## Che Garuentgi Chromicle.

SATURDAY, JANUARY 5, 1856

Wr have been occupied during so many years in planting fine looking trees that it has been scarcely thought of any importance to consider what they may be worth when arrived at the state of timber. And yet it wou!d seem to be desirable that correct information should be had upon that point even in so rich a country as England; for it is not very nowise to occupy land with trees that can be used in their old age, as well as admired in their youth.
A striking instance of the want of knowledge upon this point has been shown in the construction of the hats at Aldershott, where deal, some say Pine, the most combustible of all wood, has been used instead of Poplar, the least inflammable that is known, and which would last as long as Fir wood, or we ought to say longer, especially if well payed
with some mineral fluid incapable of feeding flame.

Another has been afforded by the difficulty of finding any one able to state, of his own knowledge in answer to a recent correspondent, to what purposes Ailanthus timber may be adrantageously applied. At last Mr. Godsall, the experienced nurseryman at Hereford, has furnished some evidence which induces us to point attention to the present subject
It is probable that very few of our readers eve heard of the tree called Ailanthus glandulosus; nor indeed is it by any means common in this country. And yet it has good qualities, even in an ornamental point of view, which should have saved it from neglect; for it is perfectly hardy, has a most noble aspect, and grows excessively fast. The account given of it by Loudon (Arbor. Brit. p. 491 ) is as exact as it could have been at the time when he
wrote:-
This species of Ailanthus is a native of the northern provinces of China, more particularly in the neighbourhood of Pekin. Seeds were sent to England, to the Royal Society of London, by the Jesuit missionary D'Incarville, in 1751 ; and they were sown by Miller in the Chulsea Botanic Garden, and by Philip Carteret Webb, at Busbridge in Surrey, in the same year. As the tree produced suckers freely, it was soon generally propagated and there are many fine specimens of it in differen parts of the country. The original tree planted by Mr. Webb was cut down some years ago; but several others, which have sprung up from the roots left in the soil, were in existence about the sam spot when we visited it in 1834. (See Gard. Mag vol. ix. p. 481.) The tree was introduced into France, in 1780, by Mr. Blaikie, and the oldest specimens are at St. Leu, and in the Jardin des Plantes. We have not heard of the timber having been applied to any useful purpose in Europe because trees of a large size are not yet sufficiently numerous to admit of their being cut down for profitable application. In France and Italy, it is much valued as a tree for shading public walks, and is planted for that purpose along with the Tulip tree, the Horsechestnut, the Platanus, and other large-leaved exotic trees. Its leaves are not liable to be attacked by insects, which is a very great recommendation, and they continue on the tree, and retain their green colour, till the first frosts in November; when the leaflets drop suddenly off, the petioles remaining on often a week or two longer The tree grows in any soil, though one that is light and somewhat humid, and a sheltered situation, suit it best. In France, it is said to thrive on chalky soils, and attain a large size, where scarcely any other tree will grow. It is readily propagated by cuttings of the roots. It might probably be found a valuable tree to be treated as coppice, and cut down every third or fourth year for fuel.
Some idea of its rate of growth may be gathered from the following table, compiled from Loudon's statements made 17 years ago, with the exception of the last:-

| Where growing. | Age. | Diameter of trunk. | Heipht |
| :---: | :---: | :---: | :---: |
| Syon |  | 3 ft .10 in . |  |
| Kew … … | Do. |  | 0 feet. |
| Cobham in Kent | 20 years. | 1 foot. | feet. |
| Wt. John's College, Cambri | 19 years. | 9 inches. |  |
| St. Len, France | 44 years. | 3-3t | 30 feet. |
| Bot. Garden, Geneva | Unknown. | 2 ft . 5 t |  |
| Hort. Gardens. Chiswick | 30 yea | ft. | $35$ |

Perhaps some of our correspondents living near these places can tell us the real age and present dimensions of the specimens enumerated. That in the Garden of the Horticultural Society has been allowed to form three arms near the ground, which has interfered with its rate of horizontal growth.
If from these facts we turn to the parposes to which the tree is applied, we find in France it bears the following character, as we learn from M. Soclange Bodin, an unquestionably good authority: "Although it likes a light rather damp soil, it nevertheless grows very well in any, its creeping roots running so near the surface that even a thin soil suits it. Its timber is hard, but rather brittle, fit for cabinet-makers' work and for similar purposes; makes vary good firewood, burning with a bright flame ; and it yields charcoal as good as tha of the Eim or the Malberry tree. The best timber is that of trees growing in a rather dry gravelly soil."

The authors of the Bon Jardinier report that it grows a yard a year; if the lateral branches are removed, and it is trimmed up to a single stem it forms a fine spreading head (parasol). They also describe the wood as satiny, pale yellow, and as handsome as Maple.

The specimens of wood with which we have been favoured by Mr. Godsail answer to this descrip tion. In the letter which accompanied them he says :-

I think the wood of Ailanthus glandulosus may
be employed in the manufacture of furniture and other purposes to advantage. It is hard, takes a fine polish, is slightly transparent, and resembles in some measure Satin wood. Its growth is rapid, as you will perceive, and the tree is hardy and very ornamental. A thin board similar to the specimen (2-10ths of an inch thick) was exposed to the weather for several years, and was found sound at the last. If I was not, like your correspondent, an Old Subscriber, I certainly would plant it extensively with \& view to profit."

The specimen which we received was a little wormeaten, and so might Oak have been under the same circamstances. But we concur with Mr. Godsall in thinking that the tree deserves much more attention from planters than it has yet received, considering the great rapidity with which it forms timber.

Since frosts will soon be doing their work among us, let us remind those whom it concerns of the very common fact that whether a low temperature does injury or not to plants depends greatly upon the precautions taken when thawing begins. In the Theory and Practice of Horticulture, p. 203, this is insisted upon, and is well understood by experienced gardeners. But as every body has not the book in question, and as more people are inexperienced than the contrary no apology is necessary for a few words of timely warning.
Many plants perish of cold, not so much because of the cold itself as because they are thawed rapidly. A row of frozen Peas facing the morning sun is completely cut off by a degree of cold unfelt by the very same crop screened from the sun. A lot of bedding out plants are frozen hard in a neglected vinery; get up the heat and they die; shade them, and thaw them very slowly, and they are as fresh ay ever. The circumstance is analogous to what happens to man in intensely cold countries. Walk tected nose, go suddenly into a heated room, and ten to one but you lose that ornament of the face. But rub it well with snow till it glows again and you are safe.

A couple of examples of what happened in France last winter may assist in rousing the incredulous to an appreciation of such facts. Last January a gardener had the ill lnck to have a batch of Pelargoniums frozen in spite of all the care he could take to shelter them. As
soon as he found out what had happened he put half into a greenhouse and half into a cellar. The first lost all their leaves; the second were completely saved. The same person took up his fine solid Celery (céleri a cstes, qu. Celeri coust hâtif?),
and left the plants at the foot of a wall facing the south. and left the plants at the foot of a wall facing the south. take them in doors, and therefore covered them well up. The thermometer, however, fell to $5^{\circ}$, and the plants were frozen. He then removed some to his kitchen garden shed, and the rest to an Orangery, where the temperature was kept a few degrees above freezing. The next morning the Celery in the shed was all right, but that in the Orangery was rotting fast.
So much for quick thawing!
${ }^{6}$ We shall have visitors early in February, and must have green $\mathrm{P}_{\mathrm{ra}}$ soup once or twice at least. Tell the gardener to provide a supply of young Peas." Such was the order given one Christmas day to the cook in a great honsehold, and duly communicated by the culinary to the horticultural department.
"Fresh green Peas in a month, in the middle of winter ! the thing's impossible," cried the astonished gardener. "My lord can't have given such an order ; we haven't a house or a light to grow them in-and if we had --"-"We must have them for all that," was the curt rejoinder ; and the gardener was left to discover the quomodo.
In his despair the worthy man bethought him that young Peas and young Pea leaves tasted much alike, and that perhaps the one might be as good for soup as the other. So he took some shallow pans, planted them pretty thiclly with Dwarf Spanish Peas, put them in his early vinery on a shelf where he sometimes grew Strawberries, and where a good heat was kept up. The Peas soon began to grow; they had air as much as it was possible to give it them, and by the beginning of February were 6 inches high, well furnished with healthy tender green leaves, and stems.
The supply thus obtained was eat like Mustard and Cress, and handed over to the cook, who declared that it made better purée than if he had had green Peas themselves.-And from that time
forward Peas were forced at as regalarly as forward Peas were forced at as regularly as
French Beans; and all lovers of good living
wondered how Lord - continued to have such
capital puree of green Peas whenever they visited him in the winter.

## New Plants.

157, Cenia proinosa, De Cand. Prodr. vi. 82. Amnng hardy annuals of modern introduction this is one of the prettiest. Although a native of the Cape of Good Hope it requires no more tender treatment than a patch of Camomile, to which in foliage it bears some resembance, the leaves ieing very finely and frequenty
divided into linear segments. It forms bright green hemispherical tufts not more than 5 or 6 inches high, from among which appear in profusion and in long succession circular convex flower-heads about as big as a sixpence, consisting of a crowd of tubular yellow florets, edged by short tooth-like rays, yellow above, dull purple on the
under side. The involucre consists of two rings of scales, under side. The involucre consists of two rings of seales, each ring made up of eight, at the edge of a top-shaped

forces adearvomsed debrit; she appear's to try her forces, and instead of immediately producing large
(rees, the vegetation consists of Ferns, some herbaceous crees, the vegetation consists of Ferns, some herbaceous
plants, of which several resemble Spermacoce ferruginea. plants, of which several resemble Spermacoce ferruginea.
This medicinal plant is used for the same purpose as the Oxalis repens, commonly called Poya, in Brazil, and Ionidium Ipecacuanha (Poya Branea in Portuguese), some Solanacese as the Nicotiana, and some Grasses analogous to the Panicum guineense but stronger, together with the Lobeliacese having large dentate spiny leaves, several plants bearing edible fruits, and finally various species which attain a greater height in five months than is attained in five years by trees destined to form the pride of the woods. The rapidity of growth in a plant is in direct proportion to the quantity of pith which it may possess, or rather in proportion to the dilatation of the cells which compose its tissues. Several Campanulacear form an under growth. Such is (in the first year) the vegetable aspect of a woodland cleared by fire.

In the second, third, and fourth years, this vegetation takes its
final growth and dies. Then appear under shrubs (Abutilon esculen. tum, which is not found in any old wood), species of the genus Cassia, and other Leguminosæ, the Strychnos pseudoquina, and others belonging to the same family.
After these species, some of which entirely disappear in the course of 10 years, succeed tall fruit trees of the genera Anona, Cerasus, \&c., Anona sylvatica especialiy. (Say Anona sylvatica, because the species to which I allude has the most perfect analogy to it, the fruit instead of being spherical assuming a conical form.) In the virgin forests there are some species of Anona very dissimilar to the Anona sylvatica. Several species of Quercus appear, of which few attain the height of 26 feet. These, it will be under-
stood, are such as spring on stood, are such
cleared grounds.
During my 20 years' sojourn in the virgin forests of Brazil I have observed that three new aspects of veretation have suc. ceeded each other in the space of 12 years, on the soil of old forests destroyed by fire. These species destroyed by fire. These species are everywhere uniformly the
same in the province of Rio Janeiro or Nitherohy. I ought to have included in this enumeration the Sonchus oleraceus. This plant must belong to the New World as
well as to the old, for it inay be well as to the old, for it inay be said to be the first plant that is
abundantly produced when an old forest is overthrown, even before the wood is burned.
Orchids.-It is not without reason that Europeans adore the Epiphytes, and more especially the Orchids, which are the ornament of the tropics. Whether as regards variety of colours, perfume, or peculiarities of form, this fume, or pecularities of form, this
family excels all others which expansion of the peduncle, and both are covered with a the vegetable kingdom presents for our admiration. glaucous bloom, whence the species derives its second Orchids are the last work of nature, and posseas that name.
Another Cenia also in cultivation is-
58. Cenia Turbinata, Persoon. De Cand. Prodr. vi. 33. This, the old Cotuls turbinata of Linneus, was grown at Oxford in the days of Morison, but was lost till reintroduced from the Cape a few years since. It is very much like the last, but has more hairy and sharper pointed leaves, while the swelling at the top of the
peduncle is much larger in proportion, and not glaucous. In garden lists we have three sorts-viz., C. turbinata, C. turbinata formosa, and C. turb. alba. They are much alike, and form a pretty variety growing by the side of C. pruinosa.

## THE VEGETATION OF BRAZIL.

The illustrious author of the "Physiologie Végétale" (M. Mirbel) has stated that, according to the testimony of credible observers, after the destruction of a forest in South America, the soil, when left to itself, frequently produces trees of a different species from those which have been destroyed by the axe or by fire-a pheno seeds buried in the earth from time immemorial can remain there without germinating, and yet preserve their vegetative powers till they are subjected to the nfluence of the air. This is an indisputable fact.
In Brazil, the soil of a forest destroyed by the axe and by fire-I say by the axe and by fire, because a forest grubbed up for the purpose of cultivating the land must aecessarily be burned-clothes itself always and not sometimes with a vegetation different from that which previously existed upon it. Nature proceeds differently rom what has been supposed. A forest does not rise immediately to replace snother, of which there only
degree of perfection which an able artist gives to his last works.
This family is found growing on dicotyledons; to meet with one on a monocotyledon, even in the midst of an original forest, is purely accidental. Out of about 200 species which I have found during many years of repeated researches, I only met with the Zygopetalum rostratum on the great Tree Fern, and on that alone it existed. A similar observation applies to a species which I named at the time Loelia epidendroides (now, I believe, Aspasia), which sprung up, lived, and died on the Vellosia or Tree Amaryllis); away from its support it made a sickly growth, the new bulbs appeared to diminish, and only a few flower stems were produced. Some tropical fruit trees, such as the Psidium (Guava) appear singularly favourable for the growth of certain species of Orchids, for instance, the Ionopsis panicalata, Burlingtonia venusta, candida, and pieta.
Woods that have lately sprung up on soils cleared of original forests appear to have given rise to the following species: Ioropsis paniculata, Burlingtonis venusta, candida, picta, Comparettia coccinea, Oncidium flexuo sum pumilum, and odoratissimum. The following terrestrial species, Neottia orchioides, Govenia Gardneri, Oncidium Pinelianum, belong exclusively to soils that have been cleared, as do likewise various species of Phaius. (Eulophia?)
Horticulturists, by the separation of a single bulb from a full grown plant, obtain in the course of the year a new bulb as strong as the old, and sometimes stronger. Nature has not this advantage. The same result is only gradually and very slowly attained by seeds, even when these find a place suitable for their vegetation. Orchids, it may be said, have their periods
of infancy, mature growth, and old, age. They pass towards the hypertrophy of some particular part, though
from one of these stages to the other, not as timber in the wild state, which is always one of natural vinour trees, which increase in height and diameter, but by a series of individuals of which the first may be considere abortive; the second producing the species in its full degree of perfection and beauty ; and the last, doubtless for want of sap, tending to a state of dryness which dees no permit the hope of flowers every year. In the Orchids which spring from seed, the roots very soon acquire
considerable strength, out of all proportion to the rest of the plant

The progressive amount of strength acquired by the bulbs from year to year is considerable, till the species The greater part of the Brazilian species flower in the rainy season, or from November till April. Although not removed from the branch on which they have grown yet if taken from a high to a moderate temperature, even in Brazil, the Orchids suffer, and the size of their new bulbs is much less than that of their predecessors produce flower-stems. When the rains are too frequent produce flower-stems, When the rains are too frequent
all Orchids are apt to perish. I have not observed them to do so in consequence of great drought.

Station of Orchids, in the Province of Rio Janeiro,
Nitherohy. It has been stated that no Orchids have been found on the sea-coast, nor in ver hot regions; but the species Burlingtonia rigida, Oncidium flexuosum, Cattleya Harrisoni, Schom burghkia marginata, or crispa, belong to the hottest regions of Rio Janeiro, the swamps near Macacu, the name of a town now entirely deserted since fever took permanent possession, about 2 leagues from the sea or
The species Cattleya intermedia, guttata, and Brassavola teretifolia belong to the banks of the Parahyba, near the town of Campos, where the temperature is perhaps even higher than at Rio Janeiro.

Proceeding from the estate of Mr. Alexander Tranio, who introduced the rearing of silkworms to Brazil, on the summit of the Serra de Morroquimado, about 10,000 feet above the level of the sea, where the thermometer in July indicates $27 \frac{1}{2}^{\circ}$, Fah., or $4 \frac{1}{2}^{\circ}$ below the freezing point and in the hottest season of the year, January 10 Roderiguez and Desroches, and at the base of the Serra those of the late Colonel Ferreira and Meudoc where the temperature is as high as at Rio Janeiro we meet with minately at all intermediate altitudes, without appear-
ing to suffer from the vicissitudes of temperature, ing to suffer from the vicissitudes of the prilliancy of their flowers

Travellers through Brazil too often run through the country without taking time to verify the correctnes of their observations. In proof of this, I need only state that have discovered some of the finest species o Orchids in the very places where these gentlemen have
passed them over. My experience tells me that within passed them over. My experience tells me that within
the tropics Orchids are found every where. The genera or species are not confined to any particular altitude; for during 18 years' residence in the country, I have found, and daily continue to find, the same species at widely different elerations-as commonly at 30 feet as at 10,000 feet above the level of the sea. As for giving the horticulturists of Europe the advice not to maintain a high degree of temperature in their houses it is useless, as they find that a high temperature is advantageous as regards the increase of the plants, or pseudo-bulbs. perishes as soon as it is in the hands of amateurs, If the latter would wish to possess plants that would outlive a Rose-bloom, they should obtain their Orchids direct from the countries where they grow; and they should take care not to overwork their plants. Ch. Pinel,
Nouveau Fribourg, Rio Jone Noureau Fribourg, Rio Janeiro. [We give the names employed by our esteemed correspondent; but some of them are evidently erroneous, although we are unable to
-VEGETABLE PATHOLOGY.-No. CII.
408. Acaulosia* (Defect of Stem).-The development of a firm healthy stem undoubtedly requires considerable vigour in a plant, and in many cases is aceomplished ny after long preparation. In most biennials, for vistance, the first season is consumed in making pro-
for the ensuing year, and in those the Turnip cr Cabbage, where the nutriment ia directed
the flower-stem may le thrown up the first year, the flower-stem may be thrown up the first year, mhe peculiar development of the variety, that the stem the peculiar development of the variety, that the stem
is not formed till the following season, and in such is not formed till the following season, and in such cases Acaulosia is regarded by the cultivator as a sign
of perfection, while the development of the stem is justly as regards his own especial object counted as disease t
409. In some cases, however, a defect of stemi is natural. Take, for instance, the common Primrose tance is named Primula acaulis from the very circuni subspecies, however, as the Oxlip and Cowslip, have well developed stem, and individuals occur partaking almost equally of the nature of the Primrose and Oxlip which at one period appear stemless, while at another there is a perfectly developed stem. The causes which produce these appearances are apparently altogethe onstitutional. +
410. In other cases, however, Acaulosia is not so Cnicus and anal dependent on scanty nourishment duces no stems, but accession of the rich loose soil of a garden, alters the habit at once and a perfect stem is produced as in other neighbouring species.
411. Sometimes, however, a defeet of stem is depend nt on other circumstances. For instance, it not un requently happens that in the garden Hyacinth though
the flowers are imperfectly developed there is almost total absence of stem, or if developed, it is reduced to a tenth of its usual length. This may arise from various
ter eauses. In the chlorosis of Hyacinthe, for instance escribed in a former paragraph, it was found to accom pany an imperfect development of roots, in consequence which, though there was enough nutriment already tored up in the bulb to cause the expansion of the flowers, the stem remained undeveloped for want of a fresh supply rom the roots. The same effect will obviously be pro duced by any cause which should destroy the apongelets, and therefore it is easy to see why excessive heat, a asserted by Ré, should be no less hurtful than constituwhere the surface soil is liable to be dried up to the where the surface soil is liable to be dried up to the
depth of some inches, should prove productive of this isease. It is scarcely probable that the flowers of hi Hyacinths and Ranunculuses should be developed without any stem, from the mere stimulation of an increased temperature, if a proper supply of moisture and nutriment were coming from below. In some cases again where the base of the bulb is decayed and in consequence not a single root is produced, the flowers are still partly developed at the expense of the nutriment already existing in the root seales.
412. Another case mentioned by Ré, after Moelıring who published an account of it in 1735 , of Poppies and other plants remaining without a stem, arising as he light likely to produce or aggravate a chlorotic condition of the leaves, originates from causes which at that time he was unable to appreciate. Such plants will, in almost every case, be found to be the victims of the growth of some one of the varions species of parasitic moulds known under the name of Botrytis or Perono spora, for while some of these species stimulate the chlorophyll, rendering it of a more vivid green than usual, others produce the contrary effect, preventing its formation or exhausting it when already made. Puppies may frequently be found in this condition, and as these moulds are especially prevalent in seasons when the soi is dry and the atmosphere moist, their effects may readily be'attributed to peculiar conditions of climate. 413. The dwarf condition of many trees in consequence of the reduction of the stems may be constitutional and peculiar to particular varieties, but unusually reduced stems may exist in cases where the trunk is generally well developed. Where trees are close together the lateral branches soon decay from want of drawn upwards the stem becomes elongated. In exposed situations the contrary effect will be produced. Frequently, however, short stems arise from injury to the leading shoot. Skilful pruning alone can administer a remedy. Injudicious pruning, even where that lopping which produces pollards is not intentional, mas cause he same ffect as accidental injury. M.J.B.

## NOTES ON PEARS

There is no fruit so full of vagaries, so capricious in its quality, adaptation to different soils, and in its seasons of ripening as the Pear. The past has been preeminently a Pear year; I purpose, therefore, to give a few rumning notes on new and old varieties, their varia tions in quality under different circumstances, and hints as to culture when necessary to serve as a Pear record for the year 1855.
After having cultivated and tasted nearly all the old varieties of early Pears, I have come to the conclusinn
 never in annuals.
$\ddagger$ The abstract of Irmisch's treatise on Bulbs and Tubers, given
the "Tranactions of the Horticultural Society of Lundon," vol. $8_{0}$ p. 217 , may be oconsulted oon this subject. The peduncle of the
Cowlip is always terminal the truss answer to the individual flowers of the Primpose which are collecte
elongated.
lhat we ought entirely to discard such sorts as Amire Joannet, the Blanquets, and Muscats, and confine our-
selves to Doyenné d'Eté, Citron des Carmes, and Beurré Giffart, as the only very early kinds werthy of cultivation. They ripen as nearly as possible in successo: ; the first commencing to ripen in July, and the others foilowing till the middle or end of Aupust, depending much upon season, soil, and site. I ain writing of their ripening here in the south, but not in a warm locality; these three varieties were all very good last season and bore abundantly. The first named, as is pretty well known, is small, and when ripe of a beautiful red and yellow. I have eaten it fully ripe from the tree, be cery juicy and agreeable, but as a rule it should fruit room, it is then is ripe and kept a few days in the fruit room, it is then more juicy; a very simple mode
of prolonging their season, and which may be applied to all early Pears, is not to gather them all at one time but to do so at intervals of three or four days. This summer Doyenné is a great bearer and seems to bear dearly as freely when grafted on the Pear stock is on he ternce, in deep rich solls. Thave seen it on the most soils it forms a pretty and most prolific bush or small pyramid ; on the Pear stock it will arow into a moderate-sized standard, and also forms on that stoe a nice prolific espalier or pyramid, $f$ such a form is referred.
The Citron des Carmes is a very old variety, and in most seasons is exceedingly juicy and agreeable ; last season they were very good indeed; when grafted on the Quince it grows freely, and bears fine fruit, but it is very apt to swell over the stock and become un-
sightly, unless the stock is carefully covered. The tree is not so tractable as the Doyenné, but throws out vigorous irregular shoots. As it does not make a handsome pyramid it is better cultivated as a bush or espalier ; in the former case its vigorous shoots should be pinched in early in June, so as to make the bush as compact as possible with such an irregular grower. In most soils when cultivaled on the Pear stock it cankers terribly; but I saw last autumn fine standards growing on a hill at Cheltenham on the blue lias clay without a spot of canker ; I have indeed rarely seen such beautiful trees. T'. $R$.
climate of pirsia.
The atmosphere of Persia is peculiarly dry, and the rays of the sun have such power that all herbaceous plants enjoy an existence of a very short duration. In early spring the Grasses and the flowering tender annuals only present themselves for a few weeko. Amongst them are most of the species common to Europe, and the Salvia tribe, with blossoms of various hues, catches the eye in every direction. Soon after the end of May the country assumes a scorched appearance, and to the vernal productions succeed a variety of shrubs, such as the Wormwood, the Camel Thorm, the G
The gardens of Persia do not produce any choice or rare plants, and it requires much skill to raise any rom seed, because their germination is seldom aided by rain but is effected by irrigation, which is not congenial when the watex chus let over the earth is speedily absorbed by the ardent heat of the sun, and the soil in consequence hardens over them. Their principal ornaments are Rose trees, Lilacs, Jessamines, and Snowballs; Tulip trees, Narcissuses, Hyacinths, rulips, the Marvel of Peru, Hollyhocks, Larkspars, Poppies, Marygolds, Pinks, Single Stocks, Wallfowers, Viulets, and a few others, are universally cultivated, but not with sufficient skill to produce any varieties or vigour of bloom. It is not in flowers, but in fruits, hat the gardens in Persia excel, and the whole rance of European fruits may be found in them, both in abundance and in high perfection. The Grapes and Melons are in great variety and excellent in quality. The Rose trees certainly blossom in great splendour and luxuriance. The large species called the Nustarund, which grows to a considerable height throwing out garlands of highly scented flowers, wou!d be a valuable acquisition to our pleasure-grounds; the Miskeeja is also a very pretty delicate cream-coloured Rose, and from a red kind, highly scented, the best rose water is dist:lled.
From this scant enumeration it may be supposec that the Persians have no taste for horticulture, yet this is not the case. All classes are particularly fond of flowers, and such as the country produces are regarded with admiration both by the nobleand the peasant, the poet extols their beauty and fragrance, and the dervise both cherishes and admires them with the utmost evotion and pleasure.
My opinion can have little weight ; but I should say that Peria does not afford a wide ecope for botanical research. Tl e plants producing assafoetida, and the fum ammoniacum.have been fully described, and these, with the sueet suhs'ance gathered or shaken from the Gurwan, are its chief pecular vegetable productions his latter is generated by an insect alone found on this shrub or thorny plant
T.es shores of the Caspian an ! the range of mountains which gird the provinces of Ghilan and Mazanderoun from the warmth and humidity of their atmospher sive birth to a most luxuriant vegetation, and have never beez diligently explored by the botanist. In the most gigantic height, whilst the Vine and all species
of fruit trees common to Europe present themselves
in every direction; Nature, in short, exercises her
fullest power over the vegetable world. Extensive fullest power over the vegetable worid. the White Mulberry to feed the silk-worm; cotton is produced in great quantities; the Sugar cane is also cultivated, and Orange and Pomegrauate trees yield abundant crops The natives of these provinces, however, only speak
praise of the Violet, Narcissus, and Tuberose, and with the addition of the Silk Acacia, I could neve learn that they held in esteem any flowering plants peculiar to their country
However, against the assertion that Persia is not rich in botanical treasures, may be placed its ancient reputation for a great variety of plants possessing the most
wonderful virtues, of old the mountain of Demawund near Teliran, Alwund near Hamadan, and the Koordish range of Alburz were famed for their vegetable produc ions. Even from India persons travelled in search o hem, prompted their supposed virtues, or from their supposed power, in combination
with other ingredients, of converting the baser metals with other ingredients, of con
nto all-powerful gold. $G$. $W$.

## ANOMALOUS CONDITION OF A CABBAGELEAF.

As every variety of vegetable tissue, however com plicated, is derived from one common source, the single original fertilised cell in the embryo sac being the parent of every one which succeeds it in the formation of the largest organism, no reason can be assigned why it
should be impossible that adventitious buds and roots should be impossible that adventitious buds and roots
should be produced under favourable circumstances from any part of the plant. We have accordingly various instances on record of the origin of such organs
in very unexpected situations, as roots and leafy shoots in the cavity of the pith of the Cabbage, or swollen roots of the Turnip, buds from the edge or surface figured roots springing from the fractured leaves of Celery, and we have just met with a case i which a snail, having gnawed a hole into the midrib a fascicle of roots has been formed, bursting through the tissue lining the cavity, and then covered with abundant delicate hairs, after, the fashion of ordinary
radicles. In all such cases we have observed previous to the formation of roots a coating of spongy cells over the wounded surface. The Cabbage has an especial
tendency to form such tissue wherever the cuticle is ruptured, or where there is a free cavity. In the instance before us the adventitious roots were, however, in reality no product of the leaf, but merely penetrated its midrib, and in consequence before a section wa itself was perfeetly dintinet from leaf or stem, and was seated indifferently on the several varieties of tissue benesth it, whe ther the parenchy and cells of the bundies of the stem ; and the vessels"of the adventitions roots were in evident connection with those of the stem, and not with those of the midrib of the leaf or its axillary bud, but carried over so as to pass both, and unite with the complicated masses running between the medullary rays. The case then was more exceptional in appearance than in reality, and our object in calling attention to it is more with a view to show the necessity of close and accurate observation in such matters, without which conclusions may be hastily formed which the premises would not in fact warrant than to indicate the particular case, which is not however without instruction and suggestive matter.
The whole spongy surface was greatly discoloured, beneath was little affected, while, on the contrary, the vascular tissue, whether truly spiral or dotted, whether against or in the direction of gravity, was gorged with matter warying in tint from golden yellow to dark taken place.
It may be well perhaps, in conclusion, to atate that the brown cavity in which the roots were formed was not exposed to the light, but covered over with several imbricating leaves. Though many similar cavities existed, in one case only roots had been generated. The botanists, that it is scarcely worth while pointing out the bearing of the case before us on the question. M. J. B.

## Home Correspondence.

Ferns.-Thanks are due for the few notices of Ferns that have occasionally appeared in your Paper, and I venture to hope that they may be continued and be seen more frequently. The items of information chiefly required are simply, if the species requires to be kept
damp or comparatively dry, whether hardy, requiring damp or comparatively dry, whether hardy, requiring $\mathrm{O}_{\mathrm{n}}$ these points correct information is most deficient; and I find it always necessary to decide by trying an experiment myself, and I have often thus found that some Ferns always designated and grown as stove varieties have stood the winter in a greenhouse where
fire was never used except to exclude frost In an excellent work now publishing on foreign Ferns(Lowe's), amongst others I would just mention two described as amongst others I would just mention two described as leptophylla and Adiantum cuneatum. Both these grow
merely a mat or two thrown over in frosty weather. As there are perhaps 10 times more amateurs who hav greenhouse accommodation only, than there are who tial it is to furnish full and accurate information on this head. It would have been desirable in the above instances to have stated-Will succeed in a greenhouse but will attain a much larger size if grown in a stove require a stove temperature, and indeed only reaching perfection under stove culture, will nevertheless succeed tolerably well in a closed frame or greenhouse from
which frost is excluded ; and many more of them would even thrive in what is called a "warm" greenhouse Comparatively few experiments on this subject hav been made public, and the scattered facts bearing vators, are lost to the public. Our readers who are i possession of authenticated facts indicating the degree enduring without serious injury species are capable o on the many amateur cultivators of Ferns by communicating them for publication. If they reach us by a certain date, say February l, we will undertake to
arrange them in some useful form. For general purarrange them in some useful form. For general purusually indicate the probabilities as to its cold-enduring capacity. Thus, for example, Gymnogramma lepto-
phylla, inhabiting Jersey and the south of Europe cannot require, however it may bear, stove heat; and Adiantum cuneatum, occurring among other stations on he Organ mountains, might be expected to bear moderately low temperature better than its general other hand azi-would seem to indicalers, other hand a curious fact that

Vitality of Seeds. - My attention was accidentally turned to the following instance of prolonged vitality many years ago, and I was induced to make some experi
ments and indulge in some speculation regarding it, for ments and indulge in some speculation regarding it, for
my own satisfaction. Whenever in this county the my own satisfaction. Whenever in this county the
Whin (Ulex Europeus) is rooted up or burnt, the common Pansy comes up invariably in great abundance So far as the soil can be examined by a common hand microscope no seeds are visible, and yet when a portion of it is exposed to favourable circumstance or growth (in a pot exposed to heat), the Pansy
aakes its appearance. In this county a flasstone is very extensively quarried for ; it is frequently covered to the depth of 20 feet or more by the "till" (agriculturally), or "mortar" of the geologists This has to be removed to get at the stone, and in the deep sections of it thus exposed the underground opera tions of the common earthworm may there be very com monly seen, and his route traced to the depth of 10 or 12 feet. At the bottom is a chamber, which generally contain quantities of amalk stones and seeds.;" of these I noticed particularly the rough "boll" of flax. The stones being a size larger than these, the cavities running from 1 mch (and also) is lined by an exceeding fine blac earth, like that which forms the "casts" of the suriace, and although to common examination no seeds are apparent, whenever the bisected pipe or chambers happen to remsin exposed to the weather on the face of the hard clay section for a sufficient time, the whole becomes green from the growth of Grasses, the seeds or germs of which must apparently have existed in the fine black earth. There are several small lakes in this county (Forfarshire) which were drained at great expenise many years ago to get at a shell marl, once in great request as a dressing for land ; the use of this is now nearly abandoned, one of the causes assigned, at least, being its fouling the land, chiefly by the presence price bein trial. The result was a heavy crop of Thistles. The land previously was in high heart and perfectly clean, the quantity was so great, and the circumstances such as that the presence of the Thistle seed could only be ascribed to the marl ; it is notorious that in ditches and ponds the Thistle seed will exist for years, but here the marl was not only covered by water for time immemorial, but had several feet of black earth over it besides, all of which was carefully excluded from the marl in preparing it for market. B. S. [We have omitted the theory, facts being more important. It is vocal generation. Nobody can explain the material quality of life.]
Lentil Sonp. - The following recipe for this was given me by an old Baronet and M.P., and was considered a great favourite and extremely wholesome. Whoever of my friends have tried it praise it before all others of its kind, and it is very economical. I trust it may prove useful at this season :-1 pint of Lentils, soak in cold water, and then add 6 midale-sized Onions, 2 heads of Celery, 2 Carrots, 1 Turnip, 1 quart of pot liquor
from boiled beef, matton, or pork, and 1 quart of water. Stew the whole slowly, as green Peas for soup ; pour it all into a mortar, and pound it well; then strain it through a tammy or sieve, and add 1 tablespoonfal of powdered lamp sugar. N.B. No stock or glaze to be ueed. 1 pint of Lentils make enough soup for seven persons. Vorthwood.
Fines in Pots.-I quite agree with Mr. Henderson's remarks on this subject (see p. 822, 1855), provided one had the convenience which Mr. Henderson appears to have; but if his instructions are intended for ama-
may not have a house or pit chiefly for Vines in whots Something more is necespary. I lave here three seasons, to have Vines grown in pots, and I am the same, were it in my power to do so with a hope of being successful in procuring a moderate crop. I have no house or pit
with a good command of bottom-heat to grow my Vines with a good command of bottom-heat to grow my Vines
in where I can have them near the glass, \&c., like Mr. Henderson. I have bark beds in two houses, but these 1 cannot fill to be nearer the glass than 3 or 4 feet, and
were I to devote one of them to pot Vines, in a short were I to devote one of them to pot Vines, in a short
time they would be shaded so much by the permanent Vines that they would not have the same chance as if they had a house to themselves ; a few hints, therefore, from Mr. Henderson on the best mode of procedure with the convenience I have would be acceptable. R. Reid, Birch House, Lancashir

## Bee Flowers.-Mr. Payne in h's "Bee Keeper's

 Guide," a practica. and useful work, recommends as good bee flowers Tussila a Petasites, Cuscuta sinensis, kindnes; to inform me by what English names these flowers are known? I have looked carefully over the lists o! the nurserymen in this neighbourhood, but cansee nothing of them, nor can I meet with any one who knows anything about them. Mr. Payne professes to write for cottagers; in such a casz a parade of pedantic Lati 2 names of plants is rather out of place. What pot-herb Sweet marjoram under Mr. Payne's fine name of Origanum humile? I assure you I write for information, not to cavil at Mr. Payne's usefui' work, and I look difficulties. $A$ ng in your pages a solution to my difficulties.. A Bee Lover, Sheffeld. [Tussilago Petasites
is the common Butter Bur ; Cuscuta sinensis is the Chinese Dodder, a plant not to be easily procured by any one-li at all ; Anacampseros populifolum is, we pre-
sume, Sedua populifolium. Mr. Payne's cottagers must live in cottages ornés].
Packing Seeds for Exportation.-Anything in paper were packed in "tinfoil," or those small leaden bottles made for oil colours, and which are very cheap, I conceive that they would keep better and be more portable the viass phials. somerset. TThe principle upon which the vitality of seeds is to be preserved is opposed to all
such plans. See Theory and Practice of Horticulture, such pla
p. 24.]

Classifying Pears.-I fear that this is almost hopeless, as they vary in character to such a great extent. I observe that M. de Jonghe (p. 837) places the Colmar and Brown Beurré (Beurré Gris) under one type.
Surely this cannot be, for no two Pears differ so widely in every respect as the Old Cormar, with its long smooth shoots, small buds, tardiness in bearing, and in the the Brown Beurré, which is remarkable for its entirely opposite characters. T. R.

## Foreign Correspondence.

distant colony like this ornamental gardening make but little progress-first from the utilitarian views of all new comers, and secondly on account of the old residents having but little opportunity of profiting by the markets of England and the superior skill and enterprise of the mother country. You might greatly assist us and benefit our growers were you to furnish twice every lists of supplement to the lists of botanical and horticultural books, seeds, plants, Dutch roots, plans of conservatories, and other erections, With price and size; wirework, garden ornaments, marked with service in distant places, and would be of essentias It is of little use to say that a list may be had by applying for it, and sending a postage stamp when a person has to send 12,000 miles. At this very time the nevly established Botanic Garden here require or 10001 and 5002 respectively, but I am quite at loss to 1000 m , and J00. respectively, but $I$ an quite at a loss to we finding brickwork and fittings ; the same is the case we finding brickwork and fitinge the with hot water apparatus, agricuitural machines, an many other things. It is also only fortuitonsly that wo know where to procure particular varieties of bulbs and tubers. I have looked very carefully over the adves tising colamns of your volume for 1854 , and can find $n$ lists of the varieties of florists' lowers. Carter's cats. logue has been my only resource for years past. Where, also, is a list of species of herbaceous plants? What is the use of saying 100 varieties may be had for a certain sum, when perhaps wo have half of them already, and the other half would not bear transport? Were each indicated by name we could send for what we want, and have them only-to send for a mere collection always entails disappointment. Another valuable result would obtain, viz., the acquisition and distribation of species
rather than varieties, and the study of Botany, instead of rather than varieties, and the study of Botany, instead of being cramped as now would be enlarged, and a sounder and more instructive view of it would be entertained There are 50 or 60 species of Narcissus, yet the seeds men sell only 8 or 10 -who has any of the others? Who 5 comy of the 30 or 40 species of Anemones excepter Crinums, or the 60 Ornithogalums, or the 120 Alliums? If I want the Ranunculus roots called Naxara, or the
old orange Brabankin, who has it still ? It would
worth while for a lover of flowers to collect them, even to pay an agent to do so, in order that he might
have some from one person, and some from another ; but how can this be done upon the present system Many a beautiful plant, too, may be easily forgotten amidst so many charmiug novelties of a particular year, and soon afterwards be lost; it is no argument to say inferior to some other. Many a plant which dwindles in England would be magnificent here or elsewhere. I believe that this state of things might be somewhat I believe that this state of things might one somewhat altered by the plan which I venture to recommend. their advertisements appearing on the same day of
the same type; having equal extent of distribution the same type ; having equal extent of distribution England as abroad. One fradesman may have more extensive stock than another, may have choicer
plants, may be cheaper, or he may possess superior structures and machinery; but how is the world to know this except by the plan I propose ? In-
dependent of this, I would state that as far as this place is concerned, if any one will send me their catalogues by post as published, I will take care that they shall always lie on the table of the Botanic Garden Museum for general inspection. A new botanic garden has been commenced bere under Government auspices, and it has been entrusted to my care. Forty acres of rich land, opposite North and East Terrace in this city,
have been set aside for the purpose; 16 acres will first be cultivated, leaving the rest for an arboretum and drive. It is expected to cost $12,000 \mathrm{l}$, a sum which may appear small to English artists; but it is to be observed that that climate is very different from ours, which does not require that range of conservatories
which are necessary in England. Scientific arrangement will not be neglected; but the chief object is the introduction of new plants, and to form a place of healthful recreation for the people. G. W. Francis

## Fotices of books

The Entomologist's Annual for 1856. 12mo, pp. 174
This is the second volume of a yearly work which
THis is the second volume of a yearly work which promises to be of considerable use both to the professed being to record the new or rare species of insects captured during the year, accompanied by other information, such as notices of new works, lists of entomologists, accounts of collecting localities, \&c. Mr. Stainton, the editor, has contributed an introductory article on the advantages of the study of natural history, and a second on the pleasures of entomology, from which we extract the following passage, one of the best in the volume which,
"It must also be borne in mind that it is no slight pleasure to find occupation and an object in every country walk. An entomologist cannot say-

$$
\begin{aligned}
& \text { And it it nothing more, } \\
& \text { onveys to his mind }
\end{aligned}
$$

A Primrose conveys to his mind a reminiscence of all the insects that feed on it; he thinks of the fat larve which eat the leaves in a lantern; he thinks of the dipterous miner that forms its mazy whitish track on the surface of the leaves; and not only has a Primrose this importance to him, an importance which, without lessening its beauty as a flower invests it in addition with other points of interest, but
almost every plant and shrub becomes to him replete almost every plant and shrub becomes to him replete
with pleasant recollections ; a walk, even when he is not with pleasant recollections; a walk, even when he is not
actually looking for insects, becomes a totally different thing from what the same walk would be to another person. But when we further consider that a walk is generally undertaken by the entomologist with the express object of finding something, and it is rarely that he fails to succeed (if not in finding the very thing he was seeking for, at least of finding something which he is glad to meet with), we can comprehend that an entomo gist derives pleasure from every walk he takes.
and rare species of Lepidoptera captured during year, together with lists of entomological works, both foreign and Eoglish, occasionally adding critiques upon them, some of which are not only written in very bad taste, but also sonvey erroneous ideas on the works themselves (See especially p. 159.) Messieurs. Dawson \& Janson have contributed articles on
the recent captures among the Coleoptera, and Mr the recent captures among the Coleoptera, and Mr
F. Smith among the Hymenoptera ; but the most valuable article in the volume is by Mr. Lubbock, entitled "On the Objects of a Collection of Insects," which well deserves attentive perusal. We trust the other ordera of insects will not be neglected in future volumes, as they have been in this and the preceding.

| Report on the Nuxious, Beneficial, and other Ints of the Stat: , if New York, made to the State gricultural siciety pursuant to an Approprian for this purpo e from the Legislature of the aic. versing the practice, and finding a right place for the
rinht man. Dr. Asa Fiteh is an exellent practical him the entomologist of the State Agricultural Society. We lave here the first of his annual rep.rts in an elaborate memoir upon the insects which are injurious
to the fruit trees in that part of North America, which it appears that although some species, such as the termed in England), the mussel scale, and some of the coccidæ, appear to be identical both in our own country are subject to the attacks of a number of different species producing varieties of disease to which our orchards are not subject. As might be expected,
the autlor is hardly all courant with the pullications of the author is hardly alt courant with the publications of
Europe. The work is, however, a most creditable performance and we congratulate the American naturalists on having so excellent an entomological annual.
The medical profession will be glad to know that Dr Copland's Dictionary of Fractical. Medicine, nne of the greatest and most inportant medical works of the pre or Part VIII. of Vol. III., now befure us, terminates with $p$. 1152 , and includes a large portion of the learn -d au Dr. Copland's labour tubercular consumption. Long having, we believe, appeared in 1844, it has not leen longer than a dictionary so elaborately executed rendered inevitable. We understand that the final completion of the work may be expected shortly

## Carden Memoranda.

Messrs. Henderson's Nursery, Pine-spple Place. worth inspectis season the glass-houses here are well coming gay with flowering plants; and places in which there is at present little blossom have been decorated them off to the best advantage. were Chinese Primulas, both sin le and double-the former bandsomer than the latter, and being from seed, they are more easily increased. Cultivators, however who are fond of the latter, and have but few plants of them in their possession, may readily have more by dividing them into as many pieces as they have crowns,
and poting them separately. This is a surer and better way of multiplying them than by curtings, as each por tion thus detached has roots to it, aud is enabled to begin growing without much chech. Among other plants in flower we noticed Early Tulips, Cyclamens, Daphnes, whose fragrance renders them favourites with everybody, and varieties of Epiphyllum truncatum the latter were in perforated pans, sospended from the roof, and arranged in this way they served to vary the appearance of the house, and had a good effec
Mignonette, sown last July and brought on in cold pits, was also coming into bloom, while som sown in August is growing on to succeed it, and thas by sowing at intervals a supply is kept up all through the spring. A plant of Fuehsia, Dominizna was in bloom, and at this season when flowers are searce it is quite an
acquisition. Its blassoms are fully as handsome as those of F. spectabilis, and the plant is reported to be more cultivable.
In the stoves the red berries of Ardisia are just now very attractive, and not less so are the large scarlet hracts of Poinsettia pulcherrima, young plants of which may be mentioned produce these gay floral leaves of larger size than old ones. Thyrsacanthus Schomburgkianus, alias 1. rutilans of gardenf, was also in plants can equal it. Its long drooping cluter of scarlet flowers are extremely ornamental. Glox inias for early blooming were arranged along the shelves of this house near the glass. They have jus been shaken out of the pots they were in, repotted, and otherwise put in a growing condition.
In the Heath-house some of the early sorts as hieVarie, Autumn gracilis, and Westcotti, were in bloom temiegated Aloe-leaved Yuccas, with stout tree-like tems and fine heads of yellow-striped leaves were als placed here and there in this house, and with good This handsome climber was planted out in a border of peat and loam at one end of this house a year last season, when it grew away freely, and now it promises to bloom profusely. The bordcr, it may be mentioned, is close to the hot-water pipes; but in a house of this kind the latter are but little used.
One of the stoves here has bten made into a Fern house, in which are many fine specimens of this of them are in pots, bat some of them are pajed out in loam and peat mixed with broken pots and brickbate in crevices of rockwork, and managed in this way they not only look more attractive but they thrive vetter cycopods, of which we need scarcely say there are now
many varieties, and some of them extremely handsome many varieties, and some of them extremely handsome,
have also been interspersed among the Ferns with good effect. Plants of Ficus barbata were clinging to the damp walls of this house like Ivy, and for situations of this kind they are well adapted. It is in the Orchid-house, however, where this Fiens is to be seen in greatest
perfection. Here, where it has been planted nut in gond soil it has made a growth of 6 feet in length in fonir five months; while its leaves, which sircad out flat
gainst the wall on each side of the stem, measure quitc
inches in length and 4 inches across. Under hind treatment, therefore, this plant may be induced to Tro æonlums in cool houses hide very speedily. push freely. They are trained here over twiggy centre and smaller pieces towards the outcides. in this mamner they have a less stiff appideance than when they are trained over formal wire trellises. On an open wall was a plant of the yellow Jasminum nudiflorum literally loaded with blossoms, which are said to have stood the recent severe weather without
njury. It must be mentioned, however, that it gets a injury. It must be mentioned, however, that it gets a through the wall on which it is trained.
The Pampas Grass in an exposed border here also stood the 'ate frost uninjured, except ta ends of the leaver, which got bleached a little.

## Miscellaneous.

Cassava (Manihot).-Two varieties or species of this plant are cultivated in the West Indies, the so-called say so-called because nelther of them is banipha); the words probably having been applied by the negroes, who, with a limited vocabulary, are nowise exact in the use of terms. The tuberous roots-the parts used-first-named las a more decided pungent acrid taste than that of the second ; and from the few comparative trial Thave made, appears to contain a larger proportion of glutimous matter and of hydrocyanic acid. When a section of the root is made, three parts are distinguish able-an epidermis, very thin and tasteless, an inner laminated and fibrous layer, which is easily separated, the principal seat of the hydrocyanic acid and gluten and innermost, the body or main portion, abounding in starch contained in a cellular structure. On the division of the root the glutinous matter exudes as a milky fluid, like that from the Sweet Potato, and with the same microscopic character. Its granules are about howow an inch in diameter, and they are coure substance of the root vary in size from to about 1 of an inch in diameter. In the mode of preparing the root as an article of diet-viz, by steeping for a shor time in water, grating and pressure, a portion of the glutinous matter is separated, and in the dressing, whether by roasting or baking, the volatile poison, the remains probably the bighly nutritious quality of the Cassava is owing. We learn from Southey's "History of the Brazils" that the Dutch "soldiers preferred Mandioc to Wheat, thinking it a stronger food:" and I have been assured by a gentleman who travelled in the wilds of South America in company with native Indians, that he lived for many days on no other food than Cassava bread, undergoing a great deal of fatigue, and found it to agree with him well and support his streng th Dr. Davy in the Edin. New Philosophical Journal.
New Way of Ripening Grapes by means of Straw and Wool.-In Hovey's Magazine of Horticulture for February is a letter from Mr. M. H. S mpgnn, of Saxonville, giving an account of a method of ripening Grapes in December manuaury. Mr. Simpson follows the business of in the human body, he bethought himself of trying something like blankets upon Vines. For ten years he has made six hundred pairs in a day, making, on the whole, between three and four millions. To retain the heat of the ground in the borders which contained the roots of his Vines, he covered them, for a foot of depth with dry hay, using two tons for the purpose. Over the hay he laid what might be called a blanket of waste woo and manure. The heat passed off very slowly from the borders thus protected; as the cold weather came on the temperature diminished about three degrees a week. On the 1st of December it was sixty degrees. His Grapes hecame fulty ripe under this process in December and they did not ripen in September.]
Medicral Gardening.-Our invaluahle ancient authority, Alexander Necham, says a " noble garden" should be arrayed with Roses, Lilies, Sunflowers, Violets, and Poppies ; he mentions also the Narcissus (N. pseudoarcissus?) The Rose seems to have been cultivated from the most remote time; early in the 13th century we find King John sendirg a wreath of Roses to his lady, par amours, at Ditton; Roses and Lilies were among the plants bought for the royal garden at Westminster in 1276: the annual rendering of a Rose is one of the commonest species of quit-rent named in ancient conveyances. The extent to which the cultivation of this flower had been carried between the 1 th and 16 th centuries may be estimated by the varieties enumerated by Lawson ; they are the red, damask, velvet, and le rovence Rose ; the sweet musk Rose, double Provence Rose was probably first imported in the 1.5th century, when the occupation of France by the English may be conjectured to have caused the introduction of many additoonal varieties of fruits and flowers; the marriage of Margaret of Anjou with Henry VI, may he regarded also as an event likely to have brought the
Provence Rose to our northern elimate. Of all the Provence Rose to our northern elimate. Of all the
flowers, however, known to cur ancestors, the Gillyflower or Clove Pink (rlin-de-rivr dit), was the com-mone-t, anl to a certon degree the most esteemed.

Mr．Loudon has stated，erroneously，that the cruelties surface ；for in this case a gross habit of growth would re the Duke of Av， receiving through the Flemish weavers Gillyflowers， Carnations，and Provence Roses．The Gillyflower had been known and prized in England centuries before；at king of flowers Gillyflowers＂of nine or ten severall colours，and divers of them as bigge as Roses．Of all flowers（save the Damaske Rose）they are the most pleasant to sight and smell．Their use is much in ornament，and comforting the spirites，by the sence of smelling．＂There was a variety of this flower well known in early times as the wall Gillyfower or bee flower，＂because growing on walles，even in winter，and good for bees．＂The reserved ront＂unius clavi gariofili＂，which is of such frequen oscurrence in medieval deeds relating to land，mean simply the render of a Gillyflower，although it has been usually understood to signify the payment of a Clove of commerce；the incorrectness of this reading must be appawn in the 12 th and 13 th centuries，when this kind of reserved rent was most common．Another flower of common growth in medieval orchards，or gardens，was the Pervinke，or Periwinkle ：

> There sprang the Violet all newe And fresh Pervinke，rich of hewe，
> such plente grew there nor in the mead．

As this plant will flower＂under the shade of trees or lofty walls，it was well adapted to ornament the securely ezclosed，and possibly sombre，gardens of early times． Florist，Fruitist，and Garden Miscellany．

## Calendar of Operations <br> （For the ensuing week．）

PLANT DEPARTMENT．
Conservatory，\＆c．－As severe weather may now，a any time，be expected，a good supply of dry litter，Ferm or other materials should bein readiness，for extracover－ ing，when required．Take advantage of bad weather，to wash up and arrange the stock of dirty pots，to paint any tubs，baskets，wires，\＆c．，out of use；repair and of various sizes，forked sticks for pegging down plants in the flower garden，look over the stores，and provide Whatever may be required for the season＇s use．If not slready cone，lose no time in getting under cover a supply of the various loams，peat，\＆c．，required for spring potting．The principal work in p＇ant houses will consist in keeping them and their iumates serupulously
clean．Moderate fires and ventilation，with frequent washing of stove plants，will be necessary．The con cervatory and show houses should now be gay with Camellias and forced plants，which will take the place o the Chrysanthemums，now over．Keep up a regular succession of plants to bloom through the spring，by bringing forward the stock of forcing plants as wanted． Roses，both dwarfs and standards，Honeysuckles，scarlet Thorns，hybrid Rhododendrons，and Azaleas，with a host of other thinys，will enable you，in addition to the usual occupants of the houses，to make a briliant show through the spring．Hyacinths，Narcissus，Tulliss，Lil of the Valley，and other plants of the above class， nust be duly forwarded as wanted．Hard－wooded plant will require a dry pure atmosphere to guard agains mildew and damp．

## FORCING DEPARTMENT

Pinerr．－A night temperature of about $60^{\circ}$ should be maintained in the fruiting pits，allowing it to rise to $70^{\circ}$ during the day，or $75^{\circ}$ with sunshine，and where the tained if this can be done without injury to the general stock．Also aim at keeping up a steady bottom－heat of about $80^{\circ}$ ，which for the present will be high enough．－ The Vines in houses about to be started should receive dressing with the ordinary composition a few day before closing the house，rubbing it well into the crevices of the bark；also get the outside border covered if not already dose；this，however，should always be effected before this season，so as to retain a portion of the warmth infused by the summer＇s sun，and throw off heavy rains Where very early Melons are required，seed o same established favourite should be got in at once． Cacumbers being very generally grown for early use， is scarcely necessary to refer to these farther here than to say that，if not already done，seed should be sown at once．These and Melons require plenty of light and moisture，and every care should be used to keep them clear of insects，and this renders it advis－ able to have them in a light by themselves．A smal quantity of Strawberry plants may now be placed in pit or frame where a temperature of abnut $45^{\circ}$ can b maintained，keeping them close to the glass，and giving abundance of air whenever the weather will permit． flower garden and shrubberies
Where any of the beds or borders require a dressing of fresh soil this should be provided，in order to have it in readiness to wheel on when favourable weather for such work may occur．Fresh soil is，in most cases， proferable as a dressing for flower beds to manure， which is apt to cause too luxuriant a growth for a first－ rate display of flowers．On soils that are naturally poor however，and where neither fresh mould nor decayed leaves can be had，a moderate dressing of well rotted farm－yard manure will be useful ；but this should be well mixed with the mould the full depth of the bed， and not carelessly turned in and left in lumps near the
part of the roots would be near the surface in the manure，the plants would soon feel the effects of dry
weather，whereas if the manure is well incorporated weather，whereas if the manure is well incorporated
with the soil，to the depth of about 18 inches，no ordi－ nary amount of dry weather will injure the plants after they once get fairly established．Shrubberies may be thinned where this involves only the cutting out of overgrown plants or lopping deciduous trees or the hardier kinds of evergreens；but where evergreens generally require pruning，the work had better be de－ ferred until March，except in favourable localities ；for although when the winter proves mild such work may be successfully performed at any time，it is never safe to depend upon this．Avoid getting upon，or working the ground when it is in a sodden state，and if the hands cannot be profitably employed at out－door worls，get at kod stock of Dahlia stakes，brooms，
hardy fruit and kitcien garden．
If any transplanting of fruit trees has yet to be done this season，it should be seen to while the weather is favourable for such work；also see to getting ground intended to be planted with young trees prepared，and spare no pains or expense to have this properly done remembering that future success will very largely
depend upon how this is effected．Make sure of thorough depend upon how this is effected．Make sure or should be removed，replacing it with some good fresh loam．When large breadth has to be planted in one season this ex pensive kind of preparation connot always be afforded， but it is better to do such work only in such quantities as will allow of every precaution being used to ensure success，and it is useless to hope for this on some soi＇s＇without making expensive prepa－ rations before planting．Get pruning and nailing forwarded as fast as circumstances will permit．Atten to keeping up a supply of Seakale，Rhubarb，and Aspa－ agus，according to the demand and convenience，by introducing quantities of the roots into heat at intervals of about a fortnight．Where there is room to spare in the Mushroom－house，the two former will be found to do exceedingly well there，and a supply will be obtained with little trouble．A quantity of roots should be got up and laid in where they can be covered in case of severe frost，so as to avoid the chance of having to take hem up when the ground is frozen hard．Also see to providing a supply of French Beans．These are fre－ quently grown in the early Vineries or in plant houses， but their liability to the attacks of red spider renders hem dangerous inmates of such structures，and where it can possibly be done they should be cultivated in a pit devoted to such purposes．For land that has been long ropped with vegetales a dressing of fresh loam would in many cases be preferable to manure，and where thi $s$ wanted and can be obtained it should be got to hand in order that advantage may be taken of frosty days for wheeling it upon the ground．Where fresh soil cannot be obtained，charred vegetable refuse，such as prunings of shrubberies，edgings of walks，and many things which turn up in course of the season，may ke cheaply made to form an excellent substitute．

## Che agrictltural Gatette.

SATURDA Y, JANUARY 5, 1856.
It was a clever conceit of the ancients which depicted the god Janus with two faces. The fanciful heathen divinity who still lends his half forgotten name to the opening month of the Christian year, lends also a significant image of the attitude it brings to every mind-of looking back and of looking forward. Lannched as we find ourselves into another of those periods, whose name is yet unfamiliar to the tongue-which the pen can hardly yet mark without the lingering error that shows at once what creatures of habit we are, not without the redeeming trait of attachment to a departed friend ; the conflicting posture between the coming and the parting guest, presents a moment whose very business, unlike any other that occurs in the full swing of current time, seems to take the intended shape of reflection. There is a time we have high
athority to know, for everything; and the openinvites but seems almost to compel the most indifferent and thoughtless, and what is perhaps harder still, the busiest and most self-absorbed, to spare some thought to the grand total that must occur, as page after page is turned in the ledger of life. Seventy or cighty such pages-and what is it then, so the work was well done, what the title of the volume may have been? Whether it was headed 'mercantile ' or agricultural,' whether was indited of the Forum or the Camp, whether it was high or humble, in affluence or in the perpetual struggle of self-renewing need-so the work was well done? It is happy for all that such moments should come; for, they are moments that bring all to a level of common brotherhood, in bringing houghts that equally belong to all.
That equally belong to all: that is a wide phrase ! Bnt it is a phrase that like the terse and pithy mottoes on the wind-scattered leaves of the Cumæan Sybil, we should like to drop upon the path of English Agriculture, to tell it, in the hour of success, in the hard-earned and well-deserved and favourable moment of prosperity, of one thing it has yet to study, of one task which whether it look backward or forward, or both, as were best at this opening of a new year, it has yet to accomplish, and has hitherto failed to do.
A century ago-only ten times ten years agoEngland was an Exporter of Corn ; and had been so for a long time. Nay, so advantageous was it thought to be to find consumers in other countries, for our cereal produce, that a 'bounty' on the export, a shilling bribe on every bushel shipped away to find its market in foreign ports was the stimulant that 'sped the ploughs' of our ancestors, and armed the conflicting views of the controversial writers of the day. Half a century ago-at the opening of the present one-all this had passed away. War bad seasons, scarcity, increasing population, with decreasing supplies, foreign markets shat against us, with a success not so great as that pro duced by the privateering dangers encountered on the high seas, and the enormous consequent rise of freights and insurance charges,-led to an inclosure of fresh land for the plough, such as had never been witnessed before in this country, but which stil failed to meet the present wants for home supply which the combination of these and other causes had engendered. In the twenty years from the beginning of the present centnry one thousand si hundred and seventy-seven inclosure bills, embracing an area of above three million acres of land were met by an increase of nearly five millionmore than five-and-forty per cent-in the population: Since then, the remaining fifty-five per cent have been added, and England presents a com munity of double the number that saw the opening of the century, while the land remaining for in closure has decreased in each subsequent decennary period till now it is scarce worth the reckoning
And how has the plough - no longer able to find another acre to supply the deficiency of the lastkept pace with the increased demand ? The account for the last fifteen years is a startling one, and may well suggest some thought for the future, as con nected with, and indicated by, the past. From 1840 to 1846 (both inclusive) our average yearly import was three million quarters of grain, and from thence to the present time the average has been nine millions and a half per annum
But would it be credited, by any one who did not know what an odd fellow an Englishman 18, that with this tremendous history behind us, with this enormous growing demand upon the produce of the rest of the world-every bashel of which is counted as it enters our ports-that we have never yet taken the trouble to ascertain what portion of the grand total that we consume is grown upon our won acres?
Given, a population of two-and-twenty millions (omitting Ireland), a yearly importation of 93 millions of quarters of grain, what is the other figure in the Simple Rule of Three Sum? If indeed we have a 'common brotherhood' in anything, surely this is of those qnestions that equally belong to all? Does the English farmer thelp to it is against his interest to his hus towards
solve this problem? to furnish his quota towate the statement of this moment)as 'Rule of Three ?' Is it not a familiar fact that the corn sold during the first four months after harvest has two years out of three during the last fifteen been sold below its true value ascertained in the subsequent average of the year? that in ten years out of the fifteen it has touched the lowest price of the year between harvest and the end of the following Jannary? Is it forgotten that in 1846 Wheat was selling from harvest to the end of November between $46 s$ and 50 s. a quarter, which in
six months afterwards fetched the extravagant price
of $102 s .5 d$. ; more than double the price obtained by the early seller
Why should this be? Why should the man who desires to sell early be obliged to sell at a loss? Why is the needy or the early bird compelled to lose? Simply and solely, for want of knowledge for want of knowledge that might be obtained early as easily as late, by the mere evolution of existing facts, facts that have existed from the moment the harvest of the year was gathered in, and even before, and only needed the collection.
But is it credible that the objectors, if such are to be found among the smaller these facts of land? Of all the individuals in the community of this country there are none who are like them so deeply, in the most simply pecuniary shape into which an argument or motive could be coined, interested in the earliest possible information of the grain-produce of the year. Let them only look, for themselves, at the returns of the months of highest and lowest price for the last fifteen years: no mirror could reflect the face of vanity or folly with more cruel fidelity, than they will see there set down their annual loss, twice out of thrice, so far as they may be confessed as early sellers. "I'll tell what crops I grow," said somebody, quoted by somebody else, at the meeting of the Tring Agricultural Society, "if the Grocer will tell how much Tea and Sugar he buys and sells, the Draper how much broad-cloth he measures, and so on." Passing by the false comparison between the grower and the retailer of an article, is it possible that the utterer, or the indorser, of this sentiment was ignorant of the fact that every 1 lb . of Tea, every cwt. of Sugar has twice gone through accurate statistical measurement, once for export daty in the country of its growth, and again on entry through the British Customhouse? As for the broadcloth argument, is not every parcel of wool of foreign growth measured for duty as it comes into this country; and, for the home-grown remainder, is it not one of the items of the very problem it is desired to solve? Would intelligence have used, or quoted, such an argument as this ? Yet it seems to have remained unanswered; and men rode home from the meeting, perhaps, with an objection suggested, or a prejudice confirmed, by an argoment which only stated traly blows up the very position it was used to fortify.
Statistices instead of being wondered st and crossquestioned as an intrusion from without, should be a spontaneous growth springing from the very root and life sap of a thriving and well-regulated business. They belong to the Civilisation of Industry. into the Future. They are the 'Governor' which the Engine should itself set in motion, to regulate itself withal. They set a man thinking a little of the relation he bears to the great world around him, at home and abroad, instead of having his eyes centred only on hiraself; and all that he grows, or does, he sees with a new and enlightened eye and with his feelings, as well as his knowledge expanded, when he is able to study the great commercial facts of the business he is taking part in, drawn from the broad area of district compared with district, country with country, and nation with nation. The petty and almost childish selfishness that cannot look beyond the home-stead-interest of its own acres, is a condition of mind which even while it exists, is gone hy: for there are things in which men outlive for a while the grown up facts of their own age, and cease to be its cotemporaries. But it lasts not long, and it is an useless straggle while it does last.
The change that has come over the agriculture of this country, in regand to its commercial relations, during the last seven years is unequalled by any former development that this branch of industry has ever before known in any country. It is no longer a home busimess; it is a great commercial concern between this and the other nations, towards whom we stand in the relation of purchasers. Not to know our own produce is to be ignorant of the first requisite towards knowledge of the market in which we buy and sell. The present move for 'Agricultural Statistics' is one of those great involunfary orbitlike movements, in which Society is borne along by the unconscious, and therefore the more safe and irresistible gravitation of its instinctive wants.
Far from thinking that the agriculturist has any thing to fear in this matter, we see in it a most important field, for him, of trade-knowledge, belonging to his most special interest and calculations. But there is more than that. There is more than words can very shortly describe of civilising, and mindenlarging, and refining influence, in the study that once draws a man out, and makes him look abroad:

Wisdom is justified of her children: it will grow in time into its moral as well as natural proportions it will outstrip that local isolation of mere' acreage' that hides a man, not more from others than from himself; and may its manhood be all that our ambi tion foreshadows for the wealth, the enlightenment and the advancement of the English Farmer

We give below the measurements, and estimated and actual weights of some of the cattle shown las month at Baker Street and Bingley Hall respectively It will be seen that on the whole the measurements were a trustworthy guide to weight. The cattle gauge made by Mr. Tree, of Charlotte Street, Blackfriars Road, on the plan furnished by Mr. Ewart, of Newcastle-on-Tyne, is superior to the old cattle gauge by CAREY in having several readings, any of which may be chosen, so that the result is to some extent dependent on the judgment of the observer, and not merely the necessary result of a rigid calculation. The same length and girth will yield less beef in the case of a Holstein ox than in the case of a shorthorn, Hereford, or Devon; it will
yield less beef in the case of a half fat large-framed ox than in that of an extra fat beast originally of smaller frame-it will yield more in the case bull beef than in that of oxen or of heifers. It is plain, therefore, that several index points should be available, any one of which shall indicate the result upon the scale, and any one of which may be selected according as the ox is "half," or "moderately," "prime," or "extra " fat, and also

In the guage animal in question is were fewer than nine different indications to every pait of measurements. A beast girthing 8 feet, and 5 feet long, 'may be 6

## stones, according to its breed, its fatness, and its

 sex. An extra fat short-horn bull, which should have these measurements, would weigh, if slaughtered, probably near 100 stones; a half fat Holstein ox, if so large, would not weigh so much as 70 .There is all this variation in the weights of animals of equal bolk. This, however, is not fatal to the use of measurement as a guide to
weight. It is only fatal to the use of any one rigid uniform rule on the subject. If you combine, as Mr. Ewart does, in the gauge you can get generally a very fair result. And those who by long practice have acquired the art of judging weight by sight should not look contemptuously upon the use of aids of this description. It used to be thought an answer to the advocates of wheels for ploughs that they were useful merely for unskilful ploughmen ; their being useful at all has insured the gradual displacement of the ploughs without them. And so these cattle gauges being useful in the absence of extraordinary skill, will become generally and, we have no doubt, usefully employed.

The following tables indicate the measurements and weights of a few of the cattle shown last
month. If we should receive reports of any others whose measurements we took they shall be given next week.

## THE DISCUSSION ON LAND DRAINING

Bifore the Society of Arts, Decimbeb 12.
Will you kindly indulge me with space in the Agri cultural Gazette to make a few statements in reference to the discussion on draining at the meeting of the Society of Arts on Wednesday, Dec. 12, which arose
on the reading of Mr. Bailey Denton's paper.
Mr. Baker stated that great difference of opinion exists amongst draining engineers, and many persons present may have concluded from what was said by Lord Berners, by the Rev. Mr. Clutterbuck, Mr. Trimmer, and Mr. Mechi, that this is actually the case ; whereas, I believe that all the most thinking and most experienced men agree very neariy, both in their theory and in their practice.
I do not believe that any of them recommend a uniform depth of drain, as one speaker inferred; but, as it is desirable to obtain a deep bed of dry soil for the operations of the cultivator, looking to this fact and to the cost, they have adopted 4 feet as a good depth in operating upon an indefinite depth of wet tenacious soil, having neither above it, nor below it, a bed of porous gravel or drift, nor a stratum or pan of nonabsorbent material by which the water is upheld. have found a depth of 4 feet, under such circumstances, answer all my expectations, with a distance between the drains of 30 feet or 33 feet. But I am strongly impressed with the belief that a distance of 40 feet apart, on some of the diluvial soils of Hertfordshire, Bedfordshire, and Northamptonshire, and which I have observed part with their water very readily, would in the end answer the purpose as fully as 30 feet, and I should be glad to elicit through your pages, from practical men, their experience on this point, as I had no opportunity
of alludiog to it on Wednesday ni of alluding to it on Wednesday night.
It may also have been inferred that draining engineers are in the habit of working without properly investigating the strat fication of the soil, but this surely
is not the case, and I do not suppose that any one would attempt to drain the cup (actually a land spring) described by Lord Berners, otherwise than by tapping it with a drain in the bottom, as prescriben by his lordship. Again, with regard to the sketch and section produced by the Rev. J. Clutterbuck, and explained by him in his usual lucid and earnest manner, illustrating the section of a porous bed of Oxford drift, overlying an impervious and undulating stratum, the operation would really consist of draining one or more land springs, and I think most men would adopt a similar remedy.
Nor is the plan pursued by Lord Berners and desig. nated the Keythorpe system, I think at variance with ordinary practice. His lordship has accomplished his object in the most effective manner and with a very small outlay, and therefore it demands our serious consideration, although it can obviously only be adopted in very rare instances ; and I regret much that I was not able to satisfy myself, by inquiry of his lordship, hat I rightly understood what he wished to convey.
It was carried out, as I understond, upon a soil having a superstratum of clay, said to be impervious (specimens of which were produced), varying in depth from 1 foot 6 inches to 5 feet, having beneath it ${ }^{2}$ porous stratum or bed, charged with water, in which the drains were laid. The water was discovered by means of trial holes, and the drains were extended towards them, until they acted upon the trial holes, and carried off tho water contained in them.

Now I submit that the water taken off hy the drains is that supplied by the water-bearing vein of shingle or gravel beneath the clay. How then comes it that the clay is so efficiently drained, when all previous attempts to drain it, by laying drains in it in the ordinary mode, at a less depth, as I understood, had failed ? been supposed ; and is it that it has been kept wet by descent of the zain water in wet seasons? But then
how is this reservoir itself supplied? Surely by per-
colation through the superincumbent (impervious) colation through the superincumbent (impervious)
clay. If such is the state of the case, then the most effective and the most scientific means have
been resorted to to obtain the desired end, and we all been resorted to to obtain the desired end, and we all
owe our thanks to Lord Berners and to Mr. Trimmer for so forcily uirecting our attention to the biacon of
science which should ever be present to the mind. But then it must be conceded that the clay could have been drained, though at a greater cost, in the ordinary way by parallel drains placed in it. If it parts with its ex
cess of moisture to a natural drain lying beneath it, so it would do so, though in a less degree, to an artificial drain placed drain, and common sense said, "Let it do its work and
we will make it subservient to our purpose." [The Key thorpe system makes use of the varying depths at which a substratum of clay exist
pervious soil overlying it.]

In this case I again submit that there is nothing a variance with the practice of draining engineers. An error might have been commited for want of care or fo
want of geological bnowledge, but whoever set abou draining the soil in question would have dealt with the porous vein, the natural drain or spring beneath the clay, if he had been aware of its existence, and not
with the ciay itself; feeling satisfied that the clay was not so impervious, but that it would part with its superfuous moisture to the absorbent bed below.
Therefore great thanks are due to the scientific gentlemen Who have with so much pains illustrated this operation and refreshed the memory of all, but there is, I think, no new system discovered.

I submit that the clay could bave been drained in the ordinary mode notwithstanding the failures that have taken place. Let us suppose a similar soil with a depth
of 30 feet instead of 5 feet. I think the draining engineer could successfully administer the ordinary cure ; but as he would not be assisted by the nat
drain he would have to make a far

The trial pits, which constitute an important f in Lord Berners' proctedings, could not be used in the same manner in drainng ordinary clays and stiff soils, You might lay some drains within a foot of them in the wet season and they would for a long time stand charged with water, in defiance of the drains, and yet the drains might be well and effectively laid. Two statements were made that I think call for special notice as worthy
of investigation. First, that of Mr. Denton, to the effect that coloured water, that is, I understand, water coloured with the soil on which it has fallen, issues from shallow drains. I am inclined to believe that in ordinary close soils 2 feet or even 1 foot 6 inches of mechanical medium willies at least. But the second atate ment I would notice, and which renders further com ment upon the first superfluous, is that of Mr. Mechi to this effect, that the sewage water which he throw over his land at Tiptree, flows out of the outfall of his drains (laid I understand 4 feet and 5 feet deep), and
into the ditches, still charged with its colouring matter.
This is so adverse to all our accepted theories that every one who understood Mr. Mechi as I did mus have been startled by the assertion. If filtration through a solid bed of earth 4 feet and 5 feet in thickness does not effectively deprive water of all its mechanical impurities, then we mnst cease to believe that in 4 feet we have discovered the depth at which water may be economically removed from the soil, after having enriched it with its ammonia and some other valuable matter which it held in chemical combination. The question also arises how far Mr. Mechi's irrigation under such circumstances is
solutely injurious.
Of course occasionally, with an unusually rapid flow, the water might become discoloured by the silt or othe sedimentary matter deposited in the drains; bat 1
understood Mr. Mechi to imply, that the water was coloured with the colouring matter derived from his tank.
If the discussion is continued at the Society of Arts, - hope these points may be alluded to; if not, I hope dation. Chas. F. Humbert, Watford, Herts

Humbert, Watford, He

## AGRICULTURAL CONSTANTS.

In this age of scientific agrienlture farmers are in old practice, while by reason of a deficient chemical education, all may not be able to judge fairly of the

For the assistance of such would be well that cer which may be called "Agricultural Constants," and these were discussed in your valuable columns, and a $d$ definite conclusion arrived at, it would be of great ser3 vice to practical farmers.
be discussed and settled

Can farm-yard dung be entirely and efficiently replaced by artificial manures ? and at what cost? Or in for dung on the land to equalise it with. guano at $13 l$. per ton and superphosphate at $8 l$ ? Would a mixture of guano and superphosphate entirely replace farm-yard
dung? If not, what are the deficiencies ! How are dang! If not, what are the deficiencie
these to be obtained ?-and at what cost ?
has made an erroneous calculation of the comparative values of bones and dung. He there states that

## 

He then proceeds to add all these separate benefits bone dust is equal to 20 tons of farm yard dung.
Now is not this an error? for according to Dr. Madden's on

## In organic matter there must be soluble matter 30 tons of bone. soluble matter easily azote dissolved do azine matter sarinthy phosphate

How then is it possible that 1 ton of boue is of equal agricultural value to 30 tons of dung?-nay, if we take the highest benefit conferred by the bone, it is only have overlooked some essential element in the calcula tion, and if so I trust some one will set me right, for correctness in such statements (which are the "Agricultural Constants" I wish settled) is of the first importance. My object is not to call attention to an errors in the work in question, but to obtain, if possible, on which we can rely. Martyn Roberts.

## YIELD OF THE PAST HARVEST

Catan and LongFord.-Speaking of a wild district of hilly country on the borders of Cavan and Longford,
altogether occupied by the smaller description of armers with scarcely an exception, and containing, may be, about 100 square miles, there are not, I believe, 10 acres of Wheat, no Barley, and little Turnips or other green crop. The Oat crep, which held fair pre ise of being over an average, has disappointed threshed out far beneath their expectations, has certainly not equal to the average yield per acre, to what extent, however, it is not possible to ascertain The crop is not only deficient in yield, but inferior in sample ; that which lodged, which much did on the lower heavier and ranker ground, was, as it ever must be, deficient in yield and bad in quality ; but that which was standing appears also to have suffered from ripening too quickly, and, therefore, not well filling. The Potato crop is very good, and has suffered but little by disease ; this is not only the general opinion, but is evidenced by the market price, as, without any pressure of sale on account of apprehended loss by disease, or article of food is at very high prices, Potatoes are selling at about two-thirds of last year's price, that is or $4 d$. or $4 \frac{1}{4} d$. a stone, a price which they have not been sold at since 1845. The hay crop appears also deficient. J. M. Goodiff, Scrabby
Norfolk.-As to the probable yield of the past har rest, I beg to say it is not in my power to give you any thing like an accurate opinion. As a proof take the following as the result of my inquiries: One large and influential farmer told me that his Wheat was 16 bushels per acre below his usual average; another said that the crop might be put down at 8 bushels less than an average, and a third declared that he had just threshed a 20 -acre field, and it only produced 4 bushels per acre. This district is a sandy loam, and averages about 30 or 32 bushels per acre. Upon the good clay loams along the sea-coast the reports are equally conflicting; we hear of land usually producing 40 of the very choicest land we have in the county, some may say equal to any in England, not yielding more than 20 bushels per acre. Again, we have fields, and I need not go out of my own parish, producing from 40 to 44 bushels per acre. On the whole, I have no doubt there is a deficiency, and taking the quality of the grain into consideration, I am inclined to think it will be fully, if I should imacine in this county we were more affected with blight than other parts of the kingdom. The Barley is not so good a crop, either in quantity or quality, as was expected, and will probably not reach an average. Turnips made considerable improvement after the rains in October, but there is a general complaint of their being consumed too rapidly. Hay is the lightest crop I
ever saw grown in this district, and a fourth of it spoiled ever saw grown in this distri
by the weather. W. Cubitt.
Monmouthshire.-In sending you a report on the appearance of the crops previous to last harvest in the portion of this county included in the division of Uske, which may be called Mid-Monmontbshire, I remarked that though the acreage yield of Wheat would most probably be a little under the average, the deficiency wouldobe quite made up by the greater breadth of land ander that crop. I find my statement to have been pretty correet, the returns from the better class of farms having been a fair average, viz, from 24 to $2 f$ bushels per acre, the quality on the whole good, though a little with the average weight, whilst on the colder farm with one or two exceptions, where for that part of the district I have heard of marvellous crops, with better
scale results the bushel tells a deficiency, the yield
proving from 18 to 20 bushels per acre. Uf Barley deficient in weipht. In Clover and hay, more particu larly, we are better off than in most purts I have been in, but we shall want it all, and it will require the strictest economy in the use both of it and straw to carry us on till there is a bit of Grass again, the
root crops are so lamentably deficient, 10 tons of Swedes per acre being thought well of this year. Mange Wurzel, the growth of which is quite exceptional her - to our shame be it said-is very good. The Whent plant is looking well, and the glorious seed time and the sigh prices have enabled and induced many to put every possible acre under Wheat. Relph, Pentryy.
from what I have been able to fean from ong, an consider the Wheat crop in thi glean from others, consider the weat crop in this immediate neighbour hood to be a little short of an average crop in quantity, but from a considerable portion of the crop being badly blighted, it is from 2 to 8 lbs . per bushel lighter than last year, and from 2 to 4 lbs , lighter than the average of seasons. Barley an average crop in quantity, but a good deal of inferior quality. Thos. Arkell
Berks.-From my own experience (having a steamengine let for hire) upon my own farm, as well as those of others, I am happy to say the yield of Wheat is much better than was ever at one time expected. The heavy Wheat lands are quite an average crop ; the deficiency is on high and thin soils from want of plant. Takin the two together I am of opinion that the Wheat crop o 1855 is not more than 2 bushels per acre short of an average, although 8 bushels short of the crop of 1854 Of Bar ey about an average crop, quality generally bad Oate above an average-4 bushels to the acre. As there are few Beans or Peas grown in my own immediate district 1 am not able to say anything about them. W. Chandler, Aldbourne, Hungerforl.

## Home Correspondence.

Farm Bailiffs, who are they, or whom ought they to be - Will you assist me to gain some information on this gratified on beve I am not alone in the wish to be have seen the question asked before, still I have often heard the subject talked freely upon when I have been in the company of farmers, and sometimes in such a manner as to lead an ignorant person in such matters to suppose that the bailiffs were a class of persons whose services could very well ba dispensed with, for the arguments were not unfrequently closed by general expressions of wonder why gentlemen did not manag their land themselves, I confess I do not exactly take that view of the case, for a person may be fond of keep a groom, and doubtless gentlemen find that this remark applies to farming, as many of our leading agricul turists do keep bailiffs. However, I wish to be understood that the remarks 1 am about to make are abt binded to detract from the value or usefulness of aan , but merely to provoke discussion, and to enable oner readers who, like myself, may not we quite au fait on this subject, to be better informed. As far as I am concerned, I must say that it is the many varieties of the farm managers that has mystified me to a degree therefore I have written in the hope that through some of your able correspondents all may be made clear. I am informed that the greater number are Scotchmen, generally allowed to be well informed upon the northern system of farming ; but often, it is said, knowing very little of the southern practices until they have served an apprenticeship, as one may of tha taken a few peeps over the hedges of the field customs should he happen to have fixed upon a locality a little behind the age as regards agricultural improvements -I mean as to his chances of success in farming, should he have a learner of this description? Another class also said to be numerous appear to be of a higher order than the foregoing, for one hears that they expect to have two or three horses kept for them, and all other things found in the like treble proportion; it is admitte that they can talk like oracles about the herd book, reaping machines, steam-engines, \&c., but it is said that they do everything by deputy except receiving their salary; that they would deem it derogatory to cast their gloves (not mentioning their coat) to touch anything except to place a finger artistically upon a few of thei choicest animals; that they can prove without a doubt that it is good policy to give an unlimited number of guineas for a descendant of Hubback (I am not sure of the name), and that the true method of saving is to curtai the price paid for manual labour, say, for instance 8 s .6 d . instead of 10 s . Is that a consistent argument Others, again, said to be next to those mentioned above as regards number, are, if I may be allowed to use the term in speaking of their occupations, of a hybric nature, that is, they are between the florist and agriculturist. I should be glad to be made aware how those two branches of knowledge combined answer, whether for the benefit of the employer or vice versá, as I am informed that the culture of flowers is usually attended with great expense, even though carried on on a imited scale. A few are said to be farmers who have tried for themselves, and have been unfortunate, or something else ; then it appears they turn their abilities to the management of similar affairs for another, when at the same time they have been unsuccessful in the same object for temselves. The last class L shall touch
upon are the smock frock or working bailifis, Farmers say that they often see land under the management of this class in as creditable a condition in all respects a that overseen by any of the varieties 1 have mentioned, that these men have not the Bame advantages of ecuca brethren, as I am told fraternity does not exist among the classes as a body. Now if the latter are competent to fulfil such duties, which of all I have mentioned is the right man for the right place
Hedge Cutting Machine.-
t page 780 of Agricultural Gazette attention is called in a long detailed article to the great importance of a hedge dressing or cutting machine. Having performed a good deal of that work pressly for that purpose" to be used by hand, I have often thought of a machine for that purpose. Such an one as W. Wooler describes I would disapprove of, and to travel on both sides of the hedge, as cross fences would be a great obstacle in the way, I should rather adopt the frame to be built upon four pillars tied with cross bars, above and below, and the two knives projecting out upon the spindle, all in one piece upon the end of the spindle at an angle of about $75^{\circ}$ or so, or
whatever slope should be most approved of for keeping whatever slope should be most approved of for keeping
hedges in the wedge shape. The pillars of the machine hedges in the wedge shape. The pillars of the machine
would answer the desired purpose best to be cast metal in fact, it should be all metal or malleable iron. The spindle and two revolving knives resting on top of frame-work ought to be good and well secured; the instead of having them concave "the knives" should rather, if anything, be convex, as they would clear themselves ; but if they were concave, as described by W. Wooler, they would drag the power very much, as I always found in dressing hedges the work was easie performed with a straight implement instead of any hook or concave being in the blade. My impression is, that being all metal it will stand more secure to its or power at which the upper spindle would re quire to be driven at to make clean work The motion at which the knives should revolve may be fairly set down at 300 revolutions per minute this would require to be brought up from the one or other of the two axles on which the frame would ravel. The greater the velocity the less power remark that if such a machine should come to be constructed all hedge sides would require to be landed in gradual rises and falls, as the hedge would allow, for the least sudden rise or fall in the machine would canse a sudden concave or convex in travelling over the different lines of fences; and applying to that I scarcely think on such are so very irregular fitable machine. The expense of such work is not very great on arable land, where the fields are of ordinary ize from 16 to 20 acres in each, which is chiefly enclose with Whitethorn. It will run nearly to $1 l$. to each pair of horses kept on the farm for dressing hedges, "I mean to be dressed annually $4 \frac{1}{2}$ feet high." If hedges are not attended to annually they are a very bad fence and costiy, which is too often the case by a majority of the gricultural class of gentlemen. or they contract on railways at $1 l$. per mile of 1760 lineal yards, ery imperfect manner ; I myself have had to den in very imperfect manner; I myself have had to do then over again after being done by other parties. But they can be got at $4 \frac{1}{2}$ feet high, a close healthy fence a the above figure, in the wedge shape, is about the mark,
and the charge I use to make for such. W. G. Abernethy
o account for the fact of drains which had run dry dis charging water just previous to a fall of rain, I beg to ive you my "reason why," and whether right or wron may be of use in ventilating the subject. The weight and consequent pressure of the atmosphere being greate in a state of dryness than in water in the soil below the drains being subjected to that pressure, it is kept lower in the soil in ary weathe than just before rain; and as the quicksilver in the tube of a barometer falls just before rail, owing to the lessened atmospheric pressure, so will the water in the soil and below dhe drains rise and flow in them for the same reason, viz, a partial relief from atmospheric pressure. Robet Mein.
Andury-Owing to the interest I take in the 20 years one amonr the having been for more tha disease, perhaps, in this country) I wrote some time back to Professor Buckman to inquire after the appear ance of the promised report of his experiments on the subject. And I write now because in his report mis akes have been made which appear in the Agricultural Gazette of the 8th Dee. One of these is of no momen whatever, and consists merely in the mistake of $m y$ name (owing very naturally perhaps to Mr. B, being in communication at one and the same time, and on the same subject, with Mr. Campbell, of Craigie) ; the other, however, is of importance, as having reference to the question in hand. I sent Mr. Buckman a box of diseased Green-top Yellow Turnip, but no Swedes; and had 25 years these affected by anbury. For more tham the farm I hold: has seldom suffered to a less extent than 20 acres of loss, often to a greater, out of 100 acres of Turnip crop. In all that time the loss from disease Swedes can hardly, I shoold thinls, hasve excoeded an
land having always been allotted to the Swedes, and to their having been treated to both farm-yard dung and artificial manures, while the other 'Turnips have only had the latter, and been planted on land offering the most favourable habitat for insects ; this, in my case has been where the old red sanóstone is very near the surface, and where it is perfectly dry by nature. I hav al! along attributed the malady to the operation insects, but such is not yet generally the opinion neighbouring farmers, nor even of my own bailiff, who has been with me for 30 years. What I have observe而 have found a small hairy red wire-worm, eating round the cuticle or bark of the rootlet, thus, in my idea ceasioning a revulsion or extravasation of the sap ending in the formation of tubercles; but I have neve succeeded in finding the appearances you describe at tha season when they might be expected to be found wer period, viz., when I sent the subjects of Mr. Buckman's xamination ; but then I ascribed this to their bein rather the effect, and a very natural
reviously long established affection. I agree with you, here is much to learn on the subject, and the investiga tion is all the more important and pressing, that 1 fear have already made a considerable step, for which $I$ feel thankful-inquiry and improvement will now be better directed. Besides the proper anbury produce, I have always noticed the presence-in a much minor degree however-of a grub of different habits. This cuts of 6 inches high. The Turnip crop of 1852 was almos totally destroyed in this neighbourhood by this insect on farms where anbury was never yet known and to an extent never attained by the anbury have tried almost all the remedial measures
suggested in print, and have found none of any avail, but alternating with Potato and other green crops in th rotation, and this is effectual, and having now adopted it for the last 10 years my losses have been comparatively trifing. Liberal manuring is also a good remedy this, when assisted by high heart in the land and by avourable weather, I have often seen carry through a field (in which scarce a plant was unattacked by anbury) to a heavy crop, the ground at topping and railing time being covered with the unsightly "knobs" and other products of the disease. W.
Broven Bread. - In answer to a corresponden J. T. B.," Agricultural Gazette, concerning brown bread, I would recommend the following recipe, which answers perfectly with us :-Mix $\frac{1}{2} \mathrm{lb}$. of coarse pollard and $\frac{1}{8}$ oz. of salt, with 24 oz . by measure of cold water

4 lbs of flour, 2 drachms of fresh German yeast (or
 in the flour right temperature). When this has rise by measure of boiling water. Mix the whole together and knead it in the usual way. The smaller the quanfity of yeast used the more wholesome and sweete will be the bread. White bread would require 40 oz ' J. T. B, and of course no pollard. B. P. R.-_A bread, all she has to remember relative to brown bread is that as it ferments easily it does not require so much yeast as white bread dough, and the flour of which it is made, or meal as it is usually called (being the Whea he brownest bread, or the coarser parts of the flour fo the lighter coloured brown bread, absorbs more moisprovan the white loaf flour. Rye-flour is a great ino" J. T. B.," and any other of your subscribers to make bread according to what is called the Rev. Mr. Hagget's plan, as follows:-"Only the coarse fiake bran is to be in rather more than 4 gallons of water ; so that when perfectly smooth you may have $3 \frac{3}{3}$ galions of clear bran water. With this knead 56 lbs of flour, adding salt and yeast in the same way and proportions as for other bread. When ready to bake divide it into loaves, an bake them $2 \frac{1}{2}$ hours. Flour will imbibe 3 quarts more of bran water than of plain, so that it does not produce more nutritious food, but makes an increase of one fifth of the usual quantity of bread. The same quantit of flour which, kneaded with water, will produce 69 lbs . 8 oz . with bran water, produces 83 lbs .8 oz ., a gain 4 lbs. When 10 days old, if put into the oven for 20 minutes, this bread Will appear quite new
Abridged from Mrs. Rundell's Domestic Cookery.
Royal Agricultural Society.-I beg to be allowed to sug gest that the Royal Agricuitural Society ought really no to publish a complete classified Index to the volumes of their Journal. The work is becoming valueless for want o
it. The Royal Geographical Society liave published about the same number General Index. A Member. [A General Index for the first eight volumes was printed with Vol. IX. Now that the number of volumes have doubled, an Index for the whol series is much wanted.]

## Sorietios.

Society or Arts.-An extraordinary meeting was held on Friday evening of last week, for the purpose of
resuming the diaccussion upon Mr. Bailey Denton" Simmonds occupied the chair. The proceedings com menced by the Secretary reading communications which he had received from Messrs. Arkell, Bazalgette, Beattie,
Blamire, and Girdwood. Mr. Arkell in his communi cation referred to two errors, as he considered them which had crept into recent practice, viz., the use of the mall pipe tiles at present made, and the putting paralle drains at equal distances apart, regardless of the existing fully ye furrow. Mr. Bazalgette's letter deve.oped more pinion, was still needed in order to the full elucidation of correct theory and practice in draining land. To this we shail hereafter return. Mr. Girdwood contended hat, in order to the more perfect discussion of the sub ect, certain points, as Mr. Bazalgette had indicated, of Aberdeen, related his experience in confirmation Mr. Denton's advocacy of deep draining. "At first," he says,
"Drain
Drainage was begun here at shallow depths, but in course of
two years it was gradually carried deeper, until 4 feet was gene
rall adopted at
aisinces apart of the eing the greatest distarce that I countenanced. I mar mention
that the sum expended under mv directions, arising from loanns
rom four different deseriptions of subsoil. A Areat part is dificicult to nard grom the number of stones and lare bet The expense, therefore, is much beyond the

perienced drainers. I have discontinued trenci ploughing im
nedintel
raty raised subsides in dry periods and expands during wet sam
sons, so that an action takes place naturally suficiently strong met with in this district. This is more apparent where the
met
drain drains have been deep and not far apart. I have recommended
old Grass land that had become in its wet state tough in the
surface, to be left hat least to e ears unbroken up after being drained. The Grass improves in quality, and the land, when is also very, great, particularly when it comes to be prepared fo
Turnips. The green surface is replaced on the drxins and rolle down liat. Before adopting 4 feet deep draine, I had much diffi-
culty in dealing with the iron ore which generally appeared at
2 or 3 feee from the surface, but by the extra depth the water at a greater depth, but the floating substance is then in moss had near the surfac
. Mr. T. Scott stated his experience as a land-drainer "In 1838, he served his apprenticeship to land draining on the the two follow ing years superintended the execution of 140 mile
of drainage, executed on the principle recommended and the of drainage, executed on the principle recommended and then 21 -inch tiles and soles, or 12 inches of stone broken to pac
through a 24 -inch ring. The effect of this drainage was wonder
ful and repaying at the time, but when he wrote to Mr. Dudgeo
in 1850 , just 10 years afterwards, to know the result, he learne
in 1850 , just 10 years afterwards, to know the result, he learned
that he had terminated his old leases several years before thy
stipulated time, that he might have the inducement, which the

##  <br> pirm whose farms the drainage

Mr. Bullock Webster's address contended for the sufficiency and efficiency of shallower drains than prerious speakers had advocated:-
"He did not, however, differ in opinion materially as to th
advantages of a uniform depth of 4 feet in strong clay subsoils mo surcharged with under water. The rexult of practices of the lasi
ten years had shown that the principle of paralle equi-distan
nniformity is anplicable only whece the ere paist of soil, and uniform inclination of surface; that it requires modi
ficatio fication directly the soil raries, and the surface becomes irregular
and that the desire for uniformity had led to a waste of mone and imperfect work. He contended that soils resting on retentive
clay subsnils not surcharced with tuder water (he was not speak ing of subsoils with veins of gravel and saud containing water
should be drained not less than 3 feet deep, hut that the depth mus be regulated his opinion was checked by the retentive nature of the subsoil, for
the water does not get into the subsoils require drainage, nocause because the subsoil is the soil we can, and then get rid of it. Effectual water through al
left no we the agricultural implements; roots of plants would as freely go
into a for-feet drain as a thre-feet one, if they had a tendenc
to stop up a drain. As to water runing uch iess depth of snils a hove the drains would extract all valual matter from rain-water or mauure. He thought it would be foun
that the temperature would be quite as high on these land
drained three feet as four feet. Ife objected to the four-fee yains on these retentive clay subsoils, because you could not ge ge further apart, as Mr. Denton admitted-because th extra foot after three feet often costs nearly as much as the firs
three-because of the expenses of the outfalls in many cases and the subsequent annual expense of keeping these outlets open
Let the roots of the crops be kept within the influence of the sun in eighteen inches of well manured snil, and he thought it woul them into four feet of clay subsoil, if you could do so. Wit
regard to the deep drainage on the clay at the Duke Wellington's estate, at Strainage on the clay at the Duke o
some years since. IIe could showe, it was tried and given an
sood whate in that neighbour. drains closer together and not so deep had since been put in. W their character by the action of four-feet drainage: now he ha frequently seen strong clays exposed a whole summer to the sur
and rain in a brick-yard year after year and yet they remaine
much the same water, and admitting air, but beyond the depth to whicl
it was moved, the dense clay subsoil. He felt condident that many estate
in this country would not cost half the money to in this country would not cost half the money to drain if all the the reper lands laid dry, and then left for a year or two befor

Mr. Hewitt Davies said :-
"My experience in draining has so decidedly been in favour What is termed deep draining, that I have long ceased to drain
shallower in any soils than 4 feet, whenever a fall of this depth could be gained, and I give 4 feet, whenever a fall of thinimum deptl am convinced occasionally there are soils and conditions when i is advisable to go much deeper. The wetness of the surface of regards depth and distance ticularly what are called strong, are made wet by the surface
water sinking only a short distance, and accumulating in the ores and fissures of the subsoil nntill it reaches the surface, and operate, and I give 4 feet as the minimum depth of the drains in
these soils because I have always found that the cracks and
fissures formed by the dronght and changes of temperatue fissures formed by the dronght and changes of temperature on
the strongest clay, and which make these soils permeable, extend below this depth, and the water from the surface may be made to
reach the drains at this distance, and I do not advise going deeper, when the object is merely to take off the surface water,
because the difficuliy and expense then too rapidly advances of admit of doing so with advantage. As these descriptions of soils
are made wet by water that soaks perpendicularly, and rests in the soil, and call for draining solely to rid them of water that
reaches them from the surface, they are only to be laid dry by parallel drains, down the fall, at widths regulated by the depth for the water to draw into the drains. The other description of draining solely applies to land that is made wet by land springy,
or water which reaches it from a distance, as well as from its own surface, and is brought to the surface by the cropping out of the lapd that Ell ington's system of draining by spring tapping was
applied with so much success a hundred years an as to a parliamentary grant of 5000 z . He found that by cutting up the
hill and across the clay into the waterg be
 it and oozing on to its wurface made wet by water brought to came to the surface. Had I heard Lord Berners' description o his soil and its watery fissures, previous to Mr. Trimmer's account
of it, I should have understood that he had dealt with land springs
or water bronght from a or water brought from a distance, and that he had succeeded in lay-
ing it dry upon Elkington's system of cutting through the side of
the strata that basing the strata that basined it in, but this system of draining can be
applied only to particular soils and circumstances, and the greater advantages from parallel draining are found to and the
narrow the fill more Webster's remarks with reference to 4 feet and shallower draing and in objection to the rule that 'depth should govern the
distance between the drains, or in other words, that 'increasing the depth in clay to 4 feet extends the words, that increasing drains draw, I emplified the effect of depthin; and Lord Lonsdale has well he early learnt the greater benefit of depth in his experience in the road sides gave in laying the ground between the drains find that the deeper the drains in all soils the wider they the drains drew further and laid the land drier, by going deeper Mr. Denton and the chairman gave concluding addresses on the subject. To them and to the speeches of pther gentlemen who addressed the meeting, we must tefer next week.

Farmers' Clubs.
Biggar: The Turnip Crop. -The competition for the argest crop of Turnips on 5 acres, from one field, took
place lately. Each field was minutely examined, and
an average portion selected and measured; the Turnips of William Gibson, to whom they awarded the prize thereon being topped, tailed, and weighed, the the Turnips $\mid$ of the silver cup prosented to the club by William the largest crop on the farm of Overburns, tenanted hy $\left\lvert\, \begin{aligned} & \text { Alsert }\end{aligned}\right.$

Melisham.-Cottuges and Hoors' rutes.-At the lace|present law of settlement, even after all he relaxations agricultural meeting here the following remarks on this that have been made in it. But this law of gettlement
subject were made by the Rev. J. Wilkinson :-One is not only a great hardship to the propries avourite topic with my brother clergymen of late ione want of coltage accommodation for the poor ; and, taking that as their text, they take the opportunity thus afforded them of reading the landowners a lecture as to their duty in this matter. I shall not imitate their example, both because I consider such advice to be much misplaced and to take a very short-sighted view of the subject, and because I believe the landowners want no advice from me to tell them that "Property Grittleton cottages with one or two roms down stairs bed rooms upstairs, a good supply of water, and a piece of garden ground, all of which is rented for about 1 s . week. The way in which Mr. Neeld has provided cottage accommodation for the poor on his estates will make his name to be long remembered; and he will sleep all the better in that palace he is raising for himself at Grittleton, for the way in which he is enabling the poor men to sleep in their cottages around him. I to find fault with any landlord for not providing cottages; for in proportion as he does so he will increase the rates and decrease his rent. It is unreasonable to expect that of any man. The guardians of Broughton Gifford were some time ago surprised to eceive a notice of the removal of a widow and her four children, of whom they had never before heard any thing, to that parish for support. Upon inquiry we found that the grandmother of the woman had been born at Broughton Gifford about 70 years before, and had been taken from the place soon afterwards by her rather. But that fact was against us rather than in our lavour, for birth in a parish is a prima facie settlementuntil some other and better settlement be set up. So that we were afraid, we should be sadded in perpetuctm with the support of this widow and her four children. But we found out that her grandmother's father had been acknow ledged as a parishioner of Lacock some 100 years ago, and inasmuch as this was the case, the great grandchil dren followed the settlement of their great grandfather and consequently we were relieved by the fact of some benevolent landlord having built a cottage in Lacock, in which this man raised and gained a settlement not only for himself but for his descendants a hundred years after im . This is an illustration of the working of the is not only a great hardship to the proprietors, but to the labouring man himself. It has been said that labouring man has his capital as well as others-and that capital is his ability and willingness to labour. And he ought to be as free to invest that where he choosas as any other man; but he is not free, for he is deterred by the apprehension that if he migrate he shall be torn from his old acquaintances and be transplanted to another place with which be has nothing more than a egal connection. We talk of freedom, but a man is not free unless he is at liberty to work where he pleases, Neither with regard to the employer is this law a fair one, for the employer is a rate-payer, and he knows he must provide relief for those who require it, either in or out of the house ; and the consequence is that he has only a choice of difficulties left him-either to employ labourers he does not want, or support them in the poorhouse; and therefore it is that a labouring man whatever his inferiority as a labourer, yet if he has large family, and is likely, with them, to become a bur den to the parish, is almost sure to get employment, though his work may be unremunerative to his est of the whole agricultural community-in the interest of the landlord, the employer and the labouring poor-some alteration in the law of settlement is exceedingly desi rable. What that change may be it is not for me to say but I trust the importance of the subject may be some sort of an excuse for having made these remarks; an I venture to hope that in the next session of Parliament
(notwithstanding the war, which almost entirely notwithstanding the war, which almost entirely decision on the settlement question, and at last see the end of that law which for 200 years has been one of the most despotic, searching, and stringent enactments which ever fettered the free action, and injariously affected the domestic condition and industrial habits e any people whatever.

## Miscellaneous.

Computation of Inechausted Improvements:-The fol lowing schedule is proposed by Mr. Humberton, of Chester, as proper for adoption in leases of land for agricultural purposes. Report of Discussion-Couran office, Chester.

## Calendar of Operations.

DECEMBER AND JANUARY.
Wegtrr Ross, Dec.-For this lest month we have had more than an ordinary supply of sterling winter weather. Ahout three weoke ago a severe frost set in, and a few days thereafter wo bad a snowfall so abundant that the mail coach stuck fast in a wreath, and for some days our letters were late by several hours. The
thaw was sudden, and so speedily did the sno dissolve, that, on the west coast, where the hillis are precipitous, the water came
down in torrento, carrying away bridges, and casing much
damage. On one property some 2001 or 300 , will have to be expended ere matters be in the same state as they were previously. The fall of rain since harvest has been mach under an been again, for a week, sealed up with an intense frost, so that our farmers have been sadly complaining of want of water to thresh out the grain. To-day, however, we have a change. It is now fresh and showery. The soil has been since harvest in a
particularly good working state; nerer was our Wheat laid down particulariy good working state; never was our Wheat laid down

Wai labour generally that we were well prepared for the severe
weather with which we have been so early overtaken. Even
no n)w the

## smapll a

 from all quarters for Potatoes and Turnips, and that farmer may dunghills sufd richfor the coming Whent crop. Farmers are now busy shippin
Potatoes, which fetch from $3^{7}$. to 37 . Fs. per ton. The diseant which appeared this suasnin in a mituated form hase need, hai been emphatically reminded that "there is much between the han was calc sustained therehs. When the disease is making way in the pit there is great diffi, ulty in getting the Potatoes into a right mar-
ketable gtate, and in the delivery of them more disputings arise than about all the other commodities of the farm.
Wear Suseex, Jan. 1. This is a time when there is little to report, all in the fields is quiet, and labour is confined to barn
work, road making, and providing for cattle, shepp, \&c. Lambing is begum, and has hitherto been fortunate. Wheat is nearly all ut, and dune gond in upening the land about the young plant, for some was put in with the land in bad order, but that is now all right, Respecting the yield of the Wheat crop in this
neighbourhood, the general account is that it is from two to three sacke heard some say be said to be mur expect to have, st that upon the whole it cannot per aore; but the land here is well adapted for Wheat, and does not suffer so much in a bad seasonn as. it will in many places
We hear often of 11,12 , and even 16 sacks grown on the acr -a crop that in some districts can only be believed to exist in and there were some very fine ronts shown, especially Mangels and Carrots, for which the locality is well suited. G.S

## Notices to Correspondents.

 Adpeesses: Correspondents: The patent corn mill is by Messrs, Samuel and Charles Adams, Oldbury, near Birmingham; theTurnip grater by Mr. Froderick Phillips, The Hall Farm, near Brandon, Suffolk.
Books oa Disease of Catrie: Chithero. Mr. Spooner's papers
in the ${ }^{4}$ Cyclopedia of Agriculture" are condensed in the in the "Cyclopsedia of Agriculture" are condensed in the Botming Beer: W P. You had better delay bottling till March Beer brewed in October is generally bottled off the following Mareh if bright, but if not it should stand over till the follow Ing October. There is an old saying that English wines should be bottled when the trees are in blossom from whose fruit the
wine was made; for jostance, Gooseberry wine in the following Apine was made; for instance, Groseberry wine in the following
ConprosT: Standifh. Caustic lime will take any acid from an ammoniscal salt, and the ammonia disunited will assume its
own proper form as a vapour liable to absorption by water, and by rarious porms materials. An old compost of earth and
lime dies not however necessarily contain caustic lime, and ruine does not necessarily contain any ammonis or ammoniaca salt. The two may, under certain circumbtances, be added together therefire without harm. Fresh urine may be added to an old heap of lime and earth without water, and even n? urine, which does contain ammonic, would probsbly not suffer motate, and the earthy matter to which it would be maded would in some measure retain it.
-Gomse: $G R$. We give the remarks of the Rev. W. D. Fox of Delamere, Cheehire, on this subject.
conamonly sold in the seedsmen" shopss is the only kind of
some will sell it as "French Gorse," but I do not think it is the least different. Decidedly sow where it is to remain; but it would also be a very good plan to have a quantity sown
in boxes-old Orange boxes answer very well, and can be go in boxes-old Orange boxes answer very well, and can be go If your ground is very foul, I would altogether sow in beds an transplant in September, and you can clean the land, but, o course, it is much more expensive, and if the land is clean it will grow much better sown where it is to remain. It is more readily sown by forming the land into drills, but the less they not necessary. If the drills are 2 feet apart' a horse hoe caa be freely used for cleansing between rows.
Jrevanien Artichokes: $W P$. They may be planted in April in rews about 2 feet apart, and 6 inches apart in the rows.
Manx: A Subscriber. The word refors to many different things, the early volumes of the Agricultural Gaxette. Its efficiency depends often on phosphates present in them in small quantities
rather than on the lime or other more abundant earth that they contain. A heavy dressing of marl is often sufficient for many useless. The gradual descent of any dresoing, as of ashes, marl, \&ce., is owing to the worm casts being taken from below them continually. Mr. Darwin's explanations of this was given some years ago in the Transuctions, we think, of the Geological Society.
Peo Drux Threshing Machine: J T B. Will you excuse the Porctay: WR C. For eggs we recommend Cochins, as they are more to be relied upon during cold weather than any other variety. The Hambro's, though good layers, are not so hardy, but if appearance be consulted as well as useful qualities, they be sarpassed; about five hens are allowed to one cock. Three ducks and one drake of the Aylesbury breed will give satisfaction. Examine the advertising columns, and if convenient, commence at once. Good Dorkings ought to be purchased at
10s. each; Hambro's at 7 s. 64 . and Cochins at $5 s,-T B$. So much depends upon the consuming qualities of the variety a day; give as much as the birds will eat without waste, and
The STRAM PLocGM: $X$. We may mention that the Manchester annual meeting at Wigan, on August 6th and 7 th, 1856 . A local fund has been raised for the purpose of giving additional and increased prizes, which has been attended with grea success. There is, however, a strong desire that there shoul be a trial of steam cultivators, and that after the trial, a dis-
cussion "on the best mode of applying such power" should take place, by practical engineers, so as to lead to the productiou dered, that so much practical sctence does not exist, in any other district in England as this. A discussion on this subjec subject should aduress Mr. F. Twining, of Parbold Hall, Tundip Cetter: Clericy, Apply to any commission agent for the sale of implements, as Burgess \& Key, or Deane \& Dray 503. ; but Gardner's Banbury cutter, costing abont 5\%, is the Erpatcin: The return of the average of Oata at page 858 last week, column $b$, should have beon stated at " $933,611 \frac{1}{2}-932,994$.

quite extraordianary, and the favour pis every thing that could be the crop was abundant $;$ it is also excellent as a late Pea. Too
tole Doveridge, November 20th, 1855.

From Mr. Uptov, Gardener to Lady Cotton Sheppard, Orakemarsh
Hall, Vttoxeeter.
Your "Early Favourite Pea," supplied to these Gardens last
year, I consider to be the best early variety in cultivation It Year, I consider to be the best early variety in cuttivation. It is
an extraordinary bearer, and the pods contain on an average, from nine to ten Peas, of excellent quality and flimour. Crakemarsh, 24th November, 1885.
From Me. Dytcr, Gardener to the Hon. R. W. Otive, 3L.P. Oakley
From one pint of Dickson's "Favourite Pea" I have this
season gathered three pecks of good seed, and at this date I am gathering excelleat Peas from a late sowing.

From Mr. Oates, Gardener to the Right Hon. Lord Leigh, Stoneleigh The Pes, "Dickson's Early Favourite" which I got from you
last seasou, I can with contidence recommend as having advantages over all other Peas now grown it tery early of excel lent favonr, and in productiveness, in my opinion, surpasses all
other Peas. I have strongly recommended it to my friends, and other Peas. I have strongly
I hope never to lose sight of it.
Stoneleigh Abbey, November 21st, 1855.
From Me. Bsown, Garddmer to W. Ormsby Gore, Esqu, Ar.P,
I have much pleasare in giving my opinion of your "Early
Favourite Pea."
It tiveness and flavour. It called forth the admiration of all who what like a wall of pods 5 feet high, each coutaining nine and te and many eleven Peas in a pod. It is a first-rate early Pes and
great acquisition ; indeed too muot cammot bo ata fiy trs favour. Porkington Hall, 1st December, 1855.
From Mr. Edwands, Gardener to Lady Broughtom, Hoole Hall,
Your "Early Favourite Pes" is the most prolific and finestner's Emperor, and is literally corered with pods from top to Whas muech pleped with it, and has desired me to write you this
Hoole Hall, 27 th Noveruber, 1855.
From Me. Strackav, Gardener to J. H. Smith Barry, Esqq, Jaar
It affords me muoh pleasure to testify to the merits of you No. 1 ," it was fit to Peather a few the same day as "Sangster"
duas after, and the crop it produced surpassed anything I ever says grom. In quality, too, it it irst-rate, and it should be in the hands of every gardener.
Marbury Hall, 4th December, 1885.

In reply to your letter, I beg to say that I have been much ration of all the gardeners in this neighbourhood whe adm growing. Its earliness, productiveness, and fine flavour render
it the finest Pea of its season which I have grown, It the finest Pea of its season which I have grown, and in future
I do not intend to be without it Faintree Hall, 10th October, 1855.
From Mr. Johi Elson, Gardener to Henry Cnderhill, Eiqq., Pirton
The "Dickson's Early Favourite Peas" I got from you this spring for myself and five neighbouring gardeners have given urs ail the ereatest possible satisfaction. It is by far the most
prolific Pea I Ever saw grown ; the flavour is excellent, and being very early it certainly is a great acquisition, and must become second and third crops, and for mowtog late to come in at the end of the seaso
Pirton Grove, 1st November, 1855.

Permit me to offer a few remark ang
consider that when nurserymen, or anyone else, introduce a really good fruit or vegetable, they ought to have every credit for
it. I am not very fast in buying new vegetable seeds: from the favourable report given of this Pea by the Horticuitural Society, I was induced to purchase a couple of quarts. One row was sown on the 12th February, with a little more than one quart of seed, which produced nineteen pecks (heaped measure) of good
Peas, each pod contrining on the avers Peas, eacli pod containing on the average nine Peas, and in many,
of them we found eleven. A row of " Bishop's Long Poi Pea; sown by the side of "Dickson"s Favourite " the same day, and
the same quantity of seed, oniy produce many of these pods were not well filled. The Peas from "Dickson's Early Favourite" were sold at 11d, per pecck. Your reanders
will agree with me this was a tolerably pood cro will agree with me this was a tolerably good crop. I consider
everybody that grows Peas ought to have, at least, one row of Dickoon's Early Favourite."
Keele Hall Gardens, Stafiordhire

CHOICE FLOWER SEEDS.

 IM PORTED GERMAN SEEDS.-Superb collections of these (see Catalogue).
SMITH'S NEW BALSAMS, Bo highly spoker of by Dr. Lindley and the National Floricultural Society. In sealed packets, of six separate colours, for $2 s .6 d . ;$ packets of mixed, $2 s$, each.

## BULBS AND ROOTS FOR SPRING PLANTING

Very splendid collections of Ranunculns, Anemones, Gladiolns, Iris Germanica, and Primula, Lilium lancifolium, and other superb Lilies, Tigridias, Oxalis, and a great variety of other Roots. For Spring Planting, see Seed Catalogue,

## ACHIMENES AND GLOXINIAS

Several superb new Continental varieties, including 10 beautiful erect flowering sorts, tubers of which are now ready, and will make fine flowering plants this season, for descriptions on .

SEED CATALOGUES SU

- GOODS CARRIAGE FREE (not under 20s.) to all the London Termini; also to all Stations on the Colchester Iine between London and Norwich
Seed and Horticultural Establishment, Sudbury, Suffolk.

## NEW FLOWER SEEDS.

MESSRS. WILLIAM ROLLISSON \& SONS
Are now prepared to supply the annexed new and beautiful ANNUALS and BIENNIALS, which have been selected from their general Stock of novelties for the present season.

Per packet.
Annual, rose-
A bronia umbellata, new, beautiful half hardy Annual, rose Ageloured trailer.
Ageratum conspicium, nei, very handimome. .... $\ldots$
 orange and dark hrown $\ldots \ldots$..... Anthoxanthum gracile, new, oruamental Grass
Browallia abbreviata, new, fine, very free flowering Browalia aboreviata, new, ine, very free
Calceolaria californice, new, very prety
cabiosefofiaia, new, very han
Campanula stricta, new, very profuse flowering variety, extremely pretty
Centauridium Dry
Centauridium Drummondi, new, orange composite flower Chrysocephalum arenarium, new, handsome Australian Everlasting
Collinsia bicolor aliba, new, pure white, very pretty
Convolvulus bicolor, Cupeopsis coronata,
Cynoglossum conlestinum, new, light bilue, extremoly pretty Delphinium cardiopetalum, new, dark blue, very beautifui Dianthus Garnierianus, new, beantiful, very sho
Erigeron Beyrichi, new, pretty composite flower Erysimum Arkansanum, new, pale yellow, handsome, sweet scented
Gomphrena Haageina, new, beautiful orangecoloured haif Gutieruezia gymnospermoides, new, very preetty

Gypsophila muralis, new, dwarf, very pretty Ancrual, withe. small glosas foliage, covered with deep pink flowers,
smitable for ed Helichrysum brach yrhynchum, new, beautiful Everlasting (Both the above varieties are much superior to the oild
mactianthum manum, new, very desirable variety
compositum maximum, new, large flowered, double, of many colours, from bright yellow to scarlet Ipomacea himbata, new, purple, with broad white margin,
very free flowering (we reeeived this most lovely Climber very free flowering (we reeeived this most lovely Climber
from our collector, Mr. J. Henshall, who discovered it in Java; this we can strongly recommend) Ipamean Mexieana alba, new, very fine
linum grandiflorum rubrum, new, the true bright crimson large flowering species from Algeria, new and very beautiful
Morna elegans, auw, very handsome Eiverlasting

Palafoaxia terapa, , , ow, fine
Phalacreas celesstina, new, beautififl iight biue
abbatia campestris, new, a splendid half hardy Annnal,
of graceful habit. glossy foliage, and bright rosy pink of graceftul habit. glesss foliage, and bright rosy pint
yellow-centred flowerr, very fine end full flowering Siliene Bergeri, new, very pretty Trifolium nurantiachm, new, free floweering äd prëty
Tropeollum Lobbi puniceum, new, dark-blood red, Tropeolum Lobbi puniceum, new, dark-blood red, splendia
Whitlavia grandiflora, new, splendid, very large dart Whitlavia granditlora, new, splendid, very large dark
bell-shaped flowers

## IMPORTED GERMAN SEEDS, in Collections.

Messrs. William Rollisson \& Sons can now supply the undermentioned German Flower Seeds, which are all in assorted colours, and sent out in sealed Coliections, as received from the first German growers in Germany. Our supply of German Flower Seeds we can with every confidence recommend, from the universal satisfaction which they have given for many years. Their superiority over English saved seeds consists in the greater variety and beauty of their colours, and the much larger proportion of double Flowers which they produce.

Asters, dwarf donble German, in 18 splendid varieties
quilied double German, in 20 splendid varieties
globe-flowered double, in 12 splendid varieties globe pyramidal flowered, donble, in 20 splen. Vars.
new dwarf bouquet pyramidal double, in 12 splendid Trutrateties new superb" French pwony-… Balsams, Smith's suyert in finest varieties
large, extremely double and well formed of are labeit, and of distinct and striking colonrs. In sealed packets, containing 6 vars. separate
Camellia-fiowered, double, in 10 new varieties Larkspurs, double dwarf rocket, in 12 splendid rarieties: double tall, in 8 splendid varieties

Messrs. Williar Rolissoon \& Sons will be happy to forward their genaral CATALOG UE of SEEDS, post free on application, and have much pleasure in saying their Seeds for the Kitchen Gardeu will be found to be of superior merit, as most of the
Kinds most difficult to ubtain true, as Lettuce, Beet, the Brassica tribe, \&e. \&e. are saved by themselves; four of their Nurseries lind most difficult to ubtain true, as Lettuce, Beet, the Brassica tribe, \&c. \&ec. are saved by themselves; four of their Nurseries
being situated at some considerable distance one from the other, afford facilities for this purpose which, under ordinary circumstances, cannot be adopted. We may hera remart that one article most difficult to git reallv tirst-rate is Beet; Rollisson's superior aret has been pronounced hy all growers to be the first in cultivation. Rollisson's Victoria Cabbage Lettuce is also a very Mesirs. W. R. \& Sons beg to draw attention to their splendid Collection of Dwarf, Standard trained, and other Fruit Trees, Which are this season unuaually fine, to the cultivation of which alone they have soveral aeros devoted. They have also a splendid Iot of fruiting plants in pots of Peaches, Nectarines, and Apricots, which they can with confldence recommend.

> The Nurseries, Tooting, London.

WILLIAMARF-TRAINED FRUIT TREES. and in offering WOOD AND SON have much pleasure and NECTARINES in the Kingdom; in shrort W. W. \& SoN
foel convinced they are not to be surpassed in the trade. Price 5s. per planti. N.B. Having a large stock of the above W. W. \& Eox are disposed to deal liberally with the trade, and will furnich
whulesale prices on application.

A. PAUL ANE SON lave to offer fine healthy A. plants of the following beantiful varieties of AZALEA NDICA in large 60 and 54 -sized pote, $12 s$. the dozen; Albs,
snithi coccinea, Herberti. Fielder's white, Speciosissima, CarmiThe following, of the same size, 18 s , the dozen:-Lateritia, Variegata, Rubra plena fulgens, Murrayana, Optima, Prince,
Aibert, Rosea Superba, lieine des Belges, IIolfordi, Iveryana, Perryena.
The same sorts, in $4 s$-sized pots, well set with bloom, $24 s$.
 ABIES OR PICEA GRANDIS (TRUE.) Chem for
H sale a small parcel of Serds of the true Picea or Abies noble Fin, which is well known to be one of the finest, as it is
nnguesti, mably the rarest in Collections, of the Conifers of Northern Califrnia. The Seeds have been recently colleceted, offered by the hindired. When delivered the Seeds will be at Per 100 Siens, $2 l .10 s, ;$ ner 500 Seeds. 102. , per 1000 Seeds, 152.
In addition to the eabove H. Low \& Co. have received Seeds of the undernamed Oregon plants :Abies Douglasi, two varieties, per 100 seeds
Abies species, probably Abies taxifolia of Jefiney, per 100 Seeds Tree, producing Frite flowers as large as Magnolia tripetala, per ${ }^{25}$ Seeds $\underset{\text { Clapton }}{\text { Nurserv, London. }}$
\&1.
EEDS FOR WALES.-Arrangements have been made by the undersigned for the speedy transit of all orders for WALES. Seeds can be forwarded from
Bristol direct by Steamer, or by the South Wales Railway, via Gloucester.

CUTTON and SONS, Seed Growers, Reading, Berks, can supply every kind of GARDEN SEEDS and FARM SEEDS of genuine and superior quality, warranted all of the growth of 1855.

Horticulturists and Agriculturists residing in the most remote parts of the kingdom, can procure good Seeds at very moderate prices from this Establishment.-For particulars, apply to
SuTTo \& Soss, Seed Growers, Reading, Berks.

## Che Garienteg Chromite.

SATURDAY, JANUARY 12, 1856.
Now that increasing interest is taken in every direction where it is possible to utilise fecal matters, especially that which we formerly endeavoured to introduce into familiar use under the pleasant name of Cloacine, the opinions of our skilfal and scientific neighbours across the Channel deserve more than ever to be recorded. The other day the application of this matter gave rise to a discussion upon a point of no small importance to Gardeners. After explaining the value of Cloacine in its fluid and solid state, some one objected to its use in any form because of the offensive smell and taste it gave to the crops obtained with its assistance. We abridge the conversation that took place on this occasion. M. Becquerel referred to an experiment with liquid cloacine made by M. Batailler, on his estate near Montargis ; the result he said was good, but the Grass crops (fourrages) gave out a nauseons smell. Another speaker remarked that this had been prevented by using leather or gutta percha hose and excessively weakening the fluid till no smell remained. M. de Gourcy stated that a friend of his in Belgium was in the habit of deodorising
his cloacine by means of sulphate of iron, and that his cloacine by means of sulphate of iron, and that
his garden crops almost always won prizes at the exhibitions. M. Moll referred to the Edinburgh meadows as a proof that the use of liquid cloacine was not injurious to the quality of Grass, and said that, in Alsace and other provinces of France where it was largely employed by market gardeners, he never heard any complaint of the quality of the prodace. M. Prpin followed on the same side,
and added that the Paris market gardeners had for three or four years past been in the habit of
using dry cloacine mixed with straw and earth for
their vegetable crops, and on a very large scale, without any inconvenience to the produce.
On the other hand M. Payen stated that in Lombardy they had been forced to give up using Poudrette (Cloacine mixed with charcoal) in the pastures, because it gave a bad taste to the milk of the cows fed there. This, he said, was no prejudice, as some people think, but an undoubted truth. If, however, he added, the cloacine was deodorised by dry earth of a clayey texture, the crop acquired no bad taste. M. Huzard confirmed this assertion; when, he said, he was at the veterinary school of Alfort, the great close of the establishment was manured with cloacine, but the practice was given up because it gave a bad taste to the vegetables grown for the use of the students. other hand, at Lucca, where large quantities of water passing through ditches filled with cloacine are conducted over the meadows, no bad smell is perceived. Oranges and Olives, growing there on slopes, are fed in this way by being banked
up with dry stones on the lower side. Finally, M. de Mortemart observed that the Indian Corn thus manured near Lucca gained no bad smell.
M. Payen was of opinion that although the co of Grass plants was not affected, yet the foliage was,
and this he ascribed to the power possessed by the and this he ascribed to the power possessed by the
leaves of absorbing by their skin both scented gases and vapours, and thus contracting a disagreeable taste. But, said M, Mori, nowhere
liquid cloacine more used than in Lombardy ; Milan it is collected in a canal the water of which is used for irrigating the adjoining meadows ; it is here that the cows are pastured from whose milk the cheeses of the country are made; so that it is clear that liquid cloacine, sufficiently diluted, has no such bad effect as the poudrette above mentioned
The discussion ended by a remark by M. Paten that every thing depended on the quantity of water ased in diluting the cloacine. Earth, also, by virtue of its porosity, and the peculiar property of all clays, absorbs liquids, detains gases and thus becomes a complete disinfectant. This seems to have been the opinion of the majority of the members present, and is probably correct. But before accepting it as entirely satisfactory we should like to hear what our kitchen gardeners have to say on the subject. Cloacine may be taken, for argument's sake, to be what is called very rank manure. Does such manure give a bad taste to regetables, or does it not? The subject is of vast importance.

## Nothing has shown more unmistakeably the intel

 ligent feeling which actuates the present Commissioners of Inland Revenue than their anxiety to relieve trade and manufactures from all excise difficulties, where it can be effected without serious loss to the revenue. This, which has led to the extinction of the brick and glass duties, has lately been manifested in a new direction, which may advan-tageously affect rural interests. It has long been a
great source of complaint among mercantile men that some branches of manufacture have been wholly driven out of foreign markets in consequence of the high duties levied in this country upon the alcohol or "spirits" indispensable to such trades. nor indeed has the inconvenience been limited to foreign trade, for among ourselves the smuggler
would step in and supply one manufacturer with Would step in and supply one manufacturer with a Naterial the whect of excise duties been fined to the manufacturer, but it has been felt by the cultivator of the soil, who till lately has been prohibited from growing materials for the distiller except under regulations which were in fact prohibitory.
A great but little known change has, however, taken place in the Excise laws. Certain descriptions of spirit are now permitted to go into consumption duty free; the condition attached to the privilege consisting in their being rendered undrinkable. Such spirit has received the name of Methylated, in consequence of being mixed with wood-naphtha, or methylic spirit, a substance so nauseous that the most depraved appetire would revolt at it. The immediate effect of this may be expected to be an immense demand for spirit from cheap sources, and of this the cultivator cannot fail to profit.
Mangel Warzel, Potatoes, and the recently introduced plant "Holcus saccharatus," will probably now enter largely into consumption. It is true that the law has not as yet made provision for admitting the last named article to be used in the manufacture of spirits, and that although the two other roots may be used if unmixed with any other material, there is said to be a difficulty in their employment because the wash they produce cannot be success-
fully converted into alcohol without the addition at some saccharine ingredient. But this must be

In the case of Potatoes and Mangel Wurzel, the raw material is produced by the lowest description
of unskilled labour, employing men, women, and of unskilled labour, employing men, women, and
children, and the refuse is valuable for cattle. These roots may be grown where grain cannot, and thus land now unproductive may become profitable,
In the case of the Holcus there seems to be the additional recommendation, that after the juice has been extracted it is said to yield 4 tons an acre of a
material for making paper. A correspondent intimately acquainted with parativs of this nature calculates that the comparative produce of spirits from an acre of land may
be thus estimated:be thus estimated
 raising the Hulcus, nor of knowing what description of land is necessary for its successful cultivation on a large scale, but it is probable it could be
cheaper comparatively than Mangel Wurzel
The price at which 100 gallons of spirits could be produced from the other articles, or from sugar, he assumes to be as under-

## Potatoes, at $50 s$. per ton <br> £6 6s. 9 d. <br> Mangel, at 15 s .

Barley, at 30s. per quarter
Sugar, at 18s. per cwt.
In ordinary years, in Scotland and Ireland, Potatoes would probably be procurable at a lower price, and from the cost of the material in the case siderable deduction may be made for the refuse.
Formerly the precautions and restrictions neces sary to secure the large revenue derived from spirits prevented the use of any material which did not afford the means of charging a presumptive produce in the earliest stages of the manufacture. And from the nature of the process this charge could not be maintained in the case of Potatoes or Mangel Wurzel, and probably not in the case of the Holcus. But that difficulty no longer exists.

The law now and the spirits to remain under the control of the Excise antil they are removed from the distillery. In lieu, therefore, of the old presumptive charge,
the Excise could easily frame other regulations which the Excise could easily frame other regulations which,
while they protected the revenue, would give perfect freedom of action to the distiller, and thus enable hinu to use up a large amount of field-produce, at present of little value, such as the refuse of Potato fields and roots of Beet too small for cattle feeding, but rich in sugar, and grown in land which hitherto no practical man would have occupied with such ? crop.
All in fact that the distiller would require would be that duty should be charged on the spirit in its finished state, and on the quantity actually produced, and this, we believe, might be carried into effect with little amplification of the existing laws.
Since the foregoing was in type a pamphlet has reached us, on the Distillation of Alcohol from Field Beet, extracts from which will be found in another column, p. 26.

## New Plants.

## 159. Canna Serves, $x . t-1055$

Most cultivators of stove plants know that one conspicarest and finest is that called Canna ividiflora, conspicuous for its tall graceful habit, and its magnifiWhen Mr. Warczewicz was in the state of Veraguas he met with a kindred species, destitute indeed of brilliant met with a kindred epecies, destitute indeed of brilliant graceful form. This, which he called C. litioflond becanse of the resemblance between its blossoms and those of the pure white lilium candidum, has been raised by M. Van Houtte of Ghent, with whom it has ing account of that skilful cultirator gives the followsuccessful. "As treatment which he has fcund were sown, and when the seedlings appeared they they transferred to the stove. When fine weather came a few specimens were put out in a very airy but thoroughly negligence or some other cause, only one of them remained alive in the autumn. Nevertheless that plant was strong, though dwarf ; another plant kept in a hot house rapidly grew 7-8 feet high, and flowered, but M. Van Houtte adds that that it ripened no seeds." M. Van Houtte adds that the plants turned into the open ground should have been taken up by the middle of september ; but that they should not be then repotted and stimulated into growth unless the roots are plunged bottox.heat- or in some other way exposed to a brisk

DANGERS OF THE BUSH-THE LATE J. BIDWILL, Esq.
(Abridged from "The Western Times" of December 24.) The public journals, and especially those devoted
he science of Botany, recorded, a short time since then he science of Botany, recorded, a short time since, the
death of Mr. John Carne Bidwill, son of Mr of St. Thomas's. He died at Wide Bay, New Souts Vales, where, by the force of his character, and the superiority of his intellect, he had attained to offices o trust and the highest degree of influence and publi usefulness. As his career was so creditable to hi His father intended him for commercial life, and edr cated him accordingly. But his strong natural taste for scientific pursuits, and especially Botany, showed tha the current of his life was setting into another channel In the solitudes of Australia, and the endless variety o its planks, his mind found inexhaustible treasures. Ho Was the first to penetrate alone into the interior of New Zealand-of which arduous but interesting journe reputation and talents were speedily appreciated in young colony, where integrity and energy of characte are the only patents of nobility. The Council offered Sydney. Subsequently he was appointed Commissioner of Crown-lands, and Chairman of the Bencil of Magistrate or the district of Wide Bay, New South Wales, an offic onerous, and in the highest degree important. Th journey which we record below was undertaken with Bay to the adjoining district of Moreton Bay - but his riends really believe that botanical investication was the master-motive that sent him forth. The fatigues and sufferings of this journey were followed by his last fata illness, during which he was watched and tended with the most affectionate solicitude by his brother magis rates, who in turns watched by his bedside, whose presence he died. Every mark of public respec Wide Bay district ; and his death press as "entailing a great loss to the colony of the South Wales, as a botanist and naturalist." Sir William Hooker and Dr. Lindley, who knew him well, paid his memory very flattering compliments-tbe one in hi Chronicle. The annexed, which was written in an interval of pain shortly previous to his death, shows the calmness with which he met it, and the Christian and filial feelings of his heart

Tinana, March 5, 1858
"I thought it would give my dearest parents pleasure to re
ceive the last words written by their absent, but I know mnet
cared for son. How much I have to thank yob for not

The narrative of his journey was written on the couch of illness. It shows the intellectual vigour which animated him, and is of general interest for the powerful picture which it conveys of the difficulties and privations which the pioneers of civilisation have to undergo whilst threading their way through the dense forests of a vegetation which has not beeg
disturbed since it was first planted by the hand of the Creator; we give it as a graphic picture of
TRAVELLING IN THE BUSH

TTinana, Wide Bay, New South Wales, June 10th, 1851. "My dear Father,-I set out in the middle of April to find out and mark a new line of road between Marybornugla and Bris-
bane; at present the distance by the road is 250 miles, the actual dis
bul
business on my part, and heartily have I since repented of
steping out of my way. For the first 50 miles I got on pretty
well. I then came to along ridge, which gave me a great deal of
trouble: but at last I passed it by an easy road, by going a little well: I then came to a long ridge, which gave me
trouble: but at last I prassed it by an easy

BRUGMANSIA SANGUINEA
A noble specimen of this fine plant grows in the pleasure grounds adjoining Crom Castle, the seat of the
Earl of Erne. It was planted in a conservatory in May, 1845, and was then about 3 feet high. Notwithstanding severe annual praning it grew too large in a few
from the beginning of summer, and it has now, January
5 th, many open on
It was planten
earth, a good portion of charred matter, rotten dong, and larned perfect drainage of course being secured. As larned from experience that Brugmansia will not stand in thens protection, ever since it was planted in the open ground 1 each year in October covered it by slicking poles in the ground, 5 inches apart, the spaces between being stuffed tight with Grassy moss raked from an adjoining wood. A span roof is then put on one side of which is thatched, the other covered with sashes, which has an additional tinued frost ; to make all sure I put inside a few cast metal pipes, connected with a stove, but even last winter, although very severe, they were seldom used, as it requires a very great frost to penetrate through Moss ${ }^{4}$ few inches thick; at the same time arrangement for free ventilation is provided. I take the protection Maually away in March and April, and altogether in May. It may be considered that the plant is not worthy the rrouble thas bestowed on it, but few could see it in summer and make that remaris. The branches are shortened in before covering, or it might bave been twice as tall as it now is, The accompanying representation will give some idea of the general appearance of the plant when in bloom.
There are many free flowering plants, commonly oceu pants of the greenhouse, which 1 think would succeed quite as well planted out as the Brugmansia, large specimens of which would add a new and interestin feature to our pleasure grounds. I propose planting ou a few next May, with a view to their remaining out through the winter, and getting glass struetures mad and removed can be easily increased in size at pleasure and removed in spring) for their protection. Some who have the management of gardens may remark, and perhaps with justice, that it is more easy to write about these matter than to get the necessary means for their execution, but here, I am happy to say, such is no the case, as my noble employer, who is both indulgent and generous, puts no obstacles in the way of improvement or experiment. Robert Douling, Crom Castle Gardens, Co. Fermanagh, Ireland.

## VEGETABLE PATHOLOGY.-No, CIII.

414. Hyposathria* (Bletting). -In an unripe state most fruits are acid, and the walls of the component ells hard and unyielding, so that without subjection to agreenby are either absolutely uneatable, or so dis agreeable and indigestible as to make them objects of
aversion except to depraved or childish appetites. This

unripe condition is called as it is merely a tranaitional state, and one which necessarily precedes ma turity, I do not think it requisite to consider it
under a distinct head, though circumstances may occur under which the fruit may never pass through those chemical changes which are necessary to bring it to perfection. This may arise from weather, inducing ungenial ciency both of light and temperature, both of which are necessary to the perfect formation of the fruit and the generation and
metamorphosis of those metamorphosis of those
matters which in due process of time are deatined to supply that proportion of sugar which is requisite for the perfection of its proper flavour, or the access of light may be prevented by the superbundance udicious removal of which proporion to the exi gencies of every function of the plant, without attention to which misehief
tuay arise in a different may arise in a different
direction, is often necee-
years, and was considered scarcely worthy of a place ; sary in cultivation, especially under artificial heat.
under glass. In May, 1851, I planted it in the open ground, having the previous autumn cut its roots
3 feet from the stem, and ever since it has attracted the attention, and been universally admired by the pumerous visitors to this beautiful demesne. At the request of some ladies on a visit here I measured the plant last August ; it was then 14 feet 6 inches high, and girthed at the ground 2 feet 6 inches, and covered an area of 165 square feet. At that time it was really a beautiful plant, completely covered with flowers and foliage to the surface of the ground; I then counted 180 flowers fully expanded, with twice that number ready to open. A gentleman told me a few days
afterwards that he had counted above 200 open afterwards that he had counted above 200 open on it. It would be difficult to calculate the
number it produced last summer, but I would say at least some thousands, as there was a regular succession

415 . In some cases no sooner has the fruit arrived at that condition which renders it available for the uses of man, than a further change takes place; the cell wail. position contents pass into a state of incipient decore decay takes place in vegetables: the pecnliar aroma decay takes place in vegetables; the peculiar aromas vanishes aid the whr become a sof vapid tasteless Pears so rapidly pass into this condition that they are scarcely worth cultivation, though some of them, as the Jargonelle, are of first-rate quality when in perfection. The change generally talies place in a centrifugal direction, a circumstance which distinguishes the condi tion from many forms of patrescence. Apples are fax less subject to such a change, in which the condition
assumed by many varieties alter they have arrive，：ar perfection is one of a gradual separation of the severa
cell walls，without any change of cotour or potrefaction， which constitutes the state linown commonly under the name of mealiness．
416．In some fruits，however，as the Medlar，Service， \＆cc．，the saccharine matter is not furmed till the walls of the cells begin to give way．Such fruits are altogether uneatable soloing as every part is in perfec health，bu When the balance of vitality is deranged，and decompo－ contents of the cells，the general mass of the sarcocarp becomes tender，and at the same time there is an agreeable acidity which renders the fruit extremely palatable，where it is not too powerful．This is the con dition known under the name of bletting，and thoug certainly of the nature of disease it is one without the accession of which the fruit is useless， 28 is not unfre quently the case with poor varieties of Medlar，or where the soil does not suit the finer kinds．In such eases the
ascoocarp blets so slowly and partially that different sarcocarp blets so siowly and partially that different
kinds of moulds are developed before the fruit becornes eatable，producing a species of putrefactive decompo sition which is destructive of every good quality． change similar to bletting，as observed above，occa－ sionally takes place in Apples，insomuch that though decayed they are sweet and eatable，bat this i not very common，and as it only occurs in individuals it must arise from some especial cause，and not from any constitutional peculiarity．＊I am not aware that bletting fruit has been studied by any competent chemist，nor is it probable that the matter would affor any point of much interest．There are comparative analyses by Berard of the ripe and unripe states of Gooseberries，Greengages，Cherries，Apricots，and Peaches，and also of Pears and Apples in three conditions：when fit for gatliering，after having been kept for some time，and when purrid．In the ripening of fruits sugar is constantly formed at the expense of the acids，and yet there is often more acid in the ripe than the unripe fruit，according to Berard＇s analysis．＂Citric acid $\mathrm{C}_{22} \mathrm{H}_{8} \mathrm{O}_{14}$ becomes by the addition of six equivalents of water $\mathrm{C}_{22} \mathrm{H}_{14} \mathrm{O}_{2}$
and this losing 6 equivalents of oxygen yield $\mathbf{C}_{1} \mathbf{H}$ or crystallised sugar．In like manner equivalents of malic acid and 16 of water losing 18 of oxygen likewise yield Grape sugar．＂Greg．Org．Chem． p． 460 ，ed．3．It is observable that in Berard＇s ana－ lyses with an increase of sugar there is always a great corresponding decrease of water．The sugar in the fruit where starelat is present is evidently not formed at its expense，nor in all probability is it formed immedi－ ately from carbonic acid and water．In putrid Pears the quantity of suar，though larger than in the fresh sathered fruit，has decrensed one fourth，the water has
 acid has increased．I can find no aualysis of Medlars or any similar fruit．M．J．B．

SPines on seedling pear trees．
A．FRW remarks were made in a previous article on the spines which are produced on the branches and was classed among favourable indications，and their absence，on the contrary，was considered as a bad omen．There is，however，a widely spread prejudice to the contrary which leads to the rejection of those spring seedlings that ought to be carefully preserved，and to the preference being given to those without spines， from which nothung good can be expected．It is there－ fore necessary to enter iuto some details on this subject， in order to demoustrate that the general opinion above alluded to is merely a prejudice，aud is not supported by facts．

All amateurs，who for the last 50 years have raised seedling Pear trees with the view of obtaining new and improved varieties，have proved the truth of the obser－ vation，that a seedling having a sufticiently strong stem， neither too thick nor too tall，furnished with spines，and forming branches and shoots，at wide angles，likewise furnished with spines which are neither too slender nor too long，and situated at distances similar to those of the shoots，have always produced，in the long run，the finest and most delicate fruits，and which ripen in long－continued succestion．
In various passages of the＂Pomonomie＂of Van Mons， the greateat raiser of fruits in modern times，the correct－ ness of these observations are completely corrohornted Aro not also the best seedlings raised by the late Thomas
Andrew Kuight，and which still exist in the gardens Andrew Kuight，aud which still exist in the gardens of the Horticultural Society at Chiswick，decidedly spiny？If these seedlings had been trained as pyramids， they would have still farther confirmed these assertions； for in that case the apines make their appearance when the soedling is two，three，or four years old；they are more numerous on the lower branches of a seedling ＊Blptting Pears are commoniy krown under the name of
seepy，as there is an absence of that acid which renders Med－ leepr，as there is an absence of that acid which renders Med
lars aud services oo agreeable to the palate．In mich fruit putre factive ferm－ntation agreeable to the palate． such cases more sulared is atmosphere is not ton detimes sud－ which，as in mpere sugar is I believe formed，in consequence of Pears which are sent from Normand
starch in any of the analyses alluded to above the existence of himself says that there is $n$ ）starch in Aples．as slices of
do not turn blue when submitted to the action of fodine microscopical examination will however，I believe，always fruits equally．
pyramd，when these are trained near the ground． The formation of spines is continued on the stem， branches，and partly on the shoots up to 8 or 10 feet alove the surface of the ground ；then they gradualiy di－appear．They are not produced on the slender twins It is in the upper part of a seedling that recently ormed spines turn first into fruitul spurs，which con－ tinue bearing for a period of perhaps 10 years withou being worn out．The spines on the stem and lower branches form spurs，year after year，successively down to the base of the pyramid．Thus，a seedling trained as a dwarf pyramid，furnished only with fruit spurs and spines changing into spurs，as well as a certain number of twigs，after having produced its first fruits in the upper part of the tree，bears seven or eight years afterwards on all the branches from top to bottom． Without having seen it，no idea can be formed of the productive power of these fruit spurs formed from spines on the strong branches of a vigorous seedling， planted 15 or 20 years in a favourable situation．I have seen many bearing from 250 to 300 Pears．It is the most magnificent spectacle that can be seen in our climate by an amateur pomologist．In the propagation of a seedling variety by buds or grafts taken from the apper part of the tree，which is the part where the spines begin to disappear，they are frequently seen to reappear on the first branches of the propagated plant． These spines are much more numerous，when，by inad vertence，the propagator employs shoots from the lowe part of the seedling，where the wood is some years from a bearing state．The tree so propagated will not be less substantial，but ite growth will not be so fine as those from cuttings higher up，its aspect will be wilder and it will be longer before it bears fruit．
As for the long，slender，sharp－pointed spines which are formed along the weakly branches，not furnished with a terminal bud，they indicate in a seedling small but long－keeping fruit．They appear in seedlings of which the wood is weak，the branches taking a hori－ zontal or pendulous direction．These bad signs in the eedling are evident in the third，fourth，or fifth year of its age．There should not then be a moment＇s hesitation the first flow of sap，to the height of 7 feet，and there bud in August following with a good new and late－keep ing variety，which can be cultivated as a standard Seedlings that are furnished with an excessive number of spines generally form trees of larger dimensions，and attain a greater age than those that have none．J．De Jonghe．

TRADE MEMORANDA．
They are swindlers：and we suppose they find the rade profitable．We have warned people over and over again against these adventurers；but the world is so ignorant of common things，and so uncommonly
gullible that we do not think we have met with much success．

## Home Correspondence．

The Horticultural Snciety．－I am a very old member having been elected before 1821．I have always cheer frlly paid my three guineas a year in aid of an institution which has been second to none in the substantial servic it has rendered to the country；but when the grea garden at Chiswick was established I for one refused to support it，and to that decision I have adhered．No that I underrated the garden or was blind to the benefits it conferred upon horticulture，but because always felt，what the event has proved，that it would be hail with pis convinced that the proposals of the Council are rational and better calculated to promote gardening than costly garden，and public shows which have now de generated into something very like a race course．For people no longer exhibit their productions for honou or for the sake of horticulture，but purely and simply for the money they can make．I see，however，with regret
that the Council wish to retain these exhibitions，only that the Council wish to retain these exhibitions，only
changing their ground．Of course，the object is revenue ；they desire，I suppase，to obtain money where－ with to carry on more important but less showy opera tions．In this they are certainly wrong．They have carried flower shows to a pitch of perfection the like of which the world never saw．Those of last year，a lemst the one at Gore House，the only one I went to， surpassed all provions ones．Let them now leave such things to their friends in the Regent＇s Park and Syden ham，and confine themselves to their legitimate business －the scientific as well as practical improvement o gardening．However iniportant the money question and I much mistake forms so large s part of ther of the gentlemen who not readily subscribe such a sum as would place the Council in a position to think of something more than the quickest way of providing ways and means．I，at least，and some of my friends，are ready with our con－ tributions if such views as mine are entertained by a large part of the Society．F．H．N．
in a late Live Plants to Australia．－There is an article roots and seeds to Australia．＂Some years since my son，who was then in England，wanting to send some Gribble＇s（seedling Apple trees）to New South Wales， tried the following method with perfect success．In a packed 1000 four or five year old plants，I forget which
in the following manner，and every plant urew．Th
plants were cut off in the stem at avout 6 or 8 ，or perhaps 10 inches，for I write from memory，from the bense or root，for the convenience of packing．He then bucked them in a layer at the bottom as closely as he packed them in a layer at the foots inwards ；and so，layer after layer，until could，the roots inwards；and so，layer after layer，unti the whole were packed．Eetween every layer he sifted dry earth，taken from and within an old barn，perfect！ dry．and well shaking the earth as it was sifted on ；so that the whole，when finished，was as if the plants had been buried，root and stem．The cover was then screwtd down，and the case shipped for New South Wales，whence my son wrote to tell me that every plant grew．It is not for me to comment upon this my in－ tention being only to state the fact ；but，acting upon the fact，I have from time to time similarly sent，using in－ differently earth or sand perfectly dry，great varieties of seeds to New South Wales，New Zealand，and India， and from the absence of complaint，which invariably occurred when I have sent seeds in any other way， infer，I think reasonably，with comparative success J．G．Bidwill．

Endive．－It is very strange that Endive with us is only known as a salad，dressed green with oil and vinegar， and yet how excellent a vegetable it forms those who have visited the Paris regtaurants must well know．I have sent yon the recipe to show how it is cooked on the Continent，the Litterness removed，and an ex－ cellent dish produced：－Chop up Chicorée，Endive，or Spinach very fine（cooks say for 10 minutes）；boil it first，then put it into cold water ；then drain the water off，and squeeze it out till quite dry．Take a good tablespoonful of flour，and a piece of butter about the size of a Walnut，mix them well near the fire，and boil them in a pipkin．Put this mixture with the vegetable， and about a teacupful of water，for fear of burning add a little salt and pepper，and boil till done．So，I think，the German mode of boiling Beetroot the true one to obtain the fine saccharine flavour，and it has been much approved at my table，though＂never heard of before．＂I have one or two more recipes，if worth your acceptance，of these kinds Noathooood，［By all meanal］

Rain－guage 6 inches diameter，sunk in the ground is 100 feet above sea level．J．Finlar
Discased Pine Apples．－Has any one been troubled with a disease in Pine Apples？Mine are infested with something of the kind．＇I hey are fine fruit，and appear quite sound before cut．When cut through some are sound and good，while others that look equally sound are spotted with dark spots，and with others the diso coloration appears to go right up the centre of the fruit． Any information on the subject would oblige $J_{.} P_{\text {．}}$ How do you water them？and how much？

Vitality of Seetls．－In your volume for 185 õ，p． 854, Mr．Darwin refers to the discovery of ancient seeds in graves in France，but supposes that＂no known botanist looked to the correctness of the names．＂If he will furn to your volume for 1848 ，p．700，he of abatract account of these discoveries in the form of an abatract
deans, concernug them. That botanist is a sufticient
autiority for the correctuess of the names of the plants rased. It will also be seen by the same accuunt of
these discoveries that much care was taken to ensure these inty in the results. Charles C. Bubington, Cambridge Orchard-Houses. - In order to obtain a succession of Peaches in orchard-bouses, it has been recommended to surn out a few trees inthe beginning of summer and are twice moved, and as each time the roots which have grown through the holes at the bottom of the pots must necessarily be mutiated, it would appear that in order
to carry pat this plan of retardation, larger pots should be used than are required in other cases. I would however, suggest a much simpler plan, namely, keeping
the pots plunged under a north wall during winter and early spring, and moving them into the orchard-house when the first bud shows a little pink. The trees will
thus receive no check. I purpose trying the plan this year. For quality I have not yet found any variety of Peach which equals the Noblesse. G. S. Seedlings.-In the Chronicle of the 22d ult. there is an article on the subject "Of the Propagation of Plants Germs or Buds from which they are originally taken." My son raised some seedlings from the common im ported dried furkey Fig of commerce, which bore invariably falling off when about half or two-third grown. I budded one of these from a Fig growing im-
mediately adjoining, and the same aspect, and the fruit varies materially in shape, colour, size, and flavour the shape is more elongated, size smaller, flavour nferior, colour darker, and the skin
shining than the original. J. G. Bidwill.
Luculic gratissima. - It is a matter of surprise that this plant is not grown in every cold greenhouse, for its
beauty and fragrance at this season of the year cannot be surpassed. Two fine plants are growing in a cold conservatory at Thorp Perrow, Bedale, where the thermometer seldom rises above $44^{\circ}$. It covers a space
on a back wall 24 feet by 12 ; in the Christmas week there were more than 100 bunches of bloom open at one time, and their beauty is likely to last for a long time,
which makes them more prized in winter. The plants which makes them more prized in winter. The plants
are never exposed to cutting winds. They were planted -one five years ago, the other six. The soil used for them was a mixture of loam and leaf-mould; so impatient are the plants of heat that the hot-water pipes near them have been covered up for two years; previou: to that the lower blooms dropped off before they came
to perfection. Hortulanus. [See our report on Frog. more in another column].

Ailanthus glandulosa (see p. 808, 1855).-In answer to "An Old Subscriber," I would suggest one use t Which the timber of the tree he is about to fell (or part
of it at any rate), may be advantageously put. If he will offer a specimen to Sir Win. J. Hooker, Roya
Gardens, Kew, for the Kew Museum, I have no dou of its being accepted and gratefully acknowledged Publicola.

Undrained Borders.-In your paper of Dec. 15th, p. 821 , a correspondent offers a plan for the protection
of wall tree borders, as well as trees. He says, "Would not, moreover, the result in consequence of the wood and buds being more perfectly matured and hardened in autumn be the production of more vigorous blussoms in ${ }^{2}$, ppring, more certain of setting, more capable resisting the action of frost, and less susceptible
blight from that or any other cause ?" I may add, illustration of this, that $I$ once took charge of a garden in autumn, and but a poor account was given of the crop of wall fruit generally, which was verified by the results of that senson when they were under my notice, for
although the trees were protected in spring by woollen although the trees were protected in spring by woollen
nets and blossomed well considering circumstances, still at the time the blossoms should have set it was a great disappointment to observe them die off and reward us with no fruit. Now, the cause I think
was plain-most of the garden was a very heavy soil, and in winter full of moisture. It appeared to have been partly drained, but not effectually, the consequence was the ground was full of slugs, worms, wireworm, \&ce, and the Brassica tribe would stand for monthe, and then prove to be more like half plants than otherwise. In fact their appearance indicated the cause of the evil, and thus no doubt it had been for years before; and although every season might bring its blossoms on the
wail trees, yet as freely would they shed them, and the wood die back surprisingly, which told too true a tale of the effect of undrained borders on fruit trees, and the little reason we have to expect blossoms to set while the root are surrounded by superfluous moisture. $J$. Drivers, Maidstone.

## Foreign Correspondence.

Monce Vale, near Ross, Van Diemen's Land, 18th September, 1855. - I confess I regret my own ignorance of botany, for there is a very extensive garden here, tionate hreadth and height, with a loftier cblong in the centre 30 feet by 20 , which have been much neglected
of late years, untillast season. A gardener of late years, until last season. A gardener arrived from
England competent it seems, though young; he brought England competent it seems, though young; he brought and this season promises well, and in Cucumbers and Melons also ; but in plants it is poor, so that I often wish for such another bag of seeds as was given me
before I sailed for New Zoaland, as every one of them
could be ued here and valu ${ }^{\text {a }}$. In New Zealand I doled
them out in snall parcels, and I am whad to learn hy have been very prolific indeed, particularly the Guatihave been very prolific indeed, particularly the GuatiI gave to three people with greenhouses; one a nur sery gardener-one a lady, who writes me word would suit it even better; the 12 sorts of Cra-
tæons: have mostly done well ; here we lisve of the common Thorn-white-but none of the pink sorts. Just now spring is bursting out upon us, though we have had no snow, nor severe frost, as in England yet winter is cold and vegetation is stayed, so that
spring and all it brings are welcome; and it is the pleasantest season, for midsummer brings heat, but which would not be bad but for the frequent droughts, which last some seasons very long, and then everything
is burnt up to positive white hest $H$. is burnt up to positive white heat. $H$.

## 

Falconry in the British Isles. By F. H. Salvin and W Brodrick. Large 8vo
As the long bow gave way to the harquebuss, and boar spears to rifles, so has falconry perished in the face of
fowling pieces and patent cartridges. We say perished because we cannot bring ourselves to believe that the sport can now be revived, even when aided by the knowledge, skill, and enthusiasm of the two authors who have produced this beautiful book.
When the late Sir Joln Sebright gave to the world his admirable little treatise on hawking, he expressly declared that his object was to point out the manner in which a wild bird may be reclaimed, rather than to enlist reeruits for a sport so completely fallen into disuse as it had become in 1826. Even then a little Dutch village, appropriately named Fulconswaerd, was supposed to be the last reluge of professional falconers,
who in that secluded spot occupied the only n+st thought who in that secluded spot occupied the only n+st chought
to remain to the race. And although our authors to remain to the race. And although our authors
assure us that Scotland had also her native breed of falconers, traces of whom existed so lately as 1819 in the person of one of the Flemings of Barochan; and even down to 1845 when Sir John Maxwell, of Pollock, had Wm. Barr, of Arrochar, aa his falconer, yet we cannot but think these were the last sparkles left of the brilliant sport which once was the glory of princes, Corn-fieldes, drains, and railways have done their work, and Falconry must, we fear, be mentioned among the arts that are lost. We are, however, assured that it still basts of its followers ; there is a club held annually at Lon, near Aruheim ; Wallachian gypsies pay tribute to
the Sublime Porte in quails, wheh are all taken by the Sublime Porte in quails, wheh are all taken by sparrow-hawks; some Russian nobles still fly hawks
over their steppes and boundess plains ; and Mr. $0^{\prime}$ Keefe, an Irish sportsman, rides atter his hawks with no little success in quest of woodcocks, partridges and herons.
"The decline," say our authors, " of a sport once so generally practised in this country may be attributed to first in causes ; the principal one having no doub of runpowder : this and the enclosing of waste lands gave the first blow to the art. A great reaction with regard to the hawks themselvesfollowed, and in place of the strict protection they used to enjoy came a most violent persecution. Discarded as allies in the field, they were and are Discarded as allies in the field, they were and are only looked upon as enemies; and the same noble bird
which in former days would have rested on a monarch's wrist, is now handed over to the tender mercies of a menial as vermin. The custom of collecting together within narrow bounds large quantities of game, artificially reared, and semi-domesticated, has tended greatly of late years to destroy the taste for real sport amongst the upper orders, and at the same time to crowd the gaols from the lower ranks of society. No pursuit deserves the title of sport which taxes nothing beyond the organ of destruction in those who follow it. The Battue system, in which hundreds of pheasants reared almost by the hand of the keeper, and scores of hares enclosed within nets, are driven into the very faces of sportsmen posted in advantageous situations, and slaughtered by wholesale with the amallest possible expenditure of trouble to the slayers, may be styled in newspaper paragraphs 'glorious day's sport,' but has certainly nothing in common with that description of sport which brings into play the qualities of energy, perseverance, endurance of fatigue, great self-command and calmness of nerve in times of difficulty, and which has given to the national character its title to respect, in the sportsman by flood and field at home, and game-preserving censists in the destruction of every bird or beast supposed capable of claiming its share in the spoil, whether or not nature has provided it with the requisite powers or even inclination. As might be imagined, this mode of arriving at the desired end generally defeats iteelf, and the extirpation of oue supposed hostile species only makes way for some other still more destructive agent, as for instance in localities where everything in the shape of weasel, stoas, or foumart has disappeared, immense numbers of rats, equally destructive to game, and far more generally injurious, have sprung up, and from their amazing iertility dtfy the skill of man to hunt them down. An gamokeeper's language ' vermiv,' no one would advocate ;
there 18, however, no doubt that such may be killed off
far too closely. It is a dangerous thing to break the admirable balance of nature, and were the habits of the greater number of our larger hawls better known, it would be found that instead of being injurious to the preservation of game, exactly the opposite is the case. Though gamekeepers are in general a prejudiced race rey of the hawlaw their conclusions seeine them the aet of discussing the remains of one of their own , is but fair to remark that we know more than one of their number who, being observing and intelligent men, rejoice in a visit from the Peregrine to their moors during the time that the grouse are laying at that season is the Royscon's principal object of pursui at that season is the Royston and carrion crow, and othe egg-8tealers which then infest the ground. On some o the Highland moors the alpine hares have become so numerous, in consequence of the destruction of their chief enemy the golden eagle, as to prove a perfect nuisance both to the farmer and also to the sportsman, whose dops are continually pointing them."
We wish we could think that country gentlemen would subscribe to these opinions, especially as regards the fashionable game-massacres, or battues, which have been invented to save them the trouble of using their legs. At all events falcons and falconers can desire no better advocates than the authors of the work before us and pange which we need only add that business, that it points out the merits and faults of the various kinds of hawk, illustrating the species with cha racteristic coloured plates, and that the whole volume is written in the true spirit of the naturalist as well a of the euthusiastic sportsman.
The Year Book of Agriculture (8vo. Paterson, Londou), for 1855 and 1856 , is not, as its name indicates, merely a record of agricultural facts, but it embraces horticulture in all its branches as practised in the United States. In this point of view it may be regarded as a useful work, to which the attention of gardeners, a well as farmers, may be directed. Mr. Wells, the editor, has done his part carefully, with the exception of correcting the press, which, where scientific names are introduced is greatly in need of revision. The volume contains a very large quantity of statements relating to cultivation in North America, and, in conjunction with the Official Patent Office reports, offers complete view of what is going on in the rural district of North America. The volume contains 400 pages of extremely well and closely printed matter, of which Agricultural Mechanics and Rural Eeconomy occupy 134, Agricultural Chemistry and Geology an, MeteoroBotany 60, Horticulture 5 Statistics, 60 pages. The text is illustrated by excellent woodeuts and bad litho-tints ; and contains by way of frontispiece a portrait of Downing, the Loudon of America, which a work of art, will bear compariso with the best copperplate book illustrations of this country. We shail frequently take occasion to refer to the pages of Mr. Wells's useful publication.

## Garden Memoranda

Royal Gardens, Frogmore.-A visit to these grea pardens, of which plans were given in our volume for 1849 , is necessarily highly interesting at any time of the year, and searcely less so at the present season than in summer, for now an opportunity is afforded of inspecting the various forcing houses in operation. Of Pine A pples alone the quantity grown here is enormous, and of the excellence of the fruit or the health of the plants it is impossible to speak in too high terms. The varieties are chiefly Cayennes and Queens, and an of them are planted out on beds of prepal sole hot water pipes laid in shingle ; even the suckers are no put into pots, but are taken off the stoois and planted out thickly at once in soil placed over a bed of leaves. The plants in the two Pineries in the principal range are truly admirable examples of skilful cultivation an careful management, not a broken or diseased leaf nor an insect is to be seen on one of them, and they promise to bear fruit wort
they are to come
Ripe Grapes are obtained here all the year round A house of Westis St. Peters has not yet been touched; the fruit in exhibits the greatest possible excellence. The bunches as Sloes and covered with a most beautiful bloom. The foliage is yet green, while that on a plant of Biack Barbarossa at one end of the house, and subjectod stalks same treatnient, is quise The latter is, howevar, a valuable late Grape, though many still prefer the West's St. Peters. Of the last-named variety in this house which, we need scarcely say, at mid-winter presents a novel spectacle. A low house filled with Black Hamburghs planted on a raised bed over a hollow chamber closed in with slates is also now full of nearry ripe fruit, making the second crop from the same Vines this season. They produced a crop last March, when they were pruned and exposed to the weather by taking the lights off. About the beginning of August they broke again, when the lights were replaced, and the result is a fair crop of frait, which will come into use after the St. Peter's above alladed to are over,
and thas there will be ripe Grapes until new ones
are obtamed trom the Vines tramed on the bac.
and upper portion of the roof of the principal Pinestoves, in which the first fruit is always produced These latter, owing to the little rest they receive, break somewhat irregularly, some of the young shoots being now nearly coming into flower, while the majority of the buds have not yet pushed ; they do, however, in time all break not yet pushed; they do, however, in time all break, and their not doing so all together is ratier an advantage than otherwise, for the fruit also ripens in succession,
which is what is wanted. This crop keeps up the which is what is wanted. be has crop from the houses in supply till new Grapes can be had from the louses in started. In the early vinery the Vines had become somewhat unfruitful ; they were therefore cut down after the crop was ripe last May to within about 3 feet of the bottom, and while they were still in full leaf. After the operation they pushed vigorously, and during the season filled the house with new wood, sthick as the thumb, with prominent well swelled buds Next season they look as if they would yield a crop of not less than 10 lbs , to each Vine, and thus a season is gained by this mode of treatment
The early Plum and Cherry houses have just been started; Strawberries are also being "set to work." The variety employed here for forcing is Ingram's Prince of Wales, which bears an excellent character both for flavour and prodactions and French Beans are fit for use here the whole year
round. The latter are grown along the kerbs of the round. The latter are grown along the kerbs of the
Pine stoves, and in the borders inside the early Vineries Pine stoves, and in the borders inside the early Vineries
and other houses. They are started in boxes or in and other houses. They are started in boxes or in
little square bits of turf placed over warm surfaces little square bits of turf placed over warm surfaces
before they are permanently planted out, and thus all before they are permanently planted out, and thus all
failures in the principal plantations are obviated and the rows are kept uniform and without blanks.
Cacumbers are grown on raised beds over heated chambers, and the plants are trained on strings over the roof of the house. After they have done benring Vines are introduced through holes in the wall from the outside of the house, along the front of which they are grown in a narrow border which is now, together with those of other houses, enveloped in a covering of Fern.
Asparagus has been "in cut" here for the last two or three weeks. The plants, which are three years old, are brought from the open ground and placed on a bed ragos is, however, obtained from ranges of low pits heated by hot water. This method has been fairly tried here, and has given most satisfactory proofs of its superiority over the modes usually practised. The Asparagus is planted in brick pits which are sunk to the
depth of 4 feet ; between each pit exists a space traversed by hot-water pipes, which spring from a central boiler; the divisional spaces are covered securely with York stone, and the beds have a tight-fitting wooden span roof. The soil eniployed is chiefly the rich loam peculiar to the garden mixed with leaf-mould and rotten manure. a he beds are usually started early in Decem-路 cutting, the size and flavour being excellent. It should be mentioned that the plants are occasionally assisted by a supply of manure wate
Early Peas in a pit
(Sangster's coming througa the . The mould in which they ere just sufficient warmth to excite ves which there is just sufticient warmth to excite vegetation. Early
Carrots and Potatoes in beds similarly constructed are also coming forward. The latter are started in warm houses, and then planted out on a bottom-heat of about houses, and then planted out on a bottom-heat of about
$65^{\circ}$. Much warmer than that does not answer ; for should severe weather occur about this season, which is very likely to happen, and the pits have to be kept covered for weeks together, the plants get drawn, blanched, and ruined.
In the principal stove Bignonia venusta was in beantiful condition. Its long pendant branches, festooning from the roof, were completely loaded with blossoms of the richest orange, and allowed to hang loosely in this manner they have a much betrer effect than when trimly tied up. In the greenhouse at the other end of the range of houses was the fragrant Luculia gratissimn, presenting such a display of flowers as perhaps has never been seen in this country before. Its top occupied an arear some 8 feet in height and nearly as full of blossoms highly coloured, and each cluster formed a perfect bouquet in itself. This plant, as well as the Bignonia, is planted out in a bed of peat and loam. The soil about the roots of the Luculia has not, it is said been disturbed for the last six or seven years. Little attention is therefore required to have it in perfection,
and when seen in the coudition in which this plant is, nothing can be handsomer. Keunedya: Marryatte trained along the roof of this house was also full of scarlet flowers, and very showy.

A new fruit-room 60 feet in length has lately been put up in one of the "slips" against the garden wall. of straw. The frouder which are 4 inches in hickness the house is 5 feet high at the back. Along the front are small fixed windows of thick plate glass, while at the end a window is made to open, and in the door at the opposite end there is an open ventiator. The circu-
lation thus produced is considered sufficient to dry up all damp, and in this house fruit is found to keep well. It is arranged on shelves placed in tiers against the

Eugenia Ugm fruted under glass here last summer, and next year it is intended to try it against the open wall. The fruit was about the size of large Black
Currants, and most delicious in flavour, fully realising Currants, and most delicious in flavour, fully realising
in this respect all that was said of it in our volume fur 1854, p. 644 . It is a most valuable acquisition.

## Calendar of Operatious <br> (For the ensuing week.)

Plant department.
Consertatory, $\alpha$ c.- Where the twiners for covering the roof are grown in boxes, or have but limited root room, as much of the surface soil should be removed annually, as can be done without seriously injuring the roots, replacing it with some good rich, fresh material, and this cannot be done at a better season than the present. The conservatory or show-house should very Epacrises, Heaths, Primulas, Mignonette, Tree Vilete Civerarias, Indian Daphnes, and many other (showy things, may easily be had in bloom about this time; and, with proper convenience, a few Roses and other forced plants, as Oranges, bulbs, \&c., should also be coming in, and will greatly assist in maintaining the gaiety so desirable in this house

FORCING DEPARTMENT
Pinery.-There is often considerable difficulty experienced in getting the requisite number of plants to show
fruit at this season, and where this is the advantage should be and where this is the case every a brisk temperature, which may be kept at from $70^{\circ}$ to $75^{\circ}$ by night, and $80^{\circ}$ to $85^{\circ}$ by day. The difficulty of getting plants to show fruit is generally the result of their growth not having been properly matured in time to allow the plants a period of comparative rest before subjecting them to forcing with the view of getting them to show fruit, and where any difficulty of this kind is experienced timely attention should b given to the preparation of the plants for another command. All thae only means or haviag them a with backward plants will be to take advantage of bright days to maintain a brisk temperature, letting it rise to $80^{\circ}$ or $85^{\circ}$ with sunghine, and $70^{\circ}$ to $75^{\circ}$ should b secared at night. Maintain a moist growing atmo sphere, but do not syringe plants overhead that are showing fruit. Also see that the roots are in a properly
moist state, using tepid water where any is wanted VINERY, -In houses being started use means wanted buds to break regularly, and where necessary bend the Vines, raising the backward buds to the highest point maintain a moist atmosphere, and sprinkle the Vines morning and afternoon. When the buds begin to break the night temperature may be increased a few degrees, and hould not exceed $55^{\circ}$ until they are all fairly started sunsh by day should not be exceeded exce care to leave th. Rub off all superfluous buds, taking is any fear about the show of fruit, it will be advisable to leave all promising buds until the bunches can be perceived. It is only in cases, however, where the Vines are in a bad state that there need be any fear about destroying all superfuous buds as soon as this can be done. Admit air on "every mild day, using a sufficien amount of fire heat to maintain the proper temperature Look well to the border, and see that itis protected from wet or sudden changes of weather ; and, where ferment ing materials are used, turn them as often as necessary adding a small quantity of fresh leaves and dung, in order to maintain a steady heat.

## FLOWER GARDEN AND SHRCbBbRTES

hing forde weather in the door operations. Where the turf is at all unlevel time should be spared in course of this or next month to repair this, as if lifted later than February it might require some attention to get it to take quickly. Unlevel url is an eyesore the season round, and it makes the mowing more tedious and difficult, hence it is worth a en necessary here to make whatever little repairs may them of fallen bits of branches, \&c, and use the roller here and on gravel frequently to secure a firm smooth surface. Let the stock of plants, except those that may be wanted to furnish cuttings, be freely exposed to air hard and render ther will admit, so as to keep them hard and rence them less liable to damp off in the even of their having to be kept covered up for some time. Any of the stock from which many cuttings are wanted should be removed to a light warm situation withou loss of time, first washing the pots and clearing and adding a little fresh soil to the surface of the ball. Some kinds of Verbenas, ac., are very subject to mildew when placed in heat in the winter season, but this is easily sept in check by means of sulphur, only let the sulphur be applied the moment the pest makes its appearauce.
hardy fruit and kitchen garden
his any planting of fruit trees still remains to be done despatch used to get to very soon, and every available to occupy ground with fruit trees, and incur the expense, \&c., of planting them, it certainly is worth consideration whether the ground is in the best possible and to incur any expense and planted with fruit trees, and to incur any expense and trouble which may be requisite in order to render the soil as suitable as can
be made for the kind of trees with which it is to be be made for the kind of trees with which it is to be
planted. To do this is seldom a work involving much direct outlay, for provided the ground is well drained,
there is little else required except labour, ${ }^{-}$materials ${ }^{\text {for }}$ concretin e, aud a supply of good loamy soil, all or Which can generally be oibtained about most place prospect of their doing well, and the necessary prepara tions for securing this can bs more conveniently, cheaply, and efficaciously made before planting than afterwarde, and the requisite preparations should be made, even if
doing this should necessitate putting off planting until another season. Push forward the digging or trenchin as the case may be, and get all vacant ground turned over as soon after this as circumstances will admit. In the kitchen garden, as in other departments, alterations will occasionally be required, such as taking up and relaying Box-eugings that have become imperfect, those that have grown too strong and bulky, turning or surfacing walks with fresh gravel, and such jobs should be done if possible before the busy season.

## Che agritultuxal Gazette.

SATURDAY, JANUARY 12, 1856.
The Times newspaper gives the following information, which as it may prove to be of agricultural importance, we publish here :-
From Peru we learn that in the Convention now in session, a most extraordinary and important project of law has been introduced by Senor Roca, to sell the Chincha Islands. The following is a brief abstract of the law.

The preamble states that, considering Guano to be the chief source of revenue of the Repablic, and at the same time a terminable one, the nation had not derived the benefit from it to which it is entitled, while the present mode of sale was unsuited and expensive. Considering at the same time the wants of the nation-namely, to encourage immigration, educate the people, and irrigate the sterile coast lands, and that the interest of the National Debt in 25 years will equal the principal, it is therefore, desirable to realise the sale of the guano in a more prompt manner for the benefit of the national treasury. Considering further that, according to the best calculations, the present amount of guano is 12,070,152 tons (Peravian measurement), which may be reduced to, say, $11,670,152$ tons by the time the sale is effected, and, lastly, that the net profit has not exceeded 30 dols., \&c., be it decreed that the guano on the Chincha Islands, say, 11,670,152 tons, be sold at public auction, in nine months, at a price not less than 30 dols. per ton, equal to $350,104,560$ dols. ; the sale to take place under the management of a committee of officials named in the bill. The regulations of the sale are next stated. The nation does not hold itself responsible for the amount of guano, and will allow no reclamation for a deficiency, nor seek it for a surplus. The law to be published in all languages, and circulated, throngh the Government representatives, in Europe, Asia, and America. The money to be paid cash, or at least one-fourth of the sum, and the remaining three-fourths at short dates. The money to be deposited in the Bank of England to the credit of
the nation, and appropriated in certain sums for the
The foregoing, which is only a brief summary, contains the principal points of the proposed measure.

The remarks which have been made in these columns on the malformations and diseases of root crops seem to suggest to us a somewhat interesting subject of discussion, namely the advisability of substituting specimens of roots at our agricaltural shows.

Although prizes are not unfrequently offered for roots at agricultural meetings, especially of Turnips, Swedes, Carrots, and Mangel Wurzel, we have never yet witnessed much competition-the only exception we remember was at Birmingham last month-perhaps
one, or at most not more than two or three competitors for each kind have come forward; and the reason usually assigned for this apparent neglect is that few large roots which can be culted here and there are no criterion as to crop, and growers refuse to enter inlo competition in a matter which appears to be too much one of chance. Just so, indeed, would it be with cattle shows if only a single point was made the standard of excellence; but when there are several points to attend to it requires skill and knowledge, united with judgment and perseverance for approaching towards perfection, to which end the many valuable points are caref tolerably wel understood by all breeders.
Here then the question arises: are not the different breeds of cattle derivative? -that is, are not many if not all their peculiar characteristics derived from cultivation?-and is not a knowledge of the circumstances under which the required changes ar brought about and maintained the basis of skill in breeding? Just so is it with roots. They
are derived from wild originals, from which they widely differ by cultivation, and each kind offers several varieties suitable for a wide range of circumstances ; hence some are used for the table whils others are employed as food for cattle, and of these one form is suitable, for one season another for others ; and of these, again, one sort may require im mediate consumption, whilst another is improved by storing.
This, therefore, introduces us to a wide range of qualifications, which in the ease of cattle are provided for by a classified schedule; and we have prizes for long-woolled, short-woolled, and mixed breed sheep; but as regards roots, their intinite such clastification, and bence scarcely any qualification is insisted upon but that of size.

Now, if we bear in mind that all our forms of root crops are liable to be deformed by degeneracy of growth, to become injured by various insect attacks, to be woody from poverty or dryness of soil, and watery from being grown too fast or too close together, we shall see that even in the growth of roots many points ought to be taken into consideration, not only influencing the successful growth and competiion connected with root crops, but also the decisions of those who may be appointed as judges of roots.

Without attempting to describe all the facts worth noting in deciding upon good roots, we
would recommend attention to the following points both from the exhibitor and judges:-
lst. A well-formed top.
2. A well-formed buib or tap root.

3d. Compactness of structure.
4th. Size.
5th. Freedom from insect attacks
1st. Well-formed tops, especially in Turnips, Parsnips, and Carrots, are such as do not present a superabundance of leaves, and consists of a single bud proceeding from the centre of the root; all such as have an acending central axis should at once be rejected, and any tendency to side shoots should be viewed as an evidence of aegeneracy.
$2 d$. In the case of bulbs or tap roots, the first point to examine is the presence or absence of lateral roots. These may be long and straggling, or larye and thick-in the first, showing the tendency to form finger and toe, and in the second bearing unmistakahle evidence of this malformation having been established; it is therefore imperative that roots for exhibition be presented with the leaves intact as far as may be, whilst the roots should never be trimmed. As regards general outline this must depend apon the peculiar sort, and in the case of all Turnips the tap root should not gradually thin downwards, but be more like a tail fastened to the base of the bulb, whilst with fusiform roots the tap root should taper somewhat abruptly from the fleshy
3 d . It has been so much the custom to look only at size that compactness of structure is usually disregarded, bat all must see that a hard jnicy root is
more use for all purposes than one of a spongy or woody nature; therefore no specimens should past to determine this point. Allied to this it may be remarked that colour as indicative of purity of sor should not be overlooked.
4th. Size should never be disregarded, especially as in most cases the object is to show the largest in their other characters as laid down they should at once be disqualified, or at least take their place ather upon other qualities than size
5th. As it is almost impossible that roots can be
well formed when subject to insect attacks of any kind, these should also guide a judgment, for even f such malformations as galls and anbury be not their result, yet form and structure, and sometimes even flavour and goodness will be interfered with by the presence of insects.
Here then it will be seen that even in the judgment of good roots several points have to be taken into consideration, which from the examples have usually noticed at agricultural shows would appear to have been overlooked, not only by the grower, but by the judges. Nor is this a trivia
matter, inasmuch as there is just as much of breed matter, inasmuch as there is just as much of breed
or sort in roots to be carefully arrived at, and as carefully maintained as in cattle; and therefore i seems desirable that their selection and judgmen should be founded upon more correct knowledge of their principles of growth.

## SUPERPHOSPHATE OF LIME

Mr. Grady has misconstrued my object in sending the paragraph referred to by him. He has gone from the phosphates, to which my remarks applied, and in cluded in his new theory the whole list of chemica inorganic elements found in the vocabulary of agricul-
tural chemistry. Our controversy will not be easily understond by casual readers except I give the extrac from Mr. Grady's lecture, where he uses the word " neutral" as being "semi-soluble:"
"Mr. Grady then dealt with the next question as to whethe
the superphosphates should be left soluble or insoluble, He the eqperphosphates should be left soluble or insoluble, H
showed by paskages from Dr. C. R. Fresenius and Professo showed by paxsages from Dr. C. R. Fresenius and Professo
Liebig, that insoluble phosphate were as beneficial to the full
development of corn as the soluble: tor the ingredients whict development of corn as the soluble; for the ingredients which
were soluble served for immediate use, whitst those which were
neutral, or semi-soluble, exercised a more perranent action ; and those which were altogether insolnhle afforded a prospect
future nourishment for plants, although fur the time being the possess no nutritive powers. It was a mistake to suppose that
artificial manures were merely ephemeral. If properly prepared artificial manures were merely ephemeral. If properly prepared
they were of a permanent character. The lecturer thien read
some testimonials to show that the Patent Superphosphate Compost had exercised upon several crops a beneficial effect for two
years in sucession-that being the whole period the company years in succession-that being the whole pariod the company
which manufactured it liad been in existence. He had no doult that experience would show the manure to be of a more lastin
character." (Agricultural Gazetti, Duc. 10.)

After reading this new theory I wrote as follows:"I do not remember seeing anything about semi-soluble phospiate in the how any manes be too soluble provided they are not washed out of the soil by the rains. Will you, sir, be so kind as to enlighten me on these points !" It will be seen that Mr. Grady speaks of soluble, semisoluble, and insoluble phosphates. Mr. Grady's mistake (if mistake it be), seems to rest with the word " neutral." This word has conveyed to his min something "semi-soluble." In fact, he says he gave the
word "semi-soluble" "parenthetically, as giving to his audience the closest meaning of the word "neutral that occurred to him at the moment that he was delivering an extempore address." It is evident that he mus have misled his andience, as they coincided with the lecturer's views, or he would have been met by objections from his hearers. There is no such thing as "semi-soluble" phosphate, but only soluble and insoluble -neutral and insoluble are one and the same thing. There are two forms of phosphate in superphosphate of fin phosphate of lime and hiphosphate or soluble phosphate
of lime. One part of the former is soluble in 1510 parts of cold water charged with carbonic acid (Liebig). "It is insoluble in water" (Voelcker). Soluble phosphate is solable in water. These are phesphates made from bones and sulphuric acid phosphates made from bones and sulphuric acid.
any other phosphatic salt occurs in superphospha of lime it is not worthy of notice, being a mere trace per cent. The "semi-soluble" phosphate on which the lecturer delighted to dwell must be a salt peculiar to "the Patent Superphosphate Compost" if any such salt exist, and on this must hang the superiority of it over all other superphosphates. On this salt depends the more permanent action exercised by Mr. Grady's patent manure. Bones superphosphates, but this is no argument in favour of using undissolved bones. It has long been known that he value of superphosphate of lime depends on the hiphosphate of lime it contain". "The larger the proportion of soluble biphosphate of lime, the greater the value attached to it" (Morton's Cyclopædia). It is found that superphosphate of lime made from bones and acid, with the addition of a little ammonia, will grow the best Turnip crops in Dorsttshire, therefore 15 per cent. of insoluble phosphate may be appliea without any fear of the solable phosphate being washed
from the soil at the season of the year in which we apply it to the Turnip crop. 3 cwt . of superphosphate of lime per acre is usually applied; therefore I presume
that 50 lbs . of soluble biphusphate of lime per acre may be applied without any fear of loss resulting from Mr. Grady does not coiacide with the views entertained by Mr. Lawes; in fact their views are antagonistic. Mr. Lawes is preparing superphosphate of lime coutaining from 30 to 35 per cent. of soluble biphosphate of lime, whereas I presume Mr. Grady would have about 3 per cent soluble (how much "semisolable" I cannot say), and 10 per cent, insoluble phosphate. I hope to see the opinions of the editor and correspondents of the A gricultural Gazette on this important subject. Geo. Summers, Houghton Farm, near' Blandford, Dorset

## [Extracts only.]

Dunure, 14 th September, 1855.
My idea is, that a most beneficial trade may be established in distillation from Mangel ; and it is no visionary project, inasmuch as within the last few years the been acture of spirit from field Beet France, and is rapidly extending at this moment. This takes place in a country in which the climate is so much drier than in ours as to restrict the produce of roots, per acre, to about one-half of what our more moist climate enables us to grow; and if such be the fact, which it is, the growth and manufacture ought to be greatly more advantageous in this country than in France. In France an excellent spirit is manufactured, a brandy which, in quality as a spirit, is unquestionably equal to the vast mass of spirit now manufactared in Great Britain and made from Mangel, which I procured from France, and which I think makes good the opinion I have stated.

There is, besides the recommendation of a spirit made from Mangel, that it would be produced from a raw material not applied to the food of man; so that, in times of high prices in grain, the price of the bread of the penple would not be interfered with by distilation. It is sufficient for my purpose that a good spirit, that an alcohol, call the spirit what you will, can be produced from Mangel ; and, as it will be seen, in great abundance, and in the manufactories of this country, vast quantities of alcohol or spirit of wine are required. I will proceed to state some detailed calculations, and to show probable results to the parties who would be concerned in such a manufacture; the farmer on the one hand, and the distiller and moderate capitalist on the other, whom I should look upon as distinct parties ; the trade.
There are many authorities, and among them Dr. Ure; in his "Dictionary of Arts and Manufactures," by whom it is laid down that 100 lbs . of field Beet os Mangel will yield 10 or 12 lbs of proof spirit (let it be taken at the smaller quantity of 10 lbs .), and 10 lbs . of proof spirit is equal to about 6.2 quarts (let it be taken at 6 quarts). Thus 2000 lbs , or, still more, 2240 lbs . (a ton), of Mangel, will yield 120 quarts or bottles of proof spirit. The produce of 1 acre will thus yield of proof spirit, if the crop be 30 tons, 3600 quarts ; if 25 tons, 3000 quarts or bottles. Let the Excise duty be for the present placed out of view, and let the value of the spirit, free of duty or in bond, be 'adverted to, and the crop taken at 25 tons: 3000 quarts at 6 d . is 75 l . ; at $9 d ., 112 l .10 \mathrm{~s}$; at $1 \mathrm{s}$. ., 150 l ., and I believe its value as mere alcohol would be nearer the latter than the former sum. How remarkable is this result, or anything approaching to it ; and yet it rests entirely on calculations founded on the statements of highly competent authorities. The conclusions are arrived at, not seeing how they can be avoided, on the basis of the facts applicable to the subject.
To pursue the subject a little farther, let a farmer dispose of his Mangel to a neighbouring distiller at 12 per ton, 25l. or 30l. per acre, as the case may be. Such a sum would amply remunerate the farmer; and if ho was to raise 30 acres of Mangel, and dispose of the erop at $30 l$. per acre, he would receive a net $8 u m$ of 900 l . in hard cash for the raw produce of 30 acreas of his farm; and bew many of the farmers of Carrick conio readily grow annually such an amonnt of crop, and cart it one, two, or three miles to the distiller. It will be seen that the probable result seems to be equally favour able to the distiller-the purchaser from the farmer. He would pay $25 \%$ or $30 l$. for the raw material, which was to yield, from the smaller of theoe sums, a manu factured article worth $75 \mathrm{l}, \mathrm{i} 112 \mathrm{l}$. 108., or as much 150l., as the case may be, leaving to him $45 l ., 72 l .10$ s. or 120!. as the value of his manufactured article, free from the price of its raw material, and as the retur he would have on each 25 tons of Mangel purchased for his capital, risir machinery, and expenditare all a kinds-a vast margin being afforded in these sums foe any shortcoming which might take place. If, instead of either of these larger sums, only $25 l$. were realised, as the value of the spirit contained in 25 tons of Mange (after deducting the 25l. paid for the raw material) how good a trade, it would seem, might be carried or If the produce of 300 acres, at 30 tons an acre, were distilled, the quantity of Mangel would be 9000 tons the sum paid to the farmers would be $9000 l$., and the
value of the spirity at only $30 l$. per acre, would be an
I have attempted to state these figures on the
anthority of the best materials I have at command, fa anthority of the best materials I have at command, far
from supposing that they do not admit of modification
or correction. I have abated much in some of the cal culations on the side of moderation

confidence that the statements are substantially cor and think that the subject is well deserving of the atten-

tion of parties more intelligent and well informed on uch subjects than myself
I may add, as an additional item of profit, that the dry fibre and tissue of the Mangel, after the whole sacchaper ton as a material for the manufacture of paper This fact I have ascertaned on the highest authority and I imagine that 30 tons of Langel would yield about
I ton (but on this point, of the quantity of fibre pro-
duced, I am not so certain), thereby adding 101 . to be duced, I am not so certain), thereby adang 10. to be
divided betiseen the farmer and the manufacturer for each 30 tons of Miangel distilled.
Before concluding, I monst state the remarkable contrast between an ack
Mangel and an acre of Barley -the usual material from which spirit (whisky in this tons per acre. I n $2 w$ take Barley at a rate of produce
quite the outside-say 60 bushels an acre, and weighing 55 lbs a bushel. This would give a weight of Barley 3300 lbs . per acre as compared state the produce of spirit from Mangel at 10 or
12 lbs . per 100 lbs . of roots, state that Bartey 12 lbs . per 100 lbs . of roots, state that Barley
yields 40 lbs . of spirit per 100 lbs . of grain. Thus
the full produce of an acre of Barley yields only 3300 lbs , or little more than $1 \frac{1}{2}$ ton of grain, instead of
$67,200 \mathrm{lbs}$, or 40 tons of Mangel. No doubt the spirit yielded by Barley is in quantity four times the
quantity yielded by Mangel : but still the 33001 bs , of
Barley will only yield 13201 b ., or 840 quarts of spirit Barley will only yield l320lls., or 840 quarts of spixit
while $67,2001 b s$ of Mangel will give 3600 quarts of amount to $42 l$., while the Mangel spirit, also at 18. gives the large sum of $150 l$. Such a comparative in these calculations, or that distillation from Mangel holds out pecuniary advantages which cannot be extracted from Barley ; and yet distillation has been a profitble trade when prudently conducted.

## A STEAM-CULTURE REVERIE,-No.I.

Lookive over my farm accounts one evening, I was on surprised to find how large a proportion of the corn "entered for home consumption" by the teams. But all this provender might have be
shape of meat instead of being converted into unEnglish people instead of being consumed in the mere And what a saving of good victuals if the toiling quadrupeds, living engines of one-horse power each, would but feed on wood or coals; or rather, if steam engines,
which really will pant and perspire as laboriously as you which really will pant and perspire as laboriousty as you
like upon no better fare than the blackest mineral bread, and a drink of cold water, could be taught to perform the operations now effected by the horse.
his thought led me into a general meditation on the subject, suggesting first the old inquiry-Why agriculrere alone of all branches of industry still fails to conpower ! Steam is a great genius as well as a mighty giant ; a simple handicraft he will raise into a manaFor the workers in metals, in textile, and other materials, he has wrought miracles-why not also for the tiller of the soil? Yet once make steam an agricul-
tural labourer, and all men agree that our sluggish husbandry would grow vigorous as any industrial art, so that Britain-happy land !-might revel in a chief staple production of bread-and-meat.
Steam has muscle enough to grapple with the clods wheel and Samson in the corn-mill, we must first beguile him into submission to the yoke. As for spinning and grinding, to be sure, our modern antitype of all the to the work; but the most honourable of all labourhis stulbornness. He is very ready at him for his stuthbornness. He is very ready at all such eutting and cooking cattle food, sawing timber, lifting drain waters off low lands, or throwing irrigation-
floods over thirsty meadown Some enterprising agriculturists have reduced him to the drudgery of conveying manure to their prolific acres, by the apparatus of pumps, hose-pipes, and hydrants so much talked of him into the field, and there made him excavate and burrow underground drains and lay in drain-tiles in the the fundamental and principal operation of husbandry Why is not seam to break up the hardened surface of atmospheric influences, cleanse it from parasitic and en cumbering weeds, and prepare it to receive and nourish the tender roots of crops 1 Twenty acres are to be pre-
pared as a seed bed 6 iaches deep; that is, 12,000 tons of hard ground have to be sliced, inverted, and erumbled into fine mould, but "the panting giant" can do it--

Aud the true reason why he does not accomplish the
feat must be, that nobody has yet watched the turning of furrow as Neweomen gazed at his palpitating teakettle we are simply waiting for a genius and his "invention." rupted by the arrival of a letter in the handwriting o
an old acquaintance, pressing me to visit him ou a mos interesting business, -in fact, to see a trial of some new agricultural machinery. The writer of the epistle-
formerly my neighbour-had often discussed with me the steam culture questi.n : indeed, he was somewhat of a
mechanical genius; for when only a bor, he had applied a blacksmith's bellows to the winnowing of corn, producine a perfect, if not expeditious, order of work fewether we had spent many liesure hours, hind sot in contriving and molelling s:eam ploughs, digging machines, and similar ingenuities. And cursory iuspection of tillage operations, butwere based pon our personal experience of deficiencies, and liesiding the field.
Residing now in a distant county, and being a com paratively wealthy man farming his own fee-simple, he wild experiments both in mechanical and chemical agriculture.
Of course I decided for "the early train" nex steamoplounticipating some practical instruction upo steam-ploughe, cultivators, and diggers.

## AGRICULTURAL STATISTICS.

Whatever be the opinions one may hold as to the dvantages of agricultural statistics, it is right that the therefore protest asainst a style of argument lately employed in Bell's Messenger, and more recently repeated body held on the 29th of last month, the subject of
statistics was introduced by Mr. E. Stenning of Godstone, and was treated too much, to my taste, in a partisan spirit; it is, however, only with one of his Rell's paper-I mean to make or meddle. Mr. Stenning's object was to show from evidenee, borne by supporters of statistics, that, where they do exist, they Maxwell's opinion against the accuracy of the Irish, Maxwell's opinion against the accuracy of the Irish, then triumphantly assumed that both were valueless. Now, even had Mr. Stenning dealt fairly with the evidence on which he founded, the answer would have been :- "Such, no doubt, are the opinions of two gentlemen, each the author of a particular system, and
naturally a little prejudiced perhaps against any other, but if their authority, when it coincides with your own general testimony in favour of statistical information to be entirely rejected ?" Mr. Stenuing, however, so far from dealing fairly with the evidence was gailty, first, of misrepresentation, and secondly, of a suppression of rdships, respecting which you may form your own pinions whether I do not prove it a fallacy, and show that the returns so taken are not accurate. Now, Mr.
Hall Maxwell, who took the Scotch returns, throws entire discredit on the Irish statistics, and says if the acreage and estimates come from the police, he would not attach weight or value to them." Here is the misentire discredit on the Irish atatistics." He was asked (p. 12 of evidence before Lords' Committee): "Have you turned your attention at all to the Irish statistical returns ?" "Not very particularly-I understand the parties employed are the constabulary-a very fiting many acres of Wheat, or Barley in a district." He many acres of Wheat, or Barley in a district." He
does therefore attach weight and value to the Irish returns of acreage, and it is only the estimates of produce he questions, on the ground that they involve an amount of professional knowledge and experience which constables can scarcely be expected to possess, is reference to Mr. Caird's opinions. He quotes these as conclusively establishing that, however well the Scotch inquiry may have been conducted, "ther was not the least test of the returns being accurate ; ut he carefully abstains from stating that Mr. Hal Maxwell was re-examined on this point by the commit ree; that he denied the validity of Mr. Caird's objec on; and that he indicated three different teste, all of which had, more or less, been employed. Such treatment of evidance-misrepresenting it here, suppreasing his audience whether he had not shown "how fallacious he plan is in so far as the Scotch and Irish statistics re obtained." Fallacious it may be as regards one o both systems, but the fallacy must be established by means other than that abuse of evidence which Mr Stenuing has employed, and which he probably unwittinaly borrowed from the weak and prejudiced article in Bell's Messenger, to which I have already alluded Correspondent.

## Home Correspondence

Thin Sowing. -The stormy year of 1855 has given practical proof of the advantage of thin sowing. Th
leaving on the ground, in consequence of the severo of mild weather late in the spring improved so mproach of mild weather late in the spring improved so much by
tillering out that a sufficient crop was produced to tillering out that a sufficient crop was produced to afford a fair yield of grain. The additional strength
afforded to the straw by having plenty of room increased the size of the heads, as well as enabling them to defy the high winds and resist the deluges of rain.
The farmer will lose nothing by dibbling his Wheat thinly in rows 14 inches apart, or even more. Following this plan the hoe can be used frequently for atirring the surface, killing weeds, and admitting the atmospheric air to fertilise the soil. The first operation of the hoe should be deep with a tool made for the purpose; the second and third hoeings should be shallower, to prevent injury to the roots of the plant. There is no greater mistake committed either by farmers or gardeners than leaving any crops too thick upon the ground, excepting e and healthy must have space to extend its branches and roots. The same holds good with regard to Turnips, Carrots, Mangels, Onions, \&cc. It sounds strange to hear men say, "The soil is poor; you must, therefore, sow more seed." The contrary is the fact, which they should know more from painful household experience ; at least many of them could answer the following question, which comes home to them :-lif one child requires a pound of bread per day to keep it in health and condition, what would be the result if three we olliged to exist apon the same allowance. Falcon.

The Wool Trade of 1855. The year opened on the trade with some demand for many deseriptions of wool, and found the manufacturers and dealers comparatively w in stock, in consequence of the great number o armers who then held two years' wool, the high prices 1853 having prevented them from selling, and the The demand for goods continuing, a disposition was manifested to take off the stocks from the farmers, who esponded and sold very freely before the clip. At the clip considerable eagerness was manifested in the purThese lane derver woal, and the marlet, and the cousequence is that at the present time large stocke are held simply because no opportunity has offered teelf of realising a profit, At the same time there has ust lately been a more general demand, and doabtless tocks will gradually be lessened as a disinclination enerally exists to holding heavy stocks at the approach ing season. On the whole the state of our trade has
been better throughout the year than could have been been better throughout the year than could have been
expected, which may be accounted for by the following expected, which may be accounted for by the following xhausted the stocks prostration of thern abroad, which naturally required some replenishing. The demands for the armies and navies of ourselves and allies have, of course, had some inflaence, and above all the magnificent harvest of America has brought into our markets ur best customer. These occurrences combined have ept up a demand larger than might have been expectec considering the high price of corm on the continent and thome, which has deprived the working classes of theipower of purchasing clothes as usual. To conclude, we would not despond as to the future, but expect air and remanerative trade; still we do not hold out any expectations of any considerable advance in the price of wool, which is at its present rate decidedly emunerative to the farmer. We may also, once for all, explaid to those farmers who see our quotations that they must make a proper allowance for expenses, such as carriage and interest of money, which are generally overlooked, and the buyers are expected to ive full quotations, although the terms are net ensh, and at the nearest town or railway station. Another remark may also not be out of place, and this refer to the greater steadiness of our report of prices than elsewhere manifested, and this arises from an indisposition to be unduly excited by casual and exceptiona
rises or falls, a register of which is only calculated to rises or falls, a register of which is ony calculated
mislead rather than to inform those who may depeni on us for information. Londom, Dec. 28.
Hedge Cutting Machine.-I was very glad to see, some weeks back, the want of hedge-cutting machinery mentioned in the Gazette, as I had long foreseea its utility myself. I have heard of one being used in the far west of the United States, where the Osage Ora, e being extensively employed for fencing in the prairies where open ditching is not the faahion, and labour being scarce and dear, there are no disadvantagen attending the introduction of "ach W Wher ${ }^{29}$. ducing the subject, and I hope the discussion will lead ducing the subject, and Ihope the a new and laboar to the invention and adoption of a new and labour
saving machine. He proposes to employ shears for the saving machine. He proposes to employ shears for tor of reaping machines. In the early reapers, Bell's for instance, shears were employed, but have now made way for the vibrating sickle. I think the same prin ciple will be found to answer best for clipping hedges of course mide much stronger and the cutting edges (if possible) to cut both sides at once, and to do this would require three vibrating sickles or saws, one on each side and one on the top. The frame in which the outer sickle works must be moveable at the will of the driver, while the machine is in motion, so as to be lifted up to pass over the cross fences. The machine most have a very efficient steering apparatus, so that the
operator can guide it independently of the motion of the horses, lize a steerage drill. W. G. Abernethy's plam
is good, but would scatter the thorns all around, and using the sickle a guide may be placed behind it to conduct the thorns to the ground, and leave them in a couvenient row to be gathered and removed so as not to trouble the sheep. Is W. G. A. right in saying that by having a greater velocity less power is required ?
[No.] If we increase the [No.] If we increase the speed of machinery, do we
not lose power in the same ratio that we gain speed? not lose power in th
Thos. $F$. Wilkinson.

Waste Lands in the Highlands.-I am glad to see that some one takes an interest in this subject, and ventures in these days to think then of use for other pur-
bagging ar affording sportsmen an opportunity
or deer, and exhibitine that som who will visit the Highland canital at the some meeting of the Highland Society (so called) will see the aecessity of doing something more than humbly imi-
tating the Lothian faiming on small patches near towns,
or attached to large sheep farms. What I think is
wanting is a system of farming adapted to the locality,
and specially suited to the climate and peculiar charac-
teriatics of the country. But in the first place we must
understand the defects of the present system. Sixty
years ago the agriculture of the Highlands was in as bad a
state, by all accounts, as it had been in the Lothians some time before. A number of poor tenants, crowded together without capital, knowledge, or encouragement, improving this state of things by giving leases to the industrious and turning out the idle, the whole was swept away logether, and in ite place the system of large sheep farms was brought in, no doubt at the time increasing the rent roll, but having no elements of pro-
gress. This, I think, is the great exror; an immense
tract of land is let to one man; this is in most instances annually deteriorating from the increase farms which wier, Birch, \&c.; indeed the sites of ol
will soon be covered with Ho sthere extent, are so still,
hills. Attached arable land well cultivated, but what is geverally some only a and and gradual improvement of the pasturage, the gradua well well kept Grass parks to afford hay for wiuter food, and Tarnips in adition to our green crops as shall afford dea may be laughed at opinion (bowever the are the better of being fed at home in winter and not eft to starve in the snow. There may be farmers who o this, but I cannot. say I have heard of them. I do pot think our peasantry are inferior to the lower classes Eagland, but we suffer from an absentee gentry, who eopl people, and regard them as some outiandish sort of congregated about their establishments. I hope this snbject will not be lost sight of, but that some endeavour will be made to bring the increased knowlelge of rural Stuan for Patting I have rec. H.
n your Paper by a Scotchman spealy seen an article atraw how well substitate for hay in fatting, and he relates ow well cattle do upon Oat straw and Turnips, in proof of which he instances the quality of the Scotch ed beasts in the London market. I freely give my testimony in favour of all that lee states. But why is no the same thing done here in the south? I think because been able under any circumatances to do but lave never believe that straw eircumstances to do it in the south here from what they are there. The chemist night be able to tell in what they differ; but I have found tha be texture of straw is not the same. In Scound tha Barley straw is generally hard and straight like Wheat straw here, and Oat straw is correspondingly hard,
while Wheat resembles canes, and in threshing makes the powerful fixed threshing machines tremble when etting it through. I think this may be owing to the and the soil partakes largely of their nature, which is and the soil partakes largely of their nature, which is not the case soukhward; now will chemists say is it this hat causes the difference, and then say what that is and the quality of the Turnips is quite as marked in its course have not so much sugar in them, and we of now that it is a very fattening agent, hence the little progress that stock make upon them. To those who can fat upon Turnips and Oat straw it does seem odd to hear of so many receipts for fatting as are now published, but I think there is good reason for them all. find in Morton's "Cyclopredia" that Oat straw is put at a very low value by the chemist, which I suppose is is the reason that we grown cut Oat crop so what ess ripe there than in the nor. 1. loss of a great deal by shaking out we would prevent the that it is not the same here as there? All these things go to prove that each locality has its peculiarities, which zanst be carefully noticed if we mean to succeed. But here is another point in feeding that is not so often oticed, that cattle in the north always have a certain quantity of Turnips during the winter when young, the object being to increase their value as fast as possible at all stages of their growth, while in the south the idea is to keep them on as little as possible, and have them only to make dung, that is, tread straw and
improve much in value, and the only when fatting time comes the change of food is so great that it is no wonid than they make but little improvement for some time they hardiy know how to eat a Turnip when first put up ; not so the Scotch beasts, they will at any time get soon hurt by their voracity. May not this do a little towards reconciling the conflicting statements about fatting paying ? G.S

Surerephosphute of Lime.-I have read with attention an article in your last Paper under the head of Supe phosphate of Lime, signed "Standish Grove Grady," ent who, after calling attention to Mr. Grady's lecture, concludes with the following:-"I do not remerabe concludes with the following:-"I do not remernber seeing anything about semi-soluble phosphate in the
writings of Lieligg or other writers, neither can I see how any manures can be too soluble, provided they ar not washed out of the soil by the rains. Will you, Sir be ss kind as to enlighten me on these points?
made wark here reasonable, and alihought I have not the sliohtest ides a to who the correspondent might be, yet as his breath must evidently be taken away ty the shock he has re he is recovering lis wind, for bein, pecording to Grady, less than "a mere tyro in chemistry, and ignoran of the first principles of chemistry," it cannot b expected that he will be able to reply for some time appears that the term semi-soluble, as applied to phosphate of lime, is not to be found in the writings of Liebig or other writers of repute, but that the credit of the due to the Recorder application must be recorded as being due to the Recorder himself. A public lecturer is public property, and his statements become a fair subject for pullic criticism, and he has therefore no right to complain if his incorrect statements or reasonings become they refer to a matter so impore more particularly when The correspondent clearly meant that he doubted the existence of any such substance as semi-solublephosphate Semi-soluble must clearly mean half soluble ; now I can understaud that a manure which contains some 14 or 15 per cent. of biphosphate and the same quantity of phos emi of lime might be termed, as regards these matters not sufficient, it requires some semi-soluble dose the brewing-it requires a little Hops and malt added But then what is this semi-soluble phosphate , tains soluble and insolable phosphate combined ? Liebig says nothing about it, nor Way, nor Playfair ; only so in his lecture he does not in his paper, he only infers there might be such a thing; for, says he, if there is different solubility, why should there not be semisolubility? Simply because there is not, we were almost
stupid enough to reply, bearing in mind, however, the we are talking of plosphate of lime, which the writer rather runs from. Now we do hope that the Recorder does not charge his jury by the means of such argnments as this. Why it is as if a prisoner brought up im, was though there might be no evidence against mitted, anil why should because a theft had been comappears that a tyro in chet he be the man? Now Mr. Grady, that an ingredient in a highly soluble state is immediately taken up by water, and must accompany that water wherever it goes. This is, no doubt, quit know full well that the water could only retain such soluble ingredient until it met with an object for which it had an affinity, and that the soil itself possesses the property of absorbing the ammonia as well as the
soluble phosphates. He would know, too, equally well that superphosphate added to the 'soil meeting with carbonate of lime and sufficient moisture became soluble" phosphate, be addetral, thetiog alone semilecturer complains that he was not fully reported so as to make him clear, and yet the report was full enough to mention that he was a director of the Patent Super phosphate Compost Company. When we read the repor we thought it a pity that anything was said about this patent superphosphate at all, because farmers ar although the lecturer's intentions were no doubt laudable, yet there are some stupid ignorant farmer who may be inclined to think that this learne Recoruer came down from London to tell them that the has moos in using the best superphosphate, or that which has most soluble phosphate in it, and though they have
got plenty of compost at home, yet they must let him got plenty of compost, at home, yet they must let him more for it than if they had the superphosphate with no compost in it at all.

he Jrurnal of Agriculture and the Transactions of the
The number just published contains useful papers both in the Journal and the Transactions which are re stitched together.
A statistical compilation and comparison by Mr. Sim
the former Great Britain, America, and France opens our wants and to the maes with a sural reference to chiefly in America and in our own improving agricul ture. The next paper is oue-historical, botanica and agricultural - on Red Clover, with especia paper on this subject, read at a recent meeting of the East Lothian Society. The writer of the paper before us enumerates the several theories of the Clover failure, and specifies among its causes-the too frequent growth of the crop on the same soil--the excretions from the
plant itself, or the exhaustion of the land of those portions which it needs as food-the want of consolide. Thorp, in the 3d vol, of the Englisl1 Agricultural Journal. He thus specifies some of the remedies which have been suggested

There are, however, some other causes of failure in the Clover crop, which the writer specifies, such as bad seed-the attucks of the slug-and of parasitical plan
hich are more obvious and more within our reach.
Aoricultur paper in the Journal is a descr tion." It takes as the sources of its information Pro Wilson's lecture on this subject before the University of Edinburgh, and a series of papers in the Revue de Deux Mondes, by M. Leonce de Lavergne, the able author of the work on the Kural Economy of Englan which has been already reviewed in our columns. Wo extract one passage in reference to the implement par or the

A very interesting section of the "Journal of Agriculture" is the collection of short papers which, under critique upon a Farmer's Note-bool;", gives the short critique upon a novelty-the review of a book, the
reference to an item in farm practice, \&e, which are eference to an item in farm practice, \&e, which are
cead with interest and facility when longer and more formal disquisitions are neglected. This has now reached its fitieth number, and its success well warrants the conductors of the English Journal in asking from its readers for the means of filling such a section there. In the present instance this collection contains a short
paper by Mr. Russell, of Kilwhiss, on the nomenclature deal of the misconception, ignorance, and misunder standing, both on the part of practical and scientific men to the misuse of the terms organic aud inorgani Gorrie on the meteorology of the year, and on the insects injurious to Pine trees. And this section conludes with a review of Mr. Stephens's Catechism Agriculture, and of the useful life of the late lamented The Transetio
The Transactions of the Highland Society contain a number of reports on the Reclamation of waste land, on Ploughing lea, on the Planting of an estate in Aberdeennide, on the Growth of Turnips with different manures, Dr And-waking machines. There are a so paper and the now well-known report on the agricultural statistics of Scotlind by Mr. Hall Maxwell. To some Chese papers we shall hereafter direct attention value of the work, and the able manner in which its character is sustained in the number just published.

## Cht Gariverey $\mathfrak{C h r o m i c l e . ~}$

SATURDAY, JANUARY 19, 1856.
How is it, we are asked, that the London Parks, of which we boast so much, are such miserable representatives of the beautiful and varied exotic vegetation which the last 30 years have been spent in collecting. Why, says a correspondent, do I see in singular beauty all manner of trees of a noble aspect, and many-fashioned, many-tinted foliage in the public and private gardens near London, while Hyde Park, the Green Park, and St. James's Park exhibit little except the eternal Elms and Plane trees, which represent the arboriculture of QUERN Anne's time?

These are questions very often put to us, and we can only answer that we do not know. There seenis no reason why the London Parks shonld not contain whatever in private gardens have been found to thrive, unless it be that trees of modern introduction are not planted there.
It may be trise that until Lord Pamerston's Smoke Consuming Act shall not only have been extended, but more strictly enforced, London soot will prove an effectual barrier to the cultivation of many evergreen trees. But that serms a bad reason why the public should be condemned to a dull monotony which deciduous trees would so readily break; and we cannot but think that adequate knowledge in selecting and skill in planting would
 an attempt would at any rate have been made long since.

Certain it is that a sooty atmosphere is the only enemy to be encountered. The impurities incessantly poured into the air from the million chimneys of a huge coal-burning metropolis, falling on leaves and impeding respiration, are injurious to vegetable health, if not fatal to vegetable life. When leaves remain permanently on branches they eventually become so encrusted with soot as to be incapable of fulfilling their destiny, the result of which is the death of the tree that bears them.

But a large number of deciduous trees are not clothed with leaves for more than five months at a time, after which the exhausted foliage falls away, and the tree remains at rest for 7 months more, during all which time it is indifferent to the state of the atmosphere, or if not wholly so, at least is able to endure a very foul one. On the west of London the enemy of the Parks is the easterly wind which, blowing for 3 or 4 months with little intermission, brings with it a canopy of soot. It is only, however, towards the end of that time that trees begin to leaf, and as soon as the East winds of spring are over trees have
little to fear from London chimneys. To us, therefore, it seems that if a little care were taken in selecting deciduous trees which leaf late, or which have polished leaves to which soot cannot readily adhere, there ought to be such a reasonable probability of their thriving, at least in the western Parks, as would justify an attempt on the part of Government to beautify those scenes of public recreation.

We may be told that such attempts have been made, and have failed; but until we know all the circumstances attending the failures, if any there have been, we must be permitted to retain our present opinion. Undouhtedly if no care las been taken in preparing the soil, if loose contracts have been made, and contractors have been permitted to use all sorts of smoke-dried nursery rubbish, well nigh dead when planted, we should refuse to admit the experiments to have been conclusive. We have not yet forgotten Victoria Park, or Kennington Common.
That we may not be accused of entertaining an exaggerated theoretical view of this matter, we shall conclude these remarks by a case. No tree in this country is more beautifinl than the Deciduous Cypress. Look at it at Kew and Syon in summer with its towering stem loaded with pale green delicate airy foliage, or observe it in autumn when changing to rich brown. There is not a more noble object. It is said to have been intro-
duced above two hundred years ago. Is it to be found in any of the Parks? We have never been able to find it there. That at least cannot have arisen from London air having disagreed with it; for not a hundred yards from where the old Crystal Palace stood in Hyde Park, there still exist, in a private garden, two flourishing specimens, probably sixty or seventy years old. Now in both Hyde Park, and Kensington Gardens, and St. James's Park are situations in which this glorious tree would thrive ander intelligent superintendence. And so with other things.

Should these remarks chance to meet the eye of the Right Hon. Baronet who now fills the office of Chief Commissioner of Woods, \&c., we trast he will cause some inquiry to be instituted into a subject with which he is himself familiar, and which we ventare to assure him is well deserving official investigation.
Ws learn from the Comptes rendus that the operation of rfstocking with Fish the fresh waters of France is going on so rapidly and with such perfect success that an abstract of the last report cannot fail to be interesting to many in this country. We need not revert to the occasional notices relating to this important subject which have occasionally appeared in our own columns. It must now be well known that by the ingenious discoveries of Golstrin, Lacepede, Boccius, Ghinn, and REMY, and others, the artificial fecundation of fish spawn has become an operation of perfect certainty and simplicity; so that there is no apparent reason why the owners of rivers, rivulets, and ponds should not have them stocked with whatever hardy fresh-water fish they may desire.

It seems that M. Costr has more especially achieved great success in his experiments with trout and salmon. Artificially fecundated eggs, brought from the Swiss lakes, and the Rhine, hatched in his apparatus at the College of France in ${ }_{66}$ Pris, and afterwards brought up in a narrow "stew" set apart for the purpose, have already begun to breed. A lake tront (Ealmo lemanus) $2 \frac{1}{2}$ years
$1 \frac{1}{2} \mathrm{lb}$., spawned lately on a bed of pebbles prepared for her. The number of eggs removed from time to time with a pipette was 1065 , and were spontaneously impregoated with the milt of a common trout (Salmo Fario), only 19 months old. Only 17 out of this number of eggs missed. In the same place are at this moment a salmon trout (Salmo trutta), a common trout, and a lake trout, the oldest not 3 years old and the youngest only 18 months, which are also ready to spawn. Six males, among which are a couple of common salmon (Salmo salar), are ready to milt, and have already mated with the females.
This striking result seems to prove that there is no practical difficulty in breeding fish artificially, but that on the contrary they may be domesticated as easily as any other animals or even as plants. It proves moreover that the practical men who maintained that certain kinds of fish can only breed in running water were quite mistaken; for these Salnonids, bred and kept in a tank, where the water is merely renewed from time to time, not ouly multiply spontaneously, but gain weight so fast that they are just as fit for food and narketable in a given time as if they were wild.
It is stated that the experiments of M. Coste are entirely confirmed by what is going on in the new waters of the Bois de Boulogne. Not long ago 50,000 young Trout, Salmon Trout, lake Trout, Charr (S. Umbla), Salmon, and Salmo Hucho, were put in, all hatched at the College of France; most of them are already between 4 and 5 inches long, and there seems every reason to believe that they will continue to thrive there, provided they are not neglected in winter and destroyed by frost. It is perfectly evident, at all events, that they have found in the Bois de Boulogne all the conditions requisite for their perfect nourishment.

We shall endeavour to find room, at an early period, for Mr. Ashworth's interesting account of the artificial propagation of Salmon at Stormontfield.

## New Plants.

160. Ceanothus integerrimus. Hooker and Amott in Beechey's Voyage, p. 329.
This is at present little known in slrubberies, although quite hardy and sub-evergreen. It forms a slenderbranched tall shrub, with the habit of C. thyrsiflorus,
azureus, and pallidus. The leaves are thin, oval, threeribbed, and almost entirely destitute of pubescence. The flowers are pure white, in narrow terminal panicles. The species was originally found in California by the

botanist attached to Captain Beechey's voyage in H.M.S. Blossom ; at a later period Hartweg found in the valley of the Sacramento. The specimen here figured was obtained from the garden of the Horticultaral Society where it had been raised from seeds received from Mr. Robert Wrench, as a Californian shrub, "resembling the Lilac, but more showy, with white Plum-like flowers." Although we may not
we can say that it is a handsome plat, well wordear vation.
C. verrucosus, quite a different species, is sometimes called integerrimus in gardens.

## VEGETABLE PATHOLOGY.-No. CIV

352*. Carpoptosis $\dagger$ (Shedding of Rice).-Several diseases with which the kice crops are affected in Itsly are enumerated by Ré, but for the most part with so little precision and so few details that it is difficult to form a correct judgment as to their nature. I have already had occasion to allude to two of these; that before us is so singular as to deserve a distinct notiee. Every thing seems apparently to go on well up to the formation of the seed; but no sooner is that accomplished than the adhesion to the partial peduncles of the panicle is 80 imperfect, that the slightest agitation, or The smallest breath of air, will cause the seeds to fall. colouras themselves are at the same time of a reddish colour and very imperfect, their albumen ill developed and their taste extremely disagreeable. Where this dreadrul malady makes its appearance, it is not con-
fined to a few individuals, but is spread far and wide and induces immense loss to the cultivator, sometime amounting to a third of the produce. The diseased seeds, as is the case occasionally with Ergot, ate not
deprived of the power of vegetation. So deprived of the power of vegetation. So far from this being the case, their vitality, or at least their term of vitality, seems to be increased, as they sometimes'lie in the ground one or two years before they germinate, and end plants which spring from the diseased seeds are parew with the same constitutional peculiarity as the pated, cropping, as every seed which remains in the uround has the power of infecting neighbouring plants. It is much to be regretted that no examination has been made of the infected grains, for whether the disease be that which produces Ergot, or whether it consists merely in some modification of or whether it consists
tissues of the seeds and their contents, the subject is of great interest. Ru remarks very judiciously that though the disease at present has appeared only in the Rice, it may possilly
be found on other aquatics, and I would therefore recommend such botanists as are interested in Vegetable Pathology to watch for indications of it in our Water Grasses. There is a disease in the Rice plants also mentioned by Ré, which may possibly depend upon the sume cause, though the phenomena are not quite the same. In this malady which Ré calls Selone, a word moperfecty in but uncertain derivation, the seed is very the panicle is sterile, the integuments alone being tormed without any farinaceous matter. This affection is said to occur in cold wet summers, or when cold winds are prevalent, especially when the seed has been long in the ground before germinating, or where it has been sown late, but if it he true that it can be prevented by early of the there may be some doubt as to the correctness of the
have hitherto considered those diseases which arise from internal or constitutional causes which whe inappreciable to the observer, and are known only by their effects. A few cases meanwhile have been introduced evidently belonging to the same generic divisions, though their
causes have been different. I now come to a large class causes have been different. I now come to a large class of diseases in which the causes are no less appreciable than the effects, at least where they are satisfactorily ascertained. In some cases however where constitutional disease already exists, the causes may act more intensely, or may be so ohscured or modified as to make the diagnosis doubtful. These causes are of various kinds,
consisting either of atmospheric conditions injurious to or incompatible with the health of the particular plants. which may be the subject of disease, direct poisons, actual injuries, or the presence of insects or parasitic fungi, inducing alterations of structure and to a greaterlatter especially cive rise to the greater part of the latter especially give rise to the greater part of the-
diseases which make the production of corn and some other objects of cultivation so precarious. It is fortunate however that the nature and effects of these are now well understood, and in more than one ins ance remedies can now he applied with almost complete certainty of success. The due appreciation of this has done away with many of the crude notions which assimilated the diseases of plants to those of men which bore an external resemblance to them, while on the other hand Animal Pathology is every day acquiring greater precision from the linht thrown upon it by the accurate investigation of parasitic fungi. M. J. B.

## ON SEEDLING PEAR TREES WHEN THEY

 FIRST COME INTO BEARINGThe raiser will now be in possegsion of a number of seedlings from the finest fruits, both as regards form and favour, which have been produced by some of the new and improved varieties. To each of these seedling plants he will take care to fasten with zine wire a number of the variety from which the seedling has been obtained. This label must never afterwards le removed These young trees, trained either as dwarf or tall pyramids, according to the directions given in a former
as quickly as possible. The successive selection will
have been made at each transplantation according as the trees appeared promising. Planted at a sufficien distance apart, the trees will have been regularly dis buddej, and the shoots thinned out, before midsummer end of the second flow of sap (last week in September or begianing of October), care will have been taken to shorten the shoots, and also the vertical stem, more oi firmness to the parts left. Firmly established in the sil by well subdivided roots, the seedling will begin to exhibit a tendency to bear fruit in its upper part. It is at the time of coming first into bearing that a seeding the perieds of blossoming, when the fruit sets, and when the latter is swelling off. Its vigour having been ascerbe easily done by its produce, and its fertility by the number of fruits. The observations made on these points can only be considered as temporary; thei years, in which the characters are more strikingly brought out.
When these points are settled the next proceeding is to thin the fruit where there are too many set on the wo fruits; on a branch spur one fruit, and on an elongated spur, (brindlc) two at most. The fruits which ought to be taken off should be cut horizontally through the middle so as not to injure the parts lef This operation is performed in dry weathe dry day, towards the end of May or in the first fort night in June. The fruits regularly distanced in this manner on the different parts of the tree become better
developed, and acquire a more perfect form and more characteristic properties. We do not say its definite form, nor all its qualities, because that form is fre-
quently not settled till after four or five years' fruiting, and because the qualities become better as the tree acquires greater strength and vizour, is more firmly rooted in the soil, and as it arrives at the period of mature growth. The same remark applies to Pear
trees grafted for dwarfs near the ground on the Pear stock with scions taken from trees which have been in bearing for several years. The young stocks influence the graft ; they retard the formation of fruit buds, and from their wood not being old enough the fruit does trary, a strong atock, grafted at the height of 6 or 7 feet trary, a strong stock, grafted at the height of 6 or 7 feet
with a scion taken from a part of a tree in a bearing condition, will in three or four years produce fruit of the same form and flavour as that produced by the tree from which the scion was taken. This is solely owing to the age of the stock and the condition of the scion
itself. In support of this many proofs could be adduced. By trying this practice it will be found that thes assertions are founded on facts aseertained by experi-
ments. Let us now return to the seedling in bearing. Presuming that it is growing in a soil that is neither to light nor poor, yet if prolonged dronght occur in summer the tree will suffer, and the growth of the fruit will consequently be checked. This may, however, be prevented by the following mode, which is applicable to planted where it is to remain, two earthenware pipes are placed perpendicularly in the earth at $2 \frac{1}{2}$ feet istance from each side of the tree. These pipes are
from $1 \frac{1}{4}$ foot to 2 feet in length, and 4 inches in diameter. They are made to rest on brickbatsin order to allow the water to escape at the bottom. Their upper end is an inch above the surface of the soil, and covered with a
paving tile, 8 inches square, and 1 inch thick. If excespaving tile, 8 inches square, and 1 inch thick. If excesfilled in the evening with rain water, mixed cow-dung. Water supplied in this manner to the lowest roots enables the suffering tree to recruit its forces during the night, and next day its vegetation exhibits iresh energy. The fruit is thus prevented from being watering of the surface of the ground is useful, but is not sufficiently effectual. These waterings are given every other day, and so long as the drought renders them necessary

Hith respect to a seedling, the training of which has beeu properly managed, the branches well established, summer pruning should be performed with great care and but sparingly, as at the winter pruning, the shoots by these operacions are generally left longer or shorter Whing to the vigour of the tree
When a seedling Pear tree comes into bearing it ceases to produce over-luxuriant shoots. Its energy is then employed in producing fruit, and in the formaWe of organs for fructification in succeeding years they are pass of arly autumn ruits, as autumn aurried, to ter, and spring fruits our observations are carried to the last fortnight of September. If the indicate its maturity by signs which the practical man ean recognise, such as the colour of the fruit itself, or that of the leaves. The most certain sign of all is when by pressing the stalk of the fruit it parts from the spur be the influence of the moon with respect to the pariod of Eeeping Pears gathered towards the period of the

It is thus that we have sept till the middle of February fruit of the Beurré Diel and Passe Colmar, the asual period of the ripening of these being December and anuary. In colder and heavier Bon, keeping Pears do However, the maturity of the fruit on the tree and th period for gathering depends greatly on the aspect, the asture of the soil and the greater or less warmth of the season. This subject has been treated at greate ength in an article in your volume for 1854, p.
As sonn as the fruit of a seedling Pear is gathered a
mall wooden label, on which is written the number o small wooden label, on which the fruit as well as the etters A. B. C., is tied to the stalk; and further, avoid all confusion or doubt, a duplicate of such label is tied to the tree. On the other side of the label attached to the fruit is written the date of the gathering, whether having seared the end of the foot-stalk by dipping slightly in melted rosin, the fruit is placed on
dry cloth on a shelf of a room, the air of whic is rather dry than otherwise. Five or six day where it is watched until it appears to be ripe. I should then be placed in a small Willow basket, and daily inspected till the time of tasting. Previously
however, to doing so the fruit should be cut in half however, to doing so the fruit should be cut in half
longitudinally, or from the eye to the stalk, but withou injuring the seeds, which, if the fruit prove first-rate will be required for the purpose of resowing. The our paper, in order that the ex che without awal ing the smallest portion. The slices, which should be smal and thin, ought to be placed between the palate and the tongue, this being the infallible touchstone of taste. The properties in the fruit having been discovered with skil and impartiality, no feelings of paternity being allowed to interfere with our judgment, they are successively noted
down on the paper on which the outline of the fruit and down on the paper on which the outhine of the fruit and
its stalk is traced. If the fruits borse on different parts of the tree continually present the same properties, goo or bad, the raiser will note them down. The first notes, dated, will serve for reference in following years, when the fruit again comes to be tasted from the same tree. If the raiser discover that either of those productions possess superior qualities, he will submit the fruit to the judgment of connoisseurs well known to be impartial. Then, when assured of the merits of the variety, he will submit the fruit to Pomological Committees. He will collect the opinions given. If all are uniformly favourimporthere is still a final pronf wanting, and the most other phe the the possess the ing, in the open air. This may be ascertained in the last fortnight of August.

Finally, the raiser will cause a correct drawing of the fruit to be made, according to its average size and
general form ; and he will also describe it. He will collect all the information relative to the tree and its fruit, together with the means of preserving the former in its full vigour, hardiness, and fiertility, according in experiments made in different soils, situations, and
By adopting this rational mode of proceeding, the raiser of a new and improved variety of fruit will meri well the thanks of those interested in the cultivation of fruit trees, sparing woth amateurs and nurserymen troublesome experiments, which frequently res
grievous disappointment. J. De Jonghe, Brussels.

## HAVE FERNS SEXES?

Perbaps you may recognise the great clumsy hand of me who wrote to you many years ago. I am still only an under-gardener ; but that's not my object in this letter. Distribution of the Vegetable Kingdom," as you pro pounded it in your "Elements of Botany," of which managed to obtain a second-hand copy. I made a sor of a circular chart or map of your tight classes, comprehending all plants and vegetables now discovered by the human mind, and the assistance of microscopes t boot. I painted the different divisions to help my memory
and then I took the card-board map and hung it up in and then I took the card-board map and hung it up in the tool-house by way of being Landy for me. I found
that we had examples in England, natives I mean, o the eight ; and by degrees I got that I could classify most plants I met with without running into the tool-house. A few months ago I was coming along with a bunch of Ferns in my hand, course thinking they belonged to the great esexua ivision (or State II.) at p. 230 of your Elements, in the for I find 1 remember things better when I hear myself saying them plain out. And so I was doing about the bunch of Ferns; when up starts the head gardener from behind a large sweet Bay tree that everybody admires, and the cook steals lots of leaves from, and says he, "Mr. Jolly, let me tell you that Feras dou" belong to that division; you've clapped them on the wrong side of the hedge." And then he pulled out the last edition of Mr. Francis's British Ferns, edited by Professor Henfrey, of St. George's Hospital, and rea in that book as how Ferns have sexes, and life as other flowering plants. At lea
My stars and elastic garters! Am I to alter that
all my fine coloured divisions ! To say nothing of the confusion that will take place in my own head for sonse months. I was told that some sharp fellow had watched the marriages of Ferns with an enormous microscope, and had made affidavit of it. "But," said I, "suppose some half-dozen other sharp fellows watched too, and didn't see 'em." At which I thought the head-gardener would have died, for he laughed consumedly ; and, apparently, at my expense.
Now, dear Editor, you long ago answered a letter or beg one line in your answers to correspondents mayin whether Ferns have sexes, or whether they may still keep their place in the esexual state on my coloured chart in the tool-house, in spite of the head-gardener, who is a most respectable gentleman. Yours to command, Gites Jolly.
Postscript to Giles Jolly's Letter:-It may be that al he question in my letter has been setted in some of your late works, but I can't afford to be flush up with all new idess and discoveries ; and I live in a remote district, and for the most part keep company with vege tables and insects during six days of the what an compelled to ask for information short and pithy from learned heads and kind hearts (like yours) in a way that won't touch my poor pocket. Yul will see, withou spectacles, that I don't mean you to publish my letter but to look upon it as intended for your private refresh ment, and the means of settling the moral condition o a large parish of plants; and of my being placed in a Fosis to speak with authority abo chaplets with which Queen Nature adorns her magnifchaplets Wo wile Jog " wish happy new year to Dr. John Lindley, and so farewell. IIt is true that Ferns have two sorts of organs, which may possibly be sexual: but upon this point we mus ask our good friend Giles to consult our columns nex week.]

## PUMPKINS AND SQUASHES.

The following communication from Dr. T. W. Harris, of Cambridge, Massachusetts, to the Pennsylvania Farm Journal, furnishes much desirable information respecting the origin, qualities, and uses of his several varieties of these vegetables
In September, 1834, Mr. John M. Ives, of Salem Massachusetts, exhibited in Faneuil Hall, Boston, new Squash, to which he subsequently qave the name of the "Antumnal Marrow Squash." This fruit, thu introduced, and brought into notice, soon became a cu tivated forte, and has ever since been extensively vicinity of Boton. So popular has it becies, in the vicinity of Boaton. So popular has it become in the
market of Boston, that it may well be called "the market of Boston, that it may well heard that name applied to it. Mr. Ives, in his description of it, called If nariety of Cucurbita melopepo, wish is an error. If not a nuere variety of Commodore Porter's Valparaiso Squash, it doubtless descended from the same stock an the latter. It must not be confounded with the kind cultivated in England under the name of "Vegetable Marrow"-a very poor vegetable, as I am assured by friends who have eaten it in London-and apparently one of the sorts which in New England would be called summer Squashes. The "Autumoal Marrow" is eaten only when fully ripe; the "Vegetable Marrow," like "Cymlings," is eaten only in an unripe state. The former comes into eating in September, but may be kept with care till March. When pure or unmixed by crossing with other kinds, it is considered as the very best autumnal and winter Squash in New England. Many cultivators have allowed it to degenerate or become mixed with the larger and grosser Valparaiso, so that we do not often find it in entire purity in our markets. It generally has only three double rows of seeds.
The Valparaiso Squashes, of which there seem to be several varieties, known to cultivators by many daplcation belong to a peculiar group of the genus Cucurbita, the distinguishing characters of which have not been fully described by botanists. The word Squash as applied to these fruits is a misnomer, as may be
 and to call the fruits of this group Pompions, Pumpkins, or Potirons. It is my belief that they were originally indigenous to the tropical and subtropical parts of the western coast of America ; they are exten sively cultivated from Chili to California, and also in the West Indies, whence enormous specimens are some times brought to the Atlantic States. How much soever these Valparaiso Pumpkins may differ in form, size colour, and quality, they all agree in certain peculiarities that are found in no other species or varieties of Cucurbita. Their leaves are never deeply lobed like those other Pumpkins and Squashes, butare more or less five angled, or almost rounded, and heart-shaped at base they are also softer than those of other Pumpkins and Squashes. The suamit or blossom end of the fruit has
a nipple-like projection upon it, consisting of the permanent fleshy stile. The fruit stalk is short, nearl cylindrical, never deeply fivefusaned, but merely lon gitudinally striated or wrinkled, and never clavated or enlarged with projecting angles next to the fruit. With seeds. To this group belong Mr. Ives sutumna
 keep quite as well as the latter.

The plants of the foreroing Valparaiso, or Potiron group, are more tender and lesshardy than those of the more subject to the attacks of worms or borers (Ayeria more subject to the attacas of worms or burers (AEgeria common Pumpkins and winter Squashes, have a thinner and more tender rind, and finer-orained, sweeter, and less strongly-flavoured flesh, on which accounts they are preferred by most persons for table use.
The New England 'Crook-neck S

The New England "Crook-neck Squash," as it is commonly but incorrectly called, is a kind of Pumplin, perhaps a genuine species, for it has preserved its identity, to our certain knowledge, ever since the year 1686 ,
when it was described by Kay. It has the form and colour of the Cashew, but is easily distinguished therefrom by the want of a persistent stile, and by its clavated and furrowed fruit-stem. Before the introduction of the autumnal Marrow, it was raisen in large
quantities for table use during the winter, in preference to Pumpkins, which it almost entirely superseded. Many farmers now use it instead of Pumpkins for cattle, the rine being more productive, and the fruit containing much more nutriment in proportion to its size. It
varies considerably in form and colour. The best kinds are those which are very much curved, nearly as large at the stem as at the blossom end, and of a rich cream stripu's and spots. Some are bell-shaped, or with a very showt and straight neck, and are less esteemed than the others; for the neck being solid and of fine texture, is
the best part of the fruit. These crook-necks can be lept all the winter, if not exposed to frost, and I have eaten of them when a year old. On account of its is prinans the most valuable variety to the New England farmer. It is said to degenerate in the Middle and Sowhern States, where, probabiy, Porter's Valp:t raiso or some kindred variety may be better adapted to the climate.

The early Canada Squash seems to be a precocious and dwarfed variety of the common Crook-neck. It is
smaller, with a short and of ten straight neck, and is of a davez and dirty buff colour externally. It comes into cating early, quite as soon as the autumnal Marrow,
and was, indeed still is, much esteemed as a table veret ble

## fur"owed, and prominently 10 -ribbed fruit, with a deeply-

 bufir aud very hard (but not woody) rind, and fine, light yellow flesh, much esteemed in the making of pies and puddings. From seeds received from Paris, under the like the Custard Squash in form and size, but of a dark green colour externally, and entirely worthless as an artich of food. Nevertheless I infer that the Custard Squabh is merely an improved variety from the same originst stockThe fruts belonging to this second group probably originated in the eastern or central parts of the two
Ameticas. They were cultivated by the Indians, and were 'ound here in their gardens and fields by Euro-
peass on the first settlement of the country. P'umplins, or hell-shaped Squashes (as New Englanders would now call them), were found as far north as Saco, by cultionterl by the Iroquois Inlians, and still bears their namse in France. Pumpkins were found by Raleigh's colnny among the Indians in North Carolina, and by genonit kinds in Brazil, and we have seen that even Caltivation has, doublless, improved their qualities, and has caused them to sport in numerous varieties, so that it is now difficult, if not impossible, to determine which of the known kinds are typical species and which are mere varieties.
A third group remains to be described. The representatives of it are the Cucurbita melopepo, verrucosa,
and ovifera, of Linnæus. It includes all those kinds called in New England summer Squashes, because they are eaten only during the summer while they are soft and tender, and in au unripe state. These are the only
name, derived from the language of the Massachusetts Indians, by whom, according to Roger Williams, this English from them called Squashes." From the same authority, and from other sources, we earn that th Indians of New England cultivated this kind of fruit or Squashes were "of the bigness of Apples, of cevera colours," while others are represented by Champlain as being considerably larger, turbinated, and more or l.-. which in France is ealled Bonnet de prätre, probul!! the prototype of our scalloped Squash, or Cucurbita melopepo. Bartram found a Squash-vine growing wild in the interion of East Finnina, chm ing to the tups of and size of an Orange. Mr. Nutall iuforms us that the warted Squash, Cucurbita verrucosa, was "cultivated by the Indians of the Missouri to its sources." It has generally been supposed, on the authority
Linngens, that the Egg-squash, Cucurbita ovifera, was native of Artrachan in 'lartary. On turning to the
account of it given by Dr. Lorche, from whom Linnæus received his specimens, I find it included in the list plants not natives of the vicinity of Astrachan, but culexotics as Indian Corn or Maize, with which it wa probably introduced directly or indirectly from Amevaried in form, being sometimes Pear-shaped, that was sometimes variegated in colour with green and white, and that the shell served instead of little boxes. Here we have plainly indicated the little Gourd-like cultishelled, and variegated Squashes that are ofte cultivated as ornamental plants. From these and
similar ruthrities, we conclude that summer Squashes were originaly natives of America, where so many of them were found in use by the Indians, when the country began to be settled by Europeans.

Under the name of Cucurbita melopepo is to be in cluded what in New England is called scalloped Squasb, and in the Middle and Southern States, Cymlings perhaps the patty-pan Squash is another synonym fo compressed fruit, with scallop edges, and more or less warted surface ; it measures often 10 or 11 inches in transverse diameter, and 3 or 4 from stem to blossim. It varies in form, being sometimes much thicker, and the name of Bonnet de prêtre, or Priest's cap; perhaps round really its oliginal form. round, are sometimes seen. The Y(th-L)

## Home Correspondence.

Horticultural socicty. - I was pleased to read (p. 22) the remarks of "F.I..S." in reference to the past, such men, and the friends alluded to, depends in
degree the stability and progress of scientific associations. They cultivate science for its own sake, and it then society can number many F. I. S." in his conclusions regarding exhibitions, and the proposals of the Council to hold them in London. It appears to me that a large and inviting field is open for early summer and autumnal shows. If a large hall
could not be got I am of opinion that a series of rooms would be equally interesting; ronms show off plants first rate. Then there might be the Orchid room, the Rose room and so on. The show in such a place could easily be kept open at least two days. If liberal prizes were offcred, "the Society" might count on a grand exlibition and plenty of visitors. The love of flowers and fruits will
never die. Who can estimate the amount of good which the horticultural shows have imparted
value of scientific associations is to be estimated according to the happiness they confer on the human kind, then may "F.H.S." and his friends rejoice that they have aided so excellent an institution. Look at the number of offishonts which have sprung from the parent society. Why Sydenham, the Botanic, \&c. \&c.,
are only imitators, and yet there is room for them and are only imitators, and yet there is room for them and
more. Mark, too, their quickness of action. It is but as yesterday that the Vice-Secretary of the Horticultural Society gave expression to the idea that Roses might be grown and exhibited in pots; prizes were
offered, and the beautiful and grand results are already patent. The capital expended in this one direction alone must be considerable. I might expatiate on the encouragement these meetings have given to the introduction of new and rare plants, but for which many must lave too mighed unseen. Those glorious groups of Orchids, the banks of Roses untouched with the scorching ray might never have inspired heavenward thoughts; the beautiful Pelargoniums with the unique "fancies" must humble Heartsease, so circular in form, velvety in substance, decided in colour, fine eye, well defined in its markings, and withal so pure, might not have been learnt had it not been for the Horticultural Society. specimens of plants and fruits from every clime might not have told of the tireless energies, the vast riches, and the advancement of England in the culture of the arts of peace, whilst the recreative, the refining, elevating, and instructive tendencies of such magnificent
f enjoyment could not have been so demonstrated Apart then from much good which the Society has
effected in other directions, I fancy that no small effecter in otlier "irections, I fancy that no smal
share of its large "capital" for usefuluess may b racerl to its strenuous support of the exhibitions. hasten to reply to an error of "F.H.S." involved in
the following sentence:- "People no longer exhibit their productions for honour or for the sake of horticul ture, but purely and simply for the money they can make." Granting this to be true, "F. H. S." must why it should be abolished. But I think I can prove that a large majority of the exhibitors not only do not make money but lose it. Take what some say is the reputation of loeing most liberal. The highest award ffered is for the collection of fruit; some of those wh compete in this class "put up" 8,12 , and 16 dishes dishes. For this the gold medal is awarded, value $7 h$ Several of the principal exhibitors have to travel
upwards of 80 miles, and some double that distance. To come in you must send one or two men, who mus stay two days and two nights in London. By this competitor cannot make money. True, the Society allows a kind of moiety for carriage, and some em ployers also pay expenses ; but many do not. I repeat that more lose than make money, and I need not tel kind of work. Councils and managers may think they are very generous (and perhaps they are, and offer as much ns they can afford) ; but "F. H. S." may take for granted that exhibitors make greater sacrifices tham than money with exhibitions, and that something els than money incites them to action. Heo. M•Evoen

The Scotch White Cluster Arape.-This was distributed by the Horticultural Society some years since; it isa robust grower and very hardy, with large leaves, but slightly lobed ; a most abundant bearer, and rather earlier than the Muscadine ; its berries are much "crowded in the bunches, and require severe thinning. It is an old Dutch variety; I have received it from Holland under the name of "V

Rain-fall and Drainage.-At the end of another remarkably dry year, it may be useful to inquire whether there is any likelihood that the general average of the rainfall may have been disturbed by any cause ; and whether therefore, we may look for a less average for the future. Will any of your meteorological correspon dents inform us if, in their judgment, such a cause may years? In "Prout's Bridgewater Treatise" (p. 337 edit. 1834) I find two estimates of the relative quantitie of the total rain-fall due to evaporation from the surface of the land on the one hand, and "drawn from the seas that encircle our shores" on the other. Dr.
Thomson (who estimates the mean fall of rain throughout Great Britain at 36 inches) attributes only 4 inches to this latter source, while Dr. Dalton gives 13 inches as the quantity of "water flowing off by the rivers evaporated from the surface of the land. These two estimates are wide enouglı apart to show that at that period not much was known accurately on the subject. Has any more definite knowledge been gained since? Would not the drainage of late years, by withdrawing the wate more rapidly from the surface, decrease the amount of
cvaporation and increase that of the water flowing off by the rivers; thus cutting off a portion of that which according to either estimate, is the main source of ou supply of rain? Doubtless many meteorologists have considered this subject, but I do not remember to have met with any discussion of it. Any information of remaris

Cucumber Disease.-The experience I have had of this malady leads me to think that it is in a great measur brourht on by improper treatment and an injudicious application of stimulants. I allude to plants under gass. The evil first appeared in ridge Cucumbers her won after a thunder-storm and a heavy fall of rain at the time I solely attributed the canse of the disease; but in the case of plants under glass this may be obviated Three years ago I had several pits and boxes, and a the plants in them were doing as well as could be desired, bearing fruit abundantly and of the best quality ; but on the amount of attention required being reduce to giving air, \&c., merely when I happened to pass hav been given had I had to depend on them for a crop, the distemper manifested itself quite as boldly as on those ridges, attacking the fruit in all its stages. Clos by I had some more pits in bearing order, but dal attended to, and out of these I continued cutting quad tities of fine fruit till the middle of November, and let be observed, those were cuttings taken off the disease plants previous to its appearance; and more, they wex grown in a portion of the same soil. Ever since it appearance has, therefore, given me little concern, as conceive that the evil is brought on by neglec Every blue apron ought, therefore, to be ashamed it; we generally are of mildew, and we ought to be the same of this disease. Angus M'Leod, Whitfield, near "Walker's Rambler" in one of the vineries here planting them close to the front parapet, to be traine
vigour, producing large and well-formed fruit, the other
had its fruit quite deformed, ceased to swell, and became discoloured at various stages, from 6 to 10 inches in length; in fact, I never cut a single fruit from it, the leaves were slightly spotted, but not generally over the plant. I certainly could not perceive that the plants more than 4 feet apart. The disease is not much fel in this part of the country as yet ; but I am led to Angus M.Intosh, Castlerea, Ireland.

Cheavin's New Patent Filter.-I went the other day to Spalding, where Mr. Cheavin lives, and bought one of
his $4 l$. 10 s. size, which certainly is at present an extraordinary thing. In two minutes the water trickles; by the time it has been three minutes at work it pours its
full stream, and that runs at the rate of a gallon in two minutes and a quarter. This would be something like 640 gallons in the 24 hours, and the filtered I have bored three times and thought I must be permanently dependent on my neighbours after all for but the filter, if it will last, has set me up. Iota.

Vitality of Seeds.-Permit me to send you three seeds of some Coniferous plant, and also part of the cone
for your inspection. About a month back I had seven seeds given me by Mr. Brown, gardener to
Esq., Alpha Road, who has had the cone in
Esq., Alpha Road, who has had the cone in his possession upwards of nine years, and previous to that
an ornament for many years in a Yorkshire. It is probably 40 years since it was gathere from the tree. About three weeks ago 1 sowed seven seeds in a small pot, in a mixture of loann, peat, and through the shell of each seed. They have all vege tated, aud were potted off to-day in small and thumb pots. Perbaps it may be as well to state that I always [The seds and cone are those of Pinus Pinea, the
Stone Pine.] Stone Pine.]

Cloacine.-That the fecal matter known under this name is capable of communicating a foetid odour to
vegetable productions is quite certain, from the fact that Agaricus picaceus, when growing from ground highly impregnated with that substance, is so undisguisedly
filthy that it is a very unpleasant task to examine it, filthy that it is a very unpleasant task to examine it,
much more to prepare specimens for the herbarium, It might indeed, under such circumstances, be as justly denied admittance into the house as some species of this is the case, it is quite credible tlat acgricultural crops may sometimes suffer in quality where the dreusing manure than cloacme where it is properly administered, manure than cloacule where ich it is considered by goo especially to cereals, to which an man to pastures
authority as more adapted that good effects of such manure, and the total absence of
any offensive t.ste or odour in the produce, we can speak from personal knowledge, where proper pains have been taken to mix it well with the general produce of the farm-yard, or, as the popular phrase is, to kill it, by the admixture of soil in such quantities as may absorb the mass. One of the best and most successful cultivators, and at the same time oue of the most observant, with whom it has been our chance to have intimate relations, set the greatest store by his night cart, which traversed the country far and near, the contents being
mixed in the course of the season not only with the manure of the straw yard, but with road scrapings and the rejectamenta of a neighbouring river, which afforded an immense mass of matter, consisting of river weeds
mixed more or less with sand, mollusca, and other animal productions. Not the slightest inconvenience was ever experienced, and the produce of the farm was superior in quality to that of most of his neighbours, and far more abundant in quantity, though either fact might, perhaps, in some measure be accounted for by the ture, like guano, such manure is in most cases too strong, but even where plants like Roses are greedy of such coarse nutriment, it does not follow as a matter of necessity that the foetor of the manure should be communicate when so treated are less delicately scented. M.J. B. Seedling Pears.-The interesting communications M. de Jonghe will probably induce some of your readers
to try their hands at raising Pear seedlings. It is to try their hands at raising Pear seedlings. It is endowed with the zeal of Van Mons, and devote whole acres to raising many thousand trees in the hope that some few may reward their toil, and I would therefore throw out for their consideration the following suggeshybridized s'e l, may give better resalts than hundreds of chance seedlings. Let us consider what is the great For winter use, nothing can be expected to exceed, or even to equal the Winter Nelis. Suppose then we cross the Easter Beurré, a handsome hardy productive and
good heeping variety but deficient in flavour, with the pollen of Winter Nelis, or else make use of the Leon le Clerc de Laval as the fennale parent. This last Pear, though a baking variety, is all but a dessert
sort, and its keeping properties deserve especial notice. If I could induce only a dozen of your readers to hybridize and ripen off only one fruit of the
very little trouble to themselves, they will, in all probwere desirous to extend their experiments to autumn Marie Lonise, is somewhat deficient in flavour, and that this might he given by the pollen of that most excellent I may mention that the eating varieties, when not too ripe, are most delicious baked, and far better than ordinary baking pears. Speckled and inferior specimens may thus be most usefully
Endire-- Holand no table is without it, and as a vegetable In Holland no table is without it, and almost no day in
the year. It is the most universally popular dish in the country, and the most savoury morsel I ever tasted. But the method of preparing it is somewhat different from that given by your correspondent. Take two gond Endives, not blanched, separate the leaves, and boil them in two waters (to extract the bitter). If still
bitter use a third water, but ten minutes before they are ready throw iu a landful of Sorrel leaves. When ready take them out and strain them, and put them ack in the saucepan with a piece of butter the size o
Walnut, pepper and salt, q. s., and a table-spoonful Walnut, pepper and salt, q. s., and a table-spounful
any rich gravy. Shake them well over the fire till of any rich gravy.
all is incorporated, and send them in hot. On no account chop the leaves. Iota.
Gooscberry Caterpultars.-This is the season in which I take an easy method of destroying these pests that caused so much loss last year in different localities. About 12 years ayo, finding my trees repeatedly attacked, I learned that after the caterpillars had done
feasting they dropped on the ground, and forming cocoons lay until the warmth of spring caused the fly to emerge, whose females depositing their eggs on the leaves, the young brood were soon hatched. I should
curred to me that if the old ones were buried be free from them altogether, and so it has proved therefore, before annually manuring the trees, I have about an inch of the surface earth, to the extent of the branches, carefully taken off and laid aside; then a few
inches more of the earth to make room for the manure; but before putting it on all the surface with the cocoons is thrown in, and thus buried under the manure and the remaining few inches of earth. Since I adopted his plan, except a few trees one or two years which had reason to think were neglected, I have been free rom the caterpillars. A few weeks since I was in a distant part of the country where I had recommended five or six years ago my burying plan to a lady had adopted it they were quite free from the insects hut added, "I take care that it is properly done." Joh

## Rain at Itchen Albas, Hunts, in 1855 :- <br> 

. W. Spicer. A ilanthus glandulosus.-Mr. Godsall's account of the
quality of the timber of this tree is nearly the same as that given me by our carpenter. I shall, therefore, now merely give you the dimensions of the tree and its probable age. At 1 foot from the ground it measures 2 feet 11 inches in diameter; at 14 feet, 1 foot 9 inches, where it branches into two arms to the heighes in diameter ; it carried a splendid top to 20 or 30 feet higher, which when made into common faggots numbered about 36. My employer considered the tree to have Elmham Hall, Norfoll.

## 

The Botany of the Antarctic Voyage. Part III. Flora Lovell Reeve.
Dr. Hooker in this work enters upon the third and last portion of his great undertaking to illustrate the vegetation of the southern Regions visited by him while ander the command of Sir James Ross in the antarctic voyage of the Erebus and Terror. With what care and skill the previous volumes were written and illustrated we pointed out at the time of their publication. In no degree is that which has now begun to appear inferior to its predecessors in execution, while it exceeds them in general interest. To a great extent the Flora of Van Diemen's Land or Tasmania is that of all Eastern Australia, as high as Sydney, and therefore, when conapleted, the volume before us will be almost as welcom to the naturalists of the mainland as to those of Tasmania itself.
The materials for the new undertaking are derived not only from the author's own observations on the spot, but from the contribations of his friends, among whom must be most especially mentioned Mr. Ronald Gunn, who with untiring zeal and great acuteness has spent no
tation of the country in which his lot has cast him. At every step we meet with evidence of the wonderful
activity of Mr. Gunn, whose name is now most activity of Mr. Gunn, whose name is now most dee first great investigators of Tasmanian Botany. Nor is it to colonists only that this work possesses interest of the highest order. Our gardens abound
with plants from Van Iiemen's Land, some of which are hardy enough to bear our hardest which are hardy enough to bear our hardest
winters. Every packet from Hobart Town brings in winters. Every packet from Hobart Town brings in
little consignments of seeds, and many a horticultural eye watches eagerly the growth of the antipodean strangers. But when it is wished to ascertnin beforehand what manner of plant may be expected to spring from seeds whose names are unknown in gardens there
has been no bonk to which the inquirer could refer. Is Dryptandra pimelecides for example with the care which is hestowed upon it? or Leptocyamustamannicus? None but a few experienced botanists could heretofore reply. The answer is now within the resch of all who public library.
The part before us extends from Ranunculacere to the beginning of the great Tasmanian order of Leguminosse, by 20 of Mr. Fitch's admirable drawings.
Grifith and Henfrey's Micrographic Dictionary (Van Voorst) to which we have adverted on former occasions, is now completed in the shape of a solid $4 t 0$ vol. of more the general reader it will prove a very useful book of reference ; and even the professed naturalist will often consult ils pages with advantage. Its great fault is that the authors never give their anthority for their representations of microscopical objects, although by far the greater part are not their own ; this, which is hardly fair to those whose figures are used, is more especially embarrassing to those who use the volume; and who, when they fail to discover the structure indicated, naturally wish to know whether they are at variance with the observations of trustworthy examinera, or are merely in the presence of some of those writers who possess the faculty of seeing what does not exist. For example, we would ourselves ask from whom the figure of the starch grains of Barley is taken, it being neither in correspondence with our own eyesight nor with that of Mr. Lennard, a skilful and conscientious artist who drew Pereira's plates. Another circumstance to which
we must draw the authors' attention is that when figures we must draw the authors' attention is that when figure are parvified instend of magnified they do not say so, as in the case of Clathrus cancellatus ; this may be of no consequence to the experienced naturalist, but must be matters will be rectified in another edition.

## Crarden Memoranda

Hecheield Place, Hants, the Seat of the Riget Hon. the Speaker. - This delightful residence is situated about eight miles from Keading, on the Great Western, and five miles from Winchfield, on the South Western lines of railway. On two sides of the house is a raised terrace garden, which in summer is a blaze
of floral beauty, and in winter is rendered interesting by of floral beauty, and in winter is rendered interesting by means of different kinds of evergreens, with which the beds are at present well furnished. Beyond is a beautifully undulated park, in the bosom of one of whose valleys is planted with Rhododendrons and other American shrubs, which serve to beautify and vary the foreground, and which when viewed from the terrace and windows of the mansion have a striking and excellent effect. In the park, which is about 350 acres in extent, are some fine Oak, Elm, Beech, and other timber trees. Larch too seems to succed admirably here, fine specimens of it being seattered everywhere throughout the pleasur grounds, and we also observed some good Tulip trees It is, however, to the kitchen garden and forcing grounds that we wish more especially on this occasion to direct attention. The magnificent forced Strawberries which have graced the exhibition tables at Chis wick from this place have astoniehed everybody, and the Pears and Apples which are annually shown at the Horticultural society's meetings in Regent Street in autumn are not less remariable. Some account therefore of the kind of gardening by which such results are obtained may not be without its use.
Pine Apples and Grapes are here, as at Frogmore, fit for table nearly all the year round, though, of course, in less quantity. At present there is a large vinery here in which there are still numbers of admirable bunches of Black Hamburghs in a good state of preservation. This house is as dry inside as it can possibly be kept, and in order that the outside border may not get wet it has been covere with Croggon's asphalte, fastened on shutters each 2 feet in width, and of a length corresponding with that o the border. Under these the surface soil is as dry as dust, and Mr. Tillyard, who is gardener to the Speaker, is of opinion that for purposes of this kind nothing could answer better. With attention late Grapes may be kept in this way almost till new ones come in. From this house bunches weighing 4 lbs 1 oz . have been cut. The sorts are the common and Mill Hill Black Hamburghs, the former of which has been found to keep sound much longer than the latter. On one Vine we counted
15 bunches, each of which looked as if they might weigh a couple of pounds. The hot-water pipes with which
this house is heated were covered with sulphur
and clay, which had been used to keep down red spider when the leaves were on the Vines. An early Muscat houre has just been started. The rods are broken in dung stea $n$.
Sthe most forward Peach house will soon be in bloom. Standard trees for the upper portion of the roof are planted inside the house, but the roots of those for the lower part are in a border outside, over which there is
a gravel walk. Notwithstanding this, however, the trees produce excellent crops, from 60 to 30 dozen of fine fruit being gathered from them every year. Figs are traiued on the back wa! of this house, and Strawberries are grown on a shelf along the top.
A rainst one of the garden walls is a kind of orchard house, which is, however warmed by hot-water pipes. On the back wall of this house are $\Lambda$ pricots, along the centre standard Plums with their branches bent down umbrella fashion, and in the front Peaches. From this house, which is 70 feet long, an amazing quantity of fruit is annually gathered. Heat sufficient to bring it in a litte before that on the open walls is given and no more, and owing to the house being thoroughly venti-
lated it is excellent in flavour, and hangs a long time on the trees.
For the first crop of Strawberries Cuthill's Black Prince is used, and on plants of this variety on a shelf In an early Vinery there is now ripe fruit of cood size. plants that have been forced. Keens' Seedling and Ingran's Prince of Wales are grown to succeed the Black Prince. Out of doors Sirawberry plants are wintered here in ridges, in which the pots laid on their sides are piled up and buried in ashes, the tops of the planis heing at the same time protected by a coating of sedge with which the ridges are covered, and in this way frost is effectuslly kept from them
brick roof, and shelves put up in the same an arched accommudation for oth up in the same place afford dry sand. Excellent early Rhabarb is also obtained from this cellar. Roots of it brought in from the open ground produce tops fit for use in about three weels after they lave been introduced.
Early Potatoes and Asparagus are forced in brick pits on beds of 2 feet deep ot leaves put in dry, and for surface heat 2 -inch pipes are employed. Although no dung is mixed with the leaves they soon generate suffcient warmth. French Beans and other early crops of Vineries and all other houses where there is enough heat. In a large greenhouse with Vines on the roof were some beautifui Orange trees well furnished with fruit, which at this season is highly ornamental. These trees, Which were beginning to get into bad condition, had had all the soil shaken from their roots last March; when they were retubhed, and since then they have thriven satisfactorily. We understand that a landsome new Orangery is about to be erected for them by Messrs. Gray \& Urmson.
Heliotropes are cultivated here in the form of standards, some of which are nearly 6 feet in height. They are taken out of the open beds in autumn and wintered cader ghass; in spring they are pruned into single when all danger of frost is over. Treated thus, after the manner of Fuchsias, they form obje
The fruit both in summer and antumn.
pecinsens of Pears and Apples in excellent with beautiful specinens of Pears and Apples in excellent preservation.
They wre arranged on shelves on straw covered They wre arranged on shelves on straw, coveved over Colmar, Duchesse d'Angouleme, Old Crassane, Napoleon, Vicar of Winkfield, Délices d'Hardenpont, and even Kinight's Monareh and Seckel. Apples also keep well in this house, whose walls are built of hollow

In the kitchen garden we noticud a
American Cranberry near a cistern, from whic of the ce flooded. It grows in peat, and yields fruit in abund ance, which is said to set all the better for being well Ihe when it is setting.
acked with liealthy trees the kitcheu garden are well stocked with healthy trees. The walls have within the last few years been greatly improved. Where they were too low they have been heightened, and they have
been everywhere washed over with the following composition, which has not only filled up nail hotes, but It consists of Pought, a tendency to keep down insects. It consists of Portland cement, gray lime, and copperas. of a lighter or diarker tint by adding a little more or kess yellow ochre to it.
By the aides of the approaches to the house and in the vicinity of the latter we remarked many thriving young trees of the better kinde of Conifers, which when they shall bave grown up will greatly improve the ap-
pearance of the ornamental grouuds. Some of the pearance of the oraamental grouuds. Some of the ticular mpasured $: 66$ feet in height and 27 through the branches near the ground. Of Taxodiums and Cryptomerias there are also good examples, but some of the latter lose their tops here during winter.

## Miscellaneous

Carnibalism in the South Seas.-The Feejee Island are said to contain nearly 200,000 inhabitants, and those not yet under missionary care are savages of the worst character. They are cannibals to a fearful extent;
habitually feeding on human flesh, not from revenge or
from necessity, but because they prefer it to other food They eat their enemies or prisoners when they can They eat their enemies or prisoners when they can
but if unsuccesslul in catchitg these, their lawful prey they will cook their own wives or children. Not long ago a case occurred at Feejee, when a wretch ordered his wife to heat the oven, and when she had heated it fhe asised him "Where is the food?" "1 ou are the
food!" was the savage reply, as the instantly clubbed her, and theo coolsel her for himself and party! The eaptain of our vessel tells me that the last time he was in Feejee, in 1847 , he saw 100 liuman bod es laid out at one time ready for couking, at a great feast. Some times they cook a man whole (which they call a "longfig"), then put lim in a sitting posture, with a fan in carry him in state, as a grand head dish for a feast. Others chew little bits of raw human flesh (as sailors chew tobacco), and put thera into their childreu' Mr. N. B. Extract from a letter from Dr: Harrey to Mr. N. B. Ward.

## Calendar of Operations

(For the ensuing week.)

## plant department

Conseryatory, \&c.-When it is found necessary to water the beds of this house choose a fine morning for the operation and give enough to well moisten the soil, using lukewarm water for the purpose, and be careful to guard against damp for a few days afterwards by giving air, or when this cannot be done, use sufficient fire-heat to secure a gentle circulation of the atmosphere. Go carefully over the plants every moning and remove any decaying leaves or flowera as snon they are perceptible, for no amount of floral display will
render a house agreeable unless accompanied by cleanlirender a house agreeable uvless accompanied by cleanli-
ness and neatners. And as soon as the beauty of any of ness and neatnems. And as soon as the beaury of any of
the pot specimens is over remove them to suitable quarters elsewhrre, and supply their places with others in full flower. Do not excice Soove plants at present wait for longer duys and more light.

## FLOWER GARHIN AND SHRCBBERIES

With the exception of pruning or thinuing, and wheeling when the weather is frosty, little can be done in these departments at present. Any of the shrubbery borders which may require a dressing of fresh soil or manure should, however, be attended to, whenever the weather is favourable for such worl $\qquad$ tlas may be in hand involving the removal of a con siderable bulk of soil, cutting walks, or anything which can loe judiciously done now should be pushed forward at liberty for the ordinary routine of spring work, which will soon be demanding attention. When out-door operations cannot be profitably proceeded with see to getting an ample stock of stakes made and painted; also pegs, labels, brooms, \&c., and put them aside ready for use when wanted. The preparation of these things is sometimes omitted until they are wanted for use, and then it is generally difficult to spare time for such tedious work, therefore see that there is a sufficient stock of all such things in readiness before the busy season arrives

FORCING DEPARTMENT
Pineries.-Cold changeablo weather will necessitate the use of a considerable amount of fixe-heat, particuwith the view of inducing the plants to show fruit, and in the case of swelling fruit, see that a proportionat amount of atmospheric moisture is secured, for accommodating as the Pine must be admitted to be, it is by 110 means benefited by a warm parched state of the atmo sphere; see that none of the stock is allowed to suffer for want of water at the root. For succe-sion plants a mperature of from will be sufficiently high, but it should not be allowed to fall below $50^{\circ}$. Ineries. The early house will now places will probably be in, and as the Vines in some must not be allowed to fall below $60^{\circ}$, and $70^{\circ}$ should we secured during the day. Maintain a healthy growing atmosphere by sprinkling the floors, \&c., as may b necessary, and admit fresh air whenever this can be
safely done. Also attend carefully to the border, and if Safely done. Also attend carefully to the border, and if
fermenting material is used do not allow the heat to decline, and where this is not used see that whatever covering is employed is efficient.

HARDY FRUIT ANB KITCHEN GARDEN
pruning of orchard trees is a matter which is too requenty neglected, and the result is that the heads of the trees get so crowded with wood as to render a crop Iruit, except upon the extremities of the outer ranches, not to be expected; and the thicket of worse injurious botht to the size and quality of the fruir, sind also to the general health of the tree. Where this atate foungs has oeen alowed to prevail hitherto, a:lvantage hould be taken of the first fpportunity of sparing time rom oller work to give the trees a carelul pruning, mimning out the inner branches severely. In the case of large branches berng cut off, the surface of the wound should be neaty trimmed off with a sharp tool, and covered with a coat of paint, to prevent the wet soaking into and rotting the wood. Prepare soil, \&c., that may be wanted for planting young trees, and get it laid down where it will be needed. Also proceed with the pruning of fruit bushes, \&e., when the weather admits, See to the protection of Lettuces, Cauliflowers, \&cc., Beans, and use theeping up a succession of Freneh the forcing houses, as they are particularly liable to the attacks of red spider, which, if once allowed to gain footing in a house, soon spreads and becomes troable. some. Also introduce roots of Asparagus, Seakale, and Thubarb into heat at regular intervals, so as to make sure of a constant supply. Rhubarb and Seakale do perfectly well ou a shelf, or the fioor of the Mushroom house, where they are probably less troublesome than se

COTTAGERS' GARDENS
Those who pussess even very small gardens will hare follow much of the routine business contarned in the The Apricor, the Cherry, or the Pear thee against the able will require of course the same lind of handling. Gooseberry and Currant pruning must be completed as soon as possible. After pruning it is well to top dress
the bushes a little. To accomplish this draw a little of the surface soil away with a hoe, then apply the manure, and, finally soil the whole over about 2 inches deep. If the weather be mild and the soil in a mellow atate, the Cabbage plot may be hoed through, and if a stock of August plants is at hand on such soils gaps may be filled up. Early sprouting Potatoes are better in the ground than on the shelf, and therefore all who have ground to spare should plant such forthwith, taking care to cover them with soil at least 6 inches deep.

## Che Mgrítultural Gazette.

## SATURDAY, JANUARY 19, 1856.

We fear that the words "Agrictlteral Cosstants," suggested by Mr. Martyn Roberts, are a misnomer. The engineer can quote his "Constants" with confidence, knowing that there is a certain fixity of character about the materials with which be has to deal. The weipht of the atmosphere, the strength of cast-iron, the flaidily of water-all
these vary within known limits, which are sepa-
rated by an interval not so very wide-and accordingly they and many other similar jtems with which he has to ded furnish him with constants in the formulæ which he applies to the varying circumstances that he has to take advantage of, or over which he seeks to triumph. But in the case of agriculture, where is the continual recurrence of the same experience? - the constant occurrence after similar causes of the same effects? Take any series of particulars of one class, whether of cauves or effects, and see how widely separated are the maxima and minima among the individuals What is an English winter or an English summer -what is the annual rain-fall ?-what is harvest weather here? It varies $10 n$ per cent. -any one o them-in any feature of the character you shall give it. What is a clay, a marl, a sand? The word applies to 50 very different things. Or, to take the illustration of his meaning which Mr. Marty Roberts gives-what is "farm-yard dung? I
may be the poorest stuff that ever figured a "oy be the poorest stuff that ever figured as fertiliser-or it may be the standard of which some chemists say that 100 of it are equivalent to 5 of Peruvian guano! We fear that Mr Roberts will not find his "constants" in the manure market. The superphosphate with which he seeks to compare this farm-yard dung is itself the most variable of things. We have Mir. (irady contending for 2 or 3 per cent. of soluble along with an abundance of the neutral or his "semi-soluble" phosphate in his compost, while other makers issue 15 soluble and 15 neutral in the hundred. And Mr. Lawes, we are told, has reached 25 or 30 per cent. of the soluble biphosphate in his "superphosphate "-and yet this name applies to all.
Shall we find the constancy which Mr. Roberts seeks in the soil, the air, or water, out of which farm produce grows-experience even of the second and the third of these particulars is against us. The irrigator knows how variable is the last in its effects in that the air itself, more especially as regards its watery part, is full of change in its character as an agricultural agent. Shall we find it in the life by means of which constancy in the character of these external agents would then exhibit itself in a uniform experience of growth? Plants and animals both vary in that vigour of constitution, according to which their food becomes assimilated. We have Potato diseases, mildews-blights-evidence on every hand in plants that there is no constancy here any more than in the external circumstances to which these vegetable affections are generally attributed. And as to animal vitality we have health in every stage of energy down to mere existence and disease and agricultural constants are not to be sought for in the foldyard or the feeding house. And if we go to the results of our operations, and see them in the butcher's shop, at the seedsman's, or at the miller's-ask for any one of the articles turned out, and you shall have it of half-a-dozen different qualities and of as many different prices. Or look at them in the tables of our theorists and scientific men-in that enumeration of equivalents by which the relative values of our produce is attempted to be indicated -and wou will find that half a dozen different authorities will give as many different statements.
If then Mr . Roberts is correct in denominating what he wants as "constants," it must be understood that that degree of variation which is permitted in the "constants" of the engineer or architect is 100-fold increased in those with which the farmer has to deal. They really are not constants, and the inquiries into their nature which have been saggested mus: he directed rather to the extent of their vaiations than to any attempted definition of themselves. With ti,is modification, then, of Mr. Martyn Roberts's sugcestion we gladly second his desire : and, as an instance, should be exceedingly glat of any information which our corre-
spondents could spondents could give us tending in any degree to
answer the question which le puts-What price per ton can we afford to give for farm-yard dung on the land to equalise it with guano at $13 \%$, and superphosphate at 8l. per ton?

Havisur described Finger and Toe in our last year's Volume, and shown how different it is in its nature and origin from Anbury, the causes of which have also been pointed out, it may be well in this
place to sum up the main differences letween place to sum up

## 1st. Finger and Tuh

a. A branched or forked method of growth of roots, the branches gradually lessening downwards.
Common to all root crops - Parsnips, Carrots Mangel Wurzel, Turnips, both common and Swedish. ural forms arise from an grown, as good agricul

## circumstances which tend to degeneracy

circumstances which tend to degeneracy,
Finger and Toe does not necessarily follow i produces Anbury in Turnips.
Soil liable to produce Finger and Toe is not neces sarily sulject to Anbury
g. Finger and Toe is most prevalent on poor soils
d. Anbury:-
. Irregular swellings or nodular appendages upon the main root or its rootlets, being tumour-like ex crescences having no determinate outline
Peculiar to the Brassica tribe, to which belong Cabbages and Turnips.
The result of insect attacks-giving rise to various kinds of galls.
. The different forms of malformation arising from different species of insects.
Different species of insects and consequently dif ferent forms of Anbury mark peculiar soils.
ferent forms of Anbury mark peculiar soils.
Is mosttcommon in good rich soil, especially if void of lime.
As regards the methods to be adopted in preenting these two affections of roots, it must be
 sider how they have always been confounded; hence, when we first pointed out the nature of Finger and Toe as it exists on the limestone tracts of the Cotswolds, many friends on soils not calcareous pointed out that liming was the best method of prevention, but it will now be seen that whatever ends to good cultivation, that is, whatever treatment different from their growth in wild nature we can place roots under, the greater will be their change; and thus their change of habit, as when seaside plants growing in places where their seed has been accidently scattered are taken to an inland habitat, both seed and soil duly prepared by cultivation and the plants being looked after (during growth), it results in the enlarged cultivated bulb instead of the smaller wild one. Having thus attained this position neglect of the conditions by which it was arrived at necessarily produces degeneracy or a reversion to the wild form. Here then, the prevention of finger and toe will be seen to depend upon observing the laws of development of good roots and keeping them subject to such laws but inasmuch as anbury is totally distinct from inquire in anbury, and narrowly watch their habits and instincts -that is, study their natural history before we can arrive at sound principles upon which to base our operations.

Now inasmuch as this still remains to be done, we must for the present content ourseives with merely commenting upon the treatment of anbur by lime, which is adopted by the practical farmer Lime is held to be a specific for true anbury, that is its fingered form; and if we bear in mind that the
warbles and clubbing, which we described in our last Paper as attacking the surface of the bulb, are universally found to prevail in limestone soils, we may conclude that that soil has a decided influence upon the existence of the insects by which these malformations are caused; and, inasmuch as the true anbury eschews lime as not suitable for the development of the insects by which it is caused, these insects in non-calcareous or anbury soils.

However, as before hinted at, we want much observation before anything like a specific can be mentioned for anbury, especially if, as we think, it is caused by several forms of insects. We
shall therefore, for the present, rest content with having shown that much discrepancy of opinion must necessarily have arisen upon the subject, from the fact of the forking of roots by mere digitation (finger and toe) having been confounded with the malformations caused by insects (anbury, clubbing, \&c.)
We may safely conclude that neither finger and toe nor anbury can result from isolated patches of manure, * manure of all kinds heing most effective in preventing the kind of degeneracy by which finger and toe is produced, poor soils being the most liable to produce it; and if manure at all
affects the anbury it certainly is not by making the mall fibres grow into large branches, thou'h it possible that some manures may be found offer a nidus for some of the insects in one or other of their stages of development.
From these remarks we may conclude that the subject of malformations of root crops is one of considerable interest in a pathological and physiological point of view, besides being one of vast importance in the economy of agricultare ; indeed, however we look at it we cannot help concluding that it will
well repay much more car-tul and extensive investi gation than it has yet received, and we therefore fee ustified in insiting communications upon the subject from our numelou; readers, in all which we would beg to off $r$ the following suggestions as a basis for the inquiry :-
1st. Accurate description and distinction of Finge and Toe and Anbury in all stages of development. d. In the case of the former, state how of en the crop has been cultivated in the sap.
3d. In both, point out the nature and composition of the soil, in reference to its geological structure and method of cultivation, climate, \&c
th. Observations should be made of the various
insects by which galls, protuberances, and other malformations may be caused.

## ON FARM BAILIFFS

I observe in the Agricultural Gazette of the 5th inst A Novice" is very anxious to know who farm bailiffs
re, and what they ought to be. He has answered the are, and what they ought to be. He has answered the
first question pretty fully himself, only that among the everal classes he mentions there is hardly one that comes up to the mark. I shall only make a remark on those lie mentions as I pass them, and then say what think they ought to be. Perhaps each class is good in its place, as there are varieties of situations for them only the highest, as he seems to think them, have no proper place on the farm, either as farmers for themself or others. This evil of the frog swening a classes, although all complain of it. But nowhere is excess of delicacy more out of place than on the farm even the farmer's wife and daughters if fine are con sidered out of character ; so I think we must agree to throw this class overboard, and banish then from the ist of agriculturists, however well they may talk of al he new things of the day. And if it is true that their dea of economy is to keep down the labourer's wages, they may as well try how it fits themselves. As to the
Scotch ones, who he says are numerous, but who, Scotch ones, who he says are numerous, but who,
though knowing ones at home must serve an apprenticeship in the south, I shall admit the truth of the assertion, but it is true of every one when from home, perhap more so in farming than any other calling. But if they are well informed in their business generally, they will soon adapt their methods to the circumstances. An they have this advantage over their southern friend. that they have never been wedded to their own parish, which is a sad drawback to improvement in the south Instead of living in the same parish, or even county, in their own country, they are like the journeyman who acquires the most perfect knowledge his business after his indentures are expired. He has learned that the plans of his native place may not be al the best, and when once this piece of knowledge i acquired, he will then be open to conviction. By seeing that different operations cal produce the same effect,
he learos to make the most of what comes under his he learge.

Respecting the hybrid-floriculturists, each occupation requires too close attention for any one to excel in both and where the attempt is made failure in one or bot must follow. I believe the flower department will be the loser, for few will like to be confined to the garden after tasting the open air in the fields.

The next class of broken-down farmers I have little the about; but they may make good managers for and rocks to have learned the position of many shoals and rochs to be avoided. And I think there is no it may have been too late for their own use, but may be worth something to others.
But now for the last class, the working bailiffs, whom A Novice "seems to think are after all the right men, and which I do not deny; neither do I deny that farms under their management are as well managed as by others. But is this because they wear a smock frock or are not so well educated? The former has nothing to do with the matter, and the latter no one, I supposa will think to be of any advantage. Why may they no be rble to talk about steam engines, herd books, feeding or threshing machines, and guiding a reaping machine? And might they not have as much philosophy as teach them to perceive and uaderstand the feelings, and, if you will, the infirmities of those they may have to superintend, which is the most important machin after all. Might not they have education enough to know themselves, and give them the tact manage others without the employment of that tyrad nous and overbearing manner which we so ota see in the conduct of the ignorant. Why should the not be intelligent men, and treat others as men! An however well this class may manage Gelds, they are no fit to be over the whole farm if they have not some education.

1 think a bailiff and farmer too ought to have served his time to the profession, and, as all eminent men hav done, get a knowledge of his business by manual expent ence more or less. They ought to be able to lay their hand to any work, if not in the best manner, at any rate so as not to be laughed at by those they are over. They may not be the best ploughmen or mowers, but they
ought to be able to handle each thing in a workmanlike ought to be able to handle each thing in a workmaun the
manner ; such qualifications will do more to secure the manner ; such qualifications will do more to secure are
cailed accomplishments. They ought not to assume a
forward and haughty bearing towards any, as that will make them be lonked upon by the more intelligent with contempt ase mean and crin ing. They ought to act in a firm and tolerant manner towards all, not disdaining to holi counsel with a tion, as all are. And them superior in some one qualifica between the proprietor and the labourer, but by a firm and prudent management he will find no difficulty in upholding his authority without parading it. Again, in their dealings with others, they ought not to assume too much, but rather prove by their tact that they do know point they ouglit to attend to-not to use the egotistical as far more suitable. As to taking lessons over the hedge, let them for we must be ever learning, and he who learns mos will go ahead. But a man cannot acquire instruction unless he has been taught in his youth how to te
himself, for that is the use of our early teaching. teaches people to teach themselves; to cut their according to their cloth; to turn all their opportunities to the best account ; to adapt their work to the circumstances under which they are placed. Those who reside constantly upon their property may have one with little make good farmers in the locality to which they ar compass ; if not there, they are at sea without ance, will stand between them and success under different circumstances. In short, an intelligent working bailif out being laughed at for his awkwardness, is the right man for the right place; and your correspondent may hence discov.r why so many of them are from the

## A STEAM-CULTURE REVERIE.-No. II.

Arrived within the precincts of my friend's domain I marvelled at the transformations which had there taken place. The whole surface of the estate was skinned of every vestige of what had formerly occupied ; and only the old contours and inequalities of ground remained uneffaced. A new arrangement of fields, fences, and crops bewildered my gaze ; and instead o the great gabled barn with its tributary buildings, and factory-like erections spread in wings and offsets over a large breadth of ground, with a lofty chimney reared from their centre

## in strips, like those I have seen at Lois-Were laid out

 the crops of roots and green food struck me as prodigiousily hulky and luxuriant. Swedes I saw with most colossal bulbs, and the Cabbages were already grown plot of astonishing Res the mown portion of one were squirting liquid from a hose-pipe, just as they do at Tiptree. Approaching the buildings-the "works" ragged chickens fed on " medicated grain," or detect the smell of chlorine gas employed in bleaching black sheep white, novelties which distressed and nearly suf, focated "Mr. Punch" in a "Chemical Farm-yard,"but making my way round a series of well filled rick sheds, and disturbing abundant coveys of plump poultry, soon found my friend in his foreman's "office.
Truly enough he had wonders to show in the form of more than one experimental steam-cultivator; but my firs husbandry he had adopted, I mast nary pape1 to his explanation
best enuacine in a new theory, which I can prises two distinct arts or processes, Agriculture comof vegetable produce out of the soil, and the converting food and re into animal productions : both supplying food and raw materials for a consuming and industrial
population. Now, one must suppose the population. Now, one must suppose that to be a very im-
perfect art which would use up a large proportion of its and productions in order to spare a remnant for market; and if this be true our present practices of fattening decomposing into a manure a reat bulk of straw and other vegetable substances which might be employed as cattle-food are both male-shift expedients, and not founded upon an enduring principle. When ay a series been evolved from the earth, lot it not be again wastefully buried for the purpose of maintaining the soil's fertility, but barter it for some inedible, unofficinal commodity, some organic refuse, or some otherwise useless
mineral, which you may legitimately sow in its only proper matrix -the earth - to procure a future vegetable abundance. I practically acknowledge this principle coal for horses that eat up so mueh of my cropping; and surely farming will arrive at a normal and matured state only atter what horses would soil devours heen saved, that which the sore hungry point : why need we lavishly pamper our cattle upon tured in $h$ main maf provender that man cannot eat? To carry out my
theory, therefore, I am endeavouring to economise all
the producs of my farm, so as to consume most of
what is lowest, and export most of what is lighest in the is lowest, and export most of what is highest in
duce is sold or ore. Every atom of my vegetable pro- all the grain being duce is sold or eaten : all the grain being sent to
market; and beef, pork, and mutton, made only o straw, Grasses, roots, and such sorts and parts o
cropping as are least wanted by human beings. I chase linseed, oilcake, and other feeding stuffs which can be cooked for no man's table; I get sewage manure from towns; fertilisers from the fisheries, and rom factories, where they are compounded out of the cattle food from manure, and human food from both of them, without a retrograde conversion of the higher into the lower class of commodities

## this main object I am conducting

 arious minor experiments. On some fields you seethe Weedon system!: cereal crops following year after year; the deep tillage being accomplished by my newly is under rotation; the green crops being manured and irrigated by steam-pumps, and thus made to some extent independent of a fluctuating rainfall. The drainage of the farm, with an occasional stream from the hite feeds the reservoir from which I mix and distri ree my manure. My sheep and beasts, except a few not a particle of manure is exposed while being manuactured to a scorching exhausting sun, or wasling and wasting floods of rain; though I can moisten and ferment it at pleasure. By the bye, a friend of mine is
making a 'double-silicate' for Wheat, which is likel making a 'double-silicate' for
to supplant the 'marvel of Peru.
an lave now told you $I$ am by means sure that ultimately the growth of corn and the production of meat will not become two distinct occupations.
that on some descriptions of land we may have whole farms of green crops; no part of the vegetable produce being sold, but all consumed in vast catcle.feeding and manure-making establishments. In other localities, every head of stock being kept, but all the straw either sold for manufacturing purposes, or with stover and inferio produce of all kinds disposed of to the meat farmers in exchange for portable manure. Indeed, farming hreatens to become so elaborate a business that the man whose habits and qualifications fit him for the refined operations of tillage, or for the delicate processes of chemical manuring, will be quite incapable of judging cattle, sheep, and live stock in general ; of selection and watchfulness in breeding and rearing; of solicitous care in fattening; of roughing it in the fair and market : in short, husbandry includes such a multisteam machinery to the breaking of a colt, from the milking, and chemistry-keeping of field to the suckling man can be genius enough to master the whole. Depend upon, when a proper division of labour shall be made, agriculture will march with quite an epic pronant distance

While my friend was thus delivering himself, considerably to my enlightenment as well as surprise, we had drawn towards the house; and now, after due introductions, \&c., there, we sallied forth fo peep at the "cultivators." I. A.C

## MR. LAWES OF ROTHAMSTED

We gave some months ago an abridged report of the address given by Mr. Lawes on the occasion of the presentation to him of the testimonial on the 19th o Lawes's remarks on that occasion:-

Gentlemen, I will now just explain to you to what arpose we propose to devote your building, in doing which I will point out in what way and to what exten science is most likely to be beneficial. The great chemists who lived in the early part of this century were generally of opinion that science would do very
ittle to improve the practice of agriculture. Si
Sin little to improve the practice of agriculture. Sir
Humphry Davy, one of the most eminent of them, wote a book on agricultural chemistry ; but I am no aware that it resulted in any improvement of the prac tice of the day. And if you consult the works devoted to agriculture up to about 1840 you will find no mention of the scientific terms so common in all works on the subject at the present day. The French and German gricultural chemists made great progress in the application of the science of chemistry to agriculture; but
little attention was paid to the subject in this country until the publication of Baron Liebig's worl in 1840 Chat wre thoroughly roused the attention of agriculturalists, and from that time there has been a constantly growing opinion amongst them that their practice night be greatly benefited and improved by the application of sience. Some of the writers on the subject o and mis-stated the mode of its applicability to practice, so that they have thus rather retarded the progress of the science which they wished to advance. Look ing at the great advantages which science has conferred on the manufactures of this country during the ast haf century, they have predicted that similar advantayes would o agriciture. We mnst not suffer ourselves to be dazzled by such delusive predictions. There is an
essentia. difference between manufactures and agricul-
ture, which it is necessary for us to bear in mind. The success of our manufacturers arises from a combination of skill and capital with an abundance of such things as iron and coal. I am not prepared to deny that our agriculturists possess equal skill and equal capital but where is the abundance of their xaw material Where are our guano beds in Great Britain! We have large deposits of phosphate of lime ; but we are deficien o that very important article-ammonia, If science low prices, it would create of necessary manures, at very culture as it has done create as great a revolution in agri diture as it has done in manufacture. But even then there would still remain a great distinction in favour o matufactures, Give the manufacturer a great and conhiued demand for his goods, and there is no limit to his productive powers. He can erect fresh buildings ; he can anstruct new steam engines; he can obtain the assistace of more factory girls. But even if we had an abundance of excellent manures at 2 cheap rate our productive powers would still be limited by climate The sun is our steam engine; the showerg are our actory children. These are not at our command-they will not do our bidding ; and, therefore, with all the dvantages that science can give us, we must not expect the productive powers of agriculture to increase in the ame ratio, and with the same certainty, as the producive powers of manufactures. Agriculture as practised Great Britain in the present day, is a very differen process, requiring more skill and capital, to agrical we practised in other nations. In those countries where land is clieap and abundant, and where a man has merely to cast his seed into the earth, without any previous preparation, and pay no more attention to it till the harvest time, when he may go and reap 40 bushels of Wheat or 100 buehels of Indian corn per cre, it would be a mockery to offer the assistance of cience to agriculture. But in a country like this, where land is scarce and commands high rents, where he land requires a great deal of praparation, and where abour is dear, the application of science is absolutely ecessary. The explanation of the exbaustion of land y corn cropping, and of the effect of various manures, involved in the science of agricultural chemistry and the knowledge on these subjects which is to be obtained from that science slould enable us to conduct our operations with certainty and success.
often received visits from practical agriculturists, some of whom have come from a great distance, and very glad I have been to see them. One question however they invariably put, but which I would they should not put. It generally comes out where the finest crop is ound ; the question is-"Does it pay ?" Of course 1 friend, whoever he may be, is apt to think, "Ah, it's all who have got a little money to spare or such pursuits; but it is nothing to me." But I must explain to you, that the object of these investigations is not exactly to put money into my pocket, bat to give you the knowledge by which you may be able to rotatiof to yours. Nelence is not to do away with properties of all ; betation; and whether it would be better under certain circumstances to grow a second, third, or even fourth crop on the same land, or to follow your usual course. Science will not enable you to grow two grain crops in one year but it may give you such information respecting the principles of manures as will enable you to turn over your capital in a much smaller space of time than you do at present. A great deal of your capital is placed in he land, where it lies dormant for a long time; but sience may correet that evil, by enabling you to put he right manure in the right place. It is sometimes said thal farmyard manure posse8ses an advantage over artificial manures, in its great lasting qualities ; this is a fallacy. The lasting qualities of farmyard manure are (in a commercial sense) not an advantage ; for it is etting it your money by instalmen mare but so many tons of oil-cake and Turnip? If a man owed you 1000!. would you prefer having it all at once, or in ten instalments of 100 . a year? The artificial manure pays ready money ; but the farmyard manure pays by nstalments. The application of science to feeding resents only another sphere of its utility. We give ou that knowledge which will ensble you to pursue that course which will be most profitable to you. It is not the object of science to interfere between landlord good knowledge of the qualities of his own land, and it will enable the tenant to turn to the best accoun the floating capital which he has embarked in the soil.

## Home Correspondence,

bservations of C. F. Humbert, on the effects of drainage, it does not eeem to me necessary that a porous substratum underling a thick superstratum of clay is supplied with the he clay. In several intains by percolation through operations, which have extended over nearly 1000 acres, I have found the clay to overlap a porous substratum when a change of the superstratum occurred from stiff clay to more permeable material. It is clear that the rain which falls on this will, on reaching the porous substratum, charge the whole of this with water as far
as it extends. In mining operations, if you enter a stratum of coal which is porous and water-holding with a mine, so as to draw off the water at its lowest leveh,
you drain the bed of coal to the distance which it extends without interruption, even for miles. I am by no
means asserting that stiff clays are impermeable to means asserting that stiff clays are impermeable to
water; in the instance I have described, of clay overWater; in the instance I have described, of clay over-
lying a subastratum charged with water the clay will absorb moisture from beneath, by capillary attraction, to the height of 2 to 3 feet ; (I do not precisely recolleet to what height water is drawn by capillary attraction) but to such height the clay will always be saturated. Now when the rain which falls on the surface percolates the clay it will soon charge it to the full. If you drain this land without reaching the porous substratum you substratum surface water, pill superstratum of clay extends over the whole of the porous substratum, and in which case the water is supplied by rain falling on the surface, and passing through the clay. I have also drained land occasionally irrigated from a rivulet which likewise supplies the water-wheel of my corn-mill, and can only use the water for irrigation when there is a surplus beyond what the miller requires. The stream on such occasions is usually muddy, sometimes thickly so, and when thrown over the land, which is in permanent Grass, I invariably observe the water issue from the outfalls much disfiltered through the soil, I rather attribute it to its finding some crevice through which it escapes into the drain without filtration. Indeed I have some pronf of this; the water having found a crevice has by degrees kVorn drain sinking. On one ocension particularly, where a main drain was laid at a depth of more than 7 feet tbrough elevated ground, over which an irrigating channel passed, I was surprised to find a great chasm more than a year after the drain had been made,
effected evidently by the process I have described, the soil below having been gradually washed away until the curface, being undermined, fell in. It required many loads of soil to refill this chasm. The drains in this irrigated land are at a depth of 4 feet upwards; the subsoill varies, a considerable portion of it being clay. On filling the drains the greatest care was taken to solidify the soil. That this was the case may be inferred when replaced, leaving the surface quite even. If I were to cut a testhole where the water does not reach at a distance of 4 feet frcm the part of the ground covered with this muddy water, I should expect it to fill with clean water to the level of the muddy water. I think Those who practice irrigation may easily apply a similar test. Thomas Horsfall, Burley Hall, Ot'ey, Yorkshire, Jan. 9. Since the foregoing remarks were written 1 have ascertained by means of a spirit level the exact height the water saturates by capillary at-
traction by measuring the distance between the surface of the water of the xiver Wharf, and the strongly defined line to which the moisture rises, as shown on the banks, in several places where the river is making inroads on he land. In each of these the distance from the sur the soil is water to the line of saturation is 2 ft . $s$ ing have seen any precise observations on this ; it would be of interest to ascertain whether the power of capillary external temperature, and as to the height to which it saturates the soil. T. $I$.
A Croxs of Mangel Wurzcl-on deep flat ground, previously under Potatoes, drills 3 feet asunder, ridges
thrown up high, and seed dibbled at 16 inches apart, thrown up high, and seed dibbled at 16 inches apart,
four or five seeds together after having been steeped till there were signs of germination; done in Mareh I ordered a parcel of the very largest roots which could be found after digging to be laid apart; another parcel of same number of roots from the smallest ; and double of these in number from the middle-sized. The average of the best, $10 \frac{\mathrm{~d}}{\mathrm{f}} \mathrm{lbs}$; worst, $6 \frac{\mathrm{f}}{\mathrm{f}} \mathrm{lbs} . ;$ middling, $8 \frac{\mathrm{~g}}{\mathrm{~g}} \mathrm{lbs}$. Produce in roots per English acre:-At $10 \frac{1}{5}$ lbs. per acre, 50 tons, 4 cwt ; at $6 \frac{?}{5} \mathrm{lbs}, 30$ tons, 4 cwt .; at eaves, 42 tons, 2 cwt.; besides an immense crop o and large. Plants at 16 inches distant give 3 to 4 feet and a yard in width for drils will be
or 10,890 plants per acre. The dibbled tufts were thined by hand when tolerably well grown, so as to show which plants were strongest.

Furm Bailiffs, who they are, \&c.-Farm bailiffs have penly, by others secretly, tair game for attack, hy some covertly, and under the guise of inquiry. It matters little who "Novice" is ; his olject is to bring into contempt a body of men than whom in their calling I may enture to say there does not exist a more intelligent, add too, a more ill requited class of men in any profes son, except indeed poor curates, who always stand par xcellence at the very top of the list of ill requited abourere. "Smock frock bailiffs" will no doubt suit the time of the discussion of the late Sir Rolert Peel's the time of the discussion of the late pir Rovert Peel' act for instituting a new police fcrce, the " old Charleys withal "so cheap." One of the Attucked.
The Best Way of Applying Salt to Land,-I read
more so as it has long been a favourite thenry and subsequent practice of mine ; but although your correspondent admits salt to be highly beneficial to the farmer, he neglects to point out its application. My practice has been to largely mix it with tan, sawdust, or any vegetable matter that will absorl) the salt in quantity, but tan has proved the most successful, which after a few months laying up and turning over may be put into the land, yielding its properties gradually but permanently up to the end of your growth. Now if only vielded to the is given of salt unmixed its properties are yied ded to the plant only in its early growth, and when
the plant most requires the stimulative action, it is foundant most requires the stimulative action, it
found to have sulsided or washed through the land. making up the dung heap salt should largely be mixed, for while it hastens vegetable decomposition the dung is is retained. Thermentation, a larger proportion of ammonia most soils, for while in light it stimulates the plant out promotes the retention of moisture, in heavy it kills insects, and digests the vegetable matter. J. K. R.

Highland and Agricultural Societt, Jan. 7, Halfyearly

Agricultural Stutistics.-Mr. J. Hall Maxwell read the report on this sulject. It announced the successfil termination of the statistical inquiry for 1855 , and pro posed that Government having requested that the society should continue the work of collecting the express its wilingness to continue the same co-operation and assistance as it has hitherto afforded, so long as this does not interfere with the original and special object of the society. The Earl of Eglinton moved, "That the meeting, having heard the report of the directors, sanction the continued co-operation of the society in obtaining the agricultural statistics of Scotland so long as this does not interfere with the original and special objects of the society." His lordship remarked that there could be but one opinion as to the utility of sile through the Highland Society ; and there could be bu one opinion as to the zeal and ability with which thei and ability which he was justilied in saying had distin guished all his acts since the society had been fortunate help adverting to the as their secretary. He could not help adverting to the readiness with which the farmers which had been asked of them. Their conduct in thi matter was most creditable to them ; and altogether he thought it was honourable not only to the society and the farmers, but to Scotland itself, that they should have taken the lead in this most useful investigation
Lord Kinnaird seconded the motion. He quite agreed with the noble earl who had last spoken, that the farmers of Scotland had in this matter set a righ which had been furnished were most valuable, and the only thing which he desiderated was that, previous to the harvest, a preliminary estimate of the crops Ile thought that before agreeing to this resolution they Ile thought that before agreeing to this resolution they
should hear Mr. Maxwell as to whether he was quite satistied that the proposal of the Board of Trate would not interfere with the business of the society.
Mr. Hall Maxwell said there were practical ways of over which the statistical inguiries had extende period society's superintendence of these inquiries had been in any way inconsistent with or detrimental to its inte rests. in the first place, he did not think that any one would say that during the period to which he had referred the society had lost position, credit, or in
fluence. He conceived, on the contrary, that it had established an extent of intluence which could scarcely have been credited. If they took as a test the number
of its members and the state of its funds they found that the funds were most flourishing, and that the accession of members to the society had at no former period been so large. He might also allude to another test: three or fumr years ago, before statistics were taken up, their general shows were to taie place arrangements made for three shows in three con secutive years. In that respect, therefore, there was a great revival instead of a falling off. Some misapprehension might perhaps exist in the minds of the public how far the official staff of the socety had directors an engrossed by the statistical returas. The directors had mothing to do with them; the various committers of the society never had their time taken up
with thom ; and there is a separate and independent with them; and there is a separate and independen
staff of clenchs for the returns. The whole matter, herefore, resolved itself into a question as to the time which he himself devoted to statisties. Now, this inquiry was couducted etween May and Nuvember and as almost the whole business of the Highland Socety took place between November and May, although statistics did take up a large portion of his time, it was hat time formerly lis own, sud no section of the suciets's busi formery his own, mud no section of
Lord Kinnaird was desirous that the sociey should receive the explanation which had been given, because
be had observed a letter in the North Eritisi Auricul turist, a'tributing the inefficiency of the journal to the time of the secretary being taken up in collecting the way were the interests of the society interfered with by these statistics.
Mr. Finnie (Swanston) wished to embrace this oppor tunity of ackmowledging, on behalf of the enumerator and members of conmittee who han aided in the statistica inquiry, their sense of the very flattering manner in which Goverument had been pleased to notice their services in this great national matter. It was fas
from his intention to say that no credit was due to from his intention to say that no credit was due to them, but it might truly be asked what advantage either landlord or tenant could derive from refusing Government the information asked of them? Were no their rents patent to every parochial board through. out the country ? Could not their neighbours and aervants number the bestial upon their farms, and Could their crops as well as they could do themselves Coal not the intelligent observer, who travelled th roads which bounded or intersected their farms, form a just an estimate as farmers themselves of the produce likely to be obtained from it And at every fair and market throughout the country were there not sheep-farmers and sheplierds who could within a perfect trifle, estimate the number of sheep kept upon the unmeasured wilds and unexplored range of mountains? No advantage could thorefore be gained loy refusing the necessary information; but notwith-
standing this, they might be justly proud that the intelligence of the rent-paying portion of the agricul. tural community had lept some proportional advance with other improvements throtiohout the country. But he must add, on behalf of the whole agricultura! community that the success of these inquiries bad depended in a great measure, he might almost sa Maxwively, on the able generalship of Mr. Hal the time occupied in this inquiry, he would asure th meeting, having been a director both before and since these inquiries were commenced, that mo part of the society's affairs had been neglected in consequence of them, and the agricultural portion of the communit conceived that it was the most legitimate way in whic the society could employ its time.

## The Garmenteg Chromicle.

SATURDA Y, JANUARY 26, 1856.
IT is now well known that the roof of $W_{\text {sst }}$ minster Harl is not constructed with wood of the Spanish Chesnut as has been long believed, bat With the Sessile-fraited Oak (Quercus sessilifhra). We have long had specimens in our possession proving this fact. But it was a question whence such Oak timber was brought, Qu. sessiliffora now being unknown in a wild state near London. Nor does it seem to have been common when old London Bridge was built, as is said, at the end of the twelfth century, for the piles on which that ancient structure stood were certainly from Q. pedunculata, the Oak still common here, as is proved by a specimen for which we are indebted to Mr. John Murray, the eminent publisher. It would be extremely interesting with reference to this point to know what the Oak was, which Caswallon or Cassibelaunus employed in order to
render the fords of the Thames impassable by the
troops of Cessar. Mr. Charles Knight, in his new "History of England," tells us that these stakes, described by Bedr, and formed of the bodies of young Oak trees, remain to this day, after a lapse of more than 1900 years, in the bed of the river near Oatlands, at a place called Coway Stakes. Surely it would be worth while to draw one of those stakes for the sake of determining what the Oak of Surrey was 54 years before the Christian era.
It now appears to be shown that the Oak timber ased in constructing the roof of Westminster Hall had a very different origin from what has been usually suspected; and that so far from having any English origin it came from Ireland.
At a recent meeting of the Royal Institution of the Royal Architects of Ireland, Mr.M'Cundy is reported (in the Builder) to have brought under notice a record in St. Michan's Church, and verified by "Hanmer's Chronicle," in the Library of Trinity College, Dublin, which states that the roof over Westminster Hall was constructed with timber procured from the site of this church; and he further stated that clumps of trees were found during recent excavations. The following is a copy of the record:-
"Stanihurst findeth that, anno 1095, there came certaine Easterlings to the north side of Dublin, adjoining to the Liffie, and seated themselves there, so that of them to this day the place is called Ostomontowne, and corruptly Oxmonton, and the parish Saint Michans, of one Michanus, a Dane and a bishop, which founded the church, unto whom Murchard or Moragh, King of Leynster, gave that parcell of land to that use. The faire greene or commune, now called Ostomontowne-greene, was all wood, and hee that diggeth at this day to any depth shall finde the ground full of great rootes. From thence, anno 1098, King William Rufus, by icense of Murchard, had that frame which made up the roofe of Wextminster Hail, where no English spider webbeth or breedeth to this day.
It is to this account, we suppose, that allusion is made in Ned Ward's London Spy, quoted by Mr. Peter Cunninghan, where he speaks of "the vulgar belief that it was built of a particular kind of wood (Irish Oak) in which spiders cannot live." In this instance, as in so many others, it would now seem that tradition, or as it is called vulgar belief, was true.

We are aware that some antiquaries doubt whether the present roof of Westninster Hall is that constructed in the reign of Rufus, because the walls were raised in the time of Richard II. And if their conjecture is well founded the Irish origin of the timber would be still apocryphal. But it is improbable that such a magnificent roof, constructed with the care and skill which characterised the works of the Norman architects, would have been found so decayed in 300 years, the time which elapsed between the original construction about 1097 and the alterations in 1397, that it could stand no longer. It is rather to be conjectured that what was called the "new roof, constructed according to the design of Master Heniy Zenely," was some alteration of the old one.
Be that as it may this important question at least remains to be answered: Why did Rufes send to Dublin for the timber for his Ha!l? when he could so easily have felled timber in the ntighbouring forests. The only explanation that occurs to us is that the adjoining woods contained then, as now, no Oak fine enough for the construction of a roof with so great a span; and that he was obliged to fetch the sessile-fruited Oak from even so great a distance as the banks of the Liffey.
Some light would probably be thrown upon these speculations were we in possession of authenticated examples of ancient Ouk from Leinster.

Tar Mormons have founded a Horticultural Society. We have hefore us the Dcscret Neros
of Oct. 3, 1855 , which shows that the love of of Oct. 3, 1855, which shows that the love of
gardening is implanted in the nature of even the most eccentric of civilised men. It appears that a meeting was held at the Great Salt Lake City on the 14th of last September, to form a constitution and hy-laws for this association. W. Woodruff
(President), W. C. Staines (V. President), Thos. Bullock (Secretary), Geo. D. Watt (Corresponding Secretary), Sam. W. Richards (Treasurer), and Edwd. Hunter, Jno. Neberer, Chas. H. Oliphant Jesse Little and Samcifl Sprague were present on the occasion. We give the names of these gentlemen in case they should be known to some of the readers of the Gardeners' C'hronicle. The following is a condensed report of what took place on this occasion. The meeting opened with prayer by the President, after which a constitution was adopted, in which, inter alia, we find the following laws:-
Any citizen of this territory can become a member
paying one dolar and annually thereafter one vollar. The Presidents of County Horticultural, or $x$-officio be Societies, or a delegate from shall keep the fifinds of the Society, and disburse them on the
the order of the President or a Vice-President, countersigned by the Home Secretary, and shall make a report of the receipts and expenditures at the annual meeting; he shall also distribute or preserve all seeds, plants, books, \&cc., which may be transmitted to this Society. There shall be an annual meeting of the Society on the second Monday of August, in Great Salt Lake City, at which time all the officers
shall be elected by a plurality of votes of the shall be elected by a plurality of votes of the mema vote of two-thirds of the me may be amended by annual meeting.
The first meeting was held in the Social Hall on Thursday, 20th Sept. 1855, at 7 P.M. Peaches seem to have been the ouly objects of exhibition. Of these the reporter gives the following account:"A large glass jar of Peaches preserved in brandy sent by Professor A. Carrangton, some of which were $8 \frac{1}{2}$ inches in circumference. A similar sized jar, containing 'the Deseret Beauty, by Dr. S. L. Sprague; who presented about lu0 of his
delicious rareripe Pear Peaches, and other varieties spread around on glass dishes. Mr. W. Woodrufr presented over 200 of his Prolific and rareripe Peaches, which hung in festoons in the centre and on the sides of the stage, also a barket of Prolifics and several plates of his delicious Mountain Sweets and Crimson Peaches. Mr. Thos. Bullock also presented a bunch of fine dark red Rareripes, hung in the centre of the stage, also a fine sample of 'the Maiden's Blash.' Mr. John Neberer presented over 150 of his delicious varieties, which showed the advanced stage of his method of cultivation. Mrs. John L. Smith sent a sample from her garden, cultivated by herself, while her husband is absent preaching the gospel. Mrs. VAN Cott sent a dish of pale varieties, also to show what a woman can do while her husband is preaching and publishing the gospel in Denmark. Mrs. Sessions donated nine Peaches, as a sample of her orchard, estimated to gather over 75 bushels this season. Mrs. Farnhas presented a basket of splendid Peaches, which measured 7 or 8 inches in circum ference, cultivated while her husband is in Australia. And though last not the least, we observed a sample from the orchard of Mr. George D. Watt, the smallest weighing over 4 ounces and measurin over $7 \frac{1}{2}$ inches in circumference. Mrs. N. K.
Whitney sent a sample of her 'Kirtland Exile, Peach, very large and delicions." We are told tha "The whole appearance of the sland was sufficient to excite the epicurean taste of the most refined and was a feast never before equalled in these vast mountain regions." After agreeing to the constitution prepared for adoption, Elder IVoodruff, the president, exhorted all present to improve their time in planting seeds, for all that was presented this evening were but seedlings, not inoculated fruit, and they would bear comparison with seedlings in Philadelphia, New York, Liverpool, or any other portion of country. This he thought was proved by what he had himself done in the way of raising fruit trees. Elder P. P. Pratr stated that the knowledge of raising fruit was one of the first articles of theology to our father Adam. Better specimens than those exhibited could not, he thought, be found on the earth. "The spell," he exclaimed" is broken; 31 years I have been setting out fruit trees, It is better to live the fruit of my lahour until thisseason. It is better to live partially on fruits than wholly upon meats and vegetables. We can now go to work and multiply fruits hy grafting, \&c., and we ought to have an orchard in every good place." The Honourable Geo. A. Smith was rejoiced to see the fruit of the labours of his brethren. He had planted fruit trees in New York, Ohio, Missouri, Illinois and Iowa, and in this city, and Parowan, and Provo, but had not yet tasted the fruits of his labours. He hoped that gardeners would give hem instructions how to plant fruit trees. Another Honourable-E. T. Benson-" knew the fruit was delicious, for he had tasted some at Elder
Woodruff's. This meeting would instil an energy into the various communities to go ahead to raise fruits, and then you will see a healthy people with rosy cheeks." More Honourables followed in the same strain.

The Honourable E. Hunter desired to be a coworker. When the Mormons first came there, it was doubtful whether they could raise fruit or cereals. Dr. Darlington and many other botanists declared they must have rain to sustain the trunk and stem. We presume he intended to add, what is not reported, that at the Great Salt Lake plants do not require rain.
The fruit was then distributed by the committee
to all in the hall Thirty-three members gave in their names, and the Society adjourned for a fortnight.

We shall be curions to observe the further opera tions of this body, consisting as it evidently does of people ignorant of gardening; for they believe that Peaches, Plums, and Cherries can be grafted on Whitethorns. There they are in a plain where rain is said to be of rare occurrence, and where the soil does not promise a quick return for even skilled labour. All that the information which has reached us shows is that the place suits Peaches on their own roots ; at least this would seem to be the case from the proceedings above described.

We are authorised to state that the Horticnltural Society has now received a sufficient number of seeds from Mr. Botrerr, to make a small distribation among such of its Fellows as shall signify their desire to receive them. They are lying in Regent Street for this purpose, where also some packets of Gynerium or Pampas Grass seed may be had. As Mr. Botterr's seeds are all from the neighbourhood of Orizaba in Mexico, it will be as well to consider that they require a greenhouse until some further knowledge shall have been gained concerning them

## New Plants.

161. Ansellia glgantea, Reichenbach $f_{0}$ in Linnoeras vol. xx., p. 673
This rare plant has just flowered in the garden of Wm. Wilson Saunders, Esq., at Wandsworth. It is extremely like $A$. africana, except that the flowers are smaller and paler than usual, and the middle lobe of the lip narrower. We entertain great doubts about its being specifically distinct from $A$. africana. What gives it much interest is its coming from Port Natal, on the other side the continent and some $33^{\circ}$ further to the southward. It is moreover, we believe, the only true epiphytal Orchid yet brought from Natal.

FAMILIAR BOTANY HAVE FERNS SEXES: Our fathers believed that when a Fern produced its seed, the little brown grains at the back of a Fern-leaf were all that nature had provided for the purpose. Linnæus thought so, and so did everybody else till : quick-eyed Polish gentleman, Count Leszezyc-Suminski, out the mistake. I will not ask you to pro

nounce both the noble naturalist's names, for letters arranged like these are unfamiliar to our Enylisk mouths; but it is proper that so great a the Gardeners' Chronicle can confer. This great event happened in the year 1848, when it was made known to His most gracious Majesty King Frederick mian $1 V$. of Prussia.
The reason, or at least one of the reasons, why nobody nobody began at the beginuing when they studied the nature of Ferns. It is indeed to be doubted whether many people, even in this enlightened age, know what the begimnisg is. Let me endeavour to make this
clearer. If you
If you look upon the damp ground where Perns shed their seeds, you may find it covered with tiny green scales not very unlike the spots called hearts in a pack of cards, only with a few hairs, for roots, asiest from near the pointed end (see Fig. 1). The ot er place to find them in is the surface of a garden There they old wall in a danp and shaded. fernery, Liverworts. They are the beginnings of Ferms, as you. will presently see.
Lift carefully one of these bodies and place it under a microscope (one of Smith and Bech's educationals wilh do) the underside upwards; you will find that it is e little convex, and on the convexity stand a few wery small projections looking like blisters, but of two sortsOne sort has a hole in the end (fig. 2), the other issomething like a netted ball (fig. 3). They have re-
ceived various ceived various names; let us cull the first a pistillity, the second an ant'ecrid.
Here we have what are now styled the sexes of
Ferns. The pistillid is the gentleman. stra lise lady, the antherid is the confessed.

Mrs. Pistillid is only a nest, with a little egg hiddea at the botom. Mr. Antherid is a sort of pimple. You may see the egg by looking into the nest ; but when you cast your eyes upon the pimple you will prosqueezee nothing except a netted surface. But if you squeeze it, out conse little transparent baga, in each of
which is rulled up spirally a sort of vegetable worm, which is rulled up spirally a sort of vegetable worm,
In time the worm uncoils, gets out of his bugand ghows
himself. In fig. 4 he is seen half extricated; fig. 5 you with a bristly beard.
When the worm aforessid sets out upon his travels he moves over the surface of the Fern-scale in search of a nest (pistillid), and when he finds one he gets in if he can; at least so says Count Suminski. That feat being accomplished a wondrous change takes place. The egg grows up into a perfect Fern leaf; at the same When a start has once been made the disappears. longer and longer, and broader and broader, another leaf unfolds from its bosom, in its turn to give birth to more, till at last all are old enough to bear brown of the Fern is accomplished.
It is out of one of these grains that the seed falls which sprouts int

Is all this really true? A good deal of it certainly is Acute observers since Suminski's time have so far verified his statements that no doubt exists about the worms, and the uprising, of a perfect Fern-leaf from tremely difficult to see, and cani only be witnessed by sell trained eyes, armed with well made achromatic microscopes, in the hands of dexterous observers. They must be taken on trust, ss are mountains in the moon, is whether the worm crawls into the nest, and how it gets there. Men, however, have come to believe in the phenomenon; and we c
And these are what are now called the sexes of
Ferns. $R . E$.

## NOTES ON PEARS.-No. II.

The Beurré Giffard or Giffart, the last of the trio of Fery early Pears, is a new variety exceedingly good; it the second week in August. It is a little below about medium size, very juicy and agreeable, with a slight Noyau flavour. On the Quince stock it succeeds well, but does not form a handsome pyramid; it is therefore better cultivated as a bush or espalier. It does not come so quickly into bearing even on the Quince as the
Doyenné d'Eté (which often bears the second year from the graft), but does not generally hear till four or five years old. There are two early American Pears, the Bloodgood and Dearborn's Seedling, which ripen in Augusr, but they are very inferior in our climate. Our This is so well known as scarcely to deserve a place It succeeds on the Quince and comes rapidly into It succeeds on the Quince and comes rapidly into naking gross irregular shoots; as a dwarf bush when removed biennially it makes a prolific tree. This treatment keeps its fibrous roots to the surface and pre this treatment it makes vigorous shoots they should be pinched in in June; on the Quince its fruit is not so large as when grafted on the Pear stock, and they ripen earlier. As a standard in most soils it cankers terribly; but it is grown in perfection in this form in climate and the Thames near Rotherhithe, where both climate and soil seem to suit it. It is, however, not the cimate alone that affects this variety so much as the Garforth, near Leeds, that from a friend, living at Jargonelie Pears in that hei knew of an orchard of healthy and fertile state. As a general mule it should have a wall ; an east or south-east aspect suits it W
Williams's Bon Chrétien, in France "Poire William," widely extended a reputation for its excellence as this variety of English origin ; but its parentage is entirely unknown. In Frauce, to quote a celebrated pomologist in America, quoting Downing in his "Fruits and Erui Trees of America," "This noble Pear is justly one of the most popular of all the summer varieties. Its size, beauty, and excellence entitle it to this estimation." It -with the exception of the fruit sellers in the its being suffered to hang too long on the tree and to becoming dry and insipid. It is better to err by gathering it too soon rather than too late, for in the in the fruit room for a week or so it is full when placed highly flavoured; it should as a rule be gathered just as it cominences to become yellowish at the stalk, its weason may however be prolonged for three or four appearance of ripening to gather some before even that appearance of ripening, and thus make three stages of gathering at intervals of a week; it is quite worthy such melting, so juicy, and agreeable

The tree is always healthy and does not seem to know and as a pyramid on the Pear stock, and on the Quince profusely; it ought not to be planted against a wall, at On the Quince stock it, form a nice compact pyrawid,
larger than from trees on the Pear stock, ripening convinced by the withering of his corn, where the soil rather earlier. A pyramid of this Pear on the Quince
stock when studded with large clear fruit it ornamental ; there is, however, some little attendant inconvenience, for one is loth to gather the fruit, they become too ripe on the tree, or suffer in flavour. Closely following Williams's Bon Chrétien we have
Beurré d'Amanis, best early autumn Pears. This is also liable to suffer from being permitted to remain too long on the tree, It is never a wighly simply very juicy, melting, and agreeable if suffered to ripen in the fruit room ; the tree is remarkable for it rruitfulaness, and equally so for its vigorous growth when grafted on the Quince stock. It seems to grow more
vigorously on the Quince than on the Pear ; it seems also to arrive at a good age on that stock, for some trees in the potagerie (kitchen garden) at Versailles are fifty years old or thereabouts and still healthy and abund and a good prolific bush; as an espalier also it bears well but should not be planted against $s$ wall in the south o England unless perhaps against a north east or eastern aspect, where it would not be likely to ripen too rapidly and will probably orchard culture it bears abundantly standards on the Pear stock its fruits are not so large as on trees on the Quince and not so liable to suffer from our autumaal gales. $T \cdot R$.

## VEGETABLE PATHOLOGY.-No. CV

 plants derive the fluid contained in the soil, and conveyed from thence to the inmost tissues by means of the spongelets, and since these fluids part with a portion of their oxygen in their passage through the tissues, which finds an exit bymeans of the leaves, and it is needful for the due elabomeans of the leaves, and it is needful for the due elabo-
ration of the sap that it should pass through those organs, which at the same time in all probability fulfil other important functions, as for example the placing the inmost tiseues in connection with atmospheric air, anything which affects the vital energies of the sponge-
lets so that they will no lets so that they will no longer imbibe or convey those functions which depe leaves so as to stop entirely be extremely injurious to the plant if it does not prove fatsl. If, for instance, from intense heat the soil cracks and admits the hot dry air to the rootlets, so that their delicate tissue becomes flaccid and at length withers quences ensue, of water is cut off and similar conse quences ensue; or where, as in spring-planted trees of many, are not sufficiently numerous for the of many, are not sufficiently numerous for the
necessities of the plant under a scanty supply of necessities of the plant under a scanty supply of
moisture ; or where, again, the external heat is nutritive fluid and evaporation is disturbed, the rootlets not sending on the stream quick enough to remedy the outward stress, the necessary consequence is great damage to the plant if not complete confined soon takes place, the upper portions may be so little in jured that there is strength enough in the plant to cause the formation of a sufficient number of new root lets to supply the present necessity; or, on the other be rapidly formed from the injured, a new supply may whole foliage has been destroyed by ins, as where the ever the unfavourable circumstances are of Jong dura tion no such healing process will take place, and in some plants, especially those which have highly divided roots, 38 in many Cape shrubs, a few hours dryness of the soil, without any extraordinary heat, is absolutely fatal.t Where the roots have been injured by transplanting, and there has been no time to form new root lets, s few weeks' drought is quite sufficient to destroy the healthiest trees, and on this account no caution orester will trust to spring-planting, a practice even in the garden, where as much as possible, in some measure supply the deficiency. Even in autumn-planted trees, where they are of considerable the, it is necessary sometimes to guard against the effects of drought by mulching, or by placing blocks of stone round the base of the tree to shade the ground rom the direct rays of the sun. This is a practice which was recommended long since by Virgil for the protection of the roots of Vines, which sometimes suffer materially from heat in southern climates, and it is still adopted occasionally. In Madeira, where the heat is obtained by deep the Vine slopes, the same end natarally stony, the stones mixed up with it should on no account be removed without due conside around them is too dry for the purposes of vegetation, a fact of which many a cultivator has been painfully

+ Ingarden practice, where so, many plauts are necessaril
grown in pots, as the active portion of the roots is generally in

## midly

is shallow and the bottom such that corn, were its moisture.
413. Where moisture has been long withheld from plant the vitality is sometimes so low that it is unable to endure a sudden or extreme change. If under such circumstances water is too rapidly admitted it is apt to stagnate, and thereby impair those supplies on which the development of buds or adventitious roots depends, mat may cause decomposition+ or carry with it noxious matter from the decayed rootlets in such abundance a to act as a putrefactive ferment upon tissues already in weak and languid condition, and if the foliage flags he powers of evaporation will at the same be diminished Hence it is often more needful to shade newly trans planted vegetables than to supply abundant water to the roots, and on the same principle it is not desirable to water plants already flagging while the full sun is shining on them. In trees which have been long removed from the soil Mr. Knight found that shading and moistening the bark was better than supplying water in some measure performs bark when young and tender and ind measure performs the functions of the leaves By judid planis supersedes them. By judicious moistening, the vitality of the cellular tissue was thus gradually restored to its former strength, nnd the consequent formstion of new roots at length enabled the plant to sustain itself under the ordinary circumstances of cultivation. § In the garden, where from unavoidable circumstances, fruit trees have not been planted till spring, and the weather proves dry, close pryning is absolutely necessary to effect the healthy expansion of the buds. If the head be left unpruned, though the buds should push at midsummer, they fre quently prove so weak and diseased, that the tree is to the last unhealthy if it survives.

In hot countries bulbs such as Hyacinths, Onions, Garlic, \&c., frequently dry up and wither in consequence of the destruction of the roots. Where there is reason to fear such consequences especial care must be taken to encourage the descent of the ronts as deeply as possible, and to protect the bulbs themselves by a sufficient covering of soil. Above all, the bulbs when first placed in the ground must be planted as far down as may be consistent with their full development

## PROPAGATION OF SALMON.

The following paper on this subject was read by Mr. Edmund Ashworth, of Egerton Hall, near Bolton, to the British Assocation a Glargow.-Is is, compara ject of the artifin a limited period that the sub ject of the artificial propagation of fish has received that attention which it eminently deserves. Though he process has been known for nearly a hundred years, there have been few attempts to give it a commercial application. The circumstances under which the recent experiment at Stormontfield has been made are sufficiently interesting and important to warrant a description of the means by which the end in view has been attained. Continental naturalists have long been acquainted with the subject. In 1758 a note, descrip tive of the process adopted by Mr. Jacobi in the arti ficial fecundation of ova, was transmitted by Coun Goldstein to M. de Fourcroy, and altimately published Fishes." Prior to that date, in 1763 , a minute account Fishes." Prior to that date, in 1763 , a minute account
of Mr. Jacobi's experiments' during a period of 30 year of Mr. Jacobi's experiments during a period of 30 year following by M. Gleditsch, was enrolled in the Memoirs of the Royal Academy of Berlin.
The efficiency of the process therein described was rested at Nortelem, in Hanover, with the most satisactory results. In more recent times, attention on the continent has again been drawn to this interesting subect by the two fishermen of Bresse, MM. Gehin and Remy. An official inquiry into the nature of their experiment resulted, on the recommendation of M. Coste, Pressor at the College of France, in the fundation of presented to the French Minister of Agriculture nd Commerce by Mr. Coste, on the 7th of February, 1853 , bears abundant testimony to the complete success which has attended the instittion. In our own country various individuals have experimented on the artificial fecundation of the ova fish. Thomas the earlisq., of Clitheroe, may be instanced as one of through the Gardeners' Chronicle in 1832. The curious and interesting experiments of Mr. Shaw of Drum lanrig have found an honourable record in the Transactions of the Royal Society of Edinburgh. But it is chiefly to the exertions of Mr. Robert Ramsbottom, of Clitheroe, that we are indebted for the practical deveopment of this science. Originally instructed by Mr. Garnett, he devoted himself to the acquisition of that intimate knowledge of the habits of fish which is all im portant in artificial fecundation. Long-contiued applis Knowlmere, the residence of Jonathan Peel, Eaq., in 1852, about 5000 salmon ova were placed in boxes by Mr. Kamsbottom, which was the first auccessful attempt with salmon ova in England. In the following year, at Outerard, in Ireland-where for the first time in the United Kingdom it was attempted, by Mearss. Edmund
and Thomas Ashworth, to render the science o
fisciculture subservient to commercial purposespisciculture subservient to commercial purposes-
$-0,000$ salmon were hatched under Mr. Ramsbottom' careful manipulation. On the 19ch July, 1852, meeting of the proprietors on the Tay was held at artificial propagation of the salmon, written by Dr. Esdaile. On that oceasion Mr. Thomas Ashworth, of Poynton, explained to the meeting the nature of the hiserations whicher and himself, and strongly recommended his brother and himself, and strongly recommended
the adoption of similar measures in the Tay, under the direction of Mr. Ramsbottom. The proposals of Mr. Ashworth were agreed to, and a committee was ap-
pointed to fix upon a suitable locality for planting of pointed to fix upon a suitable locality for planting of
boxes and construction of ponds. The Earl of Mansfield, who was chairman, and who has shown much interest in the success of these experiments, gave permission to the conmittee to make a selection of any portion of his extensive estates on which to carry nut montfield Mill, near his lordship's residence. A gentle slope from the lade which supplies the mill offered the boxes and pond. Three hundred boxes were laid down in 25 parallel rows, each box partly filled with clean gravel and pebbles, and protected at both ends ing beds were found at the head and foot of the rows, and a pond for the reception of the fry was constructed immediately below the hatching ground. On the 23d of November, 1853 , operations were commenced, and by the 23 d of December 300,000 ova were deposited in the boxes. The fish were taken from spawning beds in the Tay. The process of fecundation will be best understood by a quotation from Mr. Ramsbuttom's pamphlet, in which he describes the means employed in impregnating the ova at Outerard. "So soon as a pair of mmediately dischaptured, the tub one-fourth full of water, by a gentle pressure of the hands from the thorax downwards. The milt of a male was ejected in a similar manuer, and the contents of the tub stirred with the hand. After the lapse of a minute the water was poured off, with the exception of sufficient to keep the ova submerged, and fresh water supplied in its place. This was also poured off, and fresh substitoted, previous to removing the impregnated spawn to the boxes prepared for its reception." The ova were
placed in the boxes as nearly similar to what they would be under the ordinary course of natural deposition as possible, with, however, this important advantage :In the bed of the river the ova are liable to injury and leposited in times of flood will often cover the ova too deep to admit of the extrication of the young fry, even if hatched. The impetuosity of the streams when flooded will frequently sweep away whole spawning the ova are shielded from injury and their vivification in large numbers is thus rendered a matter of certainty and the young fish reared in safety. On the 31st o March, 1854, the first ovam was observed to be hatehed and in April and May the greater portion had come to life, and were at large in the boxes. In June size being about an inch and a half in length. From the period of their admission into the pond, the fry were fed daily with boiled liver rubbed small
by the hand. Notwithstanding the severity of the winter, they continued in a healthy condition, and in the spring of the present year they were found to have
increased in size to the average of 3 or 4 inches in length. On the 2 d May, 1855, a meeting of the committee was held at the pond, to consider the expediency depart the fry for another year, or allowing them the river then descending seawards with the fry in the ponds, led to the conclusion that the latter were not ye smolts, and ought to be detained. Seventeen days afterwards, viz., on the 19th May, a second meeting was held in consequence. grat interim assumed the migratory dress. On inspection it smolte, and the committee came to the determination to smolta, and the committee came to the determination to
allow them to depart. Accordingly the sluice communicating with the Tay was opened, and every facility for egress afforded. Contrary to expectation, none o until the 24th of May, when the larger and more mature of the smolts, after having held themselves detached from the others for several days, went off in body. A series of similar emigrations took place, until fuly one half of the fry had left the pond and deject of controversy, whether It has long been a subassume the migratory dress in the second or third year of their existence. So favourable an opportunity of deciding the question as that afforded by the Stormontfield experiment was not to be overlooked. In order th test the matter in the fairest possible way, it was resolv d they might easily be detected when returning as grilse. A temporary tank, into which the fish must necessarily descend, was constructed at the junction of the sluice with the Tay; and as the shoals successively left the
pond about one in every 100 was marked by the

These causes, in addition to the great destruction of ora as well as young, fry by will fow, thish, great destruction of insects, all tend to
limit the natoral increase of the alimen.
were marked on the 29th May than on any number in all about 1200 or 1300 . The result has proved highl atisfactory: within two months of the date of their liberation-viz., between May 29 and July 31, 22 of the young fish so marked when in the state of smolts, on their way to the sea, have been in their returfully examined. The conclusions arrived at are most gratify ing, and proved what has herstofore appeared almos incredin their short sojourn in the salt water young fish during their short sojourn in the salt water. This fact may be considered as still further established by ob-
serving the increased weiht according to date of the grilse caught and examined; those taken first, weighing 5 to $5 \frac{1}{2}$ lbs. then increasing progressively to 7 and 8 lbs ,
whilst the one captured 31 st J . whilst the one captured 31st July weighed no less than $9 \frac{1}{2} \mathrm{lbs}$. In all these fish, the wound caused by marking was covered with skin, and in some a coating of scales had formed over the part. Althnugh 22 only are men tioned, the taking of which rests on indubitable evidence nearly as many more are reported from distant parts The foregoing fully bears out the conclusions arrived a by Mr. Andrew Young, of Invershin, as reported in his valuable work on the "Natural History and Habits o the Salmon," in which he says, he marked a number smolts in April and May, and in the course of June and July following cau hat them in grilse, still showing the marks, and varying from 3 to 8 lbs in weight. To th at Stormontfield by Robert Buist, Esq., of Perth, and the information he has supplied, we are indebted for many of the foregning particulars. And to the close
observations and attentive suggestions of Mr. Walsh, of the firm of Paton and Walsh, eminent gun-maker at Perth, we are indebted for the specimens of oun fish now produced, of various ages and sizes, as well also for his valuable information of the present condition of the ponds and the young fish at Stormontfield. The experiment at Stormontfield has afforded satisfactory proo that a portion at least of the fry of the salmon assume the migratory dress and descend to the sea shortly after the close of the first year of their existence ; and what is far more important in a practical point of view, it has also demonstrated the practicability of rearin salmon of marketable value within 20 montls from the deposition of the ova. A very interesting question still remains to be solved. At what date will the fry now in no disposition to migrate, and if the silvery coat of the smolt be not assumed till the spring of 1856 a curious anomaly will present itself. Some of the fry as amolts will for the first time be descending seawards of the average weight of 2 oz., some as grilse will be taking their second departure to the sea, and others still more advanced will even have completed their second migration, and return to the river as salmon 10 or 12 lbs . in weight. It is much to be desired that the experiment at Stormontfield could be continued for a year or two onger, till the links in the chain wanting to complete the natural history of the salmo hould be obtained. All praise is due to Lord Mansfield for the liberal manner in which he has gided the carrying out the operations to this time, and from which e little advantage beyond the satisfaction to an enlightened mind of promoting the interests science and the welfare of the community. But in annther point of view, looking to the advantage of in-
dividuals, and even nationally, too much importance can searcely be attached to a scheme by which the now diminished value of our river fisheries may be restored to a state much beyond their once profitable condition, and a large amount of food provided for the people; so long, however, as we see the wholesale destruction of salmon and grilse in the mouths of the rivers, permitted by law, as at present constituted, it is hopeless to expect any general effort for artificial propagation. The nets now permitted will take any application renders them year by year more destructive the owners of the rivers inland, who are thus deprived of their due share of fish; and not until the salmon are
reduced to a still smaller amount will the conflicting reduced to a still smaller amount will the conflicting
interests of the various owners bring them to a sense interests of the various owners bring them to a sense
of the importance of legislative regulation. Salmon fishing with the rod is yearly becoming of more value, and it would not be difficult to suggest a mode whereby the present rentals for fisheries might be paid, and the sport of the anglers greatly increased. Since arriving in Glasgow, I have received a communication from my friend Mr. Buist, in which he says, "In my opinion you have kept your statements within the truth, as I have satisfactory evidence of 22 marked grilse being I hive no doubt many have been thrown in the heap without being noticed by the careless fishermen. There is at present a mystery as regards the prozress of the
young salmon : there can be no doubt that all in our ponds are really and truly the offspring of salmon; no other fish, nor even the seed of them, could by any possibility get into the ponds; now we see that about one half have gone off as smolts in their season as grilses. The other half remain as parrs, and the milt in the males is as much developed in proportion to the 10 lbs . weight, while these same parrs in the pond do not exceed 1 ounce in weight. This is an anomaly in nature which, I fear, cannot be cleared up at present. I hope, however, by proper attention, some light may
be thrown upon it from our experiments next spring.
The female parrs in the pond have their ova so developed that the granulations can scarcely be discovered by a lens of some power. It is strange that both Young and Shaw's theories are likely to prove much disputed point settled, that parrs (such as ours at east) are truly the young of the salmon.
The bottle with specimens of the young salmon a different ages was handed round the room, and created considerable interest. There were young fish with al the marks and evidences of fully developed parr, only 2 inches long, and others of the same age 5 inches long Mr W apecimen of a smolt taken out of the pond by of ova. The grilse which had been caught returning rom the sea 5 to 9 lbs . in weight, were also of the same age as these in the bottle
Some important discussion followed, in which a very general opinion was expressed, that the chief difficulty to be encountered in experimenting in the artificial
propagation of the salmon was the fuct that fish was common property, and those at the expense of experimenting were not secured any advantage from their labour. Legislative interference was deemed necessary, if these experiments were expected to prove successfu and advantageous.
From the interest exhibited by the members of the section then present, it was decided to appoint a com mittee to carry out the investigation for another year Association to be held at Cheltenham.

The committee was accordingly appointed, consistin of Dr. Fleming, the Chairman, Sir William Jardine Bart., and E. Ashworth.

## Home Correspondence.

Horticultural Society.-As one of the vast numbe who share in the regret of Mr. M'Ewen that th exhibitions at Chiswick are about to be discontinued allow me to say that I cannot agree with him that
" $F$. H. S." is in error when he states " people no longer exhibit their productions for honour or for the sake of horticulture, but purely and simply for the money the can make." Although Mr. M•Ewen may be perfectly correct in declaring that many gardeners exhibit at loss to themselves, yet it is notorious that there are a very many who have but the one object late their expenses to a shilling, and if these ar likely to exceed the value of the prize for which they intend to exhibit, they say at once, "I must stay a home, this won't pay me." In fact, are not plant hawked about from one exhibition to another by gar deners on the same principle as the country showma takes his paraphernalia from one fair to another Whatever may have been the motive, it is clear to the commonest observer that garceners have not done theil best to support the shows at Chiswick ; but, on the con trary, they have gone to the Botanic and Crystal greater and more easily obtainable. $X$., Battersea January 23.

The London Parks.-I have walked through thes parks for these last 35 years, and have often regretted their apparently much neglected state in reference the introduction of trees. Now, in this age of professed general improve ments, why should our metropolitan parks not have the advantages of such trees as would beautify and improre the scenery-such as Purple Beech, Crimson, Scarlet and 30 other varieties of Thorns (Cratrgus), Labur nums, Scarlet Horse Chesnuts (one of the most show trees known, and it grows well in smoky districts), the common wild Cherry, Weeping Birch, Elm, and ABh Turkey Oak, Limes, some of the most showy sorts a Salix, Variegated and Purple Sycamore, and in the mos sheltered places Acacias, Deciduous Cypress, glandulosus, Purple-leaved Elm, Pyrus Pollveria, \&c. and for clumps such plants as Lilacs, Snowballs, Double Whin (Furze), common Khododendrons, Honeysucke Pyrus japonica, red and white, Halesia tetrapterta, Syringas, Viburnums, Spireas, Mezereons, \&c. Now I am quite aware of the difficulty of getting trees grow in amoky atmospheres, and also in public place to prevent flowering trees and shrubs from being cut broken by mischievous people; but nothing has greater tendency to civilize, as it were, such perso than cultivating or beholding the beauties of nature the forms of fine trees and beautiful flowers. I, yourself, trust that the Government will in future some attention to this important and long-negle subject ; the cost would be trifling, the advantage greal field.

Cloacine. -In reply to your leading article on thi subject, I beg to acquaint you that I have for several yeat practised emptying cloacine from the vaults early winter into the alleys between Asparagus beds,
from thence after being mixed with the earth moved with the spring dressing on to the beds. water several times during the season from a tant (int which the water-closets eropty themselves). Aspart without injury to their quality or flavour. W. C. Under certain circumstances many kitchen Asparagus, Seakale, scc., when forced on dung,
grown in rich manured and undrained soils, are very
inferior in quality to those grown in poor and dry situations, and so with many other things. Our cloudy sky and damp atmosphere may also be an argument against the use of large doses of manure, yet from some
experince and observation I believe that the rankness experience and observation I believe that the rankness
and tendency to disease in vegetation generally-by and tendency tio disease in vegetainu geneay be so modified if not destroyed by due attention to thorough drainage, by mixtures of charred materials to secure to the foliage as to increase the produce of the ground to almost an incalculable extent. $G$. $M^{\prime}$ Ewen.

Cucumber Disease. - Your correspondent (see p. 24 ) seems to think that wherever there is disease under glass there must have been neglect. Now, withou quesiful grower writers experience and abily as i who, like myself, believe that there are other causes besides neglect which engender disease, though they may not be susceptible of satisfactory explanation or easily understood, even after careful investigation Are not our best Cucumber growers troubled some times by disease even with the best means of
preventing it, if that were possible, at command For instance, last February I planted 10 healthy plants of Walker's Improved Manchester from five years old seed in a properly prepared bed in a large Cucumber house. They progressed satisfactorily, with the ex ception of one plant, and bore abundance of fine fruit up to the middle of November ; the plant which failed flourished with the others until the fruit was 7 or onds, exude a glutinous juice or gum from several places, both on the fruit and plant, the parts affected turning black, and the leaves exhibited yellow spots. Now, this plant received exactly the same treatment as the others up to the time when disease manifested itself. Surely this, therefore, could not be attributed to neglect. Perhaps some of our most experienced growers ever been troubled with the Cucumber disease, and do they attribute it to mismanagement? Also, what is the best method of counteracting it when it does break out T. R., Thetford, Norfoll.

Aるanthus glandulosus.-Your remarks respecting China, have induced me to inform you that the original ogether with many other giant exotics for which thi place was early famed, have been cut down, owing to the great amount of shade they produced too near the all directions, making 6 or 8 feet shoots the first season, Where the soil has been moved to any depth. Our largest tree now girths (some feet from the ground) 3 feet 6 inches, while its height is upwards of 50 feet The soil is a light sandy loam, and in the lower ground the air is humid, having ponds there many acres in extent, and springs within a few feet of the surface, ills suffer from the effects of winter, more or lese, first three or four years, unless they are sheltered or have a few leaves thinned out from the sammer shoo in Angust to check late and excessive growth. This are is not in the valley where they grow lik weeds. H. Bowers, Busbridge, Godalming.
Treatment of Bedding Plants.-Will you favour me possession of this place, (as gardener) about the middle of November last. A great many of the bedding plants were either dead or in a dying state. I should (had I acted prudently) have thrown them away at the time, had it not been that other work of a more pressing natu ook my attention from the matter. It happened few days ago that my master and mistress inspected the pit in which they are in (this, and two frames,
and 3 lights respectively, is all the glass 1 possess) and said "that they feared all the Verbenas were dead also that the seedling Hollyhocks looked badly." Now with regard to the Verbenas, there were not more than 30 cuttings "put in," seemingly late in October, none of which struck root; to make amends for this neglect, the rooted branches had been hacked off the old plants, and the roots crammed into small pots with some soil pressed upon them. The branches were neither reduced nor cut back to compensate for the loss of roots, \&c.; some old plants shared a similar fate, for the ostensible purpose (it would appear) of making a display for a few weeks, afterwards to wither and die.
Had I suspected at the time that this injudicious system
had been carried on, I might have remedied the evil by
potting them afresh, and cutting back the branches, but I did not discover it until I had occasion to throw some of them away. Now for the Hollyhocks. The seeds
had been obtained from London, and were sown late in September or early in October in pots placed in a pir, which must inevitably be heated by a flue, in order to exclude frost. The walls of the pit are high, so that no amount of covering on the glass would keep the plants secure without the aid of fire-heat, as the frost would penetrate the wall (4-inch brickwork). There were two rough leaves on each plant when I took possession (I did not remove them, well knowing that they were sown
months too late, and if placed under the most auspicious circumstances would not stand over the winter. Independent of this, the pit is badiy constructed, the walls being high enough to admit of a path all round the inside. I have frequently not been able to uncover this pit (if I except bunting over the openings to exclude frost and winds, the plants being contiguous to the glass), during the space of 12 days or a fortnight. The mats being frozen at those times that some things must have been suffering, but I could not administer to their wants, and I concluded that I had better lose a few plants than the whole ; the means of having access to the inside would have obviated this anxiety and mortification. Wintering plants in this district (the north of Durham) is very precarious, where frost and snow are so intense and of
long duration. What necessity is there for sowing long duration. What necessity is there for sowing
Hollyhock seed in a pit where fire-heat is unavoidable and in October too? It was stated a few years ago that "gardening had got to its climax;" surely such a statement must have been wrong when such innovations on common practice are coming to light. It would have een better to have said (if we take the above mode of instead of advancing. J. B.

Retrospective Critacism--The article on the Clou d firofle ( p .7 ) is a confusion of terms. Girofle or Garo the, name of the spice, applied secondarily Dianthi, \&c, as spice, applied secondarily to various Dianthi, \&c., as having the same perfume. The Clou chiodo, or clavus, is the nail head, so called from it shape, and is the clove or bud of the spice plant itself, and only added to Caryophyllus, \&ce, as one may speak of a clove of Garlic or any other knob-shaped vegetable. 2. The Lupine (p.8), cultivated in the south o Europe, is not our Lupinus albus, but L. Thermis. [We believe the seeds were certainly those of $L$. albus, Some are of opinion that $L$. albus and $L$. Thermis are not specifically distinct.] 3. What Oaks did your corcould not correct M. Pinel's names.] 4. I once had Chinese Dodder (p.6); it tied all the plants in the greenhouse together, and was a good riddance. $S$.
hich I Flues.-I have a hot-house in my ground of the smoke ascending in front of my house, as well as being somewhat annoying to my neighbours. To obviat this I propose conducting the smoke from the hot-hous by 6 or 8 inch clay pipes similar to drain tiles under ground, a distance of about 70 yards, to a point where light elevation the whole way. Now what I should like to know is whether such a scheme is practicable that is, will the flue work by being led so far underground? Perhaps you may know if such a plan W. M. [Can any one answer this question ?]

Rain at Alverton for Five Years.-

The fall appears to have been little more than three fourths of the average quantity that falls here, and the rery low state of the springs is confirmatory of the def ciency. My guage is onthe ground. W. M. Truro.

## 

A Treatise on Electricity in Theorg and Practice. By A. De la Rive. Vols I. and II., 8vo. Longmans.

This elaborate work will when finished, for there is et a volume to come, exhibit in a systematic form the present state of knowledge on the subjects of which it Wreats in eleetricity, magnetism, and their application. With the exception of the well-known treatise by M. Becquerel, there is not we believe any work of simiar pretensions, although the incredible advance made in our knowledge of these subjects of late years hns rendered a complete and systematic view of them almost indispensable to the student of natural philosophy. In the two volumes now before us the author has completed the theoretical part of his subjeet, which he has divided into five parts. The first part is introductory, containing those preliminary notions which are necessary to the study of electricity and also a description of such apparatus and instruments as are essential for the same purpose. In the 2 nd, 3 rd, and 4th parts we hetism. This naturally oceapies the greater portion
the work, so far as it is completed. The reader wull laws of attraction and very perspicuous account of the electricity, of magnetic phenomena, of magnetism and electric currents, electro-dynamics, induction, the pro pagation of electricity, its calorific, luminous, che mical, and physiological effects. The fifth part trent of the and action and chectricity, viz, her, mechanical actin, a chemical acion. Some idea may be forme from the fat that then these fire treated transmission and sources of electricity, alone occupy nearly the whole of the second volume, consisting of more than 900 pages.

The 6th and 7 th Parts, which are not yet published will be devoted to an examination of the relations of electricity to natural phenomena, and to an explanation of its practical applications either to the art of healing or to the chemical or mechanical arts. Although the author goes into great detail, and explains and examines the theories which have from time to time proceeded from those who like himself have made these matters the object of their especial study, he has, by transferring to supplemental notes at the end of each volume all abstruse mathematical calculations, adapted his work to the wants of non-mathematical inquirers. At the end of each chapter the reader will find a full list of the principal works relating to the matters treated upon in it, and the text is throughout amply illustrated by wood engravings. In short, no effort has apparently been spared either by the author or the publisher to render the work in every way complete. In the chapter on the physiological effects of electricity an account will be found of the experiments made with regard to vegetation by Giulio on Mimosa sensitiva, M. pudica, M. asperata, and Hedysarum gyrans, and by MM. Dutrochet and Becquerel on Chara. From these it appears that there are notable differences between the action of heat and of electricity, in respect to the manner in which their action is exerted, and that lectricity acts in a way pection to itself The physio logical effects of electricity on vegetation have however been but little studied and our knowledge on this head is very limited; so far as they are known they appear to be of scarcely any importance. So that the vegetable physiologist may, for the present at least, as we have often asserted, disregard electrical action in considering the nature of the vital forces which he has to study. Moreover, the nonsense talked about electrical agriculture some years ago may be finally regarded as wholly undeserving further discussion.
Upon the whole the translation seems to be well executed ; but we must venture to remind Mr. Walker that the French word noued is not eqnivalent to the English word knot, nor foliole to follicle; noeud is the joint of a plant, and foliole a leaflet.

There is no index at present; but we hope that when the work is completed its valuable contents will be made more accessible than they usually are in the works of foreign authors.

## Garden Memoranda.

Clifeden nrar. Windsor, one of the Seats of His Grace the Duke of Suthrriand. - In a former article ve alluded to some of the alterations which had been made by the noble poesessor of this fine place. The handsome mansion in the Italian style, then in course of erection, is now completed. It is approached on the north side by a straight carriage drive, 460 yards in length, and 40 feet in width, the broad grassy margins on either side sloping abruptly to the road. There is also a private drive to the house of a winding and there fine masses of American plants, chiefly Rhododendrons which when in bloom produce a magnificent display. On the south side of the house immediately along its base is a fine terrace walk about 360 feet in length, and 26 feet in width, from which an extensive view of the surrounding
country and of the windings of the Thames, which aweeps past on the west side of the mansion, can be obtained. Flights of steps lead from this elevated position to a walk 18 feet wide below the terrace just mentioned, whose wall is 25 feet high and richly ornamented with Magnolias, Roses and Chmbers. To the south of this is open lawn in the shape of a fine piece of table land on the top of a hill which rise suddenly from the Thames to a height of nearly 300 feet. This noble piece of Grass has recently been greatly altered in form. A broad green terrace walk has been made all round it and a little inward rom the base of the sloping banks of this delightiol promenade is a ser and which rorm a border in from the different terraces and the vindows of the mansion. It need scarcely be added that these raised walks, floping banks, and flowery borders are all in good keeping with the style of the mansion, and that the floral design is on a scale commensurate with the different objects with which it is associated The beds, which are formed round grassy centres, are edged on the outside with Privet and Spruce Fir in the shape of a close hedge some 9 inches in height. The outlines are thus well defined, and the whole design is rendered conspicuous even when viewed from a dis tance. The steep bank between this elevated Italian garden as it may be termed and the river is thickly covered in with Yew and other trees, among which
quict moulaul walks wind in
Under the noble terrace close to the honse abo alluded to are the Orangeries, which contain some magnificent trees in excellent bealth. A few of the largest of these measure as much as 10 feet through the head,
and have stems quite 2 feet in circumference. These and have stems quite 2 feet in circumference. These
trees are taken out of their hybernatory in the beginning of summer, and placed so as to form a beautiful avenue on the lower terrace walk.
On the east side of the house is a small flower garden, the beds in which are mostiy Pear-shaped, and are at present planted with bulbs, Pansies, Forget-me-Nots, interesting was stated to be the Forget-me-Note, both blue and white, which apart from the associations connected with them, are reported to make extremely showy and effective beds. On one side of this little garden are the conservatories, which are at present gay with Camellias, Azaleas, Luculias, and spring Heaths of Chinese Primulas and other things now in flower, surof Chinese Primulas and other things now in fower, sur-
rounded by plants of a drooping character. These fill up gaps where the ordinary conservatory plants could not be placed, and serve in an eminent degree to vary and ornament a house which we need scarcely say should be leept as gay as possible at all seasons, and which without
some contrivance of this kind is not always essy to some contrivance of this kind is not always easy to accomplish. We also remarked in one of the passsges here some ornamental screens covered with Ivy, planted
in zinc trays or troughs, which are enclosed in handsome china boxes, made by Minton. These boxes are kept continually full of flowering plants, whose pots fit into sockets made to receive them, the whole being concealed from view by a covering of Moss, and arranged in this manuer quantities of them are employed in the dining and other rooms of the mansion with excellent effect. Behind the conservatory some important alterations are being carried on, among which a large Vinery which had fallen int, bad repair is being renewed. Against the south wall of a small square kitchen garden cou-
tignousto this spot is a long rauge of narrow forcing tignous to this spot is a long range of narrow forcing houses
chiefly filled with Peacla trees and Vines. These we understand are, however, soon to be taken down, and Mr Fleming's (of Trentham) contrivance for covering walls with glass put up in their place. A portion of this wall indeed is already faced with this description of house, which has an upright glass front about as high as that of the wall opposite which it stands, and it is closed in at the top by a slightly raised span-roof, one-half of the lights pose of admitting air. These sashes, as well as the upright front ones, are made to move all at one time by means of a clever mechanical contrivance made for the purpose, and thus little or much air can be given as may be desirable, and with the greatest possible facility. ately inside the glass, is a trellis of the same height, on which Peaches are trained ; while, at convenient distances apart, Vines have been planted which, after running up the front, are carried over the pathway in the form of an arch, and have their point trained down the back wall. The latter in the present instance is wholly devoted to Peach trees, which
looked in excellent condition, and it is stated that they Looked in excellent condition, and it is stated that they
produce fruit in abundance, and that the five feet trellis produce fruit in abundance, and that the five feet trellis
in front which is also well covered with young Peach trees does not shade the back wall in the least. By this arrangement therefore the most is made both of the front and back of the house, while under ordinary circumstances the latter part, we need not say, is so - haded as to be of comparatively little value. Lettuce and produced in the borders of a house of this description, and as the front can be entircly removed should that be required, all operations connected with renewing the soil, planting, \&e., can be eonducted with co ufort. Experience so far is entirely in favour of this kind of house, which when well heated with hot water as this is, promises to effect a!l it was ever intended it $\varsigma \mathbf{h}$ uld do and even more.
The early Peach house is at present in full bloom, and the first Vinery is also just coming into b ossom. On the back walls are Figs, which are reported annual y to ripen excellent crops, with the exception perhaps of fruitful as Lee's Perpetual. On the floors of nearly all the cooler houses were great quantities of Scarlet Geraniums laid in thickly in leaf-mould, and when kept dry they winter well in this way, but when they happen to unavoidubly get wet they become yellow and sickly h:ll's Black Prince is the surt preferred for the first h:ll's Black Prince is the sort preferred for the first
crop, and already many plants of it are in full bloom. In a pit were Raspberries and Cherries in pots beginning to push, as were also Roses, Laburnums, and 0 'her plants put in to force. Potatoes, Radishes, and Asparagus are also brought in here under glass. French Beans, Melons, and Cucumbers are likewise grown exensively. The last have just been planted out.
Turf pits have been found extremely useful here as elsewhere for many purposes, and amongst others for wintering bedding plants in. We noticed one filled with young Calceolarias pricked out, and thus the use of pots is dispensed with. These and other piants are said to winter well in this way, and in places like Cliveden, where great quantities of such things are wanted, such contrivances are absolutely necessary. They also answer for beeping Strnwherries in, and Violets are said to flower freely in them.

## Calendar of Operations.

(For the ensuing week.)
Conservatort, \&c.-In pruning and training the climbers in this and other houses, some regard must be paid to the time when it is desirable the plants to flower before autumn, pruning may be deferred for some time yet ; but for earlier display it should be done at once. Passion flowers, Bignonias, and similar plant which make long annual shoots, should only have thei
branches thinned and slightly slortened, while others branches thinned and slightly shortened, while others,
as Combretums, for instance, may be spurred in. Much depends upon the space allowed for their growth Kennedyas will now be showing bloom, and what training they require should be done at once; but
the pruning of these should not take place till the pruning of these should not take place il
after they have done flowering. Where Orange tree are grown to decorate the flower garden in summer care should be taken to prevent their beginning to push previous to their removal to the open air, and this more especially if the trees are wintered in a dark ronfed always a thin flabby appearance, and soon turn brown after the plants have been set tout of doors; whereas, open air, the foliage will bear any amount sunshine and still look green and healthy

Flower garden and shrubberies.
Little can be done here at present beyond what was recommended last week. Those who are fortunate good supply of this provided whenever the weather is favourable for that kind of work. Let everything in the shape of in-door operations which can be done now to save time in spring be attended to. See to having plenty of soil prepared for striking cuttings in, as also for potting off, and have plenty of draining materials prepared and sorted out in sizes. Where the stock of bedding out plants is short, the strongest stove plants should be selected and placed in a moist growing temperature, keeping them as near the glass as possible in order to secure strong growth and obtain good cuttings. If the plants are well rooted, it will be advisable soon to give them a shift, using rich soil; for it is of great importance to obtain strong cuttings, as they are not half the time becoming established plants as when weakly dwindling shoots lave to be used for that purpose.

## FORCING DEPARTMENT

Vineries.-Discontinue syringing Vines that are showing fruit; but secure sufficient moisture in the atmophere by frequently sprinkling the passages, \&c. Be afe under thas low a temperature at night as will be advantage of sunshine to raise it considerably in the daytime, and be cautious how cold air is admitted where the Vines are in leaf. As the Grapes are cleared from late houses, prune and wash the Vines with soft soap, and a little soot and lime, also thoroughly clean the woodwork, glass, \&c, and have everything clean and ready for next campaign. Peach Hovse,-Discontinue syringing where the blossoms are beginning to open, but prine a nice, moist, healthy state of the atmosphere by prinkling the passages, \&c., as may be necessary, but avoid anything like dampness while the trees are in hoom. Mantain a steady night temperature of $50^{\circ}$ to
$55^{\circ}$ while the trees are in flower. Take every possible opportunity of admitting fresh air, and where the external air can be made to pass over the heating aparatus, Bo as to get warmed before coming in contact widh the plauts, a gentle circulation should be constantly kept up until the fruit is fairly set. Avoid the admission of currents of dry cold air, however, which would be most injurious to the trees. Figs.-See that trees planted out are properly moist at the roots, and also keep thuse in pots and tubs carefully supplied with water, for any excess as respects the presence or absence of moisture at the root is very dangerous after the appearance M of the fruit, and is the frequent cause of its dropping off. Maintain a moist atmosphere, and if necessary to water the border, use tepid water, giving enough to nicely moisten the whole of the soil. Let the temperature range from $50^{\circ}$ or $55^{\circ}$ at night to $60^{\circ}$ or $65^{\circ}$ by day, giving air whenever it can be done with perfect safery
hardy fruit and kitchen garden.
Where orchard trees are infested with insecto Moss, the bark should be well scraped wilh a blunt tool to remove as many of the larver of the insects as
possible, after which the parts should receive a cost of possible, after which the parts should receive a coat of
the following composition, viz, hot lime and soot in equal quantilies, mixed with cow's urine until it attains the consistency of thick paint. This composition should be well rubbed into the crevices of the bark, in order to
make sure of its reaching every hiding place of the make sure of its reaching every hiding place of the composition, it would be useful in causing it to adhere better. It is a tedious process to properly cover large old trees with this, but its effect in clearing them of insects will repay the trouble, and an occasional coat to young trees will be useful in keeping them clear. Where early sown Peas are likely to le a failure, a quantity heat, to be hardened off and planted out tow and gente heat, to be hardened off and planted out towards the end of next month. Also make a successional sowing of an early variety on a warm border as soon as the state of
the weather permits. Sangoter's No. I. is the earliest
. the weather permits. Sangster's No. I. is the earliest
variety we know of. Likewise get in some early Mazagan Beans, and a sowing of some variety of Pea of gool
quality, as Champion of England, should be made is order to bave these in as early as possible.

## Cottagers' gakdens.

Plant Horseradish, Jerusalem Artichokes, Sealale and Rhubarb. The Artichokes will do in any wasto corner, or as a boundary screen to protect tender
things. Make cuttings of choice Gooseberries and Currants, also Honeysuckles, in the same manner, and Currants, also Honeysuckes, in the same manner, aud
Irish Ivy for covering naked buildings. Lose no cime in planting a good breadth of Potatnes, especially Kidneys; if If planted in well managed beds, Drumhead or other Cabbages may be planted in the alleys, and will come trenched for Parsnips. Make a slope and sow a littlo Horn Carrots; throw a little Radish or Brown Cos Lettuce amongst them. Run the hoe through Cabbages and soil them up a little.

## Notices to Correspondents.

## Che $\mathfrak{M g r i t u l t u t a l ~ G a t e t t e . ~}$

SATURDAY, JANUARY 26, 1856.

Mr. Gradr, of the Superphosphate Compost Company, and Mr. Sumarrs, a Dursetshire farmer, differ as to the value of solub. : phosphate in a superphosphate compost. It s) happens that a very luminous and instructive dec ion of the difference between these gentlemen wos given lately in a lecture at Plymouth before the West of England Agricultural Suciety, by Professur Voelcker, of the Agricultural College. And we may shortly say that Professor Voelcerr agrees with Mr. say that Professor oelckerr agrees

It is plain that while the first thing determining the value of a fertiliser is its fitness as food for plants, the second is its accessibility and availability for that purpose. The solubility of phosphate of lime is the measure of its value. If it were allogether insoluble in rain or land water it would be absolutely valueless, and it is just as it is readily dissolved that it is
aseful. One cwt. of an easily soluble phosphate
will have as mach influence on the current crop as one ton of a phosphate of one-twentieth its solubility, just because a year's rain will dissolve no more food out of the latter than out of the former. And if the former should wholly disappear in this way while nineteen-twentieths of the latter remain in the soil for ase in the growth of fature crops, still it is a great economy to spend annually just enough to meet the annually recurring wants of the soil rather than to lay out at once enough to last for twenty years. Nineteen, eighteen, seventeen, twentieths remain thus useless in the land during the succeeding years; and in the one case a large investment is Jong of yielding frait, while in the other a small one annually more than repays itself.

The question as to the permanance soluble biphosphate in the presence of the lime and other substances in the soil is of Iittle moment. The solubility of the substance is retained, although in other respects its nature changes. Neutral phosphate of lime, as it occurs in bones, is soluble in rain water, although comparatively slowly, but this slowness is owing to the form in which it is there presented. Let it
ferment and crumble down in a heap with wetted ashes, and its solubility and efficiency increase. Dissolve it in sulpharic acid and distribute it so among the roots of plants-never mind although the form in which this treatment leaves it is lost as soon as it enters the land, the state of division in which the solution leaves it renders it so much more accessible to a solvent that the original solubility of the bone earth is wonderfully increased, and rain water passing through 2 cwts. per acre of the bone earth treated thus will really come in contact with and take up as mach phosphate of lime in its passage to the roots of plants as if it passed through
10 times the quantity of crude bone earth. The more biphosphate, then, that a superphosphate compost holds within it, the greater is its agricultural value. A superphosphate compost which contains only 2 or 3 per cent. of biphosphate of lime, is not in our opinion deserving of its name. Farmers should look
for at least 12 or 15 per cent. of biphosphate along for at least 12 or 15 per cent. of biphosphate along
with as much neutral phosphate in any manure professing to be a superphosphate of lime.
The papers which have appeared in this Journal on Anbury and Finger and Toe in the Turnip have opened up the whole subject of injuries received by bulbous rooted crops. It matters little to the farmer Whether the crop be worthless because the plant has inherited a bad habit of growth, or because it has
been injured by the attacks of insects. These are rarely under his immediate control; but there is another class of injuries which are so obviously the result of mere mismanagement that they ought certainly to be avoided. A crop has been obtained, but is often lost by carelessness. And as it is one prolific source of loss, coming under this cause, it beconnes important to inquire whether the system of leaving roots exposed in the ground to long winter frosts is
advisable. That the eating off of roots on the land is a part of the hitherto recognised system of some farmers is quite true, and without discussing its merits in the milder seasons, which leave roots fit to be so eaten, it must be a matter for serious con-
sideration whether they should be so exposed after the wide-spread examples of decayed Swedes in 1853, which were only aggravated in 1854. It is probably too late now to take any steps for the safety of crops which have already stood a winter's
frost. We expect that the abrupt changes of the temperature of the last two months have already done much mischief in our Tarnip fields. This may perhaps induce attention to this subject for the future, and all the questions bearing on it should be tudied carefully

Besides the increased severity of winter of late years, it is probable that as the sorts of Turnips
increase, and as they are stimulated in their growth by artificial manures, and become liable to insect attacks to a greater extent each year, the very constitution of the plant may become less able to bear up against severity. Then again as far as insects are concerned, the larva of these eat their way out to pass into a further stage, thus leaving a wound for the action of frost and other atmospheric causes of
injury. Both of these considerations render the subject one of increased importance, and the relative economy of the various methods of preserving roots ought therefore to be carefully considered. If on an average of years one-fifth of the crop left in question arises whether one-fifth of an average crop
of Turnips is worth the expense of pitting the whole of it-whether 3,4 , or 5 tons of Turnips, as the case may be, are worth the cost of harvesting 15, 20 , or 25 tons of roots. There can be no doubt as to the answer to this question. The most costly mode of carrying home the heaviest crop of roots does not
amount to $6 d$. or $8 d$. a ton-it amounts to less per
ton as the crop is an abundant one-and supposing one ton saved in every five, the roots are cheaply bought at half-a-crown a ton. But on this subject we invite the communications of our correspondents. The practice of pitting root crops in the field is rapidly extending, perhaps the discussion of it here may accelerate its general adoption.

## WHO OUGHT FARM BAILIFFS TO BE?

"A Novice" thinks they ought to be "smock-frock situation of the highest class he mentions, bat still I am one of the condemned as "hybrids," if he like it. My qualifications do not exactly come up to the standard he has set down-that of reducing the labourers' wages 15 per cent. My greatest crime amongst those who
" look over the hedges" is that I employ too many labourers, and pay them too much; they declare " never can pay" to grub up a " lug" wide under the hedges that had for years been the receptacle of filth, whe Couch and stones and Docks and Thistles had for years been indiscrimately thrown and grown; that it cannot pay to spend so much time in getting out the "hitchers" that have for ages broke up the implements that happened to penetrate more than 2 or 3 inches into the
soil ; they swear it "will never pay" to burn great heaps of clay and ditch parings, \&cc., and that it is "the worst foolishness in the world to tear up the nasty subsoil" even a single inch deeper than it was always ploughed; but when I began to underdrain a water to its climax. I did not become $a$ farm bailiff by choice but from necessity; my chief hobby was orticulture and its relations, and for the parpose instructive I could afford; thus Loudon, Lindley, Mackintosh, Glenny, and many others who are still held in ridicule by the "uneducated smock-frock men," put
ideas into my head opposed to many of the practices of those gentlemen in the gowns, for while I laboured hard in the fields of horticulture I often took a peep over the hedges into the broader fields of agriculture and arbori, culture. Thus I took a lesson from "Morton's Soils," both practically and theoretically, for I was not one
day's march from Whitfield, and asked a few questions from Stevens, Low, Johnson, Liebig, Lawes, Way, Bousingault, Smith, Parke, Bailey Denton, Mr. Pusey, and a host of other authorities. I studied the herd o Lord Ducie and the flocks of the Duke of Richmond and Mr. Webb, and the magnificent specimens of the woolly
ribe of Messrs. Garne and Lane, and while studying the Gardeners' Ohronicle I never slighted the Agricultural Gazette. In my boyhood I had a little practical experience. My father had strayed from the labyrinths of horticulture, and placed me at a farm-house, the
head of which belonged to the old school; he head of which belonged to the old school; he
was a most rigid economist, his bacon was the thickest and fattest, and his cheese the hardest and leanest I ever saw : no soul in the house had any repose after $\frac{31}{2}$ A.M. Winter or summer; he heiped to miks and long at the plough-tail, which was drawn always with as many as four and sometimes six horses. He very "meres" under his hedges; he had or the character being the most hard-working industrious farmer in the neighbourhood, and was particularly noted for his important functionary the "ostler." His cattle yard was placed on the side of a hill ; it had a pond at the bottom of the yard, in which was a very small spring, all the
washings of the yard passed into the pond and out of the pond down the ditch; he regarded dung almost as nuisance, and would haul it to the side of the lane to get two or three years more washing before putting it on
his land ; he always sowed 3 bushels of Wheat, 5 bushels of Barley, and 6 bushels of Oats per imperial acre being a true believer in the doctrine of the more you side more also shall ye reap; and when we conthe that in many instances the seed was calculated by up with meres and hedgerows, we see that the waste of seed is enormous. This old gentlemen was a thorough I am sorry to say is a krus, tyin of some of the "and I am sorry to say is a true type of some of the "un-educated"smock-frock men still lingering in the south
of England. Is this what "A Novice" recommends for farm bailiffs

Is this what "A Novice" recommends for
I said before I am a farm bailiff from necessity. Some seven or eight years back there happened to fall in some straggling farms which had been managed on the smock-lrock principle till the late occupiers declared they would "ruin any man in England at $23.6 d$. per acre rent," and everybody who
looked at the land declared "they would not have it at a gift," till the lot fell to your humble servant to till it But of course I did every thing wrong. I "ploughed too deep," I " bought too much stock," I " spent too much on labour," I sowed "tho little seed," I "land out too much money on artificial food and manures," I kept the sheep too much in fold to please the shepherds, and was "too particular about a pound or two of meat" for the ruined nobody. I have made it pay 16 . per acre rent, and a fair interest for money spent, while those very persons who "would not have it at a gift," have been pressingly bidding for the refuse of it But there is
s class which is a much greater curse to the land than aclass which is a much greater curse to the land than
alude to those who have usurped the place of stewards; far too many of these worthies are taken from the rank their sinecures not by merit but patronage. With them the "uneducated smock-frock men" are great favourites, because they possess a degree of "crouching servility" peculiarly grateful to empty craniums, while the
man that can talk a little about science "place a finger artisticaily" on the good points of an animal are to them eyesores to be got rid of at an cost. I have in my rambles peeped over the hedges on many pieces of land, ay, and whole estates, which plainly show the right man is not in the right place. have seen charity land, college land, government land and corporation land in much a state of filth, poverty, and mismanagement as to be a diagrace to the times we live in, a curse on the land we live in, and a reproach to the managers, or 1 would rather say mismanagers, who to byally find to be the empty gentlemen above allude to by the gownsman. Hy. Cox, Longford.

A STEAM-CULTURE REVERIE.-No. III.
I KNEW that my friend had been for many months engaged in constructing some novel machinery, employing not only founders and millwrights in his own neighbonrhood, but also several of our nationally distinguished firms of engineers and implement-makers; and the object of all this costly machine-making was to try practically all the schemes which had ever been proposed for superseding the plough-team,-in short, to do justice to bygone as well as cotemporary inventions, and thus experimentally establish the best principles, or guard future inventors against impracticable ideas. He had embodied in metal and wood all the "power" culti-
vators, \&c., he had ever heard of; they were now collected together for the first private trial ; and it was to witness the working of some of these strange engine that my friend and myself proceeded briskly down the farm,-walking alongside a light railway which led by
diverging "sloops" and "f junctions" to the various diverging
inclosures.

Surely the pothery smoke from yonder field comes of no genaine Couch-fire; there is now and then a sooty tinge about it too suggestive of coal; and the whiter wreaths of vapour, instead of fading like a blue haze over the fallow, breaz off in fragments instead of the low crackle of burning Couch, the short snorting cough that tells me-'is a steam-engine. Behind that bushy hedge, then, are congregated the real implements and apparatus which I have for years longed to see actually working; perchance, among the number may be found that trumph of rural mechanics, clearly no moment for going round by gates, for who would not fight through the toughest Quickset when the thrill of such expectancy emboldened him? Taking a short cut, then, through a stout bullinch hedgerow, stood in open view of the assembled machines; and in describing what I saw, both then and on several suc. ceeding days of experiment, I will proceed chronologically, noticing each invention in the order of its birth, and a steam-plough besides were actually at work before my eyes; and as I had previously supposed such inventions to be rare, guess my astonishment at beholding not only several but seores of tillage machines intended to be worked by steam power.
It is a mistake to suppose that substitutes for common ploughing and digging are of very modern suggestion, or even few in number, for the sixth English patent ever granted was for "Engines and other inventions
plough grounds, whether inland or upland, and to ferplough grounds, whether inland or upland, and to
tilise barren peat and sea sands ;" the date being Jan. 17, 1618, and the patentees D. Ramsey and (unfortonate cognomen!) Thomas Wildgoose. In 1623, Alaxander Hamilton took out a patent for "ploughing.
On Aug. 6, 1627, W. Brouncker and others patented an "Engine for earing, ploughing, and tilling land by the labour of two men, without the aid of oxen or horses;" and on 17th July, 1634, W. Parnam and the were of oxen or hows "ivine wo "specifications" having been inrolled or deposited in any public office.
The earliest invention represented in my ingenious and indefatigable friend's collection is that patented by Van Thornhoff, Jan. 28, I785, consisting of a machine for digging up ground by manual labour; interesting only as being the first digging machine of which wo have any account, and as containing a principle subse couple joining of spades united side by side by a crossbock of wood working witharts at top, and shatts just above the shoulder of the spades. Upon this block the wors man sets his foot, thrusting the spades almost vert downe soil ; then puling the top handle backward wooden block acting as a fulcrum. The spit of eat broken off is cast forward; and the operator of called the the tool round at the end of what may attached by a hinge to the foot block. The inven seems to have done with the spade what Newingto done with the dibble, united two or more tools tog in a frame, and engaged both ioot and hand to whom
invention was communicated when abroad by a foreigner）
says that by this machine 36 square rods or poles of
land may be dug by one man in the space of 12 hours； but the work when done I must say is far inferior to
that of a single spade；the soil being loosened and divided，but the spits not inverted，or at least very imperfectly turned．I certainly prefer the action of the ＂caschrom＂or croozed spade used in the Fe
I should here observe that my friend has not forgotten to assemble both horse and hand implements likely to uggest the ideas for which he is searching．I saw the Indian and Chinese ploughs，the antique Egyptian sarcle， and other seratehing tools，the mattock or adze，the
breast－plough，the caschrom，a variety of spades and breast－plough，the caschrom，a variety of spades and forks，and a multitude of ploughs with convex or concave mould－boards，skim－coulters，\＆c．，and there was
My attention was next directed to a group，of contr vances patented as＂agricultural machines，＂by Major model，my friend having discriminated between inven－ tions obviously impracticable and such as might b Forth an actual trial
arliest known proposal for ploughing by means of end less chains and pulleys．In this arrangement，a number carrying a horizontal pulley，are stationed at certain distances down the fiel 0 ，the endless chain worked by motive power on the head＇and，passing from one pulley to another．Plougks are drawn backward and forward
between one pulley frame and the next ；and are hauled between one pulley frame and the next；and are hauled ext line of furrow．
Another scheme consists of a machine actuated by Any motive power（＂steam or windmill＂being men－ revolving rakes or toothed anchors attached to an ndless－chain apparatus upon the carriage．These ooks or anchors lay hold of the ground in saccession， he machine thus pulling itself onward without the liability to slipping inseparable from the method of
driving by the carriage wheels．The ploughs or other mplements are attached behind．
A novel proposition in this patent is for ploughing
mall semicircular furrows by means of laterally curved ploughs arranged about a vertical axis，and made to revolve by any motive power．An inclined plane lifts and drops them into the oround during the revolution， And in one form of the invention these rotating ploughs pellers，the implements passing through the soil in pro－ opposite direction to that in which the carriage travels， Here we see the first application of the principle upon which Usher＇s steam plough is based，only acting with a clumsiness of tie movement，together with the defective kind of tillage resulting from it，precluded any attemp at trial with full sized machinery；and，indeed，a first glance had fully satisfied my friend as to the futility of are－which are united in Pratt＇s patent．I．A．

IMPROVEMENT OF SETTLED ESTATES．：
In the midst of a costly war and increasing taxes with the price of Wheat varying between 90 s ．and 100 s ． the price of the 4 lb ．loaf ranging between 9 d ．and 11 d ．
whilst the agricultural labourer with 12 s ．per week wages is worse provided for than he was in 1850 with wages at the rate of $9 s$ ．per week；when it is remem－ bered that in our own island，in the immediate proxi－ mity of roads，canals，and railways，affording the most has ever before produced，there are at this country thousands upon thousands of acres（out of the twelve thousands upon thousands of acres（out of the twelve
millions of acres of land under arable culture，capable millions of acres of land under arable culture，，capable
of yielding 40 bushels of Wheat to the acre，but which， notwithatanding our wealth，our reputed industry and energy，and the aids so freely offered by science do not yield us 20 bushels，I believe the truth of the following statement，by Sir John Sinclair，from his essay＂On the Means of Improving the Agricultural State of a Country，＂written in the beginning of the present century，will strike every thinking member of the mmunity with peculiar force．

An age has passed，science and trade have advanced With giant strides，but agriculture，certainly to an to his country，as politicians have unfortunately assumed， the mast important of arts，has only advanced with the feeble and irregular pace of decrepitude．
I am quite aware that hundreds of instances may be cited of extensive and judicious improvements in agri－ coltural affairs ；and I am free to admit that much has been done，and that much is doing，to develope the lauds．But I must maintain that not one balf of whed
ught to have been done has been attempted；and able－bodied agricultural labourers living upon the poor－ abour would produce no iand shat corn which we are now buying from foreign countries， heas not been quite what he，since the days of Sincland as not been quite what he，gond man，pleaded for
Legislation cannot embellish the minds of our
vegislation camnot embelish the minds of our cul hand，is accomplishing that．Legislation cannot con liberal and generous course with cope lies in pursuing rising tenantry，but the spirit of the age is，I believe accomplishing that；legislation will not，I confidently ope，ever be permitted to interfere between landlor and tenant－its province lies in removing obetructions， sc．，no less in granting positive encoursgement
Much has been done，and many obstructions have aeen removed．Tithes have been commuted；wastes millions of money have been advanced for draining But one other great and munificent boon may now be accorded to the community by the removal of the bered egtates，by imply bered estates，by simply sllowing any owner of land to direction and at the discretion of the Inclosure Com－ missioners，and to charge the cost of the improvement in the form of a rentcharge（to endure 25 years）upon he estate ；so that，so long as the owner may live，he will annually diminish the charge．When he dies his successor will take the estate with the improvements， and will pay the remainder of the rentcharge．
All this can now be done，but only by a circuitons and expensive procedure．But I am inclined to believe hat no inconsiderable portion of what has been done by ur Government，is due to information obtained from private sources and through private be used as the basis of legislation，to foster and en－ courage agriculture．And I fear that at no time has ur Government thought it worth while to＂make such inquiries as may enable it to judge of what may be done with safety and advantage．＂Although correct information upon the yield of our harvests has been on all bands admitted to be essential to the guidance of our egislature，no effective means have，up to the present me，been adopted to obtain it．To know how far uring the coming year，we shall be dependan upon foreign countries for the chief article of our daily ood，is surely a question of national interest and utility and yet，becanse it offered some practical difficalties， has never been encountered by our legislators．
century ago England had corn enough and to pare，and she exported and sold out of her abundanee to her neighbours．But now she is wonderfully defici－
cient，and she is actually buying from foreign conntries more than nine millions of quarters of corn a year．
Of course population has increased；and possibly one class of politicians will say to this，that it matters not what we buy，so long as we have the means of paying ［say that it is a question of the utmost moment to all， from the landowner to the labourer ；for we are buyin millions of quarters of corn annually that we migh grow at home；the price paid for which now goes into he pockets of foreigners，and it should and might under he rostering care of a considerate legislation be paid to landlord，and his labourers divided between himself，his
I have assumed that
housands of acres of arable land prodes quantity of that they want of the outlays they are capable of producing，fo in permanent improvements，as in draining，in new and improved homestalls，and otherwise in fitting the land for the occupation of that superior class of tenants who happily are now to be oblained wherever an occupation is worthy of their attention；and my sssumption is a moderate one．But we have no data for obtaining exact information on this point；if we had，I saspect we should be startled indeed at the enormity of the waste we are annually committing，and that with unprofitable sorrow we should acknowledge ourselve

## Home Correspondence．

Hedge Cutting Machines．－W．G．Avernethy has misunderstood my suggestion．In railway hedges I think it would be of great advantage to have a machine to cut at the same time loth sides of the hedge obviously there would be no cross fences on one side， and the wheel on the other would not be difficult to get over ordinary cross fences by various easy contrivances with a fulrum wiecommend theo a pio，ac． ＂four iron pillars，＂\＆c．；as，in the first instance above all things simplicity and cheapneess of make，and the application of the most direct mechanical action and power are the great elements to success．Under this mpression I should say tor a machine to cut one side only ata ame it would be better to make thus：－To the axle or nave of the travelling wheel next the hedge would fix at a saitable distance a convex arm，from which should project immovable smaller arms with sheer cutting edge，radiating at proper angles；these would form the fixed knives of the shears，and would
travelling，that is the carrying wheel，I would fix an axl with radiating knives；this axle and knives being made course we along with the travelling wheel，and so of the others which as velocity，would form thigs would be cut．This would be the same action as a chaff－ cutting machine，but I should strongly recommend that on the revolving axle or nave there should be place rods radiating，but moving a few inches in advance of the cutting lnives，and the twigs being thus bent down over the edge of the fixed arms or knives，the cut would open as the cutting knives amputated the twigs，reducing if not freeing，the operation of cutting from friction．The machine as here described would only trim the hedge per－ fectly perpendicularly，and to make it do so at an angle so that the hedge should be of the most advisable form iz．，a wedge－shape，the axle or nave with the cutting mive would have to be adjosted to revolve at a deter－ mined angle either by a＂Hook＇s joint＂and a directing shoulder，or on an axle inclined at right angles to that of the hedge．Such a machine would require no ＂pillars or groin work＂further than two shafts（to yoke the horse in）attached to an axle，on which would the in ordinary cart wheels of suitable diameter then all that would be wanted would be a simple pin as a driver from the travelling wheel acting upon he one with the revolving cutting knives．If the ＂Hook＇s joint＂with a directing shoulder be preferred， then the travelling wheels would have to be fixed to their axle，which would then revolve．The only advan－ tage in this last plan would be the greater certainty of the cutting knives revolving equitably，in consequence of both wheels giving them their driving power The practical data given by W．G．Abernethy are valu－ able，and it would be，I have no doubt，very acceptable to your readers if many of your practical readers would be kind enough to publish similar data of cost，\＆c．，of都
W．Wooler
To Destroy the Wirevorm．－As qreat complaints are constantly made of the ravages of this enemy to the farmer，they will find by applying sulphate of magnesia， about $1 \frac{1}{2}$ ewt．per acre，sowed as a top－dressing in spring，that it will completely destroy this plague and add greatly to diminish the grub，having made use of for some years in top－dressing Potatoes and all other crops where these pests abound．Refuse sulphur of magnesia is much cheaper than soda ash so frequently this dresing． 5 he mical dressing for the land，and will greatly assist in destroying these annoyances to successfal sgricultural pursuit，being an excellent stimulant to growing crops pursuit，beng ane exear Nerbury，Bucks．

Superphosphate of Lime．－I sm charged with mystifying this subject．My paper has been read by many who consider it clear and conclusive．I am sorry the subject should be considered of so littl moment as to be treated in a flippant manner． feel obliged to Mr．Summers for the spirit of inquiry with which he has approached it．I wish to discusu it in the same spirit，although after this communica－ tion I must decline the contest，as my time is fully occupied．Mr．Summers thinks that neutral necessarily means insoluble，and that there cannot possibly be any intermediate state．Now，most unfortunately for this doctrine，chloride of sodium or common salt is neutralsalt，and yet it is the most soluble of all salts therefore if any mistake about the word＂neutral＂ha occurred，it rests with Mr．Summers，not with me． am quite willing to adopt the two states of phosphater against bi－phosphate and neutral only，and to take $\mathbf{M r}$ Summers＇s own doctrine，where he says，＂bones exer cise a more permanent action than the best super phosphate．＂Now Mr．Summers must be well aware tha the phosphate of bones is，as it is commonly called，neutral． If then neutral necessarily means insolable，it is diff－ cult to tell how these bones exercise their influce The fact is there are few if any substances really in soluble，and the inference of most scientific men is that silica，mica，earthy phosphates，and oxides，were ren－ dered soluble slowly by the carbonic acid of the soil，of decaying carbonic compounds；therefore it is a natural inference that substances rendered available for th nourishment of vegetable life must be naturally in neucral state（ i．e．neither soluble ner insoluble），unless we infer that mica contains free soluble potash，or soils generally con－ tain iron in a soluble form，which it is well known is not the case．But your correspondent＂X．＂not only cuts down his owu argument but that of Mr．Summer as well as of Baron Liebig and Mr．Lawes on the doctrine of superphosphate，for he says＂that super－ pho－phate，if soluble，added to the soil on meet become reutral＂therefore（according＂X＇s＂theory）ase确艮 cient．Why then But the ne reflect that an are to weigh $1,344,000 \mathrm{lbs}$ ，and that it seldom contains lees． than 10 per cent．of carbonate of lime，while 336 lbs of superphosphate of lime is deemed sufticient for an acre when he says bones and sulphuric acid are better than bones alone，for it follows that the small quantity lime would set the carbonie acid at liberty，forming

assuctate wish the surroundiug lime or iron to torm
neatral phosphate of lime or iron, or any other conneutral phosphate of lime or iron, or any other con-
genial compound. Lastly, neither of your correspondents appears to have paid much attention to the power of
assimilation which plants possess, although they must be assimilation which plants possess, although they must be
aware of the remarkable fact that the materials aware of the remarkable fact that the materials
absorbed or inhaled by a plant during the period sbsorbed or inhaled by a plant during the period
of its growth are in chemical combination, form, and of its growth are in chemical combination, form, and
qualicies altogether different from the substances we meet with in the body of the plant. We never find in the soil the substances which communicate the green colour to the leaves, nor is the starch which occurs in grow. The plant has therefore the power of assimilating the materials absorbed by it, and this applies as much in respect of their chemical combination as their external forms. S. Arove Girady.
Land Draining.-A reader of the Agriculturat the 5th, might be led by the remarks of Mr. Horsall to imagine that I laid it down as a necessary consequence that "a porous substratum underlying a thick super-
stratum of clay, is sup lied with the whole of the water stratum of clay, is sup, lied with the whole of the water
it contains by percolation through the clay." Now, if it contains by percolation through the clay." Now, if again, he will find that I said uothing of the kind. My object was to show, that, inasmuch as tapping the
underlying or water bearing stratum had drained the strong clay buperstratum, thas superstratum could not have been iupervious and that it might have been drained by parallel drains placed in it. The drains used in the "Keythorpe system" are cut expressly to act upon the porous stratum, in draining which they have, as was desired, drained also the clay lying above it. They could not have effected this if the clay had been surface water which now falls on the elay must percolate through it and into the porous stratum, and pass off by the drains. By simply giving an outlet to Mr. Trimmer has caused it to render most essential service, and whether all the water found in it, or any portion of it, was due to percolation throu,h the clay is 2 question that bears in no way upon the argument. Certain it is that a portion, or even the whole, may entirely due to other sources. But I have not seen the land drained; nor have I even read all that has bee written on the "Keythorpe system." Charles $H$. Humbert, Watford, Herts. Jan. 22. [The Keythorpe eystem avails itself of porous beds on the clay, not under it. 1
Manual Agricultural Labour remunerative.-We learn from various quarters that the free use of steam threshing machines is beginning to cause misgiviugs as their services will not be required in the barn during as their services will not be required in the barn during though true to a certain extent, is counterbalanced by the price of Corn being checked, from being raised at the present time to a fearful height, and need not cause any alarm on that head (want of employment) whilst Purkes's steel digging forks, or similar implements, are
exant. No able-bodied men nor lads need nor ought exant. No able-bodied men nor lads need, nor ought, between advancing crops, or preparatory for any crops to be sown or planted in Feltruary, March, or April, employed repay, or doubly pay the employer, and the pleasure in performing this labour with them, than by the constant bore and comparative slavery of beating out the corn on the barn floor with his old stick and half strong lads, may be easily, perfectly, and effectually perfurmed thy those famed forks in one day, and $3 d$. rod may be considered a fair compensation now work effectually by the common spade would cost double the amount of labour and expense. As there is much land yet to be sown in cereals, \&c., we earnestly entreat our agricultural friends to avail themselves of the opportunity of preparing, during the dead mooth of January, with these admirable implements, eithen both in repute), as much land as they possibly can, for sowing with Corn, Putatoes \&c., in February, March or A pril, with not more than 1 bushel per acre of seed Corn, in as uniform a manner as possible, and their realized, thus all the labourers will be employed to the advantage and satisfaction of both master and man. plots with Corn, and the remaiuing two-thirds with Polatoes of an early kind, alteruately, viz., in beds one yard Corn and two yards Potatoes and after erops, we vouch for them abundant and lucrative crops Seedgrowers, dc., Maldon, Essex.
Crups in County Doun.-I am now enabled to express an opanion reative to "the yield of the past harveat' baronies of Ards and Castlereagh, which may be relied upon as well founded, being the result of actual proof ou the lands cultivated extensively by my brothers and myself, and of minute inquiry from mauy farmers who state, then, that the Wheat crop has been one of the most productive within our experience. We have in-
stancen of very large produce indeed, exceeding in some
cis seven 27 cwt of 112 lbs . per statute acre, and very
commouly amounting to full 20 ewt. This produce may fairly be stated to be 25 per cent. above an average.
Of Oats the produce is very defective in quantity Of Oats the produce is very defective in quantity, and
the quality also inferior. The deficiency cannot be less than 20 per cent. and is generally estimated more highly. Barley is not extensively cultivated in this district. It may have been about an average. Potatoes, though short of what would have been considered an average by yery commencement of the disease, have proved taint than in more productive and more free fron extensively planted, are affording a large supply of frod, which is very much diminishing the consumption of the cerenls, even though the export of the article is going on to a large extent, and the price of Potatoes is
therely supported at a rate, which, but for the export therely supported at a rate, which, but for the export,
would soon be largely reduced. Reports generally would soon be largely reduced. Reports generally
admit that the produce of Potatoes is fully double that of late years. John Andrews, Comber
waste in which many large - The comparative state of want of improvenny large estates are kept by their siderable magnituje is a loss to the country of conyour exposing such an instance as I am about to relate and which the experience of many of your readers who have to deal with church or college estates will say is not singular. The Dean and Chapter of Windsor are owners of extensive farms let to tensnts on leases for 21 years, which leases it has been the custom to renew every seven years at a low rent on payment of a propor held is notorious. These bad condition of properties so faces notorious, These gentiemen not only set thei be asked to contribute, said, but it will appear they are such enemies to innovation that they not only refuse to assiat their tenants in improving thair farms, but will not even give then the opportunity of doing so at their own cost. I am the leesee of a large farin of theirs in Oxfordshire whic might be made very productive, but which
almost a waste, and I am debarred from improving by its want of draining; I therefore lately applied to thei steward to aid me in obtaining a Government loan to drain it, expressing my willingness to pay the whole o the rentcharge during my occupancy of 21 years. dvan be necessary to explain that the Governmen rentcharge of $6 \frac{1}{2}$ per cent. for 22 years, but to obtain join a leaseholder for 21 years must get the lessors to the lessee at application. One would think that as I an the lessee at a nominal rent for 21 years, and the mone the land to at least the extent of the rentelarge, the lessors would be most happy to join in an application by which they would get their land permanently bene fitted at he expense of the tenant to at least the extent of the outlay, namely, about 5 . per acre- 1 say to at leas the extentor the oulay because it is only on condition tha the draining shall benefit the land to this extent that the to the benefit from the do in ablane have the advantage of the other improvements which the draining would lead to, but which its present wet state is a bar to. But no; the steward sees wossibility of the Deans and Canons having to pay the rentcharge for one year at the end of 21 years, and does not see that by that time the estate will hav oen benefited by my having made 21 payments out
of 22 , and that I ain desirous of incurring the rentcharge for 21 years frovas seeing that the farm must each year be benefited more than the additional rent uncertake to pay, and at the end of my lease the lessor would come into the improved rent my outlay would have created at the cost of one year's payment; and so
by this refusal I must continue to hold the land in its present unimproved condition for 21 years, and the Deans and Canons will at the end of my lease find their farm remaining in its present comparatively valueless condition, and thus their future representatives are being deprived of the improved rent which their joining in the application would secure them. But perhaps it may be said, seeing the advantage is so great, "Why do I not lay out the money myself?" To this there is this unfortunate objection - were I to do so, when the time comes, seven years hence, to renew my lease, the same steward would be the first to assess the farm at the improved rent my outlay would have created, and I should thus increase the fine I should have to pay by my own act, and this, I think, every one in my position would decline doing. bou are doubtless aware that the consumption of corn by this country bas now attained to that amount that we require the assistance of about 11 millions quarters "Is the production of the large eatates vested in trustee or the public advantage to be kept down in this way by their worse than ignorance of their duty to their tenants, to their successors, and to the nation?" I think you will see in this a subject of general importance, and rust I need not further apologise for troubling you and asking you to insert this in the Agricultural Gazctle. Northamptonshire, 11 Jan. This letter has been for warded to us for insertion. It appeared in the Times - few days ago.]

## Farmers' Clubs.

Wadebridge, Jan. 7.-At the annual meeting of this society Mr. R. Pollard read the award of the judges for farm prizes. Messrs. Mark Guy, 27 points; Henry
Symons, 28 points; W. Menhinnicl, 26 points; Hart

Key, 26 points; R. Pollard, 24 points; H. Pollard, 2
points; T. Olver, 35 points; A. Hambly, 20 points and $\mathbf{R}$.' Grose, 23 points. The subjects coid 20 points the judges in awarding the farm prizes, are-extent green crops, weeds, manure, fences, stock, implements
crops, and improvements. The health of "T The crops, and improvements. The health of "The Suc
cessful Competitors," was acknowled and Mr. H. Symons. Mr. Olver said :-" "The farm occupy is about 600 customary acres,* 200 of which ar upland coarse pasture land, about 100 are what I call second or third class grazing land, and the remainde the syle. I endeavour as much as I can to carry or the system recommended by this club, and which
believe is most beneficial generally-though believe is most beneficial generally-though thers
may be exceptions in this neighbourhood-the altemate may be exceptions in this neighbourhood-the alternat system. Un these 300 acres of arable I grow 100 acrea
of Wheat, and 50 acres of out the alternate system I adopt what is commong called the six-course shift. For many years after came into this neighbnurhood I adopted the five-cours shift; but I found that to be too frequent ; I believe can now produce a greater amount of corn and cattlo by the six-course system than I could by the five-course and of course there is a great saving of labour, which is a very important item at the present day, and one that judge, not to lose sight of. I find (alluding to th judges report), that 1 stand at perlection with regar what low. And here I would observe that for the last two or three years, for certain reasons, I have no adopted the plan I now recommend in the alternate systern; I have neglected it, and consequently I have some fields that contain more Couch-grass than I wish
With regard to manure, I apply nearly the whole of With regard to manure, I apply nearly the whole of Grass ; I think it more profitable to apply it in that way than in any other ; you get an abundauce of Grass, and the land is ploughed down to Wheat, without further manure. Then, as regards my green crops, they are manured with artificial manures-guano and super phosphate. I also manure my spring crops as well as from the land a greater amount by artificial manures, to supply an additional quantity of manure for the high with regard to white crops ; as might be expected from my manuring. If I could not grow superior crop by this extra manuring, I should of course be minus b aware is an expensive aiternate system, you must affords a great quantity of food, and I stand high as my stock. If I did not stand high in that respect, if 1
did not feed more stock than my neighbours do who do not carry out that system, I should be a loser. Then as regards implements, I stand somewhat high; and implements are of great importance to us at present Labour is very expensive, and it is our duty to economiso in every possible way. This can be done by using food, for by using the drill there is a great saving of grain. But there are some places, I find from ex perience, where the drill cannot be used profitably grow pretty much Rape; and of course the land then that land wet ; and when the land is wet, it is not in a fit state to apply the drill, and there I find it better to sow broad-cast. In order to use the drill advan-
tageously the land should be tolerably dry ; but if I were to sow Wheat, after Rape, into land sufficiently dry for the use of the drill. I shoulli find a falling off in the are now, as agriculturists, enjoying a prosperous state Whatever be the state of agriculture in other parts of England, I have no hesitation in saying that the whole body of farmers in Cornwall this year will not put by a shilling. I know there are thousands of acres whicb will not produce two bushels + of corn per acre. We are making a tolerably good price of our cattle; but our Turnip crop was deficient, our summer was short of Gruss, and our hay was nearly all destroyed. Our represe
tatives thinik agricultural statistics very desirab;e, Ibelieve they would if they could be accurately obtained; but that believe, is impossitle; and I am very much inclined to believe that that which appears from Scotland will be
found to be very inuccurate indeed. Certainly we do know something of the number of inhabitants in a country ; and it is also known what about is the amount of food consumed by them. But if this statement from Scotland be true, 1 believe the country must be minus quantity it has been generally conce auything like the. There was one observation that dropped from Mr. Kendall. He said we should have great fluctuation in the price of our produce in time of peace, and that herefore it was our interest and duty to have some reater foresight into these matters, and that the merchant is better versed in them and knows when to sell and buy, and that it would become our duty to watch the markets. Now, I would observe that this is a matter of impossibility with us-we cannot always sell When we wish. For instance, there are many of us who,
within the last two months, would readily have sold corn at 30s. to 32 s. per buskel : but we could not thresh it; we had no water; and even if we had had water, that was a time when we are generally eruployed in have to be provided with food during winter. Mr.

The Cornigh acre is 5760 square yards.
The Cornish bushel is three imperial bughels

Kendall observed that the French are wiser than
ourselves; and I believe Mr. Kendall said the French had more foresight than ourselves, because last year they bought wheat at 45 s , while we bought at 70 s. I would ask if we did not benefit by that. Mr. Kendall was addressing us as a body of farmers; if we had had to sell at 45s. instead of 70 s. we should not have been so honourable member's, I believe. But what I wish to observe is that we cannot sell when we would at all times, and that we have not the control which the merchant has."-Mr. Olver then referred to the liberal and highminded character of his landlord, the late Sir William Molesworth.

## Calendar of Operations

Wrstrr Ross, 22 nd Junuary.-The weather has been very seasonable, although very variable. There has been "a little of
everything. and nothing much." We had a few mild days in
ent which the Wheat plant made rapid progress, and the earlier sow fields look thick and healthy. This bas been a auitable season
for thin oming-the ground has been oo dry, and the Feather mo
mild that every grain of seed sown seems to have brairded
 acre, and to the surprise of all it looks as thick as that which
received the usual quantity-4 bushels per acre. But this received the usual quantity-4 bushels per acre. But this
reduced quantity will appear enormous in the eges of those whose good fortune it is to cultivate the rich fields in the genial climate
of merry England. Now an intense frost has set in which Of merry England. Now an intense frost has set in, which haa
put the ground into a suitable state for having the remainder put the ground into a suitable state for having the remainder of
thle manure carted over it to the most guitable places for further diatribution, as we have not yet adopted the mode of distributing it in a liquid state. We are taking advantake of the winter
months, whilst workmen are not so reeularly ent having several acres of waste land improved. It is itenched to the depth of 15 inches, and the trenching costs 88 . an acre; and as
little drainage is required, each acre is prepared for a crop at an outlay of about 10. The soil is pretty good, and at presen Rnd, moreover, a few acres rent free might help a farmer porket;
gears very different from
grom those we have now seen and in otherwise he might fe in danger of upsetting. The peace pipe
hite has again sounded, and the farmers in the north do not seem so anticipated. They were endeavouring to make the most of their npportunity, and now they seem not disinclined to step back
into the good days of peace and plenty.

heating extensively by one boller.
JOHN WEEKS \& Co., King's Road, Chelsea, H AVE this Season the pleasure of being able to 11 refer to several otber extensive Establishments where
they huve fixed ONE BOILER to do the same wark which hiltherto has taken from six to twelve boilers.
All the world knows the highly respectabie firm of Mesars, Edward Honderson \& Co,of of the We Wilington Nursergy Wel 'ing. ton Rood, St. John's Wood, and as that Establishment is open to
the public Mesers. Jom W ekrs \& Co's Hot-water Apparatus the public Messrs. Jogn Werks \& Co's Hot-water Apparatus
will now have a chance of being fairly tested and impartially will now have a chance of being fairly tester and impartially Co. have now adopted what is called the "ONE Bories Syster."
At their extensive Nursery any gentleman or horticulturist can see the Hot-water Apparatus of several extensive ranges of Mr. Edward Henderson's own words, showing how he approves of Messrr.J.Weeksa Co.'s system of heating by hot water. He says: "I am more than satisfied woith the extraordinary results of what Messrs. Joisy Wrirs ic Co. have done for me in hoaring a great number of our hot-houses from ONB BOLLER. It is a lmost impossiote great saving produced is struly weonder fulul; tess than thou sackes of coke in 24 hours is all that in used to heat a variety of hothouses, tec., nearly 800 feet in length, and these various houses are to some extent widaly
separated, as 300 feet stand in one direction, 150 feet in another, 200 feet in another, and so son, including our large newlylaid-out vointer garden." Messrs. Johy W EREs \& Co. can also refer to several extensive private establishments, where their Hot-water \(A\) pparatus can be grivan in operation, and in every case with the same favourable results. J. W. \& Co. also adhere atrictly to all their former statements relating to their one boilsr system, and most

\author{
SATURDAY, FEBRUARY 2, 1856.
}

Tre daily papers contain, as usual, distressing accounts of a sad accident caused by ignorance of common things. It is the old story over again. One plant is mistaken for another ; a poison is cooked for dinner, and the partakers perish. There is never a year in which such cases are not recorded. The crop is as annual as harvest or haysel.
It appears that the Provost of Dingwall having invited some friends to dinner, the cook sent a rustic to fetch Horseradish from the garden. The man dug up Monkshood, a deadly poison; the cook not knowing the difference between Monkshood and Horseradish, scraped the former, sent it to table, and poisoned the guests, three of whom died in an hour or two.
This comes of people being barbarously instructed. We talk of the education bestowed upon the poor; the Scotch more especially are prond of what they do in this direction; and yet, in the county of Ross, in the midst of much real intelligence, it has never occurred to anybody that servants wan Sypely it is quite as useful for a boy or gyphering. Saght how to avoid poisoning either their masters or themselves, as to know how to write a letter.
We are no advocates for over-education; we should never propose to teach a plonghman to be a botanist, or a servant girl to be education. The neither can we approve of which the lower orders first branch of knowledge which things which surrequire is the use of the common mortance to them than even reading and writing, and if it were impossible to teach the two last we would be satisnied We would have lessons in natural history in every We would have lessons in natural history in every be taught a few simple truths, and no more; but then they should be taught well. Among such subjects, of course, the uses of common plants, and the art of knowing one from the other would find a place. The rural clergy would surely be able to
direct such studies as these; although they might direct such studies as these; although they might
be more than the village schoolmaster could grasp at first. In the reform of the studies of the Universities this ought to be insisted upon. No one should be allowed to take orders unless he could pass a good
examination in so simple a matter as the differences for the facts they made known or the conclusions between common plants, the properties they possess, and the purposes for which their parts are provided by nature. Were this required, with the addition of a little medicine, surgery, and chemistry, and some small acquaintance with other branches of natural history, we should hear no more of such terrible accidents as that now recorded. Such subjects would to many men be far more agreeable than some of the usual studies which, however ornamental, are worthless for the purposes of active life; and we doubt not would be eagerly pursued by the rising generation, which already holds in scanty reverence the attainments insisted upon by an age having little in common with our own.
But to induce the students of our Universities to occapy themselves with the physical sciences, something more is required than a reluctant acquiescence in popular demands or a faint approval. Substantial advantages must be offered by way of encouragement, such as throwing open Fellowships and assigning a certain number of them to those branches of learning which may have been introduced into the curricula of study. Unless some endowments are applied to the encouragement of physical science, we do not see that much is likely to be gained by making its study permissive, as it is at present.
Let us hope that this point will be well considered by the Oxford Commissioners; for if the Fellowships are not thrown open, it is to be feared that what may be given to the sciences will be lost to classical literature, a result which those who are most anxious for the spread of physical science would regard as unfortunate. The Commissioners have it in their power to advance the progress of modern literature and modern science without at all discouraging the ancient studies of the University, and thus to confer the most important benefit both upon Oxford and upon the cause of education in general. The opportunity may never again occur, and certainly, if neglected by the Commissioners, cannot at any fature time be seized upon by the actual members of the colleges, fettered as they all are by the obligations they have contracted to adhere to the statutes of the founders.
We cannot doubt that the academical body o Oxford, although it must not originate, would acquiesce in such arrangements as are hinted at. We have seen lately how the chair of Chemistry was resigned by Dr. Daubeney, who doubtless believed that the University was in earnest in its endeavours to render physical science an integral part of its system of study. That being so it would have scarcely become any one to continue to teach two important branches. We have therefore a right to assume from this circumstance that the general body would not murmur at any enactments which are palpably necessary to give a reality and life to its own recent regulations. It is obvious, indeed, that so long as empty honour alone is to be gained by cultivating science, while a provision for life may be secured by clinging to the classics, the former can never have fair play in the University against the latter.
Unless we are misinformed, one of the colleges at Oxford (Magdalen) has already of its own accord rendered the elections to fellowships and scholarships purely dependent on attainments, restored the college lectureships, thus providing instructors in physical science, and founded exhibitions for the encouragement of the student in the purer branches of education. But this is little, we imagine, to what might be done, if old statutes did not stand in the way; and the public naturally looks to the Commissioners, who are not shackled like the colleges themselves, to complete the work which has been commenced.

Last Tuesday the Herbaria belonging to the Horticultural Society were brought to the bammer. They consisted of various collections formed by the travellers who have been from time to time employed by the Society to procure seeds and plants in foreign countries. The Horticultural Society, not being incorporated for botanical investigation, caused these herbaria to be formed in order that its officers might be able to ascertain the names and value of the seeds which were sent home by its collectors. That purpose served they became mere records of past discovery, of very greatbotanical interestbut with \(n\), further bearing upon the objects of their owners. It was, in fact, in great museums only that they cuuld be studied with advantage and convenience. In such places they would possess the immense adrantage of being the identical plants published by various botanists during the last 30 or 40 years. Out of the materials here to be found was drawn much of the information upon which the authors of the Flora Boreali-Anericana, the Niger Flora, the Botany of Beechey's Voyage, the Botanical Register, and of numerous minor works relied where more complete information concerning the plants of Oregon, California, some provinces of Mexico, Guatemala, Chile, Ceylon, St. Heleria, Penang, and the British possessions on the west coast of Africa. So that no one was surprised to find extraordinary interest taken in the sale both by continental as well as resident botanists.
The first lot which excited much competition was No. 7, Douglas's collections, formed in Northwest America and California. These were fastened on fine paper the size of that used at the British Museum, and amounted to somewhere about 500 species; bought by the British Museum for \(32 l\). Hartweg's collections in California and Mexico, a very complete set, produced \(20 l .10 s\). ; they are understood to have been purchased for Professor Agarde ; as these plants already existed in all the large Herbaria of this country, their transfer to Sweden is a scientific advantage. Macrar's collection in the Sandwich Islands was bought by the British Museum for \(9 l\). The same collector's Chilian set was knocked down to Dr. Planchon for 9l., as also were Griffith's Bootan (11l. 10s.), Fortune's Chinese (9l. 5s.), Forbes's Delagoa plants (9l.), and a large lot from Prince of Wales's Island (25l.) ; these were purchased in part for Baron De Lessert, and in part for the Museum of Natural History at Paris. The following were obtained by the British Museum, viz., Macrae's Ceylon collection (21l.), and Grorge Don's ill-dried specimens from the West Coast of Africa (12l. 10s.). The whole collection realised rather more than \(250 l\).

162. Oncidium microchilum, Bateman, in Bot. Reg. 1843, Lindley, Folia Orchidacea (Oncidium) p. 8, No .21.
We seldom see this fine species, although it is easy to
prow and its appearance is very striking, notwithstandgrow and its appearance is very striking, notwithstand-
ing the absence of gaudy colours. From a tuft of thin ing the absence of gaudy colours. From a tuft of thin
broad leaves, not unlike those of Odontoglossum grande, rises a long branching flower stem covered with a singularly glaucous bloom; on this appear in long succession laterals bearing 9 or 10 closely packed fleshy fragrant flowers which have the merit of remaining for a long time in perfection and are about an inch and half
across. In cultivation their sepals are olive green, with

Skinner, who found it in Guatemala growing on a bare rock into the interstices of which its roots had pene-
trated. There it flourished in the full sunshine, trated. There it flourished in the full sunshine, having
no more shade than was afforded by a neighbor no more shade than was afforded by a neighborring ledge of roek for an hour oit two in the day ; and when it was afterwards met with in other localities it suill basked in the sunshine of those tropical regions, h probably experienced, as a general rule, at least \(70^{\circ}\) of teroperature, alleviated, however, by nocturnal radiation,

\section*{THE PEONY}

There is such a charm about spring flowers that w hail the Christmas Rose and the Snowdrop with glat ness, promising, as they do, a harvest of flowers fort fruits. Which they, pale and lowly, are the fom such as those of the Dablicat Hollyhock, and the Chrysanthemum, the very shortest days seem long, mod the winter tedious, till the season returns for bods to open and rosy petals to unfold. The Dahlia and the Chrysanthemum have lengthened our days of bloom in the handsomest manner possible as far as the autumm is concerned, and this being now a feat accomplished it behoves us to try our skill at the beginning of summer, and see if we can lengthen the flowering season a litith in that direction.
The Pseony surpasseth the Dablia and the Hollylock in the gaudy splendour of its flowers, and coming an it does in the changeful days of April, and continuing through May and even into June, we gain a month of more upon our chief flowering plants, for the species and varieties of Pæony are now hybridised and gotimo such good working order as to give gigantic flowers of the most delicate shades of colour long before the Rosa have been able to show a bloom, and where as fise blaze of flowers is concerned winter still reigns, uolew in the few favoured spots where peat abounds and Rbododendrons bloom to herald the advent of summer.
Tall-growing flowers would not be suitable for spring work, since our climate at that season is generally inter. larded with storms; but who does not recollect wih delight those sharp and bracing days of blue sky and bright sunshine, when shadows steal over hill and die with giant strides cast down from clouds driving alat laden with the stray baggage of the retiring winter! Ifis to gladden the garden at this time that something showy is particularly wanted, something that will grom in any garden without heat. The Pronny is not now in coarse single-petalled flower that it formerly was, l th double as the Ranunculas, to which family it belong and some of the species at least are fragrant as the Ros. When we look at the tiny button of the beantifl Ranunculus, we feel sorry that it is not taller than it in, but here we have one of the family with flowers as inge as wool mops and mounted on stems 4 feet higli, gro nisharacter. I do \({ }^{\circ}\), its varieties but to the herbaceous kinds which run its 3 for or long as one's finger.

It is frequently complained of,med that not without good grounds, that persons purchasing costly plants find that after a long time and very
long biils they have after all litse long bi'ls they have after all litte left for their pains. It is not \(s o\) with the collector of the species and varieties of Pæony, for althoogh it takes some years to get the specimens large, when they are so it is for a lifetime. I recollect an her. baceous Preony into a Gooseberr bush that supported its slender flowering shoots; yow long thin had been established before I ms had been established before I kom it to flower annually for 20 yems.
No one ever seems to think of potting a Prony in this country, although no plant could be better euited for exhibition either at home or at public shows, and yefil is a notorious fact that the Chinese have been driving trade in Pæony plants for forcing for ages past, carrys them to market sometimes a thousand miles, with or no earth about them, much after the fashion of Hyacinth bulb growers in Holland. The lovers of bright flowers at Canton and Shanghae are annulin replenished with dry roots of Moutans from the proreplenished winc china, where we are told this plani is vinces of Central China,
indigenous on the mountains
indigenous on tree monains. high and dry place, whereas the herbaceous Peovies are from their very nature and appearance equally the children of the swamp, for their deep fleshy roots forbin; the idea of their inhabiting either dry or stony ground ; they are not only natives of this country, but of hills swamps of Siberia, the gulleys and flats among the enian. in Switzerland, along with heaps of the blue Ge, Sicily,
The herbaceous Prouies are also found in Spain, The herbaceous Peonies are also found in Spain, Mr. and the south of Europe, as well as in China, Moutans on roots of the herbaceous hinds, and thus increase and propayate their stock for market.
The Tree Pæony, like the China man of ligh caste, is uncommonly slow in all its movements; beginning to shoot soon after Christmas it will hardly get into it has shoot soon after Christhas during which tiwe if it has pushed a couple of inches of wood it is good worl, has pushed a couple of inas something else to do than produce wood-it has

Fив. 2, 1856.
THE GARDENERS' CHRONICLE.
to ripen it when it is grown, and after that to rest it.
It cannot be hurried by heat, and will not flower the second year in the south of China. It is this stately and dignified character dragged through
the dreary winter months that makes all tree Pronies the dreary winter months that makes all tree Pronies tender in this country, whereas the herbaceous diss rapidly in spring, making as much growth in one month as the other does in three. It is only about 0 years
since Sir Joseph Banks got the first Tree Pæony into Kew Gardens from China, and it has since spread far and wide; individusl specimens forming a semi-globe 9 feet in diameter, and bearing 300 flowers in a season be 30 years old, and that bore some years nearly a thousand blooms. This plant is quite a gem for compaetness; it is therefore easily protected where that is outgrow its bounds, for a good-sized gig umbrella would be a perfect tent for a Moutan for 20 years.

Herbaceous Pæonies flower early, and carry a great deal of foliage, and that upon rather slender stems; in order, therefore, to strengthen these and yet not to erect a forest of masts by tying each flower stem to a inches in diameter, of seths of an inch wire, and placed these under the foliage, supported on three iron rods with hurdle claws; this ring is raised as the plants fally over their own foliage.

Peonia Moutan, var. papaveracea, is no doubt the normal form of the Tree Preony, and all the beau
tiful double-flowered varieties of P. Moutan are evi dently the offspring of this paternal stock, and since it has sported so freely into beautiful varieties in this country there can be no doubt that parties tell us are grown at Shanghae have mostl sprung from the same parent stock. It is highly important, in future improvements of this genus by hybri-
 papaveracea ; the deep colours of the late-flowering herbaceous kinds might be selected, and plants possess forlise with This would secure high colour ing effspring, and if the fragrance of some could eventually be extended by crossing to all, we should at no very distan day possess such a blaze of bloom in May (a month
before the Roses) as is nowhere to be seen except in the American garden at that season; and notwith standing the great beauty of some of the so-called carlet Rhododendrons, I know of none that would not ook pale if placed by the side of a scariet Pæony.
Let no one imagine that we have to wait for The plants are already got and actually offered for sale a all our best nurseries, and the whole of the species here, and flowered last year in the lighest periection ; were quite taken by surprise to see that Pronies growing were quite taken by surprise to see that Pronies could produce such effect that I have made notes for my own voured to draw public attention to the subject. Alex, Forsythe, St. Mary's Church, Torquay.

\section*{VEGETABLE PATHOLOGY.-No. CVI}
415. Congelatio (Freezing).-That different plants are endowed with very different powers of onduring heat and cold is plain to every one who has eyes to appreciate the simplest appearances which are pre-
sented in the natural world. While in some instances, sented in the natural world. While in some instances, as the Potato, a few degrees of cold are certainly fatal, be completely frozen without any evil consequences. It is manifest, therefore, that in the first instance the functional powers of plants are alone affected, and that decay or rupture are due to the total suppression of vitality or to increased intensity of cold, though serious lesions may take place where the cold is not sufficient
to deatroy life. The same plant may sometimes be subjected to the action of frost several days in succession, the tissues recovering their normal condition every had occasion to notice in the common winter Aconite. Even in cases where death is consequent on freezing without manifest fissures in the common stem, the walls of the individual cells are found to be entire. At a tater period they may be discoloured or give way from while the other retains its vitality, and ultinately recovers.
416. As in most instances of depressed or apparently suspended vitality perfect recovery depends upon the change of condition not being too abrapt. If the plant strong light, death is generally the consequence. Plants then and fruit which have been frozen should if possible be kept in a dark room while thawing, and if so, the injury may be trifling. In herbaceons plauts and smal twiggy shrubs the effect of frost is seldom partial, at least as regards what is above the surface of the soil, but in trees of considerable size, a portion of the trunk from Tarious canses may be affected while the other remains in the bark or alburnum (as in the case figured in De Candolle's "Organographie"), traces of which may be found in the tree a century or more afterwards, insomuch tha
from the number of layers of new wood which have been deposited since the injury. In some instances the ecayed part will dry up and there will be no further evil, especially when it is cut off from external influences hy means of the ccvering of new wood. Sometimes, communicated from the dead matter inwards, and the tree will ultimately die or become worthless. If the injury moreover takes place when vegetation is active, was the case with the cold frosty winds of May 1809 which destroyed almost every Plane tree in many parts of England. Though many of the trees were lopped, and a some instances a few latent buds were developed into tolerable shoots, the general vitality was so depressed that the trees ultimately failed, as was the case, amongst thousand other instances, with a whole* avenue of Planes in Northamptonshire, of the destruction of which we have a distinct recollection, of frost, even though life may not ultimately be sacrificed the strain is so great that fissures take place in the
trunks of trees, traces of which remain so long as the ceptre of the trunk is perfect. This phenomenon has o ate been studied accurately by Dr. Caspary in Prussia, where it is far more common than in England. It cercontents on freaing fince it takes place under intense cold, and though on first freezing the protoplasm will expand, as jce contracts on an accession of cold afte estored expansion, the original dimensions will b portionally diminished. The external rings thenare colder in proportion than those within, and therefore contract moreas they are nearer to the circumference, while perhaps the internal rings may not be affected at all ; the consequence is that the external layers are no longer able when once a fissure exists, though closed for a time and overgrown by new rings, circumstances may arise in which either from the expansion of fluid accidentally admitted from some wound, or contained in the decay matter with which its walls may be lined, the old wound is opened, a circumstance which may be repeated several times at distant intervals. Frost splits, however, take place more frequently at points where the tissue is weakened from neighbouring decay, as beneath the old wounds of fallen or amputated branches, though they may occur under intense cold in trees perfectly free from any anterior lesion. Dr. Caspary has described curious formation of ice under particular circumstances in this Journal, 1854, p. 739. The rupture of the bark such plants and the formation of fibrous plate than those which produce frost spliss, new matte being constantly supplied from behind by the rising sap, in consequence of which the mass assumes peculiar structure, the outer frozen surface being con stantly pushed forward as the tips of the rising threadhike columus freeze. This curious formation take arrested by the first comparatively severe night, though the temperature may be only a few degrees below freezing. The formation will of course cease when the upward flow of sap is entirely arrested.

The upper portions of a shrub are often destroyed aunually while the root retains its vitality, and new shoots are sent up from the base which is yet uninjured ; if, however, the frost is so severe as to injure the baris just above the origin of the root, the vitality of the root is seldom so great as to remedy the injury.
418. Frost is more injurious when the atmosphere is saturated with moisture in consequence of the tissues of plants being gorged with fluid, which ought to pass away in a great measure by evaporation. Some plants which come from a country generally overcast with clouds suffer materially from that frost of radiation to which we are so subject in England. The difficulty of the cultivation of the Silkim Rhododendrons in the open air depends grestly on this circumstance. The its being attended by the deposition of dew which freezes on the surface of the leaf, and partly from the subsequent exposure

AFTER TREATMENT OF A VIGOROUS SEED LING PEAR THEE WHICH HAS BORN FRUIT FOR SEVERAL YEARS.
A vigorous seedling which has borne fruit for three or four years, excessive production having been pre vented by judicious thinning of superfund successively arrive at its full degree of development. Year after year it will acquire more and more excellent fruit generally considered as sign of wildneass, but which, in reality, is only a favourable indication of the delicaey and late beeping of the fruit.

When the fruit of a seedling has been finally tried and deemed first-rate, the owner will be anxious to talk the tree ont of the nursery and plant it in his collection,
among other meritorious varieties; is it prudent to among other meritorious varieties ; is it prudect Planes perished when the Oriental escaped. The preceding
spring had been unusually mild, and the sudden check to the luxuriant buds was so great that the trees never recovered their the succeeding seeson.
make this final plantation or not? In general we think it is preferable to allow the tree to remain where it first ruited; nevertheless it is by no means impossible to transplant a strong seedling, even if it is 15 or 20 years old. But to insure success, certain precautions must feet square and is many feet deep should be lug on feet square and as many feet deep shere the tree is the be planted. It sug on e filled up to the is to be planted. It should then regetable mould. As soon after the ripening of the ruit as the ends of the shoots are properly matured, the ree should be carefully taken up, so as neither to break nor wound the roots. The latter are then pruned in the manner pointed out in the article on planting, (see , for 1054, p. 740). It rnay here be re three times ransplanted, and has its roots well divided, bears a final transplantation better than a tree which has been most, only once removed.
All the small straggling fibres are cut off, and the roots being spread out, and placed in the hole so that heir upper part may be 3 inches below the surface, the hole is filled up with good mould taken from the sarface of a kitchen garden, mixing it with a barrow load of
thoroughly decomposed hot-bed dung. Before the roots re finally covered up, two pails of water should be poured into the hole in order to firm the earth abou the roots, and a sufficiency of moisture being thus supplied, fibrous roots are produced, even before the vinter solatice ; and the re-establishment of the tree is thus ensured.
In order to protect the roots from frost in winter they are covered with earth to the depth of 6 inches additional. Lastly, three stakes are placed round the ree, so as to form a triangle at the base, and uniting round the stem a in a circle which should leav sufficient play for the stem of the seedling to follow the sinking of the earth in the hole, and at the same time sup port it against the strong winds of winter. The branches are not cut back in winter, nor in the following spring. It the next autumn, however, at the fall of the leaf, they are shortened back, not on the current year shoots, bu on those of the previous year. When a strong seeding is finally transplanted, the extremities of the shoot produced after the August flow of sap are cut off
The final transplantation limits the production of fruit in the following year, when not more than one-fifth of the fruit set should be allowed to remain on the tree If too many be left before the roots are firmly established the fruit will be imperfectly nourished, and the tree itself will be weakened, under a load of fruit whic it is not yet well shle to bear Afterwards, the tre must be carefully pruned, on scientific principles, for fyears ; it may then be left to isself, with the exception of supplying proper nourishment to recrui its exhausted powers, and giving it every year moderate thinning. The tree must also be carefully freed from insects if such there be, for insects do not readily attack vigorous trees, in which diseases ar rarely to be observed; and wounds in such trees are promptly healed. J. De Jonghe, Brussels.

\section*{Home Correspondence}

Occidental Plane.- You would confer a great obligation on all lovers of arboriculture if, through some of Chronicle, you would enlighten them upon the subject of a tree well known about London, which commonly goes by the name of "Occidental Plane," by which is intended to be understood the American Platanus occidentalis. About London every one must be familia with two very differen hinds of Plane tree, and in this neighbourhood (KW) han ary both hinds, the ly win very spreading lax branche the mass generally broader than the iret all, wit deeply lobed leaves and narrow elongated segments, which every one acknowledges to be Platanus orientais the other with an upright habit, less elongated branchee, the mass taller than broad, with much less deeply divided leaves, truncate or more or less cuneate at fre base, and with broad acute segments, and which fre quently (I believe indeed as frequently as the other is called orientalis) goes by the name of Platanus occidentais. I was first led to believe this latter could not be the true Platanus oceidentalis of America from the absence of the "thick down which covers the under surface of the leaves when they first expand, and which becomed gradually detached from them in the course of the summer" (most copious indeed on our native specimens in the Herbarium). "This down is so abundant on the American tree," Michaux tells us, "hathat it with dread, as they think that detached or floating in the air it has a tendency to produce irritafloating in the air it has andly consumption." Still, it must be confessed that the general form of the leaf comes very near that of P.occidentalis, but the base of the latter, instead of cuneate or only truncated, is broady cordate, having a more or less deep sinus where the stalk is ingerted, as shown in Michaux's figure (N. Am. Sylva, ed. Paris, vol. ii., tab. 63.) Another circumstance which led me to think this could not be the P. occidentalis is the fact related by Loudon and other writers of this tree ; viz., that in the year 1809 a severe frost killed back the young shoots of many of the largest plants of this species in England, "particularly those in Richmond Park, at Kew, at Syon House, at Stowe, *The general form of the leaves of these two is well repreZ. 1952, II. a. b.
at Paine's Hill, and at Claremont; "nd this so fur
injured the trees throughout all the sommer that in the iojured the trees throughout ali the summer that in the lder ones. And again Loudon says, the severe winter of 1813-14 destroyed a number of the Occidental Planes which escaped the severe frost of 1869 , so that the tree is now comparatively rare throughout Great Britain. such were really the case there must have been a third ind of Plane in this part of the great valley of the
Thames equally hardy with the \(\mathbf{P}\). orientalis, namely, he one in question ; of which I can point to a noble specimen at the north end of the dell called the "Holly Walk," in the pleasure grounds \(\dagger\) of Kew. I now
became anxious to ascertain if this dubious Platanus were described under any of the varieties of the two universally acknowledged species ; but I little expected to find what best agrees with it in Loudon under the \(P\). orientalis, or Loudon's first var.'acerifolia of Hort. Kew ed. 1, vol. ili.; not indeed that there is any cha racter given ioy which it can be distinguished from from that species in form), and he adds that "in general appearance, habit of growth, and every other
particular it clusely resembles \(P\). orientalis ;" Lut, in particular it clasely resembless \(P\). orientalis "" Lut, in figure of Mr. Salvin's tree, vol, viii, tab. \(72 a\), t which is a most faithful and correct portrait of our tree, and
if any one will compare that with the figure of P. oriontalis, it is quite clear that the "generul appearance and habit of growth" are really very different from that species. He seems to speak of it as not a geuerally known plant: "There are vigorous young tree \(s\) in the in the grounds of A. Salvin, Esq, at Finchley," Few, or perhaps none, of your readers will be disposed to agree with M. spach, who says (Hist. Nat. des Vegétaux, vol. xiii., p. 77), "Nous avons acquis !a conviction, par suite des longues recherches, que les deux (ou de doivent être toutes considérées comme variétés de l'espèce suivante; Platanus valgaris, Spach !"
this he has four varieties, and his thind this he has four varieties, and his third is (wholly disregarding Aiton), whose name he adopts, as must be clear to any one, for he quotes S. tells us, than "P. orientalis aceritolia, Ait." He quotes further P. cuneata, Tenore (an Willd. ?) though he destill more remarkable, he quotes Platanus vccidentalis of Michaux, Fl, Bor. Am, and states the plant to native both of Southern Europe and America
cultivated plant, however, in France, what he states of it talies with our tree in England: "ia plus commune de toutes les varicters dans les plantations." The Platanus oceidentalis, fisured I y Michaux, fils, and in tab. 1., is Spach's var. angulosa, "qui est rare dans les plantations, et parait propre à l'Amérique. I am aware that plants of the true \(P\). occidentalis are in nurseries, and we have young ones at Kew : that is such shoots, and while young looking very different from what we here take for acerifolia. The questions, then, to be determined are: -1 . Do any old trees possessing all the characters of \(P\). occidentalis of Linnæus and American authors exist in England mentioned by Loudon as still remainiug in the Chelsea Garden, in the grounds of Lambeth Palace, Deepdene, specifically distinct from P. occidentalis? (for it seems ide to refer it to \(P\). orientalis), and if it is, of what country is it a native? Is there any authority for its being a native of Spain? The result is of some inte-
rest, for it is this tree which is fuund best to bear the atmosphere of London, and in conjunction with the English Elm is almost solely employed for ornamenting the suburban parks. The trees should be studied in
spring before the full development of the leaf, while the down is still upon the P. occidentalis, as well as in ummer and autumn, when the leaves and flowers are in perfection. W. J. Hooker
has been tried in any of the London parks. It has bees growing here these four years, and I may add that it makes some remarks upon the absence of ornamental rees in the metropolitan parks, which he says he has London if he will pay a visit to this parl he will find, with one or two exceptions, all the frees and shrabs he 7.ames, and many others equally good and much more
1are. The collection of trees and shrubs here is large and varied, bat is necessarily confined in a great measure to deciduous kinds. Conifers do not grow at all, on account of the sm \(n \mathrm{ke}\). Of Cratænus there are upwards of 50 species or varieties; and in Pyrus, \(\mathrm{C}_{t}\) rasus and additions are continually being made of such as are likely to thrive. The situation is very much exposed to the east wiuds, not the least shelter, and the west wind
"There are, hinwerer, still larye treas." Loudn sars, "in
Chelsea Garden, in the ground of "amberth Palaee, at
cdene, and variuus uther places." - But, query, are these the Two equally tine specimets, of their kind. P. orientalis, may

is called Platanus acerifolia, the Maple or
Spanigh Plane tree.
covers everything with soot, causing the growth of many destructive to many of them. C. Wallon, Victoria Park, South Hackney.

Late Sown Flower Seeds.- Allow me to bring under your notice a species of fraud which is carried on by some seedsmen. Walking round a garden this morning,
a lady pointed ont some borders which were sown with annuals, biennials, and perennials at the end of last October, but none of which had made their appear ance, with the exception of a few Antirrhinums. She nating shortly. I told her no, for they were sown at an improper season, being too late. She assured me that she purchased \(5 l\). worth of different seeds at a seeds of Octa London, with directions the in givin directions to sow all those seeds so late ?-he must have known that it would lead to disappointment. This system cannot be too mach reprehended, as it not only gets the gardener into disrepute, but causes disappoint ments to purchasers. This case is not solitary, as I could numerate many. Rusticus, Newccoll
Aouns' experience I find this to suceed. -After two or intermediate house. I had two plants of it in 9 -inch pots, with upwards of 100 spikes of bloom on each, th tallest spikes about 9 inches long. The soil I grew them in was a mixture of loam, peat, leaf-mould, pit land, and old cow dung. I shifted them toree times, and con tiually kept stopping them till the middle of July. They red spider. I tried this open air, but I find that it does not succeed well in either situation. When they have done flowering I throw away the oldest, and cut the youngest close in and after they have made shoots about 1 inch long, 1 shake them out, prune their roots a little, and repo Rectory, near Brandon, Norfolk.
reply to "X." (p.54), to remarl that I ana not sur prised that he attempts establishing, or rather only reiterating, the narrow views (applied by another i reference to gardeners), when he contents himself with saying "it is clear to the commonest observer that gar"-
deners have not done their best to support the shows at deners have not done their best to support the shows a Chiswick ; but, on the contrary, gone to the Botanic The recon because the amount of money was greater. and that some of the classes were even better paid tha those of the Botanic ; but a very "common observer" might have seen that though the Horticultural Society had doubled the amount of awards, and brought all the gardeners in England, that that would not have com manded the success required to justify the continuance for some years that the situation of Chiswick was unfor tunate, and that no generalship, however skilful, could combat successfully against the opposition which has been for many years accumulating. Take, fo instance, its proximity to Kew, so vastly improved
-its distance from London-the remarkable unfor--its distance from London-the remarkable unfor tunate weather on the fête days-the\} very convenient and favourable position of the Botanic Societyout; take into sccount too the sameness which ha marked the Botanic and Chiswick shows, making visitor who sees the one careless of seeing the other, but the wonder will not be how Chiswick has given ap, long. "X." admits "that many gardeners exhibit at a loss to themselves;" but adds, "it is notorious that many have the one object in view ; they calculate their expenses to a shining, and it these are likely to exceed home, this won't pay." Why "poor Richard" could not give a better advice. Does "X." and his coadjutors think that all gardeners are such fools as to work hard and lose into the bargain? Where are the lecturers or to count the cost of expenses, and why expect gardener to do more than they? Think you that that van o plants which you say is "hawled abont" was produced by magic? Is it not a fact that 12 months-aye, and oft as many years-of increasing watchfulness, of mental and physical toil, was daily and nightly spent upon by one man only, were fit for exhibition, and no remunerated, but willing and generous minded servants ? No, \(n 0\), if exhibitors have erred at all, it has been in mauch the parin Alow me again to Council. It is evident that the early and late periods of the season spoken of will give rise to the improved culture of a new kind of exhibition plants, as Camellias, and a host of others, which have never yet been fairly
represented. Then instead of collections of plants, which take up an immense space, have single specimens, say a plant of Rose Coupe d'Hébé, or the old or plants, nor expensive carriage expenses, and course with prizes in proportion, which might suffice to combine novelty, beauty, and economy. Perhaps even the present "horticultural rooms," which have about them able One this is cerain - hast there are thousands in poun your great city who will thankfully pay, and not grud-
gingly, for furnishing such means of instruction and enjoyment, particularly at the spring meetings, whilst
the Society" will be continuing to give an impetas to Gorticulture, and opening up new channels of usefulneas Geo. M'Ewen
Beurre a Amanis Pear-Mr. Rivers, I observe speaks well of this Pear, but says "it is never highy
flavoured or perfumed." A pyramidal tree of this kind flavoured or perfumed. A pyramidal tree of this kind
on the Quince stock I had from him in 1853 bore this last year 14 large fruit, the first I had ever seen of the kind, and I can assure you they were as high flavoured as a good Jargonelle, and very like it in taste thongt
very different in appearance. In fact it was the highent fav in erent in appearance. In fact it was the highent does not Pear have tastedlly I season; though that the mark Covent Garden Market. The Jargonelle thrives in our deep rich soil in the marsh of North Lincolnshire perfectly, and does not cauker. One that I grafted myself 8 years ago, near the banks of the Humber, on a sucker of an old Pear stock that came up against the house, speedily spread over two of the walls and bom (and bears I believe) large crops without a trace of canker. Iota
ead with -In this locality Fairbeard's Surprise takes the second, third, and late crops it is superior to any, being of clean growth, not subject to mildew, and the flarour partakes more of the Marrowfat than the extrome aweetness of many of the wrinkled varieties. Johe Soden, Middle Barton, Oxom
Felling Beech.-A landed proprietor having seen in some periodical that the best time for cutting Beech is he summer, at which period the wood does not become cut in the winter, the having it used as a beam in an old cottage, having the date cut in-1830. It has never been painted or white washed, and is now as fresh and sound as if just put ap. Y. Z.

Pipe Rlwes.-It is doubtful whether the smoke from flue could be conveyed underground in earthenware pipes to the distance of 70 yards. The smoke would from the fluer and heavier in proportion to its distanco from the flue; so that by the time it reached the base of the shaft it would be as dense as the air about to enter the furnace and would balance it, so that there would be little or no draught. A draught, howeves, would be certainly insured by the heat from a very and fire situated at or near the base of the shatt During the conmunicate with its interior. R. .greenhouse on the Polmaise system, which has answered my purpose very well. The furnace is outside on the sour, and finding the smoke an annoyance, I took down earthen pipe, which I carried underground at a level upwards of 40 feet, where I erected a chimney of the same sort of pipe. I have found during two winters that it draws very well, and the supply of heat o the house is increased ; about the middle of its length which it keeps warm. and passes through two frames which it keeps warm. I thiuk I have seen at Maidstone a chimney, i believe belonging to paper works, at perhaps
200 or 300 yards from the works, used with success. Diamond. - Permit me to inform your correspondent W. M." that I have now in operation a flue which proceeds from an engine boiler about 90 yards in a horizontal position, and afterwards rises about 6 inches yard for 90 yards further to the foot of the bout 100 and also another similar flue which proceeds the foot of the chimney. These flues draw perfectly without any such assistance as is alluded to by you, viz the creation of a draught by an auxiliary fire. I has availed myself of the opportunity of growing crops of early
Potatoes and other vegetables upon these flues. T. H. Of the practicability of conveying the smoke of a hothous ire by means of an underground pipe flue for abont 70 yards there can be no doubt. The plan has been
adopted here for some years with perfect success and satisfaction, and I may add that advantage is taken of the ground over the flue for growing early vegetables, rom whence they are gathered at least a week earier than on any other part of the garden. Con. flue for the onvey your of his cipestbreaking from the heat of the fire ; if he will build good brick flue he may heat his house by running it 0 yards underground as effectually as if it was closer at hand. I have built and heated two houses upon the same plan, running the flues 50 yards underground, and yet they answered perfectly. The flues enter
houses at the east end, pass along the front and the weat houses at the east end, pass along the front and the and go out at the back wall ; they were then conend, and go out at the back wall; they were then
ducted 50 yards underground to the garden wall. constructed a range of pits for bedding out plants orem he fue, which furnished a little dry l eat for the whole range. The top underground should be made so that is unfavourable to a good draught.
have no hesitation in stating that your correspondent's flue will draw quite well led underground the distanco he mentions. As a case in point, I may mention thas he smoke from the kitchen fire in the mansion at mis place is conducted underground for 'about 150 yards natural a chimney in the grounds behiod however rather conser in bewise in the case of two of the Vineries here that are connected together, two of the Vineries here that are connected togetering
each about 15 yards long, the smoke after traversing over 60 yards of flue under each house-the flues being
all on a level and ranning backwards and forwards four
times underneath the floor of the houses-is conducted by one tunnel to a chimney a considerable distance to the rear of the sheds at the back of the Vineries. In a regular flue large enough to be properly swept, to facilitate which operation there are places at convenient distances in the route where access is had to the flue,
by digging down and removing a paving stone fitted for by digging down and removing a paving stone fitted for
the purpose at such places, for the convenience of the purpose at such places, for the convenience of is to manage the sweeping of the clay pipes, of which he proposes to make his flue, without taking them up, and they would most certainly soon get choked with soot. If "W. M." will have a proper brick or stoue flue con-
structed underground from his hothouse (it should not start lower than the highest flue in the house), as he has slight elevationin the ground he may conduct his amoke to any distance. W. Budson, Bridge Hill, Belper.-
The scheme proposed by "W. M." is quite practicable. The plan has been in operation here for the last four years. The following conditions are necessary :-do not the pipes in a cemented drain so as to prevent the contact of damp, otherwise your pipes may act as a drain for water rather than a dry flue for smoke. The height of the chimney stalk will depend on circumstances; there are trees or high buildings near, it must be of considerable height "to draw," and it may be well to
make provision at the hase of the shaft for lighting up a fire of shavings or such like to clear the chimney of heavy air, and thus cause a draught; this will not be required when the fires are in constant operation. Allend also ing of the flues. In our case it within a flue; but for the purpose spoken of I think the pipes proposed will answer. I may also add that the distance here is 75 yards, and almost level; but the greater the ascent the better. G. M.- "W. M." can if he does not let it dip. In the valleys of the north we find that the flues from the engine boilers of mills are often carried a considerable distance, and often terminate in a beautiful column on the top of a neighbouring hill, the mill being far below by the water side. Many instances may be seen in the once lovely vale betwixt Todmorden and Halifax, so highly praised by Cobbett, who had a good eye for scenery. Tyro, Manchister. [We have slected the above as the best among many correspoudents.]
Notes on Pears.-"T. K.'s" remarks upon August Pears were so good that I have been anxiously looking for his further promised communications. A sadly too short notice appeared last week, and unless he completes not be able to profit by it this year. So far he may be not be able to profit by it this year. So far he may be
implicitly followed by all who wish to have good Pears, except that I think Beurre d'Amanlis better in all ways upon Pear stocks than Quince. It is, however, desir-
able to have both, as they ripen at different times. What I took up my pen for, however, was to ask all Pear growers in the kingdom at once to send their lists of best Pears, mentioning soil and climate. No fruit varies so much, and no fruit is so well worth growing garden that can produce a Gooseberry bush can have a Pear tree bush, and whether we look at its value to cook, to eat, or to sell, it will beat any fruit, except perhaps a very good Apple for the first and last, though Beurré d'Amanlis even in these points. W. O. F.

Roof of Westmin-ter Hall. - A person must be very ignorant indeed of Gothic architecture who sup-
poses that any part of the present roof of Westminster poses that any part of the present roof of Westminster
Hall could have existed in the time of Rufus. The hall of Rufus had a nave and two aisles like a church, so that it is impossible that any timbers of that roof exist at present. Some of the smaller pieces may ; no simple existed in Rufus's time, or till long after in England Somerset.

Cucumber Disease.-If your Whitfield correspondent wil minutely examine two Cucumbers, the one attacked confounds together), he will find traces of the destructive power of the former very dissimilar to that of the latter. All decaying and decayed specimens that I have seen have exhibited symptoms of an attack appa-
rently constitutional, as the following evidence will rently constitutional, as the following evidence will
testify:-LLast February I commenced to cat fruit of a Black Spine and the Improved Sion House varieties, from plants tarned out the previous October, in a house devoted exclusively to their culture. The plants throughout assumed a habit of vigour encouraging the sive crop of good fruit; but, to my disappointment, one apparently healthy plant began to flag, upon the first symptoms of which \(I\) examined the stem minutely immediately below the surface of the soil, when the evil beeame visible. On the stem at this jointure numerous Imall excrescences had formed, and by the aid of a lens I ascertained that juice was exuding from them, which confirmed my fears that the upward current of sap to
the leaves was impeded in its course. Imagiaing that the leaves was impeded in its course. Imagiaing that
the evil would be contagious, I instantly removed the invalid; but in three days after another plant fell a sacrifice to the malady, and was apparently victimised under precisely the same circumstauces as the former
which up to the time attacked so highly flattered my expectations. From the remaining four I secured a luxuriant and robust growth, and cut some good fruit and this share of Fortune's bounties I attribute to my sustaining the loss of my plants, I procured some quick lime and flour of sulphur, well mixing the two ingredients together, and after laying bare to the roots the stems of the four plants, I raised a hillock round each stems of the four plants, I raised a hillock round each
stem to the heigit of wind and water, after which I stem to the height of wind and water, after which I
carefully replaced the soil, and kept the stem and materials in proximity as airy as means would allow. Thus was I enabled to cut abundance of fine fruit at a season when my neighbours were suffering from the
visitations of this incomprelaensible calamity Gr. to G. S. Wintle, Esq., Hucclecote Gardens, near

\section*{Eortetix}

Botanical, of Edinburgh, Decenber 13th.-The President in the chair. On this occasion, office-bearers for the ensuing year were elected, and several new members were added to the list. Professor Balfour exhibited specimens of Arum itahcum, sent by A.J. accompanied by the following note:-"I have been Watching the plant these last two years; it is certainly
wild, and richly spread through the whole of the Under. cliff of this island. If the plant is not the genuine Arum italictum of Koch, it is very different in almost every
respect from Arum maculatum. It is now in full fruit, whereas A. maculatum fruited in the early part of summer. The spadix is bright yellow, the lobes of leaf more divergent than in maculatum, and more or less veined with yellow. The plant in flower is frequently over 2 feet in height, and the berry rarely contains more than three seeds, whereas the fruit of A. maculatum contains eight or ten of a much smaller size. The plant grows among Ivy and rocke, throughout the rough ground under the cliff between Bonchurch and Niton." In a "It is certainly very extraordinary that the Arum italicum should be found so fax north as the Isle of Wight, as I believe the Tyrol has hitherto been considered its northern limit. Dr. Salter has seen it with
me in the wildest spots in this neighourhood, and is, I believe, satisfied of its being indigenous. Many years ago, when walking with Dr. Bromfield, I recollect his noticing an Arum in leaf, and mentioning his doubts as out for A. maculatum, and asking me to keep a look England for the last time, and he had no opportunity of seeing the plant afterwards, either in flower or fruit, nor had 1 until last year, when I found the plant in abundance all through the Undercliff, in spots quite remote from any dwelling, and in rough ground, which could never have been cultivated. It is more common here
than A. maculatum, and has doultless until now been mistaken for that plant, as the leaf is never so strongly veined as in the cultivated A. italicum, and might escape the notice of even a botanist.
I was not satisfied with its distiuction from A. maculatum until after examining the seeds of both plants." The following papers were read :-1. Report on the state of the Society's Herbarium, by the curator 2. Notes of a Botanical Trip, with Pupils, to Ben Lawers and other Mountaius in Perthshire, in August 1855, by Professor Balfour, and others.
Entomological, January 7. J. O. Westwood, F.L.S., V.P., in the chair. Mr. Samuel Stevens exhibited some very fine species of Lucanidæ recently collected by Mr Wallace at Sarawak, interesting for the remarkable series of varieties in the development of the mandibles of the opposite sexes. Mr. Stainton exhibited a specimen of the beautiful Tiger moth, Callemorpha Hera (not
previously admitted into the British fauna), captured previously admitted into the British fauna), captured notices of other specimens taken or seen on the southern coast. Mr. Shepherd exhibited a specimen of the very rare Lebia crax minor, taken by the Rev. Mr. Livesay exhibited some beautiful specimens of Coleoptera, from Texas, as well as specimens of both sexes of the ex tremely rare Goliaihus giganteus, from the rive Gaboon. Mr. Frederict Smith exhibited an extensive series of the nests of various species of Hymenopterous insects, from Natal ; some of these were of papyraceous and others of earthen material ; amongst the forme were some species win combs formed Circular, and hibited a fine series of varieties of the beantiful Ecophora Linneella, taken near London. The following papers were read :-Descriptions of three new Australian species of Pseudormorphre, by Mr. Newman Descriptions of a number of epecies of Entomostracous Crustacea, from the Atlsntic ocean, including 23 new species, by J. Labbock, Esq. A Monograph on the

Australian genus Cryptodus, by Mr. Westwood; Notes
upon Hygrotus bisulcatus and Apinn Cartisi, by Mr. Janson; and Descriptions by Mr. Sainton of thre species of Indian microlepidoptera, reared by Mr.

\section*{Jotices of 3nolis.}

OF foreign works we have before us the following. Flora Andina, part 2, by Mr. Weddell ; this important Gattungen und Arten (Berlin, 4to, with 12 excellent Gatungen und Arten (Berlin, 4to, with 12 excelient
plates), by Prof. Klotzsch. In this work the learned author propnses to form no fewer than 41 genera at the expense of the old genus Begonia; that some of his genera are good will be readily admitted, hut we regret to see others founded upon characters of the slightest possible texture. The work indicates much patient research among the materials to be found in Berlin, but they appear to be very scanty as regards
the vegetation of India.-From M. L. R. Tulasne we have a Monograplia Monimiaccarum, taken from the eighth volume of the Archives du Museum. This admirable treatise is illustrated by 10 plates executed with the consummate skill for which M. Clarles Tulasne the learned author's brother, is so deservedly celebrated. M. Tulasne unites Atherosperms to this order.-M Planchon has publishet modactyl of the ancients, a potent drug, nuw fallen into disuse (Des Hermodactes au point de rue Botanique et Pharmaccutique, Paris, Martinet, 4to.) He shows that the true Hermodactyl was in all probability the modern Colchicum varicgatum, and that its virtues were in every respect the same as those of the Colchicum autumnale now in use. It became neglected, and its value was ultimately disbelieved, in consequence of Iris Trapa natans, instead of the powerful but dangerous drug employed by the ancients.

\section*{FLORICULTURE}

The Cineraria.-We admire this flower because of its usefulness, being available nine months out of every twelve as a conservatory or greenhouse plant, and in the absence of better, it does well for cut flowers or bouquets. But the great mass of cultivators fail to grow it well. I am happy, however, to know and acknowledge that many do cultivate it successfully, annually producing magnificent plants, the sight of which is charming to all lovers of flowers. In giving a few brief hints how the Cineraria may be successfully grown, let us euppose that some good sorts were cut close down to the soil in the potabout the end of April when they had cone flowering, either planted out or placed behind a wall. In July these will be found to have commenced to grow; it will be evident that a plant may be divided.
Now, a great blunder is often committed by cutting the plant into four or six pieces, retaining many of the old roots, and then potting them in 5 -inch pots. This is a bad beginning; still it must be propagated by division of the root by single slips. Just take the finger and thumb and slip off the young shoots when they have new white roots about the size of cate' teeth: let there be no old roots at all. Pot the slips singly in 3 or 4 -inch pots, the soil consisting of loam, peat, and sand. Then place them in a close frame for a few days, shading of course when the sun ehines. The size aud demands o the place will determine the number to be propagated, time these young plants will fill their pots with roots, time these young plants will fill their pots with roots,
and cover the soil with leaves. To make them robust and cover the soil with leaves. To make them robust
and healthy, they should be placed out of doors, on the and healthy, they should be placed out of doors, on the
north side of a house, wall, or hedge, and remain there till north side of a house, wall, or hedge, and remain there till is the time to give them a liberal shift and generous food. The pots, 8 -inch ones, should have been previously washed and dried. Let about 2 inches deep of broken pots or bricks be used for drainage, and where these cannot be had use gravel, which answers admirably for draining pot-plants. The most important thing in the cultivation of the Cineraria is the use of proper soil. Hundreds of gardeners use a mixture of loam, leaf-mould, and sand, in about equal proportions but this does not answer well, for in such the plants row too tall and bare at the bottom. The mixture recommend is composed of loam and dung from an old Mushroom bed in about equal quantities, with a handful of charcosl, all well bruised together and put through a sieve. Rotten leaves should never be used for Cinerarias, and very little sand, for if sand be employed the plants are apt to shed their bottom leaves and thas disfigure themselves. I don't say that the mixture 1 have recommended is the best possible, or that fermented horse-droppings is better than cow-dung. All that I mean to say is, that if the mixture of soil and horse manure be used, hardly anybody will fail to grow, to say the least, respectable specimens of Cinerarias. The plants after being potted should be placed very hear the glass on the north side of the centre of a spanroofed greenhouse. If the house is glazed with Hartley's glass they will thrive and grow fait on the south side. About December the best planeb will
require their final shiff. In January and Febraary the flower stems should be staked or ticd out as widely as possible, and after this is done but little more will be necessary. Of course air and water are always given when required. I forgot to mention that it is

\begin{abstract}
stems in the autumn to keep uie besc plawts yrom
blossoming too soon. The second and third-rate plants blossoming too soon. The second and third-rate plants may be allowed to bloom when they like, from which autumn it is necessary to sow seed in April and May, and when the plants are up they are pricked off in boxes or pots, and placed in the shade. During the summer they are potted as they may require it, and should be always lept out of doors, behind a wall or hedge. When cuttings or slips caunot be got in July and August, seeds may be sown in June, which wil produce as large plants-hut then we cannot be sure of getting good and beautiful varieties. Though the rays of the sun are hurtful to the leaves of Cinerarias,
\end{abstract} the borders, but they do not last long. \(P\)

\section*{Miscellaneous}

Prodigious Potato.-.The Independance Belge informs its readers that "in the Belgian Colony of St. Thoma a Potato has been grown weighing more than 50 lbs . Good Bye, Big Gooseherries.
Californiar Woodpeckers.-Mr. Murray stated (see Proceedings of the Royal Physical Society, Nov. 22 1854) that he had received information on the habits o one of the Californian woodpeckers, which appeared to of being made generally known to naturalists ; and although the information is imperfect, and may possibly turn out to be incorrect, he was bold enough to commu nicate it to the Society. The statement is, that a par ticular woodpecker in California lays up a store of acorns in autumn for its spring consumption, and does so by hammering out small holes in the bark of trees, into each of which it places an acorn. His informant was his brother, Mr. William Murray. He revides San Francisco: but when home on a visit last year, he mentioned the habit of the wondpecker which has just been related. Shortly after his return to California, he receiv. from him the piece of bored bark which he exhibited to the Society, and at the same time communicated the following information which he had picked up. He says:-"I was talking to Simson the other day about the curious custom the woodpeckers here have of boring holes in the bark and storing them with acorns, when I mentioned that I had told you of it, and that you had refused to credit the fact, not of the acorns being there, but of their being put there by woodpeckers, because I was unable to say I had seen them put there. Well,' said he, ' you can tell him that I've seen them. I have seen them bore the holes, put in the acorns, and hammer them well in, and I've seen them taken out again in spring ;' and he went on to tell me that on one occasion, in the time of the great flood (some years 2.), he hau His party were camped on a kind of island that had been left dry ; and, having nothing better to do, watched the operations of these birds. There were six or eight of them at work on a tree in which there was a squirrel, who had made his house in a hollow at the root of a branch. The squirrel would pop out his head and look at them; and the moment the coast was clear he would un out and seratch away at these things, and tear away the bark ; and when the birds would see him, they vould all attack him, and he would run like hightning down the tree, and up the other side, and into his hole again, and then peep out and watch another chance to the same, evidently having great fun. This continued for about three days, till at last one o iffeball, and rid them of their persecutor." In a subsequent letter his brother gives the following dan man, told him he had often seen the woorpecker storing ne acoms, an all but Simson, he said, would introduce me to Dr. . ask o say positively. Ihe doetor stated that the provident woodpecker is the blacs one wead and yellow throat ; that he had observed them repeatedy and further asserted that they eat acorns, and that he had seen them do it. In confirmation of the possibility at least of their being vegetable feeders, Simson tells me that in the western country tie farmers frequently clea the woods by cutting the communication of the bark of the trees, and that, where that is done, these red headed woodpeckers appear in the clearings in perfect swastricts, and destryy Apples an is impossible to have any fruit. I do not know whether they eat the acorus or the grub that may be in them, but it is most certain that they bore holis lin the bark, and hammer in the acorns so firmly that you can hardly pick them ou again, and afterwards break them open, and eat some thing that is within the shell. The native Californians are so well acquainted with the fuct that they say when the woodpeckers commence early it is a sign that we
ahall have a severe winter. They keep boring the holes all the summer, and are all ready for harvest when the acorns are ripe. Wy biother adds that Mr. S mson came across Mexico with John Audubon (he presumed the son), who watched them, stuffed their shins, and deposits in Chihushua. Mr. Murray was inclined to think that the evidence confained in these letters would be sufficient to satisfy the Society, as it had done himself, that there is good ground for believing that bond self, that there is goo Colifornis tored for fonur fide acorn deposits are in Califurnia stored up for future consumption by

\section*{Calendar of Operations}
(For the ensuing week.)

\section*{PLANT DEPARTMENT}

Conservatories, \&c.-All manual operations here hould of course be performed as early in the morning as possible, in order that the family may enjoy their rambles amongst the plants without obstruction in an agreeable atmosphere and on clean floors. Orange rees in tubs are liable to be affected by a black fungu on the leaf, having the appearance of soot. This should at all times be thoroughly cleaned off; a little soap suds warm, with some su'phur mixed with them and applied with asponge, is a good remedy. All decaying flower or unsightly plants should be constantly removed, and the places of the latter filled with things in blossom brough from other departments. This structure where prope means are allowed should now be getting gay; hy bric Rhododendrons, Camellias, lower, make a fine display. Large plants of the above require much water, more than people commonly imagine, and tepid liquid manure may be given more ccasionally with advantage. Stove-heat may soon be in dulged in here on sunny days by shutting up early after a thorough ventiation. To obtain this, keep a rather
lively fire from seven in the molning until eleven lively fre from seven in the moining until eleven following fnorning. By taking the air entirely away an hour afterwards, and watering floors or other temperato surfaces, (not pipes or flues) a delightiful atmospher willpe created. Begin to repot Orchids, taking them exactly in the order in which they bud; be sure tha insects. Keep the plants well elevated, and use plent of charcoal in lumps of considerable size, fastening the whole at last, so that the plant cannot be loosened by agitation. Sphagnum or other Moss pegged on the top makes a good finish, and is to be recommended in houses which are unavoidably deficient of atmospheri moisture. Syringe plants on blocks occasionaly, Le to
the temperature be \(60^{\circ}\) by night, \(65^{\circ}\) by day, rising to \(70^{\circ}\) on sunny afternoons.

\section*{forcing department.}

Pineries.- Where the bottom-heat is maintained by means of fermenting materials such beds as may have been recently renewed should be carefully watched, an © \({ }^{\circ}\) heat at the bothm or the pots is 1 injury to the roots. It is not usual now to subject the roots of Pines to a temperature have seen growers of the old school quietly doing, but it is still too common a praclice to allow the bottom-heat at times to become too strong, throwing the plants prematurely into fruit or otherwise injuring them. Indeed we believe that more harm is done to Pines by too much bottom-heat than by any other cause, and success cannot reasonably be expected while the roots are occasionally subjected to a haking heat. Maiutain a steady bottourheat of about \(85^{\circ}\) during the growing season, but depend upon it that \(90^{\circ}\) cannot be exceeded with safety. See that the soil about the roots of growing plants is not allowed to become too dry, and secyringe carefully, until the sun becomes more powerful to dry the hearts of the plants. Vineries.-Careful attention will be necessary with houses where the Vines are fairly in leaf. Take every opportunity to admit fresh air to strengthen the shoots and foliage, ce,
cautinusly, and by small openings near the heating apparatus, and shut up early in the afternoos letting the thermometer rise to \(80^{\circ}\). Where the Vines are in bloom, let the night temperature range hetween raising it \(10^{\circ}\) by day, and Muscats need hardy expected toset well umless they can wature sink a few degrees on sharp nights than th over-heat the pipes, and render the atmosphere unhe ithy. While the syringe cannot be used the sc., sprinkiled in the morning or as often as may be necessary to secure a moist state of the atmosphere ; for unless this is attended to, red spider will be very apt to make its appearance. But, perhaps, the action, producing thin, wealily foliage, which despite the most careful inside managenent is sure to be attacked by this pest, therefore use every means to secure a dry warin state of the borders. Give Vines in pots a liberal supply of manure-water in a tepid state.

\section*{hardy frutt and Kitchen garden}

Push forward all kinds of wheeling while the ground is in a favourable state for such work. Soils of a heavy enacious character are improved fur working the more they can be exposed to secund time, turning i the frozen surface, in order to expose a farther portion to the action ot the weaher , but where it may b desirable to do this the frozen part should not the dug in deep. Look well to the protection of Lettuce, Cauli flower8, \&c., under glass, and take every opportunity o exposing such things to air. Some of the stronges roots of early Rhubarb might be covered with pors o boxes, and sufficient leaves and stahle litter to produc a gentle warmth ; this would save injuring the roots by removing them for forcing, but where there is a good worth the trouble and liter which it causes. Ge
ground prepared by heavy manuring and trenching for rear Rene ry hardly be made too rieh.

\section*{COTTAGER'S GARDEN.}

The cottager's leisure hours should be occupied in collecting together all ditchings, road ecrapings, and
other refuse matters to improve his soil. What other other refuse matters to improve his soil. What other rolks call rubbish will be to him a valuable manure, it husbanded aright. He should take care that his dung therw secure at bocase drain should be provided at one end (the lowest) with a perfect stopper, so that in the case of abundance of manure water, through rains or otherwise, the cottager could draw off the surplus into a sunken pit (water proof) and by means of a water barrow spoly it to his crops. Consult the Kitchen Garden Calendar for information on other matters.

STATE OP THE WR.ATHER AT CHISWICK, NEAR bownon.

\author{
SATURDA Y, FEBRUARY 2, 1856.
}

The paper upon Steam Cultivation read by Mr. Fowner of Bristol before the Society of Arts last Wed nesday, which we have reported in another page, was followed by an animated discussion. Letters were read from gentlemen unable to be present, indicating the channel in which experiments on the subject ought to be made, and the views of it generally
which the writers took. Several of those who had
actually incurred expense and devoted energy and
time to the solution of the problem spoke before time to the solation of the problem spoke before
the meeting. Among others, Mr. Smith, of Woolston, referred to in Mr. Fowler's paper, described the ingenious tillage implement by which, under that gentleman's direction, he had been able with a seven-horse engine to cultivate four acres a day. His experience was the most favourable described. The steam engine employed is seven-horse power When the steam is at 45 lbs . pressure on the inch. The machine is worked to and fro upon the surface of the land by 15 lbs . pressure, and it is worked to and fro beneath the surface with the pressure at 35 lbs . It then leaves the land tilled as by a scarifier or grabber. It is worked by wire ropes from a stationary engine; this being the plan that Mr. Fowler advocates.
It is a carious illustration of the way in which one invention enables or assist another-that Mr. Fowler attributes what success he has yet attained, to the substitution of wire rope for chain in the draught of his machine. So great is the friction of chain upon the land that one able to transmit 20 -horse power requires, so Mr. Fowler tells us, more than 20 horses to trail a mile of it along an ordinary ploughed field. And of course the heavier the chain the weaker in this sense it is, seeing that weight, on which friction depends, is proportioned to solid contents, thus increasing with the cube of linear dimension, while strength depending on the transverse section increases only with the square of linear dimension. A chain doubled in length and in the diameter of its material would increase in weight, and therefore in difficulty of draught eight times, but in strength or ability to withstand that draught only four times. The invention of wire rope, which being almost cylindrical creates but little friction, thus facilitates the conveyance of power to a distance, and that is the principle on the application of which our hopes of cultivation seem now generally to be built.

Oar readers will find in another page an abridged report of Mr. Fowler's paper.

A question was asked the other day by a correspondent of this Journal which many columns would not fully answer, but to the principles involved in which we may here shortly refer-" Whion is the best manure ?
Perhaps more misconception prevails on this sabject as the result of the phraseology employed in its attempted explanation, than exists from any other cause. We continually hear the "properties" of a manure spoken of, as if the whole substance had a character apart from that of its constituent parts. Such a manure, it is said, loses so much of its valuable "properties" if treated in such and such a manner. If farmers would look upon manure simply as the building material of their crops, a great deal of light would at once be thrown upon the subject. A plant is a structure, the actual materials of which in all their weight and quality already exist at the very time the seed is committed to the ground. Some of them exist in the air, and are brought down in the rain or sucked in by the leaves of plants-others exist in a more or
less accessible form in the soil-and others are added in the manure. Some of them are so abundant naturally that no artificial supply of them is needed; others of them, though present naturally in quantity sufficient for the natural growth of plants, are not abundant enough for that increased growth at which art aims. "The best manure," then, is in one sense that which supplies to the growing plant most completely, and in the form in which the plant stances which it needs as building material. In the other and more accurate sense "the best manure" is that which most efficiently, abundantly, and cheaply supplies those particular portions of the building material of plants in which the natural supply is especially deficient.
Now there are many things needed by the plant scanty source: such especially are the nitrogen and phosphoric acid which, in such forms of combination as are capable of absorption and assimilation by the plant, are undoubtedly the most powerfully fertito our correspondent's question will be given by indicating the cheapest sources of these two

Certain it is that the great demand for artificial additions to the supplies of the farmyard leads to so many sparious and deceitful offers of assistance that sound knowledge on this substance is most importan to the farmer. There are so many artificial manures in the market now-a-days that it is more than ever necessary to bear in mind that ammonia
and phosphoric acid are the two ingredients on the
presence of which the value of a manure claiming A correspondent, writing from
th throw some light on Bagnalstown, asks appeared the other day announcing a wonderful chemical manure at only a few shillings a ton. It appears to us that this is just a case in which the ignorance of the reader is the hope of the advertiser Nitrogen in ammonia costs at least 50l. a ton, and phosphate of lime in its two varieties of form from 10l. to 20\%. a ton, and these, or their equivalents, are as we have said, really the only foundations on which the reputation of any manure can be safely built, so that we are not curious as to any sort of manure which may be offered for \(17 s\) s a ton. No doubt, seeing that good stable dung is to be bought for \(5 s\). to \(8 s\) a ton, a good useful manure may be made for 17 s. but an advertisement in a London paper is intended for all the counties, and no one sends for farmyar dung out of his own. Besides, it is a chemical gentleman who advertises thus to all the counties, and we may suppose that this professes, therefore, to be a concentrated fertiliser, one whose carriage pe acre will not be a very heavy sum. Whatever may profess to be, we can confidently assert that relative proportions in which good guano has them present in it, there are not more than 1 per cent. nitrogen and 2 or 3 per cent. of bone earth in its composition. The success of the so-called "economical manure" was based upon the popu larity of the sentiment that, in the long run, cost is true economy. The manure in question appeals to the more common prejudice in favour of cheapness It is plain, however, that if an article be valueless, it is a loss to its purchaser, however low priced it may be. Rational agriculturists well know that so long as guano costs 12l. a ton, any sort of manure which is to rival it must cost at least as much.

\section*{AGRICULTURAL STATISTICS.}

No one can question the ability displayed, and sound sense inculcated, in the leading article of the Gazettc for Jan. 7th. No doubt statistics do occupy the place in man's civilisation which the talented writer of that article assigns to them. One must admit the cogency
of the arguments put forward, and the question of the importance of statistics being settled, we have only to deal with the method of their collection.
Under this head it is essential to consider the feelings, the prejudices if you like so to call them, of the class from whom the information is to come. It is the misfortune of farmers generally, from the nature of their business-their acquaintance solely with physical causes, and minute and often isolated facts-that their powers of observation are quickened at the expense of those of perception and reflection. They do not readily pereive the beariags of a questio, and thus are led to sem the tide whil they shoul arect, or aim their blows at a general truth which are only intended for a particular application of it. Thus it was with the corn laws, and it may be clearly perceived in this case that the agriculturists as a body are not opposed to the advoor imaginary modes of collection. Ask the least in ormed person in the agricultural body, without refer ence to the present question, if it be not pertinent to his business to ascertain the average yield of corn and quantity in band in his own neighbourhood? He will answer, "Yes, to be sure." Why, the farmer is trying to gain statistics every day of his life. What questions xnore important at market than the oft repeated ones:-"Is your yield au average? Have you threshed much? Shall you sell to-day ?" \&c. Is it possible that the farmers of England are averse to have that knowledge placed on a prind sue form Bus a guido to portant transactions
much annoyance might arise from covetous and interfering landlords, as from malicious neighbours, if the exactyield of corn on each respective man were known in the immediate neighbourhood. A tax on industry and talent, in the shape of an augmented rent, probably might be one result, whilst penury and negligence would be shielded; for it is certain that we do lay too much stress on the natural fertility of land, whilst under the new order of things large crops depend much essential that the yield of any particular farm should be known, and an arrangement which did not obviate this difficulty would be, therefore, a wilful violation of individual interests. The following is the summary of a plan which might be adopted in outline.
Proposed: that the overseer of every parish, when collecting a rate, should deliver to each occupier of an cre and upwards two forms for him to fill up; one to other to be a declaration with the signature that a correct return had been made. The above to be deposited at some convenient place, and by a certain
day, named in the form. To avoid recognition the returns might be made on one or more forms.
The same object would be accomplished if the returners were to forward their papers directly to some office for the purpose in London; the communication of names to be strictly confidential.
The return should be made as simple as possible
until it becomes habitual ; if too great an amount of information is sought the object will fail. Let us enter calmly and fearlessly on a discussion as to the best means of introducing a measure which the progress of time has matured, and which is likely to exert as much influence on agriculture as any of the important move ments of the past half century. We shall then be prepared for any results. Edwoard E. Agate, Kingoton, near Arundel.

\section*{COVERED YARDS AND BOX FEEDING}

THE general introduction of under-cover feeding which is gradually superseding the ordinary open farm-
yards with untroughed buildings, renders it necessary to yards with untroughed buildings, renders it necessary to consider the matter with reference to the health of our animals. The heavy losses from disease prove that a condition are many points affecting the samitary mendment I pur some other facts, in the hope that my brother agricul turists will communicate their views and practice on this important question. I say all important, because believe that when we get statistics of the number of al animals lost by disease on each farm, it will show a formidable sum-total of deduction from the farmers profits. For many years I have kept my bullocke, sheep, and pigs on open boarded floors, and with com plete success, never having in any instance had a complaint amongst them, although sometimes from 300 to 400 pigs, 200 sheep, and 30 to 50 bullocks have been placed in close quarters.
Although I cut up a great quantity of straw for consumption by my animals, still, owing to the large bull I now grow, I find I cannot get rid of it all in that way I, therefore, converted my large barn into a covere of buld have had fereli at various times three lot iihlocks, none of which turned out satisfactorly, they wegr lit the animals or che straw ever day. I suspected that the cause of this was the heatin of tle manure under them, which became so intensel hot although muist, that on removing the upper laye volumes of steam would rise to the top of the barn Cucumer was sufficient to render it as hot as became "fre fanged" and undecomposed the dung ing how many covered yards succeed and havin observed the dung from these removed in a rich coo "spitting" condition, and knowing too how discrepan feeding I feeding, I instituted inquiries into the cause, an received from one whom \(I\) consider the father of covera yards, a most lucid explanation. I had for many years seen in the covered homestalls of the Rev. Mr. Cook of Semer, near Hadieigh, many fine beasts in perfer health and condition on manure from 2 to 4 feet thick To him, therefore, I applied for explanation and infor dadion. Well, he said, "like yourself in my earl days I found my cattle unhealthy, and perceived that the cause was a too liberal supply of straw as litter; the a amiter up violent fermentation the neating process. I therefore allowed the 'pudding thinid manure to accumulate, scattering by hand ver thaly merely as much straw as would make a past mortar bed of thick doughy consiztence, the result bein the exclusion of air and perfect coolness. It would be better to run the risk of the animals being somewhat dirty than that there should be an active fermentio mass.
able explanation of Mr. Cooke's known. By only applying as much straw as will trea into and amalgamate with the manure, it is preserve in that condition in which it mayur, in is preser in for roots, without the process of dung heiping. We al know practically that if pigs are permitted to lie o fermenting or hot manure they will have the "heaves, in cattlo disease as fatal as the pleuro-pneumon he whole question of under-cover thus resolves itself into one of so proportioning the straw to the manure that the mass shall be sufficientlpasty to remain cool. I have known pig feeders (no farmers) who having no straw, successfully fatted thei hogs, although wallowing in and bedaubed with coo manure, whilst others who permitted too free a use of straw got heat and disease

The natural tendency of a farm-yard labourer is litter abundantly, nor can we wonder at it, when we know the thorough washing which farm-yards receive b heavy rains and water from untrouyhed building There is no fear of too much heating here. Still, in a warm dry spring I have known cattle attacked wid lung disease by lying on dense masses of manure open yards, the internal heat of which was fatal to their is thirteon timust in so, how great must be its loss in sloping open yards. Thinking this matter a very important one, I hare sent a copy of this letter to several agricultural periodi-
cals. J.J. Mechi, Tiptree IIall, Kelvedon, Esse3, Jan. 31 P.S. Mr. Lawrence, of Cirencester, keeps his farm horses in boxes, removing the manure once in six 0 eight weeks. He cuts his straw into 4 -inch lengths. In our enstern counties atraw is generally more glasy and reedy than in moister districts. Mr. Randall,
the vale of Evesham, manages his sheep in winter the vale of Evesham, manages his sheep in winter brick-dust, in fact. He has been for many years great clay burner, and wheels daily (I believe) on
barrowful, morning and evening, to every six larg
sheep. The result is perfect health and appetite, and sheep. The result is perfect health and appetite, and a most valuable compost, producing great crops of ruots.
I can, from my own experience, strongly recommend burned clay for this purpose.

\section*{agricultural constants.}

Ir is a fearful thing to differ from an editor, yet as well know your desire is the elucidation of truth, I constants."
It is quite true there is no mathematical certainty in any of man's productions or manufactures, and the examples you quote of engineers' "constants" are liable to great variations ; for instance, the strengh of iron
varies considerably varies considerably with the temperature and homidity
of the atmosphere during the making of the iron from of the atmosphere during the making of the iron from
the ore, with the materials put into the furnace, with the care of the makker, and a thousand other contiugencies, and yet it is found convenient that a certain
number be the exponent of the average strength of cast iron. So also in farm-yard dung; this varies in composition frum numerous causes, yet an average quality may be reckoned upon-nay is, for it it very usual to say 8 loads of dung is a mmail, 15 a moderate, and 20 a
good dressing for an acre of land. Therefore it is conceded among farmers, that for all practical purposes dung may, in calculation, be reckoned as of an average quality.
Again, as to guano, what is sold by respectable dealers is of pretty even composition; it would be more precise no doubt to substitute for the term guano
a certain percentage of ammonia, phosphates, \&c., but a certain percentage of ammonia, phosphates, \&c., but
all these attain a fair average value in Gibbs's guano. When we come to bone dust we have, perhaps, a more
certain composition than in guano, but whien a learned certain composition than in guano, but when a learned
professor of agricultural chemistry points out this as professor of agricultural chemistry points out this as
worth thirty times its weight of farm-yard dung, he has endeavoured to give us a "constant;") but which (as I before shown) appears to be an erroneous estimate, to calculations, I might have taken this statement of Dr. Madden's as correct, and acted upon it to my loss. It is therefore the discussion of such comparisons in your pages that I desire, in order to settle facts, constants," on such a basis, that practical farmers may sarely act upon them. One very important question to quality, and guano or superphosphate of average quality. Another important question to ventilate would be"What amount (in value) of manure is left by sheep on field
I have used the word "constants" for conciseness, and not with the idea that any agricultural facts are of exactly constant recurience, but I think they vibrate but yet appreciable and rateable by the intelligent farmer. Notwithstanding, if any concise term more suitable than "constants" can be named I will willingly adopt it, for the really important point is to have certain sequences in farming practice to be as elearly defined as possible. Martyn Roberts.

\section*{DIARY OF A DAIRY FARM}

As every thing in connection with dairy proceedings should be conducted with great cleanliness, it is well at commencement of cheese-making and the manage the of the cheese, first by cleansing the dairy lofts, \&c., from any remains of the former year's operations. That is to say, all cheese which remains unsold should be removed from the rooms intended to receive that of this year's making, to allow of white-washing, looking well to all encroachments made by mice, which a little mortar with pounded glass mixed with it, has been
found effectual in preventing. The shelves and floors should be thoroughly cleansed from mites, which are general'y to be found after cheese has remained on them through the winter, however attentive the dairymaid may have been in regularly wiping, and if they
are not thoroughly destroyed, they will do much injury to the appearance of the new cheese, by preventing what is called the blue coat from rising on it, which marks the richness of the cheese, which is often entirely to destroy these little enemies if they have been allowed to increase, it may require mare than one washing with hot-water and soda to ensure the entire extirpation of them, and if any of the last year's cheese remains, and the mites require destroying, the best mode of doing so is by rubbing the cheeses well with
sweet oil applied with a woollen cloth, and if necessary by repeating this process. This has been found an effectual remedy. A north aspect is considered the best for a dairy, also for cheese lofts where it is desiradmitted in the summer; bat convenience should be provided for excluding it at different seasons of the year, when it proves injurious to the cheese by causing it to crack, therefore shutters are required, or in some
situations casements of glass, whereby the light may be admitted without the air; the windows should be formed of wire lattice, sufficiently fine to hinder the intrusion of mice and birds, Stands formed so as to take several rows of shelves each side are the best for keep-
ing the cheese upon, as it generally dries better upon ing the cheese upon, as it generally dries better upon

\section*{buth of which are, however, geners
the space requisite for the cheese.}

Februar\%-It being always an advantage to the cheese that the rennet should be prepared some time before it is wanted for use, it should be made in February, and as large a quantity should be provided as can be conve nienty done consistent with the size of the dairy. Larg will hold 30 gallone, and a hole can be made at the bottom to draw the rennet from, which is much better than disturbing it at the top by dipping out, and a wooden tap should be used, as the acidity of the liquid would hav an injurious effect upon a metal one; it has been found a convenience to have a piece of board with holes perforated in it put into the jar under the vells to prevent
their getting to the bottom, and so preventing the their getting to the bottom, and 80 preventing the the tap; these littie items, though so very simple, affect the convenience of dairymaid greatly The rennet should be prepared by first making a brine strong enough to bear an egg, it should then be boiled half an hour, and when quite cold put into the jar, and to every two gallons should be added six vells, and one Lemon sliced, which does away with any disagreeable smell; an ounce of saltpene to every on should be added; it is very desirable that this essential
part of cheese-making should be provided two months part of cheese-making should be provided two months betore required for use, because it is thus more likely to check the tendency which the early cheese has
to By being made in a large quantity, the dairymaid is not obliged to be often testing the strength, which is the case when the rennet is made in small quantities, and it is liable sometimes to be too strong thereby causing the milk to become curd too quickly, which should be carefully avoided. While, on the other hand, if not of sufficient strength, the curd will be tender, the cheese not 80 good, and cause great through the sieve, and forming a sediment at the bottom of the whey lead which ought to be in the cheese, and this with good management is not likely to occur. Therefore it is of great importance to attend to the above directions for making the rennet, which, if acted upon, will enable the dairymaid to go on for months with regularity as regards the first part of the process of cheese-making : and this has great influence upon the other branches of the business. Irish vells are generally preferred, and they are not bought until old enough for use. Sometimes the butchers who buy the calves in dairy districts are required to return the stomachs for the ase of the dairy; they are considerably larger than the Irish ones, and whenever this is the case they should bo salted and kept at least 12 months before they are used, or they will iojure th

\section*{Home Correspondence.}

Floors for Cow-sheds.-In reply to your inquirer, I gave through the Agricultural Qazette, many years ago, for this and various other purposes-viz, three parts coal ashes (those from the blacksmiths' forges to be preferred) and two parts gas lime from gas works, to be thoroughly mixed, and then made into a mortar
with gas tar. If the gas tar come from gas works with gas tar. If the gas tar come from gas works
where the ammoniacal liquor is not separated, it will be sufficiently mixed for the purpose; but if the latter be separated, and the tar be thick, it will set quicker if about one fourth part of water be mixed thoroughly with the tar when used. For the floors of cow-sheds, this should be laid about 3 inches thick in one layer, on an even surface of gravel, or stone broken very down. The mortar may be laid on with and rolled shovel, and merely patted down flat. In dry wan weather, if the mortar has been carefully made, the weather, if the mortar has been carefully made, the floor will set firm in a few days. For any ordinary outhouse, half the thickness will make a permanent floor.
I have found this floor successful for everything but I have found this floor successful for everything but
pigs; but daily moisture of a pig stye, and sweeping, with the great and persevering power of the snout of large pigs, beat me, from being too sparing, I believe, in thickness for snch a trying purpose. About four years ago I removed this asphaite from the pig styes, and adopted the Portland cement as rocommended by J. B. White and Brothers, Millbank Street, Westminster, whose advertisement appears continually in the Gasette. This has completely posed even the pigs. I have ured it with pexfect suecess, not only for pig styes, but fo dairies, cottage floors, \&cc. Much depends in all these can only result from want of attention to the directions given, and carelessness. C. Lawrence.

Cutting Hedges.-I observed a few weeks ago at Wolsingham in Durham a man cutting down an old Whitethorn hedge, the stumps of which varied from 3 to 10 inches in thickness; they had often been cut at about 2 feet from the ground, and in consequence had branched at that height, forming a good fence above, whilst below (the Thorns evidently having originally been remedy this it was being cut down to within a few inches of the ground. I asked the man if the cutting could not be more speedily and cheaply performed by two men and a cross-cut saw, to which he did not
dissent, but stated that if sawn down the thorns would not sprout anything like so freely as when chopped with the axe, as he was doing, and suggested I should go to
the other side of the field and look at some which had
been sawn down, and how badly they had sprouted; he
and I find other worl chopping to be from the shaking the roots get? I there any valid foundation for this belief? W. Wooler. Farm Balliffe, de. - With reference to your corre spondent, " (he of the Attacked," I will only say that it appears possible (as is ably proved by your correspondent " \(\mathrm{G} . \mathrm{S}_{0}\) ") to answer all my inquiries with suitable and sensible remarks, without misconstruing the clearl expressed motives of an unprejudiced person. I thin that the few lines in your correspondent's letter, wherein he speaks of " amock-frock bailiffs, \({ }^{37}\) snd draws a sort of comparison between them and watchmen, contain more of personality and envious feeling towards one class of those of whom I wrote than all the attacks put together A Novice.
Moles, Partridges, Pheasants, and Ants.-An old, learned, and quaint writer begins a book in this way:thate cannot but know," he writes, "and be assure with a monster or to enter the lists with than grapple especially since what is commonly received is currently credited by the major part of the world, who taike al upon trust which they hear from such as they esteem wiser than themselves, and drinking it in without the least reluctancy." Pliny has also the same sentiment, and doubtless many others besides him. "Men," he writes, "do not anywhere more readily err than where they follow a guide whom they presume they may safely blished an, when God created the world he eata blished a balance among the animals in it, causing one kind, namely, beasts and birds of prey, to balance the required numbers and kinds to be preyed upon; thus beasts and lirds of prey in general are but few in number, living chiefly but not wholly in pairs, as lions, tigers, eagles, kites, hawks, ravens, \&c.; whilst cattle, sheep, rabbits, and most kinds of birds concregate in vast numbers and multiply extremely fast. Now, in a this the thoughtful man sees the wisdom of God; he see that the beasts and birds of prey are just as useful and while, for the good of the upon. But man destroys this salutary and wise balance, and by so doing brings great evils upon himself and on his fellow men. Thus the incalculably useful and inno cent mole is everywhere barbarously killed, and the same nearly may be said of partridges and pheasants and sometimes, as I shall show, of ants ; and I may add of many other living creatures created by a merciful and wise Providence for man's sole benefit, but which man wantonly and barbarously destroyb. If you ask farmer why he kills, or causes to be killed, molefwhat is his reply ?-why, in the first place, it is exactly that complained of by the old English and the old Roman and he inquires for bec answer io him sood or harm "But a little time together : you pay a man, Mr. Greening, to destroy your moles." "Yes, sir, I do ; and I always will." "Do you know what it was intended when that little, beautiful, industrious, and truly interesting and ianocent creature was created, that he should do? No, I do not, nor do I care; I hate to see molehills on my farm, and so, as others do, I kill all the moles I can. "Did you ever ask yourself what they lived upon? -what they were after when they showed you, by the exhibition of those hills you complain of, that they were at work in your fields?" "No, I never did." "Did you read in the Journal of the Royal Agricultural Society that in one year, and every year, full 60,000 bushels of seed Wheat, equal at this time to nearly \(30,000 l\). worth, are destroyed by wireworms? You will find in that wor I think for 1845, the statement I have just above made of the wonderful destruction made by wireworms, for remember, if 60,000 bushels of seed were destroyed full 720,000 bushels of crop was prevented, equal in
value, at this time, to upwards of \(300,000 l\) a year ! Now do not be angry; I tell you, without fear of refata tion, that if farmers, instead of killing moles, partridges and pheasants, would protect them, 720,000 more bushel of Wheat would go every year into the English markets but the creature desioned, as I have said, by a kind Providence to perform the chief part of this immense good is the mole which you and your friends destroy. But come, sir, keep your seat. and let us reason together litcle further. Some years since I had two fields, one of which was full of wireworms, and the other wo infested with them to the extent of more than one third part of it. My crops failed for the first two or thre years the land was in my possession, but overy year
afterwards they improved, and at length rapidly. What afterwards they improved, and at length rapidly. What
plan then did I pursue, Mr. Greening? Why, the plan, I boupht all the liv moles I could obtain, first at 3 s. a dozen and then at 28 . and turned them down in my fields; and one year in which I had 3 quarters of Barley on an acre and nearly quarters of Wheat the moles were at work all the summer, and in such numbers that, as I waiked amon the growing crops, the ground under my feet was like honeycomb; but that was the last year I had a mole on my land; their work being done, their food-the former pests to my crops-being all consumed, the little innocent workmen, Mr. Greening, who had per formed for me a service beyond the powert of all th men in my parish, migrated to my neighbours to per form for them the same kind of benefit they had foe and soon the whole colony was destroyed. I will add that now I will allow all the farmers in this county to
curts upun the gletbe 1 myselt oceupy all the moles from
their farms they can bring，heing convinced they would their farms they can bring，being convinced they would
do me no injury；but，if I happen to have a wireworm， they would by destroying him do me good．＂－＂But has not a noble duke，through that wonderful steward of his，compelled his tenants to destroy all the moles on their farms？＂＂He has，sir，I admit，and the same two wizards would，some few years since，have inserted the same kind of clause for the destruction of rooks；but shame，I conclude，and not knowledge，protects the birds．Of course，his Grace can insist upon what cove noble landed proprietor ought not to check but pro－ mote improvement，and there can be no improvemen bere farms are cultivated on the plan of the duke＇ Where Wh are plat law for them been enacted such as the duke＇s leases At this time they would have been what they were i 1756 ，and so must have remained．But if you can bring to your aid this noble duke and his steward，who in reality are but one man，there are on my side ranged in defence of Providence and its creatures three of the wisest heads and the most scientific pens I know－ mean Talpa himself，Falcon，and Mr．Burcham－eithe of whom singly，if placed in the balanee opposite to the duke and his steward，if scientific knowledge has weight would cause the two feathers to kick the beam．Yo observe，therefore，that wireworms do an immensity of harm ；and that moles，partridges，and pheasants，but particularly moles，do an immensity of good；and with this remark，sir，we will shake hands and end our dis marse，in resum

\section*{orieties．}

Society of Arts，Jan．25．－On Cultivation by Steam． －Mr．Fowler this evening read a paper on this subject， from which we extract the following passages：－Mr． Fowler first stated the problem as twofold－First，the application of steam to field operations；second，to the referred to the history of such attempts as lad been made towards its solution ：
We have，at least， 12 schemes patented in the last fe⿴囗十 jears
for rotatory cultivators，worked by loc nnotive engine \(\overline{\text { a }}\) ，all vary－ for rotatory cultivators，worked by loc motive engines，all vary－
ing only in detail；and it has been the favourite subject nf many of our agrieulturai writers；but would have spared them all much paihs aud expense，as，if there
is one point pore difficult than anither trom whincl to approach
our subject，it is in this direction．The enormous weight of engtaes required in which an ordinary farm pressure of steam is
ustd，and the weight necessary to give sulticient strength to the drums and frames；the difficuity of bteering such a great load to
the nicety for field operations；the yet nnkunn difficulties that may meet the rotatory cultivator，thiough，at first sight，I confess it appears well adapted to the work，to say nothing of the power
wasted in moving such a weight over arable land，and np ever so wated in moving such a weight over arable land，and np aver so
sllight an incling，might well deter the most sangnine from nay
attempt of this kind Patent office，such a monomanis at the present moment that 1 do not think it will be waste of time to endeavour to direct the
energies of my brother inventors to a different channel．For field perations we have，then，but two plans tliat can be mmon，the Important consideration of proposing to use any ordinary portable
farm en ine ；both propose to dray any given field implement farm engine；both propose to dray any given hield inplement
that may be anttached to them，such as a cunbination of plourghs， that may be attached to them，sinch as a cmbination of ploughs，
harrows，dritls，\＆ce．，but they differ in the means by which they ccomplish this
 rope，the windlass winding itself up and down the field by winding
up and paying off from two drum；a wire rope，anchored ta each premise my remarks on the merits of these plans by say ing that
I am myself a patentee of one of them，and had I not thuught nine the best，I should not have entered on the competition，an I must leave you to judge of their respective merits．After
giving you the reasons that led me to that preference，we will first consider the plan of travelling the windlass upand down the
field．A small hemp rope is passed ronnd the fly．wheel of a portable en，ine，placed in one corner of the fifld，one end being
carried round a pulley at the opposite end of the same headland carried round a pulley at the opposite end of the sanne headiand
Ind again round a pulley at the top of the furrow to be ploughied
It is then taken to the botom of the feld rcund another pulley at the bottom end of the same furrow，and again brought up the
field to the top of the furrow，where passing round another pulley whel in its passage oup or down of the ropes passing round the fit convess power \(t\)
mounted upon it，and being set in motion，turns one or two drum mounted on the windlass，and either winds up or pays off two that rope of friction．The rope that convegy the power is sup－
ported at intervaly by cartinges．and in order to convey the qud the dithicuty of
Tithlueess is necessary ment of the pulleys
cunsume any ale
strong enount oreauce the speed，can one－horse draft；that weight

\section*{pindlass at half horsse－power，}

\section*{axperiments \(I\) hate lately made on
the land show that}
oo drive engine，windlass，and whan two－horse power is rope （nearly \(s\) mile in length），the rope travelling at \(2 \frac{1}{2}\) miles per hour，and being strong enough to pull up a 10 hhorse engin
zt that speed．The disadvantage of the wind lass travelling u and down the field is very great，though the plough may
attached to either end of it，and ploughing nasy be thus easit performed ；yet，if you wisllito pull any onther fayrme machine whe
you get to the headland，you have no means of getting the im－ plement to the opposite side of the windlass，and going bac
except by the asfistance of horse－power and does not apply to the simple rope by which the implement
be easily turned．I thiul with these disadvariages，the pla traction by winding np a wire rope is greatly preterable，and ts much simpler，having fewer wearing parts，is less liable to
derangement，and more ensily managed．The jear and tear on a hemp rope at such h speed，and exposed to all sorts of weather
zis a poiat on which I amin not competeat to form an opinion，but
torner experience would lead to considerable doubt on this point．
Pefore proceding to describe the two plans for traction，to which
I siall call your attention it will he well to consider what have itfore proceeding to dercribe the two plans for traction，to which
Is lall call your attention，it will be wefl to ocnsider what have
been the causes of fanlure in the previout attempts of Heathcote， in 1837 ，O．oborne．and lord Willoughby dEresby．In the
xperiments that Mr．Parkes，the well known draining engineer， tried for Mr．IIenthronte，the dititiculty experienced was，to pro－
cure any material that would convey the requisite power without eutailing too much weight and consequent friction on the land．
Lord Willoughty d＇rerby，in the use of chain for that parpose， the friction of chain on the ground is so great that it would con－ sin frichorint more power than it is capable of bearing，when of
siny great lempth．The present perfection to wlich the manu－ ny great length．The present perfection to which the mani－
acture of wire rope tas ohtained has，however，entirely oper－
ome the difficulties that beset them；gnd in Mr．Williams＇s ame the difiticulties that bestet them；and in Mr．Williamss
and my own plan，wire－rope is the only material with which we
 urned by the engine，by one of which \＆wire rope is carried up，
and by the other passed offi；by the other，one end of this wire the passes straight down the ield，and the other passing along
 on fixed between the rope，and alternately pulted back wards and
orwards by these ropes the headlands as the work progressed．My own plan is to moun portable engine being set so as to drive them with a short rope
or chain working in pulleys．The ropes are led off the drums to opposite corners of the field，and there passed round pulleys，
anchored on a chain strecthed between two posts or anchors，and the drums beinur alternately set in motion，wind the wire rope moved up the field by being allowed to slip along the chain
as the work progresses，the engine and windass remain
ing stationary until the whole field is completed．I may Ing stationary until the whole field is completed I may
be allowed to add that one of my windlasces has been at
Work for the last six weeks at Mr．Smithis，of Woolston，near
Fenny Stratford，who will be able to give yon the results of his experience．I believe either of the above three plans 18 capable
of solving the problem of the application of stram to field opera
tions， tions，and Mr．Smiths experience would fuly justify me in
saying that it may be done at a saving of 40 per cent．over horse
lahour．Mr．Smith＇s calculations are as follows：－4 men and boy will plough an acre in 21 h hours，or 4 acres a day．This is
only the bame number of men required for horse labour，conse－ only the same number of men required for horse labour，conse
quently we have all the horse labour saved，from which deduct quentiy we have af coal，gives a saving of nearly half，as the
the cost of 7 cwt．of
wear and tear will hardly exceed the wear and tear of eight horses．Another advantage he considers must not be lost sight in wet weather，and，consequently，he can work it when he other
wise would be at a stand－still．Wavinu thus．It wise would be at a stand－still．Maving this．I think，arrived
at the conclusion that any kivtn implement may be drawn over
the land by an ordinary portable engine，it will be necessary to
consider what implement consider what implements are likely to he best aulapted to b
11sed with this tackle，so as practicaly to make it most service
able．1 loughing，of course，is the ordinary operation of a farm
and a series of tour or five plouphis，fixed in a frame will at any and a series of tour or five ploughs，fixed int a frame，will at any
rate best meet the present wants and prejudices of the farmer
Mr．Williams has invented a series of ploughs that have very will he foumd in adapting ploughs to meet the requirements of the farmer．I thiuk there is every probability that some other ins－
plement will，to a great exterut，supersede the plough，and
to this attention ought now to be turned．Mr．Smith is now，and lims been for some years，moving with horse
power a sort of grubber instead of the plough，and with，I hear power a sort of grubber instead of the plough，way of effectually
the best results．But Inust confess I see no way
and then and thoroughly turning over the soil，which is often necessary，
botl to expose it to the air and bury the stnbble and weedd，but by
the use of the plough．Still this operation can liardly be neces－ 8 8ry very often in a yenr，and，I helieve，a machine may be made
which will take the soil up on a platform to a certain height then，passing it througls revolving harrows，leave it at once in then，passing it through revoiving harrows，reare
perfect tilth，and which may be worked by traction．This would
be a great advantage，as the soil is often，when broken up，in a he a great advantage，as the soil is often，when broken up，in a
fit state to pulverise，but，after the sun＇s rays have heated it for a few days，it is quite inpossible to break it．The sets of imple－
nents that may be found best for different soils and circum－
stances to be wrked by steam－power，will be numbered by
hundreds；and it is impossible for ne to estimate the changes In which the application of steam may give rise，nor will my limits permit me to dwell longer upon it．It is worthy of serious
and careful antention，and，I think，deserves at once to be the subject of extended experiments．Having thus drawn your
attention to what appar to me to he all the most practicable
schemes and experiments for performing field operatious by
steam，I now have to refer to the other branch of our subject steam， now have to refer to the other branch a cartage of miterial to and fro on a farm．A large team of
the
liorses will stili be necessary on a farm to do the necessary carting，going to market，\＆c．，but during harvest every available
horse is often required，especially on large light land larms．Can number of horses might safely be reduced two－thirds．The prac－
tice of ricking in the field is now common，and where this is the tice of ricking in the field is now common，and where this is the
case，there can be no difficulty in using the windlass to bring
the conn to no spot．You might fix the windlass in the morning the corn to ne spot．You might fix the windass in the moramg
and clear an 80 acre feld with it in a short tima．It can be
removed and fixed again with ease in two hours．The windlass could be also uned for carting Turnip，but if a traction locumotive
could be made arsilable，it would be farbetter suited to the work．
A tram way down the centre of the farm，using the wind lases to
the right and left to bring material to the barn，would reduce the the right and left to bring material to the barn，would reduce the
horse work to a minimum，but whether the locomotive could not
be made to do the cartin．work of a farm is well worthy of atten－ be made to do the carting work of a farm is well worthy of atten－
tin．The great difficulty met with by Hancock and orhers，on
common roads，was the speed at which they travelled，but for
this purpose three miles an hnur will be a nufficient speed．I
beli belive that a few experiments wruld lead to a successful solution of this problem．One ensential to its success is，however，the use
of very hiyh pressure steam，so as greatly to reduce the weight
of the engine，and the consumptinn of as little water as possible．
Pussibility of driving two wheels is now overcome by a very Pussibility of driving two wheels is now overcome by a very
simple contrivance，which \(I\) amm rint at liberty to describe to you，
and this is a great step in the right direction．Boydell＇s wheels and this is a great step in the right direction．Boydell＇s wheels
also may form an imp，rtant auxiliary in certain states of the
weather，though I think they wonld hardly do in constant wear weather，thongh I think they wonld hardly do in constant wear．
Were I to attempt the solntion of this question，I should use
Wheels to which 13nsdell＇s rail conld be attached，whenever the
state of the weather demanded．Thus there are three directions state of the weather demanded．Thus there are three directions
in which in my judgment it would be well to make some experi－
nents， 1 st，in implements，adapted to be worked with the sterm
windlasses． \(2 d\) ，in a rotatory cultivator，worked by a portable Windlasses； \(2 d\) ，in a rontatory cultivater，worked by a portable
engine，with endless band； \(3 d\) ，in a locornotive usell for traction to do the cartage of a farm．In feel connident that a few well
directed experiments in either or all of these directions would brine out gond practical resilts in the course of a few years：but 1
would ask you whether it is right that the carry ing out of these experiments should be left th chance－whether，when so important bring them to some practical solution．If left in private hands it way，and probably will，take many years to arrive at any real resulta，and at the cost of loss and disappointment to many of a deserving but unfortunate class of men，whereas If feel contident altention，and others that no doubt would arise in the course of \(\left\lvert\, \begin{aligned} & \text { atiention，} \\ & \text { prosecuting these inquiries．}\end{aligned}\right.\)

Belfast Flax Society，Jan．18．－At the annual meeting held this day Mr．W．Charley related his experience in Flay culture as follows ：－＂Every year I eep an account of the produce of \(m y\) ground sown with Flax，and a few statistics are especially valuable．Last year，at this society，I think I mentioned that some farmers had been telling me that chey lost a good deal of money by cultivating Flax in place of other crops．I
said to the society，in some remarks that I made，that my crop brought me in a profit of \(3 l\) ．an acre．I got，I remember，a good rating for saying that my profit was so small ；and this year I selected a smanl part of a field；I had it carefully sown and attended to ；and my profit on the crop is so very much increased that it is very pleasant to me to state the amount．Last year my per acre－being an increase of 116.138.

The Keythorpe System of Land Drainage：its Principles， Efficiency，Economy，and Opponents．By Joshua Irinmer，F．G．S．W．P．Metchim，20，Parliamen Street．
Wi recommend those of our readers who have gathered their impressions from our columns of the way in which Lord Berners＇estates have been drained，to procure this pamphlet and see how the practice which his lordship found efficient grows in Mr．Trimner＇s hands from a mere instance，at first，we pre sume，of accidental success into a system－hinging capa generally the Keythorpe system hinges may hold true we do no know，but they are，it would seem，characteristic of large districts，and demand therefore the earnest atten tion of land drainers．This，it is plain，they have not yet received，or we should not have Mr．Humber speaking of the Keythorpe drainage as if it wer identical with the old methods of Elkington．The Key thorpe system does not act by urains cut into a porons bed betow the clay soil which is to be drained．It act by drains cutting through the porous beds lying over the clay subsoil．These are natural drains－furrows in the surface of the subsoil filled up by porous materia－but they cannot act as drains for waut of an outfall ；this Lord Berners gave them by his cross cut conduits which not only act as drains themselves，but set operation whatever facilities for land drainage naturo has herself provided

The following extract from the pamphlet explains the thing at length ：－
If we examine any recent railway cutting we sha see that the junction of the soil with the subsoil is very irregular，that in some places the subsoil comes within foo or so of the surface，and in others sinks to the depth of several feet．The same appearances are ex hibited in sections of gravel，sund，and clay pits；and wo have in them this advantage for observation，that in extend ing the works a considerable extent of the soil is sometimes carefully cleared for the use of the farm or garden without disturbing the subsoil．We then see that the irregularities which we had observed in section are the transverse sections of certain natural subterranea ridges and furrows．It must be obvious that the rain which falls on the surface will sink downwards til checked by the clay．It will then collect in the subter ranean furrows，and if they have sny declivity will wor its way along them through the poruus soil，breaking Now across the subterianean watercourses diagonally，crossing them at such an angle as still to maintain sufficient fall and to prevent the water from playi．g thuse pranks，in getting
in and out of drains，which we sometimes hear ascribed
to it by the advocates for making the direction of the
drains correspond in all cases with the line of greatest drains correspond in all cases with the line of greatest descent."

\section*{Tht Garientrss Chtomitle.}

SATURDAY, FEBRUARY 9, 1856.
Upor what principle is it that in some garders and great gardens too, the EABTH IN 4 TUB or pot is allowed to become so hard and filled with roots that is more like a sun-dried brick than anything for plants to grow in? Is it because men think that plants love soil out of which no nourishment can be extracted ? and into which no water can enter? Or is it that they prefer to see plants decrepid instesd of vigorons ; or may it be ascribed to that reverence for antiquity which refuses to listen to the explanstions of science, prefers an old stage coach to a railway, and the post office under the Stuarts to the electric telegraph ander Queen Victoria?
Look at these fine Orange trees with limbs in the full vigour of a green old age, bat with foliage in a consumption. Cast an eye upon those young exotics, destined some day to decorate a palace, and intended to be well nursed until the time comes when a fitting place can be found for such valuable rarities they are already struggling against an unkind destiny; their arms are shrunken, their leaves
parched and dry. How is that? Alas, they have fallen among barbarians who reanire them to
wear a look of happiness in the midst of torture, end to fatten though perishing of starration. The earth in which they grow is the place whence their meat and drink should come; but its springs are choked and dry, and the food it once contained has long since been exhausted. The roots which nature gave them for mouths are broken, awry, twisted or misshapen ; in some the passages through which food should Alow upwards in invigorating streams are bent backwards and forwards till no passage remains; in others they have followed the surface of their prison, searching round and round for a scanty beverage till at last they have become spiral, hardened, thickened and incapable of ever regaining flexibility; so that when at last the plants to which they belong are transferred to some fertile spot they are incapable of imbibing their food and perish by degrees, or having lost that power of extension in all directions, which nature gave them, they ultimately quit their grasp of the earth, and allow the trunk to fall over-a hopeless wreek.

This is no exaggeration; no highly coloured picture prepared for mere effect. The language employed, although somewhat figurative, is not untrue ant faithfully represents what was once co
Perhaps the true cause of this wretched manage ment, at least in the case of large trees, is that men do not always know how to prevent the hardening of earth crammed from centre to circumference with unhappy roots, by the only remedy, viz., frequent and plentiful repotting, or, as we say when speaking of large specimens, retubbing. To all such we recommend an excellent article by Mr. James Macnab in the Scottish Gardener. The health of the Palm trees and other large exotics Garden, Edinlurgh, is the admiration of all who see them. His precepts, therefore, come recommended by a practice to the success of which we all bear witness. The original paper is illustrated with woodcuts; and it will doubtless be consulted by those who feel a difficulty in understanding such description as we have the means of giving. In the first place Mr. Macnab describes his manner of moving heavy tubs from place to place. Such tubs, he observes, "generally stand on four bricks or stones, so placed as to give a free circula tion of air beneath, and at the same time affording facilities for draining off the superfluous moisture and thus preserving the tubs from early decay. This arrangement also affords the means of easily running the plants from place to place. Three or four iron rollers, four feet long and two inches in diameter are placed in suitable positions below the tub, and the plant lowered on them by means of piaches or crow-bars; the plant is then speedily run in the required direction.

When placed the operation of lifting the ball of earth high enough to enable the old tub to be pulled away and a new one to be substituted is effected by a pair of strong tressels, upon each which are fixed two moveable hard-wood "cradles," resembling the mould in which the trunnion of a piece of ordnance is made to work. Into these cradles fall a pair of "rollers" or windlasses worked by handspikes ; s that the ball of the tree to be retubbed stands in the centre of a square, two of whose opposite sides are formed of tressels and the other two of rollers or windlasses. It is easy to conceive how, by a simple arrangement of this kind, even the largest tubs used in gardening may be quickly and safely raised to any required height.
To work an apparatus of this kind we are told that:-"For a weight of 20 or 25 cwt . eight men will be quite sufficient, but if the mass is heavier, it will require twelve men, two being placed at the
handspikes at each end of the rollers. After the men are adjusted, two being stationed at each of the guy poles, the plant is raised a few inches by means of the handspikes acting upon the ropes, so as to allow the hoops and bricks to be withdrawn from below, as well as the loose soil and old drainage. Sweep all clean, then continue the raising till the plant is sufficiently high to allow the tub to be
run beneath it. This done, the plant must now be lowered very gently into the new tub, taking care to keep it quite upright, and exactly in the centre.

The last matter of importance to which attention has to be paid is the renovation of the soil. This cardinal point is effected thus:-"Previous to filling up the tub with its prepared soil, pots either whole or cracked, 6 or 8 inches deep, are generally placed round the surface of the drainage, the open ends next the roots; and in the case of plants in large tubs, it is the practice to continue the inserting of pots in this way while the tubs are being filled up, care being taken in all cases to keep the open ends
of the pots next the ball; sometimes as many as
eight or ten pots are introduced in this manner. In
after retabbing, these pots are generally found fall of beautiful healthy roots. The tub, after being filled up with soil, is allowed to stand a few days before being watered."

After this explanation we hope to hear no more of Orange trees being left to die of hunger because a gardener wants the means of lifting them out of their tubs and renewing the soil. Some cart rope, a little stout timber for tressels and windlasses, with some aid from the wheelwright, will enable any one to do all that is needed, beyond manual labour

The same simple apparatus is perfectly well adapted for lifting and transplanting trees in the open ground, but to that point we must endeavour to refer on a future occasion.
We took occasion some six years since in the communication of some excellent specimens of the esculent Lichen of Pallas, Lecanora esculenta, and the allied species L.affinis from Erzeroum, to call attention to its very curious history, and to publish some remarks transmitted by our correspondent there (Gardeners' Chronicle, 1849, pp. 612 and 581). It was stated, that though these Lichens, especially L. esculenta, are so acceptable in time of scarcity to mix with head corn, they were quite unknown to the shepherds who traverse the grea plain which surrounds the city, and that Dr. Hfinig, who has rambled much about the neighbourhood, had never met with them. Eversmann had in vain searched for the minutest point of attachment in the allied species \(L\). fruticulosa, though he had frequently met with specimens in a very early stage of growth, scarcely exceeding a grain of sand in magnitude. It is manifest that plants of a spherical form, having no attachment to the soil, and of small specific gravity, may be easily blown for miles by the powerful winds

which traverse the wide and open steppes, and that their accumplation, as related by Parlas and others, at the base of rocks is the natural consequence of their nature and the circumstances under which they are placed. The witch-balls, consisting of round compact rolled masses of dead herbaceous stems, present a similar but even more striking instance of Lichens were known to grow in the country surrounding Erzeroum, we should have an easy solution of the showers of Manna from heaven, of which so much has been said at different times, and which possibly are not more marvellous than the supposed descent of frogs, shells, seeds, \&-c., from the clouds, of which our journals occasionally give reports.
The power of the wind in lifting up bodies of some size from the earth and carrying them to a distance is occasionally very considerable, even in this country. In an early volume of the Annual Register, to which we have no power of referring at this moment, an account is given of a storm which took place at Oundle, and which was witnessed by the father of the present writer, who completely confirmed the report. Skins were carried from a fellmonger's yard at Oundle, and lodged in the Elm trees in the front of the Hall at Biggin, a distance of two miles in a direct line, and some other circumstances took place still more marvellous. As is usual with such winds, the breadth of the current of air was very small, along which its destructive effect was distinetly visible.
We were not aware that analogous bodies occur in England till a few days since, when specimens of a curious spherical Lichen, which rolls freely on the exposed downs or sheep-walks of Dorsetshire, as at Melbury, were communicated to us by Sir W. C. Trevelyan. It was hoped that they niight throw some light upon the mode of growth of Lecanora esculenta; but this unfortunately is not the case, as they are formed on two distinct modes of growth. Lecanora esculenta and affinis, of the latter of which we give a section in the right hand figure, are essentially centrifugal and increase after a dichotomous manner, as is distinctly marked in L. affinis, but far more decidedly in L. fruticulosa, while the specimens before ns of which we give a view of the matural size, together with a section, grow concen-
trically. It is sppposed by our excellent correspondent that the Lichen, which appears to be one of those short-lobed forms of the Parmelia stellaris group, which often puzzle botanists, and indeed to be a state of P. cæsia, in which opinion we are confirmed by Mr. Babington, is developed in the first instance on rabbit or sheep's dung, which in the process of time is absorbed, leaving a round or elliptic free mass.
We have in vain searched for the slightest trace of the vegetable fibres of which such substances are composed, and the brown matter which simulates them is merely an hypertrophy of the dark root-like bodies which clothe the under surface of so many species of Parmelia. The Lichens of the Lecanora affinis group are merely extensions by ramification and radiation of a single individual, whereas the plant before us has arisen probably from many distinct plants, which have formed a solid mass by the contemporaneon growth of many imbricating fronds. The mystery therefore, of the mode of growth of the esculent Lichen is as impenetrable as ever; but we are greatly obliged to Sir W.C. Trevelyan for the knowledge of this very curious form of \(P\). cosia, of which we can find no trace in any book to which we have access. M.J.B.

\section*{New Plants}
163. Kellensteinia Kellnerianı. Reichenbach f. in Bonplandia, Jan. 15, 1854.
Under this name has been published a terrestrial Orchid nearly allied to Zygopetalum and Warrea, fo an opportunity of examining which we are indebted to James Bateman, Esq., who in June 1854 favoured us wit a living specimen, produced in his stove under the car of Mr. Sherratt, from one of Warczewicz's Peruvian co lections. Professor Reichenbach's plant, gathered by Wagener at Truxillo, 7000 feet above the sea, had pre viously blossomed in Germany in the garden of Captai Kellner v, Koellenstein, a German amateur. It wa described as being very near \(Z\) ygopetalum tricolor, an to have flowers smelling like many Stapelias. Mr Bateman describes his plant as having pseudo-bulbs the size of a Cobnut, grassy leaves 1-2 to each, and one or two at base, flower stems 18 inches high, flowers lasting a long time, and having a peculiar disagreeable odour. We found them to be secund and of a dingy violet colour, with a yellow crest at the base of the lip. Professor Reichenbach, to whom specimens have been communicated, considers it identical with his species, which he reports to be very variable. Zygopctalum tricolor is certainly a Kcellensteinia, and extremely lik the species now noticed, but its flowers are not secund the species now noticed, but its flowers are not secuad, its lip is pure white with thin broken crimson cross bands, and the crest is neither yellow nor next ine base, as here, but white, and in a line with the side incisions. The front lobe is also somewhat smaller than the other merely of botanical interest.

\section*{on Frost splitting.-By Dr. Robert Caspary} (FRow The Botanische Zeitung.)
Ter fact that in cold winters several of our hardy trees, both indigenous and exotic, are often split length ways even to the pith by the frost, is a well known and very interesting phenomenon*, but the precise circum stances under which it occurs and the causes of it have been inquired into by very few persons, and have nd alluded to some questions connected with frost spliting in a memoirt, in which I gave an account of some observations on the diaruption by frost of the tissue in several small plants, chiefly herbaceous exotics, which was accompanied by a curious foliaceous formation of ice. The frost clefts of our trees are, however, very different from that phenomenon both in their causes and attendant circumstances. I shall presently show in what the differences consist. In January and February of the present year (1855) on the coming on of very severe weather, numbers of these fissures showed them selves on trees in and near Berlin, and gave me the opportunity of solving several questions which remaine unanswered respecting them, and of investigating more closely their causes. As the accurate knowledge of the meteorological relations at the time the clefts occurre is of great consequence, I will first give the detailsthe meteorological observations of the period in question which I owe to the kindness of Dr. Schneider, who ha the direction of the station of the Meteorologica. Institute in the Ritterstrasse in Berlin.

The commencement and middle of the winter \(1854-\) till the 13th January was, with the exception of a short cold period in November, unusually rainy. The mean temperature of November 1854 was \(+1^{\circ} 69\) Reaum (about \(36^{\circ}\) Fahr.) ; the thermometer was mostly above the freezing point, although the absolute minimum on the 15 th of the month was - \(7^{\circ} 2\) Reaum. ( \(16^{\circ}\) Fahr.). In December the mean temperature was \(+1^{\circ} 96\) (near \(37^{\circ}\) Fahr.), and the absolute minimum on the
December \(-2^{\circ} 5\) Reaum. ( \(264^{\circ}\) Fahr.) In January 1855 the lowest temperature which occurred before the * See in regard to the injury done to Oak timber the very instructive work of Hiring, "on the Characters of the difitren
Kinds of Oak growing in Germany," Berlin 1853, p. 109, with figures of frost splits.

fore from the commencenent of the winter direeted my sttention especially to those trees which had overfrown
frost elefts. 1 examined them almost daily, especially
. frost clefts. I examinelt them almost daily, especially
when the severe cold set in, towards the midide January. On the ed of February 1 firstremarked the reopening of frost clefts on a great number of Lime
trees in
Charlotennburg, and on the
ad als on number of trees in the Park (Thiergarten) which I had not been able to visit on the 2 d . Unfortunately 1 had not for 3 feew days before the 2 visitited either Chariot greater number of the trees which \(I\) subsequently examined Although 1 cannot therefore preciely fix the day when these frost clefets reopeneed, yet it canoo have taken place earlier than in the night of the 3oth to
the 3 3tst Janaury ; for on the 30 th they were eertainly not yet open. Probably it was in the night between the 1et and 2 d February, when the thermometer in the
 of the cold, from the the sth to the Tit February, they remained open, and increased on the return of the severe frost. But to my sorrow there wero only old
overrow frowt
git formed, with the exception of two trees, one a Lime tree in the Park, the other a Horse Cheenut in the parden of the papiil gardeners' establishment. Of the spliting of even give me the hour when it took place., It was even give me the hour when it took place. 1 twai
about 10 oclock at \(n\) night on the 9 th
February that it burst with a report which M. Bonche heard plainly in \({ }^{\text {his d delling }}\) situated about 20 paces from it.
(Here foiliow the detailied obbervations on the extent, direction, appearance, and other partieularr of the froes
slits of 33 different trees, Oaks, Sycamores, Limees slitzo of 33 different trees, Oike, Sccamores, Limees
Horse Chesnuts, A Ahes, Porlar, Alder, and
Bird. Horse Chesuuts, Ashes, Poplar, Alder, and Bird
Cherry, all except five noted down whist the elefts were still open, and three only of which he had no himself observed all the particilars. The diameter of the stems almays taken at 2 feet from the ground, the measirements in Rhine feet and lines (wwelths). The observations, upon which he founds his arguments.
Lion's Bridee three paces from the fotrath the
 torder projecting considerably with eight breakese, show ing that the fissire had opened and drown over again
eight times in eight different years. The eleft was eight times in eight different jears. The cleft was.
about 15 feet long, under a projecting knot, and extend. about 15 feet logg, under a projecting knot, and extend. side and ends above on tho E . The direction of the twist is to the left. The eleffopens about four lines,
the sides of the fissure ase brown and decayed, with
ne exception of about eight lines of fresh wood and bark where it had overgrown.
2. Quercus pedunculata.- In the botanic garden at Schöneberg near a footpath; diameter \(17 \frac{1}{2}\) inches of the length of about 18 feet, and ends under the stump of an old branch not overgrown. The frost cleft sides wood, where it and rather decayed. The fresh split an inch thick. The second cleft is on the E.S.E. trends to the S . and then to the \(\mathrm{S} . \mathrm{W}\). It begins at about 7 feet above the ground, and extends with breaks to the height of about 17 feet; it spans four lines. It ends neither at a knot nor at a decayed branch, but seems to be in connection with a stump about \(1 \frac{1}{2}\) foot thick, which is about 2 feet above the end shows eight breaks; the cleft had, therefore, burst open and grown over again in eight different years. Part, not sur fro Paiks, not firl from the thion's Bridg ; 12 inches paler at the hark ; but this is onot the conseguence of clefft had liain ol coser torether by the bect sides of the cleft had lain closer together by the bark. The cleft
extends to to below the erondd extends to below the ground; is about 3 feet long, and
spans four lines, It ties to the WS .W.; no twitting perceptible. No injury oceasioning it can be seen ; but close over the cleff to the west is \(a\) smoother Plase in the bark, which seems to indicate some injury
that \(h\) ha
a has overgrown.
Charlottenburg, close to the meter, with two old clefts, one scarred ; with a projecting border with eight breaks, showing an eight-fold burst ing and overgrowing. Cleft 4 to 5 lines broad, brown
on the sides, the fresh split wood 8 lines thick.
Twist to the right, aspect towards W.S.S., about 10 feet long in two portions. An irregular spot in the bark at about two-thirds of the height of the cleft discloses an injury, the nature of which cannot be deter-
mined. The second cleft is in two portions, about mined. The second cleft is in two portions, about
4 feet long, 6 feet from the ground to the N.E. No perceptible injury in connection with it.
20. Lime Tree at Charlottenburg, on the left of the
Berlin road. Stem 26 inches diameter. Frost cleft old, overgrown with a border with several breaks, extends from below about 8 feet up the main stem, is then continued above a large knot up to the fork of two branches, into one of which it is continued for about 4 feet. The ceft in its lower part is 4 or 5 lines broad, higher up quarter. The young fresh split wood is 5 or 6 lines hick, the sides of the cleft decayed, in the upper par deeply rotted away, so that the overgrown hark forms a border projecting, over the inner edge of the cleft. 22. Lime Tree at Charlottenburg on the A.N.
22. Lime Tree at Charlottenburg, on the Berlin Road. -Stem 21 inches diameter. The cleft extends from the ground up to the stump of a bough sawed off but not overgrown; is continued with a break round the stump and for some distance above it ; total length abou
12 feet. The cleft spans an inch and a half, and \(I\) could nsert my rule into it to the depth of 8 inches. The cleft was old and had been partially overgrown, but without a thickened border. The young wood and bark which had been fresh split was only about three lines thick. The sides of the cleft were much decayed and full of dirt, which must have got into it before it was
fresh opened this season. Apparently it had remained very long open in the part where it had not overgrown but where it showed a thickened border on the inner
edge formed of young wood and bark. The twist is to edge formed of young wood and bark. The twist is to
the left, the aspect S.S.W. The cleft of this tree leads to instructive conclusions, of which more hereafter 25. Bird Cherry.-In the Park, four paces old, overgrown, under a stump not grown over about 10 feet long, ceases at about 6 inches from the ground The fissure opens about 4 lines, is brown, the twist to the right, the aspect from S. to S.S.W. The fresh torn border of overgrowth about 8 lines thick.
-At Schöneberg, in the arden of the pupil gardeners establishment, five pace rom a walk. Stem 14 inches diameter. Cleft fresh, having occurred, according to Mr. E. Bouché, on the 9th February, at 11 o'clock at night, with a loud report.
It is about 8 feet long, and extends nearly to the ground. Twist to the left, direction to the south below, then by the east to the north. It crosses a black decayed apot han half way up the cleft, the decay having extended into the young wood in brown streaks, about \(1 \frac{1}{2}\) inch deep. The cleft opens to the breadth of 3 or 4 lines. 31. Ash (fig. 4).-In Soltmann's Brunnengarten rising from the ground about 8 feet high to the side of a branch, in a north-west direction. I have not mysel seen this cleft open, but according to Hofrath Soltmann and some of the people of the garden, it spans from hal to three-quarters of an inch across, and opens ever winter, closing over again in summer. The clefts o his and two other Ash trees ( 32 and 33) were remark ble as having exactly followed the scar of a longitudina sit in the bark. It was only at the top that the cleft of No. 31 slightly diverged to the left from the scar. These cars had precisely the appearance of those left by the sits that gardeners often make, as they say, to let the tree bleed, or they may have been slit from mere wantonness. By the side of the cleft are the traces of a shorter one, but which I am told does not open in frosty weather.
(To be continued).

\section*{VEGETABLE PATHOLOGY.-No. CVII.}
419. Veneficiom (Poisoning). - Plants having only very limited powers of choice as regards the matter asorbed by the spongelets, whatever is really held in solution by the water they imbibe must pass with it into such as silex are taken up more freely by one plant than such as silex are taken up more freely by one plant than laws which at present we are unable to appreciate. If however, the choice of the spongelets is limited, that of the tomates is still less so, so that whatever gasenus matter may be contained in the atmosphere will find a ready admission to the inward parts of the plant. It is obvions, therefore, that as the exigencies of plants are very different, and the same nutritive matter, or rather the same proportions of it, will not suffice for the main tenance of health in all, even under ordinary circum tances, disease may arise from a deficiency o edundancy of particular elements in the soil and atmo phere. The sals steppes of Asia produce only such plants as delight in the particular mineral which proportions. In land, again, over-manured with guano rother animal matters, health or even vitality canno be maintained, where the proportion is such as to exceed greatly the wants of the species. Wheat, for of silex, nor Cabbages where the proportion of nitro genous matter is very small. In some cases, indeed superfluous matter which could never pass off by the
stomates is stored up in the cavities of the cells, as the crystals of oxalate of lime which form such a prominent and interesting feature in the leaf cells of Figs, Hops, and many other plants, the rhaphides with which so many vegetable cells are gorged, or the carbonate of lime
in Charads. There is no reason to believe that these matters are deposited with a view to any ulterior use, as is the case with the magazines of starch, \&c., which are intended to perform important functions at some future and often distant period. Other matters, however, may be present in the soil or atmosphere which are never themselves may be destructive. Different as vegetables are from animals in a multitude of respects, there are species which so closely resemble each other that it is difficult to say to which great division of the organised world they really belong. Both these exhibit vital pinciple of and we may presume therefore that the rinciple of life, however it may be modified, is essentially the same in each. If proof, however, were
wanting in other respects, the identity of the effects wanting in other respects, the identity of the effects
produced by many vegetable and mineral poisona upon plants and animals would alone be sutficient. Whether wo take the principal organic poisons, as opium, hydroyanic acid, chloroform, dc., or inorganic, as arsenic, hydrochloric acid, iodine, \&c., we find that the effect produced is essentially the same, in some cases affecting the functions, in some the organic structure. Opium, hydrocyanic acid, chloroform, \&ce, paralyse or suspend the functions of vegetables, precisely as they do those of animals without injuring the delicate tissues; while arsenic, lead, \&c, more or less impair their structure. Nor is gaseous matter indifferent ; the comparative arrenness of fens, at least as regards the majority of the natural order of plants, depends in all probability on the condition of sulphuretted hydrogen; the impure carburetted hydrogen of gasworks is notoriously injurious trees, as is also the emanation from certain chemical works, which reduce their immediate neighbourhood to a treeless wilderness. \(\dagger\) The mischief may in many cases be purely functional at first, but the suspension of functions, especially if long continued or often repeated, except where it is of the nature of sleep, is apt to induce active disease or the destruction of particular organs, which may in the end prove generally fatal.
CP 420. It is, however, curious what concentrated poison some vegetables are able to endure. Moulds flourish in arsenical and other mineral solutions, which might have been supposed utterly incapable of sustaining any vegetable. One species is the source of great annoyance in electro-typing, as in the Map Office of the United States of Washington. The sulphate of copper is deprived of its copper by the mould, which assimilates the sulphuric acid while the copper is deposited as a thin metallic pellicle on its walls. A fungus again flourishes in the water of tan-pits where no phrenogam could exist.
421. Though the action of many poisons upon plants, as opium, prussic acid, chloroform, \({ }^{+}\)\&c., may be considered by the cultivator as mere matters of curiosity, which can never call for any especial treatment at his hands, it is most important that he should atteud to the principle involved in them, for if so he will not overmanure his plants or trees. However beneficial the substance may be when properly administered, he will not use coarse putrid manure as is the fashion with some of treating Vines, the most delicate perhaps of fruits, and the most easily impaired by injudicious treatment, nor will he be indifferent to the quality of air with which his houses are supplied. Ventilation will be of little ase if poisonous vapours are constantly rising from beneath, and these are sometimes so intense as to produce at once visible evil.
422. It is very doubtful whether plants are capable of rendering ground noxious by excretion from their sound and entire roots. It is, however, easy to conceive that such plants as Poppies, if ploughed green into the ground in considerable quantities, might prove injurious. M.J.B.

\section*{TRADE MEMORANDA.}

Manchester seems to be doing a great business in the seed line. One order has, we understand, been received for 50 bushels of Swedish Turnip seed and one hunared eight of Couliflower secd as a sample.
By the way who is Mr. Charles Bardsley of that town ?

\section*{Home Correspondence.}

The Occidental Plane.- I have long been inclined to think that a mistake has always existed in this country with respect to this species of Plane, and am much gratified that Su W. J. Hooker has brought the snbject before us. I used to tell my old friend Loudon that he was wrong in his description and identification of it, but I was theu young, and I suppose not weighty enough to
 instances. If present in the proportion of \(\frac{1}{20}\), deadly poison to vegetables, withering the leaves and ultimately
deatroying life altogether. The effects of this gas will be
familiar to most of our readers from the long and expensive famil
trials
\(\ddagger\)
\(\ddagger\)
chloroform will be fonnd in the laster place only, as its effecte on
vegetable life vegetable
appeared.
about it; but let me first premise that I have always
been a great lover of the Plane, and I may add of all been a great lover of the Plane, and I may add of all
other trees, for they seem to me when old and grand in other trees, for they seem to me when old and grand in
their proportions God's temples; and I shall never forget my feelings of admiration and devotion when standing-many years ago-directly under the Pan-
shanger Oak in this county. To look up at its magnificent branches and their aumirable disposition seeme to be looking at Divine architecture. Some 30 year since-it may be nearly \(40-\mathrm{I}\) remember being much grandfather; of them was called the Occidental Plane the other the Oriental. The former produced very large leaves, but slightly lobed; it made tolerably vigorous shoots, but they always died back about half way or so in the winter and spring, and the young trees propagated from the stools by layers (this sort would not grow from cuttings) were consequently stumpy and unsightly ; still its foliage was so grand that it became difficult to cultivate with success. I was, somehow or another, impressed with the idea that this must be th true American Plane, but when I went to the London nurseries ( \(I\), then a country youth, thought them grand authorities, I found quite a different variety under the name of Platanus occidentalis, and I was of course in a pucker of uncertainty. On applying to Loudon he so I thought I ought to be in the wrong, but I felt I wa not; I therefore wrote to the United States for some seed of their Buttonwood or wild Plane tree of trees from it, received sound them, raised some young identical with the Occidental Plane of my grandfather I forget if I ever told Loudon the result of my experiment but I bave since then always felt convineed the the Ocidenal Pla the enviral lo mosi distinct species. I do not remember the "thicl mosi distinet species. I do not remember the "thick down " on its leaves, and I most deeply regret havin
relaxed in my attachment, neglected, and lost it ; but relaxed in my attachment, neglected, and lost it ; but will (D. V.) procure some young trees from one of my
American friends, and put the question at rest. With respect to the so-called "riental Plane alluded to above \(I\) have since found it to be the Platanus orientalis acerifolia of Loudon. I have received it from France a Platanus macrophylla. This is a most hardy and vigorous growing tree, its leaves are not so deeply so than those of the true Occidental species. some sonis, and grows believe that this variety has given seeds in France where it seems to be cultivated largely; in some of the Frencl catalogues I find it under the names "Platane and as Platanes, d'tatinised into Platanus macrophylla, received thence what appear to me to be throe seedling rarieties of it, viz, \(P\), palmata, \(P\). palmata superba, with large leaves very deeply cut, and P. pyramidalis. These rapidly form large healthy trees; the latter in particular is the hardiest of all, and when young is very fastigiate becoming more diffuse in its habit as it increases in age but not spreading at all to the extent of P. acerifolia. I will, I think, form by far the finest tree of all, and grow well in soils unfavourable even to the P . acerifolia. may as well say why I think the latter and its seminal Planes : they distinct from the Occidental and Oriental than those two distinct species, they all grow freel from cuttings, whereas scarcely one cutting in a hundred of the Occidental (my Occidental) and Oriental Planes will strike root; the varieties 1 have named seem to fore, the latter the P. vulgaris of Spach, a tree from the south of Europe, and a distinct species? As far a my limited observatious have gone it is not \(P\). occiden "P. hispanica?" under which name I find it in a French catalogue. Some tree lover who has lately travelled in Spain will perhaps be able to farnish infor mation about this very interesting tree. Permit me to T. R., Herts.
healthy young specimen of this beautiful hothous climber was planted in a quantity of loose soil beneath the north side platform of a large Orchid and Fernhouse here, and trained through the narrow space between the platform and the wall, and then up the roof rafter. During the first eight months it gained considerable strength, exhibiting two or three showy flower-spikes, and progressed in growth during the season of 1855 , until by midsummer it had covered the ratter to the extent of 10 or 12 feet. Having then to all appearance arrived at maturity between the above to 150 flower-stems, which, as the winter advanced, suffered a partial check by the lower degree of tem perature adopted in favour of the Orchids; and though its parti-coloured, drooping, thyrse-like bunches of bloom, gracefully depending from the roof, were objects of general admiration, it was not until the increase of light with the opening of the new year that its ex rich brown erimson, began to assume their florid tints and at the present time the plant is daily increasing in hajered or cut for cuttings; it in a nurseryman's term, anots act
ornamental effect
There is probably no other plan than this, producing as it does racemes of flowers as wonderful for their long-continued and progressive
development as for their almost unequalled brilliancy of colour and duration of bloom, extending as they do throunhout the greater part of the year, gay as the gayest in summer, and without Some idea of the interest attached to the continued expansion of bloom from the leugthening flower stems rom able influences they will even reach the almost in credible length of 3 feet! \(H\). lutea has also expanded bright yellow blossoms, still larger than those of the species now described, and gives great promise of being fore henceforth be regarded as two of the most valuable second.class hothouse climbers yet introduced to our col lections, being equally adapted for pot culture upon artistic wire-work or upon ornamental pillars, or for
roof rafters for obtaining a prolonged bloom where good roof rafters for obtaining a prolonged bloom where good exposure to light and suitable temperature
ensured. Wood, Backhouse's Nursery, York.
Discoloured Granite.-We have here a terrace and hower garden surrounded with white granite, which during the few years it has been in use has remained quite cleau and white ; but some parts of it 1 am sorry號 employer. Can any of your correspondenis inform me how to restore it and prevent this discolouration? J. M.
Arum italicum.-The notice of this plant (see p. 71 b ), is incomplete in consequence of the omission of the date o Mr Hambrough's note. "It is now in full fruit," The statement was taken from a printed report of Pro[The statement was taken from a printed report of
ceedings of the Botanical Society of Edinburgh.]
Californian Woodpeckers.-I really cannot swallow Mr. Murray's account of the woodpeckers and acorns Woodpeckers do not feed on acorns. The long and supple tongues of these birds are not formed by nature to en very straight and ill adapted to gulp an acorn. Woodpeckers only attack unsound bark, already in a state of decay; and in it the woodpeckers find plenty of vermin
which form theirnatural and usual food. The wood peckers could never bore the holes with an acorn in their their bills are invariably closed in the first instance, and orm a kind of axe in appearance. This being the case, where had they the acorns in the meantime. Did the ohserver see them apply to an Oak tree for a supply, or and then convey them to the hole prepared in the bark It must have been for pastime-not for a provision of food. As woodpeckers are not gregarious, I cannot for the life of me conceive how they managed to assemble certainly feed on soft and pulpy fruits-Peaches to wit. Were I to hazard a conjecture, I should presume that some individuals of the pie tribe had been engaged
amongst the acorns. In this case the bill would have been suited to the food, and the food to the bill. Charles Waterton, Walton Hall, near Wakefield.
Trces for the Sea Coast.-I want a list of a few of tase frees and shrubs which are best calculated for canding great exposure to wind and a saline atmoornamental trees and shrubs, aud principally with evergreens, a steep bank running down to the sea beach, in the neighbourhood of Dover, greatly exposed to wind and storm, and the soil of which is light, sandy, and riable, with small pieces of rocix. Quercus. [The best answer we can give is the following list of trees and sea at St. Leonard's. Among them are Rhododendron ponticum, Aucuba, Arbutus, Sweetbay, Hydrangea, ponticum, Aatifolium,Yew, Leycesteria, Fuchsia, Sycamore Holly, Common and Portugal LaureJ, Spanish Chesnut Evergreen and Lucombe Oak, Mountain Ash, China Rose, Laburnum, Tamarisk, English and Turkey Oak, Elm, Pontic Azales, White Poplar, Laurustinus, Medicago arborea, Atriplex Halimus, Lavatera arbora, Cotoneaster, Erica arborea, all in perfect health.
Rain Fall and Drainage-Drainage and Capillary Attraction.-Two correspondents under the above sepa venture to suage and As to min-fall and drainage reference to the table of rain-fall from 1841 to 1855 neclusive in your Paper, January t, 1856, will show the lase is noting extraordinary in the rain-fall o inch above the ars gives the largest fall in the 15 years, and on the four years 4 inches above the average. The truth of serages is quite wonderful, whether we take the barometer, thermometer, or rain-guage ; so much so,
that having ascertained the mean variation for 20 years, taking 12 months, the majority of these months will be within the limit of that variation. There is no reason to believe that land drainage has any effect on rain-fall. After all, the evaporation from the earth is not very the earth is continually giving off vapour in those seasons when there is the greatest evaporation. The air will only take up a certain amount of moisthre, and to give it off. But if this be doubted, whence do our
great rains come from, and where do they descen most copiously ?-from the \(S\). W. and near the sea, or
on the higher lands? What makes the rain-fall in the on the higher lands? What makes the rain-fall in th east of England less than the west? Is it not that the easterly winds bring less rain, and that the sooth. western rains have expended themselves before they
reach the eastern parts? I think it will be found the the easterly rains are heavier in the east thand in th west, and vice versa, and hence the mean rain-fall is in the centre of England. This, however, requires confirmation. But depend upon it that the averages wil ot be affected by drainage. The presence or removal rees may be a cause; it is said that since trees have been planted in Egypt rain always falls. As to the second question asked by Mr. Horsfall, as to capillar attraction (if what he says amounts to a question whic he wishes answered), namely, "Whether the power o apillary attraction varies under different circumstances of soil, external temperature, and as to the height to which it saturates the soil ?" from what he says above "that he had ascertained, by means of a spirit level, th xact height the water saturates by capillary attraction by measuring the distance between the surface of th water of the river Wharf and the strongly define line to which the moisture rises," I think that he has not taken the best way to settle the question. have often observed the line he speaks of; it he were think fine sor less charged with water to the surface; as a general rule soils will take and hold by capillary attraction one-third of their bul and one-fourth of their weight. As this water evaporated from the surface, any free water in the soil namely, that which would pass off by drainage, rises to supply the place of that evaporated (the line on the face of the liank is probably the point where the rapidity evaporation counterbalances the power or rapidity capillary attraction); if the face of the bank wet aheltered from evaporation it would probably allow the line to rise higher at that point. According to the theory of capiliary atraction, water rises in a tube or i he pores of the soil in an inverse ratio of their diamete Professor Lesine calculates that in gravel, coarse san Som or clay, if in the first the gravel were divided int spaces of \(\mathrm{y}^{\frac{1}{0}}\) of an inch, the water would ascend for inches; in coarse sand, \(\overline{\text { sū }}\) of an incil, 16 inches; I Iom so drawn up is only parted with by evaporation. The Professor gives us \(25 \frac{1}{3}\) feet; I believe there is no limi in clays, except under the action of evaporation. This is of course mainly ruled by the temperature, as the surface dries ; the subsoil parts with its free water first, and then in a certain ratio with that which it holds by capillary attraction, and only in a certain ratio, belo the point of direct evaporation, so that below that poin the soil is only partially dried. J. C. Clutterbuch

Pelling Beech.-At p. 70 it is stated that a lande proprietor has tried the experiment of felling Beech the summer; and that a beam he put up in an ottage in 1830 is as fresh and sound as if just put up The Beech is the indigenous tree of the Cotswolds, an
if the above statement can be confided in (as not bein if the above statement can be confided in (as not bein this country. I would, therefore, beg of "Y. Z." favour where details, e.g., size of tree ? whi country ? was the beam laid in a pond, or prepared in an way ? is he aware of any other similar trial, and wit what result? Here we lay a Beech plank in water for ins, and then it answers floors. I have a back staircase of Beech, put up abou 2 years since, but the wood was well pickled, and this than Battic timber. I, however, them available for in-doors work, the advantage will b great indeed to myself and others. Cotswoldianus.
Peas.-About four years ago I procured a variety of Pes, the name of which was Dutch Emperor, an whose pods when eaten young were highly esteemed. have since searched many seed catalogues, but can fin nurnish me with some particulars respecting it. T. \(M\) Booth, \(P_{\text {ervy, }} \boldsymbol{Y}\) orkshire. [They are Sugar Peas, an may bo had of any great seedsman.]
Winter Covering.-As it is admitted that gardeners generally require some kind of waterproof covering for the protection of plants in', pits, frames, houses, \&cc., in winter permit me to direct attention to Mr. Lancaster"s "Lig num Textile," an example of which was exhibited at week, and after a dis sosion of two hours' duration on the subject, it was admitted by all present to be desirable and useful article. The model submitted for inspection was a "pit," for the covering of which severa modes wert a across the centre, where there was a lap enabling the covering to be drawn off at back and front; a third divided from back to front, and likewise supplied with lap. The material itself is woven wood or venee dressed with some waterproof composition which, afte being passed between heary rollers, and exposed to tha atmosphere, is said to become nearly as hard as meta This material is also intended for the purposes. roofing, \&c. \&c. W. G. Tumer, the Rookery Gardens Streatham. [When we saw this material some month since we thought it promised to be very useful.]
how this, as has been stated, can be attributable in th majority of casees to noismanagement, but I amm
opinion that when once it is discernabie, strong menaure
should be adopted for its removal. It appears from my
own experienee, and from that of previous writers in the own experience, and from that of previous writers in the
Chronicle, that this so-called disease manifests itself in Chronicle, that this socalled disease manifestsitser in
various forme, for instance Mr. Bailey of Nuneham in various forma, for instance sir. Bailey of Nuneham in
the early part of last season complains of an unheal hy the early part of last season complains or an unhealthy
root action, producing knotted protuberancee, and otherwise engendering in the plant a weakly, debilitated coustitution. "T. R." (see page e 55 ) observes that the
diseased plant exudes a glutinous juice or gum, both diseased plant exudes a glatinous juice or gum, both
from the plant and fruit, the parts affected turning black, and the leaves exhibiting yellow spots. Now my chief cause of complaint has been mildew, irremovable from the plant affeeted, even' under the most vigilant and careful treatment. Four years ago come Midsummer, Ifirst observed it on plants of the Vietory of Bath variety, and some others I do not now remember. Timmediat spplying quantities of eulphur ; this checked but did not remove the disease. I then cut the plants close in, gradually commencing morer liberal treatment, which as before. On perceiving this I cleared away every vestige of mildewed Cucumber from the frame yard, in
doing which I found but oue case of diseased root action, as described above, the remainder being perfectly sound and healthy. In a frame adjoining the
rest I
had started on the first indication of mildew some strong plants of Cuthill's Black Spine, a most useful and hardy kind (when obtained true) ; this from its robust habit seemed to resist the disease, a following spring started two frames with Tord Kenyon's Favourite and Cuthill's Black Spine. As soon as the former variety came into bearing, the same traces of mildew exhibited themeelves. I directly cleared away the plants (being careful then, as at all times, to have fresh hoil), and confined myself during the season
to the Black Spine, which produced exaellent erops, and quite resisted the disease. Since that time I have principally grown the Black Spine, bat last year I tried three or four other sorts including Lord Kenyon's, but
fortuastely enough without being troubled with the slightest trace of mildew. Joinn Coulddey, Gardener, Hardenhuisth.
Bees.-As a student and historian of the honey-bee Huber was an enthusiast. He produced a book which has been much read and admired. In writing it he was honest, though frequently in error, doubtless from his trusting to the evidence of his assistants, on whose eyes he had to depend, for his own sight was very imperfect. being correct than you, because you have only your own eyes to depend on, whereas I take the mean of many witnesses. This surely is enough to make a thoughtful man heaitate before he credits all that Huber says. His tale is told in such a straightforward and trath-like way
that it is hardly possible to disbelieve it ; hence the currency of his exrors. On this occasion I will notice one He says, that in some hives "there are found some working bees that lay eggs;" and he tells us what they are like in his wonderful story about them. modern bee books tell the same story. Let me say emphatically that there never was a fertile working bee; 'land to drive Huber's delusion away, let us ask any of 'his disciples to produce an egg laid by her. The queen is the only female, and when sle is removed from her absencegg are laid; and none ever will be laid in
horking bees are neither male nor female; they do all the work, build the combs, gather the honey, foster and feed the young, and pay supreme homage to their queen. And when she, by reason of age, becomes useless, they dethrone her ; but before they do this they put an egg in a royal cell, which when hatched takes her place. A. \(P\)

\section*{Datieties.}

Horticultoral, Feb. 5.-A Special General Meeting was this day convened for the following purposes:-To consider the suggestions made to the Fellows by the Council in their circular letter dated December 24th, 1855 ; and to authorise the termination of the tenancy of the Garden at Chiswick.
The Marquess of Salisbury took the chair. Among the Fellows present were the Duke of Northumberland, the
Earls Grey and Ilchester, Lord Downes, the Hon. W Earls Grey and Ilchester, Lord Downes, the Hon. W. Hooker, Sir John Duer Mr. John Wood, the Rev. L. Vernon-Harcourt, Mr. S. H. Godson, Mr. C. W. Strickland, \&ce., \&c.

The Vice-Secretary read a report from the Council, explaining the circumstances which led to the meeting haviog been sumnoned, and the views of the Council as to the mode of carrying on the Society in future. (The most material parts of this have already been given in the circular letters from the Council published in our volume for last year pp. 709 and 853.) Among the uditions were the following paragraphs:-
"The Garden had been the graat scene of the labours of the Society ; it was there and through it that the utility of the Society had been demonstrated to the whole world ; it was the field in which it had gained a reputation that was acknowledged wherever the name of horticulture was known ; and moreover it was the place upon which what may be almost called the affection of a large body of its Fellows had been fixed. That such a place shou!d be relinquished was a conclusion to Which nothing but the most imperious necessity could to exist, and it is in part for the purpose of obtaining the
authority of the Society to make so great a sacritice, or propose, that this meeting is convened."

Adverting to the suggestions they had formerly made upon these went on to say that-" The Council feel that upon these points some difference of opinion must be
expected to prevail. In circumstances so difficult as those of the Society it could scarcely be otherwise. The Council do not cling to their own sugrestions. The pro posals they have made are the best which had occurred to themselves or been suggested by others at the date of
their circular of December 24. Should different views not inconsistent with the financial safety of the corpo ration, meet with the approval of the present meeting, the Council will do what lies with them to give them the Cou
effect,"
Earl

Earl Grey moved that the Council be authorised to terminate the tenancy of the Garden at Chiswick as soon as the lease will permit, and to sell the property W. F. Strangways, Mr. Godson moved as an amendment that a committee be appointed to investigate the whole of the accounts and consider what is best to be done as to the continuance of the Society. Mr. Henry
Bohn, one of the auditors, seconded the motion. After some conversation, the Duke of Northumberland offered, on the part of the Council, to make room at once for a certain number of Fellows to be selected by the meeting, a corresponding number of the present mem bers of Council retiring. The wish of the meeting, of a committee, Lord Grey withdrew his motion, and the amendment was carried. The committee was then appointed and the meeting adjourned, after passing a vote of thanks to the noble chairman.

Linnean, Jan. 15.-Prof. Bell, President, in the
chair. N. H. Mason, Esq., J. R. Mummery, Esq., and chair. N. H. Mason, Esq., J. R. Mummery, Esq., and
R. J. Shuttleworth, Esq., were elected Fellows. W. W. Saunders, Esq., exhibited several vegetable substances collected by Mr. R. W. Plant in Natal, and made some observations on them. One was evidently the fruit of some Euphorbiaceous plant, and of these it was stated that the husk contained a large proportion of tannin, whilst the seeds yielded a pure oil in considerable quantity. The Rev. C. A. Johns exhibited a drawing and a specimen in spirit of Sphraria militaris, found by him in June last growing upon a chrysalis among dead leaves in Buckleigh Vale, Devon. Mr. W. Matchwick exhibited Specimens of the fruit and tracings of the leaf of Paulownia imperialis, gathered by him on the 18 th ult, in the neighbourhood of the Champs Elysées, Paris, where the fruit had ripened in the open air, on a tree about 20 feet high. The following papers ""ere read:the notice of a species of Mason Wasp, by Dr. G. Buist, in the Proceedings of the Society for June 20th, 1854, by Mr. E. Newman." 3. "A Catalogue of the Dipterous by F. Walker, Esq., with some prefatory observations by W. W. Saunders, Esq.

\section*{, Rotites of 3300Ks}

The Natural History of Pliny. Translated, with copious notes and illustrations, by the late John
Bostock, M.D. F.R.S., and H.T. Riley, Esq., B.A. Vols. 1-4. 12mo. Bohn.
This wonderful record of the state of natural science in the reigns of Nero and Vespasian has hitherto been little less than a sealed book to the English reader. We have had indeed Holland's crabbed translation, which of this country had produced nothing which could really be said to make the great Pliny known to the really be said to make the great Piny known to the
unlearned reader, until Mr. Bohn included his work in unlearned reader, until Mr. Bohn included his the more to be regretted, not only because of the intrinsic importance of Pliny's Natural History, but because its style is not such as every classical reader can understand ; so unusual are the words in many cases, so technical the language, and so brief the descriptions. Like Virgil's Georgics, it requires a reader to be familiar with country work and natural history, as well as Latin, if it is to be really comprehended. Most especially it is necessary to be acquainted with modern commentators if the old and forgotten namess employed by What, for example, did he mean by Philanthropos, Castor, What, for example, did he mean loy Phinanthropos, Castor, About such matters lexicographers and critics are often so greatly at variance that it is impossible for the reader to judge between them.

The late Dr. Bostock, by whom this translation was commenced, was well fitted for the task ; learned, careful, industrious, in direct communication with naturaliste, and having himself a considerable knowledge of natural science, he brought an unusual combination of attainments to his task. This is not said for the purpose of drawing an unfavourable comparison with Mr. Riley who succeeded him, but as an act of justice to a departed friend who was esteemed by all who knew him. On the contrary, in our judgment the whole of the translation which has yet appeared evinces the existence of qualities of the same kind, with the exception perhaps of natural history. At least it is evident that in what concerns plants Fée is taken as sufficient authority,
and not without reason. There is a singular indication of an unacquaintance with plants on the part of the truns-
lator in vol. iv. p. 464 , where we are informed in a footnote that the fruit of Delphinium Staphisagria "is of black brown colour, about the size of a Kidney Beans" Pliny's own account is nearer the truth; for he merely says that the follicles contain a nucleum triangulum using indeed the singular for the plural number, but correctly describing the triangular seed of the Common Stavesacre.

We are not however inclined to point out blemishes in a task so difficult of execution, and so useful to even believe that the worl of translation is well done throughout, as it certainly is most conscientiously.
The sterling information to be obtained in this great work can never lose its value, much as it is mixed with superstition and error. In Pliny there was united, to use the words of one of his commentators (Sprengel), "acre ingenium, studium incredibile, summa vigilantia." The work before us is said to have been compiled from two thousand Greek and Roman volumes ; and consists of 37 books, those from the 12 th to the 27 th being occupied with the history of herbs, trees, corn plants, and the whole routine of country affairs, or as it has been called Res rustica. One cannot open a page without meeting with something to amuse, if not instruct. Take for example what he says of the Plane tree, concerning which such interesting questions were last week raised by Sir WiHiam Hooker.

The first Plane-trees that were spoken of in terms of high admiration were those which adorned the walks of the Academy at Athens-[in one of which] the roots extended a diatance of 33 cubits, and spread far beyond its branches. At the present day, there is a very famous Plane in Lycia, situate in close proximity to a fountain of the most refreshing coolness; standing near the road, with the cavity in its interior, it forms a species of house 81 feet in width. Its summit, too, presents the foliage of a grove, while it shields itself with huge branches, each of which would equal an ordinary tree in size, as it throws its lengthened shade across the fields. In addition to this, that nothing may be wanting \(t_{0}\) its exact resemblance to a grotto, there is a circle of seats within, formed of stone, intermingled with pumice overgrown with moss. This tree was looked upon as so worthy of remark, that Licinius Mucianus, who was three times consul, and recently the legatus of that province, thought it a circumstance deserving of transmission even to posterity, that he, together with 18 persons of his retinue, had sat down to material for their couches in the greatest abundance, while he himself, sheltered from every gust of wind, and trying in vain to hear the pattering of the rain on the leaves, took his meal there, and enjoyed himself more than he would have done amid the resplendence of marble, a multiplicity of paintings, and beneath a ceiling refiulgent with gold.
"Another curious instance, again, was that afforded in the reign of the Emperor Caius. That prince was so struck with admiration on seeing a Plane in the territory of Veliternum, which presented floor after floor, like those of the several stories of a house, by means of broad benches loosely laid from branch to branch, that he held a banquet in it-himself adding very materially to the shade it threw-the triclinium being formed for to this singular dining-room he gave the name of his "nest."

This may serve, for those who are unacquainted with this old anthor, at once as an example of Pliny's atyle and of Mr. Riley's translation.

We ought to have noticed sooner a very useful volume published by Mr. McIntosh and Dr. Kemp, under the name of the British Year Book for the Country (12mo, Longmans). It is a rich repertory of matters Agricultural, Horticultural, Floricultural, and Arboricultural, culled from the periodicals of the last year, or written expressly for the work. When two authors of such acknowledge ability combine to produce a book the what hioh standard . and we do think the public what high standard, and we do not thill only hint that will here be disappointed. We woald only hint that more caution might have been advantageous in endorsing by Dr. Hassall, and everywhere now regarded with suspicion.

Crarden Memoranda.
Abney Hall, Chradle, near Mancherter.-This is the seat of James Watts, Esq., who has built here a princely mansion, and formed gardens worthy of it. The latter were, we understand, designed and laid out in the first instance by Mr. Skirving of Liverpool,
but they were afterwards greatly altered by Mr. but they were afterwards greatly altered by Mr.
Bigland of Manchester, and Mr. Barron has the Bigland of Manchester, and Mr. Barron has the place, viz., an avenue of Junipers, which, as seen from the main entrance of the mansion and the windows of some of the priscipal rooms, is a striking feature and well worth whatever it may have cost and as the Junipers-large handsome plant-some 10 or 12 feet high, were bronght from Elvaston in nearly their present state as to size, the expense must have been something very considerable. The conservatory is an exceedingly handeome structare, forming as it were part of the eonth side of the mansion, and so from a pieture gallery which adjoing it on the north
side; its inmates can also be seeu to advantage trom
many parts of the ground floor, and we know of no instance where the show house for plants is so efficiently and unobtrusively connected with the dwelling-house, and when lighted up at night and thrown open to the drawing-room the effect must be charming. But alchough it is so well situated, and altogether so excellently arravged, it is unfortunately ill adapted for plants, owing to the want of proper means of ventilation. The south fronts, which rise one above the other after the manner of the Crystal Palace, are altogether some 20 feet in height, and are glazed with large squares of plate glass; the roofs are ridge and furrow, and are glazed with large panes of sheet glass, and with the exception of the entrance doors and small openings in each end communicating with chimneys, no further ment, together with the heating, was entrusted to the late Mr. Sylvester, who was employed to warm the mansion. He appears to have depended on obtaining a sufficient supply of fresh air from gratings in the raised edges of the beds just above the floor, and communicating with a shaft at a considerable distance from the house; but this is found, as might have been expected, useless or nearly so in summer; for the aix in the tunnel or shafts under the house being colder than that in the house, is not likely to ascend to displace heated aix. Notwithstanding this disadvantage, however, this house is always kept extremely gay with plants in bloom which are brought from houses in the kitchen garden, and as it is found difficult to preserve even the climbers on pillars, \&c., in health for any it could be furnished with plants the only way in which the present time this house is gay with the various the present time this house is gay with the various
plants which bloom at this season, such as Camelhigh, and nearly as much through ; Daphnes in large numbers, Correas, Erica hicmalis in quantity, E. seabriuscula in the form of a large specimen which has made shoots some 2 feet 6 iuches long covered with bloom, and when seen in this state it is a really handsome plant, notwithstanding the smallness gay looking Sericographis was also here in quantity, and also the brilliant Euphorbia jacquinifiora, forced Indian, and other Azaleas, and some of the early flowering hybrid Rhododendrons, which are first-rate into bloom, and their flowers last a long time. Placed amonest the specimen plants we also noticed quantities of variegated Geraniums, such as Flower of the Day, Golden Chain, \&e, which had been taken out of the flower garden in autumn, potted, and placed in heat until they got covered with healthy foliage, and then removed here to serve as filling up plants; and they certainly have a very dressy appearance as seen under the large plant=, and appear to stand well where very few things could be placed with safety. There is a pair of Acacia decurrens planted out in the beds, one on and made to form a circle under the roof, which were loaded with bloom. This is certainly a magnificent plant for situations like this, where it can be afforded plenty of space and light. The delightfully fragrant Luculis gratissims was also in good condition, but L. Pinciana is found here as elsewhere to be difficult to get to bloom. In front of the conservatory is a broad terrace from which the ornamental ground is reached by means of a fight of steps. The flower garden or parterre is in the form of an ohlong square divided in the middle by the flower teds, which in summer and autumn are gay with Verbenas, vellow Calceolarias, Ageratums, Golden Chain, Flower of the Day, and other Geraniums, varied by such plants in the centres of the circles as Golden and Irish Yews, Junipers, and things of that sort, which serve to break that samenegs of expression which must unavoidably have prevailed had low growing plants wholly been employed. The lawn extends a small stream runs throngh it, which is made to fall over a cleverly executed piece of rockwork, which can be seen from all the windows in the south front of the house. On the west side the grounds slope gracefully from the terrace down to a sheet of water in a hollow, and altogether the laying out of the place reflects great credit Wats those win have had the management of it. Mr. effect from planting small plants; but has enriched his grounds by a great number of Conifers, many of them handsome specimens from Elvaston. Among these the last one or two severe winters have caused some losses : but still there are many fine planis left, more especially an Araucaria on the west terrace, two Picea Pinsapo, some Deodars, Pinus Cem-
bra and excelsa, Irish Yews, and the Chinese Junipers already mentioned. It may be worthy of notice that an Araucaria planted on the low grounds near the brook has been very much cut up by the winters, while another planted on high ground has been lut little injuced although in an exposed situation-a fact which may the hardibood of which there is doubt on elevated positions.

In the kitchen garden there is a considerable extent of glass, both for fruit foreing and growing plants, all of Which is heated with hot water. Some of the planthouses buit under the superintendence of the present
intelligent gardener, Mr. Smith, are admirable roomy
structures, in fact, just what are required for growing
large specimen plants in to supply a conservatory. large specimen plants in to supply a conservatory.
Here were Azaleas, Heaths, Epacrises, Boronias, and other plants of that kind, all in the finest possible health, and many of them large in size. There is also a gond collection of stove plants. The whole of the garden, both indoors and out, exhibited the best of keeping ; every part was scrupulously clean and neat-- i tion of plants is lost unless this is attended to

\section*{Calendar of Operations.}

\section*{(For the ensuing week.)}

Conservatory, \&c.- Pursue the directions in regar to temperature, \&c., laid down in previous calendars. Climbers may be looked over, and if an early display of their beauties is required some of the irregular wood may be pruned away forthwith. Passion flowers and others may receive this treatment; but permanen plants, as Acacias, \&c., will of course point out of themand freq exception. At present frequent infroduction here, and of convals must be the order of the day change in the threlone require at this time abundance of water, and keep a sharp eye to Heaths, Epacrises, and other things that are liable to get pot-bound. Srove.-Let al increase of heat take place on bright days, chiefly early in the afternoon; and then accompanied by
a somewhat moist air. Get a batch of Gloxinia a somewhat moist air. Get a batch of Gloxinias charcoal, and sand for compost in a fibrous state stove cimbers on trellises in pots or tubs that require to be shifted soon, should be cut in previously to plump buds preparatory to disrooting or shifting. Attend to shifting Amaryllises where requisite; as soon as they house and give them a little water, increasing
gradually as leaves unfold themselves. Orehids cumnencing growth should be immediately attended to keep them at the warmest end of the house and beware of drip lodging in the young bud. Some of the large specimens that require slifting and that are very dry a day or two previous to shifting. Coid Pits on Frames. - Some calculation should now be male as to how far the inmates of these structures will be able to supply the masses in the
fower garden. Frost and damp will doubtless have reduced the numbers of some hinds.

> FORCING DEPARTMENT Proceed steadily ; if pits ar

Pinery.-Proceed steadily ; if pits are at liberty and July provided with a permanent bottom heat of \(80^{\circ}\), it
would be a good plan to shift a portion of the stock into fruiting pots, in the expectation of either producing very late or very early fruit. Where a constant succession is required, we take it for granted that the final removal into the fruiting pots slould take place successively also, as doubtless this influences in a con siderable degree the period of fruiting. The young plants, tno, that have thoroughly filled their pots, at leas already stated there is pit room at command. Like many other plants an early growth with a long summer before them is important, In all operations of potting use turfy loam, and the rougher the better the plant will like it. Vinery.- Proceed as before recommended lessen the atmospheric moisture where the Vines are i blossom, and dispense altogether with syringing for while. Allow plenty of dry heat with a lively circulation of air. Peach-house. - Continue to make slow advances with heat on bright days. Cucumbers and Melons. Make a successional sowing of each of these for early sowing muy be , anted in large 5 , boxes an placed in a light part of any house in which there is a heat of \(70^{\circ}\) or thereabouts, aud a moist growniust be kept thoroughly clean ; the importance of this in early forcing can scarcely be overrated. Let all covering material be hung on rails to keep it free from dirt. Keep at all times a good stock of fermenting dung and leaves ready for making new beds or liniogs Where there is much forcing these should be mixed weekly at this period

HWER CARDCY AND SURCBBERIES
Continue to mahe the necessary preparations fo clumps or masses by sweetening or renewing the soil Plant out things of biennial character in mass? requisite; in borders the rearrangement of perennials
had hetter stand over till the latter beg/ to bui in March. Lose no time in finishing the planting of trees or shrubs.

Sow Tomatoes in heden AND ORCHARD Get hand-glasses ready for Cauliflowers in pots am, \&c, the stations very much, adding tresh loam if at hand. Turn out lour strong plants from the pots-one at each angle; they should be well sonked with weak liquid next year's furcing on trenched rich ground Plant Box edging where required, and thoroughly drain any portion of the garden which exhitits the least appearance of stagnation. Where water is apt to stand on the surface through the puddling properties of heavy rains, try to imple by a dr or lime rubbish, charcoal dast, \&ce. Plant Horseradish, if not already done; trench it in deeply, placing manure
at the bottom of the trench. Get all Iruit trees planted as sonn as possible and stake and mulch. Remember
to drain thoroughly. Nowhere is this adviee mor to drain thoroughly. Nowhere is this adviee more Pearsary than in the orchard ; although Apples and Pears are fond of stiff soils they will never prove profit. all old or overborne trees; many of this character may be improved by applying manure to the extremities of their roots, and also by good top-dressings which should always be applied the moment the leaf begins to fall in autumn.

COTTAGER'S GARDEN.
If not aiready done a few Broad Beans may now be own, and also a few Peas, and do not forget a sprinl: ling of Radish among the Early Carrots, in fact with most broadcast crops a sprinkling of Radish or Lettuce may be put in through the spring. The ThousandWeaded Cabbage is a valuable green fur the coltager. the quantity and earliness of them were surprising. The proprietor stated that it was quite as hardy as Kale. His plan is to have two or three seed beds; suy one in February, another in March, and a third in April. From these he fills every inch of spare ground through the summer, which is not wanted for other crops, and thus he has always a good supply when wanted. A little Spinach may also now be sown and some Mustard and Cress in a warm corner. Pland out a few Red Cabbages for pickling.

\section*{}

\author{
SATURDAY, FEBRUARY 9, 1856.
}

The simply descriptive style, with its substantial and sometimes heavy matter of fact, has hitherto so generally characterised the Journal of the English Agricultural Society that one is almost startled on finding in it a paper written with all the force and brilliancy of a review article. Perhaps some of the strangeness presented by this paper to the accustomed reader of the Journal arises from its being addressed to the advocacy of a policy rather than to the description of a practice-an advocacy on national rather than on exclusively agricultural grounds-a policy, too, to which the English Agricultural Society has not hitherto committed itself.
The subject of agricultual sfatistics which Mr. Hoskyns has illustrated with such fullness and such freshness in the concluding article of the present issue of the Journal has, indeed, been hitherto ignored by the Society, or rather refused consideration by it as being beyond its scope. We are glad to hear it now, at length, by the voice of one of its editorial officers, speak so decidedly and so powerfully where formerly its silence, though unintentionally, we believe, was equivalent to opposition.
It is surely infinitely better that it should exhibit the vigour and the energy of youth in its proceedings, with generous confidence in the goodwill even of those who nuay differ from the views it may commend, notwithstanding these should lead it to the very verge of the field to which it is confined, rather than creep on in the road or rather ruts of precedent by which safety may be secured, but cnly at the expense of speed and usefulness.
Mr. Hoskyns commences with an allusion to the oft-quoted simile of the ship with its crew and cargo :-
"We are 'bound on a twelvemonth's voyage. We-consnmers
of earth's harvests-are the passengers, some the crew may it be
hoped, of such a ship; we touch at no half-way port, nor can we
horten the duration of our voyage. The great centre of light and heat, round which we travel, gives us but one harrest in th year-one opportunity of storin'; vir vess 1 for her trip: and thongh (to de-cend from the astronmical to the national) we are able to import trom other shores that suppleinent of our local defiency, which the worlu furmishes of corn can we so obtain eacept fur its rquivalent in some superadded labour of our own, which still must turn its wages into forrd, and so breome an appendix to the oripina derand upon the soil. In this reactive effect if imported food the British corn grower is presented with an annually widening
margin, an enlarying fiont, so to speak, of customers, whase imported supplies are the true measure of an excessive demand overtaking the produce of his own furrows; and such is, in fact the condition of husbandry in a country requiring to import, and able to pay for, a large amount of food beyond its own anuua
produce. produce.
"But what is that? Amongst all the strange questions that curiosity or business should still have left, to ask, in a country o Domesday-Bwok-the oldest record of land statistics, it is said in Europe, and of some of the earliest efforts ever nade by government to learn the produce of its barvests-what is mor strange than that we have gone on importing corn as well as few years, upon one of the most interesting, and, one should suppose, most primitive questions it is possible for a conntry to ask itself, and containing within itself the reply, to answerWhat, in quantity and kind, is the food produce of our own sumption, say of corn alone, of which the imported supplement gathered in every quarter of the globe from fields we did not sow, has now arrived at an annual average of nearly ten million of quarlers?

The national interest of such a question is shown by instances of very recent occurrence, to be made up of the personal bearings it possesses not only on consumers bat producers. The harvest of 1846 was sold, much of it under 508 a quarter, some of it over twice that sum-this being the result of ignorance, such as statistical information would have met: and this sudden rise in price took place after most of those who "thresh out their year's corn to pay last half-year's rent-that class whom the Mark Lane phraseology cruelly distinguishes as 'needy sellers "- the same class (for so unhappily it ever is who " cannot see what good agricultural statistics can ever do "-had turned their little stock into cash, and the cash over to their landlords."

The national and commercial interests affected by this ignorance are oxhibited by reference to th evidence of Mr. Lerone Levi before the Lords Committee. Its bearings upon the science of agricul ture are illustrated by adducing the instances in which large collections of facts have in other sciences resulted in the perception of the general laws whose force and jurisdiction it was the object of those sciences to define. No faith can ever be more fruitful or more wise than that which prompts to the record and accumulation of occurrences and facts. One listens in despair to those who refuse assistance in the collection of such facts on the ground of uselessness. It is not only unphilosophical but impossible to indicate beforehand the knowledge which those facts will furnish-but the history of all human knowledge hitherto proves most incontestably that "laws" are seen in facts when massed, which, though operating everywhere, are veiled in the individual instances. A knowledge of such laws is necessarily profitable, for they necessarily operate to the loss of those who ignorantly oppose them: let us then industriously gather the individual facts, assured that the laws of their occurrence will ultimately appear to the great benefit of those whose knowledge of them enables conduct in accordance with them.

All this is as true of the facts which make up agriculture as of those which make up every other art and science. But let Mr. Hosmyns state all this in his own characteristic manner:-
"Everything throughout creation is governed by 'law;' but over most of the tracts that come within the active experience of mankind, the governing hand lies so secret and remote that until very large numerical masses are brought under the eye at once, there is something attractively teautiful in appreciating mind Which laws of unhwerving regularity and resistless fory with Withdrawn from siew, masked behindan apparently inexhanstible variety, an independence and spontaneity of action, and a playfulness of 'accicent.' semmoly without control or bounds. It is and adminnstrative pown wive this indulgent feature of creative be lost to general sight in the success of the very illusion employed. The wholn wheabulary of those who talk of 'chance' and 'luck' attest the matchless lightmess and elasticity of gait Which disguise the majestic onward tread and movement of natural law. Statistics are the touchstone under which the illusion tates' at once, and exposes to view the latent law so skilfully held in solutiou. Gathering its facts together and employing them in masses, dealing with Nature wholesale and in the gross, meeting her upon a scale of magnitude, far indeed behind her own, that never would have disclosed themselves in forces out results

Descending from the general interests of science to the more professional aspect of such knowledge as complete statistics of British agriculture would supply, Mr. Hoskyns illustrates its advantages to the farmer by the parallel influence of similar knowledge in the money market and in commercial operations generally, but here we cannot follow him. A history and critique of the several attempts towards the collection of agricultural statistics are given, and the main facts are represented in the following diagrams:-

STATISTICAL DIAGRAM OF ENGLAND AND WALES.
Agricultural Distritution of the Soil of England and Wales, on the basis of the Returns from 11 Counties, made in 1854 (and shom

Un: accounteafor, 3,814,:108.

acres.
\end{tabular}\(\quad\) land Districts.

Is a n d s, 2, 703,360 a c res.

A similar diagram is given of Ireland, to which
we shall refer hereafter. \(\mathbf{W e}\) have already taken we shali refer hereafter. more than the space ordinarily devoted to a single paper in this journal, and must leave to our readers the task of collating and comparing the several items presented in these diagrams. Let his paper on the subject in detail. The statement regarding Scotland appear as facts-those regarding England are mere estimates founded on observations of a portion only of its extent
"As far as Scotland and Ireland are concerned, the task is has been furnished, which only requires fors its complanterevidence might aimost say for its true utilite-the
corresponding tark in England and Wales.
"It is a thing too mortitying to believe ti.

So concludes Mr. Hoskyns-a considerable por tion of his paper having been directed to a consideration of the impolicy of employing the Boards of Guardians in this work
Those who are interested in the subject of Agricultural Statistics will find in the paper we have been considering useful information, elegant illus tration, and as we believe sound argument-all the more likely to be influential for the intelligent agreeable, and vigorous manner in which the whole is presented.

In the year 1847 the then council of the Society of Arts felt that in the absence of a permanen museum of inventions, it would be beneficial to collect annually for public examination for a limited period as many specimens, models, drawings, and descriptions of recent inventions, whether patented, registered, or not as it was possible to obtain the loan of. Succeeding councils have taken the same view ; and in accordance with annual custom it is intended to open the eighth annual exhibition of inventions on Easter Monday, the 24th of March next. If any of our readers should propose to be a contributor it is necessary that he should com-
municate forthwith with the secretary of the Society, Adelphi, London, stating-
lst, the title of the invention.
2ndly, whether the article will be a specimen, model, or drawing.

The articles must be forwarded to the house of the Society on Tharsilay the Gth, Fiday the Tth,
or Saturilay the ith of March. All articles should be accompanied with a brief description of the invention, a wood block (where possible), and a reference to any publication where a fuller account may be found.
No charge whatever is made for space, and the We call the attention of our readers to this intimation because many of them must be in a position to further the objects of this annual exhibition at the
same time that they benefit themselves, by contributing objects for deposit during its continuance The Society of Arts is especially deserving such assistance of this kind as agriculturists can bestow, for it has during the past few years done its best to collect and pablish, by discussion on agricaltural subjects, information useful to the farmer. Among the subjects of last year and of the present session are those of Sewage manure, Steam culture, and Agricultural progress.
Inventions capable of illustration by plan and model, and capable of illustrating any of these subjects, ought to be represented at the forthcoming exhibition. Agricultural implement makers and inventors will, we hope, do their best to render it useful to those who may examine it for agricultural instruction.

\section*{THE DUTIES OF BAILIFFS}

THe sulject lately introduced through the medium of your columus has already proceeded futther than you probably contemplated. I will, however, take the opportunity of enclosing for your insertion a statement
of what at the time of publication, in 1822 , I considered the qualifications of a farm bailiff; bearing in mind, however, that in the acceptation of the word as I put it, a farm bailiff is a person employed by the owner to take the active management of a farm under the exactly of that description called by Marshall a bustler, to define him from the manager or bailiff, and is a very proper definition. Your correspondents, however, do not appear to have made this distinction, one nevertheestate or large occupation must be considered to be a man of education, of some practical ability, and fully aequainted with all the new principles of farming. Such a person would expeet to be paid for his services libepartments of manual labour. His business being that of direeting others, and seeing that the work of the farm is properly executed, the whole department of manage-
leing confided to him, it will be needless to expatiate at greater length upon his requirements, for whatever is combined in a first-class farmer would constitute in the one case he works upon his own capital, and in the second upon the capital of his employer

In the second description, and which is contemplated by the qualifications below, an active, intelligent vorking man is described who should be thoroughly conversant with the practice of every description of
farming work and management, who acting under his employer will not be expected to attend markets, or to
buy or sell corn or stock, but to devote lis whole and buy or sell corn or stock, but to devote his whole and
undivided attention to the daily routine of the farm management, the difficulty with such a person being in keeping himself in his proper place, not arbitrarily con ducting himself towards the workmen or mixing up and siding with them against the master so much complained of by Marshall, who states :-" July 18, 1774 Why? Because I suspected him of smuggling-beause he was unequal to the management of the farm He is hated by the men and despised by the neighbours. He has good hands, but a bad hesd-a crazy couch dangerous to lull upon-a good implement of husbandry (spoilt by being made into a bailiff), but a bad husband man."
This is Marshall's definition in 1774 of what his what a been-the reversing it in 1856 will show Qualifications bequibed in a Farying Bamuph-182a.
 He will endeavour to pay them fair wages, as the only sure moll
to have the work well perforned, and to encourage his labourer
to be honest. He will ascertain what is a fair price for labour
the piece, and give it, and so long as the workman does the work
properly, continue to give it. By lowering the price in conh-
sequence of their making good earnings he will by so doing check
 Wage weekly, they will always require a great price bor wel
work, which they will bo their dupplitity make him believe is
due for their ezertions when their labour is only half bestowed

\section*{Home Correspondence.}

Superphosphate of Lime.-In reply to Mr. Grady, I am not aware that I alluded to any other salts than those that enter into the composition of superphosphate I was alluding when I said "neutral and insoluble are one and the same thing." There are not only salts that are soluble and salts that are insoluble, there are salts that have different degrees of solubility which is dependent on the amount of alkali with which the acid is combined. These last mentioned salts are not to be found in superphosphate of lime; we have no other salts in superphosphate save the soluble and insoluble.
Many of the phosphates are soluble in water, but not phosphate of lime. All chemists of note support me in this view. Liebig says, "The earthy phosphates (of lime and magnesia) and iron are insoluble in water." Voelcker says, "It is insoluble in water." Other neutral phosphates are soluble in water, such for instance, as phosphate of ammonia, phosphate of potash and phosphate of soda. These salts are sometimes formed in the soil where lime is deficient, when soluble phosphate is applied Mr. Grady ought to be informed that when chemists speak of any substance being soluble or insoluble in water, they speak of water chemically pure, and not of water containing impurities and charged with carbonic acid-such as the rain water that comes in contact with our manures in the soil. Here, then, Mr. Grady has the key to unravel the difficulty that occurs to him when he says"If, then, neutral necessarily means insoluble, it is diffi" cult to tell how these bones exercise their influence," Hain-water being charged with carbonic acid and with other impurities, we must look to these foreign ingredients for its solvent action. Mr. Grady says-" Bat argument but that of Mr. Summers, as well as Baron

Lietig aud Mr. Lawes, un, the duetrine of super-
phosphate, for he says that superphosphate if soluble, added to the soil, meeting with carbonate of lime and sufficient moisture, becomes neutral, and therefore (according to ' X .'s' theory) useless, so that we would infer that all soiss contain sufficient carbonate then to make all soluble phosphates neutral. Why Mr. Grady is wrong. Does Mr. Grady suppose that any substance with powerful acid properties could enter the delicate organs of plants and cause beneficial effects? Our soils are not strainers, but chemical filters in which the pabulum of plants is prepared. Salts form and reform in the soil before they enter the spongeolets of the roots. Soluble phosphates may safely be applied even to a fallow without any fear of inss resulting from it. In this I am confirmed by Professor Way. It is clear that the superphosphate of lime, when it once becomes incorporated with and dissolved by the moisture of the soil, must meet with lime or other bases and be speedily neutralised. If, indeed, the value of this substance as a manure were in any measure dependent on its retaining its composition and remaining in this highly soluble condition in the soil, we could not expect to see its application productive of any good result on the ails which contain even a moderate quantity of lime, much less on those of the chalk and limestone districts. Professor Liebig, who suggested the use of his manure in the first edition of his "Chemistry of Agriculture," says, in speaking of this point :-"In"a fow seconds the free acids unite with the bases contained in the earth, and a neutral salt is formed in a very fine state of division." In some cases the neutralising bases may be potash or soda, and then an alkaline and highly soluble phosphate is formed, but the quantity of lime existing in most soils would tend to convert the soluble phosphate of lime wholly into neutral phos phate of the same base. If the view now taken be orrect, the sole advantage of adding sulphuric acid to any substance containing phosphate of lime is ao pro plants but which shall penetrate intimately a large portion of soil and there reproduce the phosphate in a state of the finest subdivision, and more perfectly distributed throughout the particles of earth than it could be by any mechanical process (Way) If we require what are the characteristic properties of the various phosphates occurring in nature as minerals, we shall find that they are all without exception insouble in water. It may justly excite our surprise that they are absorbed by plants, and our curiosity lained by That manner. This is however easila also by that of amnouia combined with the cartonic acid of the atmosphere, since we find that by the action of these substances upon the pbosphates of lime and magnesia (and these occur most frequently in nature), soluble phosphates and insoluble carbonates are formed. Thus, or example, when we bring the insoluble phosphate of lime into contact with the soluble carbo phe polass or carbonate of ammonia, theresult is the formation of in soluble carbonate of lime and soluble phosphate of potas or ammonia. A knowledge of this fact is of importance, as it gives us an insight into the action of bonedust when used as a manure (Petzholdt) ; also of superphosphat of lime. See what Kuhlmann says:-"In order fully to appreciate the effect of ammoniacal saits, it is neces sary to point out that they promote the entrance mineral salts into the plant. Phosphate of lime, phate phate of magnesia, and silica can, by the aid of Every Eree fro alkalies, and thus, under the influence of sola ree from alkalies, and hus, nder and heat, will decomposs sal and ammonia, by which means soluble balus the amme bonate of ammonia are produced. Hence the ammen not only the chief source of nitrogen for plants, but also the means of facilitating the entrance into the vegetable organism of those mineral saks which are absolutely indispensable to its growth. (Comptes Rendus.) When soluble phosphate is added to the soil it is carried downward by the first rain until it come into contact with lime, for which it has a great affinity it is arrested in its progress and forms a neutral sait in that fine state of subdivision in which it can be easily decomposed by the action of the salts of ammonia, chloride of sodium, and carbonic acid along with other salts. The phosphate of lime thus formed gradually forms 8 by the plants perhaps to be again changed in the living organism of the vegetable. Geo.summers, Ho sharm near Blandford.

The Suffolk System of Land Draining. -The method of under draining pursued in Suffolk and other parts of the adjoining counties differs widely from tha at present in vogue. It is cheap and therefore generall left to be performed by the tenants. It requires to be renewed periodically, and therefore would not ba sanctioned by the Inclosure Commissioners and thei inspectors in the case of a land-owner who wished to drain an eatate in this way and to charge the cost on the estate (sidence before the Lords' Committee on the improvement of land) Fortunatoly, however, in eongequence of the chsapness of the Suffolk method thig is not necessary. Its drains are about \(2 \frac{1}{2}\) feet deep, and therefore shallow compared with the universal depth pre scribed by our, druining authorities. On the other han Deanston commenced, and which he for some time
defended against the deeper drains of Parkes. It was
even more than hinted in the paper by the late
Mr. Pusey on this subject in the Journal of the Royal Agricultural Society, that it was the origin of the Deanston system. The Suffolk method is at vari snce with all the received canons of land draining, as expounded by our most celebrated authorities, and is supposed to be discarded by the most successful modern practice. Deeper drains I am told, however, have been tried in the district by men who came to the question anbiassed, and having tried these deeper drains having conduits laid with pipes have abandoned them, except under certain conditions, for the cheaper and old established Suffolk method. Are these practical men right or are they wrong! If right, why are they right? If wrong, why are they wrong? What are the conditions conditions of partial or of eneral occurser ? the some of our experienced land drainers and draining engineers will favour us with their views on these points. I am sure you will see the importance of these questions when I add that some of the most strenuous adherents to the Suffolk method of draining do not adopt it indiscriminately on the whole of their land, but on some portions of their farms use deeper drains laid with pipes in those situations which they consider to require them. What, I would ask, are these situations, and do they exist out of Suffolk? These are questions of considerable importance, on which some of your experienced practical and scientific drainers and draining engineers will enlighten us. \(E\). W.

Publicity of Old Patents, dcc.-It will afford those of your readers interested in patents great pleasure to hear that her Majesty"s Commissioners of Patents, imto the with the importance of agricult of Pated in a series all at present, have cof paten puble tho statute for "tilling and preparing land," "ploughs and ploughing," "harrowing, hoeing, and raking," "manurwill include all the drilling, aud planting." The series excitiog so lively an interest in the agricultural mind. Under the new statute nearly thirty specifications are printed and in the course of being so, bearing on steam printed and in the course of being so, the progress here is interesting:-3 being for culture. The progress here is interesting:-3 being for
\(1852 ; 5\) for \(1853 ; 7\) for 1854 , and 12 for 1855 . \(W\). \(B\).

\section*{Eacietity}

ROYAL AGRICULTURAL OF ENGLAND Monthly Council, Feb, 6: Colonel Challoneb, trustee, in the chair. Thirty-four new members were Finances,-Mr. Raymond Barker, chairman of the Finance Committee, presented the report on the the current easiety, from which it appeared that was 2671\%. He explained that this general balance included 1200 . received from Chelmsford as a subscription towards the reduction of the expenses of the Dociety's country meeting to be held at that place terly present year. He also laid on the table the quar brauches of the Society's income and expenditure assets and liabilities.

Honorary Member.-The Emperor of the French having graciously expressed his consent to the proposal Society, the following resolutions were carnied unani anously:-

On the motion of Mr. Erelyn Denison, M.P., secondec by Lord Berners:-"That his Imperial Majesty the Emperor
of the French be duly elected an Honorary Member of the
Roval Agricultural Society of 2. On the motion of Mr. Brandreth, seconded by Lord Fever
sham:-"That a Diploma of the societr, signed by the sham:-" That a Diploma of the Society, signed by the
President, and countersigned by the secretary, with the
Great Seal of the Sociest ate 3. On the motion of Mr. Thompson, seconded br Mr. Hosk the Society, appropriately bound, be forwarded to his Imperial Majesty, together with, be the Diplomated to his
manding Committees.-Reports were
Standing Commitees.-Reports were received from the chairmen of the standing committees of the Society stating how often their respective committees had met ad how many reports they had made to the Council.
Journal and Library.-Mr. Thompson, chairman of the Journal Committee, laid on the table a copy of the new part of the Journal (XVI., 2), and subinitted to ing, cataloguing, and completing the library of the Society. These euggestions were adopted.
Chemical Lectures,-Sir John V. B. Johastone, Bart., M.P., reported from the Chemical Committee the suggestion of an alteration in the arrangement of the lectures to be delivered this spring by Prof. Way, the consulting-chemist of the Society, and aznounced on the 4th of July last. The Council adopted this suggestion, and agreed to the following amended schedule:

\section*{1. On the influence of climate on the action \(o\) f
2. On tire compostion of land-drainage wate}

A zeview of the progress of chemical science with reference to agriculture at home and abroad.
Guano-Substitute Prize, - On the motion of Mr. Raymond Barker, seconded by Sir John V. P. Johnstone, Bart., M.P., it was carried: "That the period of the Society's liability for the offer of the guano-substitule prize shall terminate with the year 1856."
Chelmspord Merting.-Mr. Barnett, Vice-Chairman
the suggestion of the local authorities and of the Chelmsford Committee, that the period of the Society's county cown, should be fixed for the week commencing Monday the lith of July. He also reported that the Monday the 14 th of July. He also reported that the Committee had adopted the plan of the show-yard submitted to them by Mr. Brandreth Gibbs, the
Honorary Director of the Show, and had given direcHonorary Director of the Show, and had given direcwas confirmed by the Council.

Agricultural Implements.-Colonel Challoner, as cliairman of the Implement Committee, laid the following report before the Council :
The Implement Committee have taken into their deliberate consideration the subject referred to them by the Council
at their Special Meeting on the 10th of December last;
namely, such a classification of namely, such a classification of implements fer competitive
trials at the future country meetings of the socirt for which alone in each year prizes shall be offered as
shall insure the trial of every description of agricutural
implement once in three years. The Committec reconmen to the council the adoption of the followning rotation for the onsuing period of three years, namely:
 Tillage and Drainage of Land. \(\left\lvert\, \begin{gathered}\text { Cultivation } \\ \text { Ploughs Marvesting } \\ \text { Harruws }\end{gathered}\right.\)
Crups.

\section*{Cultivators

\end{tabular}

The Committee accordingly recommend that the Implement Prize Sheet for the Clielmsford Meeting shonld comprise
implements in the first of the above clase implements in the first of the above classes; with the
addition of special prizes for the best Steam-cultivator and the first and second best Jeaping Machines, and of a de-
partment for miscellaneous as well as for new implements, partment for miscellaneous as well as for new implements.
The Committee beg to suggest : 1 . That implement makers wishing to have duplicate implements in the show-yar work. Stewards are to yeserve to themselves the power to arrange such hours as maz appear most convenient for the
implement makers to exhibit their different inplements in motion. The exhibitors to find the materials for such exbitions. 2. That if any exhibitor shall send machinery in time to be admitted into the yard, he shall forfeit the right of the reduced rate of railway transit
(Signed) C. B. Chilloner, Chairman.
The Report having been confirmed by the Council Mr. Ransome and Mr. Garrett submitted to their con sideraticn a Memorial, signed by a great proportion o Carlisle last of implements at the sociely s meeting at system of offering individual money prizes for competition among the implement makers ; their satisfaction at the triennial division for the trial of implements already decidain their desire to have maintained the full severity of the tests for trial, and the r as may express their approval, either entire or qualified (as the case may be), should, be placed in the qualified as the case may be), should be placed in the hands of stitution of the individual general exhibition day, in suboffered on the Society's prize sheets." On the motion of Lord Berners, seconded by Mr. Evelyn I)enison, M.P. this Memorial was read, and received the fullest con sideration of the Council.
On the motion of Mr. Thompson, seconded by Sir 6 Th : B. Jonhstone, Bart, M.P., it was resolved:ments of the same class, the judges or more imple divide the prize equally between them.
On the motion of Mr. Brandreth, seconded by Mr. Thompson, the fullowing sums were voted for the respective classes of implements for which prizes would be offered for the Chelmsford meeting (exclusively of the steam-cultivator, \(500 l_{\text {. ; reapg machines, } 50 l_{\text {. }} \text {; and }}\)

For the class of ploughs

and on this motion it was further resolved:-"That the several sums shall be divided or withheld at the discretion of the judges; and in no instance shall a prize be given unless there be deemed sufficient merit." Hoskyns, it was resolved that the following by Mr. the terms in which the Society's Prize of should be steam-cultivator should be offered, viz., "For the steam-cultivator that shall, in the most efficient manner, turn over the soil, and be au economical substitute for the plough or the spade."
Paris Agricultural and Industrial Exhibitions. M.P seconded by Sir John V. B. Johnstone, Bart. "' That the lest thauks of the Council are due to those of its members who so ably represented the Society at the International Exhilitions at Paris, for their exertions." Sir John Johnstone explained that it was intended to include in this vote of thanks the Deputation to the International Agricultural Meeting held at Paris in June last, consisting of Mr. Miles, M.P., as President of the Society ; Mr. Hudson, as Secretary ; Prcfessors

Simonds and Way, as Professors; Mr. Garrett, Mr Hudson (of Castleacre), Mr. Brandreth Gibbs, Mr Fisher Hubbs, Mr. Jonas, and Mr. Milward, as mem. bers of Council ; Mr. Milward, as the English Juror of Cattle ; and Mr. Fisher Hobbs, as the English Juror of Sheep and Pigs, on that occasion ; and Mr. Evelyn Denison, M.P. the English Juror of Agricultural Implements, at the Universal Industrial Exhihition \(h \in l d\) at Paris subsequently in the same year. Mr. Denison,M.P. compliment thus paid to themselves and their colcompliment thus paid to themselves and their col-
leagues. They expressed their entire conviction of the great advantage which could not fail to arise in favour of the two allied countries from the friendly interFommunication so happily subsisting between them.
Foreign Cattle.-Lord Feversham reported that the separate prize-sheet for the foreign cattle prizes, conditions, and regulations, would be submitted to the Council at its next monthly meeting.
Moultry Prizes.-On the motion of Sir Archibald the schedule of prizes for by Mr. Brandreth Gibbe, Mr. Fisher Hobbs for competition at the Chelmsiond meeting was unanimously adopted.
Foreign Office.-Communications received from the Foreign Office by instructions of the Earl of Clarendon were referred to the Journal Committee, and the best thanks of the Council ordered for them. The Council adjourned to their weekly meeting on the 13th of February.

\section*{Miscellaneous.}

Proper Time to Manure.-With respect to the proper time or season for putting on farm-yard, artificial, and other manures, that will depend entirely on circumstances and the convenience of the farmer. I remember
this question was once put to a very shrewd old Chethis question was once put to a very shrewd old Che-
shire farmer by a young neighbour, who had a very high opinion of the old man's judgment and experience in farming matters, and after stipulating for a fee in the shape of a jug of ale (which of course was very cheerfully paid), what think you was the old man's reply to the anxious inquirer ? Why simply this: "Put it on all the year about." Now although we may not quite the besth the old farmer that all the year about is of us agree with him that a dressing of cood manure will seldom do harm at any season ; and no doubt by this significant answer the old man meant to impress upon the mind of his young neighbour the very high value he placed upon this right hand friend. In my opinion, the best time for applying manure of any kind including bone-dust) to permanent pasture is when Tegetation is the most active (say in the months of
April and September, if the land can be spared); and April and September, if the land can be spared); and diately after the hay is carried off is, I think, a very good one. Mr. Martin at Chester.

\section*{Calendar of Operations.}

\section*{}
we were visited with the most intense black frost Christms e were visited with the mest intense black frost known for
many years, and, again, the week before last was characterised
y similar wather. In both cases, from want of the snowy covering, the frost penetrated to the depth of nearly a foot, so
hat for several days after the change ploushing \#as out of the
question. That operation is unusually yar behind for the season.
Juring the past week, however, much lee way has been made
p; for in such circumstances one must break the law against
poughing down a little trost up; for in such circumstances one must break the law against
ploughing down a little trost. One crood eftect of the black frost
remains in remains in the ease with which the lea furrow is turned. Little
or no Wheat has been sown during these twon months, and the
greater breadth remains yet to te sown next month. What few
fields do greater breadth remains yet to ke sown next month. What few
tields do show the blade appear to have sustaind little damage
from the weather. Not so furtunate are the Swodes, however; from the weather. Not so fortunate are the swodes, however; \&
large number are rotten, and the whole crop so deteriorated in
feeding quality that cattle can be kep large number are rotten, and the whole crop so deteriorated in
feeding quality that cattle can be kept improwing only by the
assistance of artificial food. Huggs, it would seem, are a hardier
race, for they have done will race, for they have done well on their cut jellow Turnips in spite
of rain and mud, and look very comfortable now that these few
days promise drier weather, thongh drawing more to frost days promise drier weather, thongh drawing more to frost, and a
little snow to-day. It is now little more than tive weeks till our lambing season comes on, and the ewe flock is daily folded on the
Turnip breaks for a few hours, and then run off into a Grass
field. Live stock markets have been dull for some time back, but begin to show more animation. Our l ceal grain markets,
which had just begun to revive, were completely knocked on the Which had just begun to revive, were completely knocked on the
had lat wek by the panic that fmanated from Mark Lane.
Business was at a stand-still, and nine-tenth of the farmers druve their corn home again rather than summit to a reduction
unwarranted by the circumstances. Short as has been the time,
the reaction has already set in, and people bit
 be wiahed. To judge from the reported drain of ber agricultural
population, Russia (if she show face at all) is more likely to
come as a buyer than as a seller. \(J . T\). West Sossex, Feb,-We have still little to report. The changeable and rather damp weather has not been suitable for
dung carting, a work that we like to get forward so as to lighten
us when the busy time of its application comes. There is a little complaint about the Turnips not having stood the winter well. and perhaps the season will urge on us all the economy of storing
them as we now do Mangel, as and Which now rot, we wilh not have ap mach difficulty ing providing
for the sheep when the frost sets in. Lambing goes on well, so for the sheep when the frost sets in. Lambing goes on well, so
far as we have heard, better than usual, and though the land has
been very wet, yet as it has been mild they hage been Very wet, yet as it has been mild they have done pretty
well. Our markets have come to a stand, but as there is still a
belief that peace will not have numch effect are holding back. We should think that threshing is about In
the same state of forwardness as usual at this time. We shall now hase our attention turned to sowing and ploughing up
behind the sheep for Oatt and Barley as soon as the land is dry
enough. Wheat still looks will bave sufiering at all; and so with the young Cloverse our market is
well supplied with every kind of mat; beef is from \(4 s_{0}\) 4d. to
\(48.8 d . ;\) mutton the same; and good port

plane Mavurz: BDT. We should be glad to know, your
 The addition of salt will uot be of any service. It would pro
bably beacted on by the sulphuric acid before the bones, and bably be acted on by the sulphuric acid before the bnnes, and
then the solution of the boones would be effected by the nulriatic acid set free fron the salt. The object is the solution of the
bones by an means, and the direct action of the sulphuric acid Is the best plan to adopt. If your land would pay for a dressing
of salt it should be applied independently or with lime. Sopraphospante: \(X\) bas sent us another reply to Mr. Grady,
which however we do not print in full as the matter is already fully disposed of. Mr. Grady, he says, had contended that the
bi-phosphate of lime being dissolved in water would go wherever the water went, and be carried away from the land with it. " \(X\) " had replied that the superphosphate dissolved into a plain and neutral phosphate, and that soils have the power of retaining both ammonia and the phosphates. Mr Grady said " X " knocks down both Lawes and Liebig, but the proper question is-Is this true or not? Never mind
whose opinions it knocks down; that has nothing to do with the question between Mr. Grady and the writer as to which " \(\mathrm{X}^{\text {'s }}\) " statement does not cut down any of the arguments as Solubility of which even after committed to the earth is a well nown fact. Professor Way considers that though the superpet it is in an infinitely divisible state, and he denominates this state precipitated (not semi-soluble) phosphate. Now
Whether this theory is correct, or whether the plant takes advantage of the soluble state of the superphosphate before it becomes neutralised, and extracts from it sufficient element state in which it can be assimilated by plants: Whichever
theory is correct, still the practical advantage is as to the superior effect and solubility of superphosphate of lime over ordinary phosphate however much reduced, is correct, as regards the variation of superphosphate in analysed, fairly drawn, and find it 15 per cent somple to be phate, 15 per cent. insoluble ditto; you go a week after phos take another sample the same way, from the same bulk, send phate, 18 insoluble ditto; or, it may just as easily be found 8 soluble phosphate, 12 insoluble ditto. 1 have found so repeatedly that soluble phosphate is such an unstable or
changeable article, and the difference between a certain soluble lly of me to guarantee what I could not, and which manure manufacturer can do, though some may profess to do so, that is to guarantee superphosphate of lime to a per cent.
it cannot be done without running the risk of continual mis chief with one's customers. The superphosphate made by me and connection and character depend upon that. That is the best guarantee Jou can have. I shall be happy of your custome, manneat Such is the reply he has
 he superphosplate ordered from him, according to analysis, oticed here on 19th January. Superphosphate. [Superphosphate Hin not resume the condition of neutral phosphate except on the the extra cair sample ought to phold true of the bulk until some real Unurps: Messrs. Waite. The plates are admirable- representations of the vegetables drawn. Truthful figures of this kind are greatly to be desired-as being far better guides than mer description can be.

ESTABLISHED ABOUT HALF A CENTURY.

J. WEEKS AND CO.'S BOLLERS.-At the beau-- tiful seat of W. Leaf, Esq., Streatham Park, Streatham, Wurrey, can now be seen additional proofs of the efficiency of incredible number of Forcing houses, Pine stoves, and extensive ranges of forcing pits. This exquisite establishment has long been celebrated for growing the finest Pines, Grapes, \&c., \&c., under the able management of Mr. Page, the Gardener, who wil John Weeks \& Co., Horticultural Builders and Hot-water Apparatus Manufacturers, King's Road, Chelsea, London,
Plans, Estimates, and Illustrated Catalogues, conaprlsing Plans, Estimates, and Illustrat
Horticulture in all its branches.

HEATING EXTENSIVELY BY ONE BOILER.
JOHN WEEKS \& Co., King's Road, Chelsea, HAVE this Season the pleasure of being able to they have fixed ONE BOILER to do the same work which hitherto has taken from six to twelve boilers.
Edward Henderson \& Co., of the Wellingtable firm of Messrs. ton Road, St. John's Wood, and as that Establishment is open to the public Messrs. JoHN WEEKs \& Co.'s Hot-water Apparatus Will now have a chance of being fairly tested and impartially represented during this winter. Messers. Edward Henderson of At their extensive Nursery any gentleman or horticulturist can see the Hot-water Apparatus of several extensive ranges o Hothouses, all connected to one boiler. We will here quote Mr. Edward Henderson's own words, showing how he approves of Messrs.J.W mexs \& Ca's system of heating by hot water. He says: Messrs. Jore Weers \& Co. have doxe for me in heating a great number of our hot-houses from one borler. It is almost impossible for me to express my satisfaction sufficiently strongly. The effect and great saving produced is truly wondorful; less than two sacks of coke in 24 hours is all that is used to heat a variety of hothouses, dec., nearly 800 feet in langth, and thess various houses are to some extent woidely in awother, asd so on, including owr large newly laid owf wointor, gavilen." Messrs. John Werks \& Co. can also refer to several extensive private establishments, where their Hot-water Apparatus can be seen in operation, and in every case with the spme favourable results. J. W. \& Co, also adhere strictly to all their former respectfully solicit a
visit to their Garden Establishment at Chelsea, which consists of HotConservatories, Pits,de, the whole measuring 1000 feet in length, exposing to the atmosphere ficial feet of glass, the Whole heated by one Boller, 5 feet high by 3 feet 6 inches in diameter, the water in the va-
rious houses circulatiog water Pipe.
The accompanying sketch represents our lar Boiler, with hollow furnace bars. The large surface which this Boiler exposes to the immediate action of the fire ordinary power.
 Horticnitural Joll Wexks \& Co., King's Road, Chelsea, Horticultural Builders and Hot Watar Apparatus Manufueturers, At our two establishments horticultural seience is fully carried out in all its branches, combining all the hoprovements of the day. We have always in stock ready for immediate use a very
extensive variety of horticultural erections; also Forcing Pits and Frames of all sizes. See onr Illustrated Catalogues on Horticultural Building and Heating by Hot Water; also of all the best Stove and Greenhouse Plants; also of the best Vines, Pines, Peaches, and other Fruit trees.

\section*{The Garmenerg Chromite.}

\section*{SATURDAY, FEBRUARY 16, 1856}

Several correspondents ask whether they can be charged with a tax of \(10 \mathrm{~s}, 6 \mathrm{~d}\). each for under gardeners ; surcharges to that amount having been made by the surveyors of their districts. A, fo instance, living in Sussex, says-"I keep a gardener and employ in my garden two labourers, who know nothing about gardening, and merely roll, rake, dig and perform the usual rough labour of the place. made a return of my gardener, as usual, but the surveyor surcharges me with \(10 s\). 6d. each for the wo labourers. Am I really liable to the tax, which was never levied before?" This being a matter which concerns most especially the readers of the Gardeners' Chronicle, we have made the necessary inquiry, and we find the following to be the present ate of the law.
In the last act passed for the regulation of certain Duties of Assessed Taxes ( \(16 \& 1 \%\) Vict. c. 90) is the following clause :-" The said duties on gardeners [namely, \(1 l\). \(1 s\). if above 18 years of age, and \(10 s .6 d\). if under] shall extend to every gardener who shall have contracted for the keeping of any garden or gardens wherein the constant labour of a person shall be necessary, or wohen a person shall have been constantly emplayed therein, to be paid by
the person for whose nse and in whose garden such
gardener or person shall have been employed ; pro-
vided that no person shall be deemed to be a garvided that no person shall be deemed to be a gar-
dener unless the whole or the greater part of his time shall be employed as a gardener in a garden requiring the greater part of the labour of one person ; provided also that any person employing any under gardener shall be chargeable for such under gardener at the rate of \(10 s .6 d\). only." Such are the words of the act.

It is, therefore, evident that for every under gardener his employer must pay \(10 s .6 d\). per annum. But what is meant by the words "Under-Gardener ?" This the act does not explain. We should have sapposed that an under-gardener would have been held to be a person skilful in gardening, but subordinate to the chief gardener, such as a foreman, an apprentice, a man employed to prune trees, or sow seeds, or perform some other of the many operations called horticultural ; by which he is distintinguished from a mere labourer, who only knows how to mow, or dig, or drag a roller, or carry fruit and vegetables to the house. But in this it appears that we shonld have been mistaken. It seems that the word under-gardener, within the meaning of the act, includes every man above 18 years of age employed in a garden under a gardener. That this is so is now placed beyond a doubt by the following decided cases:-
No. I.-At a meeting of the Commissioners of Land and Assessed Taxes held at Hanmer for the Division of
Maylor, in the County of Flint, on the 4th day of September, 1854 , for the purpose of hearing appeals against first assessments of Assessed Taxes for 1854.
Sir John Hanmer, Baronet, appealed against assessment made upon him for two under-gardeners, Appellant stated that he only kept one gardener, at an annual salary, and that the other two men employed by him in his garden were labourers not in receipt of aunual saiaries, but paid weekly wages at the rato quently, he contended, they were not under-gardeners quently, he contended, they were not under-gardeners ander the meaning of the Assessed one gardener and session. Appellant is
two under-gardeners.
The surveyor objected and stated the labourers in question were in his opinion assessable as undergardeners.
The Commissioners relieved appellant from assessment, and the surveyor demanded a case for the opinion of Her Majesty's judges, which we have stated and signed accordingly.-Joseph Lee, Thomas W. Lee, Commissioners.
Judgemen.-We are of opinion that the determiman, T. J. Platt, Samuel Martino 14th December, 1854.

No. II.-At a meeting of the Commissioners of Land and Assessed Taxes, held at the Crown Hotel, Faringdon, on the 30th September, 1854 , for the purpose of
hearing appeals against the first assessments for the year \(1854-5\).
The Right Honourable Viscount Barbington appealed against a charge made on him for four under gardeners, whom he considered as labourers, and who manament of the garden assisting, and underly wages, knew nothing of the management of a garden, and were frequently changed in the summer months, and therefore could not be termed under-gardeners as meant by the act of Parliament, but that under-gardeners were persons skilled in gardening, and who might take upon head gardener.
Mr. Webber, the surveyor, contended that as these men were employed in the garden, lawn, and shrubberies, under the direction of the head gardener, they were assessable as under-gardeners at 10 s .6 d . each, but we, the majority of the Commissioners present who beard the said appeal, being of his lordship's opinion relieved him from the charge. The surveyor being dissatisfied with the decision requested a case for the opinion of her Majesty's judges, which we hereby state and sign accordingly
The same case will govern the charge made upon Sy Robert Throck yorton, Baronet, who was r

Judgment. - We are of opinion that the determination f the Commissioners is opinion that withan \(T\). Platt, Samuel Martin. 14th December, 1854.
No. III.-At an adjourned meeting of the Commissioners of Assessed taxes for the hundred of Wootton, in the county of Oxford, held in the Town Hall in Woodstock, in the said district, on Wednesday the 26th day of September, 1855, before us the undersigned Commissioners of Assessed taxes for the eaid dis-trict:-
Timothy Abraham Curtis, Esq., Agent to his Grace the Duke of Marlborouge, appealed against an He contended tharg the Duke under-gardeners.
they were not the servante of the Dube, inasmuch labourers, hired, employed, and under the sole control of the head gardener in the public and private pleasure
grounds at Blenheim, who by an agreement,* dated
3d March, 1842 , is bound to keep such gardens in 3 d March, 1842, is bound to keep such gardens in order for the sum of 200 l . per annum, exclusive of his Mr. Curtis eper annum.
Mr. Curtis contended that the Duke could only be called upon to pay duty for the persons he employe and not for those employed by the head gardener.
William MacMorran sworn:-I am head gardener of the public and private pleasure gardens at Blenheim. Q. State the number of persons employed by you as under-gardeners.
A. I employ nine men in the summer, six in the autumn, and four in the winter. The average number of boys I employ is about six-age from about ten to twelve years, at \(6 d\). and \(4 d\). per day, bome \(8 d\)., only big boys at \(3 d\). per day. I agree to keep both gardens in and six 200l. a year. I have someti
Q. State the acreage of the gardens.
A. I cannot say with certainty. I should say about sixty acres. The Duke has full power over all the persons employed in the gardens.

The Commissioners being of opinion that the contract with the head gardener did not interfere with the Duke's liability, confirmed the charge; but the Duke being dissatisfied with their decision, demanded a case for the opinion of her Majesty's judges upon the ollowing grounds :-
Firstly, that William MacMorran, my gardener, having contracted with me for a certain fixed sum for the maintenance and due cultivation of him under tha contract being his servants and not mine, I am no liable to any tax for under-qardeners, and therefore claim exemption. But if the judges should decid that I am linhle to the tox und
Secondly, I appeal against the stated number of nine as according to the average number of persons em ployed during the year it appears that the number does
The case is
The case is hereby stated and signed accordingly Given under our hands this 20th day of October, 1855:-Charles Cottrell Dormer, John Lechmere, Burrous, Commissioners.
Judgment. - We are of opinion that the determination of the Commissioners is right.-E. H. Alderson, T. J. Platt. 6th Dec., 1855.

It would seem that these decisions of the Judges are conclusive, and must govern all future cases that may be brought before them.

IT is announced that Dr. Gustay Richard, who is about to quit Europe for many years, has deter mined to sell the valuable herbaria bequeathed to him by his father, the late learned Professor Achille Richard. Of the manner in which the sale is to be effected we are not informed, but we presume that inquiries addressed to Dr. Richard, at 29, Rue d'Enfer, Paris, will receive a reply

The contents of this vast assemblage are said to be as follows:-

N.B. The North American plants of Mrehaux published by the elder Richard, are incorporated in the general herbarium.

ON FROST SPLITTING.-By Dr. Robert Caspary (Continued from \(p .85\).
According to these observations, frost clefts occur in trees from 7 inches to 40 inches diameter; but I have also seen frost clefts on some stems of Acer dasycarpum of \(2 \frac{1}{2}\) inches thickness, and I possess a branch of a Peach tree from the nursery garden of Mr. Lorberg which is nnly 8 lines thick, and yet has a frost * Copy of au Agreement between the Duke of Marlborough
and William McMorran. I agree to serve the Duke of Marlborough, 3a March, 1842. to undertalke the cure of the pablicarand the private gardens at the
annual salary of sixty annual sslary of sixty pounds, to commence from the first of
September last, being anlowed to retain all fees for showing the
gardens if they exceed that summ, and having the salary September Last, being anowed to retain all fees for showing the
gardons if they exceed that sum, and having the salary made
up to that sum if the fees fall below it ; and heing also allowed a hp that that sum if the fees fan
house reat-free, firewood, an
undertake to account of the fees. I also undertake for the sum of two
hundred pounds a year from the ffrst dasy of September last, to
be advanced by the Duke for labour, to expend that gum in keeping the public and purve for labour, to expend that sum in
krive gardens in a perfectly neat state and proper course of cultivation. (Sigued) W. McMorran.
cleft; although I have not included these cases mongs the observations given above because I have not seen the frost cleits in these very thin stems during the time of frost, but only observed tsem at a assertion of Schubler "Observations on the Tempera-
ture of Plants," 1826), that thin trees of a few inches only in diameter are not liable to frost splitting is therefore incorrect
The degree of frost under which these clefts occus is always very considerable. I believe that the most of the above-mentioned trees burst open in the night of the lst to the 2d February, when the minimum degree was \(-15^{\circ} 1\) R. ( \(-2^{\circ}\) Fahr.). I was much pleased that the date of the splitting of the Horse Chesnut in the pupil gardeners \({ }^{\prime}\) garden, No. 29 , could be so accurately 10 o'clock in the evening of the 9th February, the ther mometer in the Ritterstrasse indicated a cold of \(-14^{\circ} 6\) (about \(-1^{\circ}\) Fahr.), and the minimum of the night was \(-18^{\circ} 9 \mathrm{R}\). ( \(-6^{\circ}\) Fahr.). In the pupil gardeners \({ }^{\circ}\) \(3^{\circ}\) Fahr. colder. The Horse Chesnut, therefore, burat by at least \(-5^{\circ} 6\) ( \(-3^{\circ}\) Fahr.)

As to the time of bursting, it appears always to take place in the night. It was so with the last-mentioned tree. Mr. Nursery-gardener Fr. Bouche tells me that several years ago a Horse Chesnut tree in his own garden also burst with a loud report, like a pistol-shot, and that was in the night. Mr. Nursery-gardener Reineeke, whose report I shall'communicate further on, had occasion to hear the bursting of Cherry trees during the night, when engaged in the heating of his plant houses.
Frost splitting gives an excellent means of observing the twisting of the stems of trees. See Alex. Braun ne oblique direction of the woody fibras, in the monthly reports of the Berlin Academy, A
Frost clefts usually close over in summer by a new formation of wood and bark, and open again in winter. But this does not take place in all cases in every winter. I have this winter observed many overgrown frost clefts in Oaks and Lime trees, which did not break open again. When, therefore, the thickened rim of overgrowth shows several breaks indicating a repeated bursting open and healing over, this does not afford the means of deducing with certainty the year when it first split, even when the intervals between the breaks are of equal thickness, for the cleft may have remained closed ne or more winters. In the case therefore of the above-mentioned Oaks, Nos. 1 and 2, the evidence of eight breaks in the border of the clefts still leaves it
doubtful whether they first broke out eight years since or earlier.
Among the frost clefts of the 33 trees which I. more particularly examined, all except six showed a connection with some local injury which had there weakened the cohesion of the woody tissul. This weakening of the tissue occurred in the following forms:-
]. Weakening by decay.
From a branch rotted away, fig. 1
3. From a stump brising of the bark, and young wood which had occasioned decay, fig. 3 r .
2. Weakening by a slit in the bark, suah as gardeners make to cause the tree to bleed, fig. \(4.8,8^{\prime}, 8^{\prime \prime}\)
Also, in those six cases out of 33 where I could not clearly trace a connection between the frost cleft and any local weakening of the tissue, I could not say with certainty that there was no such defect. Hidden from sight, there might have been some decayed spot within the wood, which may have been caused by some stump of a branchlong since overgrow, 0 as to we no loage recognisable, but which at the time when it was not yet closed over, by the admission of moisture and atmospheric air occasioned a spot of decay, imperceptible from without, but affording facilities for frost splitting. Amongst my observations I have found no certain case of frost splitting occurring in wholly uninjured trees. I may also remark that I have always carefully looked for any ice that might appear in the open fissures as indicating a previous deposit of liquid, and that I have never detected even the slightest trace of it, any more than did Treviranus in the case of Horse Chesnute and Elms ("Physiologie," vol. ii., p. 701).
T'he frost lasted till the 2sth February ; on this day came on a thaw which continued over the 26 th and 27 th. I was astonished on the morning of the 27 th, between 7 and 8 o'clock, to find the frost clefts already closed on most of the trees. Still, those of the thickest trees were not yet closed, although the fissures had become several lines narrower. Gradually, as the milder temperature continued, the clefts of these trees closed also. Here and there a single one still continued to gape, especially the fissure in the Lime trea, No. 22 , which, even at the time of writing this on the 28 th March, is still open to the width of about two lines. \(\dagger\)

VEGETABLE PATHOLOGY.-No. CVIIL
423. Veneficiuk (Poisoning). Though several species of the lower fungi are able to endure concentrated poisonous solutions, \({ }_{+}\)which would at once be fatal to higher vegetables ( 420 ), it is curious that some moulds and other parasitic fungi are peculiarly susceptible of injury from certain inorganic substances, and that solu-

In a subsequent note written on the 1st July it is stated to
\(\ddagger\) It might have been mention.
not free from the attacks of fungi, as Periconia Chebaica.
tions, as arsemous acid, sulphate of copper, \&c., in
which some species will grow and flourish, are certainly fatal to others. This fact is of great importance, because those species which are most prejudicial to man are often capable of being destroyed by such applications.
424. It was stated amongst other matters that moulds will flourish in arsenical solutions. Such solutions have been proved by Jager, Marcet, Macaire and others to
be fatal to higher plants, but Jiger has himself wit be fatal to higher plants, but Jiger has himself witnossed the growth of a mould in water containing \(\frac{1}{3^{2}}\) of
its weight in arsenic. Dr. Pereira communicated to me its weight in arsenic. Dr. Pereira commumicated to me acid, amongst the threads of which were free crystals of arsenic. This latter circumstance, taken in connection with the fact that copper is deposited in a metallic state on the threads of mould generated in a strong solution of sulphate of copper, may perhaps indicate some vital process by which the arsenic and copper are rejected, while those parts of the solution which may be beneficial are absorbed.* It is, however, well known that in those cutaneous disorders which depend upon the growth of parasitic fungi, the surest cure is to impreg perhaps as a tonic, but partly as a direct antagonist to the growth of the parasite. A superficial application has not the same effect as the treatment just mentioned. 25. We have no proof of fungi being capable of existing in solutions of sulphur. Solutions of sulphuric and sulphurous acids though very weak are grow in crude sulphur, but then this substance is insoluble in water. + It is strange, however, that this very substance is a deadly poison when crude, but finely powdered, and much more when quite impalpable, to those parasitic moulds which grow on living vegetables, such as the milar character is ar and salphur must enter into some combination in order to its absorption into the plant, and what this may be is at reflected that oxygen in a nascent state is given off by the plant, and ready therefore to enter into combination with any substance for which it has affinity, it may readily be conceived that in that condition it may com-
bine with the sulphur to form sulphurous acid, and so prove fatal to the mould, while the hardened cuticle of the leaf does not suffer. Thus fumes of sulphur, or sulphurous acid, may effect the same end in a closed building, as, for example, a grape-house, but they are not to be used without caution; and on the same prinof a fungus, is arrested by racking off the fer menting fluid into a sulphured cask.
grains, again, of sulphite of soda putinto A few with a fermentable juice are equally efficacious, as the acid decomposes the salt, which evolves sulphurous acid (Pereira under Soda bisulphis). Bisulphite of soda has also recently been used with success in the the growth of the curious vegetable produch in which entriculi is one of the most prominent production Sarcin 426. The most effectual wrominent symptoms.
426. The most effectual way perhaps of applying
ulphur, and the most permanent, is that a sulphur, and the most permanent, is that adopted by
M. Becquerel. A solution of sulphuret of potassium, or sulphuret of calcium, is treated with an acid, and then applied by means of a syringe. A deposit of sulphur is formed on the leaves, which follows every inequality, + destroys by means of its decomposition the mould already present, and then prevents the formation of a new crop of fungi. The sulphuret of calcium, without the acid, acts like magic, but is not permanent. Other chemical substances have been employed, but those enumerated are the most promising or approved.
427. Several mineral substances are used to contend against those fungi which attack cereals. Sulphate of copper (blue vitriol), perchloride of mercury (corrosive
sublimate), arsenic, chloride of soda (common salt), lime by itself or mixed with sulphate of soda, \&c., have all lime by itself or mixed with sulphate of soda, \&c., have all
their advocates, and all seem to be useful. Of these the their advocates, and all seem to be useful. Of these the effect to be due to the caustic soda which is set free on the combination of the sulphuric acid with the lime.
428. Another set of fungi is injurious not to living plants, but to their woody parts when employed in domestic architecture or in ship-building. Freedom from damp, and exposure to a frequently renewed atmo sphere are excellent preventives, but where these con ditions cannot be secured the only remedy is to impregnate the wood with something which will destroy me fungi which live at their expense. Corrosive subi

properly applied, completely successful. Where the from time to time to repeat it. The vapours of sul phurous acid might in some cases be tried for the same purpose with great prospect of benefit.
429. Mould frequently occurs in ink, which is a strong solution of sulphate of iron with nutgalls, constituting a tanno-galiate of iron. The greater, however, the proportion of the vegetable infusion, the more abundant the crop of moulds. It is certain that a large proporthere is reason to believe that in small proportions i acts as a tonic. Oxides of iron are said not to be injurious. Iron in some form or other forms an ingredient in the composition of most plants. M. J. B.

\section*{GREENHOUSE FERNS.}

This interesting tribe of plants is every year be coming more extensively caltivated. We now begin to recognise beauty in form ; once we saw it only in colour. Ferns, I need not say, are remarkable for their eledelicate organisation are also extremely interesting Being fond of plants of this description, and having observed them attentively, I have been led to believe that the following list of species capable of enduring ordinary greenhouse temperature might prove useful. I have cultivated at various times the whole of the plants enumerated, and therefore I do not hesitate to say that they may be grown successfully in houses where artificial heat is employed only during severe frost. Many species will be found less affected by cold than Asplenium Marinum, \& plant which I find will not stand in the open Fernery in the gardens here. Those epecies to which an asterisk is prefixed are what remain of a number of plants which were planted out here two years ago; some of them have been slightly protected by decayed fronds or a few leaves, and they seem to
some extent to be hardy. In the list will also be found several plants to which a D is affixed; such kinds require less moisture than the others, and will therefore succeed best in a comparatively dry house. The following is the list alluded to

Home Correspondence.
How to Treat Plants which have been Dricd up, as Orange Trees, dic., receired from abroad.-It may per-
haps be worth while to detail, for the benefit of the correspondent to whom you gave some advice on this subject a week or two since, the means by which a plant apparently quite dead from drought was restored ceived in such growth. A large Gardenia florida was remore succulent condition as to appear worthess. The withered; its leaves shrivelled up, and the whole aspect of the plant resembled a newly-planted evergreen billed by the March winds. There were many circumstances which rendered it desirable to restore the plant if pose sible, and what seemed hopeless was attempted, and, as the sequel will show, accomplished. As a preliminary the plant, pot and all, was immersed in a preimiasy sufficiently large to cover every branch. Here it re mained until the bark became plump by aboorption, and after being removed and the now saturated soil washed from its roots, leaving them as bare as the branches, it was repotted in as small a pot as would conveniently hold the roots, using a compost suitable to the nature of the plant. The entire stem, as well as the main branches, was now enveloped in Moss and kept constantly damp by syringing. Of course the plant was shaded on sunny days. The pot being plunged in a gentle bottom-heat, and a damp atmosphere maintained around the branches, in a short time the leaves began to drop off-a certain sign, under the circumstances, of returning health. Two or three weeks elapsed and tiny buds began to push; leaves 'and shoots followed, and the plant was restored. True, most of the smaller bomehes never recovered; nor was that of much moment, as the vigorous growths from their bases more
than compensated them. In all cases of this kind than compensated them. In all cases of this kind
very gentle stimulants must at first be given, and these with caution. Heat injudiciously applied, or without the necessary adjuncts, will often accele rate death rather than restore to health; and the same holds good with respect to both bulbs and seeds. The latter, when the vital principle is become dormant by age, will often decay if subjected to the excitement of a tolerably high temperature, when if sown merely in a cool frame they vegetate freely. And so of bulbs: if these are received in a dry and shrivelled condition, the first care should be to restore the lost juices; when this has been accomplished the vegetative principles may be aroused, but not before. I need hardly observe that these necessary precautions are not always attended to, and the consequences are the loss of many plants which might otherwise liave been saved Even in the cultivation of the ordinary Hyacinth this is not sufficiently observed, especially by amateur and lady cultivators. When, as is often the case, the bulbs have lost much of their plumpness, they should either be placed for a day or two in damp sand, or enveloped individually in a piece of moistened flannel, before being placed in the glasses. And even when they are there \(t\) is an excellent plan to cover the crown of each with a piece of thick blotting-paper or thin cloth, kept moist bew threads connected to it, and touching the wate elow. I have seen the best results follow this plan . W. L.
Ignorance of Common Things.-It is indeed to be deplored that whilst the clergy and gentry are founding schools in almost every village, and duly providing crained masters and mistresses to instruct the rising population in what is generally considered the most
necessary branches of learning, that botany, or as your necessary branches of learning, that botany, or as your remarks last week have it, "the use of the common a place in their studies; but the mere study of botany from books is not sufficient to bring the minds of young children, such as are usually found in village schools, to understand plants in any useful way; their minds would become bewildered in the maze of teshnical terms. My impression is that the instruction should consist in simple lectures, illustrated by the things themselves, assisted by a simple question and answer book, got up without Latin or technical terms; and as few school masters or mistresses are at present sufficiently acquainted with the vegetable kingdom to impart such instruction to their pupils, let the patrons of these should be, sufficiently well informed to impart informashould be, sufficiently well informed to impart informa-
tion enough on the subject to lead the minds of the pupils to inquire and desire to know more of things with which they have every day to do; that done, owng desire for ractice, and when accidents as you alluded to would donbtless become extremely rare; besides, a knowledge of botany would administer to the enjoyment of life, for at every step the botanist meets something to attract and interest him, at every turn a friend, an old acquaintance in every familiar plant that strikes his eye; silent and unobtrusive, but not the leas a friend, it abstracts him for a while from the cares and anxieties of life. \(H\). Honclett, Harerland.

Cucumber Disease.-The misapplication of stimulants in my opinion often generates diseases in Cucumbers, such as mildew, canker, gumming, and deformity. The fruit is also liable to bitterness-an ill quality usually removed by increasing the temperature. Even red spider and thrips are not apt to attack Cucumbers in a thriving state. Plants from the same batch of seeds and out of the same pot may not be constituted alike, and may not be
in tuy "punten, hies the mystery. What is generally
linown as disease makes its appearance in gu'nmy spots the size of a small Pea, and very
often manifests itself on the fruit, while nothing is often manifests itself on the fruit, while nothing is
wrong with the Vines; and under my own observation in its worst form never indicated flagging or want of substance in the foliage. This leads me to think that your currespondent with the lens discovered something
else, and not the evil in question. The disease now complained of is in my opinion new, and therefore it is highly desirable that discussion on the subject may be continued until some cur
Exatic Nursery, Chelsea.
Daphne Mezereum. - Passing through the pleasure
Droun.s at Bishopthorpe Palace I noticed a remarkably groun .s at Bishopthorpe Palace I noticed a remarkably feet in circumference, and from 2 to 3 feet in height, uniformly branched to the base. On inquiring the particulars of its situation and growth, \(I\) was informed that it lad for some years previously occupied a privileged position on the principal Vine border, where it was supposed to have derived its unusual vigour from the surface coat ings of mauure that have been aplied ang the winter and spring months. As a fair inference, it seems to have proved a mutual benent, and ( trust that the admirers of spring flowers (and who are not ?) will test
the efficacy of this fact by endeavouring to restore the wonted beauty of those numerous worn-out and nearly flowerless plants which are almost everywhere to b met with, and it is still more earnestly to be hoped tha the present instance of restorative power may be found equally efficacious in bringing into notice some of the variety of this species, viz., Daphne Mezereurn autum nale, nuw almost lost to our collections. Cultivators of ornamental shrubs will confer a favour by recording the Wosuit of the experim
Plane Trees.-I have long wished to know something about the different kinds of Plane tree, and am therefore very glad to read the letter from Sir W. Hooker on the subject. Can any of your correspondents say certa:nly what the large trees about Constantiople are I have a strong impression that the great trees in the plain of Buyukdere, on the Bosphorus, has leaves like those \(h r o w n ~ a b o u t ~ L o n d o n, ~ a n d ~ n o t ~ t h e ~ d e e p l y ~ c u t ~ o n e s ~\)
of what we call the Oriental Plane. I am not so sure about the trees in the court of the mosque of Sultan Sulim tn. If no one in England can decide this, I think you wuld have no difficulty in obtaining a small branch with the leaves during the summer, if you should think
it worth while. C.W. Strickland. [The late Professor Link once assured us that our common Park Plane was a Greek plant. But this was merely an obiter dictum.] Disi ase of Larch-In a plantation of some extent the Larch have got a twist in their tops. With few exceptions it does not appear till 10 or 12 feet from the quite sufficient to spoil the tree for any purpose needing straightness. In those Fir trees in which it appeared any chance of its doing so ? Is it an evil known else any chance of its doing so? Is it an evil known elsesaid t, be geologically above the old red sandstone. The slope is to the east, and not much exposed. In other plantations more exposed to the S.W. (one bad quarter)
there is very little of it. Is it possible a single gale of there is very little of it. Is it possible a single gale of
wind whiie the sloots were growing caused it? Anon. [We think so, or a sudden frost when the shoots were young and tender.]
Disoroluved Granite. - I have found the following
solution effectual in cleaning discoloured or rusty granite, viz., 1 pint of vitriol to \(1 \frac{1}{2}\) quart of clean water, laid us with a whitewash brush immediately after using the solution wash off with clean water. If this precsution is not p instead of brightening. Alex. Robertson, County Wicklow, I Ielund.

Ancient Oak.-"Coway Stakes." - Botanists are spared the expense, trouble, and bother of drawing one of is now deposited in the British Museum, and doubtless is now deposited in the British Museum, and doubtless
Mr. Franks would give every facility for examining the Mr. Franks would give every facility for examining the
same, ind the microscope would come in very well in this instance. Centurion, Athenceum Club.
Monkshood and Horsercultish. - I have reflected on your article at p. 67 , and I think of offering a prize for
the be st Horseradish to the cottagers exhibiting at our local Iorticultural Show. This may induce some of thems to learn the difference between the two plants. I want to know where I can find the best directions for its cultivation. I will have them printed and distributt . And I shall also this year get the best root our exthibitions as a demonstrative proof of the power of cultivation, and an object for cottagers and gardeners to rival. Surely the cook who would dress Monkshood brought it to her for a hare. Diss. [Thtre is some external resemblance between the crown of the root of was not seraping Horseradish. The following di\(r\) cultivan are among the sinpot:Trench the ground 2 feet or 20 inches deep in February or March, having the trenches 2 feet wide; the first trench must be taken out 15 inches deep only, and the
mould barrowed back to fill up the last trench when the mould barrowed back to fill up the last trench when the
quarter is completed. The bottom of the first trench must now be dag over 5 inches deep, and levelled even;
and plant some crowns of the roots, each cut with an inch or two of its root, at 9 inches apart along the line ; when this is done remove the line 12 inches, which will be within \(f ;\) inches of the side of the treach, the same as the first, and must be planted in the same manner. When this is done turn over the secund trench 15 inches deep upon the roots so planted, which will level the work; dig up the bottom again as before, and plant the sets in the same manner, and proceed thus thll the whole piece is finished. According to this method the rows will be a foot apart, and the sets
9 inches distance in the rows. There will be nothing further required from this time than to keep the ground clean and not to suffer any other crop to be grown upon the ground, as the Horseradish will
 Some people drop the set of the Horseradish to the and fill up the hole lightly with the decayed remains of an old Cucumber bed.]
Arum maculatum and Italicum.-1 have never geen botanists take the pplotched or culitivated. Mtaiian maculatum, not knowing the true one. I suspect the case of supposed A. Italicum in England to have arisen rom a similar mistake as to the unspotted variety of maculatum. A. Italicum is sard to have been found in Portland, but which variety I do not know ; perhaps it was thought there that the starch, or arrowroot bearing roots could not be the common Arum

Arom Inalioum.
white or yellowish.
Spedix always white or yellowish., (Typo-leanves large,
tall, green sppoiched paler.) Common everywhere in Italy,
Spadix, se., as the type. Leaves ditto, but strongly
veined white; apparently a garden varioty, spedix purpe dark maculatule.
as Spedix purple, dark or pale; rarely if ever white or Yellow. (Type-leaves short, green, spotted, as
the spathe with purple, Common in England.
f. Spadix, fec.. as in the type. Leave soneolate mixed splotches.
Arum Italicum seems to oceupy an intermediate posispathe and spadix pale) and A, maculatum-the only three true typical Arums of Europe.

\section*{B. Lawes.}

British Ferns.-The following list of species with some of their varieties may be picked up within a radius
of five miles of this place. Within that compass the conformation of the ground is admirably suited to the growth of Ferns. In low shady places many of the free growing kinds, such as Lastrea dilatata, Filix-mas,
Polystichum angulare, Athyrium Filix-feemina, Osmunda, \&ce, attain a very large size, and have a striking and handsome appearance.
\begin{tabular}{|c|c|}
\hline Polypodiu & ium vulgare \(\beta\) bitidum \\
\hline & Oreop \\
\hline  & \({ }_{8}{ }^{\text {mincoisas }}\) \\
\hline & dilatata \\
\hline \(\beta\) & \(\beta\) dumetoru \\
\hline Polystich & Fcenisec \\
\hline & mum \\
\hline & \\
\hline " & \({ }_{\beta}^{20 g u a i a r e}\) subtripinnatum \\
\hline & \(\gamma\) multiifdum \\
\hline hyrium & \(m\) Filix \\
\hline & in \\
\hline
\end{tabular}

Polypodium vulgare when growing in dry shady hedges ften has the pinne very wavy, and slightly serrated, but whether that characteristic remains constant when removed to the rockery or not I am unable to say.
L. Filix-mas has often a frond or two slightly variegated, but it seldom or never (to my knowledge) extend ver the whole plant. Several varieties of L. dilatata are to be met with, and may be distinguished easily enough by their difference of aspect, but it is a hard matter to find terms to explain their differences, so as
to point them out with anything like certainty. During the past summer I met with a plant of this species growing in a dry shady wood, among tussocks of Molinia coerulea, with robust triangular fronds of a dark green colour, on which the indusium was quite black. Is this a variety of dilatata, but I wish to know if this is considered the same as Foenisecii of Moore? Asplenium Trichomanes, although generally said to grow on dry walls, is by no means particular in this respect ; indeed In the fence of the park here, there is a plant growing
that is watered with salt water every time the tide floms; yet it does quite as well as if on a wall 20 feet high. Scolopendriom vulgare seldom eports except it is starred a grown very luxuriantly, and when this occurs, even in mare degree, it often degenerates to the primary form marginatum I have only seen growing in one place, in Although Pteris aquilina may be seen in different places varying from a few inches to many feet in height, have never seen a good variety of it. Osmunda regalis is sometimes nipped by cattle, by which much of ite otherwise majestic beauty is destroyed. Its matted fibrous roots form an excellent material in which to grow many kinds of Orchids. Polypodium Phegopteris I have been informed, was found in the neighbourhood of Penryn during the past summer by Mrs. Phillpotts In addition to the species above enumerated, other grow in the county, such as Adiantum Capillus-veneris Hymenophyllulum Wilsoni, \&c. From the facility with which many of the species may be dried so as to pre serve much of their original colour, many people dry specimens to fix on white paper merely for the prett pictorial effect which they produce when nicely done some even put them in frames. Facsimiles of then are also taken by means of a piece of oiled paper, smoked over the flame of a candle or lamp. Prs. Symons Carclew, Cornvall.
Quercus sessiliflora.-In the summers of 1853 and '34, visited Fontainebleau and had long drives through the fores. I was much struck with the appearance of the Cahs, abour 5, as be accur old Wiglinh Oaks. My puide finding that I our old English Oaks. My guide finding that I was lover of trees look care to show me alt he lime of their
forest in that way; I took notes at the time girth and apparent altitude, but these I have mislaid, and I now only remember that he first of all drove me up to the foot of an enormous tree which he called "Chene du Roi ;" this was a magnificent stick, with a clean straight bole entirely branchless, and with a compact densely leafed head. He then after a considerable drive brought me up to another, and with his "Voxia Monsieur," directed my attention to its grandeur this he called "le Chêne des Deux Freres. I remember it as being very tall, straight, an ma "le Chéne de Ferrand" was equally grand ; in fact, I never before saw such straight, clean-stemmed, bulky Oak trees, It did not strike me at the moment that they were the sessile sort, but on visiting another part of the forest where the sandstone rocks lie on the surface in large masses-one place I remember as very picturesque, called, Ithink, the Valley of Rocks- 1 found some sense-foliaged trees with acorns, and Inen found were Quercus sessiliflora. Loudon describes the leaves as being of a "paler grien" than those of Quercus pedunculata; this is just the opposite of my impressions, for I remember being atracted to some urees of Q. sessilinora on the banks the Dart by their dark green hue, and by their thick, may I call it leathery, appearance. The Fontainebleau Oak have this character. On coming to the verge of the fores near the town I observed in some of the thickets young wrees of Quercus pedunculata, and I fancied both, but I could not find any acorns on them; has any one ever heard of such hybrids? The misfortune is that it mences to bear acorns one has generally ceased to care about acorns and Oak trees. As the timber of the sessile-fruited Oak must be used in large quantities in Fontainebleau, and indeed in Paris, your inquiry as to its quality in Gardeners timber merchant. Some of your
answered by a French tion answered by a French timber merchale to obtain correct numerout readers its quality through some such source. T. R., Herts.

The Sydenham Flower and Fruit Shows.-As you hare permitted me to speak in behalf of "the Society" on the good it has effected in times past, suffer me to say \({ }^{\text {a }}\) few words on the schedule of prizes just issued by the youthful and already gigantic Sydenham. Though fruit and flower shows may bo Syent to prove that they have, yet suan hold on the minds of all ranks of the people, and that their tendency is in unison with the elevating and educational character which that noble institution is developing. And it is gratifying to find of the directld are mo efort and be wantinge, wanting to improve on whe experience of he past men o advantage of prese , dy progress ought, and will be ready to support
encourage. The schedule issued for the ensuing encourage. The schedule issued for the ensuing exhibition is an improvement upon any yet pubas aro lesse ar societies. In some cases the ptill liber and aned from those of last year, but they are still and here and thee. Aew features are observabe "Class 1. Plants grouped for effect, in or out of flower, is very properly retained; but it may be suggen here that for such grouping the exhibitors sis we provided with an ordinary stage as last seapen oval, slightly raised in the centre, and the whole of the pots to be massed over. The rather severe criticismo pots to be mossed over. The rather
last year on the general arrangem
scagretted that they have again fixed upon Saturday,
hat the show will only be open for one day. The fruit tend to exhilit more skill, as well as to prevent its being said that fruit growers were behind plant growers n any degree. It has been urged that fruit was not in the country, but the same encouragement that brought Roses in pots and other plants which were not in the and though the ensuing show may not exemplify this largely, in succeeding yeans it will be more and more abundant. That this department is not void of tent gives ample evidence. I observe that good pota. I do not anticipate that many can be brought from the short notice given. Orange trees in fruit might have been added with advantage, and when the fruit is arranged artistically on a level table not dissimilar to the manner it is "set up" for dessert (but very different from the one-sided affair of last year!,
with the Peach trees, the Grape, the Orange, the Plum and the Cherry tree in pots, tastefully interspersed either in vases or on pedestals-we can easily picture a beautiful sight, and something which is yet to be seen. It appears that this schedule is only the prelude of a much grander fruit display which is to take place in September, when we may reckon on the gardeners from quarters, and may I part in the fray. I say from all the far north will not longer exempt themselves from taking part in some of the classes, from which there is no obstacle differing much from that which their southern friends have to contend against. Let [us take Pines, Melons, Peaches, and Nectarines, \&c.. These can be packed to send to any distance. We have seen Peaches from Ireland, and compete successfuliy too why not Peaches and Pines, \&es, from Scotland? The advantage of it? Methinks I hear them say, "give us your climate." I admit for out-door fruits we have things earlier, but I hesitate not to say that for early forcing they
bave all the advantages which we poseess, Let us therefore see to it that there will be flower and fruit displays at Sydenham commensurate with the liberality or the spirited directors, and worthy of being holden in the precincts of the grandest of all gardens,
splendid of all palaces. Geo. McEven.
Furniture in Gardeners' Houses.-On coming up to the entrance gate of one of our London nurseries the other day, I observed a cartload of furnituref which had
been brought by a gardener been brought by a gardener from Yorkshire. The carter was told to take it to the gardener's lodgings,
where it will remain till he obtains another situation, where it will remain till he obtains another situation,
when perhaps it will be sent 200 miles into the country. It is well known that when an English gardener leaves a place he has either to drag his furniture about in this way or sell it at a great-sometimes a ruinous-sacrifice.
Now, will you allow me to say that this state of things ought not to last, and that if you will lend us your aid we shall see happier days. If a gardener on being having his cottage furnished, the proposal appears having his cottage furnished, the proposal appears so you would undertake our cause, methinks maany gentlemen would be induced to listen to the suggestion or solicitation of the new comer. You would thus confer a great blessing on poor gardeners, for which I am sure
they would be grateful. In Ireland it is usual and general to furnish the houses of gardeners and bailiffs And why should it not be general in England? A trifling outlay on the part of the employer would cure the evil Twenty-five pounds would purchase all necessary furniture except bed clothes, which are easily moved about. This furniture would be considered fix tures-permanent improvement on part of the estate and for which 5 per cent. might be charged in the annual balance sheet. An Old Gardener.

\section*{Jocirties.}

Britisa Pomological, Feb. 4.-(Extraordinary meet ing),-Mr. Glendinning in the chair. The subjects o exhibition on this occasion were Pears, Apples, and
Grapes. Of the last named fruit Mr. Tillery, of Wel Grapes. Of the last named fruit Mr. Tillery, of WelTripoli. Concenning the former, Mr. Tillery reported that it was one of the best white late Grapes he had, usually keeping in good condition till the end of March. Like Muscats it was stated to require fire-heat in there was sufficient sunshine to give it colour. Mr Rivers contributed a collection of Pears. Amon them were Josephine de Malines, a first-rate variety very juicy and melting, and will keep till April Zepherine Gregoire, melting and even more juicy than the last, also a first chas soat; Beurre Langelier, of the preeding bupare with which it garded to be only second rate; Jean de Witte Doyenné Gris d'Hiver, a middling good kind; Easte Beurre ; Bezi Esperen, said to be an extremely useful hind, well flavoured, hardy, and an abundant bearer, but in some soils lisble to crack; likewise Beurré Sterkmanns, a crisp, sweet Pear, but in this instancerather coarse fleshed, and one or two other kinds. Mr. Perry sent a collection of Apples and Pears from the neighbourhood of Spalding. From Mr. Kitto came specimens of Golden Cluster Apple, a good late keeping
examples of Scarlet Nonpareil. Dr. Davies, of Pershore, dessert Appie in that locality, and others, toyether with a seedling from the Sturmer Pippin, which was, how ever, inferior to its parent. Mr. Barratt, of Wake-
field, sent some Apples and Pears, all of them small in field, sent some Apples and Pears, all of them small in
size ; but some of them excellent in flavour. Ayples and Pears also came from the neighbourhood of Ipswich. Mr. M'Ewen, of Arundel, directed attention to the desirableness of offering prizes at these meetings, a matter which, after some discussion, was left to be
settled at a future meeting. Five new members wer elected.

Linnfan, Feb. 5.-The President in the Chair. H. Christy, Esq., and A. G. More, Esq., were elected of the habits of Atypus Sulzeri," by Mr. E. Newman. This spider, which was recorded as British by Dr. Leach, had not been found subsequently until last autumn, when it was met with near Hastings by Mr. Brown, of
Cirencester, whose observations on the insect and its habits Mr. Newman records. Mr. Brown thinks these rare spiders may be found scattered along the southern coast of England wherever the Hastings sand predominates ; this kind of sandy soil being congenial to its burrowing habits. 2. "Note on a Fungus found imbedded in the fens of Cambridgeshire," by the Rev. M. J. of Polyporus the museum at Kew there is a specime Mr. Hailstone, from the fens of Cambridgeshire, where it had occurred along with bog Oak, and must have been buried for centuries. The specimen is so perfect as to show the peculiar substance of the pileus, both as regards colour and texture. It perHooker. 3. "Notes on Loganiacees," by G. Bentham, Esq. A portion only of this monograph was read. The Loganiaceæ, Mr. Bentham remarks, can scarcely be said to constitute a natural order, but rather one of those knowledge of plants we are obliged to interpose between some of the creat families to receive anomalous senera rejected from them. Our natural orders, with all the improvements they have received from the most philosophical of modern botanists, are yet as dissimilar in definiteness of circumseription and apparent conformity to nature as they are in extent. After some extended philosophical remarks on the limits of natural orders, Mr. Bentham observed, that almost the whole of the Loganiacese lie very near to some part or other of the rast field of Rubiacere ; and he then distributes them into four groups, the Antonieæ, Euloganiaceæ, Fagreeer, and Gærtnereæ, standing opposite the Cinchonacese, Hedyotideæ, Gardeniex, and Cofferex, in the group of Rubiaceer respectively. The remainder of the paper number, and an enumeration of the species, with characters, \&e.

\section*{Rottct of 玉ooks.}

Dr. Sandwith's Narrative of the Siege of Kars (small vo, Murray), told as it is by one of the gallant deenders of the devoted city, will be read by all who take an interest in that country which may be the next
scene of warlike operations in the East. The work ensists of two parts; in the first the author narrate events up to the time when the city was invested; the second is a diary of the succeeding events up to the day when he reached Batoum, after being honourably dismissed by the Russian General Mouravieff, in consideration of the kinduess with which he treated the wounded prisoners who came beneath his medical care It is difficult to read Dr. Sandwith's account of the causes which led to the fall of Kars without disgust and indignation; nothing can be more clear than that the Allies must take matters into their own hands, if they are ever to recover Asia Minor, one of the richest countries in the world, from the curses of misgovernment and peculation. In this respect the course taken by the allant Williams will serve as a guide to his successors How all this was, is, and will be, the reader may learn from Dr. Sandwith's interesting pages. The tale is old indeed and so wants novelty, but it is one that cannot be too often repeated
The reader will find much to instruct him, besides politics, in the account which the author gives of the climate and productions of this litte known part of th world. He speaks in glowing terms of the riches of the mines of copper, argentiferous lead, and coal, of the excellence of the iron of Sivan Maden, between Kharpoo and Diarbekir, which he describes as being highly car bonised and "superior perhaps to any in the world," of the glorious forests, and the general fertility of the land, except on the higher ranges of the mountains, which are almost impassable in winter. Gumush Khane a place on the road from Trebizond to Erzeroum, famous, he tells us-
"For a delicious Pear which much resembles the Jargonel. I have heard it surmised that this Pear is of English importation, and is one of the traces of an English settlement of one or two centuries date; this 1 apprehend to be an unfounded idea, engendered perhaps by nationsl vanity, which will not allow the poor Turk to have even a good Pear of his own.
As to the mountain passes, those who imagine that
troops can be taken over them in winter will perhaps change their opinion after reading the following descrip
inn of what happened to the author in the beginning of December, when attempting to reach Batoum
"We at last reach :he hishest ain ; our horses are the highest plateau of the mounrolling lorses are staggering; each man has been through drifte over in gullies, and drazging his horse she during the last three hours; we none of battle for life. We then come to the worst drift of all it is a valley in which the snow has accumulated."
"I am searce able to fight my way through this hor
 for a time even to struggle. My left hand and left for a time oven struggle. My left hand and lef and exhausted in the snow' by the side of my faithful steed, who has given up the game as lost a little reflection, and a little recovered breath, however, teach me that li'e is worth one more effort. At last I rise and myself and horse are fairly landed on the opposite bank, which, being swept by a fierce wind, is almos bare of snow ; and here I lie down again. In five minutes, however, I scramble into my saddle, and turn to look at my followers. My own servant Ismael ha escaped, and is standing by my side. He reports tha all my bere lost, and that one of my horses is perfectly helpless. Some of the other people are stil struggling in the snow, but Khurshid Effendi is fairly buried in the drift, and has lost all power of saving himself ; he raises his arms like a drowning man, an cries feebly "aman, aman" (mercy, mercy). Mehemed a muleteer, asks permission to try and recover one the him to look first to Khurshia Effendi. A stout soldier now rushes forward, and by immense efforts drags the poor man out of the snow, more dead than alive. I drect some men to the him on the pack-sadule of a horse, which had been saved at the expense of its load. Khurshid's own horse has straye down the mountain, and is irrecoverable.

We now reassemble ourselves and turn to face the most frightul hurricane. We ride on over the crest of a trackless mountain, blinded by snow, and half-frozen Hussein, suddenly pulls up, tells me he is lost, and asks me if he should turn and try to find the road back again. This I know to be a matter of much greater difficulty than it would have been an hour ago. Some of the peon fle 11 minute, an the ber reflect well for five minter, and then act for the best, as he is the only man who knows anything of the
country. On this the Mollah pushes on, and we follow, hoping to escape, yet fearing that our destruction is still far from improbable. The cold is terrible, and my servant ismael very drowsy, which disagreeable symptom I never felt. After an hour's ride we at length find lantmarks, the Kurd exclaims, Elamdurli'llah ! (Praise be to God), the road is clear ; and the words are echoed through the group, and most fervently responded to by myself.

Russia: its Rise and Progress, Tragedies and Revolutions, by the Rev. Thomas Miner (Longmans, 8 vo , pp. 500), is a skilful abridgment of the history of that country from the earliest period to the death of the Emperor Alexander at Taganrog. The narrative is angement good, and the fact chosen judiciously. It is by far the best abridgment of Russian history which we have seen, and is most welcome in the present state of our political relations.
We have received a small catalogue called Notes on Plants of which the Seeds are imported by Geo. Roberts, but as we do not know what acquaintance Mr. Roberts has with the plants he professes to describe, and he ouly say say where "judy for yourselves." That the statements are not to be implicitly relied upon will be seen by the following extract:-"Crotalaria verrucosa. -A beautiful species with purple, blue, green and white Howers, with anthers of a golden yelluw." Now if the reader will turn to the Botanical Magazine, t. 3034, in which he will find this plant figured, he will learn that it is a mean looking Pea-flowered annual, the greater part of whose blossom is white tinged with green fintly stained with lead colour, and with a deep dull purple stain at the end of the wings; no "golden yellow anthers" are visible, those organs being completely
concealed, as in most leguminous flowers. In like manner Crotalaria retuss is called a spleadid plant with very large golden yellow flowers, the standard of which is sometimes a bright purple." We will no complain of the application here of the term splendid, for that is a matter of opinion; but we must say that, petal, to tell buyers that it is sometimes a bright purple is not a fair description.

\section*{Garden Memoranda.}

Holland Houss, Kevsington. - The conservatory here is now gay with Camellias, which are planted out in the borders, and many of them large plants. A specimen of the old Double Striped, quite 15 feet in height, is literaly covered with blooms also many fine flower open on it, while the Myrtle-leaved kind and the Ol Double White are not yet in bloom. These last, there fore, form a good succession to the others, and thus by
means of Camelliss alone this house is kept dressy fo weeks together. Arranged along the ceatre of this coesen
vatory are the noble Urange trees wo wher w
and all of themes. Many of them are
ot been tubare have not been re-tubbed for years, but they are annually top dressed in spring with old hotbed manure which keep them in good condition, and at the same time some cowdung and clay mixed is put round the sides of the ubs inside, so as to prevent surface waterings from passing off between the tub and ball without moistening the centre of the latter. This has been found in eummer to answer perfectly, but in winter it is removed for fear of its keeping the soil too wet. The tubs in which these trees are growing are set on feet and made to take to pieaes, so that the state of the roots can be kept in view has been however to preserve the trees in health in as amall tubs as possible, and therefore whes the trees have been found to require more root-room instead of placing them in larger tubs, the size of the bal bas been reduced and fresh soil added, and thus the tree have been induced to content themselves in tubs of manageable dimensions. The plants of Fuchsia coral lina on the square brick pillars which support the roo of the house, and which in autumn are covered with flowers from the ground to a height of 15 feet, are at present receiving their winter pruning, which consists
in divesting them of all useless spray, and spurring them close in like Vines.
In the open ground two plants of Rhododendron atrovirens are at present masses of small purple blosaoms which at this comparatively flowerless time look anusually handsome, and on some Apple trees on the awn were several very fine bunches of Misletoe, the oright green of which contrasted strikingly with the long leafless branches from which they were suspended. This favourite parasite took possession of these rees naturally; but it may be readily estabished artining the seeds on the ung slits in the bark and in erting the seeds the under sides of the bughis, them. Some young fruit trees in an orchard, which was planted here some six years ago, have borne excellent crops both in this and previous years. The ground in the first instance was old pastuxe trenched 2 spits deep; but it has all been retrenched this autumn, so that the old turf has been brought again to the surface, and it is expected that the partial root pruning which the trees have thus received will have the effect of checking exuberant growths, and thus render them even more
fruitful than they hitherto have been. The flower buds fruitful than they hitherto have been. The flower buds on Apricots on walls are very forward, and should the present mild weather continue, they will soon be open. early spot.
In the kitchen garden Peas are coming through the round. The sorts are Sangster's No. 1, Early Frame, and Prince Albert. The first has been found from ex perience to be the earliest.
Mashrooms are grown here in triangular ridges in the open air. The horse-droppings are placed in the centre, and, after being spawned, are covered with soil nthe usual way. Hay is then put over the ridge, and straw protections. In this way abundauce of Mushrooms are secured. A bed put up in September last is rooms are secured. A

Bedding plants, of which immense quantities are wanted every summer, are wintered here in old Cucumber framess covered with mats. Verbenas and other things succeed well in this way; the tops of such kinds as are found to be scarce are taken off them about his time, struck and hardened off in turf pits, which, like the Mushroom beds, are covered with straw hurdles. These pits are also found to be useful for Early Potatoes, Radishes, \&c. The Potatoes are planted a little bottom-heat of dung and leaves.
The beds in the flower garden: have all been dug, in order to prepare them for their summer occupants ; in rithin the place generally is neat anu clea, and

PLANT DEPARTMEN
Consbrvatory, dc.-This house should now be nearly as gay as at any period during the whole year. Any orthwith to some of the houses at work ; a moist atmo sphere, a temperature averaging \(65^{\circ}\), and a slight shade in bright weather, are the requisites in order to cause them to produce wood freely and large healthy leaves, Stove.-Some little increase of temperature may take place here, and that chiefly as before observed in the atemoon by shutting up early, at the same time usin sufficiency of moisture. Look over the fastenings of Orchids on blocks or in baskets, and renew the wires and otberwise endeavour to keep in check all similar pests. Examine and shift all plants that require such ttention, and cut back kinds which it may be desirable ouncrease after flowering, in order to get a supply of cuttings.

FORCING DEPARTMENT
Late Vineriss.-Where it is desirable to have Grapes fresh and plump after Christmas, a house should be devoted to the parpose ; and if the kinds selected are the true varieties of St. Peter's and the Barbarossa as black Grapes, and the White Museat and Charlesworth's Tolkay for white ones, cultivators may be satisfied that
on this point assert that Grapes should ripen in eptember to keep well; we have, however, found it very difficult to keep Grapes ripening at that time fresh throngh January. As our Vinery is very steep, we may perhaps obtain more light in November than some others ; but, certainly, we have ripened Grapes in that month of the above varieties (excepting the Barbarossa), which have been equally well coloured and flavoured as hose ripened at a much earlier period ; and we managed tieep the leaves green and fresh through the greate part of Jannary, by simply covering the borders with arm litter, to preserve the rools in action. We name that period. To phain the above, we ale the to prevent their breaking before May. Bring on the successional forcing houses, and pay every attention to the regulation of fire-heat, and admission of air. The
and bunches in the early house will now require thinning hich should take place directly the berries are di cernible ; aim at doing the work principally at the first nor allow anything greasy to touch wem. Keep the our allow anything greasy to touch them. Keep the ing apparatus twice or oftener daily, but not during sunshine. Peach House-Go over the newly set frui, and give them a slight thinning.

\section*{flower garden and shrubbery}

The demand for bedding out plants (in the spring) is frequently greater than the room devoted for their wintering can supply. It will in this case be necessary to commence propagating to make good the deficiencies. For all the soft-wooded and free growing plants a suffice ; fill up to within 10 inches of the class, upo which place 4 inches of dry sandy soil, in which the cuttings may be put directly you can procure a young growth for the purpose. As the display of flowers aring the early summer months depends mainly on the arm of the stock at planting time, it wil sadincrease the size and healthiness of the plants by its or frames out of their pots or cutting pans. them to grow in, and if 6 inches of this is placed over very light bottom-heat, the plants will soon make rapid growth; and you will have the advantage of an abunance of cutting for propagation, if wanted. Calcen hrias, Petuias, Verboras, and such thinge, answer bes for this; but where time and pot room are objects,
scarlet Geraniums, and nearly every variety of bedding. out stuff, may be managed on the the plan. Befor planting time the plants should be checked by raisin them once or twice with a spade. Put in root cuttings, in a brisk bottom-heat, of Bouvardias, and some kinds of Geraniums difficult to strike in the ordinary way, or of which cattings are scarce to be got. Sow in small pots Mauraodyas, Lophospermums, and other plants o leasure-grounds swe strog by May. Kocp down moss.
hardy fruit axd kitchen garden
The Strawberry plantations will now require going over; for the present, however, allow the leaves of las year's growth to remain, as a protection to the crowns the beds should be cleared of weeds, and a dressing of good rotten dung spread between the rows. We by no ligh forkine will do good, but only to break the crust. As soon as the pruning of espaliers and dwarf fruit trees is completed, let the ground, if poor have a surfacing of manure, and be slightly forked over leaving it rough for the winds of March to dry the suriace, when it may afterwards be raked smonth. Pruning of all kinds should now be brought to a close except Figs, which may yet remain. When Filberts ar closely pruned, a deficiency of male blossoms sometimes
occurs; in which case stick some branches of the common Hazel, having a crop of catkins on, about the bushes Hazel, having a crop of catkins on, about the bushes, to
fertilise the female flowers. Before Peaches are tied to the walls, they should be dressed with a composition, consisting of soft soap, tobaceo-water, sulphur, to which add quick-lime, to give it consistence. Whenever any appearance of scale is found on other wall-fruits, they should be dressed during winter with the above compo sition. Although both soil and weather are unfavourable for committing seeds to the open ground just at present still when necessity compels a continuous supply o vegetables to be kept up, means must be taken to over for both uofavourable seasons and solis. Fortuately and with such auxiliaries the cultivation of vegetables in unfavourable seasons becomes easier in proportion to the artificial assistance employed. To provide, therefore, against failures in the crops already sown, or where the climate is too cold to trust seeds for the present to the open ground, we advise sowing Peas, Beans, Spinach, \&ec., in addition to the kinds named in our last Calendar ; good early varieties of the former
should be selected. They may either be sown in small pots for the more. They may either be sown in smal or when the quantity isansierring to the open ground of turf 12 inches long, and 4 or 5 inches wide; turn the Grassy side downwards, and form a channel along the centre of the now upper part, in which sow the crop as you would in the open ground. Place the turves under lass, giving air, \&ce, as the plants progress, removing to which, with the turves, require merely a trench being
about 2 inches.
An important crop for cottarer is
As difficult to persuade themgers is the Parsnip, yel like the Potato liable to be ruined by disease, all kinds of stock will eat it, and it will succeed on almost any zoid A good way to keep it in winter is to spread over the crowns in November the manure that is intended for the next crop and to trench them out as wanted, leavin the soil in ridges. The ground for Parsnips should b trenched, putting the manure in the bottom, and the seed should be sown in drills 15 inches apart
state or the weather at chiswick, near london,

\section*{Che agricultural Gazette.}

SATURDAY, FEBRUARY 16, 1856.
Sound doctrine and mistaken practice in thr rrlationship of landowner and tenant have both lately received striking illustration in instances occurring singularly near to one another, both in locality and in time. Mr. Grex, of Dilston, has lately delivered a lecture on "the Daties of Lasd-
lords and 'Tenants," before the Hexham Farmers' Club, in which, although the details of the bargain
between the two were not discussed, it was plain that the recommendation given to the former was to abandon, more or less, the strict rights of ownership in consideration of the higher style of agriculture hereby encouraced in the latter. Leases for long terms of years, and leases of large farms, both o them involving considerable abandonment of the original rights of ownership, were plainly the main points on which Mr. Grey laid greatest stress and although the details of the lease are to form the subject of his second lecture, not yet spoken, the principles which he already has enunciated obviously tend to the establishment of a tenancy as nearly resembling ownership as may be daring the term of a lengthened occupation. That, then, i one side of the pieture.
The other side gives us the history of a passage in the existing relations between an owner of land and its occupying tenants in the same county There is nothing which the Duke of Northumber rand has done, in the matter we allude to, which it was not fully competent for his Grace to do. The articles of agreement on which he insists as the only terms on which his land shall be let are quite within his rights as owner; and Mr. Wetherale, his tenant, who has given up his farm rather than bind himself to their performance has no legal grounds of complaint, that we are aware, on account of the loss that he has sustained. The policy of a relationship such as the owner has here insisted on-such as the tenant has declined-is, nevertheless, a perfectly proper topic for public criticism and discussion. The impolicy of old-fashioned articles of agreement, handed down hy copy after copy from models of a century ago, stands out boldly and therefore use-fully-when, as in the case before us, their proper fruit is borne. No tenant of intelligence and resolution and ability-if he be a free agent-will undertake the cultivation of land except on conditions which permit the exercise of that judgment by which he expects his capital to yield its anmual return.

The Duke of Northumberland, just as any other landowner, may, however, refuse to allow the growth of Hemp, Rape, Turnip, or Flax as seed crops. He may require a rent of 102. for every acre above a
certain cuantity which shall be in Potatoes in any one year-manured with at least 12 tons of manure to an acre. He may require 5l. an acre for every zere of arable land on which more than two crops may insist that all the dung made each year shall each year be used and spread - that a certain length of fencing shall each year be cut destroyed-that twice in every year, at proper Whins, the Rushes, Thistles, weeds, be mown, and Whins and Brambles stubbed up which shall be found growing upon the pasture fields, sides o arable land, and in the lanes and hedges adjoining the premises: and in case the premises are not
repaired, the moles destroyed, and the Grass grounds :caled, the hedges and fences properly cut and scoured, and the Rushes, Thistles, and weeds twice mown, and the Whins and Brambles stuhbed up withir two months after notice by the landlord or his agent, he may employ proper persons to do the same, the expense whereof shall be paid by the
tenant, to be recovered the same way as rent and arrears.
It is perfectly competent for the owner of land to require and do all this, or even to descend to still greater detail, and enforce his own mode of cultivation with minuter particularity-connecting every departure from his rule with a severer
penalty than any named in the particnlars of agreemeat before us.
All we say is that such a resolution produces its natural fruit when the land as its consequence falls into the hands of an inferior order of men, as to Wiligam Wetherall of Kirkbridge pointed out to William Wetherall of Kirkbridge pointed out to
his landowner that some of the conditions to which he was thus required to bind hinself were impossible of fulfilment-that others were unjust when taken in connection with those on which he had entered to his land. It needed no one to point out that in his case no stringency was needed to ensure good cultare-that had already been exhibited. His owner-the premiom as the best cultivated in the district. And the list of names appended to a circular on the subject proves that Mr. Wetherale is esteemed highly in the north of England as an agriculturist of ability and worth.

The dismissal of such men is the natural consequence of attempts to enforce the observance of conditions such as we have described-that consequence has ensued in the instance before us : and
farmers to such a fully developed case of mistaken
practice, for it is an argument of greater weight than words in favour of the sound doctrine taught by Mr. \(\mathrm{G}_{\mathrm{Rex}}\), at Hexham, on the relative duties of landlords and tenants.
The question of Agriculutural Statistics may be said to have been at last fairly grappled by English
farmers at the meeting of the Farmers' Clab last week, when a resolution decidedly in favour of a system "on broad and equitable principles," proposed as an amendment, was adopted by a large
majority, after a most interesting discussion, not more remarkable for the spirit displayed by those friendly to the accomplishment of ample annua returns of the kind and quantity of cereal products, than for the admissions and approach to acquiescence of those previously adverse to any general scheme involving a disclosure of the results of each farmer's
labours. The introducer of the question, Mr. Wililams, acknowledged he was in some measure influenced by the prospect of a compulsory measure, yet admitted he was "decidedly of opinion that no nation ought to continue in ignorance of its capabilities of "producing the first necessaries of
life," and that "however his brother farmers might dislike to make any of their business or private matters known, the good of the country at large required that once in each year the quantity of corn the kingdom has produced should be known." The plan he propounded contemplated only a statement of the acreage under corn cultivation and Potatoes, could not be made. We know that this produce could not be made. We know that this opinion is largely prevalent, and it is the main argument against any inquiry into the probable quantity of corn grown in each year, but is it not the fact that in each year a nearly accurate estimate is arrived at all over the country before the harvest is closed ?-and may we not safely assume that if a valuer or an enamerator taking
2000 or 3000 acres should compute too largely, yet that among 1000 or more persons so employed the number under the mark might be expected to fully balance the excess of those counting too much. The estimates need not be completed until the middle of September, by which time many parcels would be tested by threshing so as to sufficiently confirm or raise
a doubt upon the aggregate returns. And why should these returns differ from the known quantities of Hops grown in consequence of a duty being paid by each grower? Is it therefore an inquisitorial system? Does any prejudice arise to the cultivators of Hops? And is there any just cause why a similar account should not be rendered by each grower of corn or feeder of stock
Mr. Sydney, of Peckham, said truly that "every farmer was most anxious, above all things, to know the price of corn, and what it was likely to be," and Why therefore should every farmer be himself unwilling to furnish the information that would assist others in forming a carrect opinion ?
We gather from this debate that one and a main step is fully established, viz., that information is wanted even by the farmer, and must be supplied. There is
some difference as to the extent to which it should be furnished, and about the means to be employed It is perhaps not of much moment how much may be at first required, as when once it is fairly carried out so that a close approximation to reality is obtained the advantages will be so obvious, the objec-
tions will so thoroughly vanish, that as much knowledge as is requisite for the alleged parpose of the public good will no doubt be cheerfully rendered by most, if not all, agriculturists. And with a little more inquiry and discussion the best means will be-forthcoming. Intelligent men should be employed, and they must be, if possible, persons conversant with the details of farming business, as
if undertaken it should be faithfully and skilfully accomplished-it would then redound to the credit of farmers, and be of infinite service to the country.
We may add that the resolation proposed by Mr. Wiluiams, while it recommended the farmers of England to unite in cheerfully giving the acreage of their crops of Wheat, Barley, Oats, Rye Beans, Peas, and Potatoes, stated that as regards the acreage of green crops, and the returns of the numbers of different kinds of stock, the Club considered it could lead to no practical result, being of
too inquisitorial a character to be entertained, and likely to have an injunous effect on the grower, inasmuch as it would affect the market value of his commodity. As regards the present system of taking the averages of the price of corr-that, it stated, was conducted in so careless and disreputable a manner that an alteration in the law respecting it is impe ratively called for. It recommended that a uniform system of measure for the sale of com should be adopted and enforced throughout the kingdom, and
should be got u
several measures.
On this Mr. Oaklef, of Doughty Street, London, moved the following amendment, which wa seconded by Mr. Bidwecl, of Ely: "That a system of agricultaral statistics, carried out on broad and equitable principles, would be of general advantage to the country: And that the present plan of takin the average price of corn is conducted in a manne so careless and inefficient as to imperatively demand some alteration." The amendment being put was carried by a majority of at least two to one
The amendment thos carried is more favourable to the progress of the contemplated measure than the original resolution-and its adoption by so in Guential a body of the Farmers' Clab is a great step in advance.

\section*{STEAM-CULTURE REVERIE.-No. IV}

My friend, Mr. Digland (for he will not be displeased t my naming him) reminded me that many of the early nventions for propelling carriages by steam or other wellinge-the rack-and-pinion railways, were not prot peling thenselves bycruch, "pare" plo without their suggetions the history of ate plaging and cultivatiog, and that the history flean is therefore bound up to some extent win hat motion, motive power, and railwaying in general. But his own collection of schemes includes only such as were specially designed for field work; and my references to other inventions will be merely to iliustrate the origin and nature of those that are purely agricultural. Of the amusing diversity of steam coaches intended for common roads, which threw many a steady-faced nag into a frenzy 20 or 30 years ago, and were expected to help the farmer's teams after they had relieved the roadsters -I found not a single specimen. And indeed my friend's mechanical mo
He had firmaly embraced the opinion that a steam Hi her of cart breed is too heavy an animal to be employed in merely travelling over arable land, dragging implements behind it; still for the sake of testing the principle, he had not omitted to try the earliest proposed engine purposely adapted for traversing ploughed ground. This was patented by Joseph Reynolds, 9th January, 1816, and without staying to detail what I saw of its performances, which were must tion. Being mounted upon three wheels it avoids that rack of the carriage-frame apon uneven ground which is occasioned by having two pairs of wheels. By an ingenious system of gearing, the two broad roller-wheels sustaining the principal weight, can be turned in opposite directions, by which means the carriage can turn "om an area of its own length." One roller can also be driven the same way but somewhat faster than the other, for traversing a curved track. The chief feature, hor ever, is that the boiler is suspended in such a mannes as to preserve a horizontal poaition while ascending or descoling a gradient And this involves no dificnlt in cenaring grading crank-shat \& fixed gearing, as the biler alo bein fixed upon the it is aupported moveable vertican, - can be raised or depressed at bearing at one end and can be raised or depressed the other, the steam pipe supplying the cylinders

Careful sunf wasto money upon a repetition bygone experiments, Digland contented himself with relating to me the history of Heathcoat's steam-plongl, and also of one or two other similar inventions, althong he has manufactured and worked some ploughing machinery of a more novel description. In 1832, M. Heathcoat of Tiverton, the well known inventor of the lace machinery, brought out the first steam plough ever put into actual operation, in which the ploughs were drawn by ropes, to and fro between the principa auxiliary carriage sustaining a pulley a considerable distance The platform carrying the engine with its distance of. The plation carrying the engine with is machinery of wheels and barrels was suppor orer larg endless flexible floor or railway extence over This drums, in order to prevent its sinking in soft and. part of the invention was founded upon a very old
posal. In 1770 Mr . R. L. Edgeworth patented an posal. In 1770 Mr . R. L. Edgeworth patented an "ess railway," In 1821 Mr . Barry patented a contrivane enabling a carriage to carry its own railway, or rathe to take up one pair of running wheels and set dow another pair, so as to step completely over a stone or other obstacle, instead of rol a perpetual rail way, cot sisting of a very large hollow cylinder, within whic ocomotive engine was placed, the cylinder rolling whe the engine clith is 1825 , also, Sir G. Carloy patented an apparatus resembling Barry's, a weries of friction collers attached to two endless chains coming successively in contact with the ground, so as to step instead of rolling along the road. All these contrivances, however, as well as Heathcoat's, have been eclipeed for simplicity and easy action by Boydell's "endle way." Heatheoat's "pulley" was monnted orward at intervals according to the breadth by the plough by means of a wiach to offer
This carriage was weighted so as the
resistance to the drag of the rope, band or c
he engine; but stakes or posts driven into, the soil at
proper distances and connected with the pulley-carriage by cords or chains were also proposed. The plat
The patent also includes another form of engine earriage, mounted upon three broad rollers or drums, intead of the broad endless bands. The steam-engine ther, propels itself at a comparatively rapid pace serving as a heavy rolling-machine, to consolidate the soil or crumble clods The steering wheel or rolle does not turn upon a transom, but its axis is set at an ack and pinion acting on only one of its bearings.
In the years 1835-6 this invention was repeated tried upon Red Moss near Bolton-le-Moors, Lanceshir ander the superintendence of Mr. Josiah Parkes, C.E. ; indeed, it was chiefly designed for cultivating such boggy waste lands as are of too spongy
character to sustain the feet of horses ; and th engine boiler was purposely constructed for consuming peat fuel. The results were that two ploughs were actuated by an engine capable of working up to \(\frac{1}{2}\) miles per hour, each turning a furrow of fibrou Moss 18 inches broad by 9 inches in depth, and completely reversing the surface. Each furrow of 220 yards in length (between the engine and the pulley) was working day of 12 hours the two ploughs could tur ver 10 acres. The engine was stationed, or rathe slowly propelled itself midway between two pulleycarriages, working one plough on each side; and thus bad to advance only 11 yards, while the two ploughs had unitedly travelled \(5 \frac{1}{2}\) miles, and ploughed an acre of land. The power required for each plough was estimated at about 12 horses; and the weight of the sod operated up from the point to the heel of the imple needed for the management of the apparatus, being at he rate of nearly one man per acre. These details ar applicable only to the first heavy process of breaking up bogey land ; but the deep culture and subsoiling of stiff elays, demanding a great amount of power, would araly prove less expensive.
But steam-ploughing was proposed not only for the Mr. Alexander Mand but also for one of our colonies. in the working of the sugar estates of British Guiana directed his attention to the occasional necessity fo patented somitivation by manual labour, and in 183 This was constructed by Mesers. Edington and Sons, of the Phonnix Ironworks, Glasgow, and tried on the estate of Possil, near that city. The cultivated land in Guiana being very flat, the fields are laid out with navigable canals on each side, these running parallel to each other machinery consists of a steam-engine contained in a punt or iron boat on the canal at one side of the field,
and of a large pulley, contained in another punt on the and of a large pulley, contained in another punt on the other implements are secured to a carriage mounted on four large wheels, and to this carriage one end of a rope or chain is attached, which passes twice or three times round a drum upen the engine, then proceeds fter passing carriage to the pulley in the other punt, an there secured. The drum revolving by the power of the engine draws the implement carriage across the field; and on the motion being revese, the carriage travels back again. The punts are shifted a sufficient
distance onward each time the plonghs reach the end of their furrows.

As I have said before, these two proposals, essentially the same in principle but varied in detail to suit par-
ticular cenditions of soil and locality, have been lately reproduced in a more practieable form, thus renderin any renewed trials of the original designs perfectly needless. In my next paper i shall describe machinery upon which my spirited friend has ventured to bestow some of his pecuniary and other talents. I. A.C.

\section*{FARM BAILIFFS}

In the Agricultural Gazette of the 7th instant. correspondent, who very modestly terms himself "A Novice," pours into your friendly ear the doleful tale of his perplexities in the pursuit of information as to
who are farm bailiffs, or who ought they to be. who are farm bailiffs, or who ought they to be.
Having had the misfortune to belong for several years Having had the misfortune to belong for several years
to that very useless class of people, I trust you will kindly permit me to give your correspondent the benefit of my experience so far as it goes, and I hope he will rise from the perusal of these remarks a wiser and more enlightened man on the, at present to him, myaterious subject of bailifidom.
"A Novice" divides the class of bailiffe into three or four difierent oxders; I would be inclined to divide it into two-first, bailiffs who are required to supply brains and experience for their employers benefit;
and seoondly, bailiffs who need not possess any greater amount of intelligence than what is merely safficient to enable them to act as they are bid, without thinking anything about the matter; the employer in
this case engaging to find the brains, whether he does so this case engaging to find the brains, whether he does so
or not. The first class I am sure "A Noviee" will allow ought to be placed on a respectable footing, second class, any sort of men who know the difference
provided they are contented to become the patient and ncomplaining scapegoats of their employers blunders. As your correspondent writes for the purpose of
cquiring information first, ws to what farm bailiffs actually are, and next, what they ought to be, it will perhaps be as well if 1 briefly allude to the differen rates. The first he mentions are Scotchmen, whom he considers well enough versed in their national system of farming, but when transplanted to the more geni south, must be acclimatised, and, at the expense of thei anfortunate employers, must serve a second apprenticeship in peeping over their neighbours' fields for the England. Now, even at the risk of being considered egotistical by your correspondent, I shall take the liberty of taking my own case as a case in point, and will show you what sort of second apprenticeship I ould have served had I derived my professiona knowledge, (perhaps that is too fine a phrase for
Mr. Novice,) from "a few peeps over the hedges of the fields of the neighbouring farmers to get an idea of their customs.

I would have learned that draining to depth not exceeding two feet was far preferable to going four feet down; that removing Couch grass or
any other weed was only incurring unnecessary any other weed was only incurring unnecessary to twenty inches wide, and leaving the plants six inches apart, was a much better plan than ridging or thinning at greater distances; that the perfection of haymaking was to bring it to such a degree of heat in the rick as to make it as brown as possible or even black, provided we did not require to call in the aid of the fire engines to extinguish the flames; that hedges fifteen feet high and having a base of twenty to thirty feet wide was beautifully rural prospect; that it was more economical amount of work that two smart animals yoked sbreast would accomplish; that ploughing should never excee hree inches in depth; that Turnips and straw should nvariably be sold, instead of converted into manure on the farm where they were grown ; that-but in short, I should only be occupying too much of your space, and trying your patience, were I to enumerate all the lessons I should receive by peeping over the hedges. The ample \(I\) have given is surely quite sufficient to con correspondent next mentions s class "said to be numerous," a class of clodhopping exquisites, redolent of Macassar and brilliant in patent leather boots, kid gloves, Brummagem jewellery, and who, Ducrow-like scour the country bestriding "two or three horses," During twenty years' experience I bave mixed with all sinds of farm managers, and I must say I have neve yet met with a specimen of this "said to be numerous" class; and unless existing only in the verdant imagina tion of "A Novice," I would strongly recommend tha the very first occasion on which he meets with one answering the description, he proceed at orce to Palace, there to occupy a a niche amongst the curiosities of the nineteenth century.
difficulties, next prow pursuit of knowledge undex what he very properly terms a "hybrid" classification genus bailiff, namely, those who profess to combine the occupations of gardener and agricultarist, " two single gentlemen rolled into one." That there are men filling compoud situstion of this ili, ay, aid evo forester is like the blin ance bai. gardener, and forester, is, not their fault but their misfortune. This fact-for an undeniable fact it is-arises, not from any desire on the part of a gardener or bailiff to fill in his own person a plurality of offices, but partly from the entire
concern being often on so very linaited a scale as to preclude the possibility of finding suffient employment for more than one person, and in such a case it will usually be found that the garden occupies the most prominent position. This is, however, only one reason another, and I am sorry to say perhaps a more genera one, is the short-sighted niggardliness of many employers. An establishment of considerable pretensions must be maintained, without the owner having either the heart, or it may be the means, to keep it up on a cale commensurate with its pretensions. Hence we find in the pages of every advertising paper advertise ments for men wanted to fill the combined situation of gardener and bailiff, and it may be forester, with the splendid offer of perhaps 40l. or 45l. a year, "and the gate-house to live in," as an inducement. Are not these magnificent prospects, Mr. "Novice?" Let us forthwith bring up our sons and our danghters to be gardeners, bailiffe, and gate-openers
The fourth variety of the bailiff fraternity is composed, according to "Novice," of those who, having been unfortunate as farmers on their own account, try to make a living by farming for others; and although your correspondent does not manfully avow his opinion, still any one may see that if be had his will such people should be sent either to purgatory or the workhouse, rather than that they should fill the office of bailiff in no matter how humble a sphere of labour. Did it never occur to a A frovice" that a man may have control, or is he so placed in the world that he cannot be shaken by any of those vicisaitudes to which every
department of commerce is liable, and from which certainly agricultural pursuita are not exempt ?

But the last class he touches upon, and over which he has spread (in the most friendly manner the mantle of his protection and patronage, "are the smock frock or working bailifs." Be it very far from me to insinuate even a shadow of discredit on this generally speaking deserving class of men. I know many casen where the farms under their superintendance are conduetel 1 lithe the and I believe profitable for their employers. Unfor tunately for themselves their early education has in too many cases been of such a limited nature as to preven them from rising in the word, as perhaps their natural bilities would otherwise entitle them to do, and thi very circumstance is the cause why, whilst perhaps per fectly suited to fill the situations they do occupy, they would be "quite at sea" in another appointment fos which a more highly educated man was better adapted If "A Novice" still desires to know who are "the right men for the right place," I must refer him to the two classes into which I divided farm managera, for the man who might perhaps answer perfectly all the requirements of a quiet countryman would cat but sorry figure if placed in a situation of greater respectability and responsibilty. A Clodhopper.

\section*{Home Correspondence.}

Steam Culture.-I perceive that your correspondent I. A. C." has in his third Reverie on this subject again commenced sailing on dry land! It would doubtles prove ediyying to more than myself to hear a little forther of the modus operand \(i\) in detail. In the mighty deep we have paddle-wheel propellers working on transverse horizontal shafts, Archimedian screw propellers on longitudinal horizontal ones, but propelling ploughs on a vertical axis beats Usher out of the feld After this Fisken's heart may well quake for the safety of his sheet anchor, for when ploughs begin to sail up and down the land broadside foremost there is certainly some risk of its being at the opposite headland nearly a soon as his rigger. Again, what is an engine? In the simple times of 1618 was it a spade, plough, or an improved caschrom? "Wildgoose "would doubtlessly have auswered either, and that the first patent for steam-engine, then ycieped under the more glowing appellation of "Fire en
Ramsey in 1630. W. B.

St. Mary-le-bone Bank for Savings, No. 76, Welbeck Street, Cavendish Square-The 26th annual genera meeting of this institution was held on Thursday th 7 th of this month, at the Office, No. 76, Welbeck Stree Cavendish Square, Sir James John Hamilton, Bart, in the chair. It appeared from the several reports read to the meeting that the progress of the bank during the past year had been of a satisfactory description, no les han 2352 new deposits having been made in the last year ; 23,398 deposit accounts remained open on the 20th November last, of which 18,192 held balances averaging less than \(2 l .18 s .8 d_{0}\) each.

Superphosphate, Assuming from Dr. Voelcker's interesting paper in a late number of your Journal that is would be wise to provide more liberally than I had done for the early growth of my coming crop of phosph, 1 was intending to use 8 to 10 tons of saper phosphate. May I ask your opinion as to making it a home or purchasig fough last year al a lower price than ground bones from he bos 5 12 and I see that the doctor puts his bones at 50.128 , an superphosphate at 62. I presume that superphosphate sold at a less price than the bones must either hnve mixture, perhaps of ashes, or must be very damp. The amount of biphosphate which a superphosphate holdas constitutes its value. Will this amount be likely to be manualy affected by want of skim in the procely to arise be merely a portion of undissolved bone? Lastly, if made at home is it better to be made some time before using it. J. D. [You had better buy the superphosphate. Want of skill resulting in the presence of a great deal of undissolved bone of course materially afiects the quality of the result. If you make it your self you had better do so a month before use.]
The Measles in Pork.-In consequence of so large a portion of the pork furnished by contractors for the nso subject known as "messles," at preseut engages much attention here, and many are anxious to obsain information respecting it, On referring to the "Encyciopedis of Agricibes the disease as having its beneath the skin on having its a watery pustules externally of a reddish colour, and there is fever, cough, discharge from the nostrils, and puatukes under the tongue." He further states that the
yields to cooling treatment. Encycloperia,
Swine, p. 952 . Now this deacription in no way to the disease known here as "measles." Thi
is marked by no external symptum, nor is it until the
flesh of the animal has been examined that any one can tell whether or not a pig is infected. By measles we anderstand the presence in the muscular parts of the flesh of pigs of small white bodies, which under a good microscope are shown to be animalcules of a very singular formation, and which, according to some Continental authorities, are merely an undeveloped stage of
the tape-worm. Neither pustules in the skin, discharge from the nostrils, or cough, attends the disease ; nor in the opinion of pig-feeders, here or there, is there any application known by which these granulations can be removed from the flesh of the pig whether in its living or dead state. Pigs infected with measles do not appear to suffer in heallh, on the contrary, the finest looking and fattest pigs are often amongst the worst affected; but the most important part of the inquiry is, Does the presence of "measles" in pork render it unwholesome? The late Mr. Youatt, as quoted in "Stephens' Book of the Farm," expresses a decided opinion that it is unwholesome. Martin, in describing the diseases of leprosy with measles, and describes the progress of the disease to its finale, when the pig sinks a mass of putridity. I have been at much pains to endeavour to obtain correct information on this subject, and have spoke to has known an instance of such finale ; on the contrary, they all believe that up to thorough fatness measles do not injure the health of the pig, and what the consequence of holding over a much infected pig after it has become fat, no one that I can find is able to say. Edmund Murphy, Queen's College, Cork.
[The disease alluded to by Professor Murphy is totally [The disease alluded to by Professor Murphy is totally
different from that briefly touched by me in the "Encyclopredia," and bas much less resemblance to the measles in the human subject than mine, although perhaps it is doubtful whether the latter is properly denominated, the measles having certain characteristics in men which is wanting in animals. Measly pork, which appears so
much more prevalent in Ireland than England, may perhaps be attributed to the gross feeding of the animal, by which means the germ of the tape-worm may be taken with the food, and not destroyed in the digestive process. I should not consider that the pork was unwholesome in consequence. Spooner L. Baily.]
Spring Wheat out of Lea. - Will any of your correspondents be good enough, through the channel of
your Paper, to give their experience your Paper, to give their experience in recard
to the cultivation of the above. I purpose sowing Wheat on a field ploughed out of lea, the said field having lain in Grass for nearly 40 years; the soil is a deep rich
dry loam, about 20 feet above the level of the sea, and situated in a good Wheat growing district. I am afraid of having too much straw, and if so the crop is likely to be laid, and consequently the quality of the grain detexiorated; I am therefore anxious to know which would be the best sort of Wheat to sow, and also the quantity per acre. I have spoken to several farmers in the neighbourhood, and they all agree that the Oat does better than any other cereal after lea. Now, I am
aware that it is common to sow Wheat after Clover stubble in the southern counties, and if such a system could be pursued in the northern counties, I conceive that that "gold yielding grain" could not be otherwise than remunerative. A.C.B., Cumberland.

Covered Yards and Box-feeding.-Mr. Mechi justly the assumption that the inporint 1 natice the assumption that the disease called heaves in pigs,
and perhaps pleuro-pneumonia in cattle, is caused by the animals lying on heating manure. Now is not this just assuming what requires to be proved? I do not believe that the constantly wearing a warm plaister on
the external walls of the chest will ever induce fatal the external walls of the chest will ever induce fatal
disease of the lungs ; but constantly inhaling a vitiated atmosphere, loaded with mmonia, aqueous vapour, carbonic acid, and withal at the same heat as the lungs themselves, is very likely indeed to corrupt the whole mass of blood, and the body of the lungs too. Mr. Randall's, of Evesham Vale, success is to me easily enough accounted; for he puts the very best ammoniatrap exactly where it is wanted, and thereby nips the floors may be accounted for by the fact of these resalts of decomposition being diluted by the air before they are inspired. In his barn the cattle were in close contact with the fermenting material, and judging from
his account only, with only a limited access of air. Then abundant air is to be admitted to keep our cattle healthy, and drive off our precious and costly ammonia to fertilise other fields than ours.
Is it not possible to combine the two desirable results-perfectly healthy cattle, and the most rigidly economical saving of every particle of ammonia? The most of meat and corn on the smallest space? I in every cultivated spot will tenaciously hold till wanted by the plant growing thereon every atom of ammonia intrusted to it ; then why not use raw manure-unfermented dung? Let its produce be constantly consuming different course of cropping or some different method of nge must be adopted ; for truth must be consistent-the errors are ours. Another question is what is the best
use to make of our straw! Ammonia is but a result of excrement; it exists but sparingly therein at first, and is it not a fact that the solid exereta of animals contain carbon enough of themselves to liberate all their ammonia? Then why use straw as litter at all when

\section*{royal agricultural of england.}

Weekly Council, Feb. 13 .-Colonel Challoner, trustee, in the chair.
Sra-Sand.-The Rev. S. N. Kingdon, a member of
the Society residing at Bridgewater, near Holsworthy in Devonshire tity of sea-sand was brought into the that a great quanfrom Bude Haven, on the north-western const Cornwall, to be employed by the farmers as a manure also from a neighbouring part of the coast called Widemouth Bay. No less than 59,000 tons of this sand had been seat inland for manure, in the course of a single year, by a canal formed for the express purpose ; and a very large amount was brought away by waggons and carts sent to the sea-shore itself. As the fertilising qualities of this sand appeared to be very evident, he quaites of thould be an iuteresting inquiry to ascertain by chemical analysis the probable cause of such fertilising action. - Professor Way expressed the satisfaction it would give him to investigate the nature of this sand,
and report the result to the Council, if the Rev, Mr. Kingdon would kindly send to him a portion for analysis, along with information under the following heads: 1. The nature of the soil benefited. 2. The quantity of sand put on. 3. How often applied. 4. Fur what crops. 5. 'The cost of application. Professor Way remarked that last year Mr. Scott had called the attention of the Council to a peculiar deep-sea sand containiug fibrous matter and used in Ireland as manure under the term "wool."-Colonel Challoner was acquainted with a sea-sand on the Wexford coast, which produced wonderful crops of Asparagus and other similar vegetable products.
Clinker-Manure.-Dr. Ritterbandt desired to place at the disposal of members of the Society five tons of a manure obtained from the vitreous substance produced
in the fluxing of iron and other ores, and known in the country as "Clinkers." This substance was treated country as "Clinkers". This substance was treated obtained. This powder Dr. Ritterbandt had tound very advantageous to Potato crops. - The Council decided that they could take no cognisance of any manure sub-
mitted to them, unless accompanied by a suitable mitted to them, unless accompanied by a suitable chemical analysis showing its composition; and that, even
in such case, the trial of manures could only be underin such case, the trias on their individual capacities Col. Challoner and the Hev. L. Vernon Harcourt ex pressed their willingness to give the manure a trial, in Dr private capacities, should the chemical analygis probanterbandt might heveatter furnish hold out a mate of cost and quantity to be employed render the application eeonomical. Mr. Jonathan Gray siated that in South Wales the use of clinkers to the laud had been attended with no advantage.
African Grasses, -Mr. Donovan favoured the Council with a coltection of African Grasses and a stuffed specimen of the great locust bird, referred to in the following communication

The Council voted their best Jobn Clakiks Doxovavo to Mr. Donovan for the favour of these presents and communications, and would feel further tavoured by his attendance a any of their weekly meesings, for the purpose of
furnishing such additional iutormation as he might possess in reterence to Atrican Natural history. Professor Way had received information from the same part of Atrica, where the summers were short and bright ; the Grasses there were represedted to him as being well worthy the attention of Euglish agriculturists. -On the suggestion of Mr. Majendie, it was moved by Linnean Society, so eminently distinguished for the acquaintance wich the botanical productions of his southera hemisphere, should be requested to examine these Grasses, and favour the Council with his report npon them.

Irish Grasses,-The following is the report of Mr Brandreth Gibbs on the dairy-land Grasses obtained

The packet of cut Grasees from Blarney Castle contain :-
Holeus lanatus, Italian Ryograse, Dimetris glomerata, Cypourus

Grain-Aerator.-On a former occasion Mr. Brown pose of explaining to the members the progress of his inquiries into the best mode of fumigating growing crops, on the principle so long tried and found effectual in his hand-fumigator for igarden use, namely, that of driving any kind of air or vapour, by means of revolv. ing fan-wheels, through the famigatory chamber, into a pipe conducting the air or vapour immediately to the plants, shrubs, or trees to which the application is desired. At the present Council meeting, M. Salaville exhibited a working model of his machine for the preservation of grain, to which a first-class medal was
awarded last year at the Paris Exhibition. The prinawarded last year at the Paris Exhibition. The prin-
ciple of M. Salaville's machine appeared to be similar to that so long ago adopted by Mr. Brown; its application, however, is different, namely, to
large masses of grain, vegetables or large masses of grain, vegetables, or other sub-
stances in barns, warehouses construction consisted of a fumigatory chamber, fon receiving the cold air or for generating the sulphurous or other antiseptic preservative or vapour-of revolving fan-wheels for driving these vapours from the chamber into the perforated tubes over which the deep mass of grain, Potatoes, \&c. was laid and received throngh their whole bulk the action of the vapours thus passed by through them. The fan-wheels are set in motion by means of this machine, not only were all insects and their eggs destroyed at a very small cost, but a greater weight and brighter appearance was given to the grain He invited the members to inspect these machines at
full work at the wharf of Messrs Charles Devaux and ., 62 , King William Street, London Bridge.
The Chairman expressed to M. Salaville the thanks of the Council for his attention in submitting this machine
to their notice ; at the same time informing him that to their notice; at the same time informing him that the Council in such cases expressed no opinion on the
value of inventions brought before them. He would be at liberty to enter it for exhibition at the Chelmsford meeting, where it would come under the notice of the judges.

Microscope. - Colonel Challoner gave notice that at the next monthly meeting he should move that the approved and complete kind for investiyations similar to those to which M. Salaville's operations on grain would lead, namely, to ascertain the exact difference produced on the grain by the action of the vapours to which it that Prof exposed. In the meantime he would suggest that day fortnight with his own microscope, and show to the members that difference between the origival and the members that
Locomotive Railway.-Mr. Manning Fellowes, of Ormesley, near Great Yarmouth, informed the Council
of an invention made 16 or 18 years since by Sir of an invention made 16 or 18 years since by Sir
George Cayley, of a steam locomotive laying down its George Cayley, of a steam locomotive laying down its the time in the "Mechanics' Magazine." He also referred to "a trial with an endless chain for propelling boats in a canal; the chain, or the slack part of it, einking to the bottom of the canal, and there, being detained by the mud, \&c., formed a basis for motion : abandoned in consequence of the room the machinery took, and the water and dirt which came on board the boat."
Cortages.-The reference made in the report on the farming of Dorsetshire (Journal XV., 442) to Mr Sturt's cottages having excited much attention, Mr Sturt, on application to him, has kindly stated to the
Council his willingness to give any of the members all the information he possesses in reference to their construction and cost.
Treacle for Cattle-Mr. Tollemache, M.P.,referred to the probable advantage that would arise, during the high price of oil-cake, from the use of treacle for the purpose of feeding cattle. It had aiready been tried, as such a substitute, with considerable success by some farmers in the eastern counties. A West Indian merchant had informed him that coarse brown sugar contained 95 per cent. of saccharine matter, while treacle contained not more than lo or 20 per cent. He thought it desirable to ascertain how far the amount nutritive value in food depended upon the saccharine matter it contained.-Protessor Way remarked that treacle consisted almost entirely of saccharine matter, of it. The Gevat kind which could be crystallised on commission to inquire in to thears properties o malt, when it was found that Barley malted was no better than Barley numalted ; in other words, that sagar was not better than starch.
Implement Report.-Mr. Fibher Hobbs gave notice that, in consequence of some omissions having been
made in the Report of the Implements at the Carlisle made in the Report of the Implements at the Carlisile
Meeting, published in the last Journal, he should bring the subject before the Council at their next Monthly Meeting.

The Compittee having referred to the Journal Committee papers by Mr. Fulbrooke on Meteorological

Cycles, and by Mr. Diekson on Flax Operations,
arranged that on that day fortnight the following subjects be brought before them
1. Colonel Clinton's communication on Improvements in the which a great Economy of Steam-power is effected. 2. Mr. Riddell's Exhibition and Explanation of his Model of
3. Mr. Hancock's Exhibition

The Council then adjourned to their Weekly Meeting on Feb. 20.

\section*{Calendar of Operations.}

Cheshire, Feb. 12.- The weather for the two last months has been very variable, commencing with severe frosts early in
December, and claanging suddenly to mild weather towards Dhe middle of the month, and in a few days to frost again, which
in about a week chan which continued to the end. During these changes very little progress was made in ploughing as the froot was geldom entirely
out of the ground, therefore carting manure when the ground was sufficiently hard, and occasionally carting Turnips to the homestead, and threshing strax for the cattle was the principal busi-
ness of the farm. The new year set in more favourably for the plough, and a good deel of land was turned over during the first
nine days when the teams were again stopped by the frost, and nine days when the teams wad again to be resorted to for a week
manuring and threshing hat
or more, when another change took place, and the unsettled or more, when another change took place, and the unsettled
weather of frost and thaw, with occasional thunder showers, consettled, and "lea" and other ploughing is now going on very
satisfictorily Notwithtandive the sudden chang settied, arily Notwithstandipy the sudden changes and occa-
satisatorily
sionally severe weather, the Wheat crops generally are looking remarkably well, and none appear to be over luxuriant; ; there is
still a good deal to be sown, some farmers thinking it better to sow in the spring than late ia the year; theiris success, of course, will depend much upon the season. The land, upon the whole, instances, both old and young, have been allowed to range the
fields and eat off the old tufts of Grass left on the pastures, which poomerly attended to on streams not much affected by dit are looking remarkably weil, and will in another month afford
good pasturage for ewes and lanabs. The practice of cutting all
 found to answer and appears to be greatly ou the increase. The
prospects of peace have affected the local corb nuarkets, and prices of What have receded at least \(1 s\) s. .d... Cer bushel. Great com-
plaints of the yield of all kinds of grain are constantly being made by the farmers; and as previous prices and a good demand have induced them to thresh out freely. we think it probable
that we have arrived at the lowest point of depression until there is a prospett of considerable importation. The cattle markets
are also depressed, but prices have not given way very mate-

\section*{Notices to Correspondents.}

Adderss: Subscriber of Many Years. Mr. Strafford, 13 , Euston Sq-
AVRrace Pricks or Grañ: Correspondent. The published averages for any week certainly are not the prices at which on the
average the grain of the country has been sold during that average the grain of that comparatively has been sold during that at a higher price, so nuch being added to the quantity, is the
main source of error. Wheat weighing 60 lbs. is sold at 70 s. a quarter, the seller making it wp to 62 lhs. a bushel, and thus of the actual quality. This is no doubt a source of error and Injustice, for the averages are guides to many payments and
charges both on farmers and on landowners. And as prices may vary five or more per cent. on any given market day,
according to those variations of quality it becomes possible that a corn rent or a rent charge may be the rate of actual sales it was properly assessable.
Box Feedisa: MIr. Mfechi adds to his paper on this subject last
week the following memorandum:-Another very imaportant point is the nature of the hottom. I Gind that in iny barn, which process sets up rapidly, whilst the bricked floor shows no signo heating. On cleaniog out the manure from the chalked floor,
it retained heat for 28 hours afterwards-not so the bricked floor. I shall pave a portion of the barts floor to see whether the chalk is the real cause of heating. [It is probably the
acceess of air beneath the unpaved portion which is the cause of heating.]
Lice in Caytur. Gre
ultimately kill them
Line and Guano: Ayrshire Subscriber. If you have very recently applied the lime hot from the kiln, it would probably dissipate much of the ammonie from the guano if you applied a
heavy dressing at once to the land. But the idea which seems prevail on this subject is that hot lime positively drives of the ammonia. It only acts by uniting with any scid which
they have held the ammonia in a more or less non-volatile state, so that the ammonia is left in its or natural volatile form. But then a great deal of it in guano is already in that form,
and it is possible to apply it to the soil, although volatite withut any great waste. If your sow it broadcast just before rain
most of it will be at once washed in; and if ou soo it and then
scarify or harrow on scarify or harrow or even plough it in, its volatility will not applied some time, and you have the meane of putting the guano well under the surface, we think that you may safely Ts : \(B\) B. We have been ploughing up old sward for Oats, and skim coulter, which throw thes deep and inches wide, using effectually burying the Grass. We followed the plough with a drill presser, and shall in a week or two sow 4 bughels of Tar-
tarian Oats per acre over it. The Oats will fall into the for Tro nd come up as if drilled at 10 inch intervals. We shall give the land a double tine of the harrow over them, and then throw
about 20 bushels per acre of lime broadcast over all and finish the harrowing roll heavily, and leave it. If Thistles come we must cut then or pull then, and if in spite of lime and
hard rolling the wireworm should destroy the plant, we must ust-keep our temper. Thare are evilis for which no othe Memedy erista.
county in such questro. It is best to adopt the practice of the Clover. We would sow Oats in Scotland and Wheat in the south under such circumstances, or depart from the general cuocm only on a very limited scale and by way of experiment. What: X. If you fear your Wheat lodging you had better roll Both of these things benefit weak lands.
Winduass: Subscriber. We presume the drum should be loose on
the vertical shaft from which the four radial arms proceed to Which your harses are attached, and that one of these arms should carry a pal falling into the teeth of a circular ratchet

J. C. WHEELER PEOTATOES SON offer the following PRINCE OF WALES.- This is the earliest round white Potato, excellent for forcing, and for a general crop can be most highly
reoommended. Per peck, \(28.6 d . ;\) per buskel, \(99_{0}\) es Potatoes 1 had from you last year; I consider them more mealy and bette
havoured than soden's
Oxford, which in some respects regembles, and far more free from disease, planted in the same
soil and in every way allke."-Mrs. CaNNING, Portfields, Hereford.
"Your Prince of Wales Potato 'I obtained when first sent ont and I beg to bear testimony to its good qualities. It is early
excellent, and very prolifc. On a plot of ground last yeur 1 am cree that 1 raised at the rate of nearly 400 bushels p per imperial J. C. Wherler and son beg to add that they have mucl atisfaction in introducing this Potato into ganeral noticewhere it is highly spoken of. It is is bo early that it escapes the disease more than almost any other variety, It is a large ALSTONE KIDNEY. - This is perfectly distince frona any othe Potato. It is an satonishing cropper, and the tobers are of large size. It keeps well, and is good tavooured, and is per bushel, 9 s.
The Rev.R. . . Brownicur, of Sprouston Manse, N. B., gives the following report of the Alstone Kidneys which he had from
 besides a few small refuse. Not knowing the Potato previously I had it planted in rows 2 feet apart, which was too close and \(10 \frac{1}{2}\) yards yielded nearily a heaped bushel. It is at the row of close upon 520 bushels per acre. The produce is unusually large
what of a Kidney, but perfectly distinct from any other. As cocond early potato it is without donbt the best, and will in ASHLEAF KIDNEY (true) an excellent sample. 2s. \(6 d\). per bushel.

MPROVEMENT OF GRASS LANOS.

UTTON'S RENOVATING GRASS SEEDS FOR IMPROVING OLD PASTURES.-Great improvemen may be effected by sowing 8 to 12 lbs. per acre of Surtox's
Ronorating Seeds, Which consist of Perennial Clovers and
Grasses of the finer kinds for improving the botto

An inorease of several Tons of Hay per acre has been thres effected on many Meadows and Upland Pastures. The Seeds should be sown early. Price reduced to 9 d. per \(2 b\). From Mr. G. Norrington, Rertory Farm, Taplow, \(26 t h 11,1855\). Grass seed 4 to som upon to acres of old pasture. At the time I took the farm the 10 acres of mea
now have a most excellent pasture."

From C. F. Thruston, Esq., Talgarth, August 9, 1855
Your and Parsnips are superb. Your Grass seeds, Mangels, answered well. They were sown in spring, under rather unfavourable circumstances. The after Grass is remarkable; Clover and other seeds springing up where nothing but the poorest pasture had been previonsly, and I think that a field of 9 acres sown with
your RENOVATING MIXTURE, is now one of the finest in ar neighbourhood."
From Sir David Cunynghame, Wellesbourne House, Warrick. ing very well. I cut nearly 2 tons of hay to the sere, and three years ago the game land hardly prodnced half a ton per acre

Sutton \& Sons also supply Grass Seeds for laying down Lund to Permanent Pasture at a moderate expense, the sorts being selected in accordance with the nature of the soil
to pe laid down, particulars of which may be obtained by post.
Many Meadons and Uplasd Pastures may be increased in value 50 per cent. by sowing these Seeds (as see the above letters).

Five HUNDRED BUSHELS OF POTATOES year by a gentleman in. Surrey, end out of which there were only five bushels diseased; nearly all the quantity were large-sized
some weighing 2 lbs., and 1 oz., and not above three bushels o Chats nut of the whole. This Potato was origivalis reared in
Scotland, and is called by the grower the Scottish Champion, and has sanis proved to have surpassed acL other sorts, both in
quantity, quality, and freedom from disease, as will be seen by quantity, quaills. and
Thetimonials. 28 , inclusive of the sack of three bushels, delivered free at the South Western Railway Station in London. Seedsma, 64 , High Street, Worrester, where further testimonials "Sir,-In answer to yours respecting the Scottioh Champion Potato, I beg to say it is quite equal in flavour to the York
Regent, is very productive, boils very white and mealy Regent, is very productive, boils very white and mealy. fhe wact,
of the sixty-seven varieties of Potatoes grown by me in the
of experiment this season I consider it the best, and shall plant it for morim next general ernp. Your obedient servant,
THE CHAMPION KIDNEY POTATO. HDDARD TILEY begs to state, in answer to the last fortnight by persons who purchased the above last season, again, that he has about 20 bubhels of good soond sets to dispose or
This
Potato the Ashleaf K idney. If planted at the same time it wild come in ten days earlier; it is quite equal to that in flavour, and Wil give dimble the crop. As a proof of its superior quatity, a
market gandener who purchased a peck of them last season has
just gent an order for a sack, for his own planting. Several persons who forced them last spring speak in the highest terms
of their being the best they ever grew for early frame work. This is one of the best keeping varieties that has ever yet been
sent out. It is a fine red Potato, nearly round, and the eye level with the surface, so that there is nn waste to it in peeling as in seedling from that well known kind the "Old Rough Red; "" it is he equalled by any other Potato now in cultivation. It will be The above will be sure to give the greatest sattsfaction to all
purchasers.
Sold in quantities of not less than one peek; they will be sent, hamper and package free, at \(5 s .6 d\). per peck; or four pecks for
1l., hamper free. A remittarice in cash must accompany all orders, or small amounts in penny postage stamps. Purchasers Would do well to name the nearest Railway Station to their resiEdWard Tinky, Nurseryman, Seedsman, and Florish, 14,
Abbey Church Yard, Bath, Somerset.
 PRINCE OF WALEES. This is the earliest round white Potato, excellent for forcing, and for a general crop can be most highly
recommended. Per peek, \(2 \mathrm{~s} .6 \mathrm{~d} . ;\) per bushel, \(9 s\). "I was highly delighted with the Prince of Wales Potatoes had from you last year; I consider them more mealy and bette resembles, and far more free from whisease, planted in the same oil and in every way alike."- Mrs. Cansmg, Portfields, Hereford. and I beg to bear tentimony to its good qualities. It is early, aure that I raised at the rate of nearly 400 bushels per imperial J. C. Whemier and Sos beg to add that they have much they have sent it into nearly all parts of the Kingdom, and everywhere it is highly spoken of. It is so early that it escapes the disease more than alroost any other variety. It is a large ALSTONE KIDNEX.-This is perfectly distinct from any other Potato. It is an astonishing cropper, and the tubers are of altogether an excellent and profitable variety. Per peck, \(2 s .6 \mathrm{~d}\).;
per bushel, 9 s . The Rev. R. O. Brompield, of Spronston Manse, N. B., gives
the following report of the Alstone Kidneys which he had from us.-"I had the Alstoue Kidney planted in fone rows of 10 yards in length, the running length of all being 42 yards, and the produce was three large beaped imperial bushels of Potatnes
besides a few small refuse. Not knowing the Potato previously
I had it planted in rows 2 feet apart, which made it planted in rows 2 feet apart, wan for the ontside row \(10 \frac{1}{2}\) yards yieldod nearly a heaped bushel. It is at the rate of close upon 520 bushels per scre. The produce is unusually large What of a Kidney, but perfectly diatinct from any other. As a short time find its way into every garden. 2s. per peck.
ASHEPAF KIDNEY (true) an drcellent simple. \(2 t\). 6 . per peck, or 9s. per bushel

MEETINGS FOR THE ENSUING WEEK.
}

The mode of ascertaining the percentage of good seeds in any given sample is to our great surprise declared by some of our correspondents to be a profound mystery, which they think it would be useful to penetrate. That trying seeds, as it is technically called, is useful-very useful-is true enough ; but as to the mystery of the art, there is none.

When a merchant buys a parcel of seed he always tries it, or should do so, in order to be certain that he buys what is sold him. He dres not allow his country friend or foreign correspondent to send him a sample half of which will grow while the other half is dead; but he requires it to be all good, or if not he ascertains the percentage of dead seed, and makes his purchase accordingly. It is certainly desirable, in these days of eager competition and underselling, that the retail customer should do in a small way what the mer-
chant does on the large scale; unless he
be content to make his purchases blindfold. It is 'many cases where propagation by grafting is well known that there are persons in the trade who attempted. carry on a much more satisfactory business by selling seeds below their cost price, than others who add 25 per cent. for profit. Thus A will give a shiiling for an article, sell it for ninepence, and grow rich, while B gives a shilling for the same article, sells it for fifteenpence and loses his trade, being denounced as a man whose charges are extravagant. No wonder that the public should wish to be enlightened on this matter. We are glad that our attention has been directed to it thus opportunely when gardeners are procuring their spring supplies.

Every body knows that after seeds have been kept a certain time they are incapable of growing. It is equally notorious that all seeds may be killed, hy hot water, or hot dry air. In neither case is there a particular instances. It is also notorious that some seeds are undistinguishable by the eye, although they produce totally different plants. No one, for Turnip, Cabbage, Radish, \&c., from each other by their seeds. Red Beet, for instance, worth \(8 s\). a pound retail, is not to be known by its seeds from Mangel Wurzel worth 6d. ; nor Cauliflower worth half-a-crown an ounce from Cabbage seed worth \(5 s\). a pound. These data furnish the clue to the great mystery before us.
Thus: A and B both give 16s. per 1b. for Cauliflower seed. A retails his at \(15 d\). an ounce; while B is satisfied with \(9 d\). A loses his trade, as we have already stated ; while \(B\) is thriving. This, like all great operations, is brought about by very simple means. A sells all his seed as he bought it but B knows better; he perfectly understands the love of the public for what is cheap, and he complies with the popular taste and prepares a cheap article Insiead of acting like his simple competitor, he buys for a shilling another pound of Cabbage seed which has either died a natural death, or been killed for the occasion. This is carefully mixed with the Cauliflower seed, and makes as nice and clean a sample as can be desired. In this way he obtains 2 lbs . of seed for 17 s . instead of one 1 b . for 16s. These he retails at 9 d . an ounce, and converts into 24s.; while A, with his honesty, receives only 20s. Moreover, for one pound sold by A with 25 per cent. profit, B sells ten, with 50 per cent. Can any one be surprised at the prosperity of the one and the adversity of the other?
If we are to judge from the endless complaints which reach us there must be a good deal of such ingenuity at work. It is therefore desirable, in the interest of the fair trader no less than in that of the public, that the manner of detecting such practices should be explained. "Trying" seeds reveals the secret. Nothing is easier, or more certain of success. We will suppose that a gardener has bought a pound of Radish seed. He is to count out some even number of seeds, exactly as they follow when spread on a piece of paper ; the usual and most convenient number is 100 . These he is to sow carefully in finely-sifted mould in a flowerpot, which is afterwards plunged in a hotbed, as if he were attempting to raise some tender annual. have grown. He then has only to count them, and the difference between the number which grows and that which was sown is the percentage of useless seed. When a hotbed is not to be had, the necessary heat may be obtained by plunging the flower-pot in a heap of warm stable liiter covering it with a handglass, or even by placing it under a bell glass in a warm room. The only precaution that requires to be taken is to be careful not to consider plants which may damp off in the operation as representing bad seeds. The damp confined atmosphere in which the seeds are raised renders this accident very likely to ocear.
Gardeners are not the only persons interested in the operation. When we look at the prices at
which agricultural seeds are sometimes sold, we cannot doubt that a "trial" of such against more high priced seeds would be advantageous. The subject indeed is of more importance to farmers than to gardeners when we consider how much greater is the stake which the former have in their crops. They may discover that very cheap agricultural seeds are as expensive as very cheap manures.

A notices has been issued by the Horticultural Society that at the meeting, on Tuesday next, Feb. 26, some questions relating to the effect of graft-
ing upon certain descripuions of plants will be ing upon certain descriptions of plants will be It is understood that the principal object will be to show what the causes are of failare or success in this ancient operation, and to demonstrate the impossibility of any permanent or healthy junction being effected between the scion and its stock in

The importance of such a subject will be appre Gated by the buyers of plants, who are invited to contribate any evidence they may possess. That evidence is not however required for the purpose of showing that grafted plants are often as perfect as seedlings; proofs of this are to be procured anywhere. What are wanted are is to say of grafts which have failed from any cause is to say of grafts which have failed from any cause
whatever-whether by reason of an unskilfal Whatever-whether by reason of an unskilfal
operator, or of the stock not suiting the graft, or from other circumstances.

We also learn that a further supply of Gynerium seed has been received for distribution from E . Brande, Esq.

We learn with much satisfaction that the late case of poisoning with Monkshood (see p. 67), has attracted the attention of Sir Wm. Hoorer ; and that there has been recently placed in a conspicuous situation in the Kew museum a specimen of the root of the Monkshond by the side of one of
Horseradish, together with a short description of the points in which they differ. This is really using great public institution for great popular advantage

\section*{New Plants.}
163. Achimenes magnifica; aliàs Locheria magnifica Planchōn and Linden in Fl. des Serres, x. t. 1013. Most people would call this an Achimenes, of which it has all the habit, and as far as we can discover all the essential points of structure. We mast, therefore object to the introduction of a new name for which there is no sort of necessity, either botanical or horticultural. It is said that Locheria differs from Achimenes in having the cup in which the ovary is seated of a membraneous instead of a fleshy texture ; so that the subdivision of genera is now to be made dependent, not only upon the mere thickness of an organ, but what is worse, of one of no functional importance. To that Petrine few in this country will subseribe.
Putting aside names we must add that the plan before us was introduced from Popayan by Mr. Triana

one of the collectors employed by Mr. Linden. It which we copy of the published plate, a figure of handsome, with thick velvety leaves, and large flowers handome, with thick velvety leaves, and large flowers
of a rich deep red colour, spotted with lines of black purple. It may be compared to a gigantic form of Achimenes hirsuta or pedunculata; like which it has the scaly rhizome and little bulbs so common among plants of its class. We observe that Mr. Linden has it nifica at the price of 20 francs.

\section*{NOTES ON PEARS.-No. III.}

In describing Colmar d'Ete in the catalogues its season is given as the "end of September," exactly th same as that for Beurré d'Amanlis, but it generally
succeeds it, and in some seasons, and I may add, froma succeeds it, and in some seasons, and I may add, from
some soils, it will keep nearly through October. I may as well say here that in giving qualified praise to Beurré d'Amanlis (see page 53), I felt that I acted with proper caution, for it is dangerous to say of any par-
ticular Pear that it is always good. Last autumn I ate ucular Pear that it is always good. Last autumn I at
some that were gathered in time, and they were really exquisite. My near neighbour had some I think large and more beautiful than mine were; he produced them at his dessert, and his friends declared they were not quite equal to a good white Turnip. To return to Colmar d'Eté: it is a very juicy, melting, and most agreeable Pear, slightly vinous, and very refreshing to as it forms a compact Cypress-like pyramid, and grows if possible, more Preely when budded on the Quince than on the Pear.
There are perhaps too many September Pears, and were in not that Pears are so variable in their flavou and in bearing we might rest and say "hold enough ", I think better to cultivate six or eight varieties ripening in the same month than three; in cultivating we
will say ten varieties all ripening in September, I have
known numbers 1, 2 , and 3 fail to give a crop, owing perhaps to their blossoms being early, and thus killed by a solitary spring frost; while numbers 4,5 , and 6 ,
blooming a few days later, have escaped. And, again in some seasons it will be found, I cannot tell the "reason why," that two or three or more vaxieties do not come to perfection; they either crack, or spot, or are deficient in flavour. Now, if numbers 1,5 , and 6 thus fail, 8,9 , and 10 may be purfect ; and thus by planting several varieties ripening in the same month ( am writing for those who have room in their gardens) holds good through all the autumn and winter months in which Pears are presentable; let me illustrate this in which Pears are presentable; let me incustrate this My Beurré Diel Pears last December were large and handsome, but they were not good; my Glou Morceau were excellent; my Beurre dArembergs and Winter Nelis all ripened and rotted early in December; but my Beurré Langelier and Passe Colmars kept well through January, and yet generally they are all Pears that ripen about the same period. So then let us look very handsome septenish yellow round Pear, is a most abundant bearer and exceedingly juicy, not rich, like a Winter Nelis, but very agreeable and worthy of cultare; it succeeds on the Quince in a light rich soil, and forms a prolific bush or espalier. Bonne d'Ezée, a full sized and handsome Pear, sometimes ripening at the end of August, but must be considered a September Pear, is melting, rich, and good, succeeds and bears profusely when grafted on the Quince. Jalousie de Fontenay Vendée, like the three preceding varieties, is yet but ittle known, but it well deserves attention; it is not large but of the full medium size, and melting, rich, and good. It grows well on the Quince, and forms a nice rolific pyramid.
We must not forget in this enumeration of Pears for September one very old, and, I may add, universal favourite, the Autumn Bergamot, or York Bergamot, or
"Bergamie" of cocknies, and "Burgundy" of those "Bergamie" of cocknies, and "Burgundy" of those
who call a Bigarrean Cherry a "Bigerroon," simply who call a Bigarrean Cherry a "Bigerroon," simply
because it is not correct. The trees of this old Pear in most soils look old even when they are young, and a very old tree reported to be considerably more than 200 years old, growing in my garden, bears good fruit, and looks as young as a tree of the same variety 30 years of age . Trought on by its tendency to canker. In cold soils the young shoots generally die half-way down every year, i.e., the shoots made in one summer canker and die back the following winter. This is a Pear that wo standand in the wal to your heirs than to yourself. It is therefore comforting to know that it can be conquered, and that we can make it "go a-head," as all things must in these days. This is done by double grafting, or these days. This is done by double grafting, of
"double working," and double gratiog is done as "double working," and double grafting is done fullows:-Take a vigorous tree of Beurré d'Amaniig
or Colmar d'Etet two or three years old, budded or or Colmar d'Ete two or three years the Pear part of
grafted on the Quince stock, and on the Pear the tree, about a foot from its junction with the Quince stock, graft your Autumn Bergamot ; in two or three years, whether trained as a pyramid, a bush, or an espalier, you will have a tree in a nice bearing state, and its fruit will he finer than from standards planted
usual way in orchards or gardens. \(T . R\)., Herts.

ON frost splitting.-By Dr. Robert Caspart. (Continued from p. 100),
Before I proceed further, it appears to me necessary
 selves in the interior of the tree; and 2 d , whether the trees I examined at the time they burst, wore entirely frozen inside.

As to the time when the changes showed themselves in the interior of the tree, Schübler, in his researches into the temperature of plants (two Disser. tations, Tuibingen, 1826 and 1829 ), does not app, we find only the following general statement ( 2 d Dissertation, p. 9 and 10). "The temperature of trees lowers itself very much slower when that temperature has descended below the freezing point \(; "\) and again, "The converse occurs on the appearance of a thaw.
frost had penetrated into the interior of the tree, if it temperature had descended below the freezing point, that temperature rises proportionally much slower" the in warmer seasons. As Schübler seldom made daild observations, and only twice in the day, at sunrise and at 2 P.M. , and for the most part only observed onco
week his thermometer, which he had inserted to the depth of 4 inches into \& Poplar tree of the thickness of 14 French inches, he could obtain no information as to the relation of the daily periodical changes of the atmosplere with the temperature of the tree. Ramenua (Ann. Sc. Nat. Pari Ser. 2, v. 19, p. 1 et seq.) has made urther researches on this point, observing seven or eight times in the day the temperature of the tree and hat air. He has obtained the resab that infuence 0 ing he more time to take effect in proportion to the thic of ness of the tree. He found that a Poplar branch o 4 centimetres (about \(1 \frac{1}{2}\) inch) diameter in the shade indicated in the centre the same temperature as and (about 19 inches) diameter felt the influence of the ex-
sernal tempurature on its centre 15 or 16 hours later,
and a tree of 1 metre in thickness only showed the and a tree of 1 metre in thickness only showed the
effects of external changes in its centre after two days or more. But Rameaux did not attain the establishing of any general law on this point. Besides, his researches uffer from a twofold deficiency ; first, that they were chiefly made in the warm season between April an September, and that he takes no account of the winter, hen, as we should conclude from Schübler's above uoted observation, the relations are somewhat altered and secondly, that his method gave no certain results, as the thermometer which Ramesux stuck into the tre had, on each occasion of examining it, to be drawn out of the otherwise corked up hole until the column of mercury was visible, instead of being provided with clumn long enough for the thermometer to be read off without disturbing it ; for by thus drawing it out it must have been made to indicate a somewhat higher degree. Under these circumstances the above-mentioned ques tion is not
investigation.
2d. Were the trees which I observed frozen through and through when they burst? The answer to this question, so important a one in the investigation of frost plitting, depends so much on the one I have just allude o, which is only partially solved, that I can unfortuaately say nothing positive, excepting in respect of very thin trees. The reply depends, in the first place, on
another question; at what degree of cold does the sap of nother question; at what degree of cold does the sap of does not yet freeze at \(0^{\circ}\left(32^{\circ}\right)\). Hunter (Philos rans., \(\mathbf{v} .65,2, \mathrm{p} .447\) ) found that the expressed juice of Cabbage and Spinach only froze at \(29^{\circ}\) Fahr. (- -1.3 young shoots at a few degrees below \(0^{\circ}\left(32^{\circ}\right)\), of which is easy to convince one's-self in the cold nights in spring. Goppert ("Development of Warmth," p. 10) o-called neutral sap and tender leaves froze much uicker at the same degree of cold than those whose sap contained more saline or resinous particles, or presente arger masses, thicker leaves and stems, and (p. 147) that " 2,3 or \(4^{\circ}\left(4 \frac{1}{2}\right.\) to \(9^{\circ} \mathrm{F}\).) of frost, if they continue
for a few days, will cause the sap of all trees, those of Coniferee not excepted, to congeal." In order to give the greater latitude, I will assume that the trees I observed could only freeze in the centre when this was cooled down to - \(4^{4}\) R. \(\left(23^{\circ}\right.\) F. ). It may now be asked, did the temperature ever sink so low in the centre? If the fact obsewved by Rameaux in June, that the temperature of the atmosphere is communicated to the heart of a tree of half a metre in thickness in 14 to 16 hours, be equally true in winter, then, indeed, all the rees I examined in 1855, of which the thickness was not more than half a metre, must have been frozen throughout before the time of their bursting in the night of the lst to the 2d February, and the larue Hors Chesnut of the pupil gardeners' garden by 11 P.M. on
the 9 th February. Let us consider more particularly he case of this large Horse Chesnut. Its diameter is 14 inches, therefore not quite half a metre. On the \(-4^{\circ} 1 \mathrm{R}\). ( \(23^{\circ}\) F.), at 10 P.M. at \(-8^{\circ} 3\left(13^{\circ}\right.\) F.) ; ; in. the course of the night of the 8 th to the 9 th it sunk to
 in a tree of half a metre, according to Rameaux, the emperature of the air is communicated to the centre in 14 to 16 hours, it would in this tree of 14 inches do so in about difference. What is this difference there will in some difference. What is this difference ? Schübler, found it once, on the 8th January, 1828, \(10^{\circ}{ }^{\circ}\) and it once, on the 8th January, \(1828,10^{\circ} 5\left(24^{\circ}\right)\); the air. He gives no data for the warmer than this difference, which possibly did not occur in our case, and in most instances he found the difference between the air and the tree much smaller. In January 1829, it that Schübler's 4 , although it must be confessed results on this point. But let us assume that from the minimum of the night of the 8-9 February, - \(15^{\circ} 4\)
\(-3^{\circ} \mathrm{F}\).) must be deducted \(10^{\circ} 5\left(24^{\circ}\right)\) as the greatest temperature that Schuibler found in Jailed in the centre of the tree after 10 to 12 hours, the tree must have experienced throughout by 6 P.M. a termperature frozen through and through before must have been frozen through and through before 11 P.M., when it
burst. Schibler also observed in his Poplar tree a burst. Schübler also observed in his Poplar tree a
temperature of \(-7^{\circ}\left(+9^{\circ} \mathrm{F}.\right)\), and in thinner trees \(-12^{\circ}\) to \(-14^{\circ}\left(+50\right.\), to \(+\frac{1}{1^{\circ}}\). F.). I may therefore, the trees I observed which did not exceed 14 inches in thickness were thoroughly frozen before they split. It sertation of 1829, p. 15) are not in accord with this assumption ; he found that after a long frost in January, 1829, of which the minimum had the preceding day been down to - \(14^{\circ}\left(+1_{2}^{\circ}\right.\)
doplatanus, in which , in a tree of Acer psell doplatanus, in which he daily ascertained the depth of
the frozen wood, the frost had only penetrated to 15.2 lines, in a Horse Chesnut to 8.2 lines, in a red Pine 12.5 lines, in an Ash only 16.8 lines, in a Hazel nut 16.9 lines, in a Salix fragilis 17.3 lines. But as he reports that the temperature of his Poplar tree fell at the same time down to \(-7^{\circ}\left(16^{\circ}\right)\) at the depth of 5 inches, and as, consequently, it must have been frozen to that depth, Schubler is thus in contradiction with himself, and some error must have crept in, and his
lations derived from the intensity of the frost in this winter show the probability that trees even of 2 feet thickness were frozen to the centre

\section*{VEGETABLE PATHOLOGY.-No. CIX.}
430. Asphyxia* (Suffocation). - It has been a subjeet f debate whether plants derive their nutriment from the air, or from the ground in which they grow. Some whires vice of a mas which constitutes a reservoir for nutritious matter erived from the while others contend that the whole of the nutriment is absorbed by means of the spongelet in the shape of an aqueous solution. The truth apparently is that a portion of nitrogenous and other constituents is carried down by rain from the by means of springs, while the humus itself supplies it share by the slow dissolution of ulmates and humates of which it is composed. The several matters entering with the water on one side supply the exigencies of the plant and as was shown before (190) on the formation a getable substances oxygen is constanily evoived under the agency of light, in its presence oxygen is evolved, while on the contrary in shade, when little or to carbon is fixed, carbon remaing in combination with the oxygen, and carbonic acid is given out.
431. Besides this supply of the four substances carbon, nitrogen, hydrogen and oxygen, essentia to vegetable life contained in the absorbed water, a the plant consists of a tissue pierced with ducts communicating with apertures in the leaves called stomates, there is a communication of every part through the intervention of delicate membranes with the outer air, the gases of which it is composed entering when in contact with the membranes at different rates of penetration The constituents of the vegetable organs may therefore in part be received from the air, and on this accoun again in sunlight oxygen will be given off on the appro priation of the carbon, in ada and in the shade carbonic acid mixed with the water, and in the shade carbonic acid will be given off on account
carbon due to the absence of light.
432. But not only is atmospheric air thus brought in contact with the intimate tissues of the plant, bu another important end is accomplished by the means of these same outlets. The wutritious matte being conveyed by water in the shape of an extremely weak solution, it is necessary for the full and constan supply of nutriment that so much of the water as is not decomposed should pass off in the shape of vapour; and this is readily done by means of the stomates, which not only imbibe the air with all it may contain, but with the噱 the superabundant moisture. If anything then mpede this course of things, the proper aeration or interchange of gaseous matter is impeded, and the plant suffers from asphyxin, whether from the presence of with fluid which impedes the accomplishment of needlul vital processes.
433. The vast importance of these ducts appears in the difference of wood structure which exists between erect and climbing species of the same genus, or even in different conditions of the same species. The stems are subject to violent torsion and compression, and therefore to insure a free passage the ducts are far larger in proportion to the need.
434. A small derangement indeed of the constituent parts of the atmosphere in which plants are placed is not so immediately dangerous as in the higher animals. A proportion of one-eighth of carbonic acid in light is not injurious though it would be in the shade. Respecting the effects of nitrogen there is a difference of opinion. Hydrogen must certainly exercise some powerful influence, because in its presence vegetables are not blanched, as related by Humboldt of experiments in the Freyberg mines, where the atmosphere contains hydrogen (133). It is, however, quite certain that there must be some proper ratio between the matters supplied and the necessities of the plant or health cannot be maintained for a long time, and hence arises the necessity in artificial atmospheres, such as those which exist in heated frames or conservatories, of taking care that a proper ventilation is established and at the same time a condition of the air favourable to a proper exhalation from the leaves, not so dry as to cause evaporation, or so moist as to prevent exhalation. In the one case the leaves will wither, in the other the tissues will be gorged with moisture. It has indeed been suggested that the growth of plants in
Wardian eases proves that ventilation is not necessary Wardian eases proves that ventilation is not necessary to plants. Plants will not, however, thrive if air is completely excluded, as in perfeetly closed botles. Their use in the transport of plants, where fresh water is scarce, and the air charged with saline particles, or when the atmosphere is loaded with smoke, is no proof that beyond their proper province they are worthy of adoption. Firm healthy wood, abundant flowers, and perfect ruit cannot be expected from such arrangements. The great difficulty is to secure a proper degree of moisture with change of air.t
435. If improper proportions of those constituents

much more are plants liable sonner or later injurious, charged with strange gases. Sulphurous acid, sulphuretted hydrosen, hydrochloric acid, and others produce death or violent disease by an asphyxia, as certainly as in the human frame. One motive for ventilation arises from the necessity of getting rid of noxious arises from the necessity of getring rid of noxious
exhalations from the soil or the manure mixed with it. 436. Some plants, again, perish by asphyxia from mmersion in water, though the process varies with the species concerned. A few days produce death in one case, while the same number of weeks may be required o effect the same end in another. Other plants of different constitution require such immersion. Where this is incomplete the air-tubes are abundant and large;
but there are also true aquatics to which, like squatic animals, the quantity of air mixed in the water gives a competeut supply. M.J.

\section*{Home Correspondence.}

Disease in Winter Spinach.-This plague was preravages were only partial compared with this last autumn. I have a very good variety of Spinach, the seed of which was first brought from Switzerland by a gentleman who noticed it growing in a cottage garden in the vicinity of Zurich in 1820. It is very hardy, and much admired for its flavour. When attacked by the plague it first turns yellowish and sickly, and gradu ally dies away till nothing is left. Mine was sown las August, and when just becoming fit for use was seized by the malady and completely swept off, though it pre viously looked quite promising. The heart of the plan seems all at once to become stagnant, the leaves assume yellow hue and gradually die. I have examined the roots of many of the plants, which seem quite sound, so that the cause, whateveritis, must be above ground. Many gardens near us have suffered just the same, not plant has been left. I should like to know whether thi plague is general or only local in its ravages-perhap some of your correspondents can tell us? Let me als ask what is the cause of this evil ? and how is it to be prevented in its destructive influence ? Quercus

Ice Houses - It is stated in your Paper of the 15th inst "that ice-houses do not require ventilation, and that ventilation ruins them." In answer to that I be to say that if constructed as mine is, ventilation i essential, and no better ice-house can be made than the ne I have. My ice well is circular, 12 feet deep by 12 feet wide, and bricked round in 9 -inch work; it has roof over it thatched 2 feet thick, on one side a doo with a latticed opening in the upper part, and imme diately!opposite a ratticed window, and neither are ever losed, 8, that there is always a draught through the house winter and summer. The house should be \(m\) derately shaded with trees, and there must be a drain rom the bottom, should the ground require drainage with a trap to prevent the air from entering below by the drain, and the ice should be covered with a foot or of straw. At the bottom of the well should be placed a layer of faggots resting on sleepers pointing to the drain, so that any water may be carried off. A ice-house constructed dike mine allows of ice being is far preferable to any other kind, and may be made a less fan half the cost of the old-fashioned ice-hous My ice lasts through the whole year, and at the end is rarely exhausted. R. B. W., Peb. 19. [We thought the question put to us related to ventiation by draine, which is always ruinous to the ice.]
Balsam Bog (Bolax glebaria, Comm.) of the Falkland Yslands.-The museum of the Royal Gardens of Kew has just been presented with a noble specimen (dried) of this remarkable plant, by George Rennie, Esq.. lat Governor of that settlement. The woodeut, in Sir James Ross's "Voyage of Discovery in the Antarctic Regions," vol. ii, p. 302 , represents a landscape, in which th tufts of this plant constitute a remarkable feature; but the best account of it is in Dr. Hooker's "Botany of the Antarctic Voyage," vol. i, p. 286. It belongs to a group of minute umbeliferous plants, of which
have no true representative in the northern hemi sphere ; and represif leses Saxifrais bears trifid leaves somethang and rigid character. Though, in size, among the smallest of it tribe, + yet, owing to the peculiar mode of increase, one single tuft of an old plant is as much as four men ca conveniently carry, and it becomes one of the most striking vegetable objects in the countries where it is Long before the Fakiand Islands, says D were colonised from Britain, mode of growth it there assumes, and by its forming a feature in the landscape that strikes the most casual observer. Now that these islands have been annexed formally to the British dominions, the Bolax or Balsam Bog is a production of still greater general interest. In Whatever portion of this country the voyager may la. he cannot proceed far along the beach without entering groves of Tussac Grass (Dactylis ceespitosa), whose eaves often wave over his head, ner the ground, huge rounded hillocks, of a pale and dirty yellow-green colon and uniform surface, so hard that one may break the aromatic smell is perceived in their neighbourlood, and dropa or tears of a viscid white gum flow from various
\({ }^{+}\)We may refer for a good botanical represeatation of the
parts of these vegetable hiliocks. The plants stand
apart from one another, varying from a few inches to 2 and 4 feet in height; and though often hemispherical, are at times much broader than high, and even 8 or 10 'eet long! The very old ones begin to decay near
the ground, where a crumbling away cummences all round, and having hut a nurrow attachment, they resemble immeuse halls or spheres laid upon the earth. Upon close examination each mass is found to be herinnumerable litule shoots rising to the same length, covered with imbricating leaves, and so densely packed that it is even difficult to cut out a portion with a knife; while the surface is of such uaiformity that Le ens sometimes spread over it, and other plants ve jetate in occasional hiles or decayed places* on the of the formation of these balls may be distinctly traced: each of them, whatever the size, is the product of a single seed, and the result of 'many, perhaps hundreds
of years' growth. In a young state it is furnished with a very long, slender, perpendicular tap-root, like a whip-lash, that penetrates the soil. At its summit arise
2 or 3 small branching stems, each densely covered for its whole length with sheathing leaves, As the iudivi dual increases in size, the l,rancties multiply more and more, radiating regularly from the rooting efntre instead of prolonging rapidly in one direction; then send out lateral shoots from the apices, and in such numbers that the mass is rendered very dense; and by the time the plant has gained the diameter of a foot it is quite smonth and convex on the surface. The solitary root mass of individuls, which are nourished by filr. us radicles proceedin, froms below the leaves, and deriving nutriment from the quantity of vegetable matter which the decayed f.li, ge of the lower part of the stems and
older branches affi, "T." "The Bolax glebaria yields a gum-resin, which is white when oozing from the wounded Item and leaves, but soon turns red-brown in drying. It has been employed as an a;plication to cuts and othor
lesions with apparent effect.s A bottle of this gumlesions with apparent effect," A bottle of this gum-
resin accompanies the specimen. Some idea may be furmed of the arpp-arance of the specimen sent, when, in addition to the above particulars, we say that, tojether with the very strong case for its transport and pack-
ing material, it weighed 5 cwt ; deduct for the stout ing material, is weighed 5 cwt ; deduct for the stout actual weight of one lump of an umbelliferous plant. It is cut off horizontally at its base from the place of
growth, but brings away no earth or stones, the whole inside being black decayed vegetable matter. Its height is 2 feet, its broadest diameter 31 feet, the circumference opposite, is 6 feet 3 inches. The very packing material entirely composed of filamentous and subfoliaceous Lichens, viz., Usnea melaxantha, U. barbata and plilorum, de., is of intelest to the cryptogamic botanist, many of the specimens being in fine truetification, and no substance cuul ibetter serve the purpose. It retained a certain degree of moisture, without showing the least disposition to hent or to decay, and is remarkably
elaatic. A second box, 12 feet long, contains fine specielaatic. A secund box, 12 feet long, contains fine speci-
mens of the rarer sea-weeds of the Falklands :D'Urillæea utilis, Hook. Bot. Antarct. Voy., 1. c. Tab. 165,164 ; Lessunia fuscescens, together with what may
be ronsidered L. pigrescens and \(L\). cordata (all figured be ronsidered L . nigrescens and L . cordata (all figured
1. c. Tabs. \(167,168,169,170\), and 171 , if really digtinct. 1. c. Tabs. \(167,168,169,170\), and 171 ,) if really distinct.
Although the fronds of the Lessonia fuscescens are part ally decayed, the stems or trunks branching at the top are perfeet, and measure 12 and 14 feet in length.
Handles for the large knife-blades of the Gauchoes are made of this, and they become as hard as and reshow their attachment to the rock, a state in which it is very difficult to procure them. Of this remarkable sea paratively common. and from bbservath are com. pecorded there is reason to believe that some attain a length of 700 feet!-and if so, assuredly the greatest length of heiuht to which any vegetable has been known
to reach. W. J. \(H\).
Sexes of Perns.-In the account by "R. E." of the
reproduction of Ferns he has called the spiral ciliary filament a worm - will not this unintentionally lead people not learned in these mysteries into the idea of an
animal agency in the production of a vegetable structure? He did not intend, I am sure, to convey such an impression. Although these ciliary filaments move abuut, no oae, I presume, vencures to assign to them an animal structure or a distinct vitality. R. Bree, Strick lancl. [What are they ?]
thiuk be in error as to textile."-Mr. Turner must I Streatham Gardeners' Society" relative to the valu. of this mat rial, for I find by my notes of the proceed ings of the Society that the subject was not discussed Gardeners' Suciecty. Daphne Mearicu

former, set ott its flowers to more advantage, and give the bed a more characteristic appearance. I would
suggest that the plants be grown in pots and plunged in the bed ; they could then be removed with n ore facility to make room for other things. A. J., Shrublctud Park.
Wall Tree Protections. - There are two points in which it appears to me that the condition and treatment of wall fruit rees aud borders may be materially improved. 1st. The fault of British climate is excess of moi-ture in autumn and mildness of temperature in the early part of winter, in consequence of which the and the wood and roots are not so perfectly ripened and hardened, or so completely and timeously put to rest as they ought to be, and would be in a drier and keener climate. 2d. There is a want of correspondence ir which the roots are bedded, and the wall against which the trees are trained in the latter part of winter and beginning of spring, before the sap begins to move.
Even so early as the latter half of January the suu Even so early as the latter half of January the sun
begins to exert considerable influence on oljects exposed to its direct action, while the ground remains under the full dominion of winter. Thus a thermo manuary rose to \(60^{\circ}\) when suspended against a common stone wall facing the south. Every day the sun acquires increasing power, the full influence of which is felt against an upright wall, while the (as yet) slanting rays produce little impression on the ground. A tree trained artificial state, in which the stem and branches are from time to time excited by warmth, while the action of the roots is suspended by the low temperature of the ground. This is not the case in an open compartment ; there the sun has little direct influence on the stem and branches, and they are surrounded by a free current of cold air which reduces it to a minimum. The roots and branches both continue equally at rest till the gradually increasing temperature of the earth and air sets the sap in motion throughont the tree. As a consequence of the conditions being so different in walled borders with soms will be both prematurely excited and weakly developed; at once exposed to early frosts and lessable to resist them. For the purpose of protecting the
borders from rain and undue moisture, when it is desirable that the roots should be ripened and put to rest, and of screening the walla from the action of the sum turely light waterproof frames which should have their January should serve as a screen to the wall. As they are to serve these purposes in succession, and might also be occasionally varied from one position to the other according to circumstances, a series of looped iron pegs might be driven into the ground at a foot or more from the wall, having the eye or loop about the same height the e the ground, which would afford sufficient fall to ends of the inner or bottom cross bar of the frame will rest and move on the loop as a support and hinge; and when no longer wanted for the border the frame might be turned up and hooked or fastened to projecting bar kept clear of the trees, and a free space left for the circulation of air. As there are sometimes excessive rains about the beginning of spring, the frames migh occasionally be let down on the border previous to their final removal. J. H. H.
Arum laticum.- Writers in the Gardeners' Chronicle sem to talie an interest in the question of the presence sorry to see this plant as a native of Britain, and am from the A. maculatum by characters which are unworthy of trust. I have also been sorry to see an argument brought against the native character of the former plant - that it "was not a native of any of the neighbouring Chronicle, and I forget in what journal it is to be found. It is founded upon the careless mode in which many persons who ought to know better content themselves with examining some old "Flora" of France to see if a plant grows in that country, not remembering that the botany of that country is only such attaining a tolerable state of perfection, and that "Buch books, valuable although they are, as Duby"s more especially so in the botany of Normandy and Brittany, the countries most resembling in situation and climate the south-western counties of England. Judging from that work, and even from Deslougehamps" "Fl. Gallica," it might be supposed that A. italicum was not found in the north-western provinces of France ; but if Ge turn to the admirable "Flore de France" of Drs found in "all the west of France from Caen to Bayonne," as well as in the Mediterranean region. What wonder, therefore, is there that a plant that is a native of the oppcsite coast should be also native in the Isle of Wight. known until now, and that should have remained unthe counties of Dorset, Devon, and Cornwall, and in the south of Ireland, in all of which it may safely be predieted that it will be soon noticed. Let me hope that some of the intelligent gardeners who may read these
lines will have the pleasure of finding it According to
my views th
follows :-
 in the spring. Spathe ventricowe below and above, with
inflexed edges when open. Berries many-seeded. itaricun (Mul).) Leaves triangular-hastate, with divari-
cate lobes and yellow veins; appearing in the autumn cate lobes and yellow veins; appearing in the autumn,
Spathe ventricuse below, penng neally flat and very
broad above. Berries three-secded.

\section*{I learn from Mr. Hambrough that A. italicum is very} plentiful in the south of the Isle of Wight, and that it
flowers in June about a month later than A. macie lowers in June about a month later than A. mackeHybrid Ouths.-"T. R." asks if "any one has ever beard of such hybrids." Every one the least converOak plantations, must not only have management of have often observed them. I venture to assert that bent a quantity of acorns collected from a mixed forest, and the produce were, say 500,000 seedlings, in such batch parent. In many nurseries are hybrids either varieties of the two species cultivated as ornamental trees, nearly all of which have been picked up in batche of seedliags or from young plantations. Sessilis Rinefidd The Plane Trees of Buyukdere.-In reply to Mr, beg to say that the large Plane trees at Buyukdere, well as all that I observed in the neighbourhood a Constantinople, all evidently planted, belong to the common Eistern form of the Oriental Plane, with leaves much deeper cut than either the tender Plane that we suppose to be the true occidentalis, or the one commonly growu in England and France under the name of acerifolia, or in France especially under the name of occidentalis. At the same time we have in culivation some varieties of the Oriental Plane with leaves still deeper cut than those of the Buyukdere treas Specimens of the foliage of the latter remarkable tree which I gathered in the autumn of 1846, were laid int Royal Royal Gardens at Kew, where they can be easily referpo an unable to say which species they belong to, nor have I seen the magnificent one at Vostizza, on the Gulf of Corinth, but I feel perfectly certain that every Plane tree which I did see when in Greece and the Levant 20 years ago belonged to that species which is called
orientatis, with deeply indented leaves. \(X\) remember some very fine old ones in the wild district betwees Athens and Marathon, growing on the banks of rivulete as Poplars and Willows do with us. One very large one at the village of Kephissia, near a magnificent old ruin of one on the banks of the little river Meles, naas Smyrna, I remember being exceedingly struck with so much so that when I returned home I dialy in dented leaves in my own little shrubbery, which though a thriving plant hardly promises to attain the size i beight of two very fine specimens of the other species (occidentalie) which have long been an ornament to the plase. I have this autumn tried the experiment o planting a Platanus orientalis on the banks of the river at this place, but I fear though in its own sunny clime the natural situation, in North Yorkahire it will pror Platanus occidentalis is the quickest grower of ence goe Platanus occidentalis is the quickest grower of the the

Cloacine-A short time ago I saw a discussion in susp Paper about the taste of plants being sometimet suspiciously like the manure in which they have beea grown. Now this is not a pleasant idea. It dissipates versice all our fond romance of science about the con write to people for ever about oxygen, hydrogen, Liebig and Professor Way, the glaxing fact will still romnin suspended before the epicurean vision that in eating our forced or "atrongly" grown vegetables, we are not eatemg ts of poor mild harmesess humuk, but actually the very essence of some horrid artificial manure company, or one of those proud monuments of rural greatness, ungypsumised dunghill. The question is one of nationa importance, and I really felt much cast down in min when I read the facts, corruborated by those mystica hieroglyphics "M. J. B." In this mental condition was looking at the plants in my greenhouse, if it was really all a dream that Roses had beautiful smell, or whether some eastern genii had not invented the famous attar to delude mankind or whether posta had not been equally disingenton when they gave to the Lily its whitenese, when my ay fell with dolight upon two huge pots containiag luxuriant stalks of what I knew full well would soan bo converted into Rhubarb pie. Now then, I suid to mysea will this great question be docided. Visions of days and dinners, in which Rhubarb pie formed a procainent part, came at once into my mind's eye. An that smoky taste-what was that? My mind reverna insensibly but with horrid individuality to the sheet
our respected vicar then browsing in happy ignoro in the churchyard. Should any of my future dinnens be from a haunch of this mutton, and a pie of tha smoky Rhubarb? To settle the question I had wi Rhubarb in my groenhouse cut on the spot, and the pio the came, my dear,'s said a gentle voic Rhubarb."
too. The truth shone out with elear unmistakable
certainty. No perversion of Liebig could possibly settle certainty. No perversion of Liebig could possibly settle
the matter in faveur of rearranged elements. The actual thing with which those pots and tubs were suractual thing with whi.ch those pots and tubs were sur-
rounded was positively identical with that smoky taste, rounded was positively identical with that smony tang the
and the glories of Rhubarb pie are with me among the and the glories of Rhubarb pie are with me among
things that were-at least that form of it which proceedeth from tubs and pots witb their well-known coverings
Strickland.
Beech Timber. - P e:m't me to inform Cotswoldianus that my statement resppecting the Beech beam is per-
feetly correct, but it is an inolited case; Beech not being the natural growth of Carmarthensliire, it has never been tried since. The tree was cut in June, 183n, the girth about five inches ; it was squared and cut into two small beams, small bits of which I send with this note to prove its soundness. It grew in an Oak wood above the banks of a small river, uothing at all was done to it as to piekling, it was cut, sawn, and inmediately used. sent the paragraph in the belief that it might be an advantageous thing to be tried again in a part where
Beech is imiligenous. \(Y\). Z. [The specimen sent us was perfectly sound.]
Rubinict Pseudacacia.- In December, 1843, I communicated to you my experience of the value of the Acacia tree; my opinion is confirmed every year-not one of the posts then referred to is decayed-they have
been in the ground 30 years. Mr. Withers, in his been in the ground 30 years. Mr. Withers, in his publication (1843), adviscd the seed to be imported requently raised it from trees in this country; but having lately heard the same remark, I wished to ascerkain the fact again, consequently I directed about then put in a box of earth upon the warm water-pipe in the hot-house, when every seed appeared in two days. This was 14 days ago, and they are now 3 inches high, and consequently removed to a cooler place. It would be difficult to exhibit any plants in a more vigorous state. I beg to add, that from the plantation made in 1823 I have for some years past cut down many for the same useful purpose referred to above. A. P., Chearra.

\section*{Boripties.}

Entomological.-Anniversary Meeting, Jan. 28. -Mr. Edward Newman, V.P., in the chair. A report from the Council was read and adopted, giving an account of the prosperous state of the Society, and proposing the sale of the exotic portion of the collection, with the view to increase the library, and to render the British collection as complete as possible with the pro ceeds of the sale. Messrs. Newman, A. F. Sheppard, Edw. Sheppard, and Waring were removed from the Council, and Messrs. Baly, Pasco, Saunders, and elected President for the ensuing year in the stead of Mr. Curtis, to whom a vote of thanks was passed, and a portrait of whom was ordered to be suspended in the meeting room. The Clairman read an address on the state of the Society, and on the progress of entomology in England during the past year.
F.L.S., President, in the clair. The Presidenters, Esesq. thanks for his election to the clair, and noninated Messrs. Smith, Waterhouse, and Westwood as Vice Presidents. A new part of the Society's Transactions was announced as ready for distribution. Mr. Samuel Stevens exhibited some very fine Coleoptera just received from Borneo, including s:veral rave and new Lucanidre. Mr. Moore exhibited some cases formed by a wild bee, Megachile lanata, within a buffalo's horn received by the East Iudia Company from Northeru India. Mr. Baly Cxhibited a specimen of the extremely rare beetle Cryptonychus porrectus, received by Mr. Murray from
Old Calabar. A note from Mr. Hewitson was read, giving an account of the creaking kind of noise made by a specimen of the peacock butterfly which had been disturbed in its hybernating quarters. A similar circumstance had been recorded by the Rev. Jos. Green in
the month of February, 1853. Mr. Newman the month of February, 1853. Mr. Newman read a note inquiring particulars concerning a species of spider
described by the Rev. R. Shepherd as forming a kind of raft on which it floats in ditches in Norfolk (Kirby \& Spence, Introduction, Yol i.) Also a nute from Foster's Voyage on the silk spider at St. Helena; orders and families from Australia. Mr. Stainton read some remarks as to the most efficient methods of promoting the study of entomology, suggesting the especial single tamilies or genera,

Botanical of Edinburge, Jan. 10.-The President in the chair.-'the following papers were read: -1 . -The author directed attention chiefly to Babington. included under the names of Epilobium tetragonum and E. alpinum. Under these have been embraced several species which require to be separated. The character founded on the nature of the stigmas, whether divide founded on the nature of the stigmas, whether divided orfundivided, and the mode of extension of the plants
from year to year.- 2 . Observations on ?the Pollen Trom year to year.-2. "Observations on "the Pollen
Tube, its growth, histology, and physiology." By Mr P. M. Duncan.-After giving a general account of the
conchiflora
"In this plant," he remarked, "the styl and stigma are at least 4 inches in lenyth, and after he lapse of 14 hours from the application of pollen centre of the style, many in the axis of the ovary, and generally one in each mi ropyle. The following is a summary of the results of many experiments on thi plant. 1. The pollen tule grows at the rate of an inch (as under great heat and muisture) twice as rapidly. (as under great heat and muisture) twice as rapidly. 2. The pollen tube is not a simple tubular prolongation
of the inner membrane (intine) of the pollen grain, except to a certain distance. It is in reality composed of a series of cells, the first of which is formed from the intine, the second is formed within the papillose cells of the stigma, the third near the axis of the style, and the others at varying distances. The last cell is usually at he spot in the ovary where the tube perfurates the cell wall of the ovary to enter the canal of the micropyle of the ovule. Each cell is divided from that above and helow by a more or less perfect involution of the external cell wall. 3. The pollen tube passes through the stigma by a regular process of cell gaw. After wards cell after cell is added to the tube by a process of division, each cell performing its function independof the Tigridia; the pollen tube effuses its contents into the sac with whose granular contents a mixture occurs, and the embryo is evolved out of this mixture. Microscopical specimens and drawings were sent to illustrate the author's views - 3 "Notes on the Chaulmoogra seeds of India." By Dr. Murchison. These seeds are furnished by the Chaulmoogra odorata, Koxb., or Gynocardia odorata. The plant is referred by Lindley to the Natural Order Pangiacese, which, by some, is considered a section of Papayaceæ. The seeds are sold in the bazaars in India, at about \(13 \mathrm{~s} .4 d\). per cwt. The bland fixed oil having a peculiar smell and taste. The seeds are used by the natives of India in various cuta neous diseases. For this purpose, they are beaten up with ghee or clarified butter, and applied to the diseased cutaneous surface. The expressed oil is prized in the treatment of leprosy in India. The surfaces of the ulcers are dressed with the oil, while a six-grain pill of the seed is given three times a day. The dose of the latter is gradually increased to twice the original quanity. The expressed oil is sometimes given internally in doses of five or six minims. Too large doses are apt to produce nausea and vomiting. The Chaulmoogra is also prized by the Chinese. -4 ."On the Gutta Percha plant of India." By Dr. Cleghorn.5. "Notice of the Flowering of an American Aloe Flowering of Plants, \&c., in the Isle of Wight." By Dr. T. Bell Salter,-Dr. Salter, at a recent meeting of the Isle of Wight Philosophical and Scientific Society, gave
the following list of plants which had stood the winter of 1854-5 in that island. Amongst the trees and shrubs those only are included whose stems as well as roots retained vitality :
Camellia japonica
Melianthus major
Ediwardsia grandiflora
Acacia armata
" juniperina
verticillata
Myrtus communis
Punica Granatum
Fuchsia coccinea
Riccartoni
" gracilis
" Youni
" globosa
microphylla
Escallonia rubra
" macrantha
" montevidensis
Hydrangea hortensis
japonica

It was observed that the Catalpa and Yucea have flowered very freely this year, and that the Fig crop has been abundant.-7. "List of Plants in flower, the open air, in the Neighbourhood of Ryde, Isle
Wight, in November, 1855 ." By Dr. T. Bell Salter.

\section*{2oticss of \$ooks}

Miss Catlow's Popular Garden Botany (12mo, Reeves) a very pretty volume, containing some excelien coloured figares of flowers and indifferent gossip about
them. As to the title it is delusive, and we protest them. As to the title it is delusive, and we protest
against it. There is no Botany in the book. Undoubtedly here are what are called " generic descriptions," whick we are told are principally taken from Loudon's Ency clopredia of Plants; not a very good source, considering that it merely gives the differential characters used by the Linnean school of Botany, and which are inappli cable to an arrangement upon the natural system, which is what is used in the volume before us. But in reality be found there generic descriptions are hot always no pains to make them harmonize with each other. Take for example Nigella and Aconitum. What is called the or exa in Nigell becomes in coll \(x\) in whil he par he parts named nectaries in igela no petals Aconitnm. Such confusion can have no other effect than that of bewildering the unfortunate hitte peopl who try to learn Botany from the work. But if this is bad, what shall we say of the following account of Aconitum itself?-the italics are our own: "Divisions
curious form, houded; szuer wed, with long stulks, and
thee petioles, small and scale-like." What shall we say ?- what can we say ?
this is most discreditable.

Mr. McLean has issued a prospectus of an illustrated work to be called The (rardens of England, from drawings made at Trentham, Wohurn, Shrubland, Alton Towers \&c. \&e. \&e., by E. Adveno Brooke, with s suitable letter-press description. The plates will be executed in ithotint in folio; some being finished by hand, and sold at twice the price of the ordinary prints. The specimens which we have seen are well executed, and convey a faithful representation of the beautiful places they are intended to illustrate.

A new and very much fuller edition of Mr. Francis Galton's work on the Art of Trarel (12mo, Murray), fas just appeared. We formerly drew attention to the and we arion of this valuable little work (l855, p. 35 ) means of copious and excellent woodcuts, has rendered his instructions to travellers intelligible to the bluntest comprehension; a very important improvement in a book intended as a quide "to all who may have to 'rough it" whether they be travellers, missionaries, emigrants, o soldiers." 'I'o the army, indeed, it must be most especially useful, and we doubt not that its value would have been felt had it formed a part of the kit of every non-commis sioned and commissioned officer in the Crimea. We see, therefore, with satisfaction that the experienced autho has been allowed by the military authorities at Aldershot personally to instruct the troops there "by a smal degree of field practice," in the rude handicrafts the require to be regularly taught. Let us hope that something more than permission will be granted ; and tha the art of campaigning will come to be considered as much a part of the drill as extension motions, or the mor it is surely as necessary that the man low afie sith the true military bearing, or even to attack an enemy and defend himself Cold and hunger and thirst, and intense fatigue are indeed, as our melancholy Crimean experience has indeed, as our melancholy Crimean experie
Mr. Roberts is dissatisfied with the remarks we felt it our duty to make upon his Notes on Plants (see p. 103). He complains of
our saying that he does not state where be finds his descriptions, our saying that he does not state where he finds his descriptions,
and tells us that in the instances quoted by us the descriptions are placed in inverted commas, and explicitly stated to be derived
from Mrs. Loudon's Flower Garden. We do not admit the accuracy of this assertion. It is true that in the description of
Crotalaria a sentence is quoted from Mrs. L., and it is true that
the derrinticns nf C , verrucosa sud retuca are between inverted the descriptions of C. verrucosa sind retuca are between inverted
comnas. Int there is nothing to conntct the one with the other,
nor dud we suppnse them to be so connected. Mr. R. must excuse nor did we suppose them to be so connected. Mr. R. must excuse
us for adhering to our opinion that there is no ginarantee of the
trnth af his duscrpitions, whether original or borrowed. Where for example, did he learn that Bignonia stans is a climber? If it
is a cliniber it is not strns, if it is stans it is not a climber. Bat
he adds that he prooluces dried specimens an is a cliniber it is not stans, if it is stans it is not a climber. Bat
he adds that he proiluces dried specimens and beautiful drawings
from nature. Why, he will see the sate from nature. Why, he will see the same sort of evidence pro-
duced by the ingenious French gentleman who is practising his
peculiar art in Tichborne Sireet. What guarantee has a buyer peculiar art in Tichborne street. What guarantee has a buyer
that the speciment and drawings can be reliad upon? We have
no doubt that Mr. Roberts believes they can, just as he believed that the exaggerated descriptions we objected to were just and
true. Ihut the public wants to kn nw something of his means of judging. We have spared space for these remarks, at some
incenvenience, because we should be sorry that Mr. R. or any other
fair dealer should be misjudged. It is, however, for them to do what buyers lave a right to require of unknown persons,
especially in these days of fraud, namely, prodnce satisfactory
evidence thas the stateraents they make are reasonably accurate evidence that the staterents they make are remsonably accurate

\section*{Garden Memoranda}

Mrs. Catleugh's Nursery, Hans Place, Cheisea.This is one of those places in which certain kinds of plants are grown by the thousand for Covent Garden market. It is, therefore, not uneommon to see here a large housefull of Pelargoniums all in full flower at one lime, another of Heliotropes, and frames some hundreds of yards long stocked with Ilignonette. Potfuls of the latter sown in September last and wintered in low cold frames will soon be in blossom, Mignonette, we need scarcely state, is sometimes sown in small pots with the view of economising room ; but where space is no object it gives less trouble and succeeds equally well sown at once in the pots in which fower. It may be wintered in a shallow frame, as has been done here, from which the lights should be removed entirely in fine weather, so as to give as much lose their Mignonette in winter, but this is for the most part owing to their keeping it too damp. It should mave little or 0 mor about three month during the dull season, and care should be taken to keep it ree from drip, which is sure to kill whatever plants it happens to fall on. When small pots are employed particular care need not be taken to have the son very rich, provided it is light; but when sown be used, draining well and placing on the top of the crocks flaky pieces of decayed manure for the double purpose of affording nourishment to the plants when they are coming into bloom, and for keeping the soil from choking up the drainage. Autumn sown plants, which were shifted into larger pots about Christmas, will blossom from the present time till about May, and another sowing now will succeed them, ant Even it may be had plentifully in the open gow away, for if topped back about this time they come in nicely for window boxes in May, which may be managed in the following manner. Having some Tom Thuatb

\section*{Miscellaneous.}

Timber Sules.-On Thursday Mr. Bentley sold by anction, at the Crown Hotel, Broad Street, upwards of 850 Oak, Elum, and Ash trees, from estates at Bransford, Leigh, Powick, and Longdon Hillend. There has not been so large a sa'e of timber for some years, and it went off exctedingly well. Elna and Ash fetched
from 1 s , to 1 s . \& d l . per foot, and Oak from 2 s . to 3 s .-
 At a recent sule of navy Oak asd other timber, grown
on the estate of Lord Portman, in the manors or parishes of Orchard Portman, Staple Fitzpaine,
Bickenoll, Tlurlheer, West Hatch, \&c., which took Bickenoll, Thurlheer, West Hatch, \&ic., which took
place at the Greyhound Ion, at Staple Fitzpaine, there were 1547 trees divided into 136 lots. The lots sold realised nearly 3000 l . Juilder.

\section*{Calendar of Operations. (For the ensuing weel.)}

\section*{PLANT DEPARTMENT.}

Conservatory, \&c. - Luculias and other winter blooming plants in veds or borders should be cut back after flowering as freely as may be necessary to keep
them close and well furnished, and this should not be deferred so as to permit the energies of the plants to be wasted in the production of useless wood. The small leaved weaker growing varieties of Citrus are invaluable for winter flowering, and considering that they are
plants of ensy cultare it is surprising that more of them plants of easy cuiture it is surprising for this purpose. If a batch of healthy young plants can be placed in a moist growing situation at once and allowed to remain until the young place out of doors for the summer, and fully exposed to the san after about the middle of August they will flower profusely luring winter, if placed in a temperature of about \(4 \overline{5}^{\prime}\) or even \(40^{\circ}\). The Mandarin, Myrtle leaved
and Otaheite Oranges are the most suitable kinds-the and Otaheite Oranges are the most suitable kinds-the
last of these flowers and fruits in a very small state. Get Camellias and Azaleas for early flowering next season started into growth without loss of time. Camellias may
le had in bloom early in September by placing them in be had in bloom early in September by placing them in when once the plants acquire an early habit of starting into growth, they make as fine wood as those grown in can be selected, there may be some little difficulty in getting then to make free growth the first season. Let air freely on fine days, which will tend to make the permanent specimens in the house break their buds slowly, and will secure close strong growth. Lose no time in repairing the drainage of any specimens which require such attention, and endeavour to
secure a healthy, vigorous root action, which is of great secure a healthy, vigorous root action, which is of great
importance, especially in the case of hard-wouded importance, especir freely on every favourable occasion to greenhouse plants senerally, and persevere in the
destruction of insects immellately they are perceived. destruction of insects immediately they are perceived. allow them plenty of space after this time "ith all the light possible, and a free circulation of air whenever
the weather will permit, but avoid cold nurtheasterly winds, which are very injurious to plants in active growth. Do not allow Calceolarias to suffer for want
of pot room, as any check at the present season will throw them prematurely into flower. Never allow aphides to gain a footin
ever one is perceived.

FORCING DEPARTMENT
Pinery.-Recently potted stock will not require much water at the root for a few weeks, and it should not be heavily syringed until the plants get hold of the fresh soil, and start into free growth. Keep the atncsphere
soft and moist by gentle syringings on the mornings of bright days, and sprinkle the passages, \&c., frequently.
Plants swelling their fiuit will be greatly benefited by Plants swelling their fiuit will be greatly benefited by
manure water in a clear state, which may be given as often as the soil requires watering. With plenty of moisture in the atmosphere a night temperature averaying from \(70^{\circ}\) to \(75^{\circ}\), allowing it to
rise to \(85^{\circ}\) with sunshine and a gentle circulation rise to \(85^{\circ}\) with sunshine and a gentle circulation
of air, will be beneficial to these. Vineries.As soon as the berries are fairly set, cut off all superflunus bunches at once, and get those left thinned as speedily as possible. It is a very common practice with young gardeners to overcrop Vines, and the result is amall, ill-coloured, ill-favoured fruit, and disappointment. Aim at securing fruit of first-rate quality, which will be more satisfactory than any quantity of inferior stuff. But depend upon it, that the way to do this is to thin early and severely. The quantity proper to be left must be regulated by the strength and vigour of the Vines, \&cc., but it should be remembered that it is quite Viner, \&c., but it should be remembered that it is quite
possible to overcrop the most promising Vine. If the possiber is covered with fermenting materials, see that the heat is not allowed to decline. The buds will now be heat is not allowed to decline. The buds will now be
breaking in the suceession house, and when this is the breaking in the succession house, and when this is the
case, the night temperature may range from \(55^{\circ}\) to \(60^{\circ}\). Take advantage of bright days to shut up early in the afternoon with a moist atmosphere, allowing the ther mometer to rise to \(75^{\circ}\) for about two hours. Figs. Watch carefully for any indications of red spider or brown scale, both being terrible pests when allowed to gain a footing on the foliage. See that the borders are in a moist healthy state, and attend to stopping the shoots before the fourth or fifth leaf, so as to get the wood matured, in order to secure a second crop Peaches.-If there is the least apprehension of red spider play the syringe freely on trees where the fruit is fairly set, and commence the process of disbudding. I green-fly makes its appearance fumigate at once. Se that the inside horders are properly supplied with water, After the fruit is set let the temperature range about \(60^{\circ}\) at night, but rather under than above this on cold nights, and with sunshine and a circulation of air should range about \(75^{\circ}\) during the day.
flower garden and shrubbery
Give lawns a good rolling after wet, and if it may be necessary to take up any of the turf for the purpuse of levelling the ground this should be done as soon as posclean, and roll frequently to make them fum for walling upon, and also to prevent the growth of weeds. Where it may be necessary to increase the stock of any of the varieties of Dahlias these should be placed in heat at varieties of Dahilas these should Do placed in heat at \&ce, planted in beds, and protect them from the depredations of mice
hardy fruit and kitchen garden.
Prune and nail Peaches and Nectarines, and as soon as this is done, if it is intended to apply a covering for the protection of the blossoms, bring it into use at once to shade them from the exciting influence of the sum. If the covering can be so arranged as to be easily let times it will considerably retard their flowering, and thus will probably be of more service than any protection which can be afforded after the hlossoms expand tection which can be afforded after the hossoms expand.
Where the early crops of Peas have been injured by frost or mice get sone planed in thes made good the deficiencies in the lines. The turves should be cut in widths about 5 inches, and 3 or 4 inches deep, cutting out a shallow channel about 3 inches
wide and on the under side in which to place the seed. wide and on the under side in which to place the seed. The turves should then be laid with the green side under in a moderately warm house, planting the Peas
and covering them with lieht soil, where they will soon vegetate. As soon as they are fuirly in leaf remov them to a cool place, and gradually prepare them for planting out. Managed in this way the Peas will not sustain the slightest check, and will root through the turf into the soil and grow away freely. If not already done clean and dress Strawberry beds. A moderate dressing of good rotten manure applied between the rows and lighty forked in will be of great service to
two-year-old plants. See to keeping up a supply of two-year-old plants. see to keeping up a supply of supply of manure water, and endeavour to keep them in vigorous health, so as to avoid having them infested with red spider. \(\qquad\)

\section*{The Ggrictltural \(\mathfrak{G a z e t t}\).}

SATURDAY, FEBRTARY 23, 1856.
At a time when new manure companies are being advertised, and new materials are being brought into their service, and when farmers are preparing for the season of regetable growth by lising in their stocks of fond for plants, it is of the very highest importance that the grounds be known on which accurate valuations of such food can alone be made.

Professor Way's paper on this subject in the Journal of the Agricultural Society has the merit
of being admirably timed, at the same time that it
thoroughly lays its subject before its readers. The difficulties in the way of estimating accurately the Talue of a manure are fally stated; lut that they are as a general rule and for ordinaly purpose practically overcome by the data and the illustra tions which Mr. Way has given will be acknowledge by many a reader who has risen satisfied from the perusal of his paper having gone puzzled to it for instruction.

The value of a manure to any one who shall use it varies with his soil, his crop, his climate. Bones are valuable on sandy soils, much less so upon clays they are valuahle for Turnips, much less so for grain crops. Ammoniacal manures are found more valu able for green crops in the North than they are in England. Again, the cost of a manure to any one who shall luy it depends apon the source fron which he seeks it Ammonis in sulphate o ammonia costs \(77 d\). per lb ., in guano it costs 4 采d per lb. And there are other circumstance affecting both ralue and cost to which Professor
Way alludes. It is plain, then, that the problem is not so simple as might have been expectedall that can be done is to give information on the market value of the several ingredients of manuie in severat of them most abundant forms, and from the average cost thus arrived at to calculate the selling value of any manure containing them. I such a manure is offered at a price above the sum thus calculated, the farmer had better take his custom to another dealer. The agricultural value of the manure is of course quite a different thing from its market value-it should be ascertained by experience : and in the absence of that it must be determined by the quantity of nitrogen and phospholis acid in a soluble form that it contains

The first table which Professor Way has quote gives the market value of a variety of differen substances which are either used directly as manure or were necessary for the calculation in which he had engaged.
Sulphate of ammonia
Muriate of ammonia,
Mable
Mor cent.

Sulphate of potash
Carbonate of potash, 97 to 98 per cent
American putash, 75 per cont.
Nitrate of soda (lusult

Common salt (clean
Agricultural salt
Sulphate of magnesià (rough), 90 per cent
Solphate of lime (minerare), gyp pari)
Coprolite (ground (precipitated)
Bone ash, 70 per
2 per cent.
Mone ash, 70 per cent. of phoanh. of phosp hate of lime...
Animal, charcont, 70 per cent. of phosphate of lime,
Bones (hail-finh boiled)
From the data which this table furnishes, th following calculated prices have been deduced.

\section*{\(W_{\text {AY remarks }}\)}
is perhaps somewhat diffentit of comprehension. It is, how-
ver,
method of valuation familiar enent
 articles. Thus, to give an illubitration, sooda ash (impure carbonate

 contains 20 per cent. of seotuble phosphate, one ton of the
manure "ill be worth, for that ingredient, \(6 s .6 \mathrm{~d} d\). multiplied by
20 , or 86.10 . \(10 \mathrm{~d}, 7\)
It only remains to give instances of the mode of calculation by which these tables are made useful to the purchaser in the manure market, and this Professor WAy has done in the case of super-phosphate of lime and guano. The mode of calculation bised on the last column in the table seems the simplest, and one instance in this way, which it is stated was first employed by Mr. Nesbit, may
uffice. The following table gives the analysis of suffice. The following table gives the analysis of
uperphosphate with the prices of each ingredient per ton used in calculating the value, first of 100 ons and then of 1 ton of the manure:-

Inver shbe pionsplaite ( \(13 \cdots\) per ceint.) 13 tons at 7 tr

"We have here 7612. 108 , as the cost of 100 tons of the manure;

Professor WAy's extremely valuable paper concludes with tabulated analyses of 78 guanos, and 17 superphosphates. The average results afforded by the two are as follow:-

\section*{The 78 analyses
guano, as under:-}

\section*{Moisture
Organic \(m\)}

Organic \(m\)
Shnd

Alkaline salts, lime and maenesia \(\qquad\) 22.78
to 6.89 soluble phosphate of lime
The analyses of the superphosphates give such varying results that to strike the average of the whole would give no useful information. The following is a classification of them :-

\section*{Of 171 specif}

Less than 5 p. cent. of soluble phosphate 11 samples, or 61 pe
\(\qquad\)
On the whole Professor Way comes to the satisfactory conclusion, in reference to all manures intended for green crops, that-
The manufacture of these manures is rapidly improving. Sounder information, abundant capital, free competition, and improved machinery are doing for agriculture in this respect what
the same causes are found to effect in every other manufacture; and although I have given the analywis of what may be called a gond per ton, it may not be long before such a sample will be considered of an inferior class. Of this 1 am sure, that the manufacturer must cease to leave any considerable quantity of phos
phate of lime undissolved, and must raise the proportion of phate of lime undissolved, and must raise the
soluble phosphate to as high a pitoh as possible."

\section*{IRISH STATISTICS}

In the Agricultural Gazette of the 22d December, 1855, p. 845 , there is an extraet from the Times, relative to the Irish agricultural produce for the year 1854, and which that paper considers, and I think with good reason, an indication of increasing agricultural wealth people. I think, however, that the Times in the article Wheat is disposed too much to attribute this improvement to war stimulant; for my part I am inclined to ascribe it to very different causes; the high prices, from whatever causes they may have arisen, would have been equally effective, if not more so, in Ireland, in the increased average of Oats, which, in its price, bears a tolerably fair proportionsl increase with Wheat, being nearly double the previous price. The increase in the acreage of Wheat has rather, I think, been determined by a returning confidence in the safety of this crop. It places, equal to four-fifths of the crop from mildew, and many persons had consequently abandoned the growing of it altogether; it has, however, in the last two or three years been less seriously affected, and to this samewhat restored confidence, rather than to war priees, may be attributed the increase of 1854 . Independent of
climate and the want of drainage rendering many parts of Ireland not so applicable to Wheat as Oats, its straw is under very low estimation either for fodder or litter, and this is still more the case with Barley straw. The ration under which it succeeds, favours the prepaof Oats.
With respect to Oata, it may be said to be our staple crop, other causes have been in operation to affect the extent of its tillage in bygone years, perhaps even more effective than war prices at present. After the famine years of 1846 and 1847 confidence being lost in the Potato, to four repeated crops of Oats; the progressive breaking down of our farmers, who, before they gave in, took auccessions of great increase in the great though very probably not in the weight of produce; then came a decrease in tillage from the overcropped \(\frac{\text { land falling into the hands of the landlords and being }}{\text { * Contsining nitrogen }}\)
leit by them, in the language of the country "waste" to natural restoration. These times have passed, and our agriculture may now be considered in a great measure returned to its former healthful condition (i) healthful I may be allowed to call it), and may be hoped Flax mader progressive improvement.
Flax made indeed a very great start from 1850 to 1853 , but its falling off in 1854 ought not to be, I should think, attributed, as the Times supposes, to its giving way to the reviving popularity of the Potato, for it never in our rotations occupied the place of our old friend, nor can they in any way interfere with one another ; it, the Flax crop, rather comes in place of an Oat crop:; bu, from the introduction in those years of supposed improvements in the manufacture of Plax and by the exertions made by those who took a deep interest in its production, it became a temporary rage this has subsided, some failed, some were disappointed and, pectancy, and some fell from their first ove, and, perhaps, even the high prices of Oats and other
grain may have had some influence in checking its culture. J. M. Qoodiff.

\section*{THE POOR-LAW}

There are few subjects of more importance to the welfare of the country than the proper administration of the poor-law, and we venture to say that so much
unmitigated evil was caused by the operation of the old unmitigated evil was caused by the operation of the ald poor-law previous to the year 1834, that if the mischiel caused by the corruption and terror of overseers and the insubordination and increasing extortion of paupers had continued much longer, there would have been a servile war waged against property and respectability that would have taxed the utmost resources and energies of England to have overcome, as even now the traces are not quite worn out of those claims of idleness to be maintained, and maledictions to be app then so common and so unmanageable.

Our attention has been directed to this subject by the pearance of a leading article in the Morning Herald of January 4 th, extolling the old system of "sub division," as he calls it, and taxing the new system of "aggregation" with injury to "the deserving poor and the ratepayers," styling it the chief of "modern now strums," and stating it to have been concocted by an "artful speculator solely for his own purposes ;" al this because from 1829-40 to 1854-5 the number of paupers in the West London Union had increased from 1594 to 2494 , i.e., 900 in 15 years, and the expense of the union from 11,793l. 12s. 11d in 1838-9 to 21,111. 5s. 3a. in \(1854 \cdot\)
Whatever may have been the causes of the inexam in this particular union they do not prevail to the same or anything like the extent in the country, although we oree to admit that a considerable increase has been observed the last two years, and as the agricultura interest is very largely affected by the good or bad condition of the poorest class of the community, it may not be amiss to examine the reasons of this augmentation of charges on account of relief to the poor to rescue the question from personal or party grounds, that we may endeavour to ascertain if anylhing can be done to arrest or alleviate a growing evil

We will first glance at the old poor-law as existing i 1834, when the money levied for poor-rates amounte to 8,338,079l., applied, as Lord Brougham said, by "a"grand violation of all sound prineiple to a system which went to support the idle and the profligate at th expense of the honest and industrious," which produce "evils the extent of which no tongue could adequately describe, and the possible extent of which no fancy could picture" detailed at length "by the concurren testimony of magistrates, clergymen, country gentlemant farmers, labourers, churchwardens, overseers, vestry men "-" who in one voice united in rejresenting a state of things which has reduced your peasantry to a state of abasement which I am ashamed to think of, and which I shudder to describe," by which some parishes actually went out of cultivation, from the difficulty 0 organising labour and the excessive amount of \(\mathrm{p}^{002}\) rates ; every honest, right-minded man avoided paro chial offices, and when compelled to serve as oversear got over their year of office as well as they could, onl daring to apply temporary means to escape the evil that threateued them without being able to stem the torrent of unblushing pauperiom with which every village in England was more or less then threatened the workhouses were worse than the prisons in scene of violence and degradation, without any prospect of improvement; high wages were demanded for doin nothing, and paid functionaries alone conld be an to manage parish affairs by turaing this confugion as disorder to their own pecuniary benefit

The poor-rates have not been so high since! For 1854 the amount was 6,973 2201 and a0 large portio of the relief ive is 6,0ed and the 4 lb log for 1855 ther the overaged more than the previous year, we may exper that a higher amount of poor-rates were levied during the year just closed; but will any one who is in th least conversant with the operation of the poor-la compare the mode of administration at present wiw the Which prevailed previous to 1834? Our friend of Henald sa! 8 pauperism is dealt with in a "wholessal way, whereas every separate case is entered in a boo with a variety of particulars by the relieving office which ensures preparatory investigation previous the case being considered by the board of guardians overy applicant has a fair hearing, and if there is any thing wrong in the inareased burden of the poor-rate
it ought rather to be attributed to a greater lemiency or
indulgence in granting relief than an indiscriminate disregard of the clainis of the deserving poor.
And now f.r those instances where it may be supposed a tendeucy exists to grant inproper relief, or
where the alleged increase of charges may admit of curtailment. Medical relief is a great boon to a poor man, tailment. Medical relief is a great boon to a poor man,
and the inclination of boards of guardians seems to be favourable to a literal grant of it; but it is nevertheless favourable to a heeral grant of it; but it is nevertheless are well able to pay a doctor themselves, 2dly by orders
being granted without due consideration by overseers of being granted without due consideration remote from the residuce of relieving officers; and 3dly, by orders being grant-d for triffing ailments on which to found clains fur other relief. Relieving in this they often perhaps err on the right side, but too much fasility in wivny medieal orders discourares altogether those medical clubs, which cost the labourer little relief. Applications for a doctor to attend the wives of labourers earning full wages during confinement are
becoming more frequent, often in consequence of the becoming more trequent, often in consequence of the
"doctors" refusing to attend without an order, because they are sure of their fee from the board.
A practice is also beginning to extend itself of getting death takes place; this is an insidious step towards the old system.

Clothes are also frequently applied for to rig out one of the family taking a place, a pitiable case is made out, not unfrequently 25 s . for a boy, and 15 s . or 20 s for girl, are allowed to start them into life; the miserable condition of the fimily being often brought about by the extravagaice or improvidence of the parents begets
commiseration for the children, which procures for them advantages not enjoyed by more scrupulous poor without considerable self-denial and privation. These hints will suffice.to show that abuses may creep in and
should be carefully watched, and when possible preshould be carefully watched, and when possible pre-
vented. Much of the increase in poor-law charges may be owing to a relaxation of that strictness which was at first enforced, and which it is the constant business of the Poor-law Commissioners to maintain; but 618 unions in England and Wales take a deal of looking after, yet it must be admitted that the qualifications of all officers and persons concerned in administering the poor-law are of a higher character than formerly; rality and houses are not the horrible hotbeds of immo in all of them are, taken as a whole, well educated and though parents who desert their offspring, rather men ini families, should wetter under the care of a master who kueps people are and endeavours to make them good, than living with a drunken or vicious parent. Une ugly feature of the sequently of abandoned girls; this item cannot be charged to the new poor-law, and like the other monster ordinary treatment for its amendment. Finally, come to the conclusion that all social evils require the efforts of benevolent and right-thinking men to devise practical measures that sliall abate evil and induce good habits, while dearness of provions must felt by nue comforts of the poor; the pressure is also ficulty keep their head above water, and the heavy taxafion is severely felt by all persons with limited incomes. For such, and for all, public journalists should state facts and argue fairly, not revert to obsolete and disautrous usages as a fair contrast to the condition of the poor at present, but remove obstacles to a right apprehension of things without fomenting discontent or insinuating useless calumnies. J. W., Peterborough.

\section*{AGRICULTURAL CONSTANTS.}

Though the unceasing calls of a very extensive medical practice have for 12 long years prevented me from writing anything on the subject of agriin the sabject, and continuing a steady reader of your valuable Pay er have watched with much pleasure the progress of the science. It is not however my inclination, neither indeed is it in my power, to resume my pen and once more enter the fiell as a
writer, but having noticed a paper of mine referred to on two occasions lately by Mr. Martyn Roberts, I am anxions to say a few words in explanation. I had quite hoped that your leader on "Agricultural Constants" would have satisfied your correspondent; but this not being the case, I would call his attention to the following circumstances in comnection with my papers on Bone-
dust, Rape-cake, and Farm-yard duog. If he will refer to the schedule of prizes offered by the Highland and Agricultural Society of Scotland, he will find that the subject was introduced in some such way as
this: "Exteusive experiea ce has proved that 1 tou of this: "Exteusive experier ce has proved that 1 tou of
bone-dust or Rape-cale is equal to 15 or 20 tots of farm-yard dung iu the production of Turnips," \&cc. \&ce. In competing for the prize, therefore, I felt that one point only was before me, viz, the immediate effects of these three manures upon a crop of Turnips On a
former occasion I had examined a somewhat analoyous former occasion I had examined a somewhat analogous
subject, viz. to ascertain why the police manure of Edinsubject, viz. to ascertain why the police manure of Edin-
burgh (ashes, house refuse, \&c.) was equal to farm-yard manure for certain crope while greatly inferior for
le the peculiar requirements for a good manure for the Turnip crop, and in the essay from which Mr. Stephens
quotes in his c. Brook of the Farm,', I went upon the same data and followed the same process of amalysis For the particulars, however, I must refer to the essuls volume of the Prize Essays and Transactions of the Society. : The mistake Mr. M. Roberts has made is in suppusing that I made an wh and out comparison
between the three \(m\) nures; thi- I did not attempt, as it was altogether foreign to the sulbject in hamd. On the contrary, the compar son referred solely to thtir relative
effects upon the Turnip crop, which, as you are aware, in Scotland always follows directly iffer the manuring; the comparion is therefore strictly limited to the im mediate effects or to those only in relation to one parti cular crop. My method of comparison has often been objected to, ind my calculations considered erroneous, but this has been entirely owing to the oljecturs overlooking this limitation to immediate effects. It mus exists, independent of manure altogether, a vas: superabundance of every ingredient, organic and mineral, which any crop can require, and yet we know that manures or sulstitutes for manure are required. The ense of this lies in the condition in which the various ingredients exist, those only being available for the pre-
sent crop which are in such a state or combination that sent crop which are can absorb and appropriate them. I think my mode of calculating will be best understood by an analogy. The soil may be compared to a banking conc rn, where there is both vested property and foating enpital, and the growing crop will represent the daily demands for cash payments. Now it is clear that crup, that is, to satisfy a large daily demand for money which has the largest floating capital, or whose vested property is more readily capable of being realised. If, has \(100,000 \mathrm{l}\). invested in land, 15,000 l. in the Funds, \(10,000 l\). in Exchequer Bills, and \(5000 l\). in cash; while Excend has in land 50,0000 ., in the Funds 50,0002 ., in Exchequer Bills 20,0001 , and in cash \(10,000 l\)., and the
third had in land 10,000 l, in the Funds 50,0001 . third had in land 10,000l, in the Funds \(50,000 l\),
in Exchequer Bills 50,000 ., and in cash \(20,000 l\).; it is clear that although the three concerns have each a capital of 130,0001 . they would yet be very unequally prepared to bear a pressure upon them for eash payments ; and in comparing their relative superiority in this respect we should simply add together all the different sums possessed, with the exception of the amount invested in land which it might be difficult to realise, and we should conclude that the proportions of 30,80 , and 120 represented their relative capabilities to meet a sudden rum. And this is what my objectors 89 I should have done with the three manures. But to that the daily customers at the bank require sometimes cash, sometimes exchequer bills, and sometimes various ingredients of the different manures, and, co
sequently, the comparison must be made differently
for the second bank can not only supply twice as many
customers with cash, but also twice as many with exchequer bills, and nearly four times as many with government stock; hence nearly eight times as many customers can be accommodated at the second bank as compared with the first. Let it not be forgo obtains by far the greater part of its weight from the atmosphere and water ; and all we can hope to do by manure is to stimulate the plants into more vigorous health by presenting some one or other of its required ingredients a a readily absorbable, or, as it might be termed, in a tempting form. I hope I have now succeeded in
explaining my meaning. Henry R. Madden, M. D. Brighton.

\section*{Home Correspondence}

Adulteration of Bread.-Flour is adulterated with Rice, Indian corn, and sometimes Bean meal. These bread hawhold water; and the latter serves to disguise milchy flour. Bean meal may be detected by the smell, on pouring boiling water on the flour; Rice and Indian corn only by the microscope, which housekeepers do not generally possess. But flour has been also adulterated with clialk, plaster of Paris, and China clay. All these may be detected by burning 100 grains (or any precise quantity) of the flour entirely away Genvine mineral substance wi leave men Genuine Wheat flour will not leave more than 1 per cent. of ash ; and what exceeds this may be charged to the adulteration. And they may be detected in the
bread, by the same process. Chalk can be still more easily detected, by mixing a teasponful of flour in half a wine-glass of cold water, and adding 20 or more drops of muriatic acid ; chalk will betray itself by effervescence. In the bread the adulteration with Rice and Indian corn flour may te indicated, though not with certainty, by drying a weighed slice of the new bread reed from the crust, over boiling water, till it will hose no more weight. The loss will show the percentage of arindian corn present. Mashed Yotatoes are also usel in bread, chiefly to improve the texture. If much is in bread, chiente betrays it; but a little good mashed Potato rather improves the bread than otherwise Alum is the most common injurious adulteration of
may When the bread is pretty strong of alum, it may be detected by the taste. Cut a good slice,
rather stale, about half-inch thick paring off the crust, put it in a deep plate or saucer, with warm water tnou_h to soak it well, cover it and set it over hot water Kieep it thus hand warm (but do not let it boil) 2 or 3 hours; then squeeze out the water through muslin, and the alum will betray itself by the taste; or boiling) evaporation. But it will not be often strong enough to discover in this way, the taste of the bread generally covering that of the alum. To detect the more common small quantities, the bread must be charred, to as follows:- First char 1000 arains of the by acid bread ; then boil it in a flask, with four drachms of nitric acid, four of muriatic acid, and four of water. Evaporate to dryness ; when cold add one ounce of distilled water and buil for a few minutes ; while boiling dilute heriwo ounces or iquor potussem. (as sold by the neutrals) and woil again for a few minutes, then filter precipitate with ammonia (the 1 quor of ammonia of th chenusts). The precipitate, if any, is alumina, showing the presence of alum ; and if well washerl, dried, ignitea quantity; but this requires a little whemical pate tice The Cattlc and Turnips of East Cumberland.-Cum berland having been very conspicuously brought before the notice of the agricultural world in the preceding year, on account of the Agricultural Society having favoured that county by holding their meeting at Carlisle, a few remarhs on the various breeds of cattle for the most part reared there, and also upon the descrip tions of Turnips mostly grown in that neighbourhood (with the greatest success), will I have no doubt be acceptable to our southern friends, who, I am informed, admired the culture and quality of our Turnip crops during their sojourn in our border city. The principal Galloway (or black Scots as they are provincially termed) and a sort of spurious breed, a cross between short-horns and Irish cattle. There are amongst the neighbouring gentry and farmers three or four choice breeds of short-horns, out the fancy prices which have been obtai she thed some parties to bring their stock to the hammer, large
sums having been paid for animals of acknowledged blood and symeen paid for animals of acknowedget find bymetry. Our ideas are that they are aon dancy to fatten, instiry, Galloway or Black Scots are the most snitable for the quality of land, and are decidedly the beat breed for small farmers and cottagers. The plan usually adopted is to sell the bull calves to the butchers as 800 n as they two calves very quickly fatten, and will feed, on average, the Irish attle aserally hos cross breed with the form and many having cast calf (before being brought The Turkips are slow feeders and hide bound. The Turnips grown here with most success are the
Swedes, Yellow Bullocks, and White Globes. The Swedes are found to be much the hardiest and best keepers, never being used until all other sorts are finished; land in good order will produce from 20 to 25 tons per acre, and calculating the price at 258 . per ton [!] this shows a valuable crop; but when the great outlay in wages and manure is taken into account, as well give a prefere thinning, hoeing, \&c., many for that the extra yield of Wheat the next year fully repays them. It may be as well, in conclusion, to mention that Yellow. Bullocks generally produce from 18 to 22 tons per acre, and White Globes 25 to 28 tons; but as in all the high and saudy soils the Turnips are almost invariably eateu off by sheep, the exact growth per acre is
not quite so correctly ascertained. The usual Turnipsheep here are Cheviot wedders, mostly bought at Falkirk, and the price for turniping each sheep per week is about \(6 d\). ; this is a high rato, but railways have maeh weight of the Turnips is calculated without ineluding the root or tops.
Box Fseding.-Having seen in the two last Gazettes some speculations on the possible or probable resuits of this system on the health and condition of animals so kept, it will no doubt be satisfactory to any persons desirous of adopting it and who may have been influenced by any theoretical objections, to learn the pracperiod in each year between October and June I period in each year belween October in boxes 24 bullocks-Shorthorns, Herefords, Devons, and Pembrokes, purchased at various mariets. I have not lost a single bulloch from disease of any kind. I have never paid, to the best of my recollection, a single shilling to any veterinary surgeon, nor has there been any ailment amongst the cattle in the buxes. My ooxes were formed simply by exca common stone wall of that height the entire length of the range back and front, to prevent any earth falling in, and without any brick or other floor ; the range is then merely divided by cross rails into compartments 9 feet square, by strong rails, which are raised by a very simple contrivanee as are raised to the ground level. That takes about in to 16 weeks. We generally find that, by that timo, an
average thriviug amual waltis off on a level to the
butcher. The week before last my boxes were com. butcher. The week before last my boxes were com-
pletely filled, some of them inconveniently. An agripletely filled, some of them inconveniently. An agri-
cultarist who was over my farm, on walking into the principal range, and who did not know what was under the bullocks, remarked on the sweetness of the building -that it was as sweet as any room in a dwelling-house. 1 told him I considered it much sweeter than most domestic apartmente, in which opinion he concurred. This week some other gentlemen had the opportunity \(n\) seeing the boxes while being emptied. They had the advantage of seeing a glorious sight to a farmer-2 feet of dung so compressed as absolutely to exclude all access to air, in an equally moist state from the top to the bottom; not a particle dry or wet, but as soon as the forks were inserted to hollow up and throw out the contents and free access was given to air, the fragrance of the preceding week was very quickly succeeded by an many a long, drooping, heavy ear of corn. The only essential to complete success, as respects this system, is that the litter should be passed through the chaff cutter, set to cut from 4 to 6 -inch lengths, or thereabouts, which insures even treading and perfect absorption of the fluids. We put in the bottom of the boxes when first started 3 or 4 inches deep of the small straws, \&c., thrown out behind the threshing-machine or some turf ashes Charles Lawicnce, Cirencester, Feb. 18.
Couch Orass.-Having had some exparience in the destruction of Conch Grass, the most vigorous enemy a armer has to contend with on a stiff soil, I have come the pest but the long steel fork; the plough and spade the pest but the long steel fork; the plough and spade pieces, and scattering them all over a field, the smallest pieces, and scattering them all over a field, the smallest has been truly said that "the man who makes two blades of Grass grow where only one grew before "is
a benefactor to mankind. Then surely the farmer who a benefactor to mankind. Then surely the farmer who Wheat per acre under the old system of cultivation) to yield 30 in these days of improving husbandry is food to grain, and consumes even more, without returning any equivalent to recompense the labour bestowed upon the soil. It theretore stands to reason that the extirpation of this hungry weed would leave a double allowance of nutriment for grain, pense of forking is generally an is foul. The exmany against using that valuable tool. This fear should vanish into thin air, after the Lois-Weedon experiments and others, which have proved that a thorough deep particularly when it is of atiff nature A othere, calculable advantage of the fork cultivation is the influence upon drainage, the air penetrating the subsoil, fuence upon drainage, the air penetrating the subsoil,
and the water runging off more rapidly. A -inch ploughing upon dirty "Couch land "is labour in vain. With such facts before agriculturists will they still conand cut as much Grass as stubsle in the Wheat crop, may appear tedious going over the same ground so often, yet cannot be too deeply impressed upon the minds of agriculturists, rich or poor, the absolute necessity of cleaning land and keeping it so, in order to obtain the greatest amount of produce. If farmers wait or steam culivation to perform the work of deep tillage, they may wait long eaough. Falcon
Italian Rye-grass.-To extracts from a pacer on Italian Rye-grass, read by Mr. Morton before the Reading, have appended the following notes from their wor experiments and observations:-1. It will, how wher, thrive in any description of soil ; in fact, will grow where scarcely any other useful Grass will exist.
have now adopted the quantity of 3 bushels per acre sown alone; but we find 2 to 3 pecks sufficient with Clovers and a corn crop; and this quantity should not be sown till aiter the corn is up, or it will get too high
before harvest. Although Italian Rye-grass is useful or this latter purpose, its great merit is for soiling or forage. (See Note 3.) 3. August is the best month, but it may be sown with safety any time letween February and Uctober. Antumnal sowing might have 8 lbs. Trifolium incarnatum (Italian Crimson Clover) per acre, Jkewise Rye-grass; and the spring sowings would be (Alsike Clover). 4. Italian Rye-grass is also useful for nursing Common Red Clover when sown with the crop, by protecting it from frost and bringing it on much dition, three or four cuttings per annum may be obtained even without liquid manure; but undoubtedly, the more manure is applied, especially if in a liquid form, the more abundant will be the crop. It is important that the liquid should be applied immediately after each upon the Grass where the scythe has wounded it, 80 much the better. 6. Mr. Dickenson has since published his pamphlet, and we would adivise our friends to procure it. It is published by Kidgway \& Co.
Gorse-One of your correspondents in page 33 asks or a description of implements used to convert Gorsi various correspondents in your Paper, that I am always glad to answer any questions I can. This particular one I must have answered already many times, I have
used, Gorse for many years, and thini it, on suitable
soils, the very best winter food for horses, cows, and calves (I have not tried it for sheep, but make no doubt
it is equally good for them). For horses it equals good hay and will keep in good condition either fast or slow going ones. Cows milk extremely well upon it, and the milk and butter is as pure as when they are on Grass, and calves thrive well upon it. With Turnips, \&c., it is equally good for feeding cattle. To begin at the beginning-first grow your Gorse. Here, I think, is ought beanon it grows on all waste ground it thought you need not take any pains or trouble about It should, however, be carefully grown on well cleaned ground, sewn much as you would Turnips on It sh, fattening the latter well dow win a light roller through the first summer, and will be better for horse hoeing afterwards. It will be ready to cut the autumn but one alter sowing. 10 mow it a scythe is required, and it must be cut level. For some years I was much puzzled how to braise it in the bes and cheapest manner ; but I then purchased from Messrs. Richmond \& Chandler, of Salford, one of their chaff-cutting machines, and found it answered perfectly
for Gorse. My plan of using it is as follows:-The for Gorse. My plan of using it is as follows:-The on feeds it with Gorse. This first-cut Gorse is put on one side as cut till sufficient is done. The feeder of the machine has then straw placed upon it, and upon this the once cut Gorse is placed with a large shovel. straw pulls it on and it gets a second cutting or bruising from the machine. The cut strad and Gorse is now ready for feeding with. This description seems long, but the process is very quick and inexpensive. I never use sny straw or hay uncut, aud when I have not expensive than Gorse, and is not half so good. In fact Gorse is the only good green food you can have in winter, and I feel convinced it has only to be fairly tried to become much used wherever the soil is light enough to grow lit. lf well cultivated it may be cut every year and yields a great amount of food. Some 50 years since a large cowkeeper at Birmingham fed his milking cows upon it, and tor a long time no one could get at his secret for having an abundance of sweet rich
milk through winter, as he would not allow any one enter his ord upon it by small farmers and cottagers. They bruise it upon a block of wood with a sort of mallet having two knives placed across the bottom. It is common there to buy Gorse. I should add, that although the machine I have of Richmond \& Chandler's has done its work quite to my satisfaction for 10 or more years, I saw great improvements upon it when at their especially devoted to Gorse; but which of course cuts straw also. W. D. Fiox.

\section*{Societieg.}
royal agricultural of england.
Webely Council, Feb. 20.-Mr. Miles, M.P resident, in the chair
Oil.cake, -The Rev. Thomas Burroughes, a membe of the Society residing in Cambridgeshire, transmitted to the Council a specimen of oil-cake which had been supplied to him as genuine "Rape" cake; but which,
from its suspicious indications, Mr. Burroughes had not from its suspicious indications, Mr. Burroughes had not ventured to give as food to his cattle until a chemical This cake on examination parts had been made for him kinds of seed, had a very pungent taste, and on dis s. Iving in hot water was found to emit the strong odour of Mustard. Mr. Burroughes, therefore, desired to and, if safe, whether it would prove nutritious.

Peat-furl.-His Excellency the Danish Minister addressed an inquiry to the Council on a subject much interest in Denmark, namely, the compression of
peat for fuel. A note on this subject was read from Messrs. Easton and Amos, the consultiug Engineers of the Sociey; and the Secretary was authorised to make further investigation on the points to which the Danish Minister had referred.
Economy of Heat.-M. Etienne Salmon, of Brussels, communicated a plan by which the heat given off from colke might ise splied to hospitals, and other large buildings, which require a great expenditure of fuel to warm them. M. Salmon' plan was illustrated by a drawing, and consisted in connecting pipes with the coke-uven, by means of which
hot air could be thrown into the atmosphere, and steam hot air could be thrown into the atmosphere, and steam
conducted through the earth in conservatories, or below the floors and along the walls of the buildings in question.
Stram Digging Machine-Miss Charlote Bauer, of Schwabitz, near Nimes, in Bohemia, reported to the Captain Bauer, in the invention of a steam digging her desire to carry into execution the plans be had, as he believed, so succesffuily perfected at the time of his decease. The Council referred this communication to Mr. Allen Ransome, with a request that he would give to Ais8 Bauer such advice in reference to the best mode
by which she could carry out her wishes as his experience might suggest to him.

Agriculiural Weeds.-Mr. Rawson, of Glanhenwyr, Radnorshire, applied for leave to print off, at his own
expunse for private distribution expunse for private distribution, two hundred copies of
Prufessor Buckman's Prize Essay on Agriculturna Professor Buckman's Prize Essay on Agricultural
Weeds, published in the last Journal of the Society Mr Rawson thought that last Journation society. the essay among the Wuch a gratuitous distribution would strongly call their attention to the importance of the destruction of weeds in their waste lands and hedgerows, and to the injurious consequences of the neglect of such eradication ; and the example once set by a few of the most enlightened of those farmere, and the good effects of it shown, he had no doubt that in due time it would be followed by those who at present were least aware of its importance.-The council referred this request to the ensuing monthly council, with an order to the printers in the meantime to keep the type of the Essay standing.
Parliamentary Legislation.-Several communicaagricultural addressed to the Council on the subject of cussion, to the ensuing monthly meeting when Mr Miles, M.P., gave notice that he would call the attention of the Council to the following clause in the Society's Cuarter, with a view to ascertain what interpretation of the Council in their proceedings:-
"And know ye further, that in granting this nur Royal Charter
 extend our Royal Protection to its national objects, under the
condition hat principle of tits constivation shanll be the total
exclusion of all ot a plititical tendency, or having reeterence to measirres pending, which no resulution, bye-law, or or our enactunent of the said
body politic and corporate, shall on any account or pretence
Steam Cultivator.-Mr. Burness, of Prospect Ter. race, Brixton, submitted to the Council a schedule of suggestions on the subject of the Society's prize of 5000 . for a steam cultivator, and in reference to the best mode generally of obtaining the great oljject of steam cultivareferred to the implement Committee, with a request that they would report upon them to the Council.

Agriculturar Meetings at Paris.-Mr. Miles, M.P.s reported to the Council the arrangements in progress by the French Government for the auricultural meeting to
be held at Paris in the years 1856 and \(185 \%\). He also ubmitted to the Council the official prize-sheets having elings. A short abstract of this will be given next week.

\section*{3intutclu\%}

The Journal of the Royal Agricultural Society of England Johi Murray, Albemarie Street To the concluding article-on Agricultural Statistics by Mr. Hoskyns-of the current number of the Journal
we have already referred. The whole volume is exceedingly interesting and useful, and does great credit to the arrangements made for carrying on the editorship of the work, which had so long been in the hands of Mr. Pusey. Among the more useful papers on manuresthe one describing the principles by which farm management in manure making is influenced, and the other the method of arriving at theintrinsic value of manures assold in the market-are those by Mr. Way on the value of Arti Chemical Changes in the Formation of Dung. To these we shall hereatter direct the fuller attention of our readers. That they may learn the general character of this issue of the periodical we may mention that of its 340 pages, 50 are occupied by a report of Buckinghamshire Farming; 24 by Mr. Bowditch's paper on Manure;
20 by Professor Buckman on Agricultural Weeds; 28 by Mr. Finlay Dun ou Lameness of Sheep ; 90 by a Chtroversial defence of the views on Agricultural epor the Carlisle Meeting 20 . Mibert, 20 by Artificial Manures, and the remainder by Mr. Hoskyns on Agricultural Statistics. Among the shorter papers is one by the late Mr. Pusey, which will be read with interest as the last contribution of one to whom agricultural literature owes 80 mach. The experiment which he describes was devised for the purpose of determining the relative influence of superphosphate-charcoal and nitrate of soda as manures for Wheat upon an exhausted soil. It demonstrated the great superiority of the last -the utter inefficiency indeed of the others under the borating hases in which they were applied-thas corn specific value of nitrogen as a manure for Wheat.

Calendar of Operations.

 rimming hedges, trenching land, \&.., all hands have been pretty
busily employed. Althnoly the ground has been wet, yet, from the absence of frost and snow, ploughing of lea has been proceeded with, the ground is in a fit state for the recep-
oo soon as the
tion. Turnips are running to their finish much quiker than was anticipated, and sheep and cattle will, in many piaces,
be on short supalies both of straw and Turnips ere the \(G\) Grs. comes. A field of good Turnips to be eaten oif with slieep whole,
now fetch from 6l. to \(8 l\). per acre. The winter, on the whole,
being dry and open, sheep haver made good progress, yet hougs have not altogether recovered the severity of last spring. Cattle
in courts are in forward condition. The railway is extendiug itself northwards, and lahourers are lookin
season, with highly remumerating wages.

\section*{The Garventrs Chromitle． SATURDAY，MARCH 1， 1856}

Darwis commenced his Phytologia in the fol－ lowing words ：－＂We have so accustomed ourselves to consider life and irritability to be associated with palpable warmth and visible motion，that we find a renitency in ourselves to ascribe them to the com－ paratively cold and motionless fibres of plants．But to reason rightly on many vegetable phenomena we shall find it necessary first to show that vegetables are in reality an inferior order of animals．If a bud be torn from the branch of a tree，or cut out and planted in the earth with a glass cup inverted over it to prevent the exhalation from being at first greater than its power of absorption；or if it be in serted into the bark of another tree ；it will grow and become a plant in every respect like its parent． This coinces that every bud of a tree is an individual vegetable being，and that a tree therefore is a family or swarm of individual plants，＂like the polypus， with its young growing ont of its sides，or like the branching cells of the coral insect．
This was the opinion of an eminent man who
urote 56 years since. Similar opinions, more or less modified, have been expressed by subsequent
physiologists. Those of Du Prit Thouans were made known to the English reader in the Philosophical Magazine for August, 1824, and have eve since been the subject of discussion as opportunities have arisen. In Prof. Lindley's earliest introduction to Botany, published in 1833, they are given in detail; and in 1835 the late M. Gaudichavd brought them before the Institute in still another form. They are familiar to the men of science of every country, and we may add are also universally accepted as true by all who can claim a right to express an opinion upon the subject. We therefore read with no little surprise in an ingenious little volume that has just appeared,* that this "neither represents the popular belief, nor does it accord with the recognised doctrines of the schools. To the popular mind, indeed, it may be said to be nearly unknown, while heretofore it has failed to secure the sanction of the greater number of our scientific botanists." What the popular belief about the buds of trees may be we do not pretend to know, any more than what is as regards the moon, or the cause of thunder but we must altogether dissent from the last part of the paragraph quoted. Men of science fully recognise the individuality of buds as a matter of theory What they do not agree about is the precise relation that exists between buds and wood; or rather in what manner that relation is to be interpreted Du Petir Thouars, and Gaudichaud, endeavoured to prove that the wood of a tree is merely the roots much skill and tenacity. Others, however, have objected to their theory upon several grounds, sach for example as the production of wood in cases where no buds are present, or because the stock of a grafted tree partakes in no degree of the nature of its scion, although according to the theory of in Petin. must consist of a mass of roots belonging to the scion; and most especially because wood is not in structnre the same as roots. It is on this ground that a conflict of opinion has established itself; nobody doubts the individuality of buds, but many doubt whether the wood of a tree is a mass of budroots. This is not the place in which to repeat the arguments which either party rests its case upon. The reader will find the most important briefly stated in the fourth edition of Lindley's In troduction to Botany, Vol. ii., p. 187, where a chapter is occupied by the subject.

Such being the case we must object to all claims to originality in a matter which, in a scientific form, has been worn threadbare, and we are glad to see that the same view is entertained by the author of the little volume whose appearance has led to these remarks. To use his own words-"He has advanced nothing that was not known before." Nevertheless he has done very well.

In a gardening aspect the individuality of buds is the cardinal point on which some of our most impurtant operations turn; such, for example, as all modes of propagation whatsoever, except by
seed. If that is not fully understood there is no possible explanation of the reasons why certain results are sure to follow the attachment of a bud or the insertion of a graft, or the planting a cutting, or the bending a layer, or the approach of a scion, or the planting an eye-our six great forms of artificial multiplication. It mast not be supposed that Dr. Harvey has occupied an entire volume of 227 pages with arguments merely in support of the indi-
viduality of buds. The identity of wood and the roots of buds is what he most especially dwells upon or if the reader pleases, the true origin of timber In all that he says he writes well, with good taste and perspicuity; and we gladly welcome him as a useful recruit to the ranks of vegetable physiologists. Those who are interested in trees and their way of living and growing, will find his pages instruct and interest them, although speculative points occupy so large a part of the work.

We have lately received from Mr. Jackson, of Guernsey, a very interesting account of some experiments he has made with a view to discover a more ready means of propagating frrens than that afforded by the process of dividing the crowns which form naturally. Mr. Jackson's experiments were made with Scolopendriums, and show that at least the curious forms of that Fern may be increased to a much greater extent than was supposed without having recourse to the spores. It seems to us that the facts thus elicited throw some light upon the formation of buds on the stipes and rachides of Ferns, which it is now known occurs in many in-stances-in some constantly, in others as it would . Trees and their Narure; or the Bud and its Atributes. By
\(\Delta\). Harvey, M.D. 12 mo . Nisbet.
appear accidentally or only occasionally. Taking these into account, it seems highly probable that, ander proper conditions, the fronds of many kinds of Ferns would produce plants if planted as cuttings; and it is further not unreason-
able to infer that parts of fronds may be enployed for the same purpose. There is much scop here for experiments, and among those which more especially suggest themselves are the following :-1. The fleshy living bases of fronds already decayed, which surround the lower part of the caudex in many Ferns, taken off with or without a portion of the rind of the caudex. 2. Entire living
fronds, of different character, taken with and withfronds, of different character, taken with and withheir base. Mr. Jackson's successful attached to were entirely confined to those Ferns which have fronds adherent to the caudex: it would be very desirable to ascertain if the same power is possessed by the fronds of those species which are furnished with a joint or articulation at which the fronds are naturally cast off, and whether by the portion above or below the articulation. 3. Healthy portions of such fronds as Scolopendrium with a moderate length of sound healthy rachis treated as cuttings. 4. Pinnæ of divided fronds cat 80 as to preserve entire the axil formed by the branching of the rachis. 5 . Simple pinnæ and pinnules of large and small size and of different textures, cut so as to preserve the axil of the vein from which they arise.
In conducting these experiments it should be borne in mind that it is usually at certain organised points in connection with the ribs and veins of Ferns, that buds or bulbils, as well as sori, are produced. The examples which o send us, consist of healthy fronds producing buds at the base, and small portions of the rind of the caudex with the living bases of decayed fronds, also throwing out buds as shown in some of the buds spring from the cut edges of the base of the stipes, and others from the cut edges
b. Portion of the rind and others from the cat edges Living hases of de- Mr. JAcKson's account

cayed fronds.
trials is as follows:-" Having
been very anxious to increase my varieties of Scolopendrium, I have been experimenting on some common sorts, and have been successful in discovering a way of increasing them very rapidly as to number, though not as to size. I find tha the remains of the Scolopendrium fronds, which
are attached to the very ends of the caudex, are attached to the very ends of the caudex,
and the tops of which must have been for many years decayed, have the power of producing young plants. Is this known to you? I find also that a perfect frond of Scolopendrium will rapidly produce a new head, though there is not the slightest portion of rhizome attached, nor any appearance of a bud. I imagine that the new bud comes out of the cut part of the base as frequently as from the edge of it, and from the lower edge as well as the upper, and in the case of the rhizome I fancy it is requisite that it should be cut lengthwise, as the buds appear to push from the edge of the cut, and cannot perhaps otherwise break through
would seem likely that those Ferns which possess some degree of fleshiness or succulency may be most successfully dealt with, probably from thei having a greater quantity of available organisable material. Does the cut upon which Mr. J \(A\) cesons, apparently with reason, lays some stress-inasmuch as these old caudices seldom produce young plants when left entire-does this cut liberate the vital orce, which becomes organised in the shape of a bud? \(M\).

NEW GARDEN FERNS.-No. VII.
18. Scolofendrium Krebsif, Kunze, Linnea xviii., Krebsir, Kze., Lin. x., 504 .
ronds coriaceous, broadly lanceolate, acuminate, pinnate; pinnme
sessile numerous, lanceolate auriculate and subcordate at the
base sessile numerous, lanceolate auriculate and subcordate at the
base, the margin repand and revolute, the lowest smaller
deflexed ovate, the upper confluent deflexed ovate, the upper confluent; sori short oblique;
short, terminal and adherent to the semi-erect rhizome.
A curious and ornamental warm greenhouse evergree cern, with the true fructification of a Scolopendrium but having pinnated fronds. We are indebted for our Henderson, of Wentworth, by whom the finest specimens we have seen were communicated. Seedling plants two years old produce with us fronds of about a fcot in length, and fully fructified; but Mr. Henderson's fronds measure nearly a foot and a half, with the ringer pinnæ about 3 inches in length. The fronds are more tapered below than above, and the lower smaller
pinnæe are more distant; the rest are crowded, and the apex is abruptly acuminate. The pinnæ are smooth,
coriaceous, spreading, lanceolate, with the base both above and below produced into an auricle, which more angulate and most developed on the anterio side in the short lower deflexed pinne. The sori

are numerous, placed obliquely and forming two lines along each of the pinna. It is a native of the Cape of Good Hope and Natal, and should therefore succeed perfectly in a greenhouse. Our plants have however been cultivated in the higher temperature of an intermediate house, in which they progress much likily. The young plants of this Fern mistaken for them, but the more mature state is per fectly distinct in aspect as well as in structure, though having some resemblance to the 'barren fronds of Lomaria auriculata. T. M.

\section*{DISEASE IN CUCUMBERS}

Within the last few years practical gardeners have been astounded, and philosophers have put on their puzzling caps to discover a preventive for the too well known Potato disease, while the community, especially its poorer members, have undergone much privation from losing the crops of that root, which has till lately been regarded, next to bread, as one of the most important items in "food for the million."
Happily for us, the subject of our present notice does not affect one of the staple articles of haman food; but one which is nevertheless much in demand, and which those great authorities in gastronomy, French cooks, deem indispensable to their craft. Unhappy, therefore, is the fate of that gardener, who in spite of vibrio mildew, burning the roots, and so forth, fails to produce them "on demand."

Various articles upon this subject have from time to time appeared in the pages of this Paper, but the descriptions of the affection have been so vague and mixed up with mildew and other causes, that with the exception of the lucid account given by Mr. Ayres, I have not seen any very intell gible
Last spring I sent to Dr. Lindley the root of a diseased plant, which he obligingly figured in the Chronicle, and which I dare say most Cucumber growers remember. At the same time, the Rev. Mr. Berkeley after examining the affected roots, made some remarks, and figured a small vibrio, which he had found, and to whose presence he thought the affection might be attributable.

After the failure of that crop, I did not use the same pit for Cucumbers again during last year, but another fer yards off. In the first the plants grew in supplied by materials, the atmospheric heat being from tanks in a chamber, and the same soil, a fine maiden loam with leaf mould, which had always answered perfectly before, was used in both cases. Every congenial condition for a successful issue was presentabundant light, heat, and moisture ; the result was, that although I failed in the first pit, I succeeded beyond my most sanguine expectations with the second crop, not a trace of the affection appearing ; but this season I have lost three successive crops in the first pit, and the roots now sent are from the first plants in the second pit, grown without check, and precisely under the same conditions which so fully succeeded last year. Yesterday I pulled up the plants, of which the one sent is an average sample. It will be seen that the excrescences have not become so large as they were when figured last year. It is not the least remarkable of the phenomena attending this disease that it should have attacked Mr. Ayres's plants, distant 40 miles from hence, and mine at the same time. My seeds have been from different sources, some from my friend Mr. Ingram, of Windsor; others from Mr. Spencer, of Bowood; others rom Bath. The soil has all been from the same source, but has produced both healthy and diseased plants. The hygrometrical conditions have both in the case of suecess and failure been uniform. The bottom-heat from which the plant sent was taken was \(85^{\circ}\). I yesterday discovered what I suppose to be the vibrio of Mr. Berkeley in one of the excrescences
Believing the subject to be one of singular interest and a phenomenon in the annals of Cucumber culture, Invite the attention of the scientific readers of this Paper to its consideration, and subjoin a few remaraly. No prognostics and varions phases of the malady No trace of mischief has been apparent to me untit that plants made three or four rough leaves. After that period the leaves do not attain their usual size, anc ther, but appear stunted. Upon examination it is found that
they are not forming roots; but where roots should be
forming, round the stems, small granular excrescences are perceived. In a short time the leaves flag in the are, the edges curl downwards, and their tissues become thickened, brown blotches appear on the surface, and the state of the roots is that of the example sent over. Henry Bailey, Nuncham, Oxford. [Our correspondent M. J. B. will have something to say presently on this subject.]

\section*{on frost splitting.-By Dr. Robert Caspary.}

I now turn to the consideration of the causes of frost splitting, and in the first place it is necessary to test the different views of the subject entertained by my predecessors.

Duhamel and Buffon (Hist. de l'Acad. Roy. de Sciences de Paris, 1737, p. 282 ) express the opinion et dut couchant" than in other directions, because the cannot have been seriously maintained by Duhamel at least, for in the " Physique des Arbres," 1758, p. 346, he states that thay are promoted by an exposure toward contradictory statements of Duhamel's, I will oppose the totally different one of Ehrhart, who, in respect of the effects of the frost of \(1788-9\) in general, and partially also with respect to frost splitting, which he had nbserved, says, for the country about Herrnhausen, those trees and shrubs which had been planted on the southern side of the heights suffered more than those on the north side" (Beitrige, vol. V., p. 148). I have on frost clefts. They do not depend upon any cold coming laterally in any one direction, but upon prere the work of man, and to are connected; thes connection with exposition. It is striking that all the trees in which I observed frost clefts were not in the midst of the forest, but near to rosds or paths, and conequently more open, as I have everywhere carefully noted. The reason of this is not that trees on the wayside are more exposed to any effect of weather in any
particular aspect, but that they are more liable to particular aspect, but that they are more liable to
injuries, not accidental only, but intentional also, for purposes of cultivation. The roads along which frost with one and the same exposure there are often atches as it were, the greatest and most inexplicable ifferences as to the presence of frost clefts. Thus in the long avenue of Lime trees from the bridge of Charlottenburg to just before the palace, which ha everywhere the same exposure, making only a very slight portion between the house No. 14 of the Berlin road and the Wilhelmsplatz, although it is precisely this portion which is the most sheltered from the north by the houses ; before and after this part there are rarely any frost clefts to be seen.

The proposition that certain exposures promote frost splitting is to be distinguished from another one,
that the frost clefts show themselves on the tree towards that the frost clefts show themselves on the tree towards
particular points of the compass. Gaudichaud attributes the fissures in the wood, and consequent deep decay which shows itself on the south-west side of an avenue of Horse Chesnuts in the Luxembourg at Paris, a metre and a half above a hedge which runs along it, to the alternating effects of frost by night and thaw by day daring the winter. ("Comptes Rendus," 1853, p 305.) As to his views of the alternation of frost and presently; I now only speak of the direction of the clefts as to the points of the compass. Gaudichaud also reports that the outer trees of a Poplar plantation near at the height of 2 metres from the ground to the length of 4 or 5 metres on the south-west side. But as fros of 4 or 5 metres on the south-west side. But as frost these injuries are independent of the points of the compass, so they cannot either have been in connection
with these points. My observations show that the clefts ocear in directions the most varied without distinction, tree. Probably the frost clefts of which Gaudichaud tree. Probably the frost clefts of which Gaudichaud speaks were all turned in one direction, because the did not remark, all lay in that direction ; for instance, the boughs of these trees might have been pruned off on that side only, as is often the case in alleys, and these were all in alleys.
3. Gaudichaud deduces the clefts in the abovemen ioned trees of the Luxembourg from the altarnations of rost by night and thaw by day. I myself had formerly remarked that "it is to be inquired whether a thaw
might not produce such a contraction of the outer might not produce such a contraction of the outer
layers of a frozen tree, as that the proportionally greater volume of the still frozen inner layers might cause them to burst." (Bot. Zeit. 1854, p. 702.) I can now give it as a fact in regard to the thaw, that it has nothing to do with the splisting. All the frost clefts observed burst open daring the severest cold, and closed immediately, as I have mentioned above, on the coming on of a thaw.
4. Göppert puts forth the conjecture that frost clefte may be partially produced by the effect of wind and brittle when the trees are frozen and consequentl of the brauches I could attribute to the effects of these
nothing to say against this vid
Theoretically I have
but practically it is certainly very seldom realised. I never saw a frost cleft in the axil of a branch, they were always either under the centre of a stump or a knot, or quite independent of any branch, and I observed hundreds besides those above detailed. That the frost clefts I observed from their position on the thickest firmest lower part the trunk, as from a reference to the meteorologic table, which shows that the wind was never more than
\(2^{\circ}\), that is to say only strong enough for a little \(2^{\circ}\), that is to say only strong enough for a little
piece of paper let fall from the height of a man to reach the ground at a distance of 6 to 12 feet.

As wood, as is well known, easily splits by dryness so an idea appeared not improbable which some friends expressed to me (as I have already mentioned Bot. Zeit. 1854 p . 702 ), that the frost elefts are produced by volume and could not resist the expansive force of the inner layers, where no such evaporation had taken place, and which consequently retained theiroriginal bulk. But this view is certainly incorrect, as is shown by the 13th January to the 25 th February, the previous rainy weather in December up to the 13th January. It is true that the relative moisture on the 13 th and 15 th February at 2 P.M. was only 50 per
cent., but no tree burst before the 31st January, and cent., but no tree burst before the 31 st January, and
from the 16 th January to that time the moisture was so great that it exceeded that of the rainy time of December and the first half of January, and even reached 100 per cent. on the \(2 d\) and which had never occurred in December or before the 6.
6. De Vriese (Some Principles of Vegetable Physiology anslated from the Dutch in the Gardeners Chronich in the stems of trees even in winter, and "often causes large trees, the expansion of which is prevented by the cold, to split from top to bottom, and the juice that is taken up stresms out through the crevices on the surface." This proposition is in every respect contrary to nature. The following facts disprove it :-1. The thinner stems were, before they burst, frozen to the centre as above shown, and therefore there conld have been no ascending current of sap in them. 2. The less will the sap ascend in leafless trees, even when, the thermometer being above the freezing point, they are not actually frozen; and the attributing to this sap which must at any rate be very small in quantity and weak in ascending power, force enough to press on the outer layers which are prevented by the cold from expanding so as to burst them, cannot on any ground when they are first produced, as from the frost cleft proved to me. The flow of juices or gam only takes place in the following spring or summer

In an article of a correspondent of the Gardeners Chronicle, signed "R. E E." (1854, p. 614), which attacks the proposition of de Vriese, another cause is
adduced for the frost splitting, which is by far the most popular, and maintained more especially by many ardeners, that the expansion of the sap in the act o reezing causes the splitting of the stem, and that the bursting of the vessels acts a great part in the phenomenon. In exotic annuals and small shrubs in which remarkable formation of foliaceous ice takes place at the slight frost of \(3^{\circ}\) R. ( \(5^{\circ}{ }^{\circ}\) F.) (Bot. Zeit., 1854, p. 665) it is indeed clear that by the freezing of the sap a dis uption of the tissue ensues, in the first place in th ayer of cambium and then also in the wood itsel but the ordinary frost clefts of our trees are certainly not produced in this manner. That the vessels in general often demonstrated, especially by Göppart, that one can only be surprised at the ignorance which would still maintain the contrary, and a refutation would be superfluous. But that in frost splitting the expansion of the
freezing sap does not cause the bursting of the stem will freezing sap does not cause the bursting of the stem will be clearly proved by the following considerations. Ice According to the researches of Brunner on the density of ice at different degrees of temperature (Poggen dorff's Annals, 1845, No. 64, p. 113), the specific weight \(32^{\circ}\) - \(1^{\circ}\). cent. is 0.91812 , that of water at 0 acquired about \(\frac{1}{1-1}\) in bulk ; but as the cold increases, its volume diminishes very considerably, more than that of any other body, even of zinc. Brunner found by the etermination of the specific weight of ice at differen degrees of temperature that the co-efficient of the linear \begin{tabular}{l} 
contraction of ice for every degree centigrade was \\
0.0000375 , or \\
\hline\(\frac{1}{7} \frac{1}{7} 0\). At \(-10^{\circ}\) cent. its specific gravity
\end{tabular} is already 0.91912 , and at - \(10^{\circ}\) cent. its specific gravity similar though not the same result was obtained by Struve (Bulletin de l'Acad. de St. Peteraburg,
1845 , tom. 4, p. 170), who by another method that is, by the direct measuring of a cylinder of ce more than 5 feet long on the Neva at different degrees of frost, found that the linear contraction of ice or \(80^{\circ}\) Reaum. was 0.00530 , consequently for one degree centigrade 0.0000520 . It is therefore clear that when a bottle or pipe, or any other closed vesse freezes it will not do so at all, because as the frost in creases in intensity the ice shrinks more than any other body. Withont fear of error we may, therefore, assume
in like manner that the watery juice of trees, even though
contain saits and organic matter, will follow the same that it will acquire its greatest rolume at the moment freezing, and with an increase of frost it will contract If, therefors, a plant bursts by the freezing of its sap, it must do so at the moment of congelation or not at all I have shown that the sap of trees freezes at a tempera ture of from - \(1^{\circ}\) to \(-4^{\circ} \mathbf{R}\). ( \(30^{\circ}\) to \(23^{\circ} \mathrm{F}\).) A plant therefore, whose tissue is broken by the freezing of the sap, must burst at a temperature ranging from \(-1^{\circ}\) to - \(4^{\circ}\left(30\right.\) to \(\left.23^{\circ}\right)\). In those exotic plants mentioned above in which foliaceous ice had formed, the rupture too place at a temperature of \(-30^{\circ}\) R. (about \(25^{\circ} \mathbf{F}\).). Bu as to the trees I observed, it has been shown that the thinner stems had cooled down to below - \({ }^{\circ}(23)\), and the sap had been frozen through and through before they burst ; the frost splitting did not occur at the time of congelation, but only at a subsequent period at lowe temperatures, a clear proof that the freezing of the sap was not the cause of the bursting.

Duhamel and Buffon (Hist. de l'Acad. Roy. de Sciences, Paris, 1737, p. 281-2) suggest that the stems are burst by the increase of volume acquired on congelation by a mas8 of moist decayed wood, or by an sccumulation of sap in the interior of the tree. They
say, "1l n'est pas douteux que la sève, qui augmente de volume lorsqu'elle vient à geler, peut produire plusieurs de ces gerçures." "Nous avons scié plusieur arbres attaqués de cette maladie (the frost splitting) et nous avons presque toujours trouvé sons la cicatrice preeminente,; un depot de seve ou du bois pourri." Dumamel says the same in his "Physique des Arbres," "Physiologie" "riranus entertains the same opert to certain degree, but only in the also does Willows Nut trees, and others in whose soft pith fluids could easily accumulate. Schübler (lst Dissert. p. 11) gees in the congelation of watery fluids "which older trees often contain in their pith " at least one of the concurrent causes of frost politting. That this canse may in some instances take place cannot be donbted, especially in ol frost clefts and trees with old knots. Gaudichaud ("Comptes Rendus," 1853, p. 801) adduces several cases where deposits of sap had been found in the cavities of old overgrown frost clefts, and where on boring the liquid was squirted far out, even, in the case of a black Poplar, to 2 metres. But it does not follow that on the congelation of this liquid the stem mue split ; for if the ice finds space enough in the cavity for its expansion, which must be the case in a large fros cleft, or in the cavity under a knot, the stem would then not burst, and to me it is more than doubrul that these any other time than in spring and the beginning of summer-at least it is only then that anything flow rom them, as 1 well know from the time of my entomological studies, such liquid exudations from frost clefts
would would appear that these liquids are not the sap of the ree, but meteoric water that has found its way in At any rate it is very rare that the causes frost clefts; I never fund an andmpuno prodac never found any ice in the cavities into the depths of which I could often see most distinctly, and the rotten wood which often covered their sides was always dry operat any ice-crystals. If these canses had ava ments I used in the last paragraph would prove that in the case of the thin trees they must have burst at a small degree of frost, or at any rate as soon as a temperature of \(-4^{\circ}\left(23^{\circ} \mathrm{F}\right.\).) had penetrated into the interior of the tree. Now as from the 14th to the 20 th January-during seven days-the thermometer only maxima were not above \(-2^{\circ}\left(171^{\circ}\right)\), and by night fell as low as \(-13^{\circ}\left(+23_{4}^{\circ}\right)\), all the clefts in the thin trees, if occasioned by the congelation of accuat have burst liquids, must have burst during that period. But dying that when they did burst they were not caused by the freezing of accumulated liquids or wet rotten wood alone.

\section*{VEGETABLE PATHOLOGY.-No.CX}
437. An̄asarca* (Dropsy). It is not intended by these terms, which in conjunction with Hydrops have been ased by Meyen, Léveillé and others to denote a particular condition of the tissues of plants, to assert that this condition is at all identical with the affection known under those names in the animal world. There is no disease in the majority of cases of any principal organ or organs causing an extravasation of fluid ; but from external causes there is a general accumulation of water a the cellular system, in consequence of which and the attendant stagnation the plant is not properly nourished, the vital energies are impaired, and as a natural consequencs of functional derangement organic mischie
at last takes place, which is more or less fatal in proat last takes place, which is more or less fatal in pro-
portion to the urgency and continuance of the outward portion to
conditions.
438. In our last article (436) attention was drawn' to the fact that plants may be drowned as effectually a animals. There are, however, conditions of the atrasphere nearly as fatal in many cases as complete immersion in water, if continued long enough. In our own country it frequently happens that long continued

Tise ground is of course saturated with water, and a the same time the air is charged with moisture, and the intensity of light grearly diminished. Evaporation from the plant is consequently almost at zero, while extialation is greatly dimmished, the result of which is that every part of the plant is thoroughly gorged with mo sture. Meanwhilione cond assimilation are much im the \(r\) proper elaboration and assimilation are mueh im pt no. entirely cease, and as the quantity of nutritive matter is diminished, the cellular tissue formed is weak and unusually penetrated with moisture. In ordinary cir cunslavees much of the energy of vegetation is directe to the strengthening of these walls by the deposit ", layer after layer of lining matter, a process which re-
quires a large stock of nutriment nixed up with the fluid asp, or at least a cuuick and continued supply Here however it is spent principally upon the multiplication of cells, and from the necessity of keeping the fluid in constant action the formation of cellular tissue is increased in proportion as the strength of the tissue diminishes. Little carbon is fixed owing to the absence of light, and the new shoots are therefore in outward strength, winter's cold hey are unproductive.
439. The cell walls, however, are not the only part whieh suffer. The protoplasm of the cells, from which every part of the plant and all its secretions derive their
origin, receiving little from the returning sap, is watery ond deficient in carbonaceous and nitrogenous matter the consequence of which is that but a small quantity of starch, sugar, and other allied substances are separated,
the proteinous matters, on the presence of both of the proteinous matters, on the presence of both o are more or less deficient, and the produce in consequence is tasteless, scentless, and innutritious soon perishing from putrescence, combined with the effects of a variety of minute monids or other fangi The seed moreover does not ripen atall, or is preserved with difficulty to the proper time of sowing, and then produces starved and chlurotic plants.
449. The effects on long continued moisture are not, however, confined to functional mischief. Where fullow, and accordingly this anasarcous state is the forerunner of many evils, especially if there be con siderable depressure of atmosplieric temperature, or Murh more of the temperature of the soil, which is the inevitable consequence of long-continued saturation. the want of a proper formation of chlorophyll, they fall off prematurely with or without any previous chlorosis, as is also the case with other articulated organs, as the flower and fruit, or the tissues begin to yield to decomposition, snd the fruit therefore rots before it is ripe spots are formed on the leaves and other succulen plants, the stem becomes cankered, and the foundation winter, when vegetation is more or less dormart, plants sutfer from excess of moisture, which induces a low state of vitality from which, though apparently flourish ing, they are unable to recover in the ensuing spring Rr. Lindley, for instance, remarks how much the suffered from the pet weather of the winter of 1859 an 1853. Much of the spotting of evergreens* in the epring arises doubtless trom this cause. As a general of moisture, a principle which all cultivators should pes petually keep in mind. After a dormant condition it is petually keep in mind. After a dormant condition it is ofren grow better if the soil is not at first saturated with water, and the same may be aid of bulbs and tubers after a ling voiage, or when they have been kept for some weeks perfectly dry. The same prin-
ciple will also apply to other plants. Such rules of ciple will also apply to other plants. Such rules of cautious proceedings are the best.
411. In cultivation in the open air, the only remedy for such a condition is to have the ground well drained so that at least there may be no stagnant moisture, and melves as much as possible of what light there is. In the conservatory, and in general under glass, matters are perature and atmosphere be regulated with the greatest perature and atmosphere be reculated with the greatest
nicety, if the roots are placed under unfavourable conlitions, it may be impossible to avoid shanking, fruit shedding, and a variety of other evils.
442. Though the conditions above-mentioned do not strictly come within the notion implied by the use of the words dropsy and anasarea in animal pathology, there is a condition of vegetables which bears a closer resem blauce to it. Elms, especially, are subject to an affec tion characterised by an extravasation of fluid, and it accumulation amongst the cellular tissue. In spring when the ascending force of the sap is wery sping where it is not appropriated quickly enough or dimin ished sufticiently by the action of the leaves, the fluid oozes out of the cells and stagnates more especially which is that both are more or less damaged, and when
that he Ivison, the intelligent gardener at syon, lately told me Coseos tree (Theohroras) and Mangoteen by an overdose of trater either in the soil or air, or by any sudden change of
air is admitted, and active putrescence takes place. M. J. B.

\section*{Home Correspondence.}

The Plane Trees alluded to by Sir W. J. Honker as growing at this place are of the species that I have always understocd to be Platanus orientalis. The largest specimens stand in a part of the domain known and celebrated at that time for an exteusive collection of trees and shrubs, many of which still remain. The argest of the Plane trees in question measures II ft. 5 in. in circumference at 3 feet from the ground, and several others are as much as 9 feet round. Sunt rees which were cut down several years since have been converted into wainscotting, for which purpose, and for cabinet-making generally, the wood seems to be extremely well adapted, as it bears some resemblance to the foreign production known as "satin-wood. These trees agree with the description of \(P\). orientalis given in the abbreviation of Loudon's "Arboretum Britannicum," but there is no reference to the Deepdene in that edition. A large tree of P. occidentalis s said by Mr. Loudon to have then been growing in he Palace Garden at Lambeth, and if thet tree is still living its species might readily be ascertained by ex large trec of the kind usually called occidentalis. Although the eastern species is a very ornamental tree - both in winter from the peculiar mottled appearance of its bark, and in summer when fully clothed with oliage-its value in that respect is somewhat lessened y its lateness in coming into leaf \(\}\) in backward seasons have known it to be nearly midsummer before the leaves were perfec

It will be seen from this table that every month of the year was more or less below the average temperature, and that the departure from the mean was very large in January, February, March and May, and considerable in 1314 and December. After the great frosts of 1795 and in 1820, 1823, and 1838. The following is the amount of rain which fell here in 1855 :-

The total fall was 25.17 inches, of which 10.82 inches fll in July and October. C. B. N. P., Knebworth, levenage, Jan. 26
Cooking of Seeds. - I remember well the rise, and I practice. About 40 or more years ago it was reckoned one of the secrets of the trade, and mostly confined to the eking out a supply of Cauliffower when it was scarce on a vision in a "bad year." I remember well being the above period in the autumn; he was a sharp fellow, and I remember the knowing shake of his liead, and his "You will see to-morrow," when I asked why he had so large an accumulation of old Onion seed, not a seed of which he assured me would grow, and which he had been buying at a low price for three or four years ! The morrow came, and with it a great man from London, who bought all his old seed, I think 10 or 12 acks (only think of sacks holding 4 bushels each of Onion seed) at a good price; in those days Onion seed
in bad seasons was sometimes 16 s. per lb , sale, and so was worth diluting or "cooking" think I was told that the new seed of that although scarce was pretty good, and each pound would bear six ounces of old seed mixed with it. At this period the mixing business was thought a great secret, and was I think confined to the more valuable seeds, such as Cauliflower, rare kinds of Broceoli, and Onion andavour to increase the profits was no occasion to then enormous. Early York Cabbage was purehased of the growers at about 9 d . and 10 d . per lb ., and sold wholesale at 48., 5s., and 6s. per lb. It was some few years after the above period that agricultural seeds, more particularly the Turnip seeds, came largely into consumption, and "cooking" them was soon found to large sums of money were made by those who first did it largely and systematically. I mean by this, they took care not to lose credit with the farmers
puting too large a quantiry of dead seed with the genuine, so as fur the seed to come up too thinly on the land; the tender consciences of some of these cookers were therefore at rest, because the farmers did not complain, but still it was thorough dishonesty, and those who have made their fortunes by the practice ought to build hospitals or endow schools to expiate their offence. The mode of testing garden seeds as given by you is excellent ; nothing can be letter, and it will soon put a stop to the practice of mixing old and dead Peas with new and expensive sols It is really no juke to give half a cromn a quatts. some new lind of Pea and to find half a pint some new wind of Pea and in a few days after sowing. The testing of agricultural seeds seems to me to require something more than what you have recommended. Farmers do not like trifling operations ; rather than count 100 seeds not like trifling operations; rather than count 100 seeds the risk of losing a crop. Let testing of seeds be made a business, and a market gardener in a small way of business, such a man we will say as Mr. Cuthill, of Camberwell, make himself a "seed tester," One for the three kingdoms will be enough, and London as the centre the most convenient place, and let the farmers send samples of their seeds to him to be tested in the following manner. We will suppose a farmer to have received his Clover seed for the season, and two or three varieties of Turnipm instead of troubling himself to count out 100 seeds of each and sow them, let him send a small packet of each to the tester, with, we will say, 12 stamps for each in prepayment. The packets may be named or numbered thus:-

No. 1. Skirving's Swede from Messrs. A

\section*{" 3. Clover from Messrs. C.
" 4. Italian Rye-grass from Messrs. D.}

This catalogue must be kept by the farmer, and the packets only numbered, and then on their being propents tested the tester writes to his employer.

Sending packets with their names in full will of course do as well, but the numbering will spare much writing, and as it will not perhaps be quite agreeable for a farmer living near the country house of his seedsman to send his name, he may sign his letter and have his reply from the tester sent to "A. B., Post office, Birtematic testing it may be; depend upon it this Bysseedsmen, and will rejoice the hearts of the houw. When we had seed-shons and seedsmen we got along pretty well, but with our "seed-merchants" and "seed establishments," seeds have not prospered ; there is yet another move to make "seed professors"
Oak Apples. Why not? An Old Shopman. naturalists to the immense number of these excrescences in the neighbourhood of Exeter. Every Oak and also the underwood of this timber tree is now (February) literally covered. Could they not be useful for tanning purposes?

Cure for Damp Walls.-It is said (and in some cases where if a that if a damp wall is washed over on the outside with sulphuric acid and water in the proportion of one to six it will not after such dressing show any symptoms of
damp. What is the change that takes place in the brick, and in what cases is such an application likely to be of benefit? If you or any of your correspondents could answer this question I would feel obliged. J. L. B. [We are quite unacquainted with any such method as that described.]
British Oaks.-I perceive that there is a tendency to believe that the Quercus sessiliflora is distinct from the Q. pedunculata. May I request that such of your readers as have attended to the botanical differences between them will send a ncte of the results arrived at to the Chvonicle for publication. I had been led to think that no permanent characters could be found for their separation ; but from the recent remarks of the Editor and his correspondents, I am prepared to be convinced of the error of such a conclusion. C. C. Batington.-_The following distinctive marks will be found pretty correct-Qukrcus pedunculata: common British Oak and White Oak,Acorns generally single, in twos or threes; fruit-stalks long. Leaves green, very deeply sinuate, short and
set-like; foot-stalks very short, almost wanting, and of a reddish-green colour. Buds small and not prominent. Branches tortuous and spreading. Tree assumes a Father set and unhealthy appearance. Quercus sbssill. flora: Bay Oak, Chesnut Oak, Durmast Oak, and Red Oak,-Acorns generally in clusters ; fruit-stalks very short. Leaves green, glossy and shining, deeply sinuate; foot-stalks very long, and of a yellowish-green Treer. Buds large and prominent. Branches uprgí Tree assu

Flarourless Pine Apples.-Can you tell me why my Pine Apples are so flavourless ? They are well grown, handsome fruit, and the flesh is of first-rate texture and quite sound, but it has no flavour whatever; in fact have
sour. I have been cutting Pines all winter, and han sour. I have been cutting Pines all winter, and have
not been out a fortnight until now. I will cut sgain in not been out a fortnight until now. I will cut again ill
the course of three weeks or so. They look to all appearance as well as plants could possibly look, being green as Leeks and stout to the base, but still the fruit, as I have stated, has noflavour. The sorts I have beon cutting this winter consisted of Queens, Ripley Queens?

very little air. very little air.
some of them ?
pone off in the same way as winter Spinach here has gone off in the same way as that described by "Quersoil; the ground on which my Spinach was sown was heavily covered with mould from a not very old inery bour, not a mile off, had his sown on rather poor light land, and he has had no disease ; on the contrary, his Spinach has been as healthy and good as it could possibly be. Colo.
Reproduction of Ferns.- You ask me what the ciliated spiral filaments described by "R. E." in worms are.
Now, I would much ratlier throw the proof of their real nature upon "R. E." Mr. Antherid is, however, most certainly not a worm or an animal organism, notwithstanding his activity as a swimmer in water. I need not say that ciliary motion is no proof of this, or indeed ceee would have an equal claim to be retained in the list if animal structures. The independent life of spermatozoids in animals is now abandoned by the best physio those of vegetables. The little coiled up spiral ciliated filament which, under the name of Mr. Antherid, produces such wonderful effects when introduced through the canal of the archegone to the embryo cell in the prothallium of Ferns is surely a simple cell, which by means of its litlle hair-like appendages finds its way the pollen tubes find their way to the ovules of flowering plants. Wonderful as is the process, and beautiful as is the design which it exhibits, it is not more so than the reproduction of the Diatomacese by conjugation. The wonder would be great indeed were we to believe that this was done by a worm, or by anything even analogous to a worm having an existence more independent than
that of a simple cell. I hope "R. E ." will not consider me hypercritical. I am anxious that the excellent information contained in your Journal should not convey wrong impreseions, and I am sure you will agree idea which I think most casual readers would obtain from "R. E.'s" description. C. R. Bree, Stricklands, Feb. 25. [ Worm =anything which penetrates gradu-ally-whence to worm. Not necessarily an animal ; it might be a bit of steel. See lexicographers pausim.

Adulteration of Seeds. - Your remarks on this snbject have recalled to my mind a case somewhat in point. certain celebrated nurseryman sent out packets of seeds of a new and beautifal flower which he had imported, at - per packet. One day a gentleman told the nurseed of another party or did buy packets of the same packet. Judge, therefore, of the gentleman's surpris When the nurseryman told him that all the seed of that particular flower imported to this country was first in
his hands, and that in sending it out he had not lessened the price to any one. How the other party was enabled to sell at a reduced price and yet obtain a profit, the sticklers for cheap seeds and the patrons of puffing, after perusing your observations on the subject, will not be at
a loss to guess. Henricus.

\section*{Forietiog.}

Horticultural, Feb. 26.-The Rev. L. Vernon Harcourt in the chair. Viscount De Vesci, J. Clutton, Esq, and W. Potts, jun., Esq., were eleeted Fellows. Several
very fine specimens of Orehids were contributed by Messrs. Rollisson, of Tooting. Among them were the Madagascar Angræecum eburnenm, Dendrobium speciosum, a species which at one time nobody could flower; various kinds of Vandas, a Phalænopsis, an Acacia, and a handsome example of the double flowered Chinese Plum. From Mr. Forsyth, gr. to Baron Rothschild, were two noble plants of Phaius grandifiorus, Medinilla magnifica, and Boronia pinnata. Beautifully bloomed
Hyacinths were shown by Mr. Cutbush, of Highgate, and Hyacinths were shown by Mr. Cutbush, of Highgate, and John's Wood; from Mr. Crockford came Chinese Primulas. Messrs. Veitch contributed a handsome new Correa raised from Australian seeds, a white-flowered Cinchonaceous plant, a small bit of Streptocarpus polyantha, apparently a free flowering kind, and a very finelooking Rhododendron (purple with dark spots on the upper petals) which was stated to force well. The same eminent nurserymen also sent several well grown and
finely bloomed specimens of Epacris. Messrs. E. G. finely bloomed specimens of Epacris. Messrs. E. G. Henderson produced a novelty in the shape of Eucharis
grandiflora, a plant with large striking snow-white flowers (see our page 804 in the volume for 1855). From the Society's garden came a collection of plants, among which were the useful winter flowering Thyrsacanthus Scliomburgki alius rutilans of gariens, Hakea acicularis, genus; the large variety of Mignonette called Reseda grandiflora, which is much more vigorous and quite as sweet-scented as the common kind ; the Crimean Suowdrop (Galanthus plicatus) gathered on the heights of Sebastopol by Col. Munro; also Dr. Fischer's Snowdrop of the same name, which is somewhat different from that of Col Munro; and Forsythia viridiesima, a hardy
have then in perfection. Pears in good condi.ion wes exhibited, which had been ripened on trees; in pots in the Society's orchard house. Cuttings of fruit trees
were distributed. Some olservations, in grafting were made on this occasion by the Vice-Secretary He bezan by stating that grafting often occurs even petals of flowers in close contact, and under certain conditions growing together, aud went on effecting the same thing artificially. It is in realisy, he said, the property of all living vegetable tissues to form permanent adhesions under certain cir-
cumstances. Fery young or nascent tissue may be made "to grow together with facility, as is exemplified in practice by what is called herbaceous grafting. Ripe tissues were next alluded to ; but even in the case o
thege it was shown that a union could oniy be effected b bringing into contact nascent matter which practically consists in fitting the line of the cambium in the stock neatly to that of the scion, or in other words fitting the Whe together exactly. If this mánipulation was not effected skifully the union, it was stated, would be im broader than the scion. It was mentioned that some believe that the scion sends down wood into the stock, but that this theory was attended by many difficulties The point had been illustrated by Dr. Maclean of Colchester, who grafted a yellow Beet on a red one ; when the two were split down the middle after they had
been united it was found that the yellow Beet still remained yellow, and that the red kind on which it was grafted still remained red. In this case there was no blending together of the tissues; the two varieties kept quite distinct. Cellular tissue, it was stated, would not unite with wood, nor whod with wood ; with unskilful operators and the employment of unsuitalle stocks bad joints were therefore of frequent occurrence. Although the scion was not of the same nature as the stock, there might be adhesion; but the line of zeparation
between the two would always remain distinct, and in bad cases it not unfrequently happened that the two parted company across the line of union. Nevertheless when stock and scion were alike in kind and constitution, as when a Pear is grafted on a Pear, and the workmanship well performed all traces of their having been grafted disappeared. It was stated that under proper conditions adhesions might therefore be permanent and perfect, and that grafting might result in as complete a plant as any seedling. Of this various proofs were produced. It was shown, however, that adhesions might be temporary either from bad workmanship or from want of consanguinity. The ancients, it was stated, were of opinion that Apples would grow on Plane trees, and Beechmast on Chesnuts ; but it was union could take place unless stock and scion had the eame e. \(\cdot\) nstitution. Sometimes durable unionsmight be effected, as was instanced in the case of Pears on Quinces and Peaches on Plums ; but they were not permanent. Evergreen trees, it was stated, did not succeed on decidunus
ones, in illustration of which an example of Quercus Turneri worked on the common Oak was produced ; the evergreen in this case had grown for 13 or 14 years, but was now dead, while the stock was alive and throwing out suckers. Similar cases with nearly as bad resurt asked, is "the same constitution?" Peaches take on Plumb, although constitutionally unlike ; but what is very curious French Peaches which take freely on the Pear Plum, dislike the Muscle Plum, and other ex amples of the same kind were brought forward. It same in constitution. The Cedar of Lebanon, for instance, would not long agree with a Larch, nor the Medlar with the Whitetiorn, or the purple Cytisus with the Laburnum. In general the following conclusions
might be drawn:-1. A scion will always form a per might be drawn :-1. A seion will always form a per-
fect and permanent union with its stock if both are from fect and permanent union with its stock if both are from
the same individual. 2. A scion will generally form a the same individual. 2. A scion will generally form a
perfect and permanent union with its stock if one is a mere variety of the other. 3. A durable, but not permanent union may be effected when one species of a genus is worked ou another species. 4. No union either durable or permanent can be expected when stock and scionare widely different. 5. Bad workmanship will render any kind of grafting perishable. Grafted plants, then, are not necessarily worse than seedlings ? A letter from a Fellow of the Society was read to show that in the case of Rhododendrons at least they were. Examples in the shape of grafted Rhododendrons, apparently pruving the contrary, were, however, produced by Messrs. Standish and Noble. It was, nevertheless, universally admitted
that except the stock and scion were identical in their that except the stock and scion were identical in their
natures plants thus increased were not so good as seedlings. Buth reason and experience therefore showed that everything depended on the consanguinity of the stock and scion, and that what is wanted is not to have new methods of grafting invented, but to know more about consanguinity. Mr. Glendinning objected to the s'atement that evergreen Oaks did not live long Deveciduous ones, and pointed to the fact that in Cerris had attained the size and age of timber trees The room was plentifully supplied with specimens of grafted plants from Messra, Standish and Noble of gratted plants rom Messr8, Standish and Noble of of Canterbury, Osborne of Fulham, Rivers of Sawbridgeworth, and from the garden of the Society.

き20ticts of Wiooks.
British Rural Sports. By Stonehenge. (Routledge.) This is a solid, clusely printed 12 mo . volume of 720 rages, wi h a gond index
"In the following Mamual of Britisl" Rural Sports, the first part treats of 'The Pursuit of Wild Animals for Sport, comprehending Shcotin \(\gamma\) - Hunting-Coursing -Fislcomry-and Fishing. Furt the second embraces an aecount of 'Racing in all its branch s,' viz., Flat
racing - Hurdle-racing - Steeplechasing - Riding to Hounds - Trolting-matches-Yachting-Boat-racingand Pedestrianism ; while the third extends over the following long list, viz, Cricket-Foo-ball-FivesBowling - Tennis - Curling - Golfing - Swimming-Kating-1orsemanship-and Driving. Avd, lastly, tion of the Anatomy, Plyyiology, and Diseases of the Dog and Horse as may enable the sportsman to preserve their health, or to relieve any of the more ordinary deviations from it. In this enumeration, Pagilism, Cock-fighting, Bull and Badger-baiting are omitted, as being contrary to the laws of the land; and, to the best of my judgment, nothing is inserted which can injare the morals, or destroy Luat gentlemanly feeling which \(t\) should be the object of every true sportaman to
For our own parts let us add that all which we have examined has proved to be well done, and that this enumeration of contents is not only no overatatement, but really less than we should have made ourseives. How sound is the author's advice may be learned from the following remarks upon rifles, in which justice is done to Lancaster's, which are unrivalled for accuracy of fire combined with facility of loading :-
"In the choice of the riffe much consideration should now be given; for the recent improvements introduced Colonel Colt and Mr. Lancaster have effected quite revolution in its form and powers. Under the old regime, a rifle was considered first-rate which would in a calm day kill at 150 or 200 yards; and a chance made shot at 300 yards was a feat to be never forgotten.
But by Mr. Lancaster's insention the windage of the ball is greatly reduced, while it is carried much further in consequence of its increased weight, and the ingeninus discovery and adaption of the principle, that the axis of its fligh should be in the sam formerly. The theory of this is clear enough, and is very beautifully acted upon by Mr. Lancaster. It is quite manifest that if a circular ball is rapidly revolving round its axis at riyht angles to its course, the friction must be enormously increased, and as a consequence its flizht must be retarded in proportion. To obviate this defect, Mr. Lancaster culculated that all the revolution which is necessary for straight slonoting is about once in 11 feet, and that all heyond that shou'd be avoided. He therefore made his barrels one quarter of that length, or 2 feet 9 inches, exclusive of the chamber in the
breech, being 2 feet 10 inches in all. This length is worked so that the rifle groove shall describe one quarter of a revolution, or, in other words, so that each roove shall commence at the breech on one side, and end at the muzzle on the top or bottom-that is to say, the side next to where it began. [This is rather obscurely stated. The spiral oval of the bore makes a quarter of a turn between the breech and muzzle, and the spire has a geometrically increasing curve.] Consequently this formation communicates such a slow revolving tendency to the ball, that on leaving the muzzle it goes on with the same kind and velocity of revolution, working its way like a corkscrew through the air, but like one with a very open and long worm. The barrel being thus formed, the ball is also made to suit it, being at the
least one ounce in weight, and cylindrical in form least one ounce in weight, and cylindrical in form, circle at the other-sometimes, as in the Minié rifle forming a deep cup with a thin adge which expand and fills up the groove, and thus increases the force and accuracy of its flight, withuut requiring any grea pressure of the ramrod. It is true that theory and practice do not always agree, but in this instance they appear to harmonise in a remarkable manner, for, on trial, it is found that Mr. Lancaster's rifle will carry, point blank, from one half as far again to twice as far as the old ones; and will also carry, with the proper allowances, four or five times as far. I should therefore unhesitatingly select a rifle on his principle, with the common conical ball, or that of the Minié rife

We entertain no doubt that Lancastry's smooth-bored riffes will speedily and eutirely supersede the o.d grooved patterns, unless indeed the two-grooved should prove an exception; for his possess as much absolute certainty of aim as is attainable, and can be loaded as often withnut cleaning and as easily as a fowling piece. A musket on this principle has been fired 160 times with greased
barrel.
Sylloge generum specierumque Ciyptogamarum quas in variis operibus descriptas iconibusque illustratas, nunc ordine systematico d. Paris, 1855 ; 8vo., pp. xxiv. \& 498.

study and for the arranyement of the herharium. study and for the arran"ement of the herharium.
Valuable notes are here and there insertel, errors corrected, the nomenclature amented, and the whole arranged according to the latest inprovements in this branch of science. Even to persons in passession of all the woris in which the species are de-ccibell, on of the
separate papers, the volume is a welcome boon, and those who are interested in this l,rancla o! Botany will do well to purchase it. 't'o the nure accomplished Cryptogamist it is quite indispensable.

\section*{Miscellaneous.}

The Purification of Sugar by Ants.- If the juice of the Sugar-cane - the common syrup as expressed by the mill-be exposed to the air it gradually evaporates yielding a light brown residue, like the ordinary muscovado sugar of the best guality. If not protected it is presently attacked by ants, and in a short time is, as \({ }^{\text {sit}}\) it were, converted inth whe ant preferring that part from its containing azotised matter. The negroes, I may remark, prefer brown sugar to white they say its sweetening power is greater ; no doubt its nourishing quality is greater, and therefore as an article of diet deserving of preference. In refining sugar, as in refining salt (coarse bay salt con taining a little iodine), an error may be committed in abstracting matter designed by nature for a useful purpose. Dro Davy in The Ellin. New Philosophical Juurnut.

\section*{Calendar of Operations} (For the ensuing week.) plant department.
Conservatory, \&e-Orange trees in tubs or pots should be carefully examined in order to ascertain whether or not their roots are in a healthy state, and those requiring more space should be shified at once;
but in many instauces it many not be possible to afford but in many instavees it may not be possible to afford orge specimeus a shitt. In this case remove as much ing the roots, and replace it with a mixture of good loamy turf, broken bones, decayed cow-dung and sand, and see that the balls of the plants are in a moist sealthy condition. Strong manure water is of great tervice to these, and may be applied freely at all keasons, particularly now when the trees will be starting into growth. It is quite impossible to use the syringe to advantage in many conservatories, and under such circumstances the flowering plants should be removed to liberal washing with the enrine, which will glso greatly nsoist in keeping the glass, \(\& c\)., clean. 'This should be done before the twiners start into growth as there will be no danger of injuring the tender folinge while they aie in a dormant state. Be satisfied with a rather low temperature for the present, and g:ve air freely on fine days, endeavouring to avvid cold drying currents as much as possible. Attent to keeping up a supply of Roses, Azaleas, and other things requiring to te brought forward in a gentle heat, and persevere in the destruction of insects. Stuve plants in active growth will energies and keep them perfectly clear of insects, \&e Give a little weak manure-water to such things as Allamandas, Clerodemdrons, \&c., if in free growth, and mulzitudes of stuve plants will be benefited by the same
treatment. Do not neglect the old but beautiful and useful Lisianthus. Keep the plants growing as freely as a mist high temperature, plenty of pot room, possible will effect, and get in seed at once, so as to insure a supply of plants for next season. Keep up a free circulation of air on every favourable opportunity, in order to induce a sturdy habit of growth. Water freely, but cautiously, especialiy in the case of recently potted specimens.

\section*{Forcing departhevt}

Pinerr:-Succession plants should not be allowed to get too dry at the root, as this would probably throw them prematurely into fruit. In re-potting these, if watered, so as to get the soll in a moist healthy stat before shifting. And where the plants are growing in the open bed the soil should be carefully examined to a sufficient depth, and if it is found to be over dry, water as often as necessary with tepid water to thoroughly moisten the mass, allowing tho or three days between each application. Maintsin a moist atmosphere, and shut up early in the afternonn, allowing the glass to Proceed with thimning the berries whenever the crop is sufficiently advanced to allow of this being done. Stop laterals, tie in y ung shoots, \&c., and keep everything neat and orderly. Maintain a stendy might temperatur taking \(65^{\circ}\) as possible; give air ireely on fine dnys, endeavour to avoid cold currents. Dee that the buds the late house are not excited by the present mili weather; keep the house cool. Watch narrowly for red spider in the early Vinery and in the forcing houses generally, and should it be detected anywhere lose no
time in washing the infested leaves and those around
oap. This may appenr a tedious process, but if the enemy is taken in time it will be more easily eradicated by these means than any other. Figs,--Keep the shoots hin so as to expose the foliage to light and air, and per severe in the use of the syringe to prevent red spide Give air freely on bright days, slatting enrly in the
afternom after syringing the hinse. P'eacues - Proafternom after syringing the hase. Peaches - Pro nd where the fruit is very thick a portion of these should te removed as soon as they are fairly set; but must each is iable to drop until aft lo allow of a few falling. Maintain a steady heat to Cucumbers of \(65^{\circ}\) sun heat. Give air on every possible opportunity ; but se very careful of cold draughts, which would ruin the tender foliage. Stop the Vines and keep them thin and regularly disposed over the trellis so as to expose then to light and air. Attend carefully to the early Melon plants, and regulate the temperature according to the amount of sunsline, taking care not to get the
Vines weak and long-jointed through a high clos temperature, for if this state is induced it will be difficult to secure either an early or abundant crop. Do not omit putting in seeds of some of the finer kinds for
succession crops. The Bromham Hall is an exceltent succession crops. The Bromham Hall is an excellen
var:ety, probably not surpassed as a hardy fruitful high var:ety, probab
flavoured kind.
flower garden and shrubberies.
Finish removing shrubs where not already done as son as possible, and lose no time in getting alterations compling the relaying or putting down of fresh tur labour to for it is a great saving of aiter attention winds set in. If not previously done get pillar Roses wimped and tied not previously done got pillar Rose for their support get them examined carefully, letting none be left that are not likely to last the season ; for \({ }^{\text {j }}\) is extremely inconvenient to replace them after the plants have begun to ramble about. It is a good plan to give pillar Roses a liberal supply of manure water when it can be conveniently obtained, or a dressing of solid manure may answer the same purpose. A inducing vigorous growth and a fine display of flowers.
hardy fruit and kitchen garden.
Get the pruving and nailing of all fruit trees finished with the least possible delay, and if any planting still remains to be done this should be completed at once, bout, as is sonetimes done, over-manare the gduce he production of gross long-jointed wood in any stage of the existence of a fruit tree; wood of this description ever gets thorougaly ripened, and in the case of stone frum, cauker, and the premature ree is sometimes the result ; and in the case of Pear tained till the gross habit induced by planting in over rich snils is overcome. Ground intended for fruit trees should first be drained, which should be done efficiently and then trenched to the depth of 2 feet. And if the natural soil is found to be too poor for the health and growth of the trees a sufficient quantity of fresh turfy loam should be added, but rich stimulating manure should nut be used, for they are son exinausted, and the trees are left to depend upon the matural soil for their support, and when treated in this way never give have their stems, \&c., scraped, and be painted with a composition of lime, soot, and cow-dung, mixed with soap-suds to the consistence of thick paint, carefully working the mixture into the crevices of the wark, in order to hury American blight or other inseets whay be lurking there. Take advantage of the in the day, with the ground in working order, to ge bros main crop of Onions. The old practice of sowing clean and thin the crop. Select a piece of deep land in good condition, and if the surface is not naturally firm render it so before sowing by treading or rolling.

COTTAGER'S GARDEN
Where not already done the main crop of Pofatoes should be planted as soon as ever the state of the ground will admit of it. In the still ancertain state of
this crop the cottager should not plant a great breadth, this crop the cottager should not plant a great breadth,
and shuuld use ouly early sorts ; for notwithstanding that the Potato is to the cottager the most useful of all vegetabe Potato is to the coth ger fourth of a crop canno be depended on, the ground may be more profitably occupied. By planting early and only early kinds, and this on light and not over rich soil, there will be a good chance of the crop being pretty well matured before the period when disease has usually commenced its ravages. See that a bed is prepared for Ouions, and also that every spare bit of ground is manured and turned over

\section*{The Ggrictltural Gatette.}

SATURDAY, MARCH 1, 1856
We have to add to our last week's report of the English Agricultural Society's meeting that the prize list and conditions of the Paris Exhibition were made known, and it was resolved, on the soggestion of Mr. Carrd, that a report of that meeting should be made to the Society by a depatation appointed

THE AGRICULTURAL GAZETTE.
[March 1, 1856.
to represent it on the occasion. We announced last
year, on the close of the Exhibition then, the liheral year, on the close of couramement offered to exhibitor in future years, but for the satisfaction of any who may intend to be present we repeat that the show will open on the 23d of May, and close on Jane 7th that live stock and implements for exhibition will French Government, and that entries must be made before April 9th. Any intending exhibitor must send before that date to any French consul in this country a declaration, of which the requisite form may be had on application to the consul. Imple-
ments are received on May 23d, and tried on ments are received on May 23d, and tried on
May 27th to 30th. Produce is received on May 26 th, ard examined by jury on May 30 th and 31st. Cattle will be received on May 2sth and examined by judges on May 30 h and 31st. Foud and bedding are provided for foreign
live stock at the expense of the Government. Intending exhibitors should immediately apply to the nearest French consular agent for the pamphlet issued by authority, containing all the information which they require.

We may mention that the prizes for live stock are very liheral, \(40 \% ., 32 l ., 24 l ., 20 \%\) being the list for short-horn yearling hulls alone, and a similar
list for bulls over one year old. There are similar lists, not so full, for Herefords, Devons, Ayrshire, and other breeds-for Merinos, Leicesters, Cotswolds, Southdowns, and other breeds-for Pigs of large breeds and of small breeds-for Poultry, and for implements.
We add to the information which has already appeared in these columns on the manufacture of sugar and of spirit from Beetroot, the following letter on that suhject from the count \(\mathrm{DE}_{\mathrm{E}}\) Gourcy, with
which we have been favoured by Mr. Caird. The writer is well quallfied to give an opinion on the subject, as no one probably has a better knowledge of European agriculture, or is better able to form a judgment hased upon so wide an experience. will be seen that the common Mangel Warzel, notwithstanding its more abundant produce, is not equal to the Silesian Beet in its profitable yield of
sugar.
The letter is as follows:-
"In answer to your questions concerning the distillation from Beetroot, let me say that it is carried on on a great scale in the north of France, where there are distilleries, and new ones spring up continually all over France. A considerable number of our manufactories of Beetroot sugar had commenced distilling instead of making sugar, especially at the
time when the Beetroot alcohols were selling as time when the Beetroot alcohols were selling as
high as 200 francs the hectolitre. Now that they only sell at 100 francs, or about that price, there are already several sugar manufactories which have returned to sugar in place of alcohol ; and it is said that when alcohol falls below 70 francs or 80 francs, the large distillers will not be able to go on. But it is thought that in the country distilleries, where the residues from distillation become very profitproducing manures of a highly fertilising character, the owners will be able to bear a greater fall in the price of alcohol than that mentioned above.

Alcohol can be made from Mangel Wurzel as well as from (tlobes and other varieties of Beet-
root, and from Carrots; bnt these roots do not give a remunerative quantity of spirit under distillation. For the distilleries, therefore, the white Silesian Beetroot is alone grown, which gives, according to the system of a distiller, Champomors, \(3 \frac{1}{2}\) per cent. of alcohol; but it is alleged that with the system near Bassé, a small town 8 leagues from Lille, as much as 5 or ( 6 per cent. of alcohol is drawn from this kind of Beetroot.
"The stems of Indian corn can also be distilled cut at the time the ear is shooting, but it is maintained that the Sorgho of China has begun to be distilled
with more profit. What is certain is that large with more profit. What is certain is that large
fortunes have been made all through France, Belgium. Germany, Hungary, Poland and Russia by an extensive cultivation of the Silesian Beeetroot, to be converted into sugar, and during the last few years into alcohol.
bandry over a large portion of Great Britain, bat that the British are wrong not to follow the example of the north of France, Belgium, and part of Germany, in the cultivation of roots for conversion into
sugar or for distillation, also of Hemp and Flax aud oleaginous plants, which certainly are troublesome, but which in the end are largely remunerative and advantageous.
The London or Central Farmers' Clab propose to depart from their original constitation, or rather to
extend it beyond the limits of a mere discussional
society for the ascertainment and publication of agricultural opinions on matters of professional and general interest. They propose to support a club plainly bat comfortably with the usual dining, drawing, reading, and smoking rooms of a club. house, and in addition about 20 bedrooms.
there is need of some such establishment, and that the prospectus which has been issued may meet with an ample response we do not doubt. The institution contemplated will have its uses, and we making known the intention of it. At the same time the society as it already exists serves well the purpose for which it was originally established, and there are many members already amply satisfied with what it does in the publication of its monthly agricultural discussions, who have no interest in the extension contemplated. No doubt the establishment of such an institution as they propose is a matter in which the directors of the society must in their individual capacity be interested: whether it be a suhject coming properly within the scope of their official
duties we do not know. We confess it seems to us duties we do not know. We confess it seems to us
that the proper work of the Farmers' Club, hitherto most admirably performed, is that of matual information and instruction.

\section*{AGRICULTURAL STATISTICS.}

The leading article in your paper of the 9th inst. directed attention to a contribution from the pen of the fuent and instructive writer who chronicled his doings on a ciay farm, on the apparently equally sterile subject of "Agricultural Statistics," and I did as I presume their volume, i. e., turned first to Mr. Hoskyns's communication, and finished it before looking at any other. mumication, and finished it before looking at any other.
The impression it is calculated to produce is a mixture of pleasure and surprise at seeing a naturally dull subject dilated upon through 53 pages in his usua sparkling style, and elucidated by illustrations drawn
from a wide circle of observation and comparison. I do not suppose that many, if any, members of the Royal Agricultural Society required to be convinced that the want of agricultural statistics, the want of anything approaching to even a probable guess of the quantity of food produced in Great Briain is discreditable to a country in the van of civilisation. If there were any who required to be convinced on this point, the
arguments Mr. Hoskyns marshals tngether are sufficient, more than sufficient, for his purpose But I am not so sure that his illustrations of the advansuch a collection are equally convincing. I have long been, in my sphere (where that may be is no great matter, but I write myself a member both of the farmer dependent alely on the cultivation of land) an advocate forit: and even the somewhat startling fact adhat the publication of the Scottish returns, by showing a larger quantity of Wheat grown there in 1855 than in 1854 (though the whole quantity was but 632,817 quarters-a very drop in the bucket of British consump tion, was the means of giving a considerable impetus to the downward movement of prices, has not altered my apinion. But Mr. Hoskyns's reference (p. 557) to
"needy sellers" who were obliged to sell early in 1846, thereby losing the subsequent high prices, will be met with a chuckle from these snubbed individuals if any of them read the Jourual-"We are the lucky balances at their bankers, are getting but \(658 .{ }^{\circ}\) I I do not think many of them would now say with Mr. Hoskyng that "the ascertained facts of the harves would be most pre-eminently serviceable" to us. Nor do I think that his quotations of prices in 1846 are quite in accordance with his own maxim of "gathering facts together and employing them in masses." It may b that in November of that year the price of Wheat was for 105 s. also fora week (I have not weekly averages at hand) but I know that the monthly averages give 60 s. as the price in November, 1846, being a rise of 14 s .4 d ,
in the three months from A agust; while 92 s . 10d. is the average for June 47 , being another rise of 30s. 3 d . in other six months! Will a collection of our statistics give us an estimate of the crop earlier than November?
Wonld snch an estimate then made be more conducive to the nation's weal than was the be more conducive rise, which gradually, but not too abruptly, checking consumption, also sufficed to draw from the very uttermost corners of the earth supplies which reduced the price so much before a single sheaf of the year's crop came into use. Trade-and the provisioning of a nation either from home sources or by importation is the greatest of
all trades-will not wait for tables or detailed estimates; it concerts its operations far in advance of clerkly computations by collecting and comparing the information atmosphere-the result of a wide-spread interco socia atmosphere-the result of a wide-spread intercommuni-
cation of opinions orally and through the press-and on these it acts, and generally promptly and successfully. The case of 1846 was an exceptional one. In that year there was the destruction-not belived in fully till October or November-of the Potato, the staple food of
eight or ten millions of the population of the British empire, an esculent of daily use in every family therein :
even this, as we have seen, was met, so far as commeree could meet it (commerce could not feed five millions of Irish peasants who had absolutely nothing to give in exchange, by an importation at steadily advancing prices, which was ultimately found to be greater than
our actual wants. Do I, in saying this, desire to thro our actual wants. Do I, in saying this, desire to throw
cold water on the scheme for a national cold water on the scheme for a national colleetion of agricultural statistics? Assuredly not. I deem that such will he, ere long, the most trustworthy index of the fixed wealth of the country-the most satisfactory
criterion of its yearly condition-the truest record of criterion of its yearly condi

How are they to be obtained? is the paramount ques. tion; but it is one upon which Mr. Hoskyns throws no light. Why have they not been obtained before? is also a question passed over without an indication of opinion further than a vague expression of regret Agricultural Society was not directed to the establishment of a system of statistical returns." Now, as I read the rules of the Society, of which Mr. Hoskyns is a prominent director, myself a very humble member, such a proceeding would have been contrary to an
express provision of its charter, which binds it to es total exclusion of all questions of a political tendency or having reference to measures pendig or "o be brou hht forward in either House of Parliament." At present possibly statistical returns would not be considered as a political question, though the expense on
them would have to be voted for in Parliament even when conducted on a voluntary system, as in Scotland ; but would it have been thus a dozen years ago, when the shadows of the coming change in the Corn Laws began to fall heavily on the agricultural mind What would then have been the progress of the Society had its general meetings been occupied with a controversy ou the merits and demerits of statistics? had its directurs and official staff been bur or anch system? Instead of the happy and harmonious co systation of men of parties which has bee the cause of much success and so much we fulness which has placed the Society at the head of the aricultural "science and practice" the woll angry debatere angry debates, and diligent canvassing oh metrer harty divisions. No, it has been much better that wo have gone-it will be far better that we should go-on a great while longer, sailing, to use Talpa's quote witho, over the ocean on our twelve months \({ }^{\text {r }}\) voyag with taking an exact inventory of our provisions vided ar and conviction that "we have aye been proagricultural ship should be put to a task which they didn't bargain for, and which the crew are supposed to have a jealousy and suspicion of.
Thus the Royal Agricultural Society has not only not been to blame for the absence of a national system of agricultural statisties, but it has been wise in avoiding what would have been up to the present time, and perhaps would be even now a thorny subject.
But our Government is not similarly to be excused. t did in 1847 propound a measure for the purposethe provisions of which are given by a witness whom Mr. Hoskyns quotes-but it was not pressed earnesly pon the attention of Parliament, and li perisied an bora. If commerce was to be advanaged, commeral promoted, landlords, and they are the agriculurist's share of Pariament, did not then car -the first were then drunk with railway gambling, the last mad with anger at Corn Law repeal The nation then, by its representatives, showed it ha

Looking at the subject impartially, and from iittle distance, I do not judge that mach if any blame justy to be charged upon the farmers of England. 11 counties of England and Wantal trial was mas. The direction of this experiment was entrusted to the agency of the assistant Poor-law Commissioners and their subordinate officers, an agency which, though in some respects effective for such a purpose, yet was exposed to the suspicion of the parochial mind. Viewing the measure of success arrived at, I think it is really mare than under the circumstances could have naturally been expected, Several of the commissioners, it is true,
were startled at the growls and black looks which their were startled at the growis and black looks which worthy Shropshire yeoman, is by name pointed out as having returned his schedule torn and endorsed with an ex ression of indignation at such questions: but realy these were small stumbling blocks. Had the commis sioners been a little behind the scenes where uing "cooking "-they would have - 1 was nearly wish repulses, which Mr. Hall Maxwell, taught by erperience in the line, would have shown than some easy way of getting remedied. But that as "Red Tapizts" will be when retorns are not exact to figure, the success arrived at by others is most encorraging. I find that Sir John Walsham's success in in district, the most important agricultural one perhaps a the kingdom, is almost complete. "In 1277 acress This nume writes, has been made of \(1,201,2\) nds of the number atated in the census of 1851 : in fact only 70,244 have not been accounted for, out of which
waters, \&c., of which the measurements are not to
be procured." This is surely a beginning of success be procured." This is surely a beginning of success which it is but a faint heart that would not follow up sphere small ; on the contrary, the district successfully "statisticated" by Sir John Walsham is in extent of dom of Scotland. He tabulates \(1,101,000\) acres, while the whole land tilled in Scotland in the year 1854 is but 2,003,695 ; and to use his own unassuming words, "The importance of Norfolk and Suffolk as corn growing counties may perhaps be not improperly illustrated by the fact that their last year's harvest realised Barley than the whole kingdom of Scotland." an Barley than the whole kingdom of Scoltand." Ay
but to collect the statistics of the whole kingdom but to collect the statistics of the whole kingdom of
Scotland is a success which Mr. Hoskyns is never weary of lauding, while the success, but little if at all less complete, in the East Anglian counties is passed by unnoticed and uncommended. The poet's "'tis distance Scottish proverb-"Far away birds have fair feathers," will perhaps account for the unmeasured laudation of
what has been done in Scotland, compared with the depreciation of the very considerable measure of success arrived at in England. Methinks the telescope might Hoskyns's diagram (page 600) of Seotland, and find it headed with an area of \(20,047,462\) acres. I turn to the Highland Society's much vaunted returns, and I find that in 1854 they account for but \(12,613,345 \frac{1}{2}\) acres, while n 1855 they account for bot \(3,529,9021\) acres. Surel coming which has excited attention and created distrus among many of the most intelligent tenant farmers o Scotland, who observe that while they are asked
to give full information as to how they employ he land they rent, the landlords are asked to giv no information as to how they use the land they
On tlisis suliject your contemporary th North British Ayriculurist writes thus: "We think that the mere surplies of cereal and other produce do not exhaust the question of agricultural statistics That subject embraces land as the raw material of most important part of our industrial resources, and every question bearing on the deve eo little satifit was the committee of the House uf orde with "h small acreage accounted for, that its report states "the ther arther changes which are to come in force this year tory in their nature, as they involve the omission of several important columns of information that were previously important columns of information that were previousl given, such as those of pastures, sheep walks, woons, \&c.
The \&c. we shall assume to mean districts from which man and sluee . leared away to tmake roon for red deer. For them there is no columu in the "Blackwood" for last month, and leaders in the Times they occupy many a fair strath where stalwart men next diagram give a square or oblong place to them? will venture to say that before he has dato for this, he will be in possession of materials for an exact diagram please him and alsoye roil of England, which will much

\section*{Home Correspondence.}

Beer is said to be less often adulterated than s supposed : the writer wishes he could join in this opinion. The pernicious ingredients used for this are difficult of detection; and the beer is mostly drunk on
the spot, where the seller knows the buyer is at his mercy. So that, the quantity trunk being very large there is probably more actual poison swallowed in beer than in any other way. The list of adulterants now before me is nearly 50 : but being unable to give easy instructions for their sure detection, I can only cautio your readers against those most likely to occur. The great object is to pass weak or diluted beer off for strong ; first, by satisfying the palate, for which it is inger, or grains of paradise, thickened with mucilage and sweetened (where required mild) with treacle, these may be detected by a good palate, being very distinct from the true flavours in good strong beer ; nor re they very injurious, except too much of the pungen agredients But it must also have the intoric quality ; and here lies the great evil. The cheapest in toxicators that weuld readily pass in beer are coculus indicus and nux vomica; both containing deadly poisons, of which minute quantities produce great effeets ; much worse than the intoxication from genuine strong beer, although undiscoverable by ensy chemical tests, Coculu indicus powder is sold, in the north of England, for killing lice on children and animals: so that, while the mother is dusting the outside of the head with it to destroy the intruders there, the father is applying it \(t\) the inside of his head through the stomach, to produce dismal giddiness, without the merriment of vinous intoxication. Of nux vomica (vomit nut), the intoxicat ing result is a kind of distressing cramp," produced by strychnine, of which the nut contains a small propo tion ; but so strong that 1 - 500 th of a grain, dissolved in an ounce of water, cramped and killed a frog immersed in it. Both also, as well as the grain of paradise produce thirst ; so that the drinker is never satisfied And all who value their health should take care, i
once entrapped by beer producing such effects, never to
buy more of it: the chemical detection of these minute quantitits requires much skill. J. Prideculuc. the article "Superphosphate," you are pleased to give your correspondent "J. D," some sound advice
respecting super hosphate. Mny I also be allowed to suggest through your culumns to "J. D." and the noble army of martyrs who enter the mauure market for purchased at the low figure put down by Dr. Voelck and others, your columns the some time siace there appeared superphosphate analysis that the real commercial value was not more than 3l. The present value of fine bones fit for making superphosphate is \(8 l\). per ton, and the present price of a phuestion of price firl specific gravity, and without a question of price fur specific gravity, and without
doubt the dearest is the best, but talke a middle price, and say sulphuric aeid at Now these being the prices of the two principal articles that should be "J. D." what sort of an article can be expected for the low figure of 6 l., and from this sum most liberal per centages are given for the sale of, and carriage paid price of bones at \(5 \%\), 12 , he doubtless meant gave the bones as from the collectors. In London rough bone are fetching 6l. 58., and they have been quoted at Hull at \(i l .73\). 1 am writing this from a farm on which we prevent the imposition of cheap manures we have lately made largely for our neighbours and friends. Havin had some experience in the manufacture of superphos phate, I am confident a fair sample, useful to the
farmer, cannot be sold under \(7 l\). per ton, and then only at a mere shade of profit, and \(7 l\). 10 s. is nearer the only price for a good sample. James Crowe, Hampen, Ando versford, Feb. 26.
Thick versus Thin Seeding. - Your correspondent "There is no greater mistake committed ether by farmers of gardeners than learing any crops ton thick upon the eground,
excepting those intended for green food a tree to be free and
heatitiy must have space to extend its branches and roots. The sime holds good with regard to Turnips, Carrots, Mangels, and
Onions, dc. It sounds strange to hear men say, The soil is tact, which they should know more from painful hnissebold
experience; at least many of them could answer the following gnestion, which comes home to them:-If one child requires a pound of bread per day to keep it in health and condition wha
would be the result if three were obliged to exist upon the same allowance?'
"Hardy and Son" agree with "Falcon," and mention one plat per square foot as being the most advantageous distance for our corn crops. I presume that "Faicon" and "Hardy and Son" will admit that the object of per acre at the least expense. This being obtaided per acre at the least expense. This being obtained,
there will be no fear of the result farmer, and the community will ultimately reap the benefit by the products becoming cheaper on account the smaller cost of production. Thin seeding has long had its adrocates, but I am not aware that we can coun amongst them any of our intelligent agriculturists tha deper on the skiful management of their farms fo selves before carryine is this? Because we all ask ou pay ?" What particularly strikes "Falcon" is the guorance of agriculturists whe say-" The soil is poo you must therefore sow more seed." This is a rule b which farmers abide, as experience has long ago taugh them the correctness of the view. Take a square for of poor soil, enriched a little by the droppings
of sheep fed on Turnips. This soil has not more than of sheep fed on Turnips. This soil has not more than lime, \&c., that is to be found in a better deseription o soil, and therefore the supply must be nearly or wholly exhausted, or a very meagre corn crop will be th result. The question then is, How are we to do this Can we do this by inserting one solitary plant in eac square foot of soil? Would the ramifications of the roots of that plant become sufficiently numerous, thread through the soil and absorb all the soluble ingredients Would it not require more spongelets or mouths than we find in one plant? I believe it would, and I believe we may in this way account for our experience in the field disproving what has been stated by "Falcon " and by "Hardy \& Son." I ought to state that I am speaking plants being only. The constituents required by the spongelets, or they cannot be absorbed, therefore the greater the number of mouths the greater the probabiity of their being taken into the plant. If we grew thin crop on a poor soil we should get stouter straw and finer ears, but I fear this would be a poor compensation or the greater namber of straws and ears-at least my experience tells meso. The beneficial action of the sun's rays is one argument brought forward by the advocates of thin seeding. The light, heat, and actinism of the sun exert their beneficial influence on our crops, the latter especially, as it is to this agent we owe the chemical processes into which vegetable life resolves itself. This may seem to be in farour of thin seeding, but in reality it is not. In thicker seeding the plauts are not so tall, and for this reason do not shade pach other more than when thinner in the ground and longer in the straw. By thin seeding we get late har
vests, and the corn is in consequence often blighted Whats, and the corn is in consequence often blightei field. I usually drill 2 bushels of Wheat, 3 bushells of

Barley, and 4 bushels of Oats per acre, but of conre the quantity of seed varies according to the richness of the soil and the earliness or lateness of the season. It
must not be overlooked that I cultivate the highest, and I think I may state some of the poorest land in Dorset shire. Geo. Simmons, Houghton Farm, Blandford. matters, haters, inquiry and experience lead us to the concla that there is much room for improvement, and that our present system is sadly defective. I always felt dis satistied with volumes of smoke, red-hot furnace doors, and requent stoking ; but until I had read Mr. Wil hnew not how to remedy these evils. Since I adopted his talented and common sense suggestions all is號 or and ash-pit, diminished stoking, and greatly in creased steam. I give the following dimensions of my arrangements

\section*{\({ }^{18}\)-inch diameter. Furnace 4 feet long, 2 feet fide the centro} dead plate): the finrace bars 33 inches below the extreme curve
of the boilte. The bridge, a straight one, 7 tinetes below the

Consequently I have about 30 cubic feet of space in my furnace for the proper admixture and combustion of the gases; and i lave an area of bridge surface equal to HO superficial inches to every syuare foot of fire-grate These spaces are more than double what I used to have ander the old syatem. My furnace-door is pierced with \(\frac{1}{2}\).inch holes, and by a plate equally pierced behind the bridge I have the power of admitting atmospheric air above the fuel according to the power required. The consequence of all this is a flame varying from 20
to 30 feet in length filling the centre flue and side flues according to my requirements. The importance of having flame instead of smoke must be ubvious, seeing that flame has 3000 degrees of heat wherens smoke is barely warm. I found that the ordinary opening in the flue at the end of the boile put out the flame in its attempt to curve up into the centre flue, but 1 more than doubied the aperture, since which it not ony sweeps through the centre of the full to within 8 ates the side flues. My does not prime, and with high pressure and rapidly fenerated steam, the old proportion of one-third steam ronm is quite unneceseary. Instead of being, as I wa riginally, short of power, I can make my power anything I choose up to 12-horse (or evaporated per hour), the original calculation being a deficient 6 -horse. The fact is in most furnaces there is hot room enough for the proper expansion and admix ture of gases ; hence in their attempt to expand we have heated doors, and other inconvenient evidences of the misapplication of heat. I need hardiy say that I have be able to remove any grit or soot in a few minutesclear flues are indispensable. I hope these remarke may be useful to some of my broher agriculturists. , Mechi, Tiptree Haw Feg. 1D. \(P\) : hava good for ordinary coppers, which should alway have holes drilled in the furnace doors, the farnace bars very large one. The greatest heat from a candle is a an inch above the flame. The flame will smoke if a solid body is pressed upon it, or rather into it. J. J. Mech
Irish Grasses.-In your notice in the Agricultaral Gazette of the 16th ult, rage 103 b , of the proceedinge of the Royal Agricultural Socicty of England, reference is made to a report by Mr. B. Gibbs on the Grasses of this district, with a view no doubt of enabling the Society to obtain definite information as to the alleged superiority of the dairy produce of the south of Ireland. This repar very meagre, Mr. Gibbs not having had sutticien in my power in publication in the Gardeners' Chronicle, should you approve of it, a list of about \(\tau 0\) of the Grasses and forage plants indigemous to the county Cork, the whole of which may be gathered in a walk of two or three hours around the city. I have arranged them in six sections, having reference to the nature of the siduations where hey grow wild; sections one and two iaclade the valuable upland, and section three the warsh Grasses. Amongs he Grasses sent from the land around Blarney Castle, Mr Gibbs, you will observe, enumerates Carex, Plantain, and Yarrow, which far from enhancing deteriorate pastures, and are mere weeds. I have not included any of the pasture weeds, but were it considered useful to do so, a formidable list.
Sect.1. Grasses found in Lor Meadores and Fastures.- Poa trivinulis lumerats Agrostis alba and valgaris, also in marshes; Dactylis
 rense, only in a few places, A Alopecurrus pratensis, in a very for
places H.leus lanaus and on upland pastures also; Lotas
wajor (not a Grass, buta a forage plant).

 alcus racemosus, here and there.

corniculatus.
Sect. 3. In Marshes. - Phalaris arandinaces, margins of streamo

 Valueless, agriculturally speaking.
Sect. 5. Th Hoods anl Fushy Places, -Melica unifora, Molini،
coerulea, Millium effusum, Holcus mollis (alsu in pasturen, corulea, Millium effusum, Holcus mollis also in pasture,
Bromus asper and erectus, Brachypnifum syltatic'm, Yertia
gigantea, Triticum caninum, all of no agricultural importance. Sect. 6. Grasses which, as Weeds, infest cultiminted Lemds,-
Alopecurus aresis, not common; Serrafilcus nollis, very
common; Triticum
 Satus and strigosa, in corn; Ins annua:

Chalk as a remedy for Finger and Tire.-I have followed the remarks in your Paper, on the diseases ealled finger and toes and anbury, with great interest,
but I do not find that any of your correspondents insist but I do not find that any of your correspondents insis remedy, viz. the free use of chalk, wherever attainable The land in this immediate district is so subject to both diseases, in its natural state, as to make the cultivation application of chalk was recommended to me some four was, and I do not now think proved how beneficial Turnips or Swedes without it, although the horses have several miles to go for it. I have for the last three year not failed to get grood full crops of both roots, and upon the same field in which previous to its application it wound Swedes, it would now be more dificult to find that measure of diseased ones. The quantity of chalk for a dressing is from 10 to 12 waggon loads to the acre the soil is a loam of every degree of strength, deeply
trained; the variation of texture does not much affect the disease but, contrary to expectation, I find the stiffer loams show it with rather more virulence than the light ones. I lave used lime at the rates of from 10 to 20 quarters per acre with good effect, but it does not, or has not hitherto in those quantities, so entirely cradicate the disease as when applied in its original form of chalk, nor do I think it so lasting in its results, R. H. Valpy, Enborne, Newoury

Bread.-Until the last few weeks, when a prospect of peace began to dawn, the high prices of corn and flour that eeveral writers for the public press surgested means by which Wheat flour might be so prepared as not only to effect a reduction of prices, but also an improvement in the bakers' loaf (as to quality), thus ren fessor James Johnston had shown that the whe Iro obtained by simply grinding the grain is equally nutri tive as the entire grain, for "by sifting out the bran we render the fine meal less nutritious in proportion, weight for weight," and thus we go on to waste much wholesone
human food. The professor dealt with the question human food. The professor dealt with the question public baker, and also the great aversion from brown bread which is felt by nine-tenths of the consumers Now, whole meal must produce a brown loaf, and as such would meet with determined opposition, the more bo as the bakers now charge it the full price of the bes white loaf. It would be an easy task to address those domestic economists who bake their own bread, and to give them ample practical directions. But as the bakers have the game in their own hands, it would be futile to enlarge on a subject that might obtain very few must not be passed over in silence. First agriculiure which of the highest quality, and in greatly ivcreased quantity ought to be grown; and this it can only be by a much system of thorough drainage carried out to 12 inches below the depth of the pulverised staple earth. An experiment upon a vast scale on the farms of the Marquis of Tweeddale has demonstrated that land, in clading the upper soil with its subsoil thoroughly broken up and incorporated, to the depth of 20 or more inches in the first instance, has produced great and increasing abundance of cereal and fodder crops, with less mnnure than is usually doled out by farmers as top-dressings, who are content with the mere scratchings of the surface by the common ploughs with their heavy com pressing soles. The two instruments invented by the which turns a true furrow, say of 12 inclies-and the Tweeddale subsoil plough effect every purpose, the latter preparing the land fur that effectual drainage above aluded to. Frequent and extensive observations have full of water under a thin upper soil. This is shown by the stagnant or runuing water that exists in the fact leads to the sugrestion that by the road sides. This to subserve as guages for ascertaining the besition of water stagnating in the for ascertaining the position of Water stagnating in the adjoining lands. If, instead of the depth of 24 to 30 inches, and finisliedl with a true and gradual fall at hottom, a criterion would be afforded (by the inlet and flow of water) whence to judge the depth at which drains ought to be made, so as to com-
mand good outfail. J. T.

THE DIRECTORS of the above COMPANI (many of whom are extensive Agriculturists) have great pleasure Machinery for the manif friends and the Rgricultira communty, hat they have now completed their extensio porkian and of the me:ropolis, and a large stnck of other necessary materials of the best quality, they are now in a position to supply thei Patent Manure of the highest quality; and, as most of the Directors and many or the Shareholders are themselves large consumer guarantee and protection to the farmer against imposition.
The great vaine of Blood Manure as a fertiliser may now be considered as a fully established fact. Ever since the first introduction of a few experiments, it has beand has for the last four seasons by hundreds with ereat success and in the next it will be ried by thousands. It affords, in fact, a conclusive answer to the question, "What has science done for Agriculture?
The llood Manure is composed of benes dissolved in Sulphuric Acid, to which is added a large quantity of pure Blood, specially prepared to suit various crops, and may either be applied by the drill or sown broadcast,

BLOOD MANURE FOR TURNIPS. The phosphates absolutely necessary for early developmen larger proportion in a soluble form than is usnally met with in ordinary samples of Superphosphate of Lime, and, the Blood supplying nitrogen, the latter growth is also secured. hence the
fuperiority of the Patent Manure. It may be used alnne at the til of 4 cwt. per acre, or it farm-yard manure is \(11 s e d, 3 \mathrm{cw}\). N.B. For this, as for all other root crops, an additional appl cation of Blond Manure will much more than repay the additiona
cost. Though 2 or 3 cwt . per acre will produce a crop superio milar weight of Superphosphate of Lime, the femunerative. The rent and charges must be paid mor Whether the land yields 10,20 , or 30 tons an acre; so that an addition of 8 or 10 tons of roots beyond the common crop cost

THE BLOOD MANURE FOR WHEAT BARLEY, OATS, ETC.
especiaily adapted for the wheat and other Corn cropients, it is een used with the greatest success in all parts of England. I is a very remarkable fact that the analysis of blood and the grain of Wheat are nearly identical, as proved by the mos require, and when properly prepared, will become the essence of vegetable as well as of animal life. The highly fertilising pro-
perties of Blood have been commented upon by Professor Way perties of Blood have been commented upon by Professor Way
and others, and the success of the Blood Manure for Wheat and other cereals, has been fully proved upon all soils by the practical experience of numerons Agriculturists. Should Whest manured with dung in the ordinary way look unhealthy in the spring, it will be greatly benefited by top-dressing it with Blood Manure,
at the rate of 2 to 3 cwt . per acre,--thus strengthening the straw, at the rate of 2 to \(3 \mathrm{cwt}\). per acre,-thus strengthening the straw,
making it less liable to lodge, and very much increasing the produce. For Barley and Oats, 3 to 4 cwt . per acre of the Blood Manure may either be sown broadcast or drilled with the seed, the former, to be well harrowed in

BEANS AND PEAS
For Beans or Peas, 3 to 4 cwt . per acre may be used either roadcast and harrowed in, or a portion afterwards, between the

MANGEL WURZEL AND CARROTS. cwt. to the acre with an equal weight of common salt should be sown broadeast over the field, and well harrnwed in, the seed being drilled in the usual way; repeated horse-hoeing between the rows is of grest importance for air and nutriment, and great
advantage will he obtained by occasionally sprinkling a little Blood Manure between the rows previous to the hoeing.

\section*{POTATOES.}

The Blood Mnnure is specially prepared for this crop, and it successful if used to the extent of 4 cwt . per acre, with helf the isual quantity of farm-yard dung, and the whole earthed up in he usual way. Should the farm-yard manure not be used, them the drill, and the set an

\section*{FLAX.}

This crop in olden time had the renown of being one of the most exharsting crops which could be put into the land, and this quantity of nitrogen, phosphoric acid, magnesia, and the alkalies taken up by the Flax plant, which renders it a highly exhausting crop. The Blood Manure is earefully prepared, so as to meet
the wants of this crop, and with its aid Flar can no longer be considered an exhauster of the soil. In using Blood Manure for this crop, from 4 to 6 ewt. ma
in before the seed is drilled.

\section*{HOPS.}

It is well known to all Hop growers that Hops require more they cultivate - proper development than any other plant waich vear, from the land necessitates the supply to the soil of a conthe Blood Manure of both mineral and organic ingredients, and of supplying the requirements of this prepared, with the objec tains all the constituents which the plant requires, both mineral and organic, and will be found as cheap and efficacious as any other manure now in use ; from 10 to 12 cwt . per acreapplied at two diferent times well worked in between the pay wh bound hill and covered up with the soil.

Testimonials from the most eminent Agriculturists who have used the Manare may be had from the local Agents. The following may be taken as a sample :-

Norfolk Farms, Windsor, Febrnary 20th, 1855.
 of Nitro-phosphate nsed on the Royal Fanns, Windsor Great a field of Swedes, which gained the cup at the Royal East Berks Agricultural Show, I have no hesitation in pronouncing it an excellent manure, and intend using it to a greater extent during the present season. \begin{tabular}{l} 
amp \\
\hline
\end{tabular}
am, gentiemen, your obedient servant, Mr. Benjuyin Gorurox, Gedney Marsh, Long Snitton, Lincoln-
shire.-" 1 drilled your manure at the rate of \(2 t\) crst. per acre shire- - I dinled your manure at the rate of \(2 \frac{1}{\text { cist. per acre }}\)
alung with the Wheat over 30 acres, and although the field is
the poorest land have on my farm, the crop ranked amongst than by saving I do not know how I can recommend it better Park Farm, Woburn, Bedfordshire, Jan. 18th, 1854. Gentlemen,-I In reply to your inquiry respecting the Nitrober. to inform you I applied it all for Swedes, and in every in stance was very snccessful, particularly so on a field of 30 acres,
where I put on 2 cwt of it per sere, with a light dressing of farm-vard manure, which has produced the finest crop of Swede
I ever grew. I with great confidence recomniend this valuable manure to the notice of the agricultural community.-I an
gentlemen, yours very traly,
G. W. BAKEz.

\section*{PRICE, DELIVERED AT ANY WHARF OR RAILWAY STATION IN LONDON:}

Corn and Grass Manure, £7 10s. per Ton.
Turnip Manure, £6 10s. per Ton.
Flax and Hop Manure, £8 10s. per Ton.
The Company beg to caution the public against the attempts of spurious imitators, seho, since the introduction of this Manure, hare professed to make one passessing similar qualities. As security, therefore, to the purchaser, every bag is nurrked "ODAMS' PATENT BLOOD MANURE," and sold only by the authorised Agents of the Company.

500 BUSHELS OF POTATOES TO THE ACRE

Tgentleman in five bushels diseased; nearly all the quantity were large-sized, some weighing 2 lbs . and 10 az, and not above three bushels of Scotiand, and is called by arpassed ALL other sorts, both in has AGAIN proved to have aurpassed ALL other sorts, both in quantity, quality,
The price is \(27,28_{3}\), inclusive of the aack of three bushels, delivered free at the Soutls Western Railway Station in Londori, Crooked Lane, London Bridge, London; or to Thos. B. ATkusson,
Seedmam, 64, High Street, Worcester, where further testimoniaia
 "Sir,-In answer to yours respecting the Scottish Champion
Potato, I beg to say it is quite equal in flavour to the York Potato, I beg to say it is quite equal in favour to the Yory
Regent, is very productive, boils very white and masily. In fact, of the sixty-seven varieties of Potatoen grown by me in the way
of experiment this season I consider it the best, and shall plant of experiment this season I consider it the best, and for my next general crop.- Your obedient servant,
"EdwARD BENNRTT, Gr. to Sir Offley Wakeman, Bart.,
"Perdiswell Hall, Worcester."
J.

\section*{}
J. WH SEED POTATOES:PRINCE OF WALES.-This is the earliest round white Potato, excellent for forcing, and for a general crop can
recommended. Per peek, \(28.6 d . ;\) per bushel, 98 .
recommended. Per peek, \(28.6 d\); per bushel, 98.
I was highly delighted with the Prince of Wales Potatoes I had from you last year; I consider them more mealy and better planted in the same soil and in every was alike."-Mrs. Cancing, Portfields, Hereford
" Your Prince of Wales Potato I obtained when first sent out and I beg to bear testimony to its good quallities. It is early, sure that I raised at the rate of nearly 400 bushelf per fmperial J. C. Whanligr and Sons beg to add that they have much satisfaction in introducing this Potato into general noticethey have sent it into nearly all parts of the Kingdom, and every-
Where it is highly spoken of. It is so early that it escapes the Where it is highly spoken of. It is so early that it escapes the
disease more than almost any other variety. It is a large
cropper, and the flavour is excellent; they can recommend it in the strongest terms. ALSTONE KIDNEY.-This is perfectly distinct from any other Potato. It is an astonishing cropper, and the tubers are of large sies. It keeps well, and is good flavoured, and is per bushel, 98 .
The Rer. R. O. Brownlon, of Sprouston Manes, N. Bo, gives
the following report of the Alstone Kidneys which he had from in length, the ranniag length of all being 42 yards, and thie in length, the runiing length of and being j2 yards, and thie Desides a few small refuss. Not knowing the Potato proviously I had it planted in rows 2 feet apart, which was too close and
made the crop less than it would liave been, for the ontside row \(10 \frac{1}{2}\) yards yielderi nearly a heaped bushel. It is at the rate of TLUKE.-This sort is now becoming well knowa. It is some what of a Kidnay, but perfectly distinct from any other. As a
second early Potato it is without doubt the best, and will in a short time find its way into every garden. 2s. per peck. peck, or 98 , per bushel, delivered carriase free.
peck, or 9 . per bushel, delivered carriage free.

IMPROVEMENT OF GRASS LANDS

\section*{SUTTON'S RENOVATING GRASS SEEDS FOR} may be effected by sowing 8 to \(12 l\) los. per acre of 8 ourtorr's
Renovating Seeds, which consiot of Perennial Clovers and Grasses of the finer kinds for improving the bottom
An increase of several Tons of Hay per aere has been thus effected on many Meadows and Upland Pastures. The Secds should be sovon early. Price reduced to 9 d. per lb.
From Mr. G. Norrington, Rectory Farm, Taplow, 26 th 11, 1855. Grass seeds to sow upon 10 seres of old pasture. At the time I took the farm the 10 acres of mpadow was almost useless. I now have a most excellent pasture."
From C. F. Thruston, Esq, Talgarth, August 9, 1855. "Your seeds have answered admirably. Turnips, Mangels,
Carrots, and Parsnips are superb. Your Grass seeds alsn have answered well. They were somo in spring, under rather unfavourable circumstances. The after Grass is remarksble; Clover and had been springing up where nothing but the poorest pastire your RENOVATING MIXTURE is now onejof the fined in our neighbourhood."
Grom Sir David Cunynghame, Wellesbourne Howse, Warroick ing very well. I cut nearly 2 tons of hay to the acre, and three years ago the game land hardly prodnoed half aton per acre. have bought elsewhere
Sutron \& Sons also stypply Grast Sechs for laying down Land to Permanent Pasture at a moderate expense, the sorts being selected in aceordance with the nature of the soil
to be laid down, particulars of which may be obtained by post.

Many Meadows and Upland Postures may be increased in ralue 50 per cent. by soving these Seeds (as see the above letters).
Goods delivered Carriage Free by Rail.

searlet faked, crimson flaked, ccarlet spotted White; also a smal quantity of purple and purple fiake.
Copy of Minute. National Floriculural Society, July 26, 1885.
"Balsams:-20 plants from F. and A. Suitri, Dulwich. The cersors not having the power to award Certificates to this clas of plants (true Anuuals, and therefore not considered Florists
flowers), wish to express their unanimons opinion of the great Howers), wish to express their unanimons opinion of the great
merit of the collection produced, which for variety, habit size, doubleness, and general excellence, are the best that had
hitherto come ander their notice." hitherto come under their notice.

Dr. Liwderex, on ingpection, said:-
Therior to the fully equa, \(T\) have seen in Continenal particulars vastry Extract from the Report of the Meeting of the National Fhorica
tural Bociety, in phe Gardeners' Chronicle, August 4 th. 1855 , \({ }^{\text {page }}\) " Bevera
geveral extremely well-grown plants of what are called
Camellia Balasms were Very handsome things they must be admitted to be; among
them were blush, purple, and scarlet kinds, and scarlet motled them were blush, purple, and scarlet kinds, and scarlet mottled
with white; and when we state that many of the flowers measured quite 2 tinches across, and 1 inch deep, some ideas of
the lind of display they made may be conceived ; their only falt was that they were scarcely sufficiently in bloom.

\section*{Che Candenersi Chromite.}

If there is any one thing upon which we have insisted from the very commencement of this Journal more than another it is the necessity of finding some method of admitting warm damp air to the interior of glass houses, copiously, and at will, without having recourse to the dry cold blasts which find their way through ordinary ventilaTons. The interior of a hothouse should feel the breeze as freely and as constantly as an Orchard House. Without some power of this kind good gardening is impossible; some power of the kind has indeed been long possessed, arising, as it does, out of the very nature of glazed buildings, but it ha been far below what the demands of horticalture require. And now that glazing with large squares and close laps has become common, it is in most cases wholly insufficient.

When the external air is admitted into a glazed house containing a moist atmosphere, it, under ordinary circumstances, is much colder than that with which it mixes; the heated damp air rushes out at the upper ventilators, and the drier cold air takes its place; the latter rapidly abstracts from the plants and the earth, or the vessels in which they grow, a part of their moistare, and thus gives a sudden shock to their cons'itution, which cannot fail to be injurious. This abstraction of moisture is in proportion to the rapidity of the motion of the air. But it is not merely dryness that is thus produced, or soch a lowering of temperature as the thermometer suspended in the interior of the house may indicate; the rapid evaporation that takes place upon the admission of dry air produces a degree of cold upon the surfice of leaves, and of
the porous earthen pots in which plants grow, of the porous earthen pots in which plants grow, of
which our instruments give no indication." To this statement, borrowed from the Theory and Practice of Horticulture, no objection can we believe be taken. What has been done to meet the difficuly is mentioned in the same work, and in other horticultural teatises; but none of the methods describer can be said to be effectual. By far the best is undoubtedly that employed by the late Sir Ronert Peel at Drayton Manor, the contriver of which has been supposed to be the celebrated Grorge Stephenson, but which we believe was really carried out for the first time at

Hewell Grange by Mr. Jonn Jonss, of Birmingham, so well known as the constructor of the admirable Underground drains were sunk, 3 feet deep, at right angles to the front wall, and extending from its inside to a walk about 12 feet distant from the honse, and parallel with it. At each end of the drains was a perpendicular shaft ; that in the inside opened immediately behind and below the hot-water pipes, and was never closed; that in the open air was closed by a moveable square plug. So long as the plug remained in its place no ventilation took place. As soon as the plug was removed, the denser external air pressed down into the shaft, among the hot-water pipes, expanding rapidly in the house, and dispersing itself among the plants. The drains being always damp, on account of their depth in the moist heavy clay of Drayton Manor, the air which passed through them was always charged with as much moisture as was required.

This plan answered the purpose well as far as it went, but its action was insufficient. Mr. Jones has now shown us some drawings of a plan by Which he proposes to augment the ingress and egress of warm air to any extent that may be
desired. This is to be effected by hollow back walls in the case of lean-to houses, and a series of counter drains. When houses are span-roofed some modification would be necessary, with the precise nature of which we are unacquainted. In this way nature must be brought not merely into motion, but into a state of great activity, so that a quick and perpetual renewal of its particles will take place oyer every portion of the surface of a plant. Those who wish to know more of the details, which cannot be further explained without drawings, will, we donbt not, meet with attention from Mr. Jones, who is now acting engineer at the Crystal Palace.
In connection with this improvement we may take the present opportunity of mentioning that a new method of constructing light hothouse roofs has also been proposed by the same experienced engineer. Its object is to do away with all movable sashes, all rafters, all drip, and all open laps; advantages which cannot be easily over-estimated where there is a complete command of air, but disadvantages in the absence of that power. The object is attained by the use of what are called "trusses" applied to the roof at intervals, and forming very cenvenient lines over which Vines or other climbers can be trained. Weak materials may thus be made as efficient as stronger ones, just as was the case with the slight trussed gutters used to carry the ridge and furrow roofs in the original Crystal Palace in Hyde Park.

Whether we take the two contrivances together, or look merely to the perfect command of air thus obtained, it seems to us that we have an improvement introdnced into construction, which is only second to that which followed the employment of hot-water pipes.
Ir will be seen by our correspondence that we did not draw attention to the Frauds in the Seed has been disclosed to us confidentially. We therefore again say to purchasers of seeds be on your guard.

There is no doubt that by means of sleam, sulphur, and old age, all sorts of rubbish are made to pass for articles of sterling value. Dead Rape does duty for Turnip seed, Dead Black Medick for Lacerne, and Dead Clover for the living. A little oil here, a little burning sulphur there, with plenty of sifting and shaking and rubbing, will produce samples even finer than what is seen when \(d_{0}\) nothing except mislead. Chemical tests all fail. Microscopes are dim. Such frauds can be detected only in one way, and that is the way we lately pointed out. Seeds must be tried.
In one respect only do buyers require to be Turther advised as to the mode of making the trial. They must not expect any sample of seeds to con-
sist wholly of sach as will grow. Various causes combine to produce some mortality; but it should not exceed 10 per cent. If, then, 90 in 100 seeds are found to grow the buyer should be satisfied; fewer grow he has a case for suspicion.

When we consider how enormous is the consumption of seeds in the gardens and farms of this country, it is evident that mere mixing with only
25 per cent. of bad seeds must be attended with 25 per cent. of bad seeds
very large loss to the public.
That every buyer should try, or cause to be tried in the manner recommended by us, or last week by best remedy we can propose for the present state of things. The next best method would be in all
eases of considerable purchases of seeds to require
writen woarranty that what is sold will grow to the extent of so much per cent. at least. If this precaution is taken, and the Written wartanty given, the
vendor would be unable to resist successfully an action for damages in case of the seeds sold proving bad. Or, payment might be made conditional upon the seeds when tried proving as good as is warranted. It is, however, not necessary for us to suggest more particularly in what way the existing evil should be met. We confine ourselves to pointing out it existence and the consequences.
Let us not be misunderstood. There is not a more honourable body of men in this country than the seedsmen of the United Kingdom. They include in their ranks merchants eminent for their probity and large transactions, and others who though not merchants have long been known for the trath and skill with which they conduct their basiness. It is in their interest quite as much as in that of the general public that these remarks have been made. They have nothing to fear from trials of their seeds. On the contrary they must fee that the most searching inquiry can only redound to their honour. But there are black sheep in thei flock, to whom our words will be as gall and wormword; men who render honesty ruinous, and bring into discredit the best men in the country. It is against them and their practices that we have warned the public; and we have the satisfaction to
believe that the warning has not been given in vain

\section*{New Plants. \\ \section*{pulcher. Planct}}
164. Gonocalyx Fl. Columb. ined.
We have received from Mr. Linden a coloured representation of this pretty plant, which he offers for sale at charming (greenhouse) shrub, related to Vaccinium, with close upright branches, clothed with dense foliage among which appear here and there pretty tubular flowers of a brilliant rose. The leaves are small,
almost orbicular, and not very unlike those of an Alaternus. The young shoots and new leaves are of a bright rosy purple colour. It was found by Schlim in

company with Calyptraria hæmantba (a glorious shrab, noticed in our volume for 1854 , p. 556) in the pro-
vinces of Pamplona and Ocaña at the elevation of 7000 feet above the sea.'

\section*{THE HORTICULTURAL SOCIETY}

The attention of the horticultural public is at this time occupied with the question of the modification
of the Horticultural Society. The Council have put of the Horticultural Society. The Council have put
forth their scheme, which is now passing the ordeal of a select committee, of whose labours we are shortly to héar. Various papers on the subject of the present
position of the Society and the causes of its financial difficulties, have also appeared in the horticultura periodicals, especially in the numbers of "The Florist" for the present and two preceding months. The sub. ject has naturally produced considerable interest among gardeners and the friends of gardening; but the very
one-sided view taken in the papers of the periodical I have menticned (which is apparently the organ of the exhibitors at the Society's and other flower shows), induces me to beg admission in your columns for another
view of the most prominent question discussed in the articles referred to, namely, the causes of the failure of the recent exhibitions of the Horticultural Society, involving in their failure the loss of funds to maintain the Society's garden.
The causes of the

The causes of the failure of the exhibitions, though variously stated, may be summed in the one complaint
of the exhibitors at the fower shows ; which is a wan of the amount given for prizes and in respect of the exclusion of certain objects from the exhibitions.
