would never abandon, was, that no presentee should be forced into a parish against the will of the people, even although no stated objections against his settlement should from that one, but which might be mixed up in it, and it was the universally recognised right of every member of the church of Scotland to state objections to a presentee, these grounds, to refuse him ordination. . That principle the Earl of Aberdeen's late measure fully recognised, nay, it extended it; but the principle was not that of non-intrusion, and therefore the church rejected it But the bill
of the Deke of Argyle ment upon the broad principle of non-intrusion, and the church would therefore support it to the uttermost of its power. The one bill prevented the ordination of a presentee found unsuitable by the church courts, the other prevented that of a presentee found unacceptable by the people. The church did not mean to substitute the one principle for the other, but to engraft them on each other. The meeting was afterwards addressed by Dr. Cooke, of Belfast, Dr. Bunting, and Mr. Smith.
Forbidding the Bans.-On Sunday morning much excitement was occasioned amongst the congregation attending Holy Trinity Church, at Brompton, by the following incident :-As the clergyman was reading the list of aspirants to wedlock, on publishing the names of two parties for the second time, a respectably-dressed man, who was standing
in front of the reading-desk, instantly cried out, "I forbid them." The congregation almost all rose, and some minutes elapsed before order was restored. The person was desired to go into the vestry, where he was attended by the clergyman, with the churchwardens, when he stated to them his reasons for forbidding the bans, which being deemed sufficient, the names were erased from the book.
Chain Pier at Chelsea.-This pier, which Lord Cadogan has been erecting in Cheyne-walk, will be opened by his Lordship in person on Whit-Monday. It is thaught that it will prove a great accommodation to the inhabitants of Chelsea.

Chasham-A very interesting series of siege operations was given on Mouday by the garrison of this place. It was expected that the Duke of Cambridge would have been present, and thousands of persons assembled to witness the operations; but in the absence of H.R.H., Col. Sir
W. Warre conducted the mancuvres of the besiegers, and W. Warre conducted the manceuvres of the besiegers, and rison having manned a front of fortification, and also the parallels, approaches, lodgments, and batteries arected against it by the engineers, the operations were opened by a general fire of infantry and artillery on both sides. After some time an offices of engineers was observed through the mmoke, moving towards a barrier gate which closed the centre of the curtain, and having hung a bag of powder to it, he lighted a Bickford's fuze attached to the bag and retired. In less than a minute the powder exploded and blew the gate to pieces. This was the preconcerted moment at which the mines were to be fired by the voltaic battery,
which wras done in the usual manner by an engineer officer in the second parallel, by rabbing one wire against another; instantaneons axplosion took place, and the effect was magnificent. An areellent breach was formed, and by a simultaneous movement two assaulting columans
rushed from their cover, one towards the gateway, and the other tomards the breach, both of which, however, were
obstinately contested antil the defenders were obliged to obstinately contested until the defenders were obliged to
retire by an escalading party who took them in flank. After some animated and akiliful skirmishing on both sides "Cease firing" was sounded, and the whole garrison who had been employed is these operations formed in front of the lines, and marched past the Commandant in review order. There were about 1200 men under arms on tho occasion, besides a great number of recruits to keep the ground. The day was propitious, and no drawback to the pleasure of the spectators occurred, excepting the absence of the Royal Duke.

Annicersary of the Sons of the Clergy.-The preliminary service of this Annual Festival was held on
Thursday with imposing splendour and solemnity in the choir of St. Paul's Cathedral, which was completely crowded upon the occasion. Prince Albert attended the festival, and took his seat with the Archbishop of Canterbury on the throne immediately opposite that of the Lord Mayor. The Archbishop of Armagh and the Bishops of London, Worcester, Chichester, Winchester, Bangor, \&cc, were also present. After the musical performances, which were of a very superior character, a sermon was delivered by Archdeacon Hale. Prince Albert listened to the service and musical performance with manifest interest and attention, and there is no doubt that his presence influenced the collection made for the charity in the cathedral which amounted to no less than \(340 \%\), making, with 1304 collected on the day of the rehearsal, as much as \(4 \% 06\). A grand dinner was afterwards given at Merchant Tailors Hall, which was honoured by the presence of Prince Albert, who sat on the right of the chair, which was occupied, as is customary, by the chief magistrate of the city About 300 noblemen, clergymen, and gentlemen were pre sent. On the Prince's health having been drunk, he returned thanks in the following speech: "I thank you sincerely, gentlemen, for this mark of your esteem. It gives me great pleasure to follow the example setme by so many members of the Royal Family of England, of assisting at the stewardship of this ancient and useful institution. I am the more gratified because I see around me the arch bishops, the bishops, and clergy of the Church of Eng land, and the Lond Mayor of the great city of London. hope that the objects of the bounty of this institation may derive fresh support and assistance from this meeting, which it gives me pleasure to attend, and that they will spect His Royal Highness spoke deliberately, and in very good and pure English, only slightly tinged with foreign accent. On resuming his seat he was loudly cheered. After many other appropriate toasts had been given, his Royal Highness and suite, accompanied by the guests at the first cross table, left the room, amid the cheers of the company, at a quarter to ten o'clock, and the meeting immediately broke up. The collections of the day amounted to the large sam of 2,0006

The Tower.-An epidemic has been for some week past prevailing among the soldiers of the lst battalion of Grenadier Guards, stationed in the Tower, which has in some instances proved fatal ; and not fewer than 80 men have been sent to the military hospital at Westminster, of whom more than 70 still remain there. The \(8 y m o p t o m i\) of the disease are similar to the influenza. Many fine and some of the men in the hospital are in a dangerons state.

Victoria Park.-It appears by our Parliamentary re. port that her Majesty's Commissioners of Woods and Forests are to be authorised to complete the contract for the sale of York House, and to apply the money arising therefrom (being a part of the land towards providing a Royal park near to Bonner's Field and Old Ford Lane, in the eastern part of the metropolis,
to be called Victoria Park. A committee is to be held in the House of Commons to consider the above question. The President Steam-ship. -In the still-agitated state of public feeling with regard to the fate of the steam-ship President, every report that holds out any prospect of ber safety is naturally received with much interest. Coneiweek, by a report, cublished at Lloyd's, that a large steamer under canvans with steam, mes seen on the 10 th April, in lat. 13 N., long. 23 W ., standing N.W. by the brig Lord Saumarez, arrived at Deal. It was at first supposed by some that this steamer must have been the President, disabled; but by others, that it was the Earl of Hardwicke, or the man-of-war steamer Dee from the West Indies. From the \(\log\) of the former, however, which has since arrived, it seems that she was not near the latitude specified, on the date mentioned. By others it is whought the ship seen must have been H.M.S. Pluto, of Africa; and by most, and the best judges, the probabi lities are considered aganst its having been the President Recent accounts from Bermuda have destroyed every hope which existed that, if she did not founder in the storm of the 12th and 13th March, but was merely damaged, she might reach that island. The steamer Dee has also ar rived from the West Indies, and it had been anticipated by her; but it seems that, up to the time of her depar ture, nothing had been heard of her in those islands.
Hopes of her safety are yet, however, entertained by many: and they derive some support from the fres that nothing whatever has been seen at sea floating from the Presuden: as, in case of her having foundered, it is thought certain that a great variety of articies, as boats, spars, trunks, boxel, \& \(\mathrm{c}_{\mathrm{r}}\) must have foated from solarge
a shipp, and strewed the octan with some evidences of the Suicide of Lord James Beresford. Whe Tigris East Indiaman has arrived from India, bringitis the melancholy intelligence that Lord James Beresford, of the 10 th Hossars, committed suicide on the 27 th Apri
ressel, being on his passage to Eugland.

Aecidenks.-On Monday morning, the inhabitants on either side of the river, near Blackfriars-bridge, were startled by a loud report, which shook the houses, and immediately after the river presented a scene of wreck, and three men were perceived struggling in the water, amidst large pieces of floating wood. It appeared that the steamboiler of a ballast barge, which was used for cleansint the bed of the tiver, had burst, hurling with it everything in its way. Several boats put off to the assistance of the three men in the water, and they were happily rescued; one
man, however, asleep below at the time, was buried under rana, however, asleep below at the time, was buried under
the Wreck; and it was some time before the body was the Wreck; and it was some time before the body was
found. The barge was in the emplor of the City authorities. found. The barge was in the employ of the (ity authorities. James Constahle, who was drowned in the barge.
Prom the evidence given, it appeared that deceased Prom the evidence given, it appeared that deceased
was allowed to sleep on board the vessel, and was occasionally employed by the lightermen who brought their craft alongside for ballast. The machine was worked by a small steam-engine of six-horse power, which had been in use for seven or eight years. On Monday morning ceased was then asleep alongside the boiler, and was in the same position when Clart the engine-driver eame board, and set the engine in motion for the purpose of
taising the ladders or inclined planes on which the ballastpails are lifted. A chain bad got foul under one of the ladders, and Clark was getting it clear, when the boiler
exploded, and forced itself through the stern of the vessel, exploded, and forced itself through the stern of the vessel, The deceased went down with it, and five hours elapsed before his body was recovered. Clark was examined at great length, and stated that the engine appeared to be in good order; that there was a pressure of 7 lbs . only on taiming a pressure of 20 lbs . on the square inch, but it was nevar worked at a pressure of more than 5 or 6 lbs . There was no gauge attached to the engine, and he could only attribute the accident to the safety-valve having stack fast, which prevented the escape of steam, and
caused the boiler to burst. From other questions put to caused the boiler to burst. From other questions put to
him by the Coroner and Jury, it seemed that great carelessness had been exhioited by Clark, and that he was not a practical engineer. The Jury, in strong terms, condemned the practice of employing ignnrant men to take
charge of steam-engines and machinery, and returned a charge of steam-engines and machinery, and returned a
verdiet of "Accidental death," with a deodand of 501 . on the vessel and machitery. At the requeat of the Jury, Clarl was called in and severely reprimainded by the Coroner for his negleot.
Fire.-On Tuesday afternoon a serious fire decurred in a lueffer and Congreve thanufactory, in Spitalfields, at The alarm was frrst given by some boys who were employed on the premista, and immediately afterwards volumes of manole issued forth from all the windows of the buitding. Great alarm ensued amnugst the silk-weavers, who crowd
every dwelling in the neighbourhood. Engines were soon every dwelling in the neighbourhood. Engines were soon
brought to the spot, but a supply of water could not be procured from the pluzs untul some time after their arrival, and in consequence the flames gained a rapid ascendancy; and in less than 25 minutes had obtained firm hold of every pertion of the premises, and were extending atcross confined situation of the burning property, and the houses that adjoined, fears were for some time entertained that this entire row of houses on that side of the street would be destroyed; but after very great exertion, the fire was at length extinguished; the lacifer manofactory having been burnt to the ground, and the house adjoining having
received serious damage. Several other houses were also received serious damage. Several other houses were also
mueh injured. The origin of the fire is stated by Mr. Parsons, the proprietor of the building, to have been owing to a quantity of lacifers igniting in thie drying-room. It appears that he was in the room at the time, and used
every means in his power to put it out, but ineffectually; two butts of water, which he threw on the flames, applearing to have no effect whatever in quenching them. His appears that this is the third lucifer manufactory in the metropolis that has been destroyed by fire within the last month.
Onpham, on Will Wednesday an inquest was held at Clapham, on William Taylor, aged 45. It appeared, that mending some cucumber frames in the garden of the Rer. Dr. Dealtry, the rector of Clapham, and, it being obwerved that he was a longer time than meedful to comatad found him lying apparently asleep by the side of one of the cueumber frames. He shook him and then found that he was dead. A surgeon said deceased had died -On Monday inquests were held, at Woolwich, on three more convicts whe had died in the hulks. The medical evidence was, that une had died of preumonia, the second the evidence, the jury returned verdicts in accordance with the medical returns. It is stated that the epidemic Whith the medical returns. It is stated that the epidemic

\section*{Z 3 robimial 7 Toms}

Lfrerpool-Accounts have boen respived in thit city,
of two more of those frightfal accidents at sea, which convey such a melancholy catalogue of human suffering. The grant ship, the Governor Fenner, whose fate must be still fresh in the mewory of our readers. The particulars are as follows:- the A mertcan ship Bronklyn sailed from
this port on Sunday morning, and the Captain of her reports that in the night, off Point Lynas, they came in contact with an in ward-bound brig, apparently about 300 tons, which immediately disappeared with all hands on board. The shock was great, and the effect almost in-
stanneous. He further states that he had a light on the ship, and that the master of the brig, from sheer incapacity, or some other extraordinary reason, neglected to his helm. The night at the time was exceedingly dart, the sea was ruoning bigh, and the \(d\) blowing fresh. The name of the vessel is unknown, bnt she is described
as being a long-built brig, and rather deep; but whether from Liverpool, London, or any other port, no evidence can be given. From the particulars at present known, it
appears almost a miracle that the Brooklyn also did not meet with the same fate. It has since been ascertained that the vessel sunk was the Mary Scott, from Valparaiso, and that the Captain and seven of the crew were drowned. Six men and a boy were picked up in the jolly-boat on and not less melancholy case relates to the loss of the ship William Brown, bound from this city to Philadelphia, and which it seems was sank by an iceberg, in the latter part of last month. From the particnlars at present a packet ship just arrived there, it appears that, when the vessel struck, thirty-three passengers, the mate, and eight of the crew took to the long-boat ; the Captain, three of
the crew, and eleven passengers took to the jolly-boat all the rest sank with the vessel. The boats parted in the night. Some days after, the mate and crew determined, of the passengers overboard, which they accomplished. There were two brothers and a sister of one fandily; the brothers were thrown over, and the sister jumped in after them. One boy begged for a few minutes to say his prayers; they refused, and hurlet him into the sea at once. Some clung to the sides of the boat, praying for
mercy; but their hands were cut off, and they were pushed into the deep. Fifteen ladies and two men remained in the boat. One hour after a sailing vessel called
the Crescent fell in with them and saved the survivors. The passengers remained on board the Crescent, and the crew hare arrived at Havre, in the I-ille de Lyon packet-
ship. The jully-boat has not been heard of. The following additional particulars have since been derived from a statement drawn up by sothe of the survivors:- the ship's company consisted of 17 persons, and she had 65 steerage passengers, nearly all Irish, with a full cargo on board. She had a rough passage out, and struck against a field of ice at nine p.a., when going urder all sails at the rate of
ten knots an lrour. She stove in her larboard bow, and within two minutes struck another fieli of ice. The ship sona began to fill, and the Captain and crew got out the hoats, which were cleared away at eleven. At miltnight
the ship went down, and the thirty passengers, who could not be taken into the boats, were drowned in her. The boats lay by each other till five A.M., when the Captain in the catter stecred for Newfoundland. The long-boat being very heavily laaten with \(s 0\) manny persons, 42 in all, could
not be managed, and was obliged to steer to the south. At night she fell in with more ice, and the wind came on to blow hard; the boat began to leak badly, and shipped a good deal of water. Finding she was likely to sink, the mate consulted wth the crew, and it was deemed necessary dead. Sisteen were then thrown passengers as were nearly while the rest were nearly stiff with the extreme cold. Shortly after a ship hove in sight, and the Captain, who was up aloft looking out for ice, saw the boat, and stood for her at the imminent riak of his own safety. This
proved to be the Crescent, and ther were received with the greatest humanity and kisdness on board. At that time ice was in sight on the surface of the Aclantic as far as the eye could reach. Out of the passengers saved, ten were women. The Havre Journal adds to this dreadful narrative, that the first passenger thrown overboard was a woman! This Journal adds, that the most serious rumours are affoat as to the cause and nature of this horrible catastrophe, which, however, cannot be cleared up until the Crescent, which is daily expected, arrives with the
surviving passengers. The American Consul at Havre has interrogated the sailors, and has had them committed to prison. The affair completely absorbs pablic attention at Havre, and the most searching iaquiry is demanded. It
is understood that no lots were drawn, but the mate gave the orders to the men to begin the work of destraction, and the combined efforts of the crew are said to have been necessary to overcome the resistance offered by the sufferers. - A public meeting was held on Monday night, for the purposeof petitioning the legislature infavour of the proposal of ministers for a fixed duty ón foreigu coms of 8s. per quarter, in lieu of the present sliding scale. The hail was rentlemen favourable to a repeal or modification of the corn-laws. Sir Joshua Walmaley was called to the chair, and the meeting was succesaively addreased by a number of speakers at considerable length on the subject for Which they had met ; and after having unanimousiy adopted the petition as proposed, the assemblage dispersed. -Mrs. Jemner, the lady why was, on the morning of Tuesday which appeared in this paper at the time, lingered antil
the evening of Priday, when she died. The inqueat took place on Monday. The evidence was substantially the Jenner was not present daring the inquiry. The jury returned a verdict of wilful marder against Mr. William Jenner, now in custody on the charge of having killed his son.
Manchester,-On Wednesday morning. Mr. Willinuson, drysalter, Hyde-road, hearing a noise below, as if seife with a carbine and a hedge-bill. He then went dim and heard a noise in the cellar ; be opened the front and bacik doors, and shortly afterwards saw two men rush out of an adjoining unoccupied house. He fired at them, bat they both ran off. He followed and overtook one, whom man back to his house, and gave him into the custody of a police-constable, who, hearing the report of the carbine had come up. He then examined the cellar, and found that a hole, just large enough to almit a man, had been made in the wall dividing his house from the adjoining
empty one. The prisoner, whose pame is Scholefield brought up at the Borough Court on Wednesday, and was committed for trial at the ensuing sessions.
Hereford.-The subject of the annual destruction of samlet, or lastspring, has been brought before the beach of magistrates of this place, by the conservator of the W ye, who stated his inter, by young fish in the town. Some conversation toolk place between the magistrates, who said they would give all the assistance in their power in preventing illegal netting and night poaching, but they had no authority to put a stop
to angling, that being especially allowed by the Act. Where, however, waters are rented, the lessee or occupier has of course the right of preventing encroachment if he
thinks proper. Counsel's opinion is to be obtained on the 4th section of the Act, as to whether the sale of last spring can be prohibited under the existing laws.
Gloweester.-Mr. Henry Vincent. who has recently been released from prison after a long imprisonment for sedition appeared in this city a few days since, and convened yard in the vicinity of Alvin-street. A tolerably large yard in the vicinity of Alvin-street. A tolerably large
assembly took place. Having given a particular detail of his sufferings in prison, he proclaimed it as his intention to stand seaffiol.t. He announced that he was deputed by the National Association of Chartists to re-organise the working men of the two counties of Gloucester and Monmouth
on a more formidable and conspicuous basis thin ever they bad been before. The Cbartists, he knew, had not sumfcient power in an electoral borough in England to return a candidate of their own; but they could make their power felt br throxing all their influence and votes into the seale of the Conservatives, with a view to defeat the party now
in power. Weston. -It appears that for a long time past deprecintiotis of an extersive nature have been committed in the gardens of Mr. Cooke, of this place, to the perpetrators Mr . Cooke was alarmed on hearing some one on his premises and, armed with a loaded gun, proceeded through the garderis in search of the intruders. After a brief search he discovered some one making off from the cucumber frames. He called out to him to stop; but he did not heed the cry, and Mr. Cooke fired. The man immediately at beholding his oirn son. It appears that the youth has been more than once placed at the bar for offencos of a serious nature; and it is supposed that through him on examining his persan as the station-house, the charge of the gun was found to have struck his neck and shooilders, though not to any dangerous extent. He was taken before the magistrates on the following dey, but the father dethe magistrates on the following day, but the father de-
elining to appear against him, lie was diselhirged with a severe admonition.
Norwioh. - A very serions aecident has happened to fir Edw. Stracey, of Rackheath-hall. The carriage wis ove-
turned, and Sir Edward was taken ap with his thigh turned, and Sir Edward was taken
broken, and otherwise mach injured.
Whilby.-An unexpected sensation and panic were felt in this towa on Mondyy last, by the elosing of the banking establishment of Messrs, Campion, in Charcm frma are nopties in this oht builders, ship-owners manufacturers, and very largely connected with the trads of the port

Fordingbridge.-On Friday a quantity of flour wes gold in the market-place of this town, which had been seixed for church rates by the churchwardens, the property
Mr. Josiah Neave, of Bickton, who had given the churchWardens notice that he would not allow his property to be taken and disposed of in the usual way, but demanded that it should be publicly sold. A petition has been got up here and presented to Parliament agninst charchrates.

Cambridge.-A very melancholy oecurrence has taken place here within the last few days. Joha Newitt. a respectable and well-conducted labouring man, lately under porter at Addenbrooke's Hospital, destroyed ur th police, stating that he was led to commit the act through dread of the Union workhonse. The unhappy man seems had, on the morning of the same day, attemptred his own life by taking a quantity of laudanum. He dercma that his wife might be made scquainted with the circ the stancats, because, as he had mure red the facy bo would sts-
turn and murder her also. The magistrates have committed the prisoner to take his trial on a charge of murder
at the next assizes. He is said to be very quiet and inoffensive in his demeanour. Daring his examination he conducted himself with great decorum, and at times appeared deeply affected. - An inquest has been held on the body, and
Headeorn.-On Friday the parishioners of this place assembled in vestry for the purpose of making a compulsory church-rate (in obedience to mition issued from the Arches Court). The Rev. C. Fielding took the chair, and having read a fex portions of the decision on the Braintree case, said that, supported as he was by the nnanimons opinion of the eminent judges in that case,
it would not be necessary to enter into discussion, and it would not be necessary to enter into discussion, and
therefore he called upon the churchwarden to read the monition. This was done, after which a rate of \(9 d\). in the Mr. S. Harman then said, that as the rev. gentleman had said a discussion was not necessary, he did not wish to enter into any, but would merely state that having had a very eminent counsel sopinion, they were determined to ment, "That instead of a compulsory rate for the repairs of the parish church, and the support of divine worship therein, the churchwardens be requested to receive voluntary contributions for such purposes." The amendment was entered in the minute-book, and having been put to for the amendment 33, against it 14 ; after which, the original motion for the rate was put to the meeting, when there appeared a majority of 19 against it. The rev. chairman then said, that as he considered the amendment tantamount to a refusal of the rate, he would call upon the churchwardens to make a rate of 9 d . in the pound, up leir owa aathority, with the their votes, which was done, and the meeting separated.
Railuays.-The North Midand and other connected railways are making arrangements by which they will be able to convey passengers from Loudon to Edinburgh in about two hours less time than they can go by the western routes. They will also be able, by the starting of a
coach from Newcastle at half-past five in the morning, to coach from Newcastle at half-past five in the morning, to take prasengens from that town to London in a single
day. The mails will shortly be still further accelerated on this line.
IRELAND. her Majesty and the royal household to this country has been got up here, and lies for signature at the Mansion-house
and other public places. The petition, which has already been numerously signed, states, that the prosperity and happiness of the Irish nation woud be promoted greatiy
by uccasional visits from her Majesty, and from those illustrious individuals whom God and nature have so happily united in her royal hoose; that, yielding to no other portion of her subjects in affection, duty, and respect, they ambly pray her Majesty graciously to honour Ireland sovereign influence with all those members of the royal family whose presence would be gratifying to her Majesty family whose presence would be gratifying to her Majesty
and to her petitioners.-At the usual weekly meeting of the Repeal Association, on Monday, the only subject of O'Connell O' Connell, which, after commenting on what he termed the present most important and awful crisis, recommended that there should be a simultaneous meeting of the various parishes of 1 reland on or about Sunday, the 23 .3rd inst., in order to address her Majesty, humbly imploring her not to receive into her confidence the opponents of the present Ministry ; and forther recommending the whole Irish nation to be prepared to preserve their liberties by the
same peaceable, legal, but determined conduct by which they had achieved them; and concluding by saying that not a single day passed by that did not prove, more and more, the inevitable necesaity of the repeal; and that the adeld force Conservative party \(p\) give enfold force to the repealers, for no man in Ireland could then bear the reputation of political honesty who did not
take a part for the repeal.- Frum the decrease in the quantity of malt used last year in the Irish distilleries, there appears a decrease of \(2,852,416\) proof gallons of whiskey, compared with the preceding year, which is regarded as a proof of the progress of temperance. -The Crown Solicitors of Ireland, it is said, are henceforth to be put upon an annual salary, by a Treasury minute-the present holders to retain their emoluments as now, each of them to be provided with a clerk at a salary of 3001. per annum.

\section*{SCOTLAND}

Glasgove.-It is said that Deanis Doolan continues obstivately to maintain that his only object in attacking Green was to give him a beating, and that he had no intention whatever to murder him; and he still labours under the trial, that the fact of death haring followed the beating, even with such weapons as were used, ought not to constitute the crime of murder. Redding is much less constitute the crime of murder. Redding is much less
communicative than Doolan; he seldom speaks, and, communicative than Doolan; he seldom speaks, and, when any questions are put to him, usuall
monosyllables. Bishop Murdoch and the other Roman Catholic clergymen of Glasgow continue to attend them. The determination to carry the sentence into effect at the acene of the murder, it seems, has caused much excitement among the railway labourers.
Dundee.-On Sunday last, dering the afternoon service, af the premoher in one of the established churches in this town was about to offer up priyets for the congregation,
the precentor gave out the following notice :- "A young
man, entering into business, earnestly solicits the prajers man, entering into but.'
of this congregation.'

Dumfries.-The papers of this town give the following account of the melancholy death of Sir F. Johnstone :horse, within his own grounds, and killed on the spot. This sad event occurred near Talford, between Annan and Langholm. At this place stands a lodge with adjoining kennels, which deceased had recently erected, and which it seems, he rode over to inspect. He had passed the pre ceding evening in the highest spirits with several friends previously to his leaving Westerhall for England the following day. One friend had ordered his horse, and was ac companied part of the way by his hospitable entertainer, after which they parted. The tenants, in the mean time, had been enjoying themselves at Talford, in the immediate expectation of Sir Frederick's return ; but their mirth was speedily turned into great alarm by the borse's reappearing without its rider; the huntsman instantly started in search of his master, and found him lying by the wayside with his skull fractared, and quite dead. The lamented baronet was highly popular with his tenantry and friends, among Whom he intended to resido permanently, and with a vien to this, had made arrangements for erecting a new man-sion-house, estimated at \(30,00 \% \%\). He was in the prime of life, and has left a widow, sister to the Eari of Craven.

\section*{Theatricals.}

Her Majesty's Theatre.-The celebrated Mademoiselle Rachel, the Melpumene of the modern French stage, made her appearance at this theatre on Monday night, for the first time before an English audience, in the character of Hermione, in the Andromaque of Racine; having been engaged by M. Laporte, with a French company, to give a series of performances during the present only about four years ago that this young lady made her irst appearance at se effected a revolution in the state of the stage by reviving the old classical drama, which for a long time had given way to the romantic and melodramatic productions of the modern school. The Grecian and Roman heroines of in her person, and the taste of the Parisian public became onee more assimilated to that of their ancestors in the day of Louis the Great. It was at first supposed that this
would not last; and many critics surmised that when the Would not last; and many critics surmised that when the first novelty was passed, and the youns actress had trod she was caple, she would disappear, and with her the antiquated productions to which she had given merely a sort of transient life. These speculations have not, however, been confirmed by the event. Mademoiselle Rachel has maintained her ground, and appears likely to do so Her appearance in London excited much expectation racter of Hermions is said to be one of her greatest efforts, and her representation of it showed that she is most suc cessful in expressing the feelings of anger, hatred, and scorn-in conveying bitter sarcasm and withering invec tive. In its earlier part the tragedy moved heavily. It
rests almonst entirely on the character of Hermione; and rests almonst entireiy on the character of Hermione; and all its terrible energy. It was then that the actress electrified, and even appalled, the audience by the intensity of her passion and the wildness of her despair. Altogetber has seldom been seen than in this young is the more extraordinary, as in youth she was almost uneducated, and her conception of tragic character was originally owing to her own genius. In person she is tall, erect, and graceful in her movements. Her figure is fine, and her features are regular but small and not strongly marked, and her eses have not the power which some of our great tragic actresses have exhibited. Her features, however, speak, and her eyes lighten, while the impas-
sioned language of Racine flows from her lips. Her desioned language of Racine flows from her lips. Her demusical in its modulations, and endless in its rariety. The bouse was foll ; and Maderoiselle Rachel's reception was such as must have afinorded her much pleasure. She ap--Mademoiselle Löise the celebrated Prussian actress made her debut at this theatre on Thursday night. She appeared in La Straniora, and exhibited powers, both as an actreas and a singer, which exeited in the highest degree the admiration of a crowded audience. She is tall and commanding in her figure, with a countenance capable of every variety of expression. Here is appran of great compass, and of a fle ribility which enables her, without apparenteffort, to achieve the greatest diffeculties
of execution ; and though she possesse these means to a surprising extent, she uses them discreetly. Her embel lishments are pare, graceful, and appropriate, bespeating a thorough and accomplished musician. The tones of her voice are singularly affecting and penetrating, and het general enthusiasm was repeatedly manifested by acclamations, and she was called for to receive the plaudits of the clusion of the piece.

Fossil Remains.-A fine specimen of the antlers of the monse elk or ilk has been found by Sir J. L. Kaye's gardener at Denby Crange, under a gonseberry bush, not nany feet below the surface. It measures sir feet from men in Yorkshire.-An iateresting geological relic bas recently been discovered in forming the sewer in North. mpton-street, Cambridge. It proved to be a tut Mammoth, lying about \(10 \frac{1}{2}\) feet from the surface in sand and gravel, in a horizontal position, upon the surface of
the gault. Its extreme length was six feet seven inches, the grault. Its extreme length was six feet seven inches, Being in a soil saturated with moisture, it was in a very tender, friable state, and a portion of the fossil ivory exfoliated when exposed to the air, showing its beautiful enncentrice rings. It will be added to the museum of the was discosered, and ten feet below the surface a rib and some vertebral bones were found, which, from their size, bo doubt belonged to the same animal ; but the most extraordinary and curious relic is said to be a human lower am (?) with the teeth perfect, deposited in dilavial detritus American Presidents.-The Federal Government up the 4th March, 1841, has been in operation fifty-two rears. During that period there have been eight Presidents of the Uuited States, of which number there are still living Messrs. Adams, Jackson, and Van Buren. The following is the order in which they served, and the deration of their service, viz., Gen. Washington, of Virginia, eight years ; John Adams, of Massachusetts, four Madison, of Virginia, eight vears; James Munro, of Virginia, eight years; John Q. Adams, of Massachusetts, four years ; Andrew Jackson, of Tennesees, eight jears : Martin Van Baren, of New York, four years. To these are to be added, since the 4th March, Gen. Harrison and Mr. Tyler
Roman Remains in France. -There have been recently turned up from a field, near Ancenis, in the Loire Inféri eure. some fragments of Roman baths, a great number o human skeletons, many coins bearing the profies of the Emperors Antoninus and Gallienus, a jarelin, and several
other iron weapons It is concluded that this was the other iron weapons, It is concluded that this was the and the soldiers massacred; particularly as the iron jave lin or spear was still fast in a leg-bone.
Relic of Shrkspeare.-Collectors of antiquities and relics of distinguished characters will feel interested in being informed that among the effects of E . Lees, Esq., of Forthampton Cottage, near Tewkesbury, there is a
curions antique jug, on which are represented the principal curious antique jug, on which are represented the primeipal
deities of the Grecian mythology. This jug was the prodeities of the Grecian mythology. This jug was the pro-
perty of Shakspeare, and its authenticity, it is said, caa Boieldieu and Talley
eighteenth century jouth whose musical talenta juast began to develop themnelven. Nobody had as yot notioed be tuerit of the yousg
irtnoso excent his master, an obscure member of the Paris Opéra Comique's orchestra. The latter doubted noise in the world. His only difficulty was to devise the means of bringing him out in a snitable manner. An opportunity presented itself. On the application of the old musician, the manager of the theatre permitted young Adrien to execute sume essays of his composition at a grand concert. Another obstacle remained to be overcome; our youthfol musician had no cont. The old masthe origin of which coincided with the commencement o the Revolution, and whici he sported only on extraordinary occasions. In spite, however, of the great interest he took in his pupil's success, he held his coat in such high estimation that he could not make up his mind to lend it him. The love of his art, however, ultimately prevailed, and the coat was reluctantly banded to Adrien with the earnest recommendation that he would carefully shelter it from all mishaps, and although it was of a capacious size, the master being very corpulent and the pupil very lean, the latter was glad to wear it. At six precisely they repaired to the theatre. The attention about Adrien's début, were manifested in all his movements. At one time he gave his pupil in haste a piece of advice he deemed indispensable for the execution of the proper manner of wearing the said garment \({ }_{m}\) so as to avoid all friction of the elbows; he taught him at the same time to avoid monotony in his execution, and to beware of such trickling from the lamps. He was trying with one hand the piano, and remoring with the other the dust that profaned the collar and sleeves of his most valuable piece of clothing, when the manager gave the wonted three strokes, and called over the pertormers ; and the worthy master was compelled to descend, and, for the first time, leave to their fate his pupil and darling black coat. At that period concerts were given in front of the curtain, which continued lowered, and the whole accompanying orchestra was stationed below in its usual place. The artistes who were to execute solos, and who successively presented themselves on the front of the stage, often had great trouble to find their way between the curtain and first coulisse. When it was Adrien's turn to come forward, he was some seconds in finding his way through the passage. His patron, who was in the orchestra, seeing bis handsome coat exposed to being soiled, by rubbing against the curtain's greasy ropes, could not stand the sight ; he rushed forward, upset his desk, and cried out in a heartrending tone, "Adrien, Adrien, do take care of my coat !" It would be a aseless artempt to describe the young man's dismay at a moment when the whole audience had their eyes on him, and he required all his presence of mind. Yet his confusion was but transient: his genius prevailed, and his execution kindled unanimous plaudits. The manager introduced him to Prince Talleyrand, who had expressed a wish to see him. After overwhelming him with congratulations, the Prince said to him with great kindness, "My young friend, do you go to my cashier, who will
hand you tive hundred francs, with whrich you will be hand you tive hundred francs, with which you will be emabled to buy yourself a new coat." Thirty-three years after, Prince de Talleyrand, whose health advancing years had impaired, was at the baths of Hyères, in Provence, living in a house where he had assembled several artists to whom he had just told the above anecdote. A very pale man, whose features denoted great sufferings, suddenly rose, and said to the Prince, who had not yet perceived him in the crowd-" Monseigneur, 1 am that same Adrien Boieldieu," reiterated the composer of so many charming operas. Talleyrand embraced the author of Las Dame Blanche, who was already sinking into his grave.
Dame Blanche, who was already sinking into his grave.
Sudden Insanity.-A remarkable circumstance has lately occurred in the Commune of Woluwe-St.-Lambert, near Brassels. Four brothers, farming labourers, living with their mother, all became insane in less than two hours. The eldest ran away; the three others were taken to the hospital St. Jean at Brussels, where they were with difficulty restrained, so great was their bodily strength, and so violent the species of madness under which they were labouring. One of the attendants at the hospital narrowly escaped being killed by them. None of these unhappy men had,

Perpetual Motion Clocks.-In the Royal Polytechnic Institution there are half-a-dozen self-acting clocks, which are remarksble mechanical curiosities. They are the inrention of a Frenchman, and are extremely ornamental in
their appearance, and never require winding up. There are several forms of construction, and various applications of a primary yower: a description of one of them will, however, be sufficient to conrey a general notion of their peculiarities. a piece of clock-work is first attached co a piece, under a bell-glass, to protect it from dust. The whole of the mechanism is seen in motion, and there is the usual dial-plate, and a pendulum. The wheels are few, the one which communicates motion to the others being furnished with projecting arms at regular intervals. each terminating in a cup to receive a ball. These bails
are supplied to, and delivered from, the cups in such a way, that their weight shall always be acting upon the revolution of the wheel as long as it can be applied to that parpose. and shall be returned to their original feedingplace when no longer asailable for that object, in order to repeat, ad infinitum, the same duty. It will at once be seen that useful as a weight to the original pluce of starting,
there aguin to be brought into action, is the principle of
the contrivance. This is effected by simple but adequate the contrivance. This is effected by simple but adequate means. A rotating fan is introduced into the chaty in motion
the air passing up which keeps it constantly the air passing up which seeps it constantly in motion.
To the spindle of this fan is attached an endless band which is then connected to a pinion-wheel in the clock, by which a screw of the Archimedean form (fitted to a glass
cylinder) is slowly turned round. The bottom end of this cylinder receives the balls as they are delivered from the cops; the motion of the screw gradually elevates them to the feeding-place. These clocks go well, and are, moreover, handsome ornaments to a room. The plan on which they are made approximates as nearly as possible to realization of perpetual motion
risoners in Europe died since, the Nestor of all the prisoners in Europe died in the prison of Ghent pierre the wheel for having murdered a young girl. He was then 17 years of age. On a petition presented to the Empress Maria Theresa, his punishment was commuted by Count Bichaliff, Hetman of the Cossacks, whose head quarters were in this city; but being destitute of means of tivity he solicited as a favour to be suffered to return to the same prison which had been so long his abode. The request was granted, and he remained in the Rasphecis 27
years more (in all 63 years), and died at the age of 80 years.

\section*{3 abo.}
the equitable performance of a contract This was a bill filed for he agreement delivered up to be cancelled. The plaintiff in the year 1835 induced the defendant to enter into an agreement by
which he contracted to lease some extensive coal districts for a rent commencing at 1506, a year, and rising for six years until the lease on notice, and withont any limit as to the quantity of
coal that might beraised during the term. Some time afterwards the defendant discovered that the provisions of the lease were at having also reason to be dissatisfied with the agreement on other points, he refused to execute the lease. The matter was aggue He observed that there was quite enough estabilished in the cause to enable the Court to dispose of it without poing through the
very numerous depositions produced by the plaintiff and the defendant. It was established that the provisions of the lease were not in conformity with the will of the mother of the defendant which expressly required that the defendant, who had only a life
interest in the property, should not crant a lease of the mines, interest in the property, should not grant a lease of the mines,
excent on the ten-tail rent or customary manner of the district in proportion to the conl taken from the mine, or what is called a ten-tail rent, was the customary mode of leasing throughout the
whole of the district. Now, by the terms of the lease the plaintiff was to be at liberty to rase and unlimited quauntity of coal, to have apower of underseting of a great extent, and could be no doubt might be a reat trary, the taking of a ten-tail rent restrained the tenant from raising more coal than he was prepared to pay for from the na-
ture of the demand. His Lordship thought there was in this quite sufficient to justify the Courtin deoiding against the specitic perhe woula have decided in favour of a specific performance if the defendant had been the owner of the fee The agreement for the lease was contrary to the custom of the country, improvident,
calculated to do great injury to the property, without any adequate return, and entered into without any proper professional advice. It had been argued, indeed, that the defendant was per-
fectiy competent to the management of his own affairs, and that he knew very well the nature of the contract he was making with the plainuff. It might be true that he was competent to manage his own arfairs, but the other part of the assertion was disproved, and experience showed that none wre are likely to be na - ement of intricate matters of business. The plaintiff alleged ment with the defencaant, but that fact could not give him any equity against the absence on the part of the defendant of a proper leasing power; and moreover, any expense incurred was at
the plaintiffs own peril for he knew, as early as August 1833 , that the lease would be withheld. His Lordsmip thought, thereore, that the bill must be dismissed with cosss ; and he was
of opinion that the cross bill of the defendant must be also dimnissed with eosts: fior although he could not ap-
prove of the bill of the plainif, yet there was not such a case as would deprive him of the aid of a court of law if he bnil had been tiled as a means of meeting that; but if the defendant had tiled a bill of discovery, he must have paid the costs; and
the mere adding a prayer of relief ought not to affect the relative the mere adding a prayer of relief oug
position of the parties in that respect.
Rolls' Cocrr. - Addiss v. Camphell.-The Master of the Rolls gave judgment in this case. The plaintiff, Henry John aths,
was the eldest som of the late Heury Joseph dddis, whose mother, Mrs. Mildred Addis, was the daughter of Francis Gosling the elder, of Norwich. The object of the sult was to set aside as framdulent the sale and conveyance of a reversionary interest in cer-
tain estates in Nortolk and Suffolk, made by Henry Joseph Addis tain estates in Nortolk and Sunt aside the fale, conveyance, and confirmation of the same reversionary interest by Crook and
Henry Joseph Addis to Francis Gosing the younter. The defendants were the parties claiming under the will of Francis Gosling the youncer, and the representatives of Crook. The Master thet the purchase could not be sustained, and both transactions, cessary parties to the heir at-law for the same sum which had been paid by Crook upon the first contract.
Colrt of Commov Pleas.- Pafton F . Wyllie. - This was an
action brought by the plaintuff, who is a nuarket-gardener, residius
at Ealing, to recorer damages for the defendant's breach of com-

residue to the hoose of the plaintir. When, however, the plasitiff
went on the \(22 d\) April to the hoase of the deferdant for the pors
 was tendered, alleging that the plautsif had broken his contract,
and that therefre he had no rislit to the trees: and upon the
 into a recognizance of 20l. to appear and answer any charge which
the defendant might bring against him. In the interval which
har elensel betreen the sole had elapsed etwe part of the defendant, the plantiof hae sold the
proceeding on
timber. Which made about uine loads, to a Mr. (irover
 Girover, and for the expense of felling the trees, and the labour
performed in lopping and toppins them, that the present actuon was brought.-From the case prevented on the part of the de-
fendant, th seemed that some mivunderstandinis hatl arisen between
the parties with reference to one of the trees, which it he partes with reference to one nf the trees, which. it appeared,
 done was irretrievable, he appeared for a short time reconcied to claim to the trien, at one time alleging that he had never made contending that the contract was a conditional one, and that the
plaintiff was to have padd for the timber on (iord Friday, the 1 th having done so, the contract was rescircted. There was no mee-
morandum of the agreement in writing and its terms could ouly
be surmised from "fscraps of coner be surmised from "s scraps of conversatiou," as was noserved by
the Lord Chief Justice, and from the conduct of the parties, muth
reference to which the evidence was rather, conficting Chief Justice Tindal summed up the evidence, and the jorr, anar
consulting together for some minutes, returned a verdict for the The same V . The sume. This was an action for the assault de-
scribed as anising out of the transaction in the former case;
after Mr. Serjeant Talfourd had opened the case, a compmoise was effected, the plaintiff consenting to a verdict, with 51. da mages, and expressing through his counsel his conviction that
the defendant tad acted from a mistaken view of the law, while Mr. Serjeant Channell stated that it never was the intention of
the defendant to charge the plaintiff with a felong, but only

SATURDAY, MAY゙ ํ., 1841. \\  \\ Liost Wedoesday
Spilsbs:
}

Tue season for Horticultural Exhibitions has fairly set in ; reports of their proceedings are coming in from all parts of the country; the time, therefore, seems to have arrived when our remarks upon the manner in which these exhibitions should be conducted will be well applied. Our long personal expe rience in such affairs enables us to speak upon them with confidence; and the want of success attending many of them convinces us that the result of that experience will be gladly learned.
To secure permanent success for horticultural exhibitions, and to render them as useful as they ought to be, five things are requisite: 1. The time and manner of exhibiting should be made known very early, and should upon no pretence be departed from; ?nd. The Judges should be instructed to make their awards in favour of fine specimens of Gardening skill, and not of mere rarities; 3rd. The Judges should be selected from among skilful persons of unblemaished character; 4th. The award of the Judges should mever, on any pretence whatever, be set aside; sth. No exhibitor should ever be allowed to be a judge. The reasons for these regulations are obvious eriough, although they are often lost sight of.

If exhibitors do not know many months beforehand on what days exhibitions are to be held, it is impossible for them so to time themselves as to have their flowers ready just at that period when they are wanted. If, after a gardener has made his preparations, the day of exhibition is changed, all his plans are disturbed; and if he is really a good garilener, he must necessarily be ready either too soon or too early for the day of exhibition. Such a circumstance disheartens an exhibitor, and renders him unwilling to exert himself in an ensuing year.

The common sense of mankind tells them that a Horticultural Society must offer its prizes for good gardening, and not for rare plants. If this were otherwise, it would be a Botanical, not a Horticultural, Society; and the race would be to the rich, not to the skilful. And yet how often do we hear people complaining that their rare and curions plants are placed second to common things! "What a shame it is," says Mr. Copperface, "t that these judges have put that Mr. Silvercup before me! don't you see he has nothing but a parcel of Heaths, and Azaleas, and Cactuses, and such things, which anybody can show ; and I have Schlechtendahlia adenocarpa, Mulligatawnia centrotrichia, Herrenusonia gladiolifolia, Schelhammera megalantha, and many more such rarities, any one of which is worth a cart-load of Azaleas: why, my master gave fifty guineas last year for only one of them things." To all such reasonings the Committee who guide the Judges should turn a deaf ear. If Mr. Copperface's master chooses to give large sums of money for rare plants of no beauty, the Committee are not justified in paying him for doing so, especially if his gandener cannot get them into health. An Azalea or a Heath, if well grown, should tate precedence of the rarest plant in the world it ill grown. Some skill is necessary, perhans, in applying this rule to practice; but the rule itself is of paramount importance.
In carrying out the last-mentioned rule, or any other, contidence must necessarily be placed in the Judges ; it is, therefore, indispensable that these persons shoull merit the contidence that is repused in them. If a man of lounful repatation, who has been known to conduct himed fisexputably in other matters, or upon whose honour there is any stain, is taken for a Iudge, nothing will ever satisfy the competitors that the award of such a man is fair. No mat. ter what his skill, real or imaginary, may be, nothing can compensate for want of personal character. We have beard well-meaning people say, "Why do you
object to that Mr. Sharpwit? you know he is an exce lent judre, especially of Fiorist's flowers; and if he has been mixed up in discreditable transactions, that has nothing to do with his abilities as a Judge." Let no man be mislea by immorality of this sort; a rogue in one thing is a rogue in another ; and no cleverness can possibly be a counterpoise to a want of honesty. It is far better to have unskilful than dishonest judges; exhibitors will be better satisfied with them, and their awards will be more often right.
If a Committee exer set aside the award of their Judges, if they are so ill-advised as even to question it, they never will have good Judges; for when men feel that they have made an award according to their skill and conscience, to reverse it is to impuga the one or the other. In the one case, a man's vanity is wounded; in the other, his character. The merit of competitors at Hort.cultural meetings is essentially matter of opinion; and the Judges have a right to expect that their opinion is placed higher than that o others; else why take them as Judges? The merits of a flower cannot be settled like the termination of a horse-race, but wnst neeessarily be left to the opinion of somebody. In any case, honest Judges are more likely to be right than those who criticise them; and if they are everso wrong, it is impolitic to interfere with them. If a Committee are dissatisfied with their Judges, they should change them, but never reverse their decision ; if they do, they will be overwhelmed with the complaints of losing exhibitors.
But a Judge, to be satisfactury to those who come before him for judgment, should not only be of unblemished character, he should also be above suspi. cion. For this reason, he ought never to be allowed to know whose exhibitious he is examining, and he should not be suffered to exhibit himself. In many Societies, it is the practice to break the Judges into classes, and to allow a Judge in one class to exhibit in some other. We do not say that in such cases the Judges will play into each otherer hands; but we are quite certain that the evhibitors will accuse them of it, and we are much afraid that the accusation has often been well founded. If the Julges have no interest whatever in the exhibition, this imputation cannot attach to them.
The success of the great exhititions of the Horticultural Society-a success to which there is no paralel, and which has enabled the Society to offer a stimulus to gardeners such as has never been applied eisewherehas been owing mainly to a steady atherence to these principles. Some awards may have been injudicious; prizes may have been given where they were undeserved, and withheld where parties had an undoubted claim to them : some such errors lave doub:less been committed; yet gardeners will always bring their productions to the Society's exhibitions, because they know that no jobbing or unfairness is practised, and that the awards, if erroneous, are honest.

\section*{RURAL CHEMISTRY.-NO. XII.}

THE earth, or soil, consists of a mixture of varions ingredients ; but the greater part of it is composed of certain substances which are called earths. Some of these are boses, and resemble the aikalies; whilst the remainder are net bases that is to say, they seem to have no affinity for acids, and
cannot combine with them to form salts The most imcannot combine with them to form salts. The most im portant of the earths which are bases, are called lime, wagnesia, and alumine
Lime, in its pare condition, is a highly canstic substance, slightry soluble in water, but far less so than the alkalie are. It has a very strong attraction for acids, heing esem able to decompose the saits of the alkalies, in consequance of the surerior attraction which it has for the acids contained in them; and it is for this reason that it is customary to mix quicklime with woodash, which contains comparatively littie frue potanh, as the greater part is
combined with carbouic acif, when it is desired to
 pmies the carbonate of potach, combines with the earbonic acid, and becomes converted into carbonate of lime whilst the potash, being no longer combined with an avid is able to exert its caustic powers. The commonest compornds of lime are tho carbonate ant the selphate; the existing naturally in immense quantities in the difforent forms of chatk and limestone; it is also very commonly an herredient of the soil, and constitutes a considerable part of the bones of animats, and ak:o sitills. Is we bave atrady stated, lime has a loss powerinl attractiva for cart bomie acil than it has for any notber acid ; and therefore lime, se pratur a ghanticy of any acid over cambnate of frothing, is oceasiened by the escape of the carbonte acid which is set at libenty 3 hati the lime crm'ines with the new acid. This bubbling, os eiferrescence, as it is cailed, enables us very eavily ts
ascertain whether a stone be limestone or wise whether any particular soil contains carbonate of
lime; for if any acid, such as vinegar, does not occasion any effervescetice it is certain that no carbonate of lime is present; and if, on the uther hand, it does expel bubbles of gas, we may be quite sure that a portion of some caribuate is present, and by far the most coumon is the carbotate of liure. All the firms of this substance are tasteless, and quite insoluble in pure water; but rainwater whica commonly contains dissolved in it a very small quantity of carbnaic acid, has the power of dissolving carbonate of lime: hence we commonly see the surface of clatk or limestoue appears gradualiy corroded or worn away by the rams, and fur the same reason buildings those which are built of granite -a stune which toes not coatain carbonate of lime, and is, tharefore, not thus acted on by rain-water. In this kiad of action no ceemical change is efected : the carbonate of time is merely dissolved by water hulding in solution carbonic acid; hence when either from heat or any other cause the carbonic acid is expelled from the water, it is no longer able to hold the carbonate of lime in solation, which is therefore deposited again unaltered.
The uses of carbunate of lime are very numerous : one of the most important is for burning into hme. This is a very curious process, for heat generally increases the atraction which two different substances bave for each other; yet in tiais and some other cases, it rather diminishes it. and the strongest heat is unable to drive off carbonic and from its combination with petash or soda, sable whe, which parts winh is so readny he alkaties When quieldime is mined with vecetable or animal substances, it grestly accelerates their decay: it, however, renders the process of putrefaction far less noisome than it is under ordnary cincumstances, because the lime absorbs many of tiee protucts of deray.
When quichlime is stahed with water, it crumbles down o a powder, and is found to have combined with a quanity of water; althorgh it appears quite dry, for the water is chemically combinod with the lime : if thit lime thus slaked is left expused to the air, it combines with carbonic acid, and becomes changed into carbouate of lime, and at the sanie time parts with must of the water with which it had previously combined.
Sulphate of lime is less common and abundant than he carbonate; it is however a frequent ingredient in the oill, in spring and mineral waters, and is foand sometimes in large beds constituting what is called plaster-stone, gypsum, and aiabaster: tinese are all compounds of lime and sulphurie acid. Common piaster of laris is dry sulphate of lime, or gypsum deprived by heat of the water Wheh it naturaily datway \(=\) contans, and when mixed with a small quantity of water it recombines with it and bemase hard, dry, solid substance. The berning of gypsum inz of chalk to make quichlime : in the former case the native sulpiuate of hine, whicis contains warer, is heated and the water thas expelied : whil:t in tine igerning of lime not only is the water expelied, but also the acid itself with which the linse was combined. Sulp hate of lime is dissolved in small cquatity ly whame, and tecordingly we find it almost aiways prewent in spring-water. which derives it from the woil through which it rises; it is the presence of thic sub-tance in spring-water which gives it
that freshuncss which distinguishes it from emmen riverwater, and rend-rs it so much more pleasant to drink than soft water: in fiet, the great thistimeti \(n\) formd between liard and soft 3 . \(e\), is nisinly caused by the presence or absence of suipmite of lime. when, the iug centritued in very small quantity, greatiy influences its usefulness for domestic parposes. The.e is only out cthir compuund of lime of much importance, and which has already beew mentiosed. This is the phosphate. It is found in suad solid matter of the plats, and forms a great part of the

\section*{ON THE PRODUCTION, DISTRIBUTION, AND} ENCE PARTICC゙CAREY TO THE NHTATOR OF CLIMATE IN CONSERVATOBIES-No.IM.

\section*{(Concluded from last Week)}

I have thus arriven indirectly at a consideration of that mode of using bot-witer ppes proiested by Mr. Penn and althouch in the twim co a queston I have expressed an opaion as to the hetle resemblance that spin a mode of bieating can have to tint emplayed h, nature. I ofter worse. That it is theoretheairs an ethement mode of ems foyyng air hear nast be adairted inambitu as it pro
 out which, as we all know, air has little power to heat o to cool. I suspect, however, that wit
those particular leaves against which movement, it is not so the sase
a system of air-heating rap in the -mall tubos, is veny \(\mathrm{T}, \mathrm{m}\)
house. The heated air remains, therefore, for a consider able period in contact with the glass roof, and with the uppe
 - radiated to the frarois.

By a process something like this, in my apinion, ins Mr other modes of artificial beatthit emploved hy nathen : thengh in those cases where the deten'tua tan 1 quence of heat othervise commanicait, this correcting operation is requisod to a farch monllar extent than when
tir teat is the instrument first employed. For these rea the it may happen that so long as a given temperature and requisite meisture are maintained, the effect upon the plants is much the same, whatever be the vehicle em-
ployed. The heated air in Mr. Pemn's arrangements, if it ployed. The heated air in Mr. Penn's arrangements, if it
reall circulated with the rapidity supposed, must of nereally circulated with the rapidity supposed, must of ne-
cessity scorch the plants, inasmuch as it receives moistare only after it has finished its course, immediately prior to the re-warming. The fact is, however, I have little doubt that it descendsfrom the roof comparatively cool, and therefore deprived, in some measure, of that exhausting power which it would otherwise possess.
But whatever may be the organic consequences of air heating, it is open as a question of economy to very serimade with an air-tight roof, the attempt to fill it with warm air may be compared to the attempt to fill a sieve with water; the fluid must be so rapidly supplied as to overcome the loss sustained by leakage, and it is easy to imagine so large an aperture in the roof as to lose the Whole of the warmed air as fast as it is supplied, and of consequence to render ineffective the whole of the pipes cmploged in heating it. But if those pipes plants, it is impossible by any amount of leakage in the roof, or indeed by the total absence of a roof radiation upon the earth and the plants must, to a great extent, perform its office; and though the air, which in onsequence becomes in some degree warmed, will escape at the defective roof, this is evidently an incalculably smaller mischief than when the lost air is the hottest portom of the prime heating agent.
The constitution of glass furnishes another very powerfol economical reason for the employment of radiant heat in fact. the relations of this valuable material with heat and its wonderful adaptation to the service of man, would Bridgwater Treatise. If glass had been as good a conBridgwater Treatise. If glass had been as good a conthe windows of our winter dwellings, and certainly it would have been useless for conservatories. If it had permitted the passage of radiant heat at low intensities, it would have been still more disadvantageous. But while it per mits the almost uninterrupted passage of the solar rays, it almost entirely intercepts all return of heat from the objects on which those rays have fallen ; it is a sort of trap giving free ingress, but forbidding all escape. In like manner as regards the heat radiated from pipes within a conservatory, a great portion of which must proceed directly to the glass roof, that roof is as effectual a barrier glass, it has been shown by the experiments of Melloni before referred to, that no sensible portion passes through. A certain part is reflected, falling therefore upon the earth and the plants ; the remainder just penetrates the surface of the glass, from which (glass being a bad conductor but a good radiator) it is sent back into the house before it has time to traverse the thickness of the material. Hence we discover partly the reason of the success which has attended the attempt to warm some of the large and entirely glass-houses which have been recently constructed. The thicker glass, which, thanks to the enterprise of Mr. Chance, can now be obtained on moderate terms, renders much more available the low conducting power of the ma terial, while its strength and flatness diminish at once the number of the laps, and the quantity of escaping apertare formed by each.
The fuel consumed during the late severe winter in the large house erected by the Horticultural Society at Chiswick was very much less than had been expected, and leas, indeed, than any previous experience could have rendered probable. I state this with the less hesitation because the position of the pipes was settled by the Committee of Management, and because I ascribe the econom:wholly to the property of glass, and especially of thick glass, to resist the escape of radiant heat, which is there principally employed.

The annesed figure is a transverse section of the house, showing the disposition of the pipes which exert their primary infuence upon the earth and the lower portions of the plants. The air, which is heated by contact with

the pipes, is partly detained it the cavity formed by the bearers beneath the sheives ; the shelves thas acquire heat, and become further sources of ratiation, as also do must become warmer than that in the ceatre of the house, and the difference of specific gravity thus prodnced causes
constant ascent near the sides and a descent towards the middle line of the building. Whether the circulation so produced is sufficient for the health of the plants, question that must be answered by the condition of the plants themselres. Certain it is that any disturbance places with are remper wnown to those who have attempted to keep ice-houses cool, or steam rylinders warm, by enclosing them within air-cases. Wherever quickly as to transfer the heat from one to the other; and hence the necessity for entangling the air by straw, sawdust, charcoal, or other similar non-conducting materials It appears, however, that Mr. Penn has found that his ascending tubes may be dispensed with, and then it becomes a question whether the soil is best and most cheaply heated by the direct action of exposed pipes, or by the air
warmed in close chambers; a question which may be warmed in close cham

There is, however, one deficiency in houses warmed exclusively by pipes within them, which arises thus. Inasmuch as it is neither desirable nor possible to make a building perfectly air-tight, so there must be a continual loss of warmed air to some extent at or near the roof, which is replaced by cold air entering below. This cold air having no tendency to rise, and the interchange of heat between superposed fluid strata being extremely slow when, as in this case, the leafiest is beneate, easily exist a considerable difference between the upper
and lower temperatures of a lofty house; not, however and lower temperatures of a lofty house; not, however,
so great as when air is the instrument of heating, but suffcient to be objectionable, and which, perhaps, is the cause of that "effect defective" ascribed by gardeners to houses which are more than high enough to contain their plants. For it has been shown that this condition is the very reverse of that presented by nature during the day, though it is a condition which is to some extent obviated by radiation of the pipes upon the soil, and very much aggravated when the pipes are burie
case in trenches under the paths.

At the house of the Horticultural Society this difficulty is met by the same means that are used to detach the boiler shed from the conservatory. The pipes are con-
 veyed 70 feet in an under-
ground tunnel, having double ground tunnel, having double
walls to retain the heat, which opens at one end into the house and at the other to the external air, and which is thus made the rehicle of introducing as much fresh air in a requisite to repair the leakage of the roof, and to maintain the purity of the atmosphere. The house in question contains more than 11,000 feet of glass, its cubical capacity is above 100,000 feet, and the quantity of pipe surface is 2,700 feet, of which 2,000 are exposed within the house, and the remainder contained
in the tunnel before described. This quantity, which is in the tunnel before described. This quantity, which is evidently small when compared with the extent of glass and the cubic quantity of the contained atmosphere, is, nevertheless, sufficient to command with ease an elevation of \(30^{\circ}\) above the external temperature. - A. Ainger

\section*{COTTAGE GARDENS.-No. XVIII.}

IT frequently happens about this time that the young crops of Carrots, Turnips, and other seedlings are seriously injured by the numerous little snails and slugs that abound in every garden, and commit great destruction unless speedily checked by the application of the very simple and effectual remedy which it is within the power of every cottager to procure. This is nothing more than a little porvered hot lime, a slight dusting of which over the parts of the garden infested with slums will be found sufficient to destroy every one with which it comes in contact. The proper time for applying it is either late in fhe evening, or very early in the morning; and if a shower follows shortly after the first application, it will probably he necessary to repeat it. The young Celery plants will, perhaps, be nearly fit for removing from the seed-bed, in prepared in a shady situation and treated in the following manner:-Rake off a little of tue finest earth from where they are intended to be planted, and tread the place so as to make it pretty firm and even; then lay a coating over it three or four inches thick of short well-rotted dung, and whole smooth. and prick the plants into it in rows three or four inches apart. Water carefully afterwards, and continue keeping them moist, which will have a great effect in acceleratirg their growth untal they are fit for final planting. In the perfurmance of this very simple operaplanting. In thether it be the transplanting of Celery, Onions, or any of the Cabbage tribe requiring sueh treatment, a little care is necessary in priching out, as it is termed. not to press the earth to the stem at the surface, and leave a vacancy unfilled about the roots. If this is unattended to,
the evil consequences resulting from the nectect will soon the evil consequences resultugg from the nect.ect will soon
he evident in the failure of the yeung plants shortly after removal. Another point deserving of notice is, never to praut the seadings any deeper than they were which has a tendency to emit roots from the parts of their stems that re co
Tbe Potatoe Onions will now be advancing rapidy. pede the swelling of the bulbs, loosen it carefully around the plants ; bat there is no necessity for earthing them up, as is sometimes practised. Draw earth to the rows of
Kidney Beans and any other crop that may require it.

Stake the last-sown Peas, and let another sowing be made ond Scarletrnners This is now also some more Broccoli and Scarlet-runners. This is now a good time for thinning out the superfinous sioots from the centre of the Goose-
berry and Currant bushes ; by so doing more light and air will be admitted to the fruit, which will be greatlv bene fited in consequence, as well as increased is size and flavour.-M.E. \(H\).

\section*{ENTOMOLOG}

No. VIII.-The Rocket Tinea Moth.-Of the many tribes of insects that attack our garden plants, and render the buds and flowering shoots abortive, and at the same time give them an unsightly appearance, the caterpillars of small moths are the most troublesome. A monast them is one which several correspondents will remeraber attacked the flowering spikes of the Rocket, Hesperis matronalis a plant celebrated in former days amongst the Dutch florists, whose flowers suffered a century back from the same cause. During the middle and latter end of last April, a the shoots of the Rockets advanced, it was found that the leaves adhered firmly together, and those that liberated themselves were perforated with large holes (fig. 1 ) on forcibly opening a shoot, for the young leaves were connected by silken threads, a small green caterpillar, of different shades varying with its age, was found in or near the centre feeding upon the tender leares (fig. 2): and sometimes a little family of four or five inhabited the same head. This larva is gradually attenuated to both extre mities; it has six pectoral, eight abdominal, and two anal body, amounting to 12, have about a dozen minute hlack dots or warts on each, every one producing a short black hair, and there is a darker line of green when disturbed or desirous of remoring, it can descend b a silken thread, which is, as usual, spun from the mouti

hatched in March, from eggs that had been laid the pre-
Perhaps the best method of extirpating them would be to search for the young caterpillars between the leaves on
the first symptoms of their presence, and extracting them with a small pair of forceps, such as are used for microscopic objects; but as some might be too minute at that tion must be repeated. Pinching the maggots in the bud is also recommended, as well as dusting the plants with flower of sulphur, which I fear would be of little nse. I and covered with tarred or painted canvass, which could be placed over a buish or small bed of flowers when it is ttacked by insects ; and it would then be easy to fumi gate any piant by means of an aperture, with a tube of plugged up, so as to keep in the smoke of tobacco, or even of sulphur, which last would in ten minutes destroy every living animal within the enclosed space.-Ruricola.

\section*{HOME CORRESPONDENCE}

Honey Deic.-I was glad to see in your paper of eport of the Honey-dew phenomenon which occurred in his grounds at Rolleston. The facts therein stated do not, in my opinion, disturb the generally-received notion that fluid. Sir Oswald Mosley found it where it is in the circumference of the spot, on which the oak tree stood; and where, trickling down from leaf to leaf, at last it fell from the extreme branches, upon the gate, post, paling, and whatever lay under or near the exterior of
the tree's area; and, had notice been taken, some would probably have been found spirted out by the aphides, beyond the perpendicular liae of gravity. All this is quite in accordance with general observation. The only circumstances tending to support the theory of simple served. But here I may perhaps be allowed to express a doubt, whether Sir Oswald Mosley's observation had extended to a sufficient height in the tree, to ascertain their number. If it had, he might have seen reason to affords abundant opportunities for observation of Kent affords abundant opportunities for observation respecting larly amons the hops, I submitced the question to my very intelligent and observant friend Mr. Golding of Hunton;
who assures me that, after the most patient and minute observation in his neighbourhood, he is perfeetly satisfied that aphides are the chief producers of Honey-dew.
That certain trees do, occasionally, secrete a saccharine That certain trees do, occasionally, secrete a saccharine
fluid is admitted; but in yeneral (according to my Fientish friend, altuays, so far as the hop is concerned) plant is free from the fluid until the leaves have been visited by aphides. On this account the mother aphis is mother wasp by the apiarian in May. We had a Honeymotber in South Wales last summer, which the practised eye of Mr. Golding enabled him to foretell, about the midule of the preceding May (when he was upon a visit at my house), purely from his detecting the approaching
birth of aphides on the oak leaves. These insects always. congregate on the under side of the leaves, and eject their
fluid on the upper surface of those beneath fluid on the upper surface of those heneath them: "and
iff," says Mr. Golding, "a leaf be so situated out of the reach of these jets, that leaf, though itself In support of this statement, we have furtherm-dew the opinions of Linnzens, Hüber, Knight, Kirby and Spence, Curtis, \&cc. \(;\) some of whom affirm that they have watched the insects inserting their suckers into the tender vessels expelling it, not orbly the sap without infermission, and expeling it, not only by the ordinary passage, but also by perceived a shower of Honey-dew descending from one of his oak trees, from which he cut off a branch, and carried it into the house, when he distinctly saw the fluid ejected
with considerable force. Sir Oswald Mosley speaks of a single fact overturning a host of conjectures; but in this case the single fact has to deal with a host of other facts, with which, however, I am of opinion; that it nat only
does not stand in opposition, but is capable of being does not stand in opposition, but is capable of being may lead to more extended observation, and elicit such farther evidence as may render the matter no longer a disputed question.-Edward Bevan, Llanferry.
Deodar in the pinetum here -I find the shoots of the Deodar in the pinetum here, \({ }^{-1}\) find one has grown two eleven feet high, and the habit beautifu! and interesting. I think they will grow as fast as the larch, when wel established. We have been planting some of all the
Himalayan species, in what remains of Sherwood Forest, called Birkland. There is a broad turf drive from Wel beck through it, to the Duke's great farm at Clipstone-
park; the drive is eight miles long. His grace intends to erect a Gothic arch in the middle of the Forest, taken from the old abbey gateway at Worksop; when finished it will be a feature to the grandest forest scenery in Eng.
land, or perbaps in Earope.-W. Tillery, IW elbeck. [Thanks to the patriotic exertions of the Court of Direc tors of the East ladia Company, there are now in this other Himalayan thous of young plants of the Deodar and expect that in an coniferous plants; and we contidently forming woods in the domains of some of the great Eng. pish noblemen. It is one of the handsomest of treen, is perfectly hatdy, and has mont valuable timber.]

Magnesian Limestone.-In a recent Chronicle, Mr. J. to vegetation. If this is true, the limestone here must have some other bad quality, for I killed vines in pots by watering the roots with a solution of it to kill worms. suffered by it. His Grace the Duke of Portland says, that it is so perniciods to land, that he never uses it on theurm. Where a heap of it lay for some time, grass Cresswell grow for a great number of years. It is from strata run all through to Doncaster. It is said to have been analysed, and contains 60 per cent. of magnesia. Walliam Tillery. [It is so universally believed caustic magnesia of magnesian limestone is destructive of
vegetable life, that we should be glad to receive some proof of its being harmless. When assertions are so directly opposed to each other as those of our two correspondents, one is forced to conclude that there is
something connected with what is called Magnesian Limestone which requires further examination.]
Summer Transplanting.-In reply to the inquiry in your Chronicle of May 8th, respecting transplanting large别 term the washing-in system, which has been attended with success in every instance. Indeed, I doubt not that by this method trees of considerable size may be removed at this method trees of considerable size may be removed at
this or any other seasom of the year with safety. Towards the latter end of last May I had occasion to form a block, or screen, in a situation fully exposed to the sun, for evergreens, not one of which was injured by the removal; and a fortnight ago we disposed of upwards of a dozen large Horse Ghesnuts, Spanish ditto, Limes, Sycamore, and Birches, all from 10 to 18 feet high, in full leaf, to a gentlemas in this neighbourhood, the planting of which I superintended : all at this time exhibit no appearance of having been removed. In the first place, we make the bole Where the tree is intended to be placed sufficiently large for the tree great care is taken to avoid cutting or injuring the roots. If a ball of earth is retained, so mocta the better, the roots. If a ball of earth is retained, so much the better, is not of much importance. As it is essential that the roots be as little exposed to the atmosphere as possible, we provide sufficient earth, either sifted or finely reduced by a spade or rake, and have in readiness as many buckets of water as will pearly fill the hole; the tree is then placed in its intended position, the whole of the water is then thrown over the roots, the fibres of which will be supported by it, the fine earth is then expeditiously sprinkled over the surface of the water, and gradually subsiding, fills all the interstices and gives stability to the tree, which is further secured by three stakes placed at right angles, which is often done.-Francis Williamson, Slut be tridd Gaden, as is often done.- Francis Williamson, Shitheld Curclens. reverting to this subject.]
To destroy Wasps.
To destroy Wasps.-A. J. D. says that he destroys wasps by pouring about a pint of gas tar into their holes,
which prevents the insects ever getting out. Those which prevents the insects ever getting out. Those wasps that enter the hole afterwards get entangled with the tar o and are hilled by this simple plan wasps may be destoyed in less time and with less expense and trouble than any other, and it may be performed with safety at any hour in the day. H. K. also testifies to the value of this system, bat ho prefers filling the holes with tar at night.
in the minds of many persons misapprehension existing in the miab of this plant. I have been told that several individuals have thrown it away when the stems have withered, believing it to be dead, and therefore it may be asefal to
send you the following information respecting it It is greenhonse herbaceons plarmation like the Dahlia or com mon Convolvulus of our hedges, has a fleshy tuberous root. Although it dies down in winter, the tuber will be found perfectly safe in the pot, ready to start into growth wish return of the season. If it does not "break" reety, a little artificial heat will be found of considerable service. The red-spider is very fond of it, and unless great care is taken, it will soon get disfigured from the England, but it doubtless will do so freely when the tubers get stronger. \(-\boldsymbol{R} . \boldsymbol{F}\).
double yellow roses in a north "everybody" would plant the midday sun cannot fall on them, there would be an end of their complaints, and E. R. would have the gratification of seeing his plants in perfection.-O. W.
Vine Weeril.-Otiorhynchus sulcatus is by far the most injurious vine weevil, and every means should be used to prevent its increase in rineries. I had once the charge numbuse in which this insect suddenly appeared in great years I about the beginning of May, and yet in previous isted, but certainly not many, therefore they must be exceedingly prolific. My attention them by ubserving the margin of the leaves antal into all sorts of shapes, and for some time I was puzzled to find hiding itself by day under the leaves or loose bark of the vines, or in any similar place, to avoid the light. I toon advantage of this habit to destroy them, by placing a
handful of moss here and there among the branches the vines, by way of trap, and into this they always retired at the approach of day. The moss was taken down and
examined every moming, and the insects found in it the failure of graftecies (probably picipes) othen causes bursting into shoots, when, if the season be adverse are the graft too weak to develop an adventitious bud, it of course dies. Both species suddenly drap to the ground if disturbed, when, ether from the instinct of self-preservation, or from being atunned by the fall, they lie as if dead, and being nearly of the colour of the earth, they are catching them-over: cantion is therefore necessary in Vegetable Vagaries. Whiting, May 11.
cured at the Hammersmith Nursery a plant of the I provariety of Cytisus Laburnum, which was then of the purple nated rased in France from a seed of that species impregnated by the pollen of C. purpureus, and it assumed a rapid rambling growth, and in five years attained the been budded apears teet. The stock upon which it has i. e., till the spring of 1839, it continued to produce a profusion of uniform racemes, and retained much of the general character of a Laburnum, but differed in having all the flowers of a dull dingy purple, and the racemes rather shorter, not being more than siz inches long, and the leaves amaller than is usual in that species. The main stem immediately above the graft is forked, and from this fork four other more slender branches proceed. About balf-way up on one of these two main branches, I was duced purple axillary blossoms, and small leaves completely answering to Cytisus purpureus, and it has since continued to grow exactly as if that species had been budded there. This spring my surprise has been increased by the appearance, on several of the ultimate branches, of a shoot producing the beautiful golden blossoms of the common Laburnum ; and these racemes and the leaflets which surround them are much larger than those which retain the hybrid character, and one of the former is full 13 inches long. The whole shrub now therefore exhibits a large solitary lateral bush of Cytisus purpureus in full a large solitary lateral bush of Cytisus purpureus in full
blossom on one of the main branches, and several of the blossom on one of the main branches, and several of the
extreme twigs of the second main branch, and of the extreme twigs of the second main branch, and of the other four principal branches, are here and there orna-
mented by a few racemes of the common Laburnum, though there is not any on either of the subdicisions of the main branch which has produced the C. purpureus.L. W. Dilluyn. [This singular circumstance kas been spondents.]
Clintónia pulchella.-W. Dumbrill, Chronicle, p. 294 speaks of the difficulty of germinating Clintónia pulchélla mould and one-third common soil, with a little sand, care being taken to make the soil firm enough to prevent the seed from being dislodged in watering, I can calculat sowing of Mustard and Cress. Where it is intended to have beds of it in the flower-garden, it may be planted out in the beginning of March, as none of the frosts that happen after that time will injure it. I have planted it out on the
8th March, and found it snccee 8 the March, and found it succeel better than if put out at the same time or later in May. There are Clintonias here are the the anteat the winter, there is no doubt they would prove as hardy as any of the Californian annuals, and, like them, succeed better in that way than if sown or planted out in the spring. -John Ha
Failure of Potato Crop.-W. S.C. of Perth, believes owing to the want of some property which the tubers acquire if exposed for a few days to the influence of light and air. He once took about a bushel of Potatoes from the pit, where they had been all the winter, with the intention of having them planted ; but the ground not being mained after which they were planted. There was, however, not sufficient to till the ground, and enough for two rows were taken out of the same pit and planted imemediately. Those that had been exposed to the intluence of the atmosphere appeared above ground more than a week before the others; their leaves were free from curl, and as healthy as
possible ; those last taken from the pit never overtook them ; the leaves were curly, and some bad to strugele for existence. He has remarked that a Potatoe exposed above ground never throws ont any shoots, but becomes hard and green; yet as soon as it is put under ground, it starts into activity at once, though of course it must not become "frosted, or the labour will be useless. To insure a crop flate-planted Potatoes, they should not be cut till planted. Slocks affected by the Scion.-In the Cardeners' Chr article on grafting and "ennobiing" of trees : the question was also discussed of the probability of a stock being in any way arfected by the scion. Will you allum me to
point out a passage in Scripture which bears upon this subpoint out a passage in scripture which bears upon this sub-
ject? I allude to the 1 lith chapter of the Epistie to the
Romans, and more parteularly to tiue 2th verse:- For Romans, and more parteculariy to tie Q ith verse:-". For
if thou wert cat out of the Oive-tree, which is udd by
nature, and wert grafed contrary to nature tinto a good Olive-tree, how much more shill these, whech be the natuBloomfield says, in diluding to this chapter, "Comame tators have astrgned many reasons for the departure trom he usual mode of graftung trees, but these are rendered tained that in rieas ine wea to ander
wild into the garden tree, to promote fruitfulness. would, then, appear that decaying trees might be revived by an insertion of brancues trom a vigorous wim tree. and it to illustrate the relative positions of the Jewish and Gentile churches. The subject is worth consideration.C. S. C.- [We should be very glad of further information apon this carious subject. For ourselves, alas ! we have no leisure for long antiquarian researches, but manty of our cor respondents have the time, the books, and the learning demanding such aa inquiry, which would probably bring to light other curious matte

Old garden hiterature is sadly in want of a votary.]
Burk. - I shall feel much oblized to the " Young Fo. rester" to acquaint us where we can obtain anything like such a price for Oak-bark as he says be has obtained. I and in the best condition, for \(91_{\mathrm{s}}\). per ton, delivered in the tmongard; the whole expense of barking and of conveyance, expense of any kind in addition to the 90 s. per ton.-An Ohd Forester, London, May 17, 1841.
Penn's Heating.-After much discassion about Mr. Pean's mode of heating, I perceive Mr. Paxton (p. 243) has thrown some lightt on the effair. I am glad he has fangled" modes of heating for the last seven years, that thousands of pounds must have exchanged masters; in many cases, to accomplish less than the old flue system would have done. I do not menn to recommend the reviin the slightest degree, but merely to hint to fresh aspirants in that way that something more than mere closet knowledge is necessary in Gardening, to secure 2 suecessful
insue to speculations of the kind. Mr. Penn, it appears, aimed at a complete circulation of the confined atmosphere of hothouses without actual draft-a praiseworthy intention, certainh-but this, I presume, is already accom plished in a sufficient degree, under good management, without any extra consumption of fuel. For my own part, I conceive that where a sufficient ingress of fresh air is provided for at a low front point in any given hothouse, together with a sufficient egress at a high point at the back, there is mithe more hedesirel an points yet permain, in which much may yet be done:
the first, a proper supply of moisture with the heat, together with a perfect and systematic command over that sapply ; and secondly, a mode of preserving sufficient heat daring the night with as little fire as possible. With regard to the first point. the slate, zincor othertroughs now so
zouch used seem to me a decided improvement-whether they are sufficient, time must prove; I am afraid not, in the case of a flat-buttomed trough resting on a round pipe. However, if it is not, it might be remedied by haring a lead trough, and by causing the bottom of such trough. by bending, to embrace the pipe. I believe that much may be done by having grated floors in preference to solid mesgh, broken sanustone, or other highly absorbent material, beneath the gratiug, there would be less occasion for anxiety about troughs. It is not a sudden flush of steam
that we want for general purposes, produced from small, hot surfaces, but a steadily-acting power of the kind from larger and cooler surfaces; and since a thermometer is considered indispensable in hothouse management, why not a hygrometer? If heat is of great importance as to acience as applicable to the one as the other? A selfacting hygrometrical regulator would, I think, be of great acting hygrometrical regulator wouce simple, economical. and certain. With regard to grated floors and porous bodies beneath saturated with moisture, I am amare that it will be urged that the temperature in that position is so much lower than in the upper parts of the house. that the effects produced this way would be unimportant. I do
zot think so. Having a curiosity to ascertaia the difference between the temperature of the back floor, and of the apper part of the bouse at front and back, I lately tried a thermometer in the respective places - in a small Orchidalowing were the results :-Orchidaceons house, 5 P.M., Bo covering on the roof-clondy atmosphere, and raining alightly: floor line at front, \(688 \frac{10}{2}{ }^{\circ}\); one foot below do. at hack, 670 ; one foot and a hall from roof at front, 70 Vinery at the same time: front floor, \(64^{\circ}\) : back do., \(65^{\circ}\); one foot and a half from roof at back, 63 . The differ ence which last appears in favour of the floor line is a re-
sult not to be depended on for calculations, as there is a flue in the back wall, and no doubt a rapid radiation in the immediate neighbourhood of the thermometer at the
baet, on account of the metallic roof. However, this will serve to throw some light on the affair. With regard to the second poist, "the preserving a sufficient heat during covering the ouly ucde. Cucumbir irames or pits, and the covered ; then wiy not housears, are, by compinon consent, and the objects alike. Is it the trouble, the expense, of both? As to tromble, such is the enthusiasm for our calling, that the term has become abmost obsolete. With re-

Ces, suffice, and probably be more conducive to healch as regards vegetation in general. I wish Mr. Paxion could be induced to give the Horticultural world his ideas on this subject. He has tried a thatched covering at Chatsworth, and possesses chances of observation which fail to the lot of few.-Robert Errington.

PROCEEDINGS OF SOCIETIES.

gether with a crowd of other persons of rank and station. The bands of the Coldstream, the Royal Horse Guards, and the 1st
Ifre Guards played during the afternoon Never was there a more signal exemplification of the benefits
which an institution like thisis is capabie of canferring. The estabbishment of horticaltural exhibitions, by encouraging competi-
tion, excites adegree of emulation which coold not be obtained
without the prospect of public praise or reward. Hence, though without the prospect of public praise or reward. Hence, though is either beautiful or rare at the present period, the most remark-
able feature in the object brourght forward, was the siuguarly
soccessfol manner in which ther had been grown . The maiority successful manner in which thees had been grown. The majurity
of the specimens poosessed vigour and prodigality as well as rich
ness of blossoms, which a knowledge of tre true principles of ness of blossoms, which a knowledge of the true principles of
culture and a correct acquaintance with the habits of indivi-
dual tribes
Azaleas formed one of the classes in which the most striking
improvement has oecurred. When the beantiful varieties new cultivated to such perfection were oruminally introduced, there
 acquaintanee with the different modes of treating them has
brousht then into atorally opposite condition. In the specimens
 the biossoms and leares are so dense that it ing almont impositite
to see through them, patches of the latter beinc only hore and to see through them, patches of the latter beine only here and
there visisle, and thus
giving greater brilliancy to the fowers. there visible, and thus giving greater briliancy to the thowers.
The character here spoken of was especially conspicuous in
A. in.dica lateritia, variegata, Smithii, and a magnificent crimson A. i.dica lateritia, vaniegata, suithin, and a mamnincent erimsons
mariety in Mr. Laverenc's घrup. With bloms of an immense
size and dazzling brightness. It is prohably the one called \(A\). indica sizpendens. Mr. Green's double-red kind, thounch not so compact
in habit, was likewise particularly showy. Next to Azaleas, the Cactacemus race was most noticeable. Green, gardener to Str B .
and Epiphyllum speciosum from Mr.
 with a large Cereus speciosissimus, and a fine plant of C. Malligardener to Mrs. Lawrence, of Ealine Park, while Mr. Bruce, gardener to B. Miller, Esq., Tooting, exhibited a dwarfer plant of a charming E. Achermanm, which was nearly as broad as it was high, and of the most elegant proportions: the uowers of the last the prodigious quantity of blossoms, elicited much admiration. singly or arranged in detached groups, were a source of great prizes having been offered for plants of this description, it was
to be expected that there would have been a larger number of
competitors, bnt the specimens were, on the whole, highly me-

\section*{}
colorum, a plant which will ever retain its high character. Two
specinens of this, trained on a trellis, which partially covered the specimens of this, trained on a tretis, which partially covered the
pots, the blowoms being diphosed all orer with as muth regularity
as if they had been purposely fastened fin the proper position, wrere subjects ot unversal esteem : they were shown hy Mr. Green.
1 large phant of stehanotus ilurliundias, witi t Butchers main collection. Gompholobium polymorphum, fom Mr. Barmes, gardener to f. W. Norman, Esq, was attached to a
fat trellis, and its numberlesslarge crimson flowers created a display which was hardly exceeded by any other object. From the copious floral racemes was very conspicuous. There was considerable merit in the culture and training of Zichya coccines,
brought by Mr. Upricht, gardener to G.C. Ridge, Esq. of Morden ond Mr. Wilson of Streatham. Zichya pannosa, from Mr. Butcher, was also exceedingly fine ; and another species of zichy,
from the collection of Miss Trail, Wras highly creditable to Mr.
Hunt, the gardener there. A noble Clematis sieboltif was sent
 its prett, pale yellow bios-oms, toretier wita manbergia Haw
 trellises, according ta their habis; and thit fat i...s are preterrei

variety from Mr. Green, of Cheam. Uf Caiee lana- there was profusion, the chief new ones being from Mr. Grees aud \({ }^{2}\) ar. pard, on a yellowihn Eriond. Mucis wotice wan taken of sit Hy-

 Hartnelli, not inferior to E. aristata major, E. elegans, with a
curious habit and delicate pink blossoms, and E. ventricost
carnea, which was liftle excelled by any other, were from Mr.
Venables, gardener to W. Harrison, Eso of Chesh penaces rubra, and E. Hartmelli nova, beantifully growa, were
sent from Messrs. Young, of Epsom. But the loveliest Heath,
and the mist charming ypesimen, was E. propenden-, Hruwn br
Mr Mr. May, gardener to E. Ghowhart, Esq.; nothmor could exceed the beauty of this plant, which was covered with pretty pink belds, ing. In the above enumeration, simply a a fenr of the most strit remark on all. Of specimen plants, not ranking witis any of to
foregoing classes, yet meriting distinction for their superior colture, such numbers presented themselves that only a selection
can be named. In Mrs. Lewrence's collection were Cytisus race-
mosus, about six feet high, spreading in all directuonis nearly a Wide; IXora Bandhuca, with nearly 30 prodigiulusly large heads singularly, graceful species, in remarhahe : perfection, and fully
five feet high, with a plant of Euphorbia splentenis, which would ornaments. A specimen of Chorozemar cordatum, from yr
Bames, was, perthaps, the most noticeable instancen food colfiBames, was, pertans, the most noticeable instancenf
vation which the show afforded. Every one know- the rambling
nature of this species, and how seluom it can be rednced wrthun nature of this species, and how seldom it can be rednced within
moderate dimensions. The plant su question was, however, of moderate dimensions. The plant in question was, howerer, of a large blossoms at the extremity of each. In short, it might be
regarded as a model of perfection; its beauty had apparenti) been caused by frequently pinching off the points of the joums
-honts. Erythrina Crista-galh was as well grown on a pot by Mr
Butcher as we have ever seen it in the open border Butcher as we have ever seen it in the open border. It no dnubt
requires merely rich soil and pienty of pot-room. The brillint
litue Lechenaultin formosa was exhibited by sevenal persons, bot none had it finer than Mr. Falconer, gardener to A. Palmer, Eq9 the pot were at all discoverable; nothing could be seear but aft spots of preen foliage, and one blase of glowing flowers. Phme the
decussata and Coleonena pulchrum, trom Air. Pawley, of the White Hart inn, Bromley, werc exceedingly well cultivated
Boronia pimata, from G. Alston, Fal, of birm ngham, Dull
wynia whia speciosa, from Messrs. Young. of Epsom. I florinunda
and Chorozema Dicksoni, from Mr. Hunt, gardener to Misa
Traill. Campanula garganica, shown by mr. Tay right, gardener to G. C. Ridge, ESq., Morden; with Selago Gil
liesii rison, Isq., all bore testimony to the sterling value of the plant
and the great merits of their cultivators. If there was one object
among the specimens which, after the chorncma cordatul among the specimens which, after the chornzema cordatum, carrie
away the palm for its splendour, and for the talent dasplayed in
its nianagement, it was pobably the ETelichre Bruce gardene, it was probably the Fefichrysum pumhtum of Mr. The plants which obtained an entrance for the alke of therr ril-
riosity were Chamarops humsilis, a dwarf half-hardy Palm, with riosity ware Chamerops humilis, a dwarf hale-hardy Palm, with
thick clusters of minute yellow fowers in the axils of its leaven. Leaf, Esq., Streatham. Another olject which was singular, ard fom Mr. Edmonds, Gardener to his Grace the Dulke of Devon-
shire at Chiswick. The scarlet of its bracts wes nausually dark, owing to the lateness of its flowering; it was destitute of leaves
which remdered its aspect still more extraordinary. Ardsim pin
niculata, from its spreading pyramidal spiles of pink blossom Aitonia capenais, for the red hue of its flowers, which have the appearance of a red bladdery capsule, and Bipnonia picta,
shrub with thowers not much unlike those of sipincampylus bit color-have all claims to beauty as well as sincularits,
Were exhibited by Mr. Venables, gardener to W . Harrison, Eal as specimens of older ones; nevertheless, they were not quite Gluxinia rubra, exhibited by Messers. Yonmg, of Epsom, and Mr Green, of Cheam, majntains its original chramcter, ann was aut inormous plant it had sustained in traveling, is in every, respect as fine as
has been represented, and has bloomed all the winter in a wam haseenhoue. Fuchsia Youelli, with long red fiowe: s, seems a
hybrid hetween F. fill cens and some of the smaller species. Cut morenver, cut fifowers of Aquilegia gladduloca, firm, we helieve,

 Cumensions of those of G. Douglanin. Mr. Watson, zaruener to
J. Wells, Esqu., hadt a handsome plant of Platylobium furmotum,
the forers of which are of a great size, yellow, with a casin of

 a
tutes a continuation of the slender stem; Cattleya Mosise, with
two fowers, which though of a less glowing tint than those o
C. Taviata, have a more rich appearance; Oncidium crispum and

 other Orchidaceex, a plant of CYrtochilum filipes, which has a tal slender flower-stem, brownish sepals and petals, and a spreading
yellow labelium. To connoisseurs, bowever, the graat in nonty
 he sepals and petals being agreeably mottled, and the lip of deep pinkish-purpte. It was sent from Mr. Pagcoe, gardener to
 Mesis. Lane, io Berhnampe ead, and acme seenling Hearte ase.
 pure, and the mark:as, fine. Among others we noticen excelien

 ever saw. -The fruits did not attract so many admirers as the flowers, notwithbtanding which, the Pineswere thought particu--
larly fine for the season, and there was a Hew one among them
 food Montserrat Pines, grown in an Orchidaceous-rouse, from Mr. Appleby, gardener to T. Brocklehurst, Esq., of the Fence, neax Macclesfield From Mr. Devis, gardener to Sir Simon Clarke, Girapes, and a hacket of nint excelleht ken's sin
berries. The Black Hambureh (ira; fe, frmm Mr. aurhall, had we were anered. Fone rem the huatenn hhorm

\section*{MISCELLANEOUS.}

Death of Mr. Moreton Dyer-It is this week our painful duty to record the decease of this lamented gentle man, who was for many years one of the Vice-Presidents of the Horticaltaral Society of London. Although, from his residence in London, not personaliy occupied in pursuits connected with gardening, Mr. DJer was always a enabled him to acquire many interesting plants, and we have at this moment before us a return of Dominica Orchidacest obtained throwgh his exertions. His friends have to moun the loss of a most kind and amiable mana, and his family to lament the most affectionate and tender of parents.
Crocuses may be easily obtained white, violet, and yellow. they should be planted in lines thus:-I, yellow, violet yellow, niolet, yellow, and so on ; 2, yellow, violet, white, yellow, and so on ; 3, yellow, white, volet, white, yellow white, and so on; 4, yellow, violet, yellow, white, yellow violet, yellow, white, and so on; 5, violet, yellow, violet, in patches in the following order:-
 den in June.-Heartsease may be arranged in the same man mer a may be obtained with violet and white Rockets (Hésperia Cress Eryaisum Barisires, o Ofher combinations in lines may be formed thus:-1. Perennial Flax (blue), drarfGoldar Rod geilos), Perenvial Fiax, and so un. 2. Red Snap-
dravon. White do., red do. white do., and so on. 3. Siberian Larhapur, Scarlet Lychinis, Siberiza Larkspar, Scarlet Lychnis, and so on. 4. Payple Faxglore, white do., purple do., white do.

Thúja flifformis.-This plant (see p .153 ) is the same after the fruit is full swelled, and shat up early in the afternoon. as Thúja péndula of Lambert's Pinus, vol. 2. pl. 67, of perhaps in Europe, is in the Arboretam at Kew; it is now 8 or 10 feet high, and has stood out unprotected for now or 10 feet high, and has stood out unprotected for certainly the same species as the one in the Chelsea Botanic Garden, which is there kept in a green-house daring the winter, whici circumstance causes the branches and shoots to be longer and slenderer than those of the Kew plant; but young plants struck from cuttings of each have no perceptible difference. It is surprising that this beautiful and hardy evergreen, so long intro-
duced, has not become more common in collections, and particularly as the plant strikes freely from cuttings of the two or three years old wood, if taken off early in the antumn and treated like cuttings of other Coniferæ. The Cbelsea plant originally belonged to Mr. Loddiges, who gave it to Mr. Lambert, and the latter presented it to the
Chelsea Garden. It certainly cannot be a Thuja or Cupréssus, but must be either a Juniper, or probably a new genus. It is very distinct from the Juniperus péndula of some Continental Collections, a plant much of the same habit of growth as the plant called Thúja pén dula or filiformis, bat with much shorter shoots- \(G\).

\section*{GARDEN MEMORANDA.}

Loddiges' Nursery, Hacekney. - The Orchidaceous house here has always some novelties to offer us, and is now particularly say. There is a magnificent specimen of the incense-exhatin
Aerides odoritum, with about 40 spikes of flowers of the most cate white relieved by spots of a bright violet purple; a large
plant of Vanda téres, growing on a log, has seven or eight of its arge blossoms expanded; the petals of this superb species are lilac, while the interior of the labellom is yellow, with several in great luxariance drooping spikes of large buff llowerr, with a blossoms, with a dark mark in the centre. The pretty Cáttley Harrisoni made some show with its large lilac flowers; and the drooping racemes of the different Saccolabiums, crowded with ningular fact with regard to the Dendrobia, that Mesars. Loddiges zerer alter their treatment of them at different times of the year, Dut always keep thens in a growing state ; they thave now become sion. One of the must curtious plants now in flower at this estaroundish prickly leaf, and is said to be nearly or quite hardy.May. 17.
C. Palmer, Esq,
, Shecklewell. - This gentioman possesses one of the most complete colleetion of Cactícex in the neighbourhood of the metropolis, and their general good health bears testi-
mony of the good treatment they receive. They are prown in a light sandy loam, and in the summer receive plenty of water, but in the winter scarcely any; and the temperature of the house a
that time is not allowed to rise very figh. Among the more re martable, were Cerens Lyriesii, desimable on account of the freedom with which it produces its long tubular white flowers bright orange scarlet flowers. Echinocactus pulchenos is free blooming species, with bright pinh foowers o one smanll plant had nine handsome blusstms expanded at one time. E. caliciche is small trianyular patches of white adpressed down. E. gladiatus
has thin, broad, erect spines, aibout two inches and a half luns has thin, broad, erct spines, aboarauce. Mammillaria cándid has the -pmes arranged in stars, and bears rose-coloured flowers
pretrily stned with white. M. Sehiedeana is a curives species. prettily stnped with waite. M. Sehienteana is a curicus species. lat wooliy rays, and when crowned by its long crimson seed
pods is ornamental. The different varieties of M. Scopa deserve potice ; one in particular called cristatat- had grown in the form of a haff-circle , and the dinerent hook-spined kinds are remarkable for the almost endless variety of colours of their spines. In
another house were some handsome specimens of Aloes, and nnother house were some handsome specimens of Aloes, and
omong them the rare A. stritit; it it a ine species with deep
ornge towers and glancous refiexed leaves, having several darik Ornage fiowers and glancous retexed ranvieg their whole leagth. - May 17 .

CALENDAR OF OPERATIONS for the ensuing Week. WATsRure out-door crops is frequently recommended during sible, an the benefit of artifcial watering is but temporary, and it has the effect of exciting the roots, thereby rendering them esse of emergency, it becomes necessary to water, itaikould be given merning and evering, more abundantly than is ussally done, an the weather renders it no longer neeessary. Discrimination no uncommon occurrence to see small basins of soil formed round the stems of freit-trees on wall , and other permanem plants, into which severa pans of water are, poured daily during Would take up the water for the beneit of the plants will form a circle at a cenisiderabe distance trom the stem. seed-beds, radishes, lettuce. and salading, will be muelh benefited artificial waternge Jut-dours, in the manner it is usualiy apphied, crop, mulching with straw, grass, or some such contrivance
which will prevent the rapit
evaporation of molitare from the oill, is muck preferable.
1.-Kitchen-garden and orchard.

Prisery.-Although it is the practice of most gardeners to pot
their pines at stated intervals, there is in fact no definite period for this operation with young plants during their growing season uat, like all others, they anoult be potted whenever they may re of iss pote. Choose a calm day for potting, disturbing their roots heiped out of the bark jeed Let the soil shert be perili mixeris, and
rather dry than utherwise. the stare of the weather, Continue to give water aceerding to to large or fast-gruwing plants, but never to newiy-pcotted ones Give air upon alit ittring pecasions, and shut up early.
VINEax. - Tie ap the shoulders of laree brauches requiring it to give theno roum, and prevent the herries dampury or briui-ing each other. thinninz or the buaches; if it is desyrabie to have a arcat number
of bunches, the berries siould be left ons them thiner.
 do not remove them all at one ume. Preserve a moist actur

Continue to give thone advancing the same treatment as before Figmended, and keep the young shoots neatly tied in.
Figers.- Do not allow the plants to suffer for weter, especially those in tubs; they may also have occasional waterings may be layered in pots for forcing plants, or by removing a cirrcular ring of bark, and covering the wounded part with a good
vall of moss kept danap, into which roots will readily be emitted and when the leares are about taling, they may be removed th
pots. The advantape of this is, that plants so raised do not grow So robust, and are more suitahle for fruitng in pots. Cariri-House- Remove to the open air plants in tabs which
have ripened their fruit. If it is desirable to preserve the fruit
on the trees, the house must be kept perfectly doy. It is a pool on the trees, the house must be kept perfectiy dry. It is a goo
plan to teepp ant the plants in tubs, as it admits of vigorous tree eing brought in at every season, whitst the last-forced are when clear of cherries, may be devoted to the growth of
ian or other melons in pots or tubs, aind trained to a trellis. Crecurgas And MELtNS. - Continue to cover at night, ac-
cording to the state of the weather: if allowed to get very cold at night, the plauts will sonn become diseased after being raised in, and accustomed to, a high temperature, , When, of course, no
good frum can be expected. Keep up good linings to Melon-pita and frames, and miss no opportunity of giving air, if only fo
short time; shade lighty during the middle of clear days. MUSAROOM-HOTES.- See last Caienar.
Give pricked-out Celery abundance of water ; plant out Gourd Phowery or wet day, if such happen. Give Capsicums, which it
is intended to plant out, abundance of air. If Tomatoes bave is intended to plant out, abundance of air. If Tomatoes b
been planted out, take care that they do not suffer for water. Out-door Department.
Hoe between and thin out the main crops of Omions when the
are too thick, and fill up vacancies where required also, the crops of Carrots, Parsneps, Beet, and all others advancing. Keep the walks free from weeds and swept, and the ho constantly employed, in favourable weather
Iso Couterby ir Rattersen for pielling Dwaris and Runners also Canterbury or Battersea, for pickling or haricots, for which
purposes they are the preferable kinds; in dry weather water the drills well previously to sowing the seeds.
Broccoli.-Sow Cape for autamn.
Cabsace.-Sow Fulham, or some similar kind, for heartin about Michaelmas.
Carrots.-Thin out to about six inches in the row ; also Pars neps and Beet to about one foot apart.
CAuLipowzrs. - Do not defer sowing after the 24 th.
Crispr.- Plant out as the plants become sufficiently stont, north to south, if possies. Cucurners for Gherlins may now be sown in the open sir on a warn
Endive,-A small sowing of green curled should now be made Letrcce. - Keep a succession planted out, and tied up for use,
Orehurd. -Disbud superttuous and foreright shoots from Grape
Vines, and nail in the shoots of Apricots neatly. To destroy
aphis, or fly, on Cherry-trees, the points of the shoots may be dipped in sof t puddle made with clay, in dry weather, which destroys the insects, and is afterwards readily washed off witn
dear water. If mildew makes its appearance, immediately dus the infected parts with sulphur, keep the ground regularly stirred abou
II.-FLOWER-GARDEN AND SHRUBBERY.

In-door Department
Stove.-Repot Ipomeas and other seedling climbers into their flowering pots. Continue to shade Orehidaceax carefully; but
have the shades so contrived as to be readily removed or drawn up, as they should never be allowed to remain on to the exclusion of light, except during strong sunshine.
to the coolest and most airy part of
remain in perfection a longer period. Plants growing fast should as they mature their growth. Propagate all desirable plants.
Give air, trc., as before. . and night. Put in enttings of Brugmánsia, Erythrina, and similar Epacris and Mand in a cool situaiv, Gowing plants abundlance of water, and larger pots as they require them. headed down and kept together in a pit, in a close and moist a mosphere, until they push new shoots, when they may be repotted in pose antil they become established agzain Water succutents growing rapidly often, but give little after they have completed their growth. Continue to repot and propagate as before.
Flower-andien. - In tying up flower-stems, as Carnations, take great care that the tie wil allow the stems to legthen withou bending or breaking them, which careless tying is apt to do
Continue to plant out flowering plants of all kinds in favourahle weather. Prune evergreens; mow lawns; roll walks; destroy weeds; and clip hedges.
Nuaskry.-Any grafts which have grown freely should be examined, and if they appear united the clay may be removed and secured by fresh ties of bass; to prevent them being broken
stakes also should be put to them,
where the grafts have faile cut down the stock to a good shoot. Weed seed-beds and disbud young trees.
Foksst asd Coppice Woons.-See last Calendar.-J. Parton.
NOTES FOR SMALL GARDENS.
Dablias that have been started in heat, and subsequently Wrown in pots under frames, shous be immeriately planted ont. and four teet apart. the colvurs being arranged as mentioned in
p. 291 ; and the soil should he mixed with rich manure, leat-mould p.291, and the soil should he muxed with rich manure, leat-mula,
and drift sand. slightly hollowed round the plonts, and this basin, as it may be Dahlias do not progress as rapidly as they ought, a watering with liquid manure about twice a week will materially assist them. When first put out. Dahlias, from their tenderness, are extremel liable to be attacked by slugs and snails; but by surrounding
tiiem with the Galvanic Protector, described in D. 115, they will reman free from these pests. Look carefully to all llower-stems and tie them if required. Beds of Pinkss should be top-dressed and the flower-buds judiciucusy thinned out, as on this the per fection to which the fowers will anrive mainis depends. Pits an frames that contain hardwood that ants may frelt and that entirely renmed; mone pan them, may be sliphtly siaded mit

\section*{NEWS OF THE WEEK}

The news from France is chietly confined to financial and domestic matters; in the Chamber of Deputies the budget of expenses has been voted by a large majority, and a discussion has commenced on the project of law reative to the extraordinary works for which the Minister of Finance intends to raise a loan. Daring the debates on these questions, the recent policy of M. Thiers in the increase of the armaments, and the present condition and prospects of Algiers, were the chief topics of discussion Marshal Soult, on behalf of the Government, declared that France was resolved to establish hęr authority in Africa, and that nothing should be neglected to complete the work of colonisation. The question of the reduction of postage to a uniform rate, on the principle adopted in this country, has been brought before the Chambers; but the Minister of Finance expressed himself opposed to such a change. It is believed in political circles that a modification of the Ministry.will take place after the close of the Session.-Our Spanish news contains additional parti. culars respecting the late election of Regent and the State ceremonies which followed that event. The Duke de Victoria has declured that he will defend the laws and constitation of the country and maintain the independence of the throne; that he will be the first to abey the laws, and that his constant endeavour will be to promote the wellare of Spain and raise her to her legitimate rank among the nations of Europe. The election of the Duke appears to have inspired capitalists with confidence, and the country generally is tranquil.-From Portugal we learn that political circles in Lisbon are agitated by the intrigues and personal rivalries of candidates for office, land that the financial schemes of the Government are consequently muchem-barrassed.-In anticipation of peace throughout Europe, Germany is beginning to disarm, and Prussia is said to have resolved on setting the example by disbanding he Rhenish reserves.-The intelligence received from Swit zerland does not appear satisfactory ; the Grand Council has assembled, but it was found impossible to obtain an absolute majority on any proposition for the re-establish ment of the convents; aud it has been officially declared that their confiscated property will be devoted to religious purposes.-From Italy, we learn that the King of Naples has reduced the duty on the export of sulphur ; a measure which is said to terminate the differences between this coutry and the kingdom of the Two sicilies.-Accounts from the Levant give additional particulars of the settlement of the Eastern question; the recommendations of the allies have been adopted, and the Sultan has granted to the Pacha of Egypt the hereditary succession, and the appointment of his own officers, excepting the nomination of Peches ; he has also consented to receive a fixed annual tribute in lieu of the present uncertain contribution, depending on a fluctuating revenue. Various measures are in progress for the suppression of the insurrection in Candia; the rebellion in Servia and Bulgaria has freceived a temporary check, but it is stated that the revolutionary movement has extended to other adjoining pro vinces. The plague is spreading to a great extent in Egypt and the whole country is under quarantine. Syria is tranquil the Tarkish Government having adopted judicions measure for conciliating the people by the reduction of taxes, and by the withdrawal of the Albanian troops.- The latest arrivals from the United States bring no definitive intelligeace respecting Mr. M \({ }^{\iota}\) Leod, who is still in prison; but a general impression prevails in New York that the matter will shortly be arranged to the satisfaction of both governments.-Considerable excitement appears to prevail in Canada, in consequence of the proposed alteration of the Timber Duties in the British Parliament, aad the commercial body have transmitted to the Governor-general a strong protest against the measure.
At home, the debate in Parliament on the Sugar Daties, which has agitated political parties for the last fortnight has been brought to a conclusion, by the division of the House affirming Lord Saadon's resolation against the reduction of the duty, by a majority of 36 . The debate, which had lasted all last week, was prolonged during Monday, Tuesday, and Wednesday nights ; and it will be found by our Parliamentary Report to develop the opinions of the leading men of beth parties. In comse quence of this result, Government have given notice of their intention to move the renewal of the present rate of Sugar Duties, which would otherwise expire in July ; and Lord John Russell has announced that the debate on the Corn Laws will commence on Friday the 4th June. It is understood that the renewal of the Sugar Duties is a preliminary measure to a dissolution of Parliament ; and preparations are accordingly making ior a general election.

\section*{7 3-me Netos}

The Count.-Her Majesty, Prince Albert, and the Princess Royal are well, and continue at Buckingham Palace. On Monday evening the Queen gave a concer day and Tuesday evening, her Majenty and Psinen Albert
honoured the Italian opera with their presence. -The
Queen held a drawing-room yesterday, in celebration of
Queen held a drawing-room yesterday, in celebration of tended.
Parliamentary. - It is stated that Mr. Montagn Gore will be a candidate for the borough of Ipswich, in the who retires.-Mr. Twiss, it is said, will be a candidate for the representation of Rury at the next eiection, in conjunction with the present member, Eurl jermyn. - The Hon. F. Bruce, third son of the Earl of Eigin, Witi ame forward for the representation
junction with the present member, Mr. Dottin.-Mr
Darby and Mr. Fuhe have annornced ther intemion of representation of East Sus-ex.-Capt. Enlkeley has annoonced his determination of tgain conteating the borough of Windsor, in the Conservative interest; and Sir J. E. tated, that Mr. Godson's seat for Kidderminster will be contested at the next election
announced himself as a cemididate for thas burngh on Liberal principles.
the present members for Plymouth, have announced it as their intention not to be put in nomination again for that boroagh. Alderman Johnton has offered himself as candidate in the Conservative interest; ald it is reported orward in the Liberal interest.-In consequence of Lord Hotham having expressed his determination not to ofier himself fur Leominster, Sir J. Flower, of the firm of
Combe, Delafield, and Coo, bas offered himself as a Reformer, and Mr. Wigram as a Conservative candidate.
-Mr. H. Hughes has made known his intention of becomine a candidate for the city of Oxford-Mr. C. Lushington has announced to the electors of Ashburton, that it is not his intention again to solicit their suffrages -
Major-Gen. Sir J. M. Doyle, K.C.B., has addressed the electors of the borough of Newry in the Liberal interest, in prospect of a dissolution.- - It is stated that Mr. F. self again for the borough of Barbstaple; and that Mr. Beamish has written to his constitwents, announcing that he will not affer himseif for the city of Cork.-Mr. Wil. liams, of Llangibby Castle, will again offer himself in the
Liberal interest for Monmouthshire; and Mr. Ewart is apoken of as a probahle candidate for Dumfries.
Irish Representative Peeraye.- Writs have heen issued from the Hanaper Office for the election of a representative Peer of Ireland, in the place of the late Errl of Belmore. The election, it i+ said, will fall on Lord Castlemaine
Helf Pay, jec.-It appears from a retum recently moved for by Mr. Hume, that the total amount of sums paid in the year 1840 for half-pay and retired allowance (civil and mailitary) was, for the military and naval departments, \(4,113960 \%\). : and for the civil departme

\section*{fforkign.}

France.-The Paris journals still continue to be chiefly occapied with discussions upon the state of affairs in England, and speculations as to the pmbable result of the present politicul crisis in this country; appearing to watch extraurdimary interest.
The Budget.-The Chamer of Deputies has been occupied with the discussion of the budget. Tha entire of
the supplies of the fimance department were voted on \(\mathrm{Sa}_{3}\) tarday. The paragraph relating to Algiers gave rise to an animated debate. during which Marshal Soult entered into some explanations of the campaign of Gen. Bugeaud, from Which such successes were expected as should enable France to carry on an improved system of colanization. He declared that it was his sfajes's sintention to streng then the power of France in Africa; that it was with that view the present expedition had been undertaken: and that. as soon as \(\mathrm{I}^{1}\) d-el-Kader should be crubhed. Gen. Bugenud he trusted would render the occupation of the country profitable to France ; that the Government was at this moment in negotiation with a foreign power to procure colonists, and that nuthing shouid be left unduge to eatablish firmly the dominion of France in the regency. telegraphie despatein was received on Monday frum Alyiers,
descrithing a smart arf ur which has taken place. in which the two Rogal Dukes were engaged. We have since rectived intelligence that the Climmer has voted the budget of expenses by 199 to 16. and had commenced the discussion of the bill for modifying the tinancial system of the c lonies.
The Goverment Lomn. - It is starad that tide Minister of Finanee, nat beily acio to make arranzements by priTate tader for the frozected Govername ican, intends to resort tu public adjullinrion: and tis messure, resolvel
on by the Council of Ministers. will be publicly notified next month, so that the adjudivation mar take place in July.-The Chamber of Deprities commenced on Tuesday the discussion of the project of law relative to the estraordinary works which the loan of 450 molition francs is intended to defray. In the Honse of Peers the detaze also turned on extrandinary credite, yoted for latul, by the Chamber of Deputies : amd the creation of the eigitieen new regiments, attacked by Generals Dejeanand d'Awbrygeac, was warmiy defended by Genemai Cubteres, the Mi-
nister of War under the Thiers Adminstration. The Remidite Darmér.- The Chancellor.
The Regride Darmés.- The Chancellor of France, President of the Court of Peers, has notified to Darmís and his co-accused the decree of the Court, fixing the com-
mencement of theirtrial for the 24 th inst. Darmés is demencement of theirtrial for the 4 th inst. Darmas is deexasperatiol. In addition to the speeeh, which he had
composed somp years since, in anticipation of beinc tried by that Court f an ottempt against the King's life, be
said to be now engaged in preparing another harangue couched in very violent terms, which he declaims in his lates all the alleged juticial murders committed by the Peers, and has classed amongst them that of General Foy was not tried by the Peers. "No matter," replied Darmés, "his death was induced by the chagrin which the proceedings of the Chamber occasioned him. I am determined to
tell them my mind." Being assured that he would not be alloren to holl are dierepertfal language to the Court, and that he routh bermored from the dock, and condemned by world, and it would be seen by his case, as well as by that no justice can be expected in such a Court.
state, that twon mire shins of the line are abont to instan fleet in the Mediterrimin, mahi.g 18 ships in all; and was preparing to leave for the island of Hyeres, from Whence it would go and cruize off the Balearic islands.-It is also said that a squadron is about to sail immediately Public Works.-The Minister of Public Works presented to the Chamber of Deputies, on Saturday, ath ac-
count of the labours of the mining engineer during the count of the labours of the mining engineerk. during the
year 1840. The chapter relative to steam-engines is carious, inasmuch as it affords some idea of the extent of the steam-power of France. It appears from this docu-
ment that there were, in the country, 159 establishments, which were provided, in 1839, with steam apparathe, con taining 5,100 boilers, of which 1,789 were used as heaters stituting togetker a force of 35,779 horses. Prance posexclusive of those belonging to the Government. The propeling apparatus consisted of 300 engines of 34,000 those ressels, in 1839, amounted to \(1,969,905\), presenting an orerpius of 551,716 as compared with that of the preceding year. The weight of goods transported by them used on the railro tons. The locomotive engine Rhone, Gard, Herault, and Loire, were 88 in number, and represented a french manafacture.
Uniform Rate of Postage.-During the discussion on the Budget of Expenses in the Chamber of Deputies, an interesting debate arose on the subject of the rate of postage, which M. Dugabe and several of his colleagues con tended should be made uniform throughout the kingdom. M. Humann, the Minister of Pinance, reptied, that the example of England was in no way conclusive in favour of
the adoption of such a measure, as the reduction had cansed a very great deficiency of the revenue, and that cirtumstances, moreover, were against any alteration being to seek after imaginary improvenente

Ministrg.-It is confidently stated, that the latent dissensiens of the Cabiat: have assumed fresh importance, and thet the Ministerial camp is now divided into two and the other those of Ir. (iuizut. It is also beliesed that a mounteation of the Miaistry will speedily follow the close of the session.
The Royal Eltpuement.-(rireat sensation appears to have been create, in the highest circies, by the elopement of one of the Princenses of the Infanta of Spain, Dun Franciseo de Paula, with a Polish gentleman, which we noticed in our last numbler. It appears that the elopement took phace from a convent in Paris, where the Princess had been plaeed, and the escape of the young lady was twiected by means of a laduar of ropes. The telegraph was set to work immediately on the circumstance heing discovered, and they were arrestud at Namur by the
Relgian prlice. It seems that they arrived there on Mondar, their carriaze having broken down on the way They were detainel tiventy-ficur hours to repair it, other wise they would have passed through Belcium without being discovered. When the police asked for their passports. Count Gerofski produced one with a false name. and hamary been requestud io sign this name he was not abie to spell it. He was detained prisoner with the inthe Government of their arrest. (Irders were directly sent trom Brusects to tahe the Priocess back to Paris, where
 fir abduetion. It is stated they lave bota declared that they were marmicd by a priest, bef we ther left Paris. The Infast Don Franelseo de Paula has since rerused to receive his daucliter, who conserquently lef: Paris on Monday
erening for Brusseis, to juw her tivo brothers, and proerening for hrusseis, to
ceed with them to Italy.
The Furtifi ations.-On Thursdar, Lonis-Mhilippe laid the first stone of one of the bastiuns commanding the Brussels raud. The works on with sueh a.tivity from the Moint-di-J jir to Bagnolet, that in a short time the whole thin the contin wall, whick is about and faced.
Spain.-No parliamentary event, say the Madrid journals, ever excited so mach anxiety as the ballot for the etection of the regency. On tue 9 tn uit. the Ministers
met to congratalate the Duke de Fictoria on his appointment. He is said to have declared to the officers of the
garrison and the civil authorities, that during the minotity constitution, and national independence. On the 10the
 ocrasion the Duke, holding his hand on the Ew? Evengeis \({ }^{*}\) sitore to defenh lezial II, and to aboere the mith dressing the senators amt Delrutics, of Tie him in ever citizen belongs to the country. The nation mishes we to continue to devote mine to its service. I shatid so, in order to accomplish a Bacred daty. I sidid dwend the of our young orphan Queen. On the field of battle I have ever fought for the cause of liberty, like the lowest of the soldiers. Now that I am invested with the highest power in the kingdom, I will be the first to obey its laws, and
cause them to be respected. With that viess. I rely on the co-operation of the representatives of the prople, and nation. The object of my constant endearoans will be to promote the welfare of Snain. and to raise her to the elles, as President of the Assembly, replied to the Resent He said, that the sentiments he had expressed had filled with satisfaction the representatives of the Spanish people, Who trusted that ine of the Ministers in their functions, until the bew Cabinet could be definitively constituted. M. Gonzales had been charged done on the Bourse ; the appointment of the Dulke, and the assurances he gave nin taking the oath; having had the effect of inspiring the capitalists with confidence. - On the th, 43 clergymen, who were endeavouring to sow dussension among the people, and had refused to present to the political chief of Toledo their licenses to preach and constate that most excitement has been produced in Carnals gena, in consequence of the following circumstance. It English Consul had requested the proser fe fesident English Consul had requested the presence of a few BriEnglish brigs came in, and it was immediately said these had received orders to seize the Dauphin, a smuggler felucca, then under the protection of the cosshguard vensel, and notwithstandfrg she hat troisted Spanish colours. A few individuals, indiguant at this attack, complained to the Governor, who sent for the Consul and the captains respect the laws of the country, and hoped they would not follow up the project attributed to them of seizing a vessel sailing under Spanish colours ; that he had informed the Government of the mensures to be taken against the smuggler, and, until its decision was made known, they ought to absain from any act likely to embroil the two follow up their enterprise, the English Consul must takc the entire responsibility apon himself. 'Tnis latter avowed his resolution of acting apon his own respousinitit. and of carreing it into execution at three, P. M. Accorniw ty boats from the two English brigs, filled with armed men, boarded the Dow, hinn, weighed her anchor, and placed her betwren the two briss, and that without paying the slightest attention to the call of the captain of the coastguard, under whusertion the felucir was placed. This act, witnessed by the greater number of the mhabitants assembled upon the mole, produced a great sensa
tion; and it is said that, upon the first signai given by the autborities, ais act of siolence and audacicy meviu have heen opposed. Next morning the Dauphin feluct had disappeared, as also one of the briys, muth th astorishment of tine inhabitants. The aumorne case : Guvernment. The affair is said to have created a very lively seasation in the political circles of 1 ndrid. The Government, it was said, was determined to foliow is up spiritedt r , and had ordered Gen. O'Daly. the commaning of the place, to be tried by court-martial for not basing avenced the "insolent conduct" of the English. The Minister of Foreign Affairs intended, moreorer, to dewas hnown to liave sent for the brigs of war.
Portcg il.-We have received nems from Lisbon to the lath inst. The political circles are representedbeing agitated by the iatrigues and personal Tie Daie of Painuella, it appears, natronizes Baren Cozta Cabral the present minister of justice, as the instrument by mhich he expectel to make some arrangement of the naminy Lares at one time was talined of for Kinance Minister Lagos at one time was tained of for rern no chanizas, had actualiy taken place, and it 523 expected that the minis try would meet the Cortes when the perand of acj runt ment exnires in its present shape. sioned, h.d acted prejudiciativ in hamperines the nimmetial schemes of the government, an 1 induring a want of com fidence among capitalists, whath homerer. it in :s therest would prove only temporary. of purewant of betnig re mitted by the preket through the baik; but at a late iour some dificuities were started. Thich it wis enpeding would prevent its remittance by this post. clamours of the revolutionary and anti-Engtist qress.

Germany.-Letters from Berlin announce that the hopes of a continuance of a profound peace in Europe
had induced the Prussian govermment to contemplate sending to their homes the Rhenish reserves. The senate
of Frankfort have presented to the legislative assembly of Frankfort have presented to the legislative assembly on the 2d March, 1841 , between Prussia and the other states of the German Customs Union on the one part, and Great Britain on the other. According to
munication made by the senate of Frankfort,
existed a treaty of navigation between Prussia and (ireat from a Prussian port with a cargo laden ist that port and her colonies on the same foonug as British ships: were deprived of those advantages." In order to put a were deprived of those adrantages period to these restrictions, the treaty of the Legislative Assembly at Frankfort have given its assent to the measure.

Switzerland.-On the 11 thi inst. the Grand Council commenced the debate upon the quastion of the convents. There was a great concourse of visitors in the galleriesso great that it was judged necessary to place seatries in The debate was very animated. Four propositions were started. First, that of the government, consisting in the sanctioning of two convents for females, to be established without the Canton; second, that of the majority of the Fahr Maria Kroenung and Gaudenthal, the Government reserving the right of reform; this proposition was supported by the members of the council, who were disposed to make concessions; thirdly, the proposition of the minority of the commission, to support the decree of abolishment; and fourthly, the suppression of the conrents which took part in the revol position, although that which had fur its object the revocation of the decree of suppressinn, reserving the right of examining the course to be pursued in respect to each convent in particular, obtained the largest number of votes. From subsequent intelligence we learn that it having been found impossible to obtain an absolute majnrity on other resolutions, one of the ruembers proposed he following :- . That the cantons shen bo prquested not to carry into effect the resolution of the liet of the
\(2 d\) of April; ; 2 . That if, contrary to what is hoped, this 2d of April; ; 2. That if, contrary to what is hoped, this
step should nut lead to any result. the canton of Argau vill dechre itself ready to make ane out compromising its rights; 3. All measures of execution shall be suspended until the question shall have received a definitive solation." The Grand Council adonted third by a very large majority. The Council also gave instructions to the Lesser Council to issue a circular to the Cantons, in which it should be expressly declared that the suppression of the convents did not arise from any motives of cupidity, and that their confiscated properiy opposition in the Grand Council immediately drew up a declaration, to the effect that they did not consider the above resolutions satisfáctory
ITAk. - Advices from Naples announce the publication of a royal decree, stating that pursuant to the report
of the Sulphur Committee, and of the Attorney-General of the kingdom of Sicily, and wishing t., encourare the mulphur trade, for the beacit of his subjects, the king has reduced the export daty on Sicilian suiphur from 20 to 8 carlins the quintal (from is. to \(2^{2}\). 10 \(d\). British), to commence from the 1st Jan. 1842. It is added, that this reduction of duty on the export of sulphur has created the greater satisfaction on both sides of the Pharos, on acEngland and the king tom of the Two Sieilies.
Ressia.-By private correspoadence from St. Petersburg, we learn that two English missionaries, Messrs. Stallybrass and Ewan, have returned to the Russian capital from their labours in Siberia; but that henceforth no
English missionaries will be allowed in the Russian dominions, and that all Russian subjects converted from heathenism will be required to embrace the faith of the Russian Greek Church. The new Runsian mission had arrived at Pekin, but the members of the ohd mission had not yet returned. They were expected with anxiety by the savants of the Russian eapital. Accounts from Warsaw state that the Emperur Nicholas, on the occasion of the marriage of his son, has conferred some favours on rial resolucions had been announced. Ey the first, all persons under sentence of dearh have thieir punishment ommuted to imprisonment inz ine; the mumenents of onfinement in the house of correction. and ordinary imprisonments, fines, and corporal punishments, are, with the exception of some cases, enticely remitten. By the he timath arrar of debt the Tand of the lingdom, till the end of 1431 , and many other claims for various taxes, are excused. This resolution contains, beciues, kingdom of Poland, in respec: to accidents and losses which they have sustained of late years. Tine third resilution grants to a number of political oneenders, of whom lution grants to a number of poritical oinerde fanished to Siberia, either a full pardon, or a dimination of the period of their punishment. Inbelligence has been received that a Rassian army of 40,000 or 45,000 men, with 80 pieces of artillery, had left its cantonments, and moved towards the frontiers of Circassia. The generalin-chief was to have joined the
force in the beginuing of April. The efforts of the Rusminas during the nest campaigny it is suid, will be parti-
cularly directed against the chief Shamill and the Tscher chenses. They were to commence operations by the siege of Cheskei, a village b
Turkey. - Accounts from Constantinople, to the 29th Egyptian question. The Sultan, at the recommendation of his allies, has consented, 1st, that Mehemet Ali's here ditary possession of Egypt shall be absolute, the succession -m officers refraining onl vernor may appoint all his own offcers, pay to the Porte, in lieu of one-fourth of the aggregate of pay to the Porte, in hiel of oue-fourth of the aggregate of of which is now under discussion. - In consecpences of the of which is now under discussion. - In consequence of the
insurrection in Candia, the Porte had resolved t) suhject the whole const of that island to a strict blockade, except he ports of Canea, Suda, Rettimo, and Candia, which blockade was to begin on the 15th inst. A squadron of ten men-of-war, having on board 6000 troops, was preraring to enforce this blockade. A note to that effect oreign legations at Constantinople. - Accounts from Bel rade represent the engagement which took place between the Atbunians under the command of the Pasha of Nissa and the Christian insurgents encamped at Alesenfssa as haviug been most sanguinary. The Christians fought courageously, ble to redite the compact body of Albanians. After their victory the Albanians committed great excesses. They murdered children and onresiating oid mea, impated the prisoners taken with arms in their hands, laid the villages In ashes, and threw the women into the flames. Between \begin{tabular}{l}
20 and 30 villages were destroyed by fire after the fight \\
of the insurgents. The Christians after their defeat fled \\
\hline
\end{tabular} ome to the muontains, and some into Servia. It was reported that an insurrection had broken out in Anatolia. A collisiou had taken place at Trebisona, between the Turks and the freeks, which arose ont of the latter having encroached on the precincts of a mosque in constructing public school. The complainta addressed by the Turks to the Porte not having been attended to, the people, exsperated by this denial of jnstice, assailed the school and evelled it with the ground - The Ottoman Government intended to issue a new paper currency on the fih June.Lord Ponsonhy, it is stated, was preparing to take his departure from Constantinople
Egypt.--The Levant mail brings no political nerrs of ny importance from Alexandrin. The plague was spreading and creating great alarm amorg the Europeans and Levantines. All the merchant vessels in port had, by the advice of their consuls, hoisted the yellow lag, and wo Enclish salors had died: and. as was obeerved in th plague of 1835 , when it broke out among Europeans, it aloo a tacked the cattle, these animals are now dying throughout the countre, with symptoms similar to those in hum of Egypt, displacing Arabs in office, and replacing them of Egypt, displacing Arabs in office, and replacing them
with Torks. The immediate effect had been a great deprewith Tarks. The immediate effect had beet a great deprethe Egyptian Government.
Syria.-Adrices from Beyrout of the 17 th ultimo state that Syris was then perfectly tranquil. Nedjib andi, the Dew Governor of Damascus, and few days before, and proceeded to their destination.-On the 12th the Seraskier, Selim Pacha, convoked a meeting of the civil, military, and religious authorities, and of the consuls of the different nations, on a plain beyond the gates, for the purpose of making to them a communication of general interest, a considerable crowd, compooed Il classes of the population, having repaired to the place of rendezvous, Selim directed one of his secretaries to read aloud a hatti-seheriff having for its object to reassure
the Svrians as to their future condition, and to inform them of the benevolent intentions of the Porte for their welfare and prosperity. On the following day the Divan assembled at the palace of the Governor. The Mufti and the Cadi assisted at the assembly, together with the bishops of the different Chrisinan rites, who were to return each five delegates, in order to constitate with the Mussulmans a council which was to establish a system of dministration conformable to the mannurs and waits of the people. Several firmans wera read to the assensuly tributions to a uniform tar of 10 per eent. on the reath and produce throughout the empire; but, considering the and produce throughout the empire; but, considering the sustained by its inhaivitants, lis Highness had deigned to exempt the Syrians from the payment of that tax, which was to be temporariy replaced by a frithing perional tas. The country had at last been freed from the prusence of the 2,000 Albanian troops, who had lept the people in constant apprehension ever since the re-occupation of Syria by the Torks. This undisciplined militia having attempted to commit some disorders along the road, the mountaineera rose in a mass against them and compelled them to proceed quietily on their march. Some misunderstanding had arisen between the mountaineers and their mir, but mo apprehensions were entertained for the peace of the country. The new customs tarifif was carried into xecution, for the first time, in Beyrout, on the IIta alt
 calcuiated to prevent the prague spread.g. cordon had been essabushed within a mile of Beyrout at the request of the British resident, contrary to the ad intereepted the communications, and was consequently in-
jurious to trade, and that it would be preferable to es tablish it round the towns where the epideroy really ex those tome Turkish authorities, however, replied tha that Beyrout should not follow their example. At Seyde the Mussulmans had demanded the abolition of the sanacory intendance, and presented a memorial to that effect the Divan, Who having submitted it to the British Consular agent, the latter replied, that the institution of the quarantine had been created by a fetta; that it could not be abrogated without a similar enactment ; and that it was the duty of the authorities to punish with severity hose who presumed to violate the onders of the Govern ment. The people, displeased at this reply evinced a dit posttion to revolt, but were restrained by the energetic

Bill, and a few Railway Bills. The Lords Commissioners were
the Lord Chancellor, the Earl of Shaftesbury, and the Earl of The Criminal Justice (Quarter Sessions) Bill was read a second
time, on the motion of the Earl of Dsvon, and ordered for committal on Monday. -Their Lordships then adjourned till Monday HOUSE OF COMMONS.
Monday,-Sir R. Ivglis postponed his motion with respect to expressed a hope that, as the flouse was then arrived at the priety of not protracting it any' further. - Lord J. Ros schl said, hat whie memisers representing large cunstituencles were de-
sirous of addressins the House, he did not see how he could in-
tertere to prevent their doing so. - mamber of petitions for and asainst the cioternment measures of Finance were presented.-
Sir E Lirchbri. was then called on by the Speaker to reume
the deloate, but decined speakiur, a-signing as a reason his wish the delate, but decined speakiur, a asigning as a reason his wish
to bring the denate to as early a cluse as pussible.- Sir C. Grb, passed in review the toreign and colonial occurrences that had then Honse that the rigility of the colonial system inad been gra-
dually reldsed, so that thuse interested in the inantename of dually relased, so that thuse interested in the mantenance of now prop)sen. The right hon. gentleman dwelt with some ear
 and would benetit the revenue: but the injury winch they wonh! thought, more than counterbalance the benetits likely to arise of opening to England the markets of Brazil. Ife dweit upon the existing distresses of the manufacturing district, and called Mr. Hobos- expressed his conviction that British agriculture put the manulucturer of Eurland in a condituon to compete with
those of tac Coutinent. There was no fixed duty, he toumht, that could be impowed, sufticrent to compensate the landed inter-
 pretisred a fixed they on comton a graduated seale, and approved of the cheme of Minatern for the recuction of the Sugar Duties. of the lanned hiterest, to thefent ontespeches of monepoly, mereiy
as an outwork to another nomopoly in the benerits of which they themselves more immedately participated. - Mir. (i. II, C.wniy Dish would gree his support to the propimals uf Ministers, but
When in committee he hopeal that reeans would be fornd to make the promsed charce more gradual. He did not thrink it just,
howerer injurious these monopolies might be to the public, for
the Legislature to turn round too suddenly on interests which it had Legislature to tu
With parties attacked obsecanse that it was a novelty to find fault Winisters seemed to think that as they left a deficiency in the country would unt forget to whom and to what that deficiency Was owing, mor blund themselves to the lose oceasioned by the
wanton reduction of the pustage.- Sir B. Hal. felt cunviced that if the meavures proposed by the chancetior of the Excheruer
were not adopted. a tax in real property would lie the only alter native. He hoperi that if beaten on this ciuestion, (anvernment
would not separate withont a previous discussion of the Coraswould not separate withont a previous discussion of the Corapeal to the country. - Mr. STraTr considered the \(20,000,0001\). as auy snibsequent regulations apon the Sugar trade. If the admission of sugar were to be resisted for fear of encouraging the
slavery ol 8 razal, it would he replusite, for the purpose of confor there was no sind of commencere with Brazil whieh would not

 pression wif the manutatuminsinterest, congratulated the country ceeded on the principle of commercial expansion.- Mr. W. Wix-
Lhays addresped the House in favour of the Goverwment mea-sure.-Mr. T. Duvcosps denounced the amendment as one of
matchless hypocrisy. He was anxious to catch a little of the Valuable and virtuous sympathy which he heard expressed
for a foreign population in favant of onr - tferine penple at home. they would bone of them disclose what their own plan was, ex-
cept \(M r\). Gonlburn, and his remedy was to let things alone. The great canses of deffciency were the reduction of postage and
the dimmished consumption of excisable liquors; and he presumed the Tories would hardly restore the rates of postage, or
the practice of interaperance in Irelarn. He hoped that the re-
suit of thit diviaion would not induce Ministers to despond. He believed the country would join the Mfowisters if they persevered; amd he would now give them a vote with greater pleasure than A- - \(r\). Briscol supported the Government measure. He said
this was national, not a party question It involved the happi-
ness of all from the sorereign que the her sibjects. - Mr. MeNrz said, he had hem muek surprised when
Ministers proposed to dectroy, at one foll swron, the bad system thoumb, wat cutainy crme when they must enther che timen the
 thought

vantage to the master manufacturers. The alteration, he said,
must be made in the monetary system. Without that a repeal of the Com-law would transfer the whole land to the monied property, whe most honest taz, he considered, would reach money as weal as land. Twe sddy. - The adjourred debate on the Sugar Duties was re-
sumed by Mr. Shbyl, whon waid that if di-tunctise duties would
keep down the slave trade, and if this country were not already engaged in extensive commerce with the tealers in slave-grown produce, he might have hesitated ufon the present question.
But as these reasons did not exist, he cruld not concur with those benevolent monopolists. Whinae lucrative phianthropy now inter-
poned fur thenr con interents. The prevent resolutinn was so worded as to leave a hope that under the happler alupices of
ancther Ministry that change might be made wlich as yet the
House was not prepared to vote. C"nder the old high duities on coffee the colonies were adequate to the supply of that article for
England; but when the reduction of the duties increased the English consumption, foreign slave-grown coffee came in and the scienticuly allow it to be re-exported, why could we cout allow it had been given to the colonists-a sum which dazzled the imagi-
nation. Surety we were entitled to a receipt in full. Since that payment we had given them upwards of 19 , 1011,000 . more in pros
tective duties. It was said that the compenation and the duties
were all given with an underntandinu that the monopoly wa were allinue. If 0 , what justutication hat there been fur letting
to conting
in the East Indians, who now joined their forces with those of the colonists against the admission of the rest of the world? On
the continent of Europe, he said, our manufactures were now fore, direct our attention to other markets than those of Europe
fore for onur export trade. To what country in the world could we turn our eyes with so fair a prospect of expanded commercial enter-
prise as to the great empire of the Brazils. While England stood
forward as the forward as the champion of humanity throughout the world, differential duties ; and while we were deliberating and expatiating on those duties, many a slave was wafting acruss that ocean
of which we called ourselves the rulers, a cargo of human victims, whose sufferings we could not mitigate or release by our prohibi-
tions upon trade. By the continuance of those prohibitions the slave trade would not be put down, bnt our revenue would be impaired, the prices of the necessaries of life would be angmented, be interrupted, and a deep and permanent injury inflicted on the Whole British empire.-Mr. Hzriziss called upon the House to in the history of this country which had gone on from year to charged Government with the most flagrant maladministration public income, he said, been dried up? Had any very extraordito have fareseen upon timber and sugar, he thouyht. there wropesed atterations
higher character than any merely tinancial ones. The present situation of our North American colonies was a conclusive reason
against the discouragement at this juncture of her great staple against the diseouragement at this juncture of her great staple
trade of timber. In like manner the sugar scheme was full of political evil ; it put in hazard the great experiment now in proaggravation of slavery and the slave trade. Lord J. Russell, he said, had talked of the existing swstem as intended for the bencint
of class interests. He could hardly conceive how it was possible structed upon so miserably short-sighted a principle, or how the Ministers themselves should be so miserably short-sighted. The shipping interest, for instance, was protected, not for the sake of
the shipowners as a class, but for the gake of that military marine on which depended the security of the nation at large: and
it was on the same prinfiple of general national henetit that the other great interests had been protected by the p
Whenever it sidl happen that the Parliament
shall treat the colonial, the surar, and the agricultural intere. as interests not deserving of support and protection, then,
he thonght, the honour, the glory, and the wealth of this great
conutry fiall have pint comery shall have pased away. He had nuthing to add to that amendment.-Mr. Viliters said that the preceding speaker had not proved the connexion asserted by him between the present
deficiences of revenue and the feebleuess of the Ministers. The scheme of Government was to increase the amount of consump. tion and the capacity of the consumer. The House, he said, was
now going to a division, he hoped to a discolution. He hoped the people wonld scan the names in the division-lists. The constituencies themselves would be on their trial, for the electurs
were descrihed as trustees for the whole people, and it remained to be seen how that trust would be discharged. The contest in this Honse seemed to be merely for a change of parties, but what plan they meant to propose on their accession to power Sir E. KNatchsurl admitted that the proposed Sugar Duties would probably sield the estimated revenue; but he believed that the same revenue might have been relied upon without the Ministerial alterations, He resisted those alterations mainly on the
ground of their tendency to encourare slave laliour, to which he had alwars been opposed. The substitution of a fixed duty on com for the existing scale would tend to endanger the supply of
frod. Was rejoiced that there was another and more popular tribunai, where members, apparently in inconsistent with themselves, would be
called on to give their explanations. The labourer, he thought, Which the distinctly a loser by that reduction in the price of wheat policy of encouraging the growth of sugar in the East Indies. The increase of our population at home, he said, had imposed it as a daty on Government to open new markets. Upon the great among the peopla and they were \(-u b j e c t s\) upon waily breaking in was danperins. of the result of this strumele he had no doubts. He had never seep a great national question tahen up by a powerful parts which dud nut suceerd. He hal on his side the onpinions- of
the movit powerni Ministers, of the most eminent modern states. men-he had on his side the wrell-known distresses of the people of this country; justice and the discrimination of the country it must inevitably prevail
Sir R. Pest sal that
Sir R. PesL sad, that even though no question of timber or of
com had been mixed with that of sugar, he would have voted ggainst the introduction of slave-grown sugar into the English forbid all commerce in the prodnce of slave labour hut mainly upon a consideration of the social and moral condition of the periment now in progress. He would not consent to \& step portable articles, anninilate the capital tested in the colonies, He wase sory that these miserable sobterfues had been resorter
to ahout the slavery in Brazil beint no reason why we should not recelve its sugar. He tboughe the whole of the arcument was to that effect, and that dimur the seven continuous naghts of

The late Lord Jumes Beresford. - We are enabled to give
the following additional particulars derived from a letter Archbishop of Captain of the ship to has arly suicide of this young nobleman, which we brietly noticed in our last Number. During the long passage from Cevlon, until the day previously to his death, his Lordship enjoyed good health and cheerful spirits ; but early on the morning ache, and throughout the day it seemed to increase, until Froprived him of reason, and led to the sad catastrophe. From the servant's account at the inquest, it appeared that on the evening of that day, before retiring for the night, he went to his Lordship's cabin, for the purpose of inquiring whether he needed any further attendance ; and having repeatedly knocked at his state-room door without cabin-floor partly covered with blood; and on proceeding to the closet adjoining the apartment he found his master with his head nearly severed from his body, and quite dead. An alarm was instantly given, but all attempis to restore life were ineffectual. After a consultation by the officers of the ship and passengers, the corpse was, with great solemnity, consigned to the ocean. The act, it is
added, could not be traced to any world added, could not be traced to any wortdly cause whatever,
but solely to a fever on the brain, and consequent temporary bereavement of reason. His Lordship s kindness of heart and amiable disposition had won him the esteem of all his fellow-passengers.
Icisenham.-On Sunday, in the middle of the day, robbery of jewellery to a large amount was committed at the residence of Mr. Gell, coroner for Westminster, in this village. It appears that while the family were at church the thief effected an entrance iuto the premises, by breaking a square of glass in one of the parlour windows, and, unperceived by the domestics, succeeded in carrying of several watches, and various other articles of jewellery, to the value of upwards of a hundred pounds. On the robbery being discovered, information was for-
warded to the police. Shortly afterwards a man was observed near the Southall station coming up the line from the direction of West Drayton, and on being told by one of the constables that he was liable to a fine for trespassing on the railway, he said he wanted to go by the next train to town, and at the same time took out a gold watch to see what the time was, which exciting the suspicion of the constable, who had heard of the robbery, he took him to the clerk at the station. On the arrival of the constable, he questioned the man, when, finding his answers evasive, he took him into custody, and on searching him, found the whole of the stolen property in his possession. While conveying him to Hanwell, the prisoner made a desperate Monday he underwent an examination, and was remanded Mor the attendance of the necessary witnesses.

Croydon, A disturbance, which at one time it was feared would have been attended with serious consequences took place last week at this town, arising out of the at-
tempt of a tee-totaller to give a lecture to the inhabitants upon the evils of dram-drinking. The lecturer arrived in the early part of the day, and emplojed the crier to give notice of a meeting to be held at the back of the Townhall. The crier, it seems, notwithstanding the errand he was upon, had little regard for the teetotal principle, for before he had gone half his round, it was evident that be was no teetotaller, and the circumstance of his giving antice of a teetotal meeting while in this condition caused velty of the exhibition, cansed a great crowd of the lower orders to assemble at the appointed hour, and the lecturer soon afterwards made his appearance, and commenced an address. During this time some of the bystanders had ob tained a quantity of beer, with which they regaled them-
selves, to the great annovance of the lecturer, who being asked to part the of sulie of the liquor, sail that he pre:tred water to the best veer that could be obtained. water, when some of the crowd upset his stool, and he fell among the mub, who severely beat him, tore his coat of his back, and used him very roughly; but by the interference of the police he was rescued and saved from any serious injury, and taken by them to the railmay-station that he might at once leave the place,
singular Case of Cruelty to Animals.-A case of some interest to farmery and others, which has caused much excitement in the neighbourhood of Bromley, under the Act of Parliament for preventing Cruelty to Animals, has just been decided by the Magistrates there. It arose out the time the fields are shut up for grass, of turning cattle and get their living along the sides of the rodds and ditches. Many complaints had been made that from such practice in some country rillages the footpaths are alm.ost useless duriag the months of May anc June, the inhaiditants being obliged to walk in the roads, whale the farmers graze turir cattie on the banks and hedges, and thus cause serious and danyerous impediments in the public thoroughfares. The evil had reached such a height in the village of Beckenham that it on the necessary to apply to the polise to interfere, and to pound ail uatite foumbt stryping on the pubiic roads or to pound ail vatte fownt stryying on the pubite roads ur dondey to be frst inip ounded. His master, a farmer, upon others to sase the donhey froas dieati by starvaiiun, nut being aware that tide A t for lareatiug Cruelts to Auimas protides Aerfaity for such an att. Appication ras
made to the Beacir of Mayistrates at Bromicy on the suioject by the police, who were referred to the surveyor of tue roads; but he refased to interpose his authonity, being of
opinion that the donkey bad been illegally impounded. In this state things remained for a month, the donkey continuing in the pound night and dav, in all weathers, unwned, but not wholly unprotected. One person, who any further 1 ood to the value of \(9_{3 .}\), refused to be at had placed expense or trouble, and the policeman, who tions mainst another to feed him, and obtained a summons against the owner, under the Act of Parliament which provides that the feeder of any animal while in the pound shall receive double the value of the keep. Epon the return of the summons, the farmer, finding that he was likely to be outlawed, set up as a defence that the donkey as not his, and the case came on regularly for adjudica the farmer, the Magistrates said that they poild aman into the question whether the donkey was or was not legally pounded. All they had to do was, to enforce the provisions of what appeared to them to be a most useful Act of Parliament, judging from the circumstances of the present case alone, and they expressed a wish that it was more generally known and acted upon. As to the ownership of the donkey, they entertained not the slightest doabt on that subject, and therefore ther convicted the defendant in the full amount claimed and costs, which, together, reached the sum of 24 s . They at the same time told the farmer that he had the right of appeal, but he paid the money at once.
Church-rates. - At a petty sessions lately held at Hackney, some of the parties summoned denied the validity of the church-rate; and the churchwarden declared he would the next day commence proceedings against them in the Ecclesiastical Court. Citations have consequently been served on five or six persons, whose arrears altogether amount to something less than thirty shillings. Having the same grounds of defence, they pro posed, through their proctor, that one case should be selected, by the decision on which the others would be bound. The charchwardens, however, would consent to no such arrangement, but determined that each case should be decided on its own merits. Besides these proceeding in the Spiritual Court, it seems that a magistrate's onder for paymert of church-rates has been sersed on uppards of 500 defaulters in the parish, with an intimation that if not attended to, distress-warrants shall promptly follo.

Aocidents.-On Tuesday morning, a young woman was drowned at the steam-boat pier, situate on the C'ity side of Blackfriars-bridge. It appears that one of the iro steamers had stopped at the pier to land passengers, and deceased, being the last to land, was in the act of bein handed by one of the steamer's men out of her, and had got one foot on the pier, when the words "Go on" wero
given, and the man, thinking the woman safe, let go his given, and the man, thinking the woman safe, let go hi
hold of her, and she fell into the water between the boa and the pier. The tide was running strongly down at the time, and she was washed under the coal-barges moored below the pier. Every means were immediately employed to recover the body, but withont effect; it was not found until more than two hours after, beneath a barge. An in quest has been held on the body, but nothing has been discovered to lead to deceased's identity.
Inquests.-On Tuesday an inquest, which had been twice previously adjourned, was concluded, before Mr Baker, on Mr. James Mottran, proprietor of the Rockingham Leeds mail-coach, which was overtarned on the evening of the 4th Feb. last, and deceased died in consequence of the injuries he received. The inquiry was adjourned for the gentleman named Richards, who had addressed a letter to One coroner, alleging that deceased had been aeglected. On the assembling of the jury, Mr. Richards attended, and gave evidence, but was unable to support his statement. ei the coatrary, it was clearly proved the period of his death. The driver of the Ruvningham Leeds coach said that he drove and was on the box when the accident happened. He attributed it solely to the damrehicle attempting to pass another (as in the present case) ce everal persons stated there was not a day passed bat some accident occurred. The jury, after a lengthened investigation, returned a verdict, "That deceased died
from typhus fever, accelerated by a fall off the Rockingham mail-coach, produced by the itoperfect and dangerous state of Goswell-street-road, and requested that the coroner would mrite to the clerk of the road-trast to repair the road for the safety of the pablic.

Suicide.-On Thursday moming a man of decent appearance, about 60 years of age, was seen to walk down to himself into the water. An alarin was given, and he was himself into the water. An alarin was giver, and he mi-
got out, atter having been in the water six or seven migot out, atter having breen in the water six or seven minutes. without success. The body was subsequently itentified as that of Mr. William Field, a respectable green groeer, residing is Hammersmith.

\section*{验robimcial Nemos}

Liverpoob- - The following farther particulars have been roceived in this city from flarre, respocting the lamenthip Willian Broten, an account of wich appeared in out last Number. On the arrival at Havre of the Fille de Lyon, with seven of the cres, it was deemed advisable to examine them at the American Consulate, and since the arrival of the Cresecrit the mate and some of the passeagers have also been examined. From the result of their evidence it is prover, the whe the hith after the vessel had sunk with ane the long-boat, crowded and deprived of her rudeler, ras in danger of sinking if the wind arose ; it did so in the night, the sea ran high, and the boat making a great deal of water, presented the painful alternative of all on board perishing, or saving some by tie loss of the rest. Sisteen passengers, fourteen of whom were men and two nomen, who were the nearest to the crew in the centre of the boat, were throwe into the sea. The principal leak was discovered, and the men were then enabled to bale out the boat and row, which they could not have done commenced at ten o.clock at night, and the Crescent was in sight at sir the following moraing. From the first the monen had been placed at the stern and bow of the boat so as not to prevent its being worked, wiich explains the reason of their being saved in sueb numbers. All were more or lens onercome by cold, and almost all the passengers who were thrown into the sem made little or no resistance, the greater number being, estended asif dead in wils, before whom the exuminetion was condueted, stated that they have not beea able to cincopar that censure is desserved by any person whatever.-A manifesto has been published by the American Chamber of Commerce at that body in adrueariog a revision of the Import Duties. The list of these is founded on the magnitude of the trade between Liverpoul ant t.e. Linited States, as comparey With that with the British West Ind.a possessions, incluching Demerara and Berbice, in wiose fivour prohibitory differential duties are sought to be maintainen. It appears in illustration of this argument that the amount of connage entered inwards from the Unised States is 465,565 tons, and from British West Indaa passessiens 43.0土t ; and outwards to the Enited States, \(196,84!\) tous; to tie British West Indies, 0,562 :-the value of produce imported from the Cinited states being \(12+29.150 \%\), and from British West India nossessions \(1,2 \div 2,2-24\). Tha 2d reason is. that the Cuited sitates takes from this country in manutactures, on an average of years, the whele value of the produce imported from tnence; and the 3 , that as the mighest duty lesied upan any article imported itto the
Latted states will shortly be 20 per cent. only on the Lated states will shortly be 20 per cent, only on the
value, it is to be experted that the states, whane proiluctions are so highly tesed, as totreeo. wheat. ace. wow are by the Briti-h tarnt, will unite with a portion of their manufacturers for the purpose of establisining a rate of duty based on a priaciple of retaliotuon. The th reason states tiaz uneralal froting on whath countries so distant as the United States are placed with tivie less remote, by the sliding scale of dety on wieat and tiour : the Sth adverts to the mntual adrantages to be ciatve: btimber; and the 6ith and last affirms, that as more than twonthinus of orm bigh inapontance to enconrage traule with those culutcies
which, like the United States, are willing to receive to any which, lite the United States, are willing to receive to nyy
extent the productions of our industry in exchagge for theirs.

Cathetral, in this city, took fiaco, in the Ecclestastical atten in Priday the the inst. Chere was only a thin lomere hraore stating that hre siould lay before Mre Travis. atro-
uitionsh injunctiens from the visitor, Mr. cate of the Ecelesiastical Court, stated that he wished to address a fow observations to the Court before the in-
unctions were issued. He appeared on behalf of two warties-first, for Dr. Cockburn, whom the Court had ting: and if the Court would not hear lim on behaff of Dr. Cockburn, then he should appear for Mr. Camon to the issning of the inimetions, to which grounds he should stricely confine himself. Dr. Phillimore said that it woull be impossible for him to hear M. Travis on behalf of the late Dean. Mr. Travis obeerved that mech being the decision, he would appear for Mr. Cmon Mark-
ham. Dr. Phillimore said he would be arguing in the
dark if he argued on the injunctions before he heard thew. dark if he argued on the injunctions before he heard thew.
Mr. Travis said he slould be glad if the Court mould inform him on this pumt. whether the visitor was going th award certain surns from one part to anuther part of mater to property would be raised. Dr. D'hillimure rephied, that the iajunctions merely referred to the fabrie fund, which was under the special protertion of the risitur. After they had been read, the Rev. W. V. Harcourt delivered a short The statements, he said, which he had made respecting he impurerishet state of the finances of the minster had been disputed, and it had been said that they wert in as thourishing a state nom as they were vears aro. He thought
that it wis of the greatest importance to the restoration of the minster by voluntary contributions, that the trath on this sabject should be distinctly known. Twenty years
agn, when hie became a member of the Chapter, the fabrie funds under the manazement of Dean Markham were ia suce a state, that had it been necessary, as it is now, to raise \(10,000 \%\). or 12,0001 . in addition to the voluntary do-
nations which the public have contributed in order to complete the restoration, it could have been dome by from 800 l . to 1000 l . a-year was annually spent on the ferric 1tself, in \& manner so jather the gradual restoration of York Minater drals in Eagland. From information derived from the Chapter-clerk, he found that the present unsatiafied chims fonds being also mortgased to the extent of 8,009 . Unless, therefore, voluntary subscriptions are tendered, this noble building, he said, would be left for many years to the contr form and dismanted state, to the asice a strong opinion that this resuls had arisen from effecting what wero called local improvements, instead of expending the moner in the manner designed by its pions donors. Mr. Travis then renewed his application to be allowed to advance argumants against the issuing of the injunctions. Dr. Phillimore observed, that it appeared the calculation on which the injonction relative to \(\mathbb{S}\) all the eireumastances, to give further time formsiden. tion, he thought it better again to adjouro the visitationThe proceedings were accordingly adjourned until tho 20th July.
Weymorth. - Property to a considerable extent has been found lately on the beach near this town. an man who lives at East Burton, near Winfrith, in proceediog of trousers lying on the pehbles. Thev appeared to hare been lving there a lung time, as if washed up by the sea. setendiag to approprace caemas ald rags, be put them his cart, and on atterwards esamining prom, he to a
something in one of the pockets, which proved leather note-case, contsining four Bank of Eagland notes The respective amounts of 51 , 20 ., but thee 1,101 b. nute being nuch defaced and torn, ap pareutly hy louz action of the sea, has been sent to the Bra's of England, 'y whose means prohably the note may be traced. There was nutning about the trousers or the nute-case to affurd any clue to the owber
Eveter.- A very serious tire has occurred at the villaye has ocelin sturte s ie milles fro and seriously damaged as mawy mure. From the parthcuiars received, it appears that the outh its ranider outhouse adjoininy a large mercantile inm, and miary was so great tiat the people living in the inn bad
effected their escape before the whole building was enveloped in tharees. In less than thentares three ad jnining houses had ignited. The engines belonging this city reached the spot about two honrs alder be pro break, but the only supply of water four o"derk in the aiternom the fire was at its bighest pitch, and n .) fewer than twelve houses were in a blasr. were ultimately got under. How the fire was occasioned is not at present known. No portion of the property, distress in the village.
Barnsley.-On Monday a tum-out of the workmen of Messrs. Taylor and Sons of this town took place, ia coil sequence of their employers requiring them scale price of 1859. The men paraded the streets to the number of ahout 2 nes, wearing reeas and gears over their showers in mockery of an army marching to battle. The workmen is said, had borne the extra wurk for some tifneturers struck at length in consequence . Taylor's hands contimued to suffer

Sheffield.-A few days sinee a landslip of considerable heffield side of the Bell Hagg Inn, hy whin a mass of ewth and rock. estrmeted at 200 toas weight, was prect pitaret ints the rind. The on and sersme the time hodlord mere rithin a few yards of the poutand ash and holly-bush are now flourishing erect close by the road-side. that formerly were seen nodding at the top of the
an altitude of nearly \(\begin{aligned} & \text { Purtsmouth.-Colonel Pasley's operations against the }\end{aligned}\) wreck of the Royal George are now going on with great
activity ander Lieutenant Hutchinson, as the executive engineer. On the 6th inst. Mr Hall, of Whitstable, who was so useful during the last two seasons, went down for
the first time, and slung some pieces of wreck. The weather and tides at first were unfavourable ; but considering the short time since the operations have been renewed, the progress has been satisfactory. The pieces of wreck recovered have been generally small, excepting four pieces
of ffor timbers, broken oft short by the explusions of last year. On the 12th a large fragment, about 24ft. long, was got up, which being nearly in the furm of the letter \(\frac{\text { Was }}{\mathrm{h}}\), it is thought must have been a prong beam, such as was used formerly about the main-hatchway of a first-rate. This was also broken off at bothenends by the explosions of last year. Some fragments of gun-carriages, together with several shot and pieces of lead, have been got.up. A
number of small charges of 471 bs . have been fired to advantage; but it is said that Col. Pasley does not think that it will be necessary to fire any charges exceeding 7001 lbs of powder in the cenarse of the present season, but generally smaller ones will be used; and that, instead of puncheons and tin oil bottles, or cans, to hold the oharges proposed. On the 13th Corporal Harris went down and recovered the large fron monkey or ram of a pile-engine, sunk at Spithead by accident in the attempt to drive a pile over the Horse Sand, as a station for the proposed sarvey of the
anclorage. Leeds.-The premises of Mesgrs. Baines and Sons, printers, and of Messrs. Baines and Newsome, booksellers, robbed of from 120\%. to \(130 \%\) in notes, gold, and silver. About 1002. of the money was in 5 . notes, principally of that, never withia the memory of the oldeat inhabitant have there been so many deaths in 'the parish of Kirkheaton in so short a space, as in the interval from the beginning to the 12 th of the present manth, 21 persons having been committed to the grave during that period, princ pally consisting of persons from 40 to 50 years of age. named Margaret Bird was charged before the magistrates bore bore marks of great violence. From her evidence, corro-
borated by that of hier neighiours, it appeared on Monday night the defendant had burst open the door of t.er iwellnight the defendant had burst open the door of wer awellon her breast athe beating and scratching her in a very violent manner. The defendant, in reply to the charge,
confidently urged that the old danae was in league with the powers of darkness, and was beyond all doubt a veri table witcb. Acting under this impression, and suffering from the pains of ear-ache, produced, as she firmly beted having used considerable violence towards her. The reasoning of the bench seemed to have ro effect on her superstitious feelings, and she was committed to yrison for a terpa of two months, in defauit of a tine of Jha, and was four moaths.

Sheffield.- Much apprebension has been caused in this town by the report that the ironmasters of Staffordshire and Shropshire find it necessary to blow out 42 furnaces, by which many persons will be thrown out of employment.
Railurals.-On Sunday erening an accident, by which an engineer named Cox received great injury, the line of the Eastern Counties Railwar. It appears that the up-train left Brentwood at four o'clock, on its way to London ; it arrived at liford about ten minutes to five, When, owrigg to the paints of the rails at the station not the foot-plate on which Cox was standing between the engine and the tender, owing to the shook it rejamaned between the foot-plate and tender with great violence. The steam of the engine was immediately turned off, and no other person was injured. Cox was conveyed by the train to the Mile-end station, and thence to the London Hospital, where his leg was found to have been so much injured that it way feared amputation would be necessary. It seems that when the same train went down to rails were shifted in a hair berore, the points of the then procesding, and not afterwards reversed. as they should have been in readmess for the train's return, and his meglect was the cause of the ne. inn.- hoin recenit of traffic on the several railways in England and Scotland (29) in all) for the last week, that is to say, up to thelatest period to which the several returns are calculated, viz., total amount of passengers conveyed, 222,210. Total receipts (including passengers, parcels, carriages, horses, era Raiiway is fast approaching completion. . On the 3lst
 to Bath, which will be opened in July, when tio entine line will be completed.-On Tharsday morning a serious accident occurred to a labourer employed at the new works now in progress near. Deptford, for the parpose of widening the railway at the junction of the Croydon and Brizhtan sspholto it seems that by come means a large muss pit erection, fell upon him, and crashed has leg ii. a vury serious manner. He was taken up in a state of insensthature of the fracture, it mas deminel ueverstry hamediately to smputate the limb.
Dublin.-It is said that Her Majesty bes been made
acquainted with the intention of her Irish subjects to present a petition to ber, which we noticed in our last Num-
ber as basing been got up in this city, honour Ireland by a visit this sunomer, and that Her Majesty expressed her lively satisfaction at this proof of be unable to leave England this year.-A chapter of the Order of St. Patrick has been held at the Castle; at which sir W. Leeson was invested with the riband and
badje of Genealogist ; Lieut.-Col. G. Murris had delivered to him the black rod, and was invested with the badge ; and the Earl of Arran was, by order of Her Majesty, invested with the riband and badge of the Order.-On and after the 15th of next month, the evening mail from London to this city, will be conveyed on the Chester and
Birkenhead Railway, and reach the station before 6 in the morning. Her Majesty's steamers, instead of receiving it on the Liverpool, will receive it on the Cheshire side of
the Merser, and sail direct for this city passengers from liverpool will be conveyed on board in a ateamer. Half an hour at least is expected to be gained by the alteration of the route of the London down-mail. SCOTLAND.
Bdinburgh.-Ik is positively atated that Government have mo intention whatever of interfering with the Scotch system of banking.
The Highlands.- It is said that the Duke of Richmond bas had a number of workmen employed for some weeks past in the meantains of Strathdoun, on an experiment, discore practicability of working the several minerals to an eminent chemist, and ou analysis gave the most pro mising rocult. Should his Grace be successful in working the mines, it is thought that the employment they would afford will be of the greatest importance in that district of the country, where thie orops are so precarious. The long
land canlage is the most serious impediment to the successful working.
Cimsoer-Dernis Doolan and Patrick Redding have been executed at Crosshill, about three miles from this city, in pursuance of the seatence recently passed on them and Glaurder of Jom Green, ganger upoa the Ediaburgh have been very great, amounting to above 50,000 , and great precautions were talken to prevent an outbreak. In malition to a large police force, there were apon the ground 58 th regiment of foot, and four troops of the lst Royal Dragoobs. The prisoners made an ample confession of their guilt ; but protested they did not at first mean to marder Mr. Green, but only to give hime a beating.- The Głasgew papers contain an account of a fatal accident that with two men, was seen struggling with a southerly wind and heavy sea, and suon after was observed sinking, with one of the men still on board; the other clung to part of
the timber. In this condition he continued nearly hoars, when exertions were made by those on shore to save him, which were so fur successful that they brought bim to land alive, but he died from exhaustion helf-anhour after. They had delivered a cargo of coals at Loch long, and were returning to their homes. This it seems,
is the fecond boat whicli has been hoot on Lochlong within these few days.

Falkirk - In removing the superstrata, consisting of an upper thick deposit of sandy gravel, with the clay, shale,
coal, \&o., in the quarry a little west from the railway coal, \&o., in the quarry a little weat from the railway
tunnel, near this place, the section exposed, about 2 j cet heep, exhibits marks of powerful volcanic ackun. Above the rock the strata in one part are thrown into nearly the form of a circle for the space of twelve feet, from the centre of which there appears a radiation, until the combustiole materials had eshausted tieir force; to the west the convalsion appears to have also been consicerable. The appearance was observed when about seven yards no
Drumeouliran.-Certain improvements were lately commenced round the woods of Drumcoultran; and the contractor, while engaged in forming a sunken fence, to his surprise came upon a heap of ancient swords, curionsly formed, of a brithe present day. Most of them are small, and more like rapiers than either a hafted or Damascus blade. One of the namber appeared to have been 9 halberd, the handle of which had been broken off in the act of raising it, or by the corrosion of time. There is an old peel or keep still are distinctly visíble about a mile off.

\section*{THEATRICALS}

English Opera House.-The performances at this theatre have been brought to a sudden termination. On Saturlay evening it opened as usual, and the new piece, T. Ifandsel Penny, was performed. After its coselu-
 Cime insward and aaid that he had reveivel a mata foom
Mr. Brmett, stating that he pouli nut Heins fone the thard the hat hat that inat ane logugor. She he was umable at that nament the su'stitute anything to:
 then otated that tinat "3s the hast niz's of the Enginh said that the fact that there were not sufficient founds in the house, and he was already burthened with five or in bia power for the eatablishment. He had brought out
his apera of Keolanthe gratis, for which Madame Vestris offered him three hundred guineas, if he would have Mr. Maciarren, ready cast . He Lad another opera by to produce it ia consequence of the secession of Mr. H. ante. He was very sorry that he had ever become the manajer of aan Loghei theatre-in wilich capacity he would nuser appear asali, but in future only as a coniposer.
Haymaraet Theatre.- On Nonday esening Macbeth was performed at this theatre, the enencing Macracters being sustained by Mr. Charles Kean and Miss E. Tree. Both of these favaurite actors experienced the wancest reception, and the house was very much crowded. Mr. Kean's performance of the character of Masbeth appeared to give general satisfaction, and when the curtain
 Tree, whose performance as Lady Macbeth was very good, was also again welcomed by the audience, and a similar compliment was paid to Mr. Phelps, for his acting of Macduff.-A little comedy, in two acts, was produced at this theatre on Tuesday evening, entitled The Philosophers of Berlin. It appears to be a slight framework, constructed for the purpose of dashing off a reflection or two upan the history of Frederick of Prussia, and the period when the name and influence of Voltaire were beginning to decline. The dramatist has taken this episode of Voltaire's disgrace to make the means of his reconciliation to Frederic exhibit his eccentricity, his good nature, his vanity, his talent, and his spleen in strong contrast. and to work out the catastrophe of a courle of love-stories, which are interwoven with the plot. The daughters of a poor merchant, and of a rich Jew, are the heroines of the play and the devotion of a lover, the cross purposes of the two Jews recoling upon each other, and the tinal triumph of vitaire in the favour of the king, combine to enable the poet to crown all parties with "poetcical justice," fashioned after the model which his philusophy had set up. The
drama pursues its way quietly, and is too slight in its purpose and wit to be called comedy ; but its dialogue has some point, and the difficulty of finding language for Voltaire has been surmounted with something like success. Mr. Wallack iressed and played the poet with much aparit, and Mr. Webster's \(F\) redrrick was in the true cosinto the same fault in acting as the dramatist has fallen into in writing an orer-caricature of the two Jews. Miss Horton sang two petty songs in the character of the Jeze's Daughter, and Mrs. Sterling, as the Merchant's Child touched off a slight sletch with much truth and simplicity. The piece was announced for repetition amid considerable applause.

Mivsionury Disuster in the Sunduich Islands.-The following estracts from a letter recently received by the Islands one of the Amerrican missionaries in the Sand Island vessel, and the extraordinary sufferings of the survivors :-" We have just retarned from our general meeting at Honolulu. Uur passage was made in a canoe to Labaiu, a distance of 80 miles-a perilous undertaking for the sea tras high, and dangerous to our little bark. From this plaoe we obtained a presage in the King's vemel to Honolulu. We had a pleasant meoting with our frienda About the time of our leaving home a very sorrowfal event occurred. The brethrea at Honolulu, fearing that we should not venture upon a canoe, engnged a vessel, which was to go to Hawaii for Mr. Lyons, and to call on its return and take us. The vessel made its passage to Hawaii, and when near its destination was upeet and lost, and all on board, consisting of 30 souls, were drowned, except four, who seem to have been minnculously preserved. When the accident occurred they were near the shore, but the wiad and current were against them, and thinking it vain to attempt to reach Hawaii, they congre gated themselves upon the rolling billows, and there, to gether in their distress, offered up their sumplications to Him who alone could preserve them from the threntening deep. They attempted to swim to Kaboolara, some 311
miles on the opposite side of the channel. One man and miles on the opposite side of the chamel. One man and
his wife took a covered bueket and tied it to their bodiem and in this way swam until the bucket came to pieces The woman swam for some time, but, seeing her husben becuming too weak to surport bimself she storped and rebbud tim until he could proceed. They went on until Kahcoluar was in sight; he then became too feable to proced mithout assistir of his wife's head. In this way she towed him for some time. His hand, however, suon let go its hold, and she fried in vain to rouse him. She then told him he must pray; he commenced, but only uttered a few words. She put his arms around her neck held him with one hand, and made for the shore. When within about half-a-mile from the shore, she found he was
dead, and was compelled to let go her hold to suppos dead, and was compeled to let go her hold to suppos. When she landed she was three dyys hairs sat sas?
humn being, and was without food. At last some fir... men found her, and conveyed her to the village, w ahe is now in good health. The captain of the vesed :...
a foreigner, and could swim but littie; his wife sived herself by the assistance of an oar. The others disapreared
from time to time until all perished but the four. Wild-foat \({ }^{2}\) in St. James's Park.-A curious cireannwas passing through the enclosure of a St. Jamen's Purk on the small island nearest lockiugham Places. A dock had just hatched a brood of young onat them, the yewag
stinctive craving for the water natural to them
ducklings, as soon as the shell was burst, waddled to the water's edge followed by the old one. One of the little ones, which had a portion of the shell still on its back, was about to make its first attempt on its favourite element, When a larre fish jumped up above the water, seized it, instamtly dived after it, and remained under water up wards of a minute, but came up without it. She the stood for some time contemplating the spot where the young one had disappeared, and, as if to make another effort to save it, again dived after it, but came up, as before, unsuecessful. The fish was supposed to be a large tront with which the lake abounds. A great number of the young are destroyed in this manner by the fish.
Fields of Iee in the Atlantic. -The following account, given by the Commander of the Great Western steamship, of her last outward-bound passage to New York, will be read with interest, as it shows that fields of ice have prevailed this year to an extent never before known in those latitudes:-On Sunday, April 18, the ship steering west, at 6 P.M., first saw one iceberg on the starboard bows; at 7.30 passed it (at that time four or five others in sight) ; at 9.15 passed several amall pieces of ice-slowed
the engines. In a few minutes after the ship was surtounded with light field-ice, which appeared similar to a freld I ran through on the 11th Feb. 1839. This induced me to go slowly, with the hope of getting througb as I had done on that occasion; but by 9.30 , finding it became closely packed, and much thicker, pradence dictated our escape by the same channel we had entered. I then stopped, and attempted to get the ships head to the eastward by turning ahead and astern untilthere was room for her to comer all ( least) two strokes heel given by either whel passing over large masses of ice. At 10.15 succeeded in getting the ship's head to the eastward, and by 11 entirely clear. From that time went slowly, passing seral icehergs ; the night at times very clear-the aurora borealis very bright. At \(3.30 \mathrm{~A} . \mathrm{H}\). of the 19th, again got embayed in the ice, stopped, hanled short round on our keel, and steered out E. by S., coasting the ice for five or six miles ; 4.20 , kept her to the westward, running through innumerable icebergs until 8.30, when we passed the last iceberg and point of the freld-ice. When the sun arose, the ice was visible as far as the eye could reach in an unbroken line from N.E. by E. by the Northward, to N.W. by W , at the same time icebergs innumerable in every ireation, forming one of the most magnificent sights I ever beheld. The first icaberg we saw was in latitude 43 , longitude 48.30 ; and the last in latitude 42.20 , longitude 50.0 . I am quite sure there was an unbroken field of that extent: and from what I heard from Capt. Bailly, of the merican packet-ship United States, I have no field-ice extended, with very littie break, to latitude 40.30 , where Capt. Bailly fell in with it on the morning of the 18th. Several other ships also fell in with it in the same longitude, and were conupletely stopped, giving them an opportunity of killing seais, which were on it in great numbers. Some of the icebergs I estimate at little, if at all less than a mile long, and from \(1 \overline{50}\) to 200 feet high. This field of ice was in large massen, some of them not less than 20 feet square by 6 feet thick or more. The temperature of the witer when within two miles of the first iceberg seen, fell suddenly from 50 to 36 degrees; air, 40 to 36 degrees. When in the ice the water was 25 degrees, air 28 degrees ; during the remainder of the night and the rol owing murning the water was not higher than 30 degrees hor the air higher than 32 degrees. Immediately after passing the last ice, the water became 36 degrees, and the
Floral C'uriosity. The Leeds papers inform us that at the last meeting of the members of the Malton Flori technical Society, a fioral curiosity was displayed in the shape of a cowstip, which had abore eighty pips, and Which had been gatierest by Mr. Georye Barker, a bookbinder, of Malton, one of the members, in a field near to Setrington, last week. Mr. E. C. . . London, near Leens, gatherent a cunday horning, whicil had 154 pips.

Causes of Fire.-One of our correspondents, Mr. J Murray, has recently pablished a letter in the Liverpoo Mercury, on the frequency, causes, and prevention of fire, Which contains many facts well worthy of attentive consideration. The following extracts will interest our readers:-"There is far too little attention paid to the that fall below are often blown to considerable dist farried into the adjoining fields, and may, in contact with farming srock. prove a serious evis; and I have wituessed bru-Lweod and tutts ef grass consumed by this means. A green taper, coloured as it is by means of oxide of cond may continue, to the end of the coil, in an ignited thongh tiameness state, and, in contact with combustible materials, may prove seriously destructive. It has set mahogang taile on tre-providentially discorered in time Bamp rass, in mectose, way spoutane uls!y tike firs, and esperial! g that of linseed, have becia the trumbul sulurces conflagration in cotton factories and the warehouses the merchants. Nets dipped in oil, and cast over conven w.oul bursts into a tiame from liuseed oil being poured upon it. Even animal matters, such as woollen, under such circumstances, come within the precincts of se. curred to myself. The vapour of sulpluric ether, instead folls to the ground like water and acciventir in the labo
ratory and shop of the druggist, from ignorance of this fact, are by no means unfrequent. I am personally acquainted with three distinct cases, wherein the premises were set on fire, originating in this source. Specks or buming lens wignite inflammable substances, brought vithin the limits of their focus; hence the curtains used \(m\) sume factories may be pasily ignited: thus, too, a waterbottle left in a window may, in sunshine, be the means of setting premises on fire, especially in a house shut up during the absence of the family; and I have seen a silk curtain consumed to tinder by the concentrated rays of the sun, in passing through the show-bottle in the drug gist's window. Spirits of turpentine will inflame, if poured out in the hot sunbeam; and I am informed by the distillers of tar and turpentine that the head of the still cannot be safely removed for thirty hours after the fire has been extinguished, as an explosion might be
 called Dutch, containing phusphorus, and having a very fuetid phosphoric smell, are exceedingly dangerous: they may ignite spontaneonsly at the temperature of summer heat, and it may now suffice to say that a recent conflagration has been traced to this canse. The cigar and the pipe are pre-eminent sources of modern conflagration; and I ave no doubt that of the seat of the Marcuis of London derry, and the late one of York minster, are eatirely attributable to the pipe or cigar used by the workmen engaged in repairs. It is not generally known that tobacco contains nitre, and that, like "touch-wood," it may continue ignited for hours Fires occurring from this cause are, apprehend, too notorious to need specific detail. It in clear, that the end of a cigar dropped among wood shav ings might be fanned into a flame by a current of air, and tossed from the top of the coach into an adjoining field and carried by the breeze into a farmer's stack yard: hay-ricks and wheat-stacks may even burst into a flame I believe many a cigar-smoker is an unintentional incendiary
Rearing a Child.-A hale and hearty female peasant, named Marie Plor, who resides in the Faubourg of Maubeuge, and who has just entered her 100th year, having latterly lost one of her daughters, more than 80 years of age, remarked with tears in her eyes to a sympathising old crone of the neighbourhood, "Ah? Dieude
ways said that I never should rear chat china states that

\section*{che Garamers Cbrantide}

SATURDAY, MAI 29, 1841

\section*{\(4=1\)}

OUR observations upon the manner of conducting exhibitions of flowers and fruits have produced us so many letters that, instead of answering them singly among a crowd of "notices," we think it better to return to the subject formally.

Some of our correspondents beg us to give them rules for the establishment of Horticultural Societies in country villages, and to tell them how to set about creating them. That is, however, a duty we cannot undertake. Local circumstances, and the condition in life of exhibitors, vary so much, and so entirely affect the nature of such rules, that no cole of laws can be framed to any good purpose. In forming Horticultural Associations, as in political legislation, those laws are the best which are framed with reference to the particular circumstances of individuals, and not upon abstract principles alone. The latter must no doubt be always kept in view, but they must be modified by the condition of the persons to whom they are to be applied. The rules we have already given are almost the only ones that will not bear to be varied or departed from. But while we decline undertaking the ta k in the way our correspondents request, we shall always be happy to give them our advice upon any distinct questions they propose to us.

For instance, we are asked by \(R . F\). whether we recommend the judges to be taken from among the committee of a Society. To this we answer that if a committee-man exhibits, that circumstance disqualifies him ; but if he does not exhibit, there is no reason why he should not be a judge; in the latter case he stands only in the position of an ordinary person of competent knowledge. The great point is to prevent jobbing, and our experience tells us that being in a committee is no assurance that a man is guiltless of this discreditable disposition. If we chose, we could name committees, the members of which have given medals to each other, contrary to all right and propriety, to the utter ruin of the associations that had the misfortune to be governed by them. No opportunity of doing this should ever be given to any man.

We see by returns before us that in some very respectable and well-managed societies, rewards have been given to gentlemen for the trouble they have taken in managing the exhibitions. This is ill-judged on the part of the donors, and in bad taste on the part of the receivers. The funds of sucieties are not, or should not be, intended for such purposes, and we are confident that the mistake only requires to be pointed out to be avoided in future. Rewards should be strictly conllined to horticultural skill; thanks are all that ought to be returned for services of another lind.
Another point to which we would call the serious attention of Committees is the necessity of obliging exhibitors to abide by the conditions under which exhibitions take place. If Committees neglect thin, they had better not fix any conditions. Suppose, for instance, that in the requlations of a Society it is declared that Pelargoniums are to be shown in sixes all different, and an exhibitor puts up six Pelargoniums, two of which are alike, he violates the prescribed conditions, and should be discualified. If this is nut strictly attended to, no one will be found to comply with the rules of a Society, and all will be confusion. A case of this kisd occurred lately at Manchester. A correspondent has sent us the regulations of the Horticultural Society of that town, from which it appears that a rule was made requiring all productions to be labelled with their proper names, in default of which the productions were to be treated as if not present, that is to say, were to be disqualified. This was a most excellent regulation, and one which we should be glad to see adopted generally. 'Now at
the last exhibition we are informed that numerous competitors contended for the prizes in Pansies, some of whom sent their pans with the name affixed to each flower, immediately above or under it, while others had no names at all; nevertheless the exhibitors were treated all alike, and prizes were awarded accordingly. Now this was clearly wrong ; the persons who violated the conditions of exhibition should have been excluded from competition. We understand that an opinion was taken in the room as to whether the Pansies without names should be admitted or not, and that the opinion was favourable to their admission. But we think this a bad precedent ; for if a majority of visitors or exhibitors can thus set aside one rule, they may set aside any other, and there will be no knowing where to stop. On another occasion the violator of some other rule will perhaps be made to suffer the penalty of doing so, and he then will have good ground of complaint against the committee, who on one occasion allow regulations to be broken, and on another require them to be strictly observed. It is inconceivable how much discontent this sort of unsteadiness of purpose produces.

From considering the duties of Judges and Committees we next turn to those of Exhibitors; for they too have duties which it is important they should understand. When a man enters the field against other competitors, he ought to remember that all cannot be first-that some must lose, while others win; and if he is wise, he will consider the chances to be more against him than in his favour. Then, if he succeeds, the satisfaction will be the greater; and if he fails the disappointment will be less. There are some men indeed foolish enough to bluster and brag about the surpassing excellence of their productions; and, of course, if the judges are of a different opinion, which is very likely, such men become ridiculous in the eyes of their acquaintances; but who is there to sympathise with them? Exhibitors may depend upon it that they are often the worst judges of their own productions. If an exhibitor knows that his judges are honest men, he ought to beware how he ascribes improper motives to them when they gire their decision against him. . A man who brings a charge of unfairness against others is always open to a suspicion of it himself. One of the first results of gardening should be to soften the feelings and suppress the evil workings of our nature, by an habitual contemplation of the ever-tranquil and beautiful features of vegetation; and all right-minded persons will yield most readily to such an influence. Those who permit "envy, hatred, malice, and all uncharitableness" to distort their feelings and cloud the aspect under which they view the success of their neighbours, are unworthy the name of gardeners. And yet, alas! how many such there are!

We trust these cbservations will be taken in good part as they are intencted, and that they will promote a feeling of good fellowship among both wimners and losers. Horticultural exhibitions are among the most agreeable of all recreations; they bring into contact persons of very different conditions in life, and when well conducted they promote most essentially the art of gardening by the anxious desire they excite in every gardener to exert his ahilities to the utmost. But if they are allowed to engender feelings of strife and animosity, as has happened, they indicate that exhibitions are gambling transactions instead of honest emulation, and their utility is immediately counterpoised.
The manmer in which the meetings of Horticultural Societies should be reported is the last point remaining for consideration. A letter from "A Lover of Gardening " so fully explains the wishes of our readers upon this point, that we print it instead of offering any observations of our own.
"I are one of that class of readers who look with intertst to the reports of Proceeding= of Horticultural Societies, but I generally feel great mortification at the way they are 'got up.' What is the use of them un'ess they give us the names of what obtains the prizes? It is the vame of the plant, that is all and everylhing to the great mass of readers-the individuals, to whom it belongs) notuing: the first is of very great importance as regards the science generally. being the criterion by which to gardening in its locality; the other interesting only to a few persuns. To put the watter more forcioly, take horse-racing, -of what value would a spirtsman corsider valy were given, and that of the horses omitted! I would suggest that, unless you are supplied with those particulars, you should decline inserting the report. This would swon you should deciine inserting the report render what is sow
very generally a waste of space a valuable and interesting department. Since writing the above, I have read the report in the last Chronicle of the Horticultural Society's grand show; in my opinion it is perfect-just what a report ought to be; and for the reverse, see the York interesting exhibition in the York Museum Gardens replete with all the faults I complain of."

There is no doubt much justice in these observations, and we wish sincerely that our correspondents would amend their ways. We must, however, in justice to the reporters, observe, that the fault is often not theirs, but that of the exhibitors, who put no names to their plants. If that is not done correctly and legibly, it is only here and there that reporters have the skill to supply the omission.

The altered state of our West India Colonies renders it probable that an entire change will have to be made in the management of estates in that part of the world. Our private letters agree in representing the quantity of sugar to be extremely small compared with what was formerly obtained; and in consequence the planters are looking anxiously for other subjects of cultivation. In St. Vinceut's, an estate which formerly produced 700 hhds. annually, yielded only 175 in 1840, and cannot be forced beyond 280 for the present season. The owner is therefore turning his attention to the cultivation of Arrowroot, Nutmegs, Cloves, and other tropical productions ; and this state of things is becoming so common, that we may expect the whole system of West India farming to undergo a change in a very few years. Should this be so, a demand will be created for active, intelligent gardeners to superintend the estates; and thus an occupation be found for many men burthened with families, whose prospects in their own country are by no means encouraging. If this happens, we shall have early intelligence, which we shall be only too happy to communicate to our readers. Should, however, any gardeners who see this paper feel a desire to offer themselves hereafter for such employment, they must understand that the qualifications will be very different from those which suffice for a place in the family of an Euglish gentleman. The duties will be anything rather than directing the routine of English cultivation even in hothouses. Tropical crops will have to be managed on the same scale as the farming crops of this country, and the superintendent will be called upon to combine in his own person the qualifcations of bailiff, farmer, and gardener in a soil and climate where not one article of growth has ever, perhaps, been cultivated by him before. Under such circumstances that kind of knowlecige called " Rule of Thumb" will be useless, but a perpetual recurrence to general principles will be indispensable. A gardener who not only knows how to do a thing, but why he does it, is the person who would be selected for a duty like that we are now adverting to; and we strongly recommend all those who are inclined to look out for these employments to prepare themselves for them by diligent study. They will be excellent appointments whenever they come. With this view, gardeners should completely master the following things:-1 The manner in which plants grow and multiply; The influence of external agencies, such as heat, light, and moisture, under crdinary circumstances; and 3rdly, the manner in which they affect plants when they take place beyond what we experience in this country.
A good deal of information upon such points may be found in the Theory of Horticulture, and more may be obtained for himself by any man who has the command of a hothouse. We may possibly enter at length into the subject at some future time.

We have from time to time received from Nurserymen descriptions of new flowers which they have raised, with a request that we would insert such accounts in our columns. We have generally answered them privately; but as their number increases, we must state once for all that we cannot insert such paragraphs, except as advertisements. Not that we doubt their truth, but long experience has taught us that, as parents are not the best judges of the merits of their children. so the growers of plants for sale are apt to look upon their pets with a more favourable eye than their customers. Wherever a new plant is seat to us for our opinion we will give it, as we alway have done, to the best uf our judgment, and with that opinion the senders must be content to abide; but we cannot permit the opinions of others upon such points as these to appear as our own. This is an affair of
far too much importance to the readers of the 'Chro-
nicle" to be treated lightly, and nothing can induce us nicle to be treated light
to depart from the rule.

\section*{RURAL CHEMISTRY.-No. XIII}

Peosphate of lime is by mo means an abundant substance, but it exists in small quaintity in a great many soil, in almost all plants and animal matters. It never Deeurs free, or anembined, but always in combination With a base, and this is very commonly lime. Thus we It in very considerable of the food of man; and we find It in very considerable quantity associated with carbonate tain it from the substances on which they feed. wheat and similar plants derive the phosphate of lime, as well as the other earthy salts which they contain, from the soil, it is erident that they must gradually diminish the quantity of that substance contained in the soil; it will time to time, by mixing with it some substance containing phosphate of lime, and this is done by manuring. All vegetable and animal manures yield phosphate of lime
to the soil, and none in so large a proportion as bones, which are likewise useful in other ways besides supplying phosphate of lime to the soil. Phosphate of lime sulphuric acid and muriatic acid : in the former case an insoluble salphate will be formed, and phosphoric acid obtained containing phosphoric acid and mariate of lime a salt which is very easily soluble in water.
Magnesia is an earth somewhat similar to lime, but far less common and abandant. It occurs usually in connexion with lime, forming what is called magaesian limes:one, winch is a misture of carbonate of lime and carbonesia is found, are the carbonate, the sulphate, the muriate, and the phosphate. The carbonate is sometimes found native pure, but by far more frentuently it is mixed with the carunate of lize or limestone, the properties of which it considerably modifies. When the curbonate of magnesia is stronly heated, it parts with its carbonic earth is almost insolubit in water, and far less. Strongly caustic than lime ; it also Las less affinity for carbonic acid, so that when left exposed to the air, it does not like lime, rapidly become converted into carbonate by absorbing carbonic acid from the air, but remains for a stone is barut in a hamekiln, when a magnesian limecoursa cuntains caustic magnesia, which, if exposed to the air, wil! ranain causuc long after the lime has all become reconverted intu carbonate: it is for this reason that purposes, where the caustic powers thus retuin forme jectonsule. Tine carbovate of magnesia, like the caroonate of liane, and indeed all other compounds of that When acted on by sulphuric acid, sulphate of magnesia is formed, which is a silt easily dissolved by water, and distinguished by a peculiar sweet-bitter taste. It is found in many mineral waters, and exists in unusually large Which it is cornmoaly caled Epoom salts pound of muriatic acid and found in mineral waters, and exists in some quantity in sea-water; it is very soluble in water, and therefore when salt which evaporated in order to procure the common when the greater part has been driven ofr by hated, but large quantity of common salt is deposited, the remaining liquor, which contains a little common salt, and nearly is drawn off. The murnia and other easily soluble salts, muriate of lime, are very deligues misia, and also the muriate of lime, are very deliques ent salts; that is to hence when exposed to dump air, tiev soon become moist and at last we find, instead of the solid salt, a very strony solution of it in water. It is to the presence of a smat quantity uf these two satits in comurion sea salt The phosphate of manneia, like the cartonite is selle. found aione, but ustually mised with the phosphate of lime: thus we find it associsted with that substance in smali quantity in many aninul and veretable matiers, limited, and the minst naportant purposes to winich its compounds are applied are as medicines
very abundant and widely diffused substance. It occurs native both pure and in combination, but it is most uscally mined with a quantity of water. It is sometimes found pure and free from water or any acid, and constitutes the rery rare, and seldom met rith. The; bat three are alumine, in the ordinary state in which it properties soil, are very different from those of the preceding bases: dees not absorb carbonic acid from the air puwers, and at pears artuaction fur frater, and when thoroughly wet it vi: its fwat plasticity, and the ease with which it mat be min olded into any form. All the rarieties of clay derive their tenacious properties from the large quantity of this pottery, bricks, tiles, \&ce, are entiraly dependent on this
property of alumine. This earth is able to combine with acids, but the salts which it forms are mostly of very little
importance, and we need not at present inguire into their importance, and we need not at present inquire into their
characters. The only one which is found native is the characters. The only one which is found native is the phosphate, but this is by no means of common occurrence
it is only found in certain districts and in very limite quantity. The sulphate of alumine is largely manufactured from certain kinds of slate or shale which contain alnmin and sulphur. When sulphate of alumine is mixed with sulphate of potash, the two salts combine and form what or conmon alum. If a little potash is added and potash pure alumine will be separated, and sulphate of potash ane remains in solution.-E

\section*{CONIFEROUS PLANTS.-No. I.}

The soil and situation most suitable for each species o coniferous plant vary so much, that to give more than general outhine of the treatment required for each would
be tedions, and few, if any, places of moderate extent could be found farourable for the growth of all. For example, some are found in swampy places, while others ouly grow in the most exposed and mountainous situations; again, some require a atrong retentive soil (Abies;) while others grow to a great size in a loose sand (P. Lamgrow tolerably well in any soil which is not too poor o wet, if eucouraged when first planted, by mixing a little sandy loam with the common soil, and taking care that the plants are two or three years old before planting out which should be done May; that they are not pot-bound and that they are elevated above the common level of the ground when planted. These conditions being attended to, little else will he required except in dry weather, whe they should be watered, and shaded with a few branches tuck round them as a screen from the sun. The object of this notice is to give only a general outline of the habits, hardiness, and locality of the rarer or little-known species : it will, therefore, be best to group them according to the different countries, and mark the divisions, if any, ning to their locality and appearance, which will giv Section I.-Mexican species

Ist Division.-Fine-leaved; with long slender leaves
these may be expected not to be so hardy as the other speeies belonging to this section.
iike those of P . sylvéstris, found by M. He place culled Ocotillo near Real del Monte, growing from 40ft. to 50 ft . high, and is probably about as hardy as \(\mathbf{P}\) halepensis.
2. P. pátula ; also three-leaved, with hard hora-shaped
cones; found growing 60 ft or 70 ft . high, at a place called Guajolote, is as hardy as the preceding
3. P. apulcensis; a five-leaved species, with rougb eggshaped cones, found by Mr. Hartweg, growing 50ft. high, the preceding
. Devoniána; a noble species, with the leaves in fives, and cones a foot long, from the Ocotillo near Real del Monte, where it is called the Pino blanco or Pino real. It is as hardy as the preceding, and forms a large tree.
P. macrophylla; a fine and rare species, with the leaves, which are from 14 in . to 15 in . in length, five in a sheath. It is from the neighbourhood of Real del Monte,
where Mr. Hartweg only found one cmall tree, but it no where Mr. Hartweg only found one small tree, but it no
doubt will form a large tree. It is as hardy as the others belonging to this division.
belonging to this division.
taining a large size; common the-leaved species at guco, at an elevation of 8000 ft above the seat; it doe seem hardier than the others belonging to this division.
. leiophylla; has five leaves in a sheath, and small cones. It is the Ocote claino of the Mericans ; a valuable timber-tree, growing from 60 ft . to 100 ft . high, and the is aber is so hard as to resist the plane. ganguco ; it may be considered as hardy as any of the d.rision.
8. P. oocarpa; another five-leaved species, from the Volcano of Jorullo, growing from 30 ft . to 40 ft . high; it is probably the tenderest of all the Mexican Pines.
oocarpoíles: has also tive leaves in a sheath; it resembles the precedin, species, but is much hardier, and was found on the mountains of Guatemala by Mr. Hart-
10. P. filifolia; a splendid species, with five leaves, from 15 in to 18 in . long in a sheath. The tree attains a Guatemala, and seems tolerably hardy.
P. Monterumre ; has the leaves ini fives, and rather coarse. It was found on the road to the Sumate near considered as one of the hardiest of this division

2d Division.-Swamp Pines; with long leaves and few branches, like P. palústris; they may be expected to prove hardy.
12. P. Hartwegii; has the leaves in fours, but someimes in ives. it was found on the Campanario, growing of gopylt. where the Oyamac, or appear at an elevation of govot. where the Oyamac, or A/bies religiosa, ceases \(t\) is quite hardy.
13. P. Russellina; a five-leaved species, with the foliage
ery long, like the Swamp Pine of North America ; it is found on the road from San Pedro to San Pablo ; attaining large size, and is probably quite hardy.
rid Dirision.-Short-leaved; which may be con-
14. P. Llavesina; leaves five in a sheath, and rather
short; it forms a small tree, from 15 to 20 feet high, on the Cardonal, near Zimapan, and is well known to be quite
Strob. P. Ayacahurite; this gigantic species belongs to the found samily, with five very short leaves in a shenth and by M . Ehrenberg, at Omitlan, in Mericor. Hartweg, 16. Abies religiosa, or the A ramel Fir of
is one of the largest and most beautiful in Mexicans: ing 150 feet in height, and five or six feet in diameter. at an elevation o 8000 or 9000 feet, and is quite hardy.

\section*{Section II.-Californian, or North-west Americad} species.

Division-Five-leaved; these are the tenderest kinds, while those with short leaves are generally hardier, particularly in this American group.
California growing to a large size. It is hardy enough in stand an ordinary winter without any protection, hut killed by the severe one of 183i-8. It is one of the most ornamental of the genus.
18. P. californica; has the leaves mostly in threes, bet sometimes only two are found in a sheath. The cones are unknown. The species is found in the neighbourbood of Monte Rey, in California; hence the name sometimes plied, Monterevénsis. It is a small tree, hardier than P. insígnis.
19. P. Monticola, a fiveleaved species with long cones, which belongs to the Strobus or Weymouth Pine division It was found on the mountains at the grand rapids of the Columbia, and in California, growing to a large size. It is hardier than either of the preceding, but seems a delicate kind, and probahly would do best on a dry sandy soil and elevated situation. It is extremely scarce.
leaves, and cones ; one cone weighed 41 bs whe received from Douglas.
20. Pínus macrocárpa; leaves three in a sheath, and with large hooked cones weighing upwards of 4 lbs . each It is found growing from 30 ft . to 100 ft . high, and 4 ft . in diameter, in company with the next species, ou the north-west coast of America
21. P. Sabiniana: another three-leaved species, baving the leaves much more lax than those of the preceding, by Which they are easily distinguished from each other
was found growing from 110 ft . to 110 fl . high, inhabiting the aqueous vegetable deposits on the western flank of the
Cordilleras of New Albion. This is not so hardy as the P. Cordilleras of

3d Division.-Short-leaved; all either Spruces or Silvers.
22. A'bies amabilis; leaves simple, cones much larger than the following. but like them in shape. It was found in Northern California, and was sent hume, by Douglas, without any other ace cunt than what the name convers. It is quite hardy, but rare.
imple: the cones are oblong nis noble Firare fat and Cound growing from \(1 / 0 \mathrm{ft}\). to 200 ft , high in Northern California, in low, moist valleys, and is quite hardy
24. A. nobilis; the leaves of this species are simple and twisted; the cones are very large, with the bracts longated beyond the scales, and serrated. It forms vast forests upon the mountains of Northern California. The
timber is said to be of excellent quality, and the tree is timber is said
quite hardy.
25. A. Menziésii ; a handsome Spruce Fir, with small sharp-pointed glaucous leaves and oblong cones. It is
found groving to a large size in Northern California, and, found growing to a large size in Northern California, and, like the preced
is quite hardy.

\section*{ON THE SPANISH OAKS}

IN looking over some of your early numbers I observe query from a correspondent ( R.) respecting certain oako mentioned in the article "Ruercus" of the Penny Cyclopredia. As I think my observations on the subject are quoted in the article alluded to, I have great pleasure in answering the inquiry. Before going to Spain, I had recently studied the llex very attentively in the Sonth of Europe: immediately on entering Spain Dobsersed that
the llex so common in the vicinity of Madrid was quite the liex so common in the vicinity of Madriu was it was
distinct from any one I had seen elsemhere, and as it the autuma I soon became acquainted with the delicious acorns it produces. Subsequent observation not only chich name it is distinguished from all other oaks, evergreen on deciduous, is the natural grortio of tise soil of the greaten part of the Peninsula, and that its range is from the Columns of Hercules to the High Pyrennees it fuund it at Andora, and its remains extend nearly as ligg as Benasque), and from the shores of the Jediterranean to the wountains of Craficia and Asturia and the Base but the common llex, though in scanty nurbers, replaces It not only is speab over the rast I hate described, but as far as an elevation of 2 to 3,100 feet, where the Toza, and other deciduous oaks succeed it: it is naturally the great forest feature of the country, the Spanish soil having been once covered with it quite to as great an extent as this island formerly was by our Ive oak.
I soon ascertained that the Encina was identical with the Gramuntia of the catalugues, a name given from a wood which once existed at Gramont, near Montpelier, whic I believe no longer exists, and which had been probably planted, as I have, since my return from Spain, exam Iles different parts of Provence, and found only the common lies.
so widely spread over the Peninsula should have escaped the notice of both foreign and native botanists, it is not more so than many other things connected with the
description of that region. Finding a species thus indigenous, and not only widely spread, but furnishing from the earliest periods of history to the present time a source of natural wealth in the food it affords both to man and substituted for that of Gramuntia. I was then ignorant that the name had already been bestowed on a species which has no claim that 1 know of to such a distinction, had not occurred to me at the time I wrote the notice of the tree. The writer of the article in the Penny Cyclo pædia states that Ballota is probably as meaning acorns to think that my description of it, as mote from general accep-
generally, was too wide. As generally, was too wide. As wrot received meaning in conver sation, I was afraid I had given too wide a construction but on referring to the dictionary of the Academy, fruto de la Encina, Roble, \&c., which is exactiy as I had rendered is is called, is still more so It is exactly as if foreign botanists had landed here, and finding an oak a little different from their own, had culled it Quercus acorn. There is no generat name in Spanish for evergreen oaks that I know of. Each species has its own distinctive appellation, Encina, Alcornoque (Corktree), Corcoja, the Kur, covers all or most of the deciduous species.
Your correspondent inquires about the oaks of Mr. Webb: my attention was early called to his pamphlet, and I hurried to examine it in quest of information on a favourite subject. Alas! never was disappointment greater I was soon bewildered, beyond the power of delivery from the labyrinth of his synonymes. After several attempts more and more ineffectual, it was forced to relinquish it, and the very sight of the blue pamphlet produces as strong a disposition to the siesta as the most ponderous volume of Duns Scotus or Thomas Aquinas could possibly do. We have Q. Hispanica, Q. Valentina of Cavanilles, and Q. Australis, as synonymes ; he might just as well make Q. Robur and Q. Toza identical. He gravely asserts that Q. Luccombeana is from the Levant: why, the original hybrid is, or was at Exeter 10 years since, and the acorns with which it was covered, as they assured me, ouly produce the Cerris, one of the parents. There can be no question that he has been deceived by the multitude of spray, or young grides in the localities he que calls it, at some distance. No question they did; they are bad botanists, but have keen stomachs, and the sweet acorn is a favourite food, and Sancho Panza and his wife were equally keen in their discernment. Well may the writer in the Penny Cyclopedia profess his inability to reconcile these conkradictory statements; no doubt Mr. Webore clear, but he has made "confusion worse confounded," and his mediey of synonymes approaches to the state of what our neighbours term a "Gaimatias. We shail hope thatements, and will not publish in his large work these statements, and Iter Hispaniense than a foreign botanist landing from his yacht at Plymouth, and working along the coast to the
Hamber, would be entitled to call the work he might make Iter Britanuicuin The only way of accuunting for some of this gentleman's statements is, that he had not particularly studied the Spanish Oaks, nor seen the species in question
Another query is made by \(\boldsymbol{R}\). respecting the Platanus Orientalis. Why called P. Hispanica I declare I can give no reason. It appears to be a case of lucus a non for I not only never saw the Platanus growing wild during
\(m y\) extensive tours in Spain, but 1 do not recollect seeing a cultivated specimen. The prevailing trees on the walks of Spanish tow ine prtreme south Alameda) and a small-leaved Elm. In the exreme south in the tierra caliente, they have others of more recen which Ition: the Cherimoya; a pepperthers. The Moor who came from the south did not introduce a species which I believe is not found in the country. I shal certainly take the hint afforded by this inquiry, and having been the means of introducing the Larch the Platanus, which would an recommirably in many parts, Granada for ex ample.-S.E. W

\section*{COTTAGE GARDENS.-NO. XIX}

Having noticed in a former number, p. 308, the preparations which are necessary to be made for the rearing of Cucumbers and Vegetable Marrow, we will now describe the method of treatment which, under ordinary circumrespect to the Cucumber: when more seeds have vegetated than are required, remose all but two. or perhaps three of the healthiest and strongest plants, taking care that doing so the latter are only disturbed as little as posatems, and give a genth waterng without wetting the leaves. As soon as they have actuired their first rough leaves and thrown up a shout, pinch of the point of it in out the vine or branches for truiting. Thene are to be trained as they advance at regular distances over the ridge, and secured with small hooked pegs from being blown aboat and otherwise injored by the wind; when they have extended the length of two or three joints they
or not, the points of the several branches must be pincied of again; and this practice of stopping, ason, with now and
be continued at intervals during the season, then a thinning of any small wiry or barren shoots, and such of the old leaves as are beginning to decay. The Vegetable Marrow requires more room than the Cucumber and to be treated in a different manner. No pinching of the young shoots is necessary excepting mekirst one,
this is only send out as many branches as are wanted. These are to be trained against a hedge or fence, or simply along the ground, the same care being taken in either case to tie or peg down the branches to prevent their being broken, a recommended above for the Cucumber. An occasiona thinning must also be given them, and such lateral shoot removed as are interfering with and robbing the principa fruiting branches. When the weather is hot and dry, watering in the evenings must be regularly attended to The first crop of Beans should now be gone over, and is the pods are beginning to form at the bottom of the stem, it is time to pinch off the tor of the plants, which will have the effect of checking their growth, and otherwis hastening the maturity of the crop. Weed and thin the Onions if not already done, and where there is a failure the ground may be freshened and the thinnings trans. planted immediately after a shower. Attend to what wa stated last week respecting the transplantior sirecting Prepare some ground in the same manner is a vegetable p. 180, and sow with Swedish Turnip. This is a vegetable much esteemed by cottagers, and remains sound and goo M.E. H.

ON THE CULTURE OF THE CALCEOLARIA.
About the middle of July, when the plants have done flowering, preparation should be made for propagating the different kinds-the herbaceous, by dividing the roots; the shrubby, by cuttings. The plants shoula be encourage in their growth a short time previously to this operation of judicious watering, the remaining flowers picked off, and the stems allowed to die down that no nourishment ma escape. A little of the old soil should be remored, and top-dressing of fresh compost added, in which the shoots gill readily take root, those shoots that do not touch the soil require to be pegged down.

The cuttings from the shrubby sorts should be struck singly, in small sixties, in a frame with a gentle bottomheat, kept shaded, and rather sparingly watered; when rooted, air may be more freely admitted, and the plants gradually hardened. As soon as the roots appear through the soil, they will require shifting into forty-eights, and to be placed in a house where they may receive plenty of to air-side air and drafts being prejudicial to the free growth of the Calceolaria; then the sun bears considerablepor the plants should remain on the shady side of the green house;
to \(51^{\circ}\)
About the beginning of September, those plants which are growing vigorously will require shifting into larger pots; and when large specimen plants are required, this operation should be repeated as often as the pots are filled with roots ; liberal drainage should at all times be given, and regular watering carefully attended to, never allowing the pots to get dry. The decaving leaves should be renoved, for if suffered to remain upon the plants. they cause mildew, and much injury ensues. The plants require to be frequently examined, to watch for the appearance of the green-fly; and when discorered, a check should be put to their increase by well fumigating the plants, and repeating the operation if the first ac young and downy difficult to dislodge these pests from the young and damp leaves. The house should be irequently steasned by damp ing the flues, as the Calceolaria thrives best in a mois atmosphere. During the winter months the plants must be removed to the south side of heing drama up weakl This the possible, and prevent theil the beginning of March when a gentle watering over the heads with a fine rose or syringe will prove very beneficial. As the power of the sun begins to increase, and the flowers approach thei blvoming season, it will be necessary either to shade the plants or remove them to the zorth side of the house, suffered to remain in the sun and allowed blom before attaining a desirable height and aize. When the flowerattaining a desirable heigar should commence, and a stick put to each shot that it may rise in its proper place, and assist in forming a regular head of bloom. A supply of liquid manure twice a week will give additional strength to the plants, and cause the flowers to expand freely. compost for the Calceolarias should be the following barrowful or lonm ; one do. bog-earth; one do. cownan for the winter potting ; an miditional hali-barrowfur of bog earth may be used, for which, in apring, a half-barrowful of loam should be subatituted. -W. Catlough, Hans-street
A NOTE UPON THE NEOTTIA GEMMIPARA
Is the fourth volume of Smith's English Flora, p. 36, Is the fourth volume of smiduced to the knowledfe of new British plant was ine of Neottia gemmipara. It was described as having been found in Ireland, near Castetown, opposite tu Bearbaven, on the morthern side of Bantry Bay, in the County of Cork, in small quantities; and adescription of the plant is added from the pen of Mr. James Drummond, its discoverer. The briel specific charaatio given by Sir James Suith havius actorde of this plant and as to the essential parts of the atructare of tis plast bistory ba become s. matter of great interset to thowe who
are occupied with the flora of this country. Smith adds to his description that several living plants were sent to So Cor garden, but their roots were destroyed by rats the specimen in a figure was made by Mr. Sowerby, from 2786. M Mackay, in his Flora Hibernica, states the locality to be Dunboy, near Bearhaven, which in Sir William Hnoker s British Flora is called Dunbog. Further than this no printed information concerning the plant was to be procured the plant, while preparing for press the last part of my Genera and Species of Orchidaceous Plants.
Ir pors referring to the Smithian Herbarsum, in which Mr. Drummond's best specimen was preserred, I was not a little surprised to find that in external appearance the plant has all the appearance of the spiranthes Romanzo viana of Chamisso; a plant found in the bogs of the loxes valleys in Vnalashka, not uncommon, and at once dis tinguished from all the neighbouring speries by which the foil, and the large lanceolat The specimen in Smith Herbarium does not admit of an examination of the structure of the flowers, so that I cannotaffirm its identity with the Unalashka plant-but at the same time there is eral resembla their being really the same.
That a plant hitherto found only in one of the Aleutian islands between Northern Asia and America should also inhabit a sog in County of Corls, is so singular a fact that whatever interest the plant formerly possessed is now greatly increased. With a view therefore to ascertain as
far as is possible the esact spot in which Mr. Drummond far as is possible the esact spot in which Mr. Drummond met with it, I applied to the Rev. William Hincks, who gentleman spection of the original journal made by Mr. Drummond during the excursion in which the discovery took place, as well as of a letter from him, written in 1825 , when Sir Flora Smich was collecting matering are extract 1810, July 30 . Left Wattevile in the morning, and e to Mr. O'Connell's of Derrinane.-July 31. Left Mr. O'Connell's early in the morning and proceeded along the river Kenmare for four or five miles, when I got a boat which took me across the river to Beark very fine landed nearly opposite Glenboy, where there is a with very lake surrounded by high mountains corered with very long heath, and a few trees of different kinds growing from that to Castletown, where I had not the least appearance of a road, but by knowing the direction I easily found it out.-Aug. 1. In the morning I set out for the Durseys? When I had got about five miles on the road very heavy rain came on, which obliged me to return without having The following dav I set out for Hingy Hill, and though the day was very unfavourable I reached the top of it. The only plant I found upon it which does not grow on the neighbouring monntsing was Rhodiola rosec I found Spergula serinoiles upon it, but that grows abundantly pen 1 The following day I spent upon Bear Island. I found hothing new upon it, bat a rery eurious species of Ophrys, which. I lelieve to be nexe, upon the main band, opposite o the western redoubt, grouring in a salt marsh near the pecimens." This is accompanied by a rough but characteristic pencil-sketch of the plank
In his letter to the Rev. Dr. Hincks, dated June 7 1.3., he cays. "The plant sou rrite, fout is the one specimens preserved of it were the one you sent to sir the late Mr. Dickson. It is a genuine species of Deutha, very distinct from spiralis, and every other species I have ever seen described. Only five plants were found in 1810. I went again to the place in 1812, and could not procure a aingle specimen. It grows in a small marshy pot, on the sharo of the main land, exectly opposite the pestern redoubt on Bear Island."
So very exact an indication of the locality of this most interesting plant will, it is hoped, emable some of our Irish friends to rediscover it. Mr. Drummond's having himself failed to do so upon his second attempt improbable that the no disco apears periodically, sometumes re a season, as occurs in New Holland terrestrial Orehdacea.-J. L.

HOME CURRESPONDENCE.
Pruning Forest Trees. - The article on the management of Birch, by " \(A\) Young Forester," and your remarks on thinking them likely to lead inexperienced foresters into occurred during my practice. I friu... if mine had two Hawthom hedges cut down
of A pri! sher coning into leaf. The former had made scarcely any shoots on the 9 th of August, 1826 ; While the latter had made shoots be-
 is also found from experience that a great difference exists in cutting corf-rods of Hazel, Birdcherry, or any other kind of wood before the early winter monthe or lete in the spring; the young shoots on those plantis eut late in the spring are more numeroun and mantetronger than those

antumn or winter are apt to be killed or severely injured, while those cut in the spring even after they are in leaf make stronger and more numerous shoots than those cut at the fall of the leaf, or soon after, will bleed to death but by waiting till it breaks into leaf it may then be pruned with impunity. This proves that all copious bleeders, as they may be called, such as the Birch. Tine, and many more, should not be cut down or pruned till they begin to leaf. You have said the "Young Forester is right," and "that it would be easy to show from physiological prineiples that the practice he recommends for Birch, viz. to 3e cut down in the autumn immediately after the fall of the leaf or just before winter, and not in the spring, should be applied to all trees cut down for stools." The facts I have stated are the result of practice, if not frome physiological principles; both cannot be true, and I am not aware how they can be reconciled. I always prefer prunat these seasons, little will be required in the winty done trees intended for stools are cut down when the sap is in a dormant state, the frost, dry cutting winds, and strong a dormant state, the frost, dry cutting winds, and strong hard, that buds will not be so readily emitted by it the eap so soon set in motion, as when the tops are left on till the sap is in motion in every part of the tree. From this It appears that if we wish to weakena too vigoroustree, prune early; if to strengthen a weak one, prone late in the spring. The same rule applies to coppice-wood, more especially to copious bleeders, as the Birch and Oak. In addition to the foregoing reasons for cutting or pruning late in the spring, the new-made wounds are not exposed to the weather for five or six months, and thus no partial decay of the exposed circumstance alone I think of importance, wound. This circumstance alone chink of importance, as well as that [As soon as we can obtain a little room we shall revert to this letter, and show why we look at the subject differently from Mr. Billington, whose opinion, as that of a man of great experience, deserves full consideration.]
Acclimatising. - It is not certain that your opinions on this subject, as developed in p. 323 , will obtain general concurrence. The idea of a power of 80 much promise, and so flattering to human ingennity, will not be readily abandoned; and I think I see an array of pens already marshalled against you, with arguments and facts, some masin, I dare say, you are right; and we hare really little power to alter by any mode of culture the original consticution of the majority of plants, or little reason to conclude that the continued operation of external circumatances of place, temperature, or the like, through any 40 the temperate or frigid zones. It is not too much, perhapb, to assert broadiy that this would have been done alFeady by the hand of Nature, if she had not prescribed limits to her own powers in this particular ; and assigned, with much and variable latitude, to every class of organised beings its proper "habitat." Nevertheless the flexibility of many plants, their capacity for variety of form colour, hardihood, and the like, bespeak the possibility of great changes, and we cannot be insensible to the numetorif period. Some plants do not seem capable of any thig period. Some plants do not seem capable of any greatest use to man, have the widest range, and seem to
be capable of endless varieties. How widely the cereals be capable of endless varieties. How widely the cereals
are extended, and how epdless seem to be the rarieties of are extended, and how epdless seem to be the rarieties of
rome of our fruits, and how various their degrees of hardihood! The animal world offers many analogies that favour the conclusions of much latitude of modification and pomers of acclimatisation. Take the horse, for example; if not, like man, a native of the tropics, he lives in a state of nature within a few degrees of those low latitudes, and, passing through all the intermediate ones, is sourhern heraisphere. If the same stock furnished the Arabian, the Flanders mare, and the Shetland pony, why and acclimatised series! But it is not my object, at present, to irapugn so mach the general conclusions of your argument, as to draw your attention to the reconsideration imparting bardihood to plants ; or rather of enabling them to resist the power of frost. In following out your deduccons on the destructibility of plents by frost in proportion to their succulence, and referring for illustration to the comparative immunity of such as are grown in high and ary satuations, you seem to overlook a consideration of far places in times of severity. I do not deny that plants more in sap, and have more water in their composition, than the same kinds standing in dryer and more sterile
sitrations. But it is not so much the moisture of low placea, or the saceulence of the plants that grow in them, hat do the mischief, as the sharper frosts to which such
 tome of the nights of aurcmon zad early spring. The and condition of higi and iow places in the latter case ; in the former. At such times the "woody ralleys" are not warm andick, and woe to trie tender plants that are guch times attend strictiy to the circumstances that determine the comparative intensity of eold \({ }^{3}\) h hish and low
so much on the presence of water, or the radiation of ca-
loric into the atmosphere (for radiation goes on as rapidly from high as from low grounds,) as on the gravitation of cold dense air into the low grounds, and thence the rapid abstraction of warmth from all objects presented to its in-
fluence. So that it is not the lioxnriant vegetation fluence. So that it is not the luxuriant vegetation, and
the damp soil of the " Valley of the Thames" clines your tend the lalley of the Thames" which in escape growing on the Surrey hills, or on the high grounds to a temperature below what their ressels are aubjected haps to actual congelation, when those of the last-mentioned places are not. I will venture to say that in some sunk from five to ten degrees lower in open situations subk from five to ten degrees lower in open situations Highgate Heath; and a difference of two or three degrees is life or death to many of our out-door exotics, and even, will allow me the use of the word) acclimatised forei-ners It is pretty certain that this country was never visited by a severer cold than that of the 20th January, 1839, and three or four degrees ; nerertheless frost by more than sufficient to make such an impression as was never before witnessed on the Common Laurel, the hardy indigenous Furze, the Walnut, and even the true English evergreenthe Holly. In many low situations in Sussex, on dry and injured as to lose all its "lop and top," whilst in high ones it remained unscathed ; and it is worthy of remark that the youngest and most vigorous trees escaped where noxiousness of mere succulence. Of two Figs in my garden, one growing in a high and particularly dry situbeen so much damaged by the frost of last winter, that all its last years wood is destroyed, and it shows no fruit whilst the latter, although its tips are withered, has some fruit buds remaining, which are sprouting vigorously. have no doubt that this latter plant was exposed to a lower demperatare by several degrees (both were ancovered) during the hard frosts of December and February. I be whichat the superior vigour or vital energy of the plan power of resistance. But the discussion of this branch of the subject, the power of resisting the influence of cold and other destructive influences inherent in the principle of vitaity, and of the variableness of that power accord-
ing to circumstances of time and place, health or disease would lead me beyond the limits I have prescribed to my elf in these hasty observations, which have already grown to too great a length. \(-\boldsymbol{P}\). P.
Acchmarisation.-To prove that your theory is correct as to the subsoil requiring to be dry for the acclimatising of plants, I can give you an instance at Glazenwood, of fine we had planted several years since a great number the consequence was that we lost them all by the succeed ing winters of 183:-38. Many of the kinds planted on drier subsoil have survived the last four winters, particu tree (9ft. high) has not suffered in the slightest degree from the late intense frost; we believe it to be the same variety as that described by Backhouse in Australia; the largest tree he measured was 247 ft . with a diameter of
18 ft at 6 ft. from the ground: the wood is extremely hard and the young branches secrete an aromatic gum : it is very fast growing: the specimen we had killed had reached 20f. We have had a large bush of the White Indian Azalea growing in the open ground for the last four years, without the slightest protection, and it is now flowering Yellow-Henry, Curtis, Glazenwood.
Management of Peristéria Barkéri.-The success that has attended my treatment of Peristéria Barkéri has in When the pseado-bulbs were received from Mexico by Mr. Barker, in 1835, they were in a healthy state, and were soon afterwards potted. The best manner of potting
them was with me a desideratum, and before I succeeded perfectly I made several experiments, but none produced such good results as the following:-In the first place I took either a square twig or a conical wire basket, (made by Mr. Petty, Bartholomew-street, Birmingham,, the put in pieces of potsherds, afterward that of the pseudobulbs, and lastly, filled up the basket with peat in pieces about the size of walnuth. This being done, I placed the plant near the glass, for I find that in such a situation
they vegetate better, and are more healthy. When the plant began to grow I supplied it moderately with water, but as its growth increased a larger quantity was given, and when it was in fall flower it was watered freely. Some of this elegant tribe of plants are injured if syringed over head : such, however, is not the case with this plant; on
the contrary, such treatment seems to suit it, especially the leaves. The plant having flowered, and the pseudobulbs being matured, (but in a dormant state,) they should not be remored from the same temperature they were in \(81)^{\circ}\); but especial care should be taken to keep them dry until the pertud of rest is over. By this mode of which flower at intervals all the year round. As a proof of the excellence of this treatment I have just had a pranot Fith seven spikes, or scapes of flowers, each of which wan three feet long, and bearing from 30 to 37 blossoms each, three inches in diaraeter. The pseudo-bulbs are six inches
bigh, and 11 inches and as half round, and the leaves are
three feet long, including the petiole, and four incben wide
\(-T\). Insleay, Springfield, Birmingham T. Insleay, Springfield, Birmingham. occasion for a fire-place against a wall, in which no floe had been provided. imagiued and successfully adopted the expedient of making a flue of slate, placing beneath it a fine was of the sort called Valencia, which is found tor the a considerable heat without injury. The angles werear together with what is called iron cement, and the put probable that this mode of making flues is susce. It is some useful application to marming conservatories: of more rapid passage of the heat through slate wall the compared with brick, might render a much smaller length of flue sufficient, which of itself would be a great advinErythrina
Erythrina crista galli, pallinted nardy, \(-A\) strong root of 1st of May, in soil of equal parts of good loam and leafmould, with a little sand, will flower in September as freely as if rept in a stove or greenhouse; a plant han lived out little sand, or coal-ashes, produces about the end of this month many mhooth, It produces about the end of this month many shoota, which heat, provided the shoots are taken off with a bit of the may be left to exhibit their splendid coral spikes in the Enis. as summers are more dry and warm in England than in this country, I am satisfied this beautiful plant would grow as freely as many herbaceous plants, by a little protection during winter.-P. Keane, Lismore Castle.
The Cricket.-The Cricket, Gryllus domésticus, wis sons, and falling into their foants by flying apon their per ways to destroy them, with insufficient many prescribe it occurred to me most fortunately to try a commen spitting-pot, with a small piece of fat floating in water, and Two were placed within the enable the insects to atcend 12 months, 2251 Cricke kitchen fender at night. In 12 months, \(22 \%\) Crickets were drowned in them.-

Strawberries.-The usual mode, and that which isn commended by Mr. Keen, is to make plantations of ruathos in summer and to plant the beds in March. To best who are impatient, the following course is perhap small pots sunk in the earth;-plant them as soon as they are well rooted in their beds: only planting them twice as thick as they are to remain, let them fruit the neat year, and as soon as their fruit is off, dig up every other plant: if the runners are put in early and kept clean, and prevented from making new runners, and the barbarons
plan of cutting the leaves in the autumn is avoided, fair crop is obtained the first year, and one season
Frankf
strack some years ago in the public walls being mach at finding some beautiful greenhouse shrubs planted in the open ground, growing most luxuriantly and in full flower. 1 found that during winter they were protected by a which house in which there was a stove, ac., appeared to be growing in a parterre forming part of the general garden, there being no vestige of the building. attempted in England; surely it might be introduced with great effect in such a place as the Italian garden at Chatsworth, \&e I suspect this house no longer exists at Frankfort: in one or two later visits I have looked for the place in vain. As public gardens are now beginning
to be thought of in this country, I may mention that those on the old ramparts of Frankfort are let out to a gardener who either for the value of the land, or at a small price, engages to keep them in order and have alWays a stock of flowers-he in fact using them as a nursery
and seed garden. I believe that some plan of this kind may very soon be safely adopted in this country. It is clear that "the people" as they are better treated, are less inclined to tear and destroy that which they are ado mitted to enjoy. At the Zoological Gardens, where any decently dressed person is admitted for a shilling tieketh fbelieve there is no instance of the flowers being destroyed: whilst mentioning this eociety I may observe that it would perhaps he wise if they were to follow the I example of some great people, and deal a little in free tracic. s. ones, the number of visitors would be more than doubled. Many very respectable people with four or five children, can only afford one or two visits in the year.- - ,
Dotrble Yellow Roses.-E. R. is much obliged by the notices which have been tiken of his anery, concerning double yellow roses. His four beds however did not perish last year from excess of vigour as X X X supposers, ysed no further progress, and the edge of the unopened flowerleares appeared as if some minute insect infested thens, though it kept itself invisible. The north bord
I pomere stons.-Mr. Beli of Hornsey informs us that our correspondent R. F. is in error in beliering that Ipomoes stans has not yet flowered in England. He states that last year he raised several plants from seeds given him blossom. The plants died down in the winter, but the cubers are healthy and are now breaking vigoronsly
The Advantage and Economy of Raviv-water.-W0 ant
not aware of any article of common consumption which may be productive of more comforts to a family, and to the gardener, than rain-water. Many perjons are practically askre extend, not to originate, a practice which I am sure is appreciated by all who have adopted it, and will be so just stood. Rain-water is valuable in every situation where it can be collected in sufficient abundance. In London, and in large towns, it is apt to be contaminated with soot; hereafter described. Wherever it can be obtained pure, or rendered so, it is rater in the very lest form. Io the gardener it is all but indispensable; our plant particularly the heautifai rems of the pasture and thowergarden, if an ample sup py of this zite of nature be at his indebted to it fur their inmediate emmort than any other indebted to it fur their inmediate comise and the facility persons, because of its great sonness, and the facilitytions in which they may emproy ion. or chemical solutions of lime, which renders them hard. Rain-water is generally supposed to be onpleasant to the palate: if, homever, it
be caretally collected in the firit instance, and properly filtered, it is found by experience to be the pleasantest water that can be drunk. I have seen the rain-water from like that of a cheese-cloth, into the water-butt ; there it deposited any impurities which were not caught by the the newly-invented portable apparatus. The water was perfectly bright and pure, its flavour (if the term be admissible) was delicious; in fact, it was the finest water I ever tasted, not even excepting that of pellucid mountain of the vapid insipidity of common rain-water remained, nor will that ever be juerceived if the fluid be properly collected and strained. If I were adilressing this to a resident of that chalky but most fertile eranary of the metropolis, the Isle of Thanet, at the nerth-east point of kent insure his instant assent to my unqualified assertion, that a gread. In some parts of Berkshire I rind tanks of the kind are in use; but with the exception of these two districts, the real filtering rain-water tank appears to be are generaliy constructed of a cylindrical form, Bomerthe resembling a shallow well; they are suak in the ground, and should be built with stone, made secure by being jointed with Roman cemeat; but good mortare parts of finely-sifted coal-ashes, and one part of the very best lime that can be got (particularly that from thoroughly burnt limestone, not the magnesian),
will answer extremely well. If it is intended for the nicest culinary purposes, the internal surface must, however, be accurately and entirely covered with a coating of the ce-
ment, of at least one-third to half an inch in thickness. No ment, of at least one-third to half an inch in thickness. No
lorick ought to be used even if coated with cement, as they have the property of rendering soft water hard, and for a considerable time after the tank has been made, if the bricks were new. From 1000 to 5000 gallons of raindust ; and if the fluid, in passing into the reservoir, be made to run through a filter prepared by putting into deep tub a quantity of well-washed sea or river sand, the depth of a foot or more-over that a stratum of bruised it will be effectually smeetened, and purified from all extraneous paatters. This tub might either be bored at the of a broad funnel, into the tank, or be furnished with a false wooden bottom pierced with holes; the intervening space would then be filled with water, when a common tap, passed through a stave just above the true bottom of the sub, could convey it away into its under-ground recipient. A tank, I have stated, is built in the ground; the opening at top is always secured either with fiat stones. or with and fitted dome, in the centre of which a sto moreable and is occasionally taken up then it is found needful to clean out the tank: but if the purifying filter were em ployed, the water would be so effectually cleansed that little or no deposit could ever be formed, and it therefore would keep weil for a very long period. A few pounds
would cover the first expense of a medium-sized tank; and Would cover the first expense of a medium-sized tank, and 1 believe that a sum under [102. in the whole would also furnish it witi a punip and pipe. by which this puritied,
and salabrious water could be introduced into the dwelling, the hothouse, or the greenhouse, and be thus atways ready to be applied to the several purposes of domestic economy for which soft water is so indispensably requisite. Under common eircumstances, nine-tentis of the rain-water that falls on every dwalling, hothonse, and their offices, are wasted: by the plan sugrested. a large portion of it would be sared, and be rheaply rendered available in the best and tanical and Zoological Gardens, Leeds.
Coloured Media and Artificial Atmospheres.-The criopen connected with peculiar coloned media. is full of singular promise. Experiment has long continced me of the affect the hygrometric as well as the thermometric con dition of the atmosphere, not to mention its chemical constitution, irrespective altogether of its relations to radiation. Professor Morichini's experiment, as well as
of magnetism to steel, that electricity must be developed, coloparted magnetism to a steel bar suspended in a violetenlnulerates vermination ; and De Candolle states that a vine grew an inch in an hour during a thumder-storns. Cress, \&co, on moistened coloured cloth, and found that germination was difucrentl \(s\) affected by the rarious colours, and that black was injurious and almost destructive to vegetation. This I attribated to the action of the salt of
iron. The experiments of Mr. Warde in reference to imprisoned atmospheres are remarkable, though the phenomena are not a little obscure. The changes here super-
induced seem to move in a circle. The electric condition of light. as affected or mondimed or the glass screen is no doubt intina rely comnected with these mutations. Mossea and Ferns are the plants that chiefly luxuriate ; but the Dinnea muscipula, Cephalotus follicnlaris, Drosera rotundifolia, Parnassia palustris, and some others, succeed best under glass covers, and afford an illustration of the remarkably atikets vegetation, not meerely. I apprebend, in the equalsation of temperature, and the softening influences of its humidity, but be medifying abrupt transitions and alternations of heat and cold, as well as the commu-
nication of a chemical product. Mr. Warde's plan affords nication of a chemical protuing experiments on artificial stmospheres.-J. Murray.
- Bark Moropinty.-Having read the reply of Mr. Paxton dealing on the part of the tenners respeching the price Oak-bark, permit me to explain the method of bark peelFigland, which, thoush it may be adopted in other places. is not done under the manngement of Mr. Parton or " \(A\) Young Forester," and, therefore, may be acceptable to bow. In a geral way ints of olak timher are snla standing, the purchaser being obliged to have it all re-
moved witha a specified time; and, therefore, at the proper stason they emplar a number of skilful woodmen to fell the timber in a workmantike manner, not haggle hack, as in some of the midland and southern commetes
but cutting it by the axe as low as possible. A number of boys follow, cutting of such brasches as a numbert peeling. which work is generally performed by women many of whom are more expert than the men. The bark is dried in some oppen space by treing laid on two rails or poles 18 or 20 inclies apart, and supported about that distance from the ground by the poles resting on cloven, or orked, stakes driven into the ground, which stakes, and \(\mathrm{O}_{\mathrm{n}}\) this temporary scaffold the bark is usually dry in a fortmight or three weeks, when it is carted to some shed stand long, will require to be covered with a canvas cloth, or straw ; but it is usually prepared ready for the tanner by being cut into small pieces of not more than three or iously scraped or payed amas or it is then put bein in sack and weighed (and is sold by weight, not by the uncertai way of measuring). The intended purchaser generally examines it before putting it in the sarks, and if the price be setted the seller delivers it when it is wanted. I never before beard of such a thing as a combination amongat Chatsworth. Generally exist in the neighbourhood of casile, Sunderland, and Darlington are all anxious to obtain goud home-grown bark, and although the price is to make it so. Last year good bark was \(\overline{i l}\). 10s. to 81 . per ton, and the expenses against it may be from \(2 l .5 \mathrm{~s}\). to 26. 158 . per ton for peeling (including the felling of the trees), 10 s. per ton for chopping, and 15 s. per ton for
carting it into the house, and from thence to its final deivery, learing about half the price clear profit. The above charges 1 know to be correct from actual experience. what Mr. Parton or the "Young Forester Whil state value of their barls, and we shall then lnow whether we are before or behind our southern brethrea in the economi cal mode of barking and felling trees.-S. N.

The Potato Crop.-I have seen in your Chronicle a good deal about l'otatoes. I beg to say, I have not changed my seed, the Black American Pink-eyes, since 1815 , and any one. I consider it owing to early planting, and giving them plenty of time in the ground to ripen well before any frost romes. This year all mine ware in by the loth and the earliest March 14 th. If hard weather is expected 1 put my manure upon the sets. I only grow one kind
for eating and cattle. Many are only now putting in their Potatoes ; mine are having the second hoeing.-J.B. II Bark Monupoly. - Mr. Paxton haring erpressed a wish that I would inform him jif I superintended the "taking up of the Oak I3ark spoken of is my letter to you upon the falling, stripping, and delivering of the whole of it Mr. Puxton is in error when he supposes I am
Tanner." I am, as I have signed myself; a "young Forester, and my motive in taking up the subject as i have attack upon the sanners. but had attempted to justify Limself by citing arguments, undoubtedly correct, but no I sincerely hope Mr. P. will throw some more light ufon the subject-A Foung Forester, Kidderminster

Failurs of Potato Crop.-In the Chroniele I observe some remarke from Penth relative to the failure of Potato
crops; and I have no doult that the failure has almost
together, fran end beeping the seed in large quantition or ener, frequently before being perfectly ripened. I have plan of laving upon the trane fincog up, adoplill the become ereen and hard such I'utatoes as I intend for seed the following yeur, and keeping them by themselvea during the winter. By this means I have never known any to fail when there has been a rery general failure in this country ; and I have notient chat a general failure has mostly followed a bad seasen for ripening the tubers hardening the secd tubers were adopated there would be much stronger and more bealthy phats would come up much stronger and more bealthy.-
New Rose.-We have lately received from Mewrs. Rose, hy them called "Rusa Deroniensis." They state that it is far from being as fine as they shortly expect it to Ther arc of opinion that it possesses properties which pant. title it to be considered one of the finest Roses which has ever heen introduced. The flowers which we received were finely formed, very double, much above the average size; and it is evident that the plant has a rigorous and excellent habit. We also found it deliciously fragrant ; somewhat deeper centre. The flowers, though large somewhat deeper centre.
and double, had expanded freely, without any imperfection or hard green eye.

\section*{FOREIGN CORRESPONDENCE}

Oahe, Sandwich Islands, June 10, 1840. - It is quite surprising how very extensively the natives hert make use of their indigenous plante; and 1 suppose it may be considered es aign of thear recas conare thom atate of barbasisn. Sondrich Inluder' food. The former, I need hardly tell you, is the bruised root of the Caldinm esculentum, more or less mixer with water; the natives eagerly gather round a calabash of this, their bright and lively eres sparkling with delightful anticiptions. There is only one why of eatingit correctly, according to Sandwich Island ton, and that is, to dip two fingers into the dish, and then to transfer them dexterousIy to the mouth without letting an atom fall back; the Po is then removed in a manner better fmagined than described. The root of this plant, when cut in slices and
baked. furnishes a regetable I decidedly prefer to the Potabaked, furnimhes a vegetable 1 decidedly prefer to the Potatute for bread, and have the slices. fried dry. lud by their plates. I prefereating it in my plate as a regetable. As you are alsoaware, the root is extremely acrid before cooking: but it will perhaps be new to you that the natives have a custom of dyeing their native cloth or tapa by immersing of a black coll esculentum) poarel colone is ob tained by taking some of the soill between the roots of the Aleuritestrilohs, and alsosome of the bark of the sametree. The tapais heated with these; but minute particularn I could not learn, as the natives are jealons of some of their cuntom becoming known to the whites; st least po I was informed onvery excellentanthority. The bread-frait is not thet utaple article of food at these islands which it is at the Society Islands. It, however, grows plentifully on one of the group, but I have never seen is used, or been able to get a taste of it. Several kinds of Fera are used as occasional food; perhaps the Angiopterisevecta is the most common. The natives will sometimes strip of the fronds, and scrape the mucilage from the internal concave antace; so jou see they are rather epicures in their way. From a ferm, which the natives call Hapee, they gather the chaffy scales, and stuff beds and pillows; these are light and elastic and are really prized by foreigners. Their arrow-root is sugar ; and if they had it not, the roots of the Tea-plant (Dracæna terminalis) monld formish both gar and spirit The latter was recently largely made from this plant, but the missionaries are now so powerning in the language of the islands, it is tabooed. Wime is that, in the language of the islands, it is tabooed. Wime is under the same ban; the rine grows well, and goontine
has been made. But what will you think of the state of these lorely islands when the natives hare been compelled by the missionaries to root op their thriving coffee-trees Is it not strange that none of us have discovered a single Orchidacea in our rambles? Nor can I hear that any are indigenous here. Yet there are several in the soich lslands. Your last letter, though non rather a distant getation. Here is one as a speciraen: Atmosphere of Tree-fems, dry season, 2 P.M., near mountain stream air in shade, \(86^{\circ}\); soil and water of strcam, Frankfort, April, 1841.-1 have found but little in the botanical way here yet. except Rintz's Nursery Gar
den, which is a very good one. Besidus a good assortment den, which is a very good one. Besides a good assortmen
of common plants, which seem rery well kert. he has several of Baron Hugel's and Dr. Siebolu's, new things which I had never seen, and some shrubs I do not remem ber in Englant, especially two species of Ilex-l.carolimiana and calamistra-the former certainly a handsome plant here, except \(Q\) pseudo-suber. There is a singular sessileacoras usually single at the very end of the short sidebranches, so as to seem terminal. The public walks hers teresting shrubs, and some are very fine qpecimens, chiefly American trees of all sorts. I find Catalpas, Gleditschias Koelreuterias, and several others fruitins here, which d

in the spring I shall find it worth while to send over a in the spring I shall find it
Boston, \(C^{\prime}\).S., 3 list Dec., 1840 .-Perusing, as I do, most of the periodieals issued in Europe on Botanical and Horticultural subjects, and haring paid some attention to them daring my long residence in the vicinity of London, I feel much surprised that so few of the beautiful flowering plants which abound in this section of the Tinted States plants which gardens of Europe, and more particularly in those of England, where such ardent desotion to Horticule tural pursuits prevails. If it suits the nature of your new publication, I will send you from time to time an account
of some of the more showy species, with remarks on the of some of the more showy species, with remarks on the
soil, and situation of their native habitats, \&c. for insertion. It seems proper, however, to preface these accounts with a few observations on the differences of climate here and in England.
The prevalence of the westerly winds with you, besides brings from the banks of Newfoundland, that mother wet fogs and damp atmosphere, so much moisture as very wet ieatly to modify and decrease both the lightand heat of the sun even in serene weather; and the accumulation of
moisture in the form of clouds deprives the English clima:e moisture in the form's direct influence. Here we have reek of clear unclouded skies, during both summer and winter,
the rays of the sun unimpeded by the moisture of the medium through which they pass. Every cultivator will feel the importance of these circumstances on many plants, Which, however able to resist the highest degrees of cold in heat, accompanied by the increased dampness which the would have to encounter on the other side of the Atlantic. A hygrometrical register might easily be kept here, but we however, aware of any means of registering the intensity of light.

The winters here are much colder than with you, ous thermometer frequently ranging as low as, and even under zero. This is an entire bar to the growth of the beautiful evergreens which adorn the English winter garden, the
laurel, laurustinus, \&c. being here greenhouse plants. From this severe weather nature has however provided sufficient protection in various ways; for the denizens of the forest a copious fall of leaves, for the inbabitants of the plains a thick covering of snow, and for the swamp-loving plants a dense growth of moss, in which protection their roots are completely and thickly enveloped. There is another circumstance which has for years attracted my attention and observation, and on which I have only been prevented by want of time from institutig erpersents allude to the great excess of electricity which pervades the atmosphere in this chmate. Thave been otten astonished quently emitted on suddenly tearing one woollen garment quently emitted on suddenly tearing one worken garment occasional impossibility of combing the hair straight ; every time the conib passes through with any rapidity, each individual hair will stand out. Aurora Burealis is also quite
common here. That this state of the atmosphere exists ia common with hygrometrical difierences I have little doubt, and as little that its effect
particularly on some plants more than others. This is, however, a subject upon which I cannot give you all my it now with a design to call more generil attention to than it has yat received.
At the heat of our beautiful plants stands Calopogon pulchellus, waich certainly exceeds Bletia Hyacinthina both in colour and singularity of structure. This plant is plentiful from three to five miles from B ston: it g:ows
usually in low swampy places, but appears to me to delizht usually in low swampy places, but appears to natural bumnocks (hills; raised about a font above the swamp; the routs are usually sis inches belor the surface ; the mould is generally light black, sandy, and completely netted with roots of the various surrounding woody
plants, most frequently Vaccinia. Andromedæ, \&c. I plants, most frequently Vaccinia. Andromedx, \&c. cesisfuily to my satisfaction. ('an it be parasitic on any of

It is very nosible my want of success arosefrom the deficiency of a place similar to its habitat although resembling as much as in my porter to make it. plant, with single fluwer, pink and white, orche laceous yellowish, with piuk stripes and crested, in wet swamps, scarcely any earth, the fibrous roots enveloped in sphag nums, through which they seem to delight to rove; plan tiful three to five miles distance; as difficult to transplant
as the former.- Arethusa hallosa. The largest, and peras the former.- Arethusa inllisa. The largest, and per-
haps most shows of our orchilacea. grows in abundance in swampy meadurs; earth light and sandy. I have nerer tried to move this, but suppose, owing to its bulbous root, that the difficulty would decrease.
I will now quit the orchidaceous family until another letter, premining, however, that there remain many yet Gentians crinita is the most beautifol of arr natise gen عians, and grow in plenty whout two miles from this: so an anua, is found is darop meadows, and by the side long grass during the summer difficuit to discover in the bloom in the month of September and October, in conimon With many other annuals it soon withers and dies. I have it regetate. I confess, how hever, theat from want of time mey experiments have not beek ganerally made with suffthe preceding for beauty; its flowers mever opean and
generally grows with a dwarf habit. I have, however, one secimen in my herbarium, gathered in a rich swamp a Oak Island, about five miles from Boston, with 19 flowers as a wherl : the height of the plant, or group of plamts, nificent.-Subtatia Chluroides. coloured plant I know but one locality, about 35 miles rom Boston, and five miles from the cona of Plymouth it grows there in abundance on the borders of a pond; it
is a biennial. I hare sume plants in pots, raised from seed. In this way there seems no difficulty with it here, and cer pond is also found Drosera filifolis in plenty. Gerardia Ausa, glanca, perticnlaria, \&e., are tall growing elegant plants, with bright straw yellow fowers, about the size of beginning of September. They are found in dry rocky whods in abundance. There is some difficulty in trans-
planting these. The whole plant is extremely tender to the touch, tl.e slightest laceration of the cuticle turning ith the injured. The seed is difficult to vegetate: it is like many
of the orchidaceæ enveloped in a tunic of beantiful construcThis tunic, previous to ripening of the seed, is a value or use after ripening of the seed I cannot tell; but fran young plants. There is room for much curious observation on the habits of these speci folia, fc. are annuals which flourish abundantly in almost
every damp spot around. They are sometimes found on dry places, but then become of dwarfish habit. Their lovely rose-coloured, but fugacious flowers are extremely ornamental and lively
NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.
 where Orchidacea and Ferns delight to grow, are found many pecies surfaces, and are said to maintain themselves by aerial roots, like those of our iv. In our gardens several have now
been established, not, however, under the names that properly been established, not, however, under the names that properly
helong to them, but with such as error or caprice have dictated. This, for instance, that in the gardens rejoices in the name of the Wallich, which has larger calyxes and smaller cornollas; nedither is it that which Dr. Rowburgh called "the parasitical,", from the
forests of the Garrow hills, as some will have it, for that species has flowers "large, pendulous, crimson-yellow, approaching in shape and size to those of Digitalis purpurea," our Foxglove. appears, on the contrary by br. Wealich. No doubt it is a native of
from all enumerated India, but from what part, or when introduced, does not appear. A stove piant, requiring a strong heat and damp atmosphere to a large piece of rough stick, placed in the pot, the remaining
space in the pot being filted up with a light mixture of leaf space in the pot being filles up with a light mixture of leal-
mmonld sandy peat, and a small portion of loam. It strikes freely trin cutting, and is one of those plants which seem to have no particular time of tlowering, for the time of flowering depends
mive on the time the plants are rested than the season.- Bot. Reg. Enarvir Cumrwit, Mr. Cuming's Coelogyne.- Store Epit. . 1 thow eollected hy Mr. Cuming, and by him sold to Messr:
 aretyolperies. with the white flowers, and a bright yellow blotech minated by ar..ep orange stain, and have shmattest, they artlying tevtherampendage on each side of the outer ridies toward- the termina-
tious. It is to thesc little peculiarities in the surface of the iabel. lum that many tribes of cis ciicuceons plants owe their varied asobserved, furniin the best characters for di- tingulshing the spe
cies. surb as shants Dendrobiums and plarts of that kind. 1he pot must
the weil drained and filled with turfy peat or sphagnum, to which the creeping stem should be faitened with wouden pegs and the
preado-bulbs left uncovered. \(f\) water is allowed to lodge about
 phyte has been imported by Messrs. Lodidiges. The sen alls and
petals are a clear creem colour, just tinged with violet at the tip
the former. The lip is the same as in the original variety, but ai the former. The lip is the same as in the original variety, bu
sumewhat taler.- Bot. Reg.

\section*{PROCEEDINGS OF SOCIETIES.} Whe hasten to correct some errors that crept into our Report
of the great meeting at the Giarden of the Horticuitural Society. We find that Vanda teres, and Cymbidium madidum, were exhi-
 of Streatham. BuTINICAL SOCIETY OF EDINBURGH. The Botanical Societro met on Thursday evening the 11 th of
March in the Ryal fistitution, nr. Greville in the chair. The
following gentlemen were elected fellows of the society:- ResiYollowing gentlemenh were elected fellows of the society:- Resi-
dent fellows 1. John F. Oqilvie, Esi., M. A.St. ©uthbert's Giebe,

the same important part equally in all classes of plants ans
animals. For example, the shape of a leaf in oree erinis flant
might be common to all the included species, and be thene incapable of aftroting a specific character, whilie in the next penus

 ant to the botaniit. and partly to puint mut a semace bf character
Which has not been sufficiently appeciated, he had been intured
to devote a portion of his time to the esamination of numeroul to devote a portion of his time to the esamination of numerous
species of the fanily of violacue. Amongt the irrevular
flowered genera of this family the stamina are onten jrovided with
door

 patustris presents an example. 2 . Relations of Nectary and Spur
-The spur usually varies acordine to the form of the netery
whe the nectary is lancet-shaped the spur is generally broad and spur, and when linear, with a louns slenders spur, oftern of great
length, as in the Pansies. Viola pestata and a few exatic sper have blunt round spurs and limear nectaries. 3. Relation of
Nectary and Colour of Flower.-Colour is generally carelessy Nectary and colour of Flower.-Cohur is genera.ly carelessly
noted in botanial writing, and often omitte, but in some cases
it may assume a specific inportance, and in certain genera it may evan be a true source of essential character. In the genas yiola
blue, yellow, purple, and \(\begin{aligned} & \text { white are the colours seen. The blue }\end{aligned}\)
 iola canina and m ntana. In the one case the vellow passes
into white. in the other into purple. Whitis rarely the normal
colour of a violet. The lancet-shaped nectary is chiefly associated wut nerer with the reetimes whith the yellows passing into white, Nways linear nectaries. The violets which are normally white,
derived from blue, have always lanceolate or rotund appendages never linear. The odorows viliets have always flowers of purplethe colour does not necessarily imply the odour. The Yellows ages. Among the canine Violets the lancet-shaped nectaries are folnd lenythening in proportion to the mixture of purple in
the blue, but the contrary in corulean flowers and their derivatives, milk-white ones. 4. Relations of Nectary and Leaf.The nectaries, as have all those with lanceolate or truly ovate leaves, and some of the pinnato-palmate. A few with cordate and some
with pinnato-palmate leares have linear appendages. All the Dansies or Violets with ovato-spathulate leaves have also linear appendares. Mracteas and Stipules; 6 . Relation of Nectary to Stem; and,. The gengraphical distribution of racters to be obtained from these relations, he thought a very
natural arrangement of this extensive genus might be made. natural Forbes then stated verbaly his views with regard to the clams of certain British Violets described in our Floras to be Viola lutea had been impioperly described as species. He even thought that V, tricolor mirht posnibly be referred to that species,
Sir William Jardine coincuded generally with Mr. Forbes' views, both as expressed in the paper rea: to the society and in his suba considerable elevation, where formerly \(V\). Lutea used to grow,
V. tricolor had takenits place; whilst on the surrounding turf, which had not been plouyhed, V. Iutea existed as before.
2. On the Botaical Characters of the British Oaks; by Dr. Greville.-Dr. Greville mentioned that during the last three jears
he had paid considerable attention to the botanical characters employed in the discrmination of the British laks. He stated
that his observations were founded upon the examination of a that his observations were founded upon the examination of a
vast number of individuals; and in reading his paper referred to numerous igures inustrating the most strining forms of the eare
along with the peduncle and young fruit. In passing under
view the characters supposed to reside in the leaf, he showed that the relative lengtth of the petiole was very inconstant No charac-
ter could be obtained frons the circumscription of the leaf, as all the ter could be obtained frons the circumscription of the liad, as ant the better guide. The base varies inuses are acnte, and rire rersh; and sometimes both lobes and sinuses are obtuse; at others Don
are acute. The starry pubescence atrributed by Professor \(D\) in
to Q. intermedia, Dr. Greville ascertained to be present in a greater oless derree in the ?oung state of nearly all the forms,
and in fact could be traced in the adult state of nearly the whole
of his series of specimens, comprehending the extreme from Q Robur to \(Q\). sessilifora. If the leaf be taken in conjunction with the peduncle, no permanent character whatever presented itseif, ares
the anthor agreed with Hr Leighton in his remark that the lares
of our Oaks "vary without the least reference to the absence or preseme or relative length of the peduncle." in regard to the peduncle itself, every intermediate in length, as was remarked by Dr. Greville that in proportion as the peduncle present ias it sometimes is in Q. sesslinicra, it is very short and robust. It appears that as the peduncle deviates from the
state as it is iound in \(Q\) R tracted, the acorns (no bonter produced at the usual intervals) The acorns are as sportive as the leaves, so that no characters combination, seem to be availalle for seprarating our native oals. Ander his observation, and to the reported dinference in the qua-
uity of the tinber of Q . Reniur and Q . ses-silifra, the author con-
 stil requires much inventitaton. It has not been in my power to
 media, and scseititlora are at present distinguished, pasa insensi-
bly and completely into each ether, ande cannot trerefore be depended on in collecting acorns for seed, and supplying the
dockyard with timber." The paper was illustrat by most dockyard with timber," The paper was Gill
extensive senes of specimens from Dr Grevile's Herbarium, showing every conceivable rariation in the length of the pedunc
and outline of the leat. Sir William Jardine thought the subje a most important one, and suggested that the propriety be entered upon by some of the members
of the Society. 1 it should be found that two species really from promiscaously planting these, and not from ciifference of
soil, situation, or other circumstances, then characters whereny

 case with the Larch A. communion from Mr. George Gardner was read, con-

 Sented Society then proceeded to the election of a vice-President, in the room of the late Daniel Elilise Ested, when Dr. Christison was the roomo of Dr. Chistison. This being the amiversary of the supper in the Hopetoun Rooms, Professor Graham in the chair,
and Dr. Neill acting as croupier in the bbsence of or. Christison.

as teceiving sat er eport of the the councer
as

 its list from every diterict in the exing dom, end ond of recordine the

 tion to the completion of that system heen applying their atten accounts, which they have adopted as the most simple in its details; and to which reference was made at the last general
meeting. They have aloo drepared fer the inspection of the uditors a balance-sheet of the accounts tor the whole of last year, Jhawiug the receipts and payments of the Scciety from the 1st of account of the state of the tunnts of the Society at the endo of that Year, and have reported to the council the further permanentit in-
vestment thes have already made this year, in the purchase of
 any probaijle expenditure the be incururred during the year, suff
 themsel ves called upon to state, that the amount of arrears due
from members is becoming so large that it will be necessary for trom membert is ibecoming so lareve that it will be necessary for Hhat is now due, bot to preventa s similar accumulation in future,
 The council having reeeived from Mr. Wyon, her Majesty's chief
medullist at the sint, the dies for the medal of the society, they
 dividuals whit have suceesfrulls ebtained these hesitiont to the in-
 of Cambrides, in promptung the objects of the society, they have
on this occasion not only to to trate the contiruued interest of that

 that the new part of the journal will be published immediatelv, and the council have decided to renew the conditions of the model experiment proposed last year on the growth of Swedish additional porizestry meeting to be heite this year, have deeited on
 distributed into to be classes. The The this yearool for primple sheents sontall be be the details of these arrangements, as well as the general regulas each member of the society. in diri.e atine tharivg pronsented toact ass the Society's representative tation was seit by the conncil to the authorities of the town, and was received by Mr. Liolton, the present, and sir Joshua Walmsley,
the late Mayor, with erery mark of interest and
respect This deputation, reported to the council the resultat of their personal iuspectou, when it was resolved, that the piece of ground,
termed the Oid Influmary Yard, and offeret by the Mayor and cor poration, should be accepted as the site for the Dining Hall
 and Dinner Committees, and Mre Luced foss seopsitory for the purf

 who should inspect the progress of their erection. and Mr. Wild having been elected to that ofice, he has proceeded to Liverpool for the purpose of making arrangements sith the coutractors to
be emploved. The Council having decided that there should this year be two days for the estribition of the stock instead of one, as day, the 21 Ist of July, and that of the Ceatle on Thursday the e 2 nnd of the socemaining open tall 2 oclockik on the Friday, the dinner place on the Thurscay. They have aso directed that Cataloguses, contaiiuing a listo of all the subjiects of the
 aunounced at the same time as those for cattle. They have de cided that the saie of dinnertickets shall only take place at Liver-
pool, commencing on Tuesday, and continuing open to the Mem-
bers in pool, commencing on Tuesday, and continuing open to the Memfor such as were elected by the esth of March last: and that aiter
the first weel in July no further election of members shall take the tirst week in July no further election of members shall take for nextyear's meeting, have decided in selecting the city of Bris tol as the most suitable locality for the Annual Country Meeting of ment and agreeably with the new bye-law resulating the announceforet has been prominimally agreed to, and will be laid before you The beterinary Committee having had referred to them the numerous answers sent in reply to the curcular containing qieneries duced into a classed formed, for the purpose of comparison and mittee, and Professor Sewell, as the representative of the Romal Veterinary College, having been requested by the council to lay Defore the Journal Committee for publication their general re-
port on this important subject for the full information of the
Members of the Sociaty. After some observations by Lord speabers of the socisty. After some observations by Lord

Society, which tis leristip ascribed to the country members not
knowing how to remit the amount of their subscriptions, the ad the items contained in the general \(25 / 35\) shee which gave a balance in the banker's hands of \(1,725 \% .3 \mathrm{~s}\). Id. in of Mr. Rafmond Barker, seconded by Mr. Ellman, Henry Handley, motion of Edmund Wodehouse, Esq., M.P., seconded by Lord ion of eighteen of the members who went out by rotation, and the addition of the following new members from the general body
of subscribers:-P. Pusey. M.P.; Colonel Thomas Austen, R. W. of subscribers:-P. Pusey, M.P.; Colonel Thomas Austen, R. W. Baker, E. W. W. Pendarves, John Villiers Shelley, Estcourt So stated that the medals had just been placed before hum, and pro ceeded to present them to those gentlemen whohad gained them. The Gold Medal to Captain Carr, for his Prize Essay on 'Rura Economy abroad,' the Messrs. Ransomes, for the exhibition of
Agricultural Implements at the Oxford Meeting ; and Mr. Cuthbert Johnson, for his Prize Essay on Plantations. The silve Sedal to Mr. Salter, of Hallingbury, Essex, for his Com-dressin Mr. John Clarke, of Long Sutton, Lincolnshire, for his universal Ridge Plough. The Medals destined for those who were not pre pool meeting. The following gentlemen were then elected au ditors for the ensuing year : Mr. Thomas Knight, of Edmonton, Mr. C. Hampden Turner, of Rook's-Nest, Godstone, and Mr. John Rolf, of Beaconsfield, Bucks, aud a vote of thanks was unani-
mously voted to the President for his raluable services. The Pre sident assured the meeting that he felt deeply the honour con his thanks. His duty had been light, as there was such a good working council. He was glad to state that the number of members had increased from 3,500 last year to 4.59 .5 this year. There
was no fear now of the future prosperity of the Society. Wher was no fear now of the future prosperity of the spirit of Agriculments for the plou hoped to see ploughs sent from all parts of the kingdom. There were some he knew coming from Sussex, and he hoped to see
some from Scotlaud hear. Arrangements would be nade at the Liverpool Meeting that the ploughmen should not be interrupted, round them. The ground should be so kept that the men might be all at work at once, while the public would not be debarred rom seeing them. The council had increased the prizes-
there would be one of 20 and another of 15 guineas. This, he conelusion, he thanked the meeting for the honour they had done him. The meeting then separated.
The usual meeting of he Regent's Park, Sir George Staunton, Bart., Vice-President fllow members: Mrs Ord, Lord Foley Mr made to the list of Davey, Mr. J. Price, Mr. R. J. Pitter, Mr. M. W yatt, Mr. A. Wylie, Mr. C. Dumergue, Rev. Dr. Dowdeswell, and Mr. C. Rich
ardson. Mr. Cade, H. M. Consul at Panama, was also pro ardson. Mr. Cade, H. M. Consul at Panam
posed a corresponding member of the Society.
Anniversary, May 24th.-Lord Bishop of Norwich, President, in the chair. This being the amniversary the Society met at one oclock. After the announcement of presentations of books, sc., ellows who had died during the preceding year the list was un asually long, containing the following names:-f. Bauer. Esq, Rev. Mr. Rackett, N. A. Ligors, Esq, M.P., Sir anthony Carhshe, bock, Bart., Rev. John Revett Sheppard, Viscount Valencia, Maj members, Gustavus Broling, of the Academy of stockholm; and ear 1 alates, Mr. Henry Wonds, of Bath, had died during the by the Secretary-Joseph Janson, Esq.. read the trea-urer's account : the receipts, from the admission of fellows, annual
payments, compositions and sale of Transactions, from May 1 st, 1810, to April 30 th, 1811 ; amounted to \(7 / 4 / 1 / 5\). \(3 d\). The expenditnre during the same period was 734.0 os . H1 \(\%\). The balance in the treasurer's hands was 77 l. 129. 3d.- A specimen of a remarkable parasite from Brazil called the Madra di Rosa was exhibited
by Mr. Parkinson. Dr Robert Brown also exhibited specimens y Mr. Parkinson. Dr Robert Brown also exhibited specimens of parasites of a similar nature: these specimens appeared to be attached, and which is probably allied to the genus Loranthus specimens of the Narcissus pseudo-narcissus, from the Isle of Wight, were exhibited, in which the flowers were much smaller which was also darker than ordinary. The following officers of the Society were re-elected: President Edward, Lord Bishop of Norwich, D.D. © treasurer, Edw. Forster,
Esq. ; secretary, John Joseph Bennett, Esq.; under-secretary, Richard Taylor, Esq. The retining members of the council were-
George Bentham, Esq., Francis Boott, M.D., W. J. Burchell, George Bentham, Esq., Francis Boott, M.D., W. J. Burchell, Those elected to serve in room of the above were-Sir W. J. Hooker, Joseph Janson, Esq., the Marquis
Parkinson, Esq., John O. Westwood, Esq.
Ipswich Cucumber Show. -On Friday, the 14th inst., an excelent display of the leading Cucumbers in cultivation was made at ciencies of all the varieties exhibited on this occasion, and it is only fair to add that the specimens exhibited by Messrs. Mills and
Weeden were cut from plants which had been in bearing from December last.

Sandbech Floral and Harlicultural Society, 1841. - The first 21 st inst., at which the flowers, fruits, and vegetables were ex-
cellent. The prize for the best pan of Tulips, consisting of six, was awarded to Mr. R. Ollier ; 2d do. to Mr. Steele. For the best Miller, 2d do. to Mr. Arlcock, jum. Amatours.- a ist prize to Mr.

South Essex Horticultural S Sontety. -The first exhibition this following were the principal prizes awarded :- Large colleg-
tion of plants, nurserymen, Mr. F. Frazer.-Small do., Mr. E.
 plants: 1st prize, Mr W. Sherrington. gartener to Mrs. Middeton; id do., Mir. R. Smith, gardeuer to N Willis, Esq.; 3rd do., Gadd, gardenier to T. Lennox, Esq.- Collection of six plants,
amateurs. 1 st prize, Mr poole ; 2d do, J. Mallard, Esq, 3 d do.

 - Calceolarias,

 prize, Mr. trust, gardener ; do. do., list prize, Mr. J. Duck amabasket of anazing size; they weighed several pounds - A few
prizes were awarded to cottagers fur vegetables from their owis gardens and irom allutments. \(\qquad\)
Royal Harticultural Society of Cornurall. - The first exhibition
or the season was held in the Polytechnic Hall. at Falnouth, on Thursday the 13th inst., and a more interestung and varied dis-
play of choice productions we have seldom wituessed : certainly, alay of choice productions we have seldom witnessed: certa have seen anything line the collections of rare and valuable piants that were brought forward on this occasion. The weather was delightful, and as usual the attendance of members and their friend is more interest taken ind horticultural pursuits by the public generally thaul in convall and it is pratifving to see the taste in these matters steadily increasing among all ranks thronghout the county. This is no doubt mainly owing to suck periodical exilar bitions as the present, and the well-directed exertions of sumular institutions having the same object in view, namely, the encoupy more room than we can afford to enter into such details as ase given in the hecal papers ; all we can do is to briety notice atew of the principal things that, either from their singulanty
beauty, or the excelience uif their culture, were objects of general admiration. Among these were some handsome specimens of hill; John P Maior, Esth, of Reuruth. and \(\rightarrow\) ir (harie Lemon, Bart., M.P.; consisting of sereral species uf Oncidum, Go. Be. longing to this tnbe we noticed the Hartwe gia purphrea, with the curiou-ly-spotted leaves and small pink-coluured atsy. It was frst time, it was stated, of its tonwering in the coumstuced from Guatema's, in 1810 , by \&. Skinner, Esq., already well known fot his liberality in making us acquainted with scme of the nost
heautiful productions of that interesting country. Fassng from the-e to plants more sencranfy cuitivated, several fine col specimens of Fuchsia rulgens in great perfectinn; severalias,
lections of (ieraniums, Encas, Verbenas, and Cinerarial which attracted misch attention, and were deservedy admired,
 noticed as a very distinct variety, and a beariful addithom be
those aireauly in cultivation. We hope and believe it will soon common after it has sot into the hands of nurserynaen. The shot of Fruit and Vegetables was rather limited, but ine specimess 0 both that were shown sustained their former character for size to such cultivators as Mr. Mills or Mr. Ayres. The Cotthers riety of excellent regetibles, some of which wondd, 角 our
have chailenged competition with thbse of thefr richer neigh-
bours. In concluding these hasty remarks, it is but right to bours. In concluding these hasty remarks, it is but right to
state that, to Mlestr. Fox, as well as to the Rev, W. J. Cooper
and sereal other memhers in the immediate vicinity. of Faland several other memhers in the immediate vicinity of Fat-
youth, we thins the societ is very much mdented for the
buge assortment of beautitul flowering plants sent from their Joge assortment of beatisul flowering plants sent t
respective gardeus for the decoration of the room, whi
. buted in mo sinall degree to increase the splenulour of
bition. The nurserymen, Mesers. Pontey, and Rendl bition. The narserymen, Messiss. Pontey, and Rendle, of Ply-
mouth, and others, also assistedin this respect, their rarious spe-
cimens being arranged in the gallery for the inspection of the

| six Onions, actumal sown (1840), do. Co-TAenien Pmizes.
 bited than on the present occasion. The deficiencr in this respect stance that wher the day for the exhibition was fixed the season
was ennsually forward, bitt a sucten change having subseqnently taken plare in the temperature. vesetation was mulb retarded which would have rendered it desirable that a di lay of a week
had taken place had it been possilie The show of Geraniums was remarkably splendid, with respect both to quantity and
quality Mr. Hnyle's Sylph, to which a first prize was awarded, was an exceeding \(y\) fine specimen, well grown, and in very exceland contained a larme number of new and heautifnl fowers. The following are the names of the 19 Geraninms for which Mr. I S. Carré obtained a first prize; Climax, Joan of Irc, Louis XIV., Fosterii Rosea, Vivid, Fanny Garth, Foster Alicia, Gains's Eing. was awarded, was composed of Climax, sunheam, Page's Queen, I ady Carlisle Oliver Twist. Foster’s Splendidum, A very pretty show of bnlbous plants was, as usnal, excellent It consis'ed of (2 pots', I. craterofles (2 pots), I rosea spléndida, Tritonia cónica, Rletia falcáta, Fladiolus cardinális inflátus His seedling lxias were
decidedly good; and his yellow seedling Sparaxis was considered to be one of the best vet prodaced, in size, colour, and pencilling. mired. Capt. Appleton's show of schizanthus, for which a first
prize was awarded him. did him great credit. It consisted of 10
pots, includine 8 varieties trantinary size and remarkable heanty, The Calceolarias were trell grown, and there were several fond ones cembited hy Mr.
Vidamour, who was the sreatest enntributor There was, howsingle named specimen "'The Bride " formed a beautiful exception the following varieties:- Teucrudes, Arraniânä, Hylansia, Máxima, Lambéti, Preta, Tweediána supérba, and Appletoniána.
The came gentleman's three pros of Rhodanthe manglesii were the bett eser profuced here, and whuld have done eredit to any
exhibition. Mr. Ifnle's secimena of Clematis aiehildit and
Clématis Florida were in fine honm. and excited much admiration
 Diplacus pimiceus Pamelea decussita, four varieties nf Erica, two Iuff, nurserymen, also sent gnod collections of plants. Two or
three dinzen Pears Beurre Rance. the prodtce of a standard tree, were exhihited by Mr. T. Dumareqq. They were in a remarkahle state of preservation: and it is to be regretted that so early period fixed for the exhibition had the effect of diminishing the quantity of frait and vecetables sent in by the cottagers, but
the quality and condition of the specimens produced was highly
satisfactory. - (Guernsey Star.)

\section*{MISCELLANEOUS.}

Effect of Coloured Light on Plants.-At the late theting of the Royal Horticultaral Society of Cornwall, tary of the Royal Cornwall Polytechnic Society, on the effects of light on the germination of plants :eriments I was then pursuing on the chemical influence of solar light led me to the discovery of some extraordinary facts connected with the action of light on vegetation. With the hope of exciting the attention of those engaged in horticultural pursuits, and of rendering some assistance -little though it be-in overcoming some of the dificul. ties experienced in causing the germination of the seeds of come rare exotics, I am induced to treapass on the time of the society. It is scarcely necessary to explain that bundle of different coloned reflection of which we owe all that infinite diversity of colour which is one of the greatest charms of creation. These rays have been long known to possess different fonctions, and have bence beell distinguished arrording to the chemical rays, the green and yellow the luminous rays, and the red the calorific or heat-giving raya. These distinctions are not in accordance with the strict truth, hat they are sufficiently so to suit my present purpoce. The considerablermeates coloured glasses porn to corresponds with the glass in colour: thus, blue glass admits the blue or cheurical in, the exclusion, or nearly so, of all the others; yellow glass admits only the
permeation of the luminous rays, while red glass cuts off all but the heating rays, which pass it freely. This affords us a very easy method of growing plants under the influfhet to which I wonld particitarly coll a teention is, that Whereas, under the influence of violet, indige, or blue
manner. The experiment is very readily tried by covering a box in which seeds are sown with soloured glasses. Plantz will grow most luxuriantly beneath glass of a blue natural process is entirely checked. Indeed, it will be found that at any period during the early life of a plant its growth may be checked by exposing it to the action of red or yellow light. Here we have the very extraordinary the greatest impression on the organs of sight, and that also which diffuses warmth through the creation, are much satisfaction that I find the results to which I have much satisfaction that ind fre corroborated by Dr. Horner, of Hull. In conclusion, I may be allowed to point out, that by studying the effect of these different rays, isolated and in different states of combination, we have the means of imitating
the nature of any clime of which a plant may be the habitant. By blending the violet with the yellow light in certain proportions, we may artifcially produce the light which shines on 'Syria's land of roses. By uniting with these the red light, we may produce effects on our which 'the acacia waves her yellow hair isolating the violet rays we may, to some extent, imitate the climate of the frigid zone.

Professorship of Bolany at Glasgour.-We understand that Dr. Balfuur has been appointed Regius Professor of Botany in this L'niversity, in the room of Sir William J.
Hooker.
Fegetable Reptiles.-The Megaclínium Búfo, or Toad Orchis, is thus described in the Botanical Register:-"Let
the reader imagine a green snake to be pressed flat like 'a dried flower, and then to have a row of toads, or some such speckled reptiles, drawn up along the middle in single file, their backs set up, their forelegs sprawling right and left, and their mouths wide open, with a large purple tungue wagging about convulsively; and a pretty strange plant, which, if Pythagoras had but known of it, would have rendered all arguments about the transmigration of souls saperfluous. It is a native of Sierra Leone, whence Messrs. Loddiges recelved whe show that the language of this account is justified by the plant itself, which is really one of the most strange that the queer motion of its tongue cannot be also shown.

M. Biot's opinion of Boucharie's Experiments on PreBring Wood.-At a recent sitting of the Institute, M. Biot offered snme observations apon this subject, the sub-
stance of which, as conveving the opinion of one of the stance of which, as conveying the opinion of one of the
most eminent scientific Frenchmen, will interest our readers :-If, said M. Biot, we consider the beautiful experiments of M. Boucherie on the injection of liquids into woody stems by natural aspiration, we find that they are
foanded on the discoveries of Hales, of the ascent of founded on the discoveries of Hales, of the ascent of
liquids in berbaceous and woody vegetables, by the double power of suction belonging to their roots, and the exhalation or eraporation belonging to their foliage. Hales has not only verified the existence of these two forces, but he means of the aspiring power of the leaves, he made not only pure water, but camphorated alcohol, and other perfumsed liquids, ascend woody trunks, and impregnate the cherie has done, but without being able to make them penetrate the fruit. At a later period another experimentalist, de la Baïsse, of Bordeaux, injected by natural absorption both woody and herbaceous plants with the red
juice of Phytolacea decándra : the ascension worked spontaneously, and reached, sometimes in a few minutes, the extremities of the most delicate leaves, and the petals of flowers, where its arrival became perceptible by the appearance of the colouring matter deposited there as the water of solution evaporated or was eshaled. What apcation of the principle recognised in these fucts, to carry iato the interior of the woody stems chemical agents which give them artificial useful qualities, which can mudify bustible and less liable to be attacked tither by cherical agents or iasects which devour thems. Mlany trials, judicionsly conducted, were necessary to discorer the liquids physical effeets desired, they did notuciter the tissue of the natural chnmels rapidy enough to become themselves an obstacie to their regalar transport and complete aspira-
tion. This is a fine application, whose results are already full of interest fur science, independent of their utility, which their practical application can aione appreciate. In
the circumstances under which the operation can take place, M. Boucherie has of his liquids can only take place at certain absorption of his liquids can only take place at certain
times of the year; and he says at the time the trees are times of the year; and he says at the time the trees are
" in sap." This specification seems to me not to ascribe the phenomenon to its "true mechanical cuuse. What is called a " state of sap," is that condition of trees when \& liquid runs from them if they are pierced, and which permits their bark to be easily detached, its inner surface being then lubricated by a particular juice called cam-
bium. But these two results in the same tree are produced by different causes, although they may in some cases take place simultaneously; and the manifestation of fitness for the aspiration of liquids by the stem alone, separated from the roots, as is necessary for the first ex periments of M. Boucherie. The running obtained by state of distension in the tree, in Which the sap, pushed upwards by the roots or previously accumulated by their action, is found in too great abund eraporating organs, joined to the hygrometrical property of the woody tissue. This phenomenon of distension,
which occurs accidentally at all parts of the year, although for every kind of tree at some particular time, is not a sign of the actual force of the evaporating and absorbing
power; on the contrary, it indicates its relative weakness and those trees whose sap seldom or never runs are perfectly suited to be injected by aspiration at certain experiments. The easy raising of the bark is also not a sign necessarily connected with the force of ascent, for the lubricating juice which then separates it from the albur contrary, it is secreted under the bark, with substances drawn from the centre, or perhaps it is secreted by the leaves, whence it descends exteriorly along the branches to
form or nourish the new woody matter. At least in trees where we can study its optical characters, such as the Birch and the Sycamore, the sugar which it contains is the same as that of the leaves, and the reverse of that of the ascending sap. Not being able to depend upon these indirect inuseful question to find the special characters which mark the time of the year when the evaporating power of every essential to the greatest force. That determination, so riments ought to have attracted his attention. But judg. ing from the extracts from his work already published, and from the report which has been made of it to the Academy, the physiological condition in question is not ye determined. For in the report, as well as in the last communications of M . Boucherie, it is specified that the tree
to be injected ought to be in full sap; and on another hand, in the first extract inserted in the Comptes Rendus, the antumn is mentioned as the time when the absorbing
force is generally the most powerfol. If I advert to these force is generally the most powerful. If I advert to these done and what there is to do. They will by no means surprise persons who have made experiments on the inward movement of the sap in large trees. Nothing equals the capricious diversity of its oscillations, between these three kinds of force, viz. the impulsive action of roots, the modified by the chemical radiations which accompany light, and the hygrometrical avidity of the woody tissue, also modified by the surrounding temperature. I had cut down 35 large Italian Poplars, all grown in the same soil. O these latalian Poplars, all gro wa (en état de plethore) which caused them to give it out from the lower section o their trunk, and one of the two presented all the phenomena of the ascension and emission of air that Coulomb has mentioned. The 33 others seemed absolutely destitute of the water in excess, and apparently prepared for wintering. I remarked on that occasion, as well as M. de Mirbel t: at the air emitted not only came from the axis of the tree that also from various points of the wet surface, and 1 proved that it was not carbonic acid. At the time of the experimen a small, bat very sensible thermometer marked in the
interior of the trunk \(+6^{\circ}\) Reau., and in the surrounding air only \(+5^{\circ}\) Rear. After many other observations, am led to believe that the contraction produced in the body of the tree, and the impression produced on its evaporating organs by this relative fall of temperature, are combined with indiridual circumstances which determine the state of fulness in whieh the plants were found. Similar variations
of conditions and of absorbing power must have been often of conditions and of alsorbing power must have been often
met with in the experiments of M. Boucherie, and the necessity of avoiding them has induced him to inject his wnods by a less sariable process; that of the introduction by ver tical filtration, which he announces as having perfectly tablished with hitn. In fact, according to the prinets which constitute its inferior apparatus for injection, and deprised also of its superior eraporating organs, is nothing more than a hygrumetric tissue, pierced longitudinally by tubes mor accidental fissures, or by still tiner channels, so that if this capillary system is once completely filled by liquid capable of entering it by filtration, and is placed verti-
cally, every new drop added to the apper section displaces an equivalent from the lower section, by the iucrease of pressure that it exercises-precisely as happens in a satarated with the hquid which we would filter. There is even a complete identity between the phethe woon of running produced by sich a filter, and by one, by filtration or by piercing, and under the influence
of constant or variable temperatures, for the liquids that the one and the other admit. I established this analogy
in 1833, by experiments made on portions of hranches roots, as well as on large rylinders of wood taken from the trunks of different trees. I made it public in \(t\) two 1833 , and the before tire Academy, the 11th of November, 1833, and the 10th of Feoruary, 1834, and they both have been published in the Journal of the Institute, vol. i., p. 229, and vol. ii, p. 60 . There is even a figure repre-
senting the process of filtration applied wood provided with an oblique lateral tube a block of think, on the occasion of the last memoir that I brought fitrate the Academy the phenomenon of instantaneous grounding upon this principle the construction of an ap paratus of double action, fit for collecting the sap from trees, by lateral piercing, both when it ascends and when tescends accidentally. In the letter that M. Boucherie has written to the Academy, on this second mode of his
operation, he says that "I should have been led by my operation, he says that "I should have been led by my
experiments to discover the process before him, if I had occupied myself with the same question." This is either giving me too much or two little. M. Boucherie gives
me more than my due, if he means that I should have been able to apply the process of vertical filtration to give woods new physical properties. Not only that idea did not occur to me, but if it had presented itself to my it without undertaking to follow it up, judging it to be too fureign to my studies and tastes. As to the scientific notion of the process, and its experimental application, which M. Boucherie has given me, I think that I can legitimately say that he does not give justice enough; added anything to what I published in 1833 and 1834 in the memoirs spoken of before. He even appears to me to have done less than I had done, in the interpretation which he gives of the results that he has obtained by
filtration; and I presume that my two publications were anknown to him. He announces, for example, that he extracts the sap from filtered trees; but, now, the produce that he obtained is evidently not the sap itself, but a compound solution formed by the liquid introduced, which contains what was left of the sap in a liquid state, besidea all the soluble matter which has been taken into the tree through the roots, or which has been formed or accume lated by vegetable life in the channels passed through by the don large cylinders of birch wood ay ple, that the large cylinders of birch wood or syca-
more, thus part with, in solution, the same kind of sugar which belongs to their ascending sap: but with this difference, that this sugar appeared to have been secreted by the vital action, and carried from
the top to the bottom during the summer in the woodr tissue. M. Boucherie has also found out that the filtered products are not identicul in the same tree at different distances from the central axis, or even at different heights. But I had pointed out beforehand the first of these results; and the second is a consequence of the diferent composition of the sap in the same tree at difierent devations at the same time, a phenomenon formerly cific gravity ; and confirmed since by optical characters, which have shown besides that in the same tree and at the same time, the sap pushed up directly by the roots, s generally different from that which fows back from the op towards the bottom in consequence of an accidental fulness of the stem and branches. This is sometimes erident upon simple inspection : for example, in a black of double action had been applied, one of the two saps was constantly seen tinged with yellow, whilst the other was colourless : and from what I can recollect of it, contrary to what might have been expected, it was the ascending sap that was coloured, and the descending sap that was ancoloured : at least, it is noted so in my experiment book, where all the rotary powers of the sap, separately served, are set down. Las on trees by filtration, has nothing in it which should surprise us: since, besides the real sap actually present in the stems, the liquid emitted always contains a proportion, more or less considerable, of the solvent matter which was introduced to expel it; so that the total volume of the filtered mixture may be increased indefinitely \(;\) and even in stopping the operation when the filtered liquid beconses identical with the liquid introduced, as M. Boucherie recommends, we must necessarily collect a mised volume much more considerable than that of the real sap. The Academy will be pleased to observe that, in making these remarks on M. Boucherie's experiments, I have not any intention of disparaging their merita. In referr, I wished ther are capable of, and also what of certainty or extension they can add to those views. Every day the applications on a large scale of in the laburatory or abstractshoors which the experispicion in the laburatory or abstract theories had given no suspicion a of ; and in return, those experiments and theories or onder
light upon the others, which serves to extend them, or their success more certain. In considering the woody tissue as a natural mould, capable of being transformed by injection into a new body, endowed with special qualikes for practical uses, M. Boucherie has conceisen a to useful and beautiful idea, but much more difficuit realise than operations purely chemical, because necessary to bring to his aid all the data that regetable physiology can farnish on the constitution of these systems, and on
heir mechanical actions in a live state; and it is not less essential to notice in the results obtained whatever can
enlighten or enlarge the ideus which science had already enlighten or enlarge the ideas which science had already
accuired. M. Bcucherie's experiments hare already furacquired. M. Bcucherie's experiments hare already fur-
nished to molecular physics extremely valuable data on the elasticity, hardness, and rigidity of the woody srstem They will enlighten regetable physiology on the constitution, and on the situation of the rescrvoirs, where are elaborated the recular secretions called the "proper injected br filtration or aspiration can or cannot dissolve them in its longitudinal passage, we shall know with certainty whether they are in communication with the channels in which the sap flows, or whether they are com-
pletely isolated, and separated by impermeable partitions. This general extension or limitation of the solvent power This general extension or limitation of the solvent power
exercised by the liquid injected, will be of great importance with regard to the more or less complete and general dispersion of the artificial properties which may thus be given to wond.
Paulownia Imperialis.-M. Neumann, director of the hothouses in the Jardin du Roi, gives the following account
of the manner in which he obtained the plant which is conceived to te Pawlownia imperiatis. In 1834 he reeived some seed's from a person to whom they had been sent from Japan in little porcelain pots. Of these seeds only one came up, but this was carefully attended to. In inches, but the leares dropped off. Being kept in a greenhouse, where the heat was probably too great, it put forth and quickly took root. In the third year the parent plant was removed into the open air, and in autumn set in, it still continued to grow, but the leaves fell off, without turning yellow ; the little tree was therefore surrounded with straw, and the root covered with leaves. The following spring, after enduring a temperature of \(6^{\circ}\), it was as flourishing as in the preceding autumu. In 1838 it grew with great vigour, incrensed proportionally in thickness, and put out two side branches. In winter it was again covered up, and suppurted a temperature of 140 so well that the tops of the branches were not in the least injured. This fact places the possibility of its complete naturalisation beyond all doubt; and, indeed, in 1839 it was even more flourishing than in preceding years. In the autumn of 1839 the tree was no longer covered up, because the early part of the season was not unusually cold ; but in January, when the thermometer fell to \(8^{\circ}\), the foot of the plant was surrounded by leaves. On Feb. M. Neumann was of a splendid green, and nine feet high. will one day become an ornament to our gardens, is Pawlownia imperialis, as he has not yet seen its flowers, which he belieres to be panicled, and of the colour of Digitalis purpurea. Siebold asserts in his Flora Japonica (fasc. I) that the Pawlownia attains in its native country a height
of 40 feet, and that it is the Bignonia tomentosa of Thunberg, which has since been placed in a new genus, and named after the Princess of Orange.-French Paper.
Dried Fluvers.-We some time since (p. 103) mentioned the beauty of some dried flowers preserved by Mrs. Bateman, of Leachurch Villa, near Derby; since that time others have been put into our hands from Miss sidew, of Etwall. They are disposed in grous One of these groups, consisting of a Tormentil, some Pe largoniums, a little Moss, a purple Potentil, a Daisy, some Quaking Grass, and a wild Geranium, is particularly pretty, and far more ornamental than the unskilful misture of yellow, and blue, and green, which is often called a drawing of flowers. The preparation of these little groups is an agreeable amusement for a lady's idle

Leares struck as Cuttings.-M. Neumann, director of the hot-houses in the Jardin du Roi, has furnished the
following remarkable case. A transverse cut was made in following remarkable case. A transverse cut was made in
a leaf of Theophrasta latifolia, so that the leaf was divided a leaf of Theophrasta latifolia, so that the leaf was divided leaf, which had been attached to the petiole, a little shoot made its appearance, and on the upper half of the cut leaf two shoots were developed. It is well known that the leaves of Theophrasta are dry and tough. M. Neumann did not at first suppose that it was possible that roots should be developed from such leaves, and yet, to his surleaf hich had first, whilst those which were on the upper half were developed more slowly from the mid-rib on which they were placed. As the roats developed themselves, the young shoots sent forth stems, and with careful management produced young plants.-French Paper.

Shakspenre a Gardener. - With regard to his youthful occupation, my claim on behalf of the fraternity of gardeners will be found, I think, to possess more verisimilitude than may be expected. Shakspeare's genius is confessedly universal; but his materials he necessarily obtained, like common men, from observation; and his by the nature of his emplovment from the age of fifteen to five-and-twenty. From that employment his thoughts must have received their first colouring: and as the technical lawyer was clearly detected throngh the mask or Sir Walter Scott's raried and extensive knowledge, so perhaps may Shakspeare' be his gigantic mind. The description of an aecomplished man, that he should know something of everything, and everything of something, will probably apply to Shakspeare : We need not, therefore, despair of discovering that some-
thing of which he knew everything; that something which formed his ostensible secupation till he adopted the pro
fession of a player; that somethinr which his early bio graphers supposed to be woolcombing, and which Malone magined to be witing for au attorney, but which I contend must have been closely allied to gardening or forest ing, or both. Nature never chose the desk or the work-
shop as the scene of a great poet's education. Shakspeare shop as the scene of a great poet's education. Shakspeare like Burns, must have received his inspiration among the fielus and the woods, and it is worth inquiring what it was that took him there. Your friead P. P. says that Sbah speare's knowledge is equally stown in '" all the walks of I will a position which I believe to be quite untenable, an one of his thoughts was to show that the prevailing widest sense of the wors In or a horticulturist, in the widest sense of he wis no other department of ar to minute and technical familiarity. Witness this extraordinary passage in the Winter's 'rale, which would fur aish the rery best motto in the world for a treatise on norticulture. Perdita has been speaking of the art of
producing varieties in flowers; an art which shares, she producing varieties in flowers; an art which shares, she says, with great
forms her that

Nature is made better by n.) mean
But nature maker that mean; so oer that art,
Which you say adds to nature is an
That nature makes. You see, sweet maaid, we marry
And make cenceive a bark of baser hin
By bud of nobler rae?. this is an art
Which does mend uature, -chanuge it rather ; but Then make your parden rieh
To which Perdita rephes,

> The dibile in the earth to set one put vip of them.
\(\approx \quad\) Here's thowers for youl.
> Hot Iavender, Mints, Sarory, Marjoram ;
The Marizold that goes to bed with the sum,
> Ald with him rises weeping : these are flowers
Oi midhle summer. 0 h . Proserpina
> For the dowers nuw - hat, trizitited, thou lets't mail
> From Dis'g waggon! Daffodils
That cume before the swallow d
> The winds of March swith beauty ; Violets, dim,
> But
> That die unmarried, ere they can behol
> Bright Phe bus in his strenthth-a malady
Most incident to maids : boid oxtips and
> Most incident to maids ; boid Oxtips and
The Crown Imperial ; Lilies of all \(k\) inds,
> The Flower-de-luce beinz one.

Witness, again, the Duke of Burgundy's description the state to which France had been reduced by the war a description in which Shakspeare's personal feeiings as an agriculturist have made him descend to minutiæ quite inconsistent with the occasion, and with the character of the speaker, beautiful as the speech is nevertheless.

That should deracinate such savagery:
The frecyled Cowsisp, Burnet, and green Clove
Wanting the scythe, all uncorrected, rank,

But hateful Docks, rough Thistles, Kecksies, Burs,
It may be said that in both these cases the subjects of the conversation necessarily led to such allusions ; but in the following the illustrations are purely voluntary. The Bishop of Ely, describing Madcap Harry's growth in grace and wisdom, despite his bad associates, says:-

The Strawberry grows underneath the Nettle
Neighbour'd by fruit of baser quality :
And so the prince obscured his contemplation
Under the veil of wildness; which, no coubt
inseen, yet crescive in his faculty
Again
As knots by the conflux of meeting sap,
Infect the sound Pine, and divert his grain
Infect the sound Pine, and divert his grain
Blunt wedges Troilus and Cressidn, Act, scene
That hath to this maturity blown up
In rank Achilles, must or now be cropppd,
Or, shedding, breed a nursery of like evil
In this last passage, besides its general tendency, we s cmark the minute becuract which assigns bhit wedges to hard knots. It might be supposed that sharpness was merely unnecessary; but not so: sharpness would be prejudicial, by enabling the wedge to choose its line of peneration, instead of following the "torive " course of the grin. This expression of Shakspeare's is as happy and as true as that of the statesman who illustrated the employment of agents too clever for their work, by the use of a harp knife
Troilus sass

In allusion to the notion of the moon's influence on plant ing and felling; while in "As you Like lt., a furester's in dignation is repeatedly shown at the injury done to the young trees by carving "Rosalind" upout their barks. Faistaft in "Henry the Fourth" says,
The Camomile the more it is trudden on the faster it grows. Clown that
He shall be net against a briek wall, the sun lonking with a a punishment which smacks a little of the current of a gardener's thoughts, as Heury the Fifth's praise of Hot-
nd Orlangst a grove, the ver straightest Plant,
both sarour consid'rably ag in of the torester.
The business of the scene, no matter how awful, or how remote in appearance froms such a \(\quad\) eccilitions, is never suf ficient to shat out this cias of faets from Shakspeare's
mind. In that most thrillug intervies betwen Hanlet mind. In that most thrillug intervie w betwem Hanlet
and his mother, he compares his umale to a " and his mother, he compares his unile to a " midelc'dear
 hay the compnst on the uevditum the then ranter." There would, homever, be no end to these exmmples, and I must now leare the question to the :urther mavesigition of the apulie; merely remirkme, that wherve. Sinkspear subiect, and shise nature, therevine is mare immaterial it is almost always a flower. Of course tiowers is not furnish very appropriate similes to the battle or the tempest, but where creation is open to him he resurts \(y=n=z a l l y\) to the garden or the wouls.

Juliet's fimiliar speech respeceing \(R\) unno's name
is like that where Lienry tic Mifth in dis ruise, speaking o The Vinlet smells to him as it doth to me.
So Don Jolin in " Huch ad.) about Nothing,
I had rather be a canker in a hectife, than a Ruie in his grace and an infinite number besides.
I have not time to count them, bat every reader must be aware that such figures as slips, scions, grafts, stocks, planting, pruning, flowering, cankers in the bud, Sce. Sce, planting, pruaing, flowering, cankers in the bud, Ske. Sce speare's own phrase, "plenty as biackberries;" while Prospero's final invocation.
fous demy-puppets, that
By moonshine do the greea-sour ringlets make,
Whereof the ewe not bites : ant yon who
Is to make minninht Minshronms.
proves his acpuant unce with the so-called foiry rings, and other agriculturdl superstitions.
Had I foreseen that I should ever adopt the vocation of critic, I would have made "priefs in my note-pook" of many similar examples, which, if collected, roold prove hat there is plenty of work for the Shakspeare Society, owhem il commend the task of establishing my position hat their hero was a Gardener.-. 1.

\section*{devictos.}

Elements of Botrony, Stuctural. Physiological. Systema tical and Medical; being a fourth Edition of the Linnley, P. L.D., F.R.S. London: Taylor and LiNDLEy,
Co., 1841 .
Those who are at all acquainted with elementary works on Botany must be aware that there existed a little book called ". Outlines of the First Principles of Botany"' in which the groundwork of the science was concisely traced by means of short paragraphs refering by numbers from
one to the other. It was nut a bo, \(k\) intended for amuse. ment, but a careful digest of the most essontial facts of Botany, drawn up for the use of those who wished to study it formally, and t. acquire a correct knomledge of the subject. It has now grown into an 8vo. of 292 pages, and the four little plates that it was illustrated by have multiplied into a large number of wood-cuts.
The difficulties that students alwavs feel in applying themselves to such a subject as Botany consist principally in their doubts as to the points which it is most im portant for them to iupress on the mind from among tises. If Vegetable Anatomy be the topic, a student finds that branch of Butiny alone comprehending details enough to constitute a science of itselt, aad he is naturally embarrassed by the difficulty of dscertaining what point it bear upon his ulterior studies, and what are unessential. Such a work as that before us is expressly intended remove doubts of this kind, by separating the facts which bear directly upon the great questions in science, from the refinements and secondary details, which hare no obrious application. In this manner the whole division of Vegetable Anatomy is brouglat within the compass of about 50 short paragraphs.
The first part treats of Structural and Physiological Botany, and comprehends an explanation of the names that are borne by the organs of plants, together with a riew of the most recent theories of structare, and an exposition of the modern views of Liehim and others concerning the nature of the respiration, food, and digestion plants. It thus embracts the principal facts on which the thenry of manures is founded. This part of the work copiously illustrated by wood-cuts explanatory of the macture of the parts, and reterred to rom the text by sinall figures raised a little above the
he following extract as an example
342 . The petals always alternate
34.2. The petals always alternate with the sepals, a necessary consequence of thair fullowing the laws of dereopment of leares.
343. If at any time the petals arise from before the whorl of petals between the sepals and those petals mhich are actually dereloned
34. As perals aimays aterante milin minks, the number of each row oi either will alway be exuctly the same. All deviations from this law are ei'her ammarent only, in consequence of partial cuhesiuas, or, if rath. are due to partas efortios \(\div\).
31.) Whater interven.; between the bracts and the stamens belour- to the flal enveiops, and is either caly or corniti ; ef whech nature are many of the organs vulgarly called nectante.
this natire are the hom-like bodies found beneath the
nyper gaieate sepal of Atonitum some cup of Narcissus
a part of the coronal appendages or coronet of
stapelia. jute.

346. But it is to be observed, that as there are no exact limits between the corolla and the stamens (348), such bodies as have been just described are often of an indifferent nature, and may be referred with equal justice to petals passing into stamens, and to stamens passing into petals.

This is particularly the case with the fringes of Parnamia 198, some parts of the coronet of Stapelia 213 , the long rays of the Possion-Hower.

347. If, however, anomalous bodies at this part of the vegetable system can be thown to belong to any whorl or series of which a part is certainly petals or stamens, such anomalou bodies are to be regarded as belonging to the organ in whose eries they are placed.

Thus in Aconitum 192, the horn-like processes fore petals; in the Mahogany 202 , and in the Canna 205 , they evidently appertain to the Andreceum 348 , and are therefore stamens. This settles the true nature of what has been called the nectary the lip, or labellum, which, forming a part of the second series of floral envelops, is therefore universally recognised as a petal, notwithstanding its singular form.

In speaking of the structure of Fungi, the following explanation is given of the ternas employed in this part of structural botany.
610. FUNGACEs, which are the lawest form of yegetation, are also cellular, some of their cells however contuining apiral threads, and are propagated by spores.
611. In the highest forms, two kinds of organs are detected: one, cyystidia shs, are conical naked elerations; the other, basidia 3s, are also conical elevations, but they bear spores in definite number on their apez.
612. The highest forms of the fongaceous order consint of a stipes \({ }^{345}\), an annalus or collar *", a pilews sus or cap, and an hymenium.
613. Lower forme are reduced to a mere peridium or integument, containing the reproductive system \({ }^{348}\)

614. Some have the sporules enclosed in asci (606)

6!5. The lowest consist of nothing but cells, placed end to end, and enclosing spores in the terminu? cells \({ }^{34}\).
Of the spenial torm: empliyed hy Vrcolngiats writers on Fungaceous plants', the principal are the following The nuing in the wrapper which covers over many of them, as Agari.s, in their youngest state. Thallur if the spawn usually generated under ground, or amongst decaying relum whuth athores to the marcin on the pinetis. Flocre are wool hise threads found mixed

 awsi, or iagna
The second part of the work is occupied by systematical Botany. It explains in the frst place tive linnean system; secondiy, a key is piren to the natural system of Botany, by means of which any order may be made out withoutsany other previous knowledge than what consists in understanding the meaning of any common technical terms. This an determining the observations apon the principles that are recognised by Botanists Upon this vart of the subject relations of plants, and the formation of natural groups. pon the following statement :-
62\%. The tmie nataral aystem, whenever it shall be discovered, will represent the species, genera, orders, allinnces, groups, sabclasses, and classes of flants, or whatever otber divisions may be admitted into it, so arranged that each plant shall stand next those to which it is more nearly allied in structure than to any others.
628. But the skill of man bas not get attained this end; no system answering to this description has been devised, nor does there appear any probability that it will be discovered till owr knowledge of plants in much monear any pro
629. All so-called natural systems are, to the present day, partly artificial and partly natural. The lower and bigher divisions in them are natural, the intermediate divisions are artificial. In other words, the stones of the edifice are hewed and squared, and the general plan is drawn out, but no builder has yet been found with skill to put them together, so as to form a consistent whole.
630. But although in theory no system that can properly be called natural has yet been devised, yet for practical purposes many answer to the name, and fulfil the principal conditions required of them.
631. The genera and natural orders can alone be considered as agreed upon by botanists, the other divisions are unsettled; and this is the reason why the naturn acden seldom follow in the same manner in the arrangements of two different botanists.
632. There is no such thing as as arrangement which shall express the natural relations of plants in a consecutive series.
633. It seems to be generally admitted by those who have turned their attention to the consideration of the manner in which organised beings are related to each other, that each species is allied to many others in different degrees, and that such relationship is best expressed by rays (the affinities) proceeding from a common centre (the species). In like manner, in studying the mutual relationship of the several parts of the vegetable kingdom, the same form of distribution constantly forces itself upon the mind ; genern and orders being found to be apparently the centre of spheres, whose surface is only defined by the points where the last traces of affinity disappear.
634. But although the mind may conceive such a distribution of organised beings, it is impossible that it should be so presented to the eye, and all attempts at effecting that object have failed. If in describing the surface of a sphere we are compelled to travel in various directions, continually returning back to the point from which we started, and if in presenting it to the eye at one glance we are compelled to project it upon a
plane, the effect of which is to separate to the greatest distance some objects which plane, the effect of which is to separate to the greatest distance some objects which
naturally touch each other, how much more impossible must it be to follow the juxtaposition of matter in treating of the solid contents of a sphere!
635. The fundamental principle of systematic botany is, that those plants should be stationed in company with each other which have the greatest degree of affinity, and that those should be placed most remotely which have the smallest degree of affinity.
636. Affinity is an accordance in all essential characters.
637. From this is distinguished analogy, which is a conformity in one or two charao ters ouly.
638. What we call the characters of plants are merely the signs by which we judge of affivity, and all the groups into which plants are thrown are in one sense artificial, inasmuch as nature recognises no such gronps.
639. Nevertheless, cousisting in all cases of apecies very closely allied in pature, they are in another sense natural
From these and other general considerations the author proceeds to explain the manner in which the natural orders of plants differ from each other, in arranging which, he adopts the method of De Candolle, the celebrated professor at Geneva, because it has been taken as the basis of the most perfect euumeration of plants that has ever been made, and becuuse the Lniversity of London have declared that their examinations shall be conducted with reference to it: a matter of no little importance to studeats.
Strictly systematical subjects are ill suited to the pages of a popular journal; nevertheless we must find room for a few illustrated extracts, or our readers will be left without any adequate idea of the manner in which the systematical portion is illustrated.
The Anonaceous order is thus defined:
Trees or shrubs generally tropical. Leaves withont tipules Flowers axillary, large, and dull coloured. Sepals 3-4. Petals 6, coriaceous, with a valvular æstivation. Stamens indefinite; anthers adnate; flaments angular. Ovaries numerous. Fruit succulent or dry, with the carpels 1 or many-seeded, separate or consolidated. Embryo minute. Albumen ruminate.
UsBs.-Aromatic and fragrant in most cases. The fruits of some are succulent and eatable, as the Custard Apple, Anona squamosa, and the Cherimoyer, Anona Cherimolia; those of others are hard, dry, and often jointed, as Habselia aromatica, the Piper Bthiopicum of the shops, and are used as peppers. Some spenies are employed as febrifuges. Trpicat Genman-Anona, Uvaria.

Anona furfuracea. 1. An expanded flower. 2. A vertical section of the androceum and gyanceum, which latter forms a central and terminal tuft. 3. A rertical section of a carpel. 4. A vertica section of a ripe seed, showing the embryo and ruminated albumen.
The following are the observations upon the Cruciferous erder:-
ITerbaceous plants ; rarely under-shrubs. Leaves alternate. Flowers without bracts. Sepals, 3, deciduous, cruciate. Petals 3, cruciate. Stanens 6, of which two are shorter (tetralymamous) Ovary superior with parietal placente, meeting in the middle, and forng a by a funiculus, generally pendulous. Embryo with the radicle folded upon the cotyledons.
A very large and difficult natural order, the subdivisions in which are now made to depend upon the structure of the embryo. They are the following:-
1. Pleurorhixece, when the embryo has the radicle applied to the edge of the cotyledons; fig. 17.
2. Notorhizea, when the embryo has the radicie applied to the bople of the cotyledons; fig. 14.
3. Orthoplocee, when the embrjo has the radicle appliod tes the badk of eotyledons which are hollowed out; fig. 12.
4. Diplecolabea, when the cotyledons are three times folded, and the radicle applied to their bacir; fig. 16.

Uses. - All the species harmless; some antiscarbatic, all more or less pungent. Radishes, Turaips, Mustard, Cress, Cabbage and all it rarieties, Rape, Charlock, are well known plants of the order.

Erucastrum Canariense. A. Afower. 2. The stamens. 3. The Hiliqua, with the valves separating from the replum. A. A trans
Typical Genrra.-Brassica, Siaapis, Draba.

Fruits of various genera. 6. Siliqua of Mathiola livila. 7. Si. Sllicula of Schiverukia podolica. 10. Silicula of Farsetia. 1. Seed of Didesmus Agyyptius cut across. 13, silicula of Me-
nomvillea linearis. 14. Seed of Lepidium Africanum. 15. Silicula nonvillea linearis. 14. Seed of Lepidium Africanum. 15. Silicula
of Ethionema cristatum. 16. Seed of Heliophila crithmifolia. 17. Seed of Mathiola oxyceras. 18. Siliqua of Mathiola oxyceras. errata.
This illuatrated explanation of the system of De Candatle is succeeded by the brief characters proposed by the author in circumseribing the allinnces of plants, by a sketch of a new distribution of the vegetable kingdom, and by a list of all the more important medical plants, with the uses to which they are applied in practice. For information concerning these matters we must refer our readers to the work itself.

A Selection from the Physiological and Hortioultural Papers of the late Thomas Andrew Knight, Esq. To which is prefixed a Sketch of his Life. London Longman and Co. 8vo. 1841.
Ma. KNIGHT was a gardener in the truest sense of the word, and although many persons who call themselves gardeners had the bad taste to undervalue his labours during his lifetime, they must, now that he is dead, if done deserve the name of gardeners, admit that he has whether as an art or a science, than any man of our days. We know there were people absurdly jealous of his frme, who had the folly to sappose that a gentleman of good familyand high station in his county, who entered the terloper, who interfered with their peculiar privileges. They could not have paid him a higher compliment. Had he been an antateur, had he been a mere inquirer into peculative matters, their jealousy would never have been andiul than because they felt he wan a gardener, more
superior to
Although we have thought it necessary to introduce the present notice by such remarks, it is not because there now remains the shadow of a shade of doubt regarding the paramount importance of Mr. Knight's horticultural proceedings, but because we wish gardeners to consider how wrong it is to undervalue the merit of an original inquirer merely because they have not the power of judging cor rectly upon scientific questions, or from mean and narrow-
minded feelings. minded feelings.
That horticulture in its present state is immeasurably superior to that of the last century, no man who is ac-
quainted with such subjects can deny; that the adrance which it has made is mainly attributable to the practical as well as scientific investigations of Mr. Knight, our whole experience assures us. The great skill of modern gardeners is owing to their knowledge of physiological principles; the discovery of those principles lies chiefiy, their application almost wholly, with Mr. Knight His influence may be unfelt; gardeners may themselves be ignorant of the source from whence their knowledge is derived : but they will find, if they trace it out, that it chieffy dates from the commencement of Mr. Knight's physiological career.

If the mantle of this great practical physiologist has not fallen upon his descendants, most certainly they participate fully in his good will to gardening, and his anxious desire to promote its progress. This is proved by their publication in the present form of the more valuable of his harticultural papers, - a republication in no way demanded for the sake of his fame, but of great importance to those whose situation in life prevents their access to the many costly volumes through which his writings are dispersed. For the matter therein contained we refer our readers to the present collection of his papers. On copious extracte from the life of thia truly great man, now copious extracts from the life of thi
" Mr. Andrew Knight received his early education at Ludlow, from whence he was removed to a school of coniderable reputation at Chiswick, then kept by Dr. Craw ord. He was afterwards entered of Baliol College, Ozford, where the late eminent physician Dr. Baillie was his contemporary: who used to say of him, 'that he managed to acquire as much Latin and Greek as most of his fellow. students, though he spent less time about it, and much less than he devoted to field sports. He was at this period and continued for many years afterwards to be an even in his boyhood, killing the game was only a secondary consideration to the opportunities which his long rainbles with his gun afforded him for studying nature; and from the facts and incidents collected at this carly period he laid in a fund of information which

He was at this time pantulily shy, and it was difficult to draw him ont; but he was remarkable for the steadiness with which he resisted ail attempts, whether be ner suasion or raillery, to join in the intemperate habits then His sommon in the Universit.
- His scbool hoildass, and atterwards his college racations, were spent either with his brother in London o with his mother, who had continued to reside at Wormes ley Grange for some years after her husband's death; but having sustained the loss of both her daughters (one in her 16 th, the other in her 19 th year), she removed to Maryknowle, a small house near Ludlowr, which Mr. Payne Knight had fitted up as a temporary residence for himself during the time he was building Downton Castle.
-Mr. Knight's mind, from the earliest dawn of his understanding, seemed peculiarly formed for the enjoyment of a country life; and the part of England on which his lot had fallen was eminently calculated to draw forth and ralleys, its rivers, its vegetable productions, its gealogical valleys, its rivers, its vegetable productions, its gealogical
atructure, and its meteorological changes, were to him atructure, and its meteorological changes, were to objects of philosophical investigation ; while the stady of what Goldamith so well denominates 'Animal Biography' afforded him constant delight and amusement.

In this manner Mr. Knight passed some years, occasionally quitting his favourite pursuits to Fisit his brother in London, at whose house he never failed to meet a society calculated to exert the most beneficial infuence on his mind and manners.
"In 1790 he accompanied his brother, and his friend Mr. Townley, to Paris; but the symptoms of the approaching Revoiution were becoming so fearfully manifest, Mr. Andrew Knight wever they returned to Lon
Mr. Andrew Kaight never again quitted En marriage, Mr. Knight established himself at Elton, in the immediate vicimity of his niv.her's and brother's residences : the acquisition of a hothouse and a farm now enabled him to prosecute his experiments in horticulture and agriculture with more adrantage than heretofore. His income, as a younger brother, was at this lime limited, and it was astonishing how much he did to advance the science of horticulture with a garden and an establishment of the least expensive description; but one of his peculiarities was, the readiaess by which, with his own hands and the assistance of a common carpenter or blacksmith, he would construct all the machinery he required for conducting his most elaborate experments.
"A Aout this time Mr. Knight became acquainted with Sir Josepl Banks; and this introduction had so important an influence on his future proceedings, that it should not The Board of Agriculture had drawn up a set of queries, o which they desired to obtein answers from different dis trictiv: and an applieation had been made to Sir Joseph

Banks to recommend persons properly qualified, to whom the queries shonld be addressed. Sir Joseph referred to Mr. Parne Knight to recommend some one for this purpose in Herefordshire; who mentioned Lis brother, as more likely than any one he knew to fulfil the object in view, from his practical knowledge of the agricultural operations of that part of England, as well as from the attention he had given to it natural history.
"Mr. Andrew Knight was accordingly made known to Sir Joseph, who soon found that he was not only eminently qualified to effect the immediate object in view, but that he had made observations, and deduced theories from them, calculated to throw much light on the more abstruse subject of vegetable physiology; and he strongly urged him to lay the resuit of his researches before the public. Mr. Kaight had not mised a great deal in general society: he had not had access to many modern scientific porks, and his information bad been almost wholly derived from the study of nature; and it was not until he was, by Sir Joseph Banks, brought into contact with many of the most distinguished men in science and literature, who assembled at the evening converzatione in Soho Square, that he was himself aware that he had observed anything which had escaped the scrutiny of other naturalists.
' In Sir Joseph, Mr. Knight had a friend always anxiows to draw him forth, and zealously alive to his success ; ever ready to obtain information for him on any subject, or to give his advice and assistance; and his suggestions were always receivel with the consideration they deserved and acknowledged with gratitude. At Sir Joseph's house he bad occasionally Qpportunities of comparing his own observations and theories with those of many of the most cele brated naturalists of all countries ; and it would probabl have been advantageous to him had those interchanges of information and opportunities for discussion been more frequent, for it would have saved him trouble in working out facts which cost all the labour and time of origina discoveries, and which labour would have been more profitably employed in building on the sub-structure already aid by other hands. He for some years purposely avoided o read the works of his precursors in the field of vegetable physiology, from an idea that, by the study of nature, un biassed by the opinions of others, he should be most likely to arrive at truth ; but he was at length induced to deviate from this course by the advice of his friend Sir Joseph.
"In the summer of \(1827, \mathrm{Mr}\). Knight had the gratif. cation of receiving a visit from Monsieur Dutrochet, with whom he had long held an intercourse by letter, though they had not previously met. The extract given below from a letter to Mr. Williams, relates to this risit:
" C We came here (Downton) from London in a single day, or we should have had great pleasure in spending a spondent, Mons. Dutrochet. who I mentioned to you as the spondent, Mons. Dutrochet. Who i mentioned to you as the discnverer of the extrancimary circamstance that animal stances are impervious to water, readily admit that Inia stances are impervious to water, readily aumit that tum tact with a fluid of greater density, or in some instances possessing different chemical powers; and the facts lse had advanced render it doubtful whether any mechanical agent is at work in rasing the sap in trees, except the membrane, which sepmrates the cells from ench cther, Which are excited to act by some power, probably chemical,
in the sap. M. Dutrochet spent a fortnight here, during in the sap. M. Dutrochet spent a fortnight here, during which we made some experiments together, and investiin) nitua, and back arain, with no further object than to have an opportunity of conversing upoth the subject of enerally well-informed men and he returned a yery zeslous horticulturist. The inhabitants of his vicinity, the neighbourhood of Tours, appear to be extremely ignorant of horticulture, and to know nothing of varieties
"Mr. Knight's time was divided between philosophical and horticultural investigations, and the fulfilment of the Juties of a country geutleman. He bad ceased to occupy any land himself, but he paid great attention to the cultivation of his estate by his tenantry; and though be was on all occasions a most liberal and indulgent landlord, and ever ready to afford encouragement and assistance to active and intelligent tenants, he was firm in insisting on the adoption of a proper course of management.
"He was hapny in his home, and beloved by all about him: and his healthful and peaceful occupations, while they supplied never-ceasing employment for his active mind, kept him free from the mortincations and disappointments which are too frequently attendant on a life of public service, or a course ố ambition.
\({ }^{6}\) Mr. Knight continued oceasionally to communicate he results of his observations and investigations to the Royal and Horticultural Societies. His last paper in the Philosophical Transactions was ' On the Hereditary Intinets of Animals,' which was rear on the 25 th of May, 1937. He took much pleasure in cultivating the attach ment of the brute creation, and it was sometimes a subject of doubt whether his children's pet birds and animals shared most largely in their affection or in his; but besides the indulgence of the kindness of his disposition, he was thus afforded opportunities of observing many peculiarities in the habits of creatures thus brought immediately under his eye, and relieved from the restraint which the fear of man, by long continuance converted into an instinct, usually throws in the way of the naturalist. His fondaess for animals was not of that senseless kind which is showa by larishing unteasonable indulgeaces on them; but it was dictated by a true benerolence, which would have led him to suffer yain himself, rather than atwe beem the caase of it to a worm or a fy. Ee ma very guetcular as to the
manner in which the game and poultry were killed for the Supply of his table ; and he sometinies eren superintended the operation himseif, that hes misht he sure it was dums the menner calcuated io rase ledst puin. At the time to spend half the day, and remain out long after his din-ner-hour, in hanting for a wounded bird; and if unsuccessful in his search, the idea of the sufferings of the poor not unfrequently resume his search early on the following morning

Though early in life Mr. Knight had been considered delicate, he had, for a long course of years, enjoyed almost calculated to confirm : he epent nathy hours of every day a the open air, in his garden, or in waining about his state: he had always leen remarkable for his abstemious habits; he rarely tasted vine or any fermented liquas, and ate little animal lood; which it is to be feared he perserered in to an injuriwus extent, for, when the puser, of the
stomach became dimainised he thie dachat inchuntal to ond age, a more generous diet would probably have bad a beneof his life, occasional sympt mes of dy-pepsia appeared, and, during the winter of \(18.1-2\), he sufferell a gond deal from derangement of the digestive organs, which at times produced a very distressing sense of suffocation. He had to have the advice of Dr. Wilson Philip, he proceeded to London at the usual time. He spent a day with his friend Mr. Williams on the road, and though much enfeebled by his illness, he bore the juurney without apparent fatigue, to his usual state of health. On the list of May he did not feel equal to taning the chair at the anaiversary meeting of the Horticultural society, nor did he ever leave the his friends, conversed cheerfully, and seemed to enjoy their \({ }_{65}\) siety.

After passing a tolerahly tranquil night, early on the morning of Friday, May 11 th, 183 B , he suddenly fell back on his pillow, and drew his last breath without a sigh or a struggle. His end was as peaceful as had been the pursuits and oecupations of his long and useful life; and few men hare discended to the grave more beloved, or
more sincerely regretted by all ranks of society. His remains were interred at Wormesley on Tuesday, May 2ld near to those of his brother and his lamented son.

His charities were very extensive, and it was only by chance that those who most shared his confidence became acquainted with the large sums he distributed. slentaneous feeling of his heart, that it is more to give than to receive; and when he bestowed money, or did an act of kindness that caused him some personal inconfor some reasun or other, it happened to be an ancummodation to himself, and that he was the party on whom the favour was conferret.

Even after he had entered his eightieth year, it was delightful to watch the spirit with which he shared in the sports of his granddlildren, and the trouble he took to
provide occupation aad amusement for them, and the pleasure which he derived from the success of his labours. "What is said by his sons of Mr. Kuight's favourite self, 'that as the most appropriately applied to himbenerolence, so that of his mind was a huoyant exuberance of thought, and a perpetual exercise of intellect, a youthful tenderness of feeling, and a smile of indescribable benerolence. Like Crabbe, too, he had no great lore for painting, or music, or architecture, and little for what a
painter's eye considers the beauty of landscape,' but he bad the strongest perception and enjoyment of the charms of poetry. Pupe, Jobnson, Gray, and Crabbe ranked first in his estimation among the English poets; and for the writings of Byron, Rogers, Campbell, and Mrs. Hemans, he bad a high admiration. His memory was wonderfully retentive, and \(n\) ) one who was much in his society could fail to remark the peculiar readiness and aptitude of his quotations. Whether the subject of conversation were grave or lively, he had always at command sume strikingly apposite illustration of ideas casually expressed; and the deep feeling of its beantics which charaeterised his manner of reciting poetry, added muilh to the effect of the pas sages so happily seleeted; and if encouraged to go on, he
would repeat page atier page of all his farvarite authors.

The singular powers of niemory he possessed were combined whth a very uncomon on iscility for retaining even the words in which ideas were conveyed to his
mind. On one occasion, at the house of his friend, the late Sir U- vedale Price, a gentleman present quoted a passage from Gibbon's Roman History; Mr. Knight expressed
doubt whethir r he had used the exaci wuads of fibbon doubt whetin. \(r\) he had used the exaci words of Gibbon
and in connunation of lis opianos repeate 1 a page and half from the arori, iacluaing the passite in question. On the book itself being reterrel to, the accuracy of his yuotation was established. This was not a singular instance ; for had it been Itume, or Robertson, or almost any other eferred to, he wonlis projably have hephy, that had been any striking passage.
A. "ansther time Dr. Cornewail, then bishop of Here-
,repeated to Mr . Kaight an epitaph on Douglas, eish \(h\) duke of Hamilton, containing twenty-two lines, witn the merit uf which he was much struck, and some discusni in on its beanties followed. When Mr. Knight the whole of the lines to his recolfection ; and on their being. written down from his dictation, they were found to pe perfectly correct
"To the end of his life this power of memory, which is paired. Aif that he read or hecurd his mind retained with the same distinctness that it would have done in former days; and when he was in his 77th year he acquired by heart nearly the whole of Campbell's poem of 'The Last nearly the same ease that he had done the epitaph more than thirty years before

 Thiwam having mirchaved the entiris stoct, or they having been liroken from seeding breeders otris own raising. Amolig the
novelties, and lowero of a finer strain than usual, the Ductios of
Sutherland, abeatiful bybloenen, and Pandora, particularly pleawe us. The Duhe of Wellington, John Kemhle, and Corio

 passer tipoit. ine
in. Mr. ifoldhan's possession. Among the Roses we noticed
Clarke', Lavinia, Cerese à belle forme, Catalani, Rosa blanca, as very fine. The Triomphe Reyales were of a cuncrios hlaracter to
any we had previoully seen. A fine rose called the (iem, broke by Mr. (ioltham, is a charming. flamed variety. Polyphemus,
charbentier, Coronation, and Mitoon, a feathered and constant bizarct, were very attractive. When a bed is so uniformly well
blonmed it is dificrut to select thowers for particular notice,
they must he seen to be property appreciated: fort it is imposibible to convey by words a sense of their beauty wheu su fimpely culti-
vated. Sereral flowers have broken into colour this season, which are not hamed, one that particuiarly arrested our attenthe first orler - the petals are round, firm, and forming a beautiful cup, the groumd cllour of the finest yellow without a tinge of impurity, and the pencilling sharp and delicate. If this thower
maintans the character it breaks with, it will be one of the best bizards prown
Pelargoniums. Those which strue great attraction here is the upyer petals brilliant orange-scarlet, with a dark blotch, and the
lower rose-colour, nicely rounded in form : the habit of this kind is good, and the fowers are well shapern and firm. Prince Alhert.
very large, upper pitals dark edged with rose, and the lower rose, and white in the centre; formm quite round, and remarkably
flat. Exnuisite a larve rose. coloried fower with a dash orange in it, aul with a good tpot on the upper, petals. Salmonia, semewhat like lady Denhiph. but with a dark mark. Incompa-
rabie; a finely formed white, with a cark rocy spot in the upper rabie; a finely formed white, with a cark rosy spot in the upper
netais; the lower ones are remarkably large end round. Rosabe la, a handsome variety in the upper petals, of which rose and orange
are happliy blemded : Purpurea erandifora, singular for its bluish tinge: Warlior, like hing, but with a dark spot: and a seedling junt openel in the style of Emperor, bnt much brichter in colour, raised betiveen arbirireum album and Smithii, which cpens white, tinted with purple, and dies off pure white, the throat, instead
of heing spotted, is striper : and should it prove at all hardy will be valuable on account of its fiowering freely in ayoung state. A
hranch of Treperolum Jarrattii, had been broken from the mother ment from the moisture of the air, continues to grow and flower reely. One of the prettiest things here is a row of stonls of the
double cllow Briar Rusa Harisonii, which had been layered last year ; the layert were suffered to remmin on, and
clothing the ground with fine yellow blossoms.-Muy 24 .
the King's.road, on the left hand, about half-a mile beyond col vill's, is one of the most beautiful exhibitions of flowers we have ever seen. It consists of Rhododendrons, Azaleas, and Kalmias,
in full thower, from the celebrated nursery of Mr. Waterer, in full tiower, from the celebrated nursery of MT. Waterer,
Knap hill. They are arranged with great skill anil taste, in beds Knap hill. They are arranged witt great skill anit taste, in beds
beneath a teut about 150 ft . long and 30 ft . wide, and present magnificence of appearance muct more easy to imagine than to deccribe No poet ever painted a thower-garden ss ferfect?y
heautiul as this is. The centre of the tent is occupied by tre Rhododendrous, the growth of 25 or 30 years, bendin se"eath the weight of their heaps of flowers; nest them are of Azaleas, and noble plants of Kalmia latifolia. There is no pubmore deserving a visit than this. It will remain in beauty for a

CALENDAR OF OPERATIONS for the ensuing Week Srovs plants which have perfected their growth, and such a
are considered most hardy, may be removed to the greenhouse where there u in now be plentr of room for them. This will prevent their secretions utherwise, will probably have theeffect of inducing them to flower in the autumn or winter. Annther advantage
will be the giving those plants left in the stove mure room and licht to perfeet their prowth. We have practised this with gond atiect in several instances, and have no doubt much more might
be done by judicious treatment. Those removed to the coole house must be watered much more sparingly than when in the

 Muline.
MRLovs. - Ridge out late kinds. Be careful to impregnate the
nit blossoms; those left to cliance seldomn somely or quickly. Water in the morning; cease to give water
somae time before the fruit ripens, and bear in mind that heat,
lizht, and moisture are the three great essentials min melon culture. Diligently destroy weeds; thin advancing crops of all kinds; to dry; make new plantations of Sage, Thyme, Hyssop, Mario-Arparigls.-Contunue to cut cluse, and keep the beds free Broc ori. - Sow Cape, if not done la-t week.
Cenitar Continue to plant out, if the weather permits: that
alreat yuat rount by no means be allowed to suffer for want of Water iidry weather ocurs. in rich, deep soil, and water well if Caplc iss may now be planted ont in a warm situation, if the
weather \(1 s\) favourable, otilierwise delay a short time. MLSTARD, CRESS, and other SA LADING.- Keep up successions.
ONIINS.-A few may be sown for drawing young.
LETTVE- Sow Cos and Cabbage; plant out a few between he early Celery.
Prast -It the last sown are up sow a suceessinn of the large or
Marrowatat kinds; earth up and stake others as they require it
 espalier, now require constant attention. More may be dune fuced, whether to strengthen or weaken the quantity uffruit, but more mportant than this. Vines sumiciently forward shonld be opped to an eye abore the fruit, and dirested of laterals and
tendriis. It will add to the size of Gooseberries and Currants if
he bushes are freed from all redundant stimmer wood at this time. Destroy insects and weeds by every means.

STovs. - The greatest attention must be paid to air, watering, should have all the room possible given them : to accomplish this more effectually adopt what we have recommended by removing to the greenhouse, as far as practicable, such as will now bear a misture : half a pint of lime and one ounce of black sulphur continue to propagate, and shift plants into larger pots, as they (ireqexhmin
drons and Orange trees, may now be removed to the ardir summer quarters, out-of-doors. The Oranges should have a rich tophouse; cuttines of most bard-wonded plants may still be put in.
PIT: AND Frame.-Continue to shitt Calceolarias, Balsams, and Cockscombs for succession. Auricilas may now be repotted, and removed to their shmmer quarters in a shady sith
Continue to pot ofit seedlings and syring rooted cuttings.
Flower-aardev.-Coutinue to plant out in favourable wea ther annuals and all other plants intended for the open ground-
secure Dahlias hy stakes, and finish plantug. Iie up the flowertems of Carnations and pipe Pimbs. Take up such early flow lowering in Autumn. Propagate Heartsease for new beds. Continue to water when necessary spring-plaisted shrubs: to mow
iawn, roll walls, destroy weeds, and pay a strict attention to Neatness.
NCRY. -Secure grafts and buds by stakes. Remore suckers and shoots from Stocks. Take the clay from newly.gratted trees, and shoots frome unions. by a fresh tie. Alost kinds of exotic trees
and secure the
may now be layered. Sow Poplar and Willow secus; destroy weeds.
Forset and Coppice Woods.-Continue to prepare the ground to circumstances and draining, which is of the utmost importance, and therefore should always be the first thing to look toOpen drains are preferable in woods to covered or rulble draius
Clean young hedgerows of all kinds, if you wish them to prosper Jose'ph Puxtun.

NOTES YOR SMALL GARDENS
An the weather is now so warm and dry great care must be taken, in watering plants, both ont of doors and withan. Wate hould never, if it cant possihly be avoided, be given while in
sun is shining on the plants; late in the evening or very early in the morning are the best times. In hirh and ary situations, mos pegged over the beds in flower gardens, or fiints laid on them will be found to prevent the water from evaporating so quicicly as
it otherwise would. In some of the small gardens in the front it otherwise would. In some of the small gardens ine the fre is but one round or oval-shaped bed, a pretty effiect would be produced by placing round it a low trellis of iron wire about 0 inche
hivh, over which might be trained Eccremocarpus, Maurandyas and other such plants. In these conrts, too small even for a
flower-bed and a walk round, a few pots of Geranums, Hy-flower-bed and a walk round, a few pots of Gieraninms, Hy-
drangeas, Cactuses, Hignionette, and calceolarias, will be found drangeas, cactuses, Hignionette, and calceolaner, and by placing 2 few evergreens, in pots, at the back of the flowering plants, the
effect will be heightened Advantage should be taken of the fine weather to plant out tender plants for summer Anwering. Th
 Henderami, feucrioides, and Ging free flowering sorts of Gerammin, and ammer the:n kinds, be plenty of scarlets, and the odd-lantinan w whe of Orange, a bed of Sairias should be

 of rabbish, stumps of treec, or training "ser bashets sal treilis
work, auch plants as the strone growing k nus if Petunias work, \(u\) ch plants as the strone growing kinds if Pehunas,
Maurandyas, Lophospermum, Kiwdoehton, and Cohe a scan-
 house. Give air frely, and shale from the mididay sun the
plants in fower, fur that will prevent thens from droping their

coming a pupa the caterpillar spins a thin oval cocoon between
two leaves, and it remains a long dark brewn pupa about a
 month. The moth is ahout an inch across, and is not very unla,
the common Silkworm Moth. The eolour of the wings is yellow,
or reddich. vellow, and the upper wings have a dark band in the or reddich-yellow: and the upper uings have a dark band in the
middle, e eiged with two lighter lines. The male is generally smaller than the female. and has much more strongly pectinated
autennæe, but the latter has the thickest body. The moths antennæ, but the uater has, he hichest body.
usaally appear in July, and the female lays her egrs in a broad
ring roumd the twigs of the trees, which they resemble so mueli in colour ais scarcely to be distinguishable
accuainted with to lessen the numbers of this iusect, is to hand-
pick the caterpillars, and search from the middle of June tuil

\section*{NEWS OF THE WEEK}

The recent prosecutions of the Paris Papers for pub. lishing the letters attributed to the King. and the pending trial of Darmés for an attempt on his Majesty's life, are the principal subjects of general interest in our news from France. It appears certain that Darmés will be found guilty and executed; but up to the present time the evidence adduced has failed to implicate his presumed accomplices. The treaty of commerce between France and Holland has been adopted by the Chamber of Deputies by a large majority. - The latest dispatches from Spain bring the important intelligence that the Cabinet is at leng'th organised, M. Gonzales being President of the Council and Minister of Poreign Affairs ; and all the Ministers being partisans of the sole Regeney of the Duke de Victoria. The appointment of the Duke is said to have given great satisfaction throughout Portugal as well as Spain, and hopes are entertained that the administration of the new Government will be vigorous and de cided. Much excitement still prevails in consequence of the rescue of a smuggling vessel by two British men-ofwar in the harbour of Carthagena; and the Executive is said to have demanded the recall of the English Consul for the part he took in the transaction.-From Germany we leara that considerable opposition exists to the commercial treaty between this country and the States of the Customs' Union; the Landgrave of "Hesse Homburg has published a proclanation promising a constitution to his subjects; and the negotiations between Prussia and Rome in reference to the affair of Cologne have again failed, the Pope having declared that it would be an offence to the dignity of the Church to accede to the demands of Prussia.-In Switzerland the Great Council of the Canton of Argau has adopted a series of resolutions confirming the views expressed last week, and declaring that the property of the confiscated convents shall be applied to charitable purposes.-From the Levant we learn that the Pacha of Egypt has objected to the conditions of the Sultan in regard to the tribute and other matters connected with the internal administration of the country; but although this will postpone the settlement of the question for a time, there appears no doubt that it will be amicably arranged. The insurrection in the Turkish provinces still continues, and much agitation prevails even beyond the frontier. The Porte is still further embarrassed, by the disturbed state of Syria, arising from certain clauses in the new customs' tariff; several collisions have taken place between the Druses and the troops of the Sultan, and complete anarchy prevails throughont the country. - The Candian insurrection has had the effect of ronsing the Continental Greeks, and our news from Athens shows that the insurgents are largely assisted by the revolutionary party in Greece, which appears to gain strength in spite of the Government.
At home, the proceedings in Parliament continue to be highly interesting. On Monday Lord John Russell declared that it was not his intention to proceed with the Puor-law Bill in the present session, and that Government had determined to abandon the Right of Voting Bill. The continuance of the existing Sugar Duties for one year was then agreed to.-On Monday a petition from the Chartist body in favour of an address to the Crown, praying for the release of all prisoners confined for political offences gave rise to an animated discussion and to a motion in accordance with the petition, which was opposed by Government on the ground that the House of Commons ought not to interfere with the prerogative of the Crown. On a division the numbers were equal, and the motion was lost by the Speaker's casting vote.-Leave was given for the introduction of a bill to abolish Church-rates, and levy a tax upon the pews and seats for the maintenance of churches.-On Thursday Lord Stanley withdrew his Irish Registration Bill, in consequence of the pressure of other business and the prospect of a dissolution; and Sir Robert Peel brought for ward his motion of want of confidence in Ministers. It was contended in favour of the motion that Ministers were unable to carry measures which they considered essential for the public welfare, and that by continuing in office under such circumstances their conduct had been at va riance with the spirit of the Constitution. In de fence of Government it was argued that the large number of usiful measures they had carried, and the result of their foreign policy were proofs of their success ; and it was denied that their recent measures were brought and the Honse has adiourned to wi manucu ast nigha coming to a division.

Southampton.-Mr. Hutchins and Mr. Mangles are candidates for this borough in the Liberal interest, and Mr. Martyn and Lord Brace, it is said, will stand upon the Conservative interest.
Lord Daim--Mr. Ayton, advocate, is in the field against Lord Daimeny-buth are Liberals.
ses re-election. Sir G Sinker will offer themselves for re-election. Sir G. Sinclair and Sir Gregory Lewin are mentioned as candidates in the Conservative interest.
Shoreham and Bramber.-Mr. D. Salomons the Whig candidate for the representation of this borough at the last election, has announced his intention, by advertisement, of not contesting the borough again. Mr. H. D. Goring. the present Whig member, retires from the representation at the close of the session; and Mr. Charles Givring, of Wiston, his cousin, comes forward on the Conservative side.
Burough of New Shoreherm.-It is expected that Mr. Jamps, the barrister, will contest this borough, upon
Liberal principles. Lusacex principles.
Suseex (West). -Lord March and Col. C. Wyndham
will be candidates for this division upon the Conservative interest
To'icr Hamlets.-The following gentlemen have been named as likely to become candidates to represent this bnrough on the retirement of Dr. Lushington:-Mr. Hume or Mr. W. Contes, in the Whig interest, and Mr. W. Cotton, Mr. Rutinson, and Mr. G. F. Young, in the Conservative interest.

Hrick:-Mr. Dempster, of Skibo, on the Conserrative, and Mr. Locis on the Liberal interest, are candidates for tuis borough.
Mac*orn ar A. Agner it is reported will oppose Mr. Mactargart, the present Liberal member
are the Conserrative cindidites, and Mr. C. Standish is brought formard on the Liberal interest.
IV:tts ( North).-Mr. Long and sir F. Burdett it is said will ayain offer themselves for this division of the countr, and Mr. H. Hobliouse it is rumoured is also in the field.
Furkishire ( \(W^{F}\) est Riding).-Lord Morpeth and Lord Niltna will be the candidates in the Liberdinterest. Sir
Fork.- There are four candilates in the field :-Mr Lowther and Mr. Atcherley, in the Conservative interest; an! Mr. York and Mr. Berkley, in the Whig-Radical interest.

\section*{fforrian.}

Frince.-The Journals still continue to be a great deal wecupied with the state of affuirs in this country, ciay, white they are fu.! of speculations on the late division in the Honse of Commons.
For:ed Letleis of Lusis-Pluiappe.-The principal subJet in point of imecret diselusecd in the papers is that, Phili Iy so frequently noticed, the letters imputed to Lovis-

\section*{osition Journals}
before a Bing less than theprosecution of Madame St. Elme Would sutisif the ountry that the letters imputed to him by that lady bitanta of Paris, was presented to the Chamber of Deputies; it stated, in rather strong language, that, inasmuch
as letters, conveying the expression of the most cowardly and infamous treason, had been attributed to King Louis Philippe, and as the judges of the land had acquitted the nisters hat rephied only by regue denials to the imputations thus cas: upon thie (hicf of the State, the public conscience, they thonsht. demanded an investigation of heir authentieity : and they aecorhmgly invited the Cham ber to cafl the hinstry to arount for a fact, which so
deeply affected the hoour, liverty, and independence of he iration. The Juurnal des Debuts, after alluree of this petition, maintains that the inquiry asked for is impossilhe, as it would be disionomable to the fing and a dis race to the Chambers and country to investigate if the King had not seeretly promised to abandon Alsiers, if he mireated lo porivy the cipital in order to turn the guns ayainst the population, and if he had not been of de-poti-m and conclurles by powers and the encourager to be pursued by the Goverument is to declare in the Chamber of Deputies the forgery of the letters, since juries had aiven verdicts which fartions were making the the sentence of the Seine Court of Assizes, condemning that Royalist print to a fine of 5000 f ., to the costs, and to the printing of 3,000 copies of the judgment, for having Louis-Phillippe letters was heard on Friday before the President of that court, Mr. Poultier, and five judges, without a jury. The court confirmed its previous judgment, against which the Gitzctte de France immediately lodged the final appeal to the Court of Cassation.
The Regicide Darmés. -The trial of Darmés, and his co-accused (Ducios and Consiliere), for the attempt on Monday, at the Luxembourg, before the Court of Peers. The prisoners were removed, on Sunday, from the Conci ryerie, to the prison of the Luxembourg. It is stated that there are \(6: 3\) witnesses, and the trial is expected to last four days. Darmés, it is thought, will certainly be convicted amd executed, but it was doubted whether the two accomplices would be condemned. We have since received the account of the proceedings in this trial on Tuesday. The whole of the sitting of the Court on that day was oc. cupied with the interrogatory of witnesses. The firist examined was the Grenadier on duty at the Post of the Lion, rom belind which Darmes fired upon the King, and who arrested him after the attempt. Most of the other witPlace de la Concorde previous to the passage of the King, and their evidence was not contradicted by the accused, Who merely corrected \& few insignificant errors. No inprincipal witness produced against Duclos, and who described one of the persons present at the spot with Darmés a moment before the commission of the crime as having a remarkably black beard, positively derlared that Duclos was not the man. lery few spectators were in the tribunes of the court. There was no stir or bustle about the Lusembourg ; it is said the public has not the slightest interest for the criminals. - The sitting of the Court on Wumber of cos as uninteresting as that of Tuesday. A gated as to his political and moral principles, but all the endeavours of the President and Attorney-General to connect Duc'os with Darmés in the commission of the crime had hithertn proved of no avail
The Budget of Receipts.-The Chamber of Deputies commenced on Tuesday the discussion of the budget of receipts. It was expected that some member of the Legitinatist party would take occasion of the debate on the chapter relative to Algiers, to question Ministers respecting the authenticity of the letter in which his Majesty promised to abandon that colony. M. Guizot anticipated them, and gave the most positive denial to the existence of such a pledge.

Supplemeatary Credits Bill for lăk0.-A sharp debate took place in the Chamber of Peers on the third and last day's discussion of the Bill for the supplementary credits for 1840 . Count d'Arguat, who brought up the report, entered upon a vindication of all the measures adopted and all the expenses incurred during the administration of M. Tuiers, and defended the immense increase of the military force of France undertaken by that Minister with great animation. By referring to the returns of the numbers of the invading armies in 1814 and 1815 , he found they atmounted to upwards of \(1,0001,000\) men. and that wasequently the force necessary to the opposed in inal of 15 . Thiers in office, uttery inadequate to meet a similar event. I warm discossion ensued, in the course of which M. Villemain reprobated the warlike statistics of the reporter, and these eternal phantasthe point of invading Furope or of being invaded by her. The boint of invading Fassed by a mape or of berity of \(8: 2\) against 43 . The The bill was passed by a majurity of se aganst on Napo-
 the Boalogne column, have been \(\nabla\) sted by the deputies;
 The Chamber of Depnties adopted, on Saturday, the treaty
 ais zith:1 i 11 . It..uss. The majority in its favonr was consiter. Muizot, considering the treaty in a political point of riex, rather emphatically contended that an alliance between France and Holland was an alliance of interests and principles, and that it was the consequence of the and priacipled by France during the last three centuries policy pursued by France daring the to caltivate friendly
and benevolent relations with the Powers of the second order on the continent. He then eulogised the Dutc Government for the sympathy it had manifested for
France during the recent Fctual serrices it had rendered her crisis, and for the port of 12,010 horses, intended for the French cavairy and by placing its steam-engines at her disposal.
Minister of War on his late campaign for re-victualling Minister of War on his late campaign for re-victualling
Medeah and Miliana have been officially published. The gedeal and Mimana have been omcian Number as received
through the telecre given in our last Numic despatches, but the details evince through the telegraphic despatches, bat the details evince
the daring of Abd-el-Kader, and the extent of his resources. the daring of Abd.el-Kader, and the extent of his resources.
He seems to avoid with great skill all pitched battles. He seems to avoid with great skill all pitched battles.-
Some of the journals state that it appears, as well from Gen. Bugeaud's dispatch as from several letters from the head-quarters of the army in Africa, that it was the precipitation with which, without orders, the Duke de Nemours charged at the head of the 24th Regiment, of which his brother the Duke d'Aumale was Lieutenant-Colonel, that prevented the complete success of Gen. Bugeaud's command of Abd-el-Kader. On the 15th the Gorernor General was to embark for Mostaganem, the rendezvous of the next expedition. He is to march from thence with that place, the army will advance on Tekedempt, whilst another column of 5000 or 6000 men is to proceed from Medeah, to destroy the military establishments of Abd-elKader.
The Royal Elopement.-The" Polish Count, wholately ran away with the Princess of Spain, the daughter o the Infant Don Francisco, it seems, is 27 years of age, and Was educated in the Universities of Cermany and France. He was never General Longermanr's aide-de-camp in
Poland, as has been stated ; it was one of his brothers, who died at Berlin. It is affirmed that his Majesty the King of the Belgians has interceded in his behalf, and that all the documents and papers necessary for immediately accomplishing the marriage have been forwarded by express to Brussels. The only condition said to be imposed from crossing the frontier, and have all Europe open to them with the exception of Spain and France.
SPAIN. - The re-organization of the Cabinet appears to have been impeded by serious difficulties. M. Gonzales Who advocated the single Regency; whilst M. Cortina, Whom the Regent was anxious to maintain in the Ministry, was labouring to effect a combination of "Unitarians"
and "Trinitarians."-The financial difficulties were also atated to be a principal cause of the delay, as it was difficult to find any public man disposed to take office under
such desperate circumstances. The declaration of a tignal bankruptcy was awaited by some leading politicians butore they would venture upon conducting the affairs of the nation.-By a telegraphic despatch dated Bayonne, May \({ }^{2} \dot{j}\), we learn that the Spanish MinisPresident wazetted on the 2 nd as M. Surray Rull, Minister of Finance ; M. Infanta, Minister of the Interior; M. San Miguel, Minister of War Minister of Justice. All the Ministers are warm partiMinister of Justice. All the Ministers are warm partiOfficial Gazette contains several addresses of congratulation to the Duke de Victoria, on his election
as sole Regent, and the news of that event is stated as sole Regent, and the news of that event is stated
to have been received in most of the provinces With a very loyal spirit and with great enthusiasm. The Duke is to receive the title of Royal Highness. The with the office of Comen held by the Duke, and also the four or five staffs belonging to the corps into which the Spanish army is now divided.Private letters from Corunna state that Madame Mina had been appointed governante of her Majesty Queen Isaof their of her sister the Infanta, at the special entreaty The rescue of the smuggler Dolphin, in the harbour of Carthagena, by two English vessels of war, noticed in our last Number, continues still to be animadverted on by journals of all parties. By some it is insisted that a signal reparation should be made by England to Spain for that outrage, adding, that the remonstrances of the Govern-
ment must not be confined merely to demand the removal mpent must not be confined merely to demand the removal
of the British Consul, but must likewise insist energy on the vessels captured (both at Carthagena and Algesiras) being brought back to the harbours where they were taken, in order that their owners may be tried by the competent tribunals, otherwise no satisfaction will have everybtained for the insult olfered to the Spanish flag, and as a derision. - It was said, in the diplomatic circles, that the flag at Gibremanded of the British Ambassador that flag, and that the agents there should no longer protect Vessels suspected by the Spanish Guvernment; and that this request was made for the purp ise of preventing unpleasant collisinns between the Governments of the two
countries.-Intellizencs had been reseised in Madria that Commander Don Miguel Matan had supriea 1 the funous He had come from Chela in a farmhouse near Agramont. He had come from the valley of Andoura, with a commisfore from Tristany to raise guerillas in the Segara. Be fore he was executed it is said that he made some import ant confessions, which might serve to defeat the plans of sereral other Carlist chiefs, who purpose making similar atteropts during the summer. Canela suffered death with reignation, but to the last moment besought an interview

Portugal.-Affairs in Lisbon at the time of the
departure of the last packet were in an unsettled state, the government, however, had succeeded in getting money some capitalists connected with the Confiance Company upon the proceeds of the Decima, which would enable
heavy arrears were still due.-The American treaty with Portugal had been ratified by the government of the United States.-Negotiations with the P.ppe are said to have gone
on favourably, and a Papal Nuncio is shortly expected at on favourably, and a Papal Nuncio is shortly expected at
Lisbon.- From the language of the press on both sides, it would seem that the news of the Duke de Victoria's
election, as sole Regent at Madrid, had given general election, as sole Reg
satisfaction at Lisbon.
Germany. - Most of the German papers are hostile to the commercial treaty between, Great Britain and the signed, the German Customs Lnion, which has been tages to be derived to the latter from the convention.From Vienna we learn that, on the 15 th inst., Prince birth at his summer palace, in the saburb of Rennweg, and gave a grand diplomatic dinner, which was attended by all day received an autograph letter of congratulation frum the Emperor. Prince Metternich was expected to remain only a few days longer at Vienna, being prepared to visit
his estates in Bohemia, and thence proceed to J. his estates in Bohemia, and thence proceed to Johannis-
berg, where he will have the honour to of Prussia, during his Majesty's intended tour through his Rhenish provinces. - A new section, eight miles in length, of the Emperor Ferdinand's railroad had been opened with the usual ceremonies. It runs from Lunenburg, in Moravia, to Mradisch, in the same province. It is ex and that in two years the whole of the road, extending to 35 miles, will be tinished. - A letter from Ensicheim states that on the Gith inst. \& dreadful storm burst over that part Neuf-Brisach a soldier who was on guard on the rampart was killed. The lightning fell in various places around Strashurg, and sereral accidents took place. At Rudeshein, a village situsted at a little distance from Mulhausen, it struck the church, made a large opening through the the altar and ornaments on it.- The Guzelle of Upyer Germany states that 71 out of 72 electors of a provincial elect a new deputy in the room of a gentleman, whe fron his being a public fuactionary, and not allowed by the government to attend the sittings of the Chamber, ha journal of Hesse Homburg of the 16 th inst. publishes constitution to his subjects.-Accounts from Berlin state that that the hope of an understandurg being come to between the Prussian Government and the Moly See is again disappointed, all the efforts of the Prussian Minister to induce the Pope to order the Archbishop of Cologne to renounce his reintegration in the diocese having failed.
The Papal Governnent declared that it would be an offence to the dignity of the church to take such a step. Count Von Bruht has arrived at Berlin from Rome, and, atter an audience with the King, a Council of Ministers
was held. His Majesty is said to intend sending the Count back to Rome with propositions of so conciliatory a nature that they can hardly be rejected.-A great part by which the distance may be traversed in 12 hours.
Switzerlind.-A letter from Geneva of the 18th inst. states that the Sardinian Goverament haring proposed to
 run along the left bank of the Rhone, the offer had been readily acceded to, and the plan was aboat to be carried into esecution.-The great counchi of the Cantun of Argw has agreed to the following resulution, by a niajority of
113 vaices against \(80:-\) The resolution of the extraordinary Diet of the Ind of last month, by whick the stat of Argau was invited to modity its decision of the 13 th Jan., relating to the suppression of all the convents of Argau, has been maturely considered by the great council, together with the fact that the Dier, in giving these instructions, coud not be acquainted with ail the reasons and circumstances which gave occasion to the decree of 13th Jan., or which attended the passing of the said decree, otherwise on a mature examination the Diet would necessity ane found that the said decree sras fuunued in great council decrees-" That the other states of the confederation shall be invited, in a friendly manner, to abstain from enforcing the resolution of the 2 ad April. Should this, contrary to expectation, not be consentid to, the in-
habitants of Argau, animated ly the patioutic feclings inherited from their forefathers, and in pater to give prom that it never designed to loosen the foderatice loud, or to diminish its authority, will acrifice:s much as is mashle
to the desire of the coniederated states, and will immedi to the desire of the contederatent states, and will immediof the 13 th J in is sileep of what modification the decree
 proof of the sincerity of this declaration, all masaures o liquidation which pass the limits of the instructivas for straightration.agreed to on the 7th Nov. 1835, shall b is invited to communicate this resolution of the great council to the high statea in the proper form, and at the
of the 13th Jan. did not proceed from any motives of imas far as possible, the buildings themselves, are destined purposes" "cated, in perpetuity, to pious and Christian purposes."
the Eastern - Accounts from Constantinople state that bstacles to its adjustment yet finally set at rest, fresh the Pacha of Egypt. Mehemet Ali, it is stated, evinced no diepreition to accede to the conditions propused to him, present Reis Effendi. In consequence of thised by the of the European powers who were to bave gone off for Alexanaria on the 5 th had received instructions to remain arranged to the satisfaction of the Porte. On been inst. the Capitan Pacha sailed for Candia. On the ith naval force to blockade that island. A note was presented on the 6th inst. to the Ambassadors of Foreiga prowers in Constantinople, announcing the termination of the distur bances in Servia. The Turkish government had resolved 100,000 ., and has signed a treaty of to the extent of Denmark. On the 4th the anniversary of the birth of the Prophet wes celebrated with great pomp. The difference which lately arose between the Ottoman and the Persian governments had been amicably adjusted. Account do Bugaria show that the insurrection is not ret pat down; it still insintains a serious character. and appear Mussul been entirely provoked by the cruelty of the Kaminitza, whe excesses committed at Lesskoveza and from various quarters, and other Christian towns are said to have been the scene of similar atrocities. The insurgents, however, seem to be in want of money, and more particularly of arms, powder, and lead : most, and is said, are armed only with seythes. A letter from Belgrade, dated the l0th inst., says that the reports which spread into laced respreting the insurrection having from Bitoglia and Salonica to Ser them. The number of refugees on the frontier of Seria was daily increasing, while the men capable of bearing arms were throwing themselves into the moun tains. Arms were wanting, as only one in ten had a gun, and the rest were obligul to be content with hatchets seycs, and pitchforks. Sympathy tuwards the insur ents was increasing in servia, althougl the government of alerine toppress int intelligence, and the merchant their correspondents. At Belgrade great agitation pre-
EGypt.-Letters from Alexandria state that Mehemet issued by the Porte on the of a circular memorandum Ambassadors of the Four Powers informinessed to the the liereditary government of Egrvt had been conceded viding thet Ali and his sons and male descendants, proto tie Eo the pashalic ; that the article fixing the trihute of Egypt at the fourth of the revenues is revoked, and postcalculatine consideration of the amount and manner of grade reserved forch in his army, but that higher Pots that, as Mehemet Ali appears inclined to oppose the system of internal administration decreed for Egypt in Sultan requests precise declorations and explanations on tinis subject, recugnivel as it has been by the separate The Pasha was preparing another state pour Powers his entire submissiom, of te formarded by the Turkist envoy to the Diran, but entearouring to make better terms respecting the tribute and appointment of his officers
of finance, commerce, sc. He visited the G on the lst inst. with a larga e visited the Gurgon steame tion the exercise of the great guns. Next day he in speeted the fortifications, similarly attended, amidst salute of artillery. He has 1000 men adding to their strength on the other side of Marabout. The plague continned varying at the rate of from 10 to 26 cases per day, and from 5 to 15 deaths. It was spreading to the Europeans. In the month of April, lit persons were attacked and brought to the hospital. and \(2 \div 10\) uthers had died before medical aid could be administered. The Paslia had put his fleet into quarantine, and was preparing to enforce similar regulations with all his other public establish pons. Two of the officers of the gun-sloops sent by the were ill of the plague at Rusetta, and their physician had died of it.
Syrid.-A Accounts from Beyrout state thit on the 11 th ult. the new custums" tarif was enforced, fir ti.e first time,
to the great cissatatactoon of the po ie, phiticulariv the mountaners, who teccured that they w....il satimit on no account to the elause respectins the export of sille betren the Drutes ablit the sroupls of the Sultan. The anion in 3 an?

 est anarchy prevaitel throughout the country ; several Christian churches had been plundered in Aleppo; and the Ties, daily garrison, encouraged by the apathy of the author:the interior offered nowhere any security to trarellers, and
the people, it is stated, were beginning to regret the intlammation white Ga duty in the mountains of syria, intamation white \(u a\) duty in the mountains of syria, and was buried at Beyrout on the \(2, i\) ult., and Col. Rose serious loss of life, betreen the Druses and Maronites had been received by the British authorities in Beyrout, and attacks on the Sultan's officers weee apprehended. The French agents were said to be rery husy in Lebannn. Tenis.-The Malna Times of the luth inst. pubblisties a letter from Tunis of the lst, announcing that the Bey, at the recommendation of the British Consul-General. Sir trade within his dominions. He liad himself set the example, by giving liberty to all his urn slaves, and promised to put an end to their further importation and ex portation in the Regencr.
Greece.-Accounts from Athens inform us that King Otho had publisbed a decree against the slave-trade. which Was supposed to hase been ditained through British in-
fluence. These accounts reprosent Grece to lop in a turfluence. These accounts represent Girece to be in a tur-
bulent state, and tiat the Gandian insurtecion dauly gained paatisans in the capital. It was feared at Athens that the foreign powers would interfere in consequence of neighbouring proviacts. There was an Inrian committee, Epirus, established at Athens, and it appeared that the government had neither the will nor the pwer to prevent their proceedings. The idea of forming an extensive
Greek State appeared to be ceneral, and an active corGreek State appeared to be general, and an active corGreeks established in Russia, Italy, and Germany. A number of Greeks residing in Austria had sent in their names as subscribers to the national bank. It was reported at Athens that Mehemet Ali had sent money to chieftain Tsanus Caratassos, who was the first to rise against Capo d'Istrias, and who had been placed under the suroeillance of the Governor of Nauplia, had escaped thence with eight followers, and it was supposed he was about to put himself at the head of the insurgents assemhe embarked. His escape had created great excitemmnt. More than 200 old soldiers had left Athens to join the insurgents, and two Captains had crossed the frontier, one surgents, and two Captains had crossed the same purpose.

Candia.-Letters from this island, dated the 6th inst., describe the insurrection to be general, and say that there are 16,000 Candians in arms against the Turkish Government. It will be seen by our Constantinople news that the Capitan Pacha had left that capital with a force to be directed against the insurgents. It is stated that Admiral Stopford, considering the serious aspect assumed of late by the insurrection, despatched to the island on the 16 th Consuls of England mid Greece were said to be in communication mith the revolters, who continued masters of the country. The insurrection was still gaining ground and the Greeks had formed a government of their own, and installed an administrative body elected by the people
Samos-Advices from Vathi of the 6th inst. state that tranquillity had been completely restored in samos The chiefs of the last insurrection were confined on board a Turkish corvette, and treated with the greatest ha-
manity. The new Senate of the island was to meet shortly for the purpose of instituting an inquiry into the circumstances of the late movements.

\section*{耳antiament.}

possible, he thought, to look at the peacefful and flourishing con-
dition ot the country, and not to be satisfied that the laws were

 might be considered as somie little proof of the sert of flarie which
it wouid excite throughout the conuntry. This question, and the it woud eveite throughout the enuntry. This nuestion, and eh
ot: ers which had been opene at the same time had stired u
every interest in the country-the East Indian interest, the Wes Indian interest, the Shiphing interest, and almust esery other in
terest of importance. There was harsly a man conmected witi any branch of industry who was not taught by certain parties
that his neightiour was his enemy: and thus different classes
were set against each other, with a notion of antagonimm of in were set against each other, with a notion of antagoni-m of in-
terest the iast notion he thought which a wise government
would desire to spreatl. The noht Earl who had last spoken maintained the principle the the price of food had no effect on
me price of labour ; but, if he went to the manuiacturers, they would tell him exactly the contrary. He took the real theory or
the suhject to be this , hat the price of labour, as stated by the noble Earl, was influenced by the state of demand and supply. Wages were hygh where the labourers were few, compared with
the demand for them. But in the case of a country thickly popu. lated like this, whether in the agricultural or manufacturing disricts, the price of labour came down to the price at which the labourer could be fed; and that feeding was delermand ietaries The noble Earl opposite Earl Fitzwilliam; denied that any and would go out of caltivation: but if he (Lord Ashburton) anderstood the argument generally adopted on the other side
it was, that soils were now under cultivation which were unfitt grow corn, and that by taking, instead of it, corn the grow th o
he better soils on the Continent, we should have it cheaper, and the wealth of this country would be increased. The whole specaation rested apon the assamption that no soils would remain ander cultivation but those which were more productive than the inferior soils would undoubtedly be thrown out of cultivation, and there would also be a very great falling off in the state of cultivation of the remainder. The present expensive cultiva
tion-the outlay for artifial manure-the great exuense of tion-the outlay for artificial manure-the great expense
draining, which was now so extensively going on, conld not, he thought, we maintained in competition with the cheaper cultivation cf foreign countries. If they inquired into the stale of labour
in those countries, ther would find that wages were not one-hal if what they rese 11 this ciuntry. How coutd the cultivators of a.day in Meckilenburg nod the north of Germany? - The Rarl of

Reviere at Wonlwich.-On Tuesday morning the rocket-service, the batteries of the Royal Artillery, and marched to the marshes, where they were shortly afterwards joined by a great nmmber of officers connected witl: the Ordanace department. At cleven oclock the MasterGeneral. Sir H. Vivian, arrived, attended by his aile-de-
camp, Major Fivian, and accompanicl by Gen. Bangalne camp, Major Firian, and accompanid by Gen. Dangalout twenty ladies and gentlemen. Led Dl.ombeldand his
ataff received the marty, and. after the usinl intratuction eacorted them to a mock fortifiation, c.mstruited a mearly the extremity of the marshes arxt the river, confor sersice mounted and a great number of oly ens nems growani. The practice immadiately aterward conmencati range of 300 yards. The shots were excellent. and told with great effect, as they were seen to great advantaye by within abnut fifty yards of the flag-staff, the object aimy at being in almost every instance very nearly struck walis and oid cuns were struck several times, slowing the against them. The exercises of the day comeluderf at o'clock, and appeared to give great satisfaction.

The Presidenat.-The excitement and interest felt by the public with respect to this ill-fated steamer, has again
been serived this week by a report, which by many has
heen considered as holding out some hopes of her still Jeing in existence

By the Tagus steamer, arrived at the log-bnok of a Portuguese merchant vessel, recently arived at that port frum Rio de Janeiro, from which it appars that on the 23 d of April, in lat. 3113 N ., and
long. 40 \(23: 3\)., she saw a large steamer under sail ouly, there being no smoke or motion of her paddles; she was scen at sis in the evening of the 233 d , and again at six lours, and made no signal, but was steering N.N.E., i. in the direction of the Azores, under topsails and latine sails, with an easterly wind, which afterwards veered to the north. They expected at Lisbon that this vessel must cent arrival from the Azores at Lisbon. It was at first conjectured that this steamer might have been H.M.S. the from the lof of the latter that, at that time, she was not near the latitude and longitude specified; and hence the belief that the steamer seen might possibly have been
the President receives some degree of confirmation, there being no other large steamer at present known likely to have been in that track at the date in question.
tempt was made to rob the Duke of Devonshire in the Surrey Zoological Gardens. It seems that his Grace, attended by Mr. Cross, the proprietor, was engaged in nspecting the animals which are enclosed in the cages closely by the crowd. when Mr. Cross observed two persnns suspicions. He accordingly watched them, and shortly after observerl one of them lift up the tail of his Grace seized them, and a policemen to thom both known as bad characters, took them into custo
dy and conveyed them to the station-house. On Wed nesd they brought before the magistrate at Cnion-hall, and sentenced to three months’ imprisonment with hard labour, in the House of Correction.

On Fridar nieht, last week, a serious a cident occurred at Woolwich to Mr. James Mellon, gar dene to the Rev. Mr. Greenlaw, rector of Woolwich He had been requested by his master to place an old able time) aniongst some lumber in an out-house. Previousiy to doing so be loaded it and fired it off, when bin fortunately it burst and shattered his left hand to pieces.
He was convered immediately to St. Thomas's Hospital, where from the serious injuries he had receised it wa deemed necessary to amputate the limb. He lies at the hospital in a very dangerous state

Fires.-On Saturday morning a fire broke out in one dow warehouses belonging to Leddard \(s\) wharf, Horsleywet wol one of the floors it appears that a taneous combustion. The fire being immediately discovered, was extinguished before it had reached any serious extent.

\section*{3Trobímial Nebos.}

Shreessbury.-Great surprise was excited throughont this town and neighvourhood on Monday by the announcement that the long-established banking-house of Messrs. Price. Jones, and Edmards, had suspended payment. It thought, be severely lit by the tradesmen of this place, and by great numbers in every sphere of life in the immediate vicinity. It appears that for many years previous to his demise, which took place a few weeks ago, the acting partuer in the firm was Mr. W. Jones, and the other wo allege that they believed the bank not only to have been perfectly solvent, but to have been in as flourishing and prosperous a state as it had been for years previous to
Mr. Jones's death. An adjustment of affairs satisfactory to the crediturs is promised at no distant date ; but re-
ports are in circulation which, if true, will render the fulfilment of these pledges doubtful. Trade throughout this district is in a very sad state, particularly in Coalbrookdie, Wellington, and all along the seat of the great ironworks on the borders of Shropshire and Staffordshire of the Copprage of this bank following so close on that shire-wilh tend materially to shake public credit, and e.nsequently still further circamscribe the little buider at present transucted. The liabulities of Messrs. Price \& . are not yet known. but they are beliered to he heary. oriered his sheplerd to remove a quantity of sheep from a piece of grass land, where they had for some tume been grazing, t. a oue-acte piece, reevichaly to its being
plorgined for mancel wurzel. The sheep had not been there many hours before the she pherd perceived several of them to ha tahen very ill ; they w. re shartly after remosed to the rass la:ad they had lately left, where the death of lo valuante ewes whs the result, an leaving lambs by their side that the sheep had partaken too plentifully of some ground sy growing

Li:coln.-A local paper gives an account of a serious accident which Lappened to Miss Davys, daughter of the Bishop of Peteroorough, on Saturday. As she was return ing froma an airsng on horseback with her father on the
Nurth Bank, her steed became unmanageable, and she Nurth Bank, her steed became unmanageable, and she
was in consequence thrown backwards with violence to the ground. Her riding-habit being long caught the pom mel of the aadule, and she was drawn for a distance or up-
wards of 40 yards before ske could be extricated. She was
at length removed home in a carriage, and although much
bruised, she is stated to be in a fair way of recorery Barrington.-At the petty sessions on Monday, Mr. Coleman, farmer, of per appeared 20 ay charge of trespassing on his neighbour's land. It anpeared that of a neighbour's, with whom he was on very friendly the occupier, who rents the land of Mr. Bend ; whe, of Kneesworth, made his appearance, and approached unt he could plainly see Mr. Coleman, and then returned Shortly afterwards, Mr. Coleman had a paper put int his hand, which proved to be a sunmmons in the handwrit-
 his tenant, saw the trespass committed, and immediately issued his summons. Mr. Coleman did not deny being on the land, and the magistrates fined him 6d. for the trespass and 6d. damage, and costs 11 s. Gid. On wishin e stated tha lling give him formation
lingzor.-A days since a medical gentleman of dence is close to the line of the Great Western railway, at Steventon, left his horse and phaeton in the care of a man Who took oft the curb to give the horse some hay; shortly
afterwards the animal took fright at somethine, and darted off at full speed, and being obstructed by one of the rail road side gates, between five and six feet in height, leape at and cleared it, dragging at its heels the phacton, the fore-wheels of which cleared the gate, but the hind wheels coming in collision with the tup rail, arrested its progress. The horse was thromn down, and the concuse currence to seize him, and thereby prerent serious consequences, as one of the trains was at the mument about to start from the station.
Wootion.-A woman attended the parish church at this place a few days ago to have a christening, and when the woman required him to baptise the whole of her children, eight in number. Her reason given was that such a pro ceeding saved a good deal of trouble, and was "done under one head.
Holsworthy.-On Friday the 21 st inst., a serious fire broke Moleswrorth, Bart. It seems that this beantitul building was erected a few years since at above 11,0006 . expense; and although an engine was soon on the spot from Launceston, and a-large supply of water, nearly the whole building was burnt down, and a large portion of valuable furniture destroyed. The fire is supposed to have been caused by an incendiary, as no fire had been lit near that part of the premises where it originated for several days previous,
and the only occupants residing on the premises were the gardener and his wife.
Chester.-A melancholy accident occurred near this city on Sunday night. It appears that Mr. Eaton, of this of several others, had beea at Parkgate on a visit. They returned honse rather late in the evening, and reached Mollington about ten oclock. On reaching Mr. Fielden' gates, the borse in their phaeton took fright, and ran into the gutter by the road side. Mr. Eaton had partiall managed to get the horse out of the gutter, when tho bush, and oyerturned it. Two of the party were thrown over the hedge, and the rest under the phaeton, which rolled unon them, the splash-board falling npon Miss Eaton's chest. Assistance was procured and the phaeton removed as speedily as possible, but Miss Eaton was quite dead. Mrs. Ray a lady of the party was also much injured.
Brighton.-On Tuesday evening an inquest was held in this town on L. G. Ebrington, Esq., who met with his The by being thrown from his thorse whie at reat lenaccount of the accident and inquest is given police said by the local papers. The caief owho had been riding with deceased, but as she was labouring under very distressed feelings, she wished to be excused giving evidence. The coroner and jury said they woull bear from ther evidence, which would perhaps be sufficient with a take a ride. That on their return from the Steine, deceased's horse ran away with him, and threw him witm great violence against a wall and rolled over him. Decease of on being picked up was quite dead. ne. He did not think deceased was a bad nier, and te had a much gayer liurse once before. The animal ween well worked the day before. Witness had known the animal ten months, and it had no sice; it was not give to eliying or stumbling. The coroner asked the \(y\) re whether they wished to question the lady, and they plied tiat they cinsidered it unnecessary. Teodand shouid be intlicted even though a nominal one. The jury therefore etarned a verdict of "Accidental death," deopan The deceased was only 95 years of age, and resided with his mother on the steme. - reparations, making for laying downa section of a and utility of the plan have been fully explained to the commissioners the town and the directors of the forthwith lixid down who have consented to a section beng flic inspection, an A model has been submitted to pubiced, and the prin appears to be very ingenioust conable to be attained. :The breakwater is to be formed in sections of 60 feet long
about ten feet above the water, and will be composed of
massive beams and timbers, braced and bolted together, but leaving sufficient spaces, between for the water to pass through, above and under. The piles of the chain pier interstices, as the waves dash against them and divide. By the sea breaking through above and under the breakwater, it is contended that the sea within will be perfectly smooth however rough it might be outside. One of the great points in favour of the plan is stated to be the expense, Which will not be a twentieth part of that at Plymouth, number of sections, which will cost about 500 , each The inventor is sanguine of the success of his plan, which,
if effectual, will be of high importance to this town, and very advantageous to vessels driven in by stress of weather, as they will be able to come in at all hours and at any time of the tide, which they cannot do at Shoreham or Newhaven. It will also be a great advantage to those quently to beat about in the Channel through not being able to get to the pier-head, which will be protected by the logs of timber joined with iron links, which will at the same time be strong and buoyant, and although it will and the whole will be fixed at the extremities with chains and anchors. It is said that the whole of the works will be completed during the summer.
Hereford.-During the extensive improvements that hare recently been going on in the Cathedral in this city, a discovery has been made that the tower is in imminent
danger of falling. It appears that some cracks in the chief wall of the tower led Mr. Cottingham, the architect, to examine into the cause. He accordingly proceeded first to ascertain the state of the main piers below in the body of the church, and these he found to be all solid. He next explored the masonry of the piers under the Norman that the arch mas quite independent of this enormous body of masonry, and that, as has been long suspected, the piers Norman arehes were still in their original position, and that the fractures which now exhibited themselses in every direction were occasioned by some defect in the main piers
of the tower. Onj taking up the bell-ringers' floor, Mr. Cottingham found the stone groining (which was put up about the time of Edward the Fourth, also pressing upon
the four angles of the tower. On removing the rubbish, the four angles of the tower. On removing the rubbish, loped itself. At each end of the four angles was a hollow chamber running diagonally through the main wall, which, from the pressure of the enormous stone piers above
alluded to, was crushing in in every direction. The failure is said to be awful to confemplate, and it is providential that the discovery was made previously to any further
pressure; which must have occasioned the total destrmetion of the torier, together with the choir, transepts, and eastern portion of the nave. Hr. Cottingham has caused the tower in order fully to ascertain its state. One ailvantage thus gained will be to expose the 52 stone column of the tower (a remarkably fine piece of masonry) to the
view of persons in the church. In the mean time, so imminent does he consider the danger, that he mill not suffer the bells to be ruig, and all attention to the other parts of the works is suspended until satisfactory repara-
tion has been made. The restoration will now be effected tion has been made. The restoration will now be effected not timely taken place, the cost would have been very great. Only a short period ago, it seems, the western
front was declarcd to be secure for hundreds of years, and yet in six weeks only from the time of that declaration It Was a mass of ruins.
Railucays.-From recent returns, it appears that the total receipts from the 29 railroads in England and Scotcalculated weere , up to the date to which the returns are merchandise, and 57,8877 of this there were \(13,743 /\). for riages, horses, and mails. The greatest receipts appear to have been taken by the following railways:-London aud Junction, 8,6931 . Biverpal Western, 8,1651. ; Grand Manchester and Leeds, \(3,042 l\). ; North Midland, 3,5691 .; and the London and South Western, \(5,5 \mathrm{~m} / \mathrm{m}\). - It is stated that the South Western Railway Company have it in contemplation to form a branch line to Salisbrary. The point of junction will be at Bishopstuke, between Southampton and Winchester. It is also said that the Great Western
Railway Comnany will probably seek to secure for this Railway Company will probably seek to secure for this
line some of the traffic of South Wilts and the adizcent line some of the traffic of South Wilts and the adjacent
district, by forming a branch from Pox, or the neighbourhood, through Warninster and Salislorry.- (on sunday Morning a labourer employed on the London and rua over by two brick waggons, which cru-hed one of tis legs. He was removed to the Sussex County Hospital at Brighton in almost a lifeless state from loss of blood, and amputation of the leg was immediately performed, but he on this rerwards died. Another serious accident occurred and Blackham were buried by a fall uf chalis nat it Carter common. Blackham was much sruised in the back, but not seriously. Carter had his thigh broken, besides receiving extensise injury about the chest. and is not expected to survive.-A few days since, as the traia which leaves Dundee for Arbroath at one o clock was proceeding eastwards, about a mile from Dundee, the guard disthe maggons in the train, and ong frome one of the last of
that two waggons loaded with liax were on fire. It hap the engines are sometimes supplied with water. The burning waggons were conveyed to it, where the flames
were extinguished, and the train continued its journey The accident was produced by a burning piece of cinde from the engine lighting upon the flax.

\section*{IRELAND.}

Dublin.-An investigation has taken place here relative n account of organ-player at Rathfarnham, numbers. An Italian organ-player, named Vernasi, who was arrested in Cork on suspicion of being concerned in the murder, and brought up to this city under a warrant purchased the leather for deceased, to make the belt in purchased the leather ror deceased, to make the belt in
which he used to carry his money. This, together with the fact of his being absent from the company of Italians about the time of the murder, and not being hear.t of until a few days ago, led to his arrest. Several persons were
examined, who stated that they had seen two Italians walking together on the Rathfarnham road the day before the murder; but none of them could identify the prisoner as one of the party. A lad deposed that he s7m tro Italians walking together on the evening of the murder, between Sir R. Shaw's gate and Rithfarnham: he theasht that Ternasi was one of the men, but conld not swe is the fact. The magistrates were of opinion that there was no and he was accordingly discharged. The transactiond sequently still remais in the
inguest has been held on Mr R . Hil weverquest has be he and \(R\). Hant, who was shot dead that one of his principal tenants was persisting in burning some land against his wish, and
his ear to remore dred ust got off his car, and the servant had not taken the horse from under it, when he heard a shot fired, and, on looking into the field into which his master had gon he saw him lying dead. No person was to be seen, and soon for dinner hour. The transaction occurred ahont 11 oclock. He was shot with a pistol, and the person who fired, it is thought, must have been standing beside-perburned speaking to him, as his hat and hair were both through the spinal marrow, so that death was instantaneous. After a lengthened investigation, during which no the crime, the jury returneal a verdict of "Willial murder against some persen at present unknown." Decease wa-
 of persons committed to the different jails in Ireland for trial in the year 1840 amoonnted altogether to about
24,863 , which is nearly \(1-320\) th part of the entire population of Ireland. The above perisons were committed to take their trials for all sorts of crimes and offences, both against person and property. -It is reported thathis Excellency the Lord Lieutenant is abuat to be married to the Dowaser Lady Somerrille. Her ladys'hip was the serond wife (f-ir Marcus Somerville, Bart.-The melancholy intelligence of the accidental death of one of the sons of the Hon. Baron Foster mas received here on Tuesdoy. The yome gentleman, who was
drowned while batling.
Clare. - In pursuance of a requisitionn from the Roman Catholic clergy, on the 20th inst., after the celebration of Catholic clergy, on the 20th inst., after the relebration of in this county, preceded by bands of music, and headed by the priests, for the purpose of seeking the restoration of
their native parliament. At the base of the hill, where
the eeting was held, 40 tents were pitched, and the gene-
ral appearance was calculated to strike a spectator with surprise. The speakers, with one or two escenticns, wer all priests. The Rer. Mr. Hastings declurd that no Irishman could hesitate to come forward and join himi in crushing the spirit of Eng'ish hatred. Reflecting on the sway of the stranger, his blood boiled in his reins. Persons calling themselves Irishmen, he said, were culpably indifferent if they did not wrest from the stranger the power of keeping them in bondase. The Rer. Mr. Tracy Ireland was sleeping : not in the sleep of drankenness, but in the calm repose of temperance. Let her enemies take care,-there was a pitch beyond which human endurance could not go, so that in one of her spasmodic fits she might crash her mountebank tormentors. Mr. C. O'Con nel, the local Crown solicitor, said that they were there that day for the purpose of estashisking ropeal-wrereus, and by legal means they would conquer or die in the struggle repeal. He would not sever Eugland from Ireland; loved Lis \&ueen too mach. After a severe attack on the conservative party, tie Ras. Mr. Sherry sud, ail meand arain, and \(7.000,040\) of Ireland's sins were preparea : die for her if it were necessary. The Rer. Mr. Quaid, in proposing the fourth resolution, thought it the more pruIrish ; the to address his hearers for the most part in teliigible, except to the natives; but it is stated that he was greeted with great applause. The meeting shortly after separated, giving three cheers for the Queen, and three for \(0^{\prime}\) Connell and repeal.

Fern used as Food.-In Nicholas's Jontmey to New ealond it of the soil; wherefore, considering the healthy and vigoroxis appearance of the natives, who live upon it, it is matural to suppose that its root, which they generaly use, preparing it is very simple. After leaving it in the fire for some time, to be heated sufficiently, they take it out, and pound it with a mallet, until it becomes quite soft, and fit for chewing. The cooks then throw ic round to the chiefs all the saccharine or nutritive matter is extracted, and, rejecting the fibrous part, they continue their meal in this primitive manner till they bave satisfied their appetite. The fern root when hot has a pleasant and sweet taste, and beins steeped in water, deposits a substance like jelly.

Antigue Rebic. - The Carlisle papers inform us, that a few days ago a person digging in a garden at Blackhall, near that city, found a curioas eeal, which-ppearo to have during the rebellion of 174 . . The seal bears a half-lencth wrtrait of the Prince. He wears a bonnet and plaid with a broad belc over his left showlder, ornamented with a rosette; and a star on his breant. His hair is rather long, and is secured behind by ribbon. This description coinand is secured behnd by a riboon. This description coinduring his invasion of England. It is thought probable that the seal may have belonged to one of his adhereats, Who wight have lust it while in attendance on the Chevalier.

Dissolution of Prollinurent.-It may be interesting to our readers to state, on the eve of the forthcoming general election, tise number of dissolutions of Parlament which have occured during the last fitteen years, A dissolution another occurred in July, 1800, in consequence of the death of that sorereign; a thrd irsollutious was resolred on by Earl Gees's Mmistry in ipril. 18.31, in comsequence of the non-success of the Reform Bill. Parliament was again dissolvet at the close of the year 1832. for the purpose of having a House ut Commons elected aceording to the provistons of the New Act. The first reformed Parhament lasted alout tws gears, having been dissolved in the Premter. Nir R. Deel's Pdilidment existed about two ears and a half, whon it canse to an end, in consequence of tue dranse uthis lite Majesty William IV. It will thus be seen that the average duration of each of the six Par-
liamen's which have been elected from 1.23 to 183 clnsive was not more than about two years and four months (under two swars and a half:. The present Parliament, if dissulved, wili nut bave lated four years; it has

In which King was described as of Chelsea, victualler, and sir R. Sidney then, for the first time, stated that he had nade the pur-
chace for himelf in the name of King. This fact being discloset to the Master, he refused to sette the conveyance, so as to give
the parties an opporluntr, of which Mr. Ranger had avalled himself by ths petion, to appiy to the co. of King, stated he kept a public-house in Keppel terrace, King'sroad, Che'sta. The p tition, after statir \& these facts, alleged that at the time or the puretaie gentleman at Clap ham, and that he had never been a farmer,
and never had resided at Winkfied. Kiug made an affidevit in support of the petition, in which he stated that he first became
acquainted with Sir Robert Sidney in 1838 , by Sir fohert callint on him at Keppel-terrace, when Sir Robert, after mentioning bis own name, inguired of him the names and residences of his grandmother, and told him he was not at liberty to divulge at prasent the reason of his inquiries, but it wrollt be of great ad-
vantage to him, and he should hear from him soon. The next visit they said tnok place about a twelremonth after, when he
informed Sir Robert he had a bruther George living as cuachman with agentieman in Cnelsea. SirR. Sidney, it appeared, wrote to the gentiman, inquing as to the claracter of king and his Wha aumt th nahe a witlement of sume fruperty on a member
of the famiy : and Sir fubert, on the same occasion, told Kin: that an old lady, interesticil in certain members of the family, iSir Robert had giren her of king and bis brother, she was determined not only to make them the onjects, of her hounty, but also trustees of part of her proper'y : and that he wisned to pro-
duce to the ladyan acknowle tgment in writing of his willingness to undertake the trust. Trusting to this representation, and beobject but what he represented, King said he offered to sign any form Sir Robert withed, Whercup.n Sir Rovert wrote
something upno paper, which King signed without realing it. Something aptcr sir Robert. he sain, paid him arother visit, and
Some turn ose Bishop hat saved his hife in his youth, and that Bishnp, wh.n wa's then can knan
althourh king declascd le knew no sich persin ; and as he had not been aule to zerve Binhop in his lifetime, he wasiletermiued license for king. Bu! kiog sand the heard no more of the aftair of the old lady or of Bishop for some time, till his brother's manter letter in reply, reiteratang the story as to Biohnp, and as to his having had relatioas of the name of King; but that it seemed
to him the Kinus were not the relatwes in question, aind that he would rerew his search of \(r\) them as \(s\) son \(a\); he could. King, and told him it any :n甲pisisa were mate as to a purctlase orac to refer the parties to him ; and a little after he called again and said some parties were making a difficulty as to the purckase were left he should forward them to him, and he if any paper was his intention to leave lima a legacy. Kins, it auppeared,
called in January last at sir Robert sideey's uifice, in Paluceyard, at his req ient, when Sir Robert Sidney proumeed the paper
 tor whath
was thus:
my tame, int a stum nut x l. iAm Rebert Sinney to purchase in thit fo courey the same tu me as trustee. "John hivg." authonity, and silat Sir Rovert Simney had atterwarls informed t:im he isda purchaseat the estate, and tisat Sir Robert siney had

was fairly persons who suppoited the petition seemed to adnet that his conduct was explained by this-that he did not wish it sprit that prevailed between them, that he intended to beerme
the purchaser of the estate; a and he accordingly resorted to grat manaber of seratarem, which were rid chioll, to say tuc
lea-t if them, and ceriainiy not mumendable. Tne cave re. in the hat
 wrong than he would have sisitained if he had done rightly.
After some further observations his Honour granted the prayer had directed as to the form of the order for a resale. Rosls \({ }^{\prime}\) Count.-Truil \(\nabla\). Bull.-This case, which is of some
interest to legatees, was an application on behalf of the plaiutuff that une of the defendants named Borilh, might be ordered to or of Mr. Salmun, who was a general leratce under the will of plaintiff, who claimed the benefit of two leasehold has that the fically bequeathed to her, might have the general estate, which had come to the hands of Bovill, auplied in discharge of habilitita detendant Bovill, as executor of the orfinal testator, caamed to retain the specific legacies, or to be indeminied in respect thereof. neral right of a specinc legatee to have the outstanding liabilut paid out of the general personnl estate. It was cleur the pay Mr. Bowill, had respectively in their power the stock and and which were part of the assets of the testatur Saimon; but he did not think that the hills were framed with a view to those pay-
nents, and, herefore, he could not make an order to that effect. The right was clear and adinitted, and it also appeared tult an indemnity had been offere. to Salmon's representatives, and yet the sut was going on, apparently adversely; so much so, as to parties. He hoped the consideration of this would bring the parties to a shorter mone of ascertaining what indemaity ought
 mighthis oceasion but to express his hope that there wuald be an arrangement. He would say nothing about the costs.
MARK LANE, FRidat, May 28.- Although the supply of portion of it left for this day's market, and prices are unaltered. There has been but litule doing in free Foreign, and we hav more inquiry for bonded-Barley, Peas, and Beans are avery dal
sale, and the demand for Oats is exceedingly limited, yet the same sale, and the de
prices are asked

SPLENDID NEW ROSE.-" ROSA DEVONIENSIS." \\
I, UCOMBE, PINCE and Co. beg leave to call the Which they possess the entire stock rery beautiful new Rose, of Which they possess the entire stock, and which they can confiduced. The flowers are very large, cupped, with fine bold outer or guard petals, of a firm Camellia-like texture, very donble, finely formed, and deliciously tragrant. They are prodtuced in great profusion from the berinning of May until the end of No. vember, and invariably expand fully and freely, without any hard green eye or cther impertection. The colour which, when the buds first open. is a creamy buff, changes as the flowers expand to a trimrose vellow, with a pinkish-buif centre This Rose has an excellent habit, being of free and vigorous growth, with beau-
tiful thick, glosse, dark-green foluage, is also quite haruy, and partakes equally of the properties of the Noisette and Ocorata classes. Six Howers of it were exhibited on Tuesday last, the 1st inst, at the meeting of the London Horticultural Society in Regent-street, and were awarded the silver Banksian Medal. strong Plants will be sent out in the first week of August wext, and will be delivered carriage free) in London at 18. each. \\

\section*{che Gardeners' Cfromide.}
S.ATCRDAY, JUNE 5, 1841.

The production of sugar in our colonies having of late attracted so much public attention, and our continued differences with the Chinese having so materially affected the price of tea, it is of no small moment that the culture of the sugar-cane and of tea should engage great attention in India. By reference to our report of the proceedings of the Agricultural and Horticultural Society of India, it will be seen that the Otaheite sugar-cane was becoming extensively spread in the Dacca district, formerly so celebrated for the growth of cotton and the manufacture of fine muslins. Dr. Falconer writes that the same kind of cane cultivated in \(30^{\circ}\) of latitude in the neighbourhood of the Saharunpore Botanic Garden had yielded produce equal to \(£ 30\) an acre ; while Dr. Gibson writes from near Poonah on the west of India, that he was endeavouring to have the Deccan markets supplied with sugar of home manufacture, and that the people at Poonah eagerly purchased it on account of its largeness of grain and superior clearness. Hence it would appear that the Otaheite sugar-cane, being well suited to the above very widely separated parts of India, will be so to most parts of the intermediate and wide-spread plains of that extensive empire.
It may not be generally known that the Otaheite canie is what is most extensively, if not exclusively, cultivated in the West Indies. Originally the East India cane, introduced from the Canaries, was alone cultivated ; butabout 1794 the French introduced the Otaheite cane into Martinique, whence it quickly spread through the West India Islands. A planter in 1797 wrote-"This cane passes wonder, and renders the appearance of the old canes unpleasant. I would not, ss a planter, have credited a report of what I have witnessed of it." - (Royle, Productive Resources of India, p. 90.) Nearly 60,000 tons of sugar were exported last year from Calcutta, and an equal quantity is expected this year.
The tea cultare in Assum may appear to many of ourreaders tohave made slower progress than might have been expected, considering how abundant the tea plant is in its wild state in Upper Assam ; bat the delay arises not from any deficiency of plants or leaves, but from the time required to instruct the natives in the art of preparing the tea for market. Therefore, though only a few hundred chests of tea are coming from Assam this year, many thousands are expected to be prepared daring the present season. By the proceedings above alluded to. we see that the tea-plant is thriving on the southern district of Travancore. Accounts bave been preriously received of its success in the \(W\) ynaad mountains, and in the peninsula of India. In the tea report, a paper is published from Dr. Falconer respecting the cultivation of tea in the more northern parts of the Himalayas, that is, in the districts of Kemaon, Gurhwall, and Sermore, which had been recommended for the cultivation of tea by Dr. Royle. Dr. Falconer now writes that he has tea-plants growing at Saharunpore, the produce of seeds procured from plants, which were themselves grown from China seed sown in the Koth Nursery; and in a letter dated 17 th January, 1841, he states-" We have now seeds in abundance from the Tea Nurseries, and are quite beyond the necessity of external supplies;" so that in the northern as in the southern parts of India, the tea plant or plants may now be considered as established.
Oxe of our correspondents has cailed our particular attention to a paragraph in our leading article of May 22, in which it is asserted that "The common sense of mankind tellis them that a Horticultural Society must offer its prizes for good gardening, and not for rare plants." This he thinks requires some modification, otherwise the desire to procure new plants will decrease, to the great detriment of gardens and to
the ruin of many spirited individuals. "The man," says our correspondent, "who successfully contends with the difficulties which attend the cultivation of many newly-introduced plants deserves more credit for his exertions than those who, after such difficulties are overcome, grow them like weeds with the assistance of the experience and skill of the first possessor.'
To this we agree, and we had no intention of stating the contrary; nor do we think there is anything in the paragraph referred to by our correspondent which is really at variance with his own opinion. It must be obvious that, by rare plants we intended such as are merely rare, and nothing more. The observation was made with reference to those cases where a collection of plants, whose principal merit is their rarity, has been placed before a collection whose great feature has been the good cultivation of the specimens.

No cloubt, if two plants in equally good health are exhibited against each other, one being rare and beautiful, and the other common, the rare plant is entitled to precedence ; but it is only on such occasions; and if the rare plant is not decidedly ornamental, no favour should be shown it for the sake of its scarcity. A gardener should not waste his skill and ingenuity in cultivating ugly plants, when there are so many in all directions that are beautiful.
Of course these observations apply to Horticultural Exhibitions-not to those which are Botanical. In the latter case, rare form or singular organisation would take precedence over beauty. For this reason, when Botany and Horticulture are equally the object of a Society, the prizes for each branch of knowledge should be offered separately; then all confusion is avoided. In the Horticultural Society of London new plants always form a separate and independent subject of exhibition, to which at the Garden Meetings special medals are assigned. For new and handsome Orchidacee a medal is offered equal to that which is obtained by the third best exhibitor of a large collection of from 50 to 60 Stove or Greenhouse plents; and for new ornamental plants, not Orchidaceous, the medals are awarded at the discretion of the judges: this places at their disposal medals of various value, from 24s. to ten guineas.
In our Notes for Small Gardens it is directed that the young seed-vessels of Rhododendrons should be cut off. This is a most useful rule, upon which we have a few remarks to make. When the Rhododendron goes out of flower, it leaves behind clusters of small seed-vessels, which swoll during the summer, and by the autumn become ripe, whether the seeds they contain are good or not. In their mature state they are of consiclerable size ; and they arrive at it by feeding upon the organisable matter formed in branches during summer by the leaves. Now this organisable matter, if not consumed by the seed-vessels, will be stored up in liranches and applied to the formation of flowers: if it is consumed in the creation of fruit it is abstracted from whatever means the plant may have of generating flowers. It is, therefore, obvious that to prevent the present formation of fruit is to promote the future production of flowers.
No one would believe the importance of these rules who had not watched the effect of attending to them. We can assure our readers that whatever the result may be with respect to other plants, it increases the beauty of Rhododendron flowers in a most remarkable degree. We could point to a garden where the scantiness of the blossoms of these plants was a subject of general remark, till the destruction of their young seed-ressels was ordered; and now there are few places where the filowers are finer.
It is, however, by no means a rule applicable to Rhododendrons only ; it applies to all kinds of shrubs and trees which naturally produce fruit. The common Honeysuckle, and all the bedutiful race of Italian varieties, form berries aburdantly immediately after flowering: every berry that ripens diminishes to some anount the flowers of the next season; every berry should therefore be removed as soon as the Howers have dropped off. The efrect will be not on! to cause these charming plants to bend down beneath the load of their blossoms, but to prolong the season of flowering, and to increase their perfume.

\section*{ON PROPAGATING CONIFEROUS PLANTS \\ \\ BY CUTTINGS.} \\ \\ BY CUTTINGS.}

Tes fullowing method of striking the different hinds of Pines from cutrings has been attended with considerable success. In August or september, select a young shoot
of moderate strangth, and cut it off, with a piece of the
last year's wood attached, forming what is technically termed a heel. The leaves at the bottom of the cutting should not be palled off, bat must either be left on entire, or shortened with a sharp knife. When the cutting is of an isch deep in phnted from a half to three-quartera sherds, on which a layer of tured about one-third wied phe an inch of good loam, and on the top of all a layer of white sand. The loam prevents the cuttings from cankering after they are rooted, which they are apt to do when planted entirely in white sand. The pot of cuttiogs may now be placed in a cold frume, kept close, and shade end of October, when they should be put in a cold pit for the winter ; care must be taken at that season that they the winter ; care must be taken at that season that they
do not suffer from frost or damp, but they must on no do not suffer from frost or damp, but they must on no
account have fire-heat. About the end of February the account have fire-heat. About the end of February the being placed closely over it; the cuttings will root readily, and many of them will be fit to pot off by the end of June. When first potted off, the young plants should be treated exactly in the same manner as the cuttings are. In the used for Pines is necessary, as they have not sufficient strength to emit roots before the wiater, and consequently perish durive that season, when only callous. If wood of two or three years' growth be taken, it will be found hardy enough to stand the winter, and with the aid of artificial heat in the spring will root freely. -G. G.

\section*{ENTOMOLOGY.}

No. IX.-The Lettuce-Fly.-There are several flies somexhat like those which are called house-flies, but smaller, that are a great annoyance to the gardener, by attacking his crops of Lettuces, Cabbages, and Turnips. It is generally supposed that they all belong to one spe-
cies ; but they have been described with care by continental cies; but they have been described with care by continental Having however, taken have received died the different Hies, I am now enabled to determine that there are three distinct species, the males of which it is not difficult to distinguish: but it is very remarkable that the females are so similar, that if I had not bred them I should scarcely have suspected their being distinct species ; and this fact is worth remembering, as it shows how extremely careful we must be in stadying the economy of insects, and not bear a strong resemblance to each other. It is not less remarkable that the habits of species so much alike in appearance should vary so greatly; for whilst the larve of one feed upon the seeds, those of the other two live in the roots of plants.
I will now proceed with the history of Anthomyia Lactucæ, which is the name Bouche has given to the fly pro-
duced from the Lettuce magots. The larve first make their appearance I believe in Angust, but they are abundant in September, on the 15th of which month I received last year from Surrey a quantity collect-d from the fowering heads of the Lettuces (fig. 1): they closely resembled those from the Cabbages and Turnips, being of a yellowishwhite colour, tapering towards the head, which was pointed and armed with two short black claws at the nose, with a minate appendage on each side of the second segment, and the binder extremity was truncated or lopped off, with
two stout, hornv, curved teeth near the middle, and four twoller ones round the edge : they were more than four lines long. These magots live in the involucra of different varieties of Lettuce, feeding upon the grains and receptacle; and when these are consumed, they wriggle themselves out backward (fig. 2) either to enter another seedvessel, or to fall on the ground ana become pupæ : many of the involucra were empty and distorted, and others which appeared perfect, on being opened presented only the skins caped the grains-the maggon. When the seed-stems are gathered and drying, the larvæ change to pupæ called "Shucks" in Surrey ; and in two days after I received the packet of magots, \&c., half of them had changed into these bright chestnut-coloured oval cases (fig. 3), which are rough when riewed under a lens, with two minate tubercles at the head, and two hooks and a few other tobercies at the tail.
In the second week of Last May a few of the pupse hatched; and on the 20th, three or four others, all of which were males ; on the 25 th, about twenty more had hatched, four of which proved to be females ; they have, however, been observed as early as April and as late as July. The male (fig. 4 magnified) is intense black, clothed with short hairs and bristies, the eyes reddish brown, and meeting above ; face inelining to chestnut colour, with a bright spot of the same on the crown; the fore part of the trunk bears four varying whitish stripes : the oody is ashy grey, the segments ulackish at the base, with a detp black triangular spot on each: the legsi are rather hong and b.ack'; wings two, stained with black, and beautifuly inid scent; pitchy; the cross lines show the natural length and breadth pitchy; the cross hines show the naturaliength and breatis
of the fly. The female is entirely awhy -grev, and less of the ty ; the eres not meeting on the (r) \(n\) n. Wita a bright chestinut-coloured stripe betreen th.m. budy oval, the
 nervures lighter tisan in the make wial it en a s in siLe
From the immense fuantitise of that Lugots whinch sometimes infest the Letuces, a very large proportion of
the grain is destrnjed, so tiat the secu eroy not tnfrequently completely fa:l: : such ras the case in Saffolk io 1.36 and the three folloring years, when the misehief was so great that: scarcely anry grains were perfected ; but last year these destroyers were comparatively scarce in that part of the kingdom.

Although it may not be an easy matter to exsirpate these matrots, their numbers might be greatly diminished by carefully separating the grains from the brown cases owhen they are dried, which might be readily accomplished
by siftug the grains in a siere, the texture or me-hes of wiinch nust not be large enough to allow the pupare to pass threouh : by this simple mode they might be effectuaily semarated, and the refuse \(c\) antaining the bromn pupx cases should be immediately burged or thrown into hot water fies rill hatch be sown with the grains, of course the poesestion of the first plants that present themseives in proper coniition to receive the eggs of the iemale flues, which are most pabiatily lad betiveen the scales of the involucre throw gin which the lithe ningats as soon as they tmerge from their shells eat into the receptacle. The male flus a least are far more active than the kimired spectes, and to destroy thein would be attenderl with great trouvie. I iear, unless some trap could te laid for tiem: ferhaps phials con tainin- surgar, of l:oner and water placed among the Let-tuec-phor's, mighit artract tnem, as it dues blue-bottle and whe drath farl inan it and he drowned. There is one point in the economy of the Lettuce-fly worth considerng, whici is, that the males are hatched in comsiderable numieris he fore, they could be canght at once, the females would do less mischief, as their eges, it may be presumed, would prove abortive: the plan, however, for destroying the pupex is evidently most worthy the attention of the gardener.
Ruricola. Ruricola.

RERAL CHEMISTRY.-No. XIV.
Tae only other earth of much importance besides the three already mentioned, is called siles or silica, and is found both pure, and mixed or combined with alumine and other sunstances,-constituting in a nearly pure con-
dition, quartz, sand, fint, \&c., and when associated with alumine, forming clay and a numerous series of stones, being in fact an essential ingredient of the sreater numbe Oilica differs from the preceding earths in acquainted Silica differs from the preceding earths in not being base - in being unable to combat with acids; an
indeed it has rather the character of an acid, for it i indeed it has rather the character of an acid, for it is able to combine with the alkalies so much in the nan-
ner of acids, that it is by some chemists termed silicic acid. It is quite insoluble in water, and unacted on by the air, and under ordinary circumstances very unchangeajle substance: when, however, combined Fith the alkalies, it is easily dissolved in water, and small quand thus formed is sometimes present in rery silica or siticie acıd, sneh as saind ur flint, are very litele acted on by putash, but when finely pounded, silica is mixed with potash or soda, and strongly heated, they uelt and form a clear transparent substance, whic. is in fact glass. Common elass always contains other substances, but the basis of all good glass is this compound of slica and alkali-either silfcate of poiasis or soda. The proportions take:n of the tro ingredients are always such that the glass obtained shail be nurfectiv unacted on by water, good glass, a s:licate will be obtined which is earitr so luble in water. A solution thi:s made is easily decomposed by any acid, as the porash has somprratively tut a \(\pi\) eak attraction for the silica, and hence that substance is separated from its solution, on the adidition of almost any acid. Though potash is scarcely able to combine with silca at common temperature in its usual states, get when the shica is in an exceedingly fine powder, the alisali is able to dissolve a small quantity; but this action is far slower
and less perfect than when the two are stroaglr heated and less
silica is almost always an ingredient of the soil, and exists there not only in its solid and insoluble form of sand. but also in the soluble condition of silicate of potash or soda ; it will easily be seens that as many stoues contain stica, they whll, whilst gradually decomposing and crumbling silica in exposire to the air, constantly add to the sol ad
 stanty being formed. Sliua if poised an - Wun as tor example corn and graseses, the gow ereat from the silica requicis they 2, raive \(t\) is enth from the soil. and are ne: wril alkali, has become soluble in water,
and is consequently able to enter into the structure of the plant. The quantity of this earth thus carried up into
plants is very considerable, and it is therefore of great importance to provide them with a sufficient supply of sllicate of potasi. For if plants like those inst alluded to are atternpted to be grown in sonl not containing silicate fioursshing. When a stack of hay or straw has been brot, so that ail the rolatile or combustible matters bave glassy-looking suustance, whicin consits principally of sllicate of potash previously existing in the plants, and which Lein's unatured by the hieat croik durng their burning, is meenly melted to \(e^{+}\)her wi:h nther substances
contained in the plants into a glass. This may aloo very ensily be observed by burning a piece of straw in the flame of a candle : abundant white ashes will be left which con tinue to retain nearly the form of the straw, and which, if kept in the flame of a candle, melt into an imperfer sort of glass, which is principally siiicate of potash. The ferent plants yaries much,--some, such as the plants wed for pohishis, commonly called Dutch rushes, contain even more tian hay or straw; and cane contains so much silice, that it appears completely coated with flint
Silica and alumine, which are generally the two principal constituents of soils, differ very greatly in their re spective uses. The former is of importance, both chemicompound with alkali, and thus being absorbed by the roots of plants, and conferring strength and stability th their structures; and mechanicaliy by diminishing the
extreme closeness and tenacity of alumine, and thus, by making the soil more porvus and open, allowing the passage of air and water through it, and enabling the roots of plants more easily to penetrate it than they could were use of alumine is principally mechanical, tending to keep the soil moist from its attraction for water, and likewise being highly useful in absorbing ammonia, both from the air and from all decaying substances evolring it in th vicinity, by virtue of that property which many porous sorbing or condensing that gas, which, as we shall shortly show, is of great importance in the gruwth of plants.
Besides the three earthy bases already spoken of, and a few others of far less importance, as they are very rare, and only to be found in particular places, there are a nuwhich are of great importance in the arts, and one of which is almost always present in minute quantity in the soil. Most of the common metals, such as iron, lead, and zinc, gradually tarnish, and bec:me rusty when exposed affinity for the reason the they have a strong graduall beygen, and under these circumstances they eoved win a fin of an oxile, or cor mostly bases, and form with acids a very numerous series of salts. \(-E\).

\section*{COTTAGE GARDENS.-No. XX.}

Tre summer proning and management of Vines on walls are points of culture with which every cottager should endeavour to make himself acquainted. Were this the case, we betieve there are many favourable spots for lines in the warmer parts of England that would be much more profitably occupie 1 than they are at present, without in ferfering in any way to present the cultivation of othier plants tiat are more ornamental, and therefore bette suited than the Vine for decorating the lower part and sround the porclil and windows of cottages. Whilst w would encourage these in every possible manner, we would as the same tinae lose no opportunity to unite the useful with the ornamental whenever it was practicable, and introtuce the rine whenever the soil and situation were of
sach a nature as togive hopes of its being cultivated with sucha nature as to give hopes of its being cultivated with success. Thase cottagers who are already thus fortunately situatet, shmalt now examine their hints and regulate the b-anches carerully so as not to retain more young nood and frui-bearing shoots than it is supposed the trees will be capande of supporting and bringing to maturity; for although sull and situation have more to do with a good crop of grapes perhaps than any mode of treatment tha may be udopted, still there is much that depends on judi cious management ; and the better this is understond the greater will be the success that will attend their cultiva tion. The fruiting branches should now have their tops pinched of two eges above the bunch, and the others masy
be stopped in the same manner when they have reached be stopped in the same manner when they have reached
about 20 in. or \(\because \mathrm{fr}\). inlength. This will induce the whele of about 20 in. or \(\because \mathrm{ft}\). in length. This will induce the whole o
them to throw out a lateral shoot from most of the eye them to throw out a lateral shont from most of the eyes, frst is aterwards to be thon of exciting the bud at the base, and making it break prematurely. Such shoots as are barren or not likely to be wanted for next year's bearing wood should be removed and no more nailed in than are necessary to cover the space that there may be for training them. It is alway pe the Tine thin and open rand the hranches tnzetier anthad tie plants rith a number mut viry ots that arent notser gatto wh he octers. and the fruis. of a haren alare of hair nowrishment \({ }^{\text {t }}\)
This is now whe ut the time when Curres oni Paran pis requice to bo gras gere carebuly, and thined to proper itatarces. Those sown brnadcast should also be thinaed to a similar distance.-M.E.H.

HOME CORRESPONDENCE
British and other Orchidacee.-The remarks of a correspondent from Boston, U. So, in your last Nuwber, hare ation of such Orchidaceusus plants as are cither the cuitiwill bear our climate. In many gardens tre see a damp hady walk neqlected, and are told that nothing will en grow in it ; but a little knoxledge ani attention win make these parts of a garden, if not quite as gay. s.t fully as inter siting as a gaudy fower-l)ed. For general purpires such piants as Digitalis purpurea, with its white and spotted varieties, Epiobium angustifolium, Ornithogalum umbel will he dive ther, del, (we. whic whaces) may be placed even under the drip of trees, tit the best-and most striking ase to which a border in such a situation can be applied, is the cultare of Orebidaceos plants. As many on these are so curious and beatitul that they are constantiy taken up from their native spots, transferred to gardens, where they frequentiy perish fer once flomering, and the present being the best and ave feash for trash bing them. Pellaps the way of your eaders; it is that pursued in the Botwe tome Oxford. The border is dug out nearly two feet deep if the soil is naturally wet perhap's more would be de sirable); it is then half filled with broken fliuts, as us.ed in mending roads, after which it is filled up mith good maiden loam and a little leaf-mould ; a smail quantity of chalk is added at one end for such sorts as require it. The plants are taken up when coming into bloom with a sparde to diturb the roots as little as possible. Before beith replanted, each individual should be held inverted in th band and watered over the roots with a fine rose: ther will then seldom suffer from removal in a horder per pared by this method, I have now flomenng for the third season after transplanting, Orchis bifolia, latifolia, maculata, and pyramidalis, Epipactis latifolia, Habenaria virids Listera ovata, Neottia spiralis, \&c., as well as the North American Cypripedium spectabile and Malaxis lilitolia, all well established, and in a thriving condition. It appears the requisites are a shady situation and perfect draioage ; the was covered with moss at one time for protection, but the blackbirds and thrushes constantly pull it atoout in search of worms and insects in very dry or serere weather; a little leaf-mould is now substituted. On planting some auditional sorts the earth was found full of matten roots of the common Laurel and Acacia (Robinia), which grow near, exactly as your correspoadent describes in the American swamps, but the only way in which I can imagine these to contribute to the health of orchidere is by at soroing the superfluous rain that falls, and thus assisting the dr.inage. I should like to comounicate, if practicable, with vour correspondent. Has Gerardia fruficosa been yet introduced into this country? It appears by the description and plate in "Pursh's North American Flora" to be the handsomest of its genus, with deep purplish blue dowers, "plentiful in the pine woods abo Mountains." I should add, that the Orchidaceous bed requires to be occasionally watered in long continued dry weather, and one part of it has the morning sun where the Orchis are placed that grow in open meadows.-C. D., Sussex.-We believe this Gerardia has not been win duced.]
Sulvia patens Hardy.-It may not be generally known among your namerous readers that Salvia patens is quite hardy, and may be cultivated with periect success in the dower-garden with other herbaceous plants. I turned some plants out for experiment last year in the borders Lere-where we are rather camp than otherwise-with no other preparation than sufficient drainage, and my success is complete, as the severity of last winter proves. The plants are much stronger than those kept in-doors,
much improved in habit, the shoots hemg double the streng reenhouse culture.-Richard Fur rest, Nursery, Kensington.
Summer-Transplaniing.-A constant reader begz to observe he has adopted the plan of planting at all seaso has in well-watered or hard ground, for a long and flowers never found it fail: all transplanted plants be transanswer equally well; even Roses in blossom may
planted in July with care, if planted in mud.-Btuy S 6 . Edmurds.
Striking Cuttings.-Among rour readers may be some, who like nuyself, are fond of raising cuttings with the least trouble and greatest certaincy. Allow me then to the mend them the plan I bave fullowed for the last ther rears with complete success. I tie nial-botues toger oy the hecks, and hand them in the windows of our sma greenhouse, having filled them with clean soft \$ater, Mrte, or pat in slips of Salvia, Calceolaria, same descripto of plants: in about two or three weeks, or a munsh. the little silyer-like roots appear, and in a week or ten days I plant them in sull pots well watered; they never seem to flaz er mind the change, and I rasely lose a slip. Myrtles are longer in forming roots-cuttings from the -ave flant have varid from sis meeks to tweise monchs: ther were pu in in auvemicer. \section*{the subj}

Bi,ch Pruning.-Your correspondent, p. 342, on the management of Birch, states that my remarks not quite agreeing with his experience, and thinking them likely to lead inexperfenced facts which have occurred during his prac tice. He quotes an instance of a Hawthorn hedge, but am not aware that the same line of management which it proper for Hawthorn would be equally so for Birch, dif fering as they do in constitution; independent of which noticed by his friend, may have had a great effect; indee I am convinced from my short experience in the management of Hawthorn, unless have been so string. .ins with regard to the riwe but in inferring that a similar course of treat ent should be adopted tor the Birch he is in error, in the spring of 1840 , about a fortnight previous to the expansion of the buds, I pruned a very large quantity of young Birci, confining the men to 10 days for the completion of their wolk, and in less than a week after the pees or shoots were in leai': the result was, that the bled scarcely at all, and nothing could have grown more sigor ously during the summer following. But a different plan should be pursued with Birch of 20 years' growth, and pication, p. 150 , that I recommended the Sirch to be cut down inmmediaiely after the \(f_{a} l l\) of the leaf, which exactl agrees with his statements with reference to the line. the commen. ement of winter has invariably made a shoot as strong, and frequently earier than that which is cut As this seems to be at variance with the experienc of Mr. Billington, I trust he will give us sume farther in formation pors 20 years' growt vinced, from observation, it would bleed to death.- \(A\) Foung Forester, Kidderminster
Burk Trade. - In compliance with the request S. N. Y., I beg to state that the price I obtained for Oak ank, delivered in good condition, was 60 . Js., and the cos peeling and delivery, 22.53 ., leaving a clear profit of \(4 \%\). it should not be placed against the bark, but against the timber ; it would amount to about 7s. per ton upon the as our northern brethren. We generally rear the bart aguinst a rail, standing about 30 inches high, placing it on eaciu side in an inclined direction with the rough side out the larger pieces longitudinally on the aper, by which method, sho ars will make it \(Y\) roung Forester, Kidderminster, May 31, 1841.
ytisus filipes.-In your answers to correspondents p. 328, Gardeners' Chronicle, you say that the plant "called Cytisus philippensis should be C. Philippi," branches.) The two beautiful plants exhibited by Mr Jackson at the May Show this week, were from the original plant sent home by P. B. Webb, E-q., from the Canaries. Whether that gentleman has yet published it know ; but he has, bis prot the staral History sone description that may happen to possess it, and it deserves to be in every collection, I would offer a few ubservations on its cultivation. It is rather difficult of multiplication br cuttings, and takes several years to maike a strong plant by that mode, but takes freely when grafted upon the common Laburnum, and grows rapidly upon that stock. It nust be kept in an airy situation in the greenhouse, otherwise it is apt to lose its branches, and become drawn and unsightly. Whether it will endure our winters I cannot say, but I tave known it resist the fros \({ }^{+}\)in a northerly iluation, when the thermometer stood at \(2 t^{\circ}\) Fahr. Per haps it may be found as hardy as its nearest ally Cytisus monospermus, which it resembles a good deal; but is easily distinguished from that species by its more slender habit, its foliation, and inflorescence : besides, the seed pods are flat, and contain generally two seeds, whilst the other (as its name imports) never has more than one, and that is a rounded pod.-John Scott, Lower Tooting.(He are glad our corresmondent enabies us to say Ford or two upon this subject. There is in the gardens a plant called Cytisus Phrtppinensis. upon he suppositio that it came from the Philippine Islands ! alias, C. Pul lippensis, winch is one of the varieties of Genista cana riensis: that prant should be named G. Minlpmi, it having
been so called aiter Mr. Phrlip Barker Webb. With regard to the bedatiful plants exhibitel by Mr. Jacksm, ther are no doubt Cytivus tilipes, a species, the fisare of Wich bas been long sulnce published in Messrs. Webb and Berchellot \& Acconnt of the Canaries, but of which no description has yet appeared. T.is is one of the moost gracetul of all greenhouse shrubs.]

Neue Mode of Heating Greentouses. - A method of heating by the embination of pure warm air and radiant hest from tur-pipes curying water in a trouzh, has been of which rester, tue seat of the Marquess of Tweedurde nished by Mr. White of Had Ingenn ; and Mr. Dobson, nished by Mr, White of Had hington; and Mr. Dobson,
the gardener at Yester, as well as L.oni Twue dale binself, express tilemselves perficely satisfied with the result of a trial throught the past winter. Mr. Dobson says the
Vinery is of light constraction, being of metal: the rafters Vinery is of light constrection, being of metal: the rafters
of maileable iron, half an incl broad and three inches
deep, and astragals of zinc. The house was finished during
the autumn of 1840, and farnished with Mr. White's patent heating apparatus. During the early part of the winter, he filled the Vinery with a variety of greenhonse the intense cold experienced early in January, he had no difficulty in keeping the honse at the temperature best calculated for the plants which it contained. Since then he has sufficiently tested, to his satisfaction, the power of the heating apparatus. In ordinary severe weather, while the thermometer in the open air, during night, ranged
between \(20^{\circ}\) and \(30^{\circ}\), he found no difficulty in keeping the temperature to any point required between \(50^{\circ}\) and \(80^{\circ}\), a range which he considers quite sufficient for any purpos of forcing. The stove was heated with coke, and during a period while the thermometer ranged between \(60^{\circ}\) and \(76^{\prime}\), the cost did not exceed \(23.6 \%\). per month. The fue consumed during the time was 10 bushels.- We cio no know what is the prinicine of the store, but it resembles an Arnote, and stands within the house, which is 25 feet long. 12 feet broad, and 13 feet high. The construction of the Vinery is explained in the following account by Mr. White :-" \(a, a\), back wall ; \(b, c\), mouths of cold-air drains, and the dotted lines their coatinuation to the hot air stove \(d ; \varepsilon, e\), a few descending steps by which it is supplied from the outside witi fuel through an opening in the wall as shown in the plaua. On the same lesel there
is a place \(f\), for containing coke, as represented by the

dotted lines; \(g, g\), is a brick casing formed in lengths of two feet each, and neatly jointed together; they are open a top, and have moreable covers. Into this casing the heated air from the stove is first received, and afterwards distributed at pleasure. In addition to the heat given of in this way, the brick casing, from retaining the hot-air, together with the fiue pipe passing through it, becomes so hot as to give off a large quantity in a radiating form. In Fig. 1, two of the flue covers are removed to show the sunace the iron water troughs fitted on the hue pien in the sectional viers, Fig. 4. The troughs are ordy filled when the beated air is wanted in a humid condition, in other cases, the humidity from the cistern \(/\), which oupplies water for the ordinary purposes of the house, will b sufficient ; \(i\), and \(j\), are woni wedses inserted on une side of the covers to raise them, more or less, in proportion to the quantity of heat required; \(i\), is the termination of the
flue pipe, where it ascends, crossing the house above the flue pipe, where it ascends, crossing the house above the
door, and entering the back wall into the chimney. When door. and entering the back wall into the chimney. lighen fre in the stove \(d\), and open nne of the cold-air drains \(b, c\), as in the present instance the internalone \(b\) is open: the atcoms represent the cold air flowing towards the stove. Where it eniers below, ant after traversing a nurmerous iormation of winding channels in a heated sta e, cischarges iowich it escene casing \(g, g\) above the taken from the external drain \(c\). the internal oue \(b\) is closed; a regulation. bowever, which is entirely at the discretion of the superintendent of the bouse; \(r\), the regula tor in the a-h-pit of the stove, the handie of which is turned so as to admit a greater or less quantity of air, by which the combustion of fuel in the stove is regulated; \(l, l\), and \(m, m\), ven-
tilaticg grates: \(n, m\), rods of iron suspended to the frames of the top windows to open and shat them; a system of small roans for inside of the roof to the cistern \(h: p\), cover of stove pit; it is hinged, and readily thromn back when admis For ordinary sized plant or fruit houses, the abor methou of heating wit be found quite sufficient.
 Where very larye structures are requires to be heated. an additional quantry may be prowared by means of not-water pipes supuited fr m a boil: ficed within the patent stove The pipes may te convesei in a difiereat ditection from stove farmace, requires no additional fuel.
Spanish Oaks.-(See p. 340, col. 3)-Ballota is an Arabic word (of which there are many in Spanish, bnt no Persian), Balut is used by Avienn: f for the ouk, as wellas called Q. Ballota? Sháh-kaiut ( \(R\) yal Ow, , i. e. the Chestnut. eeemas to hint that tue Aribs ant the the sumista

 Ackilops are very palucable, and much eaten by the country
people in Asia Minor. Tie caps only are an article o
commerce (Vel nidhi. i. e. Baluridion). [The Ballota Cak of hotanists is what our correspondent, Captain W. absurdity of anica, and the name. notwinstanding is no doubt the same thing. We have specirceus in all states, from leares very prickly to others as eten at the edze as an olive leaf.
of Currants--About 12 years ago we received a number were a few named ". Woolly karden, among whic know whether it has any other name nr noi, but I think it ought to be better known throughont the country than it is at present. It bas some properties which I think are of some value. One of them is, that it is later in coming into leaf and flower than the common red; 10 or 12 days may be the differeace. I consulder this to be a great benefit in a small garden; it generally happens when the Nematus Capra depusits its eggs on the underside of the leaf, it makes choice of the eariliest and strongest, and on this account the woolly-lenved currant oiten escapes the ravages of the caterpillar. Is it a fact that there are -everal generations of these insects in one season: I have tried pillars it but did not succeed. I fed a numaber or the chrysalis state; I watched them expecting to see an early resurrection, but was disappointed: they were per haps some of the last clecken for the season, that I har nursed : they remained with me until wiater, when I made them the subject of an experiment. It was to find out the degree of cold they could endure; the cold was somewhere about zero ; they died, but whether it was the cold, or the re-agents that produced the cold, which were the cause of
their death, I cannot tell. The woully-leaved Currant is more hardy than the common red Currant ; this was too well tested in 1839: on the morning of the 1.) h of May of that year there was a severe irost, accorupmied with snow, that destroyed the greater part of the blossom and young fruit is the neighbourhood. In West Plean garden there was scarcely a Gooseberry or common red Currant; left from the Woolly-leaved Currant there was gathered a pretty that it in general produced more than doable the quantity fruit that the other bushes in the garden brought forth. As to its quality, 1 hever hers is not taken notice of brit. Neili of Edinbargh, in the year, I am inclined to think that it must have some other Peter M'K one 1 received, I send you a leaf of it.petræ'um; but it is too acid for the sisuth of Enghand.
Tree-puards.-A cherp, light, but strong fence, to pro\(W\) illowle trees from cattle, cu.: - irowice stabes of Larch, and about 3 in . in diameter, naking use of the waste ends by cutting them into 3in. pieces; then take rod-ron in other. Thus prepared, burn holes with a piece of the iron rac through the stakes, 12 in . from top and bottom, in the same direction, and through the centre of the small 3im. pieces from end to end, having 10 of each; run the iron hrough them aiternately, connencis, with a swke. ending with a 3in. piece; then bend the wiole circulariy round the tree, tying it to the other side by twisting the spare handy labourer may fence in trees in a simple and durable manner. But expierieace has taught me to drive three Larch stakes. 3it. long, half-way into the ground, at equal distance, within the crecie of the guasal, to keep it in \(\mathbf{a n}\) upright position, or else catile will froe them acmamst the rees, and the bark often gets injured by the upper part of the guard. Lamboo-cane makes a very ormamental fence should be strong, fift or 10 ft , hivh and besirabac. Trees fore they are planted out singiy, and ought not to be cooped up in large cumbrous cradics as we often see , BI Borers, Lileiam, Gardener and Forester to the Earl of Lucan
Extruordinamy -In reading Mr. Si. John` excellent Work on Egypt and Manomme A Ali, or Travels in the Valley of the Dile, I met sith the following curions account of an extraordinary iree in ": Boghos Bey" = Gardien at Alex duced br an extremely ingenious process. Tuey tahe thre seeds, the Citron, the Orange and the Lemon, and carefult removing the external ccating from botal sides of one o them, and from one side of the two others, place the furree betreen the latter, and binding tae three together with \(£\) ne grass, plant tinem in the tarth. Frona this mised seed aprines a tree, the fruit of which elhibits three distinct species included an one rind, the divisi a being periec. 1 y isi: ifferent as if it had grown on a stpirate tree. This cufous method of producing a tripartite truat has been intea luced by Bocins Joussouff rom smyrin, his native itr, where it is said to have been peri-ed fo motine 192 nemorial.'" Mr. St Joha likewise says Bogios Bey'starte contains a great variety of rare tlowers, among which the most remarkabie are the Carnations, four teet high, the
largest and finest perhaps in the world. \(-B . D\). This sane plant is mentioned in the following manner in a pricarious tusus nature of this genus It Suxdia:- A very garden of Boghos Bey in Ale:andria. He had just re-

Sict-kut-1 mink the in ins you groted are wrong as to the lasitat of sent-n. I iceriasiy have seen ut seve-
ral times growiog nimt, and alnays in clay, aithouga tie
surface was sand; and I recollect having this pointed out to me by a botanist of some note several years ago, and observing the mistake made in its cultivation from its being supposed that the plant grew in sand. I do not, portance, for the plant evidently grows better in light rich garden mould, than in stiff soil. \(-\boldsymbol{K}\).
Gooseberry Caterpillars.-In reference to the Chrowicle, May 8th, page 19, on the Gooseberry Caterpillar, I am induced for the general good to make known a simple, sure, and effectual remedy, which I have hree different counties without failare. In the month of February or March put under each Gooseberry-bush a piece of hot lime about the size of a turnip, pour water on it, and as soon as the lime separates mix it regularly with the earth under the bush so low as the roots. More is not necessary, nor will it be requisite (in general cases, to repeat the lime for three or foar years. The fact is, the bushes, which eggs the lime destroys. The lime thould invariably be used before the
self Rearance. -Jemes Jachson.
he quieksilyer pasting the register in an the occmion of mometer at times? I imagine the register is compo-ed of toed, i. es a point of a needle broken off. is it posssible for the quicksilver to vaporise so as to effect this coufusion?
If you, or any of your nubseribers, can be the means of giving us any information upon this point you will oblige a nomerous list of complainants. There is another point, also, which requires elacidation with respect to this very usefal appendage to the green and hothorse. The upper therpass the register when expanding, and carry it back again when contracting? We all know it is so, but I have never nean it noticed or attempted to be explained. I suspect hat the specific gravity of the resisting material, which, I selieve, is composed of glass, and therefore lighter, bulk or buik, than metal, is not sufficient to counteract the effect of expansion, bat that in its retrograde motion it is wolely influenced by the attraction of cohesion consequent Bpon the denser state of the llaid, or it may be influenced
by capillary action. Have you or any of your subscribere, hich I take for granted is now become a formidable hody ried the themao-barometer? I bought it with some doubt as to ita efinacy, and it certainly failed with me. I should The to know how it turned out with other persons.- - . \(F\) mands the accompanying weeding

Purpls variety of Cytisus Laburnum. - In my former teport ( P .325, ) I have described a large bush of C . par parens issuing from one of the main branches, into which the stem of this variety is forked; and among the clus tors of hybrid lowers on dilierat ramali of the same branch I have since discovered two young shoots with the parfoct leavel and llowers of that specied. In like maner I have described four other more slender branches, which issue from the fork, and on the only ore of these four bramehes which has not produced C. Laburnum I have row discovered a this year's shoot of C. purpureus; so that there are altogether nine shoots of the former, and tour of the latter species. On all of the sir principal bramohes of the shrab there is therefore at least one shoot. either of C. Laburnum or of C. purpureus, but not of both on either branch ; and it may probably be found in ad dition to the hybrids, that each branch is limited duce only one or other of the parent species. The shrub 2 still covered with a profusion of dingy flowers inter mized in different places with the purple blossoms o C. parpureus, and about a dozen large racemes of the common laburnum, and the mixture gives it a most bis gular appearance; nor can people eavily be bronght to loolieve that it is mot produced by budding. In the ad-
joining grounds at Singleton, my friend J. H. Vivion, Eq., M.P., has a similar surub, which from among th hybrid blossoms has produced three shoots with one raceme of C. Laburnum on each but there is not ant appearance of C. purpureus.-L. W. Dillwyn, Sketly Hall.

Accentuation. - A correspondent suggests that the ejes of our readers and the time of our compositors would be kimaly spared, if the rule of accentuation laid down by the Spamish Acudemy were followed; viz. : that every name Except whea marked on the antepenultima (last syllable exeept whea marked on the antepenaltima (last syllable
loat two), or vitima. [This is a good suggeation, which wer this number we shall adopt.]
Eshibitions.-A correspondent, signing himself an Exhatitor in asmall uersy, complains of the conduct of visitors at the shows of tlowers. He says that many. especially among the ladies, have such a propensity fingering, not to mention abstracting on a small scale, that nothing short of a lecture from our editorship will cure the evil. Sume of them will pail out stick atter stick in their prograss, in onter to enfighten their party with the names. He has nut the slightes wish to und aul with thensiety to impart intornation; on the contrary, he thinn's it praiseworthy: but he objects to the manner fin which it is obtained-rizog by dragging out the atictas, inatead of
looking st them as they stand in the potis: and for this
there is no excuse, as the names are generally written that the principal roots of many plants are cloee round the pot, and by this pulling outs and pooking back they are mangled in a sad manner. Were this custom put an end to, our correspondent says we should not have to complain that plants are unnamed. Gardeners like to pot names to their plants, but they do not like those names to be made the means of injuring them. [There is some truth in tice goes so far as our correspondent represents. What is worse than the injury to the plants is this, that when the names are polled out they are often replaced in a wrong pot, and thus a Pelargonium gets the name of a Heath enlighten those who follow in the wake of these disturbers of sticks.]

\section*{PROCEEDINGS OF SOCIETIES}

African Cerlar.-A plant whose seed was brought by Sir J. Alexander from the Cedar Mountains in Southern Africa proves to be the Thuja cupressoides of Loudon' hardy, as they were not in the least injured in a cold pit this last winter, althougis the pots in which they grew were frozen quite hard. \(-G\).
in - Pa Zat of Criours for a Fiozer-garwhite White and rose Malope has a pretty effect; or the wiite and rose Malope may be sown alternately in a raw ronica, or the Nizelia of Damascas, or siberian Larkspur or Coreupsis tinetria, or Eicholtzia; or Perennial Flax myy alternate with Escholtzia, or white and blue Canspanulas may alternate with each other; or Cbina Asters may be planted tins: -1 . White, rose, white, rose, de.
2. White, bi ie, white, biue, \&c. 3. White, rose, white. blue, white, rose, whit \(\%\) \&c.
Cehrysunthemum Indicum.-M. Masson. gardener at Sezaune, in the deparment of Maine, has succectled in spring and autumi. He plices a mumber of bushy Chry
santhemums in poor earth, or in small pots, so that they have only a part of their necessary nourishment in con-
sequence of which treatment a number of tie bramehes Hoduce no blossoms. In January he theres these branches, with as many ronts as pressille, in orier to pradure trong growth, and places them in puts, with a nisisture of dung and peat earth and good garden mould, and expuses of Frely to the iniuence of the atmosphere ; at the end路 the free access of air. If treated thus, M. Masson assures us that the plants will produce blossoms in Mara, and again New Tree Paonies.-M. Poitean has siven an account of some splendin tree Pæonies, which M. His has prouced from seed, namels the Puonia moutan moteon and the P. moutan Lilliputiana. The first must be a fine plant, as the blossom is very full, iin. in diameter, and of bright English carmine,-a colour very rare amongst
Proonies. The external petals are broad, round, and for the most part not notched; in the inner petals this is more or less the case. Witinn these area nuaber of gular filaments surmounted with yellow anthers, and in the centre a number of small fringed anthers mised with these beautiful flowers do not produce seeds, but their ovaries are constantly metamphorsed into petals. The peculiar smell of the Pæony is in this plant mixed with a slight scent of the Rose. The.P. m. Lilliputiana is not larger than a full-blown handred-leaved Rose, whose colouring it also possesses. A third variety, the P. moutan roseolens, which M. Masson produced from seed at Belleville, has a beautiful full, lively, rose-red flower. The most remarkable character of this is its very decided rose scent, a peculiarity which is unhappily possessed but by Mr. Hartueg- Adrices have reached the Horticultural Society from Mr. Hartweg, dated Lima. Feb. 13th, baving been brought over the Isthmus of Panama by Mr. Mac Guay. He had in vain endeavoured to find a vessel fo to quit Lima for a fem meeks; a matter of the less im portance, because the wet season had completely set in and the mountain roads to Cuence and Lora were reported to be almost impassable. He had succeeded in obtaining the long-wished-for Convolvalus Mechoacanus, the flowe of which is of a brick colour.

GARDEN MEMORANDA
S. Rueker, Esq., West Hill, Wandsooth-The Greenhorus
here is very gay, and looks well, notwithstanding that the kinds
of plants are for the most part common, and within the reach of
 mhe centre of the huuse: and on the thor along-side them are
tome Cacti loaded with large searlet and crimson blossoms. A specimen or two of salvia patens, with their beautulul deep blue the light pink of the Hydrangeas. Among the more curious
plants in this house, is a large bulb of the Cypripedium spectit bile with seven or eight singular flowers, with pinkish labellumi formed like a bag, and white petals. In the Orchidaceous hous
 seven and eight feet high, and has at present eitht pertect lony, and one inch and a half over the mouth. This plant in
grown in a mixture of light turfy peat and sphagum, and is con grown in a mixtore of light turfy peat and sphagnum, and is con
stantly kept moist. Two varieties of the splendid Cattleys Mossix were in great beauty; one was the usual kind, the other orange botch on the labellim. A handsome specimen of Sacco-
labium guttatum, growing on a log, had no less thani six spikes, between 14 and 15 inches long, of delicate white and violet fluwers hanging down in a graceful curve. Large plants of Dendrobium
moschitum, Calceolatice. and evipreum had a ma-rificent appear-
 up a constant succession of flowers, and produces sitt.r.t.
freely. The orange-coloured Chysis aurea had a fi:ise the of
bion. properly it seems to require great moisture, and a temperature
 fairy palace for insects, not less wonderful than Aliaddin's There
were many other kind of this extraortinary tribe Aowerine in great perfection, and among them we must not forget the delicate pinkish-lilac Cátleya Lodidiésiii, and the rick crimeson-pur-
ple Biétia Sheplierdii. Ipomue a Horsialliz had scrambled about nearly all over the roof of the house, and proauced its large chusR. W. Barchurd, Esq., Wundswerth. - In this gentieman's garden the chief feature is the forciny, which is carried on in a supenoticed a cuecmber growing freevy, and frofting aburdantly,
with its roots in water. The pot in wrich it is trowing is placed

 come true from seed. rozéma Henchraannii,

haff hardy plants or annuals. Sme hinds of Roses will now be in a suthicient state of forwardness to bud, and the different
kinds of China may ov inereased by cuttungs. Hedges of all kinds oay now be clipped, and box edgings, in cloudy weather. Mow
awns weekly. Tie un neaty all aivancing flower-stems. Hoe and rake, and pay a strict regard to general neatness.
Nurs watered. Roses and many other stru's may how cuttings of Laurels and other eve greens may be put mis stake
newl- - \(r\) afted trees, also last wear's budded ones; those budded plants intenced for training should be cut back to fre or six eyes, and the laterals trained out.
FornsT . This is a good season for pran ing the side shoots from young established trees, for cleaning
he ge rows and young plantations, and for carrying on the opehe ge rows and young plantations, and for carrying on the
rations recommended in the last Number.- Joseph Puxtun.

> NOTES FOR , MALL GARDDES

Ws spoke last week of the kinds of plants to put nut of door for summer and autumn blooming, and we recur again to the subject tor the phrpose of obersnes that should contain but, ne kind of plant, or at least plants of one colour, arranged in accordance with the remarks made in \(p\) 61. For example, suppose awn ; the first bed may be filled with white Petunias, the nex carlet Ger \(\Delta\) niums or krysimum Peroffskyanum, then a bed or a plant of similar colour; then yellow Calceolarias ; the follow ing bed may be purple Petunias, and tinally a mass of Sphcnogyne specio:a, Gazania ringens, or some other nrange-coloured duced, and the effect will be exceilent, particularly when looke only to admit of one bed, the plants in it may still be advan tageously arranged in conformity with the same rule. Balsams, pel rgoniums in the greenhouse shomit be shifted mot large pots and indeed all plants that require. Dick the young seed the latter. Pinis' may now be piped, which is performed in the some of the lower leaves, and cut it over cleanly at a joint, with sharp hnife. When the piping is made, plant it in a shady situa the moul should be raised above the common level of the soli with very rutten manure and drift sand. When a sufficient num ber of pipiajs are planited give them a good watering, and place a band-wlass over then, after which it will only be necessary to
remove dead leaves, and supply them occasionally with water All hard-wooded greenhouse plants may now be set out of doors Give plent
FNHOWOL.OrICAL NOTH ES.
AT this time the leaves of nearly every hawthorn hedge in the neighbourhood of the metropolis are being devoured by myriad They likewse attack Apple-trees, and Euonymuses These cater pi larc are hatched in the autumn, but do not emerge from the hard gummy covering iormed for the protection of the eggs by the parent thl the spring. At first, when small, they burrow int a e extremely injurnous to the trees and hedges, as well as rend ering them unsightly. About the middle of the present month these caterpillars, which are lead colour, spin each a stronts web. close togetner, in which they change to a brownish-yellow pupa. Hy the end of the month many of them emerge as moths. In smaller moths. The upper wings are white, with about 20 black dots distributed over them; the under ones are blackish, and both have a fine white finge. The feet, antennæ, and body are white. The female lays her egrs in masses of from 2n to 30 near the buds of the trees. Birds and a small nind of lchneumon are the naturar enemies ars in societies to collect and destroy them; and also the bundles of cocoons.

B. llo, Wuthurmituw, can obtain Clématis montans of any of
toe prinipal London nurserymen. Great numbers of it have
been given away by the Horticultural Society. It is from the toe principal London nurserymen. Great numbers of it have
been given away by the Hogticultural Society. It is from the
Himalayas. nedgen about Battersea and elsewhere is caused by the ravages of the caterpillars of the small Ermine moth; it is a common pest in We thank Mr. Colleby for his specimen of the purple Lablumum.
We will find several notices of such appearances in it in some of vor recent uumbers. wishes us to name them.
Mr. Slude will find the meadow Fescue grass the best for a low piece of ground fiooded in winter. Pink.
Agricoli will be obliged to any of our readers who will inform
Him of the best mode of destroying the grub on meadow land, him of the best mode of destroying the grub on meadow land, nitrate of foda. Although it acts beneficially upon grass land and Dahlias, it appears to be a direct poison to many plants Very
little is yet known about its operation upon garden plants. We
have seen fery small doses destroy the specimens that they were have seen
applied to.
An Originnl Subscriber asts for an easy cure for the coccus or
scale which infests Peach and Aectarine trees, and whether it can be applied at this season without injury to the fruit.- [There have beell many remedies recommended in our columas, but we mon soap and water, in the proportions of 11 lb . of soap to 3 gai orush, and none allowed to touch the fruit Forsyth recommends
the following: viz. -1 gallons of water, 1 lb . of sulphur. \(\frac{1}{} \mathrm{lb}\). of the following: viz. -1 gallons of water, 1 lb . of sulphur. \(\frac{1}{2}\).
sott soap, 1 oz. of nux vomica, and 2 oz. of pepper; the whole
be boiled together for about half-an-hour, and applied tarm be boiled together for about half-an-hour, and applied warm. The Acacias were Acacia cuneata, published in tiugel's Enume. Botanist. The Zichya looks very much like Z. tricolor, yet the single leaf and head of flowers are not enough to say with cerdeal alike.
A Subscriber must have a little patience with Benthamia.
should have plenty of room to grow in, and, if possible, Should have plenty of room to grow in, and, if possible, the
border of a conservatory. At present almost ail the plants, except the old ones, at st. Heligan, are too young to bear Howers. It is not uncemplant is one of the varieties of Oncidium guttatum. set : we do not remember, however, to have noticed the sced. vessels of Oncidium ampliatum: the seeds will ripen, but it is uncertain whet
We nust refer Mp. Wright to Mr. Paxton's first letter, which
appeared in our paper of A pril 17 th, for an answer to several of
his questions. He will there see that one of the houses alluded his questions. He will there see that one of the houses alluded
to is ns ft hich, and therefore could not have beenc covered with
a thatchet roof. The plan of heating by hot water employed at Chatsworth by Mr. Walier does not difter maternally from other
systems where the pipes are exposed in the house; the kind of
builer used is that termed sadule-backed, the size of which of course saries with the size of the structure to be heated, the pipes are of the same size in bath houces, beinr s in. diameter
The statements made were not the result of an experiment at ant particular time, but of what took place throughout the winter, The internal temperature of the great house was fin'. of the
smaller about - \(\mathbf{n}^{2}\) If Mr Wright turns io Mr. Paxtins frrt
letter, hewill find that the flues under the hed descend alternately on each side. the inclined plane on which the pipes are supported is formed of square timber fixed at regular intervals.
\(K\) asks what is the hardiest kind of Fig ? Is there not some
emall variety which, in a moderately gond climate, bears well as a standard: Many, years ago he had from Mr Kirie a standard A standard: Many years ago he had from Mr Kirne a standard
Peach; it occasionalh, bore a good crop of very hgh -flavoured
fruit, scmewhat anstere, and in a degree approaching to the kind fruit, semewhat anstere, and in a degree approaching to the kind grown as standards in the southern parts of Germany, hut better.
He tias, however, forgotten the siame - 1 hey cultivate in some
part of Suscex a small green fig, which ripens well as a standard, and which is the "small green" of the nurseries, or the green red within of the Horticultural Societv's Catalogue. The devour such fruit. The reach was, no doubt, the Rossanna.
Sian iy wants to know why colours are called complimentars. Sun fy wants to know why colours are called complomentars.
amd in what way they pay complimets to one another, or to
other things. We really camot answer this question, which is xnuci too deep tor un; he had better ine, uire of one of our mge.
nious contemporaries. We can, however, tell him why come colours are caller complementary This expression is borrowed from a 1 tin word, compleo, I fill up and has the same origin as the more common word complete: complementarytiolours might,
therefore, be termed completing ones. If rays of light of different colours are mized together in reteine proportions they form white portions they iorm white iinht: and as green in this way com3ight, it is said to be complementary of red.. Peach and Nectarine
E. M. W. The blistered condition of the Pe leaves is what the French term la rloque. It is occasioned hy or bloated, thickened, crisp, and distorted. The midrib is contrected, and the circalation generally obstructed, so that they be come worse than useless for the elaboration of sap, and should, prodnced in warm weather.
Fanlomnia, which, however, we donbt not, is the correct ortho sraphy. The temperature that this pl int had borne is no donbt the scale of Réanmur. We thank our kind correspondent for his laving called our attention to it; and in future we shall take
eare to give the corresponding degrees of Fabrenheit as he sagsests. The temperature whi"h Mr. Neumann says the plant
 this prinee a taner or Paka; but does our correspondent reall mean that such a mistake was evt made" The boons uf old sys tematical botani tis are hittle attended to br modern writers. Bau-
hin is quoted by Homer and Schultes as far as \(-\cdots\) exandna, but there hin is quoted by Romer and Schuites as far as ‥exandra, but there
the work has st spped. De candolle cuted these works carefully in the two vciumes ois his Systema begetabiium, but that work stopped with the secend wlume, and wili never be continued. It is chietty in books sucn as smith's English Flora that the syno nymes of old writers are introduced. We have had a little mono
 form part of our classification.
Roses with their centre chas sent us specimens of double Gallic Roses with their centre changed into tufts of green le ves, and from standards formed by budding diferent varieties of the Rose

can be gathered without this imperfection, ont of four or five
do, 2 cn plants. These appearances are not ume, mmon; the arise from the pistils in the centre of the flower being converted int, leares and this a viviparous condition is taken on by the
plants. We are not aware of any one having discovered why
such a tendenc: Such a tendenc: oceurs in certain individuals and not in others; ployed, winch causesa terdency to produce green leavec rather
than trin petals. We should incline to the suppositorn that the
mannure was too strong, o., contained too much ammonia, manure was too strong, i. e., cen
which will make plants run to leaf.
J. G., st. Joth'r - When Cape bulbs arrive at this ceasnn of
the year all those which are growing nould be immediately the year alt those which are growing hould be immediately
potted in dry earth, and rio water shinh on any account be given them till their bleached sproats have become decidedly green; after that has happened water should be administered sparingly
until growth is evidently becoming more vigorous, after which until growth is evidently becoming more vigorouc, after which
they may have plenty. Keep their leaves crposed to adl the light precerve them in a perfectly dry place. Turaing the pots nn the siarted in it hothed. Mr. Herbert's work on Amaryllidaceze contains the best directions for managing such plants. Sow the
newly-arrived seeds immediately in a fentle hotbed, and give newly-arrived seeds immediately in a fentle hotbed, and give
them no water, only shade them, untll the germination bas begun.
We shall he most thank ful for results of experiments on the ferent apiarian systems.
A Cutuge ita dener. - In earthing up Potatoes the soil should
encroach as littic as puss bie on the foliage when the latter is in a young state: but as the stems advance in growth and more foliage is produced the loas of the faw lower leaves that may be fact, are the first that suffer nathral deeay. Earthing up is in all cases advantageous; but more especially so as regards the large
varieties. The sides of the ridges should be convex rather than concave or straight. because the latter forms afford but little space at top in which the tubers can form.
W. Four \(\quad l\). Fipect is understoed
rine shoots in the present cearon, with the intention that one two them shall be left for bearing fruit next season, and the other cut down at the winter pruning so as to produce two shnots in the ensuing cummer This shoot you wash to grow strong, in order
that the shonts which it is intended to furmsh may likewise be so. This being the for by so doing you will not strengthen it, as you seem to sup pose.
the quantity of foliage above it, and its solidity upon the amoun
of lizht to which that fuliage has been expoed. the disea-e called seab in Potatoes, of which you complain : and so will too much dung, appled without mixing it properly with the perfectly free from sulphur, but if the coals are really burnt to ashes, and no sulphur is present, they form a good material fo improving stifl haud.
Our /rish
Our Irish Subseriber suffers, hike many others, from a pesti-
lence that we know not how to arre-t. What we have been able to collect about destroying Caterpillars will he foumd at pp . 105,132 , and 265 . The difficu.ty of de-tron ing them consists in
doing so without killing the bu-hes, or at the least the foliage also. Wi have estracted the following paragraph, irom a letter by Mr. only the leaves, but the fruit, which the caterpillars destroy.
The trees, both of the Apple and Pear, and the Gooseberry have
been completely cleared in a fewr days by a pair Linuets in my garden. They appeared to be uncer no tear and are the figure of a cone, so that this is a director to the birds where they archodred: on the (iooneberry tree there are no cell
formed. but they lalge and feed from the underside of the le and, as above stated. those birls appeared to be under no fear, a they approsched within a lew yards to where I was watching operation of dishedgine the caterpillars is this. - they apply thei bills to the part next the stall, and carryit forward in a moment, so that the leaf is thrown open, and the bird then seizes the cater-
pillar, and proceeds to take 0 , hers pillal, and proceeds to take others in the same way, till he has
zot what I suppose, a fair number, and then retreats from the got what I suppose, a fair number, and then retreats from the
garcern to feed his young, I believe, as they return again in a
short time short time ror more. The leaves s opened by the birds appear
not to be injured hy their nperations at all: wut I have fonnd great diriculty in attempting to open those cells writhout tearmu the leaf; and the caterptlar itself ic othliged to eat an opening fo Dirvet.- The best writ on Heaths is pagation, Cultivation, and heaths is areatise on the Pro a climate where they require protection during the winter
months." By W. McNab. Edmburgh, 193, \&ro. Heaths ar not so difficult to gr)w as many imagine ; the chief requi-ites fo therr well-doing beins a soll composed of turity peat and silver
sand well drained, plenty of air, and constant attention co viater ing and shifting.
If \(M r\). Hamertun has not had an answer to his question, it is be carse we have never received his letter. Cherreul's book is Sur
la lni du contraste simultane des couleurs, and may be dad of all the Foreign booksellers.

NEWS OF THE WEEK.
The arrival of the overland manl from China and India has put us in possession of the important inteligence that the negotiations between Capt. Elliut and the Chnese Commissioner were broken off soon after the date of the last despatches, and that hostilities recommenced in Feb. ruary, which terminated in the destruction of the Bogue Forts, and in the capture of Canton. The particulars of the operations preceding and following this event are detailed under our Foreign news. It appears, however, from the tenour of the Admiral's despatches, and from the fuct that a renewal of hostulities may be anticipated India we leara the departure from Bombay of Sir J. R. Carnac, who had been compelled by ill-health to resign the Governorship of that Presidency. The Bombay army was marching to Candehar; the Punjaub contioued in a very disturbed state; the Seikh troops were dissatished, and had murdered several officers, European as well as native the Government of Shere Singhl was most insecure, and the entry of British troops into the territory was con sidered probable. From Scinde and Affghanistan there is no inteligence of importance. The chief news from Cal cutta relates to a loan at 5 per ceat., which had been opened by the Supreme Government; Cholera had broken out in that city, and numerous deaths had occurred among the inhabitants, and also in some native regiments. The news from Persia is pacific; the British agent was about to return to Bushire, and amicable relations were shortly to be renewed on terms of mutual advantage.-From the Levant we learn that much dissatisfaction prevalls at Alezandria in consequence of a counter-order, prohibiting the export of grain, in spite of the Pasha's promise to estabish freedom of commerce. Some modification of the firman is contemplated by the Porte in order to meet the objections of Mehemet Ali, and bring the Eastern question to a final settlement. The insurrection in the Christian provinces of Turkey is said to be parially suppressed ; although the disturbed state of the population, exasperated by the cruelties of their conquerors, still gives rise to serious apprehensions. The troubles in Candia still continue, and other islands of the Archipelago are in a state of revolt.-Our European news is also important: in France the chief events of the wrek have been the execution of Darmés for the attempt on the life of Louis-Philippe, and the furthe proceedings of M. Guizot in the Chamber of Deputies in reference to the forged Letters of his Majesty. Some modification of the Ministry is expected ; and the political excitement already existing in Paris has been increased by the seizure of six Journals for the publication of a letter on the subject of the conspiracy of Grenoble, connecting that event with the King. A squadron of observation has been despatched to the Levant, in order to watch the course of events in the present distracted state of the Turkish empire.-The speech of M. Gonzales, the President of the Council, developing the policy of the new Government, occupies the attention of parties in Spain; a powerful opposition is said to be organising, and the Ministry have already been defeated in the election of the opposition candudate as Vice-President of the Chamber of Deputies. The relations between Spain and Portugal are again in an unsatisfactory state, and much excitement appears to preval on the subject of some recent appointments, and also in regard to the practical fulfilment of the Douro Conrention.- Recent advices from the United States inform us that Mr. M• Leod has been removed from Lockport to New York, and that an application for his release was to be made in full court daring the second week in Mav. They also contain the intelligence of a Convention between the United States and this country, for the final settlement of the boundary question. At home, the second reading of the Jews' Veclaration Bill has been carried in the Honse of Lards by a majority of one, and the bill ordered to be committel next week. In the Commons the adjourned debate on Sir Robert Peel's motion of want of conficience in Ministers was resumed on Wednesday, and continued at great length during the two succeeding nights. The speeches on botla siles have developed the views of different parties in recaru to the great measures which have recentiy occupied the attention of the as well as foreigy, has been the subject of uiscusston. The debate of last night will be found to possess unusual interest. t was not brought to a close until half-past 3 o'clock this morning, when a division took place: the numbers beingor the motion, 312 ; against it,311: giving a majority of one that he would take till Monday to decide on what conree Ministers would pursue in vindication of their poliey.

Cbapman, brother to the present member, and Mr. C. Arabin,
are spoken of.- Ir ids. Mr. L. Lee is spoken of as a can-
didate to oppose the present Conservative member, Mr.

Blakemore.-Windsor. There are three candidates for J. de Beausoir, in the Liberal, and Capt. Bulkley in the Conservative interest. Mr. Gordon retires.

\section*{fforcían}

France.-The Regicide Darmés.-The Court of Peers, after deliberating the whole of Saturday, gave their verdict in the case of Darmés and his co-accused, in the evening of that day. Considere was acquitted: Duclos delivertd rmunals, funition; and Darmés was condemned to the death of a pirricide. After the elose of their deliberations, the Chief Registrar and First tsher af the Court repaired to the prison of the Laxembourg, at the Court repated the sentence to the three prisoners. Darmés received the intelligence of his fate with the utmost coniness. Duelos appeared greatly excited while the Reglstrar was reading the long preamble of the sentence, but when he found that he was aequitted, gave free scope Notwithstanding the entreaties of his advocate, Darmés, it is stated, for sume time refused to appeal for mercy to the King. He was, however, finally prevalled , do so, but he appeal was rejected by his Majesty. On Mecution which appears not to have been expected by the public, prevented the presence of many spectators; but there was a large display of military force. The culprit, it is stated, evincel much resignation and courage. All attempts to extort avail. The event did not produce any sensation in Paris and the entire press appears to have concurred in the justice of the sentence.

Forged Letters of Louis Philippe.-The affair of these letters, and the contradiction given by M. Guizot in the Chamber of Deputies on Thursday, to the charge broagh gainst the King continue to be the subject of violen articles in the journals, according to the particulal impres-
of politics adrocated by each paper. The general imple sion appears to be, that the question remained precisely where it stood before this debate or conversation, but and acknomledge the tact with whirh M. Guizot extricated himself from the difficulty, in which reference to the subject threatened to place him. All compliment him on the introducing the King's name into the discussion, taking merely the high constitutional ground of every Government since 18:30, that "no Ministry had the power to abandon termtory (Algiers) acquired by conquest," and that, "not possessing such power, it was alnost superfluous to declare that he had entered into no engagement or made no promise of the kind." In lauding the abilit with which the minister thus evaded the main) point (the genuineness of the letters ascribed to the King) the Oppo sition papers observe, that he referred not to the prose cution of La France for maintaining that they wer written by his Majesty, the aequittal of that journal, or to the valt petrtons presented to the Chamber in his notrer. however to put the matter, as far as it relates to Algiers, bevond all duubt, by requiring the British Consul there to take out his evequatur forthwith, and thus virtually commit his (the British) Government to a recognition of the right of France to that territory. Another somexhat interesting incident, in conneetion with the same subject, occurred during the sitting of the Deputies on Friday. M. Guizot ascended the tribune, not to rectify, he said, but to complete the account givea in the proces rerbal of the proceedings of Thursday. It appeared to formily deat or mission to reply to the Minister for Foreign Affairs, the Chamber passed to the order of the day. M. Guizot's reclamation was received with unaniroous marks of assent, and the Chamber hastened to comply with his request. This incident is considered important. It has never happened. said M. Dupin, who spoke after M. Guizut that the Chamber has passed to a vote after the speech of a Minister of the Crown, withont having heard something case, he considered was equivalent to assent.
The Minn:try.-Private letters fassert that in the bestinformed circles ministers are not regarded as firm in their places, nor indeed united among themselves. Efforts, it is said. are in progress to reconcile MM. Dufour and Odithon-Barrot. with a view to form with them and thetr the souit-Giniznt Cabinet retire or be removed. The session was understood to be closed by the Chamber of Deputies on Friday. On that day some discussion took fiace on a pention from a 1 . Wermser, of Paris, comprining that the duthorties in sasony, regarding him eaty as an Israeli'e, ond not as a Erench citizen, had brsiness. The petition was referred to the Minister tor Enregs Afairs. The budget of receipts was vated on Thuradas evening by 47 to 41

The F'eot. -The Moniteur announces that a ship of the
 Trof frimate, and a man-of-war steamer, also sailed on the with for the Levant. This concentration of the nary in those waters mas held to prove the degree of uneasiness suggested br the distracted state of the Tursish empire. Prince Luris Napo'eon.-A protest has geen published by this personage at Ham, in whica he complains of the severe measures to which he is subjected, and says he is
treated like a prisoner of the 12 th century. A hoax, indicating that an attempt to deliver him from the chatears
of Ham would be made, had been praitived on the Government, and induced precautions on a bere seale
France, Commerce, En ho Framiaio, Journal dr Pe de France, Commerce, Echo Francai, Jourmal du Peuple,

(u)nzales. I.a Mmsiers under the presiciency of 11 . Gumzaies. II. Gonzales, in his capneity of President of the CDuncil, policy which he intended to pursue. Thiee fuiloming is the substance of his speech:-He began by stating that he rould govern the country with the aid of tine present Cortes. He pledged himself to respeet accomplished facts, and to apply all his enerzy to consolidate the throne would endeavour, he said, to preserve with foreign Porrers relations of amity and good understanding, and at the same time carefully cause the national dignity and independence to be respected. I friendly intercourse would be kept up with the American republics, and the Minister welfare of the colonies. One of the first bills which would be submitted to the Legislature would have for its object to secure an honourable existence to the clergy. Another would be immediately afterwards presented, for regulating the 4 per cent. tax, voted by the Cortes in 1540 . The judiciary power would be re-organised on a plan more in harmony with the wants of the age. The home department would also undergo modifications calculated to accelerate the despatch of public business. The Government would, by all possible means, promote the spirit of agricul tural, manufacturing, and commercial association. The education of the people would be the object of its particula solicitude, and every attention paid to indmoduce ation, and to allay the public burdens. The Army would he reduced the sale of national property encouraged, the Ministry of Finance re-organised according to the ststem of centris ation, and whenever the Government felt onliged to cou clude any financial transaction, the areatest publicity would be given thereto. Finalir, that the Navy would be place on a more respectable footing.-This programme, to with profound attention, was rather (ons the Chamber of Deputies, in which a most furmidable opposition, it is said, was orcanising against the new Mini,trr.-A meeting of 90 - Trinitarian heputies ton place on the evening of the 23 d , at which it was moved that an energetic opposition of that party to the new Admimistration. between the two Gorernmens. - In consegunce of report of the Captain of a Purturnese merowant respectung the disabied steamer mentioned har IV alden supposed to be the Prevident, Lord harmment cutter had sent the Espoir, and a Portuguesetiveiy off Madeira the sebooner of are Cape de Verds, in scarch
steamer supposed to be detained in those latitudes
Grranant. The journair continue to publich artiele
against the new Treaty of Commerce between Great
Britain and the Customs' Union. Some of them admit that their remarks are too late, since the ratifications bave taken place, and turn their objections against any renewal corps of observation is about to be formed on the frontier of Turkey, in consequence of the insurrection which
it would appear is becoming universal throughout the European provinces of the Tarkish empire.-Accounts from Berlin inform us that the King of Prussia, anxious
to have as nucin light as possible thrown on the question to hare as mucin light as possible thrown on the question
in dispute between the Papal and Prussian Governments has consulted as many Prussian diplomatists as have been
employed on missions at Rome; and that to this effect Comployed Von Bruhl, Baron Von Buch, and M. Bunsen are in constant consultation on the most suitable propositions the differences. Count Yon Brahl is expected to set ont shortly for Rome. A correspondent at Rome states that the pope has refused to accept the nomination of M. Muller, the diocese for the Arclibishop, and has censured the chapter for making the election. This incident was considered likely to hinder the settlement of the differences betreen the Courts of Rome
Italy.-Letters of a late date from Rome hold out strong hopes that Don Miguel may be induced to accept royal alliance, and abandon his pretensions to the throne
of Portugal. According to private letters from Naples of he \(1 \bar{i}\) th ult., it was contemplated to construct a railrosed between that capital and Maufredonia, which would estabish a commurication between the Mediterranean and the Adriatic. The plan was proposed and encouraged by the Minister of the Iuterior, ame the 11 per cent inters to the company who should undertake to execute it. The hole expense was estimated at \(14,000,000\) of ducats (2,440,00vl.) Tae King and Queen, accompanied by the Rom Caserta to Naples.
Russia. - The papers contain melancholy accounts of the devastations cansed in the southern provinces by the inundations of the Bug, the Dnieper, the Dniester, and
other rivers in that part of the empire. The suddea heat öther' rivers in that part of the empire. The sudden heat
which set in the first days of April made the snow on the Which set in the first days of April made the snow on the
steppes dissolve with almost unexampled rapidity. Accounts from Moscow to the 10th of May mention that the arvest, had led to a fall of twenty per cent in the price of corn.
CREEY.-Further details are given of the spread o
Empire. The Bulgarian insursents had maintained themwalls of Nissa. The corps of Valenzas, in Thessaly, was daily receiving fresh recruits. In Albania there was a large insurrectionary foree, and troubles had broken out
in Thrace. Armenia was likersise in a state of revolt. Letters from Nissa complained of the searcity of provisions, and spoke of the probability of a famine. The main road ravel by it without a strong escort, at least from Nissa to Ale eimizza. It was reported that the troubles had extended to Roumelia, and that in the neighbourhood of Bitoglia are Christians, in which the former lost many men Subsequent accounts from the frontier state that the inarrection of the Christian population in Bulgaria is in a great measure suppressed. In the district of Nissa 120 illages, and in that of Leskowitz 105 villages had been vere conquerors in every fight. About 1400 Christian
amilies, consisting of nearly 9,500 persons, had taken efuge in the Servian territory, where they were encamped, inder quarantine, in the open air, and exposed to all the
aclemency of the weather. The fate of those who fled ato the mountains was still more pitiable, as they had nly the choice between dying of flunger or surrendering \(t\) discretion to the Turks. Those who took refuge in ervia carred off their cattle, which amount to 900 horses, equent intelligence from Constantinople to the l2th inst eceived by the overland mail, states that the Turkish Cabinet has been busily occupied, and had frequent conerences with the foreign Ministers, with the view of
गreparing a new firman for the settlement of the Egyptian reparing a new firman for the settement of the Egyptian ully confirmed, though concessions will apparently be pade to Mehemet Ali, and will. have for its basis the
reaty of July. A new commercial treaty has been conreaty of July. A new commercial treaty has been con-
luded between tha SublimePorte and the Danish Gorern-zent.-A formal demand has been made to the Greek Tinister by the Reis Effendi, that his Government should uake a public disavowal of any participation in the insurections of Candia and Roumelia. This, it is stated, has re not at preient on the must friendly termes.
Candra. - The latest aceounts state that up to the preant period Mustapha Pacha, the Governor of the Island, equence no hood hall lyen as yet sheil. The force of the ebels was estimat ulas : 20. 10 , meln, of whom but 5010 were rmed. Tue news of ther sailing of the Turkish fleet from onstantinophe, under the unders of Tahir Pacha, had aused much unsasiness aniongst the Christians of the iland. A Greeh named haiammatinas had arrived there, ringigg with aim a great number of his countrymen to sinforce the islanders. It was considered that in case of
general engagement the result would be doubtful, alhough the Turks would have a decided advantage on ac-

Iso stated to be in latter the Governor had been compelled to admit the Christians of note, and the ForeignConsuls, into his cabinet EGYpT.-Letters from Alexandria to the 22d ult. state that the Pasha had relazed nothing in his preparations for defence. The promised freedom of commerce has led to great loss and disappointment to the merchants, for just as
they were on the point of shipping large quantities of fiassced. an order was issued detaining it, and taking it to the account of Government at "Pasha's price." The explanation given was, that it would be wanted for seed next a linseed sale of his own to a larse amount, and could not find sufficient, as the merchants had been first in the market with cash. The cotton gromn by Europeans is also imponnded under a very high export duty. Nobody dared to complain, for the extent of each man's business depended altogether on the good will of the Pasha, who is still the sole salesman for exports. On the same day that laid hands on the linseed he had recived addess from 200 of the merchants, bankers, and others of the city of London, complimenting him on his liberality, praying that he may long continue to develop the commercial lessings of prosperity and civilisation. The Pasha's re ply was not expected by the Oriental.-Sir D. Wilkie had completed the Pasha's portrait, which he was bringing home in the Oriental to bave engraved in London. Ibrahim Pasha had left Cairo for Middle and Upper Egypt to enforce his new regulations for the more effective service of the Government in military, financial, and agricultura matters. His father was urgent for supplies of men, money, and produce. The Albanian mercenaries stationed near Damietta had a serious quarrel with the regular troops in their vicinity, and some blood was shed. These foreigners were quartered in great numbers in the rillages on the banks of the Nile, and were universaliy feared and
hated. The plague continued in Alexandria and Rosetta. In the latter the cases were 25 per day in a population only 8,000 . The cases at Alexandria varied dxily from Dec The official returns since the plague began there in Dec. 1840, to the 18th May, 1841, amount to 1084 personsattacked; of these 530 are dead. As the oriental was preparing to sail, intelligence arrived that a regimen of artillery, stationed at El Arich, had deserted into Syria the Nile to Alerandria, and had also ordered down two more regiments from Cairo. The National Guards of that city were much dissatisfied at being draughted into regiments of the line (Nizam) by force.
Cmin.-By extraordinary express, which reached Pari by telegraph from Marseiles, on Tuesday, in antici-
pation of the overiand mail, we received very important news from China. It appears that hostilities had 25th Feh, by the British, who had advanced upon Canton. Keshen, the Chinese commissioner, had been disgraced and sent in irons to Pekin. The Emperor was resolve not to yield. Sir G. Bremer on the 20th April was at Calcutta, asking for reinforcements of Lord Auckland Two European regiments had been sent by the Governor-General-Late on Tharsday night a Gasette Extraordinary was published, giving official intelligence of the operations of our forces in China, of which the above is a brief summary. Thedetails of these operations, by which, for the first time in the history of China. ships have been brought up under the walls of the second city of the empire, wil be read with interest. The intelligence published in this paper upon the receipt of the last overland-mail, brough accounts, it will be remembered, of the proceedings in the China seas up to the 13th Feb. By the accounts now
received, we learn that on the 14th the Nemesis, iron stea to be con was sent up the river rith a Chinese commis sioners, and was ordered to remain till the 18th for an answer, should such delay be found neressary. On her approaching the Bogue forts, it was found that large batand and field works were being constructed alongshore and upon the islands in the middle of the river, and that Large bodies of troops were found to have arrived from Large bod the interior, and the steve boat wre by from them. Finding matters in this unexpected position, with all hope gone of receiving a satisfactory answer, the Nemesis returned to Macao on the 18th, when all the officers of the fleet were ordered to join their respective vessels, and everything to be held in readiness for imme diate action. On the day following Capt. Elliot issued circular, intimating that circumstances had occurred to induce him to more the forces up towards the Bocca Tigris. On the 20th a notification from Keshen reached gactiations. It ing an unwilingness to proceen received from the Emperor, disannulling every agreement that had been entered on, and disallo ving any further arrangements whatsoerer The erpelition now railed op the river, and on the et th the meated field work constructed to block up the cfanel was destrosed and 80 guns of sarions ca'ibre th which it and were rendered unserviceable On the 25 th the Admiral, Sir G. Bremer, arranged a plan of attack on the forts of Wangtong and Anunghoy, which of attack on the forts of Wangtong and Anungoov, which attack or Aazaghoy wis entrusted to Capt Sir Fleming Senhounc, of H. M. S. Eleniefor, hariog with himing the

Melville, Queen steamer, and four rocket-boats. The Wellesley, Calliope, Samarang, Druid, Alligator, and Moueste were opposed to the batteries on the south, south vestern side of the che of Wangtong, and the forts on the teries on Wangtong were silenced, and the troops which had been previously embarked in the steamers, together with the Royal Marines, were landed, and in a few minutes were masters of the island, without any loss ; 1300 Chinese silenced by the fire of the Bienleim, Melrille, and bucen, and pervering that the enemy were shaken, Sir Fleming Senhouse, at the head of the marines and small-arm men, landed on the soutkern batters, and drove them in suc cession from that and the two others, and at one o' clock放 British colours were fying over both the forts. The loss incurred by the British force engaged in this affair was continue the relation of the successful progress of the force onder his command up the river until the 19 th March, when he received a report from Capt. Herbert commanding the advanced squadron, detailing the various overations of that force in the attack and capture of the orts, defences, and fiotilla of Canton, and the hoisting the Union-jack on the walls of the British factory; the guns af the squadron commanding all the approaches to the city from the western and sonthern branches of the river, tho placing in the power of the British the great provincia capital. The island of Chusan, it is stated, was give up to the Chinese on the 2.th Feb., in exchange for se veral British prisoners; and the island of Hong Kong was Keshen's treaty was a decention
India and Persia.-Tie Punjaub still continues to be the theatre of dissension and bloodshed. Three Euro peans holding high rank in the Seikh army have been murdered by the discontented and mutinous soldiery There appears to be some resson for supposing that the discontented nobles at the court of I ahore are endearonting to compass the death of Shere Sing. By the lates intelligence from that place, it seems the Maharajah wa taking an excorsion on the river, and that the boat in which he was embarked foundered without any apparen cause. This, it is thought, conld only have occurred through treachery on the part of some of his attendants. Shere Sing, however, succeeded in swimming to the shore heard of. In Scinde and Affghanistan nothing of ine the despatch of the last overlandlfmail. Major Todd had arnived in circulation as to the propriety of his conduct in so hastily quitting Merat. Some of the Calcutta journals state that the Governor-general considers hims to have been too pre the Bombay trocps have advanced through the Bolan pass. The head-quarters, under Major-Gen. Quettah on the \(2 d\) ult., and will remain there until the receipt of further instructions from Lord Auckland. A few weeks will, therefore, determine whether Herat is to be left to the care of shah Kamran and his minister Ya Mahomed, or to be held by a British garrison. The adoption of the latter measure, it is supposed, would be the most effectual means of destroying the Persian influence in that quarter. The young Khan of Khelat is stil withstanding their repeated disappointments, are still in immediate expectation of his surrendering himself. The intelligence reccived from Persia, by way of India, is pacific. It is said that the Britisb agent was about to rn to Bushire, and a newed on the basis of a treaty by which the British will consent to evacuate Karrack, and the Shah cede the fort Gorian to Shah Kemran, and arrest his expedition
to Herat. These stipulations are, however, not authen cated, and it is thought that Karrack will not be giren up. The India papers state that a secret expedition is about to be despatched by the Earl Auckland steamer to the Red Sea, for the purpose, it is supposed, of counteracting the intrigues of the French in Abyssinia. A cruiser and Aden.
Cimed States.-By the arrival at Liverpool on Tuesday, of the Packet ship Roscue, we are in receipt of papers rom New York to the Hith ins. portant intelligence that Mr. MLeod had been removed of New Yort, and that an application had been made for his release on the 6th May. \#e was brought op on that day bofore a very thin court, but the motion for his discharge was portponed by the Chief Iustice to the following week, in order that there might be a full bench-They contain also the gratifying statement that a convention has been signed between Great Britain and the United States, providing for the appointment of six commissioners, three on eack side, to settle the boundary dispute finally. If decision ot agree, they are the appoint turee otal

Casaid. - The meeting of the Canadian Parliament for the despatch of business had been further postponed till vernor, had arrived at Fredericton, from Halifax, and Sir J. Harvey held his farewell levee on the 27 th April. The Hon. Mr. Fairbanks, Master of the Rolls, and Juhys of
the Court of Admiralty of Nova Scotia, in doad.

Meeting at the Guildhall on the subject of the Corn-laws.-On Tuesday, a meeting of the Citizens of London
was held at the Guildhall, to take into consideration the present Corn-laws, and to petition Parliament in support of the proposition put forward for their alteration by her Majesty's Ministers, The chair was taken by the Lord Mayor, who said he held in his hand a requisition, nume
rously and respectably signed, for the present meeting, to consider the subject of the Corn-laws, and to prepare, if the meeting thought proper, a petition upon the subject. The Corn-laws were of importance not only to that city was done by the legislature and Government would be for the benefit of the whole community. In the discussion that was about to take place he hoped and trusted that everything would be amicably conducted, and when it had terminated, that they would separate in peace and good will towards all men. The requisition having been read, 1st. "That a free and liberal policy in the lesislation of the country, particularly in those laws which affect its agriculture and its commerce, has become more than ere necessary, from the extent of our population, the state of our revenue, the manulacturing rivary of other bations, people, and that his medge and efligatenment of the of the proposed alterng, 2nd. "That petitions enhodying the preceding resolution be presented to both Houses of Parliament, and that Sir M. Wood be requested to present the petition to the House of Commons, and that Messrs. Grote, Crawford, and Pattison be requested to support it

Victoria Park.-The following are the particulars con tained in the preamble of the Act of Parliament in regard to the new park in the East of London :- Her Majesty's
Commissioners of Woods and Forests are empowered to ay out any part of the money arising from the sale of Exchequer-bills, in the purchase of certain lands contain-
ing about 290 acres, with the several houses and buildings ing about 290 acres, with the several houses and buildings
thereon, situate in the parishes of St. John, Hackney, St. Matthew, Bethnal-green, and St. Mary, Stratford-le-bow, bounded on the south-east by the Stour Navigation, otherwise Sir George Duckett's Canal ; on the north-east by the Old Ford-lane, or Wiek-lane;' on the north by Hackney Wick; on the north-west by Grove-street-lane and Sir John Cass's charity and St. Thomas's Hospital ; on the west br lands late the property of Nathaniel Fenn and others, and by the Regent's Canal ; and including also a piece of ground, with buildings thereon, situate on the sonth side of the Regent's Canal, and called Bonner's Hall
Field ; and such lauds and hereditaments, when purchased, Field ; and such iauds and hereditaments, when purchased,
are to be conveded and assured to Her Majesty, her heirs and successors, as a royal park, hy the name of Victoria Park, and part and parcel of the possessions and land
revenues of Her Majesty in right of the Crown. Her Tajesty's Commissioners of Woods and Forests are also empowered to lease any part of the park, not esceedıng one fourth part, for the purpose of being used as sites for lang-houses or ormamachal be other ornamental buildings therein, in such manner as they shall think fit
Contemplated Parle in the South of London.-On Saturday evening a pablic meeting was held at Kernington or the purpose of petitioning Government and the Hous of Commons to form a park in the South of London. The Chairman read letters from the members for East
Surrey, Lambeth, and Suuthwarl, all of whom expresed Si:eir approval of such undertaking, and declared their inrention of supporting in the House of Commons a measure which could not be otherwise than conducire to the heaith of the inbabitants and the general weltare of the neigh hourhood. A resolution was moved to the effect "That the meeting witnessed with much pleasure the regard he healt comfort and by the flowse Colubitants of the east end of the metropolis, of the establisnment of a spacious park; and were impressed with the necessity of a similar improvement in the south of London, where by the density of the neigioourhood, and by the speedy occupaion of all vacant places for the purpose buiding, al and recreation." This resolution having been seconded in a retition, and to confer with Lords Nurmarisy and Dungannon on the subject.
The President. - Fresh hopes of the safety of this steam-ship have been raised by intelligence received from heen civeul tharsday ; but as s) niany racuours have the disanpointments have heen so frequent, the best judges seem to think it right to wait the issue of events with patience, and to offer no further opinions on the subject. The remort alinded to as received from Liverpool, and which seems to have created there the most lively excitement is as fullows :-Information bad been brought by the Fortitude. Cap. The Temperance Societies.-On Monday, being Whit Monday, the annual demonstration of the several bodie of teetotallers, and the members of the various metropoitan temperance societies, took place. They mustered in many cases, attended by the wives and children of the parties ; presenting on the whole a very respectable appearance. Numerous bands of music accompanied the proces sion, and the day was kept as a general holiday.
Greenwich Fair,-The annual Whitsuntude fair com continued Monday under very favourable auspices, and tion of great multitudes of risitors days to the hisin gratifica was delightful, and the park presented a beautiful appear ance. The rark and thee farr were tach day great:s crowded. Every year the visitors are said to be more numerous than the last : a circumstance which is in a great measure attri buted to the curtailment of the suburban fairs. sulated that more than 200,000 persons visited Greenwich during Monday alone.
Accillents.-On Mondar, several accidents occurred during the perambulations of the teetotallers aboat the metropolis, and some of a very serious description. A with his jaw-bone serionsly fractured and one of his shoulders dislocated. He received these injuries in a violent affray which took place between the teetotallers and a number of persons who ridiculed the precession as nd to by the police toling severat was unly put an both parties into custody. Another man. during the affray, ras knocked durn and trampled under foot, and receive fracture of one of his thighls. Other minor accidents also occarred
Fnquests.-On Morday, an inquest was held on Majos John Bolton, aged 3 f, late of H . M. 7 th Dramoons, who died suddeny whilst staying at Nerot's Hotel. The waite at the Burlington Hotel said he had known deceased upwards of 14 years, by his lodging occasipnally at his master's house. The last time he saw him alive was on Friday evening, when he called and wished to have a room There being none vacant, witness said he would procur one for him at Nerot's, opposite, which he did. The housemaid at this hotel said deceased came home an retired to bed about \(110^{\prime}\) clock. He appeared in excellent health and spirits. About \(100^{\prime}\) clock the following morn-
ing, finding deceased's room door open, she went in, but supposing him to be asleep, left the roons, not wishing to disturb him. She told the waiter that deceased was not up. About six oclock the waiter said he would go up and walke him, as he had lain luag chougi. She accompanied him, and on their opening the shutters deceased was found to She searched the room, but couhy frasped in both hancs, that deceased had taken poinud hat denosel that he was called in to see deceased on Suturday evening. He found him quite dead, and had no doubt that he had been so abore 12 hours. He could detect no poison of any kind, his death being caused by a fulness of bluod in the the ith Dragoons said deceased had always enjoved the best health.-Verdict, "Died by the visitation of God."

Weymouth.-A few days ago, whilst the Eagle revenue cutter, commanded by Lieut. Ray, R. N., was cruisivg in the West Bay, abont tight miles to the westward of the Bill of Portland, Lieut. Rav espied a large Freneh lugzer
making for the coast, of which no notice was taken until she came nearly abreast; the Frenchman evidently taking the Eagle from her wily appearance for a coaster. Th Eagle then made sail and gave chase, which was mon observed by the lugger. which in an attempt to escape was put on a wind. The chave was interesting, and it appeared doubtful for some time whether the Eigle w.ach come up with her. The lugger, liowever, finding the cutter gaining upon her, altered her paint of sailing, and ctuen commenced throwing over her cargo, which is supponed, from her size, to have consisted of upwards of 200 tubs. After a chase of 35 minutes, she was boardeld by ons of the Ringlish boats, and cight
foreign spirits were found on board
were Frenchmen, and the others pro
Portland, and one belonging to Preston.
Ludlow.-Mr. Cooke, landlord of the Angel Inn, in this town, was so much affected by the attempt made on the life of Mr. Mackreth by Josiah Mister, which occurred in his house, and the circumstances of which will be in the remembrance of our readers, that, in a few weeks after the event, it appears her he died a ferw days dgo.
sent to a lunatic asylum, where he

Bristol.-A local paper gives the following account of an extraordinary eseape. On the 2 th inst. two quarrymen were at work upon a projecting edre of the Black-rook a the Hotwells. It was the inteation, it seems, of the workmen to blast of the corner, and for that purpose a mine was made and charged with gunprowder. Just as a lighted match was about to be applied, the whole mass of was torn by its own weight from its attachments. This fragment with the men ret upon it fell about 10 feet ragment, towards the river; both the workmen falligg with it, and tion as inevitable. T'pon extricating then, however. it was discovered that they had experienced a prowilentia escape. Both were taicen to the Bristo! Infirmary, which one quitted the next day. The other was much bruised but no bone was broken.

Tettentt.-Further accounts have bien published relative to the calamitous fire which oceasioned the entire deMolesworth. Bart.; and which we rasticed in our las number. The mansion, it seems, thongh not extensive, was fitted up in a very handsome style, with a splendid conservatorr, gariens, and shrubberies attacherl. It appears that. Sir W. Mrlesmorth was in London at the time gardener and wife. It fisat an impression prevailed amongst the inhabitants living near ti.e eng:. that it was the work of an incendiary ; but an investratan has since taker place, and it is said that no donbt exists that it originated
through the over-heating of some of the fllues. The alarm was given to the gardener and his wife by the ceiling in one of the principal rooms in the upper part of the manthey discorered the floors in flames. They lost no time in sending for assistance. but great confusion ensued on account of there being a bad supply of water; most part however, of the furniture, paintings, 8 cc, whe saved. The mid to bo zearly 12,0001 .

Windsor. - The triennial celebration of the Eton Mon tem touk place on Thesday. The weather was very fine. and thousands of persons, attracted from all quarters,
flocked into the neighbourhood of Etun and Salt-hill to flocked into the neighbourhood of Etun and Salt-hill to
witness it. The announcement that her Majesty ani Prince Albert would hour the monsem wi.a their pre sence, gave an additional intereas to the proceedings, and added greatly to the other attractions of the dyy. Lonz before eleven oclock the square of the college was filled with the nobility and gentry of the neighburhood for miles around. The captain's breakfest in the hall took place at ten. At this entertainment, which consisted of the choivest dielicacies of the season, there were present.
by invi"tioz by inciltims of aptun. Mr. Thtax, ri,e mint hun amonnting to sizty more. shortly before eleven her Majesty and Prince Albert, accompanied by Viscount Melbourne, and attended by her suite, arrived at the college, and enfor the Queen. The procession of the boys, who were attired in the most costly and sumptuous dresses, "of had marched three times around the square, her Majest proceeded to the window of the election chamber, in the elock tnawer, to withess the flourishing of the thag by the
ensign, Mr. Monck. At the comelusion of this ceremony her Majesty partook of a lancheon :: time Zrorost's, and immediately athorwards proceeded to Sait-bill, amidst the cheers of thousmonds who lined the road. The usual ceremonies were then gone through at the Mount, and the It is staied that the mioust of " salt," br money coliect. ed by the head boy, or captain, Mr. Taring, is upwards of 3um0l., but out of this he has to defray expenses tha amount to neariyone haif. - On Monday evewing a fire broke out in the house of Mr. Layton, Confectioner, Thames street, which at one time tireatened serious consequences, buat by the aid of the engines and a plentiful supply of
mater, the fire was got under before it had caused very
much damage. It appears to have been occasioned by laundry. A large quantity of confectionery, prepared \(f\) the royal montem breakfast, and for the parties given by the nobility and gentry of the neighbourhood, to celebrate thay festival, was wholly destroyed. As soon as intimatiou of the fire reached the castle, her Majesty and Prince Abert, attended by several of the royal household, propurno across the quadrangle on the north terrace, for tie purpose of witnessing the conflagration ; but no view of the fire being obtained from this part of the castle, the rayal party returned to the summit of the round tower where they remained until all danger had ceased. Lord Melsourne and Major Keppel walked from the ca-tle int Thames-street, to observe the progress of the flames. The fire was completely got under soon after eight o cluck.
Chellenham. -The Chellenham Examiner mentio that a few days since, three or four large mushrooms in he progress of their growth actually displaced a large paring-stone, in one of the most crowded thproughfares
that city ! that John Priggs, the highwayman, whose numerous out rages on the borders of Lancashire and Yorkshire were been committed to the Castle of this city for trial. appears that he was apprehended by the Manchester police, and brought to Bacup from that tnwn, on Monday dergo an examina mmmitted by him and his companion Dickinson. On Tuesdar he was brought up before the magistrates charged with the robbery and attempted murder at' the Dirpley Arms, on the night of the 2 st March. The eridence pro luced mas similar to the account which appeared at the ume the outrage was committed. James Simpson, the landlord's son, and other members of the Dirpley family deposed, that it was the prisoner who fired the pistols, and wounded the first-mentioned witness. Others deposed having seen the prisoner in the neighbourhood the day the robbery was committed. The examination lasted until nearly eleven, when he was remanded until Saturday. It was then decided that the prisoner should be conveyed to Burnley, where he would be more secure than at Bacup, ad for his safe custody, a party of the Queen's Bays, stationed at Burniey barracks, was sent for to escort him thither. (In Saturday he was again removed to Bacup, an the witnesses were bound over to give evidence against
him at Lancaster. Mr. Wignall, who was fired at near Hawes, Yorkshire, appeared against him with other wit nesses. Tuis charge was not proved amainst him, further than that he was in company with Dickinson, who fired the zun. The charge of shooting at the gamekeepers near Sawley stands on the same footing as the above; they were also bound over to appear at the next assizes in this

Railrays.- On Monday morning the carriage trains which left the terminns at Paddington proceeded on the Great Western Ruilway as far as Chippenhan, being only 13 miles from Bath. The whole route is to be complete to Bristol by the 1st Sept. On Saturday the directors and engineers made
line of road from Woottom Bassett to Chippenham. Cheltenham line is also opened for traffic as far as Ciren cester.-A few days since as the Railway train was pro ceeding from Selby to Hull, when near the Howden station, a spark from the engine set on fire a shawl and silk cloak beloneing to a lads, who had a child in her arms, in one of the open class carriages; some gentlemen rendered immediate assistance, but their hands were severely burnt in attempting to extinguish the flames. The lady and child, however, sustained no serions injury.-On Saturda moming an accident occurred on the London and Black wall Railway, mear the Minories station. A number of men were emploved in raising. up gravel in baskets, by means of a triangle fixed in the ground, and to which pulevs ate attached, and one of them was distributing the gravel along the line, when suddenly the men at the triangle let go the handle by which the pulleys are worked, struck the man on the head with great violence, fracturing his skull. He was convered to the Londo Hospital, where he continues in a dangerous state.direct daily conveyanee is now established between Brecon and Cardiff, meeting the trains of the Taff Vale Railway in their morning trip from Merthyr, so that in four hour passengers from Brecon arrive at the Cardiff terminus.During the last fortnight, the railway train controller has been in daily use upon the Londoa and Birningham line : the invention. which is exceeding!y simple and casily manaced, similie, efectually the means, whinch hitherto have been a desideratum, of enabling the guards of a train communicate with the engine-driver while the train is in notimu.

\section*{IRELAND.}

Dublin.-It is reported that Tharsday, the 10 th June, is fixed for the celebration of the nuptiats of Lord Ebrington and Lady Somerville.-Accounts have been received here of very violent thunder-storms having been experienced in various parts of the country, which have done great damage. Two lives have been lost and numbers of cattle destroyed. - We are able to give the following additional particulars relative to the melancholy death of Mr. C. Foster, son of Baron Fuster, which we brietiy noticed in our last number :-It appears tiat on Saturday, we 124 inst., he was to lare accompanied the baron and famaly from their residence. Rathescar, in the county Louth, to this city ; but as be was to proceed on horsebacis, and the day being extremely wet, he deferred his pourney to the following Monday. In the course of the monaing of that day he and Mr. A. Foster, his cousim,
mesne of a small boat on the lake of Collon, in the deon the water when, owing, it is supposed, to some inad vertence in rowing, the boat upset. A gamekeener of Lord Ferrard \(:\) with Mr. Wedapp. \(n\) n-inhaw of that no nessed the aceident. Mr. D Ainpp pina:ge ! into the water, and quiekly reached the -rot, where the succeeded in catcbing hoid of Mir. A. Foster, and remuing him, in state of great exhaustion, and almost total insmastility but his companion had sumk. Mr. Selmph dived repreatedly to try to recover the bad, wingut surcess. He then set of by post for thes cily, the barer of the mourn
ful tidings to the family, whon hase been thrown into a state of great grief by thiceased was in his niveteeata year, amb Lis concglate course had afforded proof of the possession of talents of the firt order, while his amiable disposition and the affability of his manners won for him the attachment, not only of hi known The Irish papers state that intelligence of death of Earl Forlescue reached this city on Tuendey morning, and that his Escellency proceeded in the evening
of the same day to pay the last duties to his deceased parent; that a Privy Council was held on Wednesday to srear in as Lords Justices the Lord Ciancellor and his Ercellency. and that the Iicerecal nuptials hase in consequence of this event been postponed. The rumom appears, however, to be without foundation
Ferns.-On Thursday afternoon Mr. B. Bryan, who became the purchaser of the palace and grounds of the late Bishop of Ferns, was shot in a mood adjoining the house. He had ridden out a short time previously, an his horse having returned without its riler his sterat went in the direction his master had taken, supposing some accident had occurred. He found him lying quite dead, having been shot a little abore the hip. Beside him was a letter, or envelon, covered with blood, but not containing any writing inside. It is conjectured that the letter was handed to him br the assas identity, and that, consequently, the murder was perpe trated by a stranger, brought from a distance, who wa ignorant of his person. Mr Bryan, is is stated, was Liberal in politics, was making very great improvements, and expending jul! a weets in wown alo se fractory tenants, however, who hild leases under the late bishop, havine refused to renew with him, or to surventer the lanit ther heli, he found it necessary, in his own de fence, to serve ejectments; and in consequence of this step, it is presumed, his life has fallen a serertice. He was closelv connected with Mr. Crans, member for the aniable and inotensire antleman in in aniable and ino..nnire genll Murder aqainst some person or persons unknown.-The watch which was taken from the late Robent Hall, who was lateiy murdered in the county Tipperary, has been restured to his relations through the instrumentality of a priest, without any clne being afforded to the por petration of the murder

SCOTLAND.
Edinburgh. -The General Assembly of the Kirk of Scotland have deposed the seven ministers of the Strathbogie presbytery. The grounds of the present charge appear to be, that they continued to preach and administer the sacraments after being suspended by the Commission the December, 1839 , which suspension then confion was the last Assembly. The discussion on the question wreat leng and anionated. Dr. Chalmers, in a sposition, and Dr. Cuok, with several others, opposed it. At the close of the debate the rote was taken, when there were, for 105 Chalmers' motion, 222; for Dr. Cuok's motion, Majority in favour of deposition, 07 . The judgnend the Assembly was then read to the parties. there were mare menbers of tue lasem. on this occasion than had ever before bupencion mh the institution of the court. A note of subpension interdict in the name of the seven ministers, anal of Grace the Duke of Richmond, as patron of several of theit parishes, has siace been presented to the Court of sas and to suspend and set aside the sentence of depostion, aase the whole procecdings of the Gene? Alsembly int The ministers ap pointed by the General asstmbiy one mate the sentence of deposition against tue seven to pencled ministers of stratilusic hare since returned to town. In erery case it seems that the interdies granted erery churchyard gate, within the bounds of thnt presby tery. the sextenve was read, and thereafter posted by fie agents of the Assembly; and it was not catil the serve part of ae sabinth, a cay on which it ts ware serven. On Thumbents, that the cill inceras hell heez for the purp se of erpressing srmpathy witi, the seren ministers and \(c\) molemaing the arbitrary and unjust p.oceed in the the (ieneral Assemblr. Lord Duntermine wis. .icral chair, and his Lordship wes surounded wal the phate by an imposing array of the rank, property, and intell.. in of the metropolis. The noble Lowi opened the rat part in a speech reprobating the conduct of che dowe land, and in the kirk, in their cpposime effect were adopted.
several resolutions to General Assembly held last week the Rev. A. Murdoch, of this town, as one of a deputand, brought before the house the seloject of inregular mar-
riages on the borders, which he described as increasing to
such an extent as to be destructive to the best interests of society. The Rev. Gentleman stated that there were four society. individuals in this town who derived a livelihood
or five that source, and he read a handbill bearing the name
from that from that source, and of of them, and openly announcing the celebration appointed to consider the matter.
Dunbar.-From the report of the fishermen it appears that there is already an uncommon appearanes of herrings large shoals of young fish, moving about in all directions,
and spreading from the Bass to St. Abb's Head They are even met with by the boats at the Great Lines, in a
circuit of 40 miles off at sea, and are followed by several large whales. It is intended to begin earlier this season, and in less than a month it is expected that every fialer-Ptrth.-A local paper states that the salmon fishery has improved a little this week, but previously the month of May was the most unsuccessful almost remembered. Last tween the mouth of the Earn and the ships. On Monday a great haul was taken oppo-ite, on the Scone grounds.

\section*{ftiscellaneous.}

Cultication of Grape Vines.-At Constantia Vines are kept pruned in the form of dwarf-trees, much resem-
bling currant-bushes, and are planted in rows, about six feet apart; they are suffered to lang on the vine to ripen so long, that the juice becomes alnost a syrup. The vines at Madeira which produce its staple wine are trained about four feet from the ground, on low sloping trellises, which corer the steep side of the hills; and the same plan is remarkably good. The grape vines in America are trained upon small elmis: the badies of the vines lie buried in the sand, leaving the extremities of them rising not more than
a foot or eighteen inches above the surface; the burying of the greater part of the trunk, with its larger branches, produces the effiect of pruning, inasmuch as it prevents the unfolding of leaves and flowers on parts below the surface, While the protruded ends of the branches enjoy an in-
creased degree of light and heat from the reflesion of the sand; bence the grapes of these vines are so far supefior to the fruit of the same vine in ordinary circumstances. The vines in Switzerland are thus cultivated:-The Swiss they say the produce of a gravelly soil is better in quality, and if possibe with an inclination, so that the ground may receive the benefit of the sun all dar. They begin their
operations in the spring by trenching the earth about three eet deep: they mix with it the rubbish of old buildings, or plaster; then they plant in this earth the most healthy feet apart, and generally put two into each hole, sinking them a foot and a half in the earth. In the first year they produce nothing, and very little in the second. During grow about them, and manure them. For strong land, they use horse-dung; for light land, cow-dung. If they quantity of dung near the extremity of the roots; but, if they wish to have it in greater quantity, they put a great deal. In the third year, the crop begins to be of some is in all its vigour. The produce continues the same for ifteen years-making twenty from the commencement of planting. They then pull up the vines, and replant. In aw and cold soils, where a new plantation would not give
agood crop for near ten years, they "prorince," that is to say, instead of planting cuttings, or instead of renewing the Whole vineyard at once, and by it losing the benefit of the
soil, and their labours for ten years, they fresh-bud the branches with ejes from the neighbouring vines, and lay them in a pit, covering them with earth. The latter method is usually adopted on the coast : the former, more receding year They het away methods of pruning:first, that which they call pruning for the grape, when operating on a vine they are about to pull up: here they eave many buds for fruit, and many branches for continuing the vine: the second they call pruning with economy here they have but two or three branches to continue the fruit on each uranch. When the pruning is finished, they dig the soil to make it free, and manure it. Some vineyards they manure equally; others in alternate places each ear.-Indagator.
Hip, Hurra :-" Hip, hip. hurra!" is said to have originated in the Crusades, it being a corruption of H.E.P., the initials of Bierasolyma est perdita (Jerusalem is followers hunted the Jews down with the ery of "Hip, hip, hurra!
Sultan Makmourd.-A writer in the Manzari Shark gives the following account of the history of the late Sul-Tunis:-"In trarersing the streets of Tunis, I one day wras accosted by a grave and respectable-looking Moor, who asked me about the news of the Levant, and about the proceedings of the young Sultan. After having partly satisfied him, he said to me- It is for our sins that we
Mabomeddans are ruled by a Christian monarch. Think not (said lie) that Abd-al-Magjeed nor his father Mahmoud is of Mahommedan origin. Mahmoud was bred a Greelk Catholic, in which religion he died; and it was in the who is such to this very day, in secret. What I have said
may seem a mystery to you, but this will soon be removed In the meantime let us sit dowa here and take a cup of coffee together." After we had comfortably seated ourhis story in the following words: Me Mahmenced relating Mahmoud), the legal possessor of the Ottoman throne, was a man who feared God, loved his country, and in everything sought the welfare of his subjects, by whom he was
much beloved. His piety, or rather fanaticism, carried him to such an estreme, that he thought it sinful to apThis was the ruin of our country; it was through this that the Ottoman empire was snatched out of the hands of the people of God; for though both the present Sultars and al in authority under him are nominally Mahommedans, in
their hearts they are all Greel Catholics. I said because Mahmond never appeared in public nor in private but with his face covered, the Ottoman empire was snatched out of our hands. Now this took place in the following manner: The Russians, who for ages have had an eye upon ally unknown to ail his subjects, thought of a stratagem in which they succeeded. One day, whilst Mahmoud was administering justice, a Russian Prince arrived, and requested a private interview with the Sultan, which the latquested a private interview with the sultan, whice the hall of justice for the private audience room, whilst all the officers and people patiently a waited their return. After half an hour the Sultan, or rather a person in the Sultan's
robes, returned, unaccompanied by the Rusian Prince the administration of justice was dispensed with for that day; the people separated, and the Sultan in the customary manner was escorted to the palace. As for the Russian Prince, no one ventured or dared to ask what became of him ; sn much is known, that as a Russian Prince he was never heard of again. Things remained quiet for a few days, after which many new costumes were introduced both contrary to our religion and the manner of our fathers; many old officers were dismissed from their service, and new ones, unknown to the people, were put into their places. In short, the mild, virtuous, and religious Mah-
moud was changed into a baughty, vicious, and godless character. Is there any necessity for me to tell you that the Russian Prince now played the part of Mahmoud? All this God suffered to take place, as he will yet suffer many more things of a similar nature; for our traditions teach us that all Mahommedan countries will fall into the hands of the Infidel Christians until Christ shall come will rescue our countries from the hands of our oppressors, and will give us dominion both in heaven and in earth.
Large Trout.-A few days ago there was caught
Lochleven a trout weighing lobs, avoirdapois, or \(1500 z_{0}\);
the length \(2 \overline{3}\) zin., and 1 in. at its greatest gith. It was of the grey species, and of perfect symmetry, being considered as one of the finest specimens yet seens of this
fohb. From 3 qrs. of a pound to a pound is considered fally an average weight

Autograph of Shakspere.-A large attendance of the curious in autographs and lovers of literature was attracted on Monday at the auction-rooms of Messrs. Evans, of Pall-mall, on account of its being the day appointed for the sale of an "undoubted autograph of the immortal Shakspere. This interesting and valuable signature is affixed to a deed of bargain and sale of a house purchased by him in Blackfriars, from Henry Walker, dated March 16, 1612, with the seals attached. The house is described as "all that dwelling-house, or tenement, with th appartenances, situate and being within the precinet, circuit, and compasse of the late Black ffryers, London, \&c. This indencure is stated at the commencement to be "between Henry Walker, citizein and Minstrell, of London, of th on partie, and W. Shakspere, of Stratforde T-pon Avon, in the countie of Warwick, gentleman-W. Johnson, citizein and vintner, of London-John Jackson and John Hemying, of
London, Gentleman, of th other partie." This deed i London, Gentleman, of th other partie." This deed is
regularly entered in the Rolls' Court, being plaeed in the index under the name of Shakspere, the purchaser, instea of H. Walser, the vendor, as is the usual mode. There was much competition for this relic of the Bard of Avon, and the deed was at length knocked down for the large sum of 165 l . 1 j s.

American Woods.-Dapper, in his description of America (Acosta, B. iv., cb. 30), mentions woods 300 milie happened that a monk, a native of Spain, going to another monastery, mistook his way in some of these woods, and advanced so far, that he was obliged to climb to the tops of the trees, and proceed in that manner on his way, creepof the trees, and proceed in that manner ou hise one to the other, that no man, without hazard of his life, could venture down to the ground). He was often forced to climb up to the tops of the highest trees, to enjoy the warmon o the sun (which never could reach to two earth, through the vast thickness of the trees and bushes, and to look out for observations how to proceed on his journey. In this manner he went on for 15 days and niglits, till he while set foot to the ground.-Indagator.
Imitation of Birds used as a Decoy.-The description ere manner of living in the midst of the uncultivated regions, in Brazils, given by Prince Maximilian of Neu wrave, Morro d' rrara, conceive a wilierness, in which somMorro dirara, con le a pany of men forms a solitary outpost, sumfiently provide game, fish, and good water; but at the same time, by its亩济tance from inhabited places, entirely confined to its own
resources, and obliged to be constantly on its guard against the sarage natives of the forest, by whom it is on every side surrounded. Batachos, and perhaps Botocudos, prowled about us dnily, to watch over our motions; for his reason we went all armed; we numbered between 50 nd 00 able-bodied men. The wood on the side of mountain, on the bank of the Lagoz, had already been Indians, who were particuiarls f together. Twenty-four went daily to work; some of them were furnished with axes, others with a sickle-shaped were furninhed with long handle, the former to fell trees, the latter to cat down the underwood and young bushes. When a large tree was felled, it drew down with it many other trees to the
groand, because all these forests are interlaced, and twined ogether by the strongest ligneous climbing plants; man trunks were broken off by others, and remained standing like colossal pillars; prickly plants, especially the lay everymhere upon the ground, and made these abatis nerfectly impregnable. The Ouvidor had caused five o six huts to be built near the Lagoa, the roofs of whic were covered with Cricanna leaves. Four of our Indians ho, out every morning for the whole day to fish, hunt, and examine our traps for animals, and they always brough home, in the evening, game and abundance of fish. As soo as our people were collected together in the evening, we had no callse to fear an attack of the savages. Against a surprise by night, which they do not readily attempt in the dark, we were secured by the vigilance of our dogs. A large dog belonging to the Ouvidor distinguished himself above the rest; he seemed to scent the savages when the prowled about on the mountain, beyond the Lagoa. Qn these occasions he was quite furious, and barked long and ithout intermission towards the suspicious quarter. Th Patachos from their dark lurking-places doubtless observed us, not without wonder and dissatisfaction; and ou hun unguardedly. We often heard these savages imitate the notes of the owls (curuja), of the capuirs, and other ani mals, especially the night-birds ; but our Indians, who were equally skilled in this art, never failed to distinguish the imitation from Nature. A person not acquainted with it would perhaps have attempted to follow the call of the bird, when the arrows of the savages would have shown him his mistake." Indagator.
Signs of Weather.-The opening or shutting of some flowers depends not so much on the action of the stimulus hence their opening or shutting betokens change. I is stated in Krith's Botany that if the Siberian Sowthistle shuts at night, the it will be clondy and rainy. If the African Marigold con tinues shut after seven o'clock in the morning, rain is nea at hand; and if the Convolvulus arcensis, Catendula fluvi alis, or Anagallis arvensis are even already open, they wil shut upon the approach of rain. The latter, from its pe-
culiar susceptibility, has obtained the name of the Poor culiar susceptibility, has obtained
Man's Weather-glass.-Indougator.
Sensibi'ity of Animals.-Birds are not alike susceptible of pain. Birds as well as other animals are not all possessed of an equal degree of physical sensibility. Some sink under the least paia, while others bear with fortitude the most acute suffering : for instance, the slightest wound is sullect to bring down a woodcock, and it is ofters Grouse the fall rather than by the shot it has received. enables them to support it till death. The same observation will apply to quadrupeds; for a slight wound in the body will destroy a panther or a leopard, while the cat which is much smaller, will live with broken ribs and fractured stull. Different parts of animals also appear to vary insensibiy ; for example, the bones of the head of the porcupine are so fragile as to be broken with a switch, but
you may beat its body with a club without killing it.-

\section*{}

Abstinence of Animats. - Animals endure hunger in proportion to the nature of their food. In birds, for exhours, while those which feed on insects will hold out for a short period longer. But those which can least bear abstinence are such as live on fruit-a peculiarity that is owing probably to their stomach. which digesting more speedily, has more frequent need of aliment. This quick digestion beinwerer, attended with one adrantage, which is, that the sooner than otherg. With the granivorous species this sooner than others. With the granivain point, if nothing but the seeds, on which they usually fed, be given to them they can never be restored-their stomach having lust in part its power of digestion. With the carnivorous, on and hence it happens that, receiving the kind of food which recorery. The cause of this difference is this : fieth from its affinity to the substance of the animal, becomes peedily incurporated with it, and its jusves are highly With seeds the case is the reve-se; to be digested they must remain some time int the 3 .) onach, where they require to be previously softened and saturated. This operation sullet-a motion and force bhich a vital action in the gullet-a motion and force which fasting deatroys. If
two sparrows of the same age, and in equally good condition, be reduced, by the want of nourimament, to such degree of weakness that neitiver of them bo sbla to take

What is offered, and some braised seeds are forced down the thront of one, and a little minced flesh down that of he other, in a few minates the latter will be quite well, thile the former will die in about two hours. Granivorous birds, atthongh seeds are their chief nourishment, add hereto fruit, flesh, insects, \&c. Carnirorous birds, whether they live on flesh or insects, are uniform in thei food, and they have no recourse to seeds. Piscivorous birds are most sabject to hunger; hence they are supplied with large gullets or pouches, in which they accumulate their provision. Birds of prey endure hanger for a very considerable period, and so do quadrupeds. The Garden spider, it enclosed under a glass, cemented down, wil exist many months without foou; and althoughits bouy will become shrivelled, it will, iamediately food is restored to it, regain its wonted, 'umpness and size.-Indayator.

MORTICULTURAL SOCIETY OF LONDON.
EXHMBIMNS TT THE GIIRDEN.

\section*{Che Gatuenexs Clyonicle}
d.JTLRDAY, JCNE 12, 1841

We have on former occasions drawn attention to the great apparent importance of recent chemical discoveries to practical matters connected with the cultivation of plants, and we have expressed an anxious desire that some of the great public bodies of this country would direct a portion of their funds to the promotion of such investigations. We have now the gratification of announcing that this interesting subject has been taken up by the Hortieultural Society of London.

The noble Duke who presides over the affairs of this association has most liberally contributed a sum of fifty pounds a year towards the expenses of an inquiry into the chemistry of horticulture, more especially with reference to the influence of soil and manures upon garden plants. This, with the private subscriptious of a few friends of science, has enabled the Council to nominate a Committee, who are to determine upon the nature of the experiments to be undertaken, and who are to report to the Society, from time to time, the result of their investigations: we are happy to add that the duty of conducting the experimente has been entrusted to our correspondent, Mr. Edward Solly, jun., already so favourably known for the skill with which he managed the chemical examination of the substances submitted to him by the Committee of Agriculture of the Asiatic Society. It also appears that the Council of the Royal Agricultural Society have had the same subject under consideration, and, although nothing has yet been determined upon, that it is intended to take up the inquiry at an early period.

Now then we have a zealous and able inquirer engaged in this country in a series of formal experiments upon the plants of gardens and plantations. They will soon put to the test the statements of Liebig, which certainly require confirmation, however true they may be ; for that writer is singularly sparing of evidence in support of much that he asserts, and his book is in consequence extremely unsatisfactory to those who are accustomed to exact investigation. We regard this as a great epoch in the history of gardening, because garden plants have hitherto been but little the subject of chemical in estigation; and we are entirely in the dark respecting many points of the first degree of conseguence. The influence of the soil upon plants is still extremely obscure, the moment we descend from facts of the most general kind. There is not a man living who can tell us what kind of manure is the best suited- to a given species; or who, if he thinks he can answer that question, is able to explain to us why it is so, or what the nature of the action is which in certain cases uniformly produces certain results-and yet, in the absence of this fundamental knowlerlge, cultivation is very much a game of hazard. Why is the same variety of Oaktimber good in one soil and bad in another? And how is its quality affected by soil? Wherefore is it that the Orange will feed greedily upon blood, while the Cherry perishes under its influence? Why are certain soils eminently favourable to the production of seeds, while others are as notorious for the sterility of the plants that are grown upon them? Which are the principles in the suil that enable plants to produce an ample fuliage? and which those whose presence is required for the organization of a flower or the forma tion of a fruit! Ih hat is the nature of the influence of soil upon the colours of plants? These are questions which no man can answer, and, as we have already observel, they constitute the foumfation of the science of cultivation. If it is true that the phospliates of lime and magnesia must be present in soil in which Wheat is burne, or the grain cannot be organised, it is also probable that some other principle is demanded by the Peach, or the Pear, or the Strawberry, for the
perfect maturation of their fruits. We firmly believe that a rich mine of investigation is about to be workel, and we look with great anxiety to the operations of the miners. Even if nothing should come of their proceedings, we shall be by no means shaken in our faith that a rich vein exists somewhere.
We may depend upon it that such a fund of investigation as this is anything but a farm " omuia pollicitantem et nil ferentem."
We last week (p. 365) inserted an account of a marvellous tree, said to grow in the garden of Boghos Bey, at Aleandria, originally produced by a triple combination of embryos, and bearing in consequence three sorts of fruit-namely, Lemons, Oranges, and Citrons, all within the same rind. The evidence upon which this statement is made would seem to be conclusive; for \(\pi e\), in the first place, have the testimony of Mr. St. John, who says he saw the tree, and who speaks of the process as one of which he had some knowledge; and in the next place, private letters confirm the fact of the existence of such a tree ; and yet it appears at first sight to be so contrary to all probability, that one feels tempted to regard it as a fable We must, however, believe that in Boghos Jousouff's possession is a tree that bears (1)ranges, Lemons, and Citrons : all that we can be permitted to doubt is, whether there is not some mistake as to the manner in which they are borne, and the way in which the tree was formed ; more especially as regards the statement that three different kinds of fruit are produced under the same rind. This last statement indeed is considered by some of our correspondents as belonging to the same class of so-called facts as the rrafting Roses upon Black Currants to obtain black Roses -- Iines on Figs, which Columella affirms to be practicable-and Oranges on Pomegranates ; which last, many respectahle persons testify to as the cause of the production of blood-red Oranges.
It is certainly very surprising that such statements as the latter should be made in the present condition of natural history, and withouta word of comment, as if there was nothing in them contrary to common sense. We are, however, naturally so fond of what is marvellous, that we are perhaps more apt to believe them than if they were true; at least, such is the tendency of some minds. Not long since, one of our correspondents sent us a story relating to certain wonders said to occur in Garesfield Colliery, near Newcastle. It was asserted that in this situation every kind of wood except Oak or young Ash, be it ever so sound, when in troduced into the mine, will decay in from 10 to 21 hours, so as to be perfectly brittle in that short space of time. But upon inguiring of Mr. Gray, the viewer and agent of the colliery, we found, as we expected that there is not a word of truth in the statement. We therefore concur in opinion with those who deny that an assertion is to be considered true merely because it comes upon respectable authority, and is positive: no doubt it is even sometimes useful to disbelieve the evidence of our own eyes.

But are we to class with these fictions Boghos Joussouff and his trifacial Citrons? No doubt the probability is that the three kinds of fruits are obtained by the ordinary process of grafting; concealed, perhaps, by what is called the "charlatan" method ; that is to say, by causing two of the kinds to pass through the hollowed stem of the third when very young. Under such circumstances the three would grow torether ; or the effect might be produced by grafting in other ways, while the cause was the concealed. But is it impracticable to graft three embryos in the manner stated by Mr. St. John's informant? Ind is it physically impossible that the result should be such as is described; namely, that each fruit should consist of three parts, the one of the nature of a Lemon, the other of a Citron, and the third of an Orange? We think not.
If the stens of two or three plants, when brought in contact, will adhere and become one, so may the sides of two or three embryos: and, in fact, thisuccurs occa sionally in the Mistletoe, the Cress, the Sun-spurge. and others, without the assistance of art. Now if three embrycs of different varieties could be made to unite, would their several natures be so blended as to form but one whole, consisting of a mixture of each; or would they grow in union, each retaining its own peculiar qualities? This is a question that vegetable physiology does not at present enable us to answer, and which the recent case of the sporting Laburnum renders it still more difficult to form an oninion upon.

Of this. however, we may be pretty certain, that if the fruit of such a tree should exhibit external signs of the three parents from which it is derivel, this tripartitecharacter could hardly beconnected with theinternal organisation. It is, however, quite possible that an Orange-tree thus obtained would produce three fruits one within the other; for such an occurrence is not at variance with the laws that govern the structure of fruits, nor is it in fact by any means of rare occurrence in the species of Citrus. In our opinion it is worth attempting to obtain a plant by such means as those stated to be practised in Syria.
We some time since (p. 99) took the opportunity of mentioning the colony of New Zealand as a place towards which emigrants would do well to direct their attention. It was therefore with great surprise that we saw the other day in one of the leading daily papers what professed to be an account of the sufferings of the colonists there. Upon the authority of letters from Launceston, in Van Diemen's Land, it was asserted that general dissatisfaction existed among the settlers, who found starvation in the room of abundance, and no possibility of obtaining a livelihood. A gale of wind was said to have ruined some, and heavy rains others: that no land fit for agricultural purnoses could be found ; that the allotments were in swamps, and that numbers were waiting for an opportunity of leaving the island. It is really inconceivable how respectable newspapers can publish such reports as these, which are either false altogether, or enormous exaggerations, invented in the rival colonies to prevent settlers proceeding to New Zealand. The private letters from Port Nicholson give quite another account of the state of affairs there. The condition of the settlers was in all respects satisfactory ; money was plentiful, sawyers were earning from t3 to \(t: 4\) a-week easily; the natives were quiet and tractable; agriculture was already paying, although the labourers were getting 36s. a-week on an average. Provisions were, no doubt, dear : cheese was from i.st. to ettl. ; breal, ad. to fid. fresh beef, 13.1. ; fresh mutton, 9t. to 132. ; fresh pork, \(5 \frac{1}{2} d\); refineld sugar, sd. per lb. ; but no scarcity. Very likely there had been bad weather, though the letters do not mention it ; certainly there had been discontent, not with the country, but with the government of New South Wales, the acts of which had, however, become much more satisfactory; and we entertain no doubt that some of the settlers were disappointed and unsuccessful. But let us ask, is it necessary to fo to New Zealand for bad weather, discontent, and ill success? surely the: may be found abundant enough in places much nearer home. (If course those persons who emigrate with exaggeratel expectations, who expect a new colony to be an El Dorado, and who require all the comforts of a london drawingroom on the naked coast of all island of savages, must he disappointed. Such persons should stay at home. The emigrant's life is for a long time one of toil, and danger, and privations; but energy will surmount then; and when surmounted, the results are riches and prosperity.
\(x\) RURALCHEMIETRY- -No. XV
Tue most widely-difirsed and abundant of all the metallic oxides, as well as that which is the most important and valuable in the arts, is the oxide of iron, which exists in different quantities in a great variety of stones, is very common in soils, and is constantly present in very small पunntity in the blood of animals. Iron is very rarely indued found native in its pure metallic state, bat ia usually met with in the form of an oxide, either pare or combined with carbonic acid, and mised with alumiae and silica. Thus the rich black and red iron ores of Cumberland and otier places are nearly pure oxide of iron, whilst the cmamon clay iron-stunes, as they are called, of Stafurdshire and Whes, are carionsate of iron, The important art of siaselting ircu is entireiv a chemical The important art of siaelting irch is entirely a chat mical
operation, and depends mainig upon the fate, that at a high temperatare, carbon has a stionger atiaty for onsy-

 are the ores most commonly employed-they are firs submitted to a preparatory process something like the burning of lime, in order to expel the carbonic acid gas whish they c mans and when thus converted into oride
 and alumine, and form with them a flsible compound called a slag; which greatly assists in the meting and called a slag; which greatly assints in the
running together of the newly-reduced iron.
Iron is able to form two distinet compounds with oxy-
combines; thus, when combined with two-sevenths of its weight of orygen, it constitutes a black substance which is called the protoxide, and when combined with threeserenths, forms a brownish-red substance called the peroxide. These oxides are both bases, and each forms a distinct series of salts by combining with acids; but the saits formed by the protoxide have al vays a tendency to absorb formed by the protoxide have al vays a tendency to atsorb oxygen from the air, and thus become converted ints the
salts of the peroxide. The colour of a great many stones salts of the peroxide. The colour of a great many stones
and soils is prineipally caused by the presence of a small and soils is prineipally caused by the presence of a small
guantity of either the peroxide, or of a mixture of both of the oxides of iron. The rusting of ron, which pro-)-
ceeds so rapidly when iron is exposed to damp air, is caused by the attraction which the metal has fur oxygen. It is very remarkable that iron is unable to combine with the free oxygen always in the air, but is able to take it from its cumpound with hydromen ; for we find that in dry air, iron remains clean and bright for a long time. but wery rapidly rusts when exposed to the joint action of air and water, or kept in damp air, under which circumstances water is deeomposed and oxide of iron formed.
rust of iron is not a pure oxide, but commonly a misrust of iron is not a pure oxide, but commonily a mix-
ture of both oxides with a portion of carbonate, or ture of both oxides with a portion of carbonate, or
compound of the protozide with carbonic acid. Although iron cannot combine with the free oxygen of the sir at ordinary temperatures, yet when strongly heated it rapidly absorbs oxygen, and thus becomes converted into a black acaly ozide; whenerer a piece of iron is heated in the fre, a quantity of a brittle black oxide is formed on its surface, which easily rubs off the iron-and hence this metal is gradually worn away by exposure to and other things much exposed to the fire, gradually get thinner and thimer from the constant oxidation of the surface whilst hot, and removal by friction of the brittle coat of protoxide thus formed. When a piece of iron is
very strungly heated, it at last begins to tirrn, that is to very strungly beated, it at last begins to tirrn, that is to
say, the combination of the external part with oxygen goes on \(s 0\) rapidly, and evolves so mach heat, that the whole mass of iron is kept sufficiently hot to continue this process of combination, and in consequence the iron glows brightly, gives off abundance of sparks, and runs dow \(n\) in drops of the melted oxide for some time after it has been removed from the fire in which it was heated. In fact, iron when thus strongly heated would catch fire and continue to burn like charcoal, it it were not that the crust of oxide formed protects the metal from further oxidation, and soon stops the combustion. One of the most commoa and abundant of the ores of iron is called pyrites. which is a compound iron, because it is very difficult to separate the sure of completely from the iron, and the native oxides and car-
comple completely from the iron, and the native oxides and car-
bonate are far more convenient sourees of the metal. bonate are far miore convenient sourees of the metal.
Pyntes, or sulphuret of irom, is howerer a substance of considerahle impartance in the arts, being one of the sources of sulphur, whicia is oitained by heating gyrites in an oven so constructed that the suphar which is expelled in the state of rapour frem the prritesis conled and condensed iato the sulad furm in a dificrent part of the low. ryntes when exrosed to the air snon etwathes of absorbing and enubining wih orygen. Both the irua and the sulphur combine with orygen, and form oxide of iron and sulpharic acid; and hemee the result of this action is sulphate of iron, or common green vitriol, a satt is mast abomd otlly found in the form of viriomsly-shaped balls imbeduded in chith: and as the chatk-hills on the sea-side gralualiy wear away from the action of the sea and weather, these bails of prrites get expused to the air, and fall diown on the beach, whence they are colleeted for the use of manufacturers. Many springs of water contain a staall quantity of iron, in consequence of which they have a pecuiar inky taste; this is usualis derived from the gradual oxidation of sulphuret of iron, -and from the eame reason shils also sometines contrain traces of this sait. on being of yon is likewise very commonly found in of little vellow shaning partiles. and wometimes as havers or lumps of the solid sulphuret; its presence in coal is for sume purpmes highly objectionalife, because abether the coal is burnt in its crade state, or after being converted formed by the imperfect combustion of the salphar ; and that nauseous-sme elling gas canses serions of salphur ; 3nd operations in the arts.and consequently in such cases coal free from shiphare* at atal can onity be empliyed. It is the presenve ef this an stavee in coal that causes the strong suffucating smenl of suiplaneous acid sometimes given our by ceal ind cuhe thes.
The oxideo of iman ne cuite inow'd le in mater, but mane of the sa is uf ron, like the su!? hate are reahiy smluble in litthe alkalk is atded to them, 一thrs cornines with the acid, and the oxilic of irwa is separated as an moclitle r. \(-E\)

DISBCDDING OF PEACII AND NECTARINE
Thase trees are frequrnty.
 small gadens; not very Tapuatube for hem, especiany is the phart of tite con pers, manugenent, quite as expensive as tuas b; whinica of abunem pictae may bo menreul
 Cforan s, voue ofrsiation of us rriacifies and the bear ha mus: chat un tie quasuty of foliage with which to tree is funtisiec, arpods the iacrease in diameter of the
stem and branches, the extension and increase of roots, and the production of fruit; and yet, that no more leaves should be retained than can be freely exposed to light. In the case of a healthy tree, not one-half of the shoota when When traned against a wall, If all the branches of a
round-headed standard tree were disposed in a flattened or fan-like manner against a wall, they would be greatly orercrowded: for instead of a surface equal to that of a sphere, the foliage would be reduced within a diametrical section of the same, aff rding a surface of only one quarter of that which they formerly had. Hence it is evident that a considerable reduction of shoots produced by wall-trees must be effected in sume way or other. This is partly partly by the process of disbudding in summer. Let the accompanging wood-cut represent part of a bearing shoot; the lowest bul is left because it is the lowest, and is, therefore, most ele,rible for "training in" during the season, in order to furnish, next spring, a similar bearing shoot to that now represented, which will be cut back to the said

lowest shoot. The second bud from the base is also left for the sake of a fruit-blossom which is cunnected with it. The shoonts which were pushing at \(a, b\), and \(c\), are remored,
or disbuddled. In remoring the buls. care should be or disbudled. In remoring the buds. care should be
taken not to injure the bark of the shoot. The buds \(a\), aken not to imjure the bark of the shoot. The buds
h, \(c\), ought nut to be all disbudderl at the same time: the fore-right one, shonid the first removed, and the other successivey, ot intervals of sereral days, in order not to check the circulation of sap by a too great privation of fuliage at unce. The terminal shoot is left because there is a blossom at its bense.
As mas above observed, the lowest shoot must be prestrved throughout the summer; the other two having ruit at their base may be shortened back to about three inches after their leaves lave attained the full size, and the base of the shoots has acquired some degree of firmness The shoots of lench-trees that have been neglected may be reduced to order withoat any material injury, if the removal of superfuous shoots is thus made by little at a
time.-T.

COTTAGE GARDENS.-No. XXI
Some of the first-sown Cabbages, Savoys, and Cauliflowers that were pricked out from the seedbed, as directed at page 2.59 , will now be fit for fral planting: and If any groond remains unoccupied, let it be well manured With a portion of the best dung from the pigsty, and preparel tor thear remeption. The proper distance at which inchis apart, wind two feet between the rows. Previously 2) pas. int we whid in all cases recommend a drill to be wate wh the hom three or four inches deep, similar to hose is which l'eus or Beans are sown, and then insert the plants in the bottom of it at whatever distance may e uncinction. The intention of this drill is to get the hants a hitle deeperin the ground. so as to admit of the vance ing drawn cluse ur about their stems as they ad vacce in srowth, and \(y\) this weans secure them from
leing imwn avout and irjured by the weather in exposed situations. should it so happen that there is no spot yet racant, we would ausise the remoral of some of the early rows tiacare nenty orar hy this time-such as the Spinaci butwen the rors of Beans, and when the space it acempi. \section*{HOME CORRESPONDENCE.}

Hygrometers.-In the Chronicle (No. 21) a correspondent inquires if an hygrometer could net be contrived "self-acting, simple, economical, and certain." is I have, for the last three months, used an instrument for the purpose of regulating the moisture of the air in my orchidaceous house which has perfectly answered my purpose, 1 am induced to offer it to your notice. It consists of an old-fashioned instrument communly suld in the opticians shops an Leslie s differential thermometer, for
the figure of which see below. It is arranced so that when not in use the fluid stands at zero in thee stem, \(A\); over the bulb of the opposite stem I place a piece of muslin, C , which has been well soaked in a strong solution of common salt in water ; the muslin hafring been cut into a circular shape, is laid on the bulb whilst wet, and the moisture will make it adhere sufficiently. A shelf, or bracket, with sides, top, and back, is made for it to stand in, to seclude it from the sunshine, which is of course essential, and also to prevent the damp wall from having offect upon the muslin, so that it may draw all its moisture from have a thermometer hong on the same stand, as in all hegrnmetric observations the state of the thermometer must be attended to. The rationale of its action is simple. If the absorption of moisture exceeds the evaporation from the muslin, heat will be generated which will expmed the air in the bulb C, and drive the fluid up the opposite stem, indicating the degree by its rise. On the contrary, it the causing then exceeds the absorption, culd will :" pudacell, made are from zero to \(4110^{\circ}\), I believe. In my stove, utider the general treatment of orchidaceous plants, twherature ranging from iso to \(9.5^{\circ}\), the hygrometar has ransed from require it it cual be, range to any degree reciuired : but I do not anticipate that a greater range would be required for the cellest pit or greenhouse. As I have found it very useful in my own stove, I hope it may, be of service to your reaters; and as
it is ". self-acting," so I trust it will be found on trial "simple, economical, and effectual."-J. W". Mfarris.

Potatoes. - Sune five or six years agy I cat se:s from a few rery large fotatues of sumeient tiicaness for runtins the residue of the cat potatoes were prat on a heif in tha. Thes wue not usul for some tive; ; Dincin at them by

 their appearance as perhaps I hare ever seea from the eyed of potatoes. Where then. permit me to usí, dues rege-
tation in a potatce end : and in preparing cuts for planting, Again-sume years since I heard this remark:-"Boiled potatoes are four times as good as raw, and roast potatoes are four times as good as boiled; ergo, roast potatoes are sirteen times as good as raw for a horse." Experience have ever since roasted potatoes for my horse, a good, sound general horse for saddle or harness, as long through the season as potatoes may be considered wholesome for man hey are roasted the better he likes them, and the more good they appear to do him. I cook them in the same way tor my pio, and, I think, with equal advantage. By the
term roasted, i mean what in Lancashire is called roasted they are put into an iron pot without water, and if they ease, thes are, I think, all the better for it. I have twice sen some remarks in your paper about horses and potatoes but nothing about cooking potatoes for a horse. If cooking as I do for horse and pig should be good, as is \(m\) decided opinion, it may be wel
know it.- \(A\) Cottace Gardener.
Time for putting on Manure.-It is not only essentia that we should know the chemical qualities of manure and
of the soils to which the different sorts should be applied, but also it is of consequence to learn the best period its appireation to different crops, about which little, I be lieve, is accurately known. Indeed the same dificulty exists amongst farmers: here in Herts there is great difgrass land, some choosing the spring, others the autumn, and again others pat it on after the crop is cnt. Mr of his Potato-crops to the having ploughed in the manure early Pue autumn, instead of putting it in with the seed as mane. As regards Asparagus-beds, it is the custom growing : whereas it would seem that the proper time for putting on dung would be when the plant is growing, and making roots for next year. The same observation applies
to Sea-kale beds, \&c. What is the practice as regards Hop-grounds? \(\boldsymbol{K}\).
Disease in Laures.-May I beg your opinion as to the cause of our Laurels going off after making a shoot, which is generally clear until nearly full-grown, when the leaves begin to spot, as in the inclosed specimens? After some
time they will be full of holes, and drop off. This is the thitit year they have done so. Previonsly they grew redry bottom; after the winter of 1837-8 some thousands made a fine shoot in the beginning of summer, but befor John Murray, Northampton.- [We are umable to explain the cause of this disease. It makes its appearance in the surrounding texture of the leaf, apparently in consequence of its being dead. This point forms a centre, round which the disease spreads, like canker in a fruit tree, so that at last the point becomes a roundish blotch, sometimes as entirely of dead tissue, and when it ceases to spread, the living tissue that surrounds it separates spontaneously,
and allows it to drop out, leaving a hole behind it. There and allows it to drop out, leaving a hole behind it. There looks as if it were produced by the introduction into the system of deleterious matter which accumulates here and there in points, and then destroys the parenchyma among some branches for examination, and any of our corre spondente for information concerning it.]
Magnesian Limestone.-In reference to Mr. William epithet magnesian limestone is vague and inerefithat rock varies materially in its chemical composition, and the question seems to be, whether maguesia is to sustain the exclusive blame of being injurious, or whether som chargeable with blame. His Grace the Dule of Portland participates in the prevalent opinion as echoed by Mr. Tillery. The thestion can only be settled by a careful
comparative and quantitative analysis. Common limestone varies materially, and so does magnesian limestone Durham is, horeverer, sufficiently rare. Magnesian limestone is usually of a dun or yellowish complexion, some times dotted with minute specks, and generally effervesces feebly with acids. I fear that I may have been misunderstood. The late Mr. Smithson Tennant, whom I personally knew, stated that seeds would not gerturd, se and found they did germinate. I mentioned the fact to Professor Jameson, and I have already recorded his refif. I must leave the question with this simple
 propositions cunnected with this quention which are entirely averlooked, and yet seem conclusive. Aphides are found, and often in abundance, where there is no secretion, it should be an invariable accompaniment of their presence. There is oftentimes honey-dew in pro-
fusion where the aphis is not to be discovered; and, frequently, where both honer-dew and aphides are associated the quantity of the former so far exceeds that attributable to the numerical array of the latter, that anything rather are general concomitants:- sickly state of the plant und a morbid condition of the atmonphere An for the
plant, and on which the insect feeds, may be ejected by the aphis unchanged-this, therefore, proves nothing. I can see nothing in your Correspondent's remarks but assumptions, in perfect keeping, however, with the commffect. I must assume, on inductive grouuds, that Sir Oswald Moseley has reasoned well. My previous convic tions are strengthened, certainly not disturbe
Correspondent's communication.- Ms. Mrray.
Register Thermometers.-In answer to the inquires of T. H., the day or maximum temperature tube contains quicksilver acting upon a fragment of a needle, and the tendency to derangement may occur from the following causes :-From the needle being too small for the bore of he end of the nght obe so as to present an angular or pointed extremity to the pushing ction of the mercury. The night or minimum thee contains coloured alcohol, immersed and almost floathg in oh is an index of glass or enamel, formed ar the spirit about it by capillary attraction, and the spirit so retained forming part of the general column of alcohol, retreats with it almost as freely as if the index wo no floating in it. When the spirit is expanding, the friction
of the index against the tube is sufficiently greater than of the index against the tube is sufficiently greater than
that of the spirit, in passing by it, to keep it stationary. It that of the spirit, in passing by it, to keep it stationary. It
should be noticed, however, that both the day and night tubes may be, and frequently are, deranged by sudden erks.-Andreu Ross, Regent-streel.
Propagation by Leaves.- You requested me to state in writing the success which I had many years ago in raising certain monocotyledonous plants from the leaf. In the year 18091 first tried to raise bulbs of a Cape Ornithogalum by setting a cutting of a leaf. The leaf was cut off just below the surface of the earth in an early stage of its gromth, before the flower-stalk had begun to rise; and it was set in the earth near the edge of the pot in which the leaf continued quite fresh, and on examination (where the bulb was flowering) a number of young bulbs and radical fibres were found adhering to it. They appeared to bave been formed by the return of the sap which had nou ished the leaf. Thereapon two or three more leave were taken off and placed in like situations, but they turned yellow and died without producing any bulbs. experience, that in order to obtain a satisfactory result, the leaf must be taken of while the plant is advancing in its growth. I found it easy thus to multiply some bubs with did not willingly produce oface an oblique incision in it under ground, and in some cases just aboveground attempting, in fact, to raise bulbs by layering the bulbs were formed on the edge of the cut above ground as well as below. I tried cuttings of the stem of som species of Lilium, and obtained bulbs at the axil of the leaf, as well as from the scales of the bulb; and that practice has been since much resorted to by gardeners though I believe it originated with me. I raised a grea number of bulbs of the bosus, by setting a pot full of its leaves, and placing a bellglass over them for a short time. with equal facility from a leaf of a rare species of Eucn-
mis; and experiments with the leaves of Lachenalias were equally successful. I apprehend that all liliaceous bulbs may be thus propagated; but the more fleshy the lenf, the
Herbert
Saltpelre as Manure.-I observe that one of your correspondents gives a caution respecting the indiscriminate been killed by is anplication It think it possible that the injurious effect he speaks of, may have been produced by some impure mixture, or adulteration of common salt or other matter; for I have used a considerable quantity of pure saltpetre with very good effect, particularly on grass ; and with no injurious effect upon any plant, unti the last cask of it which I bought, which killet grass and every other plant to which it was applied. The yersor that it was not so pure or so strong as English, but that that it was not so pure or so strong as english, but that might be well to try it, as it might answer for agricultural purposes. I tried it, and it had the most injurious effect apon vegetation.-C. S. Walker, Lecmington
The Management of Forest Trees.-It is with pleasure that I see forest-tree planting assuming that character which its importance as a national object deserves. Mauy fine young plantations are spoiled by being allowed to temain too long unthinned, and others by tat operation this, I allude to the amparionisereal practice of cutting away everything to make room for an oak, no matter how sickly, crooked, or diseased it may be. There is evidently a sort of bigotry connected with the name of an oak, materially assisted no doubt by the many poetica allusions with which its nome itsatility as a timber, or its any means intend to depreciate is anly as ann that sys value as an ornamental tree, but owiy concenting to give place to a stunted ill-thrivea oalk. Many times have seen beautiful ash and lareh trees slaughtered at it shrine of (so to speak) Druidical superstiion kinds, and at the first thimning to take out such as can be spared, but aever an oak; they must always be left, much
after the same manner, and with as little reason, as the egys and joung brood of robin red-breasts are by children find I shonld certinly ant, oak; but when I see a fine ash taken away for the sake of an ; bot one third its size, or a larch perhaps four or five times as large, I then think the operators are acting injudiciously. The most passive observer cannot but have remarked how mach faster the larch grows than an other tree in the same plantation. It is difficult to find place where it will not grow, and in fact few trees thrive so well in sucb a variets of soils, situations, and eleration as the larch does, though like most other things it likes good ground. I have heard of goou-sized thooring deals dency to warp so much makes it inapplicable for such purpose ; but for fence-railing, gates, and roofing-timber for thatched houses, it is invaluable. When driven into the ground as a railing-post it will last as long as any have seen them repeatedly tried together with other kinds of wood. Where profit is the object, the quick return of capital, occasioned by its being so soon a saleable tree, must give it a decided adrantage over all others; whit the beautiful appearance it has when developing its leaves in the spring, must make it a farourite with the most refined critic. Of ash I need say but little, its utility being so well known. It is, however, too often maltreated, and cut way to make room for a beech, a silver fir, or more frequently for an oak. I never could learn the reason why beech should be preferred to ash; it grows much slower is not so durable a timber, and sells for considerably less. dift uses to which the two kinds are put being generaly slent, renders a comparison between the kind of timbe ung and tender Scotch fir, when both are exposed to the varrations of the atmosphere. Ash is more injured from want of thinning than any other tree; from its propensity to grow upright andender, it should be attended the many noblemen and rentlemen who superintend their own plantations; when full-grown it has a noble appearance, et the extreme slowness of its growth for the first 30 or perhans 50 years recommends it to those ouly who plant or picturesque beauty and disregard profit. I have seen lso the tres of also equa to nif ber. firs ; but the tardiness of its growth in early life, with the many misfortunes subject thereto, and the conseress of all the upper part of the tree when cut limber, renders it advisable in most cases to phant only a limited number I think Scotch fir much better, and the timber of a large genem grows much quicker. I am not aware whether, after attaining a certain age and size, the silver fir may grow as fast or faster than most ottuers, and cons its yonth can never be recalled, and for that reason I object to its being extensively planted.-S. N. V.
Effeet of Age in Trees on the quality of the Fruit.The following extract from Dr. Bullar's account of the Azores relates to an interesting subject, which has not, believe, hitherto received much consideration. Dr. Bullar does nol state whether grafts from the old trees Btine produce is the same as that from young trees. It think Sir W. Temple has some observations on this point. - \(\boldsymbol{K}\). gardens in the town. Many of the trees in one garden rere a hundred years old, still bearing plentifully a bighlyprized thim-skinned Orange, full of juice and free from pips. The thinness of the rind of a st. Michael's Orange. and its freedom from pips, depend on the age of the tree. The young trees, when -1 the pecomes thinner, and the seeds pradually diminish in number till they disappear altogether. Thus the Oranges that we enterm the most are the produce of barren trees, and those which we consider the least palatable come from plants in full vigou
Instrance of Glass Foreing-houses from i:ajury by that the guarantee of property, it appears strange to me hat orcinchonses from injury done by hail-storms. The same property may be insured from fire, to which it is presmand it is much more lizble, amd still tive existing presumed it is muck itore arwed, from want of data, to become a guarantee for injury done by storm. To estaCish pmeitive data for any insurance is exseedingly dim cult, lut the safe course is the one in. viz. that of taking a higher premium than the farr phlity if hom experience, woud data for the p-t blishgent surely furnism sumient office, and it would satisfaction to know that under such a visitation of Provicuence, should it ever occur, his loss might be compensated by the data. and taking the probatrility as the preper guide, it Tould be rigit to this any lin lity where ghas fircingsustained in that locality for 20,30 , or 40 years; let made; a third, if it be necessary; and after determining the injuries that hase been sustained, let the ralue of such houses, with their crops, be determined: the proportion
thus found would be, I thinla, the fair problilitys and forms
a safe datum by adding 50 , or perhaps only 25 , per cent.,
upon which a nutual insurance office might be establisbed upon which a nutual insurance oftce might be established
that would be extensively entered into. and be oceasionally of great useruiness. Nuw as to probability in a particular locality : I have been an inhlabitant of Isleworth about 30 years: in this parish and the neighbourhood there are perhaps as many tlass forcing-houses as in any spot of equal extent in the kingdom, and in the whole 3 年 years, I In some places, and simetimues, although rery ravely, it is admitied that very extensive losses have bren sustained, but by a very tritling premium beng paad by the many the very rare instances of injury worid be effectually frovided açainst, and I hope, before long, the subject will be taken into the consideration of practical horticulsurists, will be taken to establish so desirable an object.-Jufin Adams, Islezeorth.
Criticism. - Tre Gerardia fraticosa, \(P\) ursh \(h\), mentioned by C. D. is a Pentstemun! very near to P. Sonuleri. Ge-
rardias are, I believe, all annual, and the seeds are said not to keep at all, like those of the allied genera Pedicularis, Bartsia, \&c., most of mhich would be beautiful could they be easily cultivated. I do not agree with ''apt. W. that Quercus Firamuntia, or the Gramont Odas, were the Balstroyed, was always supposed in the country to be an indigenous one, and the rariety sent thence by Gouan to Linaæus is to be found in other parts about Montpeiier those places having been converted into tinegards, and I never heard that any of the Gramont Oaks ever produced edible acorns. If it be the Q. Ballota that Linnæus
described as Q. Gramuntia, it must bave been from spedescribed as Q. Gramuntia, it must bave been from spe-
cimens not from Gramont. The Gramont woods were cimens not from Gramunt. The
cleared 25 or 30 years ago.-E. \(M\).
Roses. - On the report of the Horticultural Society's Exhibition in Regent-street, last week, Mr. Rirers obserses that the double yellow Austrian Briar is the well-known Pitmaston or Williams' double yellow Briar, of a bright yellow, nearly as brilliant as Harrisonii; the variety Austrian Briar, a sery curious rariety raised from the copper Austrian Briar, in the attempt to procure a double variety of that unique-coloured Rose; the globe gellow is a hybrid between the Scoteh and Austrian Briars raised from seed in Italy, from wheace he rectived it: this, he thinks will prove a very interesting variety. The Prince Albert as it is so like George IV.; ;it is worthy of notice solely as an autumal-Howering deep-coloured and fragrant Rose ; no autumnal Rose kinumn is at all lize it. -It shoutd also have been stated that a Banksian Medal was on the same occasiuns awarded to Messrs, Lucombe, Pince, and Co.,

\section*{FOREIGN CORRESPONDENCE}

Valparaiso, Juiy 31, 1314.-The vegetation around Talpararse is not rery varied, but rery interesting. I mever take a w.alk over the fields without faling in the
way of the pretty Fscallonia rubra, which reminds me of old times, when I used to see it nailed against the walls of the gardens near Londun. It is abundant here in most of the valleys, with Loranthus tetrandrus, Fuclisia rosea, \&c. dc., and many plants which I have seen tenderly
nursed at home. Here thery tiefs any inclemeney of ther, and the zeal of the jgricuiturist alll uot eradicate them for centuries. Cucos chilensis exists sparingly in the warmer vallers. Bilbous plants, I hear, are abundiant. before we leare. I have not been disappointed in my anticipations as to the botany of warm climates: it is certainy all I could expect. Perbaps I felt a little
chagrinat the first vios of a Palm-tree. It is to stiff and rigid to be pretty. when the arr is stili ; but when agitated its leases are lihe lugge phumes lifted on the
wind. After all it is a novel ratler than a prety Not so the tree teras : I was ruite thlyan a prety abject. saw, and socu had it down arrass the pathwar, in spite of its sharp pricile:, staipped the fronds off, and land the trunk seross my simplders to make specrasens wher I had got it the the beach. Son ofterwards, I saw a whole grive of the -h-harily ansthing else: and then my de-
light was at ineigit: fur I had a sight vefure me many b. tanists at lime wowh glory to luen on. I had
 forist was fark of macho of overy aind. Among others in Peru, I eneontented a sirzuld: fat. For some time we had becal buting wow an and sol and furni-un vege-
 strange to say. the regtt.ton was is miles riand and
 and again hat a sterie country, ade io more streatis of fresh water for ceme time.

way some pieces of the tree (now prostrate), in which the Fut the copper and jappers bave long since vanished, and all that now remain are a few nails and a figure cut out of the side of the tree about four feet high; and in the square hole in the centre the papers had been placed.
Among the plants conmon there, but otherwise scarce, I saw Blandfordia, Anopteris, Fagus sp., Podocarpus asplenifolia, Cenarrhenes, \&ec. Sir John and Laly Franhlin continue to be the patrons of science in all its branches out here. Lady Franklin has purclaset a beautiful spo which she has placed under my charge to furm into a grcen to contain our indigenous plants first, but eventu nature it pussesses the Arborescent Ferns in great beanty, and a splendrd collection of the Cryptegamix,
walks are alune required to wind through gruves of Crypto-
carya glaucescens, Fagns, Cibotium, Pittosporum bicolor, \$c., which uvershador the ground, and which hundreds of
yeare could not produce by any course of cultivation. On the margin of the stream is found Friesia peduncularis, Corre erruginea, Tasmannia, and many more. The extent will be will be acres, but only a small portion, of about 5 acres, cxisting on it, and the rest will he intersected by walks, that many rare plants, and especially Crrptogamix, can Wellidied in a state of nature, it is at the base of Mount 2000 feet above the sea at its highest part.
Paris, 31vt May, 1841 . - The great perfection to which nurserynien and amateurs have brought florists' flowers in does not yield to any other in beauty or variety of colour unfortunately it is but little known, and therefure not sufficiently appreciated: I mean the Iris; one year's suc
cessful cultivatiun would give it fellowship with the Auricula, Piok, Heartsease, and Dahlia, and ensure it a place exceedingly being exnibition. There are many kinds, al must generally known are Xiphioides, Xiphium, Variegata, mottled, blue, purple, lilac, rose, and white. The second has snaller flowers, lemon, orange, bronze, gris de lin, rosy salmon, blue, and blue-purple. The two last have large flowers, selfs, mottled, bordered, and striated, blue
purple, brown, bronze, crinson, yellow, lemon, lilac, and exhibited at one of the Horticultural Society's shows at Chiswick some rears since, and they attracted much attention by the beauty and delicacy of their tints, but Variegata and Germanica I have never noticed in any great variety best sorts grown in France may be of service to amateurs May flowers. All the following will be found quite hardy and as easily cultivated as the common Blue-flag, but a good rich soil will amply repay all the trouble bestowed upnn them. Aurea, orange striated; Aurea striata, lemon tus, light onn, Antonius, pale yellow and brown; Augus tus, light blue striated purple; Augustissima, orange and dark brum; Aphillun, lemon and brown purple; Atro hiac striated purple; Aurore, dark blue purple ; Bicolor, brown and dirk violet; Bois Milon, light blue striated purple : Boccage, white and dark violet; Bergii, lemon lescens, azure blue striated; Cornelie, orange striated brown ; Cerbere, lenoon striated bronze; Conqueror, lemon and dark maroon; Don Carlos, lemon striate brown crimson; Donna Marie, pale azure blue; Flaves cens, ligyt lemon: Furmosa, blue purple; Honorabile ynle yeluw and brown crimson; Incomparable, wi.ite
striated vioiet; Jacyuesiana, bronze lilac and brown crimson: Julie Grisi, white and vinlet with silver edge Llacma, purple striated lilac; Munic). yellow striated Nawn and ermason; Multeolor, lemon and brown velvet lemon; Odoratissima, light murple ; Plicata, hiue striated vilet; PaLida spreiusa, pale lemon; Pulcherrima, blue and purfle; Rebecca, paie yellow and brown; Rellandiana. blue lilie striated; Raphael, white and brow purple burder ; Reticulata major, orange striated brown Rileta, white striated vilet: R. purpurea, purple striated lemon and bruwn: Serutina, orange striated hr wn: Simbucima major, furf le moticed violet: Striata, light biue striated whet: Triquin, Milac; Theresita, litae striated videt: Telanaque, blue striated parple; Cnique, white

\section*{MSCELLANEOUS}

Chusan.-A small but very interesting collection of seeds collected in this island has been just presented to the Horticultural Saciety by the Court of Directors of the East India Company. two kinds of Rose, the Tea of the Island, an Hypericum, a Cotton, a Wormwood, together with several otber apecies belonging to European genera. We are glad to add that the greater part is said to be in good condition: and will undoubtedly form an interesting addition to our collections.
Chidham Wheat.-At a meeting of the Council of the Royal Agricultural Society of Englaad. held on Wednes day last, Mr. Hollist, of Lodsworth, Sussex, presented a specimen of heary, clean, and pure Chidham II heat, as thoroughly good sample for the market, the seed having been drilled on a light loamy soil, on the 20th of November, and the grain weighng Gillos. per bushel, and ex pressed members gness to supply small fuanties to any of the members Who were desirous of cultivating this vahistory of the Chidham Wheat, that it was probably known in other parts of the country by different names, but that from the circur ger of from the circumstance of an ear of it haring been found 20 years ago, on a hedge, by Mr. Postlethwaite, of Chid ham, which excited his curiosity and interest in its cultiva-
tion. The specimen sent by Mr. Hollist was hervier than the prize Wheat at Cambridge, but not so bright in its appearance,-a difference he attributed to the state of the weather during its growth; Mr. Hollist having also found in his own experience the most decided differences in the slightest differences of soil, aspect, and time of sowing, with the same grain, and in the same field.
1 Protection of Hops from Insects.-Mr. Mohbs, of St. Ires, Cornwall. has successfully effected the destruction of all the small insect tribes that infest the hop-plant, by the erection of rails of a particular construction smeared over with coal-tar.-Morning Paper.

GARDEN MEMORANDA.
Messrs. Dirkisun, Aere-imir. Jume 2.- This establishment has been long celebrated for its extensire and raluable collection of
Auriculas. the present appearance of the plants is evidence of departed for this scason, and the Tulips are lin the same condi-
tion, we mult look to (arnations and Picotees, whach are full of health, and promise a frm hloonn In the Heath-huuse w plants of F araliacea plants of E . arnpmliacea major. the agricultare of the Netherlands, numerous reports of Fammers' meetings, and a good Horticultural Calendar.

The Microscopic Journal, which has begun to appear in monthly numbers, contains mach interesting and va uable information both original and selected from other journals. It also comprehends the papers read before the Microscopical Society of London, and is thus a record of the proceedings of that useful body. Considering the pecaliar nature of microscopical observations, they are, notwithstanding their direct relation to \(s 0\) many branches of science, more convenientiy considered when brought pages of treatises on distinct parts of Natural History Those who have a love for the beauties of nature, and ahe yet are ignorant of the wonders revealed ligy the microscope should provide themselves with this journal ; for they wi not only learn what the great microscopists are daily dis
covering, but how the art of constructing such instruments advances, and in what way to use their own glasses mos advantageously. The following directions, by Mr. Smith, as to the best mode of viewing objects, will be of great use

Mode of viewing objects.-Much of the beauty of the bjects seen depends upon the management of the light that is thrown upon or behind them; which can only be filly mastered by practice. It may be remarked, how over, as a general rale, that in viewing those which ar ransparent the plane mirror is most suited for bright day should hare the bull's.eye lens, when that is used, so close o it, that the rays may fall nearly parallel on the mirror if the bull's-eye lens is not used, the illuminating bod shonld not be more than five or six inches from the mirror.
The latter is seldom required to be more than three inches from the object, the details of which are usually bes shown when the rays from the mirror fall upon it before crossing ; and the centre should (especially by lamp-light) be in the axis of the body of the microscope. For obscure objects seen by transmitted light, and for outline, a full
 cate lines, like those on the scales of insects, it should be made to fall obliquely, and in a direction at right angles

The diaphragm is of
ght, and stopping such ray of great use in modifying the but noar ang such rays produced by admitting the whole from the mirror.

If an achromatic coadenser is emplosed instead of the diaphraym, its axis should corvespond with that of the wody ; and its glasses when adjusted to their right place hould show the image of the source of artiticial light, or, y day, that of a cloud or mindow-bar in the field of the microscope, while the object to be viewed is in fucus

The raost pleasing light for objects in general is that retlected from a white cloud on a sunny day; but an Ar good substicute.

A large proportion of opaque objects are seen perfectly well 'especially by day-light) with the side illuminator irrecula darn \(h x\) as a back-ground; and for showing irregularities of surface, this lateral light is sometines th best ; but the more rertical illumination of the I.ieberkuhn is usually preierable, the light thrown up to it from the mirror below being, with good management, susceptible of much command and variety
CALENDAR OF OPERATIONS for the ensuing Week. Trublong continuance of dry weather has been extremely favery known means oght to be adopted; not only to stop thei convinced that insects in gardens, like wheeds, may be rendered Comparatively scarce by adopting prompt measures for their e
irpation the moment they are detected, as well as preventive ones; one of the principal of which is cleanliness. We have
seen wall trees this season, at several places, dreadfull 5 infeste itaan ansects, mildew, and blister blight; as our oum are perfect nothing detracts so much from the eppearance of a earriten as the avacee of insent, partienianly en wall-trees, we recommemat the iv) ally ton which the trees suñered every summer as much as an he mave zen. To a gallon of lime, a pound of solphur, and the minsistence of thick whitewash, with which coat the trees all over with a brush, missing no part. As soom as the trees are pruned
this mav te performed hy toys, or when liftre clise can lie dune awh hirnd summer, in dry weatice, sow litne under the wallThe rake, by these mease we seldom have green- lly, and neve with
red-spider, yntil the scason is too far advanced for them to do much harm. EITCHEN GIARDEN IND ORCHIRD
Par hary.-Give the plants regular supplies of water; fruiter may hav manure, water cwry ctuer time, and the younger plant
ecasiwally. Syringe over-head on fue momings, or early he ziterncin befor the house is shut up, emomings, or earily in
be in bloom; moisten also with that may - they apery

brick or small pats.iel
Musmrooss. - Beds should now be made for antumn and by frequent turnings, to prevent them burning, or becoming diry the dung will be exhausted before the bed is made.
Attend diligently to destroying weeds; thin out any advancing piously if necessary, especially Caulifower and Salading; clear
ofr to the vegetable soil heap all decaying crops which cannot be Asparaces.- -Very little should be cut after this time.
CELERY, - Do not allow the soil in the trenches to become sur face-bound, which it is very liable to do after it has been for some
time watered artificially, as has been most probably the case
during the dry weather; loosen the surface and continue during the dry weather; loosen the surface and continue t)
water when uevessary.
CAULIPLOWERS. - Protect the flowers from the sun, by break able, chuonmen a deep rich soil.
 Kidver beans. - If not sown last week, sow this; water the
drills previously to sowing if the weather continue dry LeTryck. - The up the Cos kinds for blanching and plant out
successions one foot apart, keep them well watered, esyecinlly thinse designed for immediate use.
LovE-APPLEs.- Do not allow the most luxuriant shoots to re. main, or any to become crowded. for drawing young.
OXios.- sow a smaul quantity former

\section*{Hoe deeply between advance in grwth.}
platstoes. - hoe ptants are well up.
BArous.- Plant out a few early plants, as recommended for Turnips. - Sow now a good piece of White Stone; het the
ground be well broken, and the seed trod in lightly; hoe and thim Orchurd.-All Wall trees will require constant attention, in to them during and keeping down insects; wee the envine rreely commenced; all dead or cankered branches nust be remorel this is a very common fault and in cold antumns neesiary, of fruit the season affer. Sel ripened, which often causes 2 .
.
 to the fruit; stop the bearing shout, to one eye abowe the bumch, particulariy to destroying weeds and msects.
II.-FLOWER-GARDEN AND SHRUBBERY
STove - Supply liberally with water growing Orchidaceex. be placed together, to prevent them from receiving too much water; shade them during sunshine, and only then; there can be no protext for excluding the light, as is two uiten , anne by umht over.heal mornmy and evening, during diry hot weather, and
give air freely: propagate any desirable plants of winch suitable Greevaut ae.-Gire abundance of air night and day, exceps during culd winds. Heaths should have a partial shading from not stand close t yother; if mith w appears ammene them, the inplants set apart in an airy situation. This is a good season to propagate many kinds of Heaths, bat cuttings mad be put in at
any time when firm young wood can be obtained. Watch that Orange-trees, and other plants out of doors, do not suffer for water, or they will soon lose their colour: cara must also hac
taken that it have flee egress.
Hill kindh of cactueze which have donne flowerins, may he re-potted, placed in a waril nuist
ation, and lave ibeal suphlies of wate. Pits and Fraurs.- The earliest Geraniums may be pruned
down, and reduced to smaller pots, but not until they have broken fresh buds. Attend to youn
re-pot all plants as

Flowsp-carden. - Sapply with water all newit-plamed lowers, arrange and fix with pess, in their proper places, the
atems of Petunias, Verbenas, and other trailing plants, and conatems of Petunias, Verbena
tinue last week's directions

隹igently destroy wreeds. Remove the clay now bass. Ruy off suckers from Stocks, and continue layering Roses,
hard-wooded Evergreens, and other shrubs; water, weed, and shade seed-beds of young Firs
Oaks in prune off any rival leaders in young the surrouncing hertage side shoots, when necessary; clean fences and drains, and build walls.-Joseph Purton,

\section*{Notes for small Gardens.}

up the bottom of cuttings, what would be the result ise stop result would be different in different cuttings. It is sometimes useful to stop such plants as Eupliurbias from bleeding too much, stiff soil. We certainly should not like to singe them, as we to come. The use of a littie common soil below the larer of san in striking cuttings, is to enable the young roots to strike into
it as soon as they are capable of assimilating the nutriment that it as soon as they are capable of assimilating the nutriment that
kind of soil affords. The extremity of the cutting should not be planged into the soin. There is no doabt that such tiles as our would be very good things to place plants upon.

\section*{NEWS OF THE WEEK}

The defeat of the Prench Ministry in the Chamber of Peers on the Bill for the recruitment of the army, is the most important intelligence we Lare received from Paris. It appears that the Government had so little anticipated opposition, that orders hati airealy been given for the formation of the reserve, which must now be postponed for another year, in consequence of the amendment. This defeat was expected to have led to the resignation of Marshal Soult, but by the influence of the Coure, the Cabine is again united, although it has not yet decided whether it will re-assemble the Deputies to consider the amendments of the Peers. Independently of the interest of this event to political parties in Peris, it may be regarded in a more eneral character as confirming the prospect of peace in Europe.-From Spain we learn that the state of the young Queen's health has again given rise to uneasiness, and that the New Mimistry has experienced a defeat on a motion to exclude Senators holding office under Government from receiving any salary during the session ; the motion was opposed by the Ministry, but carried against them by a large majority. The provinces are in a state of complete tranquillity, and notwithstanding the late division, party feeling is said to have considerably sab sided in the Cortes.-In Portugal, another Ministerial crisis has occurred on certain questions of Finance, and on the continuance of the newly-organised militia. In consequence of the opposition to both these measures, Ministers had tendered their resignations, but from the difficulty of forming a new administration, a recomposition of the existing Cabinet was expected. The recognition of Donna Maria by the Pope, and the arrange ment of the differences between Portugll and the Iloly See, had given general satisfaction. - Tine I'rovincial Liet of the Rhenish provinces of Prussia was opened on the 23rd. - The Prussian Governmeut has disapproved of the measures of Austria in regard to the \(S_{\text {wiss }}\) Convents, and the Canton of Argau has issued a circular to the othe cantons with the riew of bringing the question so long at issue to an equitable conclusion. - From Italy we learn that in consequence of the recent proceedings of the Spanish Goverament in regard to the clergy, the Pope has threatened a bull of excommunteation argaiust spain. The negotiations at Naples on the sulphur Question are proceeding satisfacturiy, and a treaty of commerce on terms advantageons to this country is in progress of completion.The particulars of the concessions granted to the Pacha of Egypt by the Porte have been approved of by the Allied Powers ; they settle the hereditary succession in the family of the Pacha, and leave the revenue of Egypt to his entire control, sulject to the payment of tribate ; the appointment of officers under the rank of colonel is also conceded. In the event of thes terms being refused by the Pacha, hostilities, it is said, will be immediatoly renewed. - The insurrection in the Turkish provinces, and in Candia, stifl continues, and is daily becoming more alarming; it is said to be the re sult of an extensive conspiracy in all the European pro vinces of Turkey, which broke out prematarely before the plans of the insurgents were fully organised. -The arrival of the Britannia steam-ship, respecting which much anxiety has prevailed during the week, has supplied us with recent intelligence from New York; the trial of Mr. M'Leod commenced on the 17 th ult., and was expected to con tinue for several days ; the ground of the defence wras, that Mr. M'Leod acted as a public servant, and that his conduet was entirely approved by the Britist Government. The next arrival will most probably give us the result of the trial. At Home, the proceedings of the House of Commons, and the arrangements for a general clection, bave completely occupied public attention. On Monday Lord John Russell moved the order of the day for the committee of mupply, and stated that in consequence of the recent rote on Sir Robert Peel's resolution, Govermment intended to abandon, for this session, their proposed committee on the Cornilaws ; and that as it was necessary for the country to decide, by the result of a general election, the important questions now pending, Ministers wond bring the present session to a close as speedily as possible, and summon the new Parliament without diliy. On Tnesiday, the House resolved, without a divistion, that the Attorney-General showld be directed to prossecate Dr. Webster, of St. Alban's, for alleged brioery at the latelection; and leave and. On Wednesday, in the division on the first clause of the Administration of Justice Biil. Minthere were left in a minority, and the bill was const, den'ly prstpored fur three moaths. On Thursiay the motion for an Idduress to the Crown on the Danish cldims was asreed to by a majority of 11 ; and certain cimaes in the Fribery at Elections Bill were passed. - In the debre af hat night, it was resolved to yroscente the agents of Mr. Manners Sutton for bribery at the hat Cambrifge Election. In the Lords, after an animated di-cussion, the Jews \({ }^{+}\)Declaration Bill, which stood for the third reading, was rejected by a majority of 34 .

White retires, and will be succeeded by Mr. Barclay in the Liberal interest.-Somerset (West). Mr. Sandiord, it is stated, will retive; Mr. Dickinson and Mr. Ackland are the Conservative candidates.- Wallingwill be opposed by Mr. Teed, Radical. - Wiltshire. Lord Shalburne will come forward on the Liberal interest. Wigtrumohire Burgho. Col. Agnew, of Sheurhan, has stated his intention to contest the burghs against Mr. M•Taggart.- Fork. Mr. Barkley, the Radical candidute, it is said, retires, Youghal. Mr. J. Keily, jun., of Strancally, is announced as the Conservative candidate.
Camada ara Cl/ina. - The estimate of the further amount that will probably be required to defray the expenses of the service in Canada, consequent upon the late insurrection, amounts to \(108,109 \%\); and the estimate of the suns required to be voted this year, on account of the experses of the expedition to China, to \(400,000 \%\).
Pout-ofice Money Orders.-A new regulation has just been adopted at the Post-Office, with reference to money orders, which will be the means of saving the public a great deal or unhecessary trouble and inconvenience. cormeris no one could receive the money but the person Who was named to the Postmaster at the place where the attendance is inconverient, if the party who presents the order can afford "fuil information as to the Christian name, surname, address, and occupation of the person who originally obtained the order," the money will be imme.
diatels paid by the postmaster to whom it is addressed but not until these conditions are strictly complied with.

\section*{forcígn.}

France.-The Recruiting Bill.-The ministry experienced a defeat in the Chamber of Peers on Friday, ing Marshal Soult adjured the the army; notwithstand out modification; lecause. he said, the other chamber having virtually closed its sittings for the sussion, the bill would be lost if in any respect altered. The proposed of the quota required from each denartment but it wiong nevertheless, to postpone the entire bill, and, with it, the nevertheless, to postpone the entire hill, and, with it, the The amendment however proposed by General D'Am. brugeas was pressed and carried, it having been observed during the debate, that unless the chamber exercised some power when it saw reason, it might be dispensed with altogether. In consequence of this defeat It was reported and very generally believed, that Marshat that in thants raignation on Satmrday. It seeci: with sud ler illaess and wis innmed t, his bed on Saturday. He was particularly indiynmet, it is stated, at the for General D'Ambrugeas's amendment, Subsequce. intelligence informs us that through the influerve of the court, the anger of Marshal Sonlt has been appeased, an that his son the Marquis of Dalmatia is to proceed as
amaseador to Rome. The cobinet had not yet determined Whetior it wil? re-issentibe the dyuties to cunsider the bul anweded br the Peers. The Government, it is stated, thought itsiff si sure that the bill would be adopted without zmeadmens by the Chamber of Peers. that order had already been given either for the formation of the re men composing the contingent of 80,000 , placed at the disposal of the Minister of War by the last lav.

Algeria. A telegraphic despatch states that General
Bugeaud's column was ou the 22nd withia a Bugeaud's culumn was ou the 23nd withia a day's
march of Tagedempt. Two silishat affars had tahen place; the people in the meighbourhend of Catet being no longe repressed by the presence of Aod-ti-Kader, had supplied the Fremeld at Mustag man with men and lorses. Algers and the neighisurhoorl were quire tranquil. The opposition Journals call on M. Guizot to contradict or disavow the language imputed to the French Government by the English papers regarding Algeria; but the session of the Chamber being virtually over, no opportunity would present itself for reviving the subject in the tribunes, so that the matter would, it was expected, remain just whers it was.
urther Seizure of Journals.-Two more newspapers The Journals are much occupied with the affair of Didier, noticed in our last number, and much quarrelling conthat have been officially denied, but steadily repeated, of an intention to take poitical trials out juries, or in some way to modify the privileges of that institution

The Fel.-A telegraphic despatch from Toulon announces that the squadron, consisting of eight ships of Hyeres, on the frigate, returued to that harbour from a frigate and corvette sailed from Brest on the 3d inst., the former for Toulon, and the latter for the China seas.
Freuch Fisheries.-The papers contain some curio details relative to the Cod-fisheries of France. It appears that there are 100 vessels employed in that branch of in-
dustry, measuring 50,010 ) tons and manned by \(11.0 \times 10\) first-rate seamen ; and that in \(1: 93\) the mercantile navy of France was more considerable than at the present day. At the former period the seamen empluyed in it amounted oni 0,00, whereas at the present time they were only 98,0 ,
The Phenix and Britamia.-The Roval Court of Rouen pronounced on the lst inst. its judgment in the affair of these steamers, the particulars of which have
already appeared in this paper. The court, in confornity
 the judgment of the tribunal of Havre, which condemned the English company to 700,000 f. damages in favour of the French company
Another Infernal Machine.-On Wednesday night an Englishman, who came, it is stated, by the Magnet from London, was arrested at Boulogne, for having an infernal machine in his possession. It had 15 barrels, and was so constructed that they would all go off at once. He was The Procureur du Roi. All that is known of the reault is that the prisoner gives his name as Israel Levy Lillicrap, and declares that he is a gunsmith of Bridgewater, and came over with the machine and pistol, of which he is the inventor, with the intention of going to Paris to offer it to the French Government. He is about 25 years old, bears the appearance of a workman, and when detained had no ron plate shout threeor for inches long by about two inches broad. The barrels are very short, and may be concealed under a cloak or full coat. They are arranged as to fire in a semicircle. The barrels of the pistol are fixed by twos, one above the other, and may be distill in progress
SPMN.-The young Queen's health has again become unsettled. There had been two consultations of physicians on the subject. It is said that the ordinary physicians of Her Majesty had declared that a new excursion to Her Majesty's health. The Regent had accordingly directed comaittee of four doctors to consult together, and decide on the best course to be pursued. They agreed that He Majesty might safely remain in Mailrid, and that shir sen a take this suider arkid excitement ahich preceded the appointment of the Regent and Gonzales Cabinet, some dars of comparative caln had succeeded. The provincial correspondence from every part of the country represents the population as in a stat party had much subsided, and Mivisters, so far, were receiving a fair trial. It was expected that Señor Olozaga would commence operations as leader of the opposition on the question of the guardianship of the Queen. Account from Carthagena state that another smugging vessed Ther English colours, had been captured by acoa to goo board. These ecounts add that if Englishin ressels-of-wit should present themselves to rescue the smuggler, they wil not this time succeed so easily as on the former occasion vigorously, should ther again dare to undertake such a enterprise - At the siting of the Depaties on the 1st inst. the Crovernment gave some explavations in respect to the affair of Carthagena, in which England is concerned, and Spanish territory, in which France is implicated. Tur Minisier for Euatiga Affairs assured the Deputies that not oaly had the Matria Cabinet received sonne Eatisacta fur tha Carthagena insult to spuia, Lut that it ex, papish territors the Ministar wha evacire, declaring thast nation indepondence of existing treaties sho:1d be respected, but hiating tiat the Freaca Guvemment was no party to tioer infraction complained of. The Ministry being furtion Interior repeated that the Ministers would act as became
good and loyal Spaniards. Subsequent intelligence inChambers. In spite of their opposition to it, the Cortes
have adopted, by 82 against 52 , the project of the comhave adopted, by 82 against 52 , the project of the com-
mission, to the effect that Senators holding situations mission, to the effect that senators holding situations
under Government shall not receive any salary during the session. The Council of Regency and the guardians
appointed by Ferdinand's will, in case of any unforeseen appointed by Ferdinand's will, in case of any unforeseen
erent to the Queen-Mother, have pat in their claim to erent to the Queen-Mother, ha
the guardianship of the Queen.
the guardianship of the Queen. at Lisbon, brought about, as it appears, partly by the
difference between ministers and mome of their usual supporters in the Cortes, on the question as to the temporary continuance of the newly-urganised battations of militia, national guards. The ministers themselves, it seems, fresh debates on the re-opening of the Cortes, on which the Opposition was finally defeated by forts-fire votes sgainst thirty-eight. But another question had arisen of a more serious character, in consequence of the Finance Minister having refused to agree to certain projects of the Special Finance Committee, one of which, the proposel to capitalise the arrears of salaries, pensions, \&cc. into a stock bearing interest, had created great alarm among the
banking and monied interest at Lisbon. The bank had conferred with the government on the subject, and had threatened to close its doors unless the scheme of the
committee was repudiated by the ministers, and had already stopped the usual discounts it was in the habit of affording to persons having orders for pay, isc. The difficulties occasioned by this state of things, coinciding with talions, led ministers to tender their resignations on the 28th. The Queen sent for the Duke of Palmella, who had not been able to effect much up to the date of the sition of the Cabinet from the same party a re-comporesult, and that some of the present ministers would still form part of the administration. -The intelligence of the Pope having recognised Donna Maria, and given a formal great satisfaction at the court of Lisbon; but in consequence of Portagal is concerned some further nerotiation crown of sidered necessary before a nuncio from Rome could be received at Lisbon. The Spanish minister was said to be highly dissatisfied at the prospect of a speedy reconciliation between Portagal and the Pope, and the recognition
by the latter of Donna Maria at the present moment.-Up to the tume of the packet's leaving Lisbon, on the 31st from the commander of the Espoir, neither had the government from the commanders of either of their vessels, as to the result of their cruize off the western Islands, in search of a steamer which it was hoped might
have been the missing President, and which we referred to in our last number.

Germany.-The provincial Diet of the Rhenish provinces was opened, with the usual ceremonies, on the
23 rd ult., at Dusseldorf: and the metting, it is stated, under present circumstances, is looked forward to with more than common interest. The royal message contains the same proposals which were made to the other diets.
The clauses respecting an intended reduction of taxation in 1813 acquires in this instance more precision than on the former occasions, inasmuch as the budget for the present year having already been published and approved by the king some meeks before the assembling of the Rhenish of the representatives of the people as superfluous in matters of finance. At the commencement of the session, the Diet, finding that the royal commissary qualified the concession (sabictioned by eren the late hing's authority) to was published prockedings, by the demand that whatever proval, declared itself unable to conprehend the compathe restr the result was a furmal protest of the Diet against such proposals.-The discussions in the journals, with reference to the Iate treaty between Great Britain and the
Prussian league, continued to excite much interest. The treaty having been ratified, the objections to it appear to be of little practical moment, but they are important as showing the temper of the public mind in Germany.-Accounts from Hungary. under date 24th ult., state that the Bishop of firasswardien, who was the first to address a pastoral letter against mixed marriages, had resigned his docese, and retired into a Pranciscan convent, in consequence of the government having addressed remon* mee had not yet accepted his resignation. has not liklakn- - It is stated that the Prussian cabinet government in Pressian ministry has bamed the conventse and that the chatel deputation in this mater, and also the extradition of Borel.- The gurerument of Argau has addressed to the Cantons a circular relative to the convents. It states that in case the liet persists in the resolution which it had adnpt.a, Aryuz lesires that the question may be
again suisnictel to its examination, in order that the again suimnitted to its examination, in order that the
grand councl mig.t see if it were possible to reconcile opposing interests without so deceply compromising the prosperity of the canton.
RessiA.-A atatistical accoumt of the Jews in thin em-
pire has lately been published at St. Peterbhurgh. It appars from it that the number ravidiag by permision fan
the \(1 \%\) governments is \(1,0,4,349\), including both sexes.
In Volhynia they are most numerous, constituting a 1.3 th part of the whole population. In Poland the greater number is in Warsaw, of which the Jerrs form one-fourth of the inbabitants: and, indeed, in both Russia and Poland
they are greatly more numerous in the towns than in the they are greatly more numerous in the towns than in the
country places. In 1837 the total number of Israelites in country places. In \(183 \%\) the total number of Is ratites in
Poland was \(411,30^{-}\), of whom \(330,66^{\circ}\) lived in the towns, and 72,630 in the country.
Swedin.-Accounts from Stock holm inform us that the King dissolved the secret committee on the 19th ult. bers were released from their oath of secrecy, and were at liberty to promulgate what they had heard or read in comhis Majesty's words, which were delivered in French, into Swedish.
Italy.-Private letters from Rome state that the late persecutions of the clergy in Spain, and the answer to the Pope's allocution, have created great excitement there. It nesa will issue a bull of excommonication against Spain. The exiled Bishop of Pampeluna, it is expected, will come The exiled Bishop of Pampeluna, it is expected, will come lowance naid to Don Miguel one-third, and has recognised Donna Maria as Queen of Portagal.-Accounts from Na ples, under date May 23rd, state that the Hon. Mr. Temple was occupied in bringing the treaty of commerce be tween England and Naples to a conclusion. It is said that
by the terms of this treaty vessels under the British flag will obtain an adrantage of 10 per cent. in the entrance duties over the most favoured nations in ail the ports of the kingdom of Naples. - In the night of the 15th a large most freque rock above the Rue Chiatamone, one of the with a tremendous crush. Fortunately it harpened in the might, or many lives, it is thought, would have been sacrificed.
Greece.-Private letters from Athens, dated the 2nth ult., announce the return to that capital of the King, Queen, and Prince Maximilian of Bavaria. The insurgents of candia, from their brethren in Greece, and scarcely a night passed without some 40 or 50 volunteers sailing from the Pireus for Candia or Mount Atlos. Desertion had likewise set in among the troops, and a few nights before an entire company was prevented from embarking for the money had been procured to arm and equip the 5,000 men who had left Greece for the theatre of the insurre tion. The Candiots, it is said, had lately received 5,000 stand of arms and 400 barrels of gunpowder from Marseilles

Turiey.-The Porte, it is stated, has at length agreed, by the adrice of the Four Powers, to make some further modineation in the threc conditions of the origimat niman, concessions has been detimtively tixed, it is said, by the parties to the Cunvention of the listh July. 1. The heredtary succession to the Pashalic of Egrpt is settled in the family of Mehemet Ali, according to the laws of succession established in Manommedan countries, and the Sul tan gives up the right he claimed to interfere in the choice of a successor. 9 . The power which the Sultan accorded
to Mehemet Ali of nomintiting only the subaltern officers of the Pashatic is now enlarged, and be will be allowed to appoint all officers sinder the rank of colonel. Officers of a higher rank still remain in the nomination of the Sultan. 3. The sultan waives all right to con* rol the revenue of Egypt, which is left entirely at the disposal of the Pasha, and some ciminution is also to be allowed in the tribute demanded by the Porte; but whether it will Le as sessed at a certain fixed sum, or a certain proportion amount be set apart for it, which of course will vary in determined. Such it is maid ises, is a question to be of fered by the Sultan and his allies to the Pasla of Egypt, refusal of which will immediately be followed by the re newal of hostilities, in which the Porte, as formerly, will be aided and abetted by the arms of the European Powers.-According to letters from Belgrade of the 11th alt. 1,500 Albanians made, on the 2d, an attack upon the Christians whe had taken refuge in the mountains, but were repulsed with the loas of 1,100 of their number. Ac counts of the 20 th ult. state that the Albanians continued height. The Porte had, it is said, offered its thanks to the Servian govemment for its humanity in favour of the Christian refugees from Bnlgaria, and had placed at the disprosal of Prince Michael a sum of money for their relief. Private letters from Constantinople of a subsequent date inform us that the news from the provinces tionary ming every day more alarmingo to be the result of an extensive conspiracy in all the Turkish Eurepean provinces, which prematurely declared itself in consequence of the acts of violence committed by the Albanians at Nissa. Tranquillity was far from being re-established. Albanian deserters continued to overrua the neighbourhood of ioustchouk, committing the greatest excesses. The lation, compisting of Christians, Tarks, and Jews, immediately went over to the Russian territory, where they were provided with moner and promited ercinption from tare for ten years.
Thanda.-We have news from this island up to the tth inst. No steps had yet been taken by the Pasia to attuck the incurgents, who amounted to, 600 armed men, had estublished a govermant of their own. The Corsuls
of the Foreign Powers, it is said, intimated to the Pasha on the 2nth ult., that they left him to act as l.e thought elaring that their respective governments could not sanction or give countenance to the proceedings of the disatfiected. It appeared to be a prevatling opinion that the Pasha would not attack the rebels until lie receired assistance in troops from Constantinople. 2, (16) Abranions were daily expected from Volos. On the 28th a brig, fag unknown (reported and generally believed to be Ionian), bringing arms, ammunition, \&c. for the insurgents. It was supposed that her cargo was shipped in Greece, and she was allowed to discharge it without any obstacle having been thrown in her way. The insurgents have ad France, and Russia, through the Consuls. The French Consul returned the one addressed to his government; the others, it is supposed, have been forwarded. The provirequesting himent has also applied to the King of Greec cipal cthat Candia may be relieved from Turkish despotism. of the pracket-ship Slephen Whitney, New York papers from the l0th to the 15th ult, inclusive. The news thus brought is not of importance. The papers contain a long examination at the British Consal's office, in New York, of the captain and crew of the British bark Recovery, relative to the statement made by Captain Bowman, that he had fallen in with the wreck of a stip which was considered to be the steam-ship President; the evidence, however, in no manner whatever confirms that opinion.By the arrival of the steam ship Bridannia at Liverpool on Winesday afternoob, we received additional new This steamer, respecting whose safety some alarm was left in consequence of her being overdue ten days, firb in leaving the latter port she went aground on a sandbank, being at the time in charge of a pilot, and, although she Wes got off withont sustrining any damage, it was deemed necessary as a precsation to return to Halifas, and she was thence sent to St. John's to be overbauled, but found not the have sustained the least damage. Sae saited thence on the e9th ult., which is the explanation of the delay in her anival here.-Mr. Mi Leod s case, which was to have been heard on the 15 th, had been postponed by the Judges, on application by the Attorney-General of the district, who which gaged upon a leogthened trial for mannughter jury would, it was supposed, extend to thee Joth. The the 14th; but as the application for postnonement hail already been agreed ti), Mr. M•Leod's case stood for the ments commenced on the other business. The argueluded on the 24)th, when the Court rose. The reports are too lung for insertion. The arguments in the case wre not likely to be finally concluded for some days. The ground of defence of \(\mathrm{M} \cdot\) Leod was, that lirs act nas the act of a public servant. Anoug the documents read was a li.ter from Mr. Fox to Mr. Webster, dited March directel directed by his Government to make known to the lio vernment of the Cnited states, ltat the British Gorern ment entirely approved of the course pursurd by Mr M.Leod in the atfair of the Caroline, and demands his inmediate release, on the ground that the transaction was of a public character. Mr. Seward, the governor of the state of Aew lork, hau sent to the louse of Assembly a commmication, transmitring coplies of ail the correspond ence which liad taken pla:s between the expecative deUnited States concerning Ilexander M•Leod. The communication states. in substance, that no arrangement whaterer of any hind, or for any purpuse, had been en tered into by that dipartmeat with the extulutive of the partm States concerning that individual: that the de partment had no ko lhe of proca sag taken in the prisoned case, the his way to New York: that the Attomey-General was thereupon immeriately instructed to resist the motion for the discharge of the prisoner; and at the same tiane the President of the United Sunts was respectivly informed, that the appearnce of he District Altorey the Unted States as counsel for the prisoner was deemed icogruous with his duties, and injuriuus to the state or New lork: and the Assembly is assured, thast uniter no circumstances will any arrangement or proceeding be endepartment, the effect of which might be to conapromise in the least degree the rights, honour, or dignity of the state.

Monday.

Mr. O'Coxsell said the whole was a gross falsehood. There
was only smal property, which he held under the Colilege, on
which his rents became peyable in March; on all his other lands Thich his rents became payable in March; on a
the rents were paazle in Stay and vacemter.
The teet The thet' is the Pace for the contit? of Hertfort was called

 - Nithe c.mes-ation fillowed after the witness had withdrawn;
but thip remplt was, that un the motion of Mr. T. Duncombe, the with a copy of the document. Lord J. Russ mit then moved the order of the day for the com-
mittee) sip, alanden, if this wescin, their proposed committee on the Corm-
laws. He ami his colleazes. he said, were of opinion that it w-uld ant he warsantaiste in them to move that committee as
 did not feel the alleged danger of discel-ion, whien the debate
was to be in that assembly. He then cave an outline of the
 surgestion thruwn out by sir R. Peel., that the Ministers had had Ww budpets, he protected that this was sint the fact, and thrat the
budget actually produced wast the ame which hat all along been contemplated. The course which Governme of King William: they would take their estimates only for six late division he felt that in this House of Commons the present
Government conld hope for no further majorities; it was clear that the country itself must decide the important questions now pending. Ministers therefore would make no forn of the country should have been ascertained as to the future progress of those great measures.
Sir R. Pges said, that after Lord John's denial of the double
budget he felt bound to place, and did place, implicit confidence in the assurance that no such device had been practised. As to Lerd, in the speech he hat just mate, should have confined himself to one of two courses. He was entitled to abandon that mo.
tion, or to open it to the House; but he was not entitled to do both-not to withdraw the motion, and yet to state his main the reasons on the other side; but that could not be done without provoting the very discussion which it had been agreed to wave.
He was the more ready to forbear, because Lord John's assigned reasons had not carried much impression ; and those reasons
which the noble Lord had kept behind were, of course, not likely which the noble Lord had kept behind were, of course, not likely
to be stronger than those which he had brought forward. It was to be inferred from what had been said that Ministers intended an mmedaate dissolution. On that he would now give no opich pealing to the people under an excitement respecting the cornwere bound to exercive it with the least possible delay. A Parits days to be registered; and the peculiar position of the Ministry, since the late vorte, imposed an additional obligation on them
to rear to the sense of the people at once. He should oppose no obstacle on the subject of the supplies. But it was further requisite that as soon as possible the new Parliament should be con-
roked; not only by reason of the unsettled state in which all commercial business, especially the fimport trade in corm, was lef by the newly-proposed measures, but still more with reference to the condition of the Executive Government, which was
now recorded as being nn longer in possession of the confidence now recorded as teing nn ionser in possession of the contidence nience ought to interfere. Precedent was all in fawour of what he arged. Mr. Pitt, who dissolvel an adverse Parriament in 1,34, 1907 , and the same thing in \(1=31\). The contutry, therefore, had a right expect the inmen ate re-assemblage of the Legg:slatare
 oly declare that Ministers intented to advise the -peeity conmotion of the new Parliament. There was mothing, he thonght, unthe dissolution in suct- has expressed an intention to assemble made on the death of (xeorge 111 , a and again in 1431 . But wherher Lhoud fohn would make tuls declaration or not, he Sir R. Peell though he wolld not oppose any obstacile to immediate dissoluParliament. Lord J. Russble replied, that though he did not generally deem be prepared to offer to the Crown, he had no objection to declare their intentions upon this occasion, which were to advise that the present session sheule be wound up as speedily as possible, and
that the new Parilament should be summened without delay. Mr. the same position as the slavery question was in the I Inited States of America, where all discossion of the subject was suppressed
by the Congress. He was glad, however, that the House had by the Congress. He was giad, havever, hat the House had
taken a bold course. It would awake the people to a sense of theirn weakness, and forth all their energies.-Mr. WAILIT hoped that the general election would not give a raling majority to either of the two great parties, but that the people would send to the House mexabers like himself, of the country. He shonld not be sorry to see a huw parmaneat every ycar, and a new administration
every moumb, anti, the neecessities of the cuantry were attended to. Many had spoken against the new Poor-iaw Bill on the hustings, and yet roted for it in the House ; he should take note of all who spoke against the law at the ensuing elections, and
watch their conduct afterwarts. Mr. Laboccurre repeated the denial of Sir r. Peel's charge
 the sugar sutes, : retaiwothee wothout uissometion. He assuren
 by creating uncertainty and premature speculation in all the
braches of commerce connected with those articles. However, with respect both to the timber and to the corn questions, it was
no norelty that Goverament in general had long been disposed to adrance the primiples which they put forward in this budget of their disposition to freedom of trade; so little ground was On many other kindred subjects of commerce also the Board of

 ment, he thought, would be a state of conftict to which all former factions would be as nothing; and undonbtedly it was the duty
of Ministers to interpose apoun matters of so great and extensive of Ministers to interpose apour matters of so great and extensive
but that, under the circumstances of the time, he should defer
his objections not doubting that he should be again at that table
in another Parliament, when he hoped to support the Ministry of

 and tained and defended his own former statements,-Mr. MRER ments. - Mr. Hi nis said the defeiency in the revenue had arisen

 and "plander" were not too strong when ayplied to the (1rn-
laws, and thene words he fould unhesitatingly use during thy coming election. They had had a long debate, ostensibly on a
great constitutional question, but, in reality, for the mere ppuppose
of stifing the debate on the Come laws. The Honse then
 maining orders of the day were disposed of. Thestlat. - Five private tills were forwarded in their respective
stages, ainl more than an hour was occupied in the prewent of petitions, principally hor the subject of the Com-laws.-The be printed. - In answer to a questiom by Mr. Mackinn ordered to bill founded on the report of the commissioners of inquiry into the consolidation of tumpike trosts, but not to proceed with it
beyond a second reading in the present session. The Chavcelor or the Excheaver stated
question by Mr. G. Palmer on the preceding evening, that the anti-Corn-law petition alleged to have been exposed tor siguature
on the premises of the Excisc-office in the city, had in fact been exhibited in that portion of them appropriated to the use of the merchants -ince the Roval Exchange had been burnt down. The
Excise anthrities had not had any cognizanice of the matter. Mr. Pumer replied that the petition was placed on a table at
the top of the steps leading from the temporary Exchanace to the Excise yard, and that the (iresham committee, of which he was vidual Members an no authority to place it there.- Some indiment, signified their intention of abandeming several bulls now
before the fouse the Ecclesia,tical Commissioners Bill, the New south Walk- Bill, the Wetern Australian Bill, and the Bribery at Elections Biil
The Clerk of the Peace for the county of Ilertford tmade second appearance at the bar, and delivered a copy of the resister session, and the only one from which lists could be furnished to copy should be laid on the tahle on Thursday.

The Census.-Mondsy being the day appointed, under the provisions of the Population Act, for taking a census of the number of individuals who slept in the respective houses in each parish thronghout Encland and Wales on Gundar nicht, the enumerators appointed by the commissioners under the act were from an early hour of the morning until surset busily engaged in collecting the honseholders' schedule papers, and in entering them in a book, called "the enumerators schedule," with Which
they were each provided. Each parish was divided into numerous districts, uader the surerintendence of the registrars of births and deaths, by whom the returns will be made to the superintendent registrars of the respectite divisions of the country, and by them to the RegistrarGeneral. In most of the parishes in and round the metro polis, it seems, very little difficulty was experienced in obtaining the proper returne. With the exception of certain it was deemed necessary that the enumerators shouid be accompanied by a policeman. The police not on duty
during Sunday night have been entered in the proper householders' schedule, and a return of those on duty has been furnished by the respective superintendents. In addition to the above returns, each enumerator is required to give sin scoont of any persous within his district who may, on the night in question, have slept "in barges, boats, or other small vessels, remaining stationary on canais or other inland navigable waters; iu mines or pits. in barns, sheds, or the like; in tents or in the open air. They are also required to state if any temporary inflex of persons has taken place into the district, or any temporary departure of persons from it, stating the supposed canse, consists, and likewise the number of persons known to have emigrated from the district to the colonies, or to foreign countries, since Dcc. 31, 1840. To complete hese returns the enumerators have heen allinta not being required to send in their schedules before Mon day next, 50 that at least a fornight must necessarily increase in the population during the last ten years can be ascertained.

Mortality in the Melropolis.-The number of deaths registered in the week ending May 29, was-males, 426
females, 407 . Weekly average, 1838-9-40: males, 475 females, 45

Welsh Church for the Metropolis. - A meeting of noblemen and gentlemen connected with the Principality Tavern, for the parpose of opening a subscription to defray the expense of erecting a church in the metropolis for the Earl Powi havigg been called to the chair said that meeting lad been convened in porsuance of a realution adopted the preceding weel by a few gentlemen connected with the principality, who met at his house, to consider in what way they might obtain for their poor countrymen, rettled in the metropolis, a suitable place of religious wor ship, in which the native language should be ased, but adhering in all other respects to the forms of the Esta-
blished Church. The want of a Wel-h chorch le blished Church. The want of a Wel-h chinch, he said, had been long felt in the metropolis. He had the satisfaction to intorm the meeting that it had met with the hearty concurrence of the Bishop of Loadon, and, from the well-known zeal of that distinguished prelate, he wruld prove a valuable slly in furthering the object. -The Bishop resolutin moved, and Lord Kenyon seconded, the first erected in the metropolis for the celcbration of divine serrice according to the form of the (hurrh of Findand in he welsh language. The hishop of St. David's, the Dean of St. Asaph, Colonel Wood, M.P., and Viscoun was appointed to collect subscriptions, and carry into effect the purposes of the meeting. Regen's Park, - Among the measures contemplated for making the interior of the Regent's-park accessuble to the public on att sides, a plath is suid to have been devised for erossint what is termed "The ornamental mater,"
opposite Hanover-wa'e, by means of two suspunion bidges, to be exccuted upon a simall acale, and uma the principle of Mr. Dredge of Bath, whith is stated to com bine, with great ec.nomy of material and expense, all the ightness and strength desirable in such a structure.
Mutiny of a Fleet of Steamers.-On Sunday morning novel mutiny took place on the river off Lambeth. When the time arrived for the iron steamers to get under weigh, previously to commencing business for the day, the funnels and engineers, all went on shore, learing the vessels without any one on board. It appears that the people who arigate the duty during the late fine weather without any increase ut passages would be continued during the summer months. The rcen asked for an increase of wages, which was refused. In consequence of this refusal, a meeting was held by the men on Saturday night, and it was unanimonsly resulved to mutiny on the following morning and leave the steamers. When the fact became knowa to the directors, they were alarmed, and the mates were applied to, and requested to take charge of the steamers, but they refused. Fhreats and entreaties were of no avail; all hands declined to navigate the vessels until their dimands were complied with, and the directors at last were obliged to give way. The President.-On Wediesday evening thecaptannof the Waterford and Bristol packet, Orprey, arrived at Bray, at bout eight leagnes N. W, and by N. or about mid-channel between the Smalls and Saltese, a large steamer, which looked to be between marts a: hiat as the Osprey (a large Irish trader). but had lost hoth her mainmist and funn was standing N.N. W., and, 7 far as he cmat at and

 any passenger where be stood. He, however, heard from oe of the sailors that he board. The steamer appeared to be about f.ur miles and walf from the Ovprey. He thouglit that she must have tress. Her intention, he considered, was probably to have reached Milford, but finding sle could not gain that porf, land. Upon examining the chart and comparing her Course with it, he was of opinion that she could not reach
could fetch Cork. Vothing, however, has since transpired
on the sulject. The arrival of tue Britannia at Liverpool on the subject. The arrivalof tise Britannau at Liverpuol on Wedne dirnt suppused. It is thought by some that it may be one of two steamers lately built in Bremen, known to bet on their way to one of the northern ports to receive their
machinery. The captain of the Fortitude persists in the statement made by him as to the steam-ship he reported to have discovered on approaching the coast, and which we gave an account of in our last Number, remarking, that he can hardly be so ignorant of nautical matters as not to know the difference between a boat of 350 (the size of the London, supposed to be the ship in question), on the Lords of the Admiralty in the course of Tharsday, ta recommend that asteamer should be directly sent in quest of the dissbled vessel so frequently met with. This, it will plied with : and a steamer has since been despatchel from Plymouth.

Church Rases.-On Thursday a pablic vestry, numerously attended, took place in Whitechapel church, for the
purpose of making a church-rate to meet the current expurpose of the churchwardens. The chairman said that they would require a rate of 3 d . in the pound, and he Mr. Ritcls proposed an amendment, to the effect that only a penny rate should be made. Mr. Geo. Offer, whose right to speak or vote at the restry was objected to, segave it as his opinina that Mr. Offer had no legal right to said that they were not assembled for the purpose of discussing points of law, but to make a church-rate; and in his opinion Mr. Offer had a perfect right beth to be present and to give his vote, and he would advise him to
exercise that right by votiog. Mr. Coates then made a long speech against the enforcement of church.rates, which, howerer, he admitted, had the law in their favour; but the days of the dominant charch, he thought, were numbered; violated the felings of which could not much longer be maintained. He concluded by supporting the amendment. A poll having been demanded, the numbers were declared as follows: for the penny rate, 170 ; and for the threepenny rate, 128 ; giving a majority for the former of 42.
Suspeoted Murder at Diptford.-On Tuesday morning a womnn, whinse name is not known, was found in the upper romm of a house at Deptford, with her throat cut. It appears that deceased had accompanied a man of the name of Jucobs to the house in questiun about one o'clock on Tuesday mamrai:s, and he stated that he had met de before that time; that 1 razor was on the floor, and he was awoke by hearing dece.ased struggle, and on looking round he found deceased's throat was cut. He furtber stated that he hal never suen the razor beture; but it was stated bor fuund beurs a strony resemblance to one he was in the habitof using. Jucobs has been taken iato custody, and an inqueat ou the body was held on Thursday, butad journed for further evidence. It was resumed yesterday of "Temporary Insanity," being satisfied that it was her
Mortalify among the Wootwich Convicts.-On Saturday, an inquest was held at Wonlwich on the bodies of board the hospital-silip. Dr. Hope said, that every possible attention and handness had been pand to them during the time they were under his charge. Their deaths were the chest. Their bodits prasined an appearance of great emaciatinn. The Coroner swmmed up, and the jury re turnad in each case verdicts of " Natural death.
S.ci-ithes.-1)o M nday aternoon, a respectahiy-dressed man appmed to one of the chutelwaritens of St. Luke Chelsea, for fermission to assend the tower of the new church, stathag that ais notive in asing the fivour was to enable han to take a sketeh of H estminster . Wbbey.
Permassion was without hesitation granted, and be ment up the steeple to the summat, accoropauied by the bell ringer. Alsw, it four o ciock a polweman observed a person on the top of the tower preparing to precipitate himself to the ground, and in a few seconets he threw himself of Sereral persons were immediateiy on tive spot, but iffe
was quife extinct. The height of the tower is nearly \(2(011\) feet. Au knquest was beld on the boly on Turshlay, when it appeared that decesed was Mr. Themas Ligyi aged
 charch tep peed that he accompanies deveascul. at his re quest, to the top of the cower; on arriving there decensed immediately ex caimed, " 1 hh, what a saastiol vaew!" and asked if the coud see Westainoter Ahbey frim there. Witness told him he could very plainiy, and went owards thie east side, while deceased wens to the western part of that he might see the presenty callad dertased, saying he did so he lizard avoiee behiad jim say, "lt'stall sver;" and on loosing round he just san the end of decaased's c. Whes goinz arer the sereen between the pinnacles of the tonur. id person tsas ai the top of the tower bus deineanity. - W. J. Jines deposed tiat he had havipn de ceased four os tive years. For the last ten years, and up to the lazt three menths, decensed had been reading at Leamington. Lrat saw him alive on Mondny evening at
excited, and said he had left a good business at Leaming-
ton for an uncertaints in town. Thought for the last 12 monthis that dereased had not been in a sane state. II was not all embarrassed in his circumstances, beins worth several thousand pounds, and be believed it was a fear, from affection for bis wife and family, that be might Several other gentlemen offered their testimony to the same effect, bur the Coroner said there was no oceasion to prolong the inquiry by such evidence, as it was perfectly evident deceased was not in a sane state of mind. If wis not his own, and that he had been thrown off the charch tower, he would hear any number of witnesses they might wish to call. praceeded
ightingale-lane, Walthamstow, to take him into custody on a warrant which had been placed in his hands, and for ill-using her. Toll, upon opening the door for the serjeant, observed he knew what he was coming about,
and said he woald accompany him. He then entered the and said he would accompany him. He then entered the
front parlour, for the purpose, as the serjeant thought, of dressing himself, while the constable remained at the front seeing him rush ont with his throat cut, and the blood gushing from the wound. He died in a few seconds after. Deceased, it appeared, had been before the Magistrates held to bail for 12 months, found much difficulty in obtaining the required sureties.

Fire. - Aboat four o'clock on Tuesday morning, an completely destroyed it, and was attended by the loss of completely destroyed it, and was attenced by the loss of a very great sensation, from the circumstance that this the third time that theatre has been destroged by fire, and each time attended by the lois of life. It appears that the fire was first discovered by a policeman, who states that while he was walking down Stangate-street he imagined which is just above the stage. He went to the stage-door and having knecked up the fireman who had charge of the theatre, and stated his suspicions, they both proceeded down the court-yard into the body of the building, when they foumd the place full of smoke ; this increased so rainstantly alarmed the grooms, for a hasty retreat. They instantly alarmed the groums, for the purpose of saving the horses, and short'y afterwards the mann body of the
building appeared in flames. The fireman states, that he went to the theatre on Monday night at 10 oclock for the night, as was his usual custom. At the conclusion of the performances, which took place about 10 minates past 11 , he sam the gas and all the lights extinguished. There was no other fireman but himself, nor was there any watcimin belonging to the establishment, nor any person to render any assistance in case of accident, except gro m, whis had gone to bed some time before. At half past 12 was his first round within the theatre; the second at balf-past one, the third at half-past two, and the last at quarter after three o'clock. When he went upon the stage at that time there was not the slightest appearance of fire, and everything appeared as safe as usual. Thence until aroused by the policeman. They immediately went on the stage, when he saw the fire raging uudermeath it His belief "as that it was caused by some sparhs falling tirough the flooring of the upper stage, in the representapiew a a scene of the Burnigs Crumench, in the g great quantity of saw-dust collected, and the sparks falling on \(i\), he concluded that it smouldered away unperceived until it burst forth. There was plenty of water hond the theatre conuld have been saved from destruction. Mr. Ducrow and his family esenped with difficulty, and one of his female servants and three valuable horse perished in the flames. It seems that she had made lier Eseape, but again retarned iato the house, tor the purpose, overpowered by the smoke sie fell dowa where the body was afterwards found, and was burnt to death. The loss incurred is stated to be above 30,1000!. Mr. Ducr.)w is said to be a loser to a very great extent, as he was not tie female servant, when the jury returned a rerdict of \(\because\) Acciuental Deatho at the same time expressing their

\section*{Faboincial Netus.}

Cufnbroót.-A somewhat singular funeral procession reacreat twok place at II)rton, near this town, which attracted
 fie velyburing parihes., An old monan, known oniy \(\cdots\) saucepans and other sorts of tinware, and a ras coliector trmglowit the district for miles arouad, died a few days since, loaving strict injunctions to her undertaker that she showid te conveyed to Ler grave in Horton cuurcherard in her awa cart, lrawn by her favowrite donkey. Her request wis strictly cumplied with; and, notwithstandiag the numbers who were present, the most rigid decorum measured for her coffin some time presiously to ber decense, and the whole of the little property she possessed, she gave to the undertaker a few days hefore she died.
Braintree.-This parish is still in a state of great exaivement on the subjeet of the church-rate. Dr. Nicholl tas applied to the Consistory Cuurt, for a decree against
the churchwardens and pirishioners, to show cause why a monition should not be issae! aztinst them, ca.ing upun them to comsene a rotry to make a rate for the necesmust take time to cmsiter the application. Undoubtedly, he said, it was the duty of that court to uphold this law as respected church-rates; but it must take care that the proceedings in the case were regular, or more injury than parishioners refused to take the subject into considcration how, he asked, could the court proceed if the vestry again refused it after consideration?-After examining the judgment of the Dean of Arches in the Headcorn case, Dr. day, but leaves the time of meeting to the convenience of the vestry.
Gateshead Fell.-A serions explosion happened at Derwent Crook Colliery, on Saturday. It appears that the engine-house, when they became suddenly apprised of the dangerous state of the boiler, and hastened out of the place. The informat on however came too late. The
hoiler, which is said to have weighed four tons, was drisen from its bottom, and carried by the force of the explosion over the engine-house. A large piece of the bottom plato
fell on the engineer with such force, that he expired a short time afterwards. All the other men (eight or nine in number) were injurad, some by the steain, uthers by the falling stones and metal. One has since died, and another is so severaly hurt that it is not thought he will recover. An inquest was held on Monday, when sume throw much light upon the probable cause of the melan choly event, and the sicting was therefore adjourned until some of the sufferers are so far recovered as to be ablo to detail the circumstanees.
Dover.-Considerable excitement was a few days since Regiment had been shot by one of the privates of the same corps on the road to Sandwich. From the evidence however given at a coroner's inquest, it appears that deceased bad been sent with two soldiers as an escort to convey three prisoners to Sandwich, and on their retura home they went inco a public-house at Waldershare, in company with two females, where they ali, hecame intoricated. On leaving to proceed towards this place, it woul seem that deceased turned off the road into Hazlede nwood, and shot himself, for he was iound there absut two hours after mortally wounded from a musket-shot,
which had passed through his body. One of the females was also in the wood, but she could give no account of the atfair. These were all the particulars adduced in evidenee and the jury returned a verdict, "That deceased destroyed himself while labouring under temporary in sanity.
Dunstuble.-A serious tire has occurred in this town by which ?l houses have been destrayed, and property in great ratue consumed. It commenced on the premises occupied by Mr. T. Fossey, contectioner, Highs-street. of two hours, \(2 i\) progress of the flames, that several out-buildings mere bumt to the ground; and, but for the timely aid of numerous engines, it is thought that the fire would have spread to a very serious extent. An investigation into the origin of the fire has been instituted by the magistrates, but the cause conld not be discovered; no lives were los Eweter.-On Sunday morning a fire broke out in Mary Arches-street, which has been attended with more ing conseruences than any which has occurren in this city for many jears past. By great exertions it was cuntine to the huase in which it orivinated, but unt urturately hire several sacrificed. Belore the arrival of the engine sereral indaviduals had been reseturd frome the burnid house by means of ladders; one female attemytre got outher escape from a secund-thoor window; she tirst got out
side, and then let herself down, hanuing by her hands ti the sill of the window. Before, however, a lader could be raised for ber assistance, she lost her hold and rell to the ground, and was so much injured that she died shortly afterwards. There was another ludger in the house, mot old gentleman named Weiber, 76 years old. An attempt was made to sale his lite by his sim-ili-har. Who inside proceeded promeeded to oreak throug! the pane s; but the shome hrom hastuly to make his retreat, and the oid man was thas hasenly to make his retreat, and the nidemanhed, his
left to his fate. When the fire liad ben smbued, remaius were found arnongst the ruins. A
lodging in the house was also bume to decth.
Nevemadie-The nine weather which bas premiled during the past month has been sery beveficial to respetation and from all parts of the country the aseounts are of the most gratifying deseriptw, fur the whe at in . . onam better than has been the case for tise last tive yeurs at tatsondant harvest. Oats, bariey. brans, and pras are pro gress:ng farourably, and there is a prispect that the produce will greatig exceed that of last year. (fi grasa there crop is esceedingly heary, and of all kiuds of fruts pro-
will te an abundant produee this season. Fotates pro mise to yield well, and supplies have begun to arrn state nas'set. Tae accounts froin all parts of tha counrry stat the demand for grain to be dulf, prices an the decine, antes the supplies large. In some farcured parts in tue cuack proof Nurthumberland anu
Bristol. - It appears from the votes of the House of Commons, that on the motion of Lord Ingestre, a coms mittee bus been appointed on the Post-ntice communica tion with Ireland. The motion maxde by Lord Ingestre
for the appointment of a committee, which was conceded by Government, is said to be for the purpose of doing
away with the present expensive establishment of steampackets at Milford haven, which, it is said, costs orer and
above the receipts upwards of 20,0001 a-year ; and as the steamers from Bristol, which sail on the Tuesdrys and Saturdays, are stated to arrive many hours before the mails by the former route at Waterford, it is expected that the public can be more quickly accommodated. and the by the line direct from Bristol.
Railways.-On Thursday evening last week, the halfpast seven o'clock train on the Sheffield and Rotherham placed the tender before his engine, and was proceeding on hay with a heavy load, when the axletree of the tender broke, and thus stopped its progress. The engine
continued its course, proceeding completely over the disabled tender, and dragging after it one of the carriages. It was thrown of the rails, and was ultimately upset in engine quite dead. The stoker was so much injured that he has since died, and a female who was the only passenger in the carriage next to the engine was seriously in-
jured. An inquest was held on Saturday on the bodies, when the jury returned a verdict, that deceased came to their deaths from accidental causes, owing to a defect in company, that they should not allow the tender to preced the engine,-On Tuesday as a train of stone coal from the Mynydd Mawr Anthracite Colliery was being conLlanelly, the rails and wheels baing both wet, the breaks lost their power, and the waggons went off at a great
rapidity. The conductors continuing their efforts, did rapidity. The conductors continuing their efforts, did not see the danger which threatened them; but, feeling a
sudden jerk in the train, looked round, and saw the bodies sudden jerk in the train, looked round, and saw the bodies
of three cattle stretched across the rails, over which the of three cattle stretched across the rails, over which the
train had passed. The waggons continued still on the rails, and went on their course for Llanelly New Dock, which they possibly would have reached but for a timely obstruction at Parkyrhynabridge, which stopped their progress, and saved the lives of the conductors from further
danger.-The Northern and Eastern Railway is expected to be opened to Harlow in July; and arrangements are being made to run all the coaches from Cambridge to the Eastem Counties The Devonshire-street station of the opened in its atead in Cambridge-road, Mile-end.-OffiExeter will be opened given that the railway from Bridgewater on the 14 th inst.

Dublin,-His Excellency the Lord Lieutenant left the astle on Wednesday for Bristol, on his way to Devonshire, noble father's health, the Earl accounts received of his lency's marriage was named for Monday se'nnight, and the noble Lord, it is saic, was in treaty for the beautiful marine villa of Lord Cloncarry, near Blacis Rock, called Mareinvestigate the affairs of the Royal Dublia Society have made their report. They recommend the continuance of the grant to the society in preference to a dirision amongst other existing bodies, or its appropriation to a new one
they also recommend a division into sections, and specify they also recommend a division into sections, and specify also advise the transference of the schools of art to the Hibernian Acadeniy, and that the Geological and Zoological Societies be merged in the Dublin Society. The report appears to give general satisfaction. - Prom that the conty made to the House of Commons, from land in \(1: \pm 0\) to Great Britain, the Isle of Man, Van Diemen's Land, the British North American Colonies, and quarters : harley (ineluding beer or bigg), 95,9 ;8 quarters qats, \(1,404,443\) quarters ; rye, 123 quart ; pe, 1,403 quarters; beans, 14,753 quartent ; malt, 3,426 quarters . cwts.; and barley-meal, 78 cw

Tipperary. - At a recent meeting, held in consequence of the murder of Mr. Hall, and attended by 35 magistrates of the North Riding of this cornty, the Eart of Donoughagreed upon:- That it appeared to the meeting that, in consequence of the increase of crime, neither life nor property was safe in that distriet. That they considered the increase of crime arose from the defective administration of the laws, and by the remission of punishment on perThat thied, convicted, and sentenced at recent' assizes. That they were of opinion that the right of challenge not being judiciously used, has materially contributed to the convictions arose, and that great difficulty in procuring of Donoughmore he requested to transmitit these resolutions to him Ercellency the Lord Lieutenant.

\section*{SCOTLAND}

Edinburgh.-A avther public meeting has been held, in accordance with a requisition signed by about 600 gentli-
men, for the purpose of men, for the purpose of expressing cordial sympatiyy with very numerous suls reapectable, the large sesembly-room being crowded in every part. In consequence of a placard that bad been posted up throughout the city, it was apprehended that some attempt might be made to disturb the meeting, and, fur the puryose of maintainiag order, the weatemen who bad signed the reqnisition and their friend were admitted by tickets; altrong body of police was
also in attendance. No attempt wam, however, made to
interrupt the proceedings, which were conducted with per-
fect order and regularity. Lord Dunfermline was called to the chair, and addressed the meeting at considerable length, strongly disapproving of the course which hal been
pursued by the Gieneral Assembly. Mr. Anderson, Advo pursued by the General Assembly. Mr. Anderson, Advo-
cate, after a long speech to the same effect, moved " That this meeting express their cordial synmpathy wit! the seren painful nosition, and their strong disappre in their presen duct of the majority of the General tsiembly in the tin to depose them-from their offices of parochial ministers of the Established Church, becanse of their having yielded obe dience to the law of the land." This resolution having been seconded, the chairman was proceeding to read it, when had an amendment to propose; the chairmated thatever insisted on first reading the previous resolution, which was received with unanimous applause. The forme speaker then proposed, as an amendment, "That the
Strathbogie ministers were not deposed for obeying the law of the land, but for disobeying the laws of the church, and that no sympathy was due to them for the course they had followed." He then proceedel to follow up the amend ment with a speech; but the meeting manifested great impatience, and at length, a vote being taken on the ques tion, refused to hear him. He, however, still persisted in his attempt to address the meeting, until he was at length removed by the police

Glasgow.-Within the last few days, forgeries extend ing to about 8,6007 ., perpetrated by a young man, clerk in n discovered were attended with complete success, the delinquent having decamped with the whole of the above amount in his nossession. He forged, it seems, two checks for 3,i0nil and 3.500 . respectively, to which he appended the signaure of his employers, and presented them at two different In addition to these amounts, he made himself master of 1,420. by the following expedient:-Having been directed o lodge this sum in the bank, he forged in the pass-book his employers. who of cook to the counting-rousials to be coret and take it for granted that the money had been lodged as directed. As soon as he found himself in possession of he large suma of \(8,620 \mathrm{l}\)., it seems he asked as a favour that ands obtain leave to risit some friends in the High was granted, and he left town on Saturday week, but hae not since returned, nor has any satisfactory trace of the route he took been discovered. The fact of the forgeries aving been committed was not discovered till Frid , thu iving him a start of nearly eight days. A reward of 2001 ans been offered for his apprehension.
Aviemore-An Edinburgh paper states, that a very
destructive fire has occurred in the woods of Kinvachiel about four miles from Aviemore, the property of the Ear of Seafield. So soon as it was observed, every exertion was made by the inhabitante of the district to arrest it progress, and after some time they succeeded in getting is ander. The fire. however, not having been properly ex dis bonsiderable damage had been done. The lons of wood in stated a about \(2,000 l\). sterling. The origin of the fire has notbeen discovered.

\section*{fliscellaneous.}

The Proiluction wi Fruits. - The terms cioiparous and oripropots ave sometimes applied to the propagation of vegetajles-Viviparous when they produce leaf-buds prin-flower-buds, and are weak. Itia atated in Darwin's Phy-

1ologia，that in order to convert viriparous buds into ovi parous，it is necessary about midsummer to bend the riv parous branches towards the horizon．Another niode is， to twist a wire，or tie a wax－string，round the riviparuu branches of a tree：and this will induce them oviparous．Also，planting the trees，especially apple，in garden－pots，or on a foor of brichs bencath These should be grafted three or four times，seion upen scion；so that the stem may be compressed by the callus，before the branches are permitted to divaricate；and thus they become beautiful dwarfs．Likewise．wounding or breaking a vivi parous branch，or cutting away a ring of the lark，as o pear－trees，or a semi－eglinder of the bark of other trees never be planted deep in the sril．Transplanting teees induces them to bear fruit．For the same reason，if bean which are but a feer inches liiuh be transplanted，they do not become so tall；but they flower and ripen their seed shice the the is then beter to pluck up multiplies the flomers．It is there fuye better to phack up plants of broceoli，rather thandif them up，far eransplant－ ing ，that the rent－fibres may be torn，rather than cat
through．Eulbous－routed plants will produce seeds，if crowded twecther in pors，particularly the lify of the val－ ley：and so sill the orchis，if the new roots，early in the season，be separated from the old one which bas put up the flowering stem．Also confining the roots of cucum－ bers and metons in garden－rots stops the too cuxuriant growth of their leaf－buds，and renders them sooner ovipa－ the ；－they sinould wave a great deal of water，particuan of dunghills．If the central viviparon Granches of a plant be cut away or shortened，latera ones will sooner，or more completely，become oviparous The central bod of melons，as soon as the leaf is an inch in diameter，should be picked out，which will cause th plant to be oryparous，and to procuce better lateral shoots and larger fruit．The ends of these lateral shoots also
should be stopped，in the manner，as soon as the lateral flower－buds are formed．Give aidditional moisture，ma－ nure，and warmin，during the early part of the growth of fruit．In Lanca－hire，where premiums are given for large gooseberies，they suffer ouly two or three to remain on each branch；and then．by supporting a sauco water a to cover abrout a fourth part of each berry，which they call appropriately，though not most elegantly，＂suckling the gooseberry．＂－Indingator．
Reguarity of Steam．－At a dinner，at the City of Lon manasing direetor of the Great Wers，on the 3 th uil．，the pany，in eulogising the ex ellence of the Great Western＇ machiners，which had carried her nearly 130,000 miles without disappointment or missing her advertised hou of sailing，stated that he felt confident in predicting，that at half－past two oclo \(k\) ，on the \(1+h\) ，the Great Wester wrould arrive in hing a road．At that very time，it is stated her smoke was seen from the bula in the neighbourhood of King＇s－road，and she anchore－at seven o clock．
Gorman Coins of the Midate Ages．－A German paper star chat some workmen，thile lately employed at Berli ber of coins of the middle nees， 5 lbs ．The Director of the Mint on examination found them to be coins of the 13 th and 14 th centaries．They are composed of drachmas of Braunbourg and Prague mer bear no inscription，and the impriat is rery bally ex ecuted ：the latter are better executcd；part of them bea the narne of Wencesluus，Kine of Bohemia，and John，son of the Emperor Henry VII．of Lusembourt． and hustriel of haverat such enormous numbers of eaterpulars ave stripped liy the fruit and forest trees are so completely strinter．It is added，that where the railsay from as in sen to Thamu traverses the rals，the caterpillars havecon gregated in such numbers on the rals as to impede the prozress of the trains ：and that as a renuedy，the brooms Flaced in water in front of the lucomatives to remove the soow are now used to sweep away the caterpiliar

Suiciles，in Frunce．－It appears from an official docu－ ment recenty published that the number of suicides in France increases esery year．In the year \(1 \times 53\) they amounted t． 2.71 ，bence 161 more than in 1835,301 more than in 193\％，and \(40^{\circ}\) more than in \(183^{3}\) ．The de－ partment of the seine ficures for inb，nearly ome－fifth of the entire．en femaies are returned amongst the suivides． Each periol of infe．frum infency to ohd age，has paid its tribute to this malady．There are chaldren of from 8 th 14 ，nine of ij .14, of 16 ，one 21,335 of \(c 0,199\) of 50 ，and 41 of 30 ．Thas means must frecruenti？uised to destrey life are sabmersion and strmandstion．2is individuals drowned tienselives，slit hung tienselres． 183 suffecated themselres with the fumts of charwoal，wiich appears to be the principal mode resorted to by the Paristans．

SATURDAY, JUNE 19, 1841.
MEETINGS IN THE ENSUING WEER

The second of the great meetings of the Horticultural Society of London took place last Saturday. The day was as cold and cheerless as a sleeping sun and a keen north-east wind could render it in llay The bor-der-flowers were lean and haggard for lack of food. The turf, which a month before was a green elastic carpet, had become a dry and hardened floor; and the trees alone, which draw their supplies from the deep fountains of the earth, were rejoicing in their strength. Nevertheless, nine thousand persons, among whom were many of the highest and fairest in the land, impelled by the love of flowers, and not having the fear of cold and aches befure their cyes, pressed into the gardens to admire the splendid productions which they knew would be there collected for their enjoyment. Nor were they disappointed. If the gardens themselves were suffering beneath the infliction of a winter in summer-tide, the contents of the canvass houses indicated no symptoms of the season; on the contrary, the triumph of art over nature was more conspicuous than ever ; for on no occasion has a more gotgeous display of floral beauty or more gratifying proofs of skill in cultivation, been collected together, even by this great Society. For the banks of Pelargoniums and Roses, radiant with beauty - for the varied forms of Orchidaceous plants, one of which a poet would have compared to a fountain of emeralds and gold-for the glowing but delicate tints of the Heaths, and for the endless forms of othere, which by name we cannot count, we refer our readers to the report of our chronicler, to be found in another page. We can only say that those who love ". to gaze on that is fair," were well rewarded for their visit to the scene, with the single exception of those who expected a fine display of fruit. Upon this point we have some observations to make.
The display of fruit on Saturday was decidedly unworkty so great an occasion. There was not a single fine collection, none of the Pine-apples were remarkable, and the really handsome specimens of Grapes from Mr. Davis, Sir Simon Clarke's gardener, and from Messrs. Chapman and II ilmot, were sadly in need of iivals. In fact, the Judges could not find a collection deserving of the principal gold medal. That to which the second gold medal was awarded contained inferior Strawberries and Nectarines ab ut halfripe; which latter circumstance should in strictness have disqualified the exhibitor alrogether: for to exhibit unripe fruit is like exhibiting plants out of flower-neither are in a state fit for examination. We cannot suppose that this inferiority in the fruit arises from unskilfuluess on the part of gardeners, or from the cultivation of fruit being lessattended to than that of flowers. It must arise from other causes, the principal of which is probably that gardeners in the country are not aware of the regulations under which fruit is exhibited by the Horticultural suciety ; we will therefore explain them. In the first place, our advertising columbs of to-day contain a statement of the medals that are offered by the Society for fruit, The actual money value of a Gohd hinightian medal being ten guineas, and of the Gold Lianksian seven guineas, there is no want of encouragement to frit. growers: in fact, they are placed in the vane positos with respect to rewards as the exhiutors of How.as
 t. the ouncr, carringe pail, unlese thos who exlibit give orders to the contrary ; so that nn expense whatever is incurred by thase whe are :ivious empeting; and gardeners in distant parto of the country have an opportunity of displaing their skill. This being the case, we truat the great fruit-growers will bestir themselves, an! prove at the meeting of the Society in July, that their skill is not inferior to that of the fiower-gardeners, whose produc-
tions now form the principal subject of attraction. We know that the Society anticipates a large exhibition, and that a new table of a much-improred construction will be proviled for displaying the fruit to aidvantage. Let us hope, for the honour of our forcing gardeners, that the supply will be equal to the preparations in progress.
We had scarcely, last week, dismissed for press our observations upon Boghos Joussouff"s singular Orange (?), when we were favoured with the following note upon the subject from the Rev. G. C. Renoward, Foreign Secretary to the Royal Geographical Society
"When revideat at Smyrms as chaplain to the factory there, in 1812, a frut promed, as I was told, by an to me from the garden of a friend at Hajilar, a village in the neighbourhood, so singular in its appearance that should have preserved it in spirits had I been aware of the circumstance I skall presently-mention. Boghos Yusuf (i. e. Paul Joseph) is a nost estimable Armenian, univer-
sally esteemed, and was employed in his youth under the sally esteemed, and was employed in his youth under the
British Consul at Smyraa. He might, therefore, have had his tree from the same garden as that in which the one 1
speak of grew. The fruit sent to me had the size and speak of grew. The fruit sent to me had the size and
appearance of a large Orange with two or three large appearance of a large Orange with two or three large to the very edges of the different pieces, being distinctly that of the respective fruits; and on removing the rind, which, as in a common Orange, was all of one piece, the portions beneath the Lemon-coloured parts had not only a considerable degree of acidity, while the Orange had its proper degree of sweetness, but they were separated from their sweet neighbours by a distinet membrane, which in some degree accounted for their ditierence in taste. The pulp was also, I beiiese, of a lighter hue. This phesiological fact may perhaps be new to you, and if so, will form a supplement to the communication of your corres.
pondent B. D. (Gardeners' Chronich, ,ith Jupe, p. 35 ). "The patches of Lemon were merely superficial, and of no great thickness. They made bumps, or irregular elevations, on the rind of the truit.

This communication renders still more interesting the question as to the possibility of obtaining a tree by the operation stated to be employed at Smyrna It also confirms the correctness of our opinion, that if the fruit of Boghos Bey's tree exhibited external signs of the three parents from which it is derived, that triple character could hardly be connected with internal organisation. It appears from Mr. Renuuard's observations that the rind of the fruit he saw was all of one piece, and that the marks by which the Orange and Lemon were limited internally were principally colour and flavour, both which are the result of pectiliar secretions, not of distinct organisation. What Mr. St. John's account seemed to us to indicate was, that within one common rind the tree bore an Orange, Citron, and a Lemon; while the fact seems to be, that within one common rind a portion of the lobes possesses the quality of a Lemon, another of a Citron, and another of an Orange; a very different thing. Can there be any analogy between this siugular case and the not uncommon circumstance of a Peach becoming a Nectarine on one half of its surface? We very much wish some ingenious gardener would seriously attempt to obtain a tree by the grafting together of three different embryos. It wald throw light upon some obscure points in vegetable physiology:

The lovers of the Auricula will find an admirable account of the manacrement of that flower in our columns of to-day. We are indebted for it to our excellent corre-pondent, Dr. Horner, of Hull, whose skill as a scientific florist is recomised on all hands, and who at one time possessed one of the largest, and certainly most valuable private cullections of Auriculas in the hingdom. Worid that the management of every race of thowers were explained in the same clear and simple manner! A person unable to grow Auriculas with such an instructor ds Dr. Hormer, must be very unfortunate; and we attach the more importance to this fact, becaune they are plants which many would cultivate who do not possess the means of employing a gardener. but who taise the management of their flowers irit. their own hands.

the cuttings are to be slipped off from the branches as
carefully as 1 ss:mhe, so as to retain the priacipal tua at
 reatad if one or taro of the lomar tiers of leaves cluse to the stem. Other shoots besides laterals may be prepared by cutting them across with a shurp knife immediately below the fourth or fifth joint from the top, and depriving them of leares on that \(1^{n+n t}\) of the stem which is to be inserted in the ground. Some plants, such as the double
varieties of Rocket and Wallfower, strike more readily When are or tmo from the bottom upwards are made in the bark of the cutting, so that on inserting it the part which was slit will naturally spread open, and in a short time emit roots.-
Slips. or pipings of Pinks may be treated in this manner ; but in preparing them it must be remembered never to shorten the points of the leaves, as is frequently done, and
ufien proves the cause of their failure. When the ground uften proves the cause of their failure. When the ground rake, the cuttings are to be got ready and insertul for about a thirl of their lungth. two or three inches apart. The earth is then to be pressed tolerably firm around them, and a gentle watering given to the whole. If the
situation is exposed to the sun, a temporary covering must situation is exposed to the sun, a temporary covering must
he made to shade them for two or three weeks. Paper fixed to some hoops bent over them, or fresh Cabbage or Rhubarb.leaves, as mentioned at p. 19 of the Gardeners?
Chranille, mas be used for this purpose. Weeding and Chrani,le, masy be used for this purpose. Weeding and
heeping the cuttings moist liy occasional waterings in dry weather are all they will require until they have taken root, and are fit for transplanting.
Continue to attend to the crops of most importance for the use of the family. Destroy weeds; draw-earth and stake those vegetables that require to be so treated, and remove any that are running to seed.
Bees.-Although many cottagers may be careless about the management of a garden, there are few, we think, who might not possess a hive or two of Bees; and those who are desirous of doing so cannot have a better opportunity
for making a beginning than by purchasing a swarm from his neighbour ; as soon as it has settled and been hived, if possible, it should be removed the same evening to the
place where it is intended to remain. In farourable seasons, a good stock that has survived the winter will throw off three swarms; and sometimes the first one will throw of another, or what is called a virgin swarm, the same year. un which a false value is tou often placed by many uncerters. The great objection to them arises from the sufficiency of food for the winter. First and second swarns will generally succeed if thrown off early in the season; but thind swarms should almays be returned to the perent bive. The period between the coming off of the first and it is less, and therefore it nill be necessary to wateh them occasionally until the swarming is over. In performing any operations with Bees, great care must be taken to attended to, they may be hived and managed without dan. ger or difficulty.--M. E. II.

\section*{ENTOMOLOGY}

No. N.-The Dnion and Cabblge Fles.- The two-winged fly we noticed in a former Article is not more injurious to the lettuce, than those whose history we
shail now relate are to the crops of onions and cabbages. shall now relate are to the crops of onions and cabbages.
The first of these flies is called, by Bouche, Anthomyia Ceparum, after the garden onion (Allium Cepa); of this insect there are many generatims during the summer, Leeping up a constant succession of the maggots, which fig. 3 magnit 1 , and the slimy matter that is stcreted by these creatures, enuses the onion to become eventually putrid and most ofiensive. In seasons favnurable to their propagation, so eatensire is the evil, that whole crops of leeks, as well as of onioy, have fallea a sacrifice to their insidious opeThe
The exgs are stated to be deposited upon the leares of the onions, close to the surface of the earth, and as soon as the little margots emerge from their shells, they penetrate the outer leaf and nake their way between the leaves down to the base of the bulb, where they sometimes congregate in families, varying greatly in size and number (fig. 2). These maggots have been observed as early as May, and I have found them alive even in December, but June and July are the months when they are in full force. In about fourteen days they attain their full size, when they genemilly leave the onion and descend into the earth, t. become lin e within tuew induratel shins, which forms an thiptical chernut-e ?oured shall (has. 4): tuas provected from surrouncmar warers, they remain from ten to twenty
iays in tie summer, hefore the fly is perfected and makes its appeararice: brt the cutumnal pupee sest through the mar: ei in tiat torpid state, and the flies are not developed wat.i tie ed of Aprit and the begmming of May, when 1 ored thins yeas a consilerable number, at an aver"ge of three males to one texiale.
These insects are stated to be most destruetive in light soils, which may arise from the tifes not being able to moke their escape where it is stiff or clayey; and this appears probable from my finding maltitudes so completely embedded in ciods several inches uaderground, that excepting under
very favourable circumstances, they mast have perished in the earth. When onions are diseased by these maggots, the first symptom is the fading of the outer leares, which become yellow: it is, therefore, necessary to detect such
plant and carefully remave them; when strong brine or plante and carefully remave them; when stmag brine or .o destroy any of the family \(\begin{aligned} & \text { Wich may have escaped, and }\end{aligned}\)
this process may be rendered more effective and easy by sprinkling powdered charcoal or coal-dust round the young
plants, leaving here and there one unprotected, which will then become the resort of the flies, and thas enable the gardener to eradicate the mischief by removing at his pleasure the affected bulbs.
The next species, called Anthomyia Brassica, or the Cabbage-fly, is found on the wing throngh the summer, and is the parent of a maggot which bas been known to lay waste whole fields of cabbages, by diseasing the roots Thesech they feed as well as at the base of the stalk. These larvee were abundant last June, and in eight day after the flies began to appear. Successive generations are feeding until November; the later families lying in
the pupa state through the winter, and most some of the flies survive that season, secreted in holes and crevices.
When the cabbage-leaves assume a lead or yelluw colour, and droop in mid-day from the effect of the sun, such plants being diseased should be taken up, carried away, and burnt, and brine or lime put into the holes as before recommended. Gardeners, in some instanees, have collected large quantities of the pupre from the roots, by drawing away the earth ; and as these insects are exoeedingly rapid in their transformations, it is very likely that it may have a very material effect in checking their increase, and giving the succeeding crop a better chance of escaping the fate of the preceding one.
In order that these flies may be no longer confounded, the aiso that gardeners may identify them, I will describe the cross lines showing the the largest; the male (fig. J, colour, roughish with black bristles and hairs. the exes are contiguous and reddish; the face silvery-white; homs black; there are three obscure lines down the trunk, and a line of long blackish spots down the centre of the body, more or less visible in different lights; the wings are transparent, slightly iridescent, tinged with ochre at the base, the nervures pale brown; poisers ochreous; legs
ashy-brown. The female is ochreous or ashy-grey, clothed with black bristles and hairs; the eyes are redulish and remote, with a light chesnut stripe between them, bitid and darkest at the base; face yellowish-white. The malc of A. Brassicet is darker, but of a brighter grey, with black bristles; there is a black stripe half-way down the middle of the thorax, and a curved one on each side ; the body has a more decided black stripe down the centre, and the segments are marked by a line of the same colour; legs and antennge blackish; wings a little smoky. The female is pale ashy-grey; the eyes remote, with a dark ches-nut-coloured strine on the crown; the wings are similar in tint to those of the foregoing species, but the insect is consiterably smaller; and this is the only striking difierence between the females. The characters of the lettucefly will be found at p. 363.-Ruricola.

ON THE CLLTIVATION OF THE ACRICLLA. The Auricul?, though brought to the highest state of perfection in England, is not a native of Britain, buze of Indigenous to the Alps. It delights in the pance in some these vast heights, growing in gay luxuriance and there to be found on t'.e sides of these mighty mountains. By carefully considering what are the natural habits and localities of plants, we shall, in all cases, soonest attain to thei proper and necessary treatment. This in the must especial manner is required in the present instance ; damp, and the want of a circulation of pure air, being the great cause of all the loss and disappointment of which so
florists complain in their cultivation of the Auricula.
Let the first object, therefore, of the florist be, to obtain a proper frame. The pits, cold frames, ic., , whith nost min roper as not arioning the poper and reguired circumaproper, as not atording the froper and all the evils of dimp and continetnent. The futiowing is a sketch of the frame which I had constructed, and which I have used for some years with complete success, it com conveniences, advantages of light and air, as well as other convenienst.
which will readily sugrest themseives to the practical forist.

It stands on legs hetween two and three feet high, the top ughto :hide, and, as shown in the uaytran, may also be prophe
up by means of an iron bar perforated with hules two or thre

thoroughly aroind the sides and buttom of the pots. By lettins down the front lights only, the phants may bee left for dass
together, exposed to th the advantantes of liyht and air without
care or notice: and when it is devirable to sive then the benefit care or notice: and when it is devirable to crive thes
of a shower, we have only to remove the topi lighits.

Composition of Soil.- II ere florists to pay as mucis attention to the general management of fhe Auricula as am convinced that their want of success in its cultivation would be much less than it is at present. The soil most suitable (and I beg all compost-seekers will now rest satisfied that they have met with the grand secret) is simply as follows: two parts pasture sods, two sears old ; one part cow-dung, three years old; and laalf a part coarse river-
sand, with the use of decayed leaves, as will be explained in potting. Good, rich, loany soil froni an old pasture, and old frame dung, will be good substitutes for sods and cow-manure, and should be used in the same proportions. All hot, stimulating manures must be carefully avoided.
Potting. - The pots for a full-sized plant should not exceed four inches at the top and three inches at the hottom, insile measure ; they sloould also be made five and a half inches deep, to allow of abundant drainage, and should not be hard-baked, but left as porous as possible. It is a great and almost universal fault to use pots of too large a plants have bloomed for potting is immediately after the plants have bloomed; for on account of the long previous confinement in the frame, the frequent waterings and tract disease, especially rot or decay in some part of the main or tap-root, as it is called. This, in repotting, is at once detected, and consequently the life of the plant saved. Moreover, by early potting, ample time is given for the pot to get well filled with young healthy routs before the ap.
proach of winter-the great secret o: a vigorous bloom the proach of winter-the great secret o: a vigorous bloom the following spring; neglect of yearly repotting is a great evil. The important operation is thus performed:- -first, put at
the bottom of the pot at least one inch and a half of crocks of broken garden-pots; on these place a thin liyer of decayed leaves unbroken up; they prevent the soil from filling up the interstices between the crocks, and, morethe plants. Next fill up the pot within about two inches or so with the compost, leaving it slightly cone-shaped; end of the tap-root, and, having disposed the roots regularly over it, let the pot be filled nearly to the brim, so that the soil just covers the insertion of the lowest leaf.
Now strike the pot smartly two or three times on the ground, and then remove it to its summer quarters, when water must be given just sufficient to moisten the soil, and repeated at the end of a week, not before. In filling the pot with compost, I always put in about three fingers' full of decayed, or rather decaying, leaves, not leaf-mould-a pinch here and there. In repotting the following year, an unusual mass of roots will be foand surrounding and piercing them through and through; they at once afford most acceptable nourishment and drainage.
Previously to the operation of potting, the plant must be prepared by carefully crumbling off the old soil with the fingers, and then washing the roots in water, in order that any decay or disease may be detected, in which case it main root should then be shortened to within an inch of main root should then be shortened to within an inch of
the leaves, leaving only the young and new fibres or roots. One great and fatal cause of the dwindling and disease of Auriculas is the leaving too long a tap-root; it will most assuredly decay and kill the plant. When it is desired to save seed, the operation of potting must be delayed till August; but I would caution the amateur from receiving plants at all from dealers later than the beginning of this month. They will no doubt be told by them that any time in autunin will do. I repeat, IT Wrill Not do; for unless the plants have sufficient time to get well and thoroughly rooted in the pots in autumn, they will not bloom as they ought the following spring, and
It is important to know the seasous of growth and repose of the Auricula : it is in a state of growth from the end of Febraary till June, and from this time till the beginaing of August it is nearly quiescent: hence phants hence rot) be repotted (as they will be slow to root, and hence rot) at this period. From the former part of August till the middle of October, it again grows, and then reits dormant during the winter. During the periods of its growth, water must be regularly administered in June and July, sparingly, and in the winter months it must be aitogether withbeld.
The summer situation of the Auricula is all-importait. As it naturally delights to grow in oper and ele:ated regions, as on the Alps, 30 its place and position in the The parden me comparatively high and of free exposure. The pors shoud stand on planks which are raised two feet hedge having a north-east aspeet, and without awning or covering: bere they may be siffly lift tril November; for if they dre antrially repotted, properly trimmed at the root, have sufficient drainage in the puts, and if due attencarefully twist, be given to them from time to time (as by soil oceasionally with the point of a knife), the much-talkedof rot need not be dreaded; but if those directions as to
potting, plants have not been elevated on planks the required dis-
tance from the ground, and consequently left in the usual susceptible state of disease, by all means let a temporar
awning be erected over ticm if the summer prove wet.

Wiater.-In November ther may be placed in the frane, giving them all the air possible, as by letting domn lights heing kept on in case of raul. Waterine munt b gradually withdrawn, so that during December and January the soil be just kept from being absolutely dry : if it be kept wet or damp, the plants will be in great danger of contracting disease. and of suff ring from frost. In winter
during intense frost, the trame must be protected with efficient covering; two stout blankets, with an outer coend, cheanest materials. If not protected from the end, cheapest materials. If not protecteal from sevare frost, many of the flower-stems will be found deaf, or with
only two or three pips at the blooming time. In winter, only two or three pips at the blooming time. In winter,
during milder days, the plants should have sufficient air,

Blooning.-About the end of February, and during March, they must have all the air possible; and also should be exposed, by remoring the top-liyhts, to frequent gentle showers : nothing is so invigoratius. They must now also be top-dressed with a compost of two parts cowmanure, and one part loam, having previonsly removed the old soil to abolit the depth of an inch. At the begin-
ning of April, when they have pushed up their fower stems, they must not lunger be exposed to showers of rain, but the soil must to the end of the blooming season be preserven to expand, will never bloom flat, the frame must be carefully protected, as just described, every night. In watering the plants, great care must be taken to avoid the foliage; and if a drop has accidentally fallen into th
crown of the plant, it must be extracted by means of camel-hair pencil, or decay will probably be induced. small watering-pot, with a poland long bent at the end, and then contracted to the diameter of a
goose-quill, slould always be used for the purpose of watering
hen the pips are just expanding intu bloom, the frame which has hitherto been exposed to a southern spect should be removed into the sliade; or what is more feasible, the plants may be placed under hand-glasses. in a at the and shaded part of the garden, air heing admitted plants into . The best plan. however, is to remove thy plants into a common garden frame, placed in a shated sun. The pots are not placed on the ground, but on shelves, graduated according to the fall of the glass-lights. Side doors are made in the front and back of the frame
by which means any quantity of air can be adnotted, freely to circulate around the bottoms, sides, \&c., of the pots and Way, by tilting up the glass-lights, as the cold air is thus
suffered to blow directly nopon the expanding blooms hence the very great advantage of the coutrivance perfect, and overcrowded unes must be carefolly thinned out, leaving a truss of five, seven, or pine. When in full the where their beanties can be more conveniently seen and examined.
The properties of the Auricula have been truly given in a previous Number of the Chronicle. In the foregoing observations, some minor points of detail have been intentionally omitted, that the subject might not appear too rience, and most successful culture of the plant. \(-\boldsymbol{F} . \boldsymbol{R}\). Horner, Hull.

\section*{HOME CORRESPONDENCE.}

Bees.-Much has been written upon the management of becs; I have nut, however, seen auy suggestions similas to those I am about to offer for insertion in the Gardeners' Chronicle. The monden hires hitely sorecommenden have not answered the expectations of several persons who summer, the intense heat of the sun on the wood some times causes the adhering combs to melt and fall down and in the winter, the steam from the bees condens. se It is ies down the walls of comb, and protuces disuase. arerage that much b sney can be prucired on the old phan of keening bees i:: the oren air. To onviate these obstacles to success I audut the itilo wing moditicatio is of well-h..own principles:-Taking a thich thard sutficintig large th hed near its cantre, two ur three inches in diameter ; each liule
 be 12 incles square, and fiun 1 to 6 inches do. having woulen hives. In the spring, a single hioe is placed orer

 ghes is removed, and tia now hise phatise iathee by
 hiche, in tad of a hww hive. whil proseaty ise thled with moite allest ony nomber of kites hy havief a lanal and hos of propurtivat Lhame.....s. Besides t..e diviatage to the hacith of tise lees arising from tne use of straw nves the beekeepar, this plan allows of the removal of any one hive from the cumbination whenever necessary, without in
the le est cisturbine the others, thereby insuring a youthful and healthy repuivic. But the most important feature in are linced in a glass aniary yet to be named. The hives house, and so arvanged round the front and sides that the bees can pass through apertures in the glass into their bixes, and then ascead into their hives, but cannot escape inth the apiary. The teraperature within the apiary from 50 to 2110 . This will incretae the fight and day by queen, and stimulate the workers. Care must be taken to prevent ton great an irre gularits in the external and internal temperature eariy in the spring and late in the autumn, by
shading with mats. de. ; and 1 m the winter t. timued; and by introdreing a sharp current of air from side to side, the cold will be greater mithin than without the apiare. To extract the honey I cut a hole in the tops of the straw hives, placing, thereon bell-glasses thickly covered with some warm and opaque substance; I fix the glasses with mortar, inserting in it half a dozen common nails, which are drawn out when rentilation is needed To fortify the bees against the winter, the circular excised piece of hive is replacen, and the crevices are covered by mortar. Much wanecessary expense may be spared by these means, and by forming the apiary of old sashes or cncumber lights. 1 ann umwithe ather the pent should be lost by those who may feel disposed to test these bions by experiment, and therefore report progres instead of waitiny for further contirmation. In litn tried one hise only: from it I extracted 18 pounds of the of honey nearly ready to be removed. I have in glasse hives; none of them have swarmed, and all have glasse partially filled. The loculity of my residence is not well adapted to bees, and if they succeed here they will no fail anywhere.-H. Leake, Headinglon, near Oxford.
fully thing Cungs in Wier.- I once adopted success fally this mode of striking cuttings, as recommended by your correspondent-with considerable snccess in the case of seneeio, Chrysanthenum indicum, and others, and the (iu the fact in verification. Thave been informed o beariur fruit being struck and forced in this way, and Murray. [Mi. Towers, also, long since published an account of his success in the same way. In fact, it is an old practice, although not generalised till lately. We shall advert to it when the subject of cuttings comes formally before us.
Assam Tea,-I have examined specimens of Howqua and Assam teas, as imported by Captain Pidding. Cheas may be, the sume refatipe quantities of gallic acid and tannin. It has struck me as peculiar, in examining the able-nearly double that of Thea Boheal and in consist ence very much thinner. It has often weurred to me as matter of surprise, that the green and black teas (The fonis and Thea Bohea) should have eser been con tained for you are aware that sonse persuns have main one and the same plant ; relative stages of matained from other accidental circumatonces, culituing the and difference. Irreapective of colour-and I am fully aware of the necessity of caution here ( nimium ne crede colori) the form and structure of the leaf are certainly sufficient to constitute 1 speccific difference. The relative hardiness has survitu nith mee severo winters sh lio: Widis has survind. with nie, severe winters, sul dio; while the Thea Boliea has been cut ofr. The late Colonel Mark country anknown in Chinese Tartary 0 and I have been agethe nightingale having built her nest among the branches of Thea viridis cultivated in the open air, in Hampshire. J. Murray.

Rooting of Leaves.- I have never foand this circumEtance more remarkably displayed than in the case of the
 me-nots, like Aaron's rod, have "blossomed" with young plants. My worthy friend, James Coekburn, Esq.. of thm-house. (Guernsey, stoned me curions examples of the same kind is flower-stalks of the Eveleveria gibbitlora. Infant plats studled the fluwer-stalk long after being havach drom the parent stem. Leares and fragments of able for the crenatures of the leaf being fretted with young plehs even winte yot attached to the parent plant, and
stil niore so in a stite of decar. Various plants, I am
 mast now content myself sith alluduy to the facility of strihing almost fragments of the Lychnis coronária, a
favourite of mine. Not ouly will individual joints strike but if each joint be split into two vertically, two distinct plants may be obtained. The Echeveria is, however, the must temacion, ilhie, -J. Mun ray.
Wasps.- Prom the time these first made their appearstroyed by the garden-men amounted to 1201. If every and the arerare number considered to produce a swarm,

might natarally expert place. But the most :lfeetual way of keeping down their
numbers would be by associstions for the purpose in thone
}
districts where they are found to be troublesome, offering \(\mid\) less, a useful instrument. Its principle is e-sentially so mach per head to any one whe tikes them. By suel. count. The French complan of the disadiantage, of an industrious gavdener or farmer being situated close to thins that are not, the weed-seeds of the latter over-
ruming the well-kept grounds of the former; the same summing the well-kept grounds of
holls with regard to wasps.-J. \(H\).

Moratan Pranies.-Some time since you remarked, in a leading article, upon plants which would not flourish when placed in a south aspect, and you officed as an ex-
ample the Tree Preony. Nisw, at the time your remarks appeared. I had the Montan Banksia in beautiful Hower and the sun would shine upon the ghant from six A.v. to three p.a., or possibly later. Hare often seen muc larger bushes, or shrubs, of this species in the eardens of
others: but I never saw the flowers so perfect, or nearly so-they were very double, and full nine inches in diameter. Possibly the first might have been an meb or twa
more when expanded. It is fair, however. to state, that mure when expanded. It is fair, however. to state, that
although the plant is in a south-by-east border, and allhough the plant is in a south-by-east border, and
fully expused from the surface for full two feet high, the blouming portion, and that part of the foliage must de licate, Is protected by a hand-class, having a shifting top supported on four posts; so that while a perfectly free admussion of air takes place, the plant has at once the great advantage, combined with that of growing in an open border, of haviag every needful protection; and did exotic can be flowered in perfection. In a subsequent Number I noticed some specific for removing the Anserican
Blight from A pple trees. Now, the brush is certainly (or something like one) of all things needful ; but I have found the specific of simple water applied with a brush never fail in remoring the pest. I will not say that one
application will always suffice: but the remedy is so easy, application will always suffice: but the remedy is so easy,
that if two or three be required, the labour will not be grudged, where apples or apple trees are valued-Georgius. [The statement alluded to will be found at p. \(27 \overline{5}\).
We see nothing in our Correspondent's observations at variance with it. If he protects his Tree Pæonies they will succeed anymhere; our remarks applied to those unprotected, which are injured on a south border because they are caused to shoot too early in the spring, and which succeed better in a north border because they are not so early in growth.]
the Gurdeners' Chrunicle, there is an article by Mr. Paxton in which he gives direction for watering plants, and points out the necessity of watering according to the peculiar habits of each. I had a watering-can nade twelvemunthis agn, which enables me to do this very effectually, and, at the same time, prevents a great waste of water, as -My watering-can. of which I send you a drawing, is made of copper, seven inches diameter, by seven inche high holding seven imperial pints); in the side and close (the opening of the valve is five-eighths in diametar), brased to the sude of the can. A small copper pipe, three-eighths bore, is necured to this by a nut; at the end of the p.pe there is a small rose, three-fourths of an inch in diameter perforated with holes very similar to a gas-burner. If
nicels perforated, the water will spread without uniting in a stream-the valve is open and shut by means of a rod three-sixteenths thich, passing aeross the can diagonaily, and through a collar brased intu the side just abore the handle. The rod is hifted by a trigger fixed upon the bandle, spring (shown by the dotted lines,; one end of which is

fixed to the side of the can: the other end pressing upon the under side of the trigger, keeps the valve shat. In
using the waterngg-can, flace tied left hand ander the bottonx of is ciose to the prpe, the risht hand of course upon the handie; press duwn the trisger wath the forefinger, which will open the valve, and when the finger is and rose ing ny cas is fuarteen incius, but is mary be troduced amongst small pots of ontintes with yreat facility. I find the can rery bandy ia watering plants in pits, as pormin best trited to its habite. The can is filled through in the a izhourtiond shonid desire to uave a waterigen

 de by Mr. Harris, is very ingenious, and produces, toubt-
less. a useful ins rument. Its principle is e-sentially weters, n: having a diy, and the other a constantly moist-
when buib. The evaj. hation from the wet bulb, and the comequent production of culd, is shoon by the different heights of the merpury in the two tubes; and as the quan-
tity of cvaporation depends tity of uapuration depends very much on the dryness of
the air, this finsmanent, like that of Mr. Harris, indicates the comparative state of the atmosphere as to mois-
ture, but neither of them can, Ithink, be said to measure it. The term Hygrometer should for the present be limited to the invention of Mr. Daniell, because that is the only one which does really measure what we desire to learn, lamely, the number of degrees which the tempera of saturation. This beautiful instrument has been somewhat depreciated by otbers, which, though useful enouyh are in truth but Hygroseopes, and which are all of them
thable to be influenced by the motion, as well as by the dryness of the air. This source of error is to some extent
diminished when the obserrations diminished when the observations are made within
closed building; but sufficient movement mayalways exist closed building; but sufficient movement may always exist
to affect the results, and those results, even when best obtained, do not furnish a measure of the condition sought It has been supposed, though I think erroneously, that the indications of Daniell's Hygrometer are liable to be affected by the strength of the ether used to produce the cold. The ether may be so impure as to prolong the time at all; but this point once observed, the corresponding temperature is a fact independent of all accidents. The instrument should be held so as to obtain a portion of
bright reflection where the dew is expected to appear, because the dew is most easily seen where the line divides the bright and black reffections on the bulb; and inasmuch as the change may not be noticed the very instant that it cocurs, it is well to make a second observation of the temperature at which the dew clears off, and then take the mean of the two. If they are hoth taken equally late, the errors will balance each other, because in one case the mercury is taling, and in the other rising. Although,
however, I consider Daniell's to be the only Hygrometer, the others are very economical, useful instruments, and have the adrantage of being constantly in action.-Andrew Ross, Regent-strect.
Putatoes.-Will "A Cottage Gardener" (see p. 380) be more particular in his statement as to the quantity of Puta toes per diem that he gives his horse? And when he says they "should remain on the fire till they are black," does he potatoe should be reasted black quite through? And is the skin to be mashed up with the meal of the potatue, or the meal only to be gisen to the horse? And what proportion of corn is to be given to a horse, in regular gentle exercise, with his supply of potatoe feed? And also if any water, \&cc. ?- Your Correspondent quite agrees with if such a food is really as beneficial to a horse as the more ordinary and expensive food of oats. It is, how ever, important to ascertain whether any and what mate-
rial sating of expense is thus effected.一An Essex
Treatment of the Fuchsia fulgens.-No plant is more capable of being improved, or more certain of being spoiled by cultivation, than the Fuchsia fulgens. After seeing it in its best state last year, I considered it altoge ther unworthy of the character it had received. I now entertain a different opinion; and that it may afford a hint to others, I detail the treatment that produced this ciange. Last year I treated the plant like a Dablia or
Erythrina; before it commenced growing I shook the whole of the dry soil, in which it had been wintered, from its roots, repotted it into as small a pot as would cuntain them, and assisted the growth by frequent shiftings, until it showed bloom. The result was, so far as overgrown foliage was concerned, as fine a specimen as could be wished. The flowers were, however. very dispropor tionate, and produced in clusters at the ends of the shoots, These were well enough individually, but by no mean realising. as a whole, the expectations that had been formed of it. I was so much disappointed at this, that neglected it, and placed it upon the back shelf of a green house, where it remained torpid until April. It then began to put forth a few feeble buds at the extremities of its unpruned branches; and it was watered with the
other plints, but no addition was made to the soil in other plints, but no addition was made to the soil in
which it had flowered the preceding autumn. This has effected a com:lete and desirable change of habit; the foliage is much reducel, and the flowers enlarged. They have not the same tendency to drop early; and instead of bcing produced at the tips of the shonts only, they form racemes of considerable length, and in this state the plaut furms a dine olject. Why a scanty supply of nourish to the decresse of foliage, has not, I thint, been clearly explained, as the rule is not universal.-J. M., Kenl.

\section*{PROCEEDINGS OF SOCIETIES.}

 The chacti, which, of ail the more dazzling ubjects exhibited,

 langer kinds such as, C. heptargynns, wereo occasimality seen evenh
the lovely fluwers of Epiphylumi syeciosum, ors the singular mit ues of C Hagellifornus, depending gracefully from the sum. in height. Mr. Green, gr. to Sir Edmund Antrohure Bt., Cheam,
who extensively adopus the gratiug process, exhiurted specimens, which abuncanty attesteu its adrantages a plauit of
F.piphym to say that scarcely anytnug but flowers could be pereepered. Mr. Barnes, gr. to (i. W. Nurman, Esy., and of Cereus Jenhinquite as liberally bedecked with their beautiful biossums. Cereus Mallisonii, again, shown by Mr. Bruce, gr. to B. Muler, Esq., sufficient quantity of them was not expanded, and the plant, by what formal. A charming new variety, called Ipity look some ciusum grandiflorum, was brought by Mr. Cpright, gr. to G. C.
Ridge, Esq. Morden, and stood forth conspicuously, on accown
its fowers beinge neal species, and of a deeper pink hue size of those of the original species, and of a deeper pink hue. This, too, was a grafted spe-
cimen. The collection of new seedling cact, sent, by our able hybrids : the principal ones had the habit of Cereus Jentinsonii, with a large proportion of that inimitable blue colour in the
centre which characterises C. speciosissimans partouk of the character of C. Hagelliformis, but haid liwer spise, bluish green stems, and dark crimson flowers, richly tinted with elerant effect. After the Cactı the Heaths created the most strik ing display among the more popular tribes of plants. The specigreen colcur, and the flowers disposed in such enormous and dense masses, that, considering the immense which these remarks are applicable, it may be sadd to be demonstrated that the dificultics supposed to attena the culture of this inestimable genus are altogether imaginary. Every plant, we may observe, had evidently been guarded afainst the injurions exposure
to which they are sumetimes subjected near London, ior the sake hous freely circulated. No list of the species or variethes most beauti fully in flower can here be attempted: but E. splendens, with it: large, inflated, bright scarlet blossoms, and the many varieties of
E. ventricosa, vestita, and tricolur were particularly splendid. E tioning as a handsome variety, with large and conpous yellow peculaarly deep verdure to its foliage, and an abuadance of prett yellow blussoms. Climbing plants were neither numerous no that they are enhanced in beauty and fertility by beine kept in pot, and trained spirally round a cylindrical trellis, we hope tose them more common in gardens and at exhibitions. Mr. Butcher plants of Manettia cordifolia, which completely concealed a roun wire frame to which they wore attached, the pretty red blossom From the same establi, ehment there was a yigantic treilis-traine plant of stephanot1s finribunda loaded with its, fair white and
odorous flowers, and almost exceedung its uatural luxuriance odorous flowers, and almost exceeding its uatural luxuriance, and Echites suberecta, with scattered bunches of pate yeliow and supported lyy a trellis five feet 10 height, was from Mr. Ifunt gr. to Miss Traill, and, by the freedon with which it had been of Howers which cousequenth, adorned each of the shoots, it was rendered very attractive. Clematis Sieboldii afixed to a neat
trellis, by Messrs. Young, of Epsom, thongh quite hard y, show treated; for if fastened to a wall, or any flat surtace, the tiowers are too scattered, and their showy centre is no
up
bi

the best species, as well as point out the giner speciments. Leche nauitia fomosa was again contributed by Mr. Falconer, Paimer, Esy., and some suunger aud rather more healthy plant
were sent by ither exhibitors, of whom Mr. May, gr. to E. Good
hart, Esq.. Beckenham-Mr. Hunt. gr. to Mhs Traul, and Mr, Bame.; gr. to G. W. Norman, Esy., were the chief. Those from the three last persons were in all respects perfect, and the maneir May exhibition, with the promise it gives of coutminaig to do so for a yet indefinte pertou, shows that it has few rivals in point of ornament. Ximelea hiophat, trom Mr. Barnes, was only iutenue
in the filmensions of its thoral toranches to P. pectabitis. P. deeussata, in Mr. Butcher's collection, assumed the torm of a smal tree, its sumgle stem aud dropping head hemg fully six feet above
the pot, the branches presenting a nearly continoous sheet of dethe pot, the bran

and we never sawr beter grown plants. The speime
jidium fasciculatum, from Mr. Butcher, Mr. Jackson, sfe., nrove

 Mr. Girenu, and stants, appeared from Mr. Jach-on, of Kingston,
bably a garden varity
and is allied to gracilis, with retlesed sepals. And we were pleased to notice an aitmirable dwarf and spreading plant of the
old F. globusa, also from Mr. Jackson, which has been too much
 to a good tiowerine state loy Mr. (ireen, and its drouping red blossoms are interesting as
scanty foliage. Two of the best-grown greenhouse plants that scanty foliage. Two or the best-grown greenhouse plants that
we sa were the Borona denticulata of Mr. Hunt and Polygala op-
positifolia, from Mr. Falconer, of Cheam. The first was conspicu-
 ness : the last mainly for the agreeable disposition of its branches,
and the amazing bumuddance of it peculiarly handsome flowers. most meritorious. Gloxinia rubra reappeared from Messrs. most mentorious. Groxinia rubra reappeared from Messs.,
Young, Epom, and from other establishments. and poes on de-
veloping its novel reddish-crimsom flowers with additional free-
 of Gloxinia, and the so-called genus simningia. It is caulescent but dward, has shining leaves, and deep riolet. -coloured blossoms, Gesnera discolor, the plant exhibited by Messrs. Young, of Epsom,
at the last meeting, was produced in a more advanced stage. plant, came from Mr Brue or to Miller, Esq, the colour of plant, came from Mr. Bruce, gr. to B. Miller, Esq.; the colour of
the bracts wha a pale reddish pink, which is perhaps due to the
precocity of their development, for they are naturally, in favturprecocity of their development, for they are naturally, in favourplere scarlet. A specese of Simingla, possibly yillua, deserves
 yellowish hue, are br no means. without beauty. The Nxora
coeccinea, from Mr. Hunt and Mr. Bruce, were bevmid all con.
mendation. A head uf blossoms. on that of the former was at
 stem being surmounted by a panicle of elowing red flowers. C.
hastatum and paniculatum, both with spacious hastate leaves, and large terminal clusters of reddish-yellow blossoms, are valuable stove shrubs, and were exhibited in a most creditable state
by Mr. Hunt. The superb Rondeletia oodorata, one of the handisomest of all stove plant- when properly manazed, ald beariug its
sweet orange and red flowers for plemthened pertod, was, we
think, never seen in finer perfection than as produced bry Mr. Butcher and Mr. Greent. The rikged, rambling halit of this,
plant was hardly to be detected in the specimens spoken of, and the flowers were unusually good. New specles. or such as
are yet comparatively rare, llinstituted ouly a smail portion of
the exhibition. Fuchisia cordifiliai is a a pecies of Mexican origin, and has heart hapied leaves, something like thme of 1. Thigens,
but much smaller. The flowers are borne in the axils of the leaves, are solitary, aud have light dull orange-coloured sepais,
tipped with green. A large specimen from Mr. Cock, of (hir
 from F. Standighti in having greener foliage and redder sepals,
with the petais of a still deeper tint, Fruchsia globose variegata
has the leaves curiously and uniformly variegated. It was prodiced by Mr. Smith, but not in flower. From Messrs. Veitch, of Exeeter, a small plant of Lechenaultia biloba was sent. As it had
apparently flowered without any artificial stimulus, the hue of the blossoms was sinpularly rich, thongh there are decidedly two
or more varieties of thus species. Mr. Marshall, gr. to Mrs. or more warieties of th1s species. Mr. Marshall, gr. to Mrs
Langley, Kinestom, had a plant of Liliun Thunbergianum, which
was of low erowth, and had yery dark orange.coloured flowers. was of low growth, and had very dark orange-coloured flowers. specious new annual. Brachycome iberidifolia, was sent in great
beauty from Mrs. Wray. of Cheltenham. The tlowers vary conbeauty from Mrs. Wray, of cheltenham. The Howers vary con-
giderably in hre. but were, in the present instance, blue and
bluish-pupple. It would seem to be adapted for growine it pote as well as in the open border. Thap wondervil Pitcline phant
and
(Nepenthes distilatoria, about the habits of which such sinsular statements have heell made, was brought in excellent condition by Mr. Mylam, gr. to S. Rucker, Esq., Waindeworth. Some or
the pitcher
the like appendages to the leaves were unusually tine. tution; that is, where heat and moisture abound.-So far we
have restricted this record to ordinary plants and tribes: it now becomes necewary to say, that if judgment were to be pronounced
without the exclusion of any plants lecause they are cearce or
 this enchainting race was all that could be wished by their most ardent admurers. Ahove all the rest, bothin in position-for it was
suspended from the roof of the tent-and in splendour, shone a magnificent plant of Dendidobium fimbriatum, whicich cast on all sides a rich and almost metallic ylow from its golden blor-
soms, os chamingly fringen round the labellum. Literally hun.
dreds of flowers clothed lioth the old and young stems of this specimen, which was not more remarkable for its influrescence than for the regular manner in which its haif-pendulous stems
were arranged round the basket in which it was planted. Hesiors.
Rollice Rere arranged round the basket
Rolisson, of Thiching, furmished this plant. From the same firm
there there were Dendrobium cerulessens, the delicate tints of which
make it even more lovely than the preceding. It is allied to D nobile, difirering, for the most part, in having. a buish tinge in it fowers, and a more pointed lip. Epidendram alatum,

 scapes and spottei blonoml, was shown by Mr, Edmonds, gr.
ti) his (irace the Duke of Devmolire, Cinswick. Oncidium Hexuosum, evincing superior caltivation, came from Mir. Brace,
gr, to B . Miler, Esq
In these notices of Orchidacee, and in all
that have preceded them, it has been the intention to particularise and hriefty describe unty shith as are worthy of eveneral cultivation
and regard, and of which the specimens shown furnish proof that
 branches had heen inrousht down to a povition nearly horizimatal, 1moking intinitetely better than such a s had all their shont, suyprit tud erectly. Mr. Cock and Mr. Catiough were againe the most suc-
eestul exhbitors : therr colleetions were of the same tyle of growth, compact, uniform in size, and covered with a
bloom ; these two collections were enriched with some new
 they were not so compact in form, nor were the colowis so well
selected. Amougs this pecineens that attracted the greatest -imre of admiration, the Priory Queen, in Mr. Catlengh's collection,
took the lead ; was a complete mass of of bloom, and the thwer,
which hithe to has beol winderrated will now tole to which hithelto has henl
place inderrated, will now take tit pestimation. Orange Boven, Comte de Paris, Unar Ledy Mayoress, were also exceedingly fine, and were the subjects
of general commendation. In the same tent two collections were of general commendation. In the same tent two collections were
shown that exhibited ereat want of skill and juilgment in the growers; they served as tuhh th the hetter collect ass, and mado
inauifest the superiority ot thwers that are traineti and a canied
 btand of cut bloom stand of cut bloom from seedlings, exhibited by E. Foster, Esa.
se noticed several beautiful flowers of first-rate properties;
one
only was named, the Favourite, inie in form, colour, and poosessonly was named, the Favourite, fine in form, colour, and porsess
is a good substance in the petals. In a collection from Mrr
Catlengh, the Queen of the Fairies raised Catleugh, the Queen of the Fairies, raised by the Rer. R. Garth,
attracted much attention; the under petals are pure white, and margin of whate, wheh gives the flower a lively appearanc There were vthler, worthy or emark, but as aney were mpit uamed
it is impossible to particularise them. Mr. Gaines's Rising Sun it is imposible to particluarise them. Mr. Gaines's Rising Sun
Wa a tractive from its Luighturs, and a seedling from sin. Beck that most attracted our notice, but they were exhibited in a smat tent, that was crowded to excess, so that it was difficult to get sight of the howers, and mure so to ascertain to wium they, be
longed. There was also one with curiusty-cut petals. The shrubland Scarlet, - snith's scarlet, waich has ies leaves but
similar thowers. and one called ( nimpactum. laving
imater and
 finely-bloomed fowers. his seedlings were much almired, par
ticularly one unow which the lacing was very deticate and per
fect. Mr. Willmer also showed a goond stand, andi the amateur in this class merit mucir praise for their exerturus. The (alceo-
larias were finely bloomed, aud exlubited their gay and lively
 trussing make them desirabie varieties, Mr . (icens seedlin
Calceotarias were splentil- - pecimens in form, size briliancy collour, and preeicion of marking, and exhinited a sreat improve
ment in this class of tiowers. The Heartsease were nut so nument in this class of thwerc, The Heartsease were not so nia
merous as usual, and we did not observe anything uovel in this
 culuses were small, but they contained some beautiful specimens.
of the Roses it the centre of one of the large tents, that the variety seemed in finite the whole detictonsy fragrant aid meautum, The specimens from Mr. Rivers, of Sawbridgeworth, were remar rably well shown,
is well as extremely beautiful, and afforded us an opportunity of making the following notes :-In Moss Roses, the Blush, the
Crimou, or Tinvell, the Liux embourg, and single Crimmon, twere metals; Sylvain, a very large and fine deep rose-coloured variety Rusa Gailica, Shat-yeare, a suvid shaded crin-un, Eclat de
Roses a deep rose-colour'; Sir Walter Scott, deep purplish-crim son: Rien-ne-me-Surpasse. a vivid red; Vesta brilliant semi
double cearlet; hean, bnult scarlet, aud very double. \(t\) somblace
 lobred, Fleur d'Amour, deep cinson-purple, Madame Dubarry,
of the same colour; Oracle du Siecle, very darl crimson, Boule de Nanteail, crimson-purple, were finely-shaped prize
Rosee Rosea, large, double, and compact. Amoog the Spotted and
Marblea Ruses sif th.s family, Puichra Marmorea. Berlicze, Picotice, and Bizarre Marbre were very striking, Of Hybrid Provence,
Blancherleur, delicate thesh-colour, Duchesse d'Orieans, biash, Mélanie, pure white; Enchanteresse, deep rose colour; and Rme
raulte of a a creauy-white, were fintly slaped and heautiful Roves raude, of a creauy-whit,
of Hy brid Cina Roses the varieties were very nomerous: Mo

\section*{GARDEN MEMORANDA}

Highclere- - So mach interest was excited a few years ago in the by the account published by Mr. Louddon, in Vol. 10 of his Gur denlection of heath-mululd plants, that we requested a friend, con versant with such subjects, who had loceasinn to vinit the neigh He found Highclere in great beanty of folinge its present state tion of the Bech which had sufered conside blight, and incharacter and scenery abundantly justifying the
eulowien of Mr. Iondon. The place is very extensive vith miles is woodland drives, is greatly varied in surface and local circumstance, and terminated to the south by two conspicuous hills, singularly contrasted, one (Sidon Hill) most luxuriantly adorned
with wood arranged in the lapplest manner, the other (Beacon Ifill) smonth, somethat pyramidal, square foppert, crowned of an anclent entrenched camp, and looking like an artificial constructwn of Titamic magnitude. Beneath these hills spreads the
remainler of the park, with its woods and dales, its glittering remainler of the park, with its woods and dales, its glittering lakes, and pieasure grounds and splendid trees, bearing ample
witness to the taste of its successive owners. When Mr. Lon then's acmunt was written in 151, the late Earl of Carnarvon had been removed frum this world but a few months. His son
the present Earl, seents tu be fally alice to the atration the present Earl, seents to be fully alive to the attractions of his pitre, and augumentine itvely engaged in develowing its capabiby a hoara and scaffolding, erected for the purpose of carrying into execution a splendid design of oar great architect Mr. Barry whioh excited mach attention at the last exhibition of the Roya their glorious Azaleas and Rhododendrons. The hybrid Rhododendrons, intermediate between R. Arboreum and R. catawbiense brilliant in their wared livery of bright crimson. Theen most hybrids, between these hybrids and R. ponticum var, atro-parpureusa, were exceedingly benutiful, of many shades of deep crimson, deepening into rich purple, and with very lacid foliage. These second crosses are quite hardy in the rudeclimate of high-
clere, wherc the R. Altaclerense suffered greatly, and is hardly recovered from the winter of \(183 ;-8\). The first set of the many hydron ponticam and catawbiense. These plants, which form ezdensive naasses, were perfect hillocks of bloom, so profusely also a few interesting hybrids between \(\mathbb{R}\). catawbiense and and R. campanulatum; but these last have not yet attained a Rowring age. We have said enough to show that the hybrid their splendour, and to the experienced horticulturist specially but the extraordinary beauty. blewied with a frafrance that Azaless. it winld he dificult to describe. The hybrids hybrid Azalca calendulacea var trimmphans and izalea ruhencens majur were masses of outhrus towers of every shate, scarlet, crimason, orange, yellow, rream c.lour, with intermedrate and inter-
mugled tuta if yrcat vanety. One large compartment of eight burders, forming in their aggregate a Catherine. wheel pattem, new hyrid Azalens were in flower for the first time. Of these the most promucing are betwern izalea sinenvis and Lzaiea rubescens majni, ore of which, of simgular beauty, communuated by Our himits preclude us from enterine into more detall on thiy brancu of pur friend's examuatan, out we must not omit to senbed by Mr. L.cuden, in ereat beanti cailed Miforn, and it shores hail been rebout in excrillent taste, and eniargert so as to accommonate the notie ;mpretor, who, with has fanmit, resided Thas spot, when seers, as it wad seen jy vur triemit, in tie morning with its sparklimg expanse of water, its istands of Azaleas, its noinde wonds crowned at then culmmating point ay a cireular and columnar temple of chas erable magutude and elatvation. lately re-modeled min haprot manne?, after the designs of Mr. Bargy-is descrined eno as one of the luveliest and moct remarking that the views uf the last two peossecuor- of mimnclere sem to te carrued net in the happsest spurit oy the present Eart and we ce cratuate anr readers on the fact that a place which

equally applicable to all tender insects infesting the points of
branches. I.-KITCHEN-GARDEN AND ORCHARD.

Pingry. --There is a fanit prevalent at this season of plunging
the young growing Pines too thick, which usually orimates persons continuing to grow many more young plants than they
have room to mature. The plants are now about to make their most vigorous leaves; they should, therefore, have all the room possible, to prevent them becoming long and weakly. In re-
plunging now, if the state of the beds will admut of it, liunge the
pots to the rim. In honsci where there arc rafters, a sliyht shading during the midule of the day will be
beneficial, as the full blaze of the miduay sun wul miure their colour. Water may be freely given to the plants now, as often as
they scem to require it. Cuntinue to syrine orerhead in tine
weather, but withhold all water from those ripenig as soon is weather, but withhold all water from those ripening as soon ne
they begin to change colour. Give occasional waterings of
manure-water, except to newly-potted plants, and abundence on air at all favourable opportunities. Vinsiry. - Where the fruit is cut, use for a few days strone
measures to annihilate red spider, and then give the vines free exposure. Weli-drained borders shourd be copiously watered left, small berries and want of colour oceupies; if to, manyar the foliage to becone so thick as to shade the fruit materiady
when the roung wood has become hard, the lateralis miay b broken clean off, begimming at the bottom and gratually hreakin eyes breaking if the vine is kept growing at the tap. Continue to thin the berries, giving air and moisture as before
Pench-butse. - (rive alundance of air, and use the syringe
freely in the morning. Plants in pots shond have manure-wate given them oeca-ionally; keep the shom have manure-wate and use every precautionary means against insects; Irequently FiG-Bouss.-Summer pruning may be practised here, if it hat
not been rendered unnecessary by disbudding before. Give ato MELONー
Melons - Earth-up the late plants as they advance in growth: bed to become coid, and shatr lichtiy during rery hot aunshin in the middle of the day. Any emrly Meluns that have matured
their fruit, and remain healthy, may be made to yielu a ecour and frepruently a better crop. By pruning them into some healthy young shoots, renewing the linings if becessary, an
shading them for a few days, they will put forth vigorous and all favourable occasions, and regular supplies of water. CuccubsRy.- Remuve any bad leaves ur uperftunus vines; give water aud air in abundance; stop those under hand-glass; the soil will be useful.

\section*{NEWS OF THE WEEK.}

Our Foreign News is not of great importance. From France we leara that the Minister of Finance has pustponed the projected loan, in consequence of the Report on the Budget recently presented to the Chamber of Peers. It appears from this Report that the financial state and prospects of France at the present moment are partiomarly unfarourable, and that the contemplated loan wiuld \(=0\) completely absorb the floating capital of the country, that any unforeseen event in the policy of Europe, or a commercial crisis at home, would produce serions embaransments. The Government has abandoned the prosecution of the Journals for puhlishing the letters of the King, and has collected two powerful squadrons at 'roulon in reference, it is said, to the present distracted state of the Tarkish empire.-In Spaia, the Ministry has sustaised another defeat on the bill relative to alienated properties, which though not on an inportant question, is sait to have crented some alarm in the Government circles. - In Portugal, the Ministerial crisis is not yet terminated ; after several attempts to organise an administration, it does not appear that anything decisive has been settled; the Duke de Palmella, who had been applied to, has been unable to form a Cabinet, but it is considered probable that a more successful attempt will be made under the joint direction of Senhors Cabral and Magalhaes. The recognition of the Queen by the Pope has given rise to a royal address to the Prelates of the Church, announcing that this event will concuce to the settlement of all existing difference with the Holy See, and it is expected that it will directly lead to the recognition of her Majesty by the Northern Powers. -In Germany, the priucipal topic of attention is the subject of a national representation; and the Rhenish Diet has appealed to his Majesty with the view of settling the question of the Archbishop of Colegne, either by restoring him to his see, or by bringing him to trial in ceath of the Sultan is gradually declining that the health of the Sultan is gradually declining, and that Greek Patriarch at Constantinople has been deposed, and the event bas caused much excitement among the Greek subjects of the Porte. The firman containing the concessions to the Pacha of Egypt has been kept back until the concurrence of the London Conference in the conditions on which they are offered is ascertained. - The insurrection in Bulgaria is said to be put down, although the excesses of the Turks still give rine to discontent, which may, it is feared, again break out in open rebellion. The arrival of the Turkish forces in Candia has not yet checkrd the progress of the revolt. and the inșurgents are said to be desirous that the island should be occupied by the English. The state of Syria also gives rise to apprehension; the Druses and the Maronites refuse to acknowledge the recent decrees, and have taken measures to resist any hostile movement on the part of Turkey.-Intelligence from the United States inferms us that the Courts will not deliver their judgroent in tise case of Mr. M'Leod this term. The next arrival is expected to bring the President's message at the opening of the Extra Session of Congress. At home, the attention of Parliament has been entirely occupied with arrears of business, preparatory to the dissolution, which is expected to take place on Tuesday. Several bills have been passed by both Houses, and some incidental discussions have arisen on the Corn Laws, for which we must refer to our Parliamentary Report.

\section*{73lome Nepus.}

Court.- Her Majesty and H. R. II. Prince Albert left town on Monday morning, for Nuntham Park, the seat of his Grace the Archbishop of York. The Queen, with his Roval Highness, remaiaed at Nunebam until Hedncsiday

The rep, , wow, \%iol. that the contemplated loan of \(1.00,0,0,0\).., sterling, would absorb the whole of the avemaning deficit. France, and thating to nearly a shailar sum. Would require the amour fin fears to come. Thele surplus concludes by observing that this wholesale absorption of the entire flonting capital of France at the per sorption of the en its sinking fund for six years to come,
and assuming that the revenue will in that interval anderg no diminution, leaves not one available shilling to meet gested by the report, such as a commercial crisis, or the necessity for sundry expeditions to remote quarters of the world to support the hononr and dignity of France. The from such fortuitous events, any, of which would derange form us that in consequence of the above report the form us that in consequence of the above report the
Minister of Finance has postponed, for a short time at least, his intention to bring out the loan.
Lelters of Louis-Philippe.-It is stat Lals that the Government has received information that the extensive forgeries of letters, purporting to be written by the King to the late Baroness Feucheres, are, in process of fabrication, grounded upon some genvime letters the hands of certain parties, who, however, are not named. In reference to this sabject the journals are mach occupied in discussing the question, whether the constitutional inThe projected prosecution of the journals publishing the ofensive matter has been abandoned by the Government. The Ministry, it is stated, had consulted several influential Peers, as to the expediency of referring various press pro-
secutions to the Upper Chamber; but opinions were so secutions to the Upper Chamber; but opinions were so
divided and more serious considerations so weighed on the Ministry, that the motion of submitting the affair to the jurisdiction of the Peers was abandoned.
The Fleet.-Accounts from Toulon of the 9th inst.
inform us that the squadron of Vice-Admiral Hugon, composed of 12 ships of the line, one frigate, and a steamer would sail on the next day for the purpose of executing extensive evolutions between Sardinia and the Balearic Islands. Palma was to be its rallying point. Rear-Admiral Lassusse, who had been called to Paris to receive turned to Toulon, and his division was expected to put to sea in a few days. Subsequent accounts of the llth inst. state that the squadron of Admiral Hugon put to sea
on the 10 th ; but that having encountered a strong gale on on the 10th; but that having encountered a strong gale on
quitting the harbour, the Admiral had altered his course, quitting the harbour, the Admiral had altered his course,
and gone to anchor among the islands of Hyerres. -The following is stated to be the amount of the naval force Which France has at her disposal for the Mediterranean: 26 ships of the line, carryiug 1844 guns; 7 frigates, 270
guns ; 9 sloops, 214 guns ; 16 brigs, 94 guns ; 8 transguns ; 9 sloops, 214 guns; 16 brigs, 94 guns; 8 transport sloops, capable of carrying 194 guns; 26 steam-ships,
capable of carrying 194 guns; and 12 smaller ships, capable of carrying 36 guns; making a total of 98 ships, and 2,804 guns.

Algeria. - A telegraphic despntch of the 11 th ult. Gen. Barguay d'Ifillier returned to Blidah on the 2d, after having destroyed Boghar and laid waste the country through which it passed; there was at Boghar a cannon foundry, the taking of which would, it was thought, prove
a serious loss to the Emir. The Duke de Nemours a serious loss to the Emir. The Duke de Nemours
returned on the 8th to Algiers from Mostaganem, and arrived on the lath at Marseilles.
Spain.-The Ministry experienced another defeat, in to allenated properties having come under discussion, the Minister of Justice observed, that the committee appointed to revise the codes would necessarily regulate the matter, and that it was consequently needless to entertain the however, refused to withdraw it, and the bill was afterwards put to the vote and carried by a large majority. This defeat, though not on an important question, it is said,
had inspired alarm in the Government circles. The Minister of Grace and Justice and the Minister for Foreign Minister of Grace and Justice and the Minister for Foreign
Affuirs have had a conference with the special committee, Affairs have had a conference with the special committee,
to report as to the guardianship of Queen Isabella, and it Was said that it would be immediately brought before the
Cortes. There were also rumours that the Infante Don Cortes. There were also rumours that the Infante Don
Francisco de Paulo was expected in Madrid to urge his rights to the care of his niece during her minority. The Minister of Finance had not met with success in his endeavours to raise money. A proposal of the house of Safont was considered in a Cabinet Council on the 5th, but the terms rere found to be so hard as to cause their
rejection. One of the Deputies had announced to the Pejection. One of the Deputies had announced to the
Ministry, that if, previously to the 12th, they did not give some information respecting the Carthagena affair, as to the satisfaction obtained fom the Britiag Government, he position made for the demolition of the fortitications of Barcelona had been adopted by 98 against 28. To erec̣t these fortifications, under Philip Y.., it was necessary to remove 3 , fiyt edifices, and to sacrinice 33 fine streets. A
telegraphic despatch of the 11 th irom Perpignan announces telegraphic despatch of the 11:h irom Perpignan announce
that on the ith disturbances had broken out at Bareelona 3000 to \(4(001\) ) workmen (wearers) endeavouring to obtain possession of some cunfiscuted goods, which were advertised for auction, the Chief Poilitiyue and the A yuntamiento not being able to suppress them, purchased the goods, and Aguntamiesto, which was illumanated on the occasion. It is reported that the articles so confiseated and burnt were of Euglisin manufaeture.-The clock tower of che cathedral of Valladulid gave way on the 31st ult., after a very severe storm which bruke vier the town and lasted nearly two hours. Fortunately no lives were lost.
Portcgat. - We have received accounts from Lisbon to the 7 th inst., by the Braganzas steamer. The ministerial crisis was not yet over. It appears that the first appeal to the Presidents of the two Chambers having been
without any result, the Conde de Bomfim and Senhors

Magalhaes and Cabral were successively sent for to Ciutra whither the Court had removed ; subsequently the Duke of Terceira was also sent for, and, on his declining the charge, the Duke Chalmella was again applied to ; and it
was stated in the Chamber of Deputies, on the 5th, that he ras definitively occupied in the reconstruction of the Ministry ; but it appears that nothing was dune; and the general report was that he lauk abandoned the task, and ganizing the Cabinet; Baron Leiria or Marquis Saldanha being spoken of for the War Department, and Senhor Charallo for the Finance. The Finance Committee of the Chamber of Deputies had reported in favour of the condends. The Queen had addressed congratulators divito the Patriarch of Lisbon, the Archbishop of Braga, and and in prelates, announcing her recognition by the Pope the settlement of all the existing differences between the two Courts. It was supposed that this proceeding of th tion of the Queen by Austria and other Powers. -The tion of the Queen by Austria and other Powers. -The
hopes excited respecting the steam-ship Presidonl, by the Conde de Palmapst having met with a steamer, under sail on the 23 d April, (referred to in a former Number of this Paper,) are damped by the arrival at Gibraltar, on the 2d inst., of a French steamer from Brasil, and lat from the Azores, and which having been out 94 days from Rio
83 from Bahia, and 20 from the Azores, it is thoughi, might have been the vessel seen making for the Azores by the Conde de Palma.
Germany.-Accounts from Berlin state that the inhabitants of Breslau had addressed a letter to the King of Prussia, renewing the assurances of their devotion. The provinces of Silesia had refused to comply with the dea constitution throughout the entire monarclyy, and the a constitution throughout the entire monarchy, and the
same request made by Prussia had met with similar opposame request made by Prussia had met with similar oppo-
sition.-Advices from Cologne of the th announce that a thousand of the most respectable citizens of that town had addressed a petition to the Rhenish Diet, calling on that assembly to remind the King of the promise made by his father in 1815 to give a national representation to the States. The Diet has since made the application, but the result is not yet known. The Diet adopted on the 1 tha a proposition having for its object to invite his Majesty for trial before a Court of Justice. - We are or sent him steam-communication between Prague and Dresden, by the waters of the Elbe and Moldau, is now fully established. Switzerland.-Letters from Berne, of the 6th inst., mention that much coolness existed between the Austrian Minister and M. Neuhaus, the Avorer, in consequence of an angry interview which they had lately had together Italiz.-Accounts from the Argovian convents.
Italy,-Accounts from Rome, dated the 8 th inst.,
tate that Don Miguel resides completely retired at Albano. When the Pope determined to acknowledge Donna Maria, he sent for the Prince and explained to him in a private andience that weighty reasons obliged him to re-
cognize the estaulished Government in Portugal. The Prince was greatly affected. The Pope endeavoured to console him, by pointing out the prospect of a considerable pension and the arrears of former years. Don Miguel finally consented, and expressed his willingness to conform to the judgment of his Holiness. On Don Miguel's return to request the Pope not to interfere in his favour, as he would not renounce his rights to the throne
Turkey.-Private letters from Constantinopla report that the health of the Sultan was giving way daily; and add, that he is reduced to a state of emaciation and weak ness which leaves litile hopes of his recovery.-The Gree Patriarch at Constantinople has been deposed.-Lord Ponsonby s departure, on his retorn to England, it is said, has been deferred, in consequence of the serious state of things in various parts of the empire.-Subsequent accounts to await the next post from England, ere despatching the firman finally to Mehemet Ali. The post was expected to bring fresh communications from Chekib Effendi. The tribute fised on is said to be of 80,000 purses, or four ambans of Turkish piastres. M. Pontois, the French the elder living member of the family shall succeed to the Pashalic of Egypt, instead of the first-born, is said to be more consonant to Mussulman habits.- The Bulgarian insurgents had become quiet, but the Turkish military au thorities continued active and cruel in punishing the po
pulation. The Pasha of Nissa especielly showed no sym pulation. The Pasha of Nisss especially showed no sym troops and fortifications ; 80 much so, that he was suspected of having the design of making an inroad upon Servia. By others it was said he was strengthening himself against the eumity of Jacoub, Pasha of Adrianople.
hat Tahir Paulha had landed, on the 16 th ult, with 50010
men and a park of artillery. On the loth he issued a proclamation in the name of the Grand Sigaior to the Christian authorities to lay down their arms. The European Consuls recommended them to submit. The head of the ject the proposal of the Suitan, bot that he would consult the legislative bodies. They were preparing for defence, and there existed great irritation against the Turks. An arder of the 20th called upon the inbaisitants of Crete for gents were extremely anxions that their island should be occupied by the English, and that they had even openly
demanded the intervention and asaistance of this country.

Syria.-According to the last accounts the Druses and the Maronites will \(n\) it whiusledge an:y batti-scheriff nor Lerps of obserration dt Jeichen, and an adranced post a Ascalon. - The phigue is still rasin.g throughout Syria, Uniten statand
Liverpoul on Mondar afternouledunia, which arrived at ork papers to the 31st uit., inclusire. The arguments in the case of Mr. Mr eend ran abstract of mich mas given in our last Number from the acosunts brought the tannia) having been concluded, the Supreme Court took time to consider its judgment. It afterwards made an order, "that, inasmuch as it is impossible that any decimitted to the custody of the Sherif of Leod shall be comthe Sheriff of Niady herl, and that The Sheriff of New York had refused to undertake the responsibility of the custody of the prisoner, who is said to be very well treated in his peculiar circumstances. The Halifax papers are loud in their condemnation of the treatment which Mr. M'Levd has received at the hands of the verament, and blame che supineness of the British Go England seem to farth the to lorku papers friecuing the case of the prisoner may lead to a serious dispute between the two countries. Mr. M•Leod has published a letter, in which he denies the boastings alleged to have been made by him that he was present at the destruction of the Caroline, and complaius of persecution on the part of the tains little or nothing of import to the case. -The extra session angress was to commence on the 31 st ult. The message from the President would be delivered on the lst inst. The journals are filled with speculations as to the leading business which was likely to engqge the attention
of the Legislature. - The National Theatre at New York had been destroyed by fire on the morning of the 29th ult., supposed to have been causied by incendiaries.

than 5,000 of the electors. He should not have ventured under any other circumstances to aspire to such an honour,
but whilst he felt that ander other circumstances, and witheut such an inritation, it would have been arrognnce on his part to ask for the suffrages of the electors of the such an invitation, be could not but feel equally that it would have been little less than poltroonery in bim to have refused to come forward. His lordship then pro-
ceeded to lay before the meeting the rarions considerations which had induced Ministers to appeal to the country; observing that it was their duty to consider not only the questions affecting trade, but the finances of the country.
He then alluded to the incrense which bad been made by sereral foreign porers in their navies, and observed that however desirots they might be of economy in the management of the resources of the state, it was impossible to allow this great country to be placed in a position inferior iordship then addressed himself maritime forces. His whose apprehensions, he said, were groundless ; a prosperous mercantile and trading community must always, he thought, be the best customers for the agriculturists. The noble lord concluded by sayiny that Ministers had advised the Sovereign to dissolve Parliament in order to appeal to
the people. By that decision they would be content to abide. He had great confidence in the good sense of the people of England, and in the somedness of the principles triumph by their rerdict. The other candidates then addressed the meeting, which shortly afterwards broke ul. The Census.-On Tuesday, the enumerators in the various districts gave in their returns to the various registrars, by whom they are to be forwarted to the census was to tabulate and arrange his returns so as to remder the labours of the commissioners comparatively light. A correct idea of the extent of population, it is thought, will be obtained in ahout a fortnight.
Battersea Bridge.-At a court of conservancy, held before the Lord Mayor and other city authorities, at the Town-hall, Southwark, on Saturday, for the purpose of
sirearing in the jury for the conservancy of the Surrey side of the Thames, the Recorder, in his charge, adverted to the antiquity of the office. and the duties attached to it, that of preventing any nuisances or obstructions in the Thames, and said that within the last few weeks an accident of a serious nature had occurred at Battersea Bridge, Which was proved, upon an inquiry before a coroner's bridge was built; the obstructions from the starlings, and the lowness of the arches at high water. The jury subsequently proceeded un the riser in the city barge, for the purpose of making a personal riew of the nuisances comtion at the next conrt-day on the subject. From the remarks of the Recorder, it is thought that the bridge will be pulled down, and a new one erected in its place.
Importation of Oren and Miat from Scotland.-It appears that the number of oxen brought to London during last week by the Dundee, Aberdeen, and Inverness steamers exeeded 500 , besides 100 tons of fresh meat
being imported by the Edinburgh steam-slips. On Tuesbeing imported by the Edinhurgh steam-ships: On Tueswith 130 osen and 90 pigs. A stean-shir, from Berwick, on Monday landed 50 bullocks; and another, from Leith imported 50 tons of meat for the metropolitan markets.
Murder at Woolwiwh.-A gunner, named M'rarrettey, who 4 battaion, R. Ar, recollay in the Royal Arsenal retired, after being dismissed guard, to the canteen, where he became intoricated, and then quarrelled with another gunner. Several persons in the room interfered, and pre vented farther mischief being done. After this \(M^{4}\) Garrettey left the canteen, and proceeded to the barrack-room A bombardier, named Grace, was standing at the widow, When M Garretty proceeded deliverately to dhe place where his musket stood, and taking it down, fired it at him, when Grace immediately fell. An artilleryman, alarmed by the report of the musket, entered the roons and discovered the prisoner, who at once admitted that he had shot him. The wounded man was conveyed to the Ordnance Hospital, where every assistance was rendered, but he died after some hours' suffering. An inquest was held on the body together withen the above lecessed taken before his death, that the prisoner asked him to lend some money, which he refused. Several officers and soldiers were ex amined, who stated that the prisoner had been 15 years in the corpis, and bore a general good character. The insestigation lasted several hours, and a verdict of "Guity of wifnl merder" was then returned.

The F'resident. -The large steamer seen by the Captain of the Osprey, referred to in our Number of last week, and supposed, by some, to be possibly the long-missing steam-
ship President, has proved to be the Manchester steamer from Hamburgh, which arrived on Satarday evening at Liverpoot, to be fitted mith engines. It will also be seen by our Foreign News. under Portugal, that the steamer reported to hase been seen by a merchant vessel arrived ex.itho, making for the Azores. aud wrunate rissel

Viger Expedition.-Arcounts received from Madeira inform us of the arrival at that island of the Albert and Witerforce, two of the steamers composing the Niger Ma, May, for Teneriffe, at which place the Soudan had already arrived, all well.
Launch of the Ship Trafalgar.-A ministerial paper states that in consequence of the numerous impositions practisel at the launch of the Thunderer in 1831, by persons gaining admittance in uniforms, though belonging to neither branch of the service, no person whatever can be admitted into the main gate of the Doskyard, on Monday next, when the Trajalgar is to be launched, withou mullitudes who have aplieptain Superiatendenk. The week for admission appliel at Dorkyard during the so great, that painted boards have been pat up at the gate so great, that painted boards have been pat up at the gate be admitted on board; and of the thousands who have risited Woolwich, a very limited number of naval and military officers, and gentlemen in Government service and their friends, hase obtamed written orders to go on board. The bnoth constructing for the reception of her Majesty and Prince Abert is proceeding rapidy, and has an appearance similar to that of the royal boxes at the theatres, and will be decorated with Hays. It is situated on the \(\pi\) mest sute of the yessel, and is next to the riser Seats, in the form of gallerics, are also in progress of erection at the south and south-east side of the Trajalyar, and they appeir to be so strongly constructed that there is no chanc broughtent. The Messcnger steam-vessel has been cention of the Lieutenant-Governor of Greenwich Hospital, and those connected with that establishment. An order has also been issued that all the old sailors now in Greenwich Hospital, who were engaged at the battle of Trafalgar, should be on board at the time of the launch The river on the London side will be kept clear of ressels, as the launch will proceed upwards, on entering the river with the tide.
Mortality in the Metropolis. - The following is the result of the Table of Mortality for the metropolis issued from the office of the Registrar-General, showing the number of deaths from all causes, registered in the week ending Saturday hast:-total 826. The average weekly deaths last year were 926.
Fires.-On Wednesday night, a tavern in Creed Charchhane, Leadenhall-street, narrowly escaped destruction by and is and is supposed to have originated from some lighte of sawdust.-On the morning of the same day a fire broke out at the distillery of Messrs. Clark and Co., Finsbury, which was occasioned oy a the roof of the distil-house was in flames. The fire, how ever, was soon arrested.-On Thursday morning, a serious fire broke out on the premises of Mr. Green, grocer, Brick lane, Old-street-road, St. Luke's. The fire, after much exer-
tion, was confined to the lower part of the building, which tion, was confined to the lower part of the building, which is nearly destroyed.
Acculents. - On Wednesday morning, an accident was thought at new Houses of Parliament, which at firs It appears that a creat number of men were engared in excavating the earth, and had nearly reached the depth intencted for the foundation, when on a sudden a large mass of earth and stones fell in. Six labourers were found to be missing. Every exertion, however, was immediately made, and after some time they were dragged out. One man was found to be so much injured that it was deemed necessary to convey him to the Westminster Hospital, and he is not considered to be out of danger. The other five \(\mathrm{O}_{\mathrm{n}}\) Thursday a serions accident occurred in the tan-yard of Mr. Hooper, Bermondsey, to a man named William True. It appears that he was employed close to a wooden fence at a time when some young men on the adjoining premises were amusing themselves by shooting at a mark with ball. Several shots had been fired, when one of the balls penetrated the fence, and striking True, passed through his thigh. He immediately fell, and bis cries tronght some workmen to his assistance, by whom he was con:eyed to Guy's Hospital, where he remains in a precarious state.
Robberies.-Da Monday night a robbery of jewellery of a most extensive nature was discovered to have taken place at the residunco. This terrae is andice row of buuldings, and three louses next to Mr. Russell's on one side are mere carcases. It would seem that the thief had, in the first instance, obtained ingress into one of these unfinished houses, and having attale i the roof Frised the hasp of the front attic winduw. rinith was found open, and from thence passed through the rowm down the
staircase to the second floor. in the front room of which were three jowel conkers. Mf. Nossell tates that his property was sufe on a ho hosen for dimper, The value of

Lancaster. - The action brought against the Lancaster and Preston Railway Company, by Muschamp, a poor the I mencaster office of the railmay, for Bonslow, in Der byshire, hiss been recently decided in the Court of Ex chequer. The cause has excited great interest in thi the public at large. It appeared at the trial, that the plaintiff knew that the Company on y professed to carry
as far as Pieston; but as they took the parcel so directed, and the carriage being to be paid on delivery, the learne judqe, before whom the case was cried, left the fact of
reception and booking to the jury, as eridence from which reception and booking to the jury, as eridence from which the jury having found for the plantiff, this rule was ob tained to review that direction. In defence of the Comloss wh was contended that they were only is in their own care. The loss, however, had arisen after it had been delivered by them into the hands of another Company, by which it was to be carried onwaris, and their contract only was to carry it and deliver it to the other Company at the termination of their rery properly left to the jury by the learned judge. It rery properly left to the jury by the learned judge. It
was admitted at the bar, that the contraet of the defendwas admitted at the bar, that the contract of the defendit was contended that they were only bound to hand it over to the suceeeding company. Now it appleared that the carriage was to be paid for on delivery, and it nust be
manifest that there was some understanding between the railways as to the division of the profits; so that if one company received and booked a parcel "all through," the contract would seem to be to carry it all through; and a loss. if any, arose, it was but proper that he should look loss. if auy, arose, it was but proper that he shuld 100 k
to that compuny at whose office he had bookel the parcel, as they by tahing it must be presumed to lave entere into a contract to carry all through by their ayent ruling of the learned judge was therefore, in his opinion, dence to say whether that was not the coutract; and He therefore discharged the rule, thereby giving judgunent against the
Tetcolf.-We have been informed, on gnod authority that the paragraph we copied in our Twenty-third Number Honse, the seat of Sir William IIolesworth, Brat., M.P. vas incorrect. It appears that it was a very neat Italian ropenty when hen henstir property when he became of age, about six or seven years
ago. at the cest of about \(£ 12\), ,0u0; there were no slirubheries, gardens, or conservatory, as stated, nor any gar deners kept there. The housekeeper, who is the principal servant at the place, and who discovered the fire about

It originated from a beam of wood connected with the roof having been built through the chimner; this ignited and set fire to the thatch.

Forcester. - Un Friday a strange occurrence took place in this city. Dr. Pepys, the new bishop, having repaired t) the Palace, for the parpose of tahing possession, found the gates of the building closed agzinst him, and on presenting himself at the grand entrance and demandiag
aimission, was told that the palace was in possession of admission, was told that the palace was in possession o
another party, and thas his Lordship mould not be rer mitted to enter! A crowd of persons, attracted by the proceedings, witnessed the appilication of his lordship, who persisted in his claim. The party in possession wis deal oblized to sstrance, and 4 elsemhere. This notieasant affair is nuderstood to have arisen from a claim made by a creditor of the late bishop upon certain property within the palaee. The bishop retwrned to London on Sature ut his family remained anving been effected. Mrs. Pepys and the fawily were per anitred to enter the palace.
Findsor.-Some excitement has, within the last few days, been caused here among the lovers of the mysterious by a report having obtained eirculation that a house at Clewer, about a mile from the town, was "haunted. The house, it soems, is occupied by an elderly couple,
their swo danghters, and a feraale domettic. Certain
noises heard in the house are the evidences of the ghost presence, which it is said resemble those which would be
caused by a person striking his knuckles sharply and rapidly against the panel of a door. In order to set the minds of the people at rest, several county magistrates, hood, have visited the house, but have not been abler clear up the mystery. They have all been present during although herrandinary noises have been repeated, and although they have apprarentiy proceeded from a door leading from the kitchen into a c! st, close to which the
parties have stationed themselves, they have not been able to discover any trick. The knocking is so loud that it is heard by the inmates of houses 4119 or 5011 yards off Lord Clement Hill, Mr. Fuster of Cewer House,' and Mr. Riley of Forest Hill, and orher gentlemen have the ball, within three yards of this dwor, and as soon as the hnoch ing commenced ru-hed to the spot; but no one was found near it, and the whole of the fanmly were in different part of the house. In order to ascertain if the door of the closet was struck, a small piece of chip was ing had ceased this had fallen on the floor. Sn suock the son of the eccupant fastened the door by means of piece of trire, and aftur the nuise had ceased, the wit upon examination was found broken and the door force open, inwarils. At one time, the don was taken off it
hinges and placel at the back of the closet, but the knock ing was precisely the same as before. A number of the gentry in the neighbourhood bave visited the house.
Irigan.-On Satarday evening, during the contirmation \(^{2}\) held at St. Thomas's Church, A-hton, near this town, a serious oceurrence took place, which arose from a report had just concluded contirming the females. The Bishop was heard in the gallery, and this created an impression that it was giving way. A general alarm followed, and rush took place towards the stairs. In the confusion, num bers of females fell at the bottom, and others who fol femol fore them, until the staircase was thed ap, tho By the aid of the police a chearauce was at length effected after the lapse of half an hour, and all who had sustained the most serious injury were carried into thie open air. A litt sight many ape life, lithough, however, atem ber of females were seriously hurt, they have since been ascertained to he in a fair way of recovery, excepting one aged person, who was so injured that she died the same even ing. An inequest was hend and a verdict of "Accidental actually slid down the pinars supporting the roof to the bottom, and several attempted to jump duwn from the gallery, hut were prevented. The «allery has since bee carefully exammed, when it was fumb that it hant not sus the noie slightest oujy, nut cas sowere fallure of Mr. Đarmell by Messrs. Heron and (o., have stopped payment. A meeting of credters is called, when pesition made to resume working. Milliarn.-This village was a few days since the scene of a melancholy catastrophe. A man named Towndrom meve f armer of considerable respectability, but of late year rather reduved in circumstances, murdered ins wife, an and toars the and wife had for some time time past lived uahappily: but the main cause which led to the awful traneaction originate in a dispute about some mon which hatl late. ben to Towndroves wife. An imquest was keld orl be boures and after a very lengthened investigation, which brough rerdiet of "Temperars insanity.
Tole of Wightit,-A distressing accident occurred on Saturday at Bell Croft, a short distance from Newport. at the seat of \(J\). Couke, Esq. It appears that a quantity of tobacco had been set on fire in the conservatory in order Co destroy the insects, when the eldest daughter of Cooke, ayed 21, unguardedip came too pear the flame or candle, which caught ber dress, anu cecasioncd such rious injuries before it coule be subded, The parents not long since were death within a few hours. The parents not long since wer deprived of two other children by ferer. an anques.
held, and a rerdict of "Accidental death" returned.

Bath. -The journals of this town give a singular exam-
ple of spontaneous combustion which has occurred at ple of spontaneous combustion which has occurred at place, was awoke by a loud noise made by a horse in a stable close to the house, and on looking out of the window she
discovered that the stable was on fire. She called her mas ter, and on going into the stable, they discorered that the fire originated from a large canvass used for covering ricks, which had on the previous day been partly covered with two galions of oil, to render it impervious to the rain, and which, being put down in the stable in a heap, in a moist
state, generated sufficient heat to set it on fire. The fire was extinguished without much damage having been done. Gloucester. - At a meeting of the stewards of the Musical Festiral, held on Tuescay, an alteration was resolved
on in the time of holding this festival, which is now finally fixed for Tuesday, Wednesday, Thursday, and Friday, the 7 th, 8 th, 9 th, and 10 th Sep. next.
Manchester.- Several weeks a
Manchester. - Several weeks ago, the mayor of this
own received a letter from the mayor of Cork, stating that a large quantity of embezzled cotton-yarn, of various colours and numbers, was every week brought from this place into that city by parties residing there, and that there were persons in this town who bought these yarns of mission to Cork. The letter also contained the names of the parties who purchased the yarn from the weavers. his direction, warrants were taken out, and two inspectors of police went, on Saturday morning, to the houses of aree hand-loom weavers, and found in the house of each to the amount of a cart-load, which they seized. The parties were brought up at the Borough Court, when the
above circumstances were stated, and two young men, in above circumstances were stated, and two young men, in
the employ of manufacturers in this town, picked out a considerable portion of the yarn, which, they said, was like that used by them, and they believed it to be their property. A solicitor appeared for the defendants, and produced a quantity of invoices of yarns of different descriptions, sold to them, and called a witness to prove that gation, the defendants were each convicted in the penalty of \(£ 20\).
this tation.-On Tuesday morning, the inlabitants of this town were alarmed by the occurrence of a fire, by
which no less than forty houses have been destrojed. It was first discovered at one o'clock in the morning, in an unoccupied house on the Green, and spread with great
rapidity, the progress of the fire being accelerated by a strong wind. It was not until seven o'clock that the fire was effectually subdued. The houses destroyed were all
thatched and of no great value; and much of the property which they contained was saved from destruction.

Railuays.-On Tuesday an inquest was held
Cates, aged 30, a labourer on the London and Brighton Railroad. Another labourer deposed that he was on the works on the 4th of May, when deceased and himself were nel. Deceased was employed in tipping (opening one side of the cart to turn out the earth), when his foot slipped, waggon passed over his knee, which was crushed in a serious manner. The waggon was drawn by a horse, and was coming on quickly. The sleepers of the railroad were
slippery, and the earth was not wide enough from slippery, and the earth was not wide enough from the rails for deceased to get a footing. Could not account for the sleepers being slippery. Witness had slipped off on the
previous evening and cut his forehead. The witness ex. previous evening and cut his forehead. The witness ex-
hibited the wounds. which were scarcely healed up. The house surgeon of the institution stated that deceased when brought in was suffering under extensive injaries of the
leg and knee, and he died on Friday last. The jury releg and knee, and he died on Friday last. The jury re-
turned a verdict of "Aceidental death."-On Wednesday a special general meeting of the proprietors of the Northem and Eastern Railway took place at the London Tavern, for the purpose of forfeiting certain shares, the calls of tion wore declaring forfeited seventy shares, the calls on which remained unpaid. The motion was seconded by a proprietor, and carried unanimously. The chairman said laws were then passed unanimously. In answer to various proprietors, the chairman said the weekly average re-
ceipts from September to the present month were \(455 l\), ceipts from September to the present month were \(455 l\);
daring the time of the late floods they only received 1121 . weekly. Taking the average from last Feb. it was 5101 . weekly. He expected they would sbortly have 6001 .
weekly. Out of this they would have to pay the Eastern Counties Company 200l. per week, which would leave 400 l . 50 per average expenses in the latter would not exceed 50 per ceat. weekly. In consequence of the reduction in from 100 l . to 506 . It was now \(720,000 \mathrm{l}\), in 14,400 shares of \(50 l\). each. The line to Harlow was expected to be opened by the first week in August, when there would be tunnel on the the line. - The last length of the Patcham Thursday in London and Brighton Railway was keyed on conveyed to the spot in a train of seven carriages, which also proceeded to Clayton tumnel, six miles from Brighton. passage of annel will be entirely finished, so as to allow the then be of a train in about a fortnight; and the line will
tompleted to about nine miles from Brighton The road from London to Hayward's Heath is to be opened at the end of this month, Had the remaining portion of the line in August.

Dublin.-His Recelleacy the Liond-Leatount arrived

Bristol. His intended arrival was unknown to the anthohonours to the Queen's representative by firing a salute His Excellency has since remained in privacy at the vice-
regal lodge. The Earl Fortesue regal lodge. The Earl Fortescue died on Tuesday, so postponed.-The census, it is said, inspired such feelings in the counties of Limerick and Clare, that the whole country was illuminated, hill and ralley, with lighted fire-
brands. In the county of Westmeath it is reported there was scarcely a head of poultry left alive, an opinion har ing gone abroad that a tas or rate was to be levied upon them.-A constable of police nearly met his death on
Sunday morning, whilst engaged in collecting the census papers in the village of Cabinteely, about four miles from this city. The Irish peasantry expressed great horror a
this "numbering of the neople;" and the policeman after having collected the papers, was followed by crowd of persons, who knocked him down, beat him very severe manner, and destroyed the returns.-The which it was resolved that while the medical profession is now entirely unrepresented in Parliament, the pecuniary and personal rights of its members are frequently made the subject of legislation ; that such is not the case with respect to other classes of the community; and that it is
the opinion of the meeting that efforts should be made to procure the return to the House of Commons of one or more representatives of the medical profession.-A man named Daniel Shanahan has been committed to Nenagh gaol as a principal, and Catherine Ryan for conspiracy to
murder the late Mr. Hall. The latter, it seems, went to murder the late Mr. Hall. The latter, it seems, went to him that the land wes then burning. There are two other persons in custody of the police, and it is said that there is already sufficient evidence for the conviction of the perpetrators of the murder.

Limerick.-The last accounts from America inform us Minstrel bec, with 141 passengers, intending to settle in Canada. The vessel, it seems, bad a tolerable passage up to the 18th ult., when she struct on Red Island Reef. There was a heavy sea running at the time, but the boats were launched, and upwards of 101 passengers embarked in
them. The vessel went doxn so suddenly, that the "painters" of the boats could not buddenly, that the
oast off, and the people who had embarked in the boats perished, with all Who were on board the ship, with the exception only of eight persons who bad embarked in the gig, which was towing astern, and of which furtunately the rone attaching it to the vessel broke when she went down. They succeeded in pulling to White Island, where they remained Welling following day, when they were taken off by the since embarked at Quebec for this port. SCOTLAND.
Glasgour-Darid Scott, the mereantile clerk who absconded from this town after committing forgeries to the amount of 8,6001 ., an account of which appeared in our last Number, has been traced to Southampton. It has been ascertained that he left London on Thursday, the 23 rd ult., by the night mail-train, and slept that night in Southampton. The next day he started to Havre by the Calpe had wessel, having assumed the name of Douglas. He seen at Havre a few dars since; and a police-officer, with one of the principals of the house defrauded, has started pursuit.- On Monday, a sergeant and sereral soldiers quartered in the infantry barracks were placed at the po gate on the previous evening. It appears that two soldiers having been fighting in High-street, one of them was taken to the police-office, when, upon a promise of proceeding quietly to the barracks, he was allowed bis liberty. He had not, however, been liberated long before he met his
former antagonist in the Gallowgate, and the two again commenced fighting. The police interfered, but were pre vented from seizing the prisoners by a sergeant of the re giment lifting his cane to them, and ordering the soldiers to take the police prisoners to the barracks. By this privates of the 29 th had collected, consisting of severa mined attack was made on the police, abd the men rescued. One of the policenien was seriously injured. At the time the Gallowgate, from Kent-street to the barracks, was ing to between 10, no \({ }^{\prime}\) and 1.5 f 0 m indivituals, and the most serious alarm for a general riot was entertained by the inhabitants in the neighbourhood, and strangers pass ing, great numbers of whom crowded the lanes, closses, and stairs, in fear of their liyes. The soldiers and ill
disposed portion of the crowd eventually liberated the prisoners, including the sergeant, who headed the riot, and proceeded to the barracks, where, shortly after, the matter was repurted, and the ringleaders taken into custody, and placed in the guard-house. In consequence of the absence of the principal witnesses, from the elfects of the remanded, and the charge continued against them till the individuals were able to appear to give their eridence.
Leith.-In this town, as in many others, it was expected that considerable opposition would be offered to the enumerators in taking the census. It has, however, tarmed out the reverse; every facility appears to have been given, although some strange notions were enter-
tained as to the meaning or object of the retarns. "f airs" exclaimed a dowco-looking David Deans, "what did David mak' by numbering the people? And didns
ye bring the cholera on us the last time it was done among ourselves?" "This will be some of the (Queen's nonyears; "I thought that, now that she has got a bairn to nurse, she wad hae had something else to do than read ower folks' names wi' , their ages ; but some folk has an

\section*{ftiscellantous.}

Parliamento-It appears by a return prepared from the rolls and journals of both Houses, that since the year 10.99 (when it is supposed the duration of Parliaments was isted beycyond one year, only four Pariaments have ex ennial duration Of the rest only lasted above five years, three above four yenre, and three above three years. Only ten existed above two years, and no less than 36 for a shorter period. The average duration from 1009 to the present time (including the Long Parlianaent in the reign of Charies 1., and that in the not exceed the space of three years each ; so that, although nominally septenaial, Parliaments may be said to have not more than a really triennial existence
The Census.-The following calculations made in the middle of the 17 th century by the celebrated Sir William
Petty, Knight, F.R.S., scen, may at the present time be interesting if not very instruetive. He had ascertained that London " doubleth the number of its imhabitants in forty years." "That according to this donbling, the people
of Lonion will be Anno \(1840,10,718,880\) in number nd that the inhabitunts of a, considerably more, viz \(10,917,385\) in number
fore, that it is certain that the growth of the city must stop before the said year 1840, and will be at its ntmost height in the next preceding period, Auno \(1: 80 \%\); and that then, viz. 180n, the number of the people of the city will knight, having arrived at a monstrous absurdity in the year 1840, assumes nevertieless that his calcuiatous will hold good as far as the year lovo, is excessively amusing. furnishes a curious example of what was strypers. Slow, furnishes a curious example of what was sometimen

The late Storm. - Dr. Forster, the avtromemer and

Great Britain, has traced this thunder-storm across the island. It began at Brighton, fell heavily in various parts of Sussex, destroying 1 mane conservatory alate, at of the size of eggs ; it then crossed the centre of Berkshire, and proceeded in a curvilinar course west across tw the eastern part of the island, where the doctor lost sizht of it. It Furster, that the atmuspheric electricity is in less abundance than is ustual, this spring, white an epidtemic air prevails.
Effect,f Lighening.-A Sisiss Journal gives the folowing singular account of the effeet of an electric current observed reeentlyat Revignt, in the Jura. A man had taken refuge from a violent storm at the entrance of a cave in a rock, when he was struck by lightning and which were a misture of \(\mathrm{f}^{\text {exter }}\), were found melted, each in one half of its extent, and a portion of the metal they had lost was discovered fimly adhering to the nath of the man's shoes
Large Clip of Won!. - A tup of the Cheviot breed, the property of Messrs. Young and Craig, Bighouse, Sutherfound to weigh no less than \(19 \frac{1}{2}\) imperial pounds. The oldest and must expertenced shepherds in the district, several of whom are from the South, state that they never saw such an enornous clip from one animal.

Edmund sjpenser.- The lucality of the family of the illustrious author of "The Faëry Queen has. it is said, some researches into the ancient residence of his own family, has succeeded in ideatifying it wath 11 at of the great has succeeded in ideatifying it wath particulars before the public. The lictle village of II urstwood, near Burnley, in Lancashire, is the lcealtry, and in the romantic scenery of that neighbourhood it is thought that Spenser took refuge when he was driven by academical diwappointments
to his relations in the north of Eogland." The family
of the poet appear to have resided at Hurstwood about of the poet appear \(t_{0}\) have resided at Ilurstwood about
400 years, that is, from the early part of the reign of Ed400 years, that is, frem th.
ward II. to the vear 1690 .

Exccution and Resuscitation of a Murlerer. - A correspondent has communicated to us the following extraordinary narrative: - John White, convicted of the rnurder of Messrs. Gwatkin and Glenn, on board a flat boat on the Ohio riser, was executed at Louisville, on the 8 th alt., a little after six ocelock in the morning. The rope not "playing" well, oecasioned the knot to slip up oret his chin, instead of being under his ear, so that his neck
was nut broken by the fnll. Previously to bis execution, he urote a tetter in ins faller, in which he stated that he wa resent when the untirtunate men were murdered; that he did not pirticipats in she art, but was compelled to beg his own life frun two men who murdered them. He was cut down atier banginf about 25 minutes, and his body given to the dow of for purposes of experiment. dinary cirer: atemues attending an esperiment with the galvanic battery :-"The poles of a powerful galvanic pile, which had been prepared for the occasion, were imme diately applied to him, and, to the unuterable joy of all present, with the must perfect success. On the first application of thee thitel to lis bontr, which was yet warm and trembling, a uniwersal tremur was seen to pass over his frame : on a sulden he arose upon his bench to a sitting posture, and with great eagerness and impatience raised his hands to his ne. \(k\), trying to grasp the scarf in his fingers and tear it from his throat! He frist snatched at it with great rashness, as though the rope was yet around his neek, and then continued sume moments picking at the seam with his fingers, is though it was something that a thered to his throat giving inim great uneasines. But this symptom was sonn foryotten, for aimost the nest moment he rose apon his feet raised his arms level with his breast, and, opening bis blooishot eyes, gave forth from his month a most territic screcch, after whick liis chest worked as if in
respiration, in a rery videmt manner. Every one at this respirtion, in a rery tutemt manner. Every one at this exclaimed that has was alive. The excitement was too great to allow time for a reply to the remark; every eye
was riveted upon the aritated and shahing curpse. The operator onntinued \(t\) ) let upon it a fall quantum of the galvanic fluid. till the artion upon its nerves becance so powerful, that it made a temend ys hound, leming by a sort of imperfect plunge :nto a comere of the rom, dismthe galyanom. All immedi tety drom around the body. For a mument atser tis in, ent pectly motinness and dead; a sntron apmeryhed, and, takigh hotd of his arma, amnource 1 that he
simgle beat of the pulse

SATURDAY, JCME 26, 1841.

Gardevers will observe in another page an advertisement for an intelligent young man to proceed to India; and they will recollect the observations we made upon that subject some weeks ago (p. 339). We regard this as only the first of many such inquiries, and that a road is now fairly open to situations of trust and importance in our colonies. It has hitherto been very much the practice in those countries, especially in India, to look to the ranks of European regiments for young men who understand something of gardening, that is to say, for men who, having been employed as garden-labourers, and howing how to hoe, and rake and dig, venture to call themselves gardeners; and who, having got into scrapes at home, have been glad to enlist to escape worse consequences. A more pernicious system than this could not be pursued; for such men, probably, knew nothing of gardening at home, and are usually ignorant of everything that conscitutes the foundation of the most ordinary operations belonging to this art. The man who can only rake, and dig and hoe, is no more a gardener than he who fancies a blue apron tied round his waist to be an infallible sign of skill: such people are tillers of the soil, and better tillers than they are may be found among the natives of every colony.
He only really deserves the name of a gardener who not only knows how to do a thing in his own place, but elsewhere, and why success attends his practice, and how to vary it under new circumstances. Such a man, when he finds winter at midsummer, and the dog-lays in December, as in the Southern hemisphere, or a climate where our cold season of rest is absent, and in which all the energies of plants are stimulated by heat and rains unknown to him at home, is able to adapt himself to such circumstances, and to shift his times and noodes of cultivation, and to change his crops to suit them. In order to acquire this power, he must study with the utmost attention the works of modern writers on vegetable physiology, and make himself master of everything that is known concerning the way in which plants live, feed, grow, breathe, digest, and have their being. Then, combining this knowledge with the manual skill which it is his t,usiness to acquire during the period of his learning the art of Horticulture, he becomes a gardener properly so called, and is able to carry on bis profession with advantage in whatever climate he may be called upon to exercise it.
Some time since we gave an account of the experiments of Boucherie, concerning the preservation of wood from decay. These are doubtless extremely ingenious, but they have still to be verified in this country. In the mean while, it is only just to our dissinguished countryman, Sir William Burnett, to say that he also has arrived at the same result, although by different means. It seems quite certain that the application of chloride of zinc, either to wood or can-ras-that is to say, to vegetable substances-has the property of effectually guarding them against all the ordinary causes of destruction, without communicating any bad property to the substance prepared with it. Some weeks since we had an opportunity of inspecting at the Admiralty some canvas and wood that, having been partly prepared with the chloride of zine, and partly left in the natural state, hat been left in We found vaults of Somers't House for many months. We found that the strongest sail-canvas, unprepared, had become so rotten that it might be torn like damp of the paper: while on the other hand, prepared parts of the same bolt of canvas was as suuded and strong as When it was first made the subject of experiment. The like appeared to be the case with woorl under the have circumstances. In confirmation of this, we have seen a letter from an officer of H.M.S. Terror, Rows, employed in making discoreries towards the

South Yole. Both the Ercbus and Tarror had expe rienced very stormy weather and frequent rain on their visit to Kerguelen's Island; and the sails prepared by Sir W. Burnett's process wore out three other sails, and even then appeared as good as new. This office (Mr. Molloy) states that the sails, steeped in chloride of zinc, proved themselves much superior to the other canvas, and for work were much better, particularly where there is much wet, and that you cannot dry your sails for days together. They wore three main topgallant sails out for one of the other canvas, which was used as a fore top.gallant sail ; and when they arrivel at Hobart Town it was as good as ever.

This statement scarcely requires any comment. Considering the immense importance to the Navy of the protection of canvas, and its great value to farmers and others, such facts cannot be too generally made known.
\(W_{E}\) have received from the Secretary of the Nottingham Fioricultural Society a letter addressed to the members of that body, disputing the propriety of some of the rules laid down for the guidance of the judges in their decisions. The rules which are made the subject of complaint have long been found necessary, and are, we believe, adopted by all sucieties of a similar kind. "That no damagred flower should be allowed to take a prize," and that "a damayged flower disqualifies a pan," are only proper precautions to guard against the admittance of flowers unworthy of exhibition; and as these regulations act equally upon all members and exhibitors, they can form no reasonable cause for dissatisfaction, nor call for any alteration in the regulations. Laws must be made upon general principles, not to meet individual cases. The writer next proposes "that colour should take precedence of form. This is in direct opposition to the rules established among florists in this part of the kingdom, who consider that form is the first essential property that all florist's flowers should possess, for the want of which no colour can compensate. Form is a quality that can be determined with mathematical precision, and is therefore a more certain criterion whereas colour is more or less beautiful to various organs of vision, and depends much upon the caprice of taste ; and it rould be most embarrassing to make that property the first consideration upon which scarcely two persons would be found to agree. The rules of the Society were no doubt formed upon mature consideration, and we find no reasous advancen? in the letter that would justify the adoption of the proposed alterations.

Several of our correspondents have begged for information concerning the cause of their Roses this season producing green leaves in the centre, and thus becoming deformed. More than one correspondent assigns the cause to blight - the most convenient name in the world for any sort of injury that those who employ it do not comprehend. If a cold north-east wind curls up the young leaves in spring. or if night-frosts cut off the hope of the orchardist, or if caterpillars ravage a garden. or if the smoke of London is driven over the neighbourhood, or if fifty other things unpleasant occur, they are all alike referred to biight. To a word having so extensive a signification that it signifies nothing, there is no objection to referring the malady of the Rose. But our reaters will hardly rest contented with this luminous explanation of the matter.

The disease to which Roses have this season been unusually subject, is produced by the young seedvessels, buried in the cup of the Rose, becoming changed into leaves. Theoretically, a Hower is a shor: branch; its calyx, corclla, stamens, and pistil, being so many leaves arranged rouud a growing point, just as the scales in a leaf-bud. Uuder ordinary circumstances, the crowing proint of a branch in the condition of a flower has no puswer of lengtheminer, lut is always contracted and stunted as it were; and then the leaves that clothe it retain their preculiar aspect of floral organs. But if anything occurs to the flower to communicate an energy of growth not its own, the bondis that hold doma the fioral organs are loosened-the growing point extends-green leaves are produced upon its surface, as in common branches, and the halady in question is the result. Supposing the pree ernatural excitement of the powers of extension in the flower to take place when ail the parts are extremely young, all the floral leaves, or a large part, will become common leaves ; but if it takes place when the floral
condition of the parts is tixen berond all change, then the centre only lengthens, and forms a tuft of leaves; and sometimes from the be:om of these leaves young iloses will spring up, just as the first Rose sprang from among leaves of a common hind.
This sort of appearance is most common in warm springs, and is probably the result of the excessive excitement which, in such seasons, the young flowers are exposed to; or it occurs in warm, damp autumus, when such plants as Potentillas will have every Hower transformed, more or less completely, into leaves. Instances of the kind may, however, always be found, be the season what it may; and theretore we can hardly suppose that it is merely a long continuance of warm weather: it is probably in some instances, and to some extent, owing to the quality of manure, which, if extremely strong, that is, aboundin! excessively it ammonia, will be very likely to bring about the production of leaves in the middle of flowers.
supposing such to be the cause, it is evilent that, to some extent, the mischief is beyond remedy; but as it appears to be the property of nitrate of soda, salphate of soda, carlonate of ammonia, and even muriate of ammonia. to arrest the puwers of extension in plants, it is worth ascertaining experimentally whe ther the application of these substances to the soil in which the Kose grows would not have the effect of checking the evil complained of.

\section*{ON THE SELECTINX OF CYTTINGS FOR PROPAGATION.}

Thpre is no branch of gardening which possesses more interest to those who are encaged in stach pursuit than the propagation of plants. To the nurseryman it athords the means of multiplying and selling thoue which are in his possession-by it the amateur and carlener are wabled to increase the plants which they purchuse from the morseryman, and to all it preents ote of the moer beantirul illustrations of the way in which nature u: ay to mode sub servient to the purpnseenf man.

Of course these remarks, althongh applicable to all plants, apply principally to those which are difficalt to

\section*{RURAL CHEMISTRY.-No. XYI}

IT is unnecessary further to describe the metallic orides and salts at present, asthe oxides and salts of iromare by far the most important in relation to plants; the other oxides, in the soil, or in any regetable substances. What has been said of iron is, howerer, cenerally speaking, auplicable to the other metals ; they all have a more or less powerful affinity for orygen, and under proper circumstances combine with it: some have so strong an affinity for it that they are able to decompose water, and hence rust when exposed to the weather ; others again are unable to comwhen heated ; and some have so weak an affinity for oxygen, Then heated; and some have so weak an affinity for oxygen, most farourable circumstances, such as for example when boiled in strong nitric acid, which, from the large quantity of oxygen it contains, is a very powerful oxidising agent,
and is therefore able rapidly to corrode most of the metals. Some of the metals only combine with oxygen in one pro portion, whilst others combine in two or more relative proportions, and form different oxides. Thas, for example, when lead is melted over a fire and kept for a long time exposed to the air, it gradually combines with oxygen, and tharge this is an ori rellow-coloured substance called it absorbs an additional quantity of orygen, and passes into a brilliant red substance called minium, or red lead; this is a second oxide, and contains more oxygen than litharge does. Besides these two oxides, there is yet a third, which cannot be formed by merely heating red lead and exposing it to the air, but which is easily made by
boiling red lead in nitric acid; it then acquires a third dose boiling red lead in nitric acid, it then acquires a third dose
of orygen, and becomes dark brown. These oxides are not all bases; they are not all able to combine with acids and form salts, but usually only oue, or sometimes two, of the oxides of a metal are bases: thus, only one of the three oxides of lead, that containing least oxygen, is a base, and when combined with carbonic acid, forms white uited substance of very great importance. as being hetter manufarture of paint. The other two oxides of lead are unable to combine with acids, and therefore, when acted on by strong acius, they part with some of the oxygen being conversed into the protexide, which is a base.
being conversed into the protoxide, whicais a base.
We have now very hrietiy goue tlirungh most of the principal substances which are of impurtance in studying vegetable chemistry: but befor entering on the action which these substances have on the growth of plants, we
must examine the nature of thusc veretable substances which conssitute the growing paats of planis.
We cannut here describe the different modifieations of rellular and tibrous materer whicin fon the mass of plants, and indeed this is not terstrable, to we lave ony to \(d\), stances. and not with their mectianical structure and functions. When we examine a plant chemically, we find that a large part of its weight cansists of water, which is ssential to its life and growth. When this water has been expeiled by drring the plant, we rind that the remainder
consists of a number of ditferent sujstzaces, almost all of which are composed af tae four elements, oxygen. hiydrogen, carbon. and nitrogen, or some of then, comolned together in various proportions. Tae most solid of these substances, that which gives wood iss strength, and which exists in greater or less quantity in all plants, is called lignin, or woody fibre. It is a compound of oxygen, hydrugn, and carbon, rather more than half its weight
being solft carbon. Woody fibre, or lignin, is a white fiorous suiustance composed of an intinute number of very fine threads or fibres, perfectly insoluble in water, and not in any way acted on by dry air. When heated it soon turns brown, asine to a partal decomposition; for thourg
whist the earhon is umted with osygen and hydrogen its usual black colour :s lost, ret ass soon as the elements begin to stparate and the carbon is set at liberty, it always appears in its black and cualy form : if lignne be further heated, it catches fire and buas with a tolerably sright
lame. producing as the resalts of it. combustion, water and carbonic acid; and is is remarh is! that the bydrogen and oxygen in ligmin pist evactly in the right proportions
to form water if tiey were \(\theta\) muine twrether, and tie to form water if tiey were \(t\) amuine twrether, and the the joint action of airant w.ter, it inderenes, as uas been before statel, a clange somenhat smiliar to combustion: at least in hott cases carbonic acid and water are formed. The most important of the remaining substances which are common to the greater number of plants, and which are called fluten, Abumy tiber, Sarch, frum, and Sugar; but in addutioa to these, all plants contana small yuanfitias of jembiar substances, weth as oils, resins. ocsherns mature, fritares is a martious stine and Barthy ...5rsin it our i freit nd many , ther thereflere of tome

 sosen for a variety of purposes. Gluten consists of ita combustior or decay, ammonia, and sometimes in the
stances contric acid, is produced. Like all other sub pose, and give rise to the formation very liable to decoms This can, however, only take place when water is present which is absolutely necessary to such changes ; and therefore gluten may be kept unaltered for a long time, provided it be kept dry. When seeds are moistened, they underg a change, and the gluten is decomposed ; and, in conse-
quence, they either germinate or rot. Albumen is very commonly assuciated with gluten, and is similar to it in composition, being composed of the same four elements it is, howerer, possessed of peculiar properties which disand elastic qualities of glaten, whilst decaying howere it undergoes similar changes, and evolves the same substances. There are many modifications of gluten and albumen, in consequence of which they have received a to the plants from which they are obtained. Starch is contained in almost all plants. It is white, insoluble in cold, but readily soluble in hot water, and consists of oxygen, hydrogen, and carbon-rather less than one-half of its weight being oxygen. Associated with albumen and gluten,
it constitutes the greater part of the flour of wheat, and it also exists in very large quantity in the tubers of th potato. When a solution of starch is kept for some time, it is partially changed, and a portion of the starch is converted into sugar; and when starch is strongly heated, it is also greatly altered, being converted into a substance having most of the properties of gum. Under the name of gum are included several substances which considerably differ in their properties. They all agree in being tasteless, or nearly so; but some, like gum arabic, are oluble in water, forming a clear transparent solution whilst others, like the cherry-tree gum, are insoluble swelling up and forming a gelatinous mass. Gum consists of the same elements as starch, but contains rather more oxygen. Sugar, though less abundant than either starch or gum, is found in a number of vegetables, and exists in
some in large quantity. It is easily soluble in cold water, and readily known by its sweet taste: its properties differ con siderably according to the plant from which it is obtained. Sugars are divided into two classes-those which are crys tallizable, and those mhich are uncrvstallizable : that is to which when their solution rains are obtained in the forms of regular-shaped little grains, like common cane-sugar, and those which canno Sugar consists of oxygen, hydrogen, and carbon united in proportions somewhat similar to gum and starch, but varying stightly according to the plant from which it is obtained. \(-E\).

\section*{COTTAGE GARDENS.-Nio. XXIII.}

Some ground must now be got ready for the young Celery plants that were pricked out from the seeत-bed as not an oinject, (clery is usually grown in trenches three rarden. some other nlan must be adopted for growing this aseful vegetable. The one we should recommend would be to form a tench in an open compartment four feet ride and about a foot deep, placing the earth as it is aken nut equaly on both sides of it for convenience in 18 or - 0 inches apart, and dig them out a spade in width and five or six inches deep. Fill these with some well-
prepared dung and earth mised together, and insert the plants along the centre of each row sir inches distant rom one anuther, and give them a good watering afterwards. In removing Celery from the place where it was irst transplanted. care must be taken not to injure the leaves or to brenk the balls adhering to the roots of the young plants but as little as possible. There will be no difficulty in doing so if our former directions were atended to, and the ground made firm underneath the compost in which they were pricked out, as the roots will are been prevented from striking down into the soil, firmly established in the compost as to admit of the plants being taken up without any danger besides a slight temporary check, from which they will recoser in a day or \({ }^{\text {two }}\) The
The early Potatoes will now be fit for use; and as soon as a part of the ground which was occupied by them, or by any other spring crop, can be obtained, let it be immediately dug over and fillid with Leeks. This vegetable likes a rich. light soil better than one that has been recently manared, and is therefore well suited for following one of the eary car nicely whitened, it is desirable to have a good deep drill made previousiy to planting, and to insert the plants in the bottom of it six inches apart, and foot between the diills when more than one, which will nable them afterwards to be earthed up. In transplanting Leeks. or any similar crop, we should always recom-
mend a small trowel being used in preference to planting mith the dibber. The latter should never be employed anise for the purpmee of pricking out seedlings, or very ma.: phats ouch as Lettuces. Lonk to the Poratoe reginaing of Mach, will now lie ripe and for for taking up. Twist hem a ilttle at the neck, and let them remain expesed to the oun for a fex days uatil tiseir stems are withered, when they may be remored to a dry airy lace and trung up in in 2ncies.

HOME CORRESPONDENCE.
Cookery of Vegetables.-It is of very little use to grow good vegetables, if we do not know how to cook them but as regards the second, we have not made much probut as regards the second, we have not made much progreat, whose cooks are either foreign, or are taught the practice of foreign artists ; but with this exception, I thini at nine tables out of ten, plain boiled is the alpha and the omega of vegetable cookery, and plain melted butter, mint to peas, and parsley and butter to beans, the only ortho dox sance. Reformation in a system of cookery would seem to be slow; but I hope something may be done through your instrumentality, and perhaps this point may induce some of your readers to send you a few remarks on the cooking of vegetables. If not, I shall from time to time transmit a few extracts for the Cuisiniere Bourgeoise, \&c. You would do the state "some service," if only in the article of spinach, you could banish from our tables the unpalatable mass of watery, half-raw, stringy, green paste, which so often makes such an unsavoury addition to an
English dinner.-H.L.C. [We hope our correspondent will keep his promise. We will help him, forwo are, like himself, somewhat impatient of the messes called cooked vegetables.]
Water Fillers.-In a recent number of the Gardeners' ing and filtering is an article on the importance of collect interest to all gardeners, and theauthor deserves their thanks for calling your attention to the subject. The plan of filtering the water appears to me to be susceptible of some improvement. About a month ago, I had a filter made purpose of filtering rain-mater for domestic use the plan was suggested to me by a friend, and as it answers perfectly, I thought a modification of it would be suitable for tanks of large size. Enclosed you have a plan, and the following is a description of it:-A \(A\) is the floor

of any large tank ; в в, a circular wall ( \(4 \frac{1}{2}\) in. thick), 4 ft diameter inside, and 1 ft . high built upon it ; c , a wine cask, which rests upon a layer of stone chippings, about the size of marbles ; this layer is an inch thick, and covers the whole of the space within the circular wall; D D, a leaden vessel 12 inches diameter and 9 deep, set upon the bottom of the wine-pipe; E, a pump fised inside ; F F, a slate or stone cover over the well or cistern formed within the circular wall ; it should touch the sides of the wine pipe all round, as it is intended to prevent the dirt settling upon the sand inside ; the cover should be perforated with about half a dozen holes, an inch in diameter, for the admission of the water. The bottom of the wine-pipe is also perforated with the same number of holes, and covered with a layer of stone-chippings an inch thid, space over all is then filled up with Calais or any otw fine sand, to the top of the wall. It will be seen taat having the sand on both sides the wine-pipe (iaside ate out), there cannot be any displacement of it by the water in its passage through it, as would be the case if place its upon a false bottom. The motion of the water Then passage through the filter is shown by the arrows. . months the cistern fails in its action, which will be wany inch of first, it is only necessary to take out about an areag sand and replace it by some that is clean. The acer quantity of rain-water per month for tue fortity for the said to be 1.850 inches; the average quantity (or summer months will therefore be 1.58 inco 278 cubic 2,0 cubic inches, say an imperial gallon or 2.8 surface inches, per month upon a square foot of superficial sural or so that by reducing the site on which any fiorticil have the other building stands into square feet, we shal it erty number of gallons of rain-water which falls uponis 20 ft montin during the summer-for example, a builuig long by 10 broad, contains 201 square feet of surface, all fall therefore that will be the number in gallons which wifient mon it during that time : this quantity is anply sulants or amateur qardeners ifhe myself who have birlected from n large establistmients the water might be whot from the ther sources, sucin as sheds, ide., an met r-tiont draids, gardea-walls, whick if prowid hed in Roman cement and laid with a inl! towards the tank. abundance of water might be collected for all purposes; but in adopting this plan, I should interpose a small tank in the shape of
deep trough, about 18 inches wide, 3 ft . deep, and 5 f
long, the water from the walks to enter over the top long, the water from the walks to enter over the top at one end, and out ould keep back all large particles of dirt, \&c., on the same principle that a receptacle is made under water-grates to collect the dirt which falls through them. Whilst on the subject of filters, allow me to suggest that it would be a great boon to cottagers, and might well be adopted as a prize to be given by gentlemen, if small filters were provided for their purpose. cottage, I am quite sure they would rarely have occasion to procure any other. I have enclosed a plan which I think would not fail to answer the purpose of collecting and filtering rain-water for the use of cottagersists a stone or slat cistern divided into two equal compartments by a reaches to within half an iuch of the bottom ; each compartment is 9 inches square, by 18 inches deep; the bottoms are covered 2 inches deep, with small chippings of stone, and then with washed sand 4 inches thick. The arrows show the direction of the filter. You appear to take great interest in the welfare of cottagers, and I think there is nothing that conld be so great boon to them as abundance of pure water.-H. L., Hull.

Transplanting Hollies.-In the Theory of Horticul. ture, p. 302, are some observations on transplanting evergreens, to which I beg leave to make exceptions. I have transplanted evergreens at Midsummer, and hollies repeatedly and in quantity. In Marshall's Yorkshire, about twenty years since, I read of one man who succeeded in raising holly fences on an extensive scale, simply by transplanting at Midsummer. I saw the ground at that sea planting at Midsummer. I saw the ground at that sear
son, under hollies, wherever I went, covered with hollyleaves, and in that circumstance sam the reason of the practice ; for the time to move any plant is when it sheds its leaves. I then tried it season after season, and can now show holly-feaces, ten or fifteen years old, without a
gap. In Marshall's work on Planting, is a statement of this practice, in which Marshall points out the error of Miller in the matter.-S. \(\mathrm{S}^{2}\). Norfolk, June 3.-[Upon turning to the Theory of Horticulture, we find that to this-that it is a bad plan to transplant hollies in April or May, because although they may succeed at that time, the success will depend upon the continuance cumstances which cannot be secured beforehand. The cause of death in trees when transplanted, during summer, is exclusively this, that the leares lose by perspiration more water than the roots can supply, in consequence of plantation. In dry and bright weather, leaves perspire fastest, and young leaves also lose water faster than old leaves. In April and May the weather is usually dry and bright, and young leaves are forming; on the contrary, in November the weather is damp and cloudy, and the leaves are old ergo, November is better than April is shortly after it has shed its leaves; and if the holly were to cast all its old leaves before new ones appear, it also might be possess as a decis habit; on the contrary, a few only of the leaves possess this habit; on the contrary, a few only of the leaves are shed at a time, and we never can observe any material
loas of foliage by this plant. That hollies may be transplanted at Midsummer, is admitted in the "Theory of Horticulture; " but we cannot think it desirable to select that period, which is one of so much more risk than the end of autumn.?
Salvia patens (353),-In June 1840, a plant of mine opened three blooms, and on the following morning two more, and at the same time about, a dozen of the flower beds immediately above those expanded dropped off. I cought at the time it was caused by some suduen eheck flowers expanded, the same mishap occurred, and I repeatedly found, during the season, that whenever there was a display of blossom, it was followed by a bike disaster. On Thursday last, the first three flowers for the eason opened, followed next morning by two others, and eleven flower-buds hare again falles. Now \(I\) am quite sure that with me, at least, this dropping of the flowers does not arise from external causes, for the plant is very healthy and vigorous, and is never allowed to want water or have too much. Indeed, I had made up my mind last year that it was constitutional, and this season inereased the richness of the compost in which the plant grows, in the vain hope of obriating this drawback on its beauty effort mout, therefore, the plant thus seek's relier after the quiry amonest wir most successful cultivators in the North Ifind the same thing occurs with their specimens.- \(S\). Alstromeria Seeds (333) generally lie a year before they vegetate. When alloding to this beautiful genus, pray put a stop to the notion that A. Nellin is procurable The only plant is with my friend Dr. Neill, why has been unable to propagate it, and I much fear it will become
extinct. The seeds are constantly advertised, but as soon extinct. The seeds are constantly advertised, but as soon conversant with these plants.- \(S\).
Potaloes.-In a late number of the Gardeners' Chronicle, A Cottige-gardener" inquires, where does vegetation in
tion in page 120 of Mr. Knight's collection of Papers,
just published. Mr. K. sars, "In the autumn of 1 li02, observed that the potatoe had a similar power of reproset rather late in the preceding spring, in very dry ground where, through want of moisture, they vegetated very and tened with rain, many small tubers were generated on the sarfaces made by the knife in dividing the roots into cuttings; and the buds of these, in many instances, elongate into runners, which gave existence to other tubers." Here is a fact similar to the one mentioned Gy A Cottage-garwhich goes before the quotation, the question will be fully answered.-John Wedgwood.
Management of Forest Trees.-Your correspondent S. N. V. is quite right in his observation, that many plantations are spoiled by being allowed to remain too is not a bad rule ; but in general a great fanlt lies in the is not a bad rus beneral a great and lies in the original selection of trees for a plantation, and the plantation is made. If solely for ornament, a variety of trees generally in the end has the best effect; and in thinning leave the handsomest-growing trees, without much refer ence to their kinds. Bat if a prantation is made for future profit, consider well what kind of tree will, in the end, be most valuable in the particular district where the plantation is made; and in thinning, every tree should give way to that particular kind. Suppose it is wished to establish eventually an oakwood and underwood: put in a large proportion, at least half of oaks, and take care to plant no other kinds that are of more rapid growth than the oak :for instance, avoid ash, poplar, birch, and larch, which all grow, perhaps, twice as fast as the oak: consequently before the plantation is thinned, a great part of the oaks are overtopped, and even when the others are cut down the shoots from the stools will, in a year or two, overtake the oaks. When shelter alone is wanted to bring up the oaks, Scotch and spruce fir are the best narses,
moved early enough. The system adopted in the Roya Forest is very good. Of deciduous trees, maple, horn beam, and hazel are the best to plant with oaks, and they form excellent underwood, whether for ornament, profit or game. As ash makes perhaps the quickest return of any wood that can be planted if cat as ash-poles, wood at the proper size for poles, by which time it has overtopped all its neighbours; it should, therefore always be planted by itself, in what are called, in ome coulec, ash spinneys. Bat poplars are also ver thrive in almost bogs. Larch, valuable as it is, is quite unfit to mix with other trees; its proper places ar sides of rocky hills and on banks - it will not thrive in gravel or in wet land. Beech should never be put in plantation where underwood is an object ; nothing grow well under it. If wanted for ornament, a few towards the outside of a plantation answer that object, and they wil do but little mischief-it is the least profitable timber that grows, almost. Thorns towards the outside of a plantation, and near drives throngh woods, have a very pretty effect, particularly early in the year.-M. \(D-P\)

Iris Psendacorus.-It is, perhaps, not senerally know that the seeds of the yellow meadow sedge, Iris Psendacorus, hen rossted and used instead of coffee, are not only an dmirable substitute for it, but an excellent febrifuge Many years have elapsed since I enjoyed this indigenous coffee at the breakfast table, with Mr. Skrimshire Wisbeach, and a considerable period before the French laid claim to the discovery-the p
vith Mr. Skrimshire. \(J\). Murray.
Cause and Effect.-I have much pleasure in congratu lating the lovers of gardening on having a weekly journa devoted to their peculiar interests; because 1 tust that however great your desire to attend to the wishes of empirics in the art, you cannot be indifferent to the evelopment of the science. Although science is a tern a every person's mouth, I believe it is so variously co trued, as not to be defined alike by ang tro persons.
 whays have, and now be the knowledge of the true causes who defines scie " a nuwledge of truthe demonstrative The effeat lexicogranher. Dr. Johnson, in his explanation The great lexicographer, Dr. Johason, on species of knowof the term, says, "science is any art or speimar, rhetoric, ledge, one of the seven liberal arts, grammar, fuetorich
logic, arithmetic, music, geometry, astronomy;" to which is annesed what Pope very correctly says of it
nd thoure, whin ondy science, fairly worth the seren."
The justness of Pope's conclusion is clearly obrious-if
the deinition of Aristutle be adopted -as by this, science the deinition of Aristote be adopted-as by this, scien all is knowledge resulting rom the cont of every artist, and the horticulturist among the rest. is to prounce some effect. Now as it is an aviom that " Erery yredicution of nattu and of art is the effect of some cause, it nust hollow be esi oefore any effect ean be produredt the cau-e must he caise hished. and befure any cucut canently. betore any rer; can undertake to establish or to remsere any carse, tivery must know, or suppose, what it is; anl if thers th it now it, they are worising in darhats.
suppose a plant of the same kind to \({ }^{3}\) guta to thres several gardeners to cultivate; it is very ruari.a that one of them may produce a piant of very urariant al. ngor ous growth, but aeicher of tlowers, but no seed or fruit produce one witn plency the plant in perfection, healthy
vigorous, and fruitfal ; then how can it be expected that if neither of these men knows the causes of the effects produced, he can enable another person to produce the same effects? On the contrary, if he does know, how easy is are canses? are not effects sometimes the canses of other effects? and certainly it is 80 : vet ther are easily distinguished. Let any person undertake any operation whathe will find there must be a pre-esiating something upon which to ground such operation: this pre-existing something then is the immediate cause of the effect intended; and if such pre-existing something be the effect tain what this pre-existing something is; and so we may trace back until we come to the primary causes of all effects, and these we shall find to be certain elements established by the Creator, and certain laws ordained by Him to determine the state and condition of those elements, whether in action or at rest, or whether in a separate or combined state. If then we take the definition of scrence to be a knowledge of the true causes of effects; theory, to be a mere supposition of the carse, an hypothesis; and we call the application of the corporesl powers required to bring the reqnieite elements and enforce the requisite ,-we shall hare a clear field for action, and be relieved from the con a relieved from the confusion consequent onderstanding of the term science, you think the result of forty years devotio to its development worth the attention of yoar readers, will with pleasure furnish you with a few short essays, explaining what I conclude to be the causes of many of the most important effects in the caltivation of plants, the knowledge of which is the science of horticaltare. As the result of experiments in horticulture can seldom be known in less then twelve months, and as this month admits of one being repeated, which many of the growers of Grapes will find to be of great value, I will beg leave quantity and quality of the food of plants determine their growth and productions." I have tried a great variety of componnds as food and have found that one quart of cider, cider-grounds, added to two gallons of water, brings a Grapegine to more perfect prolific state than anything rape-Tis a more pers be supplied in such quantity as will saturate the earth, like water to the depth of the roots, and all over the surface occupied by the roots It must only be given once in the year, and in repated the second year, its good effects will be sustained for several years afterwards without further supplies. The Apple and Pear and the Fig are alike beneited by laws which I conceive determine the nature of the food of plants.-Jos. Hayroard.

Utility of Birds in Gardens. - In your notices to correspondents, June 5th, it is stated that green linnets are excellent birds for destroying the caterpilar on Appie and Pear trees, and also on Gooseberry bur is another bird that does the work most completely when it sets about it, but it is rather slay work when any per son is near it ; but, however, it chooses its own time and its own way of going to work. That bird is the cackoo For several years I have found it very useful; last year there was no work for it in the garden, but it has got some employment this season among the Currant and Goose berry bushes. The destruction which the cuetioo makes among sparrows and othersmall hirdsis enmmonly reckoned By the thonsand, but the ravages that it commits among caterpillars should be counted by the million. We ought to give it a hearty welcome, not altogether because spring is come, but for the great service that it renders to man.-

\section*{Peter Mackenzie.}

To Destroy the Caterpillar on Gooselerry Trees.-Get flower-pot with a side drainage hole, place a piece of lightei touchrood near the hole, at the side of the pot lay on some tobacco, damp, and place it under the tree; then lay damp mat on the tree, get a pair of bellows and how a damp in order to suffocate the insect, which will immediately fall. This done, take off the mat and throw a little slacked lime under the tree. This plan I have adopted, and have never known it to fail. That this plan may be rendered more economical, I have sometimes used moss and tobacco-paper. Should you think this worthy of insertion in your columns it may be serviceable
Honey Dev.-If the following observations lead to further incuiry and to the settlement of the question respeeting "honey-dew," they will have answered the object of the writer:-Observation 1. This spring, a Morello cherry-tree. in my gardea, was attacked hy Aphides, in. shorthy have continued so now for some time. is ni ithe tree in the garden is co affected, thas parrial haes hey Duriug the spring of last yerr. The Mianie of tha trose of my earden and of the winte nelchonithon were imure

for the honey-dew on those trees where there mere no Bulbs formed on Leaves.-I see in some of your numbers of the Gardeners' Chronicle, that the fact of bulbs being formed on the leaves is mentioned, and I can, from Iny own experience, attest the fact. About the year 1806 , the Cape, and which Iflowered in my greenhonse. Afte: the flower had decajed and the leares began to turn cofor, I put it on a shelf to keep dry, where it remained the some time, till accidentally saw it and found one of the leaves studded all round its edges with small whit
buibs. I sent the leaf as it was to \(M r\). Lee, of Hammer mith.-John Wedgwood.

Nitrate of Soda.-I am told that landiords in Cheshir forbid their temants using nitrato of sode on grass lands as they say t.at f'. grais will be ntterly ciestruyed by hac use of the arit. As fur as my expericuce zoes, the reverse
in true. I have just cut a meadow of grasp for hay, which I covered with nitrate of sodaw last July, after having mowen it: and I hare this rear a better crop, and the had it I. fur: ; and I have mowed it for these last five gears. I used six cwts. of the nitrate to five acres of Wedgwood.
Hauthois Stratwhervies. - The old Hautbois Strawberry, unlike any other, bears the male and female flowers on different roots. The mode of planting is this: mark the male plant, the sterile, and plant the lines in quincunx be the male plants, and the others the female. If this rule is observed, you will never fail to have abundance of fruit. The min time to mark the males is when they are in blosion ; and every gardener should know them and keep them apart in his nursery, to take young ones from. -This is the strawberry on which experiments shonld b made to produce new sorts, as the male and female flowers are so distiact, that there could be no great ditficulty in mixing them with any other kind; as, for instance, to give flavour to the Chili, to give both size and flavour to have done so mach to impre every kind. As gardener let them try what they can do with the Alpine. If the give the Hautbois Havoor, with half the size of Wilmot' superb, to the Alpune strawberry, they ought to receive hundred poundo premium, as proturing the most valuable additian to the dessert.-B. \(\mathbf{S N} . \mathrm{K}^{-}\)
Cutings in Wuter. - It appears from the "Notices to Correspuadeats \({ }^{i n}\) in your last number, that Mr. Towers lays claim to the invention of triking enttings in water. I rememiser seeing it practised at least twenty years ago by an old maid, who, it may be prearmad, posgessed but Fuchsia cutting into a phial of water, which she luun inside a window, where the cutting roon made roots ; ind althongh pleased with the quecess of lier experiment. d) not supyluae the oll lady ansidered herseif a doujare in conscquente. The same extlemon ence wrote a pry on propagating the basam by cuttines, whic. was though worthy of a place in the Transactions of the Horticultural
Sonci iy of Lonaton. I hant done the same thing Jears before when an apprentice \(b, y\), sinnly by puttiny a few cuttings under a hand-glass, with some pink pipings Where, in a few weeks, they grew to the top of the glass So mach for original discovery,-J. B. Whiting: [Striking cottings in water is as old as the hills. \(\frac{1}{3}\)

\title{
tions of both Sir C. Lemon and the Horticultural Society; and that
a supposed variety with violet flowers had blossomed in the same
}

 Wo scapes with a couple of Howers on each, suiffient to show that, like the others of this delightral genus, it is not only deserv ragrant finwers any extra tronble that may be taken in its cult vatin. It has been hithertu growa in a pot uf decajed vegetabic
lomps, but I suspect it would have thriven better if it had been tied to a brauch in' such as the c ord tree, and suspended from the atter of the stove."-Bot. Keg.

Disevloured Gesneria.
(F-cenheus Herbacoons Peremrial.) \(\rightarrow\) A very fine species of this beautiful genves
 purpile, and the whole intorescence giossy, as if varnished. IS
nas beent utroudideed from South America by Mr. Young, Nursery
 nail -Thus is a very fine sprecier in the way if the iemmon Queen's Stock. It has a half-shrubby stem, branching and forming a bush athut two teet high. The lower leaves are as large as
thase of some kinuis of Hound's-tongue, and like them in texturc ant form. The upper leaves are narrower, and a little wapy The thowers are in cluse racemes, large, and of a bright violet
and when they first c cpanit, the plazt is beautiful. But after fime the thowerus tem lenythens, the lower leaves fall of, and the plant hecomes na ked and uyl
not of sight when the nowerny is over. If it would become touble, as it prolably will, it would be a decided improvemen it with the semi double Sterk \(s\). in this war it would prothabsy
throw doable tiowers. The wild plant is by no means so handome as that of gardens. The smell of the fowers is unpleasant, Eat'grbon squaroswm Squarrose Erigeron. (Hardy Herbat coous Perensiail.)-A hardy perennial from N. W. America, much in having hroader radial floretts, leaveses of for different form, and aistinctly squarose. It is a good herbaceous plant; the seeds jere procured for the
Epinhyte. - A ABulla. The Trowel-shaped Feeler-wort. (Store Rigby's, stanh hope Noussery, Old Brompton. It had the general Mpearance of Catasetum maculatum, and bore 30 such iowers hot a beautiful une. none uf the colvers being at all lively. The lip has much the fnrmi of a trowel, and it is not at all hollowed
ont into a lag. It is merely concave like the bowl of a spoon. 11 the species of Catasetum require nearly the same cultivation They must have a moist stove to grow in, should be kept nearly
dry during their season of rest, and should have plenty of water when griving. When the young shoots begin to grow, they are
very apt to be injured by water lodging about them, and care
 pink flow apon tier. It is a greenhonse plant, and
native of the Swan River colony.-Bot. Keg.

MISCELLANEOUS
Linnean Club. - We understand that the first excursion of the Linnean Club will take place on Monday, the 28 th instant, when the members and their friends will meet at breakfast at Pangbourne, in Berkshire, and then proceed to investigate the natural history of the neighbourhood. They will return to town after dinner
Stealing from Gardens. - (Abstract of an act to amend the law in respect to the offence of stealing from gardens is erpediont to pake botter prorision for the protection lante roots fruit and regetable productions growing in orchards, gardens, and nursery grounds, and in hothouses, rreenhouses, and conservatories; be it therefore enacted by the ling's most excellent majesty, by and with the advice and consent of the lords spirituaf and temporal, and commons, in this present parliament assembled, and by the authority of the same, that if any person shall steal any plant, root, fruit, or vegetable prodnction, growing io any orchard, garden, or mursery ground, or in any hothouse, greenhouse, or conservatory, or shall aid or abet any person to steal the same, or stail receive any of the erery suci offender being convicted thereof before one ustice i.f the peace, within three calendar months after the commisaion of the offence, shall, at the discretion of such justice, either be committed to the House of Correction, tbere to be imprisoned only, or to be imprisoned and ept to hard labour, for any time nut exceeding six caendar months, or else shall forfeit and pay treble the value of the articles so stolen or receivel; and also, if the Justere shall so think fit, a furtior sum not exceeding Wer.ty pounds, as to such justice shall seem meet, and iu lefault of immediate payment shall be comeritt. das aforesaid: and eiery sum of money which shail be forfeited for the single value of any artiele or articles so stuten or received as aforesaid, shail be awarded to the party grieved, ootwithstanding guch party may have been examined in proof of the complaint: and the residue of every pecuntary penalty which shail be imposed \(b v\) ans justice for any such offence, shall be awared to the use of the informer, and of che poor of tie place whercin the offence shail be said to have beea commilted, in such propurtions as to the justice shall serm meet.
Bouquet fier her Mifuet\%, At the larnch on Monday at Weolwich, the bouquets for the Royal party were the subject of generas aduiration. Thit ind colre of the Qusen': table was particularly striking: indeed, we are in-
formed that lier Majesty tuuk it away in ker carriage, nd was olserved to point unt to one of her ladies tie charming Fuchsia Youeliii that surrounded the thole outer circie. We add mitia mech pieasure that these Leautitul Youell.

Asphatte Coverings for Frames, ge. -We have at last formerly described by Mr some of this prepara p. 100). It appears likely to be very dour colcmas ightness and completels wor particularly well adapted for the purposes of shade in sum mer, and of protection in winter.
called Dipludon or Diplusodon havia gexus of plants callon in troduced from Brazil, our readers will perhaps be glad to The whan mor The genus belongs to the Lythraceous order, and is nearl allied to Lagerstreemia. It consists of strubs with oppo site branches, which are often four-cornered. The leave are opposite, and often heath-like, but sometimes broad and firm. The flowers are in axillary and terminal racemes, which are occasionally contracted into heads, an are red or purple or white, not yellow or blue. Some are of considerable size, and very show ; others are smaller. In some cases the species resemble Lythrum virgatum. The accompanying figure of Diplodon arboreus represents one f the haidsomest species. They form bushes inhabiting he elevated plains of Minas Geraes, and mountain stations in the southers parts of Brazil ; and may be expected to e hardy greenhouse plants. The best of them are not to be compared with the Lafoensias from the same conntries.

The Banyan Tree.-The Bayyan, Indian Fig, Allama rum, or Ficus indica, is a tree which attracts particula notice on account of one distinguishing and remarkable property. Its horizontal branches naturally extend to a great distance from the parent stem, and being unable to stupport their own ponderous weight as they shoot forward, fibrous roots dip perpendicularly from them, and after touching the ground, swell to the size of massy pillars, and bear up the loaded boughs with the utmost firmmess These stems are smooth columns, corered with hark of a silver colour, and put forth no shoots. When they first leave the tree, they are of a brownish hue, as flexible as hemp, and wave in the air like ropes. After eatering the earth, they become stationary, and are to be found about the same tree of various sizes, some measuring less than three inches, others upwards of eleven feet in circum ference. As they at first draw their nourishment from the tree, it is probable that they afterwards return th favour by supplying it with new juices from the bountifu
earth. The leaves are plain, entire, smooth-edrad, nelther heart-shaped, nor ending in a rointec emermity. A fuil grown leat is five inches tong, three and a udii broad. and aas a footstalk upwards of on iuch in length. They grow alternately on each side of the bratoches, but not upposite to one anothe:. The fruit is of tie size of a smath cherry of a deep scariet colour. and has a bright veliow circula spot ruund that fratt of it which toncines the tree. The fruit, the substance of whicin cunsista of a great number of seeds of a dunnotive size. These figs grow without any seeds of a dunative size. These rigs grom without any stalks. atherwerg cissely in alternate positions, sill round
the smalle: bruches. They atfori food for moniseys, and a varety of the feataered race, but are nas sweet to th thste, and are scarcely ever eaten by man. The seeds are of such a nature that they pass through birds unbart, perthese means the trees are scattered over all India and the

Eastern Islands, and often placed in curious situations. Some writers, in describing this tree, have conforunded is qualities property of dropping roots from the one, and clothing it with the heart-shaped leaves of the other. An error still more palpable has been committed, in asserting that it bears no frnit. The Ficus religiosa is held in great veneration both in Ceyion and on the continent of India. In the Cingalese language it is callied bogahas, or the tree
of Buddha; and in Malabar, Alrisarum. It drops no fibrous roots from its spreading boughs, but far surpasses the Banyan in elegance and gracefalness of form, grows to a very large size. has a smooth bark, and is perhaps the most completely beautiful of all the trees which adorn the aide garden of natore. The leaves are particularly handsome, being exactly of the form of a heart, and having a long pointed extremity and a long footstal. When fall groadest part, and 8 in length, including the tapering point, which measures 2 inches. The fruit grows without talks, in the same manner as that of the F. indica, adhering to the smaller branches ; but it is rather less in size,
and does not attain, when ripe, so bright a red. This religious fig is accounted the most sacred of trees in India, and it is beld in such high estimation in the country of Candy, that the form of its leavea is only allowed to be tion of the king. Specimens of both these Fig-trees have been planted in the East India Company's garden in the (1807) in st. Helenn, where, although young, they appear (1807) in a fionrishing condition.-Cordiner's Ceylon.

\section*{GARDEN MEMORANDA}

Beach-house, Sandgate, the seat of T. Hodges, Esq.- Being at at Sandggat. We took boat, and in an hour found ourselves at a
villa immediately facing the sea : it was, indeed, on the very heach. We comld searely helieve this cou.d he the place we were
directed to. We ascended a wall and found ourselves on a terrace, nront nt the drawine.room window, and lashed by thesea at high Whter. A small lawn, with a paved walk, extended from the
hoose to a builiding looking directy on the sea, elegantly fromished
as a boat-room, ith grotesque chairs, and the usual accompmoiments to boatiog. But what was our surprise when on the one wooded plants. so arranged as completely to conceal its termina-
tion the trainiluon was marveltous, it cement but a tew secends
 fiue specemens, maany of them more than a century old, and laden
with truit and thwrers. We passed hartily through the Ora unt know ing whither it would lead, hut the staug was to contrived.
that sustance was cencealed, for aitter passing some wo ft. we
 devotel to, Orchidacees attraeted our attention; our first impres ston wase that then aw hat seen these plants treated, we had
never befire gheld them hon happyly arrageed, for in addition to the many weil erown se-imens in phta, there were several gro the recerant orcownum dexuorm, and the extraordinary Papilio loukiug lise ome tmpical butterlly rather than a thwer, the
Cattleqas and nendrooiums were sowwing freely; and the oranke Maxiliaria aromatica was imparting to the surrounding atmo-
sphere its delemus whar This brought us to the side of the arched with ereepers, which lends us to the inside of that rock Worls which shatts out the see In the whele of onr visitit to garto e.sotic collture which is found here. The rock work defends the grarden frua the spray uf the sea, is about luit. high, and compased
 Calecoiariai, and Geraniums, whese actours are of turnustal bril linnce from the apprnximation of the sea. On the whole, we
never have seen, in East kent at least, so neth a collection of exotics grown so well mnd in such a small compars. The space
 traet nt what the capabbuties of grieming are, we mey mention

First Additional Supplement to Loudon's Encyelopedia of
Plants. London, Longman and Co.
This is a very acceptabe is undoubtedly one of the most useful books that have ever issued from the press. The present olume consists of nearly 200 pages; printed in the same manner as the original, and illustrated with a great quantity of wooderts, cleverly drawn by Sowerby. - aey are stated Baxter, jon., has prepared thematter, 1840 . Mr. William Barter, jun., has prepared the matter, and Mr. George Don is announced as having revised it. What the latter genteman ray really have done we have no means of knowing ; but we presume that his revision at least extended to setting the genera and species, and correcting errors of accentuation or derivation. This being 80 , we should be gad to know upon what principle the sparions genns Mahonia is distinguished from Berberis ; while Sollya is united with Billurdiera, and Monachanthus and Myanthas, both proved forms of Catasetum, stand as distinct genera. The chief use of catalogues is to settle nomenclature, and oversights of this sort, affecting the names of common plants, in accentuation. E'pacris should be Epácris, A'picra, Apicra ; Bowiéa, Buwiea, the e being mute. Moreover, the additional species are by no means all that have been introduced since 1829; the omissions amongst Orchidacea re more especially numeroas, which is unfortanate, conidering that they are general favourites. Nevertheless, the Hork is of great value, and we doubt not will presently

John's Flore Sacre is a Iittle collection of Scriptural passages and scraps of serious poetry, illustrated by beautifully dried specimens of mosses. The hyssop of the wall is figured by Gymnostomum fasciculare, a minute species found in Syria by Hasselquist. It is often not easy o perceive the connexion between the plants and the poetr, but the book is a pretty one, "through nsture up to nature's God", themselves to look

CALENDAR OF OPERATIONS for the ensuing Week. most of the plents being in a state of active growth. It is adCattleyas and Levias, muckt less water being riler treatment, as Well- -foing thaul most kinds, and they ought to be placed near the glass, that they may receive as much light as possible, without
allowng the sun', rays to act directly upon them. Bottonn heat, allowing the sun rays to act tirectly upon them. Botton. heat, least unce a day, are essential. To prevent the current of cool air fine meshed netting. If these rules are negleeted, there leaves usually assume a spotted and sickly appearance, and their flowers

Pinzrt.-Fruiters in various stages of forwardness will now be progressing rapidily; they must have plenty of heat and moisture given thenn; if the heat of the tan at the hottom of the pots has
Lowered below \(80^{\circ}\), as much fresh tan shonld he adided pils the temperatare io degrees. The thermometer may tise by raise beat to \(90^{\circ}\), or even \(100^{\circ}\), if air is at the same time given, which should be allowed in the morsing, as soun as the sun inturuces
tie temperatire of the house a few degrees. If, during denil tive temperature of the house a tew degrees. If, during duil or

plants for the flowergarden. All advancing towert-temer Depurtment.
rowding them; if this be neglected for a fer nento withont crowuing them; if this be neglected for a few days only, the
plants can never be made to look well, and windy weather oc-
curing, their beanty may be destroyed for the seal curiug, their beauty may be destrovel for the season. Stop the
nain shoots of Petunia, terbenas, dce, when the ground is not
sufficiently cor suficiently covered. Re-fill immediatelly any vacant or shabby
beds; commence layering Carnations; taike up butbs whose ceaves are decayed; mow
dip bor and other edgings.
Nursary--Hand-weed seed-beds, and hoe wherever the boe
an be applied; prone young trees in nursery rows; prick ont in ; trim nu stocks in-
Forses and coppice Woods. - This is an excellent season for pruning young plantations, if this is attended to now as it ought
to be, winter-pruning hereafter will be much less necessary. eep down weeds about young trees of all kinds.-Joseph Paxton.
The late dry weather has rendered constant watering indis pensable in many gardens; care must be taken, however, to pre-
vent the ground from becoming hard or baked on the surface, as ent the eground from becoming hard or baked on the surface, as plants. Moss or tint stones laid pu the beds will, in a great scasure, prevent it; and whenever it does occur.
should be rather deply hoed. Thin the flower-buds of Cans-
ions, and tie up the tlower-stems neathy. An occasional waterions, and tie up the dower-sterms neatly. An occasional water
ing with liquid manure will be serviceable. Datilas will now quire constant attention, such as thinning the brauches, tying than one stem from the root, but only one strons one stuvid he allowed to remain. Manyy herbaceons perennials flower well
in pots, and by keeping a few, such as Pentstemons and Lobelias, constant succession of bloom may be had in the greenhous, at tiors. Lobeiias tlower very handsomely in large pots set alow two inches deep in water. We have seen a gooi effect prodiced
by them when on a iedpe or shelf in an aquarium. Pick of all dead leaves and flowers: dentroy weeds: clip box-edgings; and
keep lawns closely mown. (rive pienty of air to greenhosess
 where there are many piants in flower, as it will enable then to last longer. Oranges shonld have an ocaasional watering with
manure water. Pot off all ronted cartings. and take eare nut to plant theme ton deenty, as that will soon cause the
health, and perhaps kill them.

REPORT ON COVENT GARDEN
For the Week ending June 25th, 1841. "The supplies or Fruit and Vegetables have been large during show of plants and cut Flowers has heen fine. Fruit.-
The remarks on Pines in our last report apply equally to this. Hothouse Grapes of the usual kinds abound. Peaches an Large quantitres of Cherries have been brought during the week;
the kinds are Bigarreau, Black Heart, May Duke, and Flemish.
Raspberries are unusually plentious and are otfered at Raspberries are unusually plentiful, and are offered at from \(4 d\), to
sd per gallon. Several new kinds of Strawberrieg raised by Mr.
Myatt are offered; the kinds are British Queen, Eliza, and Elton one measured 7 l in. round; they are said to be of good quality and prolific bearers.- Vegetables. Generally speakimg, the remarks
made on Vegetables in the last repurt apply to this. Caulitiowers are abundant, and some of the specimens very large. Peas are exrather scarce. Carrots and Turnips are abundant. Young Celery
is plentiful, as well as salading of all kinds.- Flowers. There has been a good display of cut tlowers and plants in pots; among the latter we observed a Japan Lily, several Tuberoses, Oleanders,
and Fuchsia fulgens; and among the former were good collecand Fuchsia fulgens; and amo
tions of Roses and Heartsease.

\section*{Notices to Correspondents.}

Docblb-yeflow Rose.-Our correspondence has produced us za great many communications upon this curious subject: but we
truort that we shall be favoured with many more. The best chance - of ascertaining the secret of its cultivation is by comparing the experience of many persons writing independent of each other.
We should be glad to hear the evidence of those who have tried to grow it, but in vain.
me A. Friend nf the Goossberry-bush will in February, as directed by haps id , allowing all the adjoining bushes to remain without time, he will be well repaid for his tromble, and tind, as all my friends here have done, that my statement is correct, which, for
the benefit of others, I hope he may acknowledge in your usefal Chermicie next year.- I humese he may acknowledge in your usen. Trungle, near Penzance. J. W.-We fear yum have been tou kind to Aquilegia glanceulosa and lris susiana, and this is probably the reason of your want of growns in towe-half horem. They certanly do not requare to be warm bonder in front of a wall. drain it well, and plant the Iris in winter, and you are pretty sure to nucceed. from cold and wet in flowers, sare the seed, and keep a stock of young plants; do not crow it in a hot, dry place.
P. M. asts
country by means whether fruits, have ever been preserved in this has ever been done except as an experiment, and on a small about \(1 \overline{7 / 5}\) bv Dr. Priestley and Mr. Henry. It would appeat,

Mus. - Campanula pendula is a baridy perennial from Cauca-
and mix some lime rubbish with the soil. Tit it is growing very
luxuriantly, our soil is probably too rich. When prown in pots

 ing manner:- First of ali soe that the roots are in a healthy state give them a rich free soil, composed of sandy loam and rotten
dungs, with which you may mix about one.fourth of bruised char
coal coal be carefuil that the pots are properly drained. Wheneve they are out of flower and removed from the house, do not place
them in a dark grenhouse. as is often done, because this will
prevent the wood from ripening, and your plants will not tlower prevent the wood from ripenisg, and your piants will not tower
freely. Let them be piaced in the lightest house you have, pro a very light greenhouse without sufficient ventilation, then you must shade slightly in vert warm weather. It is a very common
practice to place them out of doors in the summer nonths, and practice to place them out of doors in ee summ in a bad green-
this is certainly much better than keeping them house. In France and other parts of the south of Europe where Orange-trees succeed so well, the summer is highly favourable
to the ripening of the wood, so that it matters little where the plants are placed in winter, but in Enterad it will not do to kee
them in cellars and other dark places of this description. If your plants are healthy, and this trearment be attended to, it is not ne cessary to give them artificial heat in spring, unless you wish to उ. Y- The neme of Four plent is \(C\)
gestion respecting a list of handsome half-hardy bulbs shall be attended to shortly. In making cuttings, it is in the most of cases desirable that the bud at the base of the shoot should be cut out. Anything which would destroy the extremity of a cutting jurious to the formation of roots, and therefore instead of facilitating the operation, would retard it. Soft-wooded cuttings flas when they are too dry: but the best way to ascertain
wand or soil is in a sand or soil is in a proper state, is to take it between the finger and thumb, when you will feel at once ir tit wee enough . When healthy-looking, their throwing off their oid leaves is not a bad sign: if, on the contrary, th
are in a hopeless condition.
A Norice. The shrubs called Bottle-brushes are species of the
genus Callistemon; particularly formosum, Ianceolatum, and genus Cailis.
lophanthum.
B. S. K. - We have never been able to ascertain what the plant calls Pomme Blanche, or Prairie Turnin collected and which he the Red Indians. It may possess properties which we know nothing of, and may be valuable to our agriculturists. We should
be glad to learn something about it from some of our correspondents.
The plants from Messrs. Pope and Sons are Epidendrum nutans and Maxillaria ritellina. When specimens are put into cotton
wool, they should be in the first instance inclosed in tissue paper wool, they should be in the first instance in
and then surrounded by wet brown paper.

\section*{E. M. MY:'s plant is Trnia glaberrima.}
táchyum is perfectly hardy. It is indeed that the Aponogeton disAT Well-uisher at Limerick will find soot-water, such as he de scribes, a very powerful manure. The proportions between soo
and water are not important. It is the ammonia of the former that renders it so valuable. what cat is.
Mr. Davidgon's plant is Crategus torminalis.
Mr. Dilluynn's Acacias appear to be
No. Dilluyn's Acacias appear to be all rarieties of A. deaibata A. pubbescens. The Eleagnus is the broad-leaved E. angustifolia, C. D. may be assured that Purshts Gerardia fruticosa is a Pent
stemon. It is in fact very near P stemon. It is in fact very near P. Scouleri. See the Botanical
Register under the latter article, and Mr. Bentham's Register under the latter articie, and Mr. Bentham's Monograp
of Gerardiex, in the C'umpmonion to the Botunical Maguzine. The kernels of Mr. Tuek's, Morello Cherries have been killed b frost ; and when that is the case, stone-fruit cannot hang on the tree beyond the period at which the stone begins to harden. Would any of our correspondents be kind enough to inform us Where we can buy or borrow Dr. W. Falconer's Historical view
of the Art of Laying-out Grounds among the Nations of Antiquity, Mr. Collier's Aucubas are, we now see, diseased, probably from
cold, or from having been bruised by other branches whipping cold, or from having been bruised by other branches whipping
them. It is a very different malady from that of the Laureis. them. It is a very different malady from that of texe Laures.
suburbun. - Hard pump-water is to many plants a slow poison. If youn had anointed your verbenas wit perhasp more so. Spoiled ale and porter, and mutton broth, are
excellent manures. It is, indeed, melancholy that nothing but excellent manures. It is, indeed, melancholy that nothing but
children should thrive in your neighbourhood. Hare patience, children should thrive in your neighbourbood. Hare patience
however, and the prosperity of your garden will keep pace with that of your neighbours' children, if you do but read the Gar deners' Chromicte.
E. F.L.'; buibs will require the same treatment as others from the Cape. They muzt be kept dry when not growing, and at tha time may be submitter to a temperature not lower than \(36^{\circ}\) but the fourth is some error: anthiopica should be æethiopica and rullaris should be scillariss
H. O.-To preserve Rose-leaves gather them without any o the green and hard parts, when they are full-biown and perfectly dry. Spread them on a sheet thinly, in an empty chamber, wher Sthe them frequently till they are quite dry. They are then fit \(t\) o
p. \(C\).-All the potatoes which the potato-ptant bears are formed by the organising power of the leaves, exerted during the seaso of growth. The more leaves you have in a healthy condition, is trme of all other plants after their kind. Ninw, to cut off the haulm is to cut off the leaves: therefore, the practice should nere be adopted. It is as bad as sewing up an animal's mouth in order to fatten it

Leake's manasement of bees, as described in No. \(25:-\) Must the aliphting board be placed at the bottom of the uniting more than two hewes chould there be mogre than one entrance: Must the holes forming the passares irnm the hives pied by each hive: for centres of the circles of hises of cours pill the holes canment be cut near the centre of the board. the box beneath be fixed to the floor-board, or remoreable?
A Luver uf Rusrs, Florn, Glenaladale, shall have answers next week.
index or the principal horticeltural subjects in

NEWS OF THE WEEK.
THE great events of the week in our home politics have been the Prorogation of Parliament by the Queen in person, and its subsequent dissolution. Her Majesty's Speech alluded to the importance of the trade and commerce of the country, and to the expediency of ascertaining the sense of the people on the best means of providing for the exigencies of the public service in the manner least burdensome to the community; and concluded by saying, that in the exerciss of her prerogative, she could have no other object than that of securing the rights and promoting the interests of her subjects. The Speaker in his address to the Throne, on behalf of the House of Commons, took a review of the provision made by the House for the naval and military establishments, expressing a hope that by promoting their efficiency, the House had adopted a course which would ensure to the country and to the rest of Europe a continuance of peace. The proceedings in both Houses previously to the dissolution, related chiefly to arrears of business, and to the passing of various measures for facilitating the public service during the suspension of Parliament.
Our Foreign news is also of considerable interest. In France the forged letters of the King, and the resolution of the ministers to abandon the prosecution of the journals, continue to attract attention. The Chamber of Peers has voted the budget of 1842 by a large majority, but not without strong protests on the necessity of further reductions in the military establishments. It appears that the Minister of Finance does not intend to bring out the contemplated loan at present; and in consequence of the rigid measures adopted by that minister for the collection of the taxes, great dissatisfaction has been created in different parts of the country. The Chamber has adopted the Treaty of Commerce with Holland, notwithstanding a strong appeal against it from the leading merchants of Paris. -In Spain, the commission appointed on the subjest of the guardianship of the young Queen has decided against the claim of Queen Christina, and has declared it to be the duty of Government to call a meeting of both Houses of the Legislature, for the purpose of appointing a guardian to Her Majesty. The speedy prorogation of the Chambers is talked of, and the Carlist chief, Cabrera, is said to be devising measures for the renewal of civil war. -From Portugal, we learn that the Ministry has, at fength, been definitively settled, Senhor Aguilar being President of the Council : its constitution is described as being of a decided Chartist character, and it is said that it will have a majority in both Chambers. The contract for the payment of the foreign dividends has been adopted by the Ministry, and the national battalions organised by the late Government have been dissolved.-The expectation entertained that the King of Prussia intended to abolish capital punishment appears to be premature, and the recent confirmation of several sentences of death is regarded as a proof that he does not think the time has yet come for so great a change in the penal code. -The arrival of the long-expected Levant mail supplies us with additional information respecting Turker, Egypt, and Syria. The firman, containing the modifications alluded to in our last, has been forwarded to the Pacha, with the full concarrence of the representatives of the Allied Powers; and much anxiety is entertained buth at Constantinople and Alexandria in consequence of the prevailing belief that Mehemet Ali will refuse to accept it, on the ground that the tribute is fixed at too large an amount. The intelligence from the European Provinces of Turkey is more favourable, but news has been receired that the Pachas of several Asiatic cities are in open revolt and on the point of separating from the Supreme Government. The mountaineers of Syria are still in a state of agitation, and the plague is raging there as well as in Egypt with unabated violence. In Candia, the Turkish authorities have landed a powerful force, and the latest advices state that an engagement has taken place in which they sustained a severe loss. - From the United States we have received the President's Message on the opening of Congress ; it is said to have given general satisfaction throughout the Union, and in regard to the foreign rela-
tions of the States, it is particularly President declares that there is no danger of the interrup tion of peace, and that the time ourht to he recardect as gone by when an appeal to arms is to be cuishlered the only arbiter of national differences.

\section*{Thont Jetus}

Cotrt.-Her Majesty. Prince Aleret, and the Prineess Royal are well and continue at Buekingham Paiace. On Mondar, the Queen and His Royal Highnes3 risited Wooiwich to be present at the launch of the Trafalage. Lords, to prorogue Parliament. General Johnson，

Erance. - Tibels on Louis-Philippe.-The journals are almost exclusively occupied with the question of the
fing's inviolability, raised on the forgeries of La Conking's inviulability, raised on the forgeries of La Con-
iemporaine, and the letters of Didier. The discussion, however, is one which can but slightly interest English readers. The opposition papers declare that ministers
dare not, and cannot, execnte the Sentember laws on the subject of lisel; the great arcument in favour of these laws having been that a liberal majority in the Chamber would never permit their full execution. The ministry seems avowedly to have abandoned all icea of prosectiting the journals before the Court of Peers for the Grenelle letters reflecting on the king. The opposition prints concontrary, say that the resolve is the result of the calm consideration of ministers, uninfinenied by threats in or out of the press; and that if the project was entertained credit of two ministers, the whule cabinet deserves the Some of the journais have founit out fresh reasons for Some of the journals have found out fresh reasons for Bennating on a lettor addressed to Louis. Philippe by M. ment in July I I3A, suisecquently Sub)-Prefect of Funment in July 1 inu, suiuseruenty sub-Prefect of cunment of Algeria. In this letter M. Bonnelier asserts that he has not been sutfeciently rewarded for services readered to the king when Dukie of Orleans, and alludes mysterousiy to some mission with which he was charged in Brittany shortly before the revolution of Jriat). by the duke a mission, ie states, requiring "penetration and sagacity.
Peershas votiary Budgel of 1312. - The Chamber of tests agminst the insumetiency of the reduction. The Marquis Barthelemy ubserved that ministers eertainiy the resersp of the for their country, or baving always the reserse of the sinding-tund to dispose of, since tiaey
still propose! (i) spend fire liundred milhous ou oublic stal propuse! w spend fire liundred millious on publie
works. He would rote for Mat ministers would spend les-a and, awose all, that Warshal Sonlt mould uishand the new regim nts furmed. to par \(t+13\) io tie marine, it was insuasible, he said, finances mato disoder. at present. Without throwing the had promised further refuctions in the militted that be of 1842 , if possible : but said that he could not expenses explicit at present. M. Barris said, that in maintaining
the army at more than 400,000 men, all hope of public doned, and a deticit of another hundred millions of franes be expected for \(18 \not 43\); a result which would be fatal not only tu the moral infuence of government at home. but long and learned emprison of her stem which the English and French could bring into action and professed himself quite perplexed and annoyed at in superiority of the English. He strongly censured suveral high naval authorities for asserting that the chief force of the nary still existed in vessels of war, and enlared on of Marine, in reply, admitted the superioritr of Enslant in naval resources, but showed the French adniralty not to have been wanting in activity. With respect to
steamers, be added, France would soon be on an equality with England, as she had actually 41 ationt, and ti.e re maining 3 , to come up to the number of at preant possessed ly that country, were in progress of construction. In the project of law for extraordmary pubtic works. which had get to come before the Chamber, the principal tem objected to appears to be that of forty millions of frames emanded fur stabling for French cavalrs. Out of \(3: 2.1411\) orses, which composed the French cavalry from 1...0 to combat the effecte of this disease that the minister decombat the effecte of this disease that the minister de-
mands the forty millions. A minority of the commission of the peers, it is said, is disposed to refuse them, on the round that glanders ravage large stables as much as =m?.! ones. The importance of this opposition was considered to be not so much in the subject, as in the possibility of an amendment, which would paralyse the entire law. Subsequent accounts, however, inform us that this quesion has since come before the Chamber, but no amend ment was brousht forward. On the subject of the stahlin - horses, as mell as with regard to the money reifirit and the rrant should be reeramined each year in prlia ment, and the destination of the funds changed, if the chambers so thought proper. The law was then carried by a majority of 96 against 23 .
Alyeria.-In the sitting of Friday, Baron Mounier called the attention of the Chamber to what he termed the "fearful expenses" of Algiers, where he said twenty millions sufficed in 18344 , and which demanded sixty-two
millions in \(1: 341\), with an army of 70,1000 men. He commillions in 1841 , with an army of 70,1010 men. He com expeditions, in which more officers distinguished themseives than at Austerlitz. He regretted that whilnt the rench had borrowed their destroyiner and pillaciner par ties from the Arabs. The captures made on these werasions were generally women and children. He shuddered, on reading in a military despatch, that "French soldiers had brought in so many heads." Marshal Soult replied that all such acts of inhumanity had been censured, and hould not be repeated, whilst a system of eachange of prisoners had been arranged, which would tend to mitiThe Finanees
The Finanees.-It is stated that the Minister of Finance does not intend to bring out the contemplated loan before Octuber, and some of the journals assert that it will not be proposed this year. Great cumplaint shrough out the country are being made on the part of the hullise holders and shopkeepers against M. Humann, who, tind ing the revenue insnfficient, fresh taxes nnnalatable, and loans impossible, has put into practice a varitty of rexatious, though not illegal ways, of raising the receipts Erery holder of an apartment has been forced to pay the rery utmost of his mobilier tax. The same severity has been exercised towards shopkeepers, paring the patent tax. And towns, which escaped surplus taxation, b retending to be a thousand or two thousand less in po figher list, and condemned to pay the surrlus. The minister, though only doing, it is said, rigorous justice ppears to be gathering a cloud of unpopalarity upo goremment, and upon the war-party, which is cunsicered to be the original cause of the increased taxation The mayor of Tonlouse, it is stated, has declared to the muncipality of that city, that the mode of making the returns of the doors and winduws slibject to tasation, pre scribed by M. Humann, was illegal, and that he woul ar, though inviter, assist at it even as a simpie spectataxes in the execution of their datr. The municipal council unanimously approved of the mayor's conduct and roted him the thanks of the assembly.
een prentuen 1 ane ami Mollani.-A petition ias been presented to the Chamber of Peers, from 300 of the most eminent merchants in Paris, against the treaty of eumanerce lately concluded between France and Ilolidnd. The petition sets forth, among other ficts, that the esecu tion of this treaty would be disastrous to the interests of that the tran to the trade of Pars. It further states. recintocity concluded between Cireat Britain and Eranc in the year la2h. whinh forvade the introduction of the produce of Ash, Africa, ur America coming irons Ei:m treaty land evades this treaty by the permission which i. ...F. of importing such produce through the Dutch port 3 and the rivers Raine and Moselle. The petition condudes b praying that the ratification of the treaty be postpone until the ensuing seas:on. The chamber, homerer, adopted the treaty on Tuesday by a majori

 Ham perion aiy by sume shpporters of the government, Was enmsticerc! uditer of regret ia Lisbon, where he had
 ofif withunt any uisturbance un the luth inst., and appears to hase been more than usuaily splendid. The Queen and hing Consort attended divine service at tue cathedral
and the latter afterwards walked in the procession, and assisted to bear the pall. together with the
mella and Terceira, the new premier, \&c.
Germasy,-The Munieiprity and Deputies of Breslau, in an address to the King of Prussia, have expressed their deep regret that his Majesty should on the occasion of his and attention which they were so anxious to display, becanse they expressed grauted for the kingdom. With due respect they urge that they only trercised their right in causing this re qo they were neither misled by visionary notions, nor in stigated by any unworthy influence abroad, as they have been accused of, expressing at the same time the hope they
entertain that liis Majesty will not question their depotion and loyalty. Accoants from Berlin state, that the King of Prussia, who was supposed to be undecided as to the question of the abolition of capital punishment, and who had not since his accession to the throne confirmed any of the sentences of death of the tribunals, has just confirmed eight sentences, from which it is inferred that he does not think the moment arrived for the abolition of that of the murderer of the Bishop of Ermeland, already mentioned in this joumal-According to the last official census of Vienna, the population of that capital amounted in 18411 to 357,927 , of whom 204,290 were Austrians, and the rest foreigners. The increase since 1837 is 23,427 ,
but these are chietly foreigners, residing in the suburbs; the city, properly so called, having only 52,593 inhabit ants. The national manufactures have within the last ten years made very great progress. Lower Austria, the 59,900 workhops. By its iron works in 1839 , Austria produced \(3,324,114\) quintals of bars, and \(522,8+3\) quintals of cast-iron-It is stated to be in contemplation to conBreslan. The first will lead from Breslan to Ohlan, and thence to Oppelu, 14 German miles. Secondly, a line from Breslau to Schweidnitz, in Freiburs; the vicinity of the Silesian mountains, so rich in minerals, it is considered
will canse much traffic on this line. Thirdly, a line from تill canse much traffic on this line. Thirdly, a line from Breslas to Franlfort upon the Oder; Prince Kolorath
and other proprietors of Lower Silesia are to have the management of this line. Pourthly, a line from Breslau through Leignitz and Gorlitz to Dreaden ; the merchants of Brestau being particularly interested in its completion. with some difficulty. The Cologne Gazette announces that the Grand Tanvel of the rilway near Keenigsdorf is pearly finished. It is 420 (ierman perches in length, 22 iu hreadth, and 22 in width. The entire road between public in a few months.- The Royal Almanack of Saxony supplies the follong of the whole kingdom amounts \(\mathrm{t}, 1,687,141\). The pro-
duce of the mines for 1839 was \(7,(100,1000\). The woollen manufactories employ between 3140 and 4000 looms, maiking annualig 1604,060 pieces of cloth. The principal silk factories are at Annaberg, Penig, and Trankenberg. In the budget of the finances, from 1840 to 1842 , the revenue is \(15,896,1\) iff., and the expenses \(15,214,996 \mathrm{f}\). The national debt amounts to \(36,908,327\) f.

HANOVRR. - Accounts, to the 18th inst., inform us some time serionaly distarbed, is not all improed for it is added that the physicians fear that her Majest is labouring under the same complaint which, in the opinion of the English physicians, cansed the death of the Jews have been published, from which we learn that the deficiency of 4144 rix dollarg, which is caused by the abolition of the tax paia by them for protection, is to be zoade good by the Treasury. Among other regulations, the Jews are excluded from the exercise of political rights, as well in respect to the state as to the commune. They representatives of the comasune. They are likewise excluded from offices of the state and commune. They cannot be adonitted so ther pablic functions. except with cemed. Thap aroral of the Ministerial department conauthorities permit it; and then only on prescribed conditans. They may, however, exercise free or corporate trades, in the samne manner as the Christians, and may
also be adonitied into quids ; and lastly, they are bound to employ Jewish workmen in the bandicraft necessary in their trade.
Greece.- - Accuun's from Athens, dated the coth ult, mention the fact that on the preceding Sunday a performance took place at the Theatre for tre benefit of the reCoart were present, and that the on!y member of the corps diplomatigue wh) attencie 1 was the French Minister. The entertainume prollured ie, 00 drachms (about 3002 ), inCluing live from the King, 109 from the Queen. and from Athens wre, it appears, jut coolly received in m it dowitht \(K\) m; Ono. it is said, was evineing much Irdrs.-Ma aty dated Naples, June inth, writen by a resp, ita ke : in resideat in that city, it is stated
that the Cajaia the Eritish brig Fenus, which arrived there from \(B=\infty\). andiand \(0: 2\) the ith iast, reported that he inaz on inis rurig. from Cadiz to Newtoundland, in the in which she must shortly after hare been biocked up.
steamer in answer the British flag. The brig not having been reported by the steamer, which was enceavouring
proceed homewards, the Captain is led to suppose that proceed homewards, the C'aptain is led to suppose that
must have been the President. He was obliged to make must have been the President. He was obliged to make into the same predicament.
Turkey. - Thelong-expected Levant mail has at length been received. The despatches brought by it, although their contents, in most material points, have been antio pated by previous expresses, are not without interest. The accounts from Constantinople of the 27h ult. news we gave last week. The hatti-scheriix, ap provet of Minister of Foreign Affairs to discuss the modifications to be introduced, had been forwarded to the Pacha on the lst inst. These modifications are precisely the same as those mentioned in a previous number of this paper. Account from the frontiers of Turkey of the ith seem to recard the
refusal of the Pacha to accept the new hatti-scheriff as nearly certain, on the ground of the tribute being fixed at too large an amount, and that he win not pay halr the sum were by the Sultan.-The accounts from the province, were more favourable. The insurrection in Roumelia was Aelced to have completely fanled. The this or woun had claimed the protection of the Pacha of Salonica, who had sent to them a detachment of 150 Turks. The Kapou Kiahia of Monstafa Pacha had arrived in Constantinople and was said to be the bearer of various communications to the Porte from that Governor respecting the situation of Candia. The grand Rabbi of the Israelites in Con stantinople had been dismissed from his post at the request of his co-religionists.-Nouri Effendi, the Ottoman Am tion since the downfall of Redschid Pacha, the Sultan had at last been prevailed upon to accept it. It was not known who would be his successor.-It has been announced to the Porte that the Pachas of Bagdad, Nardin, Mosne, and Bassora were in open revolt, and on the point of separating from the Central Government. It is added that the Pacha of Bagdad having failed in his plans, had fled into Persia. Egypt and Sxria.- Private letters from Alexandria the 28th ult. state that much anxiety was felt there for the arrival of the hatti-scheriff, which was to determine all the questions at issue between the Porte and the Pacha. From these accounts it would appear that it is not expected, in Alexandria, that the Pacha will accept the new firman; and it will be seen by our Constautinople news that the same expectation was entertained there. The amount of the tribute, and the regulations relative to the administration of the Turkish laws in Egypt, appear to be the points which the Viceroy is likely to object to. The latter was said to be in constant communication with men high in office at Constantinople, by whom he had been lately assured that the Sultan was in so delicate a state of health exchequer was completely exhausted. Ibrahim Pacha was till engaged in his tour through Middle Egypt, accompanied by the notorious Capitan Pacha, Ahmed Fethi, who was in great favour with him. A corps of 6,000 Ar-
nauts had abandoned the service of the Sultan in Arabia, nauts had abandoned the service of the Sultan in Arabia, continued much the same as at the date of our previous adrices, averaging from 15 to 2 ) cases daily at Alexandria. -The intelligence from Syria comes down to the 14 th ult. The mountaineers still continued in a state of agitation, on account of the amount of the contribution required of hem by the Turkish authorities, and of the restrictions aid on the silk trade, their principal source of wealth The affair, however, it is stated, was in a fair way of adustment, and but for the secret agents of Mehemet Ali, who are said to have been incessantiv engaged in it would hare been long since amicably arranged. The plague was raging with unabated violence.-Accounts had been received from Damascus of the 6th ult. The fête of King Lonis-Philippe was celebrated on tee lst with a pomp hitherto without precedent
Candra.-We have accounts from this island to the 5 th inst. Tabir Pacha bad landed 9,000 or 10,000 Turks, and several engagements had taken place between those troops and the insurgents, in the plain adjoining Suda. The atter, though badly armed, it is said, had defended themelves brapely, and inflicted a severe loss on the assailants, The consternation is represented as being general through out the island, and the richest families had sought refuge French had a corvette and a brig on the coast. The Ottomon blockading force consisted of a frigate, two seamers, and several armed transports.
Cited Srates - By the arrival of the packet-ship South America, on Wednesday, at Liverpool, we have re Presid. Ne" Mespape on the opening of the - ch Congres of the Cnited States. It is brief, compared with presidential messages generally, but appears to have given general satisfaction. Witi respect to foreign relations danger of the interruption of peace. "The time." obserses. "ought to be regarded as to arms is to be esteemed as the only proper arititer of
national differences." A correspondence is transmitred upon the imprisumment of Mr. AI Leod, and is states that the decision of the supreme Court, on this question, hat not yet been received. The census is the next subject introduced. The growing populaticn of the country is eloquently spoken of, and the advantages it affords to the em!grant. The expenditures of the Gorerameat present and accrung are stated to be more than the receipts; and
the defict of the present year will be between 11 and 12
million dollars. It alludes to the necessity of putting the fortifications, designed for the protection of roadsteads and cities, in a perfect state of defence, and states that in time of peace the fortifications only should be guarded, militia. With respect to the navy department, it says that the public faith reguires an imnlediate and a large appropropriation, and improvements are recummended to render the service more efficient. On the subject of the slavecrease, and that a remedy should be afforded; a further message is also promised on this subject. The interests of the people of Columbia form the concluding topic. treasury the message refers to the three financial schemes proposed, viz., the United States Bank, the state banks, submitted to Congress, with a promise of concurrence in submittes to Congress, with
aise of

 compensation for the loss he would sustain to the gentieman who had for many years acted in a highly creditable mauner as clerk and defended the bill as it stood; contending that the gentleman The Duke of Wrulington maintained that no principle had been more fully laid down, or more clearly recognised, than that
compensation to rentlemen whose intersts wrere affected should
be the price paid for all those measurce of reform of which bill was one. In his opinion, there never was a stronger case
for compensation than that now uuder consictration. The gen
fleman instion tleman in question had filled his office in the town of Manchester
for five-and-thirty wears witho for five-and-thirty-years, without reproach, and with universal
satisfaction to all with whom he was in anv way compect satisfaction to all with whom he was in any way connected. I
was was true that his office wonld not be abolished under this bill For this he thought that he had a claim for compensetion ; and
with that view he should sapport the proviso of the noble Earl, with that view he should sapport the proviso of the noble Earl, Brocham concurred generally in the propriety of adhering to
the priancilpe of compensation: but duil not think that that prin
ciple applied in the present in the ciple applied in the present instance.- Lord think that that prio
from lis noble and learned differed ot coms noble and learned friend, and thought that the principle inconsistenst, he thought, with sustice, and with the thee. It was liament, to deny compensation in cases where an office had beem filed for so many years without reproach, anil which might rea
sonably be sonabiy be looked upon as an office for life. When bitts werc
brought up to that house, not containine a provicion far the
compensation of meritorious oficers whose intereeste wet compensation of meritorious, officers whose interests were affected he would recommend their lerdchips, as he liad dane on former
oocaasions, not to be deterred by the fancied privileges of the
other house of Parllament but to inert clauser providing such

 looked upon assdecisive of the question. The noble Marquis entered
at some lenth into the merits of the ease, and contended that
the officer in question had no claim to compensation.- Lord ABINEER suppoted the clain for compensation, and int inimated
his intention of toting for the ammendment moved by the noble Earl. The noble and learned Lornt took uccacion, in His eapacity duty better than all the new magistrates of the new corporations duty better than all the new magistrates of the new corporations.
-The Earl of Rao wor was convincelt that there hau been an
understanding on his side of the Houee that the attempt of the noble Lord opposite should not be renewed that night. Noble not remember the injustice that woald be done to many people tin
Manchester by the exclusion of that borough from the bill. The Earl of WAR wICE reminded the House that when the bill was in
the House of Commons, one of the members for Warwick, being
also chairman of the gnater sesi also chairnan of the quarter sessions, proposed a clmase giving
compensation to the partes aftected by the biil in the same way
as compensation wis
 Marguis of Sat isubuy supported the amendment, and defended
the conduct of his noble friend.- The Earl of Wirk.ons said that
he certainly had left the House the precedine night under tue impression that his noble friend intended to take the course he
had adopted that evening. He had voted agzinst his note had adopted that evening. He had voted against his noble friends
amenunnent, but he hall still entertained no durbt of the comree his nubie sriend meant to pursue. If they passed the amendmen now, it would, he said, have the effect of throwing orer the bill
for another session. He thought that ground had nut been
hown for the rejection of the measure, and although he shonld do so
with pain, he felt bound to vote again against his noble friend. with pain, he felt bound to vote again against his noble friend-
The Hardis of Nomanis begged their lordship to remember
that the effect of the amendment was to alter a muny clause. -

 The Marquis of Wentueata begged to ask whether it sasier,
intention of Government to retain in ofice Messrs. Stand
A ichols, Hancock, and Handley, after the conduct which it was
proved by evidence at their lordinips' bar in the course of the late mrestigation intt the werking of the Irish Poor-law commissola,
they had pursued. He also berged to aیk whether Mr. Pheian
was to be retainedi in was the Ber retained in office. The Martuis of Normanr said that he iad already announced
that Mr. Stantey had resigned his situation, and with regard to
the uther gentiemen, there was not the slightent intention to dis-

our most anxious desire, in granting the supplies for the present
year, to place at the disposal of your Majestry the means by which
the naval and tilitary
plactablishmenta of the ocuntry minht be
 conviction that, by thus enabling your Majesty to maintain the
hoonour of the crown and protect the just jights and interests of
the people, we have adopted a course which, under the favour of the people, we have adopted a course which, under the favour of
Dirine Providence, will ensure both to this coumtry and the rent
of Europe a continuance of the blessings of peace. We now tender of Europe a continuance of the blessings of peace, we now tender
to your Majety an Act to apply certain sums of money for the
service of thi year 1.t1, aud to appropriate the supplies granted
in this session of Parliamment, to which, in all humility, wre pray your Majesp CHANCEILos then presented the Speech to her

 Death Bill, the Bribery at Elections Biil, the Controverted Eliec
tions Trial Bill, the Highway Rates Bill, the Loan Societies Bill
Mad House (Sotand) Bill and some privet Bills, the LLord
Chancellor presented The Speech, which her Majesty read with Cancellor presented The Speech, which
her ussaal clear and distinct enuciation.
"Iy Lords and Gentlemen,
"On a full consideration of the present state of public affairs,
have come to the determination of prorogning Parliament, with a
view to its immediate dissolution. The paramount importance of thew trade and industry of the country, and my anxiety that the
texigencies of the public service should he provided for in the manner least burdensome to the community, have induced me to
resort to the means which the constitution has entrusted to me resort to the means which the constitution has entrusted to me
of ascertaining the sense of my people upon matters which so of ascertaincern their welfare. i entertan the hope that the pr
deeply concer public buiness may be facilitated, and that divisions
gress of pur jurious to the course of stady policy and useful legislation nay
be removed by the authority of a new Parliament, which I shall be removed by the anthority ou a new,
"I thank you for the readiness with which you have voted the "In the Lords und Gentlemen,
"In the exercise of my prerogative, I can have no other object than
that of securing the nights and promoting the interests of my
subjects. subjects: and 1 rely on the co-operation of my Parriament, and
the loyal zeal of my people, for support in the adoption of such the eovai zeal of my peopie. for support in the adoption or such
measures as are necessary tor maintain that huly station among
the nations of the world which it has picaed Divine Providenice the nations of the world which it has pleased Divine Providence to assign to this country." -The Lord chavcer. on then said-
It is her Majesty's Royal will and pleacure that this Parliament be prorogued to Tuestay, the 29th of June inst., to be then here the 29tho of June.-Her Majesty and her attendants immediately quitted the House in the same order as they had entered it. HOUSE OF COMMONS
Monday. - After the presentation of a great number of petitions,
 as mim a question relative to the connexion of the East India
Company with iololatry in India. In doink so he did not mean to
say that nothing had been done by Government on the subject, say that nothing had been olone by Government on the subject;
on the contrary, he reruld not but compliment the rivht hon.
Baronet on the procres. which the quet tion hat made since last year. He \(\pi\) ished how th how whether the ryght hon. Baronet
could state whether any meazures were in progres, or whether
he was prepared to recommend the adoption of any measures, so he was prepared to recommend the adoption of any measures, so
as speedily to insure the euttire separation of the connexion, be-
tween the East India puvernment and the local concerns of the

Sir. H Hesporss said, in answer to the question put to him,
he hal the satisfaction of stating that he had recived by the last
mail a memorandum from India on the subject, in a postscript of which it was stated that the board of revenue had been called on by (fovernment to report in what districts pagodas existed, the
management of the affairs of which might be intrusted to persons professime the same faith as those to whom the parodas belonged, subject to the control of the Zemindars, but without the neces-
sity of submitting their accounts to any of the offial cotitectors.
The hon. Baronet would see that if these inquiries of Government were fairly carried out, the objectionable comnesion which the hon. Baronet that no exertion on his part should be wantimg
to carry the inquiry into effet, and that he should immediately
express his satisfaction at to carry the inquiry into effect, and tuat he should immediataly
express his satisfaction at he inquiry which had been instituted
and his desire that no time might be loot in bringing it to a conclusion.
The Exchange Bill and the L.oan Societies Bill were then passed.
Mr. NAKLEY hroughtit forward a motion for all papers and corre-
 tile. The hon. Member, who had brought the subject before the
House a few everings, hefore, went at some lenth into the lescriptiou of the comduct whici had been pursued towards Mr
Warner by the partiss to whom tecivon upon the meritios
the invention had been confided, and the number of trifling accithe invention hat been confided, and the number of trifing acci-
dents which hy their perpetual recurrence hall delared untir this
time the settiement of the question. He thought that much time the settiement of the questron. He thought that much
blame was due to the Lords of the Admiralty for their neglect of
 Lord. . Ressisel. saidt that he was rery imperfectiy informed
upon the subject: and he regretted, therefore, the absence of
any of his upon the subject: and he regretted, therefore, the absence of
any of his hon. friends at the tdmiraity. He certainly wished
that the House should not agree to a motion for the production of any correspondence relating to the discovery at that moment,
or until they had heard the explanations of those who were professionally acquainted with the subject. Even if it were admitte that Mr. Warner had been unfairly treated, and that he was en-
titled on a large sum for his discovery, trill it might not be for
the advantarg of the cointry that the correspondence should be fue advantage of the country that the correspondence should
furished. He hoped, therefore, that the motion would not be
pressed. He had reason to believe, from the information he hat pressed. He had reason to believe, from the information he had
received, that Lieut. Webster, who had made areport ont the uub
ject, was not the person originally appointed by the First Lorid
 own accord, as the friend of Mr. Warmer, and his repprt couic
not, consequently, have the sarne authority as if he had been
commissioned to conduct the undertaking. Lord Melooume had Subsequently referred the thatter to sir W . Parker, who had en derstood that the point upon which that negotiation had termi nated unsuccesstiuly was a difference of opinion as to the proprety of Mr. Warner's communicating the means by which he
prodiced the alleged effect. Mr. Warner was unwling to comm
mund

 Sir R. INGLIS said that he owed it to Capt. Wurnet to gay that
he had seen two letters from an individual second only as an
authority to the Duke of Wellington himself, giving a strong authority to the Duke of Wellington himself, giving a strong
opinint in farnur of the invention. After what bad fallen, , ow-
ever, from the noble lord, he would not recommend the hom. gentleman to press his motion.
received so little artention from her Majesty's Government. He thought that it was neither proper nor decent that none of the
Lords of the Admiralty should be present on that occasion. He had before stated, and he was still of opinion, that that house whas not the proper placee for such a discussion; but he regretted through the apathy of Government. The Ad madm, he said, had he, too, would be stigmatised as an impostor, or as one bereft of
all understanding; but, nevertheless, he would declare that this invention demanded the attention of whatcrer government might
be intrusted with the affairs of the councry. He was quite con fident that if all the eneglect and delay which had taken place on
this subject, alting rid of it at one time and only half listening this subject, getting rid of it at one time and only half listening
to it at another, instead of boldy facing it in order to see whether it was worthy of the attention of Government or not-if this
conduct were known throughout the cornntry, he was confident that it wonld have a very great effect upon the trial of her Majesty's Ministers in the appeal which was shortly to be made.
Mr. W. Cowrien said that when Capt Warner frits applied to
Viscount Melboume he was referred to the Admiralty, and by the Admiralty he was told that it would be more satistactory if some naval person were to speak to the efficacy of the invention. Then fit person. and as being, as he \(\mathbf{M r}\). Cowper understoord, Capt Warner's friend. Lieut. Webster therefore went to the Admiralty as a person accuuanted with the invention, and a friend of Capt.
Warner, and not as a person originally appointed by the Admiralty. The principal reason why the negotiation setween cast. Warne Warner declined complving with the conditions required by the Admiralty as regarded the number of persons to whom the secret should be entrusted, and who they should be. The Master-Genera of the Orduance had offereat to refer the matter to a ceccined of enginers, and
Capt. Wamer. He regretted the publicity thus given to the subthe First Lord of the Treasurs, it was of so unmpertant a a nature that it was not worth procucnt, and one re proise of the . Webste was less an oficial document Mr.W onter briefly replied, express, ing himself only in a small measure satisfied with Lord JJ. Russell's promise of inquiry; and after a few words from Lord Ingestra and Col. Avson, the motion was withdrawn
The Lords' amendments upon several bills were then assented
to, and her Majesty's answer to the address relating to the Danish Co, and her Maje
Tuesday.- The House met at half-past one o'clock. Sir \(J\).

Prorogation of Parlianent.-On Tuesday her Majesty prorogued Parliament in person, preparatory to its imme diate dissolution. On no previous occasion, since her Majesty's accession to the throne, At half-past one, the roval procession left Buckingham Palace, escorted by the llousehold Troops. An imrnense concourse of people lined the Park and the whole of Parliament Street, by whom her Majesty was warmly greeted and loudly cheered. Within the House. Lords the assemblage of Peeresses and strangers is said to have
been greater than on any previous occasion during the been greater than on any previous occasion during the
present reign ; the body of the House, the galleries, staircases, and even the doorways being crowded. Her Majesty wore a state robe embroidered with gold, and Prince Albert wore a field-marshal's uniform, with the ribbon and decorations of the Garter. Botia her Majesty and his Royal Highness appeared in excellent health. After the ceremony of prorogation had been gone through, an acco
Wisit of Her Majesty and Princs Albert to the Duke f Devonshire.-On Saturday, the Queen and H. R. H. Prince Albert honoured his Grace the Duke of Devonshire with a visit at his villa at Chiswick. For some days previous, preparations on an extensive scale had been made for the rofal visit. The company invited was confined to the members of his Grace's family and immediate friends. Her Majesty and His Royel Highness, who arrived at Chiswick about two oclock, were received at the tie band in attendance playing the national anthem. The entertainment was of the most splendid and, and het Majesty remained for about three hoars; bat owing to the dampness of the weather, it was found impossible to venture into the groands. At a quarter to five, the soyal of the company broke up shortly afterwards.

Latunch of the Trafolgar. - The announcement that Her Majesty and Prince Albert would be present at the thonsand of the inhabitants of Monday, induced many Woolwich, to witness the interesting apectacle. The number of persons who arrived in the town for this parpose is said to have been unezampled on any former occasio and the river exhibited a scene of extraordinary bustle From twelve o'clock, steamers of all sizes were passing down, and is computed that upwards of fifty were same point, the aros, in mas, their way to the them. In addition to the immense multitude admitted into the dockyard by tickets and the still larger number admitted without tickets at the gates thrown open to promiscuous crowds, every elevated place from which the least riew could be commanded was occupied by a spectator On the Essex side, the river presented an animated scene, being crowded to an extent of nearly two miles with parwho had a good though distant The colours of all nations, on the shipping in the rives produced a gay and gorgeons effect. Her Majesty arrive shortly before two o'clock at the dockyard, accompanied by H. R. H. Prince Albert, and her usual attendants. meet her. On entering the spacious portion of the building under which the Trafalgar was constructed, and which was decorated with standards, with a profusion of union jacks, and a flag with the arms of Saxe Coburg and Gotha, Her Majesty appeared to be much pleased with the scene, the magnificence of the vessel on one side, and the immense concourse of people on the river and on the bank on the opposite side, wha welcomed her with enthusiastic cheers. Her Majesty, after sitting for a few minutes, proceeded to the front of the vessel with Prince Aibert and lhe officers in waiting. At half-past two. Her Mawas fired to previousiy returned to the royal stand, a ake Whe Her Majesty sent Sir C. Adam, one of the lords of the Her Majesty sent Sir C. Adam, one of the lords of Nel
Admiralty, to desire Lady Bridport, niece of Lord Nel son, to perform the ceremony ; and her ladrship did it with wine that was on board the Victory, at the battle of Trafalgar. The majestic vessel then glided into the water, amidst the cheers of hundreds of thousands, who were gratified with the sight. At abont 150 yards distant from the shore the anchor was dropped, and she brought up beantifully amid the cheers of the brave old tars apon sioners, all of whem had been present in the battle from which the vessel derives ber name. A heary shower of rain prevented Her Majesty from going on board the d, as was originally inten diately after the lannch she again retumed to . The Whole went off in a very gratifying manner,
the occurrence of any very serious accidents. was held for the election of sheriffa.- The Common-Sergeant having addressed the livery upon the nature of the privilege of electing sheriffs for the city of London and sherift for the county of iniddesex, proceeded to read the list of candidates for the office. It was then announced that Ilderman Hooper dectined the honour for the present year; and the names for which the greatest number of hands appeared were those of Alderman Magnay and Mr. Rogers. The election was then confirmed by the Court of Aldermen

Military Inspection on Wormucood Seruls.-On Wednesday morning, a grand military inspection took place in the presence of Lord Hull, Commander of the Forces H. R. H. the Duke of Cambridge, the Duke of Wellington, and a large field of military uificers, and a numerous
attendance of the nobility, and persons of every class, The regiments inspected were the Royal Horse Guard (Blue), and the 2d Regiment of Life Guards. The troops went through their different novements and exercises, and performed various evolutions in a very masterly manner which elicited high commendations from the officers present. About half-past one, a violent storm came on, and dispersed the great assemblage of spectators. Hill, however, continued to direct the evolutions of the troops, and

Robberies.-On Saturday another of those daring robberies with which the vicinity of Pimlico has lately been visited was committed on the premises of Mr. Dunlop, Westbourne-place. It is supposed that the parties concerned in it belonged to a gang or the last few munths. They effected an entrance by scaling the garden wall at the back of the lhouse, 0 whick it access. After breaking a pane of glass to put back the latch and open the kitcnen window, chey procecded to cas secured. This gave them access to the kitchen, parlours, and a small dressing-room to which they contined their search for money and plate, rejecting everything that was cumbersome or likely to identich they made into the numerous boxes, drawers, \&ce. which were forced open, that they must have passed Fires.-On Monday morning, a very deatructive fire

Of this period nine months had expined. One mot his low-prisoners deposed, that deceased, about a month ago of inl as ie be sent tha'k to lis resimerit, and rather than that a- cee r, he wiun destroy himeet. \(i\). The gacher in his ward, and said that he was sery amions to kan: would again claim him? Witness wrote to the colonel of the regi mont : and in answer was informed that ther prisoner, on
his relea-e, woull be chimed. (on hearing this, dectased appeared very much depressed. One of the monitors in the cestle deposed that he had seen Geceased one atter noon, when he appeared cheerful, and was playing with some of his fellow-prisoners. In the evening, after he had taken his supper, he was locked in his cell for the
night. On the following morning, deceased was found hauging from the iron bars over his cell door. The jur first, thengight that a rerdict of "Temporary insanity" ought to be civen.
Barnsley.-A few days since an explosion of fire-damp touk place at the colliery called Darley Main, near this place, by which two young men lost therr lises.
Whacester. -The professional gentleman of this town given a proitive denial to the scatement which appeareal in the daily papers, and which was copied into our last Number, that the new Lord Bishop was refused admis ion to the palace. The Bishop, it is said, never made any claim for the possession of the palace on the day o to erival, nor was te told that he would not be permitted following morning communicating to the professional gentieman referred to, his arrival in this city, and his desire to receive possession of the palace, the possession thereo seems, had been closed against certain parties gates, temptell \(t\), tike forcible poisession of the palace, and of the furmiture and effects; and an anticipated renewal o that attempt drew tegether the crowds which surrounded Whe gates on the evening and night in question.
Wigan.-The large firm of Messrs. Heron \& Co., of this town, it is stated, have been unable to come to terms with their creditors; and the consequence is, that a fiat of hanaruptcy has been issued against them. Their liabihities are ssid to be upwards of 150.0601 ., and the bank of Mance.ester i- reported to be a sufferer to the extent of 40. \(00 \%\) \% Several large corn-dealers are also creditors to a considerable anmunt.
Mertforl.-Accounts receised from different parts u Hinfordshire state that a very violent storm raged through that county on Friday afternoon, the 19th inst., taking the hail poured dowa with great violunce, causing extes sice ch. vastation in the com lands, large foets being so comprete': lad that it is thuaght ther cannot passibly re coner. The loss sust nomb by many farmers what there alis. The loss amongat stuck is also considerabie, many attie !eing found dend on the land. Two cottases in the mixhinuurhood of Biggleswade were struck by lightning and burnt to the ground. In ofre instance it proved fata oher some distinc: from her cotrage when the tempest commenced, and hastened home, but she was found some hours after dead upon the road. The body presented no appearances of having been strmek by the electric fluid, and death is supposed to have been occasioned by alarm and over Pomen
Pontypool.-On Sunday a number of colliers and quarrymen were drinking at the Navigation-inn, Cromlyn, four miles from this town; and at about 12 o'clock at night, two quarrymen, named Powell and Gardener, left the inn to go bome. Having proceeded a short distance, they were met by three of the colliers, who without any notice knocked them down, and commenced kicking them in a violent manner. After continuing this for some time, the let them for a short period, during which Gardener at tempted to rise, when the party returned and commencen kicaing them as before, and then left them. Gardener then returned home, expecting that Powell would follow but on the nest morning a collier, going to his work, ob served the dead bodr of a man lying ou the ground, which proved to be that of Poweli. A surseon, who examine the body, found several wounds on his inead and neck ant on examining the spot by daylight, a large stream of Jhen was traced for soute distance. An inquest was held hien the evidence given by several witnesses brough Henry Mortan, ond Peter Peters, emman, about a mile from Crumlrn. Ther all speak English badly; and it is supposed that, as they are still at large, they are endeavouring to malie their way ont of the kingdom. The coroner's warrant for their apprehenfon on the chante of munder bas been placel in the hands of the police, who it fis hoped will succeed in appre ending them.
Haverfordwest.-An accident, likely to bave been het tended with fatal consequences, recentiy happened hear this town. It appears that whilst 22 ment and two girl five miles from this plice, the water broke in apon them from an chat pit with sura remility timat immediately it was 16 feet deep. Through this, 26 of the men mare dramm up by a chain, leavint the reat in the pit. Ther were for trinately able to gain as epol bejond reach of the water thiougth atb latioriont how soon it might overtake them. Alout ten o'dock the light which they had weat out, and
mean thme, those who had escaped, assisted by others, used every exertion to zellae the water doring the night anil about eicren the folurring morning, the two men and girls were drawn

Deat.- 1 fixed lighthouse on the Goedwin Sands is now in progress under the manazement and pattnt of Mr. Bash, civil engineer. It is said to be Mr. Bush 's in iron cassons of from 30 to 50 feet diameter, and to ezcavate
the sand from the internal part of the casson by the means of air chambers, uermanent and solid foundation. These order to obtain a permanent and solid foundation. These npon this base a column of about 140 feet high, for the lighthouss, will be raised. A number of men are now at equinoctial gales come on, it is thought that there is every probability of securing a solid and permanent base. This importaht undertaking is regarded with great interest, not only by the maritime, but also by the scientific world, as property.
Henley-on-Thames.-The following melancholy circumstance occurred on Thursday, at Mr. Adams's, Worsley farm, about two miles from this place. A Aleran, daring the afternoon wandering about the neighbourhood, behaving in a very alrange mancer. Burn sen mates being absent haymaking) by a person passing, who gave the alarm to the parties in the feld, who went to the house, which they found barricaded within. The man fired s gun at them through the window, by which one of them was shot dead, and three others wounded in their faces ; the door was thei first person who entered, which fortunately missed him; after a severe struggle he was at length secured, and conveyed to the gaol at Wargrave. No doubt appears to be entertained that he is labouring under insanity
Hyde-On Sunday morning, the hitherto peaceable locality of this town was the scene of a violent outrage, which at length assumed the character of a riot. In the previous week, a person from Staleybridge delivered a lecture on the importance of an immediate repeal of the union, denouncing every Englishman as an enemy of the sister island, and urging the sons of Erin to be ready to die for the liberties of their country. The effect of this which was almost entirely composed of the low Irish residing in the neighbourhood, including the navigators employed on the Manchester and Sheffield Railmay. The following Saturday, being "pay-day," the Irishmen asembled in groups in the streets at an early period of the vening, and shortly after rushed into the streets, most of hem armed with iron bars, spades, and bladgeons. They paraded the principal streets, and with loud hurrahs for nenced with this, they began to break the windows, and otherwise damage the houses of every inhabitant known to be Engit very shortly broke out again, and with more fury than before. In the mean time, however, the populace assembled in great numbers, rushed upon the Irish, and soon repulsed them. finding themselves thas overpowered they fled in all directions; but the populace having got on their fellow-townsmen, and rushing down the streets where the Irish were known to reside, indiscriminately demolished every door and window in the houses. The Irish took refuge in the upper stories, and again attempted to repulse their pursuers, but in vain: they were followed up stairs and well beaten, and then given into the hands able excitement, which was kept up till three o'clock on Monday morning, at which time thirty-four of the principal ringleaders of the Irish were in the custody of the police. There is scarcely a vestige of a window left in the streets where the riots occurred, many of the doors almost gutted. Thie extent of damage cannot be less than from four to five hundred pounds, the whole of which will it is said, have to be made good by the county. The Man chester papers state, that it is impossible to give anything must have been very great, as the surgeons at the dispen sary were engaged the whole of the night dressing the wounds of the combatants. On Monday, eleven of the prisoners were fully committed, by the magistrates, to tak their trial for the outrage at the furthcoming sessions.
Taunton.-Mr. George Stone, of this town, solicitor retired to rest a few nights ago, but could not sleep through newposition. He therefore occupled himstr atradis bis light, and som This alarmed him, and be continued to lie arrake for some time. At length, however, he fell asleep, but was roused in about ten minutes, by hearing the newsnaper rustle He sprang up, and perceived a man creeping from under the bed, who eluded his grasp, and su.ceeded in getting the ferlow had secrete himself for some bad purpose, and when he found the day breaking, thought it necessary to make arrattempt to escape
Burford.-On Wednesday afternoon an alarming ex phopm took place near this town. It appears that the half a mile a Mr. Midgeley, ironning ulbs. or 8 lbs. of ganpowder in vaper, after haviag weighed it, wen, by some means unexplained, a dreadful explosion took place The window, with most of the articles exhibited there was blown is to the street: and the shop and its contents were nearly destroyed. In the ather rooms the chairs were thmwn the shock. The shonman was reduced to a state of insensibility, and much burnt, but he is not thought to be dangerously injured. There were no custemers in the shop at the time, though some had just left it. Th flames were soon extinguished by the inmates and others
who were attracted to the spot by the explosion; but
some of the neighbouring houses suffered slightly from the shattering of their windows. It is supposed that the damage done must be fromi \(300 l\). to \(400 l\).

Railways.-It was expected that the London and Brighton Railway would open to Mayward's-heath, 17 miles from Brighton, on the 28th inst. ; and contracts for coke, Sc. Were advertised, with the proviso that portions
should be delivered by the 26 th inst. The opening, how ever, is now deferred until the 28th July, by which time it is expected, the whole line will be fibished. Claytontunnel, the longest and only one remaining unfinished, is said, will be Leyed in on Monday.-On Monday a per son named Colley was thrown on the Manchester and Sheffield Railway, by a borse which he was leading off the line near Glossop. A waggon came up at the time, and before he could rise, went orer hiost dar An inquest was held on the body. Ferdict, "Accidental death,"-O held or the bor Fiday ever ais ern pay driver on the Janchester and tivern ond charge of the retura train from themtones, being in a state of intorication, left his post at the engin and went on the tender, from wher stanitly crushed to death, the train haring passed over him -An inquest has been held at Gay's Hospital on the body a labonrer on the Greenwich Railway. The evidenc adduced proved that on the 28 th May train of carriage was returning from Greenwich to London, and that upon reaching the Spa-road, Bermondsey, they were thrown of the rails by some wooden posts which had been leflying across them, and that, after the carriages had been upon the line, decessed was fonnd at the bottom of the jumpell from the brick ork above, a heicht of 30 feet, and of which he died. From the evidence of several witnesses appeared that the posts and boards were placed upon the line to be used as temporary fences, and that the should have been remotred before the artival of the trair, under the direction of a man named Foster. Verdict "Accidental death." At the request of the jury, Foste was severely reprimanded by the coroner. -Nome rathe serious riots have taken place amongot the labourers em ployed upon the Manchester and Sheffield railway, in th neighbourhood of HVde; the English labourers harin endeavoured to drive away the Irish, whom they allege to e working at lower wages than themselves. Hitherto the riots pas expected

Dublin. - On MRELAND, the Court of Chancery was greatly crowded by persons anxious to witness the retire Lordship Master of the Rolls entered the Court, and took his seat beside the Chancellor. Mr. Sergeant (reene. Who had been deputed by the bar to alant from his judicial duties, ry complimentary terms, alluded to the long connezion of Lord Plunket with the Chancery bar, and the general suavity of his duporment torrards its members, who now berged to express their deep respect for his Lordshin and their anxiety tor his futme hoppiness. Mr. Goddard, on the part of the solicitors, made a imilar address. Lord Plunket then addressed the menibers of the bar, and, after giving expresston to his feelings gratitude and satisfaction for the kindly sentiments they had convered through Sergeant Greene. proceeded to au vert to the circumstances connected with his retwement from the benoh. Efforts had, he said, been mate to induce him to tender his resignation; but deening such a step on his part unnecessary and unwarrantable, he Lad declined o comply. Another application, however, was sutsequently made, for the same object, and from a quarter where he owed such deep obligations, that oerch ance to give way. bion he had no connesion whatever, directly or indirectly. He strongly disuppruved of it, and he did not feel himself in any manner responsible for its consequences. In now taking his farewell of the bar, he begged to repeat his gratitude for their kindness, and to express his high sense of the talents and attainments of its members, who were not surpassed by the bat of England, Scotland, or of any other country.-Pursuant to a requisition, signed chiefiy by junior bansters, a mee to ing of the bar was held on Tuesda, at by the profession, as a der what steps ought to be Campbell to the Chancellorship of Ireland. It appeared that some of the senior merabers of the bar declined to sign the requisition or attend the meeting, on the ground signt such course was not constitutional. This was alluded to by the sereral gentlemen who spt ine, whorepudiated the notion that they had not a right to meet and capress their disapprobation of a proceeding which, thes contended, infringed uyon their privileges. The was \(^{\text {. }}\). "That indsmuch was proposed and onanimousty agreed \(t\), : "Lat judicial appointments in England are made from the English bar, so a!l judicial appointuents in Ireland ought to be made from the Irish Bur." A second resolution was then unanimously adopted, th the cfiect that a Committee should be appointed, for the purpose of preparing an ad dress to he: Minjesty, prasing her to protect the interests of her faithrul subjects. connected with the lrish bur: and that such address should be signed by the father of the bar (the Chairman, Mr. T. Dicksun), on betalt of the pru-fession.-The following is stated to be the present efiective strength, in rank and file, of the army in this country fie ; four regiments of Cavalry 1,187 ditto \(;\) six regt

Infantry, and 32 depot companies, 11,466 do. Total 13,475 rank aind file.-Government having abandoned their expense, it is stated railways in this country at the public expense, it is stated that the railway from this city to Nornment for the last three years, will be inuudiatly commenced. The engineers are engaged in preparing the working plans for the first portion of the line from this city
to Naas, and are in communication with contractors as to the formation of the works on peculiarly advantageons terms. Agreements are said to have been entered into last summer for the purchase of the whole land required, within
the sum mentioned in the original estimate, io anticipation of the progress of the undertaking.

\section*{SCOTLAND}

Edinburrgh. - For some time past the King's Park has been disturbed by crowds of boys and young men, assembling apparently for no other purpose than to pelt each other with stones. The lads of the Canongate were usually such a length did their disputes proceed, as to threaten serious consequences. A few days ago a body of policemen proceeded to the spot with a view to preserve the peace but no sooner did they present themselves than both sides made common cause arainst them, and several of the officers were much hurt before they succeeded in quelling the riot The number of boys amounted, it is said,

\section*{thousand, eleven of whom are in custorly}
, On Suay aternoon a communication from Peris was received, announcing that no answer had been he forgeng the apprehension of Scott, the pernetrator or the forgeries, of whleh we gave an account in a prevous the slightest dwubt of his capture, and as a proof of it the Prefect of Pulice ha! advised that Mr. Forester, the Londun officer, and the zentleman who represents the house in which scott has been employed, shoud proceed at once to Marseilles and see the prisoner. Fir which city 17 th inst In the event of Scott being taken, it is thought that in the first instance he will be tried and convicted for procuring a passport and travelling under a false name Intelligence has this moruing reached town that Scott has
been captured at Marseilles, and that the bulk of the stolen been captured at Marseilles, and hat bue bor states that the berring fishing is daily increasing, and the fish are rapidly improving in quality. The fishing com-
 Greenock to the market of that city in time for being placed on the breakfast table. The fishing is said to have barrels of cured herrings arrived by steamer, which found a ready market, and brought a good price, being sold at
from \(4 l\). to \(4 l\). 10 s. The appearances are stated to be good is every quarter whence intelligence his been received. Diculkeld.-Last week a very serious accident be fel Mr Douglas, farmer, near this place, at the boat fummel with oak timber, tnto the boat, when from the unwield iness of the luad, the horse was forced too near the end of landing stage, and the wheel went over, jamming Mr. Dimplas s ler betwist it and the stage. Assistance having to be procured from a considerable distance, half an hou elaysed ere he comill be estricated froma his painful situaation, and thirty men were found necessary to release and lacerated in a serious manner. At one time amputation rias considered necessary, but it is now hoped that he is out of danger

Gairloch. - An Inverness Paper states that for some years past Sir F. Mackenzie, Bart., of this place, ha - salnon race which has been so threatening, and which in many cases has actually been accomplished but it is only this season that he las discovered a satis factory remedy fur this evil, and proved that the salmo can be propagated to any extent artificially, and protected from the natural enemies of their youit, as easily, and at a smalier expense, than is required for raising a head of pheasants or other game. Sir Francis, it seems, has at the present time a large school of yourg salmon fy hatched during spring in a pool prepared for native river, the Ew3 , at the proper age, thent fish were taken. The he now one and half or two inches long, and decidedl arer-tlus appearing to confirm what has wften been asperted, and on a small sole proved, by Mr. shaw, of Drumlanrig. Who is said to have first suggested this May of propagating this fisid, though the possiblity of doing it to ay ext could really prove valuable has hithert been doubted.

Prices of Bread is Pars and London.-A morning paper states, that the present assize, or fixed price of municipai authorities of that city, for the current fortnights, is 27 centimes for the loaf weighing 1 kilogramme, which, the present course of exciuage in Paris an londor, eorresponds with four-pence halfpenny add rather more
than half a farthing for the Eustish it io. Uaf, cr, more exactly, four-pence and sixty-four hundreiths of a penay sterting. The price at which the beat or "full-prieed bread is now currently sellizg in London being nine-pence halfpenny for the 4 lb . loai, although in some quarters of the town ten-pence is demanded, shows that the best brear
farthings and nearly half a farthing, or more accurately, four-pence and eighty-rix hundredths of a penny, in the 4 lb . Joaf, and in the ratio of one hundred and four and nearly three-quarters (seventy-four hondredths) per cento, or considerably more than double the price; and that English weight of bread, of the same quality as in Lomdon, for the same amount of mune y
Electro-Mugnetic Printiny Machins. - The Inventors' Adencate states, that a very ingenious machine bas been arented, in which electro-magnetic power is applied to printing; so that a person may be enabled to direct the ypographical process at a distance of many miles from he place where it is actually performed
dntiquities. - A Londonderry paper states, that on Saturday a labouring man dag up from a hollow, close to Culmore fort, a cannon-ball of iron weighing 12libs. It is thonght probable that it had been fired from one of the figates winich canmonaded the river when garnisoned by the wall, as it is much bruiseci..-The (ilasgow papers inform us, that a skeleton nearly complete, was of A vondale, Mr Jamieson, Middlecroft, a few days aso, about two feet from the surface. deposited in a moss lag, with the whole structure complete, excepting the fore part of the skull, whech ind mouldered away by being exposed. The
singular apparance of the resture, and his having long singular apperance of the vesture, and his haring lot he must have lived, and died, and been deposited there in the 6 th or 17 th centary.
Mathene Laffirge. - The Gazelfe of Limoges gives another episode in the histury of the late M. Laffarge, of wife, secured \(t\) ) his daughter on her marriage an annuity , 500 ., but, after the settlement was execated, entered into an eagagement to adrance her, for her husband, the end of twenty-four months, towards the erection of a smelting bouse. The first wife of M. Laffarge died a few months only after her marriage, having by her will left the hoie of her property to her husband. Upon this, M. Laffarge made a claim for the 50,000 f. upon M. Coinclun Beaufort, who refused to pay the money, insisting that it was merely a promised loan to his daughter, the interest of which she was to pay him by relinquishing her annuity of 2,500f. M. Laffarge brought an action for the 50,000 . his favour. Against this M. Coinclun Beaufort appealed to the Cour Royale, and the case came to a hearing last week. The court was crowded with expectants that some allasion would be made to the circumstances of the denth of the first Madame Laffarge, about which sinister rumours had been in circelation. The pleadings, howhearing which the Cour Royale quashed the decision of the hearing which the Cour Royale quashed the decision of the it is said, be laid before the Court of Cassation.

persons had come to answer the sentence passed by the ordinary persons had come to answer the sentence passed by the ordinary
in his court and in this stage of the argument it was asked such great expense been resorted to in order to bring spifitual persons to puussiment. It was well known that the want of the the present law. The court was aware that the jurisdiction of Visitor hat been described in comprehensive terms by learned
commentators, and the opinion that Lord Holt had given in the case which had been quoted, had reference to a question arising out of a charitable foundation. There it was held that the visitu
might do what he liked with his own. His lordship then com mented upon the several cases cited in the course of the ergu.
ments. and, in contmaation, observed that this court could no apply the rule applicable to the proceedings of an ecclesiastical court to acts done in that which was not a court. That statute, was divested of all jurisdiction. was not within the saving clause which left untouched the ordinary's power over his clergy, as it might be exercised in law
without process of court. From an examination of all the authorities, and a review of the arguments, the court was constraine procreded that the most reverend prelate, in so far as he had proceded at the risitation to depitic the cean or his ome, had
acted beyond his jarisdiction. They therefore declined to enter
into into the numerous points as to the proceedings of the eommis-
sary ; but there was one which the court thought not unit to be tence was final and that thecasion. It was argued that the se prohibit to he done ; that there was not even a continuing court
to which the writ of this court could be addressed. That arguto which the writ of this court coorld be addressed. That arguthe fullest extent, it might be used to give effect to unlawfin
 found that the archbishop admonished the dean not to exercise his ofice on pain of the greater sentence of excommanication, and the court was only adjourned. This court might also requre it was plain that the tan could wot appal hefore the sen tence was pronounced: for the sentence of deprivation was
tpp to that puint certaingly his grace had the power to inguire With a view to nitenor proceedings: and it seemed the Lord Chancellor had discharged an application for a prohibition, made
hetore sentence was pronounced, on that very zround. The clear conviction of the court was not embarrasseth by the oppo site judgment of the learned commissary, because it thought thar could not hut helicve that it had escaped his attention, occupie at he was iy the great variety of circumstances, and unassist
in the view he took of his office, hy advocates on both sides. the court felt any doubt on the subject, it would undnubtedly call on the Dean of lirk to declare in prohibition; but atter the long,
elaborate, and matured arguments, enforced with consumat abjlity by counsel of the highest talents and learning, the cour feit it owed it to all parties, to save delay-that they owed it rage no doubt, where they felt none, on subjects of such para niount inoportance, and so deeply affecting its rights, its interests.
 COURT OF Qcern' Bexch.-The Queen V. Moxon.-This Was seier in Dover-street, for having published a blaspbemous libe in a recent edition of the poetical works of Shelley. Three ex-
tracts were set nut in the indictment, and some others were read by the learned counsel for the prosecution, as illustrating the general tenor and tenuen the hesecution, and aiter havin stated in a ceneral way the nature of the provisions which had beer made upon the uubject in the legislative and judicial system of ancient and modern times, gave a more particular account of courtr the indictment. taken from the volume lately edited by \(M\) Shellev, the ridow of the poet.-Mr. Serjeant Talfourd, on th part ef defendant, stated that he was as incapable as any man in suciets of committing the offence charged against him in the present iudictment. The passares were extracted from a boos cou
tamink anamelines, of which the selected portions composed no taming eburanines. of whit. If the jury were to find the present defendant puith, the? munt enually condemn the publishers of
the work of Miiton, (fihhon, Bvon, Voitaire, Kousseau, Congreve. Wy holley, and even of Shak speare himself. The cause,
theref re, shisk he aureeated upon the present occavion was the crave of learsmis, genius, and truth, which he hoped woul concent crumbertes th ther protection-Lord Denman having stated. \(1 /\) g enmeral way, the natirne ac.d hubject of the prosecution, went an twonverve that he was humd. as were the jury, to take
the law as t bad been hauded town to them, and to proceed npon the prineste which haid indeed been autraitted on the part of the clearly, punishabie in law if a arry shonld find that he was in fact gulty of the publication with the intent which constimted a part

\section*{SATURDAY, JULY 3, 1841 \\  Tuesiay}

Thare is nothing we desire more to avoid than exaggerated statements of the merit of new produc. tions; and there is nothing which the public more requires to be maraled against. Nut a season passes over without the appearance of a new fluwer, or a new kitchen-araden plant, a tuw boiler, a nuw hot-water system, or a new fruit of surprisius execllence, \(i .11-\) mencesize, or prodigious productiveness; yet, a year or two afterwards, it has disappeared, no one knows whither. It is not long since a quack sold for a shilliner each, the seeds of a Tret Cabbagr, which was to cover an estate with timber, to form an avenue, and to introduce new sceuery into a landscape in one single season: the seeds were freely bought-but where is the timber? where the avenue? In all such cases common sensesteps in at last, and puts an end to the ahsurdity. If we constantly endeasour, on the one hand, to guard our readers against being taken in, by stating what the facts are concerning the so called norclues of the day; on the other hand, we shall always be anxious to make known the really valuable productions which gardeners from time to time succeed in raising. We shall very soon examine the pretensions of some of the new Grapes which are so much talked about; for the present we content ourselves with Strawherries
Every one who cultivates this fruit will admit that among the best of the varieties is that called. Myatt's Pine,-if you cau but get it. The fruit is very handsme, of a çlowing vermilion colour, and pehaps more rich than wen the old Pine it-elf: at least, it has a peculiar flawur which to everyborly is exceedingly grateful. But it will neither grow nor bear; that is to say, for one person who can cultivate it, jo fail ; and we umderstand that even Mr. Nyatt himself is losing his power over it. What there is in the constitution of this valuable fruit to render it thus shy and untractable we cannot explain, unless it is that it is a true mule, with a debilitated constitution. The oniy case we know whene real success has attended its cuitivation is that of a buaned Judge upen the Irish Bunch, whuse \(\frac{\text { crardener, after repoated failures, at last }}{}\) succeedul ins growing it frecty upon a hear of cowdung which hal been lying nesucted for some years. By the production of this fruit. however, the name of Mr. Myatt has become generally hnown as that of a neceesful Strawberry-gruwer.
The woud people of London have, therefore, been not a little internatul abut anoticr new Strawberry from the sarre',: er. Which has been exhibited in the fruirerers windows thas seasen, for the firs dine. As we lave no doubt that many inguiries will Le made avout it, we proced at onice to state what the facts are relating to it, so far as they have come to our Numwleclire.
It is calied the British Queen; is sail to be an abmulant bearti and very free growen ; and is cor tainly a very remarkable variety. Is to size, we nave measured many which averaged six inch. in an.......
 sixtmen munces; as to productiveness, ise t. is: ; .....
 Strawberries, and in two cases there were ten and

 better than Keen's Seelling havine more favour: is

 Strawberries. These are, we Uelieve, ith tra characters. The next question is, how far it t.as claims to be regardel new? The only variety with which it can be compare the the Inwtiton, itocif one of our best Strawberri : , \(4 \ldots \cdot\). 5 w in be seen among the miscellaneuus motic. - of tuday, sometimes nearly as large as this. We, however, do not think it the same: it
has much less acidity, and does not require to be almost black before it is eaten; on the contrary, its greatest excellence seems to be when it is of a clear bright rose colour ; nor is its flesh so firm as that of the Downton. With these remarks we commend the British Queen to the favour of her Majesty's dutiful and loyal subjects.

In another column will be found a letter from Mr Bates, of Uxford, uph the rules to be observed in judging flowers. The ubject which Mr. Pates seehs is no doubt praisewo thy-ramel, to cuahion a uni formity of judyment rearaing the properaics of floristo' th wers. The factivies affirted ly amiroais of bringing tenecher culivaturs frons ciffireat puts of the hinglom will greatl; a- ist, and, we hope, entirely

 able that a untomity of uin, an had! prevail. and that object will be accomphhet ov mer by their exhibiting torether than by any other mens. Comparison is the surest tent of excellence. The rriperties required by the Lobilon Florists in Carnations and Picotees are settled ani well untertoot, and they are fairly stated in this letter. But we must observe, that size aloneis not valual in London unle scombined with other indispensable properties of a fise flwer, viz., perfect form, purity of ground, and dintincteess of marking. We cannot discuss the merits of the Picut es exhibited at the Surrey Loological Gardens last July: but a pure white ground fiee from "specks and scratches," is a nccessary qualification; and whether heavy or light-edgell, the colur should be confined to the margin of the petal. Petals entirely white, and petals without white, are equally bad, and act as disqualifications; on this point there surely can be no controversy. I fluwer with not mere than eleven petals would be but semi-double, that and thin-would want the fulness ricines: and crown which constitute a perfect flower, an! would ber is almiseilice in a stand. The calyx should no: be split down to the sub-caly \(x\), but should stop a little short of it. We must repeat, that size is not recgardect as an adrantage by the London florists, unles accompanie! hy the requisite properties of a gase fl wer; bat fluwers are not considered worthy of being placed i: a stamd if they are less than two inches and a half in diameter.
 LaNDSCADE Larvening is a shigject rhich. in this conntry, has alxays been onsiderel ltewiarly Ens iish. The science, horever, has had ito wut:ties hataer countries, and of late the theory has been, pertay: wore considered has been tise case mithrerard to all subjects in anywise relating to the fine arts.
From the first we intended to devote a portion of our paper to some discussions on the principles of this portion of which so much has been written, and a large portion of which is vague and unsatisfactory. Metaphy sical discussions. pranciphes of taste, effect, composition, grand and simpie ines, and mant sund ahbinuchis marases, haunt whoerer word apremen ti.e. niscussiou of question. connected with the fistin arts, and ti. y are equally appaca le to the constiteration of the priserples ot hededenpe grdi..:s, a slster arr; aud are perwaps more whatut to like ours, without some discussions on the subject, would

 dichee to the instruct a and amusement of our readers

this country, jet one of the most complete and satisfactory as a whole that we possess. After going through if Puray. We.artm. Allit son, Girar, Shenstone, Sir W. Cl........ Shem, Pice. Payne Knight, Dugald Stewart, Ai:-W. H. Men, sir Walter seot, and some few other wrikn E,yhin and Foreign. who have considered ques wriens retating to Landscape fardening. -
ON THE PRODUCTION, DISTRIBUTION, AND PRESERVATION OF HEAT, WITH REFER-
ENCE PARTICULARLY TO THE IMITATION ENCE PARTICULARLY TO THE IMITATION
(IF (IIMATE IN CONSERVITORIES.-NO. IN Tilkt. renai:.s a third mode of using the heat of surfaces Warmei hy water or otherwise, which though not so often :) be iaticed. Mr. M'rm's method consists, as we have in tansturing the heat from the water to the house \(y\) the revalu an of the same air mixed ouly with so much frest air E creumstanices shall determine. The plan in as. by the pissace thrours it of air, which has been pre inculy heated in a separate chamber and the whote which escapes to the open atmosphere after it has per formed its duty. This system comprises, therefore, a most tiorough change of air or ventilation; a term which ha ments, the peculiarities of which consist in circulation ather than ventilation. A contiuual change of beated ai equires evidently a more constant and difficult attention 0 its hrgrometric contlition, than when the same air circulates withan the buildng, subject only to such an inter misture of fiesh air as the leakage of the house or the demand for purification may impose. If these conditions could be perfectly satisfied, we should in so far imitate nature that the plants would not remain two successive instants in the same atmosphere; but their state woul still be a very wide departure from nature, as has been gired heat the air, instead of being acted upon smblance to rature which seems gained by a change of air, ill appear, on examination, to be somewhat imaginary ; our aotion being derived from the effect of air passing through and ventilating a crowded hall or theatre. In the latter
cases the air from unoccopied spots is rery advantageously cases the air from unoccopied spots is rery advantageously bromght into places which are overfilled with living bings, and of which, therefore, the atmosppere is conormis neary covers the earth it does not appear that any particular benefit is conferred by bringing over one plantation the air which has just been exposed to similar in fluesces in a plantation to windward of it. There is in short, as experinient no less than reason proves, not that demand fur change of air in a well-filled conservatory which tie delusive analogy of a crowded roon might seem
If this perpetual change of air be not desirable as a question of liorticulture, still less is it to be allowed on the seore of expense. Air thus introduced and thus lost must be supplied with moisture in proportion to the ele ation gisen to its temperature, the latent heat of which, s it escopes into the external atmosphere, will be an imnense aduation to the loss which is sufficiently great, independen:ly of this consideration. Let it be supposed that with an external temperature at \(30^{\circ}\) we wish to maintain an internal atmosphere at \(60^{\circ}\). For this purpose the air must be heated much above \(60^{\circ}\), because it has to repair the effect of all the cooling surfaces in the house, and o all leakage, in addition to maintaining the temperature in question. Now in ordinary heating by radiant heat, al hat we require is to supply the losses by cooling and Lahage, with are much smaller, as has been shown, than when air-heat in any form is employed. But in this articular form there is the additional and infinitely greater oos arising from the fact that no fresh heat can be introduced but by withdrawing part of the internal air, which by the very conditions of the poblem must be at a temperature of not less than \(60^{\circ}\); utterly losing, thereforre, \(30^{\circ}\) upon every volume of air which passes through the fiouse m a alition to all the latent heat of the moisture with which may yens in cherged at the period of its eseape.
This ma in of heating mas be illustrated by supposing a forsent , plate a few tropieal tishes in a pierced tub, in ctantion, ana to aim at maintaming their nativ hin that indy in weuld be requate abore them. To do an acis any as mech water as flowed through the rezel :n thens ; the difference between which and hew, ns wrm: merey the c, ntents of the tub will partly expain tied less shathued in warmarg by currents of heated tar: The thans.ned vase wutid, huwever, have no loss *.... 11 . Wicil u : . . me:ra's connec' el with the pipes, and fur ardulatil montere by evaporation from the ariare. Thin in, however, and all the moditications of it, are coen to tre ubjection that all the inpurities which by ritent tall into these trourhs or gutters may be carried bs the circaiati in into the boilers, and depositing themelves there, give rise to numerous unpleasant consequences. A muti fur plan is, Ithink, to cast a trough upon ac en sailed, howsmall scale, and attempted on arger. It failed, how erge eacirasence upon the pipe to bend it in the act o raping. It my suggestion pipes with large troughs o made, wi.we the trough contains ten gailons of water in ne or noure placed in a conefvatory weald firmish an abuthant sosite of moisture rithout nostriceng beat from he soil, and without affecting the purty These troughs have iefurther alvartaze of being entirely inojerative when lett dry; whereas the open gutters fiting of tisur temporary

Had these trough-pipes been suceessolully made at the intruduced some into the lage house at Chiswick, arransung them as in this the full ellect cf the railiant the full ellect of the raviant of any mete ter commanication of heat to the ar than is unperhaps to exp-use all the pizes the piants by plae:ng them thus, provideat the height of the shelves, and other circumfarrangement.
In this way a larger por-
 tim of ti.e heat would arrive form, becur-e on the other plan the opposing surfaces of the arljacent I ipes maintain a mutual interchange of radiain, and bearme cooler principally by the contact of the air. This ohjection anplies in some degree to the iuner siles of ail hee wiich are presented to the wall, and from which therefive the heat is conveyed to a large extent by the atmo-phare. Economy would doubtless be consulted by clasing up all thuse pertions of surface which are not adnpted to radite diractly upon the plants or upon the sont. The sime effict mould be produced by clothing the inner sani-circumferences of wall pipes with non-conlucting materials, or if practicable by
portions a bright metallic lustre. \(A\). Ai

\section*{COTTAGE GARDENS.-NO. XXIV.}
\(T_{\mathrm{E}}\) have directed the cottager's attention to the manher in whinlk some of the most useful regetables and plants should be treatel; but there yet remains one to be hoticed tiat. in our opinion, is calculated to become of great importance in cottage economy: and we would orderestrnngly recommend its introduction into cottage las it in his a trial to be made of alant we mean is the Succory, which grows wild in this country on dry, calcaeous soils. In Germanr, Flanders, and other parts of the Continent, it is well knomn, and extensively cultivated, not only for fornge, but more especially for the sake of its long. spindle-shaped roots, which, when cleaned and cut in pieces the size of a small bean, and afterwards roasted and ground, afford one of the very best substitutes for coffee that have been yet discovered. It is for this purpose that we are desimus of bringing it more particularly under the eree ni conarers in tins country, to whom it will prove excerdinciy u-ciul; and we trust befure nany years elapse th see it as seneraliy culticated as it deserves to be. We rith this het when once the cottager is made acquain use to thich its ronts are so easly cocorerted, he will not require any rremiums to be held out to him as an inducement to elltisate it. Few plants are mare easily grown, it will thrive almost anywhere, unless, perhaps, in a very damp situation; Lit for our purpuse, which is to obtain as large tonte as immline, a moderan. and may he reavilly obt suiked ori. The seds are cheap time ior senanz thems, better indeed than if they had been sown earlier. as when put into the ground before Midsummer many of the poung plants will run to seed and same manner as directed at \(p\). 196 for Carrots and Pars neps. Where manure is necessary, it chould be such only
\(2 s\) is well rotted, and has been thoroughly incorporated with the soil in digging. As soon as eight inches apart, or broadcast if drilling is considered eight inches apart, or broadcast if drilling is consintered tooll into the ground without burving them too deep The subsequent culture is very simple, weeding and thinning the plants to five or six inches' distance being all they will probably require until the roots hare attained their full size, and are taken up and preserved for use.
Continue transplanting any of the Cubage tribe where
ever there is room, and clear away those in the seed.bed. or elsewhere, that are not likely to he wanted. Prick out the young Broccoli plants, and supply then liberally with water in dry weather. Jo not let the soll become hard and baked on the surface; where this is the case, let it be stirred without delay, and no

\section*{HOME CORRESPONDENCE}

Colfage Gardening.-Knowing that you take great inerest in the advancement of cottage-gardening, I send you the result of an experiment which has succeeded perfecty
with me. and which I have no doult you will be able to with me, and which have no explain on scientific priaciples. I received from a garexplain on scientifc a full-grown black currant bush, just bursting into leaf. I planted it in my little garden, gave it plenty of water, and as it began to grow freety, the dry weather set in, my plant ceased to grow, many of its leaves began to droop, and some of the fruit which had set fell to the ground. What was I to do nnm? Repeated hering was he frst that is did mure harn than good anless regularly attended to, and as I could not attend to it regularly, I had recourse to the foll wwing expedient:-I took some cow-dung and other litter and spread it over he surface of the goly of water. The effect of this, in whole a copious supply of water. Tuite efrict ; the leaves ave become broad and green, the fruit is swelling beauti ifully, and the ground has never been dry since.-A Cottager.
Calceolaria.-The sport of this genus, mentioned as having been exhibited at the last meeting of the Horticul 1835, amongst a number of seedlings of C . crenatiflora, several of which had the pockets turned inside out, as in Mr. Blaauw's specimen, whilst others had two pockets Mr. Bn together. You are aware Mr. Herbert notices p. 364-S. \(S_{\text {. }}\). Thy experimenta nin the of rption of various metallic salts by the roots have been umerous, and amifications of the plant sufficiently sinyle. I commu nicated the method I adopted to the late arr. spper, of Bath, whose experiments on the circulation ote ap lead. I
vine are justly appreciated. If 1 used acetate of detected its presence by applying to the tissue chromate of potassa; if muriate of mercury, iodide of potassium, or caustic potassa; if sulphate (or other sale) of iron, hydrosanate of potassa, and so on. Sults of iron 1 found as deleterious to regetation as even corrosive sublimate. Ithe not find acetate of lead by any means injurious, but on the contrary, in some cases at least, to acrelerat? veget \({ }^{\text {t }}\) tion and promote its lusuriance. I find that a "fancy gooseberry-grower, in Lancashire, ascribes his success in obtaining the first prize to his administering a close of accetate of lead to the plant!-J. Murray
Drosera rotundifolia, \&.c.-The Drosera, which is a flo atcher, I was once inclined to believe, as well as the Drosera muscipula, to be carnivorous. I conicss that I have changed my opinion. Both are certainly indiscriminate in their attachments. One specime abtained the other day) of Drosera longifolia had wrapped its curious leaf round the flower of a plant which bad ac cidentally come into contact with it.-J. Whra.
Destructive Grabs, sc.-It has occurred to me, that the havoc of grubs, wire-worms, sc., might be, in oceasional instances, arrested by the appl!cation of boiling water-a rather starting proposal, I admit-but it is well known that boiling water may be applied to the roots nf some trees without injury. The Vitex Agnus Castus win grow with its roots plunged in boiling water.-J. Innvray Forest-tree Planting. - Wisting both to give and ceive instruction, I beg to ofier a fer observations that experience has suggested on forest-tree planting,
plant with any chance of success, it is necessary to ascertain the state which the ground intended to be plantect is in. Supposing it to have grown corn the preceding summer, and to be lying in ridyes of 1.2 or If feet, the juest wat is to bastard-trench the ground all over, which is dove by opening a small trench at the end of the ridse, and porn the surface and turning it tato whole is gone over. tinitus This operation is best performed in the aatumn, and the trees may be planted in the spring. By suis means the ground receives the benefit of the winter's if sists, and works better than when the operation is aitogether left until the spring. The mode of planting I preerer is so to liew apere to be planted in rows; they shuluid hes set about 4 ft . apart, and young plants should be sèlected, 30 they succeed better, and usualiy overtake thase of larges size. In planting, care should be taken that it is properly done: not merely to thrust the plants into the holes, but to have these dug sufficiently large that the roos may be spread out horizontally mithout being crowded. The holes
should be filied up with fine earth. not with those dry hard lumps whi h. in dry weather, are usually formed on the surtace The huds os tere I mond reenmmend for sifit hearv lands, rut ton met, are 1 ? 0 hib Lareh, 110 Scotch
 Elnas, and ahoat 2 tif of other orrs. On a fine deep
 Eroms of sorts, 200 Oaks, 200 Sycamore and Maple, and a
fise Whek Italion Poplars, wime Alders, a.d the remainder bireh or Tree thom. These calematioms reler only to plantations that are made moly for the predection of Foplars mar be intermised with the other trees, or sweet Chesnut or Lime, added at the phasure of the proprietor. Where it is iotended is fum cerpice. I should plant 400 Oaks, 1,000 Hurnbeam, ( 7 (it) Ash, 4011 tzel, and the rest Spanish Chesnat or Lime, which grows the fastent of all Hornbeam and Ash being the best for ordinary purposen should be planted separately, especially the Ash, which is the best adapted for hop-poles, splitting for hurdles, stakes

I shoold not onit to mention that if the plantation is hoed over in the month of June, the first season, and the grass and weeds wed cleared away the June following it will require bui hatle farther attention, as the hitte about the stem of each trec during winter is beneficia tree in not impulal hy it. Turs method may be whiected to on account of the expense, but this is not so great a. ony be macined ; tha trencings can the done for 31 or 46 the plantine eun be moen-ily performed in ground so preparect than oin tae ordmaly way. Another excellent method of planting is on land that has been sereral times ploughed as fallow, when the trees may he put in either yuring or autum. Thate seen a beautiful plantation entirely of seotel lines, whim had bee a phated in land rain. If straiggt Sonteh lines are required ther should be planted alone, as they s:iffer leas from growing thick ogether than with any of tris, they will thrive in almost any suil, but a strons l.easy land suits them best. Another mode is not \(t\) plant immeliately alter trenching,
but after a cron of Pat atoes, Turnips, or the like, which but after a crop of Pot atues, Turnips, or the like, which in many cases pay for trenching, as thave knorn cottagers ansious to obtain ground on neld terms, and the land is There arions othe: metiods, such as pranting old pastures and invertuag the turr romit the trees, which for otrees in the forr: merelv laging ohe the risoc: but I have seen no l,etter than thit winh I hive first described, which with

Futce of growing Icy.-On remoring, very recently, vered that a thick leaden water-pipe had been in many places deeply indented, and in some almost squeezed flat, by the stem of the plant. The pipe looked mueed as if

Hi-kerto wheres have been pinched in their straw hives in winter now they not only survive the winter mproved management. but work with much greater des day I succe by hiving the hes uniting a swarm to the partan drawing hers and in the aternon with box, and allowing the new and red hees from the centre This is important to know.- IVilliam Blond.

\section*{FOREIGN CORRESPONDENCE.}
perintendent of the Botanic Garden, arrived some month since. On his taking office he found the gardens onginally to have consisted of 120 acres, but that orily a a out 00 were inder caltisation. The cond bet of tir late superintendent, Mr. Watson, had been so bad as to hane cansed the estabhisment to be cut down to a mere hothing. In cultivated portion things had been planted aecording , Mr. Norman tate arst proceeding was to report to the governor the that a proper classification mizht be intruduced and new plants gradually brought from the jungle, so as to benefit not only the istand itself, but Europe generally. After 12 adition flopsed, the necesen crder was giten for adil a vating the garden. The island itself appears to be most simgular, consisting of an assemblage of lalls, and of a ot for a few Palmes and a few of the Musa tribe, I could scarce conceive I was in India. In the jungle, Apocynacex, Cinchonacere. and Orchidacke. chatlly prevail. Tea las been intrudured, and planted in a \(p^{\text {nrt }}\) o the counears to thrive, but time will only prove the chand and apTea; the temperature there, durng the night, is exiremely low, ice being frequently formed, and the junge has a totally different character from that of the phans. Coffee is being extensively cultivated, and it may be done at a
great profit, so much so that I have invested what littie capital I have in that speculation, and if it answers my in the space of 10 y yars.

Madeira, May 12 , 1841. - I have not been alle to go into the interior of this island, so that I have had no opportunity of seeing the indigenous regetation of the mouncultivated with spot of ground round this town (Funchal) with the mixture of plants grown together in a plot of ground, as the Banana and Potato, lams and Wheat, Cabbages, \&c. The general system of growing the Vine is to have a single stem for about three feet from the earth, and then to train it on a horizontal trellis, garde over the whole space of ground. In some of the the effect produed planted under this covering of Peach produce a great pher saw some of the great bur 1 the yuung ofop irees breng Stamberie Cbit of Banamad ars, int Firs. and Guare the Fiss of the richest botanical spots, but owing to my heaith I was oblized to declune was oblized to decline. I called at the seat of in English fine spa erase, ther Mr. Lodiles about sern Which was more than two feet in circunfertnce: wen the ranin at this place are made of Fuchsias, Roses, and Ge the Coffee is growing in great luxuriance. I was informed that it is cultivated, asd the produce has a higher price than the imported, and is known by the name of Islan Coffee. It will be impossible to enumerate all the plant and a and a kind of Aloe, of which plants grow on the diy liuges friends roeks. I was pleased to nind ome Plaitago lanceolata, and sereral others. The buryingPlaitago lanceolata, and sereral others. The burying covered with a great variety of flowers. I was surprised at the number of hzards,-a nearly related species oo che swift lizard of England; they are so thices that upon putting my arm among the grass to gather a specimen made the vorage from Pigmouth to this place in mine days.-Joha Anselh
Boston, May 16, 1841. -The season here is wery tub ward: here is the Joith of May and not a ... it on the
 and cold ones: but there hizs been n. .t.an
 ther as we get in England in March. It is feared the farmers will suffer much in consequence. In New Hampthe eattie dying \(f, r\) whit of fort ; but there is now some arpearance of a chandes and thea it will be as hot and have it has feth cond and rainy. the fers hine Mays summer iat Euglanil ; but the weather here is ficile, both in summer and winter. The number of species af plants in the State of New York, indigenous and natur ilised, ancel 10 er ordert a cryptogama, are slants,
1.3-9 wacies have been found; of Ferms, and flants allied to them, 53 species ; of Mosses, 150 species; of Hepatise tad Charstre. 30 aptecies: 27 tre trees es surnts: 150 are reputad of plo.... medi-

 grawes the : 2 of New Yorls conthins 150 species, 24 of which are of there are 140 , more than half of which belong to the genas Carex. Cicer arietinum, the chick-pea, considerable stention. It has been much cultivated in Detroit, Michigan, and grows from 12 to 13 inches high, and beats ume blossom at the axil of each leaf. Each legume contains two seeds. It commences flowering early in summer, and continues thi late in the sult it in full blossom at top. It is a native of Spain, where it is much u+i is in magreellant in shurg: it is also empayed Dy Mr. Cuechaved, of Deine, ir taree or finir years, diffireree bretern it and the caffee honght at the grocers', and the chici-pea a mere nothng. The seed should be sown the end of May on hilis el hteen inches apart, one pea on each hill, and they will be ripe in September. plot of gronnd, thirty feet square, whl produce ears is to lerably extensive, and embraces some of the best kinds cultivated, yet the production of new varieties which are really deserving of cultivation is rare, and the accessions
to the li.t for the list fer years have bern very limited. Neariy or quate all the Amencon fr its, puriivularly pears, Which have been brought into culuvation, have been the
result of accitent. The trees have been tomit growing result of accitint. The trees lave heet whare growing aprung up from the soil, arrived at a bearlug state, and continued to prodice frut, in some instances, for years
before their muerits have been dh-coserel and made known. An in itnnce of this may beotived in the Cushing, seckite and otuer cetergated varieties. The same may be rewarked the assistance of man, show how tar his experiments ia the growth of new rarieties may be successfal, when conducted on physiological principles, espectiany in this elimate. The (rose pear first attracted notice at the Massachusetts Horticultural Snciey's R roms, in Boston, exhibited. whi.h was of exiellent quality. Its history is exhibited, wineh mas of etiellent quile of land adjuining his eatate, in Ammimerymort, find on it a natural pearall the brometres but one, for the parpose of gratung it, and remunad the tree futo his girden: the braneh left produceu what so auw cailed tue cioss pear. The toiluwromdisin, two and a hat inshes in levyth, and two and a quartur in dameter. Stak, three-ruarters of an inch smitl ind ci intommly depresesed. Sisn smoth, deep yemow, rat oa the smony s.ie, rassety ro mand the ere, and moll hmik -int. Flevi meitung, juicy, and sweet, whith a perfumed and agreeabie flavuar. In eating in December, sometimes earlier, and occasionally keeping till February; it is something resembing to add, that the whole stock of Camellia Wilderii, (p. 1.31.) Eas been testroyed by fire, and with it about \(\mathbf{1 0 0 0}\). edtings, raited fram tae best varietioe
 the principal Surveyor of the Now Zealand Company, to J. Ward, Esq., late Secrelary to the Company; dated "I believe I have now told you all the principal events mation on shat the country around us has prodeced this summer, though we were late, and anacquainted with the soil and climate. We are now enjoying vegetables, stych as green peas, cabbages, and turnips, in as high perfection tender na ure ferinin in the rotage, or from lite sowng dind nas gever trecth to resist the grassiopper, wash
which we ar. thul, it at this sea*on of the vear. The
