SATURDA Y, SEPTEMBER 20, 1856.
meetings for tab ensuing week.
Our readera will have observed that a further sale of plants in the Garden of the Horticultaral Society is about to take place. It is as well to explain that this measure has been determined apon by the Council in order to mike room for some rather considerable changes which they hope to carry into effect.

The greater part of the fine specimen plants to be found in the Sale Catalogue have been hitherto cultivated for the purpose of decorating the Great Iron Conservatory. For the future the Council propose to occupy this house, during winter, with rare evergreen plants in pots which merely demand shelter from severe cold, and in summer can be placed about the Garden in the same manner as Orange trees. During summer it is proposed to employ the house in aid of Exhibitions, should they be revived, or in such other mode as future arrangements may render necessary.
The specimens of Tree Peonies, all of which are, we believe, original imporied plants, have not indeed been employed in the Great Conservatory, but they unfortunately flower at an early period in the spring, before the pablic can be tempted by fine weather to extend its visit to Chiswick; and are therefore of little use to the Horticultural Society, although invaluable as decorations of private residences. All of them being fine old plants in pots, they will remove with perfect safety, and may be made to flower magnificently next spring.
Another, but much smaller set, consists of stove plants, now removing from the double curvilinear for which it is well adapted. In this way the Council consult that prevailing taste for exquisitely beantiful foliage which is rapidly replacing merely gaudy flowers in the public favour. It is impossible not to regard the change now at work among the lovers of plant, who begin to prefer graceful form to mere spots of culvur, as a most satisfactory indication of a great general advance in the good taste of the educated classes. Dress, furniture, architecture, are all now moving upon the same road side by side, and are already unmistakeably affected by the direction into which public opinion was guided by the Greut Exbibition of 1851
In connection with this matter we may mention
a little manouvre executed by $\mathrm{Wm}_{\mathrm{M}}$. Wrison Saumpras, Esq., the Treasurer of the Horticultural Society, which promises to place at our command all the Ferns of the whole world at a very small expenditure of money or trouble. It is well known that Ferns are natarally propagated by the small
brown bodies formed on the under side of their Stemphylium, which runs over the green leaves, and leaves and which we shall at the risk of being taken to task by our botanical friends call seeds. These seeds are not, however, what meets the naked eye when the under side of a Fern leaf is examined. The parts which are so easily seen by the naked eye are the seed-vessels; Fern seeds are little angular bodies too minute to be visible, and are expelled by the spontaneous bursting of the seed-vessels, which then remain empty behind. It may therefore and often no doubt does happen that when the brown dust from the back of a Fern leaf is sown, it has no seeds among it, but consists entirely of fragments of the broken seed-vessels. In this way we may explain the general want of success that attends the attempts of those who endeavour to raise Ferns from dried specimens gathered in foreign countries. Such specimens generally have shed all their seed before they reach Europe.
To obviate this difficalty Mr. SAunders requested Mr. Wallack, the distinguished naturalist then at Singapore, to adopt the following method. A little noderately damp earth being spread flat, the under side of a fresh ripe Fern leaf was pressed upon the earth, so as to detach the seeds and their seedvessels. The earth was then placed in a vial, corked up and sent to England. The vial was six months on the voyage home; upon its arrival in mid-winter its contents were sown in a shady damp hothouse In a short time Fern plants sprang up " as thickly as Mustard and Cress," and the plantsare now after ix or seven months from 4 to 5 inches high.
The process thus described is attended by the very important advantages of securing perfectly fresh seed, and of placing it during its passage home in a situation just as damp as is necessary to maintain vitality unimpaired. The only precautions needed are to be certain that the seed is ripe when pressed upon the earth, to take care that the latter is merely damp, not wet, when corked up, and to keep the vial in the dark. In this way all the Ferns of the tropics may be now procured with the ieatest facility.
Some, indeed, may think that we previously knew all about Fern-raising, and that herbaria need only be ransacked to secure supplies of seeds. Never was a mistake greater. We are assured indeed, that Willdenow raised various kinds of Ferns in Berlin from seeds thus procured, and that two plants of cymnogramma calomelanos were once obtained in the garden at Liverpool from seeds 50 years old taken out of the herbarium of Forster. Let us frankly own that we read these stories with incredulity; to our mind such so-called facts are open to great suspicion. No hat we presume to question the good faith of those who are said to have succeeded in the operation quite the contrary; Willdpnow, of Berlin, and Salpherd, of Liverpool, who thought they had done these things were probably mistaken. They raised something-some sort of Fern-but we are persuaded that the supposed result was owing to one of those accidents which all who are conver sant with great gardens know to their cost are so common, or rather so inevitable, in such establishments. We foand this opinion upon the general want of success which has attended attempts in this country to repeat the Liverpool and Berlin experiments. Some years ago the late Mr. Grorga Loddiges sowed the seeds of some hundred of Ferns preserved in an herbarium, and if any one conld have raised them he was the man. But the attempt was a complete failure; the seeds would not grow.
We do not mean to say that Fern seeds taken from plants recently deposited in an herbarium will never grow. Probably they will. Bat it cannot be denied that success is uncertain, and it is far less trouble for a traveller to secure seeds in the way proposed by Mr. Wilson Sadonders, and successfully adopted by Mr. Wallace, than to dry specimens for the purpose, even if, when dried, it were perfectly certain that they would grow. Many sorts might, at a pinch, be sent home in the same vial, either mixed together or separated by some little contrivance, and thus half a dozen bottles which would travel in a coat pocket would do well a duty which a bulky package of dried plants would certainly do ill, if at all.

- A very interesting paper was published two years since in the Transactions of the Society for the
Promotion of Horticulture in the Prussian dominions * by Drs. Braun, Caspary and De Bary on some new or little known diseases of plants which are cansed by fungi. Amongst these is one which affects Heaths in winter, and is caused by an extremely minute parasite belonging to the genus tenbaris ind den königlich Preins zur Beforderung des Gar-
Staaten. Neue Reibe Erater Jahrgaug.
according to the luxuriance of its growth more or less rapidly exhansts their vitality, so that at last the slightest shock causes them to fall, leaving the stems quite bare, with the exception of little terminal tufts of leaves. The parasite itself is interesting because it exhibits three distinct forms of fruit, all capable of germination, which examined separately might cause it to be considered as a very reduced Verticillium, a Dactylium and finally a Stemphylium. The matter is still farther interesting because it tends to prove that some of those moulds which usually grow on decaying or decayed substances are capable of producing injury to living structures. This point has been carefully considered by De Bary, and we think that he is warranted in the conclusion at which he has arrived. A third point of interest is afforded by the light which is thrown upon the subject by another parasite which has lately attacked Heaths in a large and important establishment, though not confined to them, but infesting various Australian plants, as Eriostemon, Boronia, Epacris, and even Conifers, as
Pinus insignis, and in all cases alike causing considerable mischief, and which together with the fungi in question belongs to a class not usually considered capable of affecting living substances. Like the Stemphylium it is so small as to be quite invisible to the naked eye. A lens shows in some specimens a very delicate colourless mycelium. $\dagger$ In these however there is no fruit, whereas in the fructifying specimens there is no trace of mycelium except under very high magnifying powers. In fertile specimens the parasite presents the appearance of extremely minute pins stuck into the withering leaves. The shaft of these is without

articulations, attenuated at the base, and about the one handred and fiftieth part of an inch in length and filled with minute granules which pour out when it is broken. This is surmounted by a globose head consisting of a compact central mass from which a number of sporophores radiate, each of which is terminated by three or four sterigmata supporting a straight necklace of globose smooth spores about $\frac{1}{7000}$ of an inch in diameter. The stem itself is hyaline, and the head of spores, which is proportionally large, of a dingy brown.
The only species with which it can be compared is a minute Aspergillus which was developed on Rice paste, while Dr. Montagne was making experiments on the growth of the red substance to which the name of blood-rain has been given. Of this we have specimens, and as we can perceive no difference, notwithstanding the difference of locality, we consider them the same with our parasite. It is well known that many species of mould will grow on any substance which affords sufficient moisture, and as the species is so extremely minute, it is possible that it may be very common though it has escaped the observation of most botanists. It is the mycelium which occasions the mischief. When the fruit is perfected, or in the course of formation, the injury has already been accomplished. A thread of the mycelinm comes in contact with a perfectly healthy eaf. In the course of a few hours (from eight to 24) the leaf becomes discoloured and soon shows anequivocal symptoms of approaching decay. At first it seemed innocuous to plants with shining eaves as Camellia and Gardenia, but these a ength have failed. There is then the same reason or supposing that it really causes disease as the ittle stemphylium, and if so the great point is to get nid of a pest which though minute is very destructive. Sulphur in varions forms has been tried in vain, and at present no better remed suggests itself. The difficulty is to find something which may affect the parasite without injuring the mother plant. Sulphurous acid produced by the burning of brimstone will certainly destroy the mould for the time being, but a slight degree of mismanagement may at the same time prove worse in its consequences than the disease, nor is it permanent in its effects. The whole crop of mould may be destroyed to-day, but a fresh crop may appear to-morrow.
It is pretty clear that the monld first originated ${ }^{\dagger}$ In one apecimen transmitted the mycelium was brown, bu is a state of Polyactio vulgaris, one of the commanest, of moulds.
in the tan with which heat was obtained for th plants, though no evil consequences have bee the perienced before in a practice of 40 years. Salphur was indeed applied to the tan, but then of itself it is not destructive to fungi, though sulphurous acid is. $\ddagger$ A specimen of the raw tan before being nsed in the propagation house now before us is fall of Aspergillus as indicated by the presence of Eurotium, a secondary fruit of that genus. The Aspergillus was not, however, the only enemy. Penicillium glaucum was almost as destructive, and as speedy in its operations, a fact which is quite new in the experience of fungi. However indiscriminate it may be in its attacks, it was never supposed capable of making inroad on healthy tissues, and since it is o widely diffused both in the animal and vegetable world, the importance of the fact is very great.
Our figure represents at $a$ a fertile thread of $A_{\delta}$ pergillus nanus with its globose head of spores; $b$, a portion of the stem pouring out its grannlar contents ; $c$, the head divested of its spores showing the central nucleus covered with sporophores and sterigmata; $d$, the sporophores, sterigmata, and spores. All more or less magnified. M.J.B.
the water flannel (Confrrya crispl).
Two sources of anxiety made their appearance here simultaneously in 1854 on the waters of the beartiful and picturesque lake, and at once threatened to become a serious drawback to the effective claracter of the landscape, and an enemy of no ordinary magnitude to the principles of economy. They were what is known as the Water Flannel (C. crispa), and a weed of American introduction, Anacharis alsinastrum. I now propose to treat of the former
In the Chronicle of the 16th ult. attention is called to the subject by reference to an article in the Moniteur des Comices, which states that M. Payen retently placel
before the Central Agricultural Associstion before the Central Agricultural Association of Paris specimens of this vegetable matter that had been obtained from Châlon-sur-Saone since the terrible inundation, in the form of an immense felt ; and who recommends, from the great quantity of nitrogen it contains, its use as a manure instead of its unprofitable destruction. In the Chronicle for 1843, page 735, 2 correspondent signing himself "R. E." scientifically describes this Conferva; and as oue such paper on the subject is sufficient I beg', to refer my readers to the valuable matter it contains, quoting but one short passage explanatory of its analytical properties :-" H evast by the waters on the meadows, and carries with every 1000 lbs . weight of it 400 lbs . and upwards of carbonate of lime, 200 lbs , of carbon, with at least 151 lbs . of the air called nitrogen." Being thus prepared wita an analysis of its constitution, 1 will endeavour to Previnow far my experience reaches over its his Trentran on the east side of the lake, and with every rise and fall of the waters, with every impurity that crep slowly and loathsomely down its shallow windings, the surface of the lake was affected. On the west side considerable spring flows into it, but it did not then remove aught of the dark coating. Yet, in the face of al this, at the time of heavy rains and floods, a stream of tolerable force would sweep over the entire lake, and carry with it much that was noisome and unsightly. In the spring of the date mentioned that course was averted, the water drained off, and when sufficiently dry was partially mudded, and now the only conuection of any consequence between them is towards its extremity, where a dam-way of an average height and abou 40 yards across is erected, and it is only when the rive exceeds its usual level that their waters mix. The lane, whim is of an oblong form, is 85 acres in exwid fall of about a mile long. At the lower end ent it is Not one drop of water booms over its ledge, the overflow being now at what was formerly considered the head of the lake, while further up is a powerful sluice by which it iseasily drained. The whole extent of its westery shore is lined with a fine array of Oak, beech,
other trees, whose branches, hanging over and dipping other trees, whose branches, hanging ovel for the probationary state of numerous aquatic fowl. In the early part of the year 1854, my attention was directed mall fields of a green, unsightly scum which seemed gradually to collect on the surface, and assume there after a few days at an alarming rate-a yellow-green mass bubbling and compressing itself into unsighty ridges.
Tnis was in the summer succeeding the altering the course of the Trent, and the first that the lake was wholly supplied with pure water. The current or to distimes was also wanting, and there was nothing to as it curb its tranquility but the winds of heaven; auter are is open only to the east, those from that quarter the lone sensibly felt. The summer passed anred last Conferva disappeared. Similar events occurred ent
year, but as I had nothing to do with its management during that time I can only speak of the disheartening labours and unsuccessful experiments it produced on
$\mp$ It might be well to try the effect of strong fumigation wily suiphur on the tan. before it is used by heatiog. Wriag migheat after the process was accomplisbed.
the part of ollers. About the usual time this year it ggain threw up its formidable and dense fields, and defied all exertions all kinds of implements could not carrying men using all kinds of implements could not keep it under, and it was almost sickening to fund in the morning spaces covered with its unsightly verdur
had been left perfectly clear the evening before.
On the 7th of July| I was directed to take the matter in band; and my first attempt was, happily, saccessful. It had become like a meadow, and a boat could not without great difficulty be pulled through it. It occurred to me that whatever good was to be done mast be effected in a great measure from the land, ingtead of trusting to boats, as more power could be exerted. I set to work with a number of men at once, and got together a quantity of planks, boards, and railings from old fences, and fastened them end to end with stout rope, allowing a space of about six inches between each plank to give them room to play. This wooden chain-about 300 yards long and assisted by smaller ones-I drew across a portion of the lake, and with ropes atrached to each end several men drew it gradually towards the shore, skimming and driving tion of Conferva, and leaving in its wake the silvery waters. tion of Conferva, and leaving in its wake the silvery waters.
The work went on joyfully till the mass got too heavy The work went on joyfully till the mass got too heavy bottomed ones, were now able to come to the rescue and runuing up alongside the chain, a good show of men lifted it with 5 -tined steel forks into them, and then landed it on the banks of the lake at convenient places. In this way we made considerable progress. Our next plan was to bring one end of the chain round a section of the Conferva and draw it to the shore, leaving it to be thrown out by one set of men while noter brought lifting it into the boats, as it saved ust the half of both time and labour. However, I considered that an improvement might be made even here, which was by taking as much of one side of the lake as the men could well manage at a time; one party pulling along the shore, and another at the other end in a punt, and getting the Conferva up as near as possible to the lood gates and lifting them, it might be washed wholesale into the Trent. I did so, and found it the most expeditious plan of any. But as I stood and saw it floating rapidly away, the thought struck me that to cast if on the waters thus was absolutely wasting what might be made not only useful, but help to repay in a certain degree the large sums of money expended upon it. The rood-gates were closed at once.
The work went on; the Conferva was drawn to land, and at convenient places thrown into large pits dug for the parpose, and well covered over with soil and quantities of leaf mould that could easily be collected in the neighbourhood. By the l2th the whole extent of the lake was free from its intolerable crust.
While working with the men in the boats the mmonia that escaped from the Conferva was at times almost overpowering ; it made us all ill more or less : and a remarkable fact showed itself in the great suantities of dead fish that had got entangled in its filaments and were overcome by the presence of so powerful an agent. Also, on examining carefully small portion of the Flannel I was astonished at the their home. fabuls number of insects that had made it tair home. Taking these important facts into consideration, I came to the conclusion that with a little attention a very valuable manure for certain purposes
was at my disposal. This my disposal
This much I have done. I will now speak of what I intend doing; and I hope my remarks will induce others to experimentalise and give the result at some future time. Weall know that in inland countries the Asparagus is not brought to such perfection as in those bordering no the sea. My opinion is that by turning the Water Flannel in the month of November, and mixing with it a quantity of salt sufficient to give it as it were an oceanic flavour, and adding to the soil and leafmould a good costing of sand, I shall, with other things, such as chopped turf, road parings, \&c., have a sed tolerably favourable to the growth of Asparagus. It might also be extensively used, and with advantage, a the kitchen garden as a manure for ordinary crops and I feel confident that as a top-dressing for American plants-minus the ealt of course-it will te found really excellent and efficacious. Nature always illustrates her designs; and in some instances the illustraTon is so simple that we instinctively ask if mure is Therefore when the Water Flannel was first noticed incrusted over the meadows Flannel was first noticed an a subject over the meadows, it brought directly home to a ite propt for inquiry - Why came it there, and what se its properties ! It was brought there in an unusual hanner but by an unerring Providence, to counterbalanee by its rich deposit the losses occasioned by the inamdation, and by its extraordinary appearance it led aan to study its formation, and by analysis to discover the secret wealth it possessed for other purposes than the one exemplified in the meadow. And now that we obtained what that land-wealth is, how easily it is obtained, and how simple its mode of application, let meadows, instead when the Water Flannel incrusts his cover it over win of repining, colle little farm-yard manure thrown with it while turning in the fall of the year, he will have for his Grass lands a fertiliser as economical and profitable as he can desire.
A few days after the lake was cleared, the day being enlan and snawy, I noticed spread over its entire suface
forming. On examining and blowterva were ayain sembled the first stage of the formation of cream upon milk ; below it the water was clear and bright The temperature ranged high, and the vane pointed S.W., but there was scarcely a breath of air to be felt The last thing before it was dark I found the crust to be getting more perfect, and I went to bed anxiously enough. In the morning a tolerable wind blew from the N.W. the glass had fallen to $55^{\circ}$, and not a trace of Conferva was visible in any direction! The water supplied by the water-works company near here is considered to be of the purest order, and yet it will produce this Conferva in 24 hours if exposed to the sun at a high rate of temperature. The year after the lake was relieved from the impurities of the Potteries, when its water was bright and sparkling, and almost wholly supplied by the spring valley rivulet, the Conferva spread over its bosom, choking up its passages, and converting its surface into a massive field of dectitful verdure and yet there is no account of its having appeared when the lake was fed by the waters of the Trent A nother singular circumstance connected with it is, that its growth is almost entirely retarded by shade; it seems to require the powerful rays of the sun on a calm unruffled surface ere its myriads of seeds germinate and roll into so distinct and tangible a form. Does it then flourish the more readily in waters of the purest character? Does all water contain particles of this vegetable formation, and require but a certain amount of atmospheric action to call it into existence Trentham.

PRACTICAL LESSONS IN BOTANY FOR BEGINNERS OF ALL CLASSES.-No. IX. Co Rev. J. S. Hensiow, M.A., Rector of Hitcham, Suffolk Columy 2d. - Numerical relations botanically ex p. 500 , I have explained how botanical terms have been coined to express the numerical relations between floral whorl and its subordinate parts. The secon column of our floral schedule is appropriated to the re gistration of such terms. Thus the two first column for Ex. 3, "bulbous Crowfoot" would stand as follows :-

| C.S. | 5 | pentasepalous | as applied to the calyx |
| :---: | :---: | :---: | :---: |
| C.P. | 5 | pentapetalous | \# " $\quad$, corolla |
| St | $\infty$ | polyandrons | $" \quad " \quad "$ |
| $\frac{\mathrm{P}}{\mathrm{C}}$ | $\stackrel{\infty}{\infty}$ | $\}$ polygynous | $" \quad " \quad,$ |

The effects of cohesion modify this mode of expressing the number of parts in a floral whorl. Our bota nical nomenclature was in great part established before the general laws of morphology were understood. When all the parts which compose a floral whorl cohere, $i$ was considered as consisting of only one part. Thus a calyx with five sepals more or less cohering, is regarded 28 a monosepalous calyx, less or more divided or cut A corolla composed of five cohering petals would be styled "monopetalous."
N.B. Cohesions between two or more parts of a flora whorl are rare in comparison with cohesion between them ali ; but when they exist, the nomenclature would be modified to suit the number of the compound parts or pieces thus formed. A calyx would thus be disepalous if its five sepals were to cohere by two and three re spectively.

Cokesion between Stamens.-The termination "-an drous" is not retained (like -phyllous, -sepalous, -peta lous) in expressing numerical relations depending on the effects of cohesion. The termination "adelphous" (brotherhood) is then substituted for it. This implies that cohesion subsists between the filaments by which the stamens may become conected into two or more separate bundles. Thus a polyandrous flower would further be styled mon-anlelphous, di-adelphous, \&e, according ss the filaments cohered into one, two, \&e., bundles. Any precise number of bundes beyond two might be expressed; but in a general way all such cases are styled poly-adelphous.

Where the filaments do not cohere, but the anther do, the term " syn-genesious" is employed. The coher ing anthers in such cases form a tube round the style.
N.B. This description of cohesion is almost exciusively restricted to the very extensive and most natural ordes Composites (Composita). In this it is nearly universal the few exceptional cases occurring smong certain tropical weeds

Another peculiarity in relation to the number of the stamens (when these are either four or six) is expreased by the termination "dynamous" (poveer or authority) Thus, tetrandrous flowers with two stamens longer than the other two, are termed "Di-dynamous," (two in authorily). Hexandrous flowers with four stamens out topping the other two, are "Tetra-dynmmous" (four in authority).
N.B. Didynamous flowers are met with in a few distinct natural orders. Ex. 17, while Dead-nettle, is an illustration among "Labistes" (Labiatce). Such as are tetradynamons are confined to the readily recognised and extremely natural order "Crucifers" (Cruciferce), of
illusiration.

Cohesion between Carpels. - In expressing the nume rical relations determined by the freedom or cohesion of carpels, respect is only paid to the number of free
earpels, or eise (when the pisur is compound) to the
number of free styles A flower with s simple pistil number of free styles. A flower with a simple pistil would be mono-gynous ; with several simple pistils (i.e. ree carpels), poly-yynous. But a flower with a com found pistil, and cousisting of many carpels, would be either mono-gynous or poly-gynous, according as it had one style or many. It would, moreover, be stil regarded as having only one style, to however slight an extent the styles of the different carpels may cohere by their lower portions.
N.B. In the following summary (from the 24 examples hitbert noticed) I believe I have inserted all the cases in which the botanical expression for the numerical relations in the differen not with respect to the absolute number of the parts present in a
florat whorl. In the whorls not noticed there would be no florst whorl. In the whorls not noticed

VEGETABLE PATHOLOGY.-No. CXXXVIIK. 568. Parasite (Helminthosporium, Cladosporium*). These two genera are so intimately combined that it is difficult to assign their limits. This observation applies more especially to those truly parasitic species which come under our present notice. They are very widely diffused, and occur in South Carolina, America, Ceylon, Hindostan and in other countries, thouyh they are not found every where like Cladosporium herbarum, which is perhaps the commonest of all vegetable prowhich is perhaps the commonest of ablieve, that which ductions. The better opioinm rather than Helminthosassigns them to Cladosporinm rather than helm
569. The species which we have more immediately in 569. The species which we have Pomacece, and not only has the one species been split into five or six, but has
$x \rightarrow$ branch
been assigned to almost as many genera. Phlyctidium,
Actinonema, Asteroma, and Spilocza have asserted their claims as well as the two placed at the head of our number. This confu-wn has arisen partly from the very different hat it astumed by the species on different plants, or oryans, and partly from the proper fruit being often undeveloped. Cladosporium dendriticum, such i the name given to the plant by Walroth, arises uniforml beneath the true cuticle under which its my celium radi of the common Service, it is referred to Actinonema or Asteroma. Sometimes it forms compact almost definite spots, when it is a Sniluccea, while very frequently the
spots are more diffused, spots are more diffused, when it is considered an
Helminhosporium or Cladospurium. Late in the year it assumes a very anomalous aspect. The spores germinate and form a dense spongy mass which abounds with conidia, and might readily be pronounced the former, the leaves of Pears and A pplea, especially strength and fruit it make killing the young twigs, while on the nosaleable, and sometimes inducing or else rendering i by extensive eracking, which adds still further to the mischief. When it has once attacked a tree it is very ap reason to believe that it is so inveterate, that where plants have been attucked by it, a new progeny raised from the seed of the diseased individuals will soon
exhibit the parental malady. A singularinstance of this is related in the Gardexers' Chronicle, 1848, p. 716 particular packet of kusvian seed were attacked by the Cladosporium dendriticum, and many of them were severely injured, while neighbouring individuals of the same species did not suffer.
the Like all parasites which are produced beneath the cuticle there is some difficulty in applying a
remedy in an early stage of the disease remedy in an early stage of the disease, nor is there destructive to the brown as to the white moulds. In the present instance the better practice would be carefully to gather up the infected leaves as soon as they have fallen, at the same time trimming off the disease then be painted with sutphur mixed with tragacanth, or with sulphur and lime, in the hope that this might slowly act upon the spores which had been deposited on make the it is essential to use something which may insoluble in water permanent. Sulphur by itself is dusted on, is linble to be washed off before it has effected any good, which it can do only by combination with oxygen to form an acid
71. Cladoriorium dendriticuon is in general very prolific in spores, but some of the exotic species rarely produce them, and are often found in the form of mere
tufts of barren threadg. Spilocrea which has long been a matter of perplexity to botanists, constituting the black spots so common on Apples, is we believe certainly a mere form, though the matter has hitherto escaped the attention of butanists. The spores are not of the same form or size on every Apple. We have seen them very different on Newtown Pippins from the nsual British form. The spores however in the normal plant and in different varieties of it are so variable, that a similar phenomenon in abnormal conditions is not surprising, M.J. R.

## The Hyacinth.-As the season has arrived when

 remarks on this justly admired spring flower may beacceplable to many of your readers, I therefore ber to give them the benefit of my experience in its culture, very different from those usually met with fiower first place, much, very much, depends upon the quality of the bulbs, which should le perfectly ripe, and the consider it highly objectionable to the better, for to the air except just to throw off any moisture they may have altained during their transmission. Always select the largest and best shaped bulbs, rejecting as a rule those that are loose in texture and small ; but I
find generally that if the base of the hulb is sound and ripe the other portion can be depended upon, and, in fact, this is the only guide to follow in regard to such kinds as Porcelain Sceptre, Prince Albert, and many others of the best sorts which have wretched-looking bulbs; indeed, so much so, that I have seen them thrown aside as useless ; it is, therefore, best for the amateur to leave the selection to those who are well acquainted with their properties until by experience he can trust his own judgment. The compost is another impartant point ; this should consist of an equal portion of turfy loam and well decayed cowdung previously prepared by exposure to air, by frequent turnings so as
to thoroughly incorporate them; and to this add about one-third silver sand, for they delight in a gritty open soil ; I prefer 6-inch or 32 -sized pots so as to give plenty of room for their strong roots. Fill the pots about onealthough potsherds will do as well -and the remaining two-thirds with the compost ; clear the root of all offisets and loose parts, and press tightly into the soil, leaving one-third above the surface; then water them sufficiently to settle the soil, and plunge them a foot at least under coal-ashes or old tan out of doors, or in a cold pit or rame. This is done to cause them to make roots before the crown is excited into growth : this is, I think, the most essential point, for unless the pot is well filled with roots good flowers cannot be obtained. In a month or six weeks, the latter being the better time, rake as many as may be required for the earliest blooming, and gradually inure them to light previous to placing them in the forcing pit, and as soon as these show their colour proceed with others in the same manner. The end of September is soon enough to pot the earliest sorts, repeating the operation until the end can ovember, by which means a succession of flowers flowers will be obtained from those not too strongly forced. If for exhibition, I recommend potting not late than the middle of October, gradually bringing them and use liquid manure in a very weal state twice week. These will be in full bloom during February and March, and I consider that no Hyacinths should be exhibited after the latter month. I look forward to the time when those Blue-bell looking flowers, such as are generally seen, will only be subjects for remembrance, for I am convinced that Hyacinths can be had 9 inches or more in circumference, and with length of spike in proportion. James Cutbush, Highyate Nurseries.
Diseased Potatoes.-I was surprised to see my note on the Potato disease translerred to your leading article of Angust 30 . It is however a satisfaction to
have a view thus faury grappled with, by coufersedly
one of the ablest men of our day and to find that so little can be said against it. That it ahuuld be receired generaily without a wider induction of faets than we at present posesse, 1 do not expect, but that it will no doubt. Your able article does much to enconrage his opinion, for it clearly shows that the theory of ungi and that of surplus nitrogen labour under precisely as great difficulties. I should not have troubled you with this note had it not been for one passoge in ideration another referred to, and to submit ior conpassage I allude to is "We forbear to remark upon orr correspondent's hypothesis that the fluids of the stem are converted into steam (!) whit h ruptures the tisenues seems to express doubt about the possibility of conductor toctrity, endeavouring to pass through conductor too smaal to transmit it, developes water into steam is unquestionable; and part is due to this. The heat which fuses metals and ignites is due to this. The heat which fuses metals and ignites
combustibles is adequate to the production of stena of any pressure which the envelope of the water will allow to be generated. But, even assuming that the electric discharge from a cloud passed through the Potato stems the earth, it is by no means proved that the obstacle to the passage of the electricity is sufficient to produce these phenomena. Having lately examined a good many Potato stems which in popular phase have been struck by lightning," and the tubers connected ure, excuse my ar less diseased, you will, I am ure, excuse my venturing to differ from you in reference to the point in question. These stems are pareetly sound before the storm. After it the internal tissues towards the upper part of the stems are quite
destroyed, but the destiuction diminishes as the stem grows thicker towards the ground. In a day or two. the top of the stem dries up completely, and, after a period of sickness, the remaiuder dies. The tems above ground present the well-known dark spote, ander ground are completely brown. The destrac-位
 action takears to me the most probable, but if chemical and tissues be oxidized your explanation is by far the best I have yet seen ; and, granting the electric origin of the decomposition, which is all I contend for, may in fact prove the true solution. I went yesterday to see a case which bears upon this matter. The place is the garden of a public institution, of about 7 acres in extent, managed by a fair gardener of the old school who is quite innocent of theory. His Potato stems were almost black, and smeit most offensively. He states that they looked well till the first btorm of thunder and lightning, but that the "lightning then fell in one quarter upon a spot about a yard, and passed across the rest of that and the whole of the next quarter. Where the lightning fell the Potatoes went diseased directly." He showed me some Lilacs which ere struck the same day, of which about balf of the and dry, the upper half of the Potato tops) is dead and dry, the portion next the stalk being yellow only. have only a few small branches in each tree affected, and those which are touched are perfectly killed. Several other cases have come to my knowledge, but
must not intrude farther upon cour space. W. R. ., Wakefield.

## Growth of Araucaria and Deodar at Valnor Pavk.-

## Dendar ...̈ Araucaria <br> 

The measurement of these was begun in 1850 . The plants were originally furnished from the ga
Green-fly.- It. Lyan Winteder, Falnor Park.
Green-ffy.- It has often struck me that your readere might do good service to each other if they would from time to time record in your Paper the various successem or disappointments which they meet with. For instance no amount of smoke has ever satisfactorily got rid of the green-fly in my houses. Frequent fumigation kept my Geraniums, \&cc., tolerably clean, but the pest still existed. This year I have immersed all my plants in a mixture of tobaceo, $\frac{1 \mathrm{lb}}{} \mathrm{l}$; soft soap, 1 lb . ; water, gallons, and although it is now more than four months since they were dipped, I have searched in vain for a single green-fly when cutting them down. Mr. Dobson of Isleworth, recommends this in his little pamphief the Culture of the Pelargonium, and I can testify forl the benefit of your readers to its perfect succesthy have
eny of them inform me in return whether they found any better method of glazing their houser than usual one with puity, which 80 soon erseks and leti water on every side? J. C.
Bees. - In your Paper of the 16th inst. your correbpondent . G. I will no produced recommend him to attempt to fill such a monstroces glass. Its weight and size would render it most venient. But I will tell him the plan which I have suc cessfully pursued for some years. in hy hives. On the
straw, 8 inches high, and 15 inches in diameter.
ales in it, eaccu hule 2 neches across, and covered with
piece of zinc. When the bees begin to work freely I remove the pieces of zine, and place a bell glass 13 ins. deep and 13 inches in diamuter on the board, coverit glass, containing 24 lbs , of honey, will generally be filled
俗 me that if I replace this glass with a fresh one the bees will probably sulk, and do very little more during the season; but if empty the glass of its honey, and working as if nothing had happened, and by the middle of August I get 24 lbs more, and leave the straw hive full for winter store. The bees thoud be fod autumn and spring. This is best done by placing a piece of the pieces of zinc, and by means of a zinc tube in erted through the top of the bell glass, pouring syrup into the cells. Apis.
Wellinytonia Diseuse.-Having noticed the reports on he disease of this Conifer, I think the following state ment may be interesting:-- have a plant of $j t$,
seedling from Mesms. Veitch. It was planted out from the pot (having been twice potted to larger-sized pots) bout a year and a-thalf ago. Till lately it has been beautiful specimen, a perfect cone, and making rapi
growth with much corresponding thickness of stem may add that it way planted in a very favourable locaity, in a large pit filled with loam, broken charenal and some dry preat over a gravelly subsoil very dry.
It has now several dead branches and blotches like ead wood on other branches, while the points of thos branches seem green and flourishing. It is singula that it appeared on this plant at the very same time
hat the blight has affected the Putatoes, namely, on the change from the long drought to cold showery very fine specimens of Cryptomeria and other Conifers around it, growing luxuriantly and with no sign asease. Ste the the Potato, that I am inclined ascribe it in this case to disease, and not to the soil, or to any malformation of the roots. I saw it planted nyself, when they appeared in excellent order. Shannon, Castle Martyr, Cork.
Use and Purposes of Ammonia in Vegeiable Economy -ln two communications on this subject, which ap. Agricultural Gazelte, Jan. 7, 1854, I endeavoured to maintain the position that the chief purpose of ammonia
is to supply hydrogen, to form, in conjunction with to supply hydrogen, to form, in conjunction with
carbon, vegetable matter or fibre-the hydro-carbonaceous substance of all vegetable structures-not of course excluding the appropriation by plants of the aitrogen of the ammonia wherever and to whatever extent their peculiar wanls or products may render it necessary, but still regarding the bydrogen as form their very substance and structure, and the nitrogen as only the partial and varying element which all in many vegetable substances, and existing in others in very different quantities. Permit me now therefore, to relate the circumstances and results of mall experiment undertaken in the same direction, and or the purpose of ascertaining the comparative effects
of administering and withlu ldang ammonia respectively in the cases of cwo plants of the same kind, placed in all other respects in precisely similar circumstances and onditions. Whe plant selected was the common pinach, being of quick and easy growth, and appearg to constitute in its immature stave a fair specimen merely vegetable or hydro-chrbonaceous substance. Two 6 -inch pots were filied with sea sand, previousi ell washed in maters which might affect or ticles or other soluble matters which might affect on eatment they were intended to be subjected to. Th seeds were made to vegetate in a very small quantity of common garden mould placed near the surface of the sand in the middle of each pot. These were placed on the top of the lower sash of a window facing the south, the upper sash of which was at all times kept down about 2 inches, so that there was a free and constant creulation of air through the interval bet we sashes and tbe open space above; and anlight and heat, while no rain could gain access to the pots. The plants were plentifully watered twice aweek or
oftener, until the water ran from the pots-one with plain water, without addition (of the Edinburgh Company) he other with the same water having dissolved 10 grains of carbonate of ammonia to a quart bottle of
water, the bottle being kept corked when not used. The ceads were sown on the 27th February, and the plants continued to grow till near the end of June, when they began to run to seed, and the experiment was stopped. At this time they had both attuined nearly a foot in height, long and slender, as might be expected under the circumstances; but I am bound to acknowledge that the plant which had been watered with plain water Was the strcngest and most robust of the two; the other baving the appearance of being stimulated into long and weakly growth by the ammonia water, similar to the tifect I bave seen produced on a Hyacinth in a glass, from the addition of ammonia to the water it was growing in. The resalt was certainly contrary to my expectaoceurred to mencing the experiment, but the thought tion of chareoal to the sand in equally measured quantities, the same sand being used again after being
was sown on 4 th July, and the relative rate of growth up to this period, as you will perceive, leaves the preponderance most conclusively in favour of the plan treated with ammonia, being at least three times the
size of the other, and weighing 87 grains, while the size of the other, and weighing 87 grains, while the
weight of the plant, not so treated with ammonia, is weight of the plant, not so treated with ammonia, is
only 26 grains. Both plants, but far more especially so the one not treated with ammonia, have made less growth in the same time than the two former did which may be attributed partly to this season of the year not being as favourable to vegetative growth as the spring and ear:y part of the summer, but znuch more to the circumstance that, notwithstanding the sand bein well washed, there may have remained in it nutritive particles of mineral and organic substances which the plants were capable of appropristing to their own wan's and being so used up, the plants in the second part of the experiment were deprived of a resource accessible to the frst. But as it is not the absolute but relative and comparative growth attained by the plants respec ively, that is of importance in the present case, the her and better apprecisted and judged of in he absence of all extraneous and independent mean Iy reason for entering so minutely into the details of an apparently trivial experiment is, that the result appears to me to suggest, or even to point not cibscurely appears to me to suggest, or even to point hiot cobsurety useful application of ammonia-viz., that plants canno beneficially use or appropriate ammonia beyond certain point, unless carbonaceous matter be present the ground ; and, conversely, that though there may be abuidance of carbonaceous matter in the ground, it remains inert and cannot be converted by plants to the urpases of nutrition, unless ammonia be also accessible to them. In the first part of this experiment, where of it in the sand and barb or only a defective quantity than the atmosphere to depend on for obtaining carbon the administering of a liberal supply of ammonia only stimulated to an elongated, weak, and watery growth, and the plant which had no ammonia supplied to it was he strongest of the two. In the second part, when charcoal had been added to the sand, the beneficial effects of administering ammonia became manifest in the production of a plant greatly exceeding in weight and bulk that which had no ammonia administered to it, remained inert in the absence of ammonia. With respect to the special object for which this experiment was undertaken, I consider the result as satiefactory as could have been expected from it. By treating one plant with ammonia, a quantity of vegetable substance mounting in its fresh state to of grains has been obtained, while the other not so treated has firnished only 26 grains of vegetable substance. As the difference is undeniably due to the action of the ammonia (in conjunction with carbon) the question anises-What is the mature of the additional substance which has been gained in the one case? Is it nitrogenous or anything in which nitrogen remarkably abounds! or, is it merely vegetable fibre or hydro carbonaceous matter? If the latier, whence has the hydrogen been obtained! We have onl now. Either has been the molic, the by virtue whith it nexplicable property, by plan iox har the case pamolis to extract the same sount of absence of ammonia to rubl hydrogen from water, it not difficult to determine naceous substance. It is not dificult to determine which of these two hypotheses is m.
consonant with correct views. J. II. H.

Flora Vectensis. By the late W. A. Bromfield, M.D Edited by Sir W. J. Hooker and Dr. Bell Salter 8 vo , pp. 673 , with a map. Panuplin.
This account of the flowering plants and Ferns indigenous to the Isie of Wight has been prepared from papers left by a most able, industrious, and conscientious naturalist, whose early death in Parestine, in consequence or greateo losses which English Natural History has latel
 Brold his bit even had present volume neve recorded
appeared.

The greater part of the work consists of systematica escriptions of plants found in the islaud, of their loca lities and uses. Remarks upon their distribution, or the physical peculiarities of the region, are confined to a introduction of 18 pages, illustrated by an excellent map nteresting as this portion undoubtedly is, the greates value of the work must, we thinik, be admitted to con sist in the very careful original descriptions in ever instance made by the author himsel, and evincing habit of scientific exactness which is wo fear le common than is supposed. These descriptions will long remain matiers of reference by botanists whose leisure does not always permit them to investigate minate de tails. To appreciate their true value the student should compare them with those of Smith in his English Flora.

We earnestly recommend the volume to the vibitor of Isle of Wight ; it will prove a faithful guide and a
constant $s$ urce o! correct informaniou, notwithsanding te too many ty pogianical exrora with which the printer is chargea
A Practical Treatise on Disorders of the Stomach with Festiom, and on Diet. By J. Turnbull. M.D. London, gestion, and on Dret. By J. Turnoulographed plate. It does not fall within our province in general to review medical works, hut some lotanical mattere are inved in the process of fermentat on which occupies so important a point in the study of indigestion, and we therefore make an exception in the instance before us. It is extended by authors far bejond the latitude which is consistent inh its ctymology or common usage. In the consileration: however of dyspepsia, acette and though the term is applied to the conversion of
starch into su_ar, which is mae of the first procesces if diesstion. In bealthy dipestion the sulva first acts on anylaceons matter, the ga-tric juice on alhuminous matter, the pancreatic on far, while bile and the common secretion of the surface of the intestines perform a valiety of important offices. It the acetic or purrefactive termentation take place in consequence of the imperfect action of any of these, or rangel, and dangerous or painiul consequences ensue. In these abnormal conditions, as almost necessary concomitants, certain fungi are developed, and it is these which require the aid of the hotanis. It is unforn time for botunical investigation, and it does not appear that our author is an exception. Whatever merit may be due to other parts, there is little to recommend this portion of the work to espectial motice. It might be scarcely fair to judge of his botanical mowed, from the misprint on the plate, and throughout the work, tuted. It does not, however, appear that the autho has a distiset notion of what a Penicillium is. Two foras of mycelium are figured, one under the name of Torula, the other of Penicillum; but the one has as much right to the name as the other. Both indeed belong probably to $P$. glaucum, but as other moulds are often developed, they may be infant states of er species, Neither at any rate can be figured as Pencillium without an indication that it is merely a pelium. That he should have neglected .is Penicillium is Miscoraphic Dietionary, where Penicilium in the Micrograpto Dicle Yero sufficient igure is given. is made to 'Turpin's excellent
 nemoir, together wh an metratel io this mom Which has been strangely negledtal Turpin did not indeed trace the hetual growus of extly Yeart globule into the mould, but his figures are exactly in accordance with the direct observatio
the article Yeust in Morton's Cyclopedia.
It appears probable that Sarcina ventriculi, which is so conmon in malignant disease of the stomach, though found in many cther organs, as for instance in the bladder, is but a form 0 some common mould. Excellen specimens in urine were lately communicated to us by Dr. Rees, but we could neither get them to germinate, fermentible we ar alution of malt We had no perhans suficient minterials for the latter purpose. I the former instance the Sarcina underwent no cbange thourh observed frequently for weeks, A very inte resting field of discovery then is open, and one which may lead to curious results both physiological and practical. That the sarcina is a mould we do not doubt porinal of controlled bit of sad oher remedies which are lnown andiferments. Proof of its real nature, however, is antiluens. 10 lose who with the necessary information have opportunities of with the necessary abundant specimens.
We must not close this notice without drawing atten tion to the interesting facts adduced by the author in proof that many of the moxe wal Mustard, Horseradish, \&c., are powerful anti-ferment This doctrine may feriaps be exteaded to the use spices in some forms of malignant fever.

## Garden Memoranda

Didsbery Lodge, the Residence of joskph Buli Esw.-This interesting place is situated about six miles from Manchester. The gardens belonging to it were laid out about six years ago by Mr. biglaad, of tha own, but since that time they have been suach topron by means of the introduction of some spiendia specimat does not suit many of the finer Conifers. A mong others we noticed, however, a fine Araucaria imbricata, now making a good start. Vases and statues are liberally dismasing eut the grounds and give the place a varied and persed appearance. At one corner of the garden is rished appesanco. which in surumer forms a cool a handsome groth, whe efuse from glassworks mixed with different coloured stones from Verbyshire. A circular Rosery is also a favourite pla Gilled with atandard Roses, but it might be improved by filing the beds with dwart sorts, to be pegs under the standards. It has hitherto been the practice to fill the beds under the Roses with buibs to bloom in spring and annuals in summer. The most conspicuons
feature about the place is an Italian garden in front of frather close, and watering very cautiously for some time the gardener's cottage. This is now gay with all the
most showy flowers that are cultivated for bedding pur poses; variegated Geraniums especially were most conspicuals. We were informed that everything here is struck in autumn, kept in small pots till the beginning of March, and then repotted into larger ones, so that by planting time they are all coming into flower, which is a great advantage in our short summers. The quantity of glass here makes it a very convenient place for keep ing plants through the winter; on each side of the gardener's cottage is a range of houses planted with
Vines, Peaches, Figs, \&c. Pine $\Lambda$ pples we noticed with plenty of good fruit on them; one house was filled with plants in pots; in the other they were planted out in a bed of soil. Between the one set of plants In two Vineries, in another part of the garden planted five years, there was a capital crop of Grapes well coloured, buoches large, and in every way excellent. The Vines are so close pruned every year that they have the appearance of walking.sticks; they are turned out in winter and the houses filled with stove and green house plants. In order to prote a large tarpauling is put over it before the autumn rains
have chilled the soil. The houses are well buit, and have chiled the soil. The houses are well built, and
glazed with Havley's rough plate glass, which has answered perfectly every expectatiou formed of it. They are ventilated by means of under-ground air drains, having openings below the hotwater pipes, and grids in the back wall; there is thus a constant supply of Ericas, Epacris, and New Holland plants out of doors to harden. Azaleas were also very fine and promised a good supply of bloom. The pots which they were in were protected from the sun with common peat laid round them. Camellias had halfshower of rain washed some of the manure down to the roots. Stove plants, of which there was a good supply, are grown in the Vineries and Pine stoves; a nice plant of Meyenia erecta was just coming into flower, and we noticed a handsome specimen of the beautiful architectural building, but hike the generaliy of such the hitchen garden the but a good plant house. Nound the kitchen garden the walls are all wired with galvanised wire, the trees looked very promising, and had no appearance of cankering where they came in contact than crops in open fields; the haulm had been cut off from those affected the worst, in order to dry them before liftiug them. $S$.

## Miscellaneous.

Glass for Carclens Structures.-An experiment has been tried by Mr. Anderson, at Longleat, of considerable interest to gardeners, by way of proving what effect the fruit houses had on the plants grown under them. Five years ago a four-light frame was devoted to the purpose, having one light glazed with Harlley's rough phate, one with Hartley's corrugated, one British sheet, variety of plants have been grown in this frame, meluding Strawherries; and Mr. Anderson informs us that no perceptible ditference could be detected, either
in the growti of the fhants, the colour of the Howers in the growtis of the phants, the colour of the Howers, that as regards cultivation, mo great amount of diffe rence exists between the descriptions of gluss mentioned; while, to suit particular purposes, one sort may be substituted for another, without causing any detriment to Plorist, Fruitist, and Garden Miscellany for September.

## Calendar of Operations. (For the ensuing veelk.)

## PLANT DEPARTMENT.

Conservatonr \&c.-Keep New Holland plants which have been placed under glass cool and airy, and avoid growing state, but everything must be allowed sufficient space, so that the foliage may be fairly exposed to light and air, and rather than be under the necessity of huddling specimens too thickly together some of the least valuupon Heaths, as this nest is sometimes very troublesome upon plants that have heen grow ng freely in a slady situation in the open air, and are in a rather soft state when tsken in doors, and apply sulphurfreely on the first a ppearance of the enemy. Also see that everything is clear of
insects. Take advantage of leisure hours to get Azaleas which have made their season's growth nicely tied, as aiso anything else requiring training, and endeavour to keep everything very trim and neat, in order to com-
pensate, as far as possible, for the paucity of flower pensate, as far as possible, for the paucity of flower
among hard-wooded plants at this seagon. Cold Pits.among hard-wonded plants at this season. Cold Pirs.-
Plants which have made their season's growth should be freely exposed to sun and air on every favourable opportunity, in order to get the woon well ripened. But such things as are still in free growth shnuld be encouraged
hy every possibie means while fine weather continues, keeping them rather close, guarding them carefully from ront. If anjthing requires more pot on water at the shifted as early as convenient, keeping the atomosphere
afterwards until the roots get hold of the fresh soil.

## FORCING DEPARTMENT.

Piveries.-Attend to last week's directions, and endeavour to afford plants on which the fruit is ripening a warm rather dry atmosphere with a moderate circulation of fresh air on dry days, and whenever this can be done without lowering the temperature too much also keep young stock growing as freely as may be con sistent with securing stocky plants, giving thern a lilieral moisply of manure water at the ront, and maintaining circumstances will permit, shutting up early on the afteruons of bright days, but give alr rather freely in aferuons of bright days, but give all rather freely in
the early part of the day, which will assist in preventing weakly growth, and after this season the syringe must not be used too freely, even on young growing peasure by means of tanks, \&ce, syringing might almost he discontinued for the seasou; at all events avoid syringing so heavily as to cause water to lodge in the hearts of the plants, which tends to blanch and weaken the foliage. Look over young stock growing in pots, and shift any "requiring more pot-room without delay, so that it may get rooted into the tresh soil before shifting , and see to having the balls moist at the time of shifting, for neglect of this is a frequent cause of young
stock fruiting prematurely. Vineriks.-Vines that are to be forced very eariy, provided the wood is well ripened, and the leaves mostiy off, sloould be pruned and dressed, keeping the house as cool as possible, in
order to prevent bieeding ; for it is difficult to order to prevent bleeding; for it is difficult to get
Vines sufficiently dormant at this season that bleeding will not occur to some extent alter pruning. And so injurious is this in weakening the Vines that where there is any danger of its occurring to any Vines extent pruning should be deferred until the advisable to cover the outside border of the early house with something that will throw off wet in order to keep the ronts as dry as possible while the Vines healthy state when forcing is commenced; but this need The done until there is some appearance of wet. The weather is still very favourable for getting late moderate amount of fire heat, in order to et them coloured while bright weather continues, and the sum has some power. Figs.-The second crop of these will be give getting over, and every possible attention should young shoots thin and closely the wood, keeping the them fully to light and air. Also keep the atmosphere rather dry; and the borders can hardly be kept too dry
after the fruit is gathered. Any over-luxuriant shoots should be stopped, or cut out altogether where they can be spared, and trees that incline to be of a gross habit should be severely root-prumed as soon as this can be done, without risk of injuring next crop; for crop of fruit need hardly be expected. Meloss, Uness where these are particularly wanted late in autumn, they should be pushed on as rapidly as possible: for besides being very uncertain late in autumn, fruit ripened after damp cloudy weather has set in is seldom good for much. Maintain a brisk steady bottom heat, keepiug the atmosphere rather warm also. Keep the Vines clear of laterals, remove decaying leaves immediately they are perceived, and use every means step the foliage clear of red spider and in a healthy

## FLOWER GARDEN AND SHREBBERIES.

As frost may now soon be expected, any scarce plants which it may be desirable to secure before they or carefully covered when there is the least cause to uspect frost. See to securing a good stock of cuttings of the variegated Geraniums before the plants are injured by frost, for although these root more freely
in spring than at present, such varieties as Golden in spring than at present, such varieties as Golden
Chain and Mountain of Light grow so slowly that spring-rooted cuttings make but very poor plants by turning-out time, hence it is desirable to gain size, even
at the expense of the loss of a few cuttings. We do not at the expense of the loss of a few cuttings. We do not
believe all that has been said in different periodicala about the difficulty been said in different periodicala for we have experienced no particular difficulty in rooting it at this season ; but we may be fortunate as regards convenience, which is simply a flue running underground in the open air ; this we cover with a suit. able depth of soil, and protect the cuttings by hand-glasses. That cuttings taken from plants growing in the open round are liable to damp in a moist warm place is well so than most things : but persong who can command a gentle bottom. heat without keeping the atmosphere warm and moist will experience no difficulty in rooting them now. The old plants of these are, however, well for these wintering wherever room can be found for them, cover the much farther at planting-out time, and autumn or spring-rooted cutiong hower they should be carefully guarded from frost antil the beauty of the garden is destroyed, when they should be talien up, potted, and stored away for the winter in a conl dry house. Continue to put in cuttings of Hollyhocks, as these can be obtained until there is an ample stock of rooted plants, and do not allow thnse that were rooted
early in the seazon to suffer for the want of pot room.

Cut off the flower stems of herbaceous plants as soou as they becume shably, and endessour to prolong the
brauty of Phloxes, \&c., by keeping them well supplied with water at the rnot. Also keep the beds and erery thing about the flower garden and grounds trim and
hardy fruit and kitchen garden
Look over choice Pears and Apples at short intervals, and gather such of the fruit as may be found to readily
part from the tree. Espalier and dwarf siandard part from the tree. Espalier and dwarf Blandards, or indeed any kind of fruit trees which exhibit more
tendency to produce useless wood than such as is lively tendency to procuce useless wood than such as is likely to furnish fruit, should be root pruned as early as convenient in the autumn, cutting out any useless shoots at the same time, in order to expose the wood expected to bear fruit as freely as possible to light and air, so as to get it ripened. Provision should be made for protecting a quantity of French Beans from frost should this vecur, and Cauliflowers should be looked over frequently, turning down a few leaves over the hearts, for these are readily spoiled by frost. Get a lot of brown Dutch or Buth Cos Lettuce planted where they an be protected by frames for spring use; attend to he earthing up of Celery that is likely to be wanted for use soon, keeping it closely soiled up, so as to get it well
blanched. Keep the late crop of this well supplied with manure water while growing weather continues. Get Oniuns dried and stored.

## Che agritultural Gazette.

SATURDAY, SEPTEMBER 20, 1856.

A manufacturer in London has discovered an artificial manure of the exact colour and smell cf Peruvian gaano and possessing the same fertilising qualities; and he is now prepared to supply the same in any quantities at a low price for shipping abroad or home consumption. So says his advertisement. It is a very important announcement, not less to the users of manures than to the "manure dealers," to whom especially the advertisement is addressed. Of conrse whatever interest the latter may have in this article being, as it is particularly described, of the exact colour and smell of Peruvian guano, it is exclusively in its possession of equal fertilising qualities that the former are interested. Supposing the truth to be told on that point by the advertiser, the question determining its value to the farmer remains:What is the cost at which it can be supplied? And we do not doubt the statement that it can be supplied at a "low price." Why, otherwise, should it be offered especially to manure dealers, who must take their profit out of it before it reaches the hands which spread it on the land? In every point of
view, then, it is plain that this advertisement conview, then, it is plain that this advertisement con-
tains one of the most important announcements to which the attention of our readers could be directed. We hope that justice will be done to it by those interested in the safe progress of English agriculture. But how can justice be done to a manure? To look at it and to smell it will not suffice to determine its true character. It may possess the exact colour and the exact smell of Peruvian guano, and yet be nearly worthless. The agricultural value of

Peruvian guano depeuds ci iefly ou the quantity of
fertilisinu matter which it possesses in a form unrecognisable by either nose or tye. The ammoniacal smell by which suano is generally known is no test whatever of its real value. Ichabue guano, for instance, smelt more stiongly of ammonia than Peruvian or Bolivian, notwithstanding its inferior quality. It was the higher "potential" value, as quanticy of their ferulising matters not immediately quailable and thus less liable to waste-that was the real proof of their superiority. That lies in their ability to increase the produce of the soil, not in their whatever to each other. Why then should this advertiser lay such stress on his manure being o the exact smell and colour of Peruvian guano Why, indeed, should he mention this at all
The advertisement is indeed addressed especially to manure dealers, but we do not see how an honest dealer in manures, any more than the man to whom he sells them, is interested in their colour or their smell. It is the fertilising properties they possess on which alone their value etther to the one or to the other must depend: and these cannot be ascer tained at once by a customer across the counter : is a laborious process which alone can put them to the test. The farmer must apply the substance to his crops, and read the result some months afterwards, or the chemist must subject the substance to analysis and ascertain the ingredient of which it is composed. Knowing these, and knowing the market prices at which they can severally be obtained, he can tell at once at what price the compound which contains them can be prepared: knowing these, together with the results for many past years of their application severally as well as in various forms of combination to the crop the farmer grows, he can tell at once what price the compound which contains them ought fairly to command. It is plain that it is the margin between the sum which the manure must cost and the sum which agriculturally it is worth on which the manufacturer and the manure dealer depend for the profits of their operations. The former at as little cost as possible prepares a manure of as great an agricultural value as possible. The latter purchases at the lowest price which the competition among manufacturers induces, and he sells at as high a price as the cost of genuine guano, which is the standard of comparison in the manure market, enables him But then if he deals honestly with his customers this standard of comparison must be intelligently and honestly applied. It is not a comparison o colonr or of smell but a comparison of actual con tents that alone determines anything of use to farmers. They must know what the new manur failing actul experience of a manure then it is the chemist alone who can with any confidence predict its fertilising properties, and any manufacturer o manure who seeks for custont among honest dealer in manure must show them what of phosphorns, of ammonia, and alkalies, \&c., his new manure contains. His announcement of its colour and its smell can only excite suspicion of dishonesty o gnorance.

Is the article on coal by Dr. Playfarr in Morron's Cyclopedia of Agriculture there is reference made to the enormous waste of ammonia resulting from the careless consumption of coal as fuel both in houses and in foundries. It is estimated at a very large sum of money. That which coal contains is saved where it is distilled, as in gas works, by the products of this distillation being passed through water on its way to the gas holders, and every one knows the consequent effects of gas water as a manure. Were a corresponding saving made in the other cases in which coal is burned, a store of ammoniacal manure would be obtained which would greatly tend to cheapen other sources of ammonia, guano among others.

It appears, however, that the ammonia which gat, as driven off from coal, contains, is imperfectly separated by the usual process, and a great additional saving is effected by a process patented by the Rev. W. R. Bowdirch, of Wakefield, in which clay is used as the absorbent. The clay, after being used for this purpose for a cer tain time, becomes charged with a number of ammoniacal ingredients, all of agricultural value, and all tending by their presence in the gas to diminish its illuminating power. So that by their removal two good effects are produced : the company send out a better gas to their customers in the town, and they have at the same time a new manure of considerable agricultural value which hey can offer to customers in the country.
The effects of this "new manure" were described
atisfactory exp-rience of its use on Giass and root crops was detailed; and the following hy the same pen describes more fully the mode of its manufac are. It appears to us to promise a very impurtan ddition to the resources of the farmer.

The new manure experimented with is a wast product which arises in te puification of gas by my rocess patented two years ago. In this process purification of gas. The clay absorbs and retains puritication of gas. The clay absorbs and retains, ver which lime has no power, which are nodetrimental in gac, but of great practical value in manure. The clay contains ready formed ammonia considerable quantity, part of which exists in contains also much nitrogen, variously combined with other substances, which by eventual decompo sition in the soil will form carbunate and sulphate o mmonia. It contains a quantity of sulphur, carbon, and phosphoras in forms of combination which experience has shown are valuable as plant food, much technical chemistry to render it suitable in a popular account intended for general perusal. The clay for purification is pulverised and siightly moistened before being placed in the purifier. When saturated it is removed thence a black fortid mass loaded with impurity. Exposure to the atmosphere oxidizes some of the ahsorbed suhstances and the clay may be used a second time with advantage when the object is to manufacture manure as well as purify gas. The saturated clay needs nothing but lying a short time under a shed to dry before it is made fine like guano and applied to land.

## Present experience shows that a ton per acre

 maximum dressing for Grass landthe maximum quantity for arable land, an when so much as this is put on it should be ploughed down, and not suffered to come into contact with
the seed. Half a ton per acre mixed with the manure has operated most beneficially upon Potatoes, and will probably do so upon Turnips. It has not been thus tried, but used alone broad-cast it has grown capital Turnips.

The cost of producing this manure is compara ively trifling, and when sold at $5 s$. per ton it leave a handsome profit to the company producing it The quantity capable of being produced is enormous and daily increasing, one single gas company in London being able alone to produce upwards of 40,000 ons per year. The gas companies in the United Kingdom number, I believe, about 1000 , and obviously could supply an enormous demard.'

## DIARY OF A DAIRY FARM.

 geptember.The work of the dairy generally diminishes greatly this month, the milk is much less in quantity, but being of richer quality the curd is greater in proportion to the quantity of the milk than during the spring and the early part ot the of the season, but of course it must be done before the food of the season, but of course it must be done before the food
of the cowsis changed from Grass. Cheese made this month of the cowsis changed from Grass. Cheese made the from frost and dampness of the air, which affects the appearance and causes it to become indented and rough in the coat, to prevent which great attention should be paid to frequen and when thoroughly dry, the cheeses should be replaced upon them; they should never at this season be turned over upon the same space they have previously occupied, and there is generally now shelf room enough to allow of this, which will be an advantage to the late made cheese. It is neeessary also at this season to scald the curd to prevent it running out of shape ; this will give it a greater
firmness than when made without it, and thr,ugh not recommended in the warm weather it is now good management to adopt it, The prucess is as follows :when the curd is taken from the press the first time, the whey being thereby drained from it, it should be broken with the hands into small particles in the cheese tub, when a scald of hot water, which should be mixed with whey and made from $90^{\circ}$ upwards according the weather, should be poured over the curd, and after being well stirred round and gathered to one side of the tub, the scaid should be taken from it and the vats filled in the same way as when not scalded.
In selecting cheeses for toasting, those made this month, or even later in the season before the cheese is scalded, are the best. Those which are prevented getting firm by the frost and dampness of the weather, and are rough in the coat, and sometimes run out at the sides, have been proved to be the best toasting cheeses; the fat does not separate from these in toasting, but has more the appearance of rich cream, and is much more wholesome thrn harder cheese when toasted, In making of the year, it is customary with most persons to use
very than vats tur the purpose, but therethy the chaese is generally very hard if bept any jength of time; whereas it has been proved that if made in vats of about five to the cwt. the cheese in the spring is very superior in quality to that made in thin vata, and in propurtion there ing by the smaall quantity of rind heese. Butter should now be potted for the winter as soon as convenient; it is quite proper it should be done before the faling of the leaves, which will give a better aste if the cows are pastured where they have on pportunity of eating them, and if put in pans in thin ayers about 2 inches thick, and salt put between ench, is will cause it to separate when cut out, and wili not require more sait to be applied to the mass than is usual to fresh butter, and it will cut out for use much more couveniently than when the salt is applied to the Letween them; it is well to make a litule brine to put on the top of the pan, which will exclude air, and the pan should have a cover to it.
Dairy cows should get frequent changes, and the best Grass the farm will supply, for now that the growth is not nearly so rapid as it has been, it is astunishing how soon the keep gets short, and this may be a good deal accounted for by the old saying, on the first coming frosty moruings, that every beast has five moutbs much Grass as the one mouth consumes; therefore will be found a great saving of green food, which desirable to make last as long as possible hould have a little hay given to them in the yards every morning before they are turned out from being milked, and they should remain an hour to eat it, by which time the frosty appearance on the Grass is gone. This supply of hay will be found to be well spent, inasmuch as the milk is more rich in quality at this season, when the weather also is more favourable for making good butter and cheese, so it is very desirable to keep up the quantity of milk by every possible means within reach. The weaning calves should this month only have access to the Grass fields during the day, having shelter in yards at night, where they should get some chaff of Oat or Barley straw, and their troughs filled with early Turnips cut small to enable and induce them to take readily to eating them. This feeding will materially assist their growth and strengthen them against the winter. Some farmers who annually rear a large number of calves recommend from experience they should get a little oilcake with the chaff in preference to so much green food, as a safeguard against quarter ill or evil, which fatal complaint often carries off many of the most healthy and thriving weaning calves at this season. The quantity should begin from half a pound and increase according to their age and as they seem somewhat high
it, up to 2 lbs . every evening. This some feeding has proved servicesble in rearing calves for fatteming purposes to be ready for the butcher a beasts at two or three years old, and when the Grass fails for their daily food a liberal supply of roots is given them instead; but to rear healthy constitutions for dairy stoek, we recommend less forcing feeding, ains quite sufficient to produce fine healthy growth.

## RISH PAROCHIAL statistics.

Cominud from $p .620$ )
Progress is clearly perceptible in the style of our loes farming, in the extension of green crops, the application of manures, the improvement of live stock in a remark able degree, and every department of practical hus bandry; as also in the size and increased accommodations in homesteads and the humbler babitations of the peasuntry in general. But while the farmer has been advancing in comfort and independence, the latter remains stationary in his poverty

I have shown how miserably he ilves even ployed and at home. If sick, and therefore unable to earn wages, he is not allowed a shilling from the poos rates if he remain at home. He may obtain medial advice and medicine gratuitously ; but neither nourishing food nor wine nor any other stimulant which his case may absolutely require to effect his recovery afforded to him; unless some chariable indiviau supplies his need the patient may perish from inanition. The medical officer who has the charge of the sick person, and is the competent judge th what is necessary in the case, has not auntrir own supply to paupers contined by siekness in englend to homes the nutriments so liberally given in England to persons in similar conditions. The disease may be the such a character as to render the removal of patient to the distant union-house impracticable, extremely hazardous; yet if the medical officor wiue, porter, or nutritious food to save life or promote convalescence, be perhaps does so at liis own expens o rather encounter the nacourteous criticisaly some grordion who not having witnessed the miserg the pain feels no sympathy with his sufferings, the palion the out-of door case of reliet, Fun are allon he ator casmot for his patient, though his recore!. ance of nourishment for heneficence.

But there are cases in which the sick labourra: nadmissible within the poor-house. He inhabbic sappose, the most miserable hut ing enson lonely heath apart from the habitations of any persons
able or willing to afford him relief, he has a wife and children occupying by day and night the small and wretched rommen whe state of a living ekeletou ; his chronic diseate to the state of a living ekeletou; his
wife goes cut to beg, and the whole family depend for their existence upon the prearious alms she may have received duriny the day. Is not this household of paupers to le relieved from the poor rates of the umion out-door relief to them, and they cannot be admitted to the union-bouse because the miserable father has a rood of poor land reclaimed by himself with spade and pickaxe from original barrenness ; pissessing this, he is not utterly destitute within the stringent letter of the might assist toward the support of his family, he will not be admisted into the poor-house. Such is the law; he clinys to his possession, and he dies without parish relief. This is no imaginary case-it is real, and But it may be ackedge.
Buanty "infirmary ? He was not this pauper sent to the county infirmary \& He had been there and dis$s 0$ destitute as to be legaliy qualified recipients of parish relief.
Again, the father of nine children, who with their mother occupy a cabin and two acres of inferior
land, lives apart from his family in the service of a gentleman who pays him 10 . a year; at most he can only
devote to his family $6 \%$ a year or less than $23.6 d$ a week. They cannot suhsist on this allowance, being too feeble to till the land profitably, and must surrender both house and land to the landlord to whom they cannot pay the rent. Neither in-door nor out-door relief is avaihjoins his jamily in the poorhnuse, making a domestic group of eleven persons at the cost of about 50 l. a year the father, and affixing the impress of pauperism on the children and breaking down the spirits of the parents. The mother and children will not be admitted; out of door relief is out of the question under any circumstances. If the Board of Guardians in this case had power and inclination to advance a little movey to purchase a little seed Barley and seed Potatoes in the spring,
and to pay fors s few days' horse-work, the family would and to pay for a fow days' hors
have been effectually relieved.
Another cass : a married woman was sick. She was urged to go to the union-house, where in the sick and
infirm ward she would have received due attention and infirm ward she would have received due attention and
comfort. But unless her hushand would accompany, the was inadmissible; he was then receiving $4 d$. to $5 d . a$ day with his diet in a farmer's house : is it common seose to urge a man able and willing to earn his own bread and something for his family, to live in a poor-
hoose, although all he asks for is temporary relief for his wife during sickness? Take a reversed case. The father of a large family working with a farmer at low wages is seized with fever. The doctor directs that he tate in the mean time. An English relieving officer would as a mater of course have offered them relief during the father's illness and convalescence; but the Irish officer, accordin!; to the spirit of the harsh Irish rour law, says "You must all go to the poorhouse ! " Th: sick man's wife refuses to comply with the mandate. She says she will heg among her neighbours and remain in her cabin, lest it should be levelled to the ground during the absence of the family, (such an act may be comit suffers terrible privations and bitter want. Does not it suffers terrible privations and bitter want. Does not such a case a
door relief?

ANSWERS TO AGRICULTURAL QUESTIONS by Mr. Heyby Cox, of Minchinhampton, Glodcestrrshire. (Continued from p. 619.)
THEORY OF AGRICOLTURE

1.     - Name the causes to which the increased fertility of land The caused is to be attributed.
The causes of the increased fertility of land after describe them all, but I think ou will be satisfied with describe them all, but I think you will be satisfied with stane of them. It is well known that where water is stagnant in the soil, atmospherie air does not penetrata, and it is likewise known that the roots of
plants cannot thrive without this element, but the land having been divested of its superfluous water, the air rushes in and supplies its place, converting noxious ingredients into wholesome food for plants. The roots follow the air and appropriate such food as air and Witer have rendered fit for them. Secondly, plants are always acuated by heat up to say $75^{\circ}$, and two or three degrees is very beneficial to most plants, that is, two or three degrees above the general warmath of the soil ; this araining will effect by carrying down the warm showers drained the into the soin, a tmoaphere becomes warmer and more congenial to the health of plants. Thirdly, rain, which before draining, was the bane of this land, is now become one of the must beneficial elements in its caltare, carrying down to the roots and diepersing through the soil ammonia and other elements of fertility. Many ingredients in suilts requiring draining are rer:dered fit food for plants by the admixture of ammonis. In the latter part of Stephen's Book of the Farm, vol, i., it is said :-"It is well known that iron in solution acts injurionsly on vegetation, and Berzelius has shown that
the erenate and aprocenate of the protoxide of iron are both eoluble in water, and that the same salte of the
peroxide, although of themselves insoluble, are ensily
rendered so by ammonia." There is yet another eause rendered so by ammonia" There is yet another eauey
which still puzzles some of the olid sclioul, fur. say they
"if the rater if the Gras withers in dry weather now, how, will it
if the water that still remains in taken away?", This he if the water that still remains is taken away?" Thi
is very simply explained, and if those oll firmers wil examine their turf they will perceive that the ends of the roots of the best Cirasses are all dead or nearly deal at the few inches under the surface where the sil has been incapable of drying te soil by evaporation Hence, in many of those soils the crop is much more
likely to be injured by drought than in drained soils where the roots have an opportunity of working to a greater depth; and in very many instances the subsoi atmans all the ingredients necessary to fertility excep
2. State some of the purposes served by fallow operations on
the soil, whether duriog the growth of the crop or otherwise One of the purposes served by fallowing is the de struction of weeds, converting them into manure.
Another is the absorption of ammonia from the air, and there are those at the present day who will asser that fallowing alone is sufficient to supply the soil with all the organic matters it requires. Although I cannot subscribe to this doctrine, yet it is quite certain that by
frequent stirring the soil is rendered much more fertile not only by the absorption of ammonia, but also by the ready decomposition of substances that would otherwise have remained insoluble.
3. Describe the economical management of a dung-heap, and
give reasons for the several processes you recongend? In the management of a dung heap I should be guided by the nature of the soil it is to be
vent as much as possible fermentation, by compressio or covering with burnt ashes, \&c., because 1 should like the fermentation to take place in the soil itself; but every precaution to prevent as much as possible the
escape of ammonia either by washing or evaporation. For thisreason I would always make the heap ona bed of some absorbing material-clay ashes are excellent, dry turves are likewise very good. When the heap was finisbed, and it should consist of all sorts of manures, that of the cow being more likely to retard fermentation than that of the horse, and the dung of pigs being almost too strong of itself, it should be well mixed to the height of 4 to 5 feet, and trodden pretty firm, and should then be well covered by 10 or 12 inches of dry loam or clay piven off in the process of fermentation. It has been said that fermentation should be prevented altogether this I cannot agree with (except in the case mentioned above), because fermentation accelerates decomposition, and ammonia is only formed in the dung-heap during the process of decomposition; this salt, however, being extremely volatile every care hould be taken to prevent
its escape; if the mass should seem too dry, it should be well saturated from time to time with the liquor from the manure-water tank. If all has been carried out in the right way, it will come out a thick, smooth,
buttery, and nearly black mass of very hinhly fertilising buttery, and nearly black mass of very highly fertilising louds of that which has beeu lying about in the yard some eight or nine months, and washed by every shower, and evaporated by every burst of sunshine or wind. I should only resort to turning in cases wher it was wanted to be got ready very quickly, and would then choose a dull or rainy day for the operation. A little salt is good mixed with the heap.
4. Name some of the ways in which the application of lime to

The application of lime to soils vaties much according to circumstances, the magnesian limes having bee known even to encourage sterility; but when lime is
made from pure limestone and applied to many soile it made from pure limestone and applied to many soils it
much increases their fertility. Thuy when applied to peaty soils it not only forms a manure of itself required by all plants, but it quickly converts the fibrous roots into a powerful manure; it also acts as a sweetener of the soil (which is often soured by stagnant water), converting or neutralising acids, and likewise forming new compounds of fertility by decomposing ol uniting with mineral ingredients which in themselves were causes of sterility, or at all events injurieus to vegetation; it also is beneficial in destroying Musses and Lichens, \&c., and converting them into food for plants. Another very good service lime renders to land is the destruction of slugs if applied in the right way and at the right time'; I counted once on a field very subject to those vermin as many as 300 on a square perch of ground the lime was applied in a caustic state, very early in damp warm morning in April at the rate of 6 pecks per
acre. Two sowers, one fullowing about five to eight minutes behiud the other, will effiectually destroy them, and render them as good as a dressing cf some sorts o imanure.

Taking the value of insoluble phosphate at 18.6 d per ewt.; soluble, \&ce, at 7 s . per cwt .; ammonia as found
in organic matter at 11a per ewt.; gy psum at 288. per ton; and the alkalies at one-third the ralue of ammonia,
we shall find the money value something hike $7 l$. per ton 6. Explain the increased efficinery of bones as a manure ob-
tauned tyy treatiog them with sulphuric acid. Bone earth, eapecially soluble phosphate, being defi ient in many soils, bunes are rendered more easily available to plants thy the decompnsition or setting free the phosphoric acid, which the sulphuric acid accom phislits by uniting with the lime in the bone, and forming new compound (sulphate of lime).

## Give reasons for the greater value of the manare from full grove ffittog beast sta s compared with that from young

Full grown fatting animals having no requirements for bone earth, and little for nitrogen, more of these ingredients pass off in the excrement than from young stock, which require the phoaphate and lime contained in the food to build up their bony structure, and more of the nitrogenous compounds for the furnishing of flesh and muscle.
8. State the way in whlch the warm th and quitetness of feeding
animals are found to coonomise their food. It is known that any sort of exercise has a tendeney
wear away the superflunus matiers with which all animals are provided. We find the hare never get fat while in a state of liberty; neither does the hard worked ox. As those products we call fat must have been intended by nature to supply heat to the body, oil to the joints, and fuel to the lungs, it is reasonable to suppose that the more quiet and reasonable warmih they obtain the less will be the requirements on their food, and the more fat they will lay on.

Explisin the process by which the addition of remnet induces
There are many other acids besides rennet that will induce the coagulation of milk by causing a certain fer nentation, and causing the caseous matter to unite and Casein bein, composed of very nearly the same gases as flesh, and the gastric juice of animals being destined to convert food into flesh and mills, being a type of perfect food containing all the parts necessary to the
structure of the animal body it would seem that rennet structure of the animal body, it would seem that renne
prepared from the gastric juice of the calf is the right prepared from the gastric juice of the calf is the
thing after all for the purpose of cheese makiog.
(to bo continued in our nexat.)

## TRIAL OF REAPING MACHINES AT

 COLDSTREAM.THe competition of reaping machines for the premium f 25l. offered by the Union Agricultural Society, came fold upon the farm of Mr. Phipps Turnbull, Crooks, nea Coldstream, on Wednesday last. The crop operated on in the first instance, was a field of Oats of a fair average
strength, mostly standing well up, the land rising in a strength, mostly stauding well up, the land rising in a
considerable acel vity from south to north : the furrows considerable accl.vity from south to north : the furrows
were of a very moderate size, and on the whole the crop was perhaps too favourable for the machinen, as presenting scarcely any obstacles by which to teat their merits in overcoming them. The machines entered for competition were:
ill , Mr. Melrose, Newhigging-a Crosskill's Improved roller-two horses propeling
2. Mr. Suttie, New Mains, Inchture, PerthhhireM'Cormack's Machine, with serrated cutters and web-delivery-two horses working by side draught
3. Mr. Crosskill, of Beverley's-Improved Resper, with serrated cutters, and vulcanised India Rubber belte for delivery-two horses propelling.
4. Messrs. Dray \& Co., of London's - Champion Reaper, with patented improvements on the original machine known us Hussey's, with diagonal plain cutters and back delivery of corn in sheaves-two horses working y side draught
Each machine was allotted (by ballot) a quantity of corn to cut; and they were each to be wrought one hour unless their allotments were sooner cat down. At the machines had cut the numbers of square yards in the machines had cut the num

## Mr. Melrese's, 6510 yards, in 59 minutes. Mr. Suttie $\theta$, 4023 Fards, in 60 minutes. <br> Mr. Suttie 's, 4023 Furds, in 60 minutes.

Mr. Crosskill's, 4724 yards, in 42 minutes.
Mr. Suttie's machine, as well as that of Mesors. Dray and Co, lost some time in repairing breakages, the exact xtent of which we were not able to ascertain. In this field the whole of the machines seemed to perform their work most satisfactorily. Mr. Crosskill's machine did he work most beautifully, as also did Mr. Melrose's. Both machines left a clean short stubble, and laid down the corn very regularly, but the horses working them appeared considerably distressed. Dray's and suttie's machines seemed to be much more easily wrought, arising, as it appeared to us, partiy from the horsea working by side-draught, instead of by propulsion, and partly from these machines being lighter than those of Crosskilis, and curting a less breadth of corn at a time. Dray and Co.'s little machine, which we understan costs a great deal less tl oney than the others, was very much admired, on account of the simplicity of its machinery, the apparent ease with which it was wrought and the regularity with which the man laid off the sheaves from the tilting board; in an average erop standing well up, we consider this a very efficient implement. Mr. Suttie's machine was also wrought with considerable ease to the horses, and required a less number of hauds to wert if; it did less work than the
others, which has in a greas measure been ac
by the time required in repairing breakages.
After finishing the work in the first field, the machines were transerred to a field of Oats, adjoining, on the
farm of Fireburn Mill, oceupied by Mr. Dods. The Karm of Fireburn Mill, occupied by Mr. Dods. The
erop here was a good deal stronger than in the first field, besides being a little twisted, and in some places laid down. Here, as in the first field, the machines cut the standing corn well enough; but it was quite evident that the whole of them will require very great improvement before they can be considered efficient implements
for cutting laid corn. Dray \& Co's machive seemed quite unequal to cutting the laid corn. The two Cross kill's got a little better on ; but it appeared to us that Mr. Suttie's machine took up the laid corn better than any of the others. They were all, however, deficient at this kind of work, and we trust the deficiencies whieh constructora of the manchines to set wrill induce the able endeavour to remedy the defects before another season. At the conclusion of the competition the judges,
Messrg, Maddison, Wandon; Dudgeon, Spylaw; Brack Messrs. Maddison, Wandon ; Dudgeon, Spylaw; Brack
Boyd, of Cherrytrees; Dove, Eccles Newtown ; and Boyd, of Cherrytrees; Dove, Eccles Newtown; and
Dr. Murray, Kersknowe, resolved to divide the premium between Mr. Crosskill and Mr. Melrose. The judges, at the same time, commended Mr. Suttie's machine ass having taken up the laid
manner to any of the other machines.

It has been suggested that at future exhibitions of this description, each reaping machine should be attended by a.staff of hands and horses of its own, strong enough for efficiently working it, to enable the judges to ascertain, not only the exact amount of work which each machine is capable of performing, but also the cost at which the
result is artained. This seems necessary to enable result is altained. This seems necessary to enable different machines, as well as to ascertain whether or not reaping by machines will be really more economical than doing the same work by the ordinary sickle and
seythe. Kelso Mail.

## on Parmesan cheese.

Tres city of Parma, which originally gave name to the celebrated cheese called Parmesan, is situated on the south side of the river Po; but the best and by far the largest quantity of cheeses sold under that name are distance between Parma and Lodi is something more than 50 English miles. The river Po, which flows from west to east, bears to the Adriatic Sea the immense body of waters which flow down the southern side of the Alps, on the dissolution of the snows, in each successive summer. The earliest accounts of this river represent it as occasioning at these periods great inun-
dations, and for many miles in breadth on each side there were vast marshes which at present, by the skill and industry of the inhabitants, present some of the very richest pasturages which are known in Europe. In those parts of its course where the river used heretofore to spread desolation and ruin the waters have been confined by immense mounds, or dikes, resembling in character the banks of canals, which have been carried above the level of the country which it traverses. The quantity of mud which is brought down by the waters of the Po gradually raises the bed of the river, and the banks are from time to time raised and strengthened to
confine the waters. Were they now to lurst through their bounds the superb pastures on each side would be sgain laid waste. These flat districts, consisting of rich alluvial soil, bear a considerable aftinity to alluvial dis. tricts in our own country, but the fields are divided overran with Vines, bearing growth, and commonly of the trees from which they han to the very summit foliage is so dense that the riew seldom extends beyond the first or second field along the roadside, and the monotony of the prospect becomes wearisome.

The cattle which are employed in these rich pasture of Lood, principally from Switzerland. Thetion of new blood, principally from Switzerland. The old Italian breed, or, as some termed it, the Hungarian breed, had remariably long twisted horns, with pale mouse-coloured skin; the best Swiss breeds are short-horned and dappled like the Ayrshire breed. The Swiss cattle in general are good milkers; but they do not last in profit more than four years or so in the hot plains of Italy.
For the formation of a Parmesan cheese the milk of inm 50 to 300 cows is required, and as there are no individual farms affording such an extensive stock of cows, it is customary to form a partnership account and neighbouring district. This man is provided with a house and some land, and has the sole management and direction of the process. He is virtually the servant of those who employ him, and liable to be removed if his cheeses do not turn out to the satisfaction of the neigh wours. It is necessary, also, that he should be a good furnished by each of the parties, and giving each credit for a proportionate share in the cheese of the day, which is carefully numbered and in due time we'ghed. In this system good failh and probity are necessarily implied, the partut them it could not continue; at the same time eacharcies interested are, in some measure, a check on quality of the milk which is contributed, and which is brought morning and evening at a given hour to the
checse factory. It is one of the very beantiful rural aights
bearers coming in from every quarter with extraordi nary punctuality, and the groups gradually increasing as they congregate near the cheese-house. The milk is
borne on the head, commonly by males as well as females; all are generally neatly dressed, and the daily meeting leads to little intimacies which have their pleasures and enjoyments. The people, I observed, were in every instance extremely well behaved, and brought in late, and that of the morning early. in each case to avoid the intense heat of the sun.

The evening milk is set for cream, and it is only the kimmed milk which is used for making the cheese ; but the whole of the morning milk is used fresh-the kimmed milk of the preceding evening being added to it, and the process of cheese making begins as early each morning as the mixture of the evening and morning milk was not deprived of its cream, the chees would be too rich and soft, liable to maggots, and would not keep; but there were, nevertheless, occasional milk and the this rule, dependant ou the quality of the of milk admitting of a mixture of the evening cream. It is in these matters that the cheese-maker principally displays his knowledge.
. The first part of the process, after mixing the two milks, is to heat the whole in a large boiler. The same Che bottom of the boiler is the gauge for the size of the cheese, and the sides expand in a curve. The following figures give the dimensions in inches

## Lepper diameter <br> Height or depth

54 inches
20 "
The boiler has a strong iron moveable handle, by means of which it is suspended on a swinging bar or crane, which turns on a vertical axle. By means of off or on the fire as occasion requires. The fire is made below the level of the floor; and it is guarded by a semicirctar wall or back which is made to fit the he fire, the spreading upper rim ought to swing over the top of the back wall and checks the issue of the smoke, which is carried by the draft of air in the front ap the chimney and flue which is constructed in the back wall. The fire is made with faggots, and the heat can be regulated very easily, either by increasing the
blaze, or drawing out the fire, or by swinging the boiler blaze, or drawing out the fire
round off the fire altogether.
2. After having been heated so as to bring a thick skim to the surface the cauldron was swung round from off the fire; and having been left to cool to a certain temperature the rennet was added.
3. The rennet is prepared at the city of Piacenza situated about half-way between Lodi and Parma, where they are celebrated for it. A small ball of it, about the size of a large Orleans Plum, was rubbed down in a sieve with some of the boiled milk into the caldron and such parts of the rennet as did not pass through the sieve were thrown away. The refuse appeared to consist of some thin pieces of skin merely. The milk was epid when the rennet was added, and it was left sland for an hour and a half, at the end of which time the milk was coagulated

When the coagulation was very decided the and seemed carefully to examine its weight and consistency. He waited a while longer and made second trial, when matters proving satisfactory, the whole mass in the cauldron was cut up, first with a sharp shallow wooden bowl, as far as the arm could reach down, and then with an instrument in shape like a churn staff or dash, except that the circular head was thinner and was not perforated.

When the curd was pretty well cut up, a dose of safiron was thrown in for colouring, after which a Thorn brush was used for dividing the curd still more minutely and producing the granulation by which these cheeses are distinguished by name in Italy, not being called Parmesan, but Formaggio di grano, that is granulated cheese. The Thom brush is zelected with a convenien straight stem, and the branches after being bent inwards, are drawn together and tied by bands of cord. It appeared very simple and most effectual implement for the pur pose, and in the hands of the operator the curd was reduced to small grains after about 20 minutes of pretty active work constantly stirring. The points or extremities of the branches are sll laid the same way towards the leading one.
mplete the granulation of the curd was complete, the fire was again made to burn brightly, and the cauldron having been swung over wear. It was then removed from the fire and left to stand until the whey became quite clear at top.

The instrument like the churn dash, with a circular hand, already described, was now used again for the purpose of compressing the granulated curds, and orcing them downwards into the receptacle or gauge at the bottom of the boiler. After this operation it was allowed to stand for a considerable time, during which it vas becoming more compact and coaguiated.
8. Next was used an instrument like a small thin as the blade might go round the curd at the bottom of the cauldron and prevent it from adbering to the sides
of the vessel. Then after being detached the curd was
again patted down with the former ruunded-headed instrument, and this was repeated several times until the mass was brought into a desirable state for being
removed from the whey. Then it was gradually and carefully worked up to the surface principally by mean of the paddle and the staff, and finally caught in a cloth hauled out by hand, and deposited in a flat round vessel of the size of the cheese, and then carried to the press-room, which was much on the plan of those in use in Switzerland, England, and other cheese countries The process which I have described I was an eye witness of on the estate of an old acquaintance, in the territory of Parma. We set out at six, and when The operations were milk in the cauldron over the fire, The cheese here commonly weighed in the afternoon The cheese here commonly weighed $3 \frac{1}{2}$ pesi of 25 lbs .
ach; that would be $87 \frac{1}{2} \mathrm{lbs}$. each cheese. The each ; that would be $87 \frac{1}{2} \mathrm{lbs}$. each cheese. The number of cows for such a cheese, taking one with another, would be
about 100 . But if each cow was in full profit 70 cows would be enough for such a cheese.
The cheeses are not sold until after'six months' keeping in the store-room. The most valuable large cheeses are enclosed in leaden cases for exportation. But these are the very large cheeses made about Lodi, and which are mostly exported from Genos. [The above, written some years ago, has been extracted from the manuscript journal of a tourist.]

## LEAF FEEDING.

In the good old times when farmers were satisfied, without farther inquiry, with what was brought before them most obviously; when they prided themselves in jogging on in the way their fathers had trod before
them; when kind Nature was allowed to work out her own work without any impertinent attempts to assist her, or rather when she was considered an annoying jade who continually thwarted them and compelled them to be ever in battle array against her; when a descent into the laboratory she was working in undel their feet with ceaseless energy would as soon have been contemplated as a plunge into Etna or a trip to the infernal regions; Nature, or rather Nature's God, gave what man in his misjudging regarded as a curse, but a blessing in disguise, that weeds should spring up among the crops he cultivated for his daily bread, and that they should obstinately contend with the interlopers for their natural rights, and assist with indigenous power their demands on the sustenance their mother earth contained in her bosom; man was then compelled, in his attempts to extirfate these denizens of the soil, unwittingly to assis Nature in effecting more rapidly the changes she was making in the crude materials of her laboratory. Now however, thanks to the lights which have broken in upon us, there are some of us who begin to believe that something more is done than the destruction of weeds in the operations we undertake with that view, that in rendering the soil pervious to the influence of the air above it, of the dews that fall on it, our manipulations assiat the labour afford nutriment to the cherished children of our cares. Yet still there are few, very few tillers of the soil who are not governed in their surface stirringg alone by the appearance of weeds; few, very few, indeed, are there who work the soil merely to assist Nature and fostunately, or rather providentially, weeds spring up so rapidly that the attentive destruction of them, desultory as it is, is very siding to the chemical actions going on
How far more repeated workings of the surface would ncrease the fertility of the soil is yet to be tried. Mr Smith, by the amount he bestows on it, is able to obtain more freque organic matters soluble, and cause to be absorbed such an amount of organic ones, as would give a fertility sufficient for green crops. It is vain to cslculste the quantity of ammonia in the superincumbent atmosphere that may fall on the earth in the 12 months, the thing is to render a field capable of absorbing all that fals on it ; nuder ordiaary, nay, under the best tillage, no field drinks up all nor anything like it, while those
which are allowed to remain unworked take in but very Which are allowed to remain unworked take in but vesy
little, perhaps no more than a part, and a very small part, of what very heavy rains bring down, for much of it runs of by the furrows into the ditches and water streams; all that falls on such land in dews and light rains evaporates and ascends again into the air, to an crude and inferior under soil dug up and turned every month for a year would become fertile earth. What would be the effect on a field whose surface was never allowed to reject atmospheric inflow? About 12 years ago I proposed an experiment with Barley by hoeings weekly, by the fortnight, and monthly, and left unstirred, but I was disappointed.
But I think there are other and greater advantages gained by repeated hoeings of a growing crop than the destruction of weeds, the admission of oxygen to act on the carbon on the soil, the inflow of atmospheric or organic elements to form soluble combinations with then inorganic constituents of the soil, or the disintegraldes which is an effect of the manipulation. The that readers of the Agricultural Gazette may reollect year 1844 I been controverted. I therein submitted that plants received food by their leaves in the ascending nutritive matters from the soil, and that thens was the supply of these matters, and tinuons was the supply of these matters, and which
would be given by every breaking up of surface, the
more luxuriant would be the growth of plants so fed.
If in this I am correct we are here offered a very strong If in this I am correct we are here offered a verystrong
reason for very repeated hoeings, indeed repeated as reason for very repeated hoeings, indeed repeated as
often as the surface shall become by any means so often as the surface shall become by any mean closed up as to prevent the ascent of gaseous fluids.
I think there are very strong, perhaps incontro vertible arguments in support of this opinion. The pores by which leaves receive gaseous matters appear to exist in their under surfaces, and therefore most conthat when leaves have been by man's hand reversed they have not thriven till by their own effort they have recovered their original and natural position.
That such gaseous fluids do proceed from fresh stirred ground is evidenced by our very sense of smell. But the probability of all, even the inorganic constituents of
plants being so supplied to the leaves of plants from the soil is much sustained by the following extract from Liebig's "Chemaistry of Agriculture." How much more wonderiul and inexphcable does it appear that bodies under certain conditions the property of volatilising and, at ordinary temperatures, of passing into a state in the form of gas or are dissolved in one. Steam or vapours in general have a very singular influence in causing the volatilisation of such bodies, that is, of
causing them to assume a gaseous form. A liquid during evaporation communicates the power of assuming the same state in a greater or less degree to all
substances dissolved in it, although they do not of themselves possess that property.
"Boracic acid is a substance which is completely fixed in the fire; it suffers no change of weight appreciable
by the most delicate balance when exposed to a white heat, and therefore it is not volatile. Yet its solution in water cannot be evaporated by the gentlest heat, without the esca
Now, if it is possible that the matters composing a plant be received by the leaves, and that its roots do which soluble matters must exist in smaller amount than they do in the medium through which they have passed to reach such depths, does it not become very probable that with the exception of water they are much more so than by what they can receive by their roots. But it might be said the cost of these frequent stirrings would exceed the profits. I think not, for the stirrings need not be but superficial, sufficient only to break the crust, and again the profit would not rest with a present increase of crop, nor even in the increas-
ing fertility of the soil, but in the disposition it would give to that produce, as seed for future crops, to a con tinually augmenting productiveness. I firmly believe that the adoption of a system founded on this principle would give us so much greater harvest returns as would much higher than it is. I know it would in Ireland. would indeed give us the "sort," and we should in its production avail ourselves of the "circumstances."

## Home Correspondence.

Steam Cultivation.-About nine years ago some agri cultural machinery was patented by Lieutenant-Colone feature being the employment of a fixed drag-rope (secured at both ends of the field by grapnels), along which a travelling steam-carriage propels itself backward or forward by a rigger of peculiar shape. Nowas in the recent invenby a grooved rigger winding, as it were, along a fixed rope (though its claina to originality does not rest on applications of this idea. In 1812, Messrs. Chapman patented a method of "facilitating the means and redncing the expense of carriage on railways and other roads," which chiefly consisted in the use of a clain (or it might be a rope or band) stretched along the road, and aroperly secured at each end, and at suitable intervals, a and in the passing of this chain round or partially round as barrel or grooved wheel in such a manner in motion. The chain may be tightened at each end by small horizontal barrels or windlasses; and at whtervals along the road are placed Y's or forks, into horizontal strain of ; so as to hold it firmly against the it to rise in order to pass round the rigger. The chain may be passed one or more turns round a barrel having chain or wedges like those of a capstan, so that the itself ; but the its proper position without overlapping round a rigger having an angular groove fitted with $V$ forks to keep the chain from slipping; the chain does not cross itself, like the cord of a drill-bow. As a further procaution againstslipping, a couple of compressing wheels are provided, to press the chain tightly into the wheels on the retiring or slack side; each of these ward or back set in action alternately according to the forof the scheme was to use an endless chaiad of limited length for travelling an unsean endless chaia of limited length in the Y forkid down some 50 feet in front of the engine
if a rope be employed it must have knots about it for advance, and thus have s tendency to retard it,
he forks to hold by). The principsl intended use of the Coulters or cutting irons also, attached to the frame, invention was for conveying coals from the Durham collieries; but travelling upon common roads, on storeways purposely laid, and at a speed of 7 or 8 miles an hour, was also proposed. For a time this scheme was put into practical operation at the Heaton Colliery, but excessive friction of the chain. This failure of the principle for rapid locomotion, hbwever, forms no valid objection to it when applied to the short journeys, snd where we have $a$ different construction particularly On July 23, 1846, Peter Claussen patented an arrange ment of riggers for propelling boats, implements, \&c by a fixed rope, in which the sawing action resulting from crossing the rope, and the excessive friction caused by the guide-pulleys and other contrivances for guarding against this wear appear to be mainly avoided. Instead of a siugle grouved rigger, the patentee employs two, letters 00 , the rope being passed first under both, then up over both, and then again underneath them, in the groove on only the couside half (asits, thus lying in rigger. The length of rope in contact with the riggers will be just the same, therefore, as if it passed one
turn round only one rigger. It is evident that as the rope is kept distended in a loop by the riggers it has a tendency to draw them close if their axles were merely supported in bearings; but affixed to each is a friction-wheel of about the sawe diameter as the rigger ; and a third friction-wheel 80 that all the stress is taken with a simple rolling instead of rubbing action. The rope is fixed, say, at and upon motion being communicated to one orping; riggers, they travel along the rope, taking their bearingframe and connecting machinery and implements along with them. By having double grooves on each rigger, rope as it passes beneath the riggers, there will of the necessity for tightly stretching it, though the wear of the rope will be greater. It is very possible that this clever arrangement may be inapplicable for propelling roads and railways (as proposed by the inventor), but for short distances in which the tension of the rope can be maintained, I can see no valid objection against it, But to come now to Sir John Lillie's invention: he passed his rope one turn round what he calls a " whelpwheel, - that is, a wheel farmished with projections on each arm having notches in which the rope is firmly held; and these projections were adjustable in slots, so as to lengthen or shorten the radius between the notches and the axis in order to vary the speed of progression. The whelp-wheel geared with a pinion on the crankshaft of the engine, and could be turned either way, to propel the carriage backward or forward. The carriage in a straight-forward direction, and three transversely for moving sideways upon the headland. Two of the latter were " lifting-wheels," being raised or lowered by means of screw and be hauled on light patforms running on rails at angles to the direction of the work and then be dran sideways by dir " "orkn line of ground. To facilitate the onward movement of the machine, an endless railway was provided for the bearing wheels, consisting of broad flat pieces of iron passing connected to each other by hinge joints, and passing round square-stave or skeleton drums supported and these self-laying rails were preceded by small double mouldboard or ridge ploughs, which cleared level farrows or patls for their reception. In certain cases the patentee proposed to draw the cultivating carriage by
travelling rope, band or chain passing round drum attached to steam-engines at both ends of the field; the two engines being shifted forward at intervals apon temporary rails. In other cases he would use only one endless rope stationed on the headanalp-wheel ; the rope passing round a pulley upon a movable! platform at the other end of the field. The mode of anchoring is wortlyy of note as bearing a strong family likeness to that employed by some subsequent inventors; the grapnels are made to hold in the bank of a ditch or the upright face of the trench. Here we have the principle of a long plate presenting its resist
ance side-ways in a shallow hole or furrow. With ance side-ways in a shallow hole or furrow. With
regard to the tilling part of the machine, any trac tion implements may be attached; and by oxtend ing shats or arms on each side the carriage several ridges or lands may be acted upon by the carriage
traversing up and down the same track. But the inventor particularly claims a revolving tiller, consisting of an axle extending across the carriage frame, and
around which are fixed radial or curved ping like harrow-tines hre fixed radial suitably shaped point for breaking up the land; and by means of a pinion upo the end of this axle gearing with a spur-wheel bolted to one of the bearing-wheels of the carriage (or with the whelp-wheel according to convenience), it is driven with pass through the soil in the direction of the machine'
preceded the revolving instruments, and by scarifying or slicing the land into narrow longitudinal slips, facilitated their comminuting action. Another part of the patent refers to a mowing apparatus, consisting of horizontal seythes fixed upon endless straps or chains, and brought rapidly across the front of the machine as it Reapingressed. I. A.
achine Mochines.-The adjourned trial of reaping diechines at Boxted Lodge proves that the makera have the enarded the pointed criticism of Mr. Fairbairn upon nought the valus qualities of their machines, and set at them by that talented engineer in his fiei red upon that class of implements at the Paris Exhibition in 1855. The judges "regret to observe that very little improvement has been rade in this class of machimes since last year." Your readers may also lament that but thres (practical men) suggested no improvements, the rewards of the Society over progress by scattering -upon imperfect Society upon "s stand-still' machinery - upon imperfect implements, showing no improvements sively used ively used for the last three years the machine considered by the judges for "reaping only decidedly the best macbine," I feel that gond service may be done by stating its defects discovered in practice. I do not find fault with the work performed; the stubble is well and evenly cat, and the straw is generaly laid conveniently for the binders; the American's clever invention deserves our warmest thanes, but I regret being unable to award an equal meed of praise to our mechanists in the corrstruction of the machine. The amount of friction caused by the (working of a rapidly moving crank by the power of three strong active steping horges to give the velocity required to prevent the choking of the knifo. The driving-wheel being closed permits the accumulation of earth, causing dragging when the coil is in the least damp, and prevents the use of the machine long after the grain is dry and ready for cutting. The above objections are so fully met by Mr. W. Fairbairn in the report alluded to, that I shall be glad if you have space to ytimulable journal for his coacluding observations of their shemins the er short-comings. On a careful examination of the several machines entered for the prizes, it will be observed that in every one of them an attempt was made to effect a certain purpose by certain means of ransmission, calculated to retard rather than facilitate the progress of cutting. In machines of this description Where horses are employed as a motive power, it is desirable to make the action as easy as possible, and to effect the motion of cutting, reaping, \&c., with as light wheels and gear as practicable. Now, these mall wheels and their attachments at present in use appear to me to be the very worst and heaviest parts of the machine, and I would earnestly urge upon the makers of reaping machines the absolute necessity of increasing the diameters and dimensions of the gear which works joumaters, and at the same time to fix and attach the they cannot vary in position, but mast move, that technically speaking, go and come with the machine These alterations being made, the proper clearing appa ratus being attached to the receiving boards, we might then look forward to the labours of the harvest being performed with much greater certainty and effect performed
than is $n$

## than is now

Common Things.-Among the common things connected with agriculture, good roads on a farm are of the greatest importance, and yet how generally are they neglected. The difference of power required to move a
loaded waggon on a turnpike and through a common countryaggon on a turnpike and through a common additional horse is necessary to drag the vehicle of az bye-way. Independent of the advantage of having an easy communication with all parts of a farm, as well as the public road leading to market, the saving in wear and tear where the lanes are in tolerable order is great Repairing roads being an operation which may be performed at any time of the year, when , labourers and teams are not otherwise employed, it cannot be considered a costly work ; indeed, the preservation of horses, harness, \&c., will balance the account of £ s. $d_{0}$. The satisfaction of feeling the animals suffer less and do more on good than bad roads, and knowing the farrier's, wheelwright's, and saddler's bills diminish under the improved system, will amply compensate the will answer the purpoce-even filling the ruts with will answer the purpoee-even filling the ruts, with The fact cannot be too often repeated that there is no manure equal to that made in the farm-yard if properly attended to. The mixture generally consists of the refuse from cows, horses, pigs, \&c., and different kinds of straw. At certain intervals, depending upon the once with layers of road dirt, ashes, or burnt weeds, particularly one at the bottom about 6 inches deep in order to eatch the drippings, and also one at the top, to prevent evaporation. If the weather is dry during the peration or putting together, a soaking with manure water ull improve the compost. Some doubts may the farm-yard, collected in tants and distributed Grass land. In the winter of 1855 and spring of 1856 small piece of pasture was dressed five times with
manure water, which had been kept in a closed reservoir during the process of carting out. The effect was not during the process of carting out. He effect was not such as to indeed a portion of the same heaponceturned over produced twice the weight of Groma heaponceturned over produced and Clover. Mr. Mechi's success can scarcely be classed under manure watering, as it is usually understood, but may more properly be denominated dressing with animal soup, his tanks receiving dead carcases, \&ce, which are mixed together by the action of apowerfulsteam-engine. It is a question whether common manure-water has no more beneficial influence on arable than pasture, the former absorbing the moisture rapidly. When a pre pared manure-heap has to remain some time before die, placed as a span roof which would throw off the rain and placed Falcom.

## Miscellaneous.

Horn Dust.-Very considerable variety occurs in the quality of this substance, owing to the intermixture of follow illustrate this very clearly

Water
Orgasic matter
Phosphates
Phosphates C arbonate of lime
Alkaline salts
Sand
Ammonia
The first consista entirely of horn in a state of grea purity, but the second contains 16 per cent of aand, and a much smaller quantity of ammonia. The former reckoning the ammonia and phosphates at the usua rates, is worth exactly 96 . per ton, and the latter only 6L. 7s. Professor Anderson in Journal of Agriculture

Calendar of Operations.
SEPTEMBER
Berwickshire Merse Farar, Sept. 8.- At length is harves commenced, but it it beyond nortal foresight to say when it will
end. Looking at the green Wheat-not an aree cut, nor likely ously wonder when the new crop could be secured, and in what condition. The heavy rains that ushered in the month of August had less injurious effect on the Wheat than on the other ching to a standstill ; and, consequently, at our usual starting time (the 25 th day) we were shocked at the sickly green hue presented by th" fields. It was only during the week just cioced
that cutting became general, and it is a common remark tha geldom has corn been cut mo green, for people have got tired of Waiting go long for it. The weather was for a fow days s.11 that We awoke to all the horrors of a sea fog, which gradually drew to rain, and heavy too at night. Yesterday was a day of unmltigated rain. and much Wheat which stood its previous trials
has succumbed at last. The eky is atill clondy and unsettled has succumbed at last. The sky is still cloudy and unsettled
and the sun at intervals scorching, so that unless we have a good and the sun at intervals scorching, so that unless we have a good
sousing breeze immediately the soaked Barley sbeaves will be in great danger of sproviting. The preliminary portion of onr crasse in the extent of lind under Barleg, a fact that has enwith a continuance of humid weather may raise the price stil expected from their appearance at Midsummer, having profired by the earlier rains ; but a considerable extent of the Pitat variety was attacked by grub, and, as usual, totalily destroyed earlier portions, witl propitious weather, promise a good crop and no cunjecture can yet be made as to how it will stand th, many vicirsitudes of its homeward career. The rains have much improved the Aater sown Tarnips, and the crop generally will be much better than was anticipated. Above all there is
"finger-and-toe." This, we think, must be attributed to rapid advance of draining and liming, operations that have lons been familiar bere, but have been kept in abeyance by want o ${ }_{184}$ capital consequilent on the ruinous prices which followed the year in some places to show the bliflit. The hay crop stond byin In some places to show the blight. The hay crop stood a very
long time s-cield, after being indifferently made, and wes not finally stacked till the middle ost month. The almost total failure of Clover makes it but very middling provender. Thick
fog agan to-night, and no sign of wind. J. T.

## SATURDAY，SEPTEMBER 27， 1856

The history of Wellingtonia is not yet exhausted M．Jules Rémy，whose account of the road from California to Mormonland we gave the other day （p．611），has puhlished some very interesting details respecting this famous tree．Coming as they do from a skilful naturalist，of undoubted exactness， they have a much higher value than any previous newspaper reports，and deserve to find a place in our columns．We translate his words，as repro－ duced in the Flore des Serres．
At 5 leagues from Murphy，in following the course of one of the affluents of the Stanislas river， which finds its winding murnuring way at the bottom of a deep wooded valley at the entrance of the Sierra Nevada，the traveller stops in amazement at the edge of a little basin about 2 miles across and some 1490 yards above the sea．Here stand the giants of the vegetable world．At the sight of these colossal Conifers，which seem to belong to some other planet，it is impossible to restrain one＇s feelings of admiration．

Ninety of these gigantic trees，the smallest of which is not less than 15 feet in diameter，are confined in a space of 50 acres，where they stand above other species of their race just as Lombardy Poplars overtop the Pollard Willows that accompany them in Furope．Yellow Mosses and Lichens floating like long tresses adorn their proud trunks； whie a paravite of the geuns Hypopritys attaches itself to their roots，and gracefully surrounds their base with stems two feet high covered with Howers and transparent rose－colonsel floral leaves．
Most of these great trees appear to have had their tops broken by the weight of snow which collects daring winter on their terminal branches．Many moreover are injured at the base hy fire，ascribed to the ignorance of the Indians．One of the trees was stripper of its bark，two years ago，to the height of lua feet by some United States people；never－ theless it continues to live at the point，its if these movarch of the forest were subject to laws alto－ gether peculiar to themselves．A spiral ladder has been formed upon the same tree by means of steps ent into its body．
In the holes formed by fire at the base of several of these trees whole families might establish them－ selves．A carriage drawn by several horses would ran with ease along one of them which lies on the
ground; for the bark is usually furrowed, so as to columns. Each monster has received an English name from their owner, who acts as cicerone to visitors. The following is a list of the more remarkable

The Bie Tree was 95 feet English in circumference, and 300 feet high. Five men were employed for 25 days in cutting it down. Their method of effecting this was as follows. They first formed a circle on the circumference at seven feet from the ground. Then by means of an enormous auger a multitude of holes were formed close together so as to destroy the equilibrinm of the colossus, and bring it over. Its fall was attended with a deafening noise as loud as the discharge of a battery of heavy artillery. Three weeks were consumed in this work of Vandalism and in stripping the carcase of its bark to the length of 52 feet. Its diameter, measured by Mr. Brenchley at six feet from the soil, was 23 feet seven inches without reckoning the bark, which was at least three feet more. A place for bowls and a house have been constructed upon its fallen trunk, and the stump, which has been planed, is surrounded by a summer house furnished with seats where the curious may meditate upon the surrounding objects. Some travellers have endeavoured to determine the age of this Big Tree, which however notwithstanding its name is not the biggest of the group, as will be seen presently, but was only the most perfect and handsomest before it was upset. Having counted the number of rings on 12 inches only of the radius they multiplied the sum thus obtained by the semidiameter, and obtained a product which led them to estimate the number of springs which this noble tree has experienced at 3000 . But having made no allowance for the difference in the rate of growth of different rings of wood they fell into a rather considerable mistake. A careful examination does not allow the age of our vegetable Methusalem to have much exceeded 2000 years. And when reduced to this figure its age is still respectable enough to occupy the mind of the philosopher with reflections upon the many revolutions that have convulsed the world since the germination of our tree.
The Miner's Cabin is 80 feet in circumference and 300 feet high.
The Three Sisters are placed so as to look as if they sprang from the same root. These three trees are intact and form the most beautiful group of the
"Mammoth Grove," the name given by the Americans to the basin in which the Wellingtonias stand. Each is 300 feet high and 92 feet in circumference. That in the middle rises to the height of 200 feet without a branch.
The Pionker's Cabin is an enormous tree, with the trank broken off at 150 feet from the ground.
The Old Bachelor is 300 feet high and 60 feet in circumference.
The Hermit, thus called because it stands alone, is 300 feet high and 75 feet in circumference. It has been burnt on one side of its trunk. It is calculated that it contains 725,000 cubic feet of timber
The Husband and Wife are each 60 feet in circumference, and their tronks, which are 250 feet high, come together at the summit.
The Family Group consists of 26 trees standing close together, and includes "Father," "Mother," and 24 children. The Father was blown down many years aaso, and measures 110 feet in circumference at the base. It is thought that he must have been 425 feet high. In falling he smashed himself against a neighbour at the height of 300 feet, and at this point he is still 40 feet in circumference! The fragment of the trunk which is now prostrate is half buried in the earth, is hollow from end to end, and detains towards one extremity the waters of a spring which he covered in his fall. The Mother is 91 feet in circumference and 327 feet high. The children are rather smaller.

The Siamese Twins and their Keeper. The bodies of the Twins separate at 40 feet from the soil, and are each 300 feet high. The Keeper, who stands by their side, is 325 feet high and 80 in circumference.
The Old Maid stands alone; her head is naked and bent; she is 200 feet long and 60 feet round.

Adie and Mary are thus called after two young American girls who first drove through the Mammoth Grove. These are two very beautiful trees, 300 feet high and 60 feet round.
The Horseback Ride is an old hollow prostrate trank, on which you can ride on horseback for 75 feet. This aged trunk is 250 feet long.

Unole Tom's Cabin is so called because its base is hollowed into a wide and deep cavern, entered by an opening $27 \frac{1}{2}$ feet, wide and 10 feet high. cavity. The tree is 300 feet high and 90 feet round.

Tom, stands 15 feet off the last, and is not quite 300 feet high.
The Bride of California is 280 feet high, and 700 roand.
The Beauty of the Forest is a very upright tree, almost without branches to the top, where it
is capped with verdure. This is 300 feet high and is capped with verdure. This is 300 feet high and 65 in circumference.
So much for M. Remy's personal observation of the Wellingtonias in the Mammoth Grove of Calaveras. According to M. Carriére the species
is now known to occar elsewhere on the Sierra is now known to occar elsewhere on the Sierra
Nevada, especially in Carson Valley, but very inferior in size, owing to the destractiveness of men; and also as high as $50^{\circ} \mathrm{N}$. latitude, whence an officer of the French navy has brought cones identical with those from California.

The article which furnishes us with the preceding matter also contains some new accounts of the great Decinvous Cypresses (Taxodium distichum) Mexico, supplied by M. Renault, a French gardener established in that country. He reports them, after personal inspection, to be true Deciduous Cypresses. About 200 are found within the fortress of Chapultepec. Of these the largest is $43 \frac{1}{2}$ feet (round) at the ground, but at 6 feet from the ground it is only 34 feet. It is about 120 feet high. At 15 feet from the ground it divides into three branches of equal size. Most of the side branches bend towards the ground, and one, which springs from about 75 feet from the ground, nearly grazes it. The root-humps, or exostoses, are few and the largest is not more than 18 or 20 inches (high ?) The soil in which the trees grow is scarcely more than 3 feet deep; the subsoil consists of a pan (couche pierreuse) which prevents the infiltration of water, so that it is often found at 2 spades deep. In the rainy season the soil is occasionally under water

The famous Taxodium of the cemetery of Popolta, near Tacuba, has been called the Cypress of Montezuma; this is the tree that sheltered Cortez. It is been frequently struck. It is not above 90 feet high; its trunk is covered with bosses, and is remarkable for being thicker at some distance from the ground than at the base. At the ground level the circumference is 40 feet, and six feet higher 50 feet.

It appears from these statements that the Deciduous Cypresses of Mexico are not so large as has been reported; not larger we suspect than speci-
mens to be found in the swamps of the United States.

The Potato mould is extremely prevalent this year though it has been somewhat kept in check by the continued dry weather. In some districts the tubers have been much affected, while in others little if any damage has been sustained. The increase of the mould, like that of most other fungi, is highly favoured by thunderstorms. It is not surprising evil, though an attentive examination would have shown many previous indications of the presence of the parasite. The Botrytis has been found on previous occasions on Tomatoes, Anthocercis and one or two other Solanads, but we had never heard of
its attacking beds of Petunia till the present year. We have an undoubted specimen before us, communicated from Bristol by Mr. H. O. Stephen, with every botanical characteristic of the species, and with equally destructive consequences. We hope that if any of our readers suffer from this parasite in their flower garden, they will try the effect of sulphur upon it, if the disease is not too far advanced. The mould grows quite as much on the upper as the under surface of the leaves of the Petunia, and is therefore more accessible than in the Potato. It is however useless making any experiment if the malady has advanced so far as to affect the stems. M. J.B.

The last Horticultural Exhibition at the Crystal Palace was one of those displays of all that is rare and beautiful among fruits and flowers which are only to be seen in the vicinity of the metropolis. The attempt to have such a show in September, when most of the great patrons of horticulture and those who can leave the din and bustle of London are rusticating in the country, was probably regarded by some as a bold experiment ; but we believe there are few who entertained a doubt as to its success; especially when they saw how liberal the management had been in offering so large a sum of money in the shape of prizes; and the collection brought forward for competition was the best evidence that could be adduced to show the directors how highly their exertions for the encouragement of horticulture were appreciated by the gardening community.
The weather was most favourable, and a very large number of visitors attended. It was good policy, in our opinion, to continue the Exhibition
for gardening to enjoy a rich treat, and that, too, on the second and third days vithout any additional charge being made beyond what is nsually paid for admission to the Palace and ground on ordinary occasions.

As 8 whole the Exhibition was deserving of much praise ; but there were some of the arrangements faulty, and by no means in harmony with the order, neatness, and beauty which are seen in almost every corner of the Palace. The plants were arranged on a stage along the centre of the nave north of the transept, while the fruit, with such florists' flowers as Roses, Dahlias, Hollyhocks, China Asters, \&cc., and the cottagers' productions* occupied another stage along the centre of the southern nave. Although the plant department lacked many of the beautiful Orchids and other favourites so familiar to us in the great floral displays we are accustomed to see in the early part of the season, it contained an immense variety of novelities of another kind, such as Ferns, Lycopods, and Selaginellas, \&c., which attracted a large share of public attention, and altogether formed quite a new feature in the Exhibition. All the specimens were admirably grown, and in the most perfect health. We remarked with no surprise, and much satisfaction, that while crowds were admiring the elegant and varied forms of these singular little plants, their more showy neighbours, such as Balsams and Cockscombs (of which by the by there were some excellent specimens), were passed over almost unnoticed. Here, again, is further proof how the taste of the public is improving. Dahlias and China Asters were shown in great variety, and in such perfection as to excite the admiration of every one who remembers what the form of those flowers was 20 years ago.
But the chief feature of the Exhibition was, as we have stated, the show of fruit, of which there was an immense collection, consisting of Pines, Melons, Grapes, Peaches and Nectarines, Plums, Cherries, Pears and Apples, Figs, \&cc. There were many beautiful examples of good cultivation, and
it may be truly said that those who were not so fortunate as to obtain prizes had no reason to be ashamed of the specimens they exhibited. One thing however must have been evident to every one who took an interest in this part of the exhibition, that to stage fruit is by no means the best way of showing it to advantage. When a stage is preferred to a flat surface it never ought to be much higher than that of an ordinary table, and in all cases there should be a division down the centre covered with green baize or some other cheap material so as to prevent more being seen than the eye can easily examine in passing. In the present case, the stage was much higher than it ought to have been, and too narrow. The fruit on the uppertier was so elevated as to be completely hid from the sight of all ordinary spectators; and many exhibitors must have regretted to find the objects of their care and anxiety in the position they occupied. The want of such a screen as we have
just mentioned down the centre was apparent to every one, from its permitting them to see the props and other expedients resorted to by exhibitors in order to display their boxes of fruit to the best advantage ; and we should hope that those whose daty t is to look to this matter, which is really of importance, will remedy the defect against another season.

VEGETABLE PATHOLOGY.-NO. CXXXI:.
572. Parasite (Polyactis $\dagger$ ). The monlds whicii belorg to this genus are amongst the very commonest productions upon decayed or decaying vegetable soil stances, A dry leaf lying on the surhace just dnmped off, a coren with of, a so the species, a good example of which is som the solyactis fascicur afforded by the annexed woodel distinction between Polyactis and Botrytis, taking the parasitic species, as for example $B$. infestans, for the type of the latter genus, consists in the articulateslightly carbonised stem anlady ference of habit, the one growing on vegetables alronts, more or less decomposed, the other on healtay pla healthy that is till they have been attacked parasite.
573. Facts, however, have lately come to light which tend to prove that such moulds though not truly paray sitic in their nature may at times act as parasites. are developed on decaying matter, from which mycelium spreads in the guise of long strago it shonid over living leaves, the fine tips of which, as it deeply seem, enter the

penetrating into the tissues, and by their decay ensueretic, but it is of such importance that it is worth stating even in the absence of positive proof as to morth mode of action. It is not indeed quite certain Whether sulphur acts upon these carbonised moulds as speedily and certainly as upon those which like the
oidioid state of Erysiphe are of a pure white, and we odave evidence before us that very delicate plants may sometimes be injured by the application of sulphur, a fact which is not surprising, as the effect is probably produced by the conversion of a portion of the sulphur into sulphurous acid, a substance which even when
so produced may easily exist in such a degree of concentration as to be fatal to delicate tissues. The effect of brimstone fumes, which are the same thing, on plants of any delicacy, even when slightly mixed with the atmosphere is known more or less by fatal experience to every cultivator. The great desidefind some substance which will act upon the darker coloured fungi without affecting the plants on which they are developed. Since however when once generated they appear to be peculiarly difficult of control, the great point is to prevent their growth at first, or at any rate first of these particulars it is needful that all the materials of which soil is composed should be in a materials of which soin in composed should be in ad fragments of vegetables exist either in contact with the nieated' by the moulds which are generated upon them. nieated by the moulds which are generated upon them.
Where plants of the same kind are crowded in pots and Where plants of the same kind are crowded in pots and one of them perishes and becomes mouldy the rest are very apt to follow, not by inherent decay but from conmakes it necessary to remove dead leaves which have

performed their functions from crowded cuttings Supposing, however, these moulds to bave become inveterate, the only hope will be in the removal of the Lole affected stock and thorough cleansing of the walls and washing with lime and corrosive sublimate. This is ane on remedy in bakehouses where bread is subject a acquire a ropy fermentation, an evil which is due to he development of the spores of some noxinus fungus, many instances of which have been recorded in France, and the same may be said of those silkworm establishments which have been affected to a ruinous extent by dine.
it will In conclusion of our remarks on Hyphomynctes Tulasne in All to advert to a paper just published is of fungi. Many facts have from time to the dualism brought forward to this effect, commencing with the speculations of Fries some 20 years ago. The subject now extends the matter to a degree which could scarcely have been anticipated. Not only does he believe that
and the breen anticipated. Not only does he believe that are greater part of the naked-spored Pyrenomy etes called fruit in definice number contained within sacs the black, but he believes that far the larger part of are the conidioid state of Lelminthosporium, Graphium, \&e., longing stiltum, Atractium and some other genera becategory to a very different series belong to the same only be It is evident that these notions can Direct experimmed by long series of observations. to bear upon them in many instances. A few cases
confirmation, and when the facts are once received as inderzied truths, the whole sulject of mycolozy mus probably be worse confounded than state confusion will will at length rise out of the clanos, and many a present cause of perplexity be removed for ever. IM.J.B.

## Home Correspondence

Orchard Houss.-A short time aqo you advised your readers to inspect the orchard house at Chiswick, an truth it was well worthy a visit. But there was atill same time, an object in the Society's Gardens Peach dore deserving attention, namely, the magnificent clothed with folinge to the very bole, and londed with fine fruit. As Chiswick possesses, I imagine, no natural advantages over many other places in the valley of the Thames, this unusually successful Peach culture mus be attributed solely to the skill of Mr. Thompson.
Upon comparing the health of the trees on the wall and in the orchard house (and I may also add the amount of their crops), the question naturally arises whether any one who possessed such a wall would care to have an orchard house. For a year or two past, communications have appeared in your journal from parties who have erected structures of the latter de-
scription, and have been more than satisfied with the results. I regret to say I cannot add my testinnony to theirs. And as, at the present time, many persons are proposing to build orchard houses, I would wish not to dissuade them from building, but to pretions has been the resulte to say that my want of shecs give my evidence; valeat tantum. As soon as Mr. Rivers's pamphlet appeared I read it, and no fairy tale ever charmed me more; an orchard house was soon built, and cultivation commenced. In order to compare my progress with that of others, the orchard visited, as also Lane's at Berlhampstead, seval times subject is likely to interest many of your readers, I will, at the risk of heing thought prolix by the remainder, enter into some detail as regards various de scriptions of fruit. Strawberries succeed very well, and much further from the glass than gardeners of the olden time thought possible. They staud in front of the
larger pots, and therefore may be said to take up no larger pots, and therefore may be said to take up no Strawbervies of and and most desirably anticipate the fruit season. Those who want fruit will of course take Black Prince and Keens' Seedling, but those who prefer flavour will wait for British Queen and the old Carolina Pine. The plants of the latter are always vigorous and nsect are aluundant on Strawberries and the spittle Of Apricots I have had few indeed, but those few were superior in quality to any I ever tasted. I observed that Lane had no crop last year, nor do I see much at Chiswick this. The trees flower abundantly, some set, but soon drop. This year I followed the advice given yivers in you she trees a single fruit. I have tried keeping them in the open air, plunged under a north wall to retard them, and not putting them into the orchardi house until the blossom phtting them into bue orthara house unt Plame often produce well enough, but the Greenzages are far inferior in quality to good wall fruit. Both they and other varieties have an aciaity mixed with their sweetness,
showing an unkindly maturation. The cnly exception I showing an unkindly maturation. The cnly exception
have met with is the Jefferson, which really ripens the stone, but grown under glass is comparatively flavourless. Coe promises well this year. I may remark that in the later editions of Rivers's pamphlet it recommended to exclude Plums from the house during the hotter months. With Grapes I have Pears, the cultivation has been too small. Of enable me to say much. From Figs in an orchard house, without heat, a first crop alone can be expected. I have now and then had a few second crop fruit, but unt good. Having tried almost all the well known sorts, I find the Brown Turkey the only one that can be absolutely depended on for a crop in all seasons, hut it may be observed that the same may be said of this variety not only against a wall but even without one, at least in tige whener parts of England. The small white Ischia Figs when you can get them are perhaps the nicest to
the taste. Peaches and Nectarines flower beautifully, the taste. Peaches and Nectarines flower beautifully,
and set sufficiently well. The trees are almost entirely free from blister and green-fly. The latter, when they ppear, are easily crushed. The red spider is the onl formidable enemy. In order to keep him in check, I syringe the house every evening in summer, just as the sun goes off, and keep the ventilators closed for two or three liours, so as to produce the mnist heat which these insects dislike. At other times, abundant ventilation, watering the plants well at the roots, as also the earth between the pots. With respect to ventiation, the difficulty is to have enough to keep down red spider, and at the same time not to retard the fruit too much. It is desiratle that the fruit should ripen rather before, certainly not later than the same sorts on the open wall. And now as to the quantity of fruit to be exhold Rivers sugrests that a house 10 feet long wi,
from 40 to 60 - dozen of fruit (p. 14). My expectation were always more moderate. For a tree in an 11 -inch pot I cousidered eight fruit quite enough ; but even this number I never got to swell fully and ripen satisfactorily. Much of the fruit after colouring perfectly, but not ewelling sufficiently, falls off all but ripe ; the remainder then begins to swell. In this way an early Grosse Miynonne (probably the same as the Pourpre Hative Veritable, and a most desirable variety) set two fruit-one fell off, and the other weighed no less than $6 \frac{1}{2}$ ounces. The trees have been duly supplied with guano-water until they commenced ripening, after which guano-water until they commenced ripening, alter which
plain water or soot-water was used. Possibly it may be better to continue the stronger aliment, and I purpose repotting the trees in 13 -inch pots. As to the quality of the fruit, the best may equal the average run of wall ruit ; but certainly does not surpass it. To conclude. To an amateur, who bas no walls, but who takes per-
sonal pleasure in the cultivation of fruit, an orchard sonal pleasure in the cultivation of fruit, an orchard house is a most desirable acquisition. On a cold spring yourself surrounded with blom, with the promise of a crop of Strawberries, Figs, and Peaches, all in their due season ; but to those who lave already an ample and well stocked wall, I cannot recommend the erection of an orchard house. S. B.
A mmonic.-In the experiments of "J. H. II." as detailed in page 631, on the "Use of Ammonia in Vegetable Economy," the chareoal absorbs the ammonis Which it afterwards gives off to the roots of the plant whilst in the absence of the charcoal the ammonia either filters through the sand or evaporates. Charcoal, as you are aware, will absorb many hundred times its olume of aumonia. A New Subscriber, Croydon. Has any one ever tried the experiment of growing a atmosphere containing a considerable quantity of ammonia, taking care to prevent this atmo phere from coming in contact with the soil in which the plant grows? InM. Ville's experiments, I believe,
the ammonia from the air may have entered the plants through the soil and roots, and not by the leaves as some people suppose. Why not have a number of plant growing in one pot, bend some of them on one side, and introduce them under a glass-case in which a small piece of carbonate of ammonia is placed, and introduce some of the other plants under another glass-case having no ammonia? A comparison might then be made between the rapidity of growth of the plants in the ammoniacal atmosphere, in the common atmosphere, and in the common atmosphere uninfluenced by the inform that ammonia is absorhed by the leaves of any plant? J. A. Clarke, Leng Suttion.

Lavons and Daddy Long Legs.-For the last four or five years our lawn (down turf) has been infested with what we call daddy long legs. Early this spring it was oo bad from grubs that we were fearful we should be obliged to relay the whole of it ; but by the use of a very heavy roller and guano, together with a wet season the lawn is looking as well as ever, and we had hoped that we had got rid of the pests. Within the last three days, however, they have made their appearance more numerous than ever. Will some of your correspondenta therefore give us the natural history of this pest and point out a remedy? We kill all we can find, but without any beneficial result. A Gardencr, Broadzoater, Sussex. Glass for Garden Structures.-I have several Pinehouses, all well ventilated, glazed with Hartley's rough plate glass one-eighth of an inch thick in large squares, My gardener tells me that it makes the houses too dark and too close; he also thinks that the fruit does not grow so large, is inferior in flavour, and sour compared with that grown und crown and British sheet. All the succession plants look green and healthy and are growing rapidily, but at this season they seem to draw a little. Sume of your readers doubtless have tried this glas for Pines, and if they would commumicate their wish Mr Brand confer a benefit on many.
Oxalis Boweci.-It may not be generally known that this succeeds well as a bedding plant. It produces its beautiful rose-coloured flowers in great profusion, until destroyed by frost in autumn ; and when planted in contrast with other gay colours I have always found it to be greatly admired. The bulbs sloould be potted the third week in March, and plunged in a centle bottom heat. I put three bulhs in a 3 -inch pot; when they pots, and gradually harden them off in frames with other bedding plants. They are planted out about the middle of June, by which time they will be nicely in bloom; it is necessary to support the flower stems with small stakes when first planted out, for if this is not done they are liable to be blown off. Until the plants have established themselves firmly in the ground, a situation rather siteltered from the wind, and well exposed to the morning sun, should we chosen for them, as they show themselves to most advantage during bright sunshine. Willian Adderley, Gardener to W. Harryman, Yutes Court, Mereworth, Rent.
Potuto Disease.-Having, like many others, raid snme attention to this disease, a medical friend jocularly cause. My mely was, "Hay if yad discovered its the cause of the cholera? because I think the discoveries will be simultaneous" For several years I have ceased to take the interest I once did in this mysterious scourge, but Im glad that others are more persevering, although I fear the explanations given are still far from Eatisfac-
tory. In your recent numbers the blight is attributed six months. Our attention was next directed to a colto thunderstorms, and the appearance of the embryo decay in the gardens and rer, that the period of the growth of the I suspect, howes in, more certain antecedent than a local thunderstorm. At all events 1 have generally found that the disease begins in this counary in the southern parts of the kingdom, and gradually travel northwards, that is, as the chmate deteriorates the crop are later aud so is the blight. As a further proof his theory I may mention eneraily have our force Po:atoes, and althourh we are not much accustomed to thunderstorms in the month of March, I have very requently observed on the stems and leaves of the plants under glass, the very uumistakeable blutches which we are familiar at ater period in our ardens and fields. I am therefore rather sceptical a o the theory of tbunderstorms being the proximate cause of the disease.
sulphate of Tron as Manure.- The paragraph at page 613 on the "Destruction of Dodder," leads me to ask any of your correspondents can give any account of the results of using sulphate of iron as a manure on chatk or limestone soils. It is curious that the improved medical treatment for the eradication of worms in chil dren should be analozous to that for removing the regetable parasite; and I have little doubt that it nainly from the tonic action of the sulphate of iron that the Lucerne is enabled to divest itself of its pest. $A$ Vero Subscriber
Heliotrone Miss Nightingale.-Daring the summer, is consequence of an advertisement in your paper, I was
induced to apply to Mr. Field, of Kensal New Town, or a plant of the above-named Heliotrope. The adve tisement described it as having a flower half an inch in dismeter, and a truss of 7 inches. The plant 1 received, although kept in a greenhouse and put into a arge pot, Has any une else had a plant from the same place, and so how has it turned out? W. M. A.
Fiost occurred here on the night of the 19 th inst. with unusual rigour. During the preceding evening there was a keen N.W. wind; towards morning a registering thermometer indicated $272^{\circ}$. Tender annuals and bedding plants have suffered greatly ; they now present a mass of unsightly ruin, eliciting astonishment from many in all their autumn glory. J. R. T., Gi
Hitcham Village Horticultural Society.-I took advantage of an invitation from Prof. Henslow again to visit the autumnal meeting of this Society. I send you a widely as possible any information connected with the welfare of the poor. Village horticultural societies, the expression of a great and philanthropic theory, may now be fairly classed among the institutions of the country. They aim at the progress, the welfare and the happiness of a class who are only able to rise out of ignorance, drunkenness, and too often crime, in proportion as they means and station. Leave a man to the full impulse of his own ungoverned and selfish passions-leave him in ignorance and neglect, and his career is easily for told How many thousands of human beings have been utterly and hopelessly ruined by the beer-shop! How many hearths made desolate, hearts broken, characters lost are to be scored up against these wretched hot-beds o vice! And yet there are thousands of human being no atisfied with a few general principles handed down fom father to son, they rest contented with the gnorance and neglect, and ofrspring drunken ness and vice, which have hitherto borne such Of late years thinking men have thought it worth Of late years thinking men have thought it worth
attempting to raise the sphere of the labourer by giving him education. With knowledge they have wisely thought it right to give the means of enjoying it. A man who looks upon a flower admires its colours and smell, but he who knows the position and uses which this flower holds in the great scheme of animate nature, has greater pleasure still. To those of the senses Rectory were es ususl prepared with much care for the ren of the exhitors and risitors. On one sid was a long tent for the cottagers' productions. Each lass of exhibited specimens was marked out by letters corresponding to the list of prizes. The productions were as good as usual ; Potatoes particularly good. W bserved that the judges gave the first and third prize in this class to the Fluke, a new Potato in this distric which is deseribrd as a good bearer, and dishes up well. It the top of this tent we also noticed a most ela porat molel of a gentleman's house and garden, with flowe beds, walks, shrubberies, fountains, and visitors all care fully and beautifully modelled. We were told that this was the produc'ion of the Miss Henslows during the past 24 hours. On the other side of the lawn the usual marquee museum was stationed, and its contents were explained the people during the day in one of Mr. Henslow's ecturets. In the centre of the lawn was placed a plan of the immense truak of the Weilingtonia gigantea, or Mammoth Tree of California, with a diagram showing its relative size in comparison with other trees and buildings ; length, 363 feet ; diameter at base, 31 feet. The base was shown by a wooden model, the length by piece of tape attached to the upper circumference of portion of the Bamboo which grew 60 feet at Kew in

We were amused by hearing that Pumpkins are in great demand by Apricot-jam makers in London! mammoths, aquaria, \&c., and for the amusement of the juveniles swings, whirligigs, sc. There were a great number of people present during the day, and amon, them Lord and Lady Hemiker with a large party, who drove over 18 miles to be present. The uuble lord has a similar society in his own parish formed upen Mr. Henslow's model, and which has surceeded admirahly. We hope to hear of many others in due time. Of course a good deal of labour is required from those who super A litte methor wil lighten this much. If any one wishes to see how this is brought to bear upon the arransements at Hitcham, I am sure that Prof. Henslow will be delighted to see them next year. B-.
Potherbs.-Having lately visited a horticultural exhibition at Perran Wharf in this county (Cornwall) I noticed there some baskets of potherbs, for which prizes were warded ; but the question arose (among a few parties who felt an interest in the proceedings) what are potherbs, or to what extent may the list of them be carried? This was not easily answered by the persons then present. Will you therefore kindly furnish a list of such plants as may be considered to come within the meaning of the word potherb ? J. M. [Potherbs and sweet herbs are often confounded with one another. The former are generally understood to apply to such herbs as are only used for the purpose of flavouring soups and sauces, \&c. They comprise Parsley, Green and Golden Pusslane, Tarragon, Fennel, Chervil, Dill, Pot Marjoram, and Pot Marigold. Sweet herbs are more aromatic and form an important ingredient in gravies, stuffings for most kinds of luscious strong meats It is the copious and judicious use of them that gives in so great a degree the cookery of the French its ruperior flavour. The sorts most in request are Sweet and Bush Basil, Pot and Sweet harjoram, Green and Red Sage Summer and Winter Savory, Spear Mint, Tansy, and the Common and Lemon-scented Thyme. $C .1$
Fulters.-I take the rain-water of the partment made for filtering the water from the im purities taken up on the roof. The rain-water is conducted to the bottom of the filter, through which it is compelled to tho overflow being delivered into the cistern. In heavy rains the water pours in so rapidly as to disturb the filtrating medium, and the consequence is that the water thus rendered turbid is mixed to me such materials and arrangement for filtering, as will allow of a rapid percolation, and yet sufficient to remov the impurities taken up on the roof? I have use coarse and fine gravel in layers, and on the top sand or granulated animal charcoal. The depth about 3 feet. J. G. We do not think you can employ any better materials or the purpose of filtering your rain-water than those you mention, and with the view of preventing the filtering medium from being disturbed by heavy rains

Rain Water pipe

we would suggest such an arrangement in the constru tion of your cistern as is shown in the accompanyin sketch. In this it will be seen that the cistern is divided into three compartments - the first receives the water in its impure state from the roof of the house, the secon course very much larger than either, holds the main supply of water after it has undergone the filtering process. The water in 1 and 2 will always stand at the same level, and in case of rain, whatever addition is made to 1 will immediately pass upwards through the filtering materials and flow into the large compartment 3 . When all are filled the filter will cease to act, and the superabundant water will then pass off by the wuste pipe at 4. As there will invariably be some deplosit at of rather large dimensions being placed at 5 , so as to enable the water to be drawn off occasionally for the purpose of cleaning and removing whatever impurities may have accumulated in it, as well as in the filter. B. $]$ Tobacco- -Some of your readers may not be aware that the leaves of higiad as resemble the Tobacco country may be so harvested as to difere of climate of commerce, making allowance for difference of cima Such Tobaceo must be more effective when used for fumigation than that which is dried in the ordinary way. I will, therefore, proceed to describe the method I have found to succeed. Towards the middle or latter end of March sow in, eny, a 6 -inch pot, and cover the
seed lightly with sand or fine soil-place the pot in forcing-house or hot-bed-prick the plants off early, as they are apt to damp, in same size pot; whe stroug enough pot them off singly in o-inch pors. Plant them frost. I sugs ary planting them out, as required each evening for a week; in their early rowth a little liquid manure is useful applied so as not to touch the leaves. Plant the rows 3 feet apart, the plants 2 feet apart in the row. The wind has great power over them, and they easily snap off; therefore as soon as they will allow of it tale off the two or three bottom leaves and earth them up all round the stem; after a time, viz., so as to be beforehand with the destructive power of the wind, again break off tho add sometimes three of the bottom leaves, ind raise a good bank round each stem. When the most forward phans are about 4 feet high, drive in three stakes to each row of about a dozen plants ; the stakes before being driven into the ground should be about $5 \frac{1}{2}$ or 6 feet long. ie some small hollow cord from stake to stake at such distance from the ground as to prevent the plants being roken of by the wia, which one hopen in pite of the previous earthing up. Tie a piece of string o the cord opposite each plant, then tie the string round he stem of each plant, not in a knot but a bow, in order that as the plants grow you may easily untie the strings and raise the cords. Cut off the flowers before hey open, except such as you wish to seed. It increass the size of the leaves to break off the laterals as they show. The lower leaves must be taken off as fast as they become ripe, that is, when the green of the leat is sightly tinged with yellow, and the leaf feels thick and firm to the touch. I wish to be understood that the leaves must not at all wither, but be mature. Be careful to gather them when not damp with sain or dew. To cure the leaves place a dozen or a dozen and half one on the other, put them in tore-room not exposed to sun and wind ; in three week or a month they will become of a dark brown (but ex amine them at a fortnight). Single them out to $d r y$ in he same room ; if a few of the time than the rest, put them in parcels by themselves. They must be wrapped up in paper 2 or 3 lbs . in parel when in a tough dry state, and placed on a shell a dry cellar. Tobacco so cured will keep for years and improve with age. I have managed Tobacco thus or a dozen years; when in good soil 1 have had some of the plants 9 feet high, and have averaged 40 z . of dried leaf to
Red Spider.-I erected a conservatory last year, and being plagued to lead off the water from the roof put a late tank inside and carried in a pipe from the gutter. In addition to having a supply of water at a moderate temperature, I find I am free from red spider. Two other instances have been lately brought to my notice where the presence of water in a conservatory has been accompanied by a freedom from this pest. In one case it had previously existed, but this year owing to a pan of guano water being kept in the house for watering, am it being more convenient to hava it in the house (a if the one in a town) than outside, it seems bo from this mall body of waused by the eve from this plarae. Nemo.

Reports on the Use of Methylated Spirits in the Arta and
Manufactures. Eyre and Spottiswoode, 8vo, pp. 55. The name of methylated spirit is given to alterwise flavoured with 10 per cent. of wood spirit, otherms known as wood naphtha, pyroxylic spirit or methyli spirit, and now procurable duty free under the prom been of the Act 18 and 19 Vict., cap. 38. It had long ber felt as a great impediment to competition with foreg used in varicus branches of industry, that all the spirit duse in this country was subjected to a heavy excise conse from which spirit in other countries is free. Ollicit spirit quence was that an enormous quan ander wis found its way into consumption, oppressed the revenue did not gain in prop that Mr such an extent was the illicit trade cass alone baving Alexander Christie speaks of four houses alone bat les to his certain knowledge consumed for years wuterthan 500 or 600 gallons weekly. In ord than in 185t directed Professors Graham, Hoffmann, and be Redwood, to inquire whether no means free whic found of enabling spirit to be sold duty fre
 poses, and be absolutely undrinkable, so that it might These eminent cliemists reported that by mixing 10 per cent. of wood naptha with strong alcohol, the latter would become so nauseous as to be rejected by even the most depraved taste, and that by no known process could it be deprived of that quality. Acting upon this
advice, the Board of Inland Revenue determined upon recommending to the Treasury that an act should be passed enabling manufacturers to procure methylated spirit duty free; and it appears from the report before us that the result has been in the highest degree satiobeepers of museums, and physicians, testify to the very great advantage with which the measure has bee spirit duty is not less important in its way than that of the duty on glass, soap, and brichis, all of which have been completely relieved since the Excise has been Wood, whore name must be held in perfect re verence by all who are anxious that the springs of
industry sliould he relieved from the undeniable evil of industry slould be relieved from the undeniable evil of
fibcal pressure. We observe that the methylated spirit fiscal pressure. We observe that the methylated spirit of museum objects, hitherto a most costy part of all such establishments; and, notwithstanding the occa.
sional presence of ascidental impurities, we can entertnin siopal presene of accidental impurities, we can entertain
no doubt that it will eventually be universally employed no doubt that it will eventualiy be universally employed of those who are unfamiliar with manufacturing pro cesses, that the methylated spirit has already been used for the following important purposes, largely in chemical analyses, for moistening explosive substances in military laboratories, the preppration of fulether for lubricating machinery; French polishing, varnish making, as a solvent of shell lae in hat making, in the fabrication of spirits of nitre, and other chemicals.

## Carden Memoranda

Petersfield, hants, the seat of R. H. Nevill, Esq.-This delightful residence is beautifully si.uated amongst the Hampshire Downs,
about four miles from Petersfield. The site for the about four miles from Petersfield. The site for the
mansion has leen well chosen; it stands on the side of a hill well backed with wood and with a fine bold fore ground, peculiarly characteristic of the scenery of that part of the county of Hants. It is only within the las Dorrothy Nears, since it became the property of Mr. and Lady ardening Nevill, that Dangstein has been heard of in the afely be said to vie with most of our finest garden in the richness of its collections of fine exotic plants, the extent of late improvements and garden erections, and in the general order in which the whole place is kept. wo grand features of the Dangstein gardens are tropical fruits, Palms, and otber fine foliaged plants, Orchids, \&c. ; the other solely for Ferns.
The tropical fruit house, built in 1854, covers a space 80 feet by 50 feet, and is 30 feet high in the centre with wings or sides for the cultivation of Orchids and
smaller specimens of variegated foliage, and young smanter specimens of variegated foliage, and young
plants of botanical interest or peculiarity. This collection is in the most luxuriant health and in the best possible keeping. Amongst the host of valuable and teresting plants in this house we noticed some splendid Musns loaded with fruit, Nutmess, Cimna-
mon, Mangosteen, Guava in fine fruit, the Jaffina cocoa Nut, Cofiee tree Arrow-root, Ginger, the Zebra Wood, the Deadly Upas ree, the Gambrye tree, the Screw Pine, the Chinese Papyrut antiquurum very fine Cotton trees (Gossy pum arboreume, the Cocoa Nut Palm, and the Wax aid ther Palms, a splendid specimen of Medinilla magni fra, and many other of the finest flowering stove plants Orchiree wings adjoining this house one is devote fine specimens of Vanda suavis, tricolor, coerulea and Roxburghi, Saccolabium Blumei, and its larger variety guttatum, Aerides Larpentee, retusum, and preemorsum, crispum, suavissimum, affine, Fieldingi (Fox's Brush) speetabilis in fine flower ; Dendrobium, many kinds Cattleya labiata, Angreecums, Odontoglossum, \&ce.; beantiful plant of Peristeria elata coming into fine
lower, \&ce. In this wing are also successfully cultivated the flower, \&e. In this wing are also successfully cultivated the lotus follicularis, the Sarracenia purpurea being far finer than it is usually seen. Here also was a fine collection on Anæectochiles doing well, and the rare and remarkable atice plant (Ouvirandra fenestralis). In the centre of other house is a tank with Water Lilies, dec. One of the stove two wings was filled with a general collection of
sell grown into specimens, intermixed with ariegated plants, such as Draceenas, Marantas, Calajumas, Rhopalas, Pandanus, Coleus, variegated line ic. Here was, Aphelandras, valy the rare Stan chica paradoxa, \&ce. The third wing is at present filled biefly with tender Araucarias, Dacrydiums, Epacris, Butas, and a general collection of New Holland plant arely is contemplation to build a large house par with store plach plante, when this wing
A Fernery was
of a span with a high back and end wall, which are beingy clothed with Ferns and Lycopods. The walls pleasing effect. The stands have a very natural are up roughly, and being studded with all kinds of Lyco pods have already the appearance of having been planted the first. The collection of Ferms in this house is of never seen so large and so varied a collection \&s is con gregated here doing altogether so well ; there is a total we noted Cibotium Schiedei, a splendid plant (which was purchased at the sale of plants at Chiswick last autumn), and Platycerium grande and Stemaria; the Bird's Nest Fern, splendid Epecimens: C:athea elegans and other tree Ferns; Drynaria cormans; Pteris and both doing admirably: Dicksonia antarctica, yery good; fine Blechnums, Ilavallias, Hemitelias, Gymno grammas, Nothochæonas, Adiantums, Cheilanthes, Neph-
rulepis, \&c. ; all the linds of Lyeonels. In this house is a beautiful specimen of the true Dragon tree this was presented to the Dangstein collection ly tha
indefatigatle collector, Mr. Skinner, who obtained , men (see Humboldt) in the garden of the Marquess de Souzal, in Oratava, Island of Teneriffe. The base o this plant was raised, is now in the museum at Kew
Attached to this Fernery, an llooking into it is Lady Dorothy Nevill's museum, in which is being collected All that is rare, interesting, and remarkable in botany fruits, dried and preserved ; indeed everything that can interest and iustruct is here to be seen. There is also the table lies the catalogue of the Dangstein collection most elaborately and heauti ully writen in varions colours by Lady Dorothy herself. Here also lies the
book for visitors nanues, clearly indicating that wherbook for visitors mannes, cleary indicating that wherrailroad, there persons will go. The collecting together this rare assemblage is solely to be attributed to the
great love of botanical Dorothy Nevill, and her ladyship's funduess for plants and good taste in all that pertains to gardening has been well supported by Mr. Vair, the intelligent and whole collection does him much credit
The houses stand on terraces, and beneath them is a ovely dell which it is in contemplation to take into the pleasure ground and plant with rare Conifers. A better situation could not be found for sucls phants. The cropped. In them is a Peacl tree case and a range of Vineries 120 feet long, and outside an orchard-house 90 feet long, well filled with pot fruit trees of various kinds well set with fruit buds for next season. A spanroof forcing-house, 100 ffeet long, is now in course of erection. This is for forcing early vegetables, \&c. There is also a house in which Lady Dorothy has all the ladyship's friends appear to send abundance. The heating of all these structures has been done by Messrs.
Haden, of Trowbridge, and is by hot-water pipes cormbined with hot air. It appears to answer well.
Near the mansion is a sunken flower garden gay with the ordinary bedding plante, and at the exit from it to the Rosery stand a pair of very fine Cupressus torulosa from 25 to 30 feet in height. Beyond the Rosery Suct 10 which the various treal ar pach are a few of the particulars its pardens and crounds; but destined we believe to be inferior to no other in such departments of gardening as the noble ady who directs the operations may devote her atten tion to.
One thing more may be said of Dangstein, that from the potting-shed and tonl-house to the Palm-house all is order, and affords an instance of what may be done in very short space of time where there is good taste and practical judgment to perform.

## Miscellaneous.

Sale at Chiswit-Some of the plants sold here on Wednesday realised fair prices, as will he seen by the following account of a few of the lots:-Mammillaria
globosa, cirrlifera and auriceps fetclied 12 . Gs.; Gasteria conspureata, a species of Noe, and Agave filifera,
11. 12s.; Polygala Dalmaisiana, 10 . : Theophrasta Jussirei, 3l. 3s. ; Pæonia Moutarn salmonea, 3l. Js. P. M. atrosanguinea, 5l. ; a variety of P. M. versicolor, $5 l .10 s$. ; and a variety of P. M. atroparpurea, 37.10 s. bout $2 l$ esch
Fuod, Cheap and Good.-The Stew.-In respect to stews, I thought I had been sufficiently explicit; but a few recipes will, perhaps, reuder their improved preparation more readily obvious. The following recipe, term it the Improved Irish Stew, It would not be ensy to devise a better one. Certainly, the ordinary procedure for an Irish stew realises results in no respects comparable. I purchased a joint, also some into into a stew. This stew-piece weighed just 5 ibs, of
which 1 lb . proved to be bone. This pound of bone

Was put down to simmer with 3 quarts of waver, Towards dinner-lime, $3 \frac{1}{2} \mathrm{lbs}$. of the meat, cut into slices, also a slice of ham, divided into suall protions, were ala a sice of ham, divided into suall phriwns, were
placed in a paus over the fire, with a little of the soup, and slowly fried on the alternate sides till three parts done. Meautime, the residuary half lb . of meat was chopped up with 3 oz. of suet taken from the roast, and chapped up with : oz of suet taken from the roast, and
made into balls atont the size of nutmeng. The meat meing taken out of the jan, the forcemeat balls, a little ane nicely brownea in turi brown the pana however, with a spoonful of commen of die suar and a slice of toast, cut into morsels the siz of dice. The pan was well cleared out with fresh soup All the ingredients, less the looes, were now joined
together, auding 3 lbs of raw Potatoes, carefully peele and cut into quarters; also half a lb . of flour rolled with a little butter, and cut into short length, the siew- the fluid wortion reducci about one half, an emiting a mont saboury odour-was served, and a proved it-el! sum ly wortiny of tha thought and care which
 recine, in writing, with which the cook was furnishel, as thus :-Improved Irish Stew.-Meat, bones inclusive 5 libs ; beef suet, 3 oz.; butter, loz.; ham, 1 slice; Putatoce lus. ; kugar, 1 inbleppoonful; bread, toasted, 1 slice We fared sumptuously on this excellent atew, the projec tion of which afforded me, I am sure, not less gratificatan han would have dome the famous powder of projection of he alchemists, which was to turn base metal into gold $A$ stew, even containing not a lb . of whole met, alio A rent Unskilful lands might, indeed, lave converted thes wretched staik, i $r$ into broth yet more wretched. little thought and skill, however, had realised a disth not unworthy n king. It is quite unnecessary, how-
ever, to include all the preceding ingrediente, or the very same ingredients, so be it the principle of prera ration be adhered to. It is also optional to make a stew half or quarter the sizc. I only wish to shom that, out of the very humblest, and, so to speak, mearest incredients, a wholesome, nourishing meal may lee prepared-a meal which, modified to suit individua resources, lies within the compass of the very poorest have already this with bread, the colfection premaring both were once ditused-might bo almost every talde. Fir people must le fed, and wholesome, savoury, and suficient fare, $I$ assert, may be pre-
pared, the ingredients being otherwise the same, at a loss forla 1 and unsufficing. Our good cook used to make such a dreadful affair of her Irish stew-a clarty mash of meat toes, without flavour or zest-that I told her I would think the matter over, and furnish her with a recipe "reduced to principles." I need hardly observe that fish, or fuwl, or game, may replace the beef
If fish, the fish-say a salm, If fish, the fish-say a salmon, or turbot, or cod, or requirements-must lue skimned, and the meat separated from the bones. The bones themselves will be sim mered with a Enitable quantity of water and seasoning, and the meat, or soft portion, treated precisely as the meat was treated. The liver may be chopped up with bread crumbs, 1onled into litte bails, and fied. In short the dish, unless something better can he thought of, had better be prepared, in essence and detail, as was the meat stewed already described. The result, as I can affirm from experience, is admirable. I hope those who may fi mour these remarkswith their perusal sill not impesch my seriousness when I tell them I have dined and sumptuously too, on various fish, some of which the very poorest here habitualy reject. Thave seen excelleat hish-fish, with a little skill, susceptible of being converted into delicious fare-cast aside along the rule, may given to swine. In fact, all fisin, as a general or the plaice, to say nothing of the bret or the flounder, or the helibut-if the meat be cut off in collops, and fried with eggs and Parsley and bread-crumb, stewing the bones in a little water and seasoning to furnish a sauce, tecomes a disin fit for a prince. nutriment, and should be vastly oftener used than they are. A dozen good oysters or more added to the fish stew, some five or 10 minutes before serving, form a sheli-fivh, pluin or fried, are good in any stew ; but, if Lept in lunger than I have said, they become tough and leathery. Musbrooms, fresh or dried, are fikewise very bacon or dripping and then mall. Dried liver, however, grated or whole, may be substituted. I donot mean that all these things should be introduced into one dish, but they do very well to alternate. It is not, inas generaly known that dried liver furnishea naring can be a cheaper one. These things are worthy of attention, since nobody will pretend to say that well flavoured, savoury, nourishing fare is not preferable to the reverse. When a fowl or game stew is attempted the giblets and more bony portions should be stewed with water and seasoning to 10 rm the soup or fluid por tion; the liver should lue chopped up with crumbs and
as before, should be browned in the pan. Compare a as negiect of this is a frequent cause of young plants without the necessity of digging deep or injuring the
dish of this kind with, perhaps, is tough, flavourless fowl, or meat boiled in any quantity of water, and the result will be very apparent. Any kind of roots, of pulse, or vegetables, fresh or dried, according to their at pleasure. I have seen Negro cooks prepare dishesoysters, fowl, game, fish, rice, vegetables, ingredients as they came to hand-which it would be impossible to praise ton highly, and often I should hesitate to say how cheap. These people are not afficted with the notion that a thing cannot be very cool, uuless it happened to be very dear. They go straight th their point, without a thought about the matter, or the "delicacies of the season," and they succeed accordingly. If, indeed, they big expensive joint, and eating it warm one day, and perhaps for a succession of days cold. The poorest of them seems to understand the the great majority of our professed cooks. They possess and women, could they only realise it, would, so to speak, prove inestimable. They possess no rambling, costly, disease-engendering, sulpetance-wasting, preposterous cooking-books; and yet, singular to say, they lano here, ten to one but she spoils your fond, while a pro fessed cook wastes it; and very probably both alike scorn to be instructed. They are ignorant of principles and in practice they are simply barbarous. They should while the strictest compliance should be insiste on. People in numbers, young and old, and of all classes, lose their health, and eventually their lives, from the unsatisfactory nature-at one time insufficient at another in excess-of their food. They cannot better. They never knew any better. They suffer, and are silent. It is a subject really well worth looking into; and I should experience a thrill of pleafamilies generally by induce mothers and heads undertahen for their benefit, and out of the usual line of my pursuits, to turn their thoughtful attention to a most interesting, curious, ind, at the same time, highly let them just consider a little drily-for it a daily need-what fond is really meant for, and how it may be most effectively, and cheaply, and agreeably rendered subservient to the ever-pressing inexorable necessities of our exisent and else suffering animal nature. Henry M'Cormac, M.D, Consulting Physician to the Belfast Hospital, dec, Belfast.

## Calendar of Operations. (For the ensuing week.)

## PLANT DEPARTMENT

Consentatory, \&c.-In cases where there are many glove plants in this house it will be necessary in the event of the weather becoming cold and wet to use a stte fire-heat, but be as sparich are other things in the house likely to be injured by being kept too warm And in this case it will be advisable to dispense with stove plants even at the expense of rendering the house somewhat bare of flowers rather than to keep them here and run the risk of injuring other things on their account. Be careful not to over-water things brought from the stove and also to use water at a temperature of $30^{\circ}$ or $80^{\circ}$ for these, as watering plants that have just leen brought from a warm house with cold water injures the young and tender roots, shortens the duration of the blossoms, and often ruins the plant. Use weak menure water for Salvia splendens and gesneriflora so as to preserve the plants in a vigorous state and keep them blooming as long as possible. Give air freely on fine days and thin out the twiners on the roof wherever pients be done with propriety, so ase exption plents to an the plentiful successiou of things for maintaining the gaiety of this house during winter.

## FORCLNG DEPARTMENT.

Pixeries - Plants swelling their fruit should be 3osisted with a brisk temperature, say from $65^{\circ}$ to $75^{\circ}$ external temperatire, keening the houge rather close on sumny days and allowing the thermometer to rise to 30 or $85^{\circ}$ thefore giving air freely. Also endeavour to proportion the moisture to the iemperature, for a high dry temperature is not favourable to the aweling of th fruit, and there is no chance of getting well swelled Maintin a steady bottom-heat of about $85^{2}$, and use every care to keep the rnil in a healthy state lear manure-water, and give sufticient to moisten the whole ot the soil, and avo frequent dribblines, for when this systern of watering is practisad it is nearly impos-ible to keep the under soi!, where the principal roots should be, a heaithy state. Use the symine very sparingy, an season is ant t., keen the surface snil so moist as to render it ditficult to judge as to when water should be given. Any young plants "rowing in pots which may require $\mathrm{l}^{\prime}$-potting shoula be seen to at once so as th
allow of geting them established in their fresh pots, white they can be kept moderately warm. See that the balls are in a proper state as tomoisture before re-potting
ruiting prematurely. Keep moist and rather warm for a time after shifting, so as to encourage the formation of resh roots. Vineries, - Should wet weather set in we with dry stable litter, Fern, or whatever can be obtained most conveniently that will answer the purpose of keeping the border dry. Nothing answers better for
this purpose than clean straw, proviled the border this purpose than clean straw, proviled the borde
slopes from the front of the house, and in this case it i easily thatched so as to throw off the wet entirely. Jut straw is ton scarce in many parts of the country to be found cheaper in the end ; nevertheless where straw can be obtained, it will be found to answer the purpose perfectly. It will also be advisable to cover the borders houses in which it is intended to keep ripe Grapes any length of time, so as to prevent the soil getting
 quently, particularly in damp weather, cutting out any keep the atmospluere as dry as possible, using gentle fires when necessary with a free circulation of air ; bu a warm temperature is nearly as injurious as damp, therefore use no more fire-heat than may be absolutely necessary. Let no pot plants requiring watering remain in houses where the Grapes are ripe and expected to hang for any length of time. Peaches.-As the trees will now be freely exposed to the air day and night very little attention will be required here for the present. The foliage should, however, be kept clear of red spider, by an occasional washing with the engine where necessary, 00 preserve it in health until has performed its functions and decays naturally
this may be done immediately the present open wal this may be done immediately the present crop of fruit is gathered, as the removal, if very carefully effected and the tree properly attended to afterwards, will no prevent the wood ripening, and there will be plenty of time for the trees to make fresh roots and get sufficiently established to carry a crop of fruit uext season if no forced too early.

## FLOW ER GARDEN AND SHRLBBERIES

Unless alterations are in hand, the principal work in this department will now be confined to mowing and cleaning, and if neatness is to be maintained this wilh require constant attention; also see to getting moss, and roll them frequently when wet to bee the surface level and smooth. Continue to afford young stock in pits and frames carelul attention, and endeavour |to get it well rooted and strong without keeping it so close or warm as to render it sappy and liable to damp off on the first approach of winterly weather, as is often the case with stock got up in heat late in autumn, and then stored away in cold pits for the winter. Admit air freely
therefore to all plants that are rooted sufficiently therefore to all plants that are rooted sufficiently
to bear it without flagging. Newly potted off things to bear it without flagging. Newly potted off thing which will impart a little warmth to tue soil and encourage the formation of roots; but sufficient air should be given to prevent anything like weakly growth Cuttings of Calceolarias, scarlet Geraniums, \&c, may still be put in where it is considered that the stock of hese things is likely to be deficient. Scarlet Geraniums hill root almost anywhere; but Calceolarias are not uite so acccmmodating, as cuttings taken from plants it the open ground are very liable to damp off in heat hese will be found to do very well however in a close or frame where there are the means of applyiog little warmth when necessary to dispel damp. See securing as many cuttings as possible of any scarce plants which it may be desirable to increase whil pere is a fair chance of rooting them, and also be pre pared to protect Scarlet Geraniums and other thiogs which it may lie intended to take up and winter, for we may expect frost any time after this season, and if such things can be protected so as to prevent the foliage and wood being much injured, they are much more easily wintered. Attend to former directions, and lose no time in getting preparations made for the removal of arge trees and shrubs, as both the season and the reather nre now very favourable for this kind and ground intended to be planted with young stuff from the nursery cannot be turned up tos soon.

HARDY FRUIT AND KITCIEN GARDEN
Look over fruit remaining out of doors frequently, and gather it as it becomes fit, as if left to get over ripe will be liable to be lolown down and bruised should high winds occur ; also examine that stored in the fruit room frequently, as there will nccasionally be a few decaying truit found for a few weeks after housing, and hese should be removed as soon as they can be per ceived. Keep the truit romm cool and airy in order to allow of the escape of the moisture given off by the fruit, Which is considerable for a few weeks at first. Examiue Plums or any oti:er fruit protected by covering ocecaaionally to see that they are not spoiling. Where it is intented to make any fresi pantations of frut trees his season, the rround should be prepared at the earliest couvenience and any fresh soil to be used for planting should be thoroughly exposed to the action of phe weather so as to have it in a mellow state when wanted for use. If not already done clean and dress Strawbery plantations, clearing away all useless runners and giving a good dressing of manre which is thoroughly decayod and which can be covered
ithe the necessity of digging deep or injuring the rather closely earthed up, using quick lime and sopt freely to destroy slugs, and if these are troublesome go er the rows every morning for several successive day and apply quick lime or pick up the pests.

SATCRDAY, SEPTEMBER 27, 1856.
30 Soark-West Midaleesex Agiciculturai Societs
Tue variety which is met with in all agricultural plants has been viewed by some with regret rather than considered as a matter for congratulation. If, however, we look into the ongin of varieties, we shall find that they are unavo he original type, being the re which surrounds the plant in question with circumstances widely difiering from those to which it is naturally spbjected. If these conditions are made to change, so, to a greater or less extent, must the forms which they induce.
Thus, if we look into the history of any of our crops, whether of grain or roots, we shall find that the varieties in vogue have been constantly chancing and accumulating. Fifty years since and a Wheat crop on the lias clays of Gloucestershire would have consisted of a coarse cone Wheat grown on the tops o high ridged lands, and even there much infested with the wild Oat (Avena fatua), and other weede
which almost exclusirely occupied the furrows/ considerable portion of it upon the screen of the machine, Now, however, a much larger crop of fine red and white Wheats can be grown or the same soil, or
rather in the same locality, for the soil by draining and other ameliorating influences is quite altered and with it has come about a change of climate, so that large crops of fine Wheat can now be grown where but precarious crops of a much coarser sor ere the rule.
It is with sorts of plants as with breeds of animals: they cannot stand still at any one given point. We may get a cross of either that will d jast whatro will be constantly result. If, however, we have skill and judgment to ascertain the soarces of our breed of animals, can manage so as to maintain our cross in consider able purity, and just so is it with plants ; wie can from time to time choose examples to breed from, we can change their position or treatment, or w false hybridisation get different qualities. With plants there is, if possible, a greater liability to
a wearing out of any peculiarity than with animals. New sorts are therefore continually necessary, and we venture to suggest to those who are engaged in introducing them a plan of operations differing from the one usually adopted.

All new forms we now meet with are but partial departures from some closely allied state, and possess therefore but a small range of new adaptations to our tarious requirements. We venture to reconlmend an attempt at the production of new varieties not from varieties already established, but from species. Florists, we believe, constantly appeal to original species for new varieties, and agriculturists and seedsmen should follow their example. May it not be possible that by reverting to the original and natural sources of all our varieties, we shall obtain a stock more certain to reproduce itself, and more likely to yield a vigorous and healthy produce
At a late meeting of the Imperial Agricultural Society of France, M. Pommier produced a sample of what he considered Guano from one of the West India islands. The substance having been analysed by M. Payen was found to consist of the following substances:-

M. Payen added that this guano could have no other value than what belonged to the phosphate of verised, which would cost 10 francs per 1000 kilos Such being the case, the mere freight of the article would be more than its market value. It therefore could not only not be considered as a guano, but could have no agricultural applicability

A machine for digging Potatoes has been lately in successful operation in several parts of Scotland and Ireland, to which, from the uniform reports of its efficiency, it is right that the attention of our readers should be drawn. The inventor is a Mr Hanson, whose address may no doubt be ascertained by application at the Albert Model Farm, Glasnevin, Dublin, where his implement underwent its last public criticism. We onderstand that it consists essentially of the framework, coulter, share, and mouldboard of a common plough, and that by a pinion working into a wheel which acts as sole plate in taking the weigbt of the plough motion is given to a set of revoiving forks placed so as to operate on the furrow slice just as it leaves the turn-furrow.
These forks fairly disintegrate the whole mass of earth as it is lifted, and scatter the Potatoes which it may contain over the surface of the ground on
hich the plough has already operated.
We are told of the machine that in its trial at Glasnevin last week it performed its work admirably, completely lifting the drill from the bottom with the inclined sock, while the revolving forks completely separated the Potatoes from the earth, throwing them up in the air, where they were caught by a netted screen, and deposited compactly on the surface for the gatherers.

The judges appointed to determine the merits of the implement reported-

18t. That Hanson's patent Potato digger worked well, efficiently and economically in and on be generally used are putinto a proper state of cultivation for the Potato are pat into a proper sta
2d. That this implenaent, besides being a good Potato raieer, is a valuable cultivator or pulveriser of the soil,
thus completely mixing the manure and soil, besides scattering any weeds free of soil upon the surface, so a ohe easily collected by the harrows and weed-rake. tory implement for putting in autumn Wheat or Oats, tory implement for putting in autumn Wheat or Oats,
inasmuch as it completely mixes the soil and manure, inasmuch as it completely mixes the soil and manure,
and pulverises the ground evenly for the reception of the seed.
4th. That the machine is simple, strong, easily
naged, and can be worked by two horses with ease.
AGRICULTURAL STATISTICS IN IRELAND.
The importance justly believed to be attached to the obtaininy correct agricultural statistics of all countries generally, but of such countries as are purely agricupolozy for now attenpting tospecially, will plead my apolozy for now attempting tu trespass on your pages, on the statistics of Ireland, a country perhaps the most purely agricultural on the globe but certainly the mos in Her Britannic Majesty's dominions. If any of your readers doubt the importance of having such statistics correctly ascertained, he need but glance back over the various newspapers published throughout Great Britain and Ireland for the last six months, and if I mistake not he will see thnse of all slades of politics and polemics, from the great Times in London to "Paddy Keliy's Budget of Fun " in Dublin, stuffed more or less with our statistics as paragons of excellence. And why
 tant occasions, lut more especially on such oceasions as the great meeting of our Agricultural Improvement Society of Ireand lately held at Athlone, when his Excellency dealt largely in figures which the majority of those who heard lim and many of those who
read his speech believell to be "as true as gospel?" He said, "I wish however not to deal in general ities on a subject of this sort. I derive my information from the very valuable returns collected by the constabulary of this country; and this is a matter in which I conceive that you in Ireland have got a material start over your proud neighbours in England." His
Excellency further said, "These returns, as you are well ware, are collected annually, and be it spoken to the are supplied voluntarily, and rare indeed are the instances which the information requested is not supplied with alacrity and good will." There is no doubt whatever that in so far as "the gentry" or landed proprietors geveraliy are
concerned much "alacrity and good will" may have been manifested. Butgiving them credit forall the "alacrity an goodwill"and the absence of all exaggeration on their parts, what proportion of the gentry of Ireland sufficiently versed in such matters as to give returns on which the least reliance can be placed? Not one in every 20 , except in so far as farm stock only is concerned; and as to the farmers and people generally, how could not admit) their willingness to give the desired information, calculated to give it with any degree of accuracy? Not one in a hundred. But supposing they were all so qualified, how hat "alacrity and goodwill" so boasted of by hi Excellency? Not one in every thousand. Such is not the
feeling of my countrymen, and no man regrets the absence of that feeling more than I do, and it is wit pain I quote one of the best of Ireland's sons, namely the or centuries been at whe peasantry of Treland have were governed, and watch their operation in every instance with a jealous eye. Even guilt itself, however aturally atrocious, obtains commiseration in their ysto from the mere spirit of opposition to There is gcarcely a cottage in the south of Ireland where the very circumstance of a legal denunciation vould not afford even to a murderer a certain passpor to concealment and protection. To the same cause may be traced in all likelhiood the shrewdness of disguise the coolness and the affected dulness, the assumed mpicity, and all the inimitable subtieness of evasion die which an Irish peasant can display when be is requently display a degre of would throw the spirit of Machiavelli into ecstasies, And this, I assure you, can be said with as much justic of the same peasantry in regard to the aqricultural statistics sought for by the Irish police as if the nam "Terry alt" or a s Molly Maunts and whereabouts of a Terry alt" or a " Molly M'Guire," not alone" in the south of Ireland," to which Griffin alludes, but to the east, west, north, and centre of Ireland, for they believe the information sought for by the police is for anything and everything but "their advantage nor is their evasion in such matters confived to the police queries, for they would observe the same towards all men, and on all occasions, with very rare exceptions, touching land is valuations, and management, but none more keenly than in the very statistics now under consideration But supposing that the gentry and the people possesse supply this information and all the desired willingness communicate it, was adequate time allowed the police or did they take the necesaary steps to obtain it? No they did not. In proof of this I could give you examples, innumerable examples, that I have seen ill every year
and on various parts of Ireina since this scheme was
first broached ; oneor two such examplesmay suffice, bein those under my own eye and regarding which I challenge contradiction. I hold and manage a farm here on my orim account ; I manage four or five others in this locality for one of my emplojers ; and from neither of these farm couldthe police get authentic information regarding them except through me personally, and strange to say that though the police know me well, and though they know there are few who could and who more willingly would give them reliable information, not one of them ever applied to me for it either as regards my own farm or those others I am managing. If I am told they could obtain the necessary information through their own knowledge of this locality, to this I must say, impossible, were I even to give credit to the police for possessing the necessary education to qualify them for such an undertaking. But when I know that not one of those policemen, nor any other of the many policemen I have met in any part of Ireland since "the Peelers" were
established about 35 years ago in Ireland, ever possessed such qualifications, am I not justified in pronouncing this vaunted scheme to and a snare? Again, the period selected for obtaininy these statistics was the reverse of opportune, for since these returns were said to have been sought for and made up, cropping of various kinds to a great extent had been done of which the cultivators of the soil had at the time but little if any idea. For instance, on the townland where I reside there were nearly 5 acres of Flax sown since the middle of June last, before which those who sowed it had no idea of being in a position to do so. So with Turnips, nay even of Oats itself. Some who had Oats growing then apparentiy healthy ploughed the land on which they were growing, so bad did the appearance of the crops turn
out to be, and sowed 'I'urnips on the same land. These are facts.

In thus pronouncing an utter condemnation of the accuracy of this scheme, I wish it to be particularly the curately obtained, or as nearly so as circumstances will admit, lut which never can be done by such a body as our Irish police ; who, though perhaps the best organised staff in her Majesty's dominions for the duties which they have learned to perform, are not the men to supply agricultural statistice, whatever they may do in enforcing the destruction of weeds along the road and roadsides, for which they have now ample time, having little else to do. Query, would not an act
of parliament be necessary to justify their enforcing this of parliament be necessary to justify their enforcing this think also that until such an the obtained thei attempts at the destruction of weeds, though backed by county surveyors, Poor-law gaardians, grand juries, the celebrated Registrar-general, Mr. Donnelly, nay the Commissioners of Police and the Lord Lieutenan himself, will be as futile as their attempts to collect agricultural statistics. Edward Carroll, Cranemore House, Newtonbarry.

ANSWERS TO AGRICULTURAL QUESTIONS.
By Me. He AGRMCULURAL QUESHON

## (Conchuted from p.685.)

recent agricultural progress.

## State the principal additions made number of our agricultural implements.

Locomotive steam engines adapted to threshing corn brick and drain tile machines, reaping machines an cheese-making machines, sleam ploughs and steam draining ploughs, digging machines, drills with cups and levers for coulters, horse rakes and lever harrow pulping machines for roots, liquid manure drill, and last not least the great steam horse ; and there have been such improvements in nearly all our farm implements, such as horse hoes, harrow, wheel, and cid crushing rollers, as almost to claim the title of new.
2. Name those crops the cultivation of which has been either
introduced or very largely increased during the past few

## years.

Mangel Wurzel, although grown to some extent 30 or 40 years apo, is now much increased in cultare. Itaian Rye has been introduced and is very largely increased within the last fer yeara. Triolinm incarnatum is to of recent introduction, but the calture of all fallow crops has much increased.
3. What is the most important improvement now generally
edopted in the man
clay goils?
The old system of managing clay land was Wheat, fallow, Oats, Beans, Wheat, and fallow, and into this
but since draining has been introduced largely into then description of long a din aeplat been introduced with profit; Mangel 'Wurzel has been introduce instead of bare fallow, and has produced great crops Kohl Rabi and Cabbage have likewise been found to thrive in those soils.
4. Describe Mr. Smith's (of Lois Woodon) sytem of cultivatigg its हuccess receives its explanation.
Mr. Smith professes to grow Wheat on only half his land, that is, in alternate strips of about a yard each, "It will surprise onr "proud English nejghbours" to hear in
Flax being sown as iate in the season as the 16 th of July, "the
flight of Mahomet", $n$ land not capable by orlinary treatrent
to produce three barrels of Oats of 14 stones of 141 bs each stonet

real
realised, as I have no donbt whatever they will, I may he
trouble you with a notice of Flax growing in this locailty.
cultivating the intermediate strips very deeply as long as he can get between the strips of Wheat, which strip that is cultivated this year will be Wheat nex year, and so on. No doubt Mr. Smith's land is rich in
inorganic ingredients, and by breaking up a few inches inorganic ingredients, and by breaking up a few inches
of the subsoil every year he continuts to call into practice those elements which have loug lain dormant and by the frequent stirring it gets it imbibes some portion of ammunia from the air and water, and there is no doubt chemical changes take place on the soil coming in contact with the atmosphere that supply a still larger quautity.
. Nave vulh recent gelogical discoveries as have been
alreaty
culture.
I am not well versed in geology, but I think the greatest discoveries likely to benefit agriculture are the bringing to light the coprolites and the riches of the green sand in
earth in Spain.

## cancre <br> \section*{e cultavation er yiven crircu osest sulted.

}Italian Rye-grass is cultivated now in many ways Some mix it with the seeds of Clover and common Rye and sow with Barley or spring Wheat; but the most approved way is I think to sow by itself in the month
of March or A pril. The surface of the ground should be made firm before sowing, and the seed slightly har rowed in, and the roller again passed over. The productiveness of the crop varies much according to the quantity of mature applied. About 10 tons at each of three cattinss is a very good crop, but it may be forced up to five such cuttings, and may be grown per acre of this Grass; from 3 to toushels per acre is the usual quantity of seed. . poper place is 1 think near the homestead or feeding stalls, where it can be very liberally
supplied with manure water. Nothing seems to make so quick a return for any expense incurred in manure as Italian Rye-grass. I have seen accounts of upwards of a ton of gunno in solution with water being profitably em ployed on this crop per acre. 1 have seen some very fine pieces of it on clay soils, but from all the accounts have read it seems to have produced the most astounding resulta on what had formerly been a blowing and almost barren sand ; but from its very gross feeding habits I should searcely recommend it into a common rotation in very great quantities, as it feeds on nearly the same ingredients as the Wheat plant ; or in other words I do not consider it at all an ameliorating crop. I shouln say manuring systep that could be grown where the phe cattle relish it much.

## STEAM CULTURE.-BOYDELLS TRACTIO

 ENGINEWe have now arrived at the horses, that which is likely to procure for the subject the past 14 days Mr Boydell has been ploughing land on the past 14 days Mr. Boydell has been ploughing layd on Middleton, and Butts Farm, Hanworth, occupied by Mr. Middleton, and Butts Farm, Hanworth, occupied by Mr. exhibited at Chelmsford-turning up a fallow 9 inches deep, at about one-fifth of the expense it conld be done horses in the district, the quality of the wor being declared by als who exam ad seser the having been advertised, we attended on Tuesday and Friday, the 16 th and 19 th inst., and shall present the readers of the A-riculturcul Gazelte with a brief account of what came under our observation.
On Tuesday the engine was trench-ploughing a smali
field on Steam Farm with two of Cotgreaves' trench ploughs, Air. Cotgreaves himself superintending them. The work was being done about 12 inches deep, and at the rate of 5 acres per day, or half an acre per hour The engine to appearance would have hauled near another plough, as it was never working up to its full pressure of steam; but the two ploughs being all that were at command we had not an opportunity of bringing this to the test of experiment. The quality of the work gave great satisfaction, especially to the market gareners of the neighbourhood, some of whon offered give 30 s. per acre for land so trenched, assuring Mr. of the market-garden grounds of the capital could be had at this rate,

The dally expense of the engine and hands was estimated at about 30 s ., so that the cost per acre would be $6 s$. ; consequentiy the profit would be $24 s$. per acre at the above , estimate, equal to $6 l$. per day- $66 l$. per week.
On Stearn Farm there was also a good deal of ploughing dcne by the engiue in two large fields with tour of
Howard's 9 inches, and the rate of ploughing from 8 to 10 acres per day. The quality of the work was superior, fully equal to what could have been done by four horses in engine work, being comparatively level and of great length
On Friday the engine was at work in a large field on Butts Farm. It was again hauling four common plougha, ploughing 9 inches deep, and at the rate of an acre per than any of the former, being nearly as level, of greater
length and rather lighter in quality of soil. Both fielas, "our successful operation of it at that present dry time. on Steam Farm, although of a gravelly character, were The difference between Mr. Baiser's statement and the yet rocky hard in the bottom, but here the soil was cost of ours only appears in his burning and paring more friable and sandy, consequently the plonghs were more earth, and more deeply than ourselves in the more easily held, enabling the ploughmen to make far operation, though no doubt paying better in the end better work than that done by them with horses in the
The se

The steady equal draught of the "steam horse" deserves special notice, as it differs widely from that of horses, Accustomed to the latter we think little about the irregularity of their traction force when holding the plough behind them, but we have only to examine their mechanism and the ever-varying position of the fulcra (footprints on the ground) aver which their muscular force acts, and compare them with those (the endess rails) of the traction engine, to perceive that the difference is great and wholly in favour of the latter. In point of the steam hurse almost went alone, for re saw Mr Nidilieton remove his hand from one of them for a considerable distance, aud
The expense of ploughing 9 inches deep with four ploughs is thus given :(even if he had used dust coals, as some do, to keep heir fira xception, ho the earth to red hot bricky colour ane ubstance destroys the organic properties of the soil toc much, and on yery many soils does not so much real ervice as partially burning it ; and it will be recollected nd for this reason it was, that we only pretended to burn" some and "scorch" the rest of the soil sufficiently to kill all living sulstances the fires were composed of, the stean and smoke enriching the soil in no small degree. Of course Mr. Baker's description o his broad-sharing with four horses instead of ours with
three, would make his expense mnre than ours ; but his coe, woal make his expense mure thu ; acout in this item differs only out, though the expluded in implements, irons, ce., was "crenses" the land with three horses, which swells his account 3s. 6ut. more than ours, we finding it unnecessary for this operation, on account of our rowed Wheat crops being so well cultivated in spring with the searifier, and by repeated hoeings; waing morr raking answered for this. Burning is set down in Mr. Baker's item at 11.6 s . 8 d ., whereas we expended and noticed only 15 s. We did not note 10 s . or 12 s . per acre ; this is an error of our friend Mr. or 12 s , per acre ; this is an error of our Grendencrs
Baker's, who no doubt took it from the Gard Chronicle and Agriculiural Gazette of September 13th, where we ohserve the editor wrote himself-" The exWhere we observe the editor wrote hinseli-" ore cxpense This was a paragraph of his own words in the leading article of that paper. Again, we used no eight trusses of strarr, and no wood or bushes, and here is brought to view 88 . more expense than ours; we having made shift without any. Lastly, we left ont of our account the spreading altogether; and here again is $48.2 d$. more,
thus swelling his total, and making in all more than our expenses per acre:-

##  <br> Expense per acre more than ours

 differences It gives us great pleasure to be able to correspondence in so friendy a man trivial expense and trouble. Thanks to the penny postage for this. A. Ilardy \& Son, MaldonA. Arditration Avitration among Patences-Ame, when inventive talent has been brought to bear on agricultural matalent has been oxt and when a number of chinery to so ch be directed towards the accomplishonent minds may each of establishingsome sort of tribunal for of a similar object, of estabisal claims of patentees. The economically settling the rival clamsive that unless the present law courts are so expensive that the patentee object in dispute is of universal adoption, the patentee when he enters them to defend his invention from inno vation or attack nust bid adieu to all pecuniary reward for his own labour and ingenuity. I certainly thinil that a large portion of the beavy fees which are stil inflicted on patentees should be devoted to this purpose. No honourable inventor would object to submitting hi claims to such a court of arbitration, and 1 doubt not that the Royal Agricultural Society of Engiand woul lend their influence towards the protection of inventors, and would refuse admission to their show yards to implements that can be proved to be invasions of others in ventions. The distinguishing feature of the present time with regard to inventions is, as before alluded to, the union of several minds in the perfection of one implement. This has of late been abundantly shown in our reapers, steam ploughs, threshing machines, drills, and particularly the water drills; and it is of the greatest importance to the public that each inventor should be protected and rewarded to the extent of his own invention. Few persons at the present day who have had opportunities of judging are disposed to doubt that opportunities of judging are risposed practical and economical, but whether by Fowler's or by Boydell' economical, but whether new machine combining both principle, or by some dew mach we will not venture principles or improving on either we whould, however, greatly regret that Fowler's merits should be passed over, or that Boydel should go without his reward, or that either should b called upon to waste large sums of money in defendin their inventions from the innovations of other W. C. Sponner

White Clover.-A question has been asked as to the unusual prevalence of the 引perennial White Clover thi year. Allow me to suggest that it may principally be attributed to the dry seasons we have had during the last few years, which has been somewhat unfavourable to the various rank Grasses which delight in moisture, and has consequently enabled other Grasses for which dry weather is favourable, such as the White Clover, to obtain the supremacy. There are abundant proofs that the soil contains a vast quantity of the seeds of plants which prevented from vegetating by unfavourplants which are prever the superior vigur of indigenous plants. In addition to the cause we have assigned we may also urge that at this period of the
year the White Clover drops its seeds, which are
numerous in proportion to the number of plants, and thus in favourable years the growth of this plant is likely to increase each year, thich fact is consisten may add that we have found the application of the earthy phosphates extremely conducive to the growth o the Whits Clover. W.
Failure in Oats after Green Crop, Dunfriesshire.-I is a general complaint among the farmers of this district failure this season, whereas in former years they used to reckon with certainty on a good crop after green crop retentive clay, was manured as usual, in some cases with farm-yard dung alone, in some with farm-yard dung and guano together, and in some with guano alone, and the result is the same in all cases. Can you assign a reason
for this change? Is it attributable to the weather? month of July ? Is it attributable to the weather? The mometer was near the freezing point, while Aurust was for most part excessively hot. Igncramus, Nithsdale Dumfriesshire, Sept. 20. [In what form does the failure appear? It may arise from abortive ears, from a stunted growth, from blanks in the crop, from injury by being laid, from mildew, \&c. Each of these appearances would indicate a separate cause.]

The Crops.-As the Oat is par excellence the corn crop of Ireland, it may be satisfactory to say that in rally a superior crop both in stook and under the flail there are no doubt some light crops of it, as must be the case where people will take successive crops of it crop also is excellent, abundant, and mealy, and, although the leaves are blighted, the stems or stalks of the main crop remain green and succulent and the tubers not than can be beneficially used up by swine of made into boxty (bread made of grated Potatoes), a great loss can be said to have been incurred. "B,", in the Chronicle of the 13th of September, sppears to favour the hypothesis of eletrical affections, and
subscribes to the opinion of those who ascribe the disease "to atmospherical causes arising from the electrical changes that are continually taking place, pro
ducing a certain condition in the air unfavourable the health of the plant, and occasioning such a check t its growth as to bring on disease and hasten its decay" B." produces in support of this opinion data of the atate of the weather immediately preceding the appear( 3845 ) to 1853 in the west of England, taling periods not prior to the 18th June nor extending beyond the other early Potes were notrious that forced and other places to have were reported in each year from I believe, so early as March ; and further, he seems to confound the primary cause of disease with those causes data illusory. For the press of it, so as to render all his these atmory. For the disease occurring previous to a primary cause independent of them. Yet although it may well be disputed that these atmospherical changes produce the disease, yet, I think, it admits of little doubt that after it exists they do promote and further the progress of it, as being most favourable to the fungus I am certainly borne out by the prevalence mions of the many of the vegetable produ make its first great swoop. But "B." says that these electrical changes which are effectual in this disease are continually taing place, and he is correct ; wherefore, then, is the appearance of the disease confined to such narrow limits of time as from the 18th of June to the
13 th of August? Why do they not operate previous to
these periods on the crop generally? "B." further
the an these changes produce a certain con occasioning such a check to its growth as to bring on disease and hasten its decay." Without wishing to must be permitted to say it is very far from being so in Ireland, for it has been generally and in every year and place remarked that never do the crops of Potatoes appear so healthy, so luxurious, so ander the earlier indications of it, disease, and that leaves are but partially injured, this luxurious condi tion is maintained, and that even after the leaves are withered and burnt up, those kinds of Potatoes which have the property of most resisting the disease retain lent long, certainly for a mo and of large growth; indeed everything about them, with the exception of the diseasp, showing a vigorou hife ; and in 1845 no crop could exceed in apparent decay till the time of full and perfect ripeness ; no disease was indicated, wor the slightest suspicion entertained of it, till they were dug, and housed, and pitted hat year was magnificent. J. M. Goodiff.

Farmers' Clubs.
Wingswort:
the on Cheese Malking.- We give here

A bbott, which appears to deserve a wider publication han it has yet received.
Having paid much attention to the details cheese-making for the last few years, the observations I
have to make to-day will be of a practical nature. In the first place, I may state that the mill from which cheese is made consists of three distinct parts,-ccream curd, and whey. The art of cheese-making consists in the complete extraction of the whey, and in the proper compacting and curing of the curd, and of keeping and
drying the cheese until it is ready for the very important part of the process is, to thorough separate the whey from the curd, without extracting the butyraceous matter at the same time; if this is not laved to, the cheese will heave, and be of a bad handling of the curd; if a warm hand is applied, it is sure to facilitate the escape of butter, which passes off I will whey in the form of o
admit the mode I adopt in making cheese. Mubject will $\mathrm{s}_{\text {, }}$ to make cheese only once a day, commencing in the morning. The evening's milk, as taken from the cows, is poured through a sye or sieve, into a tin pan cooling down the milk to make it for the purpose of generally left there during the night. The morning's milk, as taken from the cows, is mixed with the cooled evening's milk; the heat of the mixture will mostly in milk wis about 75 or 76 , which is the heat I set the months ; in winter I consider $\overline{7} 8^{\circ}$ to $80^{\circ}$ not too warm or in frosty weather $82^{\circ}$ to $84^{\circ}$, which latter heat 1 seldom or never exceed. The reason why it is pu together so much warmer in the winter is, from its cooling down so much faster in the process of making, and if this was not done, becoming too cold for the thorough extraction of the whey. If at any time it is thought the evening's and morning's milk will not, when mixed together, bring the temperature to sufficient leight, a portion of the evening's milk is warmed for that purpose, by floating it in warm water when heating milk for the cheese not to raise the temperature above $100^{\circ}$; if it should happen to be and cheese) ; when that is done the thaness in the curd with a graduated rod made for the purpose, the rennet pulso and annatto Annatto I find one pound of Fullwood's Black Imperial Annatto I find quite sufficient to colour 25 cwt of my
cheese. The colouring and rennet having been put in the milk, it is well stirred with the dish, covered lightily with a cloth, and left to coagalate.' In about an nd ill cut in intersections of about six inches apart, down carefully stand another hour, when it is broken remark, that the warmer the milk is at the time setting together, the sooner will coagulation take place, but the curd will, in consequence, be tougher and less in quantity ; on the contrary, the cooler the milk the longer will the card be in forming, and the more tender its quality, but its quantity will be greater. Immediately after the curd has been broken down, it is carefully collected together with the milk dish, and allowed 10 or minutes to settle down, when the sinker or curdgatherer is applied, for the purpose of taking off the form something like a soup plate, made in size to fitinside the cheese tub, the upper part or rim, finely perforide with holes, to aliow the whey to escape uperrarate pass into the well, or hollow part of the curd gatherer rom which place it is laded out. The curd-gatherer is pressed carefully and gradually down by the dairy-maid, curd-gatherer comes in contact with the curd it requires ome additional weight; I use a can with more or less hey in it according to the weight required. When the whey has ceased rising into the well, the curdgatherer is taken off, and about six inches cut and aken from the outside or edge of the curd, and laid in the centre of the cheese tub upon the other curd, and the whole cut in intersections; the curd-gatherer is gain applied with a weight resting upon it sufficient to press out the whey gradually; this operation is repeated olidg three times, or until the curd is sufficiently conserew press for the further extraction of the whey the cloth used for containing the curd whilst under the screw is coarser and stronger than the ordinary heese cloth, and is commonly called screw cloth When talien from the cheese pan as before stated, it is press, and allowed to drain for about ten minutes, after which it is tied in the cloth and the screw applied he pressure is taken off, and a portion of curd cut from the outside all around, and laid in the centre upon the other part of the curd, which part is also cut in intersections with a large dull knife, and the board and press again applied. This operation is repeated two or hree times, or until it is considered sufficiently dry for grinding in the curd mill. Great care should be used while under the screw not to press too hastily or too
heavily; if this is not attended to in this case, and ndeed in every other part of the process of cheese making, a considerable portion of the butyraceous matter will be forced out, and the cheese of course deteriorated. The curd is then weighed and ground in
the mill, allowing about 33 lbs . curd to a 16 in diameter cheese, which, when dry and ready for the market, will take about five cheeses to the cwt. : about eight oz, salt is at this time intimately mixed with every
33 lbs . of curd ; the ground curd is then put in 33 lbs. of curd ; the ground curd is then put int cloths; the cheeses are now put under the serem dr left without any pressure about an hour, after which the screw is applied lightly at first and gradually increased. It will generally be two or three o'clock in the afternoon by the time the curd is ground and pat inder the screw; about seven in the evening it is take rom the screw press, turned, a dry cloth applied, and put under the lightest stone press. On the second day twice, morning and evening, and clean cloths applied each time of turning. On the morning of the third day the cloth is removed, and a little salt applied externally, a hours longer under the heaviest stone little salt being applied each time of turning ; it is then aken from press and remains about three days on the salting stones, where it is turned and salted every morning; the cheese is then wiped clean and dry, put on the cheese turner in the dairy, where it remain about 14 days, more or less according to the state of the weather, and is turned every day, after which jt is emoved to the warm cheese room, and is kept on a aid on the common plaster weeks longer ; afterwards, way will be ready for the market in seven or eight I
I consider there is a great advantage in maling cheese only once a day, and commencing in the go through all the operations careful!y, which could not be the case if the cheese had to be made at night some part of it by candle-light, and from the servants being tired they would be verylikely to slight some part of the process in order that they might get off to bed. It is essentially necessary that there should be sufficient time allowed for the dairy-maid to go through the whole of the process gradually and carefully; where there is hurry le of quanrity and quality. The evening's mi.k must be
cooled, or it would not keep sweet in hot weather, nor would the cheese be so rich and tender. By putting the cheese together at $75^{\circ}$ or $76^{\circ}$ in summer, you pro-
duce a curd rich and tender, and much greater in quantity than if it was put together at from $85-95$ as is done in some dairies. Milk as soon as taken from the cows airy-maids put it t there is a great loss (at all events of quantity) by those who adopt that plan. [The remainder of the lecture e shall give next week.

Miscellaneous
Trial of Reaping Machines at Woolmet.-The following report of a day's comparison of several reaping
machines is taken from the North British turist:

to be equal to the work. The delirery webs being that of Bell's
Lid the grain equally. It cut 2 roods 17 poles in 37 minutes, 0 enacrein 61 minutes. Crosskill's Bell did not operate satisfactorily. than once, causing several stoppages. This defect in workmanship has proved more than once the cause of disappointment and
fillure in this machine. The time taken was not teated. After eompleting their portions in the Wheat field, the machines were atanding, of medium thickness and length of straw, and being no Gore than a fair average crop. Husey was even more decided, and a furor was proanced among the the judges issued the following report:- "The eareful are of opinion that Mr. Markes has not only failed to amard, but that his machine, in its present state, is interior to
any of the others which were brought forward, ,iz., a Croskinill exbibited by Mr. Wilson, Cowden; a Hussey's, altered and ex-
hibited by Mr. Forrester, Stewart Mall; aud a M"Cormack's,
altered and exhibited by Lord Kinnaird. Lacent as rearads the aitered and exhibited by Lord Kinnaird. Lxcept as revards the aceord the buperiority to Mr. Forrester's machine. At the same and surpassed any of its former appearance. Crosskins was so much impeded by failure of parts of the machinery from defective
workmanship, as to prevent the judges from instituting a proper comparison between it and the nore regnlar performauce of fared in showing that his machine is as yet superior either in efficiency or economy, it appears to the judges that, in principle, it appronches that simplicity which is desiderated, and that it maty as further experience may suggest.-Johs Mileer, Chairman."

## Calendar of Operations.

COUNTY WEXFORD, Sept. 11 , OMBER. nprecedently great--price ditto. Beans suffered from here is and have not filled well-produce luxariant Potatoes, especially Primroses, are diseased fionn the same cause in some instances, but half the tubers are sound generally one-fourth is gone. Some other sorts in the same fields lime compost are perfectly cood.
Mid-LOTHIAN, Seph. 18.-Except spring sown Wheat and some part of last week a considerable quantity of rain fell, but for the The crop is being rapidly carried in first rate order, and if the fine weather continues a few days longer, the principal part of it will it secured. Generally speaking grain has bulked well when cat.
It gives promise of a full average yield. Wheat was scarcely of bo good a colour as could have been wished but the sample will
not be injured in any way, particularly as there has as yet been no sprouting. The Turnip crop, which was very backward for nometime, has made great progrese, and may now be regarded as nearly an average.

## Notices to Correspondents.

Eetroor SUGar: A Farmer. The following passage taken from a letter by Mr. Caird to the Times partly answers your ques-
tion; but it must be remembered that a Beet grown here, and one grown in Germany are two different thinss the capitalist farmers of this part of Germany in England any such large capitalists engaged in arriculture the largest scale with those of sugar boiling and sugar refining The sugar factories are very extensive and costly in construc-
tion and machinery, and are managed with great econmy and skill. The business has been established here only about ment of increasing profits, caused partly by a higher price and The gield, which some years ago was as one tor 15, has now been increased to one in 12. The molasses, after the sugat is the premises for fatteaing cattle, finds a ready kale as food for
milk cows at atout 20 s , a ton. The growth and manufacture o the crop furnishes a continnous source of employment to a
large body of labourers, nearly all the year round. The sugar facturer of $15 \%$ a ton, and as a duty equal to 10 s . a ton is levied by the Government on the raw Beet when it goes into the
factory, it would be difficult indeed to name an asricultural crop so beneficial to all concerned with it as sugar Beet. It can
only be produced to adrantage, howerer, on a rich fria, 1 . of the hest quality: but. as under farnurable circumstances the
raw lieet will weigh 20 tons an acre, the gross value of this crop far exceeds that of any other agricultural crop that can
be grown in this northern climate. As a source of revenne to the Government, none of our excisable crops can approach it, been doubled within the Government. The rate of duty has diminishing the progress of this rems, withont in any way Beet, but the baners, or yenman proprietors, generally let their land to the sugar makers at high rents for this special crop." Bentallis Broansiape: Sub. It is to be had at varions prices Crom 7, upwards. Apply to any implement salesman. would recommend hat fomentations twice a dav for some time continued, and a little camphor ointment rubbed in afterwards. ## VALUABLE IMPROVEMENTS IN MOWING MACHINES. <br> BYROYAL <br> LETTERS PATENT.

Under the Patronage of Her Majesty Queen Victoria, and His Majesty the Emperor of the French

## ALEXANDER SHANKS AND SON, ARBROATH, FORFARSHIRE.-PATENTEES.

A. SHANKS AND SON, while soliciting the attention of the Nobility, Gentry, and Gardeners to their A. Horse and Pont MOWING and ROLLING MACHINES, the completeness and superiority of which sre now well known, around flower beds, Nc., and which han now undergone a trial amply sufficient to enable the P'atentepa with all confidence to offer it as the cheapest as well as the most efficient aud coruplete machine extant. The improvements effected by the l'atentees enable the machine to be worked with perfect ease by one person. It requires no change of wheels or rollers in mowing verges; will cut can be effectually regulated in a few seconds by merely turning a screw, and being simple at well as complete in ita construction the machine can be easily worked and managed by a common labourer. The machines are firted with due regard to strengeth and huperior to mowins with the scythe liable to get out of order. The work is executed with great rapidity, and in a manner vastly the turf. The Rolling and Mowing Machine is now in common use at all the Rogal Gardens, Windsor, Kew, Buckinglam Palace and Osborne. Illustrated Price Lists forvarded on application.
N.B. A. Suanks \& Son finding that their Patented Improvements are pirated, beg to caution the public against purchasing Machices with their improvernents without their name and address marked on the Hachines.

NEW PATENT INVENTIONS FOR STABLE REQUISITES.
Awarded a Prize at the Paris Exhibition, and Patronised by the English and French Govermments.

THE Original INVENTORS of the PATENT ENAMELLED MANGER RACK and WATER TROUGH 1 AS ONE FIXTURE, to which they have made fmportant additions, the mafn features of the same being explained in the description and engraving.
A represents the Patent Halter Guide and Collar Roin, the ball ${ }^{\text {or mixing with the food in the manger, is alone sufficient to claims }}$ of which is taken to the back of the manger, works with, ease and
freedom up or down the guide bar, and is noiseless in its operafreedom up or down the guide bar, and is noiseless in its opera-
tion, as also a sure preventative againgt the most restive horbe being cast in the stall. B The Patent Portable Seed Box can be instantly detached
from the Rack without disturbing the hay. The saving of the C The Seed Boxdetached, made of Galvanised Sheet Iror, light rnd durable. D. The Y'atent Saddle and Harness Bracket combined, can be used with great advantage in Harness Roams, where space is an
object, as the long portion of the bracket can be truned up out of object, as the long portion
the wav when not in use
COTTAM'S MANGERS are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, or Enamelled.
Immorsed Stable Guttering, with moreable safety corers, Sanitary Traps, Stable Pumps, Double Corner Mangere, Hitness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show at COTTAIN \& HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

## ©he Garoeners' ©hromicle.

SATURDAY, OCTOBER 4, 1856.
The finest of climbing Roeses is the "Cloth of Gold." The finest of yellow Roses is the Cloth of Gold. The finest of Noiseties is still the Cloth of Gold. And yet how few know it except as a dwarf, grown in a pot or a border, and bearing there a scanty supply of its noble blossoms. Nevertheless it yields to none in the power of flowering, producing, if properly managed, enormous quantities of golden balls.
In the year 1846, while still a novelty among Noisettes, Mr. Rivers described it in the following words:-"We have recently had a fer additions to this class, and two are worthy of especial notice; these have been raised at Angers, from Noisette Lamarque, and no Roses have p rhaps so well rewarded with their beauty the care of a cultivator the first in merit is Noisette Cloth of Gold, called in France Chromatella. One would suppose, to see this Rose in bud, that it could not be a yellow Rose, as the extreme outer petals are nearly of a cream colour, but when expanded it is one of the most brilliant and beantiful of yellow Roses, with petals thick and waxy, bearing exposure to the hottest sun without fading. In habit it is very robust, bearing in this respect much resemblance to Jaune Desprez; its leaves are large, shining, and the whole plant, when in luxuriant growth, most beautiful. While rare, as at present, it would not be prudent to expose it daring the winter in the open border; a soath wall will probably be the best situation for it, as it seems to delight in heat : but when more abundant it may doubtless be planted out as a pillar Rose, for which it is admirably adapled, as it makes shoots four to six feet in length in one season : cultivated in this manner it will doubtless require protection." No statement could be more accurate ; its merits still remain unquestioned, and yet we never see it except under the circumstances just described. Some say it won't flower; some think it tender they are most unjust. It is perfectly hardy, of a vigorous constitution, and will hear no end of flowers when kindly treated.
At Hetbel Hall, in the country of Norfolk, once a seat of the Beevor family, situated in a village of the same name, known to the Jovers of trees as the place where the most ancient Thorn in England is to be found, there exists a specimen of our Cloth of Gold Rose, nusurpassed even in the west of England, where the finest examples of the variety are said to grow. Planted some 10 or 15 years since by the Rev. F. Bickmore, and now belonging to William Birfmore, Esq., the reverend gentleman's successor, it covers half the south-east side of the house, occupyit covers half the south-east side of the house, occupy-
ing a space of little less than 500 square feet. The stem at the ground is 10 inches round ; the vigour of the plant is everywhere in proportion; the leaves present the most robust health, and in the middle of September many flowers as large as the fist still remained to show what the summer maguificence had been. Mr. Wilmam Bickuone infurmed us that
the wall had been one mass of yellow blossoms,
What is the explanation of this horticultural
What How has it happened that a Rose phenomenon? tender, and a bad flowerer, and even no unwilling grower after a year or two has selected for a display of its powers a county not famous for its warmth, and a situation in which no advanta geous circumstances are discoverable. The only pecaliarity in its place is that it stands within two feet of a gravelled road which falls towards the wall and conducts the rain-water to the roots of the Rose after every shower. It is thought indeed, from the swollen and grooved condition of the main stem next the ground, that the scion of the Rose has sent its own roots into the soil and is independent of the stock, an opinion the truth of which we can neither confirm nor deny. We have nothing here likely to have produced such a specimen.

Certainly it is not in Norfolk air, in Norfclk soil, or in Norfolk rain that the explanation is to be found. The secret is good management. This Rose tree is never pruned more than is absolutely necessary to prevent the branches smothering each other. We entertain no doubt that as fine growth, as profuse bloom, and as exuberant health is to be secured anywhere south of the Humber where the aspect is warm, the soil well drained, the border freely acted upon by the sun, and the management the same as Mr. Bicknore's.

This opinion is we think confirmed by the following memoranda with which we have been favoured by some of the most experienced of our Rose-growing friends, to whom we put the simple question"How should the Cloth of Gold Rose be grown :

Messrs. Wood, of the Woodlands Nursery, Maresfield, say:-" The Cloth of Gold Rose grows and blooms well planted and trained against a wall or trellis work with either a west, east, or due eastern aspect, and even north if in a sheltered place where the north and north-eastern winds cannot touch it. Due east is preferred. If planted west the afternoon sun takes its colour from it. It requires no pruning (except the dead wood), but plenty of space to grow, and the long shoots it makes being very pliable can be turned back and trained to the work, and be made a good covering, if on trellis-work. It being a very rapid grower the more room it has to grow the better it flowers. It grows and blooms better grafted on the Manetti stock than on the Dog Rosc."

Messrs. Lane, of Berkhampstead, remark that:-
"The most successful way to grow Cloth of Gold is to plant it against a warm wall (south), and not o prane it."
Mr. Francts, of Hertford, writes to the same effect:-"The Cloth of Gold Rose," he remarks, "we have found flower freely and fine from the first year's buds, but seldom after, appearing to lose all its propensity to flower in its rapid growth. Where it is planted out against a south or west wall, budded on a stock and left to grow on a Briar, it will flower freely every year; its habit is to flower at the end of the shoots and on side laterals, therefore it should be very sparingly pruned. It may be seen to perfection at Earl De Grey's, Wrest Park, Silcoe Wm, Parker's, Esq., Ware Park; and the Rev. Philip Honeywood's, Minks Hall Rectory, where it flowers regularly every year."
Mr. Mitchrle, of the Piltdown Nursery, says: -"I get my best blooms from maiden plants worked low on the Briar ; if they grow very strong shorten the shoots in order to get blooming wood. For early bloom I plant to a south-east wall, worked on the Briar trained like a Peach tree; I then have the largest and most magnificent blooms early in the spring."
Finally, Mr. Wm. Paul, of Cheshunt, has favoured us with the following very detailed relation::To flower the Cloth of Gold Rose surcessfully is one of the nice points of gardening which draws largely on the knowledge and skill of the experienced cultivator. By nature it is a shy bloomer; it grows vigorously, producing fine masses of broad handsome foliage, but seldom ripens the wood sufficiently to flower well. Such being the case we believe it requires special treatment to overcome these tendencies. But what are the facts? It is ordinarily planted in company with other Roses, the Aimée Viberts, the Géant des Batailles, and similar free flowering hardy kinds, subjected to the same commonplace treatment, and then in most cases discarded, because the cultivator while acknowledging its
beauty considers it intractable, and therefore practically worthless. We cannot help thinking that this frequent and inconsiderate dismissal of the finest of climbing Roses is much to be deplored, and shall endeavour to point ont the means of flowering it with the view of inducing more appropriate cultivation.

The Cloth of Gold Rose is in the best position
where not too limited for space-the front of a cottage for exaniple. Choose a good healthy plant
on its own roots and plant it out in the month of May. Secure, first, a thorough drainage at the root next, a good holding soil, well loosened to the depth of 18 inches and not too rich. Roses in general like a rich soil, but here we recommend the use of turf and leaf-mould in place of manure. This may seem a trifling distinction, but it is these nice points in cultivation which make so wide a difference in the results. The plant has a tendency to grossness, and a moderate diet is usually followed by moderate growth, wood well ripened and set with flower buds instead of wood buds. Having obtained this point, care must be taken in pruning not to cut away the flower-producing eyes. Over and over again have we seen the flowering destroyed by the mere fashion of pruning. is well even during the growing season (summer) to regulate the growth by stopping any gross shoots that may appear, thinning out others where crowded, that the sun and air may find free access among the leaves and branches. In spring (April) pruning may be performed. If summer thinning has not been attended to, cut out crowded shoots (also gross, weak, and unripened shoots, unless required to fill blank spaces) shortening the few well and regularly placed shoots but little, for it is not from the base but from the middle and points of reell-ripened shoots that the flowers usually spring. This, again, is not the pruning recommended for Roses general, although applicable to this special case.
"The Cloth of Gold may also be grown as a Tree Rose submitted to the same soil and treatment as sbove described, tying the branches down to a hoop or to the ground to keep them from being broken by the wind. We have obtained flowers on the Cloth of Gold as a Tree Rose ten months after budding by carefully selecting for use flowerproducing buds. Where there is a plant on a wall treated as above described there will usually be no difficulty in sparing a few such for this purpose. The flowering of this variety as a Tiee Rose is however more uncertain than when the plant is trained against a wall, as the difficulty is greater regulating the growth and ripening the wood; the plant is also less conveniently protected in winter, which is necessary in case of severe frost, on accomut of the tenderness of the bark. Against a wall a mat hung over one plant is sufficient protection, allowing it to remain till the sun no longer reaches it.
" We have seen many of these plants growing in various parts of Great Britain and on the Continent, nine-tenths of them flowering but sparingly or not at all. By far the finest ever met with was found trained against the front of a house facing the river Dee, between Aberdeen and Ballater. It was the month of September, and the flowers and flower-buds hung in magnificent profusion, presenting to the eyea mass of large egg-shaped yellow Roses. The waving corn was bright and ready for the sickle, but the deep rich tone of these yellow Roses impressed everything around them case of special treat ment, in which knowledge and attentive cultivation were found triumphing over the mere routine of ordinary gardening.

Let us hope that after these expla-
 nations the Cloth of Gold will at length receive the honour which is so justly due to it as the noblest of the Yellow Roses.

The Hethel named in the preceding remarks is famous for something more than a Rose. Hethel Old Thorn is one of our vegetable patriarchs, a still living witness perhaps of Roman conquest, Danish forays, and Druidical superstition. According to tradition, it is mentioned as "the old Thorn" in a deed dated early in the 13th century; and it is reported to be described in one of the "Chronicles" as the mark for the meeting in an insurrection of the peasants in the reign of King John. We should be much beholden to any antiquarian reader who can point out the Chronicle in which this statement is to be found.

That the tree is of very high antiquity cannot be doubted. Mr. Grigor, who described it with an inexact figure in his Eastern Arboretum in 1841 gives the following measurements:-" At one foot from the base of the trank, twelve feet and an inch in circumference; and at five feet high fourteen feet and three inches; while the circumference of the space over which the branches spread is thirtyone yards. Its trunk is reduced to a mere shell and though somewhat divided, it has none of that shattered appearance which we sometimes observe in the Oak The ramification of the top has assumed a style which we can neither trace in the Oak nor in
any tree of its own species, the branches forming a thick grotesque mass most curiously interworen It is covered all over with Lichen and crowned with
Mistletoe, adding still more to the effect which age confers upon such objects.

Mr. Hudson Gurnex, upou whose property it now stands, adverts in the Eastern Arboretum to a circumstance unnoticed by the author of the work "Not only," he says, "the bark of the hollow tree is as hard and as heavy as iron, but every branch, most curiously intervolved, is a hollow tube, into which you may put your arm, all the interior wood being gone." What adds to the singularity of the tree is that many of the branches are slit up one side, so that they look like planks half rolled up, or as if the trunk had been gradually split asunder into long strips which afterwards turned their edges inwards, nature repairing the wounded surfaces. Similar instances of this peculiar mode of growth occur in the same neighbourhood, which is rich in old Hawthorns; several, for instance, may be seen on Mr. Edward Freestone's property at East Carleton. It would be interesting to hear from those who live near ancient Hawthorns in other parts of England, whether they find this peculiarity in the specimens within their observation. The greater diameter of Hethel old Thorn at five feet high than at the ground level, observed by Mr. Gricor, is caused by the spreading asunder of the involute divisions in question.
We rejoice to add that this relic of ancient times is still in good health, and carefully protected from injury by a fence maintained by direction of Mr. Hudson Gurney.

## IVew Plants.

183. Galeottia fimbriata, Linden Cat., aliàs Batemannia fimbriata, Linden and Reno. Mi.
In one of his catalogues M. Linden published this plant under the name we have here adopted. Subsequently in conjunction with M. Reichenbach he referred it to Batemannia. Whatever may be hereafter the fate of the genus Galeottia, it can never be united with Batemannia, which ought perhaps to merge in Maxillaria. Galeottia, with its great ribbed crest, two-winged columr,
nder nonce, takin in its larger sense as comprising pasides typical Acidia, is not however one with which he is much concerned, except his farm comprise the ho is much of cider and perry, as is often the case in the west of England, when he will occasionally suffer considerable loss. ${ }_{5 i}$ considerable Acidium proper has however some interest for the farmer, because one species is connected with the guestion as to the baneful influence of the Berberry on Wheat. The notion has undoubtedly arisen from the fact that the Berberry is so ofth has been confounded with the rusty appearance which so constantly precedes mildew in Wheat, and which is in fact the young condition of the
plant by which it is caused. plant by which it is caused. ong orange-coloured neeklace-like strings spores contained within a membranous sac which opens above in a radiating manner so as to present a very elogant appearance. The spores germinate as observed by Tulasne, and produce broadly cymbiform secondary spores of two orders. The spores of $P_{\text {uccinia }}$ graminis are produce two kinds of secondary spores. Moreover in EEcidium there are spermatogonia filled with minute spermatia which are discharged in the form of little gelatinous drops or teudrils. In Puccinia spermatogonaare far more rare, but they have been aser
by Tulasne. There is no doubt then that AEidium is as perfect a plant as any neighbouring genus, and cannot therefore with any probability be supposed to be a condition of Puccinia. Authorities besides, whether scientific or practical, are by no means uniform on the influence of the Berwerry, nor has ex-
periment confirmed the common notion. Mr. Knight's experiments were not solitary, and led to no positive result, though in one instance, which if soli tary might have misled him, there seemed to be some
evidence in favour of the effect of the Berberry on evidence in favour of the effect of the Bersery
Wheat. Staudinger, Hornemann, and Jusieu came on the contrary to a positive conclusion that the plant exercises no baneful influence. It should be remembered, moreover, that no districts are more subject un known except in gardens, and that the plant is comparatively rare in England, though abundant in some paratively ${ }^{\text {localities. }}{ }^{*}$
57\%. Species of Ricidium proper occur on many plants of very various orders. Though there are un that they have been multiplied beyond all reason ertain different genius being for the most part supposed to produce its own species. The injury is not always considereble, but in some cases, as $A$ izerione coronaria, Sambucus disadensis, Euphorbia, \&e., the matrix is more or less distorted, sometimes acquiring iu the Elder the peculiar appearance which is known under the name los stag's
Horn in the Ashand some other plants. In these cases the parts affected die as soon as the fungus has attained its fall development, or shortly after, but if the leaves are affected without any general change of structure, the plant if perennial suffers only a temporary check which may be completely remedien the next season. which suffer, buty the leaves are not the only paris sometimes a peculiar nauseous taste. And the species is sometimes so abundant as to diminish sensibly the saleable produce. The fruit of the Berberry likewise is affected as well as the leaves, and is then generally more or less distorted.
184. The spores vary in colour from white to pale orange, scarlet and brown, and the investing membrane which with the aid of a needle may be picked out per lectly entire from the surrounding tissue, varies con siderably in the degree of development and mode or
rupture, and hence in a few cases the species are not easily distinguished from Uredo without atientive examination. M.J.B.

## ON THE INFLUENCE OF WOODED SURFACES

 in Preventing inundations.THE following note, addressed to the Inspector of Foreste by M. Millet, was read before the Sociét Impériale et Centrale d'Agriculture :-
mundations are nearly always produced when a considerable quantity of snow is quickly thawed, or after heavy rains; and above all when these two circumstance are combined. It may be affirmed that an inundation will take place whenever the principal stream and its tribu in a receive more water from their gathering-ground in a given time than they can carry off. Hence it is ocear if the snow or rain-water were subjected to certain conditions which would render their flowing of slow and regular; therefore, the natural conditions, o Which the immediate effect is to render the melting of snow and the running off of rain. water on no occasion meaner too sudden or too rapid, are assuredily the best effectual ones for diminishing their intensity.
Now, wooded ground anites these conditions in a remarkable degroe. With regard to the melting of snow, no one is ignorant of the fact that snow thaws much more slowly on woody ground than ion surfaces

## of thee Henslow's Report of the Diseases of Wheat, in Journal Rnst Royal Agricultural Society; Staudinger on Ergot and

are in the habit of frequently passing through then, will have observed that the beds of snow are some weeks, and in some cases several monthe, longer in thawing than those in the open country. The conse quence is, that on wooded ground snow-water is onil gradually sinking in the ground, and never collecting in large quantities so as to suddenly form a torrent o swell the tributaries of a river. It is quite different with ground that is not covered with wood, and especially with that which is absolately naled. There, indeed the heat of the air, the solar rays, rains, \&c., hasten the thaw, frequently producing in a short time a consider able body of water, which, in consequence of its volume flows rapidly towards the principal stream of the val ley, and causes it to overflow, because it receives more With can carry away.
With regard to rain, this is what takes place: the rain-water which falls upon a wooded surface is, to a great extent, retained on the leaves, shoots, branches, and trunks of the trees, as well as by the underwood and Briars; it is absorbed in a great measure by the leaves, Lichens, Mosses, and by the bark of the cially when it is thick, the rain, even when heavy, only reaches the soil at the end of some hours, and in some cases only after the lapse of several days. These are facts of every-day occurrence, and may be observed all times in the forests of everee- resinou trees, Retained by an almost infinite number
of small surfaces, the water is sometines to a great extent again evaporated, and in any case the por extent again evaporated, and in any case the porabsorbed by plants, such as Mosses and Lichens, and by the humus which takes it up in great quantity. Here is a striking instance of those small causes which, in nature, produce such grand effects. It is only after
having passed through this series of retarding intluences having passed through this series of retarding infuences,
and after having traversed so many absorbent surfaces, that the remaining portion of the raiu-water reaches the soil ; and there again it meets with a multitude of root and fibres which frequently take it up in large quantities, and invariably present an obstruction which prevent it from flowing away too rapidly and suddenly by the surface.
Wooded ground has therefore the effect, as regards inundations, of regulating and distributing the flow o rain and snow water, so as to render it harmless. In nature all is harmony; when the imprudence or avarice of man destroys that harmony, disturbance and woods and copses has prodnced that disturbance and commotion of which we have now to deplore the sad results.

I do not think that the beneficial effecte of wooded ground can be seriously called in question. To deny the offluence of surfaces covered with wood upon the dis ribution and regular flow of water is the same as to deny the influence of light upon vegetation, or that of leat upon the maturation of fruits. If there were stil unbelievers, I would say to them, you have not
observed; observe, and you will of preventing inuud tions; but facts clearly show the uselessness, if not the danger, of artificial works for that purpose. If we wid to master water we must resist it whilst it is in drops, whilst still a rivulet; we must not wait till it beeomes river or torrent. Beaides, great artificial works, even admitting them to be effectual, are extremely expensive. Plauting is also attended with expense ; but the outlay is amply compensated by the return. Lastly it cannot be denied, that to completely clothe the have greas slopes with wood, or at least those pater, is an object that could be effected for a less sum than tha representing the amount of property quickly sacrifieed by the disastrous inundations themselves.

ON THE INFLUENCE OF EXPOSURE UPON the elevations which plants attain UPON MOUNTAINS.
From Alpir. De Caydolle's Géographie BotaniqneRaisonnée. Comparative observations upon the height to which species ascend on the north and south slopes of indi vidual mountains, and especially of isolated mountains are very rare. The most exact travellers have neglected this point of research, or have not met with
mountains favourable for conducting such observations. mountains favourable for conducting such observations, The following are the general results deduced (by M de Candolle) from several very valuable talles ( which we must refer our readers to his work itself).
. From observations taken in Swizerlata the Beed Fagus ascend 564 feet higher on southern slopes than they do upon northern.

Froun observations taken by M. Martins on Moun Ventoux in lat. $44^{\circ} 10^{\prime} \mathrm{N}$. ; height, 6278 feet ; soil, calcareous ; slope, 19,30 towards the north and owards ascend 450 feet higher on the south side
3. From observations made upon Mount Etna, lat.
${ }_{44^{\prime}} \mathrm{N} . ;$ height, 10,908 feet ; soil, volcanic, the mean limit of 13 species, both wild and cultivated, is 1145 feet highie
Now in Switzerland the mean annual temperature Now in Switzeriand the mean annual temperature
decreases $1^{\circ} 9$ for every 315 feet, whence it follows that

20 over one to the north, for the plants ascend 564 fee higher on that exposure. Un Mount Ventoux (a isolated mountain) the decrement is $1^{\circ}$ for every 26 feet, whence a southern exposure there is the equivalen of a little less than $2^{\circ}$; for plants there ascend 450 feet higher on the southern slopea Lastly on Etna the decrement is $1^{\circ}$ for every 274 feet, and the consequent effect of a soathern exposure is about $4^{\circ}$; for plant ere ascend 1145 feet higher on the southern slopes
The great difference between the results obtained upon Mount Ventoux and upon Etna are due to the higher northera latitude of the former ( $7^{\circ}$ ), and this shows that the direct effect of the heating and chemical rays of the sun is twice as great in lat $37^{\circ}$ as it is in $44^{\circ}-47$
Another method of ascertaining the direct influence of the sun's rays upon vegetation is detailed in the fol I wing experiment. "In 1847 "" says M. De Candolle, I sowed in the Botanic Garden of Geneva two series of seeds of annual plants; one set in a place fully exposed to the sun, and 3 feet to the southward of a wall ; and the other in a position half shaded by large trees to the southward of the bed. To appreciate the effects exactly I calculated the number of days required to bring eaci to perfection, and the temperature during these cays, and then multiplied these data according to the method proposed by M. Boussingault. I thus ascertained the amount of heat required for each plant expressed shade. The plants growing in the shade (supposing that shade to have been absolute) would lave received exactly that amount of temperature together with a diffused light ; those planted in the sun have received an apparently less amount of heat, which has been made up for by the direct rays of the sun. Thus Cress, Lepidium sativum in the sun, sown May 24, Howere July 12, ripened seed August $9:$ ditto, ditto, in the hade, sown May 24, flowered July 13, ripened seed August 17. The product of the number of days multiplied into the sum of the mean temperatures for the period between sowing and flowering is in the sun the in the shade 819 ; difference 21 ; which is due to the direct effects of the sun s rays, The product of the period between flowering and fruiting is in the san the and in the slade 646 ; difference
effect of the sun's rays." J. D. H.

## CULTIVATION OF SKIRRET.

The Skirret (Chervis Fro,"Sium Sisarum L.) belongs to the family of Umbellifers. It is a perennial plant with bunclies of fusiform, fleshy roots from 6 to 10 inches in len th, and from to 1 inch in diameter, omewhat crooked, of a russet colour externally, the Hesh being white. The stem is cylindrical, channelled, and frequently exceeds 3 feet in beight; the leaves are alternate sheathing reddish at the base. The flowers are small, white, sweet-scented, disposed in au umbel surrounded by an involucre, with three reflexed leaflets. The grain is oblong-oval, a little curved almost cylindrical, rather thin and narrow, flattened at one of its extremities, and marked with 5 longitudinal furrows ; its colour is brown, sear yellow, or grey-

This plant is a native of Northern Asia; one of its varieties has been cultivated in China from time immeesteen and the property of restoring the vital forces is attributed to it. Introduced to this country in 1548 , the cultivation of Skirret extended in gardens and fields, and the roots were used as a luxury on the tables of the rich. $\dagger$ According to Linnzens it was cultivated in his time in almost every garden ; but at the present day its curtivation has been almost entirely abandoned for that of the Rotato, and to such an extent that it is hardly mentioned, and even completely omitted, in most modern works. It is astonishing that greater attention was not paid to it when the Pota
Among those who have paid most attention to the revival of the cultivation of the Skirret, Professor Sace should be mentioned as the principal. That learned chemist has shown that of all alimentary roots this is the richest in nutritive substances, as is shown by the following analysis :

The Skirret is likewise so easy of digestion that it was for
leptics.

The flesh of the root is white, firm but tender, floary, sometimes, however, a little fibrous. Its flavour is mild, sugary, with a slight flavour resembling that of Celery. A few minutes is sufficient to boil it. It is also eaten fried, and it makes very good soups. M. Huzard thinks that if it could be grated finely whilst raw, and allowed to dry for some time, it would make excellent and very nourishing broth.
In field culture Skirrets may be of great service
t some authors attribute a more ancient date to the cultivation of the plant, grounding their opinion on the fact that TTiberius during an annual tribute of a certain grantity of them; but it appear hat this so-called skirret of the aucients was in reality the
either as a ruot crop, much liked by cattle, or for
furnishing starch, sugar, and alcolio'. The valuable property which it possesses of remaining in the ground without being injured by frost allows of the workmen and teams being employed in the winter stason. But whilst we participate in the hopes formed on this sub-
ject by Messrs. Sace and Huzard, we must confine oureelves bere to the garden culture of this plant.
The Skirret requires a soil that is soft, light, deep, grows remaikably well in ground which has been manured in the previous season with cow-dung, such as that which has been cropped with Cabbage or Broad Beand. On account of the length
should be rather deeply trenched.
The plant is propagated by seed, or by divisions of the roots. The grains preserve their germinative power for two years, according to M. Vilmorin, and for
three or four years according to Rozier and other agriculturists. A pint of the seed weighs $5 \frac{3}{4} \mathrm{oz} .52$ grains and a quarter of an ounce contains 1858 eeeds
The seed is sown broadcast, or better in drille, to allow of hoeing and weeding. February is preferred or making the sowing in the south of France, March in the central portions, and A pril in the north. Nevertheuite hardy. When the seedlings have acquired suf quite hardy. When the seedings have acquired sufinches apart. The surplus plants may be used for transplanting if required. The Skirret may also be proEach division, in order to give a good crop, should be furnished with a bud, and should be taken from a cluster recently dug up, say the evening before, or still better the same day it is to be planted. The plants so propagated are usually more forward in their vegetation than those raised from seed
Wher produce the largest and tenderest roote.
Wred to account by planting them at 8 inche may be turned to account by planting them at 8 inches apart in the kind of soil above recommended. They grow in some seeds from which, if gathered and sown imme-
diately, a root as thick as the finger can be obtained; diately, a root as thick as the finger can be
but this mode is not so good as the preceding
Hoeing and weeding performed pretty frequently and at the proper time encourages the growth of the roots to a remarkable extent ; but to obtain them tender and delicate, which is most desirable, frequent but moderate weather. As the plant is impatient of drought it is a good plan to earth it up like the Potato. Lastly, as authors recommend it to be cut off in order to increise the size of the roots; these stems may be given to natie. Care for seed.

The roots are taken up with a fork. This operation is commenced in November, and continued throughr ut the winter as required. In case of severe weather a
sufficient quantity should be taken up and kept in the root cellar.
In the sonth the aeed ripens in September, bat later in the north. That of the second year is to be preforred. After gathering it should be dried for some days in the sun, cleaned, and stored in a dry place.

From want of aufficient data we cannot state the produce per acre of Skirrets. M. Huzard thinks it considers it superior to that of any other root crop. In his experiments, made, it is true, upon a very small scale, and under the most favourable circumstances, bunches of roots were produeed weighing from $10 \frac{1}{2} \mathrm{oz}$. to
4 lb .2 nz , and on an average 1 lb . $14 \frac{1}{2} \mathrm{nz}$; this would make the produce the enormous quantity of 79 tons $13 \frac{1}{2}$ ewt. per acre ; but this is evidently an exceptional case. There is no doubt, however, that for the quantity and quality of its produce this plant merits, in a high Revue Hovicole, $A$ ur. 1856
[Note. Since the French call this plant Chervis, it is necessary to remarix that it has nothing to do with our
 amall salad named in French Cerfeuil.]

## Home Correspondence.

Orchard Houses-It is to be regretted that your
agreeable and zealous correspondent ss. S ." has not agreeable and zealous correspondent "S. B." has not
succeeded fully in his orchard-house culture; he seems to me in a slight degree to lack practical skill, and has perhaps been a little too careful in shutting up his house, neither has he used the syringe enough. I have Nectarines, and have never been troubled with red spider, owing, I presume, to my simple mode of culture, something as follows: As sonn as the fruit has arrived at the size of a horsebean, my man (not a regular gar-
dener) has opened the house about 7 A $M$, syringed the trees shortly ift $r$, and if required given them some whter; about 6 p.m. he has again syringed them and with me this has not been a gentle shower on the urface of the leaves, bat each tree is singled out and the syringe forcibly used to the under surface of the leares. This treatment has been followed till about have been thrown open and kept open night and day
till the middle of September, or at least till stormy and
windy weather has made it more agreathle to have
them closed. By this treatment my Peaches have not perhaps been quite so early as they would have leed, August last, and the Early Grosse Mignonne ripe the econd week in the same month, but they were large, of good flavour, and the trees with leaves so large a several of my trees in 13 -inch pots, and four years old, Ihad upwards of two dozen of fruit, and they are full cf 1854 I had such a crop of A pricots on my potted trecs that some of the branches broke down with their burthen; in 1855 the crop was less, owing to the trees being exhausted by the too heavy crop of the previous year. This year my crop nearly failed, owing to the
severe frost of March 3lst (thermometer at $18^{\circ}$ ) destroying the greater portion of the blossom, the trees being placed in a very airy part of the house.
friend near Devonport has an orchard house nea 100 feet in length, in which he has succeeded in growing finer crops of Apricots than have ever been seen in that part of Devonshire; it app ars, thereI am inclined to think Mr. Rivers quite correct in recommending Plums that ripen in summer to be placed out of doors ; but this should be taken with some qualification, and applies more particularly to the narmer parts of England, for in an orchard house in the vale of Gloucester, a lean-to built with boards for its walls and well ventilated through the crevices of the boards as well as by its regular ventilators, Peaches have not
ripened well, but Plums (Greengages, Jefferson's, and others, have been of the most delicious flavour, and a dish of Reive Claudo de Bavay placed on the table in November, 1855, was described as quite exquisite. Pears also ripened in the same honse are always if fine flavour. This seems to tell us that in a cooler climate than we have in the near neighbourhood of London Pears and Plums may remain under glass to ripen thei fruit with advantage. I may mention here how neces sary it is to "leave well alone." A friend on talking to out of the pots, to cut off all the roots at bottom that were twisted round the pots and to xepot them ; he lost his crop of fruit, and so did the employer of his adviser. My trees remain in their 13 -inch pots, and have not
been shifted for four years; they are this year I think more vigorous than ever, and their fruit has been as large or larger than in any previous year. Many of measures trees that have borne from two to three dozen regard to Figs, as far as my experience has gone, "S. B." may add the White Marseilles to his collection for the orchard house, and perhaps the Angelique, which I have found a nice white Fig and a grea which I have

Instinct $\uparrow$. Reason.- I was sitting in my dining-room yesterday afternoon (Sept. 25), when there suddenly came ou so violent as ${ }^{\circ}$ quall of wind and rain that I mose from my seat and went to the window to observe the
effect on the trees in my garden. My window looks effect on the trees in my garden. My window looks at once my eye was attracted by some small object running near me. It proved to be a spider dartiog towards the centre of its geometrical web, which was sash, in such a way as to be only partially sheltered from the wind and rain. "Look here," I said to my companions within, "here is a spider whose web is violently agifated by the wind, and he imagines that he centre of the web, and was feeling the radii to discover whereabouts the prey was limed. But no! the wily hunter knew his business better than I. Presently I saw his jaws at work; a cord suddenly slackens and collagses-then another-a portion of the web hangs loose. As an A. B. seaman gathers in the flapping folds of a topsail, so he draws under him the loosened meshes of the net. Onward he advances, warily but nimbly, severing a cord here, huddling together his spoiled work there. After the lapse of perhaps a minute a third part of the web was clean destroyel; but not a single thread Which formed the substantial framework was even slackened. The destroyer of his own handiwork then swung like a pendulum, till the line which sup he hastily retired, carrying the debris with him. What remained of the web was perfect, as far as went, being that portion which was least ex
posed to the weather. It is not for me to say that this series of operations resulted from any reasoning process in the brain of the contemptible insect; but thus much I hesitate not to say that, in my bumble judgment at least, if a human being possessed of the highest intellectual development had suddenly found himself so circumstanced and after due deliberation had decided that his wisdom would be to destroy a part of his machinery in order to mave the whole, he could not have carried out his intention more skilfully than did this poor hairy spinner. If however the latter was guided merely by instinct, will one of your learned reuders kindly favour me with a definition of instinct, as this is a simple, unadorned, uncoloured, and unexaggerated narrative of facts, related by one accustomed to observe incidents in natural history, and aware of the importance of extreme accuracy. I think it necessary to verify my statement by giving my name in full. Tostill exist in and spider alter
nnot Eay. C. A. Jokns, Callipers Hull, Rickmonowort Hybrid Melon.- The Melon, of which I send you pecimen, was cut from a plant raised from a seed of green-fleshed Beechvood Melon; it had no doubt been hybridised by a searlet-fleshed China Melon which grew alougside of it in the same house. An opinion of
its merits would much oblige. W.I., Cranmer $H$ all its merits would much oblige. W. I., Crammer Hall,
Fakenharm, Norfoll. [The specimen sent was oval in shape, measurivg $14 \frac{1}{2}$ inches in girth the one way and $16 \frac{1}{2}$ inches the other. Skin smooth, slightly ribbed, pale green in coloar, very hard and a quarter of an inch thick. Flech a beautiful degp orange, about an inch in thickness, tender, and delicious. Altogether quite first-class variety.]
ymips Quercus pedunculates.-When at Dawlish in Devon, in March 1853, I was struck with the profuse ccurrence of an Oak gall, then new to me, on all the scrubby Oak bushes which about Dawligh form solarge gall, which has already keen so ably described in jour pages, threatens to cause no inconsiderable injury to
plantations of young Oak, and thenefore its gradual spread through the couniry is much to be deplored. That it is so spreading may be gathered from the following notes. Previously to March 1853 I was staying for some time at Weston-super-Mare, but though I botanised much among the scrub Oaks which abound on the neighbouring heights, I did not observe any of the galls upon them. I am, however, informed by Mr. Chas. Pooley, who sojourned a short time at that place this summer, that the gall is there met with at presenc in considerable abundance. Since 1853 I have seasched most diligently for any sign of the pest in Gloucestershire, but in vain, until the present month, when in one of the rambles of the Cotteswold Club T. B. Lloyd Baker, Esq., the president, found several of the galis on the Oaks growing upon the elevated scarp of the Cotteswolda in Uley bury Wood ; and since then, in a ride through Oakley Park the seat of the Earl Bathurst, at Cirencester, I nutice a slight sprinkling of the gall on a small tree in one of the wood rides near the Cathedral Firs. To what extent feel convinced that it is only just making its appearfee convinced hat it ondy just quantities I have seen elgewhere, I should expect that whout some check its spread will speedily be a matter of serious import, aud as anything which can limit its merease is I think a subject worthy of attention, I beg to offer the following suggestions as easy of adoption in the present stage of the progress of the pest. At the present moment the larva of the cynips which is the his globular home, so that from his not yet having eaten his way out the galls are quite without aperture; if therefore the galls be now gathered wherever they may be found and dried the larva is destroyed, and of course with it the fecundity that might have resulled from the perfected insect. Now it has been sugcested that the galls are nearly if not identical with the nut-gall of commerce and in its present state may as much as one-third the amount of gallic acid of the Lest Aleppo galls, a cir cumstance which would repay the cost of gathering them. In the present state of the case, therefore, it seems advisable to instruct boys to gather the calls from the young trees, which, if nut found marketable at once, can easily be kept in a dry state. This operation whilst it will check the spread of the evil will, at the same time, relieve each individual tree, for it must oot be forgotten that vigorous trees become mpossibie if the sap of youth is thus to be expended s the pre like early fraiting will ssuredly bring a out arest premature old age; and thus the King of the forest seems in danger of a degeneracy in ong, whilst the property of the landowner imatiely be promptly attended

Doubtless the subject will receive greater attention by and bye; but it seems necessary formidable for anything of service to be done. J.B.
The Early Grosse Migsonne Peach-Your correspondent "S. B." errs I think in judging this to be the Pourprée Hâtive Véritable; for many years it has been escribed in the Bon Jardinier under its name as avove, nd has always borne a high character. The Peach Pourprée Hêtive Véritable seems to me a myth, for have never yet met with it either in France or England, and yet I have most industriously sought for its ame in all the catalogues of French nurserymen from the Rhone to the Rhine. I have not, however, had an opportunity of contulting either Duhamel or, Poitean. Persica.
Hartley's Patent Rough Plate Qlass.-I heg to inform you thas we do not grow Pines hero. I therefore cannot assist your correspondent who seeks information s to the effect the above-named glass has on Plums, Cherries, Apricots, Figs, and Sirswherries, \&cc., under , Apricots, Figs, and Sins Geraniums, Calceo hrias, Minulus, Fucheias, \&c., in the houses and pits. The winter garden is also glazed with it. I think thereore I have named variety mufficient to test its merits, with which we are perfectly satisfied. I however leave you to judge, from the condition of the things you saw When here, of our success with any of the above named which you did not see. I may however add that I have found plants of almost all kinds to succeed under it per-
atter was of the best quality, as burning would be a ten imes worse nuisance than the supposed slight diminuwould not, however, recommend it for pits or frames without some hesitation) for winter forcing, because you cannot see through it how things are going on.
However bad the weather may be the lights must be pened for that purpose, a practice which does not at all times answer. William Breadley, Somerlcyton. [It was impossible for plants to be in better health than at
Somerleyton early in September. The winter garden, the prettiest thing in England, was magnificent.]
Gas Water as a Manure seems at present to occupy some attention. I have used from the last seven years with the most satis factory results. When convenient, it is used on the land intended for Maugels and Swedes; we have never been able to put it on thin enough for corn, which gets into ear. Where it had been used for Potatoes prove the Potatoes, which it made cun to haulm not improve the Fotatoes, which it made run to haulm. The an Elm-tree hedge, where we never could get anything to grow ; as far as it went, there was as fine a crop of
Stone Turnips as jou could wish to see-on the unwatered piece as usual nothing. If put on Grass the horse shoull move quickly and make no stoppages. I have all mixens saturated with
earth, \&c. James $M$. Ronald, Bromley.
The Singleton Fig.-Can any of your correspondents tell me in what respect this sort differs from the White Ischia ? Judging from its description it is exactly like it in size, in shape, in colour, and in its rich luscious also bears a close resemblance, as it is dwarf and very prolific. The Nerii Fig, which was exhibited last year the same kind. (then of Arundel) and others, seems to that all doubts about the names of fruits should be put at rest as quickly as possible, and your pages are most certainly the best medium we possess for such a pur-
pose. The White Ischia Fig will ripen well in a warm orchard house, with its walls formed of brick, in the south of England; but does not ripen well in a cool boarded orchard house. With gentle forcing it succeeds boarded orchard house. With gentle forcing it succeeds in its cultivation. Observer
Quercus sessiliflora, - I am informed by your correspondeat," A Welsh : Subscriber," p. $470 b$, that
"Llanrwst" in that communication is misprinted for "Lannerch." Some days ago when I was in the Forest of Dean, I was told that it was the opinion of the officers of the forest and of the royal dockyards, that the timber of Q. sessiliflora suffered more damage from the effect of a shot in splitting and splintering the wood in its the same cause. If this be so, then is Q. pedunculata preferable for the use of the royal nayy. But unless the fact has been established beyond dispute by well authenticated experiment, made either for the express purpose or casually on ships known to have been built for direct experiment by officers of the navy or the Ordnance. The results would now be "certain to be and the pieces of each species experimented upon if too large to the admitted into the museum would no doubt be well disposed of in some part of the grounds, with inscrintions explanatory of the mode of experiment and the effect produced. Diss. [It is very much to be regretted that the Ordnance officers do not take this gretted that the Ordnance officer's do not take this means and no one else has. But they must have better Dean than they are likely to find in the Forest of Dean. 1
Arapes in Pots in Orchard Houses.-I have to-day in my orchard house, which weighs $1 \frac{1}{2} 1 \mathrm{lb}$., less half an onnce ; there are still two bunches on the Vine, each of which weighs upwards of 1 lb ; the berries are very pot; its roots have struck through into the border, which is deep and rich. Several other Vines in the same house have borne excellent cropt and produced large bunches. Vitis.
Names of Sirawberries.-So numerous have been the hat I find oneerries raised within the last few years, varieties. This fact alone should, I think, deter any one rom giving " synonyms," which I faucy has occurred in Royal Nursery, Slough, advertises in your last , of the a Strawberry, which he calls the "Filbert Pine," "proved at the Royal Gardens to be the best and most asefnl Strawberry grown." At the July exhibition at Chiswiek in 1854, Mr. Ingram staged some half dozen vamedied "Filbert" Strawhich and among them was one advertised "Filbert," which I take to be the same as is advertised by Mr. Turner. This Strawberry I distinetly recognised as a seedling raised at Manor Farm some years since, and sent out as "Myatt's Seedling"
and by this name I think it should still be known. $W$. and by this name I think it should stil
Page's Blight Composition.- Will you insert a paragraph in the Chronicle soliciting the opinion of gardeners generally whether they consider this useful in deatroyfag inseets upon fruit and other trees. I have myself than 112 hours I found them still alive, whilst I have
destroyed numerous plants by using it. 1 have ur, ed few of the mure important of them. have refused to pay Messrs. Page and Co. for it upon public grounds, as I consider I should not be using my customers justly in offering to sell them an articlo which I myself consider perfectly useless. The opinion of the whether I am right or wrong. Should there be a great majority against it, I think I shall be justified on public grounds in letting them try the result in a court of justice. J. Scott, Crewokerne. ¿We are unacquainted with the merit of the composition. The only report we have seen came from Mr. Gordon in the Garden of the Horticultural Society, who found no advantage in it for himself.]

## Garden Memoranda

Royal Nursery, Slougir.-Hollyhocks and Dahlias have bloomed beautifully here this season. Among the former we noticed very fine examples of Miss Ashley,
soft creamy liush; Aryo, a very fine yellow; Miss Nightingale, pale lemon; and Standard, deep salmon. Among Dahlias, the following fine kinds were in ex-
cellent condition: Yellow Beauty, Duchesa of Wel lington, creamy blush; Lord Palmerston, a very fine deep scarlet; Eclipse, dark purple; Jer!ection, Bessie, Captain Ingram, Colonel Wiudham, Miss Burdett Coutts and Lollipop. One of the new continental fancy varieties Magicienne, crimson purple with white tip, looked as if it would be an acquisition. Among two year old seedlings Lady Popham, white with lilac tip Delta, a fine yellow ; and Saturn, yellow tit ped with cherry, were all fine. The first blooms of the Crystal Palace Scarlet that opened here were very poor; but
as the season advanced they improved. Here, however it grows too tall for bedding purposes, for which it would require to be pegged down
[We cannot say any thing in favour of this, except that it is a good colou and dwarf, not
damp land. Ed.]

Mr. Veitch's new scarlet Larkspur was blooming brilliantly; it is certainly a fine addition to herbaceous plants, as is also Delphinium "Bella Donna," a variety coloured flowers. Among hardy Phloxes, Countess of Home, white with a deep carmine centre, was very good, and Madame Fontaine, white with pale rose centre, is also one of the finest varieties grown.

The different kinds of new bedding plants have been tried out of doors here this season. Among Verbenas the lost for this purpose seemed to be Madame Ab and Jaquinta, deep maroon; Duke of Cambridge and Field Marshal, purple ; Nuel, Lord Raglan, and Pre eminent, scar!et; Mrs. Halford and Mrs. Foster white; Loveliness and Madame Plantamour, rose
Gćant des Batailles, General Simpson, and Crimson Perfection, crimson; Standard Bearer, deep purplish blue with white centre; and Blue Bonnet, pale blue. These are all fine kinds. Victory, purple with a large white centre, is also cme of the best Verbenas grown.
Among bedding Geraniums Almas is one of the finest variegated varieties; its leaves are smonther and thei margins whiter than most others. This is the sort which was so much admired this year at the Royal
Botanic Society's July show, where a basketful of Botanic Society's July show, where a basketful of it bright scarlet, and it appears to stand the weather well Countess of Warwick and Annie are also both good. A dwarf variety named variegated Tom Thumb As bedding scarlets none seemed better than Attraction and Royal Dwarf, both excellent varieties for that purpose. General Simpson is a brilliant scarlet with a white eye, and Lady Downes also appeared to be a good
addition to that clase. Bedding Calceolarias have im proved wonderfully of late. We noticed here two large beds of Prince of Orange in full bloom, a valuable varifty which keeps extremely gay till very late in the were Orange Perfection and Orange Boven; the last is a most beautiful kind. Frecta and Groldfinder are also both good yellows. The best blue Lobelia here for bedding furposes was one named speciosa, a spreading variety with large rich
deep blue flowers. Anong Petunias Dr. Andry, one of the continental striped kinds, looked as if it would be a good bedder ; Springfield Rival, crimson, and Spring field Purple, also appeared to be two desirable varieties for out-door decoration.

In one of the houses Ingram's Princess Royal Gera nium was in full bloom; it is a bright cheerful looking rosy nink with a lighter coloured centre. The ever flowering Impatiens Jerdoniæ was also beautifully in bloom. Pelargoniuma, both plants for exhibition and young stock, were in excellent condition, and the same may also be said of Cinerarias. The latter are wintered along the front of them. Pinks, Picotees, and Carna. tions, of which there are immense quantities here, were also very healthy and strong. In short, both out doors and in, everything exhibited the best of order and keeping.

## Miscellaneous.

Mr. Loddiges' Orchids. - A fourth portion of these fair prices, as will be seen froun the following list of a
 Vanda suavis, 101.108 ; V. teres, 6l. 5s.; Dendrobiuma densiflorum, $7 l$. ; D. anosmum, 4l. 8s. ; Sacculabiuas
furcatum, $5 l .15 s$. ; S. guturtum, $5 l .5 s$; Lrelia autunsnalis, $4 l .178 .6 d$. ; L. Perrini, $4 l$. . 10 s . ; Oncidium Lanceanum, 4l.; Lyeaste Skinneri, 5l. 10s.; Cattleyz Mossize, fine variety, 3l. 15 ss.; C. labiata atropurpurea, Huntleya meleagris, $3 i$ Buthingtia maculata, Paphia tigrins, 3 . Other lots, of which there were in ali 125 , fetched froms 10s. to 2l. 10s. per lot
Fertilising Properties of Boghead Charcoal.-Siese I last addressed you on the fertilising properties of this material mixed as a manure, and its uses in rendering
greenhouse plants almost free from the attaclis greenhouse plants almost free from the attack
of the green thy, I am glad to state that four dozen of my Calceolarias, six Rose trees, and the remainder of my greenhouse plants, with
only one exception, have been free from their attacke Some of exception, have been free from their attack persons, and placed in the midst of other plant wher were covered with green fly had green fly on them in a charcoal plants, however, were not destroyed by thean as was the case with the other plants, and the grean appeared very unsettled, roaming about on them. In the above instance, the situation of the Boghead char coal plants was similar to a healthy person sleeping asnd feeding with a number of unclean people in a confine and dirty ronm, where, in a short period of time, the would be attacked by the same insects which fed on their personal uncleanliness. A putrescent soil and eer. tain conditious of the atmusphere predispose certnim plants to diseaseand the attacks of insects, the plants throwing off hrough theirleaves, \&c., an albuninousexcrement which is the excess of azotis d matter taken up by thet roots, and not aseimilated by them, thereby ettraction insects to them, who by instinct select such plants to ley their eggs on, knowing that they contain an abundant store of food for their young in their juices and on thei leaves. The same plants, however, grown in Boghew charcoal soil, obtain a due proportion of carbon am the former contributing to an increase hlorophyll, flowers, and volatile oils, and the latter to firmaess and strength in their catieles. Patrescemt matters in the soil are neutralised by the antiseptic pooperties of the charcoal, and Moss will not grow poaps a papate, are to be seen in those localities where such beape are placed, which is not the case where there re heaps of charcoal. The acari found in brown sugar, and which cause the grocer's itch, feed on the aibuminous matter contained in it. No acari aro cound in loaf sugar, which is free from slbumiasam matter. Thousands of ants were seen in a dart heap of unrefined sugar, and fed on the all uminous matter unti consumed by them, when they left the carbonaceous part of it in a clear statc. My experiments lead ne to con ceive that, were there no putrescent matters in the world insects would nearly be extinct, as, without them, such scavengers of Nature could not exist. Whea the atmosphere contained a larger quantity of carbonic seid gas, and plants thereby obtained a larger proportion of carbon than they do now, vegetation on the carthas that period was far more luxuriant and healthy. If cleanliness is next to godliness-and if, of late years, in this en, science, \&cc, bave promoted sanitary measure community from the tormenting attacks of insects-why should not sanitary measures, when pursued with regard to yegetaion be attended with equally beneficial result pore the also frem of insects plaals, al ree then a from thats Were sanitan the above 30 tons of flea-powder annually? Having foand bove 30 tons of fea-powder annualy Having foan last year that my beal Melone manure mixed with coal tar, $i$ have tried further expe riments with it. My method is to mix the tar with manure when heaped; and, in preparing the hot berd or Cucumber and Melon plants, oo pour on every 6-inch layer of manure put into the frame some coal tar, at the rate of 2 gallons for each plant; on the anrince of the manure from 9 to 12 inclues of soil is placed, and then mixed with one or two shovelfals of Boghead chareoal. To those who have had their Cucumber plants dis eased, 1 Would recommend the above experment eeling convinced, from the fine-flavoured Cucura bers grown by mae, and the large, healthy foliage of my plants, that disease, where prevalent, would bo prevented. Cultivators, of late yeary, from an anriely of gain, have been induced to over-stimulate certain plants by a constant use of putrescent manures, in order without a due portion of antiseptic carbonacenus matter with such manures, such plants are predisposed to disense and the meteorological changes of the atmophere. My Dahlias, last year, were in a great measure destroyed by the wireworm; this year, however, by the ee Boghead charcoal in the pots, and in the soin where the wire juised to the wireworm has not attacked thern. If, as atabed plants have negative electricity at their roots, and plants have negative electricity at increase of carbon in the soil must, from increasing the amount of carbom in some plants, render them better conductors of eleo
tricity, and, consequently, conduce to their bealdy
growth; whilst, on the contrary, an excess of albumen them bad conductors of electricity, and the albumen becomes more readily deconposed by an excess of ozone in a warm, moist atmosphere. The concentrated state of oxygen in ozone, in is is a is, $I$ believe, to hasten decomposition, and furnish plenty of carbon to vegetation; hence it does good where an antiseptic carbonaceous manure is used. have on former occasions stated disenses in the Vin and Potato prevailed more in the immediate neighbourhood of the sea-coast than inland, which I cannot but consider to be connected with the action of ozone on such plante, grown in a putrescent soil. Ozone, on the sea-coast, is nearly always in excess, and thei sea-shore ure in the atmosphere nearit. All theaboveaccumulating coinciding causes appear to me to exert important in fluences on vegetation. As the results of my experiments with the ozonometer here may be interesting, I beg to tate them to you. In September, 1855, an ozone paper which I elevated on a mast 70 feet high, indicated for par or five days from five six of ozove, whilst another zone. This year, on several occasions the ozone papers elevated at different heights, indicated the least amoun of ozone at the greatest height, and the greatest amount of ozone at the lowest height, as follows (ozonometer 0.10):-

zone in moderation, in a pure atmosphere, conceive does good, but its excess where there are heaps of animal and vegetable matters, \&c., is fatal to man and certain regetation. In the former case, it is like a wine glass of brandy taken in a tumbler with pure water ; and in the latter case, like a large guantity of brandy in the Journal of Gas. Lighting.
The Journal of Gas Lighting.
The I merican Floating Ball
The American Floating Ball Wrashing Machine.This machine, which attracted a good deal of deserved attention at the Paris Exhibition, where very many of
its counterparts were purchased by the English, is now its counterparts were purchased by the English, is now
being manufactured to a great extent in this country, and a depót has been opened, Moore's, 133, in High Holborn, for the purpose of informing the pu'lic as to the nature of its operations. We have closely inspected this machine, and seen it at work. A number of wooden balls,-more or less, according to the trough in which the clothes are to be washed-are set in motion by a handle worked by a lever, and which gitates an apparatus on which the linen is placed This movement causes the balls to rub against each material to be cleansed, and by their excentric action imitate to a nicety all the routine of a washerwoman's daties. In this way clothes are washed far cleaner
than by the ordinary method, and with singular rapidity. The threefold operations of pounding, rubbing, and squeezing are done at the same time; and as the floating balls offer only a limited resislance to each other, the finest fabrics are free from that injury which is consequent upon the ordinary course of proceeding. The wear is, moreover, much less ; and not even a button has, it said, been known to be torn off hy the thousands of the machines now in use thmoghout Europe and America. The consumption of soap is smaller, and no necesoity for boiling is necessary, excepting in the case of extreme foulness. The hants of the operator, which may be a child, are never immeraed in the water, and consequently there is no fear of that blistering, chapping, and bleeding of the fingers attendant upon the poor swasherwoman's pursuits. It seems to us an cxcellent abour-saving machine, and one the permanent character wood with which it is made. Mechanics' Magazime.

## Calendar of Operations.

 (For the ensuing week.)
## PLANT DEPARTMENT

Conservatort, \&c.-Early Chryeanthemums will now be in a forward state, and such as show their buds prominently should be got under glass; if it is desirable to have them in bloom as soon as possible they may now safely be placed where a little artificial that they are placed near the glass, well supplied with manure water, and air given them freely, as anything the shape of cose confinement will soon ruin Indeed the whole stock of these should now be placed although they will bear more of that than most things, it is not good policy to leave them to the mercy of the weather much after this season, unless in favoured localities. It is better, however, to place them in skeleton frames, or in a sheltered situstion where they can be covered in ease of need, than to huddle them too thickly together under glass, or to put them, as is sometimes done, under the shade of Vines. See that tree spider, for if the foliage is allowed to get disfigured at this season the plants will long remain unsightly afterwards. Greenhouse. - See that Epacrises and other winter blooming things are p!aced in a light part of the hoves, where they will be fully exposed to the sun, so
subject to mildew frequently and and anying else diately the pest can be perceived. Water must be very carefully applied at this season, especially in the case of large specimens, for there is much more danger in overplants more active then the weather is warmer and the quently, and never water until it is absolutely necessary Any of the late growing Heaths which may be in wan of more pot room may still be shifted, but do no expose them to cold winds, and water very carefully very rapidly at this season. Get everything requiring t nicely tied ns soun as possible, so as to give the plants a neat appearance, and render the house as interesting as poes
blowm.

F FLOWER GARDEN AND SHRUBBERIES
Where evergreens have to be removed let it be done as soon as circumastances will admit, for the most past. The scarcer varieties of variegated Geraniums should not be risked in beds too long; they had better becomes at all threatening. After potting it will be a good plan to place them on a gentle bottom heat in pit or house where the atmosphere can be kept suffi ciently dry to prevent the folinge being injured. So
circumstanced they will soon become established, when they may be stored away for the winter in a cool dry house where they will be out of the reach of frost. Any beds which may have vecome slabby, and which are to be planted with bulbs or anything else for spring decoration, should be cleared at once and replanted. Keep Grass short and frequently rolled so as in some measure to prevent the growth of Moss and keep the frequently in damp weather so as to render them smooth and comfortable to walk on.

## FORCING DEPARTMENT

partly from an and partly from pipes under the bed, as is frequently the case where the pot system of culture is of which there will be some danger, owing to the in creased amount of fire-heat that will be necessary soon after this season. Provided there are means of stopping always should be, the temperature will be very easily regulated, but where the one set of pipes cannot be worked without the other the botom-heat must be frequently examined, especially where fresh tan has lately been added, and if found to be getting too strong the pots should be slightly raised, drawing the tan from about them. Any excess of bottom-heat is injurious to Pines at any season, and would be particularly so now when the injured roots would
not be so specdily replaced by new ones, as would not he so specdily replaced by new ones, as wouht are growing more vigorously, and no care that may he necessary to secure a steady bottom-heat of about $80^{\circ}$ or $85^{\circ}$ should be spared. Give air rather freely on bright days to plants ripening their fruit, and also to young stock in a growing state, and do not keep the or so warm as to induce anything lize weakly growth according to the amount of light and the state of the of duvg linings, the plants must be kept very close to tlie glass and rather dry at the root, admitting air as freely ns can lie done without lowering the temperature ton
much, for there will be nothing gained by growing plants at this season as freely as it is possible to do in dung heat. Success in Pine growing is to some extent dependent upon having a supply of suitable soil, and fortunately this is not difficult to ohtain in most neigh bourhoods; but the best turf is greatly injured by being cut and carted in a wet state, therefore see to getting a good stnck luid in before the ground gets saturated with protecting the borders from heavy rains, and whatever it may be purposed to do in this way should not be put off until the ground gets saturated with wet. Keep houses in which the fruit is ripe dry and cool, using gentle fires with a little air when the weather is damp and also on cold nights. Be very sparing, however in the use of fire heat after the Grapes are fairly ripe, as most varieties soon shrivel if kept too warm after
they are ripe; but where the fruit is not yet ripe use brisk fires with a free circulation of air. Keep Vines in pots, where the orject is to ripen the wood, rather dry at the root, with a rather warm dry atmosphere, and expose them to all the light possible ; and where the wood is properly ripened get the plants pruned and remove them to cool situation, buk it out of doors see that the roots are protected from too much wet or frost.

HARDY FRUIT AND KITCHEN GARDEN
Attend to fruit out of doors, looking over it frequently and gathering it as it becomes fit, so as to prevent its being blown down and bruised by high winds. Keep
the fruit roow cool and airy; examine the fruit frequently, and pick out any that are found to be decaying Use every possible means to get the wood of Peach ani ivectarine trees mell ripened, and where the walls are flued a little fire heat should be applied until the leaves begin to fall freely. Also if the tress are too thick of young wond, every shnot that will not be wanted at nailing time should be cut out so as to expose those
left to sll the light possible. Attend to former direc-
tions as to root praning, and where this is required get it done at once. Root pruning, however, is not can strise where the subson is such that the roots will be better to lift bottom of the border, as cutting the horizontal roots, although it might check the gross habit for a season, would not induce a fruitful habit. Clear off all crope that are done with, and get the ground manured and ridged up for the winter; also see that weeds are destroyed among growing crops, taking advantage of dry days for this worls, and get every corner thoroughly cleaned, for the weather may soon be less favourable for this sort of work. Keep Celery rather closely earthed up, in order to prevent the plants getting injured by frost.

four scrts:- - (1), The Whitiell Nied Straw, and $(2$, the Fenton-
 tive varieties of Red Wheat, the former yielding rather the
bulkier, though st the eame time the somewhat coarser prodnce of the two. They have all been grown on a light sandy soil; and in every case it has been as atanding crop of bright unmildewed straw. Price 50 os. per 4 bushlels, including the sack. Post-office orders to be made payable at Kingston-on-Thames
Joun C. Mostox, West Moulsey, Surrey.

## The Ggrictiltural Gasette.

SATUBDA Y, OCTOBER 4, 1856.

The proper seed time of Wheat varies according to locality. In Sussex we have known Wheat sown all through April and up till May day, and one of the best crops we ever heard of was of April Wheat sown late in April, yielding 48 bushels per acre o first-rate quality. This was of the harvest of 1855 As a contrast to this we may refer to the practice prevalent some years ago in the higher parts of Gloucestershire, where the young Wheat had brairded before the harvest home. And Messrs. Handy tell us that their first sown Wheat was up a fortnight since; and they "sincerely wish it were possible for them and everybody else to get all their Wheats sown moderately thin by the end of September."
There are two considerations both tending to recommend an early seed time: one is the saving of seed which is certainly effected, because a very small number of plants if well established before small number suffice to stock an acre; and the other winter suffice to stock an acre; and the other
relates to the greater ability of the soil to feed a plant when the demands upon its stores of food are spread over a longer period. A plant of Whea: sown early will not only exhibit before winter comes a bulky growth above the ground, bat it will have sent its roo:s throughout the soil, so that when the period of growth returns, it is in the best possible condition to take advantage of growing weather above and of fertilising matters below.
We do not know whether, if we except the division into spring and winter Wheats, one sort is more par-
ticularly adapted for early sowing than another. The selection of sorts most likely ought to be guided simply by the money value of their produce. That together, may be expected to yield must money per acre. And there are so many claimants of high rank in this respect that it is difficult to give them severally their due. We received two ears of Egyptian Wheat the other day from which we rubbed out 250 grains-probably an unprecedented number Certainly these two ears would yield as much flour as five of average growth-and a difference so great should open the eyes of farmers to the great range of produce which the Wheat crop exhibits as the result of this one circumstance-difference of sort In a letter from Woodford, near Ketterins, wher Mr. Tiney manages General Arbuthnot's farm, we were told that the Red Wheat introduced last year as "Tiney's Success," has proved as profitable elsewhere as it had done there. Among other place to which its reputation has extended, orders have
been received from the south of France, where for quality and for yield it has proved as successful as in Nortbamptonshire. And we may refer here to experiments described by M. Vilmorin in a recent number of the French Journal of Practical Agriculture, when a number of Engli,h and French varietie were tried against one another with various results the English sorts, however, generally proving most productive. The Blood-red Wheat yielded 263 bushels per acre ; Hickler's Prolific, $22 \frac{1}{2}$; Spald ing's Red, 22; Fenton, 183 ; Victoria, 14 $\frac{1}{2}$; while singular to relate, a mixture of all the sorts yie
the most of all, namely, $29 \frac{1}{2}$ bushels per acre.
Red Wheats are, we think, becoming more generally sown in this country than white Wheats; they are certainly less liable to blights and mildews, diseases which appear to affect our crops the more as cultivation increases the fertility of the land. Never theless new sorts of white Wheat also are being in troduced, and we hear of a sort of remarkable excellence as proving exceedingly productive on the same farm to which we owe the red Wheat just named.

Certainly very great service is done by those who succeed by selection, care, and cultivation in thu improving the productiveness of our principal crop.

As a large part of the Barley harvest was in some districts materially injured by heavy rains, insomuch that in certain fields it was impossible to find a single grain which had not sprouted, and where the crop had not been mowed, those ears which had been beaten down grew even more rankly than those which had been cut, it seemed desirable to try some experiment as to the germinating qualities of such injured seeds both as regards malting and sowing. We accordingly selected from a field which was the most injured of any in our neighbourhood a fair sample. Out of 485 seeds which were the subject of experiment there was not one in which the roots had not greatly protruded, or in which the acrospire had not more or less moved. In very few however was it visible at the tip of the seed. The seed was thoroughly dried by exposure to a hot sun where possible, and in the intervals was thinly spread out in a dry room. It was in fact at the moment of our experiment in good grinding condition. The seed was then divided into two portions; 185 were committed to the earth, and the remaining 300 steeped as for malt. In the first case 100 were placed in a pan without any drainage. After 11 days only 17 had sprouted, and of these only 11 perfectly. Of sprouted perfectly, 12 imperfectly, and two only refused to sprout at all. The 71 plants were healthy, and would doubtless have yielded as well as others which had never been damaged. The 300 grains were steeped for 40 hours, and then laid seven days in Couch, the time during which it is not allowed by the Excise laws to sprinkle malt. By some means or other ei,ht of the grains were lost. Of the remaining 292,155 threw out the acrospire withont any root, 42 threw out a root with no acrospire, 31 threw out both, and 64 did not germinste at all, but first turned rosecolonred, as in the Wheat described in a late number, and these were covered with Penicillium glaucum and an obscare Mucor.* The 42 which in malting threw out roots only germinated strongly when placed in soil, but in the greater part of the 155 which had thrown out no fresh roots, the acrospire only increased in lergth, without any further development of roots. On the whole, then, as far as the experiment goes, such seed wonld answer as seed Barley in properly drained land; and for malting, though it conld not be expected to produce a fine - The Mucor was very sparingly branched, with minute phite then sollow of an inch long. The vesicles were first white then yellow, apd ultimately black.
article, as there would be always some mouldy
grains, it might answer very well for domestic purposes, or where a very pale beer was not desired. Indeed some 20 years ago we remember some excellent beer being made from Barley which was so grown as to be unsaieable. In the sample on which we experimented the germination had proceeded far, that were it consistent with the Excise laws,
could they be relaxed on petition, the Barley needed only to be placed upon the kiln to make a very fair article. Thenewsteeping, however, did not seemito do much injary, for the water in which the Barley was steeped roughly tested with sulphate of copper and solution of potash gave when boiled no red tint. The greatest drawhack seemed to be the to germinate again. On principles which we shall mention presently we were quite prepared for a tolerably favourable result, though the following curious circumstance was rather against i
maltiter in our neighbourhood, being completely out of stuck, was ohligen to make a steeping during the hot weather. His floor, from disuse, was perfectly dry, and he neglected to wet it before the Barley was laid in Couch. The moisture was, in consequence, so rapidly extracted from the Barley that it would not germinate kindly, and it was impossible to add any water, as it would have infringed upon the Excise laws. Consequently, it was left till the end of the seven days, and the malt when sprinkled thus became one mass of mould.
It may at first seem surprising that the Barley should be capable of germination a second time, as it is contrary to the nature of most seeds. But it nust be remembered that the seeds of corn are differently constructed from those of other plants. If a seed just germinating is carefully divided, it will be found that the active point from whence the saucer-shaped or plano-convex disc which is in intimate contact with the mealy contents of the seed. As soon as the grain swells with moisture, and the starch begins to assume the condition of
sugar or other chemical forms, this disc, like a placenta, imbibes the nutritious matter and stimulates the acrospire and rootlets into growth. This dise is, in fact (according to Richard, whose views the writer of the present article has adopted after an attentive exanination of the germination of many endogenous plants), $\dagger$ the true radicle, or radicular end, as it is called. The rootlets are merely adventitious, supplemental that is to the true radicle In consequence, though the rootlets may be destroyed and dried up, so as to be capab?e of being rubbed into powder, the true root is still intact and ready to convey nourishment again when the starch is again placed in circumstances to undergo those chemical changes which precede or accompany germination. New rootlets may, therefore, be thrown out, and replace the old ones perfectly, or if the base of the embryo have suffered so that no new rootlets are thrown out, the disc has still activit enough to nourish the acrospire, and longer continued experiments would in all probability have demonstrated the growth of new adventitious routs fiom a higher portion of the axis.

The practical view of the case is of much importance. Did not good Barley realise so great a price, the loss experienced from grown Barley, where it is possible to get it dry without heating or moulding, would not be great. The agriculturist has often wished for permission to malt his Barley without duty for purposes of feeding, and the work is done for him already, and where there was not too great anxiety to carry before the grain was properly dry, there has been no chance either of heating or of mould. We will conclude our observations with a word of caution. It is well known that an equal quantity of malt and Barley mixed together will make excellent beer in consequence of the action of the diastase of the malt upon the raw grain. Some farmers within our knowledge have stated their intention of nsing sprouted Barley in the same way, as a mixture with malt. It would be well for them to ascertain first whether such mixture is legal. $\ddagger$ Such Barley as we examined is really malt, and its use might incur much trouble and expense. It would be well, therefore, to act under competent advice or not at all. M. J. B.

Our correspondents Messrs. Hardy and Son have been taken to task by Mr. Bakeri of Writtle for the faulty estimate, as he believes, at which they $\mathrm{pu}_{\mathrm{t}}$
the disc be considered radicle or coryledon, as its office remaing exactiy the sam
$\ddagger$ Application has been made within our knowledge for permission to kiln-dry sprouted Barley for the use of cattle, with What result we have not yet heard, nor do we quite see the advautage gained exeept there is fear of heating. An ex
perienced excise officer las informed no that there is great doubt about the legality of brewing with sprouted Barley.
the cost of autumn cleaning stubbles. They are not responsible for the whole of the statement which appeared on the subject in this Paper a week or two columns fairly represents and vindicates the state ment which they originally made. Mr. Bakzr estimates the process as costing twice as much as what they put it at. "The expense," he says, "of my operation is as under :-
o broadsharing 4 inches deep-four horses at $3 s .8 d_{n}$
and one man, $3 \frac{1}{2}$ acres per day, $5 s .6 d_{0}$ per acre, In-
cluding irnns of implement
 preading, at $1 \%$ d.
Eingt trusses of atraw, at $8 \ddot{i} \%$
Hood or bushes

Cost per acre $\qquad$
rocess; but it must be borne in mind that the land becomes at und, upon the first crop,
re; the rubsequent effects are visible for several jears, and the
Now this is a very much more costly as well as a much more $\in$ fficient operation than is generally contemplated. What is generally wanted is merely a superficial operation. The paring need not cost one-half so much as is here put down, and neither need the kurning. Of course if it be desired to roast the soil throughout its depth a cost may be incurred per acre exceeding even Mr. Bakfr's or any other estimate, according to the quantity of the material to be burned; but if the object be merely to destroy the surface filth and the seeds which it contains, and spread the ashes, leaving the land ready for such ploughing and other cultivation as may he deemed adrisable before winter, it can be done for a sum less than 20 s . an acre, unless the weather be exceedingly unpropitious. We had apwards of 101 acres of old turf pared and burned parine (it was los less than at $12 s$, to $15 s$. per acre-the burning at $12 s$. an acre, and the remainder, $3 s$. or $4 s$. , was the price agreed on for spreading the ashes. Now, it is absurd to suppose that the paring and burning of stubble need cost much more than half as much as the paring and burning of old turf. In the first place, the paring by horse-power need not cost above $4 s$ an acre, and though it were done by the oreast-plough, it need not cost more than 7 s . an acre. That is what it costs in Gloucestershirethe operation is a common one in the Cotteswold district, and we have this week seen it going on, the master having promised 6s. and the men expecting $7 s$. per acre for it-and if the weather be dry the subsequent burning after the harrows have been over it does not cost 10s. an acre: the whole peration being within the sum named by Messrs. Hardy.

Considfrable displeasure has been excited by the address of one of the judges at the Athlone meeting of the Royal Agricultaral Improvement Society of Ireland. Mr. Torr, well known as an agriculturist of high standing, who officiated on that occasion, took it upon him to condemn the agricultural implement makers of the country for objecting to the competiion to which their implements have been subjected at the annual meetings of our agricultural societies, where from a few hours' or even a few minutes observation of its performance, judges venture to pronounce upon the merits of an agricultura machine.
Mr. Torr is reported to have spoken on this point in the following terms:-"He had to tell them that the implement makers of England had combined and formed an organisation to prevent competition in the implement class. In his opinion they were acting most ungratefully to the Royal Agricultural Society hy pursuing such a course of conduct. Many of the large and eminent makers, in the pursuit of a ery lucrative business, had risen to a position which they did not wish to lose, and feared that if they competed they might be beaten by some one of the ittle fellows. The originators of this combination pparently masnanimous declaration to explain away the apparently magnanimous declaration that they did oot want money prizes at all; but the truth was, that they desired to avoid competition and exhibi tion altogether. He held that where there was no competition there could be no sure test for decision pon merit.
Messrs. Howand, of Bedford, very properly, as it appears to us, protest against the unfairness of thin combination to prevent competition, the reverse is the foct in proof of which a deputation of the leading frms waited upon the council of the Royal Agricultural Society of England, in November last, urging the scciety, among other things, to grant a more extended
trial to, and a more minute inspection of, the implements and machines for which prizes were offered.
That to which the implement makers are opposed is the system of awards altogether without, or with not be credited that at agricultural meetings of the present day the relative merits of agricultural inm plements were decided frecquently without trials andficed for the trial of a chaff-machine, 20 sheaves for a threshing-machine, two or three bouts for a plough, and 20 yards

It is plain that the classification of implements, by which one divisiun only of the whole series
tried each year, is a great improvement on the system which has hitheito prevanled. A full and adequate trial of their machines is what manu-
facturers have desired, and their efforts to obtain it facturers have desired, and their efforts to obtain it
have gainerl very considerable success in the arrangement to which they have led, which was first adopted at Chelmsford, where a portion only of the imple ments were submitted to examination-an examination trustwortliy in proportion to the greater time
and attention which were thas secured for it. So far from their customers having any reason to
sympathise with Mr. Torr in his mistaken criticism on this movement of the agricultural machine makers, they have every reason to be satisfied with the result to which it has led.

Messrs. Howard add: - "The new arrange ment was for the first time carried out at the
late meeting at Chelmsfurt; and the order and regularity with which the trials were conducted
contrasted most favourably with the prcceedings of former meetings. We think that all who Witressed the trials at Chelmsford must have been convinced that the new arrangement was a great improvenient, and worthy the adoption of other
agricultural societies. It may be argued that other societies cannot afford the expense of the $n \in$ cessary testing apparatus, nor the time and cost of lengthened trials. If so, they had better not offer prizes; for in such matters what is worth doing at all is worth doing well.'

FAILURE OF THE SWEDE CROP The injury sustained by the Swede crop must be seriously felt, and the failure will be greater this year than
it has been for many past seasons. When the plant was yet in its infancy the fly began its deatructive work with great energy, causing a deficiency and in many cases a
tot il failure of the plant. This was succeeded ty the long drought of July, which completely dried up and withered the leaves, leaving scarcely any signs of vegetation. common Turnip is but little better 'Th, theught the which presented itself was the Black Palmer, though however, scarcely disappeared when the grub a tacked the plants, leaving the ground almost in a state
nakitness. This grub gnaws the roots of the Swede. have not as jet noticed it in the common Turnip, but it has sadly destroyed the C'arrots in the same manner as the Swede. Seeing the many evils to which this root
has been exposed this season, the failure is not to be wondered at, and our only way to evade the evil is by inding a substitute.
Many persons advocate the growth of Potatoes, as they are a better paying crop and leave the ground in
a clean state for the succeeding corn crop, but they are not generally used as food for live strick; moreover it is an uncertain crop, being liable to disease.
To raise a good crop of potatnes we require a very equal temperature, which we seldom experience in this uncertain climate. Farmers are generally hecoming more alive to the real value of the Mangel Wurzel, it being more extensively cultivated, and is this year One of my reasons for writing on the present subject is to show that the Mangel Wurzel root may be made a good substitute for the Swedich Turnip, which is year by year becoming more difficult to raise on land which gressive depreciation take place both in the quality and quantity of this root, not to speak of the numerous may say an established fact, we can only remedy the maysay an established fact, we can only remedy the crops. The Mangel Wurzel root is the first which presents itself to our notice, and I will now speak of the
advantages it possesses over the Swede and other roots. Firstlys it porssesses over the Swede and other roots.
is particularly advantageous to its growth, as it flourishes without interruption in a
showery season and moderate temperature like our own, and it also withstands a long drought better than any other root crop, as it is able to support itself by deriving moisture from the atmosphere. Then, sgain, it is
seldom injured by the insects which infest the Swede crop, such as the fly, grub, \&e., and the reason why it its not so sabject to be damaged by insects is because of its rapid growth, they not having time to destroy it to loss of plant should occur the deficiency can be supplied by transplanting the root after they attain a good size.
fingers and toes like the Swede, which renders this root highly valuable to those who cannot grow the
Turnip through want of chalk, lime, or marl), which is always an expensive operation for the tenant farmer There is not much difference in the expense of cultiva tion of the two crops, but in the yield Mangel Wurzel
will prove most valuable, as with the same culture and will prove most valuable, as with the same culture and one-third more Mangel Wurzel, that is, to say, if your soil was good and climate favourable
It can also be grown with as much success after a catc must be in a state of clean the Swede, but your land you to give more than one ploughing. It may ke sown as late as the end of May; one advantage of late sowing sown early, lesides being able to cultivate them after cattle crop.
This root will also keep in a state of perfection for many mouths, and is highly valuable as winter food fo eattle, possessing more nouriohment than the Swede that it is not fit for feeding purposes until after Christmas, and some go so far as to pay not till the following spring, but it has heen discovered that the cause of its no agreeing with cattle did not arise with the roota
but in the mode of application. By giving with them sut in the mode of application. By giving with them counteract the relaxing effect produced by the Mange then the real feeding value of this root will be obtained Carrots are said by some to be a good crop to cultivate instead of the Swede, but are very
grow as a root crop for feeding purposes.

Upon the proper rotation of crops the main succes agriculture depends; will it not then be attende change the roration of our root crop? has induced me to write this article that it may be th means of arousing the attention of agriculturists to a leneficial to the agricultural community. John $J$. E Robertson, Bursledon, Southampion.

INFLUENCE OF EXAMPLE ON IRISH AGRICULTURE.
farms ean so live, how might they live, what might they not net were the land brought under a better economy? Example is more than any other the one
thing needful; and farms well conducted dotted over the land would certainly do much good. A farm of a hundred acres here and there would fully answer the purpose; a larger one would not convey the lessons we would inculcate to the smaller holders of land, it would not be suitable to the extent of their holdings, and a emaller one would not pay for its managenent. I ahould be glad to undertake such a one; I have the heart for the thing, and I trust the capacity for it, but I have not the capital. Would any one make up this deficiency and join me in the undertaking? $500 \%$. would suffice for such an essay; and with this capital on 100 acres I have every confidence that over 20 per cent. would be cleared. would guarantee 10 per cent. as the minimum of his share to my sleeping partner, and this l could secure on a small income of my own. J. M. Goodiff, Ecrably, County cavan
P.S. By Mr. Butt'a census of 1835 the average value of produce in Great Britain per acre amounted to 4. 7s. 1. , while that in reland was only $2 l .98 .3 d$. Is value has not increased in Ireland since that year. From the failure of the Potato, and the late distress of the people, I should think it had rather deteriorated. The extraordinary prices of the last two years are exceptions.

## Home Correspondence.

Boydell's Steam Locomotive.-I think "W. B." misunderstands the nature of a wheel when he says, "the fulcum is the bottom of the wheel where it rests on the round;" and that "the velocity of the top of the wheel is couble that of the boltom. The fulcrum of a of a wheel is precisely the same at the bottom as at the top, or any other part of its circumference. [This is confounding angular velocity with actual movement orwards-unless the wheel drags it is plain that when at the point of contact.] There is no witchBoydell in trying the experiment, it may benefit Boydell in trying the experiment, it may benent the frame of a four-wheeled carriage so that it hangs plumb with the centre of the axle; then move the carriage forward 6 inches, and they will find that the top of the wheel has moved 6 inches on ore side, and the bottom of the wheel 6 inches on the other plumb line. Their velocities are equal, and it is utterly impossible it can be otherwise. Mr. Boydell, at p. 572 , states the power of the engine equal to drawing 4080 lbs .
over a pulley 132 feet per minute. This is $538,560 \mathrm{lbs}$. over a pulley 132 feet per minute. This is $538,560 \mathrm{lbs}$. raised it foot per minute, or exactly 16 -horse power. Now, it is clear that no combination of machinery can increase the power, and if Mr. Boydell will apply the dynamometer and ascertain the strain required to dray the p'oughs at Hounslow he will find the loss enkailed hy using his engine to be enormous. But he will add to the value of the experiment if he will apply an indicator to his steam cylinder and ascertain the power required ept clear of the groun the whole engine. He will then see more clearly the mistake he has made in using such a machine for steam ploughing. I think "G. P. S." makes an error when he states-" The equal to the friction or bite on the ground of its driving wheels;" he ought to have added "less the power required to move the engine itself," because the friction of the driving wheels on the ground varies with the nature of the ground and the weight of the engine; and these may absorb the whole power of the engine, soas to leave no tractive power. I am afraid this is nearly the case with Mr. Boydell's engine, that the neas the the ther is used greater part of the power produced in the boler is machine, and it never can be an econoto mave the machine, and it never can be an econo-
mical means of steam ploughing. R. S. N., Gatcsheadmical m

Labour and Poor Rates.-Being a constant reader of your Paper and a tenant farmer in England, I have been expecting an answer to Mr. Martin Doyle's asser tion of a fortnight since, " that in England the price of labour is regulated by the price of bread." Thi assertion is utterly unfounded, and were he in my position Mr. M. Doyle would soon find out the well-known fac that labour, like every thing else, is only regulated by the common rule of supply and demand. in your last week's Paper Mr. M. Doyle compares the carrying out of the Poor-law in England with that in Ireland, praising up our benevolent plan as compared with the harsh lans I can assert that the Irish plan is far superior to the English, and that our present system is the curse of the country; we are daily getting nearer to the old system, and our population is and will be, "till we adopt he Irish plan," steeped in pauperism. Mr. M. Doyle quotes cases; he is quite wrong in thinking the guardians rught to have given out-door relief; they did what was ought to have given out-door reles, for private charity but not for poor-rates. If Mr. M. Doyle lived in a country parish in England he would soon see how the country parish in England he old man pauperises his giving out-door reliet to one old man pauperises are that the improvident thould suffer; let us with poors rates keep such improvident persons from atarving by "tiving them indoor relief, but we must leave the rest
yreat innorance of England in the present day, 1 hope
that you will enlighten our minds with an article in your Paper to confute these statements, which are liable to do mischief not
Eurly Harvesting. -The extreme importance of early harvesting was never more apparent than during this tempestuous weather, which threatens to prevent the altogether. Seed time, growth, and harvest may be compared, in a sense, to a voyage. It is of importance in the one case as in the other to bring the business to a apeedy, safe, and satisfactory conclusion.
harvest is not safe, and it is not always satisfactory, The grain is often shed in process of cutting, from over ripeness, to an injurious extent. It is shed by the
wind; it is consumed by birds and vermin; it is injured by the occurrence of foul weather. The loss is both direct and indirect. The undue continuance of the grain unharvested occasions great anxiety. It prevents the preparation of the soil for the forthcoming crop. sprouting and the green Grass growing up amid and into the corn sheaves, the rain of the hopes of the hasbandman, and the consequent scarcity. rule, a late harvest-cutting is wholly unnecessary. It has been proved by experimental trials by competent persons -trials of which the particulars have beengiven in various journals-that it is not necessary, in order to realise
the createst produce, to wait until the crops shall be what is termed "dead ripe." These experiments are detailed, for example, in the Gardeners' Chronicle. It has been shown that crops, i. e. corn, cut green, gave as great a yield as when they were cut dead ripe; and and weighings, and otherwise testing the yield, that that yield was greatest and most satisfactory when corn was reaped when the stalks or stems were on the turn ut partially xipe, as it seemed, that it winnowed and cut partially xipe, as seemed, haty whowed and ripened in the sheaf, and it was ready to remove off the ground perluaps by the time that people practising the ordinary dilatory process would be thinking of cutting
their grain for the first time. The great importance of an early harvest is otherwise apparent in the circumstance that as the grain would be ready for the sickle and come in at different times, the work would be distributed over a longer period, and the same pressure for hands would not be felt as now when every one almost wishes to cuthis grain at the same time. There is obviously a greater choice of weather also. It is not long since I saw the grain over a wide
tract of conntry, if cut early, quite ready for the sickle; but kept waiting for the dilatory period when certainly much of it would be lost. As it is, the yearly and collective losses from dilatory harvesting are sometimes enormous, and quite beyond my that the grains which are raised in an early district will ripen earlier if sown in a late district, than wonld seed which was raised in the late district. For this and other reasons, then, it will be desirable to judicious eed often. The advantages of early and verising the soil, and prompt reaping are well known. They all concur in furtherance of the practice of early harvesting. Great however as is the importance of these and other procedures, past, present, and to come, the resting eaxly harvesting I look upon as more important than any of them. Indolence, prejudice, and the most unwarrantable dilatoriness in this cold, wet, precarious climate are the means of yearly taking the bread out of the mouths of thousands. As a general rule the month of August should show the great majority of the grain-bearing sields denuded of their produce. And assuredly no reaper's of corn in any situation should await the windy rainy weather of the autumnal equinox. Henry
2M'Cormac, M.D., Belfast, Sept. 28.

## Bocieties.

Wicton District, Sept. 24.-At the annual meeting of this Society presided over by P. H. Howard, Esq., of Corby Hall, the Chairman in proposing its prosperity spoke among other points of agricultural interest on the adulterntion of food and the cost of manore. He said:Many of the periodicals which devoted their attention to the
subjeet had seen with regret that the supply of Wheat and other
 smailer towns-had bien serionsly adulterated. The profit of compositions of much of the bread and tood supplied ot othe
Iohabitan's of large towns particularly. By this means the
In firmmer was defrarged of a portion of his. proitst, and the thealth
of the consumer endangered. In France, severe laws had been made against the eadmiverrere of alum and other deleterious com-
pounds with bread. He believed that in England laws sonewhat similar existed, but they were aimost incapatle of being enforced He trasted, however, that during another session of the Legisla-
ture public attention, and that of Parlisment ture public attention, and that of Parlizment, would be directed
to this subject. He would now for a moment glance at a subiect to whish his attention had beendrawn moment glance at a subjectect of Lord stanley
Lond stanley made a speech on general agricultural subjects, but Lond Stanley made a speech on general agricultural surbjects, but he thongtt that he hat omitted to look near home,
patt of the surfice of the county of Lancaster was

 not be safely recommended until it
nore severely and accurately tested.
[On this we must observe that Mr. Howard seems to have mistaken the design of the remarks to which he refers ahove. Our object certainly was anything rather than to encourage the farmer to believe that in successfully compete with guano and so cheapen it.]

## Farmers" Clubs.

Wirlisworth. - The following paragraplis conclude Ir. Abbott's lecture on Cheese
The Dairy Room. - It is very common for farmers to make the cheese in the kitchen, where all the cooking and washing operations are carried on. There is much error in this; it may do very well in the winter
months when warmth is required, and when the farmers generally make but little cheese, but in the summer gronths the cheese ought to be made in a room sladed rom the sun, with little fire, and no cooking or washing for the family to ba allowed, and everything kept perfectly clean and sueet, as milk is more easily contaminwith the slightest impurities than any other substance made, and also bept in it, or an adjoining room which is cool, say about $50^{\circ}$, and free from draughts or currents of air, for two or three weeks after it is made so as to dry gradually; for if it be taken immediately to a hot room the sudden change will cause the tender cheese
to crack, and be a source of troutle and annoyance from
he cheese maggot
The Chase Room-or the room where the cheese
dried and got into that state which makes it ready for the market. The room should not be very warm, for if such is the case it will cause some of the cheese to rise and injure the flavour. I think the heat of winter below $50^{\circ}$ there will not be much harm done to the cheese. Light should be excluded to prevent the mischievous effect of the fly, and I think it is best to exclude the air also
I do not promise you that by adopting this mode of making cheese you will always obtain the best price in the market.* Perhaps some few others who make upon the old system may get as much per ewt. as those who make according to this plan. Nor will you be able to make every cheese of the dairy of uniform flavour and quality; 1 consider the latter to be impossible under any system, for there are so many things that affect the quality of the milk, such as the different plants in pasturage, Turnips, the dressing given to land by artificial manares, close, hot, sultry weather, \&c, all of which seriously injure the flavour and quality of the milk before it is drawn from the cows. But I do believe that if you carefully carry out this method, you will make very fat cheese, and about a fifth more in quantity than some of the old systems of making cheese.
Some one may ask, Why is it that cheese made on our system, being so rich in butter, does not fetch a higher price in the market than others? My answer to that question would be this: That I never yet found that the consumers gave much preference to very fa cheese (at least the great bulk of them); they have been accustomed to cheese modera ely rich, and from long use they seem to prefer it, or at all events to like it quite as well, as far as my experience goes. For seems to take the lead, and fetches a hige cheese, coloured I nems ta tare the lead, andrethesa high price there; now futter, faw a cheese that kuality of the mill or what is more likely, from the excessive heat in coagulation, too much skewering and manipulation in the process of making, the large Cheshire clieese is comparatively poos
in butyraceous matter. The Cheshire dairy farmers in butyraceous matter. The Cheshire dairy farmers
seldom exceed three cwt. per cow. Therefore, if by making rich cheese on the method I have stated, you cannot expect a much higher price per cwt, yet you will be anply remunerated by the extra weight which you will have for the market.
A friend of mine, (Mr. Charlesworth, near Longnor, has adopted a different mode of cooling his milk. He has laid down in a cistern, through which a constan stream of cold spring water is directed, about a dozen yards of leaden pipe, half inch bore. The milk is made to pass.,through this pipe, and in doing so, is cooled down sufficiently for keeping sweet.
In concluding this subject I will state some further
Some farmers, who protess to get a great price for their cheese some farmers, who protiess to get a great price for their cheese,
are in the habit of selling for so muel, and return perhaps ab

na labour the latter sustains by keeping the cheese such a length
$\dagger$ This is owirg in part to putring the cheese together at a low
 lation, or "coming"- to using the curd-gatherer instead
gathering with the luands- and last, not least, to grinding the curi gat hering with the lands- and last, not least, to gri
in cue curd-will instead of crushing with the hawd.
farticuars of my plan. All my cheese is entelel into book, an account kept in a tabular form, stating each day the quantity of milk in gallons, the heat when put
together, the quantity of curd in pounds, and the number of cheeses made of each size, and such remarks made upon each day's make as.'may be considered neceseary.
Every cheese is dated, with a character for the month and figures for the day of the month, so that I can refer o any cheese at any future day (while in my possession), and tell how it was made.
For marking the cheese I use the letter U made of wire for the month, which by altering its position, will serve for every month in the year, and figures made of the day of the month. Thus, for

## Feb. 20th-C25 Mar. 25th-25

## pril 25th-25 , \&

I could refer you to different parties who have adopted this mode of making cheese who now make a first-rate article, where before they found it impossible to make cheese "stand," although on other f

On the place I now occupy, my predecessors procured the most experienced dairy-maids from different parts of the county, and yet could never make the cheese do vell. Any one may examine my dairy and see if such is the case now. This shows the importance of the system where there is difficulty in making the cheese stand."
It has always been my plan to purchase small cows for the dairy, believing them to be the most profitable. For instance : two small cows make together from eight to nine cwt. of cheese per annum. The large deep milking cow would probably make in the same time from 5 to 6 cwt , but would consume quite as much ood as the two small ones put together, and sink more in value. This I have proved by experiment; consequently, I decidedly preter the small cow for the dairy
My dairy consists of from 30 to 40 cows, and average cow per annum, about 575 callons of milk, 740 lbs of curd, and from 4! to $4 \frac{1}{2} \mathrm{cwt}$. of cheese.

## Miscellaneous.

Testimonial to Mr. Mechi.-A proposal is on foot fort Cestrimonial to the enterprising and hospitable owner of of whether everything that Mr. Mechi does at Tiptree in the way of practical farming, is so correct and perfect that it ought to be followed up everywhere, and his dogmas universally adopted, it must be admitted, even by those who sueer aud doubt, that he has done a reat denl for the improvement of agriculture. Feeling his, a committee has been formed, comprising Mr.
James Beadel, Mr. H. Dixon, and others in this county, Mr. Allen Ransome, in Suffolk, and several eading agriculturists in other districts, with Mr. Eatson, of Combe Down, Bath, as chairman, to give expression to the public "aprreciation of his efforts to assist in agricultural progress as well as his undeviating hospiality. A purpose thus modestly worded is ca culaced tural improvement-all who have sat as guests at the annual festivals of Tiptree; and it is to be hoped that the subscription, which is to be confined to a guinta each, and to close at the end of the year, will place in the Hall some memorial of the "yatherings" that will (o) credit to the agricultural spirit of the county.Chelmsford Chronicle.
Agriculture in France holus the first place in the production of national wealth; it employs 25 million 3600 millious of pounds. This inmense mass of produce, in which Wheat figures to the amount of 56 million pounds is, nevertheless, not sufficient to prevent he country from going abroad to make up the 1815 to supply of grain. On striking a balance amounting, in round numbers, to 140 million bushels, and the exports, amounting to 70 millions, it is plair that the production of the country shows a deficit on the whole, and that it has been necessary, on the average, siuce 1815 , to import into France, annually, 2, 450,000 bushel of Wheat, representing a value of from 600,000 . to $800,000 \mathrm{l}$, if the purchases were made at ordiuary prices. Unfortunately the deficit does not occur with thi annual regularity, and the danger consists harvests ancertain intervals at which these insufficient bushels recur. There were upwards of 2 1854. On such oceasions the prices rose immoderately; thus, in 1817 , he average price of importation was 10 s. a bushel, an in 1847 it rose to 248 . At other times the excess of the harvest did not allow of importation. We four, able to export to England, in 1848, of Wheat and 000 , to the value of $1,200,000 l$ l., in 18 189, 1, $1851,2,800,000$. Unfortunately, lwoking carefully into the matter, we find that the prices of exportation did not repay the coat of cultivation ; in reality, we exportwas at low prices, and obtained from abroad what was, amounting high prices, causing ene year 1847 alone Official stistics show that altogether, from 1815 to 1847 a period fors from abrod 144 daye subsistence, at a cost of 400 million pounds In Fravee, the cultivation of Wheat extends over abou 50 million acres of our best land. Anmually, nine millions of acres are under Wheat cultivation, pro-
ducing on an average 13 bushels per annum, making
about 200 million bushels. This rate of produce is distributed very unequally; some special acres producing 44 bushels, others only seven or eight. The general average in the department du Nord is 23 According to the opinion of men best qualified by practical experience in drainage matters, it is calprataled that there are 15 million acres of land under Wheat cultivation which are capable of being drained ith adrantage. These figures are below those of our mesule, Mons Garean, given in his report on the Drainage Law of 1854 ; they scarcely come up to the Drainago calculations of Monso Herve-Mangon, as shown in this Etudes sur la Legisiation anglaise, whist they gree exactly whe "ocording to the most his "Trates de Drainage. According to the most moderate surpesin, wil promote the application of draicage to five minion which is capable of deriving sure benefits from it. Wheat will cover every year $12,500,000$ acres of those lands, upon the supposition of a four-course shift, as generally adopted in France. All agriculturists and economists agree to estimate the increased value of the harvests that would arise from drainage, especially in over $2,500,000$ acres, this increase amounts to 11 million bushels. The influence of 11 million bushels on the Wheat harvests of France, turning the scale of our markets precisely at those times which would otherwise have been times of scarcity, will be immense We shall find in this resource a guarantee agoesties and sufferings of the masses produced by dearth of Such periods of dearth, you are well aware produce at times the most serious political embarrass ments, and place our public finances in a critica condition. If this be so, are we not right in saying it is a question of national importance! From the Repont of Comie de Bryas to the Legislative Body on the slat Loan of $4,000,000$ l. to French Agriculture

Notices to Correspondents.
Disease ty Pigs: A Corrorphent describes his case as follows some wash containing refuse brine mixed with their meal they did not eat it heartily, so that on the 17 th there was very little wash put with their food. This they ate tolerably O the morning of the 18 th one of the pigs was observed to be
continually rubbing lis head and neck against the tronglo, and he very goon became weak and stupid. Bleeding-the vilga remedy for most diseases of pigs-was tried, bit the animal rapidly grew worse, and we son decided to kill him to sav his life. He bled pretty well, and the meat proved quit tomach was full. By referring to 'Youatt on the Pig,' think this must be a case of what he calls Gastro-enteritis, a he extracts an account of a very similar instance mentioned in th Veterinarian' for 1811. The rest of the pigs, although fed wit caution of feeding them lighty for a day or two afterwards." Gox Sand: Humulus. We do not know what it is.
together, and add to it 3 cwt . of Peruvian gnano to as much of the compost as yoll can afford per acre. Mix it weil, and spread 2 quarters per acre now-or 3 or 4 cwt. of it in spriag having previously treated it with 1 cwt . of sulphuric acid in Hosses: Eiquus. Carrots and good Oat straw are a fair substitute 10 lbs . of Oats a day
Malx Coonss: A Coro-keeper wants the experience of any of ou readers who give malt coombs to their cows. He says "ralt
coombs or grains:" they are two different things. He will find a bushel and a half or two bushels of grains a day to large cow, along with other food, productive of milk. O malt coombs we cannot speak from experience

CHARLES TURALWA Y PEACH. Oducing this very valuable new variety, raised by Colonel Salway, Eghama Park,
st the Royai Garrens, and Mr. ING
lowing testimonial as to its merits.
(Copy) THE SALWAY PEACH.
"I am pleasedt obear testimony to the excellence of this new
LATEE YELLOW PEACH. It is a variety uqite distinct from
other late kinds, both in appearance as well as in the texture of other late kinds, both in appearance as well as in the texture of
the fruit. The flesh is of a deep orange colour-like that of an Apricot - soft, melting, and separates clean from, the stone. The froit is good size, and ripens on the open wall the beginning o
povember. The Salway Peach will be found \& valuable acqui-
Non kition, owing to its lateness and good quality.
"Royal Gardens, Frogmore, Sept, 23, 1856." homas Ingram. In the "Florist" for December, $1854, \mathrm{Mr}$. J. Powell of the
Royal Gardens writes:-"The fruit is round, skin deep orange Royal Gardens writes:-it The fruit is round, skin deep orange,
tinged and mottled with red on the sunny side ; flesh orange tinged and mottled with red on the sunny side; filesho orange
tinged with red at the stone, melting and juicy, witha a higlily yerrumed flavour. It is a perfectly hardy variety.
There is every reason to believe it will be an excellent forcing rariety, as it sets freely and is a good bearer, and
had so late in the season it is an invaluable variety.
Extract from the "Transactions of the British Pomological Extract from. the "Trabsactions ar the British Pomological
Societ" (No. I.)." A seding Pench raised in the zarden of
Colonel salway, from a stoue brought from Italy, was exhibited by Mr. Turner, of slough. The fruit was of nedium size, ando a deep golden yellow colour; the flesh also of a rich deep yellow
coiour, very melting, juicy, and rinous, with somewhat of the Favour of an Aprico. At ith ugh great perfection and as highly flavoured as any of the september varieties, and was highly

## The Cardeness Chromite．$^{2}$

 SATURDAY，OCTOBER 11， 1856.The autumn has brought further information about Orchard Houses，and we perceive that our correspondents are already communicating their ex－ perience．That they should arrive at different results is what was to have been expected．Had we returns of the first two or three years＇manage－ ment of a Peach wall by those who had never pre viously seen one，there would be a still greater con flict of evidence；some would have had no Peaches some a few，and a few many．Upon the whole this kind of stracture is getting into still more favou than before．And well it may，when bad springs and bad summers and indifferent autumns have to be contended with．

It seems to us that one great mistake is made in this matter．An idea has gained possession of some minds that it is better to grow fruit in an orchard house than out of doors；whereas the real object of such a contrivance is to grow fruit well where you cannot obtain it out of doors．Jt is like the glass sheds and tumbledown houses of which we have spoken occasionally as producing admirable results， Nobody recommends such places for imitation when better things can be had．The point to observe is that under skilful management as much may be done in very rude structures as in buildings on which the glazier，carpenter，and ironmonger have lavished all the skill that money can purchase．We never saw finer Grapes or a heavier crop than in an old tumble－ down flat－ronfed glass lean－to，with half the panes broken；the skill of its owner rose above the defects of the building；but it would be absurd to suppose that hecanse we record this fact we therefore recom－ mend Vineries to be old，tumbledown，flat－roofed with half the panes broken．
The main objection which we now hear taken to an orchard house is that it will not yield sufficient return for the trouble and expense attending it， unless we include the pleasure of managing it as part of the return．Let us try to work out this problem in a span－roofed house 60 feet long and 20 feet wide，with a walk all round between a side border and a rectangular bed in the middle．
Such a house will have forteen rafters on each side，and three uprights．Against each rafter there will be one Vine，and against each upright two others．This gives $14 \times 2+3 \times 2=34$ Vines in pots．Of course these Vines will be trained upon the rod system
At the end where there is no door the border will afford ample room for 6 Fig trees．

On the borders there is room for 12 fifteen－inch
pota ander the ridide, 18 others 12 inches in dia-
meter on exch side, while 18 more will stand n each of the side horders. This makes $12+18 \times 2+18 \times 2$, or 84 laige pots for miscekLansoovs fruit trees.
Then there will be ample room for 750 Strawegnay pots, if 488 are used as described at $p$. 387 of our present volume ; and these may be at least once changed, making 1500 pots of Strawberries in the season.
Thus it appears that our House will hold 34 Vines, 6 Fig trees, 84 miscellaneous fruit trees, and ${ }^{1500}$ pots of strawberries.

## possible for them to proance

Each $\mathrm{V}_{\text {INE }}$ may bear 10 good bunches of Grapes, averaging 1 lb : this gives 340 lbs . weight for the Hase
Half-a-dozen fic rness should yield as many fruits as any small family can consume-say 100 each.
Let us assume that the miscellaneons fruit trees consist of 50 Pears, 10 Plums, 10 Peaches, 8 Nectarines, and 6 Apricots. Each Pear tree ought to carry 36 fruit, each Plum tree 60 , each Peach tree 12, each Néctarine 12 , each Apricot 24 at least. Apples, with one or two exceptions, Gooseberries, Currants, and Raspberries, are not worth growing.
If this estimate is correct, and we believe it to be quite within the mark as soon as the trees are in fall bearing, the produce during the season will be as follows:
$V_{\text {risss, }} 34$, each producing 10 bunches $=$
Fises, 6,

Prusus, 10 ,
PEachis, 10 ,
nketanises, 8
Such we say is a very possible produce ${ }^{340}$
$\qquad$
$\qquad$
$\qquad$
$\begin{array}{r}96 \\ 144 \\ \hline\end{array}$ orchard house $20 \times 60$ feet in full bearing. That it is no exaggeration is sufficiently proved by experience ; the produce indeed is too low in Plunis, some of which bore nearly 100 each in the Garden of the Horticultural Society last year, although it was only the first year of successful trial; and so of others. We take the produce of a Peach Garden last year a Chancellor Peach bore 17, an Acton Scott 13, a seedling, Peachl 14, a Violette Hâtive Nectarine 17, a Fairchild Nectarine 21 fruits. We therefore certainly regard the above as a perfectly fair estimate of what may he had under good management, when the trees are all in full bearing. That 36 are not too many Pears per tree is shown by quite young plants having
Mut rednce the estimate by one half, in order
But a
to make allowarce for accidents and want of skill, and the return is still most ample for 1200 square feet of ground.
Of course, in order to obtain such results, a selection must be made of varieties known to be good bearers. If gentlemen wish to experinentalise they must prepare for loss or failure. It would be folly for example to grow in an orchard house Beurré Diel or Vicar of Winkworth or Chaumontelle Pears, as well try Uvedale's St. Germain; nor woold the mistake be less to introduce Peach Apricots, or Shanghae or Chancellor Peaches, or Stanwick Nectarines. They are unsuited to this mode of cultivation. We cannot say that the very best possible sorts are yet known ; but a good many are, and vice eersït, which is not less important.
What may be the best mode of managing these houses is perhaps still to be settled. The funtamental principles are air in the greatest possible degree, well selected sorts, and well potted healthy plants abundantly supplied with liquid manure. If the last point is attended to there will be no risk of failure from debility. Some recommend that the roots should be allowed to find their way out of the bottoms of the pots, and then be cut off. To this practice we see great objection. What should be attempted is rather to keep the roots within the pots, and when they occupy too much room to dispot the plants and remove with a sharp knife some of the coarsest of the roots, afterwards replacing the plants carefully.
Having said thas much concerning the capabilities of orchard houses, we ought to point out what is undoubtedly a defect in the rery best of then. They are unprovided with any means of heating them. Theoretically, indeed, they require no heat; that is to say they are not forcing-houses. Bat it Would be a very great gain if some means were proVided of mitigating the effects of nocturnal radiation in the spring, when the thermometer in the interior of such places sinks lower than consists with the safety of the crop. For example ant the owng Figs in a building of this kind dropped off late spring for
want of a little protection at night. We presume that a tarpauling, or reed mats, or one of Paxron's railway roofs, placed over the glass at night, would do all that is required, but such contrivances are expensive, and expense is exactly what an orchard house is to prevent. Nor would they afford what is wanted in the autumn where Figs or Grapes are grown. For such crops onr summers are too short, and our autumn heat too low. Night coverings can only prevent loss of heat; they create none. It is therefore desirable that some kind of heating apparatus for occasional use should be provided.
For this purpose iron hot-water pipes would of course do all that could be required; but such a heating apparatus again costs more money than should be expended on an orchard house. We should think that every end would be answered both in spring and autumn by a flue constructed of large drainpipes, whose joints were carefully secured by well tempered clay lime, and chopped straw, such as is used in making clay lumps for cottages. It would only be necessary to take care that such a flue is only heated with wood, or weeds, or some vegetable rubbish which will smonider, and produce plenty of hot smoke without bursting into much flame. Any country labourer would put up such a contrivance for a few shillings, and if smoke did find its way at first through the joints of the pipes it would be easy to stop the crevices with more clay.

Although summer Figs, set from the buds of the previous year, and such Grapes as the Sweet Water or Muscadine, will ripen without artificial autumn heat, yet we are convinced that all who have tried their skill upon orchard houses will admit that it would be infinitely better if the gardener were provided with some sort of cheap apparatus to pro-
duce warmth; or if warmth is not wanted, to dry the air in our damp October weather.

We have lately received from Trentham two New varietiks of fruit, both of which deserve special mention.

The first is a black Grape, of most excellent quality, thin skinned, not a Muscat, earlier than the Black Hamburgh, and having the valuable property of hanging late without shrivelling. Its leaves are middle sized, thick and capable of bearing even such a sun as we experienced last July, when the foliage of so many other Vines suffered seriously. Its origin is unknown. In appearance it somewhat resembles the Black Prince, but the flavour is much more delicate, and the berries are longer. The two diameters are as 20 to 14 in this, but as 17 to 14 in the Black Prince, a very great difference. Mr. Rivers who has seen it conjectures that it is sone foreign variety allied to the Amella or the Gros Sapert; but as this is very uncertain, the variety miay be called the Trentham Black.

The Melon, which will bear the name of the Trentham Cocoa Nut, is much like that fruit in form and size, and is remarkable for combining a very thick hard rind with an abundant white delicate flesh, like that of the Trentham Hybrid Persian. This being the case it possesses great value as a keeper, or for travelling long distances. It is reported to be an abundant bearer, being hardy and robust in its growth. We understand it has been found still fit for table at Christmas.

## New Plants.

184. Weigela coreensis, Thunberg in Trans. Linn. Soc. 184. Wigl : aliàs W. amabilis, Planchon in Fl. des Serres, VIIII. t. 855. Bot. Mag. t. 4893 ; aliàs Diervilla grandifora, Sieb. \& Zucc. Fl. Japonica, Why this plant, perfectly well figured in the Icones Krempferianæe, should have received the garden name of amabilis we are unable to explain. Nor do we see how it is to be distinguished from the Diervilla grandiflora of siebold \& Zuccarini. In some respects it much resembles W. wosea, but differs from it firstly, in its more reticulated leaves, crisp edge of the corma, and garden quality of foucrivig in the autumn, when we have nothing like it among hardy shrubs. We have now (Oct. 8) a specimen before us loaded with most brilliant deep rose-coloured flowers, trailing (for it is not much of a bush) over a peat border among Rhododendrons, and uncommonly handsome it is. In our judgment it is beyond all comparison the best autumnal shrub after the Rose.

PRACTICAL LESSONS IN BOTANY FOR BEGINNERS OF ALL CLASSES.-No. S. Colemn 3d. Resulls of adhesions botanically expresscd refer back to Exs. 4, 5, 6).-W here adhesion takes place between the parts of two contiguous floral whorls, the free (non-adhering) portions of such parts in one of the whorls appear to be seated on, or to arise from, the parts of the other The technical therm

Insertion" expresses this result. Thus in Ex. 4. common Primrose, the stamens are "inserted " cn the corolla. In Ex. 5, common Cherry (or wild-Cherry Plum, of our catalogue) both the petals and stamens are inserted" on the calyx. Where no adhesion prevails, the
Ex.

Floraldisk.-That portion of the floral receptacle which lies between the sepals and the carpels, is called the "floral-disk." It is evident that the petals and stamens, which always originate from this disk, will be "inserted" on it, when they do not adhere to the sepals on one side, or to the carpels on the other.
I restrict the terms "superior" and "inferior" (as explained under Ex. 6) to the ovary and calyx (or to a perianth which does not include a distinct corolla). I reserve the application of the terms Hypogynous, Perigynous, and Epigynous (as was originally intended), for the insertions of petals and stamens only. As soon as the application of these five terms (as thus restricted) becomes thoroughly appreciated, there will be no difficulty in the learner comprehending a botanical work in which such terms are less restrictedly applied.

Hypogynous" (insertion on the disk) implies an absence of adhesion, either with the calyx (outwardly) or with an ovary (inwardly). If the stamens adhere to the corolla, their insertion with respect to it will be "Epi-petalous;" but the insertion of these two floral whorls when thus adhering will together be hypogynous.
"Perigynous" (insertion on the calyx) implies adhesion with the calyx to such extent that the free parts of the adhering whorls (corolis and stamens) appear to originate upon it. Where the ovary is inferior, it will be essential that the petals and stamens should adhere to the calyx to a greater extent than they do to thie ovary, otherwise the insertion will appear epigynous.
"Epigynous" (insertion on the ovary) implies aadhesion of the petals or stamens with the ovary, to a greuter extent than with the calyx.

Gynandrous." The epigynous stamens of some flowers are so completely combined with the pistil as to adhere even beyond the ovary, and then little or no portion of the filament remains free. In these cases the anther and style are more or less "adherent," and the result is a fleshy column in the centre of the flower, with the anthers and stigma on its summit. This form of epigynous insertion is termed "Gynandrous." It is eminently conspicuous in the highly-prized order "Orchidanths" (Orchidacece), the species of which are now-r-days so successtully cultivated, whereas a feif yearg ago they were considered almost unmanageable.

In many cases there is no difficulty in determining, at a glance, the nature and extent of the adhesions that subsist between contiguous floral whorls. Where this becomes difficult, from the crowding or minuteness of the parts, some degree of caution and more or less skilful manipulation is requisite. By gently removing the calyx with a pair of forceps, some portions of the corolla and stamens will be detached with it, provided those two floral whorls are perigynous. They will remain attached to the disk if they are hypogynous, or to the summit of the ovary if they are epigynous. A first observation should always be made, to determine whether the ovary is superior or inferior. If it be superior, the petals and stamens will very rarely indeed, as in the White Water-lily (Nymphca alba's, be found adhering to it; and consequently, in flowers with superior ovaries, we may expect to find either hypogynous or perigynous petals and stamens. If the ovary is inferior, it is impossible the corolla or stamens can be hypogynous, but they may be either perigynous or epigynous ; always remembering the strict applican tion of these terms is often not attended to in descriptive botany.
The following tabular view includes all the possible results from "adhesion" to be

N.B. Beginners must not be alarmed at these remarks about the strict use to be made of the above terms. They will soon learn to appreciate their value, if they will only consent to examine and observe such flowers as readily admit of their application. Where there may be anbbiguity. they should (for awhile) trust the experience of those who having acquired tact sufficient for the purpose have determined the real
s. sufficient for the purpose have ia question. This they
character of any known flower in character of any known flower ia quastist, and finding out may ascertain by inspecting the plass to which the plant belongs. But, for this purpose, they must have been made acquainted with the meaning attached to uie words by which such sections are designated. therefore be advisable to intercalate a morping op the lesson [or two witl our instructions for filing ap which includes matters entirely classificatory.

ON LOW TEMPERATURES CONSIDERED
(From Alpe. De Caxdolle's Géographie Botanique Raisonnée.) I should not have alluded to the action of cold upon plants were it not that grave errors are generally widely spread and believed in reference to this subject and uns the face of numerous well established obserrations. which they do not possess, as to overlooking the fact that there are temperatures considerably above the freezing point that are truly hurtful.

Thus, much has been said about rupture and disorgani sation of tissues through the action of cold ; no doubt the distension of the cells consequent on the conversion of water into ice, and the contraction of solid tissues owing to the severe cold, must in certain cases produce mechanical injury, but study and observation show that cold far more often acts upon vegetable tissues in a very
different manner. Cells are not always gorged with fni I when the accession of cold takes place, and moreove their walls are elastic. The solid tissues can often contract without rupturing, and we know that it is very rare to see fissures produced by cold in the trunks of trees. Now we find

That certain plants are killed by cold before the merciry has descended to the freezing point.
2. That a multitude of plants will retain frozen water in their m
The first of these facts is exemplified every time tha a hothouse is inalvertently cooled down to $35^{\circ}$ or $40^{\circ}$ When a hothouse plant is reduced to $32^{\circ}$ or even to $29^{\circ}$ there is no freezing of its contained fluids, and yet perishes. It is difficult to pronounce whether its death or by the impossibility of its performing certain chemical operations, or loy a physiological action upon tha
mysterious property called life; but the plant dies, and that suddenly.
The second phenomenon was insisted upon in the most positive manner by Petit-Thouars in 1817, in one of his best works (On the Effects of Frost upon Plants),
but it has since been forgotten. I made the same but it has since been forgotten. I made the same Dr. Coindet further made experiments upon the depth to which cold penetrates the truuks of trees, and showed after a frost ce extracted from the trunks or harge trees, the interior of herbs and buds, which notwithstanding were not injured thereby. M. Duval has insisted upon the samie lact, upon whith Goeppert, Morren, and Lindley have made special observatious.
So far as regards the application of this question to geographical botany, it is of nore importance to deter plants. On this point agriculturists and physes affect plants. The sun's rays impinging upon organs which agree. The sun's rays impinging upon organs which Sudden falls of temperature are hence always apt to be dangerous, especially in localities where the sky is clear and the horary variations considerable, such as the
interior of continents and lofty mountains. On the other hand, the effects of the cold are most severely felt in moist places, and by plants that are gorged with lluids, conditions that most obtain in maritime localities and in the bottoms of valleys.
Lastly, it is to befobserved that the same degree of cold does not uniformly produce the same effects at all times on the same species. The duration of the cold (not given by the minimum thermometer), the state of the plant, its age, the moisture of the soil and of the air, the nature of the soil, the presence of snow, all exert
considerable influence. Authors have given us a multitude of examples of this, and without repeating these, I would say that they should form some guide to our mode of treating certain questions in botanica geography. J. D. H.

## Home Correspondence.

Our Potato Crop.-I have lost nearly all my Potatoes and so have my neighbours ; and I hear it said on all sides that as much damage has been sustained this year as even in 1845 and 1846, in proportion to the area under cultivation. It would be extremely interestigg correspondents of the Gardeners' Chronicle who are to be found all over the United Kingdom will combine to furmish you with such an amount of information as will to post you a memorandum stating as briefly as possible whit he finds to be the proportion of loss in his own neighbourhood; and I dare say you would take the combe. [We should be glad to do so, and thank our correspondent for his suggestion.]
Pree Grants of Land in Canada.-I copy the followLing from a late No. of the Montreal Herade:- "Crow is hereby given to - Toronto, July 12th, 1856. Notice is hereby given to emigrants and others, that the undermentioned lines of road in Upper Canada are open for settlement, upon which free grants (limited to 100 acres) are to be obtained upon application to the
respective agents, subject to actual and continuous residence thereon. The Addingtea Road running from the townslip of Kaladar to the river Madawaska, 35 Kiles in length. Agent, E. Perry, Esq., Flint's Mills, Kaladar. The Hastings Road, runuing from the township of Madoc, in a northerly direction $\overline{7} 4$ miles.

Agent, M. P. Hayes, Esq, residing in the township of
Madoc. Also, the Ottaws and Opeongo Road 80 miles settlement in September last. Agent, T. B. French, Esq., township of Grattan. Josepr Cauchon, Torouto township of Grattan. Joseph Cauchos,
July 14,1856 ." This is an official Government announce ment, and I understand the lands to be granted are of first-rate quality. Can you say how I am to proceed in order to secure such a grant? L. N. T. [We could probably give you the address of an active and compe tent agent in Canada if you were to communicate your real name and address.]
Select List of Wall Trees.--Subjoined is a ground very well trained fruit trees; but they bear very little fruit. On No. 1 there are two May Duke Cherries, two Fig trees, a Bon Chrétien Pear, and young Peach, Nectarine and Apricots, all which bear abundantly. No Egg and Bon Chrétien Pears, with some young Peaches.

102 Yds

No. 7 has half Greengages, half Coe's Golden Drop Plums, which all bear moderately-and but moderately The other walls are useless, except for two Jargonelie Pear trees and two Magnum Bonum Plums, which the aspects and soil (a clayey loam resting on a linetone rock from 2 to 4 feet below the surface). Some 14 years ago I planted a garden wall, half out of a nurseryman's list, hall by directions given me in the Grardeners ${ }^{\prime}$ Chronicle, in answer to a query, I was there
directed what trees to plant and in what aspects. The directed what trees to plant and in what aspects. The walls pianted according to these directions had before never produced much. I now intend to plant new tree radually removing the old ones, and again apply or advice as to sorts and aspects. The situation is in the centre of Ireland, or rather 40 miles north of it, and he climate moist. Caranensis. [For Aspect No. I take Mignches Netarines: 1 Balgowanse, 1 Grosse Hâtive, 1 Downton. Cherries: 1 May Duke, 1 Elton. Apricots: 1 Moorpark, 1 Royal. Pears: 1 Glou Morceau, 1 Easter Beurré. 2 Brown Turkey Figs. Duke Po. 2.-Cherries: 1 Magnum Bonum, 1 Jefferson. Pears: 1 Jargonelle, 1 Fondanted'A atomne, 1 Seckel. Aspect No. 3.-Apples : 2 Manks Codlin, 2 Keswick Codlin, 3 Tower of Glamis, 2 Devonshire Quarrenden, 2 Oslin, 2 Kerry Pippin, 2 Dumelow's Seedhing, Jar-
 owan do, 2 Roman Apricots 1 Breda do. Pears : Marie Louise, 1 Beurré Diel, 1 Thompson's, 2 Glou Morceau, 2 Knight's Monarch. Aspect No. 5.Apples: 2 Wormsley Pippins, 2 King of the Pippins, 2 Blenheim, 2 Hawthornden, 2 Golden Noble, 2 Mere de Ménage, 2 Ribston Pippin, No. 6.-Pears: 2 Williams's Bon Clirétien, 1 Aasse Colmar, 1 Jargonelle, 1 Gansel's Bergamot, 1 Autumn Bergamot, 2 Ne Plus Meuris, 2 Beurré Rance,

Coe's Golden Drop. Cherries: 2 May Duke, and Coe's Golden Drop. Cherries: 2 May Duke, and 2
Elton. Aspect No. 8. Red Dutch Currant and Black Naples do. |l]
Lete Flowering Plants for Autumen Decoration.-On looking over our parterres it will be found that many of their gayest occupants have suffered from the and that they are no duli and comparatively insignificant. Amongst the sufferers are our Geraniums and Calceolarias, which are indispensable for summer and early autumn decoration, but as the season advances are unable to uphold their position. Therefore I propose to bring more into notice two or three plants great favourntes of mine, which are now in their
glory, and have much to recommend them. The first lory, and have much to recommend them. The firs generally known, but hitherto scarcely used for decorative purposes, but its merits cannot be too highly eulogised ; it is a distinct species having rosy purple flowers, neat habit, growing from 1ors to feet high, admirably. It is a plant of easy cultivation, being best raised from seed in eariy spring, and planted out the end of May, when it will begin to flower in August, and
continue in perfection through October, but it mus e seen in mass or line as we have it, then some idea an be formed of its superior qualites. The nex a point of interest is the Tagetes signata (or tenuiolia), an annual of the Marigold kind, having deep orange coloured flowers, beautiful foliage, and
neat bushy habit of growth, neat bushy habit of growth, height 1 to
feet; an excellent plant for massing 2 feet; an excellent plant for massing. A great error is often committed in planting out annuals in putting them too close together ; thus in the case of Tagetes, one plant in every 4 square feet of ground is quite sufficient. The third is the Double White Feverew, an old well-known plant, which is well adapted for bedding and to grow in line as in the ribbon fashion aise it from seed in the spring, when it will flower wel ate in the autumn. There are two others I shall mention which are very generally used ; but in many places not to the extent they deserve. One is the Calabrian Soapwort, with its pink star-like flowers, one of the best plants for bedding we have to sustain the gaiety of the flower garden through the autumn. The other is the little Koniga maritima variegata, a useful plant for bedding and to grow in line, being very hardy, continuing to bloom late in the season. Another very fine late flowering plant is the Lobelia ignea. These, torether with parle, yellow and white Hearteene, would create a splendid display after most of the summer things have faded, and as many families do summer things have faded, and as many amester or October, in such places hardy late flowering plants deserve our best attention.
Hartley's Patent Rough Plate Glass.-In reply to "H."I beg to observe that I lave two Pine stoves well ventilated, glazed with this glass in large squares. 4 ins,
squares in one stove are 2 feet 6 inches by 1 foot 4 , squares in one stove are 2 feet 6 inches thick. My plants in the other 2 feet 8 inches by 8 inches thick, My plants them in better health than at present. In summer they swell their fruit well, and it is of the first size and quality; but in winter I find it inferior both in size and flavour to what I have grown under Bingle erown glass. I shade from the middle of March to the end of August.
Before I employed shading my plants were very much burnt. W. T:
Heliotrope "Miss Nightingale." -The Rev. W. M. Allure wrote to me to say that the Heliotrope 1 merely in June was pronounced fyvianum. This I beg to deny, and to assure him that it was the true Heliotropium Miss Nightingale, raised by me, I not baving grown any other variety. He also states in your columns that it has ouly produced a few small the fine truss it had when i sent it to him. Inve forgotten conclude that it has mothad proper treatment; I may also ad that also ada Sple rixipal solo this Heliotrope has been to the the plapal sale who have it mas been to the trade. Among those who have hod, Veitch mention Messrs. Turner, Bragg, Lee, Hopgood, Rollisson, Smith, Walton, Hays, \&c., from all of whom references may be had. Williann Field, Florist, Kensal
Toun. [Surely this would be best settled by sending us blossoms answering to the description of the vendor.] The Filbert Strawberry.-Under this heading (see p. 663) Mr. Myatt, of Deptford, makes some allusion to the variety now generally known as the "Filbert Pine." If Mr. Myatt will refer to the "Florist" for 1854, p. 275, he will find a descriptive list of new Strawberries by Mr. Powell, of the Royal Gardens, Frogmore. Mr. Powell, after giving a highly favourable account of the "Filbert Pine," concludes with the following remarks:-"The origis of this fine Strawberry is unknown. It was sent to us two years agn from Filbert House, near Maidenhead, as a new Strawberry, and it was therefore called the 'Filbert;' it is also known in the same locality under the same title." It will be seen that the Strawberry was not raised by me, neither was it sold as anew variety, but merely recommended as an excellent kind, worthy of general cultivation; and I am pleased to have Mr. Myatt's evidence in confirmation of this opinion, aad congratulate him as the raiser of so usefal considered a name, Mr. M. having so many seedlings,噱 and if Mr . Mrity question name, Mr. Myatt should suggest one
fusion, as well as any addition to an already too long list of synonyms. Charles Tumer, Royal Niurser!, Slough. [We protest on the part of the public against any change in the name.] I had ascertained, before I saw your last Saturday's number, that the Strawberry called the "Filbert Pine" was identical with a seeding which Mr. Myatt kindly sent several years since; but I was not aware that it had been sent out as "Myatt's Seedling" till I saw his letter. I can fully confirm all that has been said in its favour; indeed, I consider it one of the very best Strawberries that has been raieed. The fruit is very handsome, of a brimant scariet to the extreme tip, and of exquisite fisvour. It is also a most abundant bearer-runners planted out in August often producing 10 or 12 large bunches of fruit the following summer-although not so large as some varieties, the earlier berries will mostly weigh upwards of an ounce each. I should be glad to know from some of your correspondents ho vigorously, and produced an abundant crop of large handsome dark red fruit; but the flavour was very poor-not equal to that of Keens' Seedling ; it resembled ome of the Belgian varieties, and was totally destitut of that fine aroma by which nearly ail Mr. Myatt'a
seedlings are so pre-eminently distinguished. The Queen and Omar Pacha, growing upon a portion of the same ground, was remarkably fine flavoured. I wish to same ground, was remain whether "Sir Harry" had done better in different soil. IIenry Doubleduy, Eppin!, Oct. 8
young Vines in a range of house border and plant young Vines in a range of houses where Grapes have never been successfully grown. In the first place I intend having the old border taken out to the depth of
3 feet from the back wall inside to the walk in front, 3 feet from the back wall inside to the walk in front,
which is in all 26 feet. Then make a good firm bottom with a slope to carry the water to the walk in front which will be 1 foot deeper than the border, filled with stones, having a large drain tile in the bottom intend having at least 9 inches of drainage at the bottom of the border over which I shall put the soil to the depth of 2 feet 3 incles, composed of one-half of quarter of rich old dung and one quarter of burnt earth, lime rubbish, old nigat soil, bones, and blood. I shal plant $i n e s$ one year old struck from eyes, one plant
under each rafter, and train on the single rod and spar system. The garden has a fall of 1 foot in 40 towards
the north, where the houses stand facing nearly due the north, where the houses stand facing nearly due
south. There is a pond behind the wall, the surface of the water 3 feet below the ground level of the houses There is a drain 12 feet from the walk in front which carries off all back water from the garden. The houses well heated with hot water are 12 feet wide, front lights 3 feet and a half high, and back wall 12 feet. I shall with suecess by adopting the above plan. H. N.T. [No plan can promise better. But we should certaiuly exclude blood from the border.
nicle of Sept. 27, on "Orchard Houses," signed "S. B.," and which has been copied into other papers, there has been thrown a damp, not only on orchard houses, but on Hartley's glass. Amongst others on me has the damp rather fallen, as I am in communication at this moment other parties for the glass, Hartley's Patent Rough Plate, for a house from 60 to 90 feet long. An unfortunate reckon on a crop out of doors of either Peaches, Nectarines, Apricots, or Figs. I do not place much faith on either in a badly constructed house or in some other local deficiency; but sincerely trust you will not let his assertions go uncontradicted after all that has from time to time appeared in your Paper in favour of such garden structures. Westmeath. [We have altered our opinion in no one particular. Whether or not orchard houses succeed, depends like everything else on skill. W have known them to be condemned by a gardener who when cross examined on the subject, was forced to adm that he was always behindhand with every operation eaten up with red spider, and more often furgot his ventilation than remembered it, We would refer you to a leading article in today's Chronicle. 1 sinca. Mr. Rivers's book was the guide, and here let me say, that did I build another I should prefer brick piers in lieu of the corner posts; the first would last for ever, the last, on a clay soil, I am afraid not longer
than a common gate post ; the additional expense would than a common gate post; the additional expense would
be a triffe. I should also have the house 1 foot higher, for on the lower side you cannot prevent the tree touching the glass, thereby shading the fruit, and there has been no comparison between the crop, the flavour of the fruit on the higher side of the house being so far superior to that on the lower. Next, agreeing with your correspondent of the 27 th, if you can depend on - do not build an orchard house. Why build a Vinery at Fontainebleau? Of course you would not require it but on the top of these Hampshire hills, where you cannol get a crop of Peaches or Nectarines one year in seven with all the care in the world, here the orchard house is invalualle. The expense is nothing: with brict foundation, the first outlay is the last; no fire, no flues, no glazing, for such glass as Hartey'a Rough Plate house is 21 feet long, and the first year we had 40 trees this is too many, 32 is quite enough in 13 -inch pots. Not a large crop the first year, upwards of $\grave{0} 0$ the second, and about 400 this, the falling off being with those trees overeropped last year and in the Apricots, the only sort of which in future I admit being the Moor Park. Another great advantage in the orchard house for a small family is that your supply is continuous, for you select your sorts to secure it. The first members were gathered on the 1st or August (for re Peaches and Nectarines I gathered this morning (October 4), and of these there are respectively four dozen and three dozen in the greenhouse good for another week. As to the size of the fruit, it rests with yourself -half a dozen on a tree or four dozen. As to the flavour, you must not imagine this will be equal to the best out in the country, and on the table a Peach is a Peach, and in the country, and on the table a Peach is a Peach, and
much of the fruit is as good looking as you can desire. Of the surts of Peaches the Barrin, ton is decidedly the bestlate, and the Noblesse the best early. The Chancellor is too late, and the Teton de Venus has not done sort that follows in succession, but I should omit the
orange Pitmaston. on one tree I had nine very fine the other twenty-five very sweet and good. The other Nectarine is the Violette Hâtive. The Ischia Fi, will not do; the house is ton cold ; besides, on this soil, clay on chalk, we grow the finest Figs I ever lieheld, and Plums of all sorts succeed admirably without the protection of
the orchard house. Two Peach trees (Barrington and Royal George) cover the boards at the back of the pots, nd succeed well, and ourside my house Currants and
Plum tree fill every inch available. The Gurdence Bentworth Hall, Alton, - About the middle of Sep tember last I paid a visit to Sawloridgeworth to inspect Mr. Rivers's orchard houses, previously to building some on a large scale; I was so perfectly satisnied with his success that on iny return home 1 immediately set work and completed, about Christmas, a house trifling, and the satisfaction it has afforded me so great, that I have just given orders for another house to be that I have just given orders for another house to be
built. Mr. Rivers's trees were loaded with fruit, and as he was generous enough to allow me to pick what liked, I can vouch for the flavour being exquisite. My much of a crop, nevertheless some of the Vines he sent me last February in small pots have produced six fine bunches of very highly-flavoured Grapes; likewise the Pears sent at the same time have now some exceedingly they are certainly as handsome fruit as I have ever een either in England or on the Continent. I have alsonad a good crop of Plums, all planted this year, as I have a little tree of Coe's Golden Drop,
the whole fof which I could cover with my hat, with 16 beautiful transparent Plums thoroughly ripe, and the one I tasted of delicious flavour ; the Black Diamoni Plums have also been literally laden with fruit. My
trees are now fast going to rest for the winter, the wood having been ripened more than any wood I hav ripening of the wood the chief cause of the success orchard houses. We have made a slight alteration here as regards the holes in the pots; instead of having them round the side near the bottom, and we consider that we have more control over the roots; instead of lifting luxuriant growth. I consider also that the nearer the roots are kept to the surface to receive the benefit of the sun, air, and fresh water, the better it is for the ripen ing of the fruit. My trees have been syringed every
night and morning, which with me is a very short operation, having merely to turn a tap, when water from pressure of 32 feet can the thrown over the house in any quantity. I never saw trees in a more healchy state than mine, with every prospect of an abundan pondent "S. B." has committed some great error either in last year's cultivation or this. Sigma.
Filtering Apparatus.-I have read with much interest your remarks on a filter in your Paper of September 27, and as am just makigg a to put a few questions, in the hope of obtaining in to put a few questions, in the hope of obtaining in ubject from yourself and from any of your readers who have any experience in such matters. In your plan you have a waste pipe in No. I compartment, but surely by becuse in a flush of rain the water will rush into No much faster than it can filter through and run ove from No. 2 into No. 3, even though No. 3 was almos mpty when the rain began ; ery 0 , the small space in o. 1 from the water line to the waste pipe 4 will soon e filled, and then all the fresh rain water will flow away down the waste pipe; whereas by having your
waste pipe in the main compartment you get all the ain water into it, and it does not overflow till quite ull. My tank is thus:-
Rain water pipe.
Rain water pipe.

Waste pipe.
Now, I would ask, is it best to have the filter only in Nos, 2 and 4 of the tank, or in Noor 1 and 5 also
Where is it best to place the waste pipe? proportions would you put the gravel and charcoal each, and how much altogether? and would you add a layer of washed coal cinders, which I am told is good as a cleanser? I trust this will cause attention to be drawn to a matter of which I think the importance is not at present at all sufficiently appreciated. Inquiver. the object of having the waste pipe in NO. 1 (as shown at page 646), instead of in the main compartoment,
is to obviate the inconvenience that was found to arise is to obviate the inconvenience that was found to arise
from a flush of rain displacing the filtering material in the cistern of our correspondent " J. G.,'" and rendering the filtered water toul. This will always be the case when the waste pipe is placed in the filtered-water cistern, and no $\dagger$ rovision made for the water to escape when there happens to be a greater supply than can
easily pass through the filter. In your tank we should recommend a pipe for this purpose $(b b)$ in each of the divisions 1 and 5. They may be fixed as near the top as possible, so as to allow as much room as may be thought necessary between them and the opening from the filters into the main division. We do not think the filtering materials need be placed in 1 and 5 as well as in 2 and 4. Of course the size of the filtering compartments and the amound material must be in proportion to the quantity of water that is likely to pass through them. A layer of washed coal cinders we think will be found of great advantage, in addition to the uaual materials, such as gravel and charcoal. B.]
spider.-In ycur Namber of the 27 th alt. vatory is accompanied presence of water in a consercan assure your correspondent that such is not always the case, I can speal confidently upon this subject, for last year I held the situation of indoor foreman in an extensive establishment where we had one tank (and in some instances two) in erery house for the reception of rain water. Notwithstanding this, however, red spider was plentiful enough in almost every house, the conservatory not excepted. A Lowland Lad. [Were the tanks covered or uncovered?
Dropmore Araucaria imbricata.-As Sir W.J. the finest Araucaris we have ho the height of with the particulars in order that every one may obtain the information at the same time. The height of our largest specimen is 38 feet 2 inches; diameter of branches, 20 feet linch; girth of stem near the ground, 5 feet ; 3 feet from ditto, 4 feet 3 inches. This superb tree grows on a raised mound of earth, which is the very sort of situation for ind of earth, which is the health, is clothed with branches down close to the ground, and forms a perfect pyramid. Philip Frost, Dropmore, Oct.

Shanking of Grapes.-Perhaps the following remarks as regards one of the causes of shanking may be interesting to Grape growers. My old gardener, who has for nearly 30 years grown me excellent Grapes, has this season failed in maturing his late house. The cause of his mishap he attributes to his having unfortunately watered the Vine border, which is outside, and to the drenching rain which set in immediately afterwards, and continued more or less for three weeks, which he says chilled the roots and caused an obstruction in the sap, so that the scorching sun which set in so suddenly after the rain sun-strucs (as be termed it) many of the shoulder footstalks, and consequently more than half of due berries in each bunch turned acid instead of producing saccharine matter. The few berries that have coloured are very good. An Old Subscriber.

The late Mr. Otto.-It is with regret I have to repost the death of Mr. Otto, which took place at Berlin on the 7th of last month. He was for many years Director of the Royal Botanic Gardens of that town. He was also chief editor of the Allgemeine Gartenzentivalg, of which he was the originator, and was well known as a distinguished botanist not only at home but also abroad. He died in his 73d year.

## れrdicus.

Elements of Entomology; an Outline of the Naturat History and Classification of Aritish Insects. By IT is little to the credit of our entomologists that they have not yet been able to prepare a systematical account of British Insects. Were our knowledge of wild plants confined to scattered sketches, popular introductions, desultory memoirs, or fragmentary works, society would be as unwilling to approach the science of Botany as it now is that of Entomology. No man alive can remember the time when there was not to be found in every good library a systematic description, more or less complete, of all the plants known to inhabit the United Kingdom. From the time of Withering and Smith to the present day men of science have always been found industrious enough to collect into a methodical arrangement whatever was known of our wild plants. Up to the present hour no entomologiti has done the same for his branch of arience. Marsham indeed attempted it ; but his work, excellent for its time, came to an end with a single volume to have ventured on the task. The consequence is that as there is no classified deseriptive account of Britich insect, so thinks of getting beyond Patterson's Zoology, or Milne Edwards, or some elementary wow ehall nature. If it is asked, as it often is of us, "Where shant I find an entomological book containing the same acco. of instets as Smith's English Flora, or Babington's Manual, or Lindley's Synopsis, or Hooker's British Flora give us of plants?" the answer navaidably is "nowhere." Let us hope that this discreditable condition of systematical entomology is not to last much longer, and that some one will have spirit, talent, and perseverance enough to do for his own subject what others have done for their branches of our national Natural History. Surely it would be better to concentrate strength upon a great public object than to waste it in detail upon mere gossip, or polyglot absune; let Peihaps the task is beyond the streng plan, and wort exactly to it ; first appointing an editor under whom all should to it ; first appointing an edable scientific status would arm him with authority to beep his various
coadjutors to the plan. One might work out Carabidæ,
another Curculionidæ, a third Muscidæ, a fourth Hemiptera, or parts of it ; and so on.
e the hrbinger of such . that Mr. Dallas's new book were the harbinger of such an operation; but we scarcely dare hope to find it so. In fact we have not yet dis-
covered for what sort of readers it is destined. Of what covered for what sort of readers it is destined. Of what
are called introductions to Entomology we surely have enough already, which tell what an insect is, how to distinguish Coleoptera, Hemiptera, Diptera, \&c., what the changes are through which these creatures pass,
and such other superficial facts as a mere reader looks or. Of books for readers we have plenty; it is for English students that something is really wanted.
Perhaps we ought not to judge a work by the first number out of fifteen of which it is to consist; we Dallas's pages with the exception of his style, which he must excuse us for saying is unworthy of the subject. fortunately for the brevity of this part of our story, "subject to the dreadful imputation of dryness," are Mr. Dallas himself describes as "that charming lightness with which many popular writers on science dilute exception of excessive diffuseness, there is good promise for future parts.

## Garden Memoranda.

Biddulph Grange, near Congleton, the Residence of James Bateman, Ese. - Situated on the northern
border of Staffordshire, in an undulated and comparatively cultivated district, with some hills of moderate height in its vicinity, and, in the nearer neighbourhool, Biddulph Church tower, the spire of Knypersly Church,
and the ruins of Biddulph Hall, with a small stream flowing down an adjoining valley, there is nothing in the position or surrounding accessories of this place which would at all take it out of the range of an orquiet little village, about three miles from Congleton, on the high road from this town to the Potteries Biddulph Grange lies on a branch road, a short distance from the church, which is a handsome old structure, pleasingly situated, and well supported by Yews, Deodars, \&c. Mr. Bateman's grounds are at present bounded on the west side by to mand which is intended to divert, so as to put the gardens in the midst of a small park, with a suitable approach from the main or turnpike road. The entrance and offices
are yet in an unfinished and transition state, and there is much also to be done in several parts of the place Indeed, Mr. and Mrs. Bateman appear to find their chief occupation and amusement in personally directing
the progress of the various works; and hence these are the progress of the various works; and hence these are
carried on deliberately, and as if to prolong the interest carried on deliberately, an
attending their execution.
The property has been in Mr. Bateman's possession abont 14 years; and when he entered upon it the house
was merely a farm residence, and the grounds, for the most part, a swampy field. Probably about 14 or acres are now devoted to ornamental purposes. The Whole of what has been done has therefore had little
opportunity of acquiring its full claracter, and yet there is an appearance of finish and furniture about even the most recent parts, which strongly serves to show what may be effected by a wisely directed skill, and a due regard for the habits and requirements of plants.
The climate is a wet and cold one, and the locality of the gardens is naturally much exposed, especially to the rest and east, from the former of which quarters, in
particular, violent winds are experienced. By a happy rearrangement of the surface of the ground, however, and its formation into an infinite variety of miniature hills and dales, nooks and recesses, a considerable amount of shelter and exposure, sunniness and shade dryness and moisture, has been obtained in the mos ingenious manner; and the plants selected and their panitions, and a a careful regard for their healthy developwants, and a careful regard for their healthy developIn fact, the takes the visitor completely by surprise In fact, the leading idea which seems to have pervaded
the mind of Mr. Bateman in the production of such maxvellous diversity of surface throughout the place has evidently been the preparation of a suitable and congenial home for nearly all the hardy members of man great plant family which the curiosity or taste of so prominscovered and cultivated. And this idea is able delicacy of kept int the minuch a recessities of plants, including soils and subsoils as well as every peculiarity of situation, that no experienced observer eight of it pass round the place is ever likely to lose This, th
numberlen, is the great and true secret of most of the grounds are irregularities of surface into which the thought trifling and little without such an argument for

Two
Two principal consequences have almost necessarily mentioned of the adoption of the rule of action just picturesqueness and variety of outline, and the produc pioturesqueness and variety of outline, and the produc scenes, each of which has a character of its own. To accomplish these two objects in a satisfactory manner demanded, however, an amount of contrivance, and an
appreciation of picturesque form, which are seldom
found in an amateur, but which are here combined and found in an amateur, but which are here combined and
exemplified in a very striking degree. Ornamental walls, or walls covered with lyy or other climelers, Yew Holly, and Beech hedges, covered ways or corridors of wood or stone, irregular or more formal archways, eries, masses of roots and trunks of trees, with larger or smaller groups of shrubs, are some of the means by which these changes are brought about. Hollies and Yews enter largely into the materials by which the mounds have been clothed, and the more delicate $p$ ants shaded or sheltered; and the former of these have been obtained in such numbers from the hedge-rows of the country, and have been so skilfully removed, and tabe such picturesque shapes, that they alone contribute very the place
From the scrupulous attention which has been paid to the natural habits of plants and the conformation of accompaniments to supply them with the necessary cond:tions of successful growth, another ineportant conditions of successful growth, another iuportant been educed, which is that of bringing different kinds of plants together in groups of the same or kindred spucies. A constant succession of fresl objects, in
sufficient numbers, and bearing sufficient resemblance to each other to produce a marked effect, is thus presented to the visitor; while the necessary change of
condition provided for them begets a still further and condition provided for them
A yet more notable characteristic of the gardens at which they are separated is of the many parts into an individual character, and seldom, even by ascending to the summits of the highest mounds, affords more than a general and passing glimpse, which a few years' addihouse or other essentially different parts of the the while many elevated points yield the best views of the region to which they belong and of the country genethe entertaining rooms of the house and from the terraces embraces either the open glades, or the water, or the tops of the shrubs and trees which clothe the rounds, and scarcely anything which does not combine harmoniously with the rest, or unite agreeably with the
more distant landscape. This will te at once recog. mored as a very high achievement of art. for although the scene which includes the whole grounds is devoid or the scene which includes the whole grounds is devoid of any great features, and does not affod numerous vistas
or large glades of lawn, or a concentration of fine points from the chief windows of the house, the eye travels over an irregular wavy sea of shrubs and trees iu which here is nothing incougruous, and which form no It should be mentioned also, in this reference to
It sorend the cound complete isolation and the distinctive characteristics o certain parts of the place, and to the general harmony of each of these parts with the whole, that, though the ransition from one kind of scene to another is oiten so he means by which the transitions are effected rene rally seem appropriate, and in accordance both with the scene left and that which is to be entered upon; that there is no semblance of sham or trick about any of ments are so nicely and inartificially connected with each other that any person may be taken round the place in two or three separate circuits, each exhibiting entirely new features, and appearing to be quite independent of the rest ; while a nearer acquaintance with de design will show that the paths through these several racty all communicate with the leadiug general walks and that the effect of isolation of parts is not attained lead to nothing.
As an example of the correct feeling which has not merely dictated the general arrangement but defined the smallest details of these gardens, it may be well to note specifically that all the ground in front of the prin-
cipal windows, and that which comes into direct associs cipal windows, and that which comes into direct association with the house, has an artistic character peculiar to
itself. Terrace platforms, ornamental walls, corridors, and arches in complete agreement with the style of the house, trim hedges, elaborate parterres, stone edgings to the walks, or plants that blend well with architectural change of level is brolien by steps, and by terrace walls or banks of Grass ; blocks to support unpretending vases or pots of characteristic plants are placed at the top and is without its fitting (although very varied) termination; ways and arches are introduced, which, while thay fulfil some other object, give length and character a a vista ; and the amount of finish in all these details accurately adjusted to their distance from the house and their importance as components in the general would occupy to, much space to adduce many examples, along the garden frunt of the huse, and ascends by an irregular series of steps to a higher terrace at the eastern end of the grounds, there is a covered way which masks
part of the offices, and excludes also a bulb garden, and though it is entered by appropriate arches of stone, its
tength is such that it would be damp and cold if lined length is such that it would be damp and cold if hined
with stone throughout, and it is therefore, as being part of a leading and house promenade, cased entirely with
dista. At the end of the same terrace, agann, where the root a from the house and the proximity to a rustic a terrace would render a terrace wall inapprupriate, points are in themselves, they are significant as items of a general system, which is most faithfully and happily owed throughout.
Considering the multitude of departures from good this country-and, as must reluctantly be added, almos as often when under the guidance of men who profess the art of landscape gardening as from the unaided efforts of amateurs-it is really refreshing to encounter an instance of this kind, in which the highest practical objects and the most pleasing combinations of art are so carefully kent in view. It is understond that Mr Bateman has designed and carried out the whole of the arrangements of his place without other professional A.R.A., the Ferns, Kensington, from whose sketches the various arellitectural and artistic ections about the grounds have been constructed. E: Kcmp.

## Miscellaneous

The Mcuritius.-We are happy to announce that Mr. Latiouchere has confirmed the provisional appointment of M. Boaton as Carator of the Museum of Natural History at Port Louis, vice Professor Bojer deceased.
Hilliam Yiurell, FLES., \&c.-Early on Monday morning, the

 A few days hefire his death he appeared at the Council of the
Linnean Enciety with his usulal cheertulness and head. The following Saturday he accompanied a friend (himsel an invalul) to Yarmouth, enjoyed, as wrs his wont, his voyage, and went to bed on Sunday with the anticipation of a more than ordinary shire of good and refreshing sleep-his appetite good,
his spirits gond, his strengtla unimpaired. He was seized, however, soon afterwards with a ditheulty of breathing, upou which
he got up and multeked the door, in order that assistance if he got up and uritocked the door, in order that assistance, if
required, might be ohtained without difficulty. On returning to
bed the cymen bed the semptoms increased, and he asspnted to the splggestion
that a medical man shotld be called in. This was done pron but aithont effec: Alsut half-past 12 on the Monday morning
he expired cutuly be expired culnity, nud whithnt pain. A telegraphic message
being transultited this friend ard executor Mr. Van Vonrst the removal of his remains to London, and thence to Bayfurd in
Herifurdshire, was effected. Here he was the last buried 12 hrothers and sisters, a father, and a mother. In September
1854 he transferred to the album of a relative the lines from "First and lest,
The earliest summonued and the longest spared,
adding that this was what he wished to be his epitaph. Thie
immediate cause of death seems to have been disease of the
 James', where his father (in partnership with his uncle) was a
news-agont His son continued the business, a reminal to the
corner of Little Ry quitt and simple life. For many years the house was familiar not to mention foreigners, to whom the reputation of one of the
soundest living zoolngists was well known, and who never visited it withont being struck by the kind and communicative manners of its hospitable inmate. A few months of his lifs, were apent as
a cl rik in the buking honne of Messrs. Herries, Farquar \& Co.
Before, however, he win 15 he a cl rk in the bauking-honse of Messrs. Herries, Faryuhar \& Co,
Before, however, he was 18 he had decided upon joining his
consin in a more independent mode of hife-independent, but of a cousin in a more independent mode of me-independent, but of a
remarkably oven tenor, more so even than that of scientific men
in zeneral, so proverbial for the uneventful character of their in general, so proverbial for the uneventful character of their
lives. As a young man he was fond of shooting and angling, in
both of which he excrlled. A Londoner by birth and residence and af whicti he excrlled. A Londoner by birth and residence,
and a Londoner in many respects by education, he was, as long
as the rod and the gun were the chief pursuits which attracted as the rod and the gun were the chief pursuits, which atrracted
him to the open downs of Cambridgeshire or the undulating
fields of Herts (Royston, the residence of Mr. Wortham, and Bishop-Stortiord, of Mr. Nash), - a sportsman amongst sports-
men, but never that exceptionable or equivocal personage
denominated a sporting clidracter. Some of his friend denominated a sparting cliaracter. Some of his friends were
such; but Mr. Yarel , thongh skifful ennugh to have done ge never made a practice nf backing his own skill by heavy wagers. His tastes were, upon the whole, those that the rus in urbe well
suited - hutter, perhaps, than the urimixed country. They were
ithose of F anc Walton- Witizn those of I-anc Walton-citizen and angler, rather than those of
the full and perfect yeoman. His first publication was "Notices
 Jurnal for March $152 \overline{3}$. In 1827 , the "Observations on the
Traclew of Birds," \&c. were published in the Linnean socipty"
Transactions: and in the same fear, in those of the Roval Society,

intellectaal character is seen in his wolks. The part geographical distribution
always convidered that, in treating it as he had done, he smuggled

Repulsion of Water from the Leaves of the Nelum-bium-This phenomenon, with the Lotus more pargeneral been very differently explained. It is beautifuliy manifested by the little pistici, a water plant in appearance the common Endive. This plant, which either roots itself on the margin or floats about on the surface of the water, has both sides of its leaves which when magnified show themselves in the form of a succession of beads diminishing in size towards the apex ;-they entangle and retain the air, and so obtain
a high degree of buoyancy. When pressed under water they look like little flowrets of leaf or of frosted silver. It is the same organisation that enables Rose, Clover, and young Cabbage leaves, young shoots of crain and Grass, and the numberless other plants tha xhibit dew in its beautiful pearly form, and not as a urfaces, the same that produces like resulis usually ascribed to oil or crease on the feathers of birds especially of water low, and most of all of diverswhich when they plunge under the surface seem to carry with them a perfeet flash of light. A piece of
glass, a varnished or greased surface or polished stone, throws the water off as perfectly as the various matters enumerated; but in none of these latter cases is there any appearance of reflection. The water, for the time being, is in perfect contact with the surface which intervening air plate, essential to secure reflection. have not before observed any such explanation as has been here attempted, offered for this very beautiful class of phenomena; -it seems to me perfectly conclu sive as well as new. Dr. Buist's Notes on the Litus.

## Calendar of Operations. <br> (For the ensuing week.)

plant department.
Conservatory, \&c.-The preparation of plants to bloom at Christuas should be taken in hand forthwith, in order that no hurrying at an after period may he and those which take the longest time to bring into flower. Dwarf Oranges and Daphnes, if their wood is well ripened, may soon be made to show bloom in a gentle bottom-heat. Azaleas and Gardenias ta ke longer pit where a little artificial heat can be applied and pit where a little artificial heat can be applied and
increased as the buds swell. The stock of stove plants previously prepared for winter flowering should likewise be placed in a warm light part
of the stove, where they will soon commence flowering. The different varicties of Epiphyllum truncatum are very useful at this season, and if they have formed Their buds they may be placed at the cool end of the Stove to open their flowers. Another useful plant for which when in bloom forms an elegant vase plant a few at a time should therefore be potted in rich soil and placed in a warm pit, ns should also a few of the Mignonet potted Roman Nareissus and Van Thol Tulips. Mignonette, Neapolitan Violets, and Chinese Primroses should be placed in suitable situations to forward
them into bloom, and the reserve stock in cold frames should be kept secure from rains : but at the same time it should have plenty of air. Give seedling Calceo larias and Cinerarias another shift and keep down green fly. Maintain a drier atmosphere in the stove ater this time, and never allow the night temperature every forenoon when the weather is at all favourable. As regards Orchids the principal part will be at rest or approaching that condition, and therefore should be rept cooler and drier; if a perfect show of bloom is wanted, prevent their starting into growth at this season, which some kinds in vigorous health may
attempt to do. Lrelias and other sorts now in bloom should have a comparatively dry atmospliere to preserve their flowers in perfection. Aerides, Vandas, and other kinds requiring more heat should be kept at the clean and neat, and look closely after cockroaches and woodlice, which are often troublesome at this season.

Forcing department.
Prexeries.-Plants swelling their fruit must now be assisted with a warm moist atmosphere; use, therefore, sufficient fir heat to secure a night temperature of at
lenat frum $65^{\circ}$ to $70^{\circ}$, and $75^{\circ}$ by day, allowing it to xise considerably with sunshine, and admit a little fresh
ing sufficient fire-heat to allow of this being done without lowering the temperature, and if there are means of admitting fresh air so as to bring it into contact with the pipes on its entrance into the house, a little may be admitted with advantage in all states of the weather and in the case of houses which have to be kept warm in winter there should always be some contrivance for admitting fresh air under or against the heating apparatus so that it may get warmed iefore coming rangement a moderate supply may be admitted constantly without requiring any extra amount of fuel to keep up the temperature. Also endeavour to secure a
steady bottom-heat of about $85^{\circ}$, and endeavour to keep the soil about the roots in a propexly moist state, giving clear, rather strong, manure-water when necessary but if the atmosphere is kept properly moist the soil will not require much water for some time. It is very diffcult, however, to get Queen Pines to swell proper now should, unless in cases where ripe Pines of any size or quality will be valuable early next spring, be kept cool and dry as soon as they have done flowering until the middle or end of January, and then be afforded a brisk moist temperature; treated in this way, we have often found them to swell off exceedingly well, and
where ripe Pines in winter are in demand Cayennes, where ripe Pines in winter are in demand Cayennes,
Black Jamaica, and Montserrats should be prown to furnish thaica, and Montserrats should be erown not only swell better in winter than Queens and the larger sorts of blacks, but are also less liable to be hard and inferior in quality. Fruit approaching maturity must also be kept warm, but the atmosphere should be kept rather dry admitting fresh air freely on every favourable opportunity, for anything like moderately well-finvoured fruit will not be obtained at this season without a liberal use of fire-heat. If any of the young stock in pots appear to want shifting examine these at once, and shift such as are found to be at all pot-bound, for young plants if kept short of pot room through the winter will be apt to start into fruit instead growth in spring

## FLOTVER GARDEN AND SHRUBBERIES

Continue to take up and pot such plants as it may b garden decoration bloom better whien of a certain age, and such, with others which it is desirable to take care of for propagation, should be first attended to. Last season's late struck cuttings of scarlet Geraniums, and most of the other bedding kinds, should be especially reserved; for when carefully potted and grown they blonm earlier and finer the second year ; besides there is often a difficulty in procuring cuttings of the latter in sufficient quantity to satisfy large demands, and thi affords an additional reason for preserving them. Large Salvias may he transferred to pots, and, required, will help to keep the conservatory gay for some time. Calceolarias, Petunias, Verbenas, ani similar things which are ensily propagated should be lhey to rema cared off and thrown to the rubbish heap. Attend to cuttings not yet struck, which after this time will root more freely if a little additional heat can be given them ; such as are already truck should be placed in their winter quarters. Make rrangements for wintering Fuchsiss, Hydranceas, Brugmansias, \&cc. ; pot off intermediate and Brompton proceed with the planting of all sorts of trees and shrubs whenever the weather is favourable for operations of that kind.

HARDY FRUTT AND KITCHEN GARDEN
One of the greatest drawbacks to out-door gardening is the failure of wall fruit, too often arising from illintended to be renewed during the any borders ammediate steps should be taken (if not already done) to procure a supply of good loam, if possible the top pit of an old pasture ; if of a heavy mas a porio of the sweepings or scrapings of roads may be mixe with it for Peaches, Nectarines, Cherries, and Apricots it will suit Pears and Plums in its natural state. Le the bottom of the intended borders be not only well drained with earthenware pipes to carry off all excess of water, but place a foot or more of gravel beneasb deep for Peaches and Apricots, and 2 feet deep for Plums, Pears, \&c. The borders should have a good slope from the wall to the walk in front. Ground for orchards and fruit tree quarters intended to be planted this senson should be trenched, and during the operation a dressing of short dung may be well mixed with the soil, more particularly for Raspberries, Gonseberrier, and other small fruit. The first point however to secure should be thorough drainage; if that is inefficient, the result will necessarily be nasatisfactory.

the funds of the Club. Members exhibit free. Alt entries mist be made on the printed forms of Certificates, Inteniling Exhibitors are particuariy requeated to observe that the Entries finally close on November 8, and none will bo
received after that day. Lists of the Prizes offered, with $n$ copy of the Rules and Regupost free on application to T. Beandrith Gibse,
Corner of Halfmoon Street, Piccadilly, Loudon. Hon. See.

## Thi Tgricultuxal Gastts.

The diseases of cultivated plants are almost if
not quite as multifarions as those which affect animals under restraint, and if we inquire into thei history we shall find that the mal-action of the organisation of both families is for the most part due to a change of those circumstances which make up the sum of the difference between wildness and cultivation, and which change becomes more marked, and its effects more complex the farther the individual is removed from its original type. Were we to follow out an investigation into the history of vegetable pathology we should soon become aware that as time has advanced so if new forms of disease have not actually arisen in modern days among some of our cultivated varieties, certainly the diseases incidental to vegetation have spread to an alarming extent, and we see this more particularly in such plants as are most cultivated, such as the Turnip and Potato.

As respects the Potato murrain the idea just enunciated seems to have struck inquirers into its causes, one of the plans recommended the peing the again procuring a Potato crop from the seeds instead of the tubers-an expertient the comparative failure of which says little against the thecr $r^{\prime}$, inasmuch as the utmost that was attained in such experiments was the getting a new sort from sorts already in cultivation, and not the complete reversion
It was with the idea of investigating the origin of some varieties of plants in cultivation, and at the same time of bringing about new sorts, tha some few years since we commenced a series of experiments; among others in the "ennobling" of wild Parsnips and Carrots, and the production of new sorts of Vetches from a far removed wild species. These have been so far successful that at
this moment we have before us a level topped -chances much less considerable than are kn much as 9 inches in circumference, produced from the small wild root; and in the Vetches, our samples for this year presented both a winter and spring variety, of a good agricultural kind, derived from the cultivation of the diminutive Vicia angustifolia (narrow-leaved Vetch),
But as amid our experiments of this nature those on the wild Oat will doubtless be looked upon with as much interest by the farmer as the botanist, we shall now address ourseives to a description of the transmutation of the Avena fatua, reserving an account of changes in other agricultural plants for another occasion.
The Avena fatua is a Grass which almost universally accompanies agrarian circumstances, that is to say, it seldom if ever occurs in a truly wild aboriginal state, but is an attendant upon tillage, and in some soils is a most common and detested weed in various crops, but more especially amid grain, whether of Wheat, Barley, or Oats, sometimes too with Beans or seeding Vetches, or indeed in any crop which is of sufficient duration to allow it to ripen, and from which it is not eradicated in weeding by the hoe.

It is a tall Grass, rivalling the height of the finest cultivated Oat, from some forms of which, and especially those with a lax panicle, it is at a first glance not readily distinguishable ; however, a more careful examination and comparison with the so-called Avena sativa enables us to make out the following differences:-

The experiments about to be detailed were per formed with the Avena fatua. In the autumn of 1851 we collected some seed of the wild Oat, putting it aside for spring planting, and in the spring of 1852 we drilled a plot of $2 \frac{1}{2}$ yards square with the seed that had been kept during the winter, a fact to be carefully noted, as it forms a first and most important link in our chain of evidence, thus constituting what we shall hereafter revert to as a cultivative process. The seed came up well, and the plants on ripening were tall and robust, and the grains presented a scarcely appreciable difference from the wild examples; but if anything there might have been a slight tendency to increase in the quantity of flour. The seeds again collected and preserved through the winter were sown in a patch of similar size in a different part of the garden in the spring of the following years 1853-54-55, with little alteration from year to year, though in some examples the following tendencies seemed from the first to be gaining strength :-

1. A gradual decrease in the quantity of hairs on the florets.
2. A more tumid grain, in which the covering "skin" was less coarse and the awn less stout and straighter.
3. A gradually increased development of kernel or flour.
The seeds of 1855, without selection, were treated through the winter the same as before, and sown in the spring of the present year, the resulting crop gathered in the latter end of August presenting the following curious variations:-

15t. Avena fatua, wild Oat of the trve type with large bent awn twisted at the base
2d. Avena fatua, var. sativa, with inose panicles of
fiowers, florets quite smuoth and tumid, with or with-
out straight awns, some few examples slightly hairy
towards the base. This is near the Potato
3. Avena fatura, var.s stiva. - Panicles more compact,
fowers inclining to one side

2, quite devoid of hairs, a wn straight. These present
the type of the White Tartarian Oat
Each of these forms is now separately saved for further experiment whilst the shed seeds of the plot are left to grow as they would do in nature, with the view of demonstrating the downward progress by the reverse methods to those adopted in the cultivative ones.
We may add here that in the article Avena in Mozton's Cyclopedia of Agriculture, Dr. Lindiey referred to the probability of the wild origin thas demonstrated ; suggesting that the cultivated Oat is
"a domesticated variety of some wild species, and may be not improbably referred to Avena strigosa the bristle-pointed Oat, which would become the common Oat by a slight alteration of the form and division of its pales and the loss of one of its awns

The exveriments, as far as they have now is in the clearest possible manner that the, shoy fatua is the parent of our cultivated Oat, and that not only of one but of more forms or varieties produced in the same space of time and by the same series of operations-conclusions which cannot be other than interesting to the hotanist, whilst to the farmer they offer considerations no less curious i
heory than important in a practical point of view. weed Oat it follows that the weed may result from a degeneracy of the cultivated form, and this will serve to show how true the instincts of the old fashioned farmer not unfrequently were; as w remember that some years since a main objection o the growth of Oats on stiff lias clays was tha they left behind them wild Oats, and all who have had to deal with there as a weed, as it not un requently occurs on the stiffer lands of the lias orest marble or Oxford clays, may well dread any cause of its increase. As a botanical notion this by the species maker; however, actual experiment has at length demonstrated its truth, and it may ust be mentioned that a confirmation of this has in the meantime been arrived at by a different process which we can now only shortly detail.
On the examination of stray plants of Oats from shed seeds where the year before Oats had been the crop, examples are not uncommon with a few hairs at the base of the floret, whilst the awn will be mostly stiffer than those in the crop, and this on thin soils where wild Oat is not usual as a weed Again, on stiff clays in which the weed prevails many intermediate forms or degrees of wildness will be observable, perhaps derivable from the cultivated Oats brought to the soil in manures.
But further, if we examine Oats grown on good Oat lands we are aware of the following character-
istics-a greater weight for the bushel, and a more plump gran with a finer coat and the awns scarcely more than bristles ; and, as we know from observa tion, these qualities are immediately reversed if we sow good Oats from a favourable Oat soil in a district unfavourable to the growth of this corn.
Here then the result of our experiments and observations is to show that the wild $\mathrm{O}_{\text {at }}$ hy cultivation will yield different sorts of a cultivated or crop Oat; so that new varieties, and that direct from the original source, are easily attainable, and also that the cultivated Oat may degenerate into the wild form from which it has sprung, and in some soils in a very short space of time.*

A very interesting and useful series of letters has appeared in the pages of our contemporary, Bell's Weekly Messenger, on the Breeding op Cathlis Mr. Willocghny Wood, who is well known by agriculturists generally as a short-horn breeder, and by our own eaders as an occasional contributor on hat subject to the columns of this Journal, argues and advises, from a lengthened experience, on the cheapest and most efficient method of obtaining herd of superior cattle. Of course he recommend patient attention through a course of years as likely to bear a more permanent fruit than direct purchase of the class of animals that is desired. Such a method is not only more economical but it confers the experience and skill necessary to the full developement of whatever degree of success attends it
The points insisted on are:-(1) the selection of the most promising cows-" ordinary short horns which are now to be found in almost every district in the kingdom "-choosing such as are of a healthy constitution, yet refined in character, large in the frame short in the leg, and, above all, excellent milkers; (2) "the offspring of these cows by a thorough bred bull should in their turn be put to another short-horn bull of equally pure breed," choosing an animal presenting excellence in such points as are defective in the herd. "But perhaps in most cases the first cross will not so much present any one fault in particular as a want of uniformity of form, combined with a certain hardness indicative of the inferior blood on the female side. The second cross will greatly tend both to promote uniformity and to improve quality in the next generation. The bull to accomplish this purpose, ought to possess that combination of merits which entitles him to be called a good animal. He ought also to belong to a family which is known as reproducing, in the majority of the animals belonging to it, those qualities which the breeder desires his herd to
Mr. Wood disputes the commonly received idea

- In this report several curious botanical changes which tool Thace as the experiment progressed have not beon moticed, a they
reader.
that the second cross of pure blood is less saccessfal han the first. He says-"There can be no question that the persevering use of short-horn bulls is the surest means of obtaining in the highest degree a combination of size, quality, and early maturity." He then contends at length for the merits of the short-horn breed as retaining, along with their aptitude for fattening, extraordinary merits as atundant milkers.
The latter portion of the second letter, from which we have made the above extracts, relates particularly to the question of cost; and Mr. Wood's advice is given in the following particulars :-(1) Purchase bulls by private coniract from a well established breed in preference to resorting to sales where they are "prepared "for sale, and thus not only are their defects disguised but they are injured for work, besides which at a sale the purchaser contends against the most matured judgments and longest purses in the world; (2) Buy either bull calves or aged bulls. "Each of these courses has its advantages, and both are more economical than the unual plan of buying bulls at a year old.'
Finally, the advantages of attention to the good reeding of your herd are summed up in the following paragraph :-

A farmer whose heifers I occasionally see, and which are bred by chance, and reared on a combined no-system of starvation and carelessness, has a lot of 18, which may be worth on a average about $15 l$. The produce of the same cows, many of which are good ones, by a well-bred bull, would have been worth 20.0 eacl, making a gross profit of $90 l$. on the lot. A good calf costs no more to rear than a bad one, while with actual the keep of the heifers, it is not so in wan of care, attention and sheltor. On farmes where steer are reared, there would also be $2 l$. per head additional value for them. Suppose that from 50 cows 18 heifers nre reared, at an enhanced value of $5 l$. each, and 20 steers at an advance of $2 l$. per head, this would give an annual gross profit of 130 l ., in return for an outlay every three years of from 20 to 30 guineas in a weuldeem his farther-seeing neighbour who gave 30 guineas or an animal not worth above $5 l$. to the butcher, bereft of reason. Surely, then, such matters merit more consideration than they receive. They are a sample only of what constitutes the difference between farming for edge of the principles of breeding, the agriculturist will find a mine which will as amply repay the working, as in the chemistry of soils, or the physiology of vegeo tation."

Tere main facts regarding the Agriculturat Statistics of Ireland for 1856, as given in Mr Donelly's able report just published, will be found stated in another page in answer to the inquiries of a correspondent.

## RESULTS OF AGRICULTURAL EDUCATION IN

## IRELAND.

First, then, as to the actual benefit to the country in the immediate vicinity of the school, I consider it to be very great. On my first acquaintance with this roadside fences were in great disorder, a few Turnips were grown by large farmers, but positively no Carrots nor green crops other than Potatoes by any but proprietors of estates. The tenant farmers were ignoran of subsoiling, trenching, putting down Clover and Grase seeds properly, in fact, of every right process of agriculture, Cows were kept out both winter and summer, and guano was unknown. Lime was the usua remedy employed to restore the exhsusted soil, and not unfrequently applied in conjunction with manure. country people were in the habit of breaking up lea land for Potatoes ; afterwards taking a crop on wheat, or two crops of Oats, and then giving their latato cro so who would put out dung for the the only rotation of crops with which he was acquainted.
Now all this is changed, and a great improvement is perceptible. No farm is without Turnips or other green crops; fencing is being carried on to a consider able extent; the benefit of draining, subsoiling, and cleaning the land properly is known; and the people are acting on that knowledge to a great degree. propriety of house-feeding cattle is acknowledged, and wherever the farmers have sheds, they put in thei cows during the winter months at least ; and the ma who puts lime and manure together into his field now as much ridiculed as was formeriy the agricul turist who dug with a fork, put Potatoes in drills, and touk out weeds with a grubber.

As the soil does not call for much drainage, I cannot ay that it has been practised immediately about the of fexcept to a partial extent ; but great nu bee of fences have been levelled, and large fiel Waste land has made out of three or four small grown, and the rotation been reclaimed, Carrots are grown, and the mostly follow in arops is understood and masll farmers, and in an effectual manner by the large farmers.
The improvement of farming in this neighbourhood
 maintenance of the Mudel Farm, were it not that the
Aamers themselves doo so, and $I$ have reeived testimony from very competent judges to the same effect. As $I$ send you herewith these leters themselves for your
perusal, I will proced to to give you $a$ few notes of peruita, piat to sone of the teant farmeers about the
thite school fron which you may judide or their sentiments
celative to the Yerrahy establistment. Cornefits relativiv to the Yarraby estabibishment Correilius
Carroll holds 70 acres ;tuinks the greatest pood has bend done by the sclioool ; remembers thatet befire has establishmeut all cattle in the country were out all now a much greater breadth of Turnips and green crops inter; has levelled ditches and enouse-feeds in which he ascribes entirely to the example of the Model Farm.
Edmund Ryan holds 17 acres ; soiled his cattle all last summer; intimates the cleaning, preparing, and subsoiling of the land as he has seen practised
Michl. Geary has 34 acres; learned from praise
Michl. Geary has 34 acres; learned from the Model Farm to clean, and cultivate deeper, and subsoil ; all which he was ignorant of till he saw Mr. Smith do roperly; funds now that he has better crops even with less manare than formerly; is going to level all his fences, and make large fields; put in his cows earlier than heretofore;
Edward Ryan has 21 acrea; learned to till his Turnips as he ought; drained a little, and levelled many ditches, and made large fields; cultivated a deal of waste land; Smith was the cause of all this; has more to do yet in the way of improvement under cattle, and has built a house for that purpose; has subsoiled, and what was the worst part of his land is the best now.
Patrick Walsh farms 74 acres; has learned a great deal from the school ; borrowed from Smith rotation of crops; knows that his neighbours, even though they have not carried out generally a full course of rotation, yet many of them have gone a great way towards it; did not formerly house-feed on green crops, but does 80 now ; grew Carrots and Turnips for feeding of stock last year, in consequence of what he learned from the school books, and found it answer extremely yell ; lays down Grass seeds; drained for the last three years, and has now fine land where Furze only grew
before; says his inoprovements in the way of throwing before; says his improvements in the way of throwing
small fields into large ones may be seen by referelce to small fields into large ones may be seen by reference to
the Ordnance Map. Before the school was established, knew nothing of putting down green crops properly, or of the qualities of manures ; says that no one in Ballyquiroo knew how to grow a Turnip until the Model
Farm was established, and that the Turnips grown formerly were not a fourth of what they are now in size. and subsoil ; grows more Turnips; ploughs deeper than Smith's advice; house-feeds with Turnips as far as he before finter ; purposes to sow Rape; never did so positively has done all this from what he learned at the school farm, and would expend more capital in improved farming, but that his means are small; thinks that people from a distance have benefitted likewise, as he has frequently accompanied parties from other parishe opinion, they took valuable hints from Smith's plans of farming; has levelled fences partially ; never will take two grain crops in succession; has used guano a good
deal ; means to drill Potatoes for the future ; thinks there is hardly a farmer in the neighbourhood but has learned something from the establishment of the school and farm.
Patrick Mahony is a Poor-law guardian, a member of Kildorrery Dispensary Committee; has a shop in Kildorrery, and farms over 150 acres, besides having lately taken on lease 1150 acres of inferior and Farm, and subsequently at Glasnevin ; declares he knowld not be able to farm so largely without the son; states that it was in consequence of the ledge displayed by his son regarding land and its acres : aig that before the establishment of the schoo there was little sign of green cropping, only a few Turnips, and no Carrots or Mangels among the Jarmers has levelled fonces a good deal; house-feeds in winter and will do so in summer also for the future, as his the will superintend the farming bushes, has found many farmene symem very profitable ; knows that is sure that they adopted plans similar to what they Sawith knows that the neighbours take advice from Smith ; says that the boys of the industrial class spread being ariety of information through the neighbourhood, bling able to teach their parents the method of dibhas put his Potatoes in drills this year; never had rrots until this year.
[The above is extracted from a letter to Dr. Kirkpatrick, of the Albert Institution at Glasnevin, by the
Rev. Waziere Brady Irector of Farrahy. It was

## Home Correspondence.

Leaf Feeding.- Under this head, at page 636 , it is ${ }_{\text {stated }}^{\text {stated - " About }} 12$ years ago I proposed an experiment monthly, and left unstirred, but I I was disappointed," This is certainly discouraging to those who believe in the theory, and who also practise hoeing amongst green had given thuald have been glad if your corresponden cases, the state of the land when operated upon, the kind of weather at the time, and the manner in which the work was executed. The reason why he was periods periods; whereas, reason and not rule should dictate
the time when land ought to be stirred. When rain frlls on dry ciods in the summer when Barley is growing, the water turns to a solid body, or say, it undergoing this change from liquid to solid, it not only but it also expands the earth and plants growing thereon, tinue till the surface of the earth be comparatively moist, the clods will be so far expanded, that they wil all to powder by gentle friction. At this favourable condition of the earth, let the hoers go to work, either by men or beasts, and every experienced man can But I never saw written or printed a description this natural chemistry save in Nature's own peculiar way, $i_{0} e_{0}$, in a marvellous expansion of leaves. On the
contrary, let the rain fall till the water has ceased turning to a solid, and the soil becomes gorged with water, then start the boes, and the earth will be kneaded
state that drying winds will leave it in sealed packetculable. Nor will the soil both soil and crop is treatment till it has undergone the reverse action of water turning to a solid in its interstices, a work which the frosts of winter generally perform in a satisfactory manner. Perhaps the disappointment arose from bad hoeing during a parching sun. An ignorant hoer is a dangerous subject amongst green crops during hot dry weather, though it is undoubtedly the proper time for the hoe to go to work, providing the work is done as it left in little hillocks, alternating instead of hoed, and patches ra patches, radiation goes off so rapidly between those would be spoiled during three hot, dry, and cloudless would be spoiled during three hot, dry, and cloudless
days. But if the hoeing be done by a good workman who strikes swiftly with his hoe, he spreade the pulverised soil pretty evenly over the surface, and the crop is wonderfully improved at the end of three hot cloudless manner The fine earth that the hoe has left in this by which means moisture is condensed amongst the roots, and thereby the crops are benefited; in this case Giles.
The Poor Law in Ireland.-As an Englishman farming over 600 acres in Ireland, I think it right to protest against the conclusions of Martin Doyle on the subject of the Irish Poor-law. With the Irish, such as hey are, I believe out-door relief would be simply ruinous to the country. When any one can gravely and publicly suggest the advance to a cottier of seed Barley and Potatoes, and the hire of a horse to set them, out of the rates, it is easy to judge what degree of sound principle on this aubject he has attained to. I would Ungest to him to tell us how many of the same class in five years? This sort of false principle (and let me dd false humanity tro) runs through the whole view Prejudices against the cleanliness and order of the
workhouse (p.609) are thought to entitle to out-door relief, provided they are insuperable. The case is rested not on what is best for the community, but what the poor person would like best. The error surely arises mainly from looking at the Poor-law as a cure for all the ills of poverty, instead of simply as a relief or destitntion. No Poor-law can attempt the one without causing far worse ills than it cures. The other is its true function, but not 80 as to supersede the need of private charity in the thousand cases which public charity cannot possibly touch. Any one who knows industry so general in England is sadly wapting here The bareat subsistence in idleness is eagerly caught at, ather than honest hard work for a better living. Further, the habit of scheming prevails (must I say amony imagine. Friends and friends' friends and relatives to the tenth degree are brought to bear, and worked on the enlarged principle that though you gain nothing yourgelf by the job, yet you will thus get a claim to similar help for your own job when you lave it to do.
If a weekly allowance from the rates was attainable, the ovils of the old Poor-law in England would be a joke to what would happen. One may see here men who woul not give or lay uut a shblling of their own money, voting away public money as if they had to pay no part of it, with a recklessness that seems incomprehensible; the secret is, partly, some friend or friend's friend is to gain by it, and partly fear of what others-" the neigh-
bours" will say or do. It is clear to me your corre-
spondent hes never practically had to do with athe
administration of the Poor-law, else be would nerer talk as if the rates now levied on his division were of use in relieving its poor, while the same amount of no out-door reli simply for the support of the 19 paupers of his division simply for the support of the 12 paupers of his division relief, which cannot be reduced, and for the charges of the Union eatablishment in proportion to the valustion of his division. This last item may perhaps be tion of his division. This last item may perhaps be reduced somewhat (I have done it in my own Union) amount whe only one, and it is chldish to think its English Poor-law is the cost of out-door relief. The English Poor-law is the amendment of a far more lax System, and many abuses still prevail under it. In Ireland the workhouse system started fair, and was so much clear addition to the relief available to the poor. It has worked well, and does in substance effectually relieve the destitution of the country. No doubt the cleanliness and order are disliked (what a confession ! and act $2 s$ a test. They are the only check. There is not a shred of shame or independence of character such as keep people off the parish in England. They are only a check on the individual. No one by reason of house lis house are near relations (uncles) of two of the most wealthy tradesmen in the next town. A man earning 10 s. a-week from me emigrated eimply to better himself, and a week or two after he was gone, his wife and chil dren went to the house, where ome of them have now been forr yesrs I have known cases of children of now who was at work and did not wish to go into the honse, sent in on the sly, among the family of another, who was going in. Others brought from a distant Union where the parent was at work and therefore inad missible there, left with a pauper confederate in our Union and sent into our house as deserted children. Most of the worknouses are admirably managed, better than in England. In my own Union, for instance, the school is good. The giris are taught knitting, spinning, and sowing. They wash the clothes and scour the workhouse land has a crop of vegetables on it grown by the boys that would do credit to any garden. The consequence is girls and boys are taken as servants by farmers, \&c., even when loo young, and those who know the girla among this class inan English workhonse will besurprised to learn we have hardly an instance of a gial turning out ill. Most people will think such habits of cleanliness the poor the better not only for the community but on live in on out-door relief. The workhouse hospital is open to all the lower classes, whether paupers or not. They remain till they are thoroughly cured; their dietary our hospital cases are of this class. The families of the sick are never required to go into the house with them. The dispensaries give medical relief to all lighter cases. The unmeasured abuses of the out-door relief during and atter the famine show plainly what it would be. The present system is working well, and with the faults of the Irish character, such as they are, to substitute ont-door relief with its opportunities of abuse and temptation to scheming, seems to me little short of madness. pauperising them than it could possibly do good by sub-
stituting one kind of relief for another, while to such as me I believe it would be simply ruiv. W.
Boydell's Engine.-It is quite true that the bottom of Wheel when rolling is yet stationary at one point, but fulerum grinding being the ground anterior to it, hence the when such is the fulcrum. In the case of Boydell': wheel rolling on its rails the stationary point is still further from the fulcrum, for here we have three fulera-the rail on which the bottom of the wheel acts, the cycloidal arch, and the toe of the rail ; but for the latter two the friction of the former would not permit wheel, much traction force. The bottom of Boydens not stationary. This, however, is not what we meant when we said the top of the wheel moved at double the velocity of the bottom, meaning by the velocity at the bottom the translatory velocity or distance rolled over, .e., during the time the bottom of Boydell's wheel rolls he length of one of the rails, the top of the wheel rail, the plans under a plank twice the length of such a rail, the plank resting on the wheel. W. B.

## Farmers' Clubs.

Milborve, Sept. 17.-Mr. Summers, of Houghton Farm, introduced the subject of "Rotations of Corn particular properties of each description of Corn" He We allow the varyinu characteristics we have to deal with, both in soil and climate, and our systems ought to be varied, that the requirements of each plant may be present through every stage of its growth. There are systems followed by someagriculturists and condemned by others, and why? Because, probably, Nature has been hind to one and unkind to the other. Who in this room would not condemn my system of growing Oats and dredge [What is dredge !] as the ouly corn crops in the rotation? Yet such is my system on my most elevated land. If I grew Barley it would be all tailing, and the
yield very small. If I grew Wheat, probably it would
never ripen. The Oak grown on this land appears as if it were growing in the south of Norway. In fact it is
land situated at 900 feet above the level of the sea, and exposed to every wind-land on which the Turnip does not outlive the severity of an average English winter. Althongh the Oat is invaluable to me, it is not grown largely in Dorset-it is not of cen grown except tiveness of Wheat and Barley. As I say, I have some land situated at a great elevation, but yet the climate must not bear all the blame of our scanty produce. The ame remarks as were made by Professor Johnston, in his "Letters Wigtownshire, will apply to us. He says, You pass an imaginary line and the husbandry changes; the soil seems more barren, the people more
indolent, and their methods more primitive. You ask he reason, and you are told that the climate is unfavourable to profitable culture. But if in the midst of this broad tract of country a patch of limestone, or trap, or appear to vanish, and heaven and earth seem to conspire n rewarding the diligent cultivator of the soil." It is just so with us, we have both a cold soil and climate temperature is much lowered by the wood and trees The temperature of the soil is slso much lowered by its The temperature of the soil is also much lowered by its inability to retain moisture, and the consequent evaporation and the flying off of heat, which tends to chill both the soil and the air. By what I have said you will readily perceive that I would recommend an alteration alteration in soil or climate. What rotation could be better adapted to the county of Norfolk than the fourcourse? but yet it does not extend far north-it is no apore lile Ncoland. The Scotch system of husbandry climatic conditions being more nearly allied. On what are termed good Barley soils we know it to be the universal rule to grow Barley after Turnips, followed by two years Grass and Wheat. This is correctly called the five-field system ; and where it can be carried ou on this description of soil without detriment to the stock, I would recommend its adoption. Any farmer wants-it may er ant en prove beneficial to the soil and stock. The chemist would teach us that if all the substances, organic and inorganic, were supplied to the soil its fertility would be maintained ; but practical farmers are aware that ine meehanical state or as the chemical state. They know What if they were to reverse their crops of Barley and Wheat, growing Barley after their Grasses and Wheat
after Turnips, the land would be too firm in texture for the former and on some land too light and friable for the latter. Deep ploughing is practised for root crops, therefore that firmness of the subsoil requisite for Whea that the essence of the droppings of the sheep may no escape downwards, we get a firm subsoil for the Clovers and afterwards for wheat-both plants thriving and Barley crop should be as far removed from the Wheat erop as possible, especially on this description of soil for after Barley we always find the land in that light a good crop of Wheat for the two following years. This arises partly from the fine tilth produced when preparing the land for Barley, but more especially by that peculiar
characteristic of the roots of Barley-they impart to the soil that looseness so detrimental to some of our cultivated plants. Here wo find much good resulting from the introduction of the Clover plant. This plant seems ing out of consideration the rollings and treading of sheep to which it is subjected. From whatever cause it arises we find the land, when the old lea is ploughed, of the Whest plant. There are few farms composed wholly of good Barley soils, and even when they are thus constituted the predominance of natural Grass
land may prevent the adoption of, or at least in some hand may prevent the adoption of, or at least in some
messure do away with, the old lea as a crop in the rotation. I follow this same five-field system as nearly as convenient on a portion of my farm, as I cannot grow growing two green crops; but I grow Rape, or Rape and Turnips, in place of old lea, as the latter do not furnish my sheep with sufficient food at the right season
of the year. I know what would be the result were I to neglect the preparation of autumn food for my sheep. By thus altering this old five-field system I increase the production of straw; but whether there is any to be solved. I believe that the yield is sometimes greater, and that, situated as I am, it pays me to
dispense with old lea. There is not so much to fear from looseness of the soil where it is of a more adhesive character; therefore Wheat may follow better more closely, and as it retains the manure it with advantage. In this rotation we get first Turnips, second Barley, third Grass, fourth Wheat-
Vetches or Rye are often introduced between the Wheat and Turnip crops. I once followed this system on my stiff soils, but Barley is so liable to become laid after it and now follow a five-field system, which I shall now
proceed to notice. Thus fire-field system is follow proceed to notice. Thus fire-field system is followed on
some of my best land-ou land better adapted for Wheat
than Barley. The system is, first year Turnips, second April Wheat, third Grass, fourth winter Wheat, fifth Barley. I manure highly for Turnips, and, besides the
fold, I give a heavy dressing of farmyard manure to my winter Wheat. To this land I give much attention during the winter preceding the Barley crop, doing my best to make it approach the character of a gond Barley soil. I find this rotation much more profitable than the four-course, being enabled to grow nearly as many sack When Beans, Peas, or Vetches are introduced into any rotation they do not usually interfere with the succession of white straw crops, but merely as what are termed catch" crops. They are all three rather uncertain crops, and the two latter render the soil rubbly-in fact
the pernicious effect of seeding Vetchies may be seen the pernicious effect
through a rotation.

Banbury.-At the late annual dinner of this Society Mr. G. Harcourt, M.P., spoke on the price of agriobservation had been made, that the prosperity agriculture was promoted much more in time of war than in time of peace. He was persuaded that a slight knowledge of the political history of this country would be sufficient to convince them that although war might result was to check the permanent prosperity of the country. He was now nearly the oldest member of the House of Commons, and his experience extended back to the latter years of the old French war. What was the effect of that struggle upon the agricultural interest of this country : In the years 1810, 1811, and 1812, the prices of all kinds of agricultural produce had risen enormously; the cost of Wheat in the two last years being 120s. a quarter. At that time however the Bank was not obliged to pay its way with gold ; an unlimited paper circulation was allowed, and prices of all descriptions of produce rose enormously. Of course, while prices vere rising great advantage accrued to the seller ; but was evident that such a state of things could not last ay after the pressure upon the that when the peace came, this exceptional state of things ceased, and a universal panic ensued. As he told them, at that time
Wheat was selling at 120 s. a quarter, and landlords Wheat was selling at 120 s. a quarter, and landlords thought their rents low at 80 s, an acre; but after the pas bre continental ports iere opened, fore, and the rtificiol the this country in large quant such distress ensued, that Parliament was called upon to interfere. Parliament accordingly took the matter in hand, and committees of the House of coater. The result of their subsequent deliberations was, that in order to assist, as they thought, the agriculturists of the kingdom, Parliament passed what, in his opinion, was a most iniquitous was prohibited until the price reached 80 s . a quarter. But was prohibited until the price reached 80 s . a quarter. Bat did that cure the evil? No; for in the very next year, distress country than be agn iculcural they had had distress in the country since, of sufficient importance to call for causestination of Parliamentary commilfes into ita causes, there had never existed sur 1815. It was all very well to say that war raises the prices, and that other causes might tend to keep them up after the war last war! Had we not been paying tax upon tax? the income tax had been doubled, 10 per cent. had been added to the malt duty, and all those progressive reductions contemplated in time of peace by former
Chancellors of the Exchequer had been put a stop to. What, he asked, would have been the state of the labour market had the late war continued? The ranks of the militia would necessarily have absorbed almost all the young able-bodied men of the country, and although he did not pretend to say that they would not have been of great atility, yet, in his opinion, they certainly would not have been so usefully employed as if they had been engaged in agricultural occupations, and their absence would naturally have tended to increase the price of agricultural produce. Then, again, had the war gone on, the price of iron must naturally have risen to a great extent, and consequently there
would have been an increased expenditure for agricultural implements, or, what would have been worse, no expenditure at all, the effect of which would have been to deprive the farmers of all those improved facilities for the cultivation of land which happily they now possessed.

## Farm Memoranda.

Black Hedley ir 1814-Mr George Hopper wa an excellent sample of the north of England yeoman Possessed of a good property and in easy circumstances, which characterised the Borderers of old, and baving to boot a spice of more honesty and civilisation, he secored the good will and friendship of all with whom he had to do. He was likewise noted for some origina or eccentric habits, always, however, tending to benevolent or harmless results. Mr. Hopper's experience and skill in husbandry, especially in the department of live tock, was universsully admitted, and he took pleasure in them on all occasions a hearty welcome at Black Hedley.

I had the pleasure of making his acquaintance at Park end, the hospitable mansion of John Kidley, Eaq., in
1813-14. Mr. H. welcomed me most lindiy, and we spent a most agreeable evening. I found that Mr Hopper farmed largely. He was once rather famon or his blackfaced sheep. For several years he had abandoned this breed, finding more profit in the Cheviot or rather in what is called the Tynewater. The wool of the Tynewater sheep is decidedly finer in quality. Mr . H. considers Mr. Kidley of Parkland, and his father, to be the most extensive storemasters on Tyne and Reed waters ; their clip this year must realize at least $2000 /$ Mr. H. is an extensive jobber, and is for ever on the oad. Mr. Bates of Halton, and he, frequently speculat in purchasing Turnips for consumption on the ground by sheep; choosing dry soils, such as the neighbourhood
of Corby Castle, \&c. In 1812-13, they purchased 3 -year-old Wedders, at $1 l$. 158 . per head, and sold them to butchers at $4 l$. 6s., leaving a very handsome profit I find Mr. H. altogether sceptical as to a real unfailing milking breed. He has frequently had common Tees water cows, who gave 30 or 40 quarts of milk per day but he never knew any of their progeny come nearly up to that mark. He is not sanguine in the success of our riend Bates's cross breed. In his opinion, if you leave thorough-bred shorthorns, you will find no breed pay acre for acre so well (ceteris paribus) as pure Kyloes. The Earl of Strathmore is making up a very fine herd of Skye cattle at Streatham Castle. Mr. H. saw his lord ship's steward, Mr. Dobson, sell lately in Darlington market a lot of 3 -jear-old Kyloes steers to a butche arm Mr. H. quite pasture, and fnished of at Streath th qualities of a good breed to be chiefly developed when put up to be fed off the shambles. Mr. Robson, butche in Newcastle, who kills upon an average of twelve months one beast a day, besides sheep, calves, 2 c. ., also coincides, Robson purchases largely from Mr. Bates, and declares the crossbred beef to be particularly deliexd rich, and that he finds his account in giviog to pay him for it ertai the ordinary market rates. Mr. Bates, of Kirkleavington, of noted celebrity as a shorthorn breeder, farmed Halton Castle, near Hexham, at the period when I formed his acquaintance, in 1813-14. It was a very great privilege to me, and I can with truth say, that his knowledge of husbandry, was only equalled by his kindly spirit, and frank communication of valuable information. My residence was within a reasonable me I me, I fear, to trespass over much upon his hospitaity. Like most men, Mr. Bates had his weal points, but ho enjoyed, as he well deserved, a high character for skill, integrity, and zeal in his vocation. About the time when my acquaintance with Mr. Bates commenced, the manufacturers of York and Lancashire were in full blow, and the demand for beef of superior quality was universal. Having this in view, and entertaining a belief that it was possible to introduce a permanent breed of catlie, wibre, without sacrificing early maturity, dairy qualities, or any of the valuable properties of that most estimable ored Mr. B. began to cross the Kyloe cow with the shorthorn bull. It is well known that the rule laid down by Culey, Cline, and other distinguished men of or and practical knowledge, is to use a small male, Without disputing the accuracy of this theory, Mr. B. simply declared that he was determined to have Kyloe blood on one side ; and that he had failed in finding a Kyloe bull, poseseing these points which he considered to be desirable. He certainly effected a great deal, and was, for a time, quite satisfied with the results. The grade cows proved excellent dairy stock, more especialy in
article of butter. I saw one which was giving 15 bs . of wel. I saw one which was from churning a portion of her milk in a bottle, I confess that it appeared to me to be a somewhat questionable test. The great and perceptible improvement in the grades was in the additional depth and weight of the fore quarter. The Kyloes and grades are, for the most part, kept upon moorland farm, some distance from Halton, wing Mr. B. had mproved by draining, ptually, the cattle ex nerimen fid an pars cross was periment failed and was abandoned. The first crosed upon the progeny of grade buils, and the cows, as the process advanced step by step, reverted to pure shorthorn. farmers and breeders of the district alway them, even when they carried of like age, but of pure horthorn blood. At every agricultural meeting, is Bates puts forward a challenge offering to stake which no against a like sum, grades and shorihorns, from the reeder was found to accept (as they saidisfactory and ifficulty or impossibility of coming to alloway blood wi employed by the Messrs. Collinge is beyond all doubt though how applied, or in what form or measure, believe to be absolutely unknown. I am further incinen to consider it as a mistake made by these cleve of or The alloy may be traced even at this day in so to regard highest bred stock, but which.
rather as a beacon than as a guide-post. Loraine, and Halton was the property of Sir Charles Love upon a lease of 21 years. It contsined a considerable porta * Mr. B. Kept altogether a very large breeding stoct

of rich, and a yearly old pasture. This portion of the
farm lay much upon a declivity, and was laid under farm lay much upon a declivity, and was laid under water (eatchwork) for a portion of the winter. It was Mr. B. used it mueh in finishing off his stall-fed cattle, and always to good profit, enabling him to lit the andical period when Turnips were used up, and Grass critief in ordinary pastures was not ready. He alwass said that this system naid him remarkably well
In after life Mr. B. purchased a beautiful estate in Yorkshire, where he pursued his course as a breeder of Durham, chiefly from his favourite Duchess tribe, which Durham, chiefly from his favour te uurivalled for all the valuable qualities of are probably unrivalled for all the valuable qualities of over, high claims as dairy stock, an important consideration often too much overlooked in high bred herds. Mr. B. was by no means rigid in his notions of breeding in and in. His rule was to regulate that by circumstancess. So long as no degeneracy appeared in the produce, he felt no scruples on the score of affinity. At the time when I was in the habit of visiting his stock, he had two shorthorn bulls in use-Ketton by Favourite, and Baron by Ketton, both of them very superior animals. Mr. B. valued Ketton at 1000 guineas, and declared that he was well worth that money to him as a breeder. I frequently saw the original Duchess, for whon, as a yearling heifer, Mr. B. paid 185 guineas at the great Collings sale. To my unpractised eye I confess she seemed to have been pretty well paid for, but I did not know then, as I do now, that blood is all in all The Hon. A. Ferguson, in the Canadian Agriculturist.

## Calendar of Operations.

> SEPTEMBER AND OCTOBER.

Bebwiceshire Merse Farm, Nept. 29ih.--Harvest commenced with the month, being just a week later than usual, and for a week all went well under a propitious sky. The kecond week was characterised by warm th and humidity, with occasional thunder
showers, which, besides retarding the cutting, prevented the cut grain from making any progress towards keeping condition.
The third week opened with a splendid dry west wind, which oon overturned the stooks and dried them thoroughly, and on the 17 th all hands were at work carrying Barley and Oats. The wise it should have had the preference. The greener and by far the more extensive fields got a shake to the extent of a couple of bushets at least per acre. Four days of such weather, but with no moonlight, put about two-fifths of the crop in the stackyard, and cut. But on the very Saturday night it changed, and such a week of north-east wind and rain has not tried our spirits for many a

year. The corn is soaking and what is uncut is twisted and beat year. The corn is soaking and what is uncut is twisted and beat down, and this delightful state of affairs gives no sign of got used to it, like eels to the skinning. Pastures are destroyed hut Turaips have much benefitted, consequently store cattle, | especially those forward in condition, are dear. Our neighbours |
| :--- |
| in Lammermair have scarcely begun harvest at all. J. T. [We | in Lammermair have scarcely begun harvest at all. J. T. T. [W

learn from another correspondent that Sept. 30 was the 9 th day o almost continuous rain; one quarter of the crop is carried and the rest much sprouted; harvest prospects are most discouraging.
October 6.-After a fortnight's rain we find our crops in a sad plight. It is only three years since we had a leary fall of rain the high temperature (abont $60^{\circ}$ ) of last week, especially Friday there has been such a germination as fow have witnessed before. The proportion of grain in the field during these rains may be
stated at about one-half of the Barley and Oats, and nine-tenths of the entire Wheat crop. Of the latter, one-half being uncut Fas but slightly sprouted, and that only where it was much laid The earlier half was just ready for carrying, and promised
pretty
sample $-a$ reffection that aggravates the hardship of thi case. At the same time it seems that few can be blamed fo having lost time, for all was secured as soon as it would keep
This morning we are opening out every sheaf, and there is scarce one that is not more or less sprouted. On minute examination we should be inclined to estimate the per centage of germinated grain at not less than 25 per cent. of the earlier Wheat. We
have often heard of corn being as "wet as muck"" but until now we never saw the dread reality. The barometer has risen steadily to a pretty fair position, and the nights incline to frost, so we may hope for a cessation of rainy weather. And, with a
hard breeze, we might select and carty nome of the better hard breeze, we might select and carry nome of the better Conditioned sheaves, but as yet there is no prospect of that not one sheaf has been secured in stack, and in Lammermuir Grass, and cattle have lost condition fast the staty ruined our rendering it unadvisable to draw Turnips for thera. Now han ever, the land has got much firmer, and we proceed with alacrit to give them their dues. The sowing of Fallow Wheat and
Winter Teres cannot yet be thought of. J. $\mathbf{T}_{0}$. Notices to Oorrespondents.

## Che Garvenerg $\mathfrak{C h r o m i c l e . ~}$

SATURDAY, OCTOBER 18, 1856.
An Apiarian asks us whether Honey gathered from Rhododendronts is poisgnous. There is a sargeon, he says, living near him who will not keep bees on that account; and as our correspondent keeps bees, and there are a great many Rhododendrons cultivated around him, it is of great importance to him to know the truth, for if the question is
settled that Rhododendrons poison honey he must give up the pleasure of keeping bees.
Considering how commonly and largely this plant is now caltivated among us, we can readily believe that the question is one which many others besides an Apiarian would be glad to see answered.
Tournerort's Voyage into the Levant, a most
interesting book now almost forgotten, gives impor-
tant information upon this point. "When the Army of the ten thousand came near to Trebisond, a very strange Accident befel it, which caus'd a great Consternation among the Troops, according to Xrnophon, who was one of the principal Leaders of it. As there where a great many Bee-hives, says that Author, the weldiers did not spare the Honey: they were taken with a voiding upwards and downwards, attended with Deliriums; so that the least affected seem'd like Men drunk, and the others like mad Men, or People on the point of death. The Earth was strew'd with Bodies as after a Battel; no body however died of it, and the Distemper ceas'd the next day about the same hour that it began; so that the Soldiers rose the third and fourth days, but in the condition People are in after taking a strong Potion.

This accident was ascribed to the poisonous quality of some plant, abundant in the country, apon which the bees largely pastured is found," according to Puiny, "upon the same Coast of the Pontus another sort of Honey, which is call'd Monomenon, because it makes those mad that eat of it. 'Tis thought the Bees collect from the Flower of the Rhododendros, which
frequent among the Forests. The people of those parts, though they pay the Romans a part of their Tribute in Wax, are very cautious how they offer them their Honey.'

This Rhododendros has been thought to be the modern Rhododendron, which is extremely common " on the coasts of the Black Sea by the side of streams from the river Ava (or Sangarius) to Trebisond. This species is reckoned unwholesome. The Cattel never eat it but when they can find no better "There is all the likelihood in the world," he says, "that this Honey was suck'd from the Flowers of some of our Species of Chamoerhododendros. All the Country about Trebisond is full of them, and Father Lambert a Theatin Missionary agrees that the Honey which the Bees extract from a certain Shrub in Colchis or Mengrelia, is \{dangerous and causes Vomitings. He calls this Shrub Oleandro Giallo, that is to say, yellow Rose-Laurel, which without dispute is our Chamaerhododendros Pontica maxima, Mespili folio, flore luteo.'

- From this it would seem that according to Tournerort more species than one yields poisonous honey, and especially his yellow Chamærhododendros, which is the plant now called Azalea pontica. He further relates how desiring to make a present to a
certain Pasha whom he accompanied on the Black Sea he made up "great Nosegays of it to put in his Tent: but I was told by his Chiaia that this Flower caus'd Vapours and Dizziness. I thought he rally'd very pleasantly, for the Bassa complain'd
of those Distempers. The Chiaia gave me to understand that he was in earnest, and assur'd me this Flower was prejudicial to the Brain. Those good People, from a very antient Tradition, grounded perhaps upon several Observations, maintain also that the Honey which the Bees make after sucking that Flower, stupifies those who eat of t, and causes Loathings.'
Hence it is to be inferred that the honey obtained from both Rhododendron ponticum and Azalea pontica is deleterious. But the great Russian botanist and traveller, Pallas, was of opinion that the latter alone is mischievons. He says that the effects of the Euxine honey are like those of Lolium temulentum and occur in a country where no Rhododendron grows. The natives are well aware of the noxious qualities of the plant, and it is related that goats which browse on the leaves, before the pastures are green, suffer in consequence, and moreover that cattle and sheep perish.
Such too seems to be the opinion of Europeans personally acquainted with the country in which these two plants grow, and the honey that is produced there. "Our poisonous honey is, as is well known, rendered deleterious by the bees feeding on the flowers of Azalea pontica, which is found all along the coast between Trebizond and Batoom. The sale of this honey is prohibited, but it is neverwith wholesome honey." Thus writes our intelligent correspondent Mr. Henry Calvert, than whom no one is more intimately acquainted with the plants on the south side of the Black Sea, or with the people and their habits, a knowledge
gained by many years' residence at Erzeroum in the gained by many years' residence at Erzeroum in the
consalar office of Mr. Brant. A sample of this honey from Mr. Calvert is to be seen in the Museum in the Royal Botanic Garden, Kew.
Such, we believe, are all the facts at present known respecting this matter. While they show that honey gathered from Azalea pontica is be-
yond all question dangerous, they leave that of

Rhododendron ponticum almost free from the im putation that has been laid at its door.
$W_{\mathrm{E}}$ observe the following paragraph in the last Number of the Florist:- "Although the Horticultural Society's house in Regent Street did not meet with a purchaser the other day, when put up to auction, we hear hopes are entertained that an opportunity of disposing of it by private treaty
will offer itself bef,re long. In the meantime, we understand that the Council are actively engaged in organising a system for the future management of the gardens, which in time will make that establishment equal to the requirements of the Society. We are glad to learn, too, that no rash or
sudden changes will take place, but that the various sudden changes will take place, but that the various
suggestions and plans for the complete remodelling of the management and maintenance of the gardens will undergo very careful deliberation by the Council, and when the plan for future guidance is fully determined on the different improvements contemplated will be gradually introduced, as the financial position of the Society will enable the Council to carry them out. If all this be true, we feel sure that the Council are acting wisely, and we hope a large accession of new members will be the result, and that another year will see Chiswick regain its former position, if it does not entirely surpass it, which, from all we hear, it is very likely to do."

The friends of horticulture will no doubt rejoice o hear on such good authority that the prospects of the Society are so encouraging. The last meeting added 17 new Fellows to the Society, and we understand that several more will be proposed for election at the next meeting on the 25th of November. What the arrangements will be for that occasion is not at present determined; bat we believe that the subjects of exhibition will be
chiefly, if not wholly, confined to fruit. We can chiefly, if not wholly, confined to fruit. s . tions of homb-grown fruit, excluding that of the Channel Islands, will be awarded on the occasion, Professor Lindufy having placed 5l. at the dispesal of the Council for the best collection, and Mr . Wentworth Dilke the same sum for the second and third best.
It is also as well to mention that under the new regulations Visitors are admitted free to the Meetings only under the following conditions, viz.:1. By the personal introduction of a Fellow. 2. By the production of a Fellow's transferable ivory ticket. Or 3. By the written Order of a Fellow. It is also to be observed that no Fellow can issue more than one admitted by it can in no case exceed two ; that no Order can be received unless filled up and dated by a Fellow ; and that no Order can be received on any day except on that the date of which it bears.
The effect of this will be to prevent the rooms in London being inconveniently crowded, and to render the meeting more select.

As far as we are informed, the general intention of the Council as to the Garden is to discontinue mere decorative cultivation, for which experimental and illustrative gardening are to be substituted, to crop whatever part can be so treated for the purpose of rendering the establishment in some degree selfsupporting, and to take measures for pointing out to visitors, by means of a monthly guide book and
otherwise, whatever may be at any time most worthy of inspection. In this way it is hoped that the operations carried on in the Garden will be rendered instructive to all classes of visitors. In connection with this plan a number of old, useless, unproductive or duplicate fruit-trees are already in course of removal from the orchard and elsewhere.
$W_{E}$ observe in a late Number of the Revue Horticole a statement by Mons. Duohartre that Orchidaceous rpiphytes are incapable of feeding upon moisture suspended in the air as invisible vapour. He says that experiment has satisfied him that this common idea is completely erroneous, and that they feed wholly mpon the mere water which, in a fluid state, comes in contact with their leaves and roots. A damp atmosphere, according to this observer, furnishes absolutely nothing in the
shape of food, and can have no effect upon them except diminishing perspiration, which might be excessive if the air in which they live were to become too dry.
M. Duchartre asserts that copious watering and syringing, especially upon the roots, are what such Orchids want. In their natural situations they receive it abundantly in the form of rain; and in our houses they must also have it if they are to thrive. We are nnacquainted with the detailed experiments which have led to these conclusions in the justice of which we are not at present prepared to acquiesce. The statement is, however, im-
portant, and cultivators should look to it. Maybe it throws some light upon the mysterious disease that has appeared in our Orchid houses of late. While, however, we pause to hear more of M. Duchartri, we admit at once that the skin of Orchids is much in need of very careful examination. What, for example, are the innumerable papillæ, one to each cell, which characterise the upper surface of the leaves of such plants as Phalænopsis ?

## New Plants.

185. Demprobiuk Macarthis. Throoites in Bot. Mag., 4886.

A glorious novelty belonging to the Stachyobian Dendrobes, with long reedy speckled stems and magnificent pink flowers which are more than $2 \frac{1}{2}$ inches long before they expand. They are rivals of such a thing as Sobralia macrantha. Sir William Hooker states upon the authority of Mr. Thwaites, who discovered and named it in compliment to Mrs. McCarthy, the wife of the Secretary to the Colony of Ceylon and a true friend of science, that it occurs sparingly, pendent from the trunks of large trees in the forests of that island aboat Ratuapoora and towards Galle. Its native name is said to be Wis-sak-mal, "the meaning of which is Rainy month flower or May flower." In a note from our invaluable friend Mr. Thwaites we observe that he found it, with above eighty other important and most interesting additions to the Ceylonese flora, while on a trip into the jungles in the south of the island. Its general appearance he describes as being that of a Lrelia; and the excellent figure in the Botanical Magazine does remind us of Lablia anceps. It is a treasure to Orchid growers.
186. Dendrobium Falconeri, Hoaker Bot. Magy t. 4944. Another most beautiful novelty from Bootan, with the habit of D. Pierardi, but with flowers as large as those of D. moschatum, and far more richly coloured. A pale cream colour forms a ground, on which at the points of all the divisions and at the base of the lip is ath of intense purple, which in the lip is bordered with golden yellow. The sepals are a delicate pink. On a shrivelled knotted drooping stem 3-4 feet long, upwards of 60 such flowers appeared and continued 12 or 14 days in perfection. Its history is said to be that it was imported in April last from the mountains of Bootan at an elevation of 4000 feet, under the name it retains ; that it was purchased at an auction in London; and that it flowered with George Reid, Esq., of Burnham in Somerset. We presume it to be the No. 1135 of Griffith's Bootan plants Itinerary Notes, page 194), observed "on rock
The species belongs to the Eadendrobia, and not to the Dendrocorynes as stated in the Botanical Magazine, in consequence of a misconception of the are the two finest plants by far of the two last seasons.

## FLOWER GARDENING.

Among the more recent innovations in flower gardening, the introduction or rather more general dissemination of what is called the ribbon system of embellishment is not the least interesting; or in an artistic point of view the least effective. Singular however as it may appear, notwithstanding that, the first ribbon was planted more than 20 years ago at West Hill, Wandsworth, then the suburban residence of the Duke of Sutherland, the system has not progressed or met with any worthy patron in the vicinity of the metropolis. A recent visit to several of the most celebrated suburban gardens has quite convinced me of that ; indeed with the exception of two examples, one in the garden of the Royal Botanic Society and the other at Syon, I have not seen one single exemplification of the system which even approached mediocrity. Hence the system is not popular ; men of intelligence and from whom you would expect better things rail against it, just for the simple reason that they do not understand and consequently cannot appreciate the highly artistic character of the system. Thatiated with there cannot be a question, for as associase lines architectural objects it is an extension of those are to which the mouldings and various ensichmen hapy their entire interest. The idea therefore was a collur one which trangferred these multiplied lines of colow to garden scenery, and for that idea I believe ribbon at indebted to the Duchess of Sutherland. The ribbon at West Hill was a serpentine one, and though it mighons at be, in truth was not, so well executed as places in Enville, Dadmaston, and present time, yet hat part of the country are at rie prion and as such is was the first step in the right dion.
Of the form of a ribbon a notion prevails tbata straight line only is admissible. I incline to an opposite opinion, and though I have no objectio my choice ine in a proper position, yet if I must have ay line of give me by all means a softly curving line, "he gentle beanty," rendered still more beautariously contrasted play of light and shade upon the varioust be of concolours. A ribbon to be effective mast broad, indoed siderable length, and narrow rather , and beyond tha vidth lat proad to large a surface of colour, and widta they prean please the eye. I have seen ribbow pain rather than pleas only 3 feet wide, but they were
planted with plants of proportionate size-a fact which intend to exemplify before I conclude this paper.
In the counties of Stafford and Salop this system of gardening is perhaps more extensively practised than in any other part of England. I had an opportunity of visiting several of the principal gardens in those counties in impressions. At Trentham as might naturally record my the ribbon system is extensively carried out, and as Mr. Fleming cannot do anything indifferently, it is almost Fleming cannot do anything indifferently, it is almost
needless to say the ribbons are very effective. The needless to say the ribbons are very effective. The the kitchen garden, may be said to be the connecting link between the utilitarian and the decorative depart ments, and emerging as I did from the garden the "surprise" of that "blaze of bloom" was not only very dazzling, but also highly gratifying. To some extent however the ribbon was patchy; the Calceolarias patens in the back row had also played false. The following Mr. Fleming gave me as his arrangement for the present season, which I have recently been informed is.very effective: Back row-Branching Larkspur, blue; Matricaria grandiflora, white ; Petunia Shrubland Rose, rose:; Calceolaria Kayi, orang ;; Myosotis, blue, and Saponaria calabrica, pink, double row intermixed ; Geranium Golden Chain, green and gold ; Lobelia ramosoides, deuble row blue. Where the Golden Chain Geranium is not sufficiently plentiful "Musk" may be substituted with good effect. Mr. Fleming had various modifications of ribbons, and as a hardy one accessible to every one Eschscholtzia californica, orange; Convolvulus ginor, blue ; and Musk, yellow; the last abutting upon I must not omit to mention a rivulet quitting Trentham It apparently meavders in a circuitons route between. some specimen evergreen trees, as Portugal Laurels, some specimen evergreen trees, as Portugal Laurels,
\&ec, and certainly at a distance the casual observer might mistalie it for water. The following is a nice arrangement for a ribbon: Back row-Salvia patens and Branching Larkspur intermixed, blue; Matricaria crandiflora, white; Geranium Tom Thunb, scarlet Calceolaria Trentham Brown, bronzy brown; Calceolaria Kayi, orange; Geranium Manglesi (variegated), and Verbena Tweediana (scarlet), intermixed, white and scarlet; Musk, yellow; Eobelia ramosoides, blue. At Keel Hall, Mr. Hill had formed a very nice ribbon on each side of a narrow Grass walk thus-next ards an excell variety of dublo Fhumb, afterand backed by Dahlia Zelinda, maroon. These borders ware not more than 4 feet wide, and being crammed fall of plants certainly looked exceedingly well. Passing on to Enville the most enchanting ribbon one. Back row-Delphinium. Hendersoni, blue; Pantseolaria gentianoides coccineum, red searlet cerise ; Lobelia speciosa, Hlue; Geranium Cerise Unique, orange variegated. The beautiful play of colour in this arrangement was very remarkable. गhe variegation of the Golden Chain, the flowers being taken off, the cerise of the flowers, coral stems, and peculiar marking of the foliage of the Cerise Unique, divided as the two kinds were by a dense line of bright blue and backed by the Orange Calceolaria, was a combination of colour the effect of which must be seen to be appreciated. For a sarrow ribbon no arrangement conld be more effective, bat it is not every person that can plant out Golden
Chain by the thousand, and those who cannot will find a good substitute in small plants of the Flower of the Day if the flowers are regularly taken off and the plants are not permitted to get ton tall. The Cerise Unique in this arrangement will also look best if placed in the full sun, then the stems and leaves get their full colour, which is a matter of much importance. It Chief been suggested that Geranium Commander-in proceding arrange better than Cerise Unique in the ness in the colour of Cerise Unique which I very much admire, just for the reason that I consider Flower of the Day is more useful than any of the more recently intro daced and brighter-coloured variegated Geraniums. I ahould mention that the precediug ribbon was verged Grass Grass. Here is another arrangement with patens, blue ; Calceolaria Kayi, orange ; ditto, Indian Corief, crimson brown ; Geranium Tom Thumb, scarlet rorget-me-Not, blue ; Geranium Golden Chain, orange and green. The pleasure grounds at Enville being new and supported with the greatest liberality by the noble proprietor, Mr. Aiton has an opportunity of carrying duthe ideas in first-rate style, and well he performs his duty, for nothing can be more perfect than the management of the flower beds under his direction.
Splendid, however, as was the appearance of the flower garden at Enville, I think perhaps the groups at Dudmaston, near Bridgenorth, the residence of G Whitmore, Esq., were stlll more beautiful. Nothing could suw bedsen, and 1 never at any time nor in any place traall, very small as compared with those previously mibibioned, but the whole of the shrabbery borders wer tako in and standing as you could at one point and ribbon was preeented thele of the garden, nearly a mile of d'ceil was mostented onthanting. The Variegated Alyssam man very oxteasively used next the Grass, but in adjoin loming is blue Lobelis was introduced. The fol lowing is a very niee ribbon:-Back row-Dahlia

Tweediana, scarlet; Variegated. Alyssum, white Another very nice pattern was:-Back row, white mon gentianoides coccineum, Scarlet and White Phlox mixed, scarlet and white ; Calceolaria Kayi, orange Geranium Tom Thumb, scarlet; Lobelia ramosoides blue; Alyssum, Variegated, white. The number of
bedding plants turned out at that place is very large and how with so small a quantity of glase is Mr Mitche large contrives to provide them is a of glass Mr. Mitchell trouble some provide them is a problem which would trouble some of the best gardeners of the present day to solve. He does it however, and does it well.
In gardens of strictly architectural design, plain and variegated Hollies, plain and variegated shrubs of all kinds, hardy Heaths, and many hardy American shrubs, offer great facilities for the ribbon system, and I doubt not before many years pass we shall see such ribbons planted ex thick stick in his plants at equal distances and think the The lin will come without further trouble. No, no preserved demarcation of each colour must be strictly to intermix, the effect, and, in fact, intention, will be marred at once. It is upon heeping the various lines of colour perfectly independent of each other, touching but hinges, and those who cannot success of the system tion to that particular had better not attempt the plan. I shall recur to this subject again before long. $A . P$.W.

VEGETABLE PATHOLOGY.-No, CXLI.
578. Parasites (Peridermium, Ceratites, Restelia, Gra phiola, Cronartium*). These are all subgenera of Eci-
dium. Of the two last Graphicla affects Palms dium. Of the two last Graphicla affeets Palms and Croiartium species belonging to the genera Cynanchum,
Pcoonia, Thesium, Quercus. Both are of such alimht consequence in a practical point of view to most cul tivators, that they may be regarded as mere botanical curiosities. I have seen, however, Gruplicla ver troubleseme in Palm-houses, impairing the beauty and exhausting the strength of the plants, but it is not common in this country, and Cronartium is very rare, if it is of far at all. Peridermium, Ceratites, and Resestelia are 57 . 2 consequence, and deserve specia in the evelo. Peridermium differs from Lacidum in the great which which it grows and the degree of nourishment which it affords the peridium is more or less developed, sometimes acquiring a length of more than half an inch with a proportionately increased thickness. The species are confined to Conifers, which are sometimes distorted by them in a very curious way. One magnificent species of which the Dr. Thomson on Abies Smithiana in Thibet
f which the following is a faithful representation.
 the kindness of Sir C. Lamb, The branches bs exactly like some phenogamous parasite. The fasciel springs from a swollen knot, the leaves are no longer distichous, but dispersed in spirals, and their form and texture is entirely altered. They are, moreover ew bus, while the normal leaves are evergreen, and bud is developed from the tips of the naked re athes every year, producing a tuft of leaves whic at first yellow, but at a later period acquiring Peridermium Pini is the pos oxhausted young plantations, and is sometimes so abundant in the branches as well as the leaves that death speedily ensues. No remedy for this evil has at present been suggested.
580. Ceratites is confined principally to Pomacece though one or two species oscillating between this and the following sub-genus occur on plants of other families in Ceylon. On Hawthorn, Quince, and some other Pomacere it is often very conspicuous, attacking the frui sometimes as well as the leaves. It is distinguished by the narrow strap-shaped lobes at the orifice of the peridium.
581. Perhaps the worst of all these pests is Restelia Which is so common on the leaves of Pear trees, occur
ring sometimes in such quantities as to injure greatly bie fruitiulness of the trees. This has many characters

in common with Ceratites, but the lacinise instead of being free are all connected together, so as to form隹e cage thres guished by the oozing out of guished by the oozing of the spores or spermatia, When P Pear ine escaper in fure rally incresses, ypreading. On the contrary the evil generand increases, spreading to every neighbouring tree, arre propagating the desolation. The sooner it it arrested the better. When once it is observed every affected lear should be carefully gathered and burnt a soon as it is gathered. It does not appear that any wash is of benefit, nor is it quite clear should experiments be made at what precise time it should be applied. The wiser plan is to pick the leaves as soon as the orangecoloured thickened spots appear before the spores are developed. M. J. B

## Home Correspondence

Orchard Houses.-I am glad to see, both from your , ents, that " $\mathrm{S} . \mathrm{B}$." is likely to be in the minority on the subject of orchard houses. My own experience is de cidedly in their favour. About four years ago I built oue 65 feet long, and 20 broad, with a glass partition in the centre. One end I heated with hot water and in this I grow flowers of various kinds, a Fig tree covering the partition and Vines trained up the rafters on one side only, which leaves me plenty of light, and prevents my flowers being drawn up; these consist in succession of Cinerarias, forced flowers, such as Rhododendrons, Azaleas, Kalmias, Lilaes, Roses, Pinks, \&c. These have now been forced three years in succession, being allowed to complete their growth, and form their buds in a cool house. Next come Geraniums. These are put in their places on the earthen beds, just as they are coming into bloom. They then root through into the beds, and this year remained in full beanty between three and fous months. They continue when treated in this manner to throw up fresh trusses of bloom during the whole period when they are cut down and removed, and I then fill my house with Fuchsias, Achimenes, and Gloxinias ; and now that these are over, 1 have just taken upand potted my Chrysanthemams, struck in May, grown in an open border, and measuring from 3 to 4 feet in height and 2 feet across, You will see from this statement that the warm end of my house is one blaze of beauty almost all the year round. Now for the cold end. Last year my trees of every kind were one mass of bloom, and the fruit set as thick as Gooseberries. I thinned an incredible number, and ripened 90 dozen of very fine Peaches, Nectarines, and Apricots. It would have been better for my trees had I not taken so larg a crop. This year I had plenty of bloom, but it did not set well. I have, however, had about 20 dozen and knowing how scarce wall fruit has been I am quite satisfied. My trees are now in perfect health and full of bearing wood for next year. The result, then, of my experience I should say is this : as regards Peaches, success perfect; Grapes, do. do.; Nectarines, not so satisfactory, the fruit sets bat does not swell freely, it is apt to shrivel and drop off before ripe; Apricots not satisfactory, treea diffieult to kerp in health, bloom drops off; Pears and Plums sueceed as a matter of conrse. Having thus given you the benefit of my ex porience, will you allow me to criticise your leadin perience, will you allow me to criticise your leading up the rafters of the orchard house you will so shade

One of the most curious species, however, is that which forms the clusters of branches which are known in
Germany by the name of "witches' besoms." 'Thi Germany by the name of "witches' besoms." "this great abundance near Hastings, from whence we have

- From res around, and dsecea the skin; engas, a hom; Raste
 writigg, and hemce transierre
the other fruit that though you may grow it in abundance it will have little flavour. $2: 1$, the Stra wberries you say may be changed at least twice; I have found that out of door Strawberries are ripe before my first crop in the orchard house is cleared. expeetation too high when you speak of each of such trees as can be grown in a pot. 4 th , I very much doubt whether you could grow 18 fine Peaches in a 13 -inch pot as I have done, if you coufine the roots to the pot; your crop too would be far more exposed to danger from accidental neylect, for in such weather as we have had in July you would require a man to be constanly watering if you had many trees. I qome means of keeping out spring frosts, or assisting Figs to ripen in autumn. Mr. Thomson's boiler, which I see advertised in your columns this week to hes 1000 feet of 4 -inch pipe for $4 l$. is, 1 hope, only the first step towards obtaining a cheap hot-water ap paratus. Ans Amateur, Bentley, near Furnham. Agreeing as I do with the views of your corresponden the gardener at Alton, I beg to say that, like him, found the front border inconveniently near the glase. This has been remedied by lowering that border ahout adjoining the path to the same level. The upper line of board in the front wall was, according to Mir. Rivers's plan, on hinges, but when the border was lowered, I hinges likewi.e, and think this power of extra ventila tion desirable in hot weather. In order to allow this second line of from the I cover all the apertures with fishing nets nalled inside the house, so as to keep out birds and deter dogs, cats and rabbits dur:ng the summer nights. In construc ting the orchard house I made an alteration which I think an improvement on the origiual plan, namely, stopping the path about 4 feet from the further
end. Thus 8 square feet of border are pained. An extra tree may stand at the back, and a piece of board laid ou the earth in front amply compensates for a little extra difficulty in getting at the trees in the extreme angles of the house. In my Po been only partial. Possibly I may have erred in diminishing the quantity of water given at the roots, as
also the syringing, after the fruit fairly turned colour and commencell ripening. Such diminution of moisture is a general rule in gardening, but possibly unsuited to orehard-house culture. At all events, I intend next year to try the effect of more abundant watering ; but he chief alteration on which I rely is a shifuing of the of apace in the house-one tree had been so treated last year, and the result has been encouraging. With respect to the general question. That Peaches can be grown succesefully in pots, under glass, without artificial where there are no walls, or where the climate is unfarourable, an orchard house is a most desirable luxury may be considered as undeniable. That in originating and bringing into general notice these asolic a no one is more ready to affirm than myself. But at the same time, not having realised in my own ex perience that amount of success which the perusal of Mr. Rivers's pamphlet led me to anticipate, I ventured to record the result of that experience in order to moderate the expectations of othere, and thus prevent demur sappointment. Some of your correspondent who can say that the fruitful picture drawn in the pamphlet has been realized by themselves, or in other words, that they have been able in a house 24 by 12 to grow 48 fruit trees, and to gather in one season 96 dozen of fruit, equal in quality and size to good wall
fruit? The plaia faet is, Mr. Kivers points out what a tree under the most favourable circumstances may possibly perform, and it is rather assumed by his readers than asserted by him that a large number of other many of which are placed at hehack, house, will, on an average, be equally productive. S. $B$.
Wellingtonia gigantea.- I have had three seedling plants of this fine Conifer under my care during the last two seasons. The first was 4 inches in height, and was phanted out in a wood in November 18fo, where it was surrounded with underwood, which afforded it consider1855 it became diseased, owing to the confined state of the air, and died off piecemeal until it became a mere stump; it was then lifted and repotted, and has now made a healthy leading shoot. The second plant was in all respects similar to the first, and was at the same time planted out on the lawn; here it was sheltered in some measure from the prevailing winds, but it enjoyed a free circulation of air. So situated, it has withstood the severity of two winters, with the precaution of a slight protection, and has made a leading shoot of 10 inches this season. It is now 2 feet in height, and in perfect
health. The third plant was also a seedling of the same year as those just noticed, but it was reserved for pot culture; it was been kept under glass during winter, and has never been exposed to more than a doose and pho of frost in May 1855. It was put out o came diseased, exactly like the plant described in your Number of the 20th ult. It was at once remored to an
and here it soon hegan to recover, and with an occar sional shift, made 16 inches of a leading shont in one 20 people. W. B., Esher. season, with side branches in proportion. It was again late in aurumn put under glass, where it was kept through he winter, giving it but a very limited supply of water. In May this year it was again turned out of doors, giving In May this y ear it was again turned out or doors, giving progress, and is all as regards hralth that could possibly be desired. This plant is now 3 feet 3 inches in beight 4 inches in circumference at the base of the stem and at the commencement of this year's grow th $1 \frac{3}{3}$ ineh in circumference, forming a pyramidal shaft from base to top. I have also observed that this plant has hardly made any perceptible progress during the day, but that Night, 10 p.m.

it has performed its growth between 6 P.M. and 6 A.m. I have kept a journal of its rate of progress, of which the accompanying scale is a representation. It will be bserved that it is increased and retarded in proportio to the warmth of the night. John Reed, Orton Hall,
Peterborough. Neterborough.
Nerii Fig.-In your last week's Paper a doubt is ex pressed whether the Nerii be not the same as the small green Ischia. Without being able to solve the doub satisfactorily, I would nevertheless observe that as the latter is an old and well-known variety, it is very im probable that the late Mr. Knight should have con sidered the Nerii a new sort, and written a paper describing the manner in which he overcame the difficulties which impeded its successful cultivation He also observes that the second crop is worthless bot here and in Italy, which is not the case with the green Ischia. Again, Mr. London, writing as one who had himself tasted the Nerii, remarks that it differs from all other Fiys in containing a slight acidity. Further, Mr.
Markham, in the Chronicle of April 3 , 1844, says that Markham, in the Chronicle of April 3, 1844 , says that
even in the latitude of Hewell (in Worcestershire, I presume) the Nerii is the very best Fig for the ope wall, while it is admitted that the green Ischia will not succeed, even in the neighbourhood of London, in an orchard house, unless the walls be of brick. It think the question is one which will bear, and well deserves probing. The Horticultural Society s Fig fruit well ; but if they have a plant of Nerii they might ry it in their orchard house by the side of a green Ischia. S. B.
Washing Machine.-Will any correspondent have the indness to report his experience of the American Washing-machine (with balis), as adapted to the use of
family, its economy, \&ce.; and also of the French Bread-kneading machine, and whether the latter also is

Hurtley's Rough Plate Glass.-"W. B.," Somerleyton, stares that he would not recommend this glass for frames, because he cannot see through it-Query. He would not change it for sheet glass, unless it was of the hest qumlity-does not that imply a doubt? Will not that which obstructs the vision do the same with re. gard to the rays of the sun? How many years' experience has "W. B." had of rough plate glass? You eay that it was impossible for plants to be in better health than those at Somerleyton were when you saw them; does that opinion embrace fruit trees with re_ard to present crop and prospect for another year? R. [Our remark applied to all that we saw.]

Shanking of Grapes.-I would attribute the cause of your correspondent's Grapes shanking to the Vines being exhausted rather than to too much wet and sun stroke was at one time in a large establisument in which the Vines happened to fail in the sume way as your correspondent's ; the roots were lifted and placed in well decomposed manure ; the next crop was most excellent, and there was not a buuch with a bad berry in
may mention that I always thought that what is called shanking occurred when the Vines were showing their bunches, and when they made their appearance twisted round the Vine or anything they conld come in contact with, afterwards becoming useless. This I should attribute to a cold wet border ; if 1 am wrong, I hope some one will put me right. Jas Stexart, Gardener, Witchingham, Norfolk.

Fine Borders.-Noticing in your last week's Number that you are averse to using blood in vine borders, will you do me the favour to inform me what you consider the best suited for that purpose? The border at present consists of pasture loam and dung, with amall quantity of bones, but having been recommended use tlesh as an addition, your advice will much aseis me. Would it not be useful to the public, and be the means of saving trouble, if gardeners adverising through the medium of your Paper, were to state the amount of salary they require? there areobjections doubt not, but I question whether the interest of all
parties would not be enhanced thereby. [We think so.] A. M. [Blood, flesh, and all such substances make Vines rank, difficult to ripen, and predisposed to mildew or any other disease.]
Potato Rot.-I had a lot of sound Potatoes put into a celiar which contained a quantity of superphosphate of guano. I find now that they are nearly all diseased. Reader. [There is no doubt that the presence of ammonia in the air hastens the decay of the Potato.]
The late Mr. Otto. - Christoph Friedrich Otto, late Director of he Royal Botanic Garden of Berlin, died September 7,1850 He weas born December 14, 1883, sand came to Berlin in 1s0i gardener, he was appointed Sub-Curator of the Royal Botanic
Gardens through the influence of Willdenow, who appreciated his talents and worth. In January, 1811, he married the
daughter of an officer in the War Department, by whem he had five children, of whom a daughter and a son are still living, the
latter beiug the present Inspector of the Botanic Gardens in latter beiug the present Inspector of the Botanic Gardens in
Hamburg. Deceased was appointed to be Inspector of the
Berlin Gardens on the 14th April, 1814, afterwards received the Berlin Gardens on the 14th April, 1814, aflerwards recentrusted
fourth class of the order of the Red Eagle, and was ent
with the guardianship of the newly established school for young gardeners, receiving at the same time the title of Garden
Director. His activity in raising the Berlin Garden to the high position it attained gave public evidence of his zeal and skill He also published five or six works on ootany, known by editing
the Cactus tribe, but has been most especilly know
the Allgemeine Gartenzeitung from the year 1833, in common with Dr. Albert Dietrich. A genus among Umbelliferous plants wa circumstance he retired from the royal service in 1843, receiving a pension of $120 l_{\text {, }}$, which is considerable
generality of German pay. Th. von Spreckelsen.

## 

Hand-Book of Zooloyy. By J. Van Der Hoeven. Translated from the $2 d$ Dutch edition by the Rer. W. Clark, M.D. Vol 1. 8vo. Longmans ; pp. 85. The ink of our last week's remarks on British Lintomo logy was hardly dry when this important volume was put into our hands, in which we have from then of a foreigner, admirably aided by a very competen (ranslator, a most useful epitome of Entomological science, brought down to the present day, mixed and however, with other branches of Natural isistory, ang tha Mr. Westwood's invaluable
Frofessor Van der Hoeven in this first volume treats? phyaiologically and systematically, of all know Intusoria, Polypes, Acalephs, Echinoderms, Entozoal Rotatorials, Annulates, Insecte, Arachnids, Crustaceans, l'unicates, Conchifers, and Molluscs-a prodigious entar prise, which none but a master would darterate upon, and which exhausts the field of to inture nimals. His manner of proceeding is to th of the each of these great classes by a general account individuals that compose it, of their place in the of organisation, their anatomy, their habits, propagatrue and so on ; after which the genera are given in ample systematical manner, with critical remariss We do no references to the literature of the subject. We do nout find in these pages long rambling dreamy discoursas a of which angels themselves would fail to exinctions of defimite meaning. and renera are admirably given with hat genuine Linnean brevity and precision which seem to have almost quitted common books on Natural History.

The author is thuroughly alive to the all-important fact
that systematical works are not discertations, and that in that systematical expect to find the differences alone between the former we expected descriptions being confined to specisl treatises or monoyraphies.
The part relating to insects alone occupies 300 pages of which 40 consist of introductory matter, while that of Arachnids or spiders fills 40 more. Extracts from systematical matter being unsuited to our columns we
limit ourselves to a striking passage or two from the part limit ourselves tha a string passage from which the reader will be able to see the skilful manner in which the whole subject is handled.
"We have already said that the scorpions are viviparous. With the egg-laying spiders, the egg,
under the changes of development, slowly loses its previous form, and almost assumes that of a spider, indicating all the external parts of the inclosed animal. At length the shell bursts on the thorax, and the spider, first with the head, and afferwards with the thorax, comes to. view ; then follows the abdomen, to which however the egg-membrane, like a scale, continues attached for a spider, through whose integument the granules of the yolk may be clearly distinguished, is not yet in a state to weave a web and catch its prey; for the spinning organs are still concealed beneath the common integu-
ment. After the lapse of a week, or, in some species, a longer time, during which the spider takes no food, it a longer time, during which the spider takes no food, it
casts its skin for the first time, and is, as it were, born casts its skin for the first time, and is, as it were, born for the second time. The young spiders now quit, on
some mild day in May or June, the web in which the mother had hidden her eggs; they allow themselves to
fall on the ground by a thread, and begin at once to fall on the ground by a thread, and begin at once to
weave their nets, or in some other way, according to the instinct of their kind, to watch for small insects corresponding to their age and powers."
"The power of reproduction

The power of reproduction in arachnids is commonly, as in the preceding class, cousidered to be
gmail. In many, however, lost feet can grow again. Thus Geoffroy once saw a Phalangium, in which one foot was less than the remaining seven, and which probably might have grown at a later period. At all regenerated. In animals whose growth is limited, i. e. which do not grow after they are capable of propagating, I think the reproductive power, in this full-grown state, is small. In such a case are insects after their spiders and crustaceans."

The organs of sense in arachnids are limited, as far as they are known, to those of sight and feeling A distinct organ of hearing has not yet been discovered. The seat of taste, probably also of smell, is to be sough canal. For feeling the palpi, in many at least, officiate in others, where, as in Scorpio and Chelifer, they are covered with a hard skin and are shaped like shears,
they serve for seizing prey. The long feet also of they serve for seizing prey. The long feet also of
spiders and of Phalangia, and especially the thread-libe feet of the first pair in Phrynus, are peculiarly adapted for organs of feeling. The eyes are constantly simple. Behind the convex cornea is placed a very round lens, which is received by a vitreous humour concave on the anterior surface. Behind this humour lies the retina, surrounded by a coloured pigment of the choroidea,
which at the fore part, between the lens and the vitreous humour, forms a ring like an iris. For the presence or absence and the number of simple eyes, we Often, as in Scorpio, Phrynus and Telyphonus, two simple eyes are placed close together in the middle, and on each side two groups of smaller simple eyes towards the margin of the cephalothorax. If this disposition be compared with that of insects, then the middle eye may be litened to their simple eyes, and the two latera Th? rolume consists.

## Garden Memoranda.

Biddulph Grange, near Congleton, the Residence or James Batrman, Ese., continued from p. 679.-The house at Biddulph Grange is an irregular semi-Italian structure, on the western margin of the grounds, and is
built into a bank which slopes rapidly from the east to built into a bank which slopes rapidly from the east to which side the whole of the gardens lie; and presents a long and picturesque façade, the offices being at the eastern end, and partly sereened by ornato the south and the west; the fall being considerable a both directions, especially the latter
The entrance to the house is on the northern side. It is at present incomplete, and the stables are nearly space in frout of the entrance will probably be furmed into a court, and surrounded by an ornamental wall On atepping into the porch, we notice a passage to the rigat, which leads directly into the gardens, and is inwonld not pass through the house. Turning to the left, however, the eye rests on some fine antique Roman visitor then immediasely finds himself in walls, and the ranning north and solyth, find himself in along corridor sonning north and south, with the house door at the soath end of it. The western side of this corridor
consists of a wall, with recesses lighted from belinind, and having a ware Fern in each of them. The eastern
of 6 or 7 feet, the remaining spaces being openings which reveal a very remarkable Fern garden. The artificial, but presenting a most natural appearance ; the locks being piled up as ligh as 10 or 12 leet in some parts, and most beautifully clothed with Musses and Ferns, their outline and effect being varied by an admixture of Hollies, Mahonias, and o her evergreen shrubs ; while a little clear stream meanders through he hollow, relreshing the plants with its mois ure, and gladdening the ear by its music, until it loses itself beneath the corridor
Coming so suddenly and unexpectedly on this delightful little scene, which, with its green luxuriance of vegetation and its delicious shade and repose, offers the most pleasing welcome after the fatigues or discomforts of a jnurney-especially in warm or dusty weather-the mind is well prepared fur receiving subsequent agreeable impressions ; and not even the pertume and gaiety of the richest exotic flowers, however tastefully clus tered about the entrance, vestibule, or corridor, appear calculated to convey so cheerful a greeting as this litte greemess.

Nothing could be more healthy, or appear more at home, than the beautiful plants which line this singular little glen. Large masses of the stately Osmunda regalis, and the almost equally noble female Asplenium overhang the rill, and are surrounded by the no less Many other interesting plants that delight in moisture and shate of mut of or the dark hue of the rock, and the still deeper tint by the dark hue of the rocks, and the still deeper tint Nearly the whele
Nearly the whole of the British Ferns, and a few of the hardy exotic species, are brought together, and find their fitting position in this charming little nook. Of the former, the following 17 species are found wit

## Polypodium vulgare Blechnum boreale

Aspidium Filix--mas
Asplẻnium Trichomanes
Adiantum nigrum
Aspididum dilatatum
aculeatu
Pteris aquilina
Polypodium
Phopteris
Ophloglossum nulgatuma
Seolopencirium officinarum Osmunda regalis
Aspidinm Oreop Aspidiam Oreopteris
Botryehium Lunaris.

Within 15 miles of the place there are also Polypodium calcareum, Aspidium cristatum, and Allosorus crispas the common Helleborus fortidus, with it handsome dark evergreen foliage, is found to flouris here in excessively shaded positions, where notming
appears to live; and is therefore a valuable plant.

## A distinct and different view of the Fern garden

 likewise obtained from the window of the dining-room which is judiciously placed on the north side of the house, and to the coolness and comfort of which the Ferns and the water must essentially contribute during the summer season. From this point the rocks and shrubs are so disposed as to exclude altogether the entrance corridor, the stables, and other out-buildings, and all the yards, sce., at the rear of the house; trifling depression in the upper outline admitting a view of the summit of a neighbouring rocky hill, the rock at this point being left bare to correspond wetter with those of the distant hill, and both uniting together in the most natural manner. Another slight opening between some Holly bushes on the top of the rocks just allows a peep of the better part of the ruins of Biddulph Hall, in which there is a carious tower with a somewhat conical or domical cap to it. To the observant visitor, it win scarcelydow and the entrance corridor are so near each other, as to render it difficult to rrange the rocks and plants so as to be seen in different aspects and yet to equal advantage from each of them, this has been most completely accomplished; the two views being quite dissimilar, and yet each equally favourable of its kind. The scene from the corridor has the little stream in front of it, with the corridor has the corridor itelf-a circumstance which outlet beneath the corridor itself- circumstance whichwould be wholly inadmissible in respect to the view would be wholly inadmissible in respect to the vould convey the disagreeable impression of the stream passing under or into the house. Entering the house, and walking through a vestibule which is appropriated which are hung, in frames of Cherry wood, the original which are hung, in framea of Cherry wood, the original drawings made for Mr. Batemans splendid wors rom, the window of which last, looking south, has been made the centre point for an entirely fresh garden scene, including a small architectural terrace, inclosed with a characteristic stone balustrade, and having a recess at the western end to increase the picturefqueness of its outline, and give a new stand-point for looking at another part of the grounds. This terrace also com-drawing-room and the library, the latter being a handsome a partment recently added to the western end of the house. The terrace opens towards the east into a long walk to be described presently.
Five or six feet below the level of the terrace-itself sbout 2 feet beneath the floor of the drawing room-is a small rectangular enciosure, with hedges of common Yew around it, and a flight of steps connecting it with the terrace. This inclosure protects and frames a paur principal beds filled with hybrid China Roses, the
remainder of the inner space beng occupied by a neat
Mosaic pattern of broad Box edging with red sand between, and a band of white sand round the whole. The design of the plot is simple and conventional, with no attempt at elaborate monogrsms or intricate lines no attempt at elaborate monograms or inticate ind the
and the box edgings being unusually broad, and the and the box edgings being unusually broad, and and
spaces filled with sand so very small that it is obviously spaces filled with sand so very smas with flowers, there impossible for them to le occupied with flowers, there common to works of this deseription. The Box is allowed to grow up into a depress d cone about a foot in d ameter, thus forming a neat finish, in the centre And near the four corners of the Grass plot are fou golden Yews, cut into sharper cones, about 2 feet in beight. 1 gravel walk environs the Grass plot, and is itself encompassed by the Yew hedge already menhoned, the walk being cnnveyed through an opening in the later by another flight of steps down iuto a smaller curculing fountais, and the fence around which is a low wall backed ly a dwarf Yew hedge
The Yew hedge at the sides of the parterre is trimmed so as to show piers or pilasters at regular intervals, projecting frons the hedge, and rising above it 5 or 6 inches sat he base there is a further projection, resemb ground. The object of this lower projection, besides giving a littue more character to the hedge, is partly to conceal the defects which frequently occur towards the bottom of hed ces, and partly to ass st in getting up the part of the hedge consists of a separate set of trees, planted on the level of the walle, while the upper portion is planted on a bank, raised to about the height of the top of the lower hedge. A large conical-shaped mass of Yew , at the two upper corners of the parterre, against the terrace wall, completes the outline of the picture, and a standard Kobinia inermis, contrasting beautifully, in its pale green feathery foliage, with the sombre tint of the Yews, s .
Over the parterre the eye ranges from the drawing room window to the site of the proposed fountain, an beyond it to a small sheet of water many feet lower down, and to the most open and ordinary piece of lawn about the place. Not that this scene is al an a for the water has an irregular outline, and place one; for the water has an irregular outhine, and the masses of shrubs are well arranged, and there is a picturesque island, and scarcely anything is seen of the ravel walks. But this portion of the grounds is more in the usual style than any of the other parts ; and, as regarded from the drawing.room window, it gives the necessary
The conservatory commanicates with the corridor of the house and the terrace, but not with either of the roome. It has a narrow border round it, supported by a raised kerb stone, and the centre bed also edged with a kerb stone; and the middle is raised atill higher by means of a similar kind of support. it is used chiefly for tender Ferns and Camellias, not being quite light enough for the customary kinds of flowering plants. The upper sashes are made to slide, for ventiation, by means of four large weights attached to each waskets for plants, according to a plan originated by Mr. Fleming, of Trentham.
rrom the library, which has a southern aspect, too, and the erection of which was not contemplated when the terrace was formed, the ground a platorm on he reve this point, and to a walk which starts from the house oposite the centre of the library window, and passes all round the grounds. The riew from the library window is along this walk, which has rregular masses of shrubs, Ivy, \&c., on either side; the union with the art-nue character of hows ad the errace being preserved by two small square beds, on either side of the walk, just wader the inray wishow, an Irish Yew being planted in the centre of each, and the rest of the ground in them carpeted with Cotoneatter microphylla. The library view is thus kept distinct from that of the drawing-room, notwithstanding that they are only separated by the conservatory, a length of about the line of division.
Before leaving the house, of which it is not here proposed to give any further account, a peculiarity of the dining-room may be just noticed, as it seems to involve enience and a merit. At the end in whica the recess for the side-board is placed, the recess is proonged bethou screen wall, so as to constitute a curridor, room, and through which dinner is served. As the house extends, moreover, in a long frontage, towards the east, with the ground fast rising in that direction, Mr. and Mrs. Bateman will be able to pass out of their rooms on the upper floor into a glazed gallery, which is lead on to an upper terrace, connected at length with the high terrace at the eastern end of the gardens. They will thus have facilities for getting readily into the grounds from their private apartments, without the necessity for traversing one of the entertaining rooms, or any of the lower part of the house. $E . ## Miscellaneous．

Use of Plants in the Economy of Nafure－That the office of plants in the economy of the world is not sin much to purify the air tor animals as to supply them with nourishment，may be argued－lst．From the nature of the operation in which oxygen gas is liberated by vegetables．Plants take carbonic acid，water，\＆c，
from the air，and decompose them，giving back to the from the air，and decompose them，giving back to the
atmosphere a part of the oxygen，while they transform atmosphere a part of the oxygen，while they transform vegetable products（mostly the prepared materials of vegetable fabric）．The raw materia＇s used contain more oxygen than the vegetable matter produced from them does．The surplus oxysen has to be eliminated， and is therefore given off in a free state，which appears to be the essential thing here；the formation vegetable fabric，or of organic matter，by which alone the plant can grow，form its parts，and continue to exist ；or the evolution of the oxygen gas necessarily 2d．From considering the kind and the degree of the dependence of the animal creation upon these two results of vegetation，namely，the veretable matter produced and the oxygen gas liberated．Now upon
the first，as is well known，the dependence of the animal the first，as is well known，the dependence of the animal
creation is entire and absolute；upon the second，only romote and coutingent．For vegetable matter so pro－ duced furnishes the whole food and fabric of animals． Without it animal life could not have existed at all ； and were its production now to be suspended，all the herhivorous，and then th carnivol ous races，would perish almost at once．On the other hand，the amount of the dependence of＇animal life upon the disengagement of oxycen gas by plants may be estimated by supposing txsing vesetation to cease evolving free oxygen，or
（which would come to the same thing）by supposing （which Wuald come now operation in the organic world to absorb this element as fast as it is given to the air by plants． How soon would the diminution of the oxygen of the air be felt，even by the higher classes of animaly ？ Making the needful calculations，M．Dumas has answered this question by assuming that the unbalanced action of the whole animal kingdom for a century would not consume more than 1.8000 th part by weight of the inappreciable to the most we possess at the present day，and which certainly would have no influence on the life of animals；＂－that，as respects the higher races of animals，＂it would require no less than 10,000 years before all the men on the face of the globe could produce an effect which should be sensible to Volta＇s eudiometcr，even supposing vegetable life to be extinct during the whole of this time；＂－80
vast is the original stock of this important element of the atmosphere．Surely，then，we ought not to call this remotely needful action upon the air the essential office of vegetables in the economy of the world，nor viow as a subordinate or concomitant end that opera－ tion of organising matters which provides the whole formal creation with sustenance，aud the failure of which for a single year would depopulate the earth．Nor should we call that the essential office of vegetation Thich certainly was not essential（as the other was）to －the existeace of an abundant animal life before and （however propitious）has not been proved to be necessary even to the existence of man．Of course there is no question here of this as a function of vegetation，and of the reciprocal action of the two kinds of organised beings upon the air，as maintaing the balauce of its ele ments ；but even here it is not always considered that as Sir Boyle Roche once said，＂the reciprocity is all on one side ；＂that though the animal kingdum could not exist at all without the regetanie， kingdom might very well exist and flourish without the animal．In other words，the vegetable creation is a provision for the animal，－immediately and continu－ ally essential，in one respeot ；remotely and contingently needful，possibly essential to its well being，but not to its being，－in the other．－Edin．Nero Philos．Journal．

## Calendar of Operations．

## （For the enouing week．）

## PLANT DEPARTMENT：

Consertatory，\＆c．－－Air should still be freely admitted whenever the weather is favourable，but it should be regulated so as to avoid draughts，which nnder any circumstances are injurious，Dry weather should likewise be taken advantage of to clean the surface suil of pot plants，and to wash the ousides of the pots to promote free evaporation from the soil daring damp weather；great attention should likewise be bestowed in keeping the slielves，stages，and paths free from dirt，decayed leaves，\＆c．These ittle atten－ tions give huses an agreeablo look at a season when flowering plants are getting scarce．Conservatory and stove－creepers trained under the roof will require an additional cutting in to allow more light to pass to the plants un．terueath；such as have done blooming may be well thimed out at once，and the remaining shoots tied somewhat closer together．I Hardenbergias， should however orer early spring fowers materially aftect their beauty in spring．Before placing Gloxinias，A chimenes，and similar thiugs to rest let each phantbelabelled in order that no confusion mayarive when phey are wanted in opring；all the above keep much better in the pots ia which they grow than anywhere else，
and should be winterea in a roomor shed where there is no danger to be apprehended from frost．

FORCING DEPARTMENT
Pinemes．－Where the bottom－heat is obtained from fermenting materials it is generally found to decline very rapidly on the occurrence of dull cloudy weather， and any necessary addition of tan or whatever else is used should be made directly it is wanted，so as to secure a steady temperature of about $85^{\circ}$ for the roots． be worth being at some trouble to have it in a rather dry state，for when used very wet it is apt to chill the roots at first，and when fermentation commences the heat often becomes so strong that the plants must be raised．Vinemes．－Ripe Grapes will require to be fre－ quently looked over，cutting out any decaying berries unside thenches have not been well thinned，the of dampries must be carefully examined in the event liable to get distigured．Avoid，if possible，having pot plants requiring watering in houses where the fruit is expected to hang for any time，and where any plants must be kept under the Vines they should be watered in the morning，using a little fire heat with air to get the atmosphere dry before night．Gentle fires will be necessary here when the weather is damp，but use no more than may be necessary to keep the atmosphere in motion，for too much warmth is nearly as injurious as damp．

FLOWER GARDEN AND SHRUBBERIES．
In most localities the heavy rains we have lately ex－ perienced must have greatly damaged the appearance be saved shoulder kinds of plants，anc such as are to fore with potting such plants with as much dispatch as possible，and if practicable a little artificial heat should be applied to help them to root before winter．In general a show of spring flowering plants is quite as acceptable as the more gaudy occupants of the parterre in summer，and steps should now be taken to fill up the beds as they are cleared，for the purpose of contributing to the enjoyment of spring．A miscellaneous mixture
of dwarf early blooming shrubs，perennial plants and buibs，is most commonly planted；but in regularly laid out beds，as in geometric flower gardens，the disposition of colour should be cerefully considered，as there is an abundance of spring flowering plants and bulbs to form rich and varied display if properly arranged and carred out．Lawns will now require daily sweeping to present anything like neatness；roll constantly wherever gravel walks for the winter and afterwards let them be well rolled in order that the water may pass freely off the surface．All operations of planting，relaying turf， and border－making should be actively proceeded with．
hardy fruit and kitchen garden．
As a supply of salading is generally in request during winter a stock of Inearly full grown Lettuce and Endive should at once be transferred to pits or frames．Where the protection of glass can be given in frosty or wet weather，the above should be kept in reserve for use in very severe weather．Endive is blancued for salads and kitchen use by various means，but a way we prefer after being tied up when perfectly dry is to cover as much as requires bianching at one time with leaves over to prevent them fron being blown about with wind．Sow a crop of Radish in a frame for winter Celery，Cardoons，and Leeks should be earthed up in dry（weather；Broceoli，Borecole，\＆c．，may still be hoed between，as should also winter Spinach，thinning it out 16 inches apart．

upon the farmer an unnecessary drudgery in book－ keeping．All that the farmer can desire is to have a correct statement of his capital at the beginning and end of every year，and of the receipts and pay－ ments of cash connected with the crop and live stock of that year．＂

We thiuk that a work on Farm Accounts might be usefully made to teach a good lesson in agricul－ ture incidentally，at the same time that it teaches a good method of recording its results．Mr．Stephens reaps a profit from the farm of 500 acres which he takes in hand of 416 l, ，employing a capital of $3000 l$ ． －spending only 3301 ．in labour－Wheat selling at 36s．1d．a quarter！Barley at $19 \mathrm{~s} .4 d_{\text {．，and Oats，}}$ 15s．9d．English farmers will be puzzled to know how the work is accomplished．

Ma．Mecar＇s connection with city affairs is，we are told，to be signalised on the forthcoming Lord Mayor＇s day in a very characteristic manner．We anderstand that in place of any symbolic representa－ tion of agriculture，such as has on previous occasions attended on the men whom the citizens have delighted to honour，we are to have the literal van－ guard of agricultural progress as part of the proces－ sion，Mr．Mechr most properly marshalling the array：and Boypele＇s Locomotive is to clatter through the streets，drawing after it reaping－ machines and threshing－machines for the astonish－ ment and edification of admiring Londoners ！
Ir is well to repeat occasionally warnings which we have often given．Gentlemen resident in the back streets and slums of our large towns giving orders for Wheat，＂a quarter to be sent as a sample，＂for prize sheep and pigs，\＆cc．，ought not to need the sort of introduction which we give them here：they ought to be sufficiently well known without it．And yet we hear continually of their success in victimising．Only the other day a couple of young pigs from a prize sow at．Chelms－ ford travelled 300 miles to an order from one of them．The animals must have been barely worth their c？rriage if sold again as pork，and their original owner no doubt thought that he needed no other security than this．The fact that it is worth while paying fur the carriage of such animals such a dis－ tance proves that the system of roguery here is as complete as it is in other departments，furnished with its receivers of stolen goods as well as with its thieves．

The proper plan，on receipt of any doubtful order， is to apply through a member for information from the Trade Protection Society which every town contains．Mr．Сотtam，the Secretary of the Man－ chester Trade Protection Society，at once，on appli－ cation being made，ascertained the fate of the prize pigs；he could have done so before the theft as well ${ }_{a}{ }^{3}$ afterwards if application had been made in time．

Tar Midland Counties Exhibition of Fat Stock， Vegetables，and Poultry takes place in Birmingham as usual early in December next．
We refer to it here for the purpose of calling attention to a new feature in the scheme，which is announced in the following paragraph ：－
＂Sveepstakes for Breeders，being also Exhibitors of Stock－It is proposed to open a sweepstakes in all the classes for Herefords，Short－horns，and Devons，for the purpose of establishing a competition between the breeders of Cattle who are also the feeders and ex－ hibitors．The subscription will be $5 l$ ．each；and breeders who may desire to join in any of the sweep－ stakes must give notice of their intention to the Secretary，and forward the amount of their subscriptions not later than the lst of November，when the entries will close．The stock competing for the several sweep－ stakes will also compete for the ordinary prizes offered by the Society，and will form part of the usual classes in the Show；and the judges will decide the sweepstakes in each case after making the other awards in the class． If only one entry shall be made in a class，the subscrip－ tion paid towards a sweepstakes will be returned to the exhibitor；but no nomination can be withdrawn after the entry has been received．＂
This may result in a very considerable addition to the attractions of the meeting，and we would urge upon intending exhibitors that they should not delay to apply to the Secietary for the requisite cer－ tificates，as the entries close on the 1st of Novem－ ber－the Show being held in the first instead of the second week in December．This change in the date places the Birmingham Meeting one week earlier than that of the Smithfield Clab，and we may reasonably anticipate the show of stock will be much larger in consequence．

## IRISH PAROCHIAL STATISTICS．

Ler us now see how the labourer who，from necessity， takes refuge in our union house fares，comparatively
premise that the supper meal for able－bodied inmates， preluding boys and girls above 15 years of age，is still，i believe，the exception rather than the rule in dier，in three of the four provinces．Last year I took what I then liad reason to conclude to have been the average dietary in the worlhouses of the Poor－law unions（those of Ulater excepted）．It was as fullows ：－

| Artioles． | Days of the weak． | Meals． |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |
| Meal in ounces | Sundey ．．．．． Honday Tuesday ．．．．．． Wednesday． Thureday ．． Friday ．．．．．． Saturday．．．． |  |  |  |
| Buttermilk in <br> pints ．．．．．．） | Sunday <br> Monday <br> Tuesday <br> Wednesday <br> Thursday <br> Friday ．．．．．．． <br> Saturday．．．．． |  | ， | $\ldots$ $\cdots$ $\cdots$ <br> $\ldots .$. . $\cdots$ <br> $\cdots .$. $\cdots$  <br> $\cdots$ $\cdots$ . <br> $\cdots .$. $\cdots$ . <br>  $\cdots$ . |
| Bread in ounces． | Sinday <br> Monday ．．．．． <br> Tuesday ．．．．． <br> Wednesday <br> Thursday <br> Friday <br> Saturday．． |  | 14 12 8 6 <br> 14 12 8 6 <br> 14 12 8 6 <br> 14 12 8 6 <br> 14 12 8 6 <br> 144 12 8 6 <br> 14 12 8 6 |  |
| Soup in quarts | Sunday ．．． <br> Monday $\qquad$ <br> Tuesday $\qquad$ <br> Wednesday <br> Thursday <br> Friday <br> Satunday $\qquad$ |  |  |  |

It will be seen by a glance at the suppor column that boys and girls in the adolescent state were not，I fear I may add are not，allowed an evening meal；when they pass the age of 15 ，and are not infirm，the light and digestible supper previously given to them is withdrawn． I think that the general fact of extremely low feeding to persons in health，and employed daily in the farm work so profitably executed in many of the Irish work－ house establishments，justified me in recently expressing these opinions：＂In England boys and girls are not classed as adults in the workhouses until they are full 16 years of age；in Ireland the boundary line is placed at 15．Have physiologists discovered that Irish are more precocious than English children？＊＊I place my objection to the refusal of any supper on the gronnd， that in the adolescent state，working people especially require as full and generous diet as circumstances will permit．The general principe on which pauper dietaries are framed in England is a just one；viza，to reduce，but in a trifling degree，the quality or amount of diet，so that the hard working labourer supporting his family by his unaidedindustry at home，should not have reason to com－ piain that the non－working man in the union house has by his self－supporting industry．But it is not true that by his self－supporting industry．But it is not true that
English labourers who have families are generally better fed at home than in the union houses；I believe that the contrary is the fact ；and，even if not so，the stringent application of the same general principle to the Irish poor，under their different circumstances，is not consistent with humanity．When the dietary tables were arranged for the Irish union houses，labourers＇families（fully employed too）were literally subsisting on even a lower scale of diet than that which was then framed for the paupers in those asylums；but taking into consideration antecedent periods，when the Potato was the common and often an abundant food，three meals a day consti－ tuted the general diet of the labourer－occasional seasons excepted．At present，and for some time past，the number of families limited to two meals a day is smal indeed．Therefore，taking a retrospective view of the period aatecedent to the failure of the Potato，and a prospective one of much improvement in the physical condition of the Irish labourer，would it not be desirable to raise the scale of diet for those whomay be necessirated to occupy union houses．？（I arn not pleading for such indulgence to idle or disorderly persons，or sturdy beggars，whom I would treat differently altogether．） To any person who could obtain the means of living out of these nupopular abodes the charitable boon of a supper，consisting of a piece of coarse bread with a drink of inferior mill，or a plate of Indian－meal stirabout， would not be in itself a temptation for remaining in what is deemed cheerless imprisonment．The poor detest the union house，and only go there from utter destitution or temporary necessity．＂＊

Subsequent experience has proved to me that I was correct in assuming that the boon of a slight supper，in addition to the previous allowance of two slender meals， would not act as an inducement to any labourer for cabin fong his straw pallet under a poverty stricken cabin for the comforts afforded in the union honse．I fervently hope that the simple supper deseribed in the table will not be longer withheld in any unioa house； tual，and Physicul Conditions，＂by Martin Doyle．Groombridge \＆Sons，London， $185 \overline{5}$ ．
to give less than this is positive inhumanity．As mast does not enter into the poor Irish labourer＇s ménage at all，I do not venture to suggest that it should constitute an article of diet in his poorhouse food excepting in the infirmary department．t

The dietary table in our nnion house comprehends supper，and is as follows：－

Able－bodird Working Males．
Brealfact．－31 oz．Oatmeal and 31 oz．Indian meal，mado froto Dirabout；$\frac{1}{2}$ pint buttermilk． 4 oz ．Indian meal ； 1 pint butter－ milk．
Supper，－One－third of a pound of brown bread； 1 pint of soup． Able－bodird Wobeing Fryales．
Breakfast．－ 3 oz．Oatmeal and 3 oz．Indian meal，and $\frac{1}{2}$ pint of butteruilk． milk．
Supper．－交 lb ．rown bread and 1 pint of tea，at the rate of
oz of tea and 4 oz ．of sugar， 1 pint of sweet milk to 3 l quarts of water．
Boys Akd Girls abote 9 ATD UNDRE 15 yeams of Age Breakfeat－$\frac{1}{2}$ oz．Oatmeal and 2toz．Indian meal，dec．；$\frac{1}{2}$ pint weet milk． ozner．Oatmeal and 3 oz．Indian meal，\＆c．； 1 nagg buttermilk； 1 ditto sweet nuilk． $1 \frac{1}{4}$ naggin of sweet milk．
Supper．－1 1 lb ．of brown breud；
It is needless to particularise the rations for the aged and infirm，and for children．Stirabout or porridge of Oatmeal and Indian meal 18 the perpetual food for two of the three meals．No cookery can combine these materials with buttermilk so as to offer any variety to materials with Surterm I may question the judgment which prescribes porridge of the same sort for continual diet， when other sorts might be introduced．This dietary being established for a union which represents one of the best portions of the kingdom，as regards the agricul－ tural population，may be properly compared with a dietary fixed for a corresponding class in Cumberland， where labourers are confessedly among the best paid Longtown Workhouse，in the north border of Cumber－ land：－

|  |  |  |  |  |  |  |  |  |

The Cumberland pauper in contrast with ours is fed sumptuously．What excellent varieties！How many good things accompany the standing of Oatmeal porridge． There out－door relief is preferred both by goardian： and paupers－a common case in England，being cheaper to the ratepayers and more grateful to the recipients of elief．The average earnings of rural labourers＇families in Cumberland are about 18s，a week all the year round those of families around mannot exceed half that arount，though all articles of food are nearly at th same price in both countries．When it is said then that the Irish labourer was never so well off as now，I reply that his condition is bad at the best ；it is by no mean commensurate with the advancing prosperity of toe country and of the farmer eapecially．It is triumphantly
i I may refer to page 32 of my pamphiet for the case 0 labourers on a poor－house farm being sent without supper to oed for them a bit of bread as an inducement to industry and conduct unless they ware ander 15 years of age！

October 18, 1856.$]$
THE AGRICULTURAL GAZETTE.
reported that his wages in the past harvest have bee exceedingly hish, but what has been the duration of
this golden period? Frum two to three weeks. I am this golden period? Frum two to three weeks. I am
only remarking on the state of the labourer in a given diatrict, and that a limited one ; and I know that 1s. $6 d$. a day, with diet, has been the highest rate paid, with brealffast and dinner, to reapers and binders, and this only to extra hands called on for the brief harvest. I myself have paid, indeed, 3s. a day to each of two men they were so engaged for a second week any where this is a sort of skillied labour well remunerated, and only a few practise it. Labourers reguarly employed ments ; therefore, unless some other members of their amilies worked (receiving from 18 . to $18.6 d$. . a day for two or three weeks) they gained no extra advantage, though Barley-our staple grain-is jielding to the armer an almost is slso estimated. What is when it of the labourer if Indian meal should bear price corres pondingly high with that of Barley-mesl ? Potatoes, so promising when I wrote the first page of the present communication, have been seriously affected by the well crop is rotten ; here is a source of disappointment and poverty to the dabourers, who four or five weeks ago bundant and consequently a cheap supply of thei avourite food. Their prospects for the winter ar gloomy indeed, while the farmer rejoices in his sbun dance and profits largely by the labour he has employed

## DIARY OF A DAIRY FARM.

Cheem making twice a day is generally given up in this monib, and two meal or half coward cheese is milk to make it once every day ; the milk set up at night should be slimmed and put into that taken from the cows in the morning; of course a larger portion must be warmed to make it a proper heat and this muss ill be aware the dall heat than in the summer; the process of making aturally tendiug to cool it at this season very diffe cently from when made in the warm weather. The curd must be scalded in the manner recommended last eason, makes it quite as profitable to take a part out of the cheese and appropriate it to butter as to allow all to remain in it, particularly as the milk is richer than in the spring; therefore it is recommended to convert cream from the night's milk into butter. Another the cream to be put into the cheese at this season that the checse withal will be of inferior quality thus late. When the milk is so diminished as not to be ufficient for making every day, family or skim cheese adopted in making the most of the milk, all being once skimmed except that milked the same morning, which hould be put into the cheese as it comes from the cows. if made in thick vats as recommended last month, which 8 a very great improvement upon that made in thin as ar a very and though but little, it is well worth taking off and patting into the cheese, and is worth nothing for any ther purpose. The cheese now on hand must have with a woullen cloth, and dry boards be appropriated fur turning it upon; the difference in the appearance and
quality of late made cheese is very much affected by management, which is often not sufficiently attended to.
A cow should not remain in the dairy, as a general rule, after she has had five or at most six calves, always armer, exceptions, according to the judguens to keep them longer in the daisy on account of superiority of blood, to get as many young stock of their sort, or from some animals showing an unusual disposition to yield a great quantity of milk, and these last, while paying kept longer, to be the mothers of as many young milking cows as prudencesmay suggest can be reared from them, which we may expect to show the like constitution as heir mother, and so in their turn prove most useful additions to the dairy stock. It has been proved by experience and experiment that the milk of cows six Seven, or eight years old, though it may not decrease
in quantity dimmishes in richness, added to which old cows consume a much greater quantity of food than those younger, and as this is so without their producing anything line an adequate return, it is much better roanagernent to rear a sufficient number of young Stock to come into the dairy each year to supply the
place of those which from age or the accident of other animals not proving in calf it is desirable or necessary should leave the dairy. These should not have been milked during the last two months as previously recomponded, in order that they might gain as much flesh as Laical food on which this being much the mold or any dairy stock, such being very hearty feeders. They should now however be taken from the fields, as the Grass can bo more profitably given to other poor stock.

While these cows should be pushed on by better
foud, early Turnips mny be givela with advantage Ooud, early Turnips may be givea with advantage
wieh hay or cut chaff, and aul, addition of which may be found convenient, or this latter could be omitted until the lavt month, when this or a The weaning calves should now be only in the Grass fields by day and in yards with shelter at night, when they should be supplied with cat Turnips and chaff, or the Carrot-tops and Swede-tops may take the place of roots are by this time beginniug to be secured for the winter, and for the next month the tops may be iven with advanrage to the cattle for which it is cows, a flavoar is discovered in the butter, to pry cows, a flavoar is discovered in the butter, to preevery gallon of cream should be put in it, and placed in a tin vessel and heated in warm water for alout 20 minutes, the cream being frequently stirred during this time and allowed to cool very gradual
Onsiderably diminished, and there pigs must now be been improved by runaing on the stubbles, they should now be sold, or those intended for fattenifg should get stock are disposed of to select the best to be kept for breed should any be required to take the place of the old sows,
should it be desirable that any of these should not breed ayain. The desirable that any of these should not bee stock should bes aved forward for them, to provide for the time when food is more scarce.
The young pigs of the second farrows, which Bhould be now two months old, may get a good supply of skimmed nillk, as in most dairies by this time cheese is only made once a day, therefore the evening's milk is frequently skimmed for butter. This milk, with a little mixture of meal from any inferior corn, will soon make these pigs very nice pork, and with about six o desirable that porkers at this season should get their food warm, a little sealding water poured on the meal, and this cooled down with the skimmed milk will make the food a proper warmth. A Acorns may be gathered iu and laid by as food for the older pigs, from one or two quarts a day is a sufficient mixture with other food for each pig. The acorns are mixture with other food for each pig. The acorns are sprout, in which atate they make much more wholesprout, in which atate they make much more wholesome food than if given when gathered to fresh, and as
clisdren may be generally found glad to pick ap acorns cliildren may be generally found glad to pick up acorns be added to the farm produce at a very cheap rate.

## Home Correspondence

Agricultural Statistics.-There has been a good deal Wristen and said lately upon agricultural statistics, some farmers these form the larger number-injurious. Now I believe that the reason why the iden is not liked among farmers is, firstly, because it is considered inquigive them: some again think theix landlords would know too much, but this last objection I think a very poor one. Supposing, however, that these statiatics could be collected without subjecting the farners to any f them be removed $f$ cal this, thes of corn, sce, any the year, it would encourage speculation or produce stagnation, as the case might be, so as to be detrimental to the growers or to the consumers. I know this is an objection agains their collection held by a number of very well informed and infiuential farmers; assuming, however, this opinion
to be incorrect, let me go on to propose a method by to be incorrect, let me go on to propose a method by
which their collection might be effected without any one knowing the secrets of our business (for I am farmer), this forming, as mentioned above, one grand reason for things remaining as they are. I propose, then, that in every parish a person should be appointed -pernaps a farmer would be best, but I conceice the postmaster would be as good as any-who should have it as his office to send every occupier of land in his parish a printed form containing columus for the number of aures of each hind of corn and the number of each kind of stock kept, requesting that it may be filled up on certan day of the month and returned to him. Thes orms should have the address of the appointed person free expase, and lave no signsture attached to them There would, no doubt, for a year or so be some who there whis course this would render the collection very imperfect but for this I can think of no remedy though I should imagine it would not last ong. The lorms when returned (the person who send them out should know how many be has distributed should be sent to some head office-one for each count would be best- and there compiled, and from these that of the whole country might be ascertained. It would be useless for any one to attempt to estimate the quantity per acre before harvest ; as soon, however, as some wa hreshed it would be known how the yield was, and a pretty near guess might be made of the whole number of quarters grown in the kingdom. I believe, wers this plan adopted, there might be aiso a column for the
number of quarters of each kind of com and atock sold
last year, and also one for an esumate of auy old re-
maining at the time of filling in the return could $s$ (heturn. No one affairs ans possibly find out any particular person's aflir, and sfter fow harvests, from knowing the
 opinion grown the preceding year, a pretty accurate crops were ith be formed of I presume the 15 th July would be a good time for the returns to be filled up, and it should then be atated how the crops on each farm were progressing. Lcisurely. [There would not be the smallest guarantee of accuracy under this plan, for it would be impossible to refer a single paper to the pernon who prepared it].

The Irish Poor Lavo.-I have only this day ween your Gazelte of the 4 th, in which "A Tenant Farmer" has rather bluntly asserted that I have ahown great ignorance of England in the present dsy, and that my statements are liable to do mischief not only in England but also in Ireland. I beg leave to inform him that I left a rural district in England only last year, after a residence there during the seven preceding yeare, and that circumstances led me to have a perfect whedge the details of the Poor-law systen pere, an ill marts of England. If the "Tenant Farmer" will do me the favour of reading my recent publication entitied "The Agricultural Labourer viewed in his Moral, Intellectual, and Physical Conditions,"* he will perceive that my acquaintance with the Poor-law system and with the condition of the poor is not merely superficial or theoretical, but deep and practical. I would refer him to the stasistic tables 4 and 21 , descriptive of cases fully investigated by me. He may aee also remodia considerations" which may not displease him. Unless convinced, hy reasoning and facts, that my assertion that "in England the price of (rural) labour is regulated by the price of bread, is erroneous, I still main tain its accuracy. I am familiary acquainted with farmers who meet together (previously to the harves period in particular) to regulate equitably among them selves the rates of labour according to the cost of food at least so far that the labourer shall have remunerating and sufficient wages, even though the supply of labom should be rather in excess of the deman

## Foreign Correspondence

The Reaping Machise in Adetria-We have been requested by our correspondent Baron Ward an Englishman settled in Austria, who has for some years past turned his attantion to agricultural pur suits, to send you (which we do herewith) a translated copy of articles which were publisied in th General Agricultural and Arboricultural Gazette" (Allgemeine Land und Forstwirthschaftiche Zeving) to Vienna, on the 6 th September last, relating ching experiments made with various reaping and mowing machines, particularly of some constructed by Baron principle of H
Ward himself.

The results therein stated we conceive cannot but be interesting to your agricultural readera, J. \& $\boldsymbol{R}$ $M^{6}$ Cracken, No. 7, Old Jewry, London.

## The Journal of Agriculture, and the Transactions of the

## Uctober 1856. Blackwood \& Dons.

The current number contains papers on the science applicable to ayriculture, and on several branches of the practice of agriculture. It is perhaps less various in ite xtract a passage from a prize essay by Mr. J. Loclhart Morton on agricultural drainage

The system of drainage somewhat extensively carried out on the former estate consisted for several years prior to 1847 of shallow drains in every furrow, as occasionally visited and inspected the operations, hat period my connection with the impruviug opera ons was formed, and not being then so complete convert to deep draining as I now am, I was onl lesirous that the 27 to 30 -inch drains should te mad at least 6 inches deeper. As the proprietor was strongly in favour of shallow frequent draining, the depth could not for some years be increased to more than 30 to 33 inches. Experience, very soon acquired, however demonstrated the ract, that while shailow drains did hey failed, after several years, to dry it so thoroughly as it required to be in order to grow successfully every description of field crop. Impressed with this convic on, I obtained permission in 1848 to enter on a series f experiments in draining very dense clays at differen epths and distances apart. The first field drained fo this purpose consisted of 16 acres of good brick-making
clay. It was in pasture, covered all over with Rushes, and produced scarcely any other food for stock than lue Carex Grasses. The enclosure was laid out in hree sections, the first (No.1) to be drained 18 feet apart and 30 inches deep; the second (No. 2) 27 feet, and 3 feet 3 inches deep; and the third (No. 3) 36 fee -inch, and 4 feet in depth. The materias drains, $\frac{8}{4}$-inch ones at the upper ends, all laid without collars. There were several cross main-drains, besides a principal one at the lower end. Part of the latter was laid with arge open tiles and soles, but 4 -inch circular pipes were chiefly employed. The work was performed in the summer season, and a double paring of good clean clay
was laid over the pipes. In filling the drains, the plough was employed to some extent, but care was taken to revent the formation of voids. None of the surface soil was filled in, but the top spading was laid over the filling, with the red side up. The expense, irrespective of the cost of laying out the works, stood thus by the mperial acre :- a Depp

 ow, and the work was got cheaper done than it could oe got completed for now. Looking at the dimensions of the different sections, it will be observed that in No. 1 the drains were too far apart for very clayey land, and even the width of the drains in No. 2 was too great for the depth. The results of this experiment may now be stated. On the land being put under Oats, he crop proved most productive over the 18 feet drains, next beat on No. 2, and especially in the old urrows, very inferior on No. 1. It happened to be a The yext, and a good test was afforded in consequence. The next crop was Turnips after a very deep crossploughing. Over the deeply-drained secticn the roots saried considerably, some being good and some bad. Neither was the crop on No. 2 so good as could have been wished, though better than on No. 1. The crop over the shallow drains was the best, and the land was firmer in wet weather than on the other divisions. An Oat crop and then hay followed, and under both the eep drains showed that, for a distance of about 12 feet on either side, the land was thoroughly dried, but farther off than this scarcely drained at all. The whole field is ow in pasture, and the conctasion I have come to in reference to it is this, that none of the systems are satisfactory. The shallow arains did great good at first, and the deep-wrought very badly; but now, so far as the deep ones are aule to draw, they are doing excellently well, but the others are not. Had I drained 24 feet apart and 4 feet deep, I have every reason to think that the drainage would have been most satisfiacory. As it is, this is not the case. But ons sometimes earns more from failare than from anccess in such operations.Another field of about 18 actes, which 1 subse.
quently drained by desire of the propritor 30 fees partilly and repeatedly observed that the ground is only well drained 11 feet on each side of the drain. The subsoil is very dense clay, with pieces of 'till' breaking in at intervals, but is not one of the worst bleeding kinds of stroug
land. A few notes on different fields will be sufficient to indicate the system ol drainage which has been found most successful on this property

A field of 25 acres, a deep earthy soil, and strong yellow clay subsoil. Drains, 24 feet apart in one section, and 4 feet deep. Results most satisfactory. Another section, drained at 27 feet intervals, same deal to be boasted of. Another enclosure, having mueh the same soil as the last drained, $22 \frac{1}{2}$ feet apart, and 3 feet 9 inches deep. Very satisfactory drainage secured. Part of a very stubborn clay field drained 32 feet apart, and 4 feet deep. Not satisfactory as to results, not more than from 10 to 11 feet being thoroughly drained on either side of the drains. Many other instances miyht be enumerated ; but, to save space, I may simply by observation of the different modes of drainage which have been undertaken over the whole estate.
"1st, Drains 30 inches deep, and from 15 to 18 feet apart, have given favourable returns, but after six or eight years they are not so effective as before, and Ruahes begin to come up. 2d, When the drains were only about 3 feet 3 inches deep, and 26 to 28 feet apart, they did a great amount of good, but at that depth rarely dried the clays for more than 11 feet on each side of the drain. 3d, In all cases, even in the strongest clays, 4 feet drains, if not more than from 24 to 28 feet asunder, have thoroughly stood the test of years, and given complete satisfaction.
stone drains and tiles covered with stones have failed completely on this property after eight or ten years, and it would now be considered a waste of money to use them.

In conducting some experiments to ascertain whether deep or shallow drains would run first after rain, I obtained very curious results, as the following figures will show I placed a series of drains in a part of one of the worst drawing clay fields I could select One drain was made 4 feet deep, and the next to it in succession only $2 \frac{1}{2}$ feet. Their lengths ware the samenamely, 90 yards, and to prevent surface-water getting down above the tiles, the filled-in clay was most care-
fully rammed with a paving-beater. It was in dry weather the work was performed, and the mouths being all made to discharge separately into an open diteh, rain was anxiously waited for. In October it came on all at once, and it was then found that the 4 -feet drains ran a considerable time before the other ones. After they had both been running a little, the discharge was measured, with the following resulta:-

The 4-feet drain discharged $2 \frac{1}{2}$ pints in $2 \frac{2}{2}$ minutes.
The 2p-feet draid
"On the following day, when the rain had abated a little, the average discharge was found to be as under

" The experiment was made in 1848, and, notwith standing the filling of the drains, being almost puddled, they are still working well. For several years subsequent to the time that has been mentioned, the deep drains continued, after a fall of rain, to discharge a good deal had an opportunity of examining them, but have no doubt the result continues to be the same.

## Calendar of Operations.

Chrshrix FARy, Oct. 14 CTTOBE The groat vicissitudes of weather lately have in some measure disappointed the expectations of the
farmers as regards the erpps of this county In the early part of
the summer the corn erops upon well cultivated land had an the sually promising appearance, and farmers generally were very sallyuine as to the result, the storms, however, in July,
eappecilly the oue on the Sth, and again in the early part of Aspecialt, beat down the luxuriant crogs, and as we articipated
Aune
some time before harvest, the yield of Wheat is very deficient, the estimate being about one bushol to the thrave; we therefore
think an average crop nay be considered very doubfult; we also
fear from the same canse that these remurky ill apply to think an average crop nay be considered very doubtul; we also
fear, from the same cause, that these remirks ail apply to
Barley and Oats. Beans are not nueh sown, but from informa-
 ouk of the corn was secureet to syy that in consequence of the
of September,
weather becoming very wet about that time, with little or no weather becoming Very wet about that time, with little or no
wind, many acces of Wheat and oots on the higher ground are
much sprouted and still oat on the land, uriess carted yesterday, in very bad condition. Grass has been plertiful, and the make clay lasd has diminished greatly during the late wet weather,
and a considerable quantity of after Grass has been destroyed in
tolerably good, and we have heard of some beavy crops of the
latter, as much as 40 tons per acre; but the great complaint is
that they have run much to seed, and this is attributed by many that they have run much to seed, and this is attributed by many
to the one or other is the canse, but the want of good gennine seed. If
Mangel Wurzel or Turaps are sown too early, or are too
highly manured and over forced, more especially if not hoed highly manured and over forced, more especially if not hoed
in time, the plants will naturally produce a large quantity
of leaves, and form a thick neck, but if they are of a genu-
ine kind they will nut run to seed. Early and Becond early

 mhee erowded corn-yards afforded pleasing evidence that the
 Lothis and to the norllh of Ediinburgh little more than half the erop has been secured, and it was very distressing to see whole
felds covered with stooks, the blackened appearance of which showed but too clearly the damage they had sustained. The fields around Berwick, and for 10 miles on either side of it, are not very clear, but the Oats exposed are of good colour. Further southing very large, and suggestiug some deficiency in the system of atting and gathering in the crops in those districts where they are still exposed, and where soil, climate, and farming are equal Whest Sussex, Oct 14, -Sinc. theen much to notice particularly. The weather there has sometimes rainy has on the whole been favourable for getting he lavd prepared for the naxt Wheat crop. The leas have ploughed up more easily than nsual, and the frequent changes which is now just begun, is done with less than the ubual amount flabour; and at present there is a prospect of its being done in good time. For this part of the county it is considered early to ears, promise this year to do well, and though the earlier two ave failed so much, yet with abundance of Grass and good bay buying-in season, and we have had to pay the same high prices as last year. At Appleshaw and Weyhill fairs-which may be considered as one, the latter being a continuation of but advanced in price daily, while last year they were easier to buy at last, but as the best are all disposed of at first the last
sold are very much the dearest. Hampshire Down full-mouthed ewes fetched from $38 s$. to $42 s$ a head for the best quality to lamb his month and next they are preferred 48.. to b6s. to lam as the lambs if earlier are too forward for the market, and if ater the Downs come into competition with them and reduce in selecting the proper time to put the ram with theme ware worth the seller's trouble. Downs are wanted as forward as possible, and on some farms and with certain treatment they are or much forwarder than on others. Respecting the yield of complaint on every side respecting it. But it masy arise artly from our having formed too the steamers, but much of it ought to have been left for some time longer, as it is unfit to grind do. Barley is dear, and though there is a good deal inferior ostly sprouted, still grinding sorts are also high. Fat pies eighing from 18 to 28 stones of 8 lbs ., are freely selling at $5 s^{\text {. }}$ and the price is not so high; it is abont 4 s . 6 d .; it has been upwards of $5 s$. The young Clovers do well, but there is fear of
the slugs among the Trifolium and Rye. They are very destrucve in the gardens at present, and we should think a flock of duck would be of good service in the flelds to destroy these epredators. G. S.

## Notices to Correspondents

Cheap Food: $A B$. We should preferoilcake to either Oats or Eeans at present prices. We are not learned in the lam you have destroyed a fence which formerly existed, we imagine say injury from consequent trespass must be borne by yourself.

THEy) THE SALWAX PEACH.
LATE YELLOW PEACE. It is a variety quite distinct from other lat. The fosh is appearance as well as in the texture of Apricot- aoft, melling, and juicy, very saccharine, highly aromatic, and separates clean from the stone. The frutt
good size, and ripens ous the open wall the beginning of sition, owing to its lateness and good quality. Trowas Irceax
(Signed)

Royal Gardens, Frogmore, Sept. 23, 1856.
In the "Florist" for December, 1854, Mr. J. Powelt of the Royal Gardens writes:-"The fruit is round, skin deep orange, tinged and mottled with red on the sunny side; flesh orang
tinged with red at the stone, melting and juicy, with a highly pertumed flavour. It is a perfectly hardy variety." There is every reason to believe it will be an excellent forcing varitty, as it sets freely and is a good bearer, and
uad so late in the season it is an invaluable variety. Pomological Extract from the "Transactions of the Britisu Pomolis (No. I.):-"A seedling Peach raised in the garcien Colonel Salway, from a stone brought from Italy, was size, and of a deep golden yellow colonr; the fiesh also of a rich deep yellow colour, very melting, juicy, and vinons, with somewhat of the flavour of an Apricot. Alhoagh this was gathered from the Wall on November i, it was in as great perfection and was highly flavoured as any of the Septenber varipties, and
recommended by the Society as a valuable late Peach.'

 SATURDAY, OCTOBER 25, 1856.Ir will have been remarked that we have lately asked for information concerning the real value of a substance that has been sold largely to gardeners under the name of Page \& Co,'s Blight ComposiTTos. According to the advertisements this preparation is capable of destroying "blight "upon the Hop, Roses, wall-fruit trens, Cucambers, Melons, Vines, stove and greenhouse plants. The word blight is also explained to include green-Hy and be denied that a material capable of eradicating the two last insects would be of very great value, protwo last insects would be of very great value, pro-
vided it did not also deatroy plants; but in the case of green-fly, thrips, and red spider, there are so many ways of keeping them down that a wash against such enemies is of much less importance. We have, however, found from our correspondence that excellent gardeners differ in opinion as to the efficacy of the preparation in question, sone pronouucing it valueless, others speaking ri it in high terms of praise. Such heing the case, it has become desirable to ascertain if possible the real merits of the case, and this we have endeavoured to effect. Whether snccess has attended the attempt our readers will be able to jadge for themselves.

In the advertisement are 167 testimonials to the excellence of the preparation for one purpose or excether: these include two out of four notices of it that appeared in our columns during the year 1855 ; and 23 letters about it have since reached us. Both testimonials and our private correspondence proceed from some of the best and best known practical gardeners in this country, so that materials better fitted to assist the judgment can
scarcely
There are in all 192 testimonials now before us, which the greater part are vague and general, but some are specific. In order to ascertain to what such a crowd of letters really testifies, we must have recourse to the ordinary process of analysis. This we have employed most carefur, and the following result:-Eight say the Composition kills insects of all kinds; one that it kills every
insect it touches: four that it kills insects; one that it killed every insect; another that it destroy all pests ; one that it is useful for all kinds of insects; two think it will answer the purpose ; three find it answer the purpose on Cucumbers, Melons, and Peach trees; 13 find it of great service, or that it gives great satisfaction, or are otherwise satisfied; 7 report or in every way; from 20 more come other forms of expression, such as the very best thing, the most efficacions, very effective, very useful, and the like one finds it effectual in an orchard house; anothe says it did good; one is much pleased; a second
thinks it surpasses anything; another found it a complete cure ; another approves; one thinks it valuable remedy; one will not be without it; and one says "it does execution quickly." It thus appears that out of the 192 cases to be investigated 70 consist of general expressions of satisfaction. All the others may be regarded as bearing testimony to its utility in destroying aphides and thrips, to which alone the word blight seems to apply.
There never has, indeed, been any question as to this point; the real difficulty is to ascertain whether the Composition tells upon red spider, or those far more furmidable enemies, scale and mealy bug. Eight persons having as above mentioned declared that it kills insects of all kinds, it would seem that no doubt ought to remain upon the subject. We also find the follow operation, viz. 25 as to red spider, 15 as to scale, and 15 as to mealy bug. But on the other hand we have one pronouncing against it as a remedy for red spider, four as to scale, and five as to mealy bug. Of the latter some express themselves in terms of condemnation which we need not repeat.
Here then lies the difficulty in determining what the preparation in question is worth. That the evidence before us is all given bona fide we quite believe, although it must be owned that some of it would be more satisfactory if it were less complimentary on the one hand, or less abusive on the insect, that it is a complete cure for every disorder, honey dew and the ravages of ants included, or another declares that it is of no use whatever, gross imposition and so on, we cannot but feel
that such evidence shonld be struck out from each side of the inquiry.

What causes the great difficulty of arriving at a just conclusion is the important fict that persons of equal skill soberly express different opinious Under these circumstances there seems to be no for themselves. If it should be finally found to possess all the good qualities ascribed to it, there can be no doubt that it will be a great gain; on the other hand its ascertained utility in destroying aphides and thrips will repay the cost even if it
should be found that it fails as a remedy against red spider, scale, and mealy bug.

Let us hope however that in carrying out serious examination of its action those who try it will not fall into the very common
error of mistaking the cause of such consequences as may ensue. There is a story curren of a very skilful gardener who maintained insects, mealy bug and scale included. Paradoxica as this may have seemed it involved a great truth. The constant care, the perpetual washing and cleaning that are required to keep down such pests of themselves conduce most powerfully to the health of plats ; and it is certain that the same amount of care wiln never be given where there is no need of repelling sutb active enemies. We do not at all say that the adrantage spoken of in the testimonials
before us, where scale and mealy bug are concerned, is due to scrubbing and washing rather than to Messrs. Page's preparation; but it may be so, and at all events it is desirable to draw attention to such a possible cause of error.

In consequence of the late rains Fungi bave been extremely abundant this autumn and vast quairities have been collected without much discrimination supply of the London markets. It is very probable that the quantity of salt and spice which is used in the manufacture may modify the poisonous qualities

Fungi preserved for winter use by the Ruswian though vinegar is generally added to the brine in which they are preserved. At any rate the quantity of the condiment nsed at one time is in general so small that no evil effects arise, whatever be the mixture. It is, however, some comfort to know that a very poisonous looking species which is very often used is quite harmless. Bushels of Coprinus atramentarius have been manufactured into sauce this year, a species which abounds in gardens and waste places, and is recognised amongst other points by its dissolving after a few hours spontaneously into an inky fluid. Dr. Badhas put this down in his book as affording an excellent Katsup, as also heen used for that purpose in this neighbourhood or nearly jo years. Our main object in this notice is to afford all the information in our power to such of our readers as may fall in with such a manainnocence on our own experience. M.J.B.

VEGETABLE PATHOLOGY.-No. CXLII.
582. Parasite-(Tuburcinia*).-This genus consists of two or three species, which prey upon the tubers or Linaria and Solanum. They differ greatly among themselves, and do not probably all belong to the same cate gory, but as is the case with other hypogeous plants apparently similar, they may have very different affinities. In Linarica spuria, according to Talasne, the affected plant does not seem to suffer in its general health from the parasite. It blossoms and perfeces its seeds. How far this may be the case in other species does not appear; it is however certain that as far as Potato tubers are concerned, which is the important matter for cultivation, Tuburcinia scabies does considerble mischief. It is on account of this latter species that the genus requires notice in this place.
83. The parasite was first noticed in Martius' 'Ireatise on the Potato Disease, $t$ and afterwards very briefly characterised and referred to the genus Tuburcinia in Mr. Berkeley's account of the Potato Murrain, which appeared in the first number of the Journal of the Horticultural Society of London, and a short notice of the disease is given in the thir volume of the same journal, p. 37, in company with the malady commonly known by the name of Scab, $\ddagger$ It is not confined to any particular sort of Potato, but is said to be more common upon white and yellow Potatoes than upon blue and red. It is by some attributed to injury in digging, as it sometimes makes its first ppearance in Potatoes stored up for winter use; but is far from unfrequent in the natural soll, where it some times destroys the crop altogether. The first appear ance of the disease is indicated by little spots of a arker and less pure colour and less shining than the rest of the cuticle; they are orbicular in form and seattered over the surface, but they soon become confluent, and probably from a slight degree moisture the dirt adheres to these spots more than to the rest of the tuber. When the tuber is divided no difference is seen between sound and diseased individuals except an increased disposition to change colour on exposure to the atmosphere According to the condition of the weather or tempera fure, and when the tubers are stored, the hygrometri condition of the air, the spots more or less speedily
change their aspect. The cuticle begins to get loose, he subjacent parenchym changes colour and adheres closely to the ekkin, and at last little flat pustules appear upon the surface, while their cuticle acquires a deeper int, and the interstices become rugged and speckled. The tubers at first were not impaired in point of flavour, but now they have a faint disagreeable taste, which is communicated to everything with which they are mixed. If in this condition the tubers send out shoots they are weaker than usual and often go back.
584. The cuticle has hitherto remained entire. It now fails in the centre and exposes the underlying colours. If, however, the peel be stripsumes different of the pustule comes off with it, the whole of the tissue having assumed the same structure as is the case in the affection more commonly known under the name of scab. As the malady proceeds, the thick diseased skin at last shells off and the underlying cells make their appearance sullied with the greenish brown spores of the fungus. The tissue in the neighbouring portion is more or less discoloured and cecomposed, and where the disease is very virulent, the pustules run so dee pletely that they are perfectly worthless. In some instances the pustules are so frequent that, as in the confluent smallpox, they occupy the whole surface.
585. A few ceattered tubers are often affected by ho disease. In some years it is scarcely possi so prevalent as to do great mischief. This was especially the case in 1847 in Cornwall and the Seilly lslands. As far as my own observations go it occurs principally in damp ungenial seasons in badly cultivated land, especially where Potatoes have been planted many

Die Kartofom tul Evidemie, to feast or gormandise
Die Kartofell Epidemie, p. 23, tab, 2 , fig. $9-13$.
I have availed myself largely in the fext of Martius account,
or mere rubbish has been applied.
56. As regards the parasite itself it was first named by Walroth Erysibe subterranea, his genus being equivalent with Uredo and not with the genus rgenerali known under the name of Erysiphc. Martius bave it the name of Protomyces, and in the Journal of the Horticultural Society it is referred to Tuburcinia. The spores are composed of numerous cells, built up rowad a central cavisy, with one or more apertures on one side leading to a large central cavity, and indicate relation to Sporidesmium rather than Credo. Their form is in fact that of a bomb-shell with one or more plane circuiar apertures. They are attached to delicate threads, as is the case with some of the large compound Sporidesmia. The only remedy against the evil is good cultivation, and especially the use of well decayed stable manure, which seems to agree better with Potatoes where manure is used at all, then the mere refuse of the dunghill. M. J. B.

## THE SEWAGE QUESTION AND MARKET

 GARDENINGMay I bring under the notice of your metropolitan eaders a project for the drainage of the capital involving a new system of, or at least an addition to, our market gardening. My plan of drsinage is contained in the subjoined extract from a letter addressed to the Metropolitan Board of Works, and that of gardening would be something as follows:-To grow Italian Rycgrass and garden vegetables alternately on a large scale. The land under Italian Rye-grass, for example, would be let to farmers, cowkeepers, dc., either to be used as green food or hay, and when broken up from Grass to be well manured with the sewage, trenched by means of steam ploughs, and then let for the season to market gardeners for growing any kinds of crops they might think beat, the land to receive any quantity of liquid manure during the season as might be agreed upon. Of course a tenant might hold on lease 100,500 , or 1001 acres at a fixed rent, receiving the eewage of so many inhabitants, and cropping as he thought proper. During the winter months when there is plenty of rain to wash the orosser portion of the sewage into the soil it would be applied in its natural state, and also to ploughed lands during summer ; but for vegetables'nnd Grass during summer'I propose separating the solid from the liquid by a mechanical process, and applying the latter in a clean state, or as pure as rain water, only word I arrange a certain system of liquid manuring to suit a certain system of cropping, mahing the two go together so as to yield the largest rent for the landlord, and profit for the tenant.
have only included waste lands for manuring, but a large area of porous soils on both bankis of the Thames might be used, and also in the interior of the country. I have lately, for instance, gone over some 3000 acres to be let, at from 25s. to 60 s. per acre. Now, the sewage revenue arising from such would be the increase of cost and value of the manure applied. According to Mr. Cuthill's pamphlet on "Market Gardening round London," the cost might be increased some $5 l$. per acre, and the manure applied might be worth about 122 ., making 1. . per acre. Now. supposing 7 l. to go for extra expense in markeling and increase of cost and profit, it would leave a balance of 102. per acre-a money-making revenue on a large invesiment; or the account may be stated thus: 23 inhabitants to each acre would give 12 tons of freces and aine in their natural state per acre to 100,000 acres, which, at $10 l$. per acre, would produce a revenue of $1,000,000 l$. annually.
Further into details we need not go. No doult some of your readers may feel disposed to quote the Fulham experiment in opposition to my project ; hat it號 not appicable ; for (1) before the kewage gets to pumley Brige in so wasted as hot properly pumping; (2) the sewage thus wasted is int pro applied ; and (3) the system of cropping is not adapted for the sewage. Under such
It will the be cen that a large revene may be ained from the applied to the proper quality of soil, sufficient not only o save the pockets of the ratepayers, but alvo to return them a large annual income after the redeeming term. How different will be the result of any brick sewerage system of sending the sewage some 40 miles from the capital, for all the sulphuretted, carburetted, and phosphuretted hydrogen gases generated in then whontis returved, polluting the atmosphere of the metrop wilh worse than at present; as they from placing every house upon a hot-bed of pestilence
The following is the extract above alluded to :-

#### Abstract

sewery on the surface; but the sandy and chalky soils in question will always be in a state to drain up the greatest flow of sewage. Telding a clear profit of npwards of 10 l . vearly per acrello, now Fieleng a successtul example in proof of this. taker, therefore, an Act of Parliament be got without delay secure the above land to the inhabitants of the metropolis, a landowners, with mannrial distric armed under steam culture, I venture to say that if proper! flalian Rye-grass, \&c., \&c., will yield redeeming in the capital invested, \&s., \&c., will yield redeeming inter st on A population of $2,500,000$ will gield annually upwards bis the dropping of and urine in their natural state. Add to mount to nearly the eatule, soap-sude, \&c., and the result will ot say only $1,000,000$ tous, sufficiently diluted with watere bast, to produce an increase of producully applied, ought, a 50,000 . If a ton of freces and urine, I repeat, do not yilid an hadease of produce of the value of ten shillings yearly, it 4,00 tons, superior to Peruvian guano; so that, at the price of turning less out of gunno than double the above lypothesis be nearer the result than half that sum, after a few years' app cation of the manure."

## Home Correspondence.

A New Nectarine.-I send two fruit of a late Nectaine from a potted tree in my orchard house. I received St. Edmunds. Mr. Kaight, then gardener there, told me that the tree then growing against the south wall present Messrs. Lee, of the Hammersmith Nursery The fruit, as you will see, are large, although from The iruit, as you will see, are arge, although from a
cree in a pot. It is a free stone and piquant in flavour, but not very aweet, owing I presume to the cloud weather we have had lately. As it is most esirable to prolong the season of so esteemed fruit as the Nectarine, this sort for orchard houses in the south of England is likely to prove worthy of attention; it has uniform glands and small flowers, and is most likely allied to the Peterborough Nectarine of the Horticulcural Society's catalogue. Thos. Rivers, Sauvariety, to us unknown. It is much like the White Nectarine in appearance. Although too acid in the state in which we received it here is a fine aroma about it which more heat ould not have failed to develope. And it is not a clingstone.
Shanking of Grapes.- While this subject is before the gardening world, it would be well for those who know what "shanking" is to state their experience respecting it. I believe from the fact that they have never had to deal with worn out or deep planted Vines. Did any one ever see Grapes shank in pots unless they were deluged with cold water? Did any one ever see them shank on dry, any one ever see them shank on dry,
gravelly, or chalky subsoils, where the roots wer allowed to seek their own food? Did any one ever se "shanking" occur where the border was artificially warmed? Did anyone ever observe this evil on open walls where the roots are warmer than the atmosphere? I have under my care a Vinery Which the Vines were planted about 25 years ago there is not the least sign of a root within a foot of the surface; they grow strongly, bat the wood is watery and one-third of the berries "shank" just as they change colour. Early in the season they throw out "spongioles," which under a dry atmosphere dry up have rarely seen an instance of Vines rooting up the stem which has not been accompanied by "ghanking." can produce proof respecting the difference of tem nerature in the soil and atmosphere having an effect on Grapes at the period of ripening. A Viue planted against an open wall with its roots belely water which daily overflows and completely the roots, is now loaded with Hamburg Grapes as Such is my experience in reference to "shanking." ferbaps Mr . Whiting can throw sone further light on the sabject. Whiting can throw some further light on until he replanted them. John Gadd, Bignor Park, Petworth
Late-foweving Plants.-Your correspondent "J. G. has broached a subject which is interesting to many and which I have found from experience particularly worthy the attention of gardeners where families only reside at their country seats during the shooting season beg to add the names of a few other plants to which J. G." has not alluded, and I hope other gardeners will do the same. Amongst searjets, Salvia fulgen and Lobelia propinqua are good, and grow on good soil from 2 to 4 feet in height; and of the more humble sabjects in that cooour the little Cuphes platycentra is not the most despicable, for although not very showy it vill stand a great deal of rough weatber and is very Fuchsis plobuss Riccars; of reds the old-fashioned strictly speaking sabjects for the parterre. Then amongst blues, Ageratumgrandiforum, with its variegated variety, stunds prominens It in the orange class we have the annual Tagetes signata and the useful Tagetes lucids, which requires the eame treatment, but it dues net grow so high as the former,
and requires to be planted rather thickly; then of
yellows which have stood whist their neiphours have been shorn of their beauty by wind a:ad wit, we have Calceolaria amplexicaulis and a dwarf variety of Marigold, I think called pumila, but which is difficult to get true to colour of the seedsmen; therefore it should be carefully saved when once a plant of the true colour is obtained. Let me name, en passant, and recommend to all gardeners who do not already know it, a gem of a different kind and a real boon to those who enjoy good salad, namely, Short's Early Dwarf Beet, raised by Mr. Short, gardener to Sir W. B. Proctor, Bart., Langley Park. Thave a bed of it, and each plant is a model of its neighbour ; indeed, they are unique in every point which constitutes a good Beet. H. Howlett, Havirland Hall.
Large Gourd.-A specimen has been grown in the garden of G. W. Tiremans, Esq., of Lofthouse Hall, near Redcar, by lis gardener Mr. Milner, which measures 5 feet 8 inches in circumference, and weighs 8 stone. M
Poisonous Honey.-Please ask "Apiarian" how it happens that the bees which feed through the winter on the khododendron-poisoned honey are not all destroyed. To be sure, "what is one man's meat may be another man's poison.". He need not "give up the pleasure of keeping bees," nor the delight of looking on
Rhodadendrons either, rest assured. Will Honeycomb. Monstrous Buccoli - I Broccoli which may possibly be worth attention. have been an extensive grower of that vegetable for more than 20 years, and I have never seen anything like it before. To what cause is its anomaluas condition to be attributed? J. Clark. [Your Broccoli is very curious, from the fact of six perfect heads being grown on one and the same plant. The cause of this rather unusual formation is probably owing to some injury
and short jointed, is ripening beautifully, and will carry planted come Vines in a border made of old pasture, manure, and lime rubbish. This constituted a much looser mass that that which I lave described above The roots went immediately straight down like Carrots, I cut down the canes last winter to two eyes, and the result has been long-jointed spongy wood, snme of it inferior in strength to the young Vines of this ear. $G$. $L$., Canbrid, C. [But what of the effects Yines : ] - We have liere four Vineries, the West in which from successive bad treatment are very desirable, chiansted the do remove them, flling up with Hamburghs and Muscatg. I have this season remade our border in the following manner, removing the old soil to the depth of 2 feet 6 inches, and placing in the bottom about 10 inches of bricks and stones broken fine on the surface, with drains to carry off water, and resting thereon nearly 2 feet of prepared compost, in which the Vines are planted, but from the construction of the houses their roots are all outside. Now, I had thought that from such a preparation their roota would be in a healtby medium, and that by a proper alplication of fermenting material in the forcing season, and a slight mulching when necessary, I should insure success. But my employer has heard of, and advises the surface to be entirely covered with stone or tile, or in fuct, concreted. Would you be kind enough to say if this plan or any other would be better than what I propose. Park. [This method is recommended by Mr. Spencer, of Bowood. See Theory and Iractice of Horticulture, p. 144.]
variety Pach Apricot.-I observe that you place this variety amony fruits not fit for orchard hoses. I presume this is merely a clerical error, The Peach Apricot is arown very largely in the south and west of France on standards and is I think the largest and best of the Moor Park race ; it is very short-jointed, and bears nuost abundantly in pots in the orchard bouse. I have had small trees in pots so full of fruit as to nearly destroy inemseives, every twig being covered with fruit to the exclusion of leaves, thus weakening the tree. I must observe that I have only permitted this to take place out of curiosity to see how many fruit such pigmy trees could give. Thos. Rivers. We are glad to hear so good an accuunt of this variety. Renorts of a different nature have reached us. We should have hardly expected so large an Apricot to be productive enough to suit an orchard house.

Sir Harry Strautherry.-In your Paper of the 11 th inst., p. 677, a question is asked Straw. Dab Strawberry. I beg to inform him that pur. vember 18.54 ; the following summer they bore ahundantly, and in point of size, flavour, and colour I had never seen or tasted any Strawberry at all to enmplare with it. I have also since heard it expressed by practical gardeners that it is a question whether aly other Strawberry yet to be raised, or recently introduced, will ever come up to it as a first-class table berry. So forcibly struck was I when I gathered my first crop of fruit with its fiavour, that I distributed the berries among my friends, and the result was that the Sir Harry is now in almost every garden in and about this town. How it is that Mr. Doubleday was disappointed with its flavour, I cannot imagine, unless it has been that he is not growing the real sort, or that it has been that the fruit was exposed to much wet and gathered ill that state. I may further add that the juges acting for our exhibitions in 1855, on seeing the dish of Sir Harry, eyed them with dumb astonishment, and when their slence was broken the first guestion asked was, Are they as good as they look ?" and on each tasting they pronounced it superior to any oher Strawberry at that time grown, awarded it the first prize, together with highly recommeuding it. They also inquired the address of the owner and raiser, for the purpose of ordering plants. should it be that Mr. D. has purchased his plants from some other than the raiser cure some direct from Mr. Underhill, of Edgbaston, Birmingham, when I will vonch that Mr. D. atter once fruiting them will aree with me in all that I have frus a may say with truth that too much wrut In in mut much if it will cannot be sad Lancashire Floral and Horticultural Society.

Rough Plate Glass,-In reply to "C. Ho's" inquiry, beg to infort experience of this glass, and have not observed a single instance of scorching under it. I do not recommend am perrectly satien wiod I ,
 shade than sheet or crown glass, hnowing that eme of it does so, fur from its interior quality condemaed a great deal that was supplied or our structures, and should have done sa with more of it had is not been fixed before I observed it, I also know that some of it is quite clear. Now, if I understand the matter righty, the object of fluting is to diffuse the sun's rays Allowing such to be the case and the object attained, may is not lave the same effect on the vision, and thus prevent the desired concentration on the object looked at to
observe it uschuchy ? I have not referred to the earliest serves me rightly, Mr. Hartley somewhere said that the materials of which sheet glass is composed, and that it was calculated to produce a slight shade; what then if we find it do so ; is it anything more than we might expect ?
bnt make both kinds from the same material and the bame furnace, if jou will. May not the fluting (allowing it to have the desired effect) by the diffusion of the rays apparently diminish the light, but not really do so ? generally applicable; it was only intended for "H." Our first arructures put up here, which consisted
Vineries, Peach-houses, plant-houses, and pits, were all glazed with sheet, supplied by different parties. In every case we are subject to scorching, or perhaps more "H." No doubt the manufacturers of this glass, as every other article, will endeavour to meet the prices of their customers; if, then, they get an inferior arcicle We might with equal reason do the eame thing with regard to the cloth of which our coats are made. I may also observe that this glass was supplied by different some of inferior quality. W. Breadley, Somerleyton
Cestrum nocturnum and Gardenia Rothmarni-O visiting the gardens of his Grace the Duke of Leeds, at
Hornby Castle. Yorkshire, I was much .struck with a
very fine specimen of Cestrum nocturnum, so rarely
seen in cultivation. It was one mass of blossom, and has been in flower for the last four months. Its F
fal fragrance scented the whole house, which is very arge. I cannot find it in any nursery catalogue, which I regret, as it is one of the most fragrant plants in cultivation. In the same house is a magnificent specimen of Gardenia Rothmanni covered with flowers and buds, also bearing fruit, whi in robust heath Thi phe seldom seen in collections. I may observe that very extensive improvements are now going on which wit place these gardens among the first in the kingdon
on the one-bniler or Weeks's system, has been erected, which heats 10,000 feet of piping, and gives great satis faction. An extra boiler is added in case of accident, but as yet one is
required. J. P. B.
Ammonia--"A New Subscriber," referring to my communication on this subject in the Chronicle of the different resuls obtained in my experiment, by pointing to the property of charcoal to absorb and retain
ammonia. There might have been some validity in his ammplied solution had the comparison lain between two plants both treated with ammonia, one growing in sand alone, and the other in sand and charcoal. It might
have been contended in that case with some reason that the plant grown in asand derived no benefit from the ammonia, as it was dissipated and lost to the plant while the other did so from the ammonia being absorbed by the chareoal and retained for the use of the plant. stances of the experimot apply even if it could would leave untouched the real merits of the question at issue. Granted in the largest extent that charcoa absorbs and retains armonia, the only question at al by what means did the ammonia enable one of the plants to fabricate so much additional vegetable substance? Was it by furnishing directly from itself and was the material or element which it supplied towards fabricating vegetable fibre or hydro-carbonaceous matter hydrogen or nitrogen? J. H. H.
Petunia imperialis.-This may possibly be a desirable plant for pot culture, to decorate our greenhouses with I purchssed two plants of it in of its succeeding in beds. I parchssed two plants of it in spring, and intended to propagate it abundantly for another season. I planted calices made their appearance-then hopes were enterthined of beholding erelong their besutiful double white flowers, scented like a Carnation; but my expectations Were frustrated, for on examing the calices, which were fully formed, stme were found quite empty, while otherg has passed, and I have not been rewarded with a single bloom from either plant. Perhaps some one who may have grown this Petunia more extensively will report hesir experience of it. J. $G$.
Coona Nut Melon. - Your notice of this variety at page 676 fully coincides with my experience of it
Seeds of it were given to me by Mr. Fleming. We had it here as late as Jan, 6 th this year. The fruit was cut on Nov. 16th, 1855. The flavour is excellent, and no keep good even after November. William Thomas, Gars dener to the Right How. Lord Hutherton, Teddesley Park, Stayfordthire.
Trellis.- Would some of your readers favour me with a reply to the following query? I am snxious to put a
trellis to my dwelling house; is is better to trellis to my dwelling house; is it better to put
galvanised iron wire one or a wooden one? Rempstom.

Died af Calderston, Lancashire, on the 14th inst. aged 65 years, Mr. Alexander Morton, who for 30 years faithfuly served as gardener Joseph Walker, Esq.,

Aduanced Text Book of Geoloyy. By D. Page,' F.G.S. 12mo, Blackwood, pp. 326.
In our volume for 1854, p. 91 , we spoke favourably Mr. Page's little Introductory Text Book on Geology. The author's new work is of a higher, though perhaps not more important kind, for nothing can be more the rudiments of a science. The great merit of these two books consists in their good arrangement, exact ration of the positive which all must understand from the merely speculative, which can so often be very well dispensed with. A course of this kind may not indeed lead to brilliant views or scientific coruscations, but it illuminates without dazzling or distorting. Upon this point indeed Mr. Page is himself explicit: "The author has endeavoured to write as he would have and encouragingly yet not disguising the real difficulties that lie in the way-treating the subject as one which the humblest observer may contribute his mite, rather than attempting to propound authoritatively on problems, the satisfactory solution of which deeper and more exact research, than Geology as yet can boast of. The author requests his lurother geologists who may glance over these pages to remember that own peculiar intended to contain an expositon lemen tary outline of the science as now established by the leading workers in Britain, France, Germany, and America. The main object has been to render the student such assistance as will enable him to proceed in the field as a practical observer, and to read with appreciation the higher treatises, special monographs, always be the aim of elementary works whether called uctions
The order in which the subject is treated follows :-Objects and Scope of the Inquiry-General Relations, Structure, and Conditions of the EarthAgencies resulting therefrom, or chiefly concerned in teristics of the Principal Rocks and Rock-MassesClassification into Systems, Groups, and SeriesGeneral Characteristics of Fossils-The Silurian, Devonian, Carboniferous, Permian, Triassic, Oohitic, Cretacenus, Tertiary and Post-Tertiary Systems-General Review of the Stratified Systems-Theoretical Deducof Practical Procedure. The whole concluding with a capital Glossary of Technical Geological Terms and General Index.
From this enumeration the reader will see how completely the geological field is worked up. The manner of working it is excellent; there is neither too much nor too littie of anything which a stadent requires, mere details being wisely referred to in the special treatises of the most eminent writers on the subject. What the views of the author are with respect to the connection between Agriculture and Geologyiwill be gathered from the following statement.

The assistance which geology is calculated to confer on the science of agriculture, though somewhat over rated at one time, is certainly among the most obvious classes of ingredients-arganic and inorganic ; the former derived from the decomposition of vegetable and animal matter, the latter from the disintegration of the subsoil or of the subjacent rock-masses. Without a certain proportion of organic matter no soil can be fertile, hence the continuous application of animal and vegetable manures; but it is equally true that without a due admixture of inorganic or mineral compoands all attempts at its permanent improvement will be fruitless. All the mineral elements essential to fertility may not exist in the soil of a particular locality farmer can readily obtain the required ingredient from armer can readily obtain the required ingredient rrom own fields, and so effect the permanent improvement in question. To do this, however, he requires to know not only the chemical composition of rocks and soils, but the precise spots they occupy; in other words, he must be familiar with the language and delineations of geological map of his own district, and know the lithological peculiarities of the respective formations. We have already stated that for agricultural purposes wo sets of maps are necessary-one exhibiting the ature and area of the supericial accumulations, and nother devoted, as usual, to the rock-formations that he below. Aided by such helps, and sufficiently acquainted with the science to be able to take advantage of their assistance, the geological farmer has a power at either in the permanent improvement of the soil he occupies, or in the choice of a farm for carrying on the operations of some special department of husbandry. Besides the permanent adm xture of inorganic subtances, there are other conditions necessary to increased fertility; such as facilities for drainage,
capability of retaining moisture, the innocuous nature
of the subsoil, and the power of absorbing and retainiog the solar heat. Soil overlying trap and limestonc requires less artificial drainage than that envering the the former rocks are traversed by numerous joints and fissures which act as so many natural drain-pipes, while the latter are chiefly tenacious and impervious elays. Again, land of itself dry and friable may be rendered wet by springs which arise along some line of disloce geology would cheaply lead off these springs at their source, while he who was ignorant would laboriously furrow-drain his whole field, and find, after all, that hic was the less effectual method of the two. Such are mere indications of the assistance which geology is eal eulated to confer on agricultur apt to be overrated, however, unless the farmer same time avail himself of the assistance of the chemist meteorologist, and vegetable physiologist. As with the farmer, so with the land-valuator; and though shrewd practical man who has travelled a good deal and rept his eyes open to points of amenity, faclities for market, and so forth, may often approximate very closely to the real value of an estate, depend upon it another possessed of the same shrewdness and experience, and skilled in the geological bearings of the district to boot, will be much the safer guide. In fact, without a bnowledge of the mineral structure of an estate, it is altogether impossible to ascertain its value and so it has happened, even within the last 20 years that estates have been sold at so many years' purchase minerand-rent merely, and in total ignorance of a mineral wealth that might have been fairly suspected from the most cursory glance of a geological map o the district. It may be true that the functions of the land-valuator are altogether distinct from those of the mineral surveyor, and that the report of the one should be accompanied by the report of the other; but even in the valuing of land for mere agricultural purposes, the man who is ignorant of the mineral facilities of district-its limes, clays, marls, shell-sands, phosphates and so forth-can give but a very uncertaiu and unsatisfactory opinion."
As an example of the manner of dealing with facts we select Mr. Page's explanation of the origin of Flints. mass so different in composition as chalk is also in some respects an unsettled problem in Geology. It occurs in uodular masses of very irregular (often fantastic) forms and variable magnitude-some of these not exceeding anyinch, others more than anyard in circumference Although thickly distributed in horizontal layers, and occasionally in vertical lines of large nodules or potstones," the nodules are seldom in contact wit ach other, each being completely enveloped by the chalk. It is rare, indeed, to find a continuous layer of flint, as we find a layer or band of ironstone, though the nodular or concretionary states of these two materiale are precisely similar. Externally, the flints are composed of a white cherty crust ; internally, they are o grey or black silex, frequently full of flaws or eracks,
and often contain cavities lined with chalcedony and crystallised quartz. When taken from the chalk pit they are brittle and full of moisture, but soon dry and assume their well-knownthard and refractory qualities Flints almost without exception enclose remains of sponges, sea-archins, detached spines, corals, and other marine organisms the structures of which are often pre served in the most delicate and beautiful manner. In some specimens the organism has undergone subsequen decomposition, and the space it occupied has been either tion hollow or partially filled with some sparry incrustaaggregations of silex round some organic nacleus, just like the ironstone septaria of the coal-shales, the grains of the oolite, the ironstone nodules of the gault-all of which are aggregations round some organic centre, be it a fragment of plant, a shell, a tooth, coprolite, or other organism. This is now the generally received opinion and when it is remembered that the organisms naust have been deposited when the chalk was in a flocculent and pulpy state, there can be little difficalty in cenceiving how the silex, held in solution by the waters of deposit, would, by chemical affinity, attach itself to the decaying organism. The solubility of silica is a wollknown fact in nature ; it occurs in most thermal springs -in soils, whence it is elaborated by many growing plants for their structure-in waters, whence sponges and infusoria elaborate their silicious shells and spicara -and all decomposing rocks, like the felspathic granites, greenstones, and tufas, are continually supplying it to the streams, rivers, and ocean. The cause of its abundance in certain cretaceous areas we may never bow, but it is altogether a mistake to suppose that fint is a product peculiar to the chalk. The spongiferons cherts of the Portland and coralline oolites, and the tubipore cherts and flints of the mountain limestone, are identical n origin, the they are all but identical in composition. Indeed, repeated lines of black flint nodules may be traced in the carboniferous limestones of Bathgate as distinctly and continuously, and as purely ailicious as ever were traced in the chalk-pits of Kent and Surrey this worls, there are excellent woodeuts, where the subject rendered them indispensable.

The Norwich Union Reversionary Interest Compary Lette and Co.) This is a pamphiet by Mr. Le Capper the directors garble papers, wilhhold information, and
refuse to allow the auditwrs to examine the value of the out of our way to notice matters of this kind; but in these swindling days it becomes a duty on the part of
the whole body of the press to call attention to such statements as those of Mr. Le Cappelain.

## Garden Memoranda.

Biddulph Grange, thr residence of James BatemaN, Ese-(Continued from p. 695). -From that part of en and cons is surround by balustraded wall, the principal terrace walk conducts us eastward, between a wall on the north which helps to exclude some of the offices, and which is picturesquely clothed walk on the south side. The walk is edged from the walk on the south side. The walk is edged pied with Yuceas, Acanthus, Saxifraga crassifolia, and similarly striking plants placed at regular intervals.
Passing along this walk for 10 or 12 yards, we enter Passing along this walk for 10 or 12 yards, we enter,
y' an appropriate archway of stone, a long wooden corridor, the sides and roof of which are formed of undressed Bamboo, in regular patterns. The effect of
this covered way, artistically, is to enclose and prolong this covered way, artistically, is to enclose and prolong practically to cover an uninteresting part of the house, and also to shut out a small bulb garden. The entrance to this latter is through an invisible door on the south side of the corridor, and it occupies a small strip of ground running paraliel with the corridor itself, and otherwise surrounded by a Yew hedge. The bulb grounds, and can bs readily visited at thowe periods of the year when the plants are in flower, or shut up during the long remaining period when this tribe of plants Every cultivato
allowing them to bulbs must have felt the dificuit and ripen their growth, after the flowers have passed way, on account of their extremely untidy appearance and the questionable expedients of removing them into are commonly resorted to. By Mr. Bateman's arrangement, however, all such difficulties are entirely over come, and the end of the garden furthest from the entrance is even separaied off from the rest by a
trellised arch covered with Tropeolums and other trellised arch covered with Troprolums and other climbers, the bulbs which flower earliest being placed
beyond this arch, so that there is no necessity for entering that part when the plants in it have ceased flowering.
Eastward of the long passage in the main terrace, the walk runs for a corresponding distance to that at the western end, between walls covered with climbers an borders filled with classic looking plants, to another arch may, which at once answers the purpose of leng thening the vista, and forms the entrance to an enlarged square space, treated as a parterre, and used for Dahlias, dyhocks, \&cc. The point at which the arch occurs, mentioned, very happily afford the means of introd jus a fow steps to effect the necessary change of level the ground, as before stated, rising considerably towards From.
rom the centre of the Dahlia garden another series of little parterres, each on a lower level, descends Unwards to join the lowest terrace walk formerly luded to the enclosures in every case being effecte Yew hedges, and cross walk being lermi ighes the noe by small recessed room under the highest terrace. The parterre which adjoins the Dahlia garden is devoted chiefly to Roses, and is backed to ue east and west lyy a row of standards, with climbers frained to poies at the corners, the Yew hedges forming admirable background, again, for exhibiting the fowers of these. At the lower end of this series of parterres, too, another ingenious device is adopted for preventing the eye from ranging beyond the parterres themselves into a scene which would not harmonise with them. A large Holly is placed at either side of the last flight of steps, and trimmed to a bare stem to expand into 8 or 10 feet, when they are allowed t trimmed into the shape of a bold flat canopy, and which, while effectually blocking out the view, appears quite in character with the Yew hedges, and gives the eodfal finish to the series of descending steps.
Returning to the leading terrace, after quitting the coneidenh a small kitchen garden, and between rows of espalier fruit trees, till it reaches the extreme eastern terrace. It is Mr. 'Bateman's intention to convert the espalier ence into a trellis for ornamental climbers, and the object has partly been carried out, Cherries and other standard fruit trees bemg planted in rows, on raised nounds about 18 inches high, with neatly mown lawn between. The trees are all of equal heights, and of the most perfeet form, in which they are to be duly pre-
served by proning which by pruning; and the edges of the mounds on trees, the branches of which are so interlaced that they prevent the earth from crumbling down, and the foliage makes a very pretty edging in the summer. Everyrueriy, it does not seem out of place in this part of the pleasare-grounds ; and certainly, by its comparative departments.
The eastern-terrace is between 4 and 5 feet above the level of the orehard, and runs north and south. It is ascended by a flight of steps in a steep Grass bank, and is backed by a lofy Beech hedge. A sort of alcove of Yews occurs in the hedge opposite the principal terrace, forming a recess for a broad white uru-shaped vase, which gives the proper finish to the most important walk about the place.
To the northwards, the eastern terrace is connected by another set of steps with the higher terrace, this latter running parallel with the main terrace, and being atached to the upper rooms of the house as before intimated by a glass covered way. The covered way will have an open path in front of it, and extends from the house to the east end of the Dablia garden, where it is the general grouping. At this point there are also steps by which the upper terrace cau be gained without passing through the house
In constructing the walls which, from the diversity of level, are introduced so freely into this section of tha rounds, Mr. Bateman has in some instances employed an elaborate stone coping, which, as will be well known to those familiar with building operations, makesa large and serious item in the expenditure. But, as the walls were to be masked with Ivy and other climbers, the stone coping has gradually disappeared in a very short time, so that in many parts it is not now seen. For the walls recently erected a coping of Ivy alone is to be years the same effects will be produced, and or four eaves will abundantly suffice to throw off the water; the cost of the stone coping being completely saved.
A row of tall Irish Junipers has been planted along the top of the eastern terrace, a standard Portugal Laurel flanking the steps from the other terrace on ither side. An opening through the middle of the great Beech hedge lands us suddenly in a new area of limited size, called the Egyptian Court, which lies to the east of he terrace; and another opening pear the south end of the hedge carries us by a winding narrow walk into the
root garden. The terrace is stopped by a seat at the root garden. The terrace is stopped by a seat at the southern extremity, and there is a cluster of small Ye
trees opposite the central opening in the Beech hedge trees opposite the central opening in the Beech hedge,
thus blocking up the view from the Egyptian Court thus blocking up the view from the Egyptian Court These little things are noticed because it is in small things of this kind that real taste is sho
Before dismissing the terraces, it may be evert for a moment to the lowest of them all, which is evel throughout, and which is in the same line as the higher terrace, being joined to it by the two sets of parterres, and having the site for the fountain at the western end, and a rough ornamental arched stone recess, leading to a lower part of the root garden, at the other extremity. A large Holly hedge divides this lower terrace from the general pleasure grounds; but Mr. (which is towards the wall) so much disposed torh sice ragged and bare, that he purposes putting in its place a Yew hedge, which does not appear so liable to this hedge. The reat of the ground, a space 10 or 12 feet wide, is arranged in two levels, the upper or northernmost space being about 3 feet ligher than the other. They are divided by a wall arion ac., and the upper space is ased for surberres, plants. All the beautiful Detphiniums, Pliloxes, Pentplants. All the beautiful De!phiniums, and many other tribes, which the modern system of fiower gardening lans almost banished from our gardens, or to which a congenial position is rarely allotted, are here appropriately provided for; and being in a part of the grounds where they cannot be seen except specially visited, and which does not necessarily form the route to any other part, the beanty of the place is not marred by their decaying stems, or by the absente sorts are, however, so carefuily mixed together, that there is probably a very short period of the year in which some amount of gaiety is not kept up throughout the entire length of the border.

The small enclosure which forms the Egyptian Court is an oblong or nearly square area, with the outer angles on the eastern side cut off. It is hedged in with Yew, except to the west, where there is the Beech hedge aready described. A walk passes through the cenre, Egyptian arch of stone a long gloomy stone corridor in the Egyptian character. The corridor is terminated by lofty apartment, with a lare recess opposite the entrance, and another on the left or northern side. door and porch give exit, again, on the southern side, to the Pinetum. The building is not yet finished, but it is designed to fit it up privcipally with Pine and Fir wood, as adjoining the Pinetum, and to introduce a good deal of coloured light into it, using it for a refreshment room in occasional rural fêtes to be given to school and other children. For this purpose, there is an aperture in one of the recesses, communicating with a path behind and with a swall room where water could be boiled or othe preparations carried on, so that everything in the way of provisions could be handed through this concealed openung.
Grass occupies the balk of the space in the Egyptian Court, but a litile more character is given to it, and the
sombre effect of the Yew hedge is increased, by

Two lare yew in the centres of the two Grase plots. stand on the midlle of slightly riva surrounded at a littie distance by an edging of Golden Yews, hept dwarl, and which is agin encompaseed by a lower edging of common Yew. The appearance of the whole court is unique, and being thoroughly excluded rom the rest of the grouads, and entered upon suddenly
 which must always be delightfal. E. K.

## Miscellaneous.

The Society of Arts, John Street, Adelphi, has offered premiums for the following among other subjects during the following seasou. All communications must be written on foolseap paper, on one side only, with an inch and a quarter margin. They must be accompanied by such drawings, models, or specimens as may be necessary to illustrate the subject. The drawing should when suspended on the walls of a meeting-room. In when suspended on the walls of a meeting-rooms. In
regard to Colonial Produce of all kinds, it is absolutely necessary that a certificate from the Governor, or other qualified person, should accompany the samples sent to the Society, certifying that they really are the produce of the particular district referred to. The samples should be sufficient in quantity to enable experiments to be made, and an opinion to be formed of their quality; and it is desirable that the cost price in the district from which they are forwarded should be given. In every instance the maximum extent of the plantation from which the produce has been taken should be stated, with the average yield obtained, and whether similar articies bave hitherto been exported from the Colony, or not, and in what quantities. All communications and articles intended for competition must be delivered to the Secrelary, at the society's house, free of expense, on or date of receipt, does not apply to articles of Colonial produce.
22. For the discovery or manufacture of a new Smokeless Fuel Which shall not occupy more pasce, or be of greater weight than
the fuel now in use; and sball be equat in the amount of heatiog power, without lis bilits to injure metals in

## view of their being reeled in England.

nia and its conpounds, from sewage waters and retuse matters, 210. For the beat method of converting precipitated or extracted Sewrege Matter iato a dry or invalable atate, for agricultaral purposes.
211. For the best method of enriching the solld matters obother asits, or mauures in which the solid sewage matter is other salts, or manures in which the solid sewage matter is
deficient, so ss to adapt it to various agricultural crops; or, by
 public raghc, with special re
the introduction of railwass.
The Oblique Direction of the Ligneous Fither, and the Twist of the Trunks of Trecs occasioned thereby. By Professor Braun. - The twist of the wood of many trees is a phenomenon well known to wood-cutters, shinglemoglected by botanists. The distinguished geologist, neglected by ootanists. Buch, appears to have first directed the Decandolle, in his Organographie (1827), was the first bolanist who spoke of it. Professor Braun, in the Proceedings of the Berlin Academy of Sciences, gives the result of a great many observations made on this Spain, and America. Most trees show this obliquity of the woody fibre more or less. In certain species the tuist is almost uniformly in the same direction ; thers both directions occur with about equal frequency, While in not a few no twist is distinctly observable Sometimes the same directions prevail in the majority of the species of a genus, or even of a whole family;
in other cases opposite directions occur in the same genus or family; and it is curious to remark that, in some instances, nearly allied species of Europe and America twist in opposite directions. In a few instances the fibre of a young tree is twisted in one direction, that of the old tree in the opposite direction. In speaking of the direction, it is necessary to come to an understanding, first of all, as to what we mean by right or left, a distinction attended with more difficulty than would appear possible. Yrofessor Braun follows DecanColle and others in viewing the twist or coil oljectively,
imagining himself in the centre of the coil. The twist of the fibre may be discerned in splitting the wood or in its cracks when the bark is stripped off, or in the course of the fissures made by lightuing. Very often the bark itself, at the angles or superficial lines of the trunk, indicates the direction of the wood within very disgspecies of Fagus, Juglans, and Carya, either in Europe or America, nor in V̈lmus, Ailanthus, Frcacinus, Acer dasycarpum, Qleditchia or Robinia, though the latter exhibits a very slight twist to the left. The wood ginica, the Chesnut of Europe, the European and American Salices, Populus pyramidalis, Cornus Aorida Liviodendron (in Indiana and Hllinois, though in cultivated specimens the twist was found to be the other Pray ; but more observations are required,) the Peach, only leguminons tree known to twist to the right. The twist to the left hand is the more common ; it occurs in most Conifone, especially in Juniperus virginiana, Tax odium distichum, Pinus sylvestris (of which young trees twist, however, in the opposite direction), Picea Castanea americana both in opposite dirya vulgaris and Castanea americana (both in opposite direction to the nearly allied species of the old world), Quercus Robur, Populus anyulata, Catalpa, Esculus Hippocastanum, the Pear tree, and more than any other the Pomegrarate ; also most leguminous trees. Most American Oaks, the Sassafras, Acer nigrum, the $\Lambda$ pple tree, \&c., The cause of the apparent twisting is not easily ascerThe cause of the apparent twisting is not easily ascer the whole stem, but belonos to the growth of the successive annual layers. Professor Braun connects it with the growth of the wood-cells, of which the ends, at their formation, are horizoutal or nearly horizontal, become wedge-shaped as they elongate; and if these wedges ascume the same direction in the whole wood-cells would assume a certain obliquity; so that this twist of the wood is connected with the intimate nature or disposition of the cells themselves. But this is not sufficient to explain the higher grades of the abliquity, which sometimes reaches an angle of 45 degrees.-Edin. Newo Philos. Journal.

## Calendar of Operations.

## (For the ensuing week.)

## PLANT DEPARTMENT

Conservatort, \&ce.-All plants belonging to this structure should now be under glass. Cleanliness and free ventilation (whenever the weather will admit of it) should receive constant attention. If severe weather
should occur, do not hesitate to use a little fire heat at should occur, do not hesitate to use a little fire heat at
times, especially if the houses contain a good many times, especially if the houses contain a gnod many
phants in bloom; for in that way a free vencilation may be indulged in to expel damp and staguant air. By means of Roses, Chrysanthemums and other late many weeks to come. Supply them occasional!y with weal manure water in a clear state. Cold pits plunging material if new and dry; coal ashes ree also very good. Whatever material is employed keep the plants within a foot or so of the glass, and
endeavour to leep the soil in somewhat dry state. A portion of the stock of Roses, Lilacs, Honeysuekles, \&ce., in pots, may now be placed in a pit to have a slight advance of temperature. The present is a good time to We have remarked this twist very evidently in somend Fir troen in Praeraar, the bark of which had ben stri pped off
to leave the wood exposed to the weather. $-[E d$. Phil. Jour.]
a supply of Rhoduden irons, Azaleas, and halmias for
forcing ; select plants well set with bloom, desired size. Some of the hybrd scarlet Rhododendrons, as Nobleanum and others, require but litle drons, as Nobleanum and others, require but litile
forcing, and are the best to start first. Pot them in as small pots as their roots can be got into without injury and place them out of the reach of frost till wanted A few of the stove climbers may yet be in bloom Remove dead flowers from them occusionally, and stop all straggling shoots. Let the atmoophere in the stove be moderately dry, in or
rature may be permitted

Pinepirs.-WORCING DEPartment
Penting materids it is very rapidly on the occurrence of dull cloudy decline and any necessary addition of of dull cloudy weather, used should be made directly it is wanted, secure a steady temperature of about $85^{\circ}$ for the roots. In adding fresh fermenting matter at this season it wil he worth being at some trouble to have it in a rather dry state, for when used very wet it is apt to chill the roots at first, and when fermentation commences the heat often becomes so strong that the plants must be raised. Vineries,-Ripe Grapes will require to be frequently looked over, cutting out any decaying berries and if the bunches have not been well thinned, the inside berries must be carefuily examined in the event of damp weather, otherwise the bunches will be very liable to get disfiyured. Avoid, if possible, having pot
plants requiring watering in houses where the fruit is expected to hang for any time, and where any plants must be kept under the Vines they should be watered in the morning, using a little fire heat with air to get the atmosphere dry before night. Gentle fires will be necessary here when the weather is damp, but use no more than may be necessary to keep the atmosphere in damp.
flower garden and shrubberies.
Proceed with potting such plants as it is desirable to keep with as much dispatch as possible, and if practicable a little artificial heat should be applied to help taken to fill up the beds as they are cleared, for the purpose of contributing to the enjoyment of spring. miscellanenus mixture of dwarf early blooming shrubs, perennial plants and bulbs, is most commonly planted but as was stated last week in regularly laid out beds,
as in geometric flower gardens, the disposition of as in geometric flower gardens, the dispositiou of
colour should be carefully considered, as there is an abundance of spring flowering plants and bulbs to form a rich and varied display if properly arranged and carried out. Lawns will now require daily sweeping to present anything like neatness; roll constantly wherever the turf is hollow to keep a firm sward. Well cleau gravel walks for the winter and afterwards let them be well rolled in order that the water may pass freely off the surface. All operations of planting, relaying tur and border-making should be actively proceeded with.
hardy fruit and kitchen garden.
Where the wood is well ripened and root pruning is intended either with wall trees or those in open quarters, a commencement should be made with the earliest ripened trees first. As regards vegetables, the principal crops of Celery and Cardoons should have their final earthing up before sharp frosts set in. The spring crop of Celery will however stand the winter better with only a moderate earthing up and the remainder towards spring. A wide sheltered border should be selected for hand-glass Cauliflowers. The soil if not already light and rich should be made so previously to planting. Put three plants under each glass in a slight hollow, which will be useful in spring when they require water, and may afterwards be filled up as the plants advance. Keep the glasses on for a few days after planting; afterwards The smaller plants should be wintered in a frame, and some of them should be potted in 5 -inch pots for turning out in spring. Beds of Rhubarb, Asparayus, and Seakale should be cleared of theirdead stems, \&c., as soon as the leaves are ripe; where the above are in reqnest in December steps should be taken to force them. Pits heated with hot water are most suitable for the two former, planting the crowns thickly in light rich soil over a moderate bottom heat. Asparagus should be kept as near the glass as posible in order to improve its colour and flavour. Where pitsare wanted for other things a few roots of Rhubarb may be placed in the warm end of the Mushroom house or in a cellar, but most people think the flavour improved hy being forced under glass. Later crops of lhubarb may be forced in the opel ground where it grows, using pots or boxes for covering the crowns, and leaves or leaves and dung for the heit ing material. Seakale may be either forced on the ground as advised for Rhubarb or taken up and the roots put thickly in a frame on a gentle bottom heat.

SATURDAY, OCTOBER 25, 1856

Ir may be as well to draw the attention of malt sters to a very important clause which was intreduced into the Excise law in the last session of Parliament. It is notorious that enormous frauds upon the revenue have been committed by the expedients of nixing mere Barley with malt, and selling the mixture as if it had all paid duty. Malt roasters the mixture as if it had all paid duty. Malt roasters
especially have been concerned in this variety of cheating. In order to aroid detection the Rarley to be frandulently mixed with malt has been killed, so that it might not germinate when the supervisor removed samples for trial. In this way, all Barley incapable of growing being taken to be malt, as much as 90 per cent. of killed Barley on which no duty has been paid, has in some cases gone into consumption as if it were really malt
To put an end to this practice it is now enacted (19 and 20 Vict. c. 34 ) "that all corn or grain found in the custody or possession of any roaster of malt or dealer in roasted malt, which corn or grain shall not have germinated to such a degree that the plumule therenf shall have been elongated to the cxtent of one half the length of the grain shall be deemed to be unmalled corn or grain within the meaning of the said last mentioned act.

We find that Government is resolved to carry out the law as now altered, orders having been issued to ail supervisors and officers to take every opportunity of examining the rtock of malt roasters and dealers, and to seize or secure every sample in
which germination has not taken place to the extent, discourages the growth of such. So this cause of above de cribed. Let us hope that this order of the board will be $\epsilon \mathbb{X}$ cuted with the utmost rigour-for it is too bad that consumers should be plundered by rapacious dealers of vast sums, the payment of which can only be submitted to so long as the urgent public service.

We are asked how to discourage the growth of Funguses in Pastures.

Let us first inquire what are the causes which tend to the growth of these funguses? and then deduce the best method of discouraging their growth and increase.

1. The circumstances which most favour the growth of funguses are poverty of soil and dampness of the atmosphere. The first of these sometimes matifests itself on dry sands, at others on wet clay lands. In the former case it is usually because the sands rest on a pan or stratum of clay. The
damp atmosphere usually proceeds either from proximity to rivers or water-courses, and thus lowlands are more liable to funguses than the neighbouring uplands, as seen on the wide spread commons or "Hams" on the River Severn, where Mushrooms are abundant. Or it characterises high lands and cloudy hill tops, which are sure to be the habitat of hosts of species of funguses.

The food of these lower tribes of plants they find in the decaying material of a higher species of vegetation. The decaying roots of dead or diseased Grasses is the commoner nidus and yield most of
the food of the fungus. In all poor pastures the the food of the fungus. In all poor pastures the
duration of the life of a species of Grass is very precarious as evidenced by the quantity of decayed tufts which are seen in such situations at most seasons of the year. In this case the roots are left behind, and these roots contain phosphates and
alkalies which long since were pointed out by alkalies which long since were pointed out by
Professor $W_{A y}$ to be the principal constituents of the funguses, and more especially of one species, the Agaricus prime us, which is so common a cause of the fairy rings in some upland districts. As regards poor meadows it is quite astonishing the changes that take place in the position of the Grasees according to circumstances ; thus a poor upland consisting for the most part of Bromus crectus, U uright Brome Grass, Brachypodium pinna-
tum, False Brome Grass, and Cynosurus cristatus, Crested Dogstail, will suddenly change by merely Crested Dogstail, will suddenly change by merely
folding sheep on a portion from day to day; and these very Grasses will die out before the advance of Lolium perenne, Perennial Rye-grass, Dactylis glomerata, Cocksfoot, and Poa pratensis, Meadow Grass. Now, in the first state, fairy rings
and funguses of various species at different seasons and funguses of various species at different seasons
will be the result, but in the second scarcely a vestige of these can be traced. We have an illustration before us in a meadow where we have watched their progress for some years, and this in a season when funguses have been peculiarly rife. The truth is, these hetter Grasses, suitable to an
improved soil, are all of them more perennial in improved soil, are all of them more perennial in eattle continually crop them down, whereas poor Grasses are refused by cattle, they seed without interruption; and then having performed the important function of reproduction they die out, and the decaying roots on the approach of damp and fogs become the nidus of funguses.
Thus, if we revert to fairy rings, we shall find that these always cousist of a double circle-one green and the other brown; the green circle is where the fungus has acted as a manure, and there the Grass is fresh and vigorous and can no more grow the fungus ; the brown ring is caused by the mycelizom or fungus spawnattacking the roots of the feeble, poor, and dying Grasses-hence their colour. These roots however, in the economy of the fungus, will be converted into manure, and the green ring will in another season follow the brown.

Lawns are specially liable to be visited by funguses, so that these are as much a pest to the gardener as the farmer. The reason is obvious enough; lawn are continually being mown and material removeda process very different from depasturing, and the consequence on some very old lawns on poor soil is that Grass can searcely be maintained withont the constant sowing of fresh seeds, and these grow more after the style of annual Grasses than in the longlived perennial method good species observe in tolerable pastures.
(2.) We have, then, left little to be discussed under the second of our subject. Dampness of soil Aira coespitosa, Tussac Grass; Avena pratensis, Meadow Oat Grass; and Briza media, Quaking Grans-none of which cattle choose to eat; and these, like Grasses of uplands, also seed and early
die out; it follows that no draining immediately
fungal growth is removed by an operation which
will furiher encourage the grow'th of good species, will furiher encuurage the growl
while it discourages that of bad.

If again from any circumstance-poverty of soil too frequent haymaking, \&c., this dying out of the Grasses and consequent encouragement of funguses will soon effeet a cure. On the rich pasture lands of Cheshire funguses were most abundant, but how rapidly we have seen them dispelled before a compost of bones, ashes, and refuse, especially refuse from old building. Again, on the forest marble clays of Gloucestershire, where the Agaricus pri mutus was plentiful, we have seen a slight dressing
of guano increase the crop of Grass but ruin the fungases for some years, so as to encourage haymaking where it was scarcely before thought of But this latter fact only proved the more strongly years' hay-making has brought the pasture to its former poverty and the funguses to their previous luxuriance.
Here, then, we may conclude that the folding of sheep on a small portion at a time on land growing funguses-the feeding them while there with hay corn, and roots greatly enhancing the benefits of the
process-will discourage the growth of these plants, process-will discourage the growth of these plants,
and so will top dressings of all such kinds as encourage the growth of good Grasses.
As regards lawns, an occasional sprinkling of guano mixed with fine coal ashes will be found suddenly to cause increased luxuriance to the Grass, and to get up a good turf more certainly than resowing lirass seed, and in good turf it is rare to see funguse in any quantity, thoush in all situations a bit of a decaying plant of any kind or an accidental deposit of dung may bring about some species. These however are only exceptional, and not like the larger
crops which in some places are constantly being developed.

HOME FARM MANAGEMENT.-No. XI.
The remarks made in my last letter on the working of the green crop break are applicable to every
species of roots, but it is the Turnip I have now to refer to. It is not my intention to describe this or any other plant botanically. My object in writing these letters is altogether a practical one, and therean immediate bearing on practice. The Turnip, suffice it to say, is a cellular plant-that is, it is composed of an immense number of small cells or sacks, which are, more or less, filled with juice. It is the aim of the farmer by a liberal system of
manuring to increase this cellular matter in the largest possible degree. He has already succeeded in grow ing large crops; but it would still be an exceedingly difficult matter to fix any limit beyond which the deve-
lopment of the Turnip bulb could not be carried. With a supply of manures, which both in respect to the aggregate amount of their fertilising power and the proportion the various elements bear to each other may be assumed as sufficient for a crop of from 40 to 50 tons per acre, there can be no reason for supposing that so large a quantity of bulbs might not be grown on every
soil of ordinary quality. It is true that the climate would require to be favourable in order to obtain such a crop even under the best management; but though we take the south of England into account, a produce not more than one-fourth short of the weight which has been stated
might undoubtedly be obtained in the aggregate. It is a mere compound question of skilful working of the soil-skilful application of manares-and skilful summer management of the crop. Give us these requiremente, and all that has been assumed as possible may easily be accomplished. Even for the comparatively dry climate of England there are remedies in the tritaration of the soil and the preparing of suitable Turnip manures, which to a very large extent will be found successful Now, here is a fine field of agricultural resources to to cultivate upwards of 40 tons of Swedes per acre he would make the whole farmers in the surrounding country stare with astonishment. And yet this produce may really be obtained. Nay! let me say further that it has already been obtained in this country. is not necessary that I should detail the whole system of managing this root crop, for every good farmer knows it. But I have expressed an opinion that its average produce might be very largely increased and must therefore indicate how this can really be done.
Beginning with the soil it may be premised that deep and effective puiveration must be sedulously attended to. objectionable, and if a depth of 12 to 15 inches can in some cases be obtained it will be all the better for the
crop. Of course if the land is naturally wet it nuws be crop. Of course if the land is naturally wet it nust be need be expected. And in reference to the quality of the soil the inherent fertility of the more friable clays renders them greatly superior to most of the lighter silicious sorts of land commonly termed "Tarnip soils." The preparatory work is no doubt greater with the former than with the latter, but the inorganic elemente iberated in the one are of far greater vaiue than those
et free in the other. Well, assuming that an argillaceous loam has been well pulverised to the depth of fully 12
inches, let us see how the heaviest crop possille in the inches, let us see how the heaviest crop possit le in the
circumstances might be produced. One of the main circumstances might be produced. One of the main
conditions is to form the land into zidges or drills varyconditions is to form the land into ridges or drills vary-
ing from 27
to
30 ing from 27 to 30 inches in width. These drills shoald
not be high, but that there must be ridges of some sort f a heavy crop is to be obtained I unhesitatingly assert Farmers in the south of England affirm that their dry climate requires them to sow on the flat. My plan would be to sow on low ridges, and by loosening the soil between the rows and lowering it a little around the roots so as to let them swell properly to bring the whole urface nearly to a level. Keep the soil constantly stirred and there is no fear of the drought affecting the rop. The manures to be used may be put into the drills, wich on being reversed by the plough will leave them with a sufficient covering; for if only portable fertiliser are to be employed it matters hittle how they are
applied, if only well mixed with the soil. There are everal manurial compounds which I know to be capable under favourable circumstance of giving very large rops, but here I shall only give a recipe of one of these suitable for Swedes:-

Now, here is a liberal application which on ordinary soils will be certain to give a very large crop, but because the purchased manures will cost fully $4 l$. an acre it may be objected to on the score of costliness; but firet xpense is not the point to look at. The proper course s to ascertain that such an application will prove remuaerative in the end, and considering the heavy crop which it is sure to give, there need be no hesitation in wing that if the soil has been properly wrought it will leave a far larger profit than a light manurial dressing is capable of doing. It is perhaps necessary to state that all the portable manures should e sown separately, uuless they are mixed up with a sufficient quantity of dry ashes and sawdust to prevent their decomposing each other. The guano at least must be sown by itself. Care should be taken in applying the manures to keep them near enough the surface to permit the first roots thrown out by the plants to reach them at once. Under a libera system of manuring like this, there must neces arily be more room allowed to the plants than i considered sufficient in ordinary Turnip culture. I the drills are 28 inches wide, the distance apart of the plants may be from 15 to 18 inches. Even with 16 oches between the plants in drills of the width referred to, it would only require the 14,000 bulbs with which an acre would be stocked to be each a fraction more than $6 \neq 1$ los to give a crop weighing about 40 tons. Now a Swede six or seven lbs. in weight is but a smal Turnip, and with good management the average size may certainly be increased beyond this figure.
The great difficulty in raising some of the softer kinds of Turnips with forcing manures is to prevent the cells of the bulb being filled with air instead of juice. They become spongy and therefore much less nutritious than remedy for this evil by selecting a variety of Turnip which is not much predisposed to it, but unquestion ably the main cure is to be found in the effective working of the soil, and in leaving the plants sufficiently thin upon the ground. Those bulbs which are most given to sponginess have usually comparatively few absorbing roots, and when forced into a rapid growth by large quantities of gross manures they attain a great size without being properly elaborated. But if the soil is stirred to a good become stronger. And gathering from the earth in which they ramify the inorganic ingredients necessary to correct the tendency to imperfect development communicated by rank manures, they yield-If sufficien space is allowed them-a large and as nearly as possible a normal produce. While the growth of the absorbing rootlets ought to be encouraged as much as possible, the intelligent farm manager will observe that very great injury may be done if the horse hoeing of the crop is delayed so long as to render it certain that they will be severed by the operation. By all means work the space well between the Turnip rows, but take care to do so before the plants have sent ont their roots to any coneiderable distance
If the irrigating appliances of modern times have been adopted, great advantages will be derived from an occasional dressing of the Turnip crop with diluted tank liquid. In some cases Turnips even which have been highly manured have a tendency to flag, and a refresh ing shower of weak liquid manure, mixed with a very * The principal use of sawdust charred with sulphuric ecidbesides the organic matter it supplies-is as a fixer of ammonis.
Mixed with the guano and other substances it, as well as the Mixed with the guano and other substances it, as well as ters.
common salt, prevents the dissipation of ammonical matter
If allowed to lie in a rot-heap however for five or six weeks and If allozed to lie in a rot-heap however for five or six weeks an
occasionally damped with liquid manure or gas-work ammoniacal water, it really makes an excellent manure. analysis. As it is in crystals, it may be necessary to grind it
into powder. Thas is pasily done by the common millstones, or
by a corn bruiser. At any pubic work where there is a crushing par-minh, the cost of powde
case it is but a small sum
little guano or reduced Kape-ake, will renew their gross yield. This application should be made in the evening, and will be best done by the nozzle of the
hose pipe being rua along each line of plants. When hose pipe being run along each line of plants. When
an injurious drought prevails, a dressing of nearly pure Water may save the crup. This is just one of the many ways in which the irrigating process may be turned to
practical account at a very small expense. practical account at a very small expense.
I hope enough has been said to show that even the the country may yet learn a great deal in respect to the production of a large and sound Turnip produce. Beyond a certain point it is impossible to add to the bulk of a cereal crop withuut destroying its quality, but with Turnips the case is altogether different. The more and healthier will their bulbs be. What is finger and toe disease, as I previously remarked, but the result of derangemed betwe prof ortions when arions of nutrition Hence it is always more severe on land which is either of a thin poor quality or is soft and contains too much loamy soils. To prevent this disease we must not only work the soil thoroughly, but where the latter is
naturally poor in some of the inorganic ingredients naturally poor in some of the Turnip, we must supply them in the form of manures. By this means and a careful selection of bulbs from which to raise the necessary
seed, there can be no doubt that finger and toe might be speedily overcome. All the remedies which have been tried have ouly been successful in the proportion in
which they have either liberated mineral substances in which they have either liberated mineral substances in
the soil or supplied these directly to it. Lime for instance has been found valuable as an antidote simply because it did the former of these services and perhaps conjoined with an occasional liming, will be found safer cure for the disease than the latter alone can be many respects to that of the Turnip it is unnecessary to bailiff of a home farm can succeed in inducing the tenant farmers who are watching his movements to with advantage to themselves much heavier crops of curnips than they ever did before, the advantage they will derive from an improvement being effected in important in its results on other agricultural practices. A deep stirring of the soil, and a liberal use of home made and purchased manures modified to suit the composition of this root will not fail in giving a much larger
yield by the acre than is generally considered an averyield by the acre than is generally considered an average crop. From the hardiness of the Mangel-its
suecess in a dry climate as well as a moist one-its nutritive composition as food for fattening and dairy stock-and above all for its fine keeping qualities, this green crop ought to be more extensively grown than it
has been hitherto. If the example of eminently successful culture is to be set anywhere, surely it should
be on the various home farms scattered throughout the country, and particularly on those where, as in Enyland, weight. Such farms may be of more service agriculture in general by setting a pre-eminent example in the raising of monster crops of feeding roots than in almost any other way. It needs skill to do that, but sought after. J. Lockhart Morton, Mid-Lothian.

Leaf Peeding. -"Ben Giles" asks for information relative to an experiment witi Barley, which I inci-
dentally alluded to as a failure in saying I was disappointed, and which has led him to suppose I was disappointed in the resulis I expected from the process
of frequent hoeings, while my intention was to intimate of frequent hoeings, while my intention was to intimate
I was disappointed in making the experiment $I$ had proposed, and this arose from unavoidable circumstances. From getting possession of the ground late in the spring I was not able to sow the Barley till rather late in May, I forget the exact day; a drought had set in which lasted for ahout six weeks after I had sown it, in most
of the drills I had sown salt, and in these drills no vegetation took place till the rain came, the seed remained in the ground as free from any appearance of germination as it was on the day it was sown. The growth was then so late that 1 abandoned the experiment, as it could not in any way have proved satisfacthat judgment should be used in hoeings, but he has a strange theory about the solidification of water in the sumaner season. The great object of hoeings with regard to leaf feeding is, I conceive, by breaking the which siller up by the washing of rain to allow the free low of leaf food from the soil, while they have the efiect, in mechanically exposing the soil to aerial actions, and by intermixture of its parts to forms this food,
everything that promotes the evolvement of this food everything that promotes the evolvement of this food
must also tend to the escape of moisture, for it is by the evaporation of moisture that the weightier or inorganic fortions of this food are carried up, as salt is carried from the ocean, yet we shall find, I believe, that the
finer the disintegration of the soil the better does it retain a beneficial amount of moisture. I do not know that it is desirable at any time, certainly not in dry
weather, duriug the growing of a crop to go deepe
injurious to disturb the clay about the roots in real honest summer westher, and I believe the admission of the oxygen of the air to act on the carboniferous matters in the soil is sufficiently facilitated by such superficia stirrings, especially where deeper working has been in the
winter, for the under-soil when once loosened is slow then winter, for the under-soil when once loosened is slow to
consolidate; in this case I comprehend by under-soil the fertile soil immediately under that moved by the boe although it sta ds equally good with what is usually termed the subsoil. He must be a tyro indeed who
would hoe clay ground in the state of mire when euperWould hoe clay ground in the state of mire when supermproved husbandry calculate on work being imperfect done, although I know it is very difficult to get work out of the ordinary jog trot way done as it should be in the present uninstructed condition of our labourers; it is follow operations whose occult workings they cannot compreliend, and which they are therefore disposed to despise and slur over. Hot dry weather is no doub the proper time for the hoe to go to worls for the also the time when hoeing is most called for under the intent of leaf feeding, and however performed I cannot conceive it is possible to be injurious although it may be less effectual; in such weather it is called for very heavy, and here is curiously exemplified one of the advantages that hoed land has over unhoed; but i is not in receiving the benefits of this infow of orgamie
elements that rest the advantages of the hoed land over the unhoed in regard to leaf feeding, for whatever may be the amount of water in the atmosphere derived
directly from the earth, it very probably falls far short of that which is derived from the perspiration of plants. The dews then which fall in the night must contain much of the excremental matters of planks, which falling on unhoed ground enter it not but reascend in the same state with the returning heat of day; the leaver of plants growing on this unboed ground take in off, containing much matter which they cannot assimilate, and which we cannot but conceive must be injurious to them; they are indeed compelled to swallow, instead of wholesome food, their own excrements. Now in hoed ground the case is quite changed; these excremental matters are swallowed up by the earth and digested in her bowels, and with the returning heat of day she sends forth a stream of well concocted vegetable food leaf food, to pourish the plants growing on her surf, math with increaso the which man has bestowed on her. Is is to be recollected that according to my theory of leaf feeding not only organic but inorganic matters are probably taken in this way from the earth by the leaves, while water is principally taien up
by the roots. If this theory be true, the necessity of keeping up the supply of food regularly by hoeing is obvious. All our principles of culture, all our rules of tillage, tend to these ends. We seek to fill the surface with organic and inorganic matters in such aetive operation a state as to form compositions that may nourish the plants we cultivate by their leaves; in deepening the soil we seek to increase the capacity of our vegetable storehouse, and to give freedom for the expansion of their rola continuous supply water to their roots, the seeking of which is the father of their growth. We are ignorant of this ; we fancy it is more solid food they seek, truly dissolved in water, but I believe every examination and inquiry we can make would tend to establish this a thirst. Under favourable circumstances, that is when they can, the roots of plants descend to depths where expect themer, but depths in which we corishment the organic and inorganic matters which we suppose the object of their being is to lay hold of ; either downwards or laterally they seek the presence of water ; they pass from the presence of our manures deep or wide into the ground to which that manure does not reach, and perhaps it is only the moisture which that manur generates the is effectual to their early growth entered on this subject so largely in these columns years ago that it is now a stale story. J. M. Goodiff.
Public Testimonial to Mo. Mechi. - Many of your readers will be pleased to learn that it is proposed to raise by subseription a public testimonial to be given to Mr.
Mechi, in recognition of the services he has rendered to Mechi, in recognition of the services he has rendered to
agriculture. There are few who have inspected his farm agriculture. There are few who have inspected his farm
and eujoyed his hospitality that will not feel he is entitled to some such acknowledyment from them, and many who have known him only from lus general advo cacy of agricultural improvement will feel that one who has laboured so loug and so zealously to awaken a public spirit in the cause should receive some such distinction. We believe the idea has originated in bis own neighbourlhood, notwithstanding a prophet is seme his new-fanglod farming was made the subject of jest. The land round Tiptree has latterly evidently benefited by his example. For some years aster Mrently with those adjoining; the land in the diatrict was generally foul and the crops were poor, and the soil had every appearance tit pores at a late a reat improvement has become of poverty, but of late graference between Mr. Mechi' luxuriant crops and the poverty of the adjoining has luxuriant crops and the porerty of the a
that such an example eftects, and one that his visitors may observe, and may be faken as some evid spread of insprovement from a centre. H.D schools an schools and reformatory establishments is a movement in the right direction, and calculated to benefit the rising generation to an incalculable extent, provided those who promote and those who undertake the work give sumicient attention to the subject in all its ramifications. To rescue the ignorant and helpless from a state bordering on mere animal existence (even worse than brutes, because the intelliect is diverted from its true course by neglect and bad example) is an occupation of the highest order. Impressions are easily made on, and as easily effaced froma, the minds of children of tender age ; it is therefore more necessary to guard agains those with whom they are compelled to associate, without the possibility of a temporary separation. One of the greatest obstacles to the improvement of the working casses is the miserable condition of their dwugs. in their wretched mates are obliged, without regard to age or sex, to live in the same room, frequently having only one to serve every purpose of a family, and that not al ways to themrelves. Under these circumstances is it possible to raise the feelings and redeem the characters of the dissolute of both sexes, without remodelling the dens in which they congregate? It is a reflection on this country, abounding in wealth and intelligence, to permit our fellow creatures together like "the beasts that perish," baving no power together tike the beasts that perish, baving no power The imperfections of human nature are fully demonstrated in the natural inclination youth has to imitate strated in the natural inclination youth has to imitate What which is bad, even under favourable auspices, with profligatocomand ment to retire to to avoid heariog the filliny language of drunken savages? In such company schoul teaching id soou thrown to the winds, and lessons of morality laughed at, and religion turned into ridicule if ever thought of. To give reformatory institutions and school a fair chance of effecting a salatary change in the condition of the labouring classes and others, self respec founded upon responsibilhty to a Supreme Being must be inculeated as a basis upon which everything else should rise. How can this be accomplished without a better description of lodging is picvided? There is little use in telling men, women, and children they should eschew evil and do good, when they are placed in a position where temptation to commit $\sin$ is hourly If the their eyes, and from which they would by in a morronlinspection acpunint them would by indiscriminate use of sleeping rooms, the truth would appear how impossible it is to expect improve appear how impossible it is to expect improve-
ment, however advanced education may be, till young people at home can follow the advice they receive at school. In the higher ranks, where no excuse exist for transgressing the laws of God and man, how often do men and women fail and lower themselves to the animal! Is it therefore surprising that those who hav no such facilities for shunning the haunts of the vicious should fall into the suares and pitfalls that strew theipaths ? In the full enjoyment of comforis and laxaries men and women pass judgment on the faults of the lower orders of the commanity (lower merely in rank, in the eyes of the Almighty all are equal), and yet the very foundation of half the mischief so prevalen in the country is to be attribated to the confined dirty cottage and lodgings set apart for the poor. The remedy for this disgusting evil being in the hands of the upper classes, including every one abcve want, they should show their supariority by deeds and not only by words. If a hungry man is desired to eat and you give him nothing to satisfy his appetite, you mock his sufferings. If you teach a child religion and morality in the morning, and send him or her amongst unprincipled companions in the evening, the outside of the cap is clean bat the inside unclean-the result hypocrisy. Fatcon.

Burning Clay for the permanent improvement of soricultural and garden land. This is a subject which more than 10 years ago excited much interest. A very clever and skilful cultivator on one of the first-rat properties in Derbyshire wrote upon the subject, and From the letter now at hand a fow lines will be quoted rom the leller and of the following suggestive but in the mealy intractable and binding clay is one remarks. A really intractable and farmer has to con of the grest obstacles with which a to say nothing of texture, it admits of no direc mechanical improvement notwithstanding the able and most judicious practice recommended by the anthar "Talpa, or the Chronicles of a Clay F'arm." I admit that by deep ( 20 inch) culture inverting and perfectly blending the upper and lower strata of strong land much improvement can be effected by atmospheric influence, provided algo that adequate drainage to greater depth be made. It is equally true that the thorough subsoil operations conducted by the Marquis ofweddale has been attended with the greates the catecory, for sand will be useless, for the stiffes natural clays always abound with the siliceous element. Lime and chalk, though corrective to some extent, are chemical agents; and even sharp coalashes can by no means be always depended on. In the vicinity of
raised within the few last years and burned to a complete brick earth. This material is in itself ntterly incapable of supporting vegetation, and therefore when the gardens and pleasure grounds of the Crystal Palace were laid out the foundations and substrata of all the walks were made with burnt clay, upon which the coating of fine gravel was superposed. Hence, nnt Norwood clays are noted for their great depth and tenacity; and therefore all the roads of approach have We have thus learned some valuable lessons during the formation of the Palace and its vicinity; and now are taught that by burning till the iron of a clay has been transformed from a pale, drab-coloured protoxide into a full red peroxide, the clay has entirely lost its deleterious qualities, and aequired others which render it heavy land that has ever been discovered by gardeners. Great judgment is, however, required in making use of a material so utterly inert; and this caution leads to the introduction of a few extracts from the Derbyshire correspondent's letter before-mentioned. In the firct the process is thus described:-"I throw out a trench 8 feet wide and about 3 feet deep; in this I throw so ground level, and place upon that stronger wood, as the roots of old trees, \&c., regulated according to the quantity of clay to be burnt. Advantage is then taken of fine weather to light the fire, and when this is done the whole is covered up with that stronger part of the clay which came last out of the trench. As the fire adrances more is thrown upon the heap, making an embankment with the top soil, and all that part which contains any vegetable matter. As the fire still increases
the clay contiguous is dug up and thrown on the top. The heat subsiding, the soil is spread out, and from the carbonaceous principles it receives in the process is rendered fully equal to soot. Burning clay destroys every species of weed and insect; and "where the process
was performed years ago, I have scarcely observed either slug or snail." It would be easy to extend the quotations; but I judge it sufficient to say, that by incorporating stiff land with a material so produced, the improvement is rendered permanent by the complete therefore permeable for the roote, and thus inducing and maintaining a highly fertilising condition in land that had previously been little better- than stexile. J. $T$

## zorietieg.

Witham.-At the annual meeting of this Society last week, Fowler's steam plough completed in the course of the day the five acres on which it was at work. And this was no holiday experiment, got up as a show for farm, for Mr. Crump, as we have before stated, has become the owner of the implement, and has been the first to harness down steam in this form as a general labourer on the farm, having ploughed 64 acres with it
in 11 days. Passing on to Oliver's the visitor found a an 11 days. Passing on to Oliver's the visitor found a
sabtial luncheon provided by Mr. W. Hutley, and him some idea of the enterprise and slill which that gentleman brings to the business of agriculture. One yard is used as a pork manufactory, as it may well be called, from the system pursued and the number of its porcine occupants, there being 200 pigs here preparing fattening stalls near a splendid Hereford ox held his levee, for few came who did not pay him a visit, and he was worthy of it from his beauty and breed. Its plough field we found good competition going on, and 41 men and 6 boys at work, the prize of 5 l. offered by Mr. Bentall throwing the field open to the skill of the whole county. A show of agricultural roots from the farm of a discussion on the qualities of roots. It consisted of very fine Mangel of different varieties, Swede and white Norfolk December Turnips, and summ
Mr. Mechi announced that his irrigation continues to benefit his crops, which are good-two beavy land fields of Wheat just threshed having yielded six quarters per acre. In his opinion, the want of drainage on the
heavy lands has this year proved very injurious, the heary spring rains not having fistrated through the undrained soils. He was convinced that both Boydell's and Fowler's steam-ploughs will soon be extensively used.
Mr. Boydell and his engine will be in Russiain a few week3.
Lord Rayleigh said: As to my own little field of Wheat on which, as I stated last year, I made experiand I can give you a statement which I drew out this morning. I do not know in the general course of husmixed up with that of oher fields, but on this plan I have hap it kept separate, and the result is as follows :-
hisve had it kept separate, and the result is as fol.
1853. The balf, i.e., one acre Wheat, and the

Now, if you can go on from year to year getting $8 l .10 \mathrm{~s} .8 \mathrm{~d}$. withont mauure or expense, except for trenching the
tallow part and weeding (it takes only one horse to drill it, and a donkey to roll it), for which the straw and offcorn pays, I think you do well. My man says (I do not
say it would do so in a large way) I have so land that pays better.
Mr. W. Hutley.-How long has the land been in Grass ?
President.-Mr. Hutley always asks me that quesion ; I do not know why. Ceriainly, in my recollection it has not been in Grass. I grow $2 \frac{1}{2}$ quarters of Wheat 16 acre every year without manure. The trenches are 16 inches deep,
running measure.
Mr. Dixon, on the Potato crop, said: Within the last three or four days letters have appeared in the Times -one from a clergyman, who said he had a system of cultivation that prevented the disease, and that system
was to plant large tubers. Another clergyman said his system was directly the contrary, and he planted small sets. Now, it so happened that, without being aware of those letters, I have in my own mind pretty well settled that, and I am quite satisfied the plan 1 have pursued is the correct one. I have this year tested the experiment of planting large Potatoes whole, against the usual method of planting the smaller roots or cut sets. The field was, in the summer of 1854, an old pasture, upon a strong adhesive loam; the turf was ploughed up to the depth of 4 or 5 inches, and then burnt to the amount of 150 yards per acre; the ashes were spread, and the ground was planted with Swede Turnips for a seed crop. In the spring of this year a crop of Potatoes was forked in, without any manure. The large Potatoes selected weighed on an average, half a pound each, and were planted
exactly a yard apart each way; the remainder of the piece with cut and small sets in the usual way The result of the crop"is as follows:-The yard apar plants produced, by measure, rather less than $2 \frac{1}{2}$ bushels per rod, and by weight a few pounds short of 8 tons per acre. The small sets, either whole or cut, produced rather under 2 bushel3 per rod, by measure, and by weight 7 tons per acre. The sample of the former by the disease to the extent of 1 bushel in 20. The crop of Potatoes this year is inferior to that of last year by upwards of 20 per cent. My crop last year, upon 7 acres, was 2916 bushels, which, at 40 bushels to the ton, will average upwards of 10 tons per acre, and scarcely any were diseased. The sorts planted were entirely new to this district, with the exception of an acre of York Regents, being Flukes, which I obtained from Liverpool, and Scotch Dons, which I procured producing 100 bushe I attribute this large prop to my metho than others In the autumn and winter of last year I double forked the field to the depth of 17 or 18 inches, placing the lower spit uppermost; nothing more was done to the coil till the Potatoes were planted, and the only manure applied was $1 \frac{1}{2} \mathrm{cwt}$. of guano, $1 \frac{1}{8} \mathrm{cwt}$. of salt per acre sprinkled over the sets before they were covered up.
The Potatoes came to me in fine condition, being sizeThe Potatoes came to me in fine condition, being size-
able, neither large nor small, and were planted whole at the rate of about 26 bushels per acre. The best manure that I know of for Potatoes, and which I commonly use, is guano and salt. This year I thought the land was good enough without either, and I was probably mistaken. Some years ago I took up from a single Potato planted whole upwards of a bushel weighing 65 lbs . I had two acres of Wheat on land that has been double dug, and on which I had increased crops cannot late two years; it was strong and laid, but 1 cannot state the produce, as I could not get the machine to thresh it; I caltivate a good deal of my land with
double digging, and the soil is much improved by it. I think that is the way of using our best land by deeper culcivation than we have yet tried; there is some particular manure in the soil which is never brought out till we bring it up in this way.
Mr. Crump.-With regard to the steam-plough, that bad thot come on me by surprise at Chelwsford, for had thought anxiously about steam ploughing for the
last two years, and I had endeavoured with various manufacturers to set to and make one. My idea was, that a plough of that kind might be made to plough the land, but I could not find the means of resistance at each
end of the field. Directly I laid my eyes on that at Chelmsford, I saw it was the very thing, and I lost no time in giving an order for one, which I expected to bave two months ago. I received it last Monday fortnight, and we got it up on the Tnesday. I was told my found that engine, which is one of six-horse power, was of no kind of use, it would hardly put the plough in motion; I then received a message from Messrs Eddington, stating they had one of eipht-horse power on the railway for me. I have bad it 14 days, and deducting the time for stoppages from breaking, I think we
may fairly estimate the working time at 10 hours a day for 10 days. Up to last night we ploughtd 58 aeres, and
the work was done in a manner superior 10 what it
was to-day, for to-day they began to plough fleeter, but when I went I got the plough set a little deeper, and you saw what it has done. It was put down this morning in a field of about five and-a-half acres, and they poughed about five acres, but I think it is the same time. They burnt seven been done in and the cost, as near as possible, was $16 d$. an would have reduced the price, and perhaps it would have been 14 d . an acre. The reason is that every
stoppage carries on the consumption of coal. can form no exact estimate of the expense of repairs, but I estimate them at $1 s .6 d$. That wou'd bring the cost to 23.10 d . Whether my estimate of wear and not exceed it. On this 58 acres there is little wear and tear ; on 1000 acres, the sum I have stated would give 75l. to repair it, and I think that is a sufficient estimate; I do not as yet see the slightest wear. Now I propose with the men to go with it, and the number is ve, the price should be $2 s$, an acre; I think it will not
do less than 10 acres a day, which will be a sovereign so that the men would have 4s. each. That with the coal and the wear and tear brings it to 48.10 d . an acre. -The President : There is the expense of taking it to
and fro. - Mr. Crump : I think the $28.10 d$. would uclude all. I am not certain that I shall fix it a 2 s. 10 d , but that is my present estimate. Every day 1 ee the plough I like it better, and I think the thing will in time become as easy to manage as a wheelbarrow, and worthy the attention of all who have land uitable. I can hardly estimate the cost of horse power My idea is that it costs you 5s. an acre for horse labour o plough with, and for labourers. If so there is an dvantage in this respect in the steam plough. But there is another advantage, for if a man keeps teams of 0 horses he must employ them 240 days in the year he can't make one pair of horses plongh more than an acre a day, and he must plough nearly all the year
but by steam you may have all your land ploughed in the summer horseflesh, but a greater saving in the better and I have ploughed 7 inches easily with four shares, Mr Fowler talks of making an engine with a windlass under neath it, so that it shall be all one. I do not think he rould succeed in that, for I think it would be too cumbersome, and he will find it more trouble to move it than o move two. My men can take the plough down and put it up in another field in four hours, and that is not great time. I think a 12 -horse engine, with wheels fitted with Boydell's endless railway, so that it could be moved to any field, would be very advantageous. I rention indeed. Then as to reaping machines-I pur chased one of those tried at Chelmsford. The society you are aware, refused to allow one of these machines to he removed till it had undergone a further trial. The maker, therefore, said he would exert himself to get one or me, as he was anxious to have it introduced into this neighbourhood, and I should have it on the 6th of August. I did not get it till the 11 th, and thas los ome of the best time of harvest. At last we got it. did not like the look of it, it was too cumbersome, and t did not work two liours before some parts of it hecame trained, and we could not go on further. I went to the rial of these machines at 'Mr. Fisher Hobbs', where saw the maker, who said he was sorry for what bnd ccurred, and the machine he had there should come and cut all my Wheat for nothing, as the only amends he could make me. But I purchased that little ma chine of Dray's; I had it home on the 17th, and set to work, and I was so much pleased with it that elegraphed for a second, and had another that nigh as could be. I propose next year to use them in this way. I need not begin harvest so soon by a week, and shall thus have the most valuable week in the year to inish up Turnip hoeing, which is generally behind a that time; the corn will be in a very advanced state of
ripeness, and we shall set our reapers to cut it, then ripeness, and we shall set our reapers to cut it, then bind it, and pitch it up off the land without traving it at ind thst they reapers, with the carr and pair of horse will work one of them from morning till night, while three are required for some of the others. The next point I have to refer to is the water drill. I bought ne of Chandler's patent water drills, and put in all my Tangel and Swedes with it, and I never had such a plant before in my life. The cost was 25l., and I am paid four times over in the first year of using it. The Three hundred gallons an acre is an ample quantity for Mangels and Swedes. Thus moisture goes in with the seed; every seed vegetates almost at the same time the very moment they come up there is food for them from superphosphate of lime, which I use, and I leave you to judge whether my plants grow when they
are up. On 50 acres of Mangel I have scarcely a rod are up.
misplant.
Mr. Dixon.-Mr. Crump lent me his water drill, the Mr. Dixon.-Mr. Crump lent me his water dredes with You have no difficulty in drilling six acres in a day. I put in with it one and a half hundredweight of phos plate of lime to the acre, and had a perfect plant this dry part of the kingdom in the cultivation of these crops.

## Miscellaneous.

An Act agciunst the Grouth of Thistles received the Royal assent on the 19th of March. It is one the necessity of which must be obvious to every one aequainted with the colony, and, with a view to its effectual operation, it is of a very stringent character. It may seem, at first sight, that its provisions are too sovere, but from its nature the act requires to be armed with very rigorous powers of enforcement, and with heavy penalties for non-compliance with its provisions. After reciting in its preamble that great loss and injury are occasioned to the lunds of the colony by the spread of the plant called the Thistle, and that no measures can be effectual for its eradication unless provision be made for its destruction on private as well as public property, the act proceeds to provide the required remedy. By clause 1, any owner, lessee, or occupier of land in Victuria upon which, or on the half of any road adjacent thereto, Thistles are growing, is bound, after it days' notice signed by a justice of the peace, to destroy all Thistles on such land, or failing to do so, he incurs a penalty of not less than $5 l$. or more than $20 l$ incurs a penalty of not less than oceupier's usual or last Service of the notice at the occupier's usual or last the act are determined in a summary way by two or the ace are dustices of the peace. The justices, however, have more justices of the peace. power to suspend the conviction on proof that the destroy the plant. It any owner, lessee, or occupier neglect or refuse to destroy thistles on his and or a
space of seven days after the receipt of notice, any person armed with a written authority from a justice of the peace may enter on the land, with sufficient assistants, to destroy and eradicate the nuisance, and may cause the expenses to them in a summary way the peace, and recover them in a summary way Melbourne Argus
Self Education.-How is an acquaintance with science to be obtained by men who have but a small amounst of leisure, a scant supply of books. no apparatus worthy of the name, and the opportunities of attending lectures few and rare? We have no teachers, no lectures, no apparatus, you will say. Now in answer to this I wish to place before you a great truth, which somehow seem It is this, that logrning must come from within, not It is this, that learning must come from within, not from without-that listening to a lecture is not learning -that looking at man making experiments does not teach you to manipulate in science. Only think of a man learuing to make shoes, or to sing or to play on a musical instrument, by attending lectures on shoemaking or music. He who wishes to mount must gird up the loins of his mind. Lectures and teachers are all very well to keep idle boys to their work and to stimulate the indolent. All mental improvement resolves itself ultimately into self-improvement. Be assured that the differences between the facilities which the rich and poor respectively have for acquiring knowle lige are not so great as is commonly imagined, especially in this country, where a man can procure for a few slitlings the very best manuals and text-hooks in almost any branch of literature or science. He need not even go to that expense : he may join an institution, such as this, and have the use of all the books he may require for a few pence. You may buy a Euclid for a shilling, an arithmetic for the same, a treatise on chemistry for a couple of shillings. These are your best teachers Your books will not tire in giving you information they will repeat it for you again and again. If you slow to comprehend them, they will wait patiently for you until you are ready to proceed with them. They will put up with your ill humour, they will bear with your mistakes, and it will cost you but little to keep them. But, you rill say, though books are chesp, sud may be easily procured, we have no apparatus, and apparatus are scarce and dear, beyond the means of the poor man to obtain. Now, here is another error there is a great deal too much talk about apparatus for teaching science, and the necessity there is that the State should manufacture it, and supply it at a cheap rate to schools and institutions like this. A man who is
eager to learn - who is determined to know his subject eager to learn-who is determined to know his subject -may, if he be at all handy, or with the assistance of the village carpenter or blacksmith, extemporise his
apparatus. Polished mahogany, and expensive brass apparatus. Polished mahogany, and expensive ar al work and complicated adjustments, Wollaston, the inventor of the method of rendering platinuin malleable, that when a continental chemist of some celebrity called on him and expressed a wish to be shown over the laboratories in which science liad been exriched by so many important discoveries, the doctor took him into a little study, and pointing to an old teatray on the table, with a few watch glasseb, test papere, a small balance, and a blowpipe on it, said, "There is all the laboratory that I have." Rev. Dr. Booth at the Lewes Mechanics' Institule.

## HORTICULTURAL FSTABLISEMENT, KING'S ROAD, CHMLSEA.

## THE WHOLE HEATED BY ONE BOILER.

The accompanying sketch is a bird's-eye view of our Horti Boiler, on the syisliment, the whole of which is beated by Ous

WEEKS' ONE-BOILER SYSTEM."
The sketch helow shows the kind of Boiler, irom which there is a
main flow and return pipe up each side of the eafablishment valve for every house and division, by which any orie can he heated alone, and any or all of the others remaining quite cold, or the The main flow and return nipe are laid
The main flow and return pipes are laid in drains with ormamental gratings over them, so that the whole of the heat from them
can be uiade use of at pleasure. The water circulates thmo
The water circulates through 5030 feet of pipe throughont the ine, they would extend about 1000 feet, exposing to the atmosphere upwards of 16,000 superficial feet of glass.
We have no besitation in asserting that there is no apparatus in nch a trifling such an extent heated by one single boiler and a blishments of the Nobility, Geatry, and Nurserymen who have NG How our One-Boiler System; and in some instances the Dwavz garden, say from 200 to 300 feet from the house, all of which have been attended with perfect success.

The accompanying ketch represents on ioproved Upright Tubu lar Boiler, with hollow furnace hars. The large surface which this Boiler exposes to the imme diate action of the fire renders it of extraordinary power.
J. W. \& Co. manufac ture these Boilers of all sizes. The largest size measure 5 feet 6 inches high by 3 feet 6 inches diameter, and exposes to the immediate action of the fire a surface of 340 uperficial feet. The mallest size is 18 incle high, by 18 inches in diauster.

Buildings of every description, Dwelling Honses, Churebes Warehouses, Horticultural Buildings, \&e, separately or combined and to any extent, can be effectually heated by one burner.
Hothouses, Greenhonses, Conservatories, Forcing Pits, \&c., Bulum o the day any extent, erected in any wors of every descriptimn, and the best materials of every description.

The Gardenerg" ©hromitle.

SATURDAY, NOVEMBER 1, 1856.

The termination of summer has brought the nsual account of large Gourds grown here and there to the astonishment of persons unacquainted with such productions. One gardener tells us (p. 709) how he had one weighing $112 \mathrm{lbs} ., \mathrm{Mr}$. Hamp, of Ware, is proud of a specimen weighing 136 lbs ., and a third assnres us that in the garden of Captain Hall, of Cotfield House, near Exminster, a monster of a "Citrouille" has been produced measuring seven feet in circumference, and weighing a hundred and fifty pounds. To us who saw that famous PumpKin of Lord Rodnex's in 1834, which weighed two hundred and twelve pounds and was eight feet rounc, and who have made the acquaintance of others not much smaller, this is nnt surprising ; but we never hear of such specimens without regretting that a plant so enormously productive, and which demands so little care, should not be more extendemands so little care, shoul we would recommend the skill of a gardener to be directed to monster Gourds, but because the mere fact of a plant being able to carry one such specimen thows how great a number of smaller ones it is capable of bearing.
If indeed these Gourds were mere curiosities, or if they had but little utility, they might be very well left in the neglect they now experience. But well left in the neglect they now experience. But
they are excellent articles of food, and are capable of assisting more than is suppoved in eking out the produce of a little kitchen garden. This our neighhours across the Channel know well enough; the traveller sees them in the markets of the north of France cut into large slicess sold at a very small price to the lower and middle classes; and if he has the cariosity to taste them in the form of soup, or
plain boiled, he learns one more lesson
To monster Gourds, if grown for use, there are many objections. The ground which will hold a plant capable of carrying one of 150 lbs . would produce 20 or more of 15 lbs . each, and those small fruits constitute the real value of the crop. For the fault of Gourds is that they do not keep well aiter having been cut open, becoming mouldy and spoiling
unless placed in a very dry and thoroughly ventilated place. Therefore they ought to be used in the course of a few days after having been begon; an object not so easy to accomplish with a mass weighing a couple of hundred weights, but perfectly attainable with small specimens.

Those who wish to turn their attention to Goard growing for the kitchen should take care to select proper kinds. Some are bitter and unfit for use others are watery and insipid; others bear badly The French prefer the Spanish Potiron, the great yellow Potiron, and the Brazilian Sugar Gourd
(Courge sucriere du Bressi). We also observe that an "Courge sucriere du Bressi). We also observe that an in 1 \{45, is getting into esteem on account of its sweet farinaceous flesh, which is quickly cooked, and because the fruit is small, not weighing nore than 6 lbs . to 8 lbs . each. In our own experience however nothing equals for excellence and productiveness the great Egg Gourd (Cucurbita ovifera), the flesh of which is firm, sweet, not watery, and admirably adapted to cooking. What may be done with this in even so bad a summer as that of 1856 , will be seen from the following statement.
On a piece of heavy clay soil, in a low situation rather shaded by trees, measuring about 6 yards square, two plants of the Egg Goard were set in May. For some time they made little progress; at covered the ground. Both having cast their fruit continually, water was given freely, still without the desired result. At last one of them was thoroughly sluiced with a mixture of two or three pounds weak Californian guano, a couple of spadestul of cowdung, and water left for a day in a tub exposed to the sun, the whole being washed in with rain water. This answered, and the fruit set. Eventually the first plant remained barren, while the second bore seven fruit of the following weights, viz., 78 lbs ., 231 lbs .

A larger weight of wholesome winter food could, we think, be hardly obtained from the same space of ground ; and much less would have sufficed had the Gourds been in a warm corner and their vines had room to scramble about. Let us add that the tender extremities of the shoots form the best spinach in the world; and a couple of plants will produce several dishes in the course of the season.
Several persons have been lately much surprised at the fall of immense quantities of small branches from Oaks and other trees, the point of separation being as neatly defined as that of a leaf-stalk from its attachment. An account of this phenomenon was given in the Gardeners' Chronicle last year under the article Cladoptosis in Vegetable Pathology, and all we have seen since confirms the correctness
of the view there taken. We have lately had an instance in a large branch of an Ash tree, which was nearly falling upon us after the fashion of Horacres "triste lignum." Just as we got under the shade, without a moment's warning, a large
branch, though there was not a breath of wind, fell at our feet. On examination it was clear that separation between the dead and living bark had taken place exactly in the same way as in the smaller with moisture after a very wet night, which made the decayed wood unable to support the weight after the separation of the bark. In other cases where the wood is tougher or less decayed, as for example very frequently in the Elm, the living portion of the bark grows while the upper part decays and forms a cushion round the branch which
after a few years decays and falls away, leaving the cushion ready to close up the orifice. M. J. B.

PRACTICAL LESSONS IN BOTANY FOR
BEGINNERS OF ALL CLASSES.-No. XI.
By the Rev. J. S. Henslow, M.A., Rector of Hitcham, Suffolk. are termed their "organs;" most of which undergo considerable alteration, in size and shape, from the enrliest period of their visible existence till they have aequired their full dimensions. There are very minute
"elementary organs" which it requires the aid of a microscope to distinguish. These will be specially noticed in describing the anatomy of the "external Organs," with most of which we are partially familiar under the names of root,

Whilst the school slates are in continued requisition

Floral-schedule, an experiment or two will show the conditions under which "external organs" exist in the early stages of a plant ; and also the manner in which these and others, sabsequently formed, are gradually eveloped (enlarged by grouth) as the plant increases, But, a few preliminary observations on seeds will be necessary, before the experiments alluded to can be endered effective
Example 25.-Seeds of the "Garden Bean," or its variety the "Horse Bean" (Vicia faba), are well
adapted, from their size, for our purpose. If the seeds are dry, they should be prepared for observation by being soaked in cold water for bout 24 hours. If hot water is used they will be ready in a few minutes. On the surface there is a black stripe ( $\mathbf{H}$ ) commonly called the "Eye," but technically the "Hile" (Hilum). This is a sear left by rupture of the tissue which connected the seed with the inner surface of the Bean-pod, which is a seed-vessel " or " Pericarp" ( $P_{e}$ ricarpium) within which it was
developed. A hile necessarily developed. A hile necessarily
exists on the surface of all seeds,
 but is often small and inconspicuous. If a moistened weed be wiped and then gently squeezed, the imbibed water will be seen to issue from a very minute hole close to one end of the hile, and termed the "Micropyle" (micropyla) ( $m$ ). A micropyle perforates the seed-skin more or less obliterated), to allow of its position being determined in the same way in which it can be detected in a Bean-seed. In some seeds it is close to the hile, in in a Bean-seed. In some seeds it is close to the hile, in
others at a distance from it. The mode by which its others at a distance from it. The mode by whic
position may be determined need not now detain us.

Embryo. Botanical Examiners testify to a singular difficulty which many of the botanically examined seem to experience in obtaining (or at least in explaining, he molentific ldea altached to the word embra. our sciene efforts whach have been ma eginner, and it he trust to them he will feel puzzled to attach precise meanings to the terms "Seed," "Embryo," "Albumen," and "Cotyledon," Let the beginner himself remove the seed-
skin of a well
soaked Beanseed. The $u$ hole of the white posed by this operation is the
"Embryo" bryo is a young plant, a living

ONE Cotrisdon

with subordinate parts (its external organs) prepared to fulfil eertain vital functions (peculiar processes), so soon as they shall have been duly stimulated into activity by the combined influences of moisture, heat, and light.
In a ripe seed, the enclosed Embryo may be likened to a chicken just ready to burst the eggshell. As such chicken has its two legs, two wings, and other organs more or less developed, so has the present Embryo plant its two cotyledons (peculiarly modified leaves) (c), its radicle (little root) (r), its caulicle (little stem) ( $c^{\circ}$ ),
and its plumule (little terminal leaf-bud) ( $p$ ). All these and its plumule (little terminal leaf-
organs are in this case conspicuous.
Cotyledon (pronounce Cottyleedon). The two Coty ledons ( $c$ in fig.) constitute the main bulk of this Embryo. On removing one of them it will be found to consist of a firm fleshy substance, slightly convex outside and flat on the inside. All Embryos with two cotyledons are said to be "Di-cotyledonous."
Caulicle. The cotyledons are attached by very short stalks in opposite sides of a small stem termed the "caulicle" (caulicula or tigellum) (c'). The cotyledons are closely pressed together and inclined towards one side of the caulicle.
Radicle. In one direction the caulicle ends in a par which tapers off conically, and is called the "Radicle" (Radicula) (r). This becomes the root of the developed plant. The boundary between the caulicle and radicle is seldom well defined. The imaginary plane which may be supposed to separate them is termed the "neek," and from this the radicle elongates in one direction ( $d 00 m$ wards) and the caulicle in the opposite (upwards)
Plumule. Above that part of the caulicle to which the cotyledons are attached, it is curved and lies conenlarged, and is termed the "Plumule" (Plumula) (p). This is a nascent "leaf bud," and the leaves of which it is composed are partially distinguishable, being faintly traced out, and closely packed.
Albumen. Certain materials, often farinaceous (as in corn), and either mealy, horny, fleshy, oily, or of other onsistency, are botanically termed Aibume. they must not be confounded with the organic substance
chemically so called. This botanical albumen exists in greater or less quantity in the seeds of many plants. It surrounds, wholly or partially, the embryo. It some times forms the greater portion of the entire bulk of a seed, and the embryo is then proportionably smali,
sometimes very minute. Seeds which possess albumen are termed "albaminous," in contradistinction to those
which being without it are "ex-albuminous." Those
albuminous seedswhich contain di-cotyledonous embryos are mostly small. The seeds of the Castor-oil plant
(Ricinus communis), and of the Nux vomica (Strychnos Nu.c rornica) are good examples among the larger sinds. Their albumen is copious, oily in the former, horny in the latter. 'Their embryos have large, but ex. tremely thin, delicate, and leaf-like cotyledons. They bered that Nux vomica seeds are deadly poison.
N.B. Albumen always exists in the early stages of a seed, but is often (as in the Bean) entirely absorbed by the embryo before the seed has ripened. In these cases the large cotyledons contain the nutriment essential to the germination (early grouth) of the embryo plant. In albuminous seeds, it is the residual portion of the nutriment prepared for the embryo which constitutes their so-called albumen, and this is then imbibed after germination has commenced.

Poly-cotyledonous Embryos. It is not unfrequent to meet with embryos which usually possess two cotyledons, bearing three or even more. But there are certain plants whose embryos always have several cotyledons (poly-cotyledonous), as in the albuminous The seds of some of the Pine tribe or Conifers (Conifera). The seeds of the Stone Pine (Pinus pinca) are well adapted for showing this. As this tree ripens its cones
in England, the seeds can be procured through a in England, the seeds can be procured Pinrough a
nurseryman. Those of the Scotch Pine (Pinus sylvestris) will answer if the others cannot easily be obtained.

Mex. I find the capital letters on the portion of the floral schedule explained in No. X. have puzzled a botanical friend for
10 minutesp. He suggests it would be better to print the worls
referred to in full. Eut, I ma explaining ta closely as I I can the "actual plan" adopted in the village school. These initial letters are employed to prevent loss of tine whenever the children havat
to prepare a fresh schedule on their slates. A little exercise of to prepare a fresh schedule on their slates. A little exercise of
tact and memory is advisable in such cases. If necessary, the
children turn to the two diagrams hung on the walls, as explained in Nos. II. and III. They there see the lettors to be ettployed
and the position they occupy on the diagrams serves to recal the
words they are intended to designate. I have no desire to see Words they are intended to designate.
Erely a matter of expediency.

THE TRUFFLE, THE TRUFFLE OAK, AND TRUFFLE FLY
In a notice laid before the Academy of Sciences an the 10th of January, 1847, M. B. Robert gave some interesting details respecting the intimate connection which exists between certain trees, and especially some species of Oaks, and the Truffles which are found beneath their shade. He very clearly showed that beneath their shade. He very clearly extremitics of the imperceptibly fine fibrcus roots of these roots, M. Robert then raised the following important question, but without answering it: "May it not be admitted that Truffles are a sort of subterranean Gall-nute, originating in a similar manner to those found upon the young branches of the Oak, and which are caused by the puncture of an insect
In a letter written to M. Barral in the beginning o. the present year, Comte de Gasparin states that he ascertained the correctness of an assertion made by Pousseau, of Carpentras, that in order to mak Truffles appear in a locality where they do not already xist it is merely necessary to plant certain species of Oaks, called Truffle Oaks.
$t$ has long been known that a particular species of fly, or Tipula, continually haunts the Truffle grounds, depositing its eggs in the ground where the Truftle wil be produced ; and, lastly, that the latter when fully rip. decays, occupied as it is by the larve of the fly, and is soon devoured by the grubs, which, in their turn, give rise to a new generation of flies, and so on.
M. Ravel, of Montagnac, Basses-Alpes, where the production of Truffles is continually becoming greater, and whose family has for more than a century been engaged in the sale of that article, and who has himsel contributed greatly to the advancement ot as tant branch of industry, believes, after 30 year observation, that he has discovered the true nature the Truffie, and the means by which the latter is pro pagated. He only became acquainted with the no M. Robert in Comte de Gasparin's letter after his arrival in Paris in July last; and if his views This those of these gentlemen, it is purely by accident. oinciuence has inspired him with rresh each of thos who have preceded him has only brought out a portion of the truth, whilst he has produced it entire ; and he of ne ance, numercus proofs in support of his opinions. can adcuce numercus proch he has arrived in the following memoir are these

That the Truffle, even if it can or ought to be considered a fungus, is not a purely vegetable production; it originates in consequence of a hy puncturic the delicate fibres of the roots of some species. In this and especially those of the Quercus sessilinora. respect its origin is animal, and it ought to sidered as an underground variety of the Gall-which ma That there are certain
justly be called Truffle Oaks. 3. That there exists a sort in the same way as ther should be called a Trufteset,
a fly called the gsil insectrofle itself, but in the root from which the Truffe is produced that this fly deposits rom which the Trufte is produced hare the Truffle, are
transformed into larve, which will devour it if not
taken up, and which will produce a new generation of flits.
. That each species of Truffe has its own kind of Oak, and its own Truffle-fly
6. That Truffles of any
duced at will, in suitable soils, that is, in free calcareous soils, by the planting of Truffe Oaks, and by the importation of the Truffle-fly proper to the species of Truffe that is required.
M. Ravel does not pretend to deny that the Truffle is a fungus, having a distinct organization, but he sgency, that is to say by the diffusion of spores, that it is produced essentially in the same way as galls, by an accident happening to the roots of certain trees, or by the puncturing of these roots by a certain insect; so thas unless the roots are punctured by the fly, the
existence of the Truffle would be as impossible as the existence of the gall-nut without the agency of the gall insect. The Truffle, then, according to his view, is the work of an insect. The following, according to $M$. Work of an insect. Trufle originates. The flies, which are seen skipping continually, even in winter, over the Truffe 'grounds, reach the fibrous roots and puncture their extremities to deposit their eggs. The puncture
causes the issue of a milky juice, which is the first canses the issue of a miley juice, which is the first
element of the Truffle, its embryo; the slender fibre of the root perishes almost immediately, and the drop remains isolated; from white it sooon turns to grey,
then brown, and finally black; it grows at the same then brown, and finally black; it grows at the same time at the expense of the substances rich in nitrogen
and carbon which it meets with in the earth, and which are most abundant near the roots of the tree. If at the mowent of formstion several milky drops or embryo Truffies come in contact, they unite and form ${ }^{2}$ leave to M. Ravel the responsibility of his theory, merely contenting ourselves with giving publicity to his doubt; but he adds "If the formation do take place in a different manner from that which I have described, if instead of originating like galls from the puncture of an insect, the Trufte springs like Mushrooms from loss necessary. its office would be to bring the spores in contact with the roots on which they could germinate, in the same manner as insects carry the pollen of flowers on their legs and other parts of their ladies." In any case, M. Ravel considers it an undeniable fact that the Truffe-fly is an essential agent in the pro duction of the Truffle, and he goes so far as to say that be would prove by experiment that a soil rendered
inaccessible to the fly will never produce Truffles. This is the reason why Truffles are only abundant where the ground has been rendered sufficiently soft by rains occurring at the proper period; that they are very rare in dry seasons when the soil is to a great
extent impermeable, and thus they cease to appear or to form themselves when dung is spread upon the sarface, or is dug in, for it has the effect of driving away the fly.
It results from the above, upon which we do not venture to pass an opinion, but which is, at all events, contains the eggs of a certain species of fly, that the development of these progresses with that of the pound of vegetable and animad substance, a statement which is supported by the fact of the Truffle being extremely rich in nitrogen. The eggs hatch as soon as the Truffle has arrived at maturity and is fit for the nourishment of the worms which are produced within , takes to supply the larvee or the chrysalides of the takes to supply the larvee or the chrysalides of the
Truffle-fly, and also the acorns of the Truffle Oaks. Abridgcd from the Cosmios. [We give this, not because soridgca from, the Cosmios. (We give this, not because
of its novelty, or its truth, but as a specimen of the kind of value that belongs to the statements of incapable observers. Next week we shall have something to say
by way of comment.]

## VEGETABLE PATHOLOGY.-No, CXLIII.

587. Parabite (Ustilago*, Smut Dust-Brand). This genus contains some of the most formidable and destructive parasites which affect a variety of plants of
very different Grasses which are cultivated for the nutriment of man and of those domestic animals which form so important a part of his food. They differ considerably in colonr and character, varying from purple or lilac to violet and all of a dingy tint and of very simple structure. The bodies, however, which are commonly known by the Dame of spores are merely the first effort of vegetation. They germinate when placed under proper conditions oblong decid and produce by means of constriction secong order. In Ustilago receptaculorum at least the secondary spores have a similar form, though not precisely the same origin, a
spores of the third order.
588. The Ustilagos are at once distinguished from which and similar genera by their minute dusty spores Thich are void of any puduncle, or which are detaclied cesatis, very early Tilletia, which have somewhat similar habits,

- Frome wro, to burn.
spores. They are found in different parts of the plant;
 hyporites, and typhoides, but more frequently in the
organs of fructification, which they deform at the same organs of fructification, which they deform at the same
time that they appropriate all their nutriment. The time that they appropriate all their nutriment. The
leaves of Grasses affected by C. longissima have long narrow parallel bands filled with dusty spores, bu T. hypodites destroys the whole stem with the in florescence before it bursts through the sheath. We have seen Grass crops suffer materially from it, for where it once commences its attacks it is usualiy very abundant. U. typhoides in a similar way affects the ing, for which they are the best and most durable material.

589. The smat again of the Indian Corn is by no means confined to the fruit. It frequently attacks the stem, and forms large swollen wen-like bodies many aches in diameter filled with spores, and the decomin Great Britain, but in some cases where the cultivation has been attempted the crop has not been free from this dreadful plague.
590. All our Cereals are more or less subject to be Wheat is comparatively no exception, though smutty Wheat is comparatively rare. Barley and Oats are
subject to it, but seldom in such quantity as to attract notice. It, was, however, peculiarly abundant during the present season, and in some cases destroyed a least one-third of the Barley crop. The crops were,
however, so abundant that when a brisk wind had however, so abundant that when a brisk wind hat
dispersed the spores the loss was scarcely felt. notion of the abundance of the spores may be obtaine from the fact that the ground where the smut was produced was of an uniform black all over. There was moreover a shower of black rain in the neighbourhood which was attributed to the smut ; but as no competen person examined what fell,
591. Though smut is higbly destructive where it abounds, it is not so injurions to the harvested grain as bunt, because the spores are in great measure dispersed before the grain is ripe, which is not the cnse with bunt the spores of which are frequently not set free till it is broken up by the flail or threshing machine, added to which it is entirely void of the disgusting fish-like odour which is so offensive in the bunt.
592. The question of most intarest to the farmer is how he may get rid of the plague, for though he may speak of it as a good sign when there is but little of , on the same principle which so often lead good words, so long as the matter does not come home 00 closely to their experience, no one would pretend destroyed by it to have a third or more of the produce destroyed by it. The remedies are, undoubtedly, the ame as those of which we shall have to speak unde the seed is not so apt to be impregnated by the spores as bunted Wheat. The greater part is dispersed at an early period, and falls to the ground, where it is ready to attack the sprouting seed. We have, however, failed in obtaining smutty grain from seed purposely to affect the stem as well as the inforescence, but we have never seen any example.
593. We are not sware that any experiments have been made of the effect of smut spores taken as food The Ustilago which affects the common Reed is said to produce severe h. M.

## Home Correspondence.

Strawberry Tiles superseded. - Few inventions, imagine, have been struck off at first in so perfect a manner as not to admit of improvement. I migh instance steam engines and many other things, and but half tended. I need not, however, give in detail their gradual progress towards perfection; suggestions may admit of as much improvement as actual inventions Some six or seven years ago much was said about what were called "Strawberry tiles." The ostensible object was to preserve the ripening fruit from dirt and damp ultimately proved that these contrivances had little practical value, and I have not seen in the Chronicle (and I tale it regularly) an advertisement of them for I don' know how many years. These Strawberry tiles, howver, I have hit npon. The only fault I ever heard attributed to these tiles wes, that they excluded too much light to these tiles was, that they excladed tor man rendermoisture, and air from the plants, thereby soon render-
ing them unhealithy; and that even the fruit (though ing them unhealithy; and that even the iruit (though kept clean) was dry and somewhat stuntel. the bottoms out of a couple of dozen twopenny pots and turn them upside down on a rich border, sinking the broad
end 2 inches in the clay, then fill them with strong rich loamy compost, such as the Strawberry delights to revel in, and plant a couple of healthy runners in each pot; the roots will have free access to
the border through the pot, the plants will have all the
T There is no reason why there shonld not be showers of black rain from the mixture of smut as well as showers of yellow rain
from that of the pollen of Pines, Oaks, or Sallows a not very
unfrequent occurrence.
benefit of light, meisture, and aur that hature can bestow, and the fruit at the same time will be raised
five or six inches above the dirt and clay ; Bcarcely any five or six inches above the dirt and clay ; Bcarcely any shower, was this thought of than the plan was put in sooner was this thought of than the plan was put in phe bottoms nicely out all round ; I then dug a sloping border very deep, manured it richly, and placed the pots in rowz 2 feet one way and about 16 inches the other, sinking them, as I said, 2 inches in the ground filled them rather tightly pressed with proper soil to within about an inch of the top, and put a strong young unner of British Queen into each pot. The promp and healthy growth of the plants was soon manifest, and the foilowing year-last summer-they bore plentiful crop of beautiful large fruit of excellen havour. I am confident the berries were vastly improved by being kept so perfectly clean and free from airt or intact with anything damp, and the plants course most luxuriant and healthy, and are so still. O the experiment, and contrivances for the purpose the experiment, and contrivances for the purpose
should be made at the pottery, as the process which I had to go through (with the loss of about three pots o the two dozen) would not answer, neither do the boken edges stand the frost very well; they should be nade with a rim on both ends. The plants require to be kept well watered in summer, from being raise ap above the border they get dry much sooner. Rober Curtis, Kilkenny
Pampas Grass (Gymerium argenteum).-A fine specimen of this is now in full bloom at Shortgrove, Essex,
the sent of W. C. Smith, Esq. From the description the sent of W. C. Smith, E8q. From the description given of this Grass in your Number for Nov. 1854 p. $708, \mathrm{Mr}$. Smith was induced to purchase a small plan of itof $m e$. It has been treated as follows :- $\ln$ December of the same year it was put into a 8 -inch pot, in ric loam and sandy peat, and placed in a greenhouse. The following February the roots had filled the pot; it was then repotted into one a size larger. In March whived another shift, which was repested in Apr when it was put into a 3 -inch pot. All this time May, when a large hole was made for it in the ope ground, and filled up with two or three wheelbarrowsfu of a good mixture of rotten manure, rich loam, and peat earth. The plant was then turned out of its pot and planted. It grew very finely, and in November pro duced one panicle of flowers on a stem 9 feet in height It was not at all injured by the winter last year, and now it has in full beauty 18 panicles of flowers, most of them on stalks more than 9 feet in height. What a this season of the year could look more noble or attrac five : It has been planted on a sloping Grass lawn, near piece of water. A plant so grand, hardy, and easy of ultare is surely worthy of a place in every gentleman' grounds. William Chater, Safiron Walden, Eseax
Orchard Houses.- Much has been said both for and against orchard houses. Like everything else that hreatens to interfere with old established usages, the subject must needs have its detractors. Was some experienced gardeners, wheo thing to thew growing Peach trees in pots, that it was the height of folly to attempt it. "Plant them in your borders," sai they, "and you may have fruit, but never thank of such toy-like practice as that of stiching them into fower pots." My employer, however, being desirous of havin an orchard house, we had one put up in Oclober las year on the plan recommended by Mr. Rivers. It was 25 feet in length by 12 feet in width. This we stocked with a dozen Peach and Nectarine trees in bearing condition, along with a miscellaneous collection of maiden rees for future bearing, all in pots. The result has been highly satisfactory, all things considered for it must be remembered that in our norther unny days throughout the past season, and every body knows that abundance of sunlight is essential to the production of good Peaches. The fruit, in point of flavour, was equal to that grown on walls, though scarcely so large must however confess that a desire to have richly aden trees tended to produce this result. I doubt no that we shall yet be able to improve in the management of these structures, and notwithstanding the adverse circumstances connected with a season such as the past, here is no reason why we should be discouraged ; it there at least are not, for we have determined to xtend our orchard-honse in the expectation of again obtaining a suitable return. J. D., Fife.
Scorching under Glass. - At the end of last year lass Cory, gazed wa anice of my friends I used 14 . Contrary to My reseet, he squares beogecured glass were these conceived that in our climate we required every ray of light that could be obtained, in order to beep plants in a perfect state of health. The means intended to adopt to prevent scorching were, in the first place, horough ventilation; and it this has not answered hould have stretched over the house an old Imaged would cut the foci of the glass, if any, and at the sam time allow the sun's rays to penetrate ; but this latter plan I had no occasion to adopt, as althounh my Vines grew 9 and 10 feet in length, and were trained quite close to the glass, I had not a scorched leaf; and this I attribute to the plants being in robust health from horough ventilation, and a well constructed Vine but a good rich loam, plenty of sand, and well rotted
horse dung, the bea vemg about 2 feet deep, below every 6 feet. My ubservations lead me to suppose that scorching proceeds not from the effects of using transparent glass but from imperfect cultivation.
others give their experience in this matter. Sigma

Wintering Fuchsius.- It may interest some of your readers to know that most of the new and tender varieties of Fuchsia can be wintered out of doors by about 10 or 12 inches deep at the edge of a Laurel bush or similar sheltered place. I have preserved some for several winters in this way; they were dug out about the beginning of May and planted where they were to grow, and they flowered admirably during the season. Most of what were buried survived the severe winters of 1853 and 1854, both winters of intense frosts here. J. Webster, Gurdon Castle.
A. Fact for the Advocales of 1-inch Drain-pipes. I have in my garden a drain about 30 inches deep under a gravel walk; formed with the old-fashioned draining bricks laid one over the other, and forming together a 3-inch circular bore or pipe, as accompanying figure. I have just had occasion to open it at I find fully 1 inch of its depth filled up,
 as shown in the accompanying representation, evidently by mere infiltration of and sediment from foul water. Its exact date I cannot state, probably about 1780 , cerQuercus sessiliflora.
Quercus sessiliflora.-Having felt some interest in jour investigations into the two species of British Oak
and quality of the timber, I was disappointed that no more notice of your inquiry for localities of the growth of "gessilifiora" was taken than one correppondent informing you that many specimens were to Having been among a few Oaks this autumn, I have therefore looked out for myself, and can inform you that the oldest trees in Marlborough Forest are of this kind, and so is the chief part of the Oaks round Southgate, ramble through the shady lanes there this fine autumn ramble through the shady lanes there this fine autumn weather would enable any one the acorns, now fully ripe. An Old Subscriber.
Odd Peach anl Nectarine Treca-Can any of your readers inform me what is the age of the Peacl and
Nectarine treesin the garden of Hurstmonceaux Abbey, Nectarine trees in the garden of Hurstmonceaux Abbey,
near Battle? Also if it is considered advantageous for trees of these kinds to be of great age. A Constant Reader.
Swouns.-In reply to the inquiry of "Citizen" (see in the habit of me to state that I have some which are which are about 1 ft .6 in . or 2 ft . wide, and 8 or 9 in . deep. C. Po, Naisworth, near Stroud, Gloucestershire.
Potatoes in Tan.- It is nine years since I first directed attention to the planting of Potatoes in old tan, a practice I have ever since followed with the best results. My Potatoes grown under this method have been witnessed by hundreds both at public exhibitions and in a growing state at home. At the former they
havealways stood pre-eminent. Although I must admit I have always stood pre-eminent. Although I must admit I
am one of the most fortunate in escaping the disease, I am one of the most fortunate in escaping the disease, I growing them in old tan. This is, however, a very grest point in their favour, and it is entirely through using this that my Potatoes have always called forth clear and free from seab. It is by selecting the earliest varieties, planting early in spring the middle sized tubers in old tan-taken up and stored away with sprinklings of lime as soon as sufficiently ripe, hat I always manage to escape the disease, that had any bad ones worthy of notice, and unless these points are strictly adhered to we shall never successfully escape it. In the third page of a short treatise on the Potato, recently written by me for Mr. Atkinson, Seedsman, Worcester, and attached to by planting early, using early varieties and large sets, the best means would be employed of escaping the disthe best means would be employed of escaping the disease, which I butieve now everybody it is a folly to plant early varieties, \&ce., if they are allowed to remain in the ground and grow a second time or rot, which is often the case. A great portion of the Potatoes round this neighbourhood were perfectly ripe by the end of July or the beginning that time was prrfectly sound, in fact scarcely a bad Potato was to be found. Now, if these had then been taken up and stored away the crop would have been perfectly free from disease. The great point since tbe appearance of the disease is to have the Potato crop suffienther and the damaging effects of wet and cold at weather and the damaging effects of wet and cold at attained by anything short of the method above recommended. The Potato crop has suffered more in parts of this district this season than has ever been known since the appearance of the disease. I have
been called to witness many acres of Potatoes that have not paid for the labour of digging up, yet all these Potatoes alluded to were quite August. I trust that the folly of planting late Potatoes Aad carelessly leaving the early ones in the ground to
and by so many persons complaining of their Potatoes nud so many persons complaining of their Potatoes evil it must be through perseverance, and the following method :--Plant early varieties so soon after the second week in February as the ground will permit, previously
dressing the lund with lime; place them from 2 to 3 teet dressing the lund with lime; place them from 2 to 3 seet apart from row to row, and use all the old tan you can skin is set hard and the haulm died down; store them away perfectly dry, dusting them over with sprinklings collection having the last two sensons grown a large and out of $\tan$ for experiment, I am able to state that some varieties are very liable to the disease on all kinds of soil, while others have never shown the least mind by all Potato planters. I shall be happy to give my experience to any reader of your journal, having carefully noted the produce, size, quality, \&c., in my notebook. Edward Bennett, Ar. to
Bart., Perdiswell Bull, Worcester.

Glass Screen for Walls.-The following is a representation and descriptive account of a glass screen which covers paxt of a Peach wall in the gurdens here; it is a contrivance of my own and differs from anything of the kind I have heard of, and having been in use for two seasons I have found it exceedingly useful both as a fine bealthy growth. I was induced to adopt it through having found great uncertainty in getting Peaches to set their fruit well under coverings of netting and bunting. I find, however, the greatest drawback to consion in not getting the wood perfectly ripened in autumn, late growth being encouraged by excess of moisture at the roots, and frost generally gets in before the tree has stopped growing. The buds are consequently only in a half-ripened condition, which makes them less able to withstand any sudden change of temperature so common in a British climate. My portable glase screen will in a great measuve assist in overcoming this defeet by transferring it from the wall to the border to ward off heavy The also ase The trouble of removal is a simple matter, being per

Glabs Screen for Walle.
formed by two men in a short space of time, no raftere ie either case being used. The sashes are made upon the most economical principle, with ae little carpenters work as possible. The glass is made to slide into grooves in astragals its own thickness, three lengths of which fill the sash ; a piece of casement lead put between keeps the cut edge from chipping; a wood pin through the bottom plate keeps the whole tight, no putty is therelonger (A A) to allow a space of 6 inches clear for ventilation; an inch board 8 inches wide is fixed under the coping of the wall and notched ort (B B) for the ends of the sash to rest against, and which is kept fast by halfinch iron keepers screwed on. This board is fixed by a strap of iron passing over the wall and a bracket under The sash rests on a plate its own thickness, with an inch fillet on each side at 1 foot clear space from the ground, and at 4 feet from the wall. This and the coping board remain fixed when the sashes are removed. I have little doubt that with care in storing the sashes away in winter they will, on account of their durability, prove Webster, Gordon Castle Webster, Gordon Castle.
Swallows.-A remarkable circumstance-not to call i a phenomenon-was observed by me and others on the 27 th of September last. On that day, when no less than 40 cubic inches of rain passed into my rain gauge through an 8 -inch square funnel (or 64 square inches) giving a net superficial return over the land in this immediate locality, swallows not only "hawk'd" very low, almost touching the ground in their rapid flight and evolutions, but numbers settled together in the Grass of the Fairfield and in the middle of the road in the High swallow In general we rarely sea the true or chimney abounding in and near Croydon, bat in this martin abounding in and near Croydon, but in this instance I observed the swallow exclusively. The excessive quantity of rain that fell between the morning o September 15th and the night of the 29th must, I prosume, have brought down the insects which usually abound in the air, thus constraining the hirds to take their food on the very surtace of the ground. J. Towers
The Filbert Strauberry- The following fact may per hape help to strengthen Mr. Myattis etatement with
here was a gentleman living at Philberd's House, not "Filberts," Who cultivated all the beat hardy fruits to be had. He sent my employer during the Strawberry season several dishes-I think 12 sorts-of that fruit and amnngst them was Myatt's Seedling. This woutd probably be about the time it was iutroduced to the Royal Gardens. Argentum, Maidinhead.

Wellingtonia gigantea.-I have had two small seedlings of this under my care for two seasons; they were respectively $3 \frac{1}{d}$ and $4 \frac{1}{2}$ inches high when I received them (in Midsummer, 1854). After a few days' rest the finest plant was shifted into a seed pan 15 inches wide and 4 inches deep, in a mixture of turfy loam, peat, leafsoil and sand, and placed in a cold frame, where it remainer till the following spring. It was planted out in May in a sheltered situation; a pit was dug for it 3 feet in diameter and $2 \frac{1}{2}$ feet deep; in the bottom of this was found a stone drain, which was retained; the pit was filled up with good loam, leaf-soil, and log
enrth. After planting, a raised hand-glass was placed over the plant two monthe, when it was removed, but replaced on higher props in December, its rapid growth rendering this necessary. It now measures 2 feot 8 inches high; girth at base, $4 \frac{1}{2}$ inches; diameter through the branches, 3 feet; growth of leader this year 1 foot 4 inches. The other was a leas robust plant when reseived, and unfortunately its leading shoot got broken; but one of the tiny lateral shoots was tied up, which soon formed a nice leader. This plant now measures 2 feet 4 inches high ; girth at base, $2 \frac{1}{2}$ inches ; diamoter through the 2 inches. Mildew (or somethiug else ?) has slightly affected their twiggy shoots; but wherever it appears it at once removed by cutting off the diseased parts. Wm. Baxter, Riccarton, near Edinburgh.
Araucaria imbricata.-Seeing a report of the fine Araucaria imbricata at Dropmore has induced me to give you the dimensions of another which I annually see in my tour through these counties, the property of R. G. Newton, Esq., Millington House, Bridestowe Oakhampton, Devon. Its height is 20 feet, diameter o branches at base 16 ft ., with 15 tiers of branches, and very ymmetrical, circumference of stem at bes, 30 inches situation is well drained, very humid, well sheltered situation is well drained, very humid, well sheltened
from the north wind, bat exposed on the south side to the wind from the Dartmoor Hills. I may add for the benefit of travellers, and those interested in such mat ters, that it can be seen from the high road leading from Oakhampton to Cornwall. Alec. Pontey, Plymouth Nursery, Plymouth.

## 20ticts of 300ks.

Mr. Van Voorst has added to his works on English Zoology A Manual of the SCe Anemones comamonly found on the Engliah Coast, by the Rev. George Tugwell, of Oriel College, Oxford. Although the book is written in the popular style for the benefit of ladies and gentlemen not naturalists, it contains matter which the latter may profit by; for the author's head is clear, and he is evidently \& master of that art of analysis without which natural history is little better than a land of mist ordare we say it?-of moonshine. Most especially we refer to pp. 98 and 99, where the student will find an example of the way in which the scientific distinctions between genera and species may be made intelligible "to the meanest capacity." Since we regard Mr. Tugwel as being skilful in teaching those who are hardly teachable, we must give a few examples of his familiar method ; and first fromhis "Glossary of Hard Words":-

Hydraform, hydra-like (hydra, an animal which lives Latin)

The Hydra of old story was a monster who hived in some marshes, and destroyed people. As soen as one head was cut off, two more appeared, unless the actua cautery was applied. He was probably a malaria, and the moral of the allegory is that half-sanitary measures are worse than none, since they excite and do not remove the causes of the evil. The hydra viridis is a fresh water zoophyte, bearing many polyps on a green stem. He lives in marches, and reproduces himself eren faster than his prototype.

Prasitic, the specific name of an anemone. A parasite was a person who stationed himself (parc) beside (siton) the food (Greek) of another; hence, originally, a messmate, \&c., then it degenerated (too gether with the practice) into the idea of flattering tuadying,' and the like ; afterwards it became appied in Natural History to those animals who took np their abode on or about some other animals or some plants, and did not select a freehold of their owu.
The mode of analysis is after the following fasmion. Having shown what a Radiate is, and how s Polyp is ne of the Radiates, and that among Polyps are Helian thoids, he proceeds thus:-

Having settled that the animal in question is a Helianthoid, we ask two questions:-
"Is he partly covered with a hard shell or coating of lime, firmly fixed to the rock ?
"If so, he is a coral ; and we pans on. harder than the reet of him?
"If so, then he is not a corrl, and we nak few nome questions about him :
"1. Axe these single polyps fonnd to be united, not
their base, sumething like the runners of Strawberry
plants?
"If so he is a Zo-anthus ('live flower') for a plate f which I may refer you to Mr. Gosse's new work on Marine Zoology

## any way ? "If so-

Are his tentacles (long feelers or arms surrounding is mouth) in tufts, like patches of Mignonette roun a flower-bed, or in circles without any break in them?
"If the former be the case, the specimen is a Lucer aria, and lucernc means 's lamp,' and therefore the name is (as usual) descriptive of these tentacles hanging round the creature, like lights in a chandelier
"If his tentacles are in regular circles, he belongs the 'family' of the Actinoids, or 'sun-beams'name which the cool depths of his antacle shot out its many-coloured lights among the pink corallines and the dark tresses of the sea-weeds." And so he goes on
f the reader does not learn a good deal more by his book thau what a Sea-Anemone is we shall be mazingly surprised. Most especially is it suited to illustrated by hall a dozen coloured plates.

The Gardener's Everyday Book. By Geo, Glenny
Crown 8vo. Cox, King Sireet, Covent Garden. isown 8vo. Cox, King Sireet, Covent Garden This is a monthly record of what should be done in a
garden. It contains 288 pages of closely printed matter, arranged in double colurnns, Under eack month are given plain common sense instructions fo the management of the pleasure ground and shrubbery he flower and vegetable garden, the orchard and fruit garden, the nursery, pits and frames, the forcing ground, the stove and hothouse, conservatory indow pardening. On all these gubjanium-house, and information will be found, and, owing to the differen matters belonging to them being placed in alphabetical order, any operation or culture of any particular plant readily got at In this respect the plon of the book good; it is neatly got up, and, although somewhat ncomplete and scarcely perhaps up to the present time the kind of som hom such a monthly remembrancer must prove a rea oun. We regret however to add that ittle attention appears to have been paid to the proper spelling of manical names, many inaccuracies of that kind occur ring throughout its pages.
Mr. Smith has just printed a Catalogue of the Fans in the Royal Gardens at Kew, for the purpose o exchange with other gardens. Although Lycopods are xeluded, which we much regret, the list includes between confusion that exists among Ferns, and the dis cordant views of the dilettanti and real botanists who have studied these plants, it is most desirable that som ognised. We recognise the authority of 4 Smi , list ; it is a great practical convenience, and we shal rigorously adhere to it on all future oceasions.

We have received parta 3 and 4 of Mr. Weddells valuable Chloris andina. They are entirely occupied by Compositre, and form most important contribution
to our knowledge of the Flora of the South American to our kno
Highlands.
A new number (the 3d) of Dr. Hooker's beautiful Rlora of Tasmania has also been issued. The plates conEricacere.

## Garden Memoranda.

## 

 Man, Eso. - (Continued from p. 711.) The transition froma the Egyptian corridor and the apartments attached to it to the Pinetum is immediate, and probably as telling as any riing about the place. From the dimnese and confinement we emerge at onee into asouthern exposure, with a fine open winding walk in the front, and the very remarkable groups of Pines, \&c., on either side; Knypersly Church, two or three miles distant, making the central point in the view. The building just left is fitted up exteriorly, towards the
south, with a porch and gable in the old Cheshire style, aving quarterings of stained timber showing amids the usual plaster
The Pinetum, in so far as it has yet been completed, is perraps one of the most successful and satisfactory things of the kind in the country. It is arranged on each side of a long walk, which, in very bold and easy curves, makes the circuit of the pleasure grounds, and which commencing as already described, leaves the Pinetum by a rude stone tunnel, prsses into the Rhododendrun ground, skirts the open lawn and the lake seen from the site the library, and fiumlly returns to the terrace oppo contine ibrary window. Being the longest and mos and airy, walk in the grounds, it is also the most open and airy, and changes its line in a particularly easy who walk for health and exercise.

Aloag the meargian of this walk, thore are broad
bands of Grass, of very varying widths, running
irregularly into numberless larger or smaller bays and indentations, which compose the base of the mounds that rise on both sides. The Grass is wholly free from auy kind of breaks or furniture, the walk is extremely bold and geatle, there is nothing to draw away the attention from the mounds themselves, Chenglante upon them.
Changing in height, by the softest undulations, from 6 to 10 or 12 feet, and their faces diversified with an infinite number of little swells and depressions, these mounds are clothed, for the most part, with the common Ling, or Heather, the brownish tint and wild character of which constitute the most admirable background for the various greens peculiar to the foliage of the Conidditionally, in some cases, by a further backyround of ews and Hollies.
Mr. Bateman's idea-doubtless the oaly true one-of Pinetum is a most irregular series of groups of the same or $k$ ored species of Conifers; and he has placed these groups more picturesque, and of bringing the beautitul forms of many of the sorts between the spectator and the sky, without any intervening background. The great variety in the shape and height of the mounds kewise affords the best facilities for securing the precise mount of exposure, shelter, shade, moisture, or dryness, Which any particular species may demand. And the earpet of Heather, by its colour, and by its naturatness, seems to transfer the plants at once, in appearance, to their native hills, while, unlike bare earth or Grass, it requires no labor onder.

Comparatively recent as is the formation of this Piuetum, and thongh the plants are none of them much more than 10 or 12 feet high, the difference between the system of grouping here pursued, and the common method of spotting about the plants at comparatively regular intervals on a flat surface, is most conspicuous and satisfying. Nothing of the kind could be more beautifal than the groups of Deodars and Araucariasat least a dozen plants in each group-which burst into view as the Pinetum walk is entered. Occupying slope to the west, and nasuming the greatest diversity of character, with some of them standing out clear against he sky, and otherg-especialiy the Deodarg-being backed up by the mounds themselves or by Yew treea planted behind them, they present them hose most conversant with their forms, fin man the difference of habit which the Araucarias assume that some fanciful name, indicative of their character has been applied to each individual plant
The mounds on which the Conifers are planted are amost purely artificial, being formed from the material obtained by throwing the walk into a small valley. The whole of the soil taken from the surface of their site has been used to provide for the plants, each of which has a arge heap of it to grow in. By means of drainage, too, and by having maturally a bed of sand as a subatratum in some places, a dry and sandy subsoil is supplied to uch as prefer it, like the Deodars, and a stiffer and moister bed is retained for the Araucarias. The Wellingtonia, ton, is placed on a wet and comparatively undrained bank, this being the condition in which it is said naturally to delight.
It may probably be desirable, before giving a more detailed account of the Pinetum, to explain a little further what is meant by the term "groups," or the ny of the proping described here. in mo hater as that their branches are likely to touch for 20 or 30 years Several specimens of the same or allied species are, owever, brouglt together in irregular clusters, the from each plants being placed at very varied distances here and there round the outsides of the clusters to here the appearance of naturalness and irregula comple the appearaoce or considerable interspaces occur, which are either partiall filled with dwarfer and very different plants, for the aie of contrast or variety, or are left quite blank
On each side of the entrance to the Pinetum there an exquisite specimen of the Juniperus recurva, vax densa, looking exactly like a beautiful green fountain Mr. Bateman has found that the vrdinary form of thi species is so loose and ragged in its habit as searcely to always oning; but that the variety above named ealthy and perfect. A number of plants of the same ind, together with the original species, and severa ther sorts of $J$ uniper and Cypress, are clustered at the back of the two principal specimens, and in thei mmediate neighbourhood. Here are also Cephalotaxas farringtonize and drupacea, a beautiful glaucous variet f Juniperus chinensis, the elegant Thujopsis borealis, which has proved perfectly hardy, Torreys Myristics, which stood out unprotected through the last winter and many more common species. As related to the bove, though they are not placed in their vicinity, uniperu spheerica may be mentioned as a very hand which has a pretty drooping habit: J drapecen Crimean species, with a very marked glaucous appear ance ; and numerous varieties of the Savin (J. Sabina) which grow here in great luxuriance, and of which the Ta arisk-leaved variety is the densest and the most elegan
to be recommended for this climate. The Cryptomeria japonica, however, grows perfectly well, and retains its
colour throughout the seasou if planted on a bank colour throughout the seasou if planted on a bank
with a northern aspect. But it is now giving place entirely in Mr. Bateman's estimation to the variety called Lobbii, which has a much closer and compacter habit, and keeps its lovely green tint in whatever situation it may be placed. The Taxodium sempervirens, too, has always flourished here, and there are many fine young plants of it
After the Araucarias and the Deodars, a patch of Golden Yews and Hollies is introduced on the swell of one of the most prominent mounds, to produce a litue chage of colour, and to marl the transition to another follows, and prou Pinus austriacs and its congeners then Specimens of this to yield some very decided the very tops of the mounds in the more grposed positions, and its extreme hardiness, with the massive and sturdy its extreme hardiness, with the massive and sturd northern district render it northern dis. Mr. Batemas hasewise ex having lost a single specimen, although some of them were transplanted at 9 or 10 feet in height.

Pinus excelsa and its alliances stand at the point of the mounds where the walk begins to turn to the west and are therefore in a particularly open and windy situation. This appears, however, only to have the effect of rendering them dwarfer and denser, and thus improving their habit P. monticola occurs in thie group, and has produced cones, though only about sis feet high. P. Cembra and its varieties also seem to be as hardy as P. excelsa. The Weymouth Pine, which is in this affinity, is only pleasing when in a very young state. Pinus Ayacahnite and P. Lambertiana, of the same alliance, are planted in a shaded place, and are growing exceedingly well.
Just before reaching this turn in the walk, the clothing of the mounds is somewhat changed by the use of masses of Erica carnea, E. ciliaris, E. multifors, and other hardy Heaths, and then a total change is produced by the substitution of the common Vaccinium of the neighbouring bills, among which tufts of largelenved Ferns are occasionally to be seen. A large mass points Double Furze is likewise thrown out at one of the colour : this practice of seeking bold effects from broad conspicuous clusters of foligge or flowers being one that more lars of foliage fle the place.

Oaks and Thorns of divers kinds occupy the mounds for some distance after the walk has taken a decided westerly course. Among the Oaks is a good collection of evergreen varieties, several rare Himalayan species, a beautiful weeping variety of Quercus cerris, and a very effective variety of $Q$ pedunculata, with a manifestly fastigiate habit. The scarlet-leaved Oaks are, moreaver, thrown together in the background, and will produce some splendid autumal colouring. The Thoms are nicely relieved ro regards winter effect by having a few Hollies, with which they always mingle well, interspersed among and scattered behind them.
The Picea and Abies tribes succeed to the Oaks and Thorms as the walk advances, and they carry us to the tunnel which divides the Pinetum from the Rhododendron ground. Most of these are more recently planted, and they evidently do not thrive so well as the Pines. Still, they are placed in a much lower and more sheltered spot, and the Abies Douglasii, Morinda, canadensis, and the elegant little orientalis, are growing quite vigorously, as are the Picea Pinsapo, grandis, and Nordmanniana. The P. Pinsapo, which is often confounded with $P$. cephalonica, is very much superior to the latter in habit. P. cephalonica, in fact, grows 80 shabbily, and gets so much injured by frost, and so greatly resembles P. Pinsapo, that it should not be admitted into small collections. The Mount Atla Cedar turns
Shortly before arriving st the tunnel, which has rude natural-looking entrance arch, formed of two large rregular side stones and a key-stone, and is flanked with rough walls, over which Iry and evergreen shrabe will hang down, a break in the mound to the morth conducts us, by a grass glade, to an area of irregular shape ducts us, by a grass glade, to an area of irreguiar shape
which is laid down with Grass for a bowling green, and is enclosed with mounds of different heights,offering arious positions and sspects for the more teader and arger leaved species of Pine, inclading some of the Mexican sorts. P. Benthemians, macrocarpa, and Lindleyana rank among the hardiest and noblest of the species in this division. P. insignis is of doubtful hardinees.
In some parts of the Pinetum, where the walk ha been sunk a good deal below the natural level, the banks at the sides are so steep, that neither Grass no any ordinary kind of vegetation would grow upon them To avoid the necessity of making the slope easier, and to furnish some little additional variety and pictureeque ness, number of the small rugged stumps of Oak hat have been kept dwarfed in hedge rows have been stuck into the banks in irregular patches, here and there, and quantity of the common Vacciniums and Ferns mixed with them. They all appear to be crowing, ond produce a few stunted shoots each summer, which can easily be kept within due limits and they present a degree of wildness and appropriateness which no rocks or dead roots "or stumps could at all equal.
It has been mentioned that the Cryptomeria thriven
beautifully here when placed on a bank with a northern
aspect, and the same result is noticeable with several other plants of similarly luxuriant habitg. It appears plain, therefore, that although the tendency of such plants is to produce strons the beginning of winter, and which a deficiency of light must render yet more pulpy and immature, still, the being withdrawn from the action of the sun after the occurrence of severe frosts is not merely sufficient to counteract the existing juiciness and immaturity, but actually preserves the plant from the injury it would receive in what would have seemed a more suitable,
and even a necessary exposure to light. This is an important principle in the process of acclimatizing delicate exotics, and one which it is believed has not been at all adequately considered by cultivators. $E . K$.

## Miscellaneous.

Hollyhocks.-We extract the following from Mr. Chater's extensive catalogue of varieties for sale in his nursery at Saffron Walden :-" They require good old with plenty of thoroughly decomposed manure; such as old Cucumber beds, or night snil mixed with the earth. If the subsoil is wet they will thrive remarkably well in the summer, but in the winter wet is very injurious to them when old plants are allowed to remain ; to prevent which I remove to the depth of 1 or 2 inches the monld round the neck of the plant, and fill up with
white sand, about 6 inches round the stem, level with the surface; it is simply to preserve them from wet, insects, and slugs, from which, in the winter, they are apt to suffer very much, if not killed. I strougly advise young plants to be planted every year, as you would Dahlias, if you wish to secure fine fowers. They may be pros for bottom heat. Young plants raised from summer cuttings are best preserved by repotting them in October into large pots, the iarger the foetter, in light will grow during the winter. In March or April turn them out into the open ground, and they will bloom as fine and as early as if planted in the autumn. Plant them not less than 4 feet from row to row, and 3 fee apart in the row. If grouped in beds, not neaver than
3 feet each way. They will grow well in the shade of distant trees, but by no means must the roots interfere In May, when the spikes are grown a foot high, thin them out according to the strength of the plant; if well established and very strong, leave four spikes; if weak two or three; when they are required for exnibition only one must be left. The following observations and as I believe the best way of showing the Hollyhock is in spikes, I venture to give my opinion of what I consider as the standard of a perfect spike In judging, the first point I should notice is the individual flowers on the spike, the perfection of which consists in the petals being of thick substance, the edges smooth and even. 'I he florets occupying the centre must be compact, closely arranged, rising in the middie to a half globular form, with a stiff guard petal extending about half an inch, or in proportion to the size of the centre ball, so that the different parts of the flower hav a uniform appearance. Second-the arrangement the flowers on the spike should be regular, not crowded open spaces between each flower, but so disposed that the shape of each may be distinctly seen, and fully blown, the uppermost covering the top: and nothing can add more to its beauty than a few small green leaves between the flowers, which give it an elegant and graceal appearance. The third point is colfur--the brightest, strongest, and most distinct stand first, but it is desirable to obtain all imaginable shades. Stake them before they get tos high, and secure them well in by tying, and they will grow erect. The most robust grower does an require a stake higher than 4 feet from the ground If the weather is dry at this season of the year, they must be watered with a solution of guano, or any other
liquid manure, poured carefully round the roots, avoiding pouring it on or too near the stems. To grow the flowers fine, cut off the lateral shoots, thin the flower buds, if crowded together, and take out the top of the apise, according to the height desired, paying attention topping it you ghe incresse the size of the flower, but at the same time shorten its duration of flowering, and perhaps disfigure its appeurance.'

## Calendar of Operations. <br> (For the ensuing week.)

Plant department.

- Conservatory, \&c.-As the display of flowers in the open air is nearly over for a season endeavour to particularly as it will prove an additional source of enjoyment to those r.ho cannot take outdoor exercise. Fires by night may be requisite, but regular admissions of air should be kept up both to keep the house moderately dry and the atmosphere in a pure healitiy state. Chrysanthemums should be introduced as they come into bloom. Early flowering Camellias (a few of the earlicst started), Orange trees, Daphnes, and the
such stove plants as yet remain in beauty. Great care should be talen to provide sufficient ventilation at this season both to stove and greeuhouse plants during may perhaps soon be necessary to dry ip permit a free ventilation by day. It should in fact be a point to get the wood of hard-wooded plants ripened as soon after this as can be done even by the help of fires, as it will save a great amount of after trouble and loss during the ensuing winter; use sulphur freel whereever indications of mildew appear, which will not be very troublesome if the directions above are acter upon; keep every part of the houses clean and
frequently wash the glass to admit every ray of light which at this season is invaluable. Advantage should also be taken of wet weather to thoroughly wash in fected plants. Pelargoniums if pot-bound should be potted at once or they will lose their lower leaves, potted, and allow them the warm end of the house.

## FORCING DEPARTMENT

Pineries.-Plants swelling their fruit, and those in boom should be assisted by a rather warm temperature but excess of moisture in the atmosphere must be avoided at this dull season, particularly where the plants are in flower, or the fruit approaching maturity use strong clean manure-water in a tepid state for plants swelling fruit, but do not get the soil too wet The temperature for the growing stock should now be egulated very much by circumstances; keeping them rowing gently where it can be done without drawing and weakening the foliage. Keep the soil about the root n as equable a state as to moisture as possible, for the plants showing fruit prematurely in spring, and the same is true with regard to the bottom-heat, which must also be carefully attended to, keeping it moderate and as regular as can possibly be done, Vineries.Where forcing is commenced about this time a rather higher and moister temperature will be necessary to in duce the buds to start than would be the case at a more natural season. There is no better means of securing bundance of moisture and a gentle warmth than by placing a moderate quantity of stable manure on th niside border, and turning this, \&c., as may be required out where the forcing houses are visited by the family and are expected to be neat and orderly, this method is out of the question, and the syringe and whatever other means of a less objectionable character may be at command must be used instead. The night temperature, begin with, should range about $50^{\circ}$ by fire-heat, raising to $60^{\circ}$ by day, or to $0^{\circ}$ with the assistance of the sun. Also endeavour to secure a little warmth for the roots in the outside border, and if fermenting materials are used, watch these narrowly, and endeavour by timely additions and frequent turnings to secure a regular entle warmth of $60^{\circ}$ or $65^{\circ}$ at a foot below the surface of the soil. If fermenting materials are employed, there will be a great saving of labour, \&e.., by thatching them with a good coat of something to throw off we and preserve them from the weather. If plants in pots and boxes are used for forcing at this season, they shouid be placed in a mild botton-heat, so as to excite a bealthy root action, which will cause them to breai more freely and in less time than can be done without bottom-heat.

## flower garden and shrubberies

The condition of the autumn struck cutings should be ascertained, and wherever indications of damping appea remove the pots to drier quarters; give air liberally to young plants in pits and frames. Scarlet and bedding out Geraniums should be kept in houses where fires can occasionally be lighted, by which they will grow gently through the winter. As the Vineries are cleared of Grapes fill them (unless they are otherwise occupied) wilh the more choice things; reserving the pits and frames for the Calceolarias, Lobelias, and similar plants, which do not suffer so much from cold and damp Wherever alterations are in progress lose no time in completing the transplanting of evergreens, the present mild damp weather being favourable for their removal. As soon as the greater part of the leaves are off the rees let the pleasure ground be thoroughly cleaned and swept ; the leaves (if of sufficient quantity) should be stacked up for forcing purposes, covering borders, and the like. Such parts of the lawn as are contiguous to the mansion should be swept daily to remove leaves and worm-casts, and the gravel walks should be frequently olled to preserve a smooth surface. The present is a good time for re-arranging the herbaceous ground, which is rendered necessary every two or three years by many of the free growing plants getting too large. Let the borders have a dressing of well rotted cowdung before replanting, especially for Phloxes and other strong-rooted genera.
hardy frlit and kitchen garden.
Carrots and Parenips having fiuished their growth should be taken up and stowed away for use. Throw some fine earth among them in the pit to keep them plump and fresh. A part of the Parsnip crop may remain in the ground longer if other work intervenes. Go over the wiuter Spinach with the hoe on a dry day, and follow with a dressing of soot; this useful winter vegetable requires strong stimulating manures to have it iu perfection in winter. As Caulifl wwers are easily damaged by frost, go over them frequently and ie the forwarder the advancing heads. a portion of the less
succeed, or laid in deeply in a sheitered place with their heads inclininy towards the north, to be protected with straw or mats in frost. Clear the ground of crops as they go out of use, aud trench or dig over rourhly: immediaty. Caumoners under giasses and in frames Khubarb, Seakale, and Aspend to the preparation of rous of Rhubarb may be forced in the Later ground where it grows, using pots or boxes for covering the crowns, and leaves or leaves and dung for the hea:ng material. Seakale may be either forced on the round as alvised for Rhularb or taken up and the oots put thickly in a frame on a gentle bottom heat. Pot a supply of Mint, Tarragon, Burnet, and Sorrel or winter use.

## The agritultural Gasette <br> SATURDAY, NOVEMBER 1, 1856.

We diréct attention to Mr. Brandreth Gibbs announcement of the next Cattle Show of the Smithfield Club. It takes place in the week fter that of the Birmingham Fat Cattle Show commencing on Tuesday, Dec. 9. This arrangemen enables a full representation at each of the severa breeds for which competing lists are opened-and a better meeting may in consequence be expected Those intending to exhibit must bear in mind tha Saturday, the 8th November, is the last day on which entries can be received-and immediate application therefore should be made to Mr. Brandreth Gibbs, the honorary secretary, at his office, Corner of Half moon Street, Piccadilly, for the necessary forms of certificate and entry

The purity of seed is a matter of such vital mportance to the farmer that we gladly devote this column to a discussion of the following question from correspondent:-

Will Swede Turnip inoculate with Drumhead Cabbage, both growing for seed side by side ?
On examining the natural history of these two plants we find that both are the result of a long pres of cultivalive processes, for alh Brassica, the Swede is a hybrid of two recognised species having for its parents-
Brassica Rapa, common Turnip,
Napus, wild Navew, Rape or Cole-seed and the Drumhead and all the Cabbages must be acknowledged as primarily derived from the Brassica oleracea, sea Cabbage. There is alro reason to believ
that several of the recognised hearting Cabbages Greens, and Broccoli, have been more or less hybridised by other species of the genus Brassics, and at the same time there is reason to doubt whether the species of Brassica enumerated by botanists are not themselves derivatives from one or two types.
As respects the Swede we would offer the folowing as the result of experiments, the issue of which will afford interesting matter touching the question in hand. Some three years since we planted side by side plots as under :-

| Plot 1. | Plot 2. |
| :---: | :---: |
| Common White |  |
| Roand Turnip | Common Rape |
|  | seed. |

These both flowered at the same time, and when ecundation had taken place, every plant of the Rape was carefully removed. The seed of plot 1 was carefully collected and sown the next summer and the result of it was a good plant of the lighter coloured leaved Turnips; but with an intermixtare of about 5 per cent. of the darker hued leaves of the Rape, which by weeding and thimning so as to isolate them with as much care as possible went on growing in a most favourable manner, resulting in the following types of form, with of course many intermediate forms and condi ions.
lst. Most of the Rape-like plants ran soon to seed, but during their growth their herbage inclined to the form and aspect of the Turnip.
2d. About 5 per cent. of the Rape-like plants did not run, and in these the tap root presented a bulging and fleshy growth; in short, they were just what malformed "finger and toe" Swedes in cultivation would be. These were transplanted for seed, and this year the seed has been collected with a view to carry on the research.
Here then our conclusions are that we have as the result of these experiments oblained one step or more in the development of the Swede, which is but a hybrid and in this case prodaced by the simple means of growing different species side by side; and if we grow Swedes from seeds of run of root branched (fiuger and toe), or of any malformed examples, or if we use our own grown seed too often, or coltivate on the same ground too frequently, we shall by degeneracy reach the same point with at least many of the plants in the paricular crop at which our exteriment now rests in its upward improving or developing progress.
Again, if we carefully investigate any field of Swedes, and the same is true of the common Turnip, we shall see that whatever be the type of the bulk of the crop, yet there will always be an admixture of other forms: sometimes nome of these may even be in advance of the crop, in which case it may be good judgment to save them for seed; but in general the tendency will be to many ohjectionable sports, such as a conical leaf stem
above the bulb, large wild leaves, and perhaps two or three bunches of these and several kinds of malformed roots: and these departares from their type will frequently be found in a greater degree with the careless farmer, who usually gets his seed in the cheapest market, for which it is generally grown in the cheapest manner, that is without thought or care for quality, so that the quantity be but sufficient.

The results here glanced at are quickly brought about by seeding Turnips as they stand without transplantation, for if the best crops be more or less mired or impure, certainly seeding withont selection can but augment this defect. Seed growers, however, usually transplant in the present day, but then ever, usually transplant in the present day, but then and when these are, as is too frequently the case, planted on slips of land side by side with different sorts not only of Turnips but plants of the same family, hybridising if not certain is at least probable.
As regards the Drumhead Cabbaye, it we look over
few acres of these we may frequently see among others the following types of form in the same field and from the same seed
a. The sessile-leaved, unwrinkled, incurved close flat topped hard grown true Drumhead. Green.
b. The same, but taking on colour like a pickling Cabbage.

## conical shape.

d. All these types with a short petiole-leaves a little wrinkled and but slight inelination to heart
e. Longer petioles, leaves much wrinkled, with a tendency to the growth of a lignate form.
In these the three first $a, b, c$, are true Cabbages though of different types; $d$ is just showing symp-
it the elements of what the gardener terms a green.
These ohservations and experiments therefore tend to the following conclusions:
1st. That under the most careful management the keeping der vative plants (and all "sorts" are s0) pure
to any one type is a matter of considerable difficulty.
hybridisation brought about either naturally* or artificially

3d. Hytridisation may be effected between different genera, hut is mure readily accomplished between species of the same genus.
4 th. The nearer sorts or species are together, the more likely are hybrids to be the result.
In connection with this interesting subject we may state that as sorts increase of any given plant, whether of Cabbage, Turnip, or Swede, the difficulty to ohtain pure seeds becomes greater, and while the seedsman is often justly blameable for this, as he would be, we think, in seeding two Brassica, side by side, yet we must bear in mind that some sorts retain their individuality more per-
manently than others, and thus whije they may retain their specific qualities in one district this may not be the case in another totally different.
$W_{B}$ understand from the Secretary to the Guernsey Agricultural Society that the resolution of that Society to affix a brand to all cattle exported from that island is sabjectirg them to a good deal of what appears to us unjustifiable annoyance. Dealers in Guernsey cattle have no right of complaint on account of such a resolution. On the contrary, it seems to us, by insuring the purity of blood, to be conceived in the interest of all through whose hands such stock may pass. But whatever may be its immediate influence, as for instance on the value of Guernsey cattle exported previous to the date of its adoption, certainly it is quite within the power of the islanders to act on such a rule, and to advertise it as widely as they please. There may be very good
Guernsey cattle bred out of Guernsey-the question as to whether they are natives will be answered by the brand-not the question whether they are worth the price the salesman puts upon them. That must be determined by the judgment of the purchaser, now as hitherto. The birth-place of the cattle may be an element in their value, and if so it is right that it should be properly attested.

## MR. CHADWICK

FUTURE OF AGRICULTERE, AND OF AGRICULTURAL
The following is part of a paper by Mr. Chadwick, on the future of manulacturers and of mani facturing labourers, and the tuture of agriculture and of agricul tural labourers; read at the agricultural section of the recent Congress of Bientaisance at Brussels, and reported in the Moming Chronicle:-
In regpect to the future of the labouring classes in agrieulture in England, it appears to me to be under influences similar to
those which $I$ have alroady shown promise favourably for the
labouring clases in manuture labouring classes in manuffactures.
It need mot be enforced how a

piecework for draining, and made to earn nesarly one ohalf more wrges, were, by higher food, soon put into a superior phy
sical condition. Besides the labour which demands great vianour, thereris the tabour in agriculture which demands great
skill; and skill is more productive than ordinary agriculturiat re aware of. I was staping recently with a friend, an eminen nd successful English agriculturist, Mre. Huxtable, who, while ndang rioges and furrows of a field in such a manner as endanger the waggon, when my friend ordered a man to take
charke of it, and reproached his bailiff with his wasteful im.
providence in intrusting so valuable a piece of machinery as that whggon and the horse to a boy. My priend observed, moreover, a horse carefully, was, for the saving of the horse as well as the machine, worth his double wages; that even in the common opera-
tion of digging one labourer who was skiful was more profita' le cultura procesces. The same eminerit agriculturist has, with th
nid of tetem and improved macelininery, quid processes. aud labol
 instead of being cultivated by only 16,000 labourers at only 8 s
or $4 s$. per week wages, would require for its improved cultur of them 16 . per week; and this county is to a greater or lesse provement tbroughout the whole kingdom; and that improvement whilst it must raise wages to the agricultural labourers, and
remuruerate the capitallat, would cheapen food to the general The most eminent of the "navvies" in England come from
The hill districts of sandstone-grit and granite in Lanceashire and ther northern counties, where there are favourable sanitary condittions of pure soft water nod forced ventilation, and pome natural
drainace by winds and storm. Their alimentation too has been ventrally good. Sime of the leading navvies have represented

selven have admitted to me that faters of Oatmean and Potatoes
with milk), though in great quantities, have done
 superior alimentation at the least is required. though it is by no
means the sole requisitite, and mental as well as bodily stimuti are needed for the attainment of superior work. M. Nidault, a
rench engineer, in his treatise on irrigations, gives accuunt of similar cluss of labourers to those by Bome deemed peculiarly our wn. He describes as a most interesting class those who dernte
bemselves especially to the execution of canals and other
 they can advantageonsly contract farconsiderable workg, especially
in digging or levelling. The digging of an irrikation canal, it ather a large one - one, for instance, of seven to eight metres wide, and which may also serve for navigation-is one of those works without any delays, which requires that a number of workmen being generally insufficient, they are obliged to seek labourers in the neighbouring districts, and prefer applying to the por and populus countries, such as Savoy and German-Lombardy. This
true thas there they can find cheap labour, but at he same time the a.uurrers are without vigour; and though they may be contented
with small wages, they will aliso give very little work, I have always

 Much in this instance might be ascribed to climate, but the imported at high wagesented in Coing Carcutta of Lancashire artizan there under the shade of unbrellas held over them by Hindons, engaged at low wages to
attend and perform this service. Labourers of our Army Wor ka abourers, and of particular feats of strength performed by that the Croat labour, chiefly engaged by us in the first instance,
was dear at sixpence per diem and that in relation to the works performed in the East, by whatsoever race, it would bav English fabourers and materiais, all the way troum Eng land, for the execution of the works. In the course of discussions on the
suhtect with the members of the Congress met here. , have
received much confirmatory testimony uon my view of the fact. has had ships built abroad, and also ships reparred in every prin-
cipal port of the world ; but he avows that, notwithstanding the ery nigh wages of our shipwrights, he has found their labour as
cheap as any he has elseewhere met with. In respect to agricultural labour, another of our colteagues, a landowner in Poland,
who has been some years in England, and who has studied its equal to two Polish labourers; but thand one Polish labourersand those not serfs-were required to do work equivalent to one
average English agricultural labourer. In this extreme differnce, however, the difference of tools was included, with the di-
ferenae of skiil and energy. Another Polisll gentleman here, states to ma that he compared the expense of the ploughing done there by plonghmen at 14s. per week wages with an equal quan-
tity of ploughing done on his father's estate in the rcustomed way there, and lie found that the work done at Cirencester had the advantage in cheapnoss. On a particular connparison made
in Normandy, the labour of three Norman agricultural labourers was found to be equivalent only to that of two Enylish, or more
particularly two Kentish labourers ; and from other information which Ihave receeved from engineers, con armed by members of the present Congress, about three Danes, or Norwegians, or Swedes,
would be required to do the same quantity of work as two average Engli h labourers. Superior workmanship, as well as quickness
of execution, with the aid of superior toole, will frequently tead of execution, with the aid of superior tools, will frequently tead
to augment the value of the English labour beyond the dif-
ference of the gross produce. Admirable work is done by AngloI repeat that I do not ascribe the difference of result mainly to presised by urai-administration and pallperism, is otten as inforior into suitable training and candition, are found, according to the
acknowledgment of English labourers, to keep step with the
best. Indeed, in the Crimea, under the directions of our army administration, the ordinary labour and tasks of earthwork
required from soldiers-raised chiefly from those same districts from whence the best navvies have been obtaned, and acknowamungst all the troops in the field-were only to remove leacrbie
yards a day in a loose soil ; that is to say, that at leat two
soldiers were required to do the work done with an interest and "a will" by one navvy-the navvy very often the brother or relation of the soldiers, or coming from the same village I am glad to find that the general observations of the mos of Van Thaer and Burger, in Germany-ure in accurd with my facts display to be of the greatest social and political moment; tion of every form of serfage, but of slavery itself. I have bee West Indies, and have had some insight into the slave labou
Whaing as and white free labour. Slavery will sooner fall with our brechren in America, when they find it, as they eventnally will do, as comthan by any amount of condernation or it as being bad as social institution. It appears to me that count Gasparin juborr
cites, as an instance of the power of free as against slave labor the fact that the masnufacture of sugar from the Beetruot keeps its with a plant containing $18-100$ of sugar, grown in as superio climate, has great difficulty in contending against the fro sugar, in a climate most unfavourable to its devolopment, alvanced districts of the north, tempted by the cheaper land, the
apparently cheaper labour, and better climate of the south, go there to take farms which were in the market; but when they have exumined the quality of the labour there, they
clined the enterprise. I $\operatorname{man}$ happy to find that Count Gasparin has made analogns observations. Muzard, being consulted on the expediency of the purchase of anme land in a cortain canton
of France, answered, Beware! you will not yet from land there of France, answered, 'Beware! you will not get from land thene
the promised return. I know the men of that counery; they want activity; the pupils who came from it,
just appreciation!" exclaims
arising from a bad regime,

## 

## THE TURNIP FLY

[Mr. Charles Poppy, of Ipswich, has presented eport on this subject to the Society of Arta, which has been recently published in their Journal. The following an abridgment of it.
From the great loss of plant of Turnips last year, and general destruction of Turnips this year-so similar to what occurred from 1825 to 1833, and I believe onwards, and which has taken place periodioally for ing observations on the subject, although I am quite aware of the difficulty of the subject from past experience, having had a correspondence with the Secretary of the Society of Arts, upwards of 30 years since, which continued for a year and half, as is reported in the
"Transactions" of the Society, vol, 45, pages 11 and 54 , in 1827 .
The Doncaster Report on the Turnip Fly, published 1834, cunsisted of 89 pages. I can, however, but briefly enter upon the subject; thus my observations
will chiefly relate to the remedies proposed within the will chiefly relate to the remedies proposed within the power of farmers individually to apply, and suggest a
probable means of so reducing the flies as to render them harmless, by a systematic application.
From the loss of the first plant of Turnips, all farmwork is thrown in arrear; re-ploughing and sowing, and hay-harvest at the same time to attend to ; no Turnips fit to hoe when the hay is stored. If the second sowing begins.
Mr. Blake, agent to Slr T. F. Palmer, Bart, Rockingham, says : "Never lost a plant; atribute this to drilling thick. Plants
 the fy by sowing 8 or 101 lbs of seed per acres."-Extracss from Mr. Thylor, late of Ditchingham, near Bungay; Norfolk, and
Mr. John Hayward, of Stuke Hall, near Eye, Suffolk, both horse-boe, and always sncceeded in obtaining a plant" Mr. Taylor and Mr. Hayward both oceupied good Turnip land farrus, $r$ I doubt whether a plant could have always been obtained in eriance of ty, if bradcasted, unless excessively thick.
Many of the correspondents of the L'oncaster Association state,
that by sprinkling linse over the Turnip plants several tines hay commonly obtained a plant of Turnipg; others state that, soot is preferable to lime, as it manures as well as annoys the fly. One watered a field five times at \& eont of 15 s . per acre, and I could grearla increase this list of specifics, having selected,
the most popular only; but I believe, from upwards of 30 years practice
hich is hass axpensive, and applicable under any circumetrances, drilling or broad-casting, on the ridge or on the stetch, highly
manured or not, as far as the fly is concerned.
The mode and means of obtaining a plant of Swedes might be stated in few words, but to induce farmers to try it, the reason
Why it may rationally be supposed ihat it will prevent the fly
from destrosnus or njurung the Turnip plant, and that it is but
a trifling expeuse, and little trouble, must be explained, and acts stated.
Having hired a heavy land farm, bounded on two sides by
extensive woods, in which I was informed by the late Rev. Wm,
Kirby (the eminent entomologist), that so all the Turnip flies in the neighbou
laining that taining that
 by accident that I ascertained that the fly preferred the labits of the fly, "that they conld fly as well as the golden me to persevere to grow Swedes, as none of my neigh bours grew ong after swedrs, and hus swedea." Thinking that if such was the fact it might enable me to grow
wedes, instead of preventing my being able to obtain a plant,
eing aware that Mr. Paul of Staraton was in the habit of sowing deeoys for the flies, and catching them off with a net, I took my
drill to clean fallow field lying along the side of a wood, and
drilled one widt of the drill across the middle of it, being 00 ruds probably frons th $\rightarrow$ whod. As soon as the Turnips were up, flies
attacked them, but being very thick the Tunips kept srowiug.
Having givell the flies time to collect, I had a wargon Having givent the flies time to collect, I had a waggon load of and along the sides as far as flies leap; and having plenty of and, sa I supposed, arl the flies which had existed ine the woods
and neighbnurhnd; but on sowing the field with Turnips, others
came and destruyed the plant Thus at the proper seasin for sowing common Turnips (having cups of all sizes on blocks which conld be slipped on; and having adopted the general opinion that the fy preferred the Swede to
the common Turnip), Ifilled every alternate hopper of the drill
with common Turntpand Swede, and thus drilled probably more than half a peck of swede seed per acre, at 15 incties from row to
ow but to my surprise the fly settled on the white Turnips,
and scarcely toucled the Swedes. Finding this, I had the Swedes and scarcely toucled the Swedes. Finding this, I had the Swelles
chopped into patches, and, when an inch or two high, had a pinch
plucited ooe of every bunch of SWedes, and when a little more then left till fit for singling By this means I got a regular plaut and fair crop, considering that it was late for Swedes.
Having ascertained that the fly prefera the common Tarnip to (Tery thick, to feed the filev) and Swede need for a crow, ind never After having adopted dr lling common Turnip seed in alternate
rows with Swede beed intended for a crop, some years. a small farm fell undrr my care where the bailiff said swedes conld not hs
grown, as the ty would destroy the plant. I however decided to hater to ciuse it, tu vegelate before the Swedes were up, and
having pritued the drill with swede and common Turnip seed, I
sent it of to the farm, and followed maself. After having seen topped the tuintiels that. distributed the common Turnip reed,
to ascertann what difference it conld make"-a good plant, and
tcellent crop was arone excellent crop was grown. This circumatsoce showed that it was

I left off drilling decose on ruy own farm alsn, and only sowed less ancording to soll or weather), and sull pever tailed of obtain-
 information on circulars naver Elypland and Scolland. requesting
ind habits of the Turnip fly; and received 102 returns, but with hittle practical inform
too expensive and did not meest every circumstance
Tn cow Turnips very early to be in lime to sow a second time in case the fly destrny the plant, frequently causes a loss by cost
of sed and labour. If the first sown escape the fly, it is very liable to mildew, and to be of inforior quality; and if the fy
attack the first sown, waiting to ascertain whether a sufficient plant will survive may prevent sowing a second time till it is too survives an attack of the fly (if the land is re-ploughed), is be cause it has laid a length of time without boing atifred, and he-
gained moisture; such will be the caso If left untilled for a time and unso
A seed merchant a correspondent of the Donoaster Agricul pral Associaticn) stated that "those who sowed early were his
best customera." The questinn to be considered is whether it is best customera. The questin to be considered is whether it is less expense to sow decoys during two or three years when no
injury would have occurred from the attack of the fly, or to lose a plant, and hare to playsh and re-snm the land once in two or
three years. It is not whether the plant is destroyed only, but
whether it is jagged, stunted, and retarded in its growth, and a Whether it is jagged, stunted,
loge time in coming to the hoo

## Home Correspondence

Reaping Machincs.-It will be recollected I designated the present reaping machines as unphilosophical more fully, or it will be doubted whether I understand or have hat aympathy with true mechanical progres or have loat mpalhy with trueg simply becarse it happened to be the last a acrien of simply becalse it happened to bo the labi of a exies mechancal ofres. Viewed a praccical light, it a downigh imitation process, since it still fells the entire tree merely to get especially to deal with is the philosophy of its mechanism. Some time back I propounded the following doctrine, viz.: mechanism being permanent in it nature must be placed in such position that it shall be continuously employed, or else its use will be unpro fitable to some class. Now perfection can seldom be attained in anything human, still it will follow that in mechanical contrivance the nearer we approach the principle involved in the above docirine, the greater the benefit and proint to the whole community; and the further we diverge, the greater the evil and loss It happens that our public speskers and societies in referring to agricultural mechanism invariably appea to an experience deduced from the manufacture of cotton or iron, \&c.: quoting the results by an applying these examples to the agricultural art; but every soul of them overlooks the fact that the operations of agriculture are intermittent, whereas those of manufacture are incessant ; and hence from the want of parallelism arises a false and into which they are advised to plunge, I need only point out to my farmer friends, so abolutely essential is it considered to the profitable working of a permanent and expensive mechanism, that it should be kept continually a going, that in Manchestor grow, into a. proverb to say "When the mill stops, the man" ruined;" and again we often read in the public prints "our mills are only working half-time, and great distreno in consequence prevails, Nowlookalagriculture:sowing comes but once a year, and you maire a 30l. permanent and distinct mechanism for it; reaping comes but wase maki, ditto clod crushing, and a lot of operation entailed by that laborious and imperfect granulating process called "ploughing" (processes not needed in the garden, nor in the field, if plotghing did not prevail). Well, in consequence of the intermittent nature of agriculture, I say it is unphilosophical to strive to make an expensive fixed mechanism, and hope in time to prove it is uneconomical to make any expensive permanent mechanism, merely to execute a cheap temporary operation; and I have no hesitation in saying that when the come to appreciate the wide and marked difference existing between their own continuous mechanical operating, and the perforee temporary operating of agriculture, we shall not hear them talking about that similarity of result which might be produced by pursuing a course like their owno Mr Joseph Whitworth at a engineers, admirably a she anmers "that thition" he proceded to adduce a case in proof of onr tition," he proceeded to adduce a case in proof of ont great" progrese in mechanical cmanance was as follows: "30 years ago the cost and fling trueing a surface of cast-iron, by chipping and filing with the hand, was' $12 s$. per squarefoot; the same work is now than ld . per square foot ; and this as you know is one of the mont important operationg in mechanics. It is therefore well adapted to illustrate what our progreas has been." Let me now call the particular attention of our agricultural mechanists and farmers to that which follows. He continued: At the same time this incresed production is taking place, the fixed capital of the country is augmented; for in the case I have mentioned of chipping and fling by the hand, when the coot of labour was 128 . per foot, the capital requined for tools for one workman was only a few shillings; but now the labour being lowered to 1 penvy par foot, capital in planingl machinea for the wortman is required which
arge outlay of capital invested in machinery to increase production makes it impossible to curtail the hours of
working machinery. In some cases two sets of worliworking machinery. In some cases two sets of workpeople have to be employed in relays, each working 3 hours a day, and this system, perhaps, may in time be extended."
Now, agricultural mechanists, what a lesson does the above teach you! It informs you that the operation of planing, being co-existent with iron manufacture, should be continuous, therefore they could afford supersede tools costing only a few shillings meet this they are not only compelled to keep the machinery a going all day, but they must actually have "relays" that it may never stop, or the investment would not pay. Here's a scythe costs a few shillings, and you seek to supply its place by mechanism costing many pounds. Can you also fulfil the essential condition that your expensive mechanism shall be kept continually at work? Or can you guarantee that the article produced shall be sold at a much lower cost than is now the case? Or that there shall be 144 times more of it in the country? I need not pursue the comparison of agricultural to manufacturing operations any further, but assert there is little if any analogy between the two cases, and no inference to be drawn as to the result of an extended use of permanent mechanism in agriculture (that is, in the field). Our mechanists will ask "Am I writing against the use of machinery in the feld ?" To which I answer "No!" I am merely
making a move for its right employment. I warn making a move for its right employment. I warn
them that in this particular branch of the farmer's business Man is the thing for the field; and instead of their seeking to make mecbanism superior to the man, they must rack their brains to make it subservient or subordinate to him. I tell them that that course mechanical proceeding which is applicable to a continuous manufacture is inapplicable to an intermittent as regards mechanical feld, that man unassisted can are the operations of the eld, that merform nearly the whole; and with a slight addition of power and
mechanical aid he would be able to execute the whole at a less cost and with a greater ultimate result than is now obtained ; and further, that he is the only cheap mechanism, fulfilling the conditions "temporary and convertible ${ }^{3}$ I know of, suited to plant production. But our mechanists do not study how to aid him to execute with ease to himself the processes of the field ; umassisted they find him insufficient, therefore discard him. I blame them fur not thinking: they seem only to stand by, ready to minister to every want of the roceeding may be businesslike, but it is not patriotic That which (under certain conditions) may be "profitable to the purchaser," may not be so to the consumera good war is a good thing for the farmer, but what
about the consumer? True wisdom should strive to benefit both ; and in the field this can be effected. It Will be some time before our mechanists can be made comprehend that "standing implements may prove as great a tax upon a community as a standing army. They will think the simile far-fetched-it is not. The productively. It is evident this question of the right and wrong use of mechanism in the field is not yet underatood and requires to be well ventilated by discussion before it will be appreciated by the many. Farmers are not to be blamed, for not making discoveries for themselves; they are too much occupiel mechanical and philosophical advisers they look for progress, and on the heads of these latter persons will the recoil be, if under a false analogy or the plea of a C. Burcham, London

Early Harvesting.-A recent journey over some 40 or 50 miles of road furnished in almost every direction more or less the display of unharvested grain, the grainsheaves lying wet and reeking on the drenched surface. There could have been no more striking comment on the grain had been brought home and stacked, but in such a condition as to render it necessary to unstack and scatter the sheaves afresh over the ground, so as to give them a chance to dry. The loss must be very great. In Switzerland, where the climate is also wet olevations than but where corn is raised at vastiy greater sheaves of grain on upright poles provided for the purpose, and thrust sufficiently into the soil. This expehent might now be followed with advantage here, did any provision subsist for it. It would also be very practicable to straddle the grain-sheaves on ropes or poles stretched or laid transversely. It must be obvious, one would suppose, how much sooner the grain would
dry during the short intervals of dxy weather thus suspended than when left on the wet suil, sheaf supported by sheaf. We never, however, see this or almost any other unusual expedient resorted to by farmers. This inability to adapt one's conduct in the matter of harresting, according to the circumstances of the case, calturiat less continue so long as the children of agrirepatition. The principle of origination, namely, that repetition. The principle of origination, namely, that is just as needful as the principle of imitation, which should not be alone adhered to in education. It seems pery trrange, however, that agricultural teachers and preceptors do not tura their more direct attention to
portaut as any question of manures or thorough draining. As a general rule the grain crop might be housed a full month before the period of our actual harvest Clay soils should be drained, this not being so neeessary
with sandy soils. The seed should be brought from an early district and early sown. Above all, but preferably in connection with every other proper agricultural prebegins to change in colour, 80 as to allow it to winnow and ripen in the sheaf, and so avoid the risks and uncertainties, if not aetual losses, attendant on late har vesting. Henry M4 Cormac, M.D., Belfast.

## Farmers' Clubs.

Hexhass: The Lease- - At the last meeting of this committee appointed in reference to leases, from which we make an extract.
"Your Committee, in performing the duty assigned to them by the Club, have thought it better to frame the form of a lease rather than of a mere agreement, and in appointment, they were to have regard to the interests of both landlords and tenants. They have endeavoured so to frame the lease that while the tenant will be free will be prevented, in as far as a lease can do so, from running out or deteriorating the farm. Thus, by the cropping clause, while he is prevented from taking two white crops in succession, or from growing more than a fixed quantity of Potatoes, without an outlay in purchased manure, he may by such outlay grow as wide a breadth as he chooses. He will also be at liberty to curtail his Grass to a certain extent, so as to take Pulse or other crop in lieu of it, and thus prevent his land becoming 'Clover-sick.' Your Committee think i right that, in the concluding years of a lease, the tenant should conform to a stipulated rotation, so tha he may not have more than a fair share of the farm for an away-going crop, and that the incoming tenant may have a fair portion of Grass and fallow to enter rotation or be as may be agreed upon by the parties. For good land on Tyneside your Committee are unanimously opinion that a four course rotation, with liberty to substitute a Pulse crop for a portion of the Grass when in this is most proficable, but mane farms is evident that on the lighter portions of such farms a less exbausting rotation, such as the five or six course ought to be followed. What that rotation is to be will be determined according to the nature of the farm and by the parties interested.

The following is an abridged copy of the lease
It first, of course, names the parties to the lease and the subject to be leased, excepting from the latter all mines, minerals, and quarries, in and under the said farm, with liberty to work. Also excepting all woods, underwoods, trees, and plantations, upon the said farm with liberty to prune, cut, \&c. : also power at any time to take any part of the said farm for roads, to straighten boundary fences with neighbouring proprietors or
farms: excepting also liberty for the landlord, or those authorized by him, to enter upon, and hunt and shoot over the said farm, the tenant also having liberty to lunt and shoot over the said demised lands.
Note.-If the farm is situated in the vicinity of the landlord' residence, and the game is to be absolutely reserved, the pre-
ceding clause will be omitted, and the following substituted
"And also except the game upon the said farm, with power to the landlord or those authorised by him, to compensation over she said farm, the done either by the said ganne, or by parties preserving or in pursuit of the same, and the amount of such compensation to be fixed by arbitration, as hereinafter provided

Then follow the details respecting term, rent, penal rents, and taxes, including
"The further rent of 10 pounds for every acre cropped contrary
to the course of husbandry hereinater provided; and a turite
rent of five pounds for every ton of Turnips, Mangel, star,
hay, which shall be carried away from the said farm unles
purchased manure to the value of one pound for every ton
Turnips or Mangel, and of two potunds for every ton of straw o
hay so carried away be applied to the said farm within the yea
immediately following such sale. [The tenant being bound to
hay so carried away be applied to the said farm within the yea
immediately following such sale. [The tenant being bound to
give due notice to the landlord or his agent of his intention so t
dispose of any Turnips, Mangel, stram, or hay, and to produce
dispose of any Turnips, Mangel, straw, or hay, and to produce
vouchers of the parchase of the said manures I Provided al was
that the said last-mentioued rents shall be payahle only for the
year in which they are incurred, and must be claimed within 12
year in which they are incurred, and must be claimed within 12
months after the same shall become due. Excepting the case of
penalties incurred for plonghins up old Grass land, when they
shall be pavable from the time ther are incurred, and continue
shall be parable from the time they are incurred, and continu
jearly during the term.]
(in Cropping it sars. -The tenant shall keep and leave in
permanent Grass the tollowine fields, via. :-........... permanent Grass the tollowing fields, viz.:-............... An
sball during the said term cultivate the remainder of tan
according to the rules ot g od husbandry, and in particular h according to the rules of giod husbandry, and in particular he
shall not at any time take two white crops in successinn, nor
have less than one-fifth part of the said land in Grass, nor more
than aco.... acres in any one year under Potatoes, withnut
applying to the said farm within the following year purchased

The report and lease having been read a fewsuggestions were made in the course of discussion with the view f rendering it complete. Thus, on the suggestion of Mr. George Lee, it was provided that the tenant shoul not only not be able to sell Turnips, hay, or straw, \&c. off his farm without procuring proportionate manure but that he must not do it without acquainting his landlord. Furthermore, on the suggestion of the Chairman, Mr. Grey of Dilston, the fine of $5 l$. proposed by the committee for miscropping was raised to $10 l$., and in the case of ploughing up old Grass land rendered both retrospective and cumulative, on the ground that the tenant might, especially towards the end of the term, gain more by violating the cropping conditions of the lease than the amount of the fine. While the clauses as to taxes were under review, it was agreed to specify such as should be borne by the landlord, in order that no misunderstanding might ensue; and, on the motion of Mr. Dods, a clause on insurance, which had been
omitted on the ground that it was needless to provide for what it was the interest of the tenant to do without any conditions, was inserted; along with an additional clause, with a view to ensure the good repair of the fences, \&c.; which, as well as the preceding additional and explanatory clauses already enumerated, will be found inserted between brackets in the body of the lease. The clauses which gave rise to most discussion vere those affecting game, one of which proposed to give to the tenant the same right of hunting and shoot ng as to the landlord; the other, to confine it to the landlord, and the tenant to receive compensation for damage. Mr. Dods explained that the committee had been in favour of the former clause, while he was in favour of the latter, the adoption of which he now moved to the exclusion of the other. Mr. Trotter, who denounced the game laws, and held that it was absolutely impossible to compensate the tenant for the damage done by game, by the trespass to which if the and other sources of annoyance and loss, moved that the ormer clause stand to the exclusion of the secon Mr. Dods said that so long as the yame laws were the aws of the land, they must deal with them as such and that, if Mr. Trotter's motion were adopted, landlord would, as soon as he came to it, read no furthe but throw the lease aside, as being a tenant's lease whereas it has been the wish of the committee to frait a lease fair to both sides. The Charman also, whil having no liking for the game laws, pointed out that the clause of Mr. Trotter would be of no use to a tedland might consider it hard that, after being at the expense of watching and preserving game, the tenant shate take his share of the sport equally with hoved that some discussion, Mr. Lee, the seties to the lease migh both clauses stand, so that which suited them best. This was carried select that which suited them best.
by a large majority. Abridged from the Netocastle by a lar
Journal.

## Farm Memoranda

Robgill Tower (the residence of J. M ${ }^{\circ}$ Connell, Esq., oout 15 miles to the north of Carlisle).-"My stock here consists principally of sheep, which are kept in the
summer and winter. They stand on sparred foors. The liquid and solid manure passes down between the spars. The liquid portion goes at once to heep by a gutta percha hose, and is prevented from going immediately into the tanix hy a large flat grid. The water is then turned on to the grid, and a boy, with he aid of a roller and scraper, soou washes as much of es solid manure as will dissolve into the tank, leavin the grid only bits of Grass and Turnips, and wool ce, which are then removed from it into a cart, and aid in a heap on the land, where required, to decom the tank contains nothing but urine water and lved manure, which latter gradually settles at the ottom. The tank is built of brick, and arched over every drain which goes into it is carefully trapped ventilate the tank into somon drain he ingress and egress of air. This drain comes out ome 100 yards from the building. Inside the tank I have an agitator, worked by the engine when the umps are at work. The mixture is drawn out of the tank by two pumps, with a 4 -inch suction pipe open at the bottom; but on the surface of the ground the liquid ases lumps getting in by accident I can look into this box and remove them. I have laid 3-inch iron pipea about 2 feet deep underground, 80 as to be free bove ground, that 120 yards of gutta percha hose can water every corner of the fields. In one of these iron pipes near the pumps I have a safety valve, so that there is any stoppage in the pipes the liquid putting guano, and particularly gypsum, into the tank as these substances are apt to cake and gradually fill them up. From May till October, heep 10 head of cattle, and 7 horses, besides making 24 cart loads of hay. I have cut my Grass four, and ome of it five times this summer, $M$, instead of the and getting poorer it gets richer. ad time to getup its f sewage is concerned, my experience leads me to elieve that it will have a greater fiet upon vegetation fargely diluted and frequently applied, than if only occasionally applied and less diluted. The objection to the former plan is, however, that it costs so much more in storage of the sewerage and in the cost of application. apply the sewage to the land summer and winter. Iy tank will only loold a fortnight's supply. In the hardest frosts I put it on the ploughed land only, and it scapes through the crevices to the bottom of the farrow, and is absorbed by the land without much exposure to the air when the thaw comes. I do not consider it requisite to have large storage room, so that do this quite as effectually in the land as in the tank. The manure in my tank is constantly changing, as it is umped every second day on to some portion of the inter and thus have occasion to pump much seldomer n winter, and save expense. If, as I believe, this ystem will repay me for my outlay, there is no doubt hat applying fown sewage to the land in the neighbour ho fill tow, ws the oury be pay "finitely becter, as "Mis Mr. M'Conmell han mine in proportion. This is Mr. M'Connells alill of fas Mr Mechi cannot ccellence. Mr. Mech cannopp completeness and cleaniness, but whether this characteristic can be pres of perations would depend entirely upon the attention hat may be directed to details. That attention must be lose and unremitting; and there is no reason why it hould not be; we saw nothing to lead us to suppose hat it would not be. The engine that pumps the iquid manure from the tank upon the surrounding fields is one of Clayton and Shuttleworth's. It cost 200t.; the tank cost 100 guineas; the pumps about $60 l$.; and the piping bout 3s. a yard ; laid down, the 120 yards of hose hrough which the liquid manure is driven, 211. The engine is capable of throwing 2000 gallons an of machinery, such as Grass and Turnip-cutters, corncrushers, threshing-machines, and others, some of which we saw in active employment, preparing the food of the sheep and cattle for the day. The appearance of pplications of talian Rye orase and had all the freshness and preen hess of Rye-grass, and had all the forms and greenrery feet spring chit thell the the very feet. Mr. MConnell told that and crops, more or less, to the same process, and all throve
alite. Certainly the contrast between the fields that had undergone this gaturation and those which had not, was remargone this saturation and those Mr. MrConnell is adding largely to was remarkable. Mr. M'Connell is adding largely to
the ladd under cultivation; it is poor and requiring the land under cultivation; it is poor and requring eing a layer of what is called "mossdrift," which effec tualiy prevents the escape of water from the spongy soi on the surface. All this is very difficult and expensive, but Mr. M'Connell has the best men, beet horsee, and the best implements brought to bear upon the work;
he has the capith, the ability, and determination to carry
it out. Whether it will pay is, we believe, a question which neither he nor any one else at present can solve may with all our heart, for to such enterprisine mer Mr. M'Connell, the pioneers of improvement $\in$ even hough self-interest be at the bottom of it, society is indebted. Abridged from the Carlis'e Patriot.

## Calendar of Operations.

Border of tar frys, Oct. 27.-The weather has been ex tremely favourable during the last week for proceedtug with the
second harvest of the year, viz., that of root crops, sorry to be obliged to give a sad account of the Potatoes, for has in greater measure diminished their soundness. On the best Potato land the injury sustained by the disease lis very ex
tensive, and on all other soils there is hardly any to be hal worth preserving; those Potatoes that were gathered earlier have sbared the same fate as those now digging, consequently herefore apprehend a great searcity of good Potatoes in the pring, at least if other districts are affected with a simita the field ready for storing is about 25 s . per ton. Mangrels also promise well, they will not be cleared generally unthl about the
second week in November; they appear to be now growing most qualified men, so difficult was it generally to obtan a plant, and qualified men, so difficult was it generaily to obtann a plant, and rain cbanged the aspect surprisingly of sll the green crops. appearance of the pastures will enable the grazier to keep his stock out of doors and on Grass for a longer period than usual, we have a cheering prospect of an ample supply of wholesome
roots for spring feeding; the prices of all store stock therefore forward than nsual. Wheat seeding stock is more fresh and state of the weather as could be required; it is now performed in almost every other field. Farmers of highland in this neighOctober, assigning as their reason' that if it grows too much benre Christmas it sustains such a check by the spring frosts as it is held advisable to sow. Wheat as soon in October as the lanc be possible to sow it at all, if a rainy ".Jatter end." So also the skirty land is sown soon rather deep, to get if possible a well-
established plant. On fen soils it is thought to be a pood time if established plant. On fen soils it is thought to be a good time it done by the first or second weeli in November, some men being well Red Wheat seems to be on the decline, Browick, Siab, Giant White Chaff, and other novelties taking its place. The demand for seed having slackened markets have had a duller tone, and is the weather prove favourable for threshing When the buste o ably cause prices to recede. Barley still retains a bigh figure, and horse-corn may be said to be in good demand. There seems
to be plenty of employment for labourers, and the greatly in creased use of machinery seems to have introduced some anima
tion into their habits; there is no lack of men able to mana he most complicated machinery, and with higher quallifications we may reasonably prosume higher wages are received; women may be a greater desire to get rid of weeds, but that by improve cultivation weeds seem to be more hroltic not unumal mortatality among them, and more attention is given to breeding them,
so that the great and increasing demand for good cart-horess can nly arise from extended culture or augmented production

## Notices to Correspondents

Antered by Mr. Disraeli the other day at the Amersha
Society. He said, "He recollected when the establishment such societies Was ridiculed. It Was said that Sir Isamc meeting, and it might have been said that at no agricnitural meeting was the plough invented; but the instinct of human nature was superior to all such criticisms, and these societies
continued to be formed for the benefit of agriculture. Men continued to be formed for the benefit of apriculture. Men
must feel the advantage of these meetings, whereby they are must feel the advantage of these meetings, whereby they are trict. Here we find the life and spirit of the country united,
and in that union is strength. I place not only the defence, and in that union is streugth. I place not only the defence,
but the vindication of all these societies on the broad trath, are, as in large tomns, the means of aggregation you must hare reconrse to societies such as these; and on no occasion do we
fail to recognise their beneficial effects. The operations of this and nther societies may not be extensive, but the object at
Which they alim is the beneficial condition of man. You cannot thow your eye over the awards of this day without
feeling that they tend to elevate man. It is idle, gentlemen,
to euppose that the ceremonies of to-day will vanish as the to suppose that the ceremonies of to-day will vanish as the
sun. No; the sturdy ploughman of to-morrow, or the boy who ' whistles at the plough' if he should meet the successful farmer who has cultivated thie best five acres of Swedes will
feel a spirit of faternity. Which all the laws invented by senators can never achieve." A fuller report
will be found in "the Newspaper."
MPROVEMERT OF COTTAGEB: Falcon. Thank you.

## The Gardenerg Chromicle.

## SATURDAY, NOVEMBER 8, 1856.

Can Troffles be ohtained like Mushrooms by skilful cultivation? No question has been more frequently put to gardeners, or more unsatisfactorily answered. If we could believe the stories that have occasionally been current upon the subject, or the books that impostors have written, there is no great difficulty in the matter. But when the directions found in such works are reduced to practice failure has been the invariable result. Nevertheless we should take courage, and recollect that all the attempts at cultivation hitherto recorded have been made by persons unacquainted with the natural history of the plant and have been nothing more than blind groping in the dark. No better specimen of this could be found than one which has been circulated by the Cosmos, a weekly French journal, from which we last week gave some extracts, reciting the opinions of a M. Ravile, who professes to have the advantage of 30 years' personal experience. It is needless to repeat the farrago of absurdities which this gentleman has endorsed. The reader will find them at p. 724. We confine ourselves to one or two points. By far the best account we have of the real habits of Traffles is to be found in the Messrs. Tulasnn's Fungi Hypogaei (4to, Paris 1851). In that important work, which exhausts the subject, is found a distinct denial of the parasitical habits assigned to these singular plants by hasty observers. "There is one circumstance," say these learned authors, "which has more influence on the growth of Truffes than the nature of the soil, and that is the presence of explanations. Some persons have ascribed to trees explanations. Some persons have ascribed to trees
some direct influence, and have imagined such a
elation to exist between their roots and the Truffles found near them as could only be explained upon he supposition tha ormer (Haller as well as M. Robert, see p. 724 inclines to this view; at least, he suggests that Truffles may adhere to the roots of trees by certain threads). Others, on the contrary, see no further connection between trees and Truffles than this, that the latter require for their growth shade and a soil ariched by the decay of the leaves, fruit, or twigs and small roots of the trees which overshadow hem. We have often found Truffle-hunters persuaded that the first opinion was well founded, but nevertheless, notwithstanding the utmost care we have been able to take in digging up Truffles in the vicinity of trees, we have never succeeded in discovering the slightest connection between them and roots." The notion that Truffles are root parasites may therefore be regarded as being definitively negatived.

As to the speculation that they are a sort of gall formed on roots by the puncture of what is called a Truffle-fly, we really cannot condescend to discuss such a question. From dreams let us pass to reality.
There seems to be no doubt that Truffles prefer the neighbourhood of certain kinds of trees; Oaks and Hornbeams are their favourites, but they also thrive ander Hazels, Lime trees, Sweet and Horse Chesnuts, the Box tree, and the Lilac. But no sufficient ground seems to exist for the belief that one kind of Oak suits them better than another. Pine trees alone would appear absolutely prejudicial ; for although Truffles are sometimes found near such trees, it is only when they are mixed with great quantities of Oaks.
There is no doubt that the soil they prefer, or perhaps require, is calcareous or a marly loam. At least they are found in greatest abundance in such earth
Such seem to be some of the certain facts which modern science has been able to extract from the rubbish of superstition and ignorant observation. It is to such points that the attention should be directed of those who want to establish Truffle grounds, and not to such absurdities as Truffle-flies. To this we may add two other circumstances which experimental cultivators must bear in mind. The first is that Truffles are propagated by spawn in the same way as the common Mushroom; and that they even spread through the ground in rings like any Agaric. The second is still more important. It is the universal opinion of Truffle gatherers that if the young Truffle is touched or disturbed it will grow no further; for which reason they never leave in the ground the small ones which they may displace less Truffles grow no furt Much however as a crop may be injured by disturbing the ground when young, no inconvenience is experienced when they are full grown, and there are always enough then left to produce another crop.

Those who have Truffle grounds take good care not to break up the earth to any depth during spring and winter from fear of hurting the growth. Truffles gathered at such seasons are tasteless, unripe, and found just below the surface. It is the Truffle of December, formed during the heats of autumn, and ripened under the rains of November, in which the flavour of the plant is really developed.

These points we commend to the consideration of all who wish to attack the only apparent impossibility which gardening can now be said to have failed to overcome.

The origin of Cuba Bast is at length discovered. The substance known under this name has now become familiar to gardeners in consequence of its general substitution for Russian matting in tying up plants ; but nobody could make out what tree produced it. In vain was inquiry directed to quarters where information on such points might have been expected to exist. Havannah merchants knew nothing about it, and Don Ramon de la Sagra, formerly the director of the Botanical Garden at the Havannah, and afterwards author of a learned work on the natural productions of the island; was equally anacquainted with its origin-a strange circumstance considering that the substance has a commercial value. But so it is; the commonest things are the least familiar to the learned, who are apt to look so high that they see nothing at their fect. Not that the learned alone are open to this imputation. We have known very werthy painstaking gardeners who would have felt themselves disgraced if they could not furnish you with an hour's discourse concerning costly exotics decorated with Latinobarbarous names, but who did not know the distinction between an Alaternus and a Phyllirea, or a Blackthorn and a Buckthorn.
history of Cuba bast, which Sir Wm. Hooker, by
diligent inquiries, has ascertained to be produced by a West Indian tree, described years ago by Swartz under the name of Hibiscus elatus, and which seems to be nothing more than a variety of the common Hibiscus tiliaceus. A full account of the discovery is given in the new number of the Journal of Botany, from information collected from Mr. Henry Christy, Mr. Scharfenberg, and Mr. Wilson, the Superintendent of the Botanic Garden, Jamaica. There is therefore some hope that this useful material may now be prepared in our own colonies, and sold at a lower price than it bears at present.

The columns of one of the daily papers have been occupied lately by letters from persons complaining of the desecration of Hyde Park. One gentleman has found out that some magnificent old trees have been cut down and instantly removed in what he regards as a very stealthy manner. Another writer charges the unfortunate first Commissioner of Woods \&c., with having, per se aut por alios, actually removed, rooted up, felled, or otherwise destroyed some promising young trees. So that according to Hacl is a ruthless destroyer, before whom, like another Attila, young and old are alike condemned to the axe. It is a great pity that gentiemen wil not endeavour to understand the meaning of what they see before they rush into print and abuse public officers for doing their duty well.

It is evident that these writers know nothing about forestry. It is even doubtful whether they can say what the trees are which they declare have been thus shamefully wasted. At all events, it is evident that they are ignorant that death is the fate of Elms as well as men, and that trees require standing room as much as the riders in Rotten Row

What are the facts? Mr. Mann, the Superintendent of Hyde Park, who is doing his work in a very praiseworthy manner, has stated that the trees which have been cut down were old rotten Elms which it was necessary to remove. He might with great truth have added, which had become dangerous to passers by. The writer in the Times does not know that some of the old Elms in Hyde Park are knocked over by every heavy gale; he does not know that the Elm is in its very nature one of the most brittle of trees after it has reached the period of maturity ; he does not know that no experienced forester willingly stands beneath the heavy branch of an old Elm loaded with summer foliage; he does not know that while enjoying the shade of such trees in Rotten Row he sits beneath the sword of Damocles. Although he does not know these commonest of common facts he might have heard how in 1851 one of the workmen in the Crystal Palace was half killed by the breaking of a huge limb, which snapped like a Carrot beneath the poor fellow's weight, and he might have seen in the same building two more of these trees which a few years before broke across the solid trunk, some feet from the ground, destroyed by the weight of the $x$ own heads. We warn this gentleman to take care how he rides too near the old Elms in Hyde Park.
As to the removal of young trees, we shall only say that if we wanted evidence of care and knowledge being now found in the management of Hyde Park and Kensington Gardens, we should put our fingers upon that circumstance. And the more so because it shows the existence of some moral courage in thas offending, under a sense of duty, the prejudices of the ignorant. In nothing is this great country more the scorn of intelligent foreignera than in the state of the plantations to be found in all directions. Belts and so styled clumps of what the owners are proud to call trees, but which ought to be denominated scaffold poles, are their characteristic features. Those who planted them never ventured to thin them; they loved too well their "delightful shade" to venture upon the removal of even one; and so they stand, encumbering the ground, disfiguring the landscape, and useless for all purposes except burning. Such was formerly the state of a large part of Kensington Gardens, as all may see who visit its most wooded part-and such management not only rnined the trees for the time being, but rendered after attempts at cure almost inoperative.

Of course we do not intend these remarks to be taken in a universal sense. On the contrary, a knowledge of the nature of trees is spreading, though not so fast as could be wished, and many examples are to be found in this country of as skilful many. But we do say that examples to the contrary are deplorably common, and quite characteristic of England.
The object of those who now have the super
skill and knowledge for rude ignorance. For this the wise correspondents of the Times are pleased to denounce them. Long may they merit such denunciation.
Anong to-day's Advertisements will be found an official announcement by the Council of the Hosmcultural Society of the arrangements for the meeting on Nov. 25. The principal object is to produce an exhibition of fruit; but flowering plant or other objects are admissible. The new arrangements respecting the introduction of visitors will come into operation for the first time. An unlimited power of admission no longer existing, it will be necessary for strangers to apply to Fellows of the Society or Candidates for an order, authorising them to be preserit. We are rejoiced to add that as considerable a number of Candidates for election have sent in their recommendations and will be ballotted for on this occasion, as was ever known in the early and most prosperous days of the Society.

We understand that Mr. Hermann Wendland; Hofgartner at Herrnhausen, is about to proceed to Guatemala with Mr. Skinner, at the expense of the King of Hanover. Mr. Wendland's scientifio knowledge raises the expectation of highly interesting discoveries in Natural History being the ressit of his mission.

In another column will be found an advertisement of some remarkable Conifers which are about to be sold by auction on account of Messrs. Standish \& Noble. We understand them to consist of several hundreds of Cryptomeria japonica and Taxodium sempervirens from 7 to 12 feet high, many fine specimens of Cephalotaxus Fortuni, Abies Nordmanniana and Pinsapo 7 feet high, Pinus Benthamiana 5 feet high, Abies Douglasi up to 16 feet, Libocedrus chilensis 5 feet, to say nothing of largs Deodars, Araucarias, and Mount Atlas Cedars, among which is a specimen 15 feet high. In addition to these are many fine Rhododendrons and othor plants, all carefully prepared for removal.

The locality of Bagshot being little known now-a-days, it is as well to add that plenty of conveyances are to be had at the Sunningdale Station on the South-Western Railway.

PRACTICAL LESSONS IN BOTANY FOR BEGINNERS OF ALL CLASSES.-No. XII. By the Rev. J. \$. Henslow, M.A., Rector of Hitcham, Snffolk Germination of Embryo Bean.-A convenient mode of observing the first stages in embryos is to seatter seeds upon the surface of moist earth in a pan, and to cover this with a bell-glass. A saucer and tumbler will suffice on a small scale. A few may also be sown in a pot or in the open border and allowed to perfect their flower and fruic. In some cases (as with the pips of an Orange) the pan must be placed near the fire. Generally in a few days, more or less, according to the nature of the seed, the embryo begins to develop. Following up our observations of the Bean, we find the seed-skin cracks near the micropyle and the radicle ( $v$ ) gradually protrudes. In whatever position the seed may lie the end of the radicle iuvariably turns downwards and penetrates the soil.

## As the caulicle ( $c^{\prime}$ ) lengthens

called "fibres" $(f)$ are given off. Th
branch, and the term "fibril" $\left(j^{\prime}\right)$ is applied to the ultimate subdivisions. The growing extremities of tap, fibres, are highly hygrometric (capable of $a b$. sorbing moisture), and have in consequence obtained the name of "spongioles" (little sponges) (s). It is through the spongioles that plants absorb the chief bulk of whatever water they contain.

STEM,-The plumule develops into - "stem" (s) which is here quadrangular, and would technically be considered "square." As the stem extends it gives off leaves, one above
another at certain distances, and at another at certain distances, and at
regular intervals (equal angular distances) round it. The consequence is, that a line drawn from the point Where a leaf is given off to that
 upright.
Lraf-buds.-The upper angle made by a leaf with the stem or branch on which it originates, is termed its "axil" (axilla the armpit). In every axil of the Beanplant on which we may lay hands there will be found a " bud." It forms a small projection from the stem, and When destined to produce only a leafy branch, is organised on the same plan as the plunule or terminal nascent leaves of which it is composed are more or less cunspicuous, a few of the outermost often retaining the form of scales, and acting as a coat to the inner ones. Some buds are destined to produce flowers. These will be noticed in the next Number
N.B. So predominant is the law which secures the formation of axillary leaf-buds, that we find them even
in the axils of the cotyledons. If not at first apparent, they are capable of being soon developed in the germinating embryo of the Beal, and rise up as two branches
bearing leaves like those on the stem developed from the bearing leaves like those on the stem developed from the
plumule. If the main stem be cut away, here is double plumule. If the main stem be cut away, here is double
provision made against its loss. If leaf-buds are removed from a plant and properly treated by a skilful hand they develop roots, and thus become separate plants. Under our experimental bell-glass we may further cause "adventitious leaf-buds" (those which are found otherwise than in the axils of leares) to be developed about the mutilated extremity of the stalk of a young Horse-chesnut ( (Esculus), or of an Orange (Citrus),
two plants which I name from personal experience, though there may be nothing very novel in the plan.
(To be continued.)

## THE WAR OF THE ROSES.

I HAD returned, after a long day among the partridges, to that which every Englishman considers the natural sequence of his sport-a good dinner; my dessert was
on the table; my legs, I am ashamed to say, were on on the table; my legs,
that vacant chair, which some day, I trust, being a that vacant chair, which some lay,
bachelor, may be more worthily oceupied ; and in my bachelor, may ind dearer to me than wine or Walnuts, "A Catalogue of Roses, by Thomas Rivers, for 1856.7." The Turnips that day had strikingly resembled the Rose
immortalised by Cowper, and which I have always immortalised by Cowper, and which present, being in a regarded as the most uncomfortabloplesent,
dripping state, which "Mary" could possibly have offered. The clay, too, had been particularly adhesive, and I remember that when I came to the "solect Noisette "I took a bumper of sherry, and felt that
nothing but love among the Roses could have kept $n$ e nothing but love among the Roses could have kept n'e so long awake. Suddenly, but without surprise (who myself surprised without perturbation, Hercules, Fieschi, and Dick Turpin ?) I foundmyself in my Rose garden. It was broad daylight and every Rose in bloom. Kean was as glorious in October as his
namesake in the "Winter's Tale." General Jacqueminot, H.C., with the fair, ladylike 'Triomphe de Bayeux by his side (why do not Rose-growers cultivate more generally this distinct and elegant variety?), was glancing gloom a his ria Perpetals poul kicaut gloriously among the Hybrid Perpetuals. Faul Ricaut bent tenderly over Coupe d'Hebé, and swore that Auguste Mie was coarse and colourless in comparison Bat while these summer Roses seemed only interested in their ow privarialy, ane oreat topic of public import. I soon discovered that the subject of discussion was the Catalogue I had just been perusing, for it sion was the Catalogue
was strewed over the Rose-garden, so that the dwarfest Was strewed over the Rene-garde, tallest pillars, so that might read, and suspended to the tallest pillars, so that the highest standard might see. The Duchess or Sutherland having been requested to preside, hegan by remarkming that she never remembered, since she had been a Rose, to have been agitated by more painful feelings, or to have realised more sorrowfully the old adage-" No Rose without a thorn." ("Oh, oh,", from Inermis.) They had always regarded Mr. Rivers's Catalogue with as much reverence as a Roman Catholic could feel on receiving a letter from the Pope-("Hear, hear," from Pius the Ninth) - for he was indeed the Papa or Father of Roses; and they had looked for ita appenrance as anxionsly as young ladies awaiting les modes from Paris, for Mr. R. was their arbiter elegantiarum, and set the fashion in Roses. Now, for the first time, the publication had been received by certain malcontents wing evice complaints subb rosa, they had wiuh expres a general meeting. She called upon them to come forward and state their grievances, that the case might be fully discussed.
Madame Guinoissean, H.P., then gracefully rose, and Meneral murmur of admiration followed among the field marshals, generals, colonels, and other gentlemen present, as also from the Emperor Napoleon himself. present, as also fromon with every Rose that bloomed, nothing but love and respect for dear Mr. Rivers ; still she thought he had not done her justice. Let them recall her history, and judge. She arrived in that garden in November last, and, though a perfect stranger, had experienced a most gratifying reception, being placed in a most agreeable locality and edeupon a most liberal diet. She had done her best, in consequence, to give satisfaction, and had good reason to end of June, the master came his usual round. She well
remembered watching him as he passed from one tree
to another, and the feeling of envy which shot thro very petal is he lingered with Madame Rivers. He was hurrying past, as though expeeting to find no beauty there, when her first full bloom, on which she had bestowed immense pains, and which really was to quote the complimentary language of Mr. Lane and Mr. Paul,, "beautifully cupped," "large and double," suddenly caught his eye, and she saw him actually start. Then he drew near admiringly, gently moved the flower into the light most favourable to its best display, and gazed, with the happy smile of a true florist, long and fondly-
"As though within the petals of a Rose
Suddenly, and to her great surprise, he rushed away, and darted from the Rose garden ; but soon returned o put an end to her suspense, and bringing him with heir respected guardian, Mr. Mirs. Never, never hould she forget her happiness, when, pointing to her, he had said, in a joyous and exulting tone-"There,
gardener, there is a Rose!" Well, the very next gardener, there is a Rose!" Well, the very next
morning, just as they were waking, "with their rosy morning, just as they were waking, "with their roay
faces washed with dew," she was severed from the parent tree, and found herself reposing on some fresh parent tree, and found herself reposing on somees ine most beautiful she had ever seen. For a time they were kept in darkness, and so travelled many miles, being at last brought to light in a spacious hall, and placed among some hundreds of other Roses, collected and arranged like themselves. By-and-by, three shrewd and thoughtful-looking men approached them, and she was informed, in a whisper, by Mr. Paul Ricaut, who had been in the habit of attending similar exhibitions ever since he could remember, that these were the judges. They stayed long with some of the groups, making notes, and examining every flower, but at some they gave but a momentary glance, just shook the head and passed. Arriving where she was they smiled snost graciously, and she was feeling particularly proud and seized her by her neck, and, lifting her from her zinc tube, exclaimed-"Hollo! what have we here?" "New to me," said No. 2, "but evidently good ; shape perfect ; colour novel, most delicate, and beautiful." "Why she has petals enough for two Rosen," quoth went to ${ }^{2}$ gem, and no mistakio trio 1 gin went they on went the judacial trio. Again finally placed before us, to our unbounded joy, a large all was pro hornt the Loud cheers from all parts. uccessful competitors coll furning quite palo winh fif hould mot indulge in further eulogy of self, bat would content her self with stating that, on two subsequent occasions, she
had been equally "victorious, happy, and glorious" as had been equally "victorious, happy, and glorious" as
n her first debut. Had she not, then, just cause for on her first debut. Had she not, then, just cause for dissatis/action, when she found herself classified by Mr Rivers among Roses "not quite first.rate," merely described as "bright rose," a
Alphonse de Lamartine might not possess those charms and graces which beautified the last speaker but she had been thrice successfully exhibited in her society ; more than one judge had pointed to her and said that she was "the sliape they wanted;"Mr. Lane had kindly said that she was "globular, and very pretty;" Mr. Paul considered her to possess as "fine form, large and full;" she had been calied a "duck," a pet," "a love," and "a darling," by hundreds of young ladies, while scores of gentlemen had pronounced her to be "a stunner," "a tidyish flower," \&c.; she was a great favourite with her master, who had budded her in a most ample and complimentary manner; and she herefore did not see why she was to be degraded by Mr. Rivers; she would not endure it-no, that sis would ; and if he came within reach of her thorns, she had a great mind to seratch his eyes out.
Miss Nomi would say that a more industrious, steady, little Rose than herself did not grow in that garden Now was she not most regular in her habits, punctua in blooming, abundant in flowers of never-varying fuiness and beanty? Was she not nearly related to, and considered very closely to resemble, the distinguished Duchess in the chair. What had she done to offend Mr. Rivers ?
Madame Lamoriciere would like to be informed what Mr. Rivers wanted. She knew that she was a little uncertain, but it was the privilege of her sex to be so and Mr. Rivers ougat to be in in subject, for she had no hesitation in saying that he him self was a regular flirt. He had said once upon a time that her "shape" Was "exquisite, and now be had for hed her for newer charms, anht piuk." ("Shame for her except that she was
shame!" from all the ladies.)
William Jesse would be blowed - ("Order! order !") that is, he would be blowed in a floral sense, if he stood that sort of thing any longer. Mr. Rivers had eaid that he was "certainly one of the most beaatiful large Roses in existence," and now he had put him in the awkward squad. He knew that he was getting old and could not stand moving about to shows, but he was not afraid of comparison with many modern upstarts; and as for tbat brute Beranger, who had usurped his place in Class I., he would fight him any day in the week for a gallon of liquid manure. (Loud cries of "Order.") He many who had been promoted to the firat division. He
did not wish to speak disrespectfully of the fair sex, bu
he would put it to the meeting whether Miss Alexanhe would put it to the
drine Bachmeteff had
Duchess of Norfolk must excuse him for saying that he did not think much of her shape. General Jacqueminot wore a gorgenus uniform, but be wanted padding-there was nothing of him. He had lived for two years next door to Gloire de France, and had not seen a good
bloom yet. As for La Reine and Madame Campbell d'Islay, he would only say that in the Midland Counties they were coarse, vulgar Roses. Madame Fremion was pretty, but too slight and slim for his taste. He rality showed "an eye." As for Prinee Chipetouzikoff, in his opinion he was as hollow as a drum. He should move that their mutnal friend, the gardener, be
requested to light his pipe with "A Descriptive Catarequested to light his pipe with "A Descriptive Cata-
logue of selected Roses," by Mr. Thomas Rivers. ( ${ }^{\mathrm{a}} \mathrm{No}$, no," and general disapprobation.)

Devoniensis then rose in all her beauty, and so delicious a perfume filled the incensed air, that it did seem almost possible to

## "Die of a Rose in aromatic pain."

She was received and heard with the most profound respect and admiration. She said that as an English Rose, born on English ground-("Hear, hear," from George the Fourth, H.C.) -she felt bound to notice English Rose-grower. And first of all she would ask them one simple question-" Who reinstated the Rose, as the queen of flowers, in this country ?" (Loud cries during which Madame Laffay and some other elderly Roses during which
were removed in a fainting state.) Let them not forget their debt of gratiude. Nor should they forget how he, their founder and benefactor, had, with unvarying consistency, rejected from his catalague those countless impostors who had come of late years from France to deceive the English public. There were not more Hybrid Perpetuals in this year's list than in the last; five had retired, and five had been promoted to succeed Mr. Rivers had pruned with a somewhat too trenchant blade? She thought, with all deference, that he had done so. She thought that the first four Roses who had spoken (and she would add the name of Mr. Joseph
Decaisne, whose silence did him credit,) certainly ought to be in the first class. But she would remind them that they were distant many a long mile from Saw-
bridgeworth, and that in different soils and situations bridgeworth, and that in different soils and situations
the same Rose presented very different aspects. She believed that if Mr. Rivers had seen the complainants as they bloomed there in the summer, he would have declared them to be "quite first-rate;" and she bridgeworth those Roses which he had attempted to blight, he would have refrained from uttering his "every Rose has its season;" and some of them might find themselves in 1857 unable to maintain the position they had obtained in 1856. At all events, let them rest
assured that to merit true aud lasting justice must be assured that to merit true and lasting justice must be ledge their excellence when fairly and fully proven. No
really good Rose need fear the aphis of jealousy, or the really good Rose need
This speech was received with general applause, and expressed their perfect readiness to abide the test of time (with the exception of Mr. William Jesse, who seemed to have taken a dew-drop or two too much, and
to be particularly "cupped").
All was now couleup de Rose, and while three cheers
were given for Mr. Rivers, I awoke to finish my were given for Mr. Rivers, I awoke to finish my
shorry. So R. H., in Twrner and Spencer's Plorist, Fruitist, and Garden Mzacellany for November.

## Home Correspondence.

Potato Crop.-For the last year or two disease has been gradually decreasing in this neighbourhood; this year it has prevailed to a small extent compared with
either of ihe preceding years, and should the next year or two witness such a rapid decrease we may soon hope to hear little or nothing of it. The yield is good, and the quality of the Potatoes first-rate, quite like what they used to be. F.S., Carclev, Cormuall. -I think the
information which Mr. Bennett offers (see p. 726 ) respeeting the sorts of early Potatoes which he has found least liable to disease this unfavourable season space for trying experiments on an extensive scale. By planting in February and taking up in July we
have escaped disease with early Ashleafs for the last have escaped disease with early Ashiears for the last is apwards of 30 bushels, and there has not been one diseased tuber amonggt them, while within a few yards of them, and on a pieee of ground open to the south-
weat, well drained, and doeply trenched for the purpose of planting fruit trees, the crop of Regents planted up in August, and after being carefully sorted and stored away in a dry place with alternate layers of dry burnt soil, we now find many unfit for use. The soil in dresued with leat soil, old tan, and decayed refuse from the kiteben garden. I have tried Forty fodds, Goldfinders, Iriah seedlings, Flukes, Early Shawe, and many other
varieties, but in favourable seasons I have not met with
a better Potato either for cropping or for table than the
Regent. John Stevens, Gardencr, Maivern Hall, Solikull.
Wellingtonia giganteu.-I have read in your Paper the description (see p. 643) of the "Wellingtonia" as found at the Mammoth Grove, California; in most
respects it gives a correct and clear account of those great natural wonders, but I think I can furnish you with some additional particulars that you may consider
interesting. Mr. Lane (brother-in-law to Lord Exinteresting. Mr. Lane (brother-in-law to Lord Ex-
mouth) and myself while making a tour in the interior of Calfornia in March last visited the Mammoth Grove, and foand our anticipations more than realised by a sight of that magnificent grove of trees. We had not the means of measuring the height of any of them but the one that had been cut down near the inu. the contre to the outer ed the stump of this tree, from to be 1568. My friend and myself ascended to the height of 120 feet the tree that the bark has been stripped from, by the aid of stakes driven into the tree. The first branch is some feet above this
height. The tree did not appear to have suffered from the loss of its bark, although more than two years had elapsed since it was stripped. We picked up several cones, principally from the been taken from), part of which I brought to England and gave to Mr. Pince, of Exeter, who has now in his nursery a large number of thriving young plants from a lithographed obtained on my return to San Francisco rate, and which I forward to you with the description. I have also a small branch with cones attached to it from the "Mother of the Forest," which was cut off by

a riffe ball-the only way to get at it. Jno. Kelly, | Filleigh House, A A dlleigh, Devon. [The figure alluded |
| :--- | to is extremely interesting. We only regret that our limits forbid its insertion. By permission of Mr. Kelly it will be exhibited at the next meeting of the Horticultural Society.]

New Zealand.-Can you inform me whether the climate of New Zealaud or any part of it would be likely
to ssit the growth of such plants as Chinese Azaleas, the Cape Heathe, and other (as they are called) greenhouse plants? Can you also mention a few of the plant which have been derived from that country, and by the letters N . or S . for north or south, describe the part of
the islands from whence they have been procured? The object of my inquiry is that (knowing a little of plan growing) I may be enabled to form some idea of the climate of the country. Supposing that Azaleas, Heaths, \&c., could be grown successfully there, what would be the best way to keep them alive during so long voyage ? Emigrant. [We know of nothing to preven Chinese Azaleas and Cape Heaths being grown any where between Auckland and Canterbury, unless the They ceuld only go out in Ward's cases. Why not let They ceuld only go out in Ward's cases. Why not liat to resemble that of Sydney, without its drought and excessive heat.]
Rogers' Conical Boilors and flaing the joints of Iron Pipes with Portland Cement.-Last anturon I purchased one of Rogers' boilers for heating a large Vinery, and had heard much of this boiler, but I must allow it has surpassed my expectations. I never before knew ooiler which could be left for 24 hours without any I met with one which consumes so trifling a quantity of fuel (Welah conal and cinders), or in which the heating properties have proved so satisfactory. Mine is place against the back wall without any shed, and merely bricked round to prevent the escape of heat, and if made after Lynch White's pattern with an iron chimeney, no other brickwork is required. After the fire is lit the damper is shut and the fuel is left to smoulder at a red heat. The price of these boilers is only $508 .$, and they are capable of carrying 150 feet of 4 -inch pipe, or 200 of 3 -inch. The priee of 4 -inch pipes is $18.1 d$. per foot, so that the whole sum for heating a large house would only amount to $11 l .2$. Could anything be more economical for heating an orchard house as Gavdeners' Chromicle of the 11th ult.? The above prices I quote as sold by Lynch White, whose boiler at 50 s. is
one of the most compact things you can imagine, and one of the most compact things you can imagine, and
requires no attention for 12 hours. My pipes are all ointed with Portland cement and fixed by my gardener. A cheap apparatus of the above description (and no only cheap but first-rate) would thoroughly exclude all fross, and if required would tend much to ripen the fruit and the wood. Portland cement I find also answers well for joining all underground iron pipes. Sigma.
Irom Water Pipes.-In the month of April last laid down cast-iron pipes for conducting to my house water from the river. It is used for washing of linens as well as for other domestic purposes. At first the reddish ochry colour of the water rendered it unfit for any purpose. In the course of a few weeks this defect sabsided, but even yet the red or yellow colour, derived evidently from the pipes, causes great complaints from the laundrymaid and from the members of my family whose clothes are washed in this water. Can you suggest the use of any substance in the washing tubs which would remedy the evill
Swans.-I am indebte i to your correspondent "C.P." for a satisfactory and practical answer to my question 1 shall be further obiged to him or to any other corre-
spondent who will be kind exough to inform me whether

I may expet my swans to swim through a culvert or two which it will be necessary to build to carry a parish road and a cartway or two across my cut. (I am told there is yet a lady who will not travel per railway from Bath to London, but posts to Chippenham for fear of the Box tunnel.) If swans are not afraid of for fear of the Box tunnel.) If swans are not alraid of information as to the headway they will require between the top water line and the soffit of the arch. Citisen Loquat. - Will any of your correspondents be good japon japonica) will blossom and bear fruit in a common which gives no indication of blossoming. What is the best mode of treating it ? $F$. [It will bear very well if grown in a warm well ventiated greenhouse. It does yer, do as well. It is a tree.]
Fine Borders y Carrion.-Carrion is very seriously mended by one writer on the cultivation of the Vine, while others, with reason I apprehend, thing diffrently. I have seen a dead dog buried in a Vine order, and I have seen upon examination after the carrion was decomposed that all the roots near it wete lead-could any other result have been expected? If people would but consider under what circumstances the Vine is found growing in a wild state, and also where it does best in wine growing countries, they would, I think, discard the idea of using carrion altogether. It has always appeared to me that too Vine and too little on the formation of a dry porous, and warm border for the roots ; if the formation of the order at first was more attended to, we should hear less about shanking and of Brown Hamburghs. It also appears to me that less heat would be required inside the house if the roots were kept in advance of the op, as Nature teaches us they ought to be. The common method of heating early Vine borders hable to many objections; it is unsightly, it is sttended with a great deal of labour, and as heat always ascend more rapidly than it descends, the plan must be the majority are. A quantity of dung lying upona herder for a number of months has a tendency to make it damp and sodden, and prevents the air from entering o much attention shoul appeared strange to me that Apples as to have the bottom heat for them on yationat and scientific principles, and that no such plan is adopted with the Vine ; at least such is seldom the cas. there will always be plenty of shanking while such reatment is adopted need not be wondered at. I trust some one will answer the queries putby your correspon dent Mr. Gadd! at page 709; if there are any of your readers who have made their borders with carrion and bullocks' blood, they ought, I think, to give us the Menefit of their experience. Chai
Monk's Orchard, Bromley, Kent.
Catsup, about which one of your correspondonts inquires, is probably an Indian word. See Jehnson'g Dietionary, D. C. L. [We de net find the wort in the edition of Johnson, before us, nor is it in Richardson.]
Sir Harry Surawberry.-Observing in your celumng a letter from Mr. Townley stating his own and many others' opinion of this fruit, more especially as regarde Havour, I shall be glad to be informed what is the Myates Pin which havour 25 years ago, or his more recent British Queen (matchless in quality), Carolines and several other old and valuable Pine Strawberries, are to be the test by which Sir Harry shall be judgeds then that it will not bear the least comparison with them; it lacks altogether the rich sugary character in which the kinds just mentioned abound. Nevertheless it is an excellent Strawberry and well worth oxtensive cultivation ; it is a very mach moproved Kohio Seedling (evidently its parent) with all the refreshing and agreeable juice of that old and justly esterned: variety but stronger in growth and an abunabser of it its fruit is also large. I was an early parchase I have now above half an acre containing many thousands; therefore Would be Woul you be goo in sur constitutes flavour in actrawberry acceptation of the term? Richard S. Yabes, [High flavour in a Strawberry is, wo presume, if peculiar mixture of aweetness, aeidity, high flavour is also absent.]
Cloth of Gold Rose.-Seeing your account of the Cloth of Gold Rose which grows at Hethel, I think it may not be unsatisfactory to you to know that such is not altogether a rarity in this county. I have a Clotir of Gold worked on a Felicity stock in 1850. It flowere, the second year, now measures $5 \frac{1}{1}$ inches in the ster and spreads over a surace of 128 flowers and beds; and at this moment (Oct. 31) it has more than a scores, and at this moment (Oct, 31) it has more than a a malf of that number almost bursting. its rapid growth to a copious supply of moisture, which it obtains from a verandah against which it grow, which, it strikes me, has something to an I have gigantic growth of the Hethel Rose. And Inty my Rose has no special advantages. There is alao anoweb, Esq., of Stalham, in this county. N. R. P. Kewp Esq., of Stalham, in
crop of these all last month and up to the present time, for even now the canes are full of fine fruit, that a few words about their culture may perhaps be useful. There are four Varieties more particularly worthy of notice. Rogers' Victoria-Merveille des Quatre Saisons, yellow;
this is large, sweet, and excellent-Merveille des Quatre Saisons, red ; this is about the size of the Red Antwerp, and very good-Large-fruited Monthly, or to give its long, French name, "Framboisier de tous les mois à très groe fruit." The first is a sort sent out many years ago
by a Mr. Rogers, then of King's Road, Chelsea; it rather dwarf, not of a very robust habit, and yields fruit nearly all through September. The second and third have their fruit on very long spikes and bear most abundantly all through October, and till destroyed by the frost Their culture is very simple, as they merely require Raspberries, and cut down close to the ground early in March. No canes to bear in summer should be left, for the fruit they yield then is small and inferior to the
summer varieties; in autumn their fruit is large, and of excellent quality. The fourth sort requires a different mode of culture, for unless the soil is very rich and moist it ceases to bear in the autumn if suffered to grow more than oue year without removal ; the canes
should therefore be taken up every season any time should therefore be taken up every season any time planted on a fresh piece of groand, or on the same ground well manured, and then cut down close to the ground, leaving only one bud above the surface; under this treatment they will yield an abundant crop in repay the trouble of transplanting. For orchard-house culture in pots they will be found excellently adapted, particularly the third and fourth sorts; for this pur Fose they should be potted into 11 or 13 -inch pots in doors during the summer, and removed to the orchard house in September; they will then ripen their fruit byegone days of Raspberry-tide. Thos. Rivers.

## Eocietits.

Entomologrcal, October 6.-J. O. Westwood, Esq., V.P., in the chair. Mr. Samuel Stevens exhibited a
specimen of the beautiful and very rare Carabus intrispecimen of the beautiful and very rare Carabus intri-
catus, taken by Mr. Reading in a wood near Plymonth, and Monohammus Sutor, found in an old Ash tree near Yaxley; also a bottle of Liquorice powder destroyed by
the larver of the small moth Tinea fenestrella ; and a beautiful series of minute moths from Moreton Bay, in South Australis, Mr. Stainton exhibited a number of remarkable cocoons and cases of Lepidopterous insects
from South Australis; also some specimens of the larvæ of Lepidoptera preserved in small ciosed glass tubes. He likewise read a note from Dr. Colling. rood on the preservation of Lepidopterous larve so as made some observations on the blind species of sidered distinct from the Niphargus speleus of Schiodte and the Gammarus subterraneus of Leach. Mr. Dutton exhibited a remarkable variety of Polyommatas Adonis, very dark in colour and with the
markings nearly obsolete. He also stated that he had recently observed Nomophila hybridalis in great numbers at Eastbourne, near Beechey Head, but day that not a single individual was to be found. change in the wind had taken place. Mr. Westwood brought for distribution among the members specimens Lophyrus rufus. He had received a number
the larve from one correspondent, all of which had produced females. He mentioned other instances of the developement of great numbers of specimens of only one of the sexes of different insects. He also presented, on the part of Mr. Spence, a box of minate and interesting insects of all orders collected in
Ceylon by Mr. Thwaites. He also brought for distribution specimens of the small Wax moth which had destroyed a case of preparations illustrative of the products obtained from insects exhibited by him in some account of different points in the economy of this destructive insect. He also communicated a note received from Mr. Yarrell shortly previous to his death troats streat great scarcity of the May-fly in the the pait season. Mr. Nuueham exhibited specimens of upon Sedum 20 -punctata reared from larver feedine specimens of Lelephyrus. rufus and its transformations. Specimens of Lophyrus rufus and its transformations.
Myme exhibited specimens of the larve of Deilephila Galii from Deal ; the larve when young were green, and very much resembled those of Macroglossa
stellatarum. Mr. Smith described a new species of stellatarua. Mr. Smith described a new species of
bee from South Australia, remarkable for its beautiful bipectinated antennæ.
Bomanical of Edinburge, July, 1856.-Some account of a mass of fragments of Fossil stems, or of PseudoCossil stems, found in the interior of the Trap near
Binay Craig, Weat Lothian, was given by Dr. Seller who, is presenting to the Botanical Museum several blach mapes eomposed of cylinders exactly resembling the pipes of refined liquorice, took occasion to notice the situa-
to an organic cause Thure is due to a mineral or several years ago, in mining the face of a besaltic rock to procure material for the repair of the adjacent roads. limited quantity of these singular bodies laid bare was very specimend was soon almost entirely exhausted by the bourhood. Dr. Seller, by the kindness of a friend having had for some time a specimen in his posseston, was induced last week, when on a professional visit near the place, to inspect the spot where the discovery was
made. The cavity from which these bodies had been taken, has the appearance of a large shallow washhandbasin. It is on the face of a perpendicular wall of basin. It is on the face of a perpendicular wall of
basalt, the whole height of which is about a hundred feet. The cavity in question is something near 15 feet
for directly below the summit, and there is access to it by narrow ledge running for a fow yards ang this pre cipitous side of the hill. When the face of the rock is viewed from the little valley below, the basalt seems to rise vertically to the line of this narrow ledge, while the remainder of the height forms a cap running in a transverse direction. That more of these bodies will be place, seems not improbable. The little hill itself is a rew hundred yards north-east of Binny Craig, another eminence of moderate height being interposed. It is on Mr. Robert Thanging and miles from Linlithgow, towards Uphall.

Dr. Seller proceeded to state the grounds on which he had been led to refer the figure of these bodies to an organic rather than to such a purely physical cause as The pmimà facie evidence is, that their substance is nearly pure carbon like that of charred stems, that it soils the finyers, that it gives off bubbles of air when put into water, that minute particles of it under the microscope have an appearance very like that of freshmade charcoal, and above all, that the cylindrica character is quite remarkable, the exceptions being trivial in the extreme, while each body like a vegetabl stem is plainly made up of a containing cylinder, and a contained cylinder. He admitted that there were
markings present due to crystallisation, and that a distinct arrangement of the component textures of any the ordinary kinds of stems had not been made out but he did not regard that as surprising in bodies which lad probably been subjected at first to an excessive
heat, and had afterwards been buried for countless heat, and had afterwards been buried for countless He did not attempt are altered from their original atate-all that he contended for is, that these carbonaceous cylinders are more probably the rernains of individuals of one definite species of the vegetable kingdom, modined by the extraordinary circumstances to which, they have been derived from vegetable nature at large, changed into the figure of an organic body by the cryataline properties which hay He insisted that belong to anthra
or to silica, He insisted that it was strongly
favour of the view he adopted, that the cylindrical figure lay within the ordinary rule as to the production of stems, but wholly out of the rule as to the conformation of mineral bodies; that as far as he could discover, there is no evidence of the existence in mere mineral nature of a force capable of producing like cylindrical forms in indefinite number; that t compare to the columnar tendency in basalt and green stone, or to the stalactitic tendency known only to
belong to carbonate of lime in aqueons solution, the production of cylinders, some a little greater, some ittle smalier, but, for the most part, as perfect as shaped by an effort of human art, and closely corre-
sponding to the variations in size observable in the individuals of a species growing in the same place, is to carry analogy beyond its prescribed bounds. If however, they should prove to be pseudo-stemas, they are at least most remarkable bodies, and deserve attenof mineral aggregation.

## 20tices of 1300率,

The Journal of the Linnean Society, No. 3., contains seven Zoological and the same number of Botanical papers. The most important of the former are descrip. Mr . Halalogues of Singapore and Borneo conclusion of Mr. Bentham's paper on Loganiaceer, and the Rer. M. J. Berkeley upon the Immersion of Seeds in Salt Water parts of which have appeared in former numbers of this Journal. On the same subject is also a note by Dr. Salter, from which the following is an
" In the year 1843, the authorities of Poole in Dorset shire determined to deepen the channels of Poole Harbour to facilitate navigation. For this parpose a large number of ballast-lighter-barges were employed to scrape the mud from the bottom of the channels and convey it to the shore, where it was deposited in large
quantities. During the winter sufficient mud was thus obtained to cover an area of some hundred square yards several feet in thickness, and this was accuroula ted to such an extent, that a quay was made of the hardened mud on the edge of the shore. The quay
however was never used, nor its surfice disturbed.

Larly in the following spring I fanas surprisea wo hat the surface of this harbour-mud exhibited abundant egetation, of a character totaly distinct from that of nd the uay o species were recngnised, the fora of this mu quay was not only found totally dietinet from the ittoral vegetation which surrounded it, but it containe plank wich did not grow within many miles of the pot, and one which was probably foreign to the county. Immediately surronnding the mud quay wa. he ordinary vegetation of our southern harbour shores, Statice, Salicumia, Atriplex, Carices, \&c., whilst on his exposed mud itself not one of them was to be seen but inslead of these there sprung up a large crop of Ost and Barey, some plants of Lyoimachia vulgaris, one plan Centaurea calcitrapa, and multitudes of Epilobriwn lirsulum ; and besides these there were other plants which I did not recognise, or whose names I have orgotten. To my mind it appeared conclusive, that the seeds which produced this crop of vegetation must have been in the mad at the time it was deposited on the shore by the lighters. Taking the plants I have amed as constitutiag part of the vegetation of this new-made land,-they none of them grew in its neighbourhood. The Cereall, which constituted the most numerous of the plants, were not cuitivated within mile of the spot. This mud quay was made at the extremity of the peninsula upon which the town of Poole is built, and the nearest field upon which Ceresla are caltivated is on the other side of the town, and a east a mile from the shore. Lysinachia rulgaris does not grow within four or six miles of the spot ; Epilobiam解m two or three miles, and Centaurea calcitrapa is scarcely known in the county, and certainly not none tef miles of Poole. Now remembering that the of these plants grow eilher on the mhore around too the they miles distant, focmbering land and there the solo sory and, and that the ordinary shore plants, growing in abundance only a fow feer from its edges, were not be seen on it, and further, that this abnormal vegetation showed itself the very next spring, even only a few conceded that the seeds wire in the mud at the time it was apread upon secas were in the madat is still further suatained because are ; and that expalanatio suggests itself, which would sufficiently account for the presence of the seeds of the plants named, in the situation from which the mud was obtained. The mud was collected in the main channel about midwny between the head and the mouth of the harbour At the head of he harbour two rivers pour their water into it, the river Frome and the river Piddle. Theso ivers take their origin in the western parts of the county of Dorset, and in their course pass through districts having every variety of soil and capable of furnishing vegetation of great diversity; on their banks, moreover, two of the species I have mentioned (Lysimachia and Epilobium) grow in profusion. Is it 00 much to suppose that the seeds from which these plants sprung had fallen into the rivers in various parts of their course, had gone with their waters into the harbour, and ultimately reached the position from which the mud and they had been collected? That explanation appears to me to be very probably correct but whether it be received or not, the more importan point - that a variety of seeds had been for a period, probably considerable, at the bottom of Poole Harbour
 ained their vitality till brought under the influence of ir and rain and warnth, and had then produced
healthy vegetation-that is a point which I healthy vegetation-
cannot be disputed."

Prof. Ansted's valuable Elementary Course of Geology Van Voorst) has reached a second edition. It contain 2 pages more than the las, is considerably alered and improved, and excludes the appendix relating to Indian Geology, which is now introduced into the body of the glossary of mining and other terms is very complete and extremely useful to the general reader,

## Miscellaneous

Peat and Peat-Mosses.-Peat, which is a product o cold or temperate regions, arises chiefly from the annua growth and decay of marsh plants-Reeds, Rushes, Equieetume, Grasses, Sphagnums, Confervæ, and the like being the main contributors to the mass, which in pro cess of time becomes crowned and augmented by the presence of Heath and other shrubby vegetation. Peat moss has a tendency to accumulate in all swamps and hollows ; and wherever staguant water prevails, there t increases, filling up lakes, choking up river courses, entrmbing follen forests, and spreading over ever surface having moisture sufficient to cherish its growth it occupies considerable areas in Scotiand and England hough rapidly disappearing before drainage and the plough; but it still covers a wide extent of surface in Kussia and Finland, in North America, and in insular kositions Shetland, Orkney, and the Falkland positions, af shellan, Orney, cupied by Palkland slands. no accurate estimate; but some idea of the eological importance of the formation may be formed rom the fact that one of the mosses on the Shannon is 50 miles long and from two to three in breadth, while - great marsh of Montoire, near the mouth of the Loire, is not less than 50 leagues in circumference.

Some of the scotish mosses have been dug for fuel to
the depth of 20 feet, and many in Ireland and Holland the depth of 20 feet, and many in Ireland and Holand stages of consolidation, from the lonse fibrous "turf" of the previous summer, to the compact lignite looking "Peat" formed thousands of years ago. It has been \&c., according to the situations in which it occurs, or according to its texture and composition as fibrous, papyraceous, earthy, and piciform ; but seeing that the distinctions are of little practical value. Besides the peculiar plants which constitute the mass, Peat-mosses contain the trunks of the Oak, Pine, Birch, Alder, Hazel Willow, and other irees, together with their seeds, fruits, and cones-apparentiy the wrecks of forests ontangled and destroyed by the accumulation of the swampy Peat, prostrated by storms or felled by the hand of man. And, what is deserving of special notice, the trunks of many of those trees are of most gigantic
dimensions, in districts where now the same species dimensions, in districts where now the same species
struggle on for a stı nt and horns of the Irish elk, stag, ox, and other animals are found in most of our British mosses, with occasional remains of human ari, as canoes, stone axes, querns, flint arrow-heads, \&c., of the British stone period; Roman weapons and coins that date to the first invasion of the island by the legions of Cæsar ; and not unfrequently the skeleton of man himself. Some of these fossils are comparatively modern; others point to a period apparently coeval with the dawn of the human race
Page's Advanced Text-book of Geology. Page's Advanced Text-book of Geology.
Cabbage Timber- Jorsey is celebrated for its Cabbages, and for their tall, tree elike character, a peculiarity partly owing to the custom of the peasantry in removThus a Cabbage garden in Jersey has somewhat the appearance of a little grove of Palms; so that in walking between them you literally walk under their foliage not unfrequently 10 and 12 , and more, feet long, quite erect, and straight, and are made use variety of purposes. Planted closely, as living fences, they keep out towls and small animals; sheds are
thatched with them; they serve as stakes for Kidneythatched with them; they serve as stakes Por Kidney the purpose of upholding the thatch or roof of the
amaller classes of farm buildings, cottages, etc., and if kept dry are said to last upwards of half a century Our friend Mr. Samuel Curtis, a resident in the island informs us that he has seen a stak that measured 16 feet in length, and that one that had grown up under the protection of a cider Apple tree had its spring shoots at the top occupied by a magpie's nest! The stems are now much used for making walking sticks
("Jerzey Canes"). Stalks 11 feet high, and very good looking and firm walking canes, are deposited in the
Kew Museurn of Economic Botany. Hooker's Journal of Rotany.

Temperature of Flower of Victoria Regia.-Dr. Cas pary has made experiments on the flower of this plant, and has arrived at the following conclusions:- $A$ short elevation of temperature, especially in the stamens. About an hour after its expansion, the temperature of the tlower falls to the extent of from 0.9 to 2.9 degrees Fahrenkeit. After this the heat rises to a maximum, Fahrenheit, and that of the water 1.24 to 10.44 degrees ahrenheit. This increase of temperature is independent of any change in the heat of the air or of the
water. This independent maximum, as it is called, is succeeded by a second period of floral heat, which Caspary calls dependent, inasmuch as it is under the influence of the atmospheric temperature, attaining, like after midday. This second period has two minima and two maxima. The elevation of temperature occurs in the anthers, the filaments, the staminodia, the petals, and the ovules. The greatest heat is exhibited by the anthers; the maximum exceeding that of the water by 6.6 to 13.39 degrees, and that of the air by 1948 to
29.9 degrees (the latter was observed on 2 d November 1855 at 10 A.M.) The filaments are always cooler than the anthers. In the embryos the temperature is not so elevated as in the anthers, and the maximum is only $1 \cdot 1$ to 52 degrees above the water, and 45 to 18.9 the increase of temperature is still smaller than in the embryos, the maximum being 2.7 degrees above the temperature of the water, and 64 degrees above that different flowers, and in the anthers it sometimes sttains 61.83 degrees, in the embryos 60.7 degrees. These phenomena are distributed to the absorption of nxygen and evolation of carbonic acid. Edin. New
Philos. Journol.
Professor Tinco,-Letters from Naples dated Oct. 4 announce the death of this gentleman, who had long Palermo. He is succeeded, ad interim, by M. Todaro, until the retura of Prof. Gussone from Ischis.

## Calendar of Operations.

(Por the enewing woek.)
Cosservatory, \&e.-The summer floweridg twiners nhich ianally get unsightly at this season shoult be cut
will submit to that kind of treatment. The slight shade which they afford in summer to plants underneath them it need scarcely be stated is not now required. Give ar freely on all favourable occasions, but guard against damp by using gentle fires. Let pot specimens in bloom them, for the finest plants become too familiar to be interesting when allowed to remain too long in one place. Cold Pirs.- If not already done, get straw shutters or whatever else it may be intended to use for
coverings for these prepared and put in readiness for use without delay. Straw shutters, if instance, but they are considered by many to be the most efficient of any kind of covering in use, and taking into account the time they last they are, perhaps, as cheap as any. Expose the stock here freely growth and get the wood firm, in which state the plants will be less liable to suffer from the confinement which may soon be necessary than if kept close and coddled with too much warmth and moisture. Very little water will be required at the root, but look over the stock ven few days, witholding water until it is absolutely he only then giving a moderate sothis, season. If green-fly makes its appearance on any of the softwooded thinga apply tobaceo smoke, and see that this pest is extirpated at once, otherwise it will disfigure if not ruin the plants upon which it is allowed to harbour Heaths and other things subject to the attacks of mildew must be closely watched, and sulphur applied the moment the enemy is perceived, but neither this nor green-fly will be very troublesome, unless the plants are kept too close and damp; therefore be careful to keep can be done with safety.

FORCING DEPARTMENT.
Pinkries.-The trying period for those who have to winter their young stock in pits heated by fermenting materials has now arrived, for with sunless weather, such as is common at this season, it is a very difficult matter to preserve Pines in a healthy state, where Keep the linings sufficiently strong to maintain the emperature at about 65 , which will allow of giving air rather freely on fine days, and a little must also be given in all states of the weather, when doing so does should be no attempt made at inducing growth with the present amount of light, but the linings should be Lept rather strong, so as to be prepared against the occurrence of severe weather, and also to allow of fiving sufficient air to prevent excess of moisture. See hat efficient coverings are prepared previous to the occurrence of sharp frost, and endeavour to keep the dry state. This system of Pine growing is now, how dry state. This system of Pine growing is now, however, but little practised, and it would be economy on the part of those who adopt it to supersede it at once by means of a hot-water apparatus,

FLOWER GARDEN AND SHRUBBERIES
Choice plants in borders intended to be protected for be wiater by singhly where it can be obtained in good thick flakes, is by no means a bad protecting material ; but unless it can be procured in pieces of considerable thickness it is not so efficient or useful as spent tan, coal-ashes, or half decayed leaves.

Also see to getting Fuchsias, and such things as are usually protected for the winter by covering, secured against frost
before it is too late. Dry Fern is an excellent material for covering the stems, \&c., of plants that require slight protection in winter, and is, doubtless, the leas but thonable, as regards colur of anythigher, and probably the best substitute is straw that has been exposed to the weather sufficiently long to darken its colour. Choice sorts of Hollyhocks, of which there is not sufficient stock of well-established young plants in pots, should be taken up, potted and placed under glass these cannot with safety be trusted to the mercies of a
severe winter, and plants taken np, potted now, and severe winter, and plants taken up, potednly, useful for furnishing euttings, and these if got in early in spring will make excellent plants for next season. Where alterations are in hand, push these forward with all possible dispatch while the weather continues favourable for out-door operations. Be very careful to secure transplanted things against wind, especially large plants, which slould never be left until they are properly or otherwise made fast, for when this is put off it frequently happens that the roots get injured through the tops being rocked about by the wind. Get any projected alterations among the shrubbery or herbaceous borders done in readiness for cleaning up as soon as the leaves are down; also get ground intended to be planted and ridnas and possible to the westher, putting in plenty of good rotten manure, especially where the Hollyhocks are to stand for these require a deep rich soil.
hardy fruit and kitchen garden
A sowing of Peas and Beans to afford the chance of a very early crop may now be made, ehoosing sheltered piece of ground for the purpose ; the soil should be of a light dry character. For Peas use an early hardy sort, such as Sangster's No. 1., or Daniel
O'Rourke. The forcing of Seakale and Rhubarb must now be attended to; and where there is a good stoc
of strong roots, a supply of these will be easily kept ap. Where there is room to spare in the Mushroom-house, his forms a very suitable and convenient place for forcing these. The roots should be placed on a slight with old tan, or the soil and manure mixed from an old Wushroom bed, giving a good watering to wash it in amongst the roots. The bottom-heat should not be allowed to exceed $70^{\circ}$, as too much heat is not favourable to securing strong growth, and, except for the first crop, it may be dispensed with altogether. Take advantage of wet days for making fresh Mushroom beds, and clearing out those that are spent ; also collect and prepare droppings for forming fresh beds, by spreading them in a shed, and turning them everyive fermen tation after putting up. Clear up all decaying leaves, \&c., and stir the surface of the soil on dry days among growing crops, es Cabbage, Spinach, \&c.; also get all acant ground manured and ridged.

SATURDAY, NOVEMBER 8, 1856.
We have never listened to a more interesting or complete discussion of the influences affecting the condition of the agricultaral labourer, nor to one conveying a higher impression of the ability of those who conducted it than that which took place last Monday in the rooms of the London Farmers' Club It was opened by Mr. Spearing, of Hampshire, who described in detarl the condition of dester coung and argued for a better description of cottage to be given him-for his better educationfor the extension of his cottage garden-for a system of lodging-houses with reading rooms for young men -for a better relationship of master and servant, including attention to such details as payment of wages any day of the principle which should influence it throughout, for an individual acquaintanceship and sympathy on the part of the master with the labourers he employed. Mr. Spearing concluded by quoting the impressive address of the late Mr
Justice Talfourd, delivered as his dying charge, in which he lamented that separation between classes, out of which suspicion, ill-feeling, and consequent violence and crime often grew.
Mr. Spearing's paper was followed by some excellent practical remarks from Mr. Baker of Writtle. He spoke of after treatment rather than school education as the great cause of the altimate condition of the labourer. It is when the lad has left school, or even left his home, driven from it perhaps by perpetual discomfort there as contrasted public-house, that lawless habits and bad principles are acquired. Writtle is better off than most other places as regards its schools-but it is no on that account the
tion of its labourers.
The condition of cottagers too is not wholly dependent on the character of the cottage. Mr. BaEER has built a 4 -roomed cottage every year for the last 15; but his efforts have been to a great extent thwarted by the determination of the occe reducing their accommodation to the same low level as is deplored elsewhere. One of the most satisfactory means he has employed is the ex20 perches of land to every tenant and torbids the growth of grain ; his only rale apart from this is that no work be done upon the Sunday. Every plot is held at a week's notice, so that the occupation may be at once determined upon the
for them-s power held by the landlord in order that he may eject any one who shall commit an act of theft or crime of any kind. Mr. Baker is the cordial advocate of reading-rooms and evening schools, day and Sunday schools; but he considers the influence of the masters over their servants to be greater than that of any of these agencien. A master who having entered into a contract with his servant, and finding that he is earning more wages by it than had been intended, shall escape from it or alter it, or in any way evade the conditions binding on himself, does thereby teach dissimulation and dishonesty and suspicion for all time coming more effectually than the contrary of all these evils can be inculcated at schools or out of books, or by word of mouth.
Mr. Sidney, of Clapham, followed Mr. Bakrr, with remarks on the character of school books and the literature generally to which working men had access. He argued for information being conveyed on matters of direct and daily interest, and condemned the publications of the Tract Society as being inadequate to the instruction of their readers upon
subjects connected with their maintenance and employment.

Mr.Williams, of Wiltshire, criticised the addresses of Messrs. Spearing and Baker. The difficulty as regards cottages was not to be overcome by the mere inculcation of duty upon landlords. A question to be considered was the difficulty of building the house required for a price on which its tenant could pay a reasonable interest as rent. As the extent allowed by Mr. Baker, and he would allow the cultivation of grain crops. He argued cordially for the extension of schools, and would be glad to see all public-houses closed by law upon the Sabbath day
The Rev. C. JAmrs then delivered a very admirable address upon the interests of the working man. the training of the child. At present the master often was labouring to undo what children learn not only in the street but at home. They are generally left neglected till they have already acquired bad principles and habits-whereas what was needed was that they should be properly taken in hand and cared for during youth, and after the period of school education had necessarily closed. Among matters of detail Mr. James declared that it would be a national advantage if farmers would every where pay their men on any day but Satarday; and how they abon mastly blamed and punished servants-young men and women have been turned out homeless and resourceless for merely accidental inattention or pardonable ignorance
Mr. Thomas, of Bedfordshire, then gave a very interesting account of his experience as a master, more especially in reference to the management o boys. He employs 20 of them under a careful superintendent, who can correct and teach them He gives $3 s$. a week to each, and in addition a $6 d$
ticket as \& reward : this is withheld except it be ticket as a reward: this is withheld except it be
deserved by good behaviour, and every six months, in lieu of the 26 reward tickets which may have been acquired, a card is given enabling the purchase of 13 s . worth of clothing, and the lads afterwards spend the evening of that day at the table of their master. Mr. Trosss contended for the personal in fluence of the master as the great educational influ ence to be strengthened and improved by every pos sible means, and to be regarded as far transcending in its effects upon the future life any quantity of what slightingly
We hope again to refer to this discussion. The esolution at which the Clab arrived simply affirmed in succession the sentiments to which utterance had been given by the speakers.

The sixth harvest is just concluded since the ntroduction of the American reaping machines, and yet reports are coming into us from every prorince of their adoption as if they had never been heard of before. Ever since the commencement of the Irish exodus there has been a growing want labourer experienced to cut down the harvest. Every year as it has rolled past has added fresh proof, if such were wanting, of the necessity of reaping by machiners reports of many having only made the discovery that their crops could be cut down more economically with reaping machines than with the sickle or scythe.

There is perhaps not a greater obstacle to pro gress in bringing machinery successfully to bear which farmers are now purchasing reaping machines, partly arising from the difficulty experienced in selecting the best ones, and partly from the hopes of
next year producing better. Aware of the obstacles to be met with in the field, they at once perceive that none of the machines yet exhibited are capable of removing them, and therefore delay purchasing, in the hopes of another harvest giving birth to the
desired improvement. Thus year after year has desired improvement. Thus year after year has in possession of the harvest field.
It were perhaps as diffleult to condemn as to justify such a line of policy. The circumstances of the farmer are best known to himself, and in the absence of the necessary information here, it would be premature to advance argument in support of either side of the question. Perhaps in many cases the priee has as much to do in the matter as the merits of the machine. Until something is done to remove from agriculture that over-parsimonious economy of investment which has hitherto characterised the implement, and indeed every department, the price of
$a$ thing will continue to exercise no inconsiderable a thing will continue to
infle upon its merits.
We are, however, fast getting into that advanced state of progress when investments must be governed by resalts, more especially as regards reaping machines. This will appear evident from a very saperficial glance at the faets of the case,
for the question is no longer what a machine costs, or whether a crop can be cut cheaper with it than the scythe or no, but whether the principal breadth of the harvest field can be cut by machinery when labourers cannot be had to cut it other-
wise. To talk of the scythe when there is none to work it, and when crops are fast being lost from over-ripeness, the weather, \&c., is not the reasonable course to purstue : loss by delay will soon cover the value of a machine. It may probably not be repay itself in four weeks' it ime, or during the period of a single harvest. In some exceptional cases it may even redeem itself in a week. The loss of $20 s$ s. per acre is soon sustained in the harvest field, so that if this can be saved, or the half or fonrth of this, it goes to redeem the price. It is
not the price therefore which ought to be the first consideration, but the probable saving which a reaping machine will effect during the period of arvest.
The mechanism again is another question which must, like price, give way to the demands of the
field. On this head the prizes of the Royal Agriculfield. On this head the prizes of the Royal Agricul-
tural Society have all but ceased to be a trustworthy goide, as each individual trial has been dependant upon exceptional data. There is probably a greater difference between the different machines of one implement maker in the hands of different workmen than there now is between those of
different implement nakers at our summer trials. different implement makers at our summer trials. good tool," and the working of the reaping machine will be no exception to this rule. In the selection of all other implements the workman is invariably guided by his own experience, and this may be In the course of trial, if a farmer finds one machine better for cutting under specin 1 circumstances than another in one case, and inferior in another, he may find an advantage in having both.
Bat although price and mechanism are secondary considerations, they are by no means unworthy of notice. On the contrary, they merit special investigation at this season, more particularly the former, for the high price now demanded is a great barrier
to general adoption. We are not to be understood to general adoption. We are not to be understood
as inferring that the profits of manufacture are too great; but that a more economical subdivision of labour might produce a cheaper article and a mach more extended sale, analogous to what has taken place in all similar cases. Unfortunately implement makers are somewhat in a similar position with farmers-expecting further improvements annually ; but making every allowance for obstacles of this kind, something obviously could and will be done to lestom the prime cost of reaping machines. The
growing necessity for an increasing demand fully growing necessity for an
Companies might be formed for the express purpose of letting out reaping machines, or working them in harvest, as threshing machines and drills is a certain class of farmers who will parchase their own machines, but there is another class who would prefer either to hire a machine or let the cutting of their erops at so much per acre. There is evidently here an open field for the profitable investment of capital, for were machines to be had either way they could not fuil to find employment in harvest, while
their success would indace those to preanese wha preferred investing their own capital. In some districts companies are already being formed for the introdsuction of improved machinery, and such could
take ap the subject of reaping without delay, so as

Now if their efforts to bear upon the next harvest. combine, they could easily enter into arrangements with implement makers to get cheaper reaping machines, as their orders would justify the erection of improved machines for their manufacture. The suggestion merits immediate consideration, as this is the season for making provision in this manner for the harvest of next year. Such companies would not interfere with private enterprise, as those who let out threshing machines and drills to hire could make the necessary provision for supplying their customers with reaping machines also. Such a combination of strength would not only secure the
safe ingathering of our crops in harvest, but stimulate invention to produce improvements.

JT mast not be concealed that there is another side to the reaping-machine discussion beside that presented in the foregoing renarks. There are districts, we are told, where cheaply as in others with it : where skilful labour rightly led and organised, is even more economical and efficient than horse-driven machinery elsewhere has proved to be. Take the following picture of a most tedious and harassing harvest from the pen of our correspondent in Wester Ross as an illustra-tion:-
"On Tuesday, the 9th September," he mays; "we commenced the most precarious harvest we have ever had to do with. For the first six days little rain fell and having a good deal of strong Wheat to cut, our harvest work was scarcely interrupted; the second week we had four whole working days; the third week we had one only; the fourth week we wrought four days, and on Friday, the 10 th Oct., with much hard driv ing and with little attention to our usual working hours, we had the whole crop secured. Uur harvest thus engaged in the peculiar work of the of which were we these days, notwithstanding that much of the corn was laid, and laid in all directions, about 90 acres were cut down by five scythe-men, and within the remaining seven days nearly 70 stacks were carted to the stack-yard A wet and protracted harvest is necessarily an expensive one. Last year we cut and secured the crop grown upon
a similar number of acres for $20 l$., or at the rate of about 4s. 6d. per acre. This year, the crop being heavier and the season unfavourable, our outlay is $27 l .$, or 68 . an acre. In this calculation the
wages of the half-year servanis are not although all were engaged in harvest worb. There still a little to cut in the higher districts in this neigh bourhood, and a good deal to secure. There has been more loosing and spreading of sheaves to prevent sprouting and accelerate drying, and more turning of heated stacks, than has been for many years, and small that is in that dry condition in which we would small that is in that dry condition in which we would
desire to see it. The weight of our new Wheat is from desire to see it. The weight of our new Wheat is from
59 to 61 lbs. per bushel, and that of Oats from 37 to 40 lbs , and the weight of the different kinds of grain will continue uncommonly low until it be dried by the winter frosts or winds of spring. Our stackyards are greatly more bulky than usual, and, although much of the grain will be inferior, the quantity will be beyond an average."
Here we have the work completed for $4 s .6 d$. an acre in a good year, and $6 s$. an acre in a very bad one-a price which it is not too much to say will barely pay for merely cutting corn, apart from tying and stooking, in many English districts. The cost of the additional labour unenumerated hereto the amount. If there be one to every 50 or 60 acres of arable land, that is but 88, a day during harvest over 25 or 30 acres of grain, or $1 s .6 d$. to $2 s$ per acre, according to the length of harvest time And it will be generally admitted by English farmers that if the use of reaping machines should reduce their harvest expenses to the experience of harvested by hand, it will not be merely justified but highly satisfactory.

Here, then, is the most favourable case that can be put forward for skilled hand labour as against machinery. But the answer plainly is-not only that in many districts there is not that skilled hand labour to which, so skilfully directed, this experience is due, but positively there is not adequate labour of any kind whatever. The reaping machine is not pitted against a full supply of har-vest-men, and even if it were, as it might be, it would seem, in Wester Ross-even then, the saving of a week of time, the cutting down of 20 of those acres on the first two days of their one whole week this year of harvest weather, while the men so occupied might have been in attendance on the machine engaged, would have so far saved the harvest as to render the employment of the machine most profitable. The machine is not pitted against an adequate supply of men, it is as a remedy for the
want of men that it is called for. Thongh were it
the ground-that skill which makes hand-labies there so much more economical than it is elsewhere would cheapen its employment al8o. The experiene, of our correspondent is thus no answer to the eam of the reaping machine as argued above. If it beso urged the rejoinder is two-fold-(1) that the alter native proposed does not exist; we have not that sufficient hand-labour with which it is proposed to contrat it-and (2) that even in those localities where there may be enough of men to cut the corn, a machine which shall shorten the process will, in hazardous and inclement weather, often repay its cost alto gether apart from the question of expense per acre, by saving much corn which would otherwise have been spoiled in the field.

## OIL-CAKES

Op all the varions oil-cakes which are used for feeding or fattening, Linseed-cake is employed most abundantly, and justly prized as the most valuable kind of cake. Rape-cake, lately imported in large quantities from the Continent, where Rape is much grown, is now also much employed for feeding cattle and sheep. Poppy-cake likewise is a valuable feeding material, but occurs only
occasionally in trade. Of the other varieties of oil-cale which are now and then offered for sale, we will only mention here Cottonseed-cake and Mastard-cake. Cotton seed-cake has lately been introduced ioto England, and been found a very valuable feeding substance. Allusion is made here to Mustard-cake because it is frequently sold as Rape-cake, which it indeed resembles closely.
Many samples of these different oil-cakes, from various countries, have lately been analysed by Professors Way, Anderson, and myself. These analyses have shown that the composition of even one and the same kind of cake is liable to considerable fluctuations, arising principally from the mode in which the cake is manufactured. But as the observed differences in composition do not materially affect the practical deductions to which the analyses of oil-calses give rise, I shall content myself by presenting in the subjoined table the average composition of oil-cakes, as calculated from a large number of analyses:-

The ash which remains behind on burning any of these oil-cakes contains a large proportion of phosphoric acid, lime, and potash. Oil-cakes thus contain much of the constituents of which the bony skeleton of the animal body is made up.
In explanation of the preceeding table, I would observe that the differences in the proportion of oil and fleah orming matters obtained in the analyses of different samples of cakes of the same kind are quite as large, or sometimes even larger, than the differences which are
here stated in the sverage composition of cakes of here stated in the average composition of cakes of
different kinds. Thus, for example, it is stated in the different kinds. Thus, for example, it is stated in the an average 12.79 per cent. of oil, and Hape-caise 11. 10 per cent.; but it does not follow from this that Liweedcake always contains more oil than Rape-cake. ${ }^{\text {GGene- }}$ rally it does contain somewhat more oil ; but, on the ther hand, there are some Rape-cakes which contain more oil than most Linseed-cakes
This remark, indeed, applies to all feeding materials, We are too much in the habit of spenking of the composition of cake, Turnips, Mangel Wurzel, or hay, as is these complex mixtures of substances were simpla chemical combinations, presenting us with a fixed composition, whereas the differences in two samples of the same produce are often very great. Any one who has tried practically the nutritive effect of good and bwalymade hay, or of Turnip grown on good Turnip land and n peaty land, knows well that there is a vast difference between hay and hay, or a Turnip and a Turnip, In peaking of the nutritive value of any article of food boo precise a language is out of place; and it is simply bsurd to draw nice general conclusions from sman differences which the analyses of different-feeding
materials may have yielded. Unless the differences are strongly marked and constantly observed in a great number of cases, it is unsafe and irrational to attach recise nutritive value to different articles of food, especially if the opinion is founded solely upon analytica data, and not corruborated by actual experimental trala for, after all, the chomical composition alone of an value.
The history of oil-cakes prosents us with a atriking ample illustrating the truth of these remarks.
Good Rape-cake contains nearly as much oil, and even more flesh-forming principles, than the beb Linseed-cake. In a purely chemical point of
Rape-cake ought to be, if not superior, at least Rape-cake ought to be, if not superior, at least
diversity of opinion entertained by practical men respecting the merits of both cakes, I believe an extended experience of
dispate that, weight for weight, Linseed-cake is much dispute that, weight for weight, Linseed-cake is much
better than Rape-cake. It is not, I believe, dificult to scount for this superiority
In the first place I would observe that Rape-cake has a strong, hot taste, and is not liked much by cattle; whereas goon Linseed-cake is sweet and agreeable to the taste. The natural appetite of animals, to a certain extent, it strikes me, may be regarded by us as a guide to what is good or bad for them ; and though a dislike an animal will never get on so well upon food which it naturally dislikes as upon another for which it is greedy. 2. In the second place, it may be stated that the oil of Rape-seed naturally possesses a disagreeable smell and taste, and is apt to turn rancid. Rape-cake, which contains about II per cent. of this oil, thus has a great tendency to become rancid, and consequently unpalatable to cattle.

In the third place, I would observe that Rape-cake contains a much larger proportion of indigestible woody fibre than Linseed-cake; whereas the latter contains on an average about 9 per cent. of woody matter, the former contains as much as 20 per cent., and even more As stated above, the proportion of substances not concake. But as in the case of Rape-cake, about one hal of these substances consists of woody fibre which is pf no use whatever to the animal, and as Linseedcake contains only 9 per cent. of indigestible fibre, it
is clear that Linseed-cake must be superior in this respect to Rape-cake
4. Lastly, it may be as well to bear in mind that good Linseed-cake is hardly if ever adulterated, and seldom more frequently han any other description of cake the seeds of weeds. The experienced eye will find no difficulty in recognizing in Rape-cuke the seeds of Mustard, a disagreeable, bitter, or acrid taste, and possibly may pomess poisonous properties.
I would direct special attention to the fact that Rape cake often contains a considerable proportion of Mustard Rape is grown on account of the oil which its seed farnishes, the fields are often very foul with Mustard but as Mustard itself is grown on account of its oleaginous seed, no care is taken to eradicate it, and hence is that Rape-cake contains frequently much of tie ex-
pressed seeds of Mustard. This admixture is injurious pressed seeds of Mustard. This admixture is injurious
if the cake is given to fattening cattle in any quantity. Sheep do not appear to be affected so much as cattle by Mustard. Rape-cake, which is rarely quite free from Mustard, therefore may be given with greater advantage to sheep than to cattie.
The fact that some eamples of Rape-cake are full of Mustard and others comparatively free from it, perhaps
accounts also for the differences of opinion which farmers who have tried Rape-cake entertain respecting its feed ing value. Rape-cake, free from foreign seeds and well food, may indeed be a valuable and economic article or which contains so much Mustard that it is difficult to decide whether the cake is Rape or a Mustard cake, Such cake should never be used for feeding purposes, to which it is given.

> (To be continued)

MR. CHADWICK
PKOGRESA AND COMPARATIVE POSTTION OF AGRI The following is a further portion of Mr. Chadwick's address at the Congress of Bienfaisance at Brussels, Containing statistical facts and observations made in England, from his position as Commissioner of Inquiry comparisons as to the state and progress of agricuiture in France and Belgium.
The etrief detrimental circumatamee which in large district conditions for the improvement of agricultural labourers is the maintenance-under the influence in the House of Commons of
proprietors of whule parishes -of the law of parachial settlement sons restricts the administration of relief to the destitute per the boundaries of those parishes. Under that law proprietor
have a supposed interest in prerenting dwellings being built on relief of the labourers, in the event of destitution arising from an canase, and the lands of the eve proprietorsare arorked chiefly by
laboutrers living at a distance in overcowded dwellings in vil ages, or in the suburbs of towns. By the operation of that law, thed," and where they are almost adscripti glebos; where, while have the slave's security agailust want (for whether they worl
or 'ill, they usually gatn little more), they have the Alave'
ves to do the leat they can By the practical operation of otives to do the least they can. By the practical operation of
in
lam the cultivator is usually conined to the choice of suo the continuay happen to be comprised within bis pariah. By demonstratiuns affirded by comparisons with the free labour
districth-that all parties suffier by it, proprietors, farmers,
labourers, its value in olir arricultural districts is restricted, and the
benefit of the prioclples of inproved auministration, with th praparation of which II was chinorged by my colleagues of the
Commasion if Inquiry in 1833 , have been seriously diminished. England es compared with means of agricultural laboure of labourers in manufac be important for the legislative principles under considerstio
and M. Ducpetiaux in Belgiumo, and by M. Le Play in France, show
a still a still lower material condition not only of agricultural labourars ers to whom I have adverted as the nosat depressed labourers in England, will be Pound to have at present better means than the
small farmera in France and Pelgium, that is to may, their wages
will produce to them more of necessartes and comforts than are will produce to them more of necessarlias and comforts than are
actually enfoyed, at all events, by a large proportion of small farmers in Frabce. A person who whe himselforia family of amined the condition of the small farmers in Normands, and
declared to me that the living of the labourers of his own county was superior. A Dorsetshire labourer, who earns 8s. and 93 . per week, has for his principal diet three 4 -lbs. loaves of the best
wheaten bread per week, or nearly 2 oz.per diem; and 3 its of
cheese per week, or 5 oz. per diem. He will also liave his quart cheese per week, or 50 z . per diem. He will also have his quart
of strong beer, which costs Gd. per diem. If he did not prefer the
beer, he wight have for his 6 d. three quarters of a lb. of the best, or 1 lb . of ordinary meat. Such a diet would be assuredly far higher
than that of the small farmers, who never taste meat exept on
the coccasion of great fertivals, and whose main article of ciet is a black bread of Rye or inferior grain.
displaying the inducements to improvement, as in cularly to some points of actual progress
future promise of agricultural production.
Some of our political economists have assumed that the future increase of agricultural production can ouly be obtained by the
cultivation of poorer soils for a less and less return, or at a greater and greater expense of labour. But these assumptions I have genethe least productive. As revpects the promised return of those
now under cultivation, it should be borne in mind that all the great expenses of agriculture are nearly constant, whether for
heavy or light production ; thus rent, local or general taxes, the labour of preparing the land. ploughing, harrowing, rollung
drilling, and the seed corn are the same whatever the crop may be, and that except in the article of mannre-i.e, in the amount of
ammonia supplied, and a small amount for threshing, \&c., there
is no substantial difference between a harvest of 20 buchels and one of 40 bushels per acre. The gain of a greater and greater
return, at a less and less expense by high as compared with low
caltivation, is shown in a table contained in an able treatise caltivation, is shown in a table contained in an able treatise
by Mons. Lecoutenx, Ancien Directeur des Cultures de l'Institus Agronomique de Versailles.
In this table, displaying the relation of the fixed and variable
charges of production, the yield of corn and its return in mone on the one part, and the quantity of manure applied on the
other part, he proves that at low culture, with an expense o
and 294 francs per hectare, including 74 francs for manure, the yield
of Wheat is 14 hectolitres per hectare, or 15 bushels only per acre, at an expense of 17 frances 52 centimes ( 13 si 10 d. .) per hecto
litre, is e, 2.75 bnshels; that with internediate enlture, at total expense of 337 francs per hectare, including 109 franes for
manure, the yideld in 20 hectolitres, or say 21 bushels, culture, at a total expense of 440 francs, with 156 francs for manure, the yield of Wheat is 40 hectolitres, of nearly 42 bushels, at a net price of 7 franes 52 centimes per
hectolitre, say at 68 . the 2.75 bushels; that is to say at $40{ }^{\prime}$, 388. Looking at the great extent of low culture, it will be cbvion that at times much corn must be exported from France, and I amp
assured that it is so often from Poland, not only without any ent, but with Inw payment to the prodicers for the labour
of the like position of high and low culture and of the promise of aid down in law that if a f. rmer did not produce 11 bushels an middle of the last century, or in the time of our first great agri-
cultural improver, Tull, the yield averaged 16 bushels acre; at the commencement of the present ceatury, in the
time of Arthur Young, the average yield of Wheat of the corn growing districts in England was about 20 bushels per acre; ${ }^{8}$ is
present some statistical returns give about 27 or 28 bushels but more carenly conducted (Necent stank) 30 bushels of Wheat
the average of one county
but the returns of the examiners for the great corn factor
nr merchants, on which I should rely, give more thau that, o
districts.
In the condition of low culture the expense at which corn was
raised approached tn 40 s . the quarter, or 5 s a bushel; in 1848 it
 ar a yield of 32 bushels, rent, tithes, and rates being $11.8 s$. 42 .
per acre; whilst, in the cases for France, given by M. Lecouteux it is put down as 45 franes the hectare, or 14s. the scre. Siace
then Mr. Hnatable has fncressed his arerage yield to 36 bushels 10 and 11 france the bectolitre, rent and taxes being as abore stater, or 90 franes the hectare; ", but this has been on a chally soil engineering appliances, which I believe could only be executed
profitably there for a district comprising a number of other farms and where consequently there is not room for the liquified manur cultivation on a sufficiently large portion of the farm. In the for a yet further advance. Yolksire proprietor, who is now here, is I am glad a say ready to challenge as an understatement my state
ment of 30 buabels per acre as the average, for that h
on his own farm sud others about him grow 40 bushel on his own farm and others about Norfnlk average is underreporter. I am bappy to be enabled to give the following retur
from a quarter on which I can implicitly rely; and I invit attention to it, as exemplifying the agricultural progress since
the repeal of the corn laws, and as displaying the element appa the repen of tue corng productions of undiminished if not increased
rent in manufacturing
returns to the producer, coincidently with extended consumption

- Mr. Huxtable's charges are-rent, 1l.; tithes, 5s.; poors

Average Produce of Wheat upon a farm in Norfolk containing 1090 seres under the plough is three periods of seven year
each, showing the increase in quantity sown, the increase of

|  | Acres. | Bushels per acre. | Price per quarter. |  | Amonnt рег acre. |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| years to 1880 | 214 | $25 \frac{1}{2}$ | 8\% | ${ }_{0}^{d .}$ | $\stackrel{\text { ¢ }}{9}$ | 1 |  |
| 1846 | 268 | ${ }^{297}$ | 58 | 4 | 10 |  | 9 |
| 1853 ... | 344 | 373 | 47 | 6 |  |  |  | Stated in another form, the general proyress of agricultare

in England may be represented thus;-In the time of Tull four bushels of seed were commonly used, When the yield was ouly 16 bushels per acre. Later on the yield was five fold on the example of the improved cultivation to which I have or the yield is 17 -fold upon the seed nown, and by an improved
drill it is axpeeted to be advanoed to 20 -fold. Indeed, Mr. Mechi states that he only used noe busbel of Wheat per acre on his
liquified manure farm where his yield this year has been 48 bushels.
Let me look at the agricalture of the cortinent, with the view to
its future and the future of ita population. its future and the future of its population. M. Lecouteux son-
cludes a passage: - "And it is thus that adjoining land cludes a passage: - Anem the 40 is is 30 bushels per acre, because they
where well manured and well tulled, we ind other land where the ield of Wheat is no more than from 8 to 11 bushels, and it i thus that the agricultural atatistics prove that the average yield
is no more than from 11 to 13 bushels per acre, for the whole of France". Whilst the arerage retum even of the Department Paris, and of superior climate as well as moll for Wheat doe not appear from the statistical returns to be more than 18 hroughout France appears, nccording to Count Gasparin, to be only five-fold. The average for Belgium appears to be under 90
ectolitres the hectare, or about 20 bushels the acre. Properly onsidered, these statiotics of the present yield may, on comparison ductive abbsigtences, slimentation, and interchange for a future, earlier or later, as there may be energy or insetion.
A friend, an ancien prefet, to whom I described statisucally Ireland doela of much of the small farm or cotter poplicatio large portions of the small farm cultivators of Franco. And it may be premised that whilst in some districta of Ireland-as in
Kerry and Mayo-more than 60 per cent. of the families, cliefly cottior and smanll farmers, live in mus hovels of only one foom occupied by the like population, with only one openiug, the
door ; and $1,817,328$ with only two openings, the doar and one Window; and $1,320,937$ with only two windows; and these comprise more than half the number of houses in the country, and
comprise a very large proportion of the agricultural population. I bave ascertained from much testimony which I have had and cottier allotments, under conditions which impair or
revent the sdvantageous application of the energfed of the rish labourer, the working hours of his days, or the efliciency of the labour within the hours of his days are reduced to one-hal England, under more systematised direction - that from Which he has nothing to do, at markets where he has nothing to sell, the working days of his year are reduced to 200, or to onethird less than those of an English labourer: that from his residence in a mud hovel-himself and all his family, and commonly
is pig in the same room-damp, filthy, and unhealthy, the corting years of his life are reduced by eight or ten years, or nearly one-fourth less than thowe of an enngisi agricut from the excessive sickness, and the premsture neortality of the adult or roductive handa a greatortion of dependent childres, orphane ad of dependent hands is charged upon the reduced produce o people of Ireland's case, and the members of the Congress who widh the statistics of the refurns of produce from poor cultars

#### Abstract

incident to small farms with littlis capital. With us, if we suppose it were put as a dilemma to choose Whether we should retarn to the agriculture and the yield of the commencement of the century or give ap the Indies, I believe there wowld be little hesitation ou the Indies, I believe there wowld be little hesitation od the part of the majority of the population; and I believe they mould far rather abandon every sdidition of territory than return the Engiish agricultural yield of the middle ages, or to the preserat declared average yield of France; and I hope that it may this side of the Channel, that if it werr fairly put to the vote they ould prefer to have their capital and energies direeted to Fould prefer to have their capital and energies directed to England on thair present territory by a better agriculture than hat they should have the requisite means ex the enemies that excite the geatest apprehy wion, and they would east unwillingly pay taxes for defences against the A phis devas ator. Marshes and lands surcharged with stagnant moisture are pay of each regiment, one year's isbour of the men kept unpro ductively in barracks, will ordinarily suffice for the drainage of square mile, i.e., for making a square mile of defences against thech enemies. To our neighbours the irruptions of the Rhone ar them apparently that the spare labour and arms of their soldiers nonder engineering generals, may be the best directed.

To be condinued.)

## Home Correspondence.

Large and Small Potatoes as Sets.- At the late meeting of the Witham Agricultural Society, reported in the Pata of and small tubers or sets. With us in Ireland, previous to the Potato failure, small Potatoes, round seed ass we ow call them, were rarely if ever planted-they went to the gentlemary who paid the poor man's rent; the sets were cut from the table-sized Potatoes, and of these whole ones were not planted, for they were altogether nositable to the ridge, and when I tried some about 30 years ago I believe I was thought crazed; they, however, turned out a very productive crop planted 2t feet apart every way. My plan was drills opened in the usual way, the manure taken out and spread, a line the usual way, the manure las at $2!$ feet distances, the stretched across the intersections, the manure drawn prer them by the hoe and then covered with the plough when strong up they were crose ploughed and finished
off with the shovel, leaving the Potatoes in little mounds-the field was of 6 acres, poor, worn out and
stubble, hilly and inferior land, yet it, was one of the stubble, hilly and inferior land, yet it was one of the
best crops in the country. On the same kind of ground best crops in the country. On the same kind of ground
I have, however, had as good crops in drills from cut sets. Since the Potato failure it has become the general custom to use for sets the Potatoes that are too small for the table either whole, or cut if their size permits, discarding the very small ones; very rarely are marketable Potatoes now cat for sets, and the opinion ductive with the larger ones. But the use of these small sets is, I think, objectionable, as tending to deterioration. It cannot fail to have been observed, even in drills, but much more in beds, that some, even in many cases in beds a large proportion of the Potato plants produce a much greater nuunber of small Potatoes than others; some in which these smal
ones constitute the entire produce of the plant, and in which case they are very generally much more numerous than where larger ones are found some again produce a large number of small ones with very few large ones. Thus in the aggregate the amoun oxceeds that of the small ones under the superior plants. In planting these small Potatoes, we plant to a great extent the offspring of degenerate parents, and, as like produces like, we must under ordinary circumstances
expect the return will be of a very large proportion of these small Potatoes, and this deterioration must pro ceed to increased deterioration in every succeeding crop. As these inferior producing plants are found growing their inferiority either to the manure or the moil. It may arise from the later shooting of some of the eyes, but I must think it arises chiefly from degenerate sets; this opinion is in accordance with our experience in all vegetable and animal productions. Indeed, I so fully
concur with the advocates of careful selection of seed that I have often proposed in Potato tillage to plant whole and large Potatoes at wide distances, and in digging out to select for sets those that are eminently produc-
tive of good large Potatoes, but various dissppointments have prevented my carrying out my views. J. M. Goodiff:
Agricultural Statistics in Ireland.-When writing to you on the subject of our agricultural statistics I did not contemplate "the commotion" which the publication of the said letter has caused. The fact of my having "stirred the coals" has thrown some light amongst some who kept dark; on a subject they now wish to be
better illuminated; and hence the great number of letters which I have since received from various parts of Ireland in sustentation of the objections I had but cursorily glanced at against the correctness of the statistics so much lauded by his Excellency the Lord-Lieute nant, and so much extolled by certain portions of the press whose editors and contributors know very little of reply to the letters I have received on the subject, have endeavoured to do so privately to some, and would not hate troubled your readers further had I no seen a letter from the Registrar-general bearing date September 15, 1856, containing a paragraph or two Excell think it necessary to notice. He says, Your constabulary is altogether voluntary; and I feel assured it will afford pleasure to your Excellency to learn, as bog to say it is most gratitying to me to have it in my power to state, as far as I am informed by the enumerators, who amounted to nearly 4000 , hostility to the collection of those returns has been displayed by only one landed proprietor in Ireland -a fact most creditable to the good feeling and intelligence of all ranks and elasses in this country". Mr. Donnelly, it will be seen, admits that one landed proprietor showed "hostility" to the collection of those statistics ; but he does not say sey : "As I find that misapprehensions exist in some quarters relative to the steps taken to insure accuracy in filling the returns by the constabulary, I have given in the appendix copies of the instruction issued by me to the several enumerators, and slao of the forms upon Which the extent of land under tillage and number of live than were collected." Never was man more mistaken misapprehension at least that I could learn or been no the part of any one, except that of supposing that we can collect agricaltural statistice correctly or nearly so it, or in the time allowed for such purposes. One extract more: "In conclusion, I have great pleasure in aequainting your Excellency that in this as upon previous occasions I have received in reference to the
collection of these statistics valuable assigtance from the magistracy, the clergy of all denominations and other influential parties, and also from the public press," \&c. afford beyond what assistance could the magistracy aid in lieeping the people in awe, but without the power to elicit from the same people one - word
of truth. Whereas the very presence of the police but awakened their perhaps wrongly founded suspicions, sharpened their wit, stimulated their cunning, athoris their evasiveness in reply, without conaffording in them the least confidence in the land laws which they believe to be one-sided. Let no one suppose that perspanalorunkind feeling towardo Mr. Doanelly, of whom
persoually I know nothing in the world. I believe him
to be a man of high character, otherwise he could not obtain the situation he holds. Experience may qualify him in the course of time to ascertain the agricultural statistics of Ireland more approximately correct, but he ever hopes to do so with any degree of accuracy he should be is no business of mine, though $I$ am not one of those who believe that "what is every man's business is no man's business," for a matter of such importance House, Newtowsubarry.

## Buriftirs.

## royal agricultural of england.

Monthly Council, Nov. 5.-Mr. Evelyn Denison, M.P., President, in the chair. The names of 33 candi-Finances,-Mr. Raymond Barker, chuirma
Finance Committee reported barker, chairman of the Finance Committee, reported that the current cashbalance in the hands of the bankers was 1027l. He also submitted to the members the usual quarterly balancesheets of income and expenditure, and of assets and liabilities.
House.-Mr. Raymond Barker, as chairman of the House Committee, also reported the progress of the repairs in the course of being made during the autumn in the house of the Society.
Statistical Tables.-Mr. Thompson, Chairman the Journal, Committee reported the recommendation of that Committee that the Council should pass a vote of thanks to Henry S. Bright, Esq., of Hale, for the iberal manner in which he had placed his statistical tables at the disposal of the editors of the Journal-a recommendation which the Council at once cordially adopted, and passed an unanimous resolution to that ffect.
Prize Essay.-Mr. Thompson also reported from the Journal Committee that the Judges of Essays had ade the following adjudication
To Thomas F. Jamieson, of Ellon, Aberdeenshire, the Prize of Forty Sovereigns for his Essay on the Chemiaal Results superinduced in newly-deepened Soil by Atmospheric action.

Trials of Reapers and Stram Plough.-On the notion of Mr. Brandreth Gibbs, seconded by Mr. Allen Ransome and Mr. Druce, the best thanks of the Council were voted to Mr. Fisher Hobbs for the facilities he had offered for the deferred trial of reaping machines and steam plough at Boxted Lodge, for the liberality with which he had supplied his horses and
men for their working, and for the general courtesy he had displayed on that occasion.
Country Meeting in Surrey.-Mr. Alcock, M.P., as chairman of a public meeting held at Reigate on the 4th inst., presented the following memorial on the part of a special committee :-

the Brighton turnpike road, on the west by land which would be
the unusual advantage to persons on quitting the railway car-
riages of finding themselves actually within the implement show
yard. In fact we

Smithirild Club, - Mr. S. Brandreth Gibbs reminded those Members of the Society that intended to become exhibitors at the ensuing Christmas Cattle Show, that the latest date for the receipt of entries would be Saturday, the 8th November.
Communications were received from the Foreign Office announcing that the Cattle Distemper had ceased in Mecklenburg; also, that the Government of Norway England and Scotlanportation of Horned Cattle from England and Scotland into that kingdom. Mr. Bolton presented, through the President, Aaper on the
Aëration of Land. Mr. Warriner, of 38, Finsbury Square Aeeration of Land. Mr. Warriner, of 38 , Finsbury Square announced what he believed to be the valuable discovery

The Council adjourned to their next monthly meeting n the 3d of December.

## Farmers' Clubs.

Woodbridge,-Mr. Mechi was recently invited to publie dinner at Woodbridge by the inhabitants of Suffolk, as a mark of the esteem with which he is regarded, and a a small acknowledgment of those useful and hospitable
gatherings which have now for many yeara been associated with his name. Andrew Arcedeckne, Esq., High Sheriff of the County, presided upon the oceasion. In
proposing Mr. Mech's healuh, he said-"As an agriculcurist, as a gentieman of the highest character, and a most hospitable man, Mr. Mecin was known over the
pitable, jolly, better sort of man in existence than their friend.-Mr. Mechi, in returning thanks, asked himself What he had done to merit their good esteem and their kind favours? The conclusion he came to and their they had forgiven him for any agricultural follies he had committed, and that after ten or a dozen years reflection they thought that he was not quite so wrong as they had he did to those farms what, as a man of business, he thought was right and proper-that was, to begin to spend money upon them, and to alter their unimproved
condition. At that time there was a great difference of opinion as to what improvements should be made. He believed that a great many of the farmers of England, at least many of the farmers of Suffolk thought, ten or fourteen years ago, as they had all thought in their time, that the farming of Suffolk was not so bad, and that the farming of England was not so bad after all, and that there was not so very much to learn as he had pointed out; but they must recollect this-that every componnd multiplication, which seemed to be such a quite clear that that rapidly increasing population de
quas manded a corresponding increase of production, which could not be carried out unless with improved meansunless they invested in the soil, on the part both of the landlord and tenant, a very much larger amount of capital and intelligence. Had it not been for their invitation to come to Suffolk, he should to-day have been at the Witham agricultural meeting, where he should have seen the steam plough at work. Probably they were aware that there were two kinds of these ploughs now in use : one was by Mr. Fowler, which was worked with a wire rope, and which some of them might have seen in operation noon his farm, and he might mention that his neighbour, Mr. Crump, had also bought one and was now using it; but that gentieman's
fields, it should be understood, were not limited to 3 or 4 acres, but were 20,30 or 40 scres in size, so that he had no difficulty in that respect, and with his common engine he was working the steam plough satisfactorily. Then there was Mr. Boydell's engine, as seen at the Royai Agricultural Show at Chelmasord, walking about like a Mammoth, and which had been doing work which they would see reported in the gricultural Gazelte by a careful witness, after two days after it and cultivated was stated that it drew ploughs of ouly one-fifth of that incurred in ploughing by horses; and that the work it was doing which would cost 15s. hy horse-power was done by it at is. 10 s. what with horses would cost 158 ., and see what the result of that saving would be to the agriculturist; instead of the horses being obliged to leave off at halipast 1 or 2 o'clock, sometimes when the work was really wanting to be done which was necessary to enable them to continue at work from day to day, they would find that if they had got a steam-horse they would noy require to be quite so kind to it, but wo make bay when the sun shone." He saw Mr. Boydell a day or form part of the civic procession of the Lord Mayor elect, for inasmuch as London conld not do without country-made food, they considered they should identify goriculture with commerce as closely as possible. To return to Mr. Boydell, he had no hesitation in saying that his invention was one of those events in agriculture and the mightiest changes ever known; and when he applied to Mr. Boydell for his engine, he replied, "The Emperor of Russia will have both me and my engine in a fortnight, to use in that country for various purposes, but abe all for down hill down hill, or over a swamp, where horses could not go Arsenal at Woolwich, which had an inclination of one in 10 . He first saw 10 strong artillery horses attached to a gun without being able to move it, but 12 being put on, they at last managed to get it up the hill ; whils Boydell's engine took the gun (which weighed 10 tons and itself 12) up the hill, and what was still more difficult down the hill too. Besides which he was informed it had gone over rough ground and deep cavines in an extraordinary manner. He mentioned these circumstances because he thought they we worth consideration. He believed thiat asten engines, case at present with drills and travering steand would an engine of the long be let out to work at so much per acre; and he had yet to learn Ithat a farmer would object to pay 28 or $3 s$. an acre less to have his land ploughed 2 or 3 inches deeper than at presentla him with regard to the engine to which he had aliuden, hat not only had he endured the wearing anxiety of the invention, but that it cost him $10,000 \mathrm{l}$. before he could place in. Ae blace in the far the public good which he hoped would been spent for the public god which Let them not therefore throw cold water upon such inventions, but rather let them adopt them as soon as possible; and if ever he visited their neighbourhood again (which hoped, after the reception they had given him dis evening, would not be long distant), he shande enalarge-
ment of their fields，and find their beautiful Suffolt horse somewhat superseded by the iron steamer ploughing their ground，which would consume coals instead or Oats．＂But，some ors？＂Why they must farm Whea we to do with our Oats ？Why after Wheat，orusion he would remark that he thought soil．In conclusion he would remark that he thought the tendency of such meetings as the present was to make gentlemen think these matters over and soim－

## Calendar of Operations．

Lanorgbiotr Sherp Fary，Noo，3．－Harvest in this apland district has this year been a most tedious business．The grain earliest cut has sustained material damage，yet upon the whole
隹 Fe have been fally more fortunate than most of our Low country easther was at the worst．This portion of the crop having been at in comparatively dry weather，wis got in very the weather was 50 boisterous．The loss from this cause has been very considerable．What was uncht was aik was cut，from so nuch handling in opening down and tying up．Towards the close of October the weather changed favourably，though even then we had little or no winning weather，and we eear a consider ble quantity oficiain has aeed so long as they have this year harvest operations are cors has been thoroughly steeped and soaked，we notice that it is next to impossible to get it into even olerabie condition for stacking，although the weather may be
rdinarily dry．The wet weather and open autumn have how－ ver，ensured the Turnip crop，which has not been po large for the ast two or three years．Turnips are still growing，as we have
 seeks to come．Pastures，are remarkably yood for had abundance of keep，are in capital condition，and such as to please the most anxious and watehful of flockmasters
and shepherds．We have had fewer deaths this backenu than for many years past，and have as yet entirely escaped grass－
ill，which in some seasons is so deadly；althungla we generally begin to consider ourselves pretty safe from the disease when it eet cases may occur before the hoggs are put on to Tarnips；after that，though we have seen an occasional case，we never have had
it to gerious extent．So deadly is grass－ill amongst hill hoggs that we are not aware of ever having heard of a single case of recovery when once seized by it．The disease is generally at its height before the shepherd can notice it．Bathing and smear－ adhere to the practice of smearing with a compound of tar and butter or oil；but bathing or dipping is now all but universal in this range of bills．The expense of smearing is at least doubie that of bathing，whilst dipping is by far the cheapest method
Wool－buters and especially those who are also manufacturers， evince a decided partiality for dipped wool，and readily giva more or it．By this process the wool is kept much whiter taan when abath consisting of Tobaco and spirit of tar is used．In the
later ease $a$ stain is imparted to the wool by the Tobaceo and spirit of tar which it is difficult if not impossible
ont
ntirely to bleach out．
on the whole，however，we prefer the bathing system as the one most beneficial in the eradication and prevention of ccab，and except smearing tending mort to the preservation of a clean and tealiy skin．wrotected and sheltered are reared the tups will，on the more protected and sherered
situations，be put to the ewes about the 8 th or 10 th of this month but on the higher grounds the tups are not generally put out till the 22 d ．

SATURDAY, NONEMBER $15,1856$.
Some time since attention was drawn to an apparatus proposed by Mr. Hazard for egconomising heat, and diverting what is now so largely wasted in glass houses to some useful purpose (see the Gardeners' Chronicle for May the 17th of the present year). It was shortly afterwards suggested by a correspondent that the principle might be ase fully applied in bad climates or seasons to dryin hay or corn, especially where a steam engine exists upon the premises as is so often the case now (see p. 411). The agricultaral application of the method not concerning us we shall only observe that we have seen a sample of wet hay thus dried which was as perfectly prepared as if under the most magnificent sunshine.* It is to the importance of a drying apparatus for other purposes that we wonld direct attention.
There lie now before us samples of Tarragon, Tarnips, French Beans, Carrots, Cabbages, Onions, and Celery, dried by a current of air heated to $100^{\circ}$, in which all the good qualities of those regetables when fresh are as perfectly preserved as in the best French preparations. The Tarragon, the Onions, and the Celery, are most especially remarkable for having retained all their peculiar flavours, without contracting any other; in fact, they are what they were when first gathered minus only the water they contained and which has been carried off by the heated air.
In addition then to any advantage that may arise from keeping air in motion in greenhouses by Hazard's apparatus, or from œeconomising fuel, there is this other gain that it furnishes its possessor with an excellent contrivance for perfectly securing summer crops for winter ase, or vice versấ. Sweet herbs indeed, such as Tarragon, Mint, Savory,

* Simee this was in typo wo have received the North British
Agriculluriot in which is an important letter on this subject

Marjoram, Bayil, and the like are dried without much trouble by means already existing in all gardens; but their quality is necessarily impaired, and under the best management is not to be compared to that of samples quickly dried at a low temperature. If slowly dried they are apt to become masty, if quickly at a high temperature they acquire a well known burnt flavour that spoils them for the kitchen; and it is not in every English summer that the sunshine they want is to be secured at tho right time.
Supposing however that sweet herbs can already be easily dried sufficiently well, there still remain the materials for soup and other kitchen purposes in winter, such as green Peas in their pods, Celery, Kidney Beans, \&c., which cannot be preserved by any ordinary process; and here an apparatus for easy and quick drying becomes invaluable. The dried Kidney Beans and Celery now before us are perfect in their way.
But the value of a drying chamber does not stop here. There are seeds of various kinds to dry after they are gathered; and who does not know the loss of time and vexation that attends the operation in a bad damp sunless antumn. We only need mention Beans, especially Kidney Beans, as an example familiar to all gardeners, who discover to their cost how soon such ill-ripened, ill-dried seeds become mouldy and spoiled during winter. Prepared in such a drying chamber as is now under consideration, their preservation would cease to be a matter of difficalty. The same with Onions and other bulbs.
In another point of view the possession of a drying room would be of inestimable benefit. We allude to the curing of bark, which is very often the gardener's business. How enormous are the difficulties against which the forester has to contend in preparing this valuable material; what care to take in the stacking and thatching; what watching, and sometimes what bad success after all in securing a bright clean sample. To nothing would quick drying at a low temperature be of more signal advantage than to the preparation of bark. A great wooden hat, ran up in a wood, constructed of worthless slabs and shaky planks, furnished with a temporary chimney, fitted with a drying apparatus, and heated by forest rubbish would secure our precarious bark crop in as fine or even finer condition than the best of the best climate in Europe. As to the cost, we apprehend that the mere saving of labour would soon defray whatever that might be, for the bark, which must be so carefully and ingeniously set up in the open forest, might be thrown pell mell into the drying shed.
We therefore would seriously direct attention once more to Hazard's apparatus, as being the best suited to gardening purposes of all that we are acquainted with. No doubt similar effects may be easily produced otherwise. But we know of no means which, in connection with existing structures, is capable of doing the work required of it 80 œ.conomically or perfectly, or with so little trouble.

It is now more than fifteen years since the public was made acquainted, through the columns of this Journal, with Boucherie's mode of preserving wood from decay (see Gard. Chron., 1841, pp. 71 and 147). In May 1842 a lecture was given on the subject at the Royal Institution. At later periods the matter was from time to time reverted to, especially in 1851 ( p .580 ), when a figure was published representing the process as conducted on a large scale in the forest of Compiègne. From some cause or other it has however made no progress in this country, and until the appearance the other day of a pamphlet on the subject by the Permanent Way Company (26, Great George Street, Westminster), we had supposed that unexpected practical difficulties had presented themselves and stopped the process. In this we were mistaken. It now appears that wood is prepared by Boucherie's method on a very large scale for French railways, and that English engineers are adopting it.
Dr. Boucherie's first idea was to compel trees to fill themselves with preservative substances, by their own natural imbibition; and to a certain extent this was effected. The mauner in which fluids direct themselves when sucked in by a growing tree was however apparently capricious, some trees, the A:h for example, as ascertained by Mr. Hyett, of Painswick, and Mr. Fonsyth of Dunach, absolutely refusing to take up the fluids presented to them; the process recommended was moreover troublesome except in the case of very small trees, and it was soon abandoned. The next plan was to suspend logs of trees perpendicularly, and to secure a reservoir to the upper end, so that the preserving flaid might by its own weight sink down into the tree, displacing and driving ont the sap, whose presence is one of the great causes of decay in timber. This, too, seems to have been superseded
by the present method, which is thus described in the pamphlet before us.
"Soon after the tree is felled a saw-cut is made in the centre, through about 9 -10ths of its section. The tree is then slightly raised by a lever or wedge at its centre, and the saw-cut is then partially opened. A piece of string is then placed round the saw-cut, close to the outer circumference of the tree, the support is then withdrawn, and the sawcut closes on the string, thereby making a watertight joint. An auger hole is then bored obliquely into the saw-cut; a wooden tube is then driven into the hole, the conical end of which is attached to a flexible pipe, which is in connection with a cistern or reservoir at an elevation of from 30 to 40 feet above the tree intended to be preserved." In the case of verylongtrees the foregoing method is slightly modified. "When the timber is under operation, the sap runs out from the ends in a clear stream, showing the amazing quantity of this fluid which it contains in fact, the preserving fluid will traverse a tree 12 feet in length with less pressure than is required to force it laterally through a plank three-quarters of an inch in thickness. As the sap is forced out the preservative fluid follows it, and its presence at the ends of the wood is ascertained by a chemical

supporting also inspected a number of posts for the Northern Railway, and found them in a state of perfect preservation. The engineer in charge of the line showed them one of these posts which was sunk in the Oise in 1848 ; this post had a splinter partially detached by a stroke of an axe at the water's edge, The splinter, which had been recently separated from the post, had its edges perfectly sharp, and offered as great resistance as it would have done at the time when the tree was felled. The superintendent of the telegraph as sured them that the Fir employed on the Northern line had remained in perfect condition until the present day; whereas the Oak posts on the Rouen line had undergone a very perceptible alteration.
Similar evidence is collected as to sleepers for railways, and some of the specimens may be seen in Great George Street. The practical result is that all the telegraphic posts in the French empire are now prepared by this process. The administration had 200,000 on the 1st of January, 1855, and sinee that time have caused 32,000 additional posts to be provided. The preservation of the posts is readered complete, although the first were prepared and laid down in the year 1846. French railways Chemin de Fer du Nord alone, in the year 1846, laid
down 80,000 Beech and Birch sleepers and in 18053, upon examination, these were found in so complete a stat of preservation, that the Company immediately or dered a forther $\begin{array}{ll}\text { supply } & \text { of } \\ 300,000 \text {. }\end{array}$ 300,000 . In France large quantities of Vine-propsase now prepared cess ; and it is
pletely expelled, and the timber impregnated obvious that it may be applied with equal advantage throughont its length with the preserving fluid." The to Hop-poles. accompanying woodcuts further explain the process. Such is the method of charging a tree. We have seen it in operation on the premises of the Perma nent Way Company, and nothing can be more simple or effectual. As to cost we should not suppose that the apparatus required on a moderate estate need cost more than $10 \%$. The small expense will thus enable the process to be applied in cases where it has not hitherto been available. It will be economy for all proprietors of land of any extent thus to preserve the timber used on their estates for fencing, farm buildings, gate posts, \&c.; an advantage they could not enjoy so long as the impregnation of the timber required expensive cylinders and costly steam apparatus.

The possibility of introducing any foreign fluid into trees, expeditiously and deconomically, being thus demonstrated, the next question is, how far is the durability of timber secured by the operation? Upon this point the evidence appears to be conclusive. There is a report of three French engineers, Avrir, Didion, and Mary, published in 1850, relating their observations at Compiègne upon blocks of Beech and Hornbeam, from which it appeared that Beech injected with sulphate of copper eight years before was still perfectly sound, although the same wood and Hornbeam unprepared or injected with other fluids were for the most part entirely decayed. They further report that they saw several logs of Hornbeam in the bark, from 23 to 26 feet long, impregnated with sulphate of copper; and others of the same dimensions which had been left in their natural state. The first, on being tried with the axe, proved to be in a state of perfect preservation, even at the surface; whilst the latter, being affected with the dry-rot, allowed the tool to sink deeply into their substance. They also caused two trees, of about 12 inches diameter, to be sawn across one had been impregaated with sulphate of copper, the other was in its natural state. The first was perfectly preserved, except in the centre, where they found a small circular spot of dry-rot, not penetrated by the liquid. The second, that is to say the Hornbeam in its natural state, was decayed, excepting about a twentieth part of its section, in certain portions radiating from the centre, in different direc-

Experiments show that no fluid answers so well as a very weak solution of sulphate of copper, or corrosive sublimate; but the latter is too expensive. Sulphate of zinc, acetate of lead, sulphate of iron, oil, tallow, rosin, pyrolignite of iron, all have been tried without satisfactory result.
What is most important is that the worst kind of timber lends itself most readily to the process, and answers best. Beech, Hornbeam. Poplar, Birch, Scotch and Pinaster, Spruce, Alder, Elm, have been operated on with success. Heart of Oak proves impenetrable. To use the words of Messrs. Avril, \&c.: "Those kinds of wood which possess most moisture, and, of the same kind, those which have grown in the dampest soils, are most easilv penetrated. It follows that the least-esteemed kinds of timber, and consequently the cheapest, are precisely those which afford the best resalts when injected with the sulphate of copper." The extent to which this injection goes will be seen from the following experiment. The increase in weight observed ia wood after impregnation varies according to jts nature, depending on the quantity of air it contained, which is replaced by the liquid. The French engineers give the following examples :-
Beech $\quad . .0$ inc
Dak (sappy part only)
Hornbeam
Birch
Poplar
Alder
Asht
Scoteh Fir
White Fir y) 55 lbs.
2 lbs .10 oz .
70 lbs .
50 lbs.
156 lbs.
156 lbs.
Only one other circumstance requires to be borne in mind, which is that the operation depends for its success upon the permeability of the timber operated on, and that all timber is most permeable while standing or just felled. It is therefore desirable that if performed in the summer it should be immediately, before the tubes contract, and if in the wioter in the course of a few weeks after felling.
We have entered thus at length into the subject because it is second to none in importance in relation to the interests of our country readers. It is to our minds clear that the refuse trees of an
estate will thus acquire the value of first-class timber for posts, rails, beams, fences, and all purposes of permanent construction. There seems indeed to be no reason why a mansion should not be put together with Beech or Poplar, or Hornbeam, with the exception of the floors and fittings. It is also evident that the value of low-priced timber nrost rise, since experience has shown its applicability to all sorts of purposes in which durability is concerned. A country gentleman has only to fit up an apparatus, purchasing a license to work it from the patentees, and he becomes almost wholly independent of the dealers in foreign timber. We shall hardly be over-sanguine when we predict the speedy arrival of a time when Poplars, Willows, and all sorts of fast growing but now perishable trees, will be universally planted with a view to the parposes for which slow-growing hard wood trees are now alone thought suitable.

The sorts of fruit trees best suited for an Orchard House cannot be said to have been yet ascertained. They ought to be constitutionally good bearers ; and therefore all large fruited varieties should in our judgment be excluded; for the possessor of an Orchard House would we suppose, in most cases at least, prefer a good many fruits large enough for table, to a few very fine specimens. They ought to be of excellent quality, or they will not deserve the protection an Orchard Honse is able to give them: for which reason we should exclude such a Peach as the Chancellor and many sorts of Plums, although bearing freely under glass. They ought to furnish as long a succession for the dessert as is to be secured, keeping in view the other indispensable qualities of good bearing and good quality. Lastly, the varieties ought to have naturally a compact
manner of growth, and not to bear long, weak, and wiry shoots.
In Mr. Rivers' new edition of "The Orchard House" will be found a list of the varieties that he recommends; and doubtless his opinion may be safely followed. But there are many who prefer
being spared the trouble, if not difficulty, of selectbeing spared the trouble, if not difficulty, of select-
ing from the best selections; while others may wish to know what other men of experience may have to say. We have, therefore, procured from one of our most practised judges of orchard fruit the following selection, which he recommends as fit for an Orchard House with a view to abundant bearing, good quality and successional ripening :-

## 12 soots of Pearz:-

## Seckel Comte <br> Comte de Lamy

Beurré de Capiaumont
Louise Bonne (of Jersey)
Marie Louise
Charlotte de Brouwer
Thompson's
Beurré d'Aremberg
Winter Nelis
Bezi de Caiss
moseghine de Malines
12 sorts of Plums:-
Early Prolific (Rivers) Royale Hative
Drap d'Or
Early Orleans
Denniston's Superb
Perdrigon Violet Hâtif
Reine Claude de Bavay
Greengage
Jefferson's
Reine Claude Violette
Coe's Golden Drop
Ma of Cherries:-

## May Duke <br> Royal Duke <br> Late Duke

8orts of Apricats:-
Red Masculine
Large Early
Museh Musch
Breds
Roman or Brussels Kaisha (delicious but
sorts of Peaches:-
Early New York
Acton Scott
Grosse Mignonne
Royal George
Noblesse

4 sorts of Nectarines :-
Fairchild's Early
Elruge
Violette Hàtive

If any of our readers who have personal ex perience in Orchard Houses can improve upon this ist we should be thankfal for their suggestions.

Comte de flandres pear (Coll Vak Mons) Arowa the new varieties of Pears there is one which more especially merits the attention of cultivators. It 1843 , the Van Mons' seedlings, and first bore fruit in to one of his after his decease. It must have belonged grown at a period when Van Mons had ceased to supergrown at a period when Van Mons had ceased to superintend his cultures himself, for it exhibits such unpro-
mising characters as would otherwise have occasioned mising characters as would otherwise have occasioned
its condemation. When its shoots begin to grow, this variety has a whitish down on its foliage aimilar to that on the has a whitish down on its foliage ait Poire de St Omer, the Poire Legipont, or Merveille de Charneaux, and Calebasse Tougard. From the observations of Van Mons, this character indicates a summer Pear, a kitchen For or one of indifferent quality.
For 10 years the variety in question, to which M . Theodore Van Mons, son of the professor, had given collections of the most intelligent amateurs. During this period there has been time to examine it attentively, and we have heard different opinions upon its merits.

Some said that it succeeds upon the Quince stock, bur does not live long except against a wall, and in grod
soil; others who cultivated the variety on the Pear soil; ; others who cultivated the variety on the Pear
stock, planted in \& light and rather poor soil, had stock, planted in $\%$ light and rather poor soil, had
gathered fruit which, on the averase, ripened in October; others, who cultivated it as a low pyramid, on the Pear stock, did not obtain the desired result. On visiting atock, did not obtain the desired result. On visiting the extensive collection of an amateur, we remarked in
1854 and 1855 a tree which was growing on a rich humus soil, and trained as a half standard, bearing fine frait in its upper part, or about 8 or 10 feet from the ground. These fruits, which were perfectly formed and as fine as that figured in the Annals of Pómology, v. ii., p. 87, ripened in the months of December and January, the period when the fruit from the seedling tree ripened in 1843-44. We have had fruit from
grafts on the side branches of an old tree, planted on grafts on the side branches of an old tree, planted on clayey soil, and it has kept in the fruit rom till May, and was superior in quality to the Glou Morceau. This year a tree grown as a half standard, after having set
more than a hundred fruits, of which we cut off about two-thirds, produced 18 Pears similar to that figured.

threads produce globose spores, which sometimes pro duce others of a third order.
595. Though the germination of the spores is easily followed out the mode of eutrance of their nyyceliun into the young Ceresl has not yet been ascertained Thas it does enter is certsin, because corn rubbed with the spores of bunt will almost always give rise to bunted ears. The thread protruded immediately from the spore are larger than the stomates and cannot enter them,
bat the delicate threads which rise from them are quite bat the delieate threada which rise from them are
capable of entering and may thus affeer the corn.
apable of entering and may thus affect the corn.
596. Bunt is not confined to the grain, though that is its most usual situation. We have seen it in artificially inoculated Wheat, running in straight lines down the stem, like $l^{\prime}$ redo longissima. Wheat is oftener affected than any other plant, but bunt has been found on Hordeum murinum, Agrostis Spica Venti, and other Grasses. It is said also to be found on Songhum, but Tilletia Sorghi-vulgaris is a very doubeful species, as the spores are quite different from those of T. Caries, arme mode of development agrees with a hard rigid columella. +
597. No parasite is more injurious to Cereala than bunt, but happily it is one of the few affections of Plants which is readily controlled, insomuch that the proportion of bunted eare in a crop is a tolerably sure indication of the degree of akill or care which belonge to the cultivator. Each farmer has his own remedy Simple immerin in warmer has his own remedy. service from washing of the spores of the parasite, but if the crop is to be completely free, some nddition must be made to destroy those which still adhere to the grain. Corrosive sublimate, arsenic, and blue vitriol are employed for this purnose, but besides the danger are employed for this purpose, but besides the danger attendant on the use of such poisonous sulstances,
two former are apt to act upon the seed itself if from two former are apt to act upon the seed itself if consequent on bad weather, it is not
sown at once. Blue vitriol, unless prepared o sown at once. Blue vitriol, unless prepared of
great strength, has not this bad quality. A very simple and effectual mode of treatmen is to mix quicklime and boiling water together and apply it hot to the Wheat placed in smal convenient heaps, so that every seed may be covered with the mixture while still at a high temperature. This plan is called pudding. The most efficacious plan, however, though one which is little if at all practised in this country, is to of sods). The What is then steeped in the solation, and dried off with powdered quicklime, the effect of which is to decompose the sulphate of sods, the sulphurie neid combining with the the caustic soda is left behind to destroy the spores of the parasite.
598. It does not appear that Wheat much mixed with bunt is unwholesome. The colour of the bread made from it is injured, and the nutritive qualities probably impaired, but though extensively consumed at times by farmers and labourers we have never heard that it is injurious
to health, nor is it as disagreeable to the taste as to health, nor is it as disagreeable to the Laste as of the raw fungus. Bunted Wheat is bought up
This fruit was produced on a spur from the stem. There are longer and narrower fruit produced by spurs on twig.
Eye large, open, level with the top, with the five segments of the calyx projecting. The sides form three ribs near the eye, skin yellowish green at the time of gathering, freckled with brown, especially near the stall, which is woody and about an inch in length. The tree is vigorous, hardy, and an abundant bearer when it is worked on a good Pear stock, planted in a rich soil, and trained, not ab a d war pyraber branches and thick shoots, which are slightly kneed in ascevuing, and bears after eight or ten years handsome and excellent fruit, ripening in December and January. As the fruit is very heavy, and is apt to be blown down by the equinoctial gales, it is prudent to gather it a day or two equare the full moon of September. These practical before the full moon of September. in completing the
notes will perhaps assist some one in nocount of this variety, which we consider to be one of account of this variety, which whe consider to
the best new Pears. J. de Jonghe, Brussels, Nov. 2.

## VEgetable pathology.-No. CXLIV.

594. Parasite (Tilletia,* Bunt).-The effect of bunt on corn is like that of smut, to convert the tiseues into, or rather to replace them by, a mass of dust-like spores. In smat however these are soon dispersed ; in bunt from the stronger texture of the walls they are in general retained and are not broken up till the flail is pat to the harvest. In smut, though dirty and disagreesble, there is no offensive smell ; in bunt the greasy spores have an odour like that of stale fish. There are moreover differences in point of structure. In smut the walls of the spores are simple, that is, not composed of cells, while in bunt they are reticulated with the diseepimente of the component tissue. The result of germination in the smut which affects Cereals is not ascertained so completely as that of many other parasites. In Tilletic they are very curious. Each spore protrudes a thread, from the tip of which grow other curved fusiform threads, which are ultimately connected by lateral processes.t When the connection is completed the new * Named by Tulasne ater Mathier Tillet, anthar of three treatises on But and smut, pubished in moine out some years since in the Journal of the
Hortienltural Society of London.
principally by the gingerbread makers, for which purpose the dark colour is of no consequence. It might also enter safely into the composition of Katsup, the dark apores answering the same purpose as those of the Mushroom. M.J.B.

## Home Correspondence

Bowood Muscat Grape.-A seedling raised at Bowood between the Cannon Hall and Muscat of Alexandris. It differs somewhat from both its parents ; although it is a week or 10 days later in breaking in the spring the fruit ripens rather earlier than the common Muscat. The bunches are broader and shorter-every bloom sets, even in a temperature comparatively low. This is a marked feature, and the bunches are invariably compact and regular in consequence, and must be well thinned out to allow the berries to attain their fall size. The berries are oval; when grown in a light house we find them Pear-shaped, more than oval, large, and of a bright amber colour when ripe. The habit is scarcely so vigorous as that of the common Muscat. It is very productive, there being frequently three and four bunches on each shoot. The bunch sent has been grown in an unfavourable situation-a low dark pit. The original Vine in a light house produced berries much finer, but being weakly it has been cut down to make wood. J. Spencer. [This is a very fine thing, and perfectly distinct. The bunch is very large and well shouldered, with strong footstalks. Berries very large oval, inclining to obovate, 14 inch in l-ngth by $\frac{1}{18}$ of an inch acmes (the proportion between the two axes is as 2.625 to 3625 ). The skin was greenish yellow, or of the same colour as that of the White Muscat of Alexandria, but it was evident that the berries had not acquired the colour of complete maturity. The flesh was firm, juicy, with a rich sugary Muscat flavour. Seeds 2-4. This variety, from its being an abundant bearer and a free setter, forming masnificent well shou'dered bunches, appears to be highly deserving of cultivation. R. Thompson. We have never seen a buriety of greater promise. The appearance of the bunch and lerries is most magnificent. The quality is
$\pm$ We have just received from India an excellent example of

Grase, the exact specific name this condition in some cultivated Grass, the exact specific name

Grape. Editor.] Lilium gigantew. With us this receives the same
reatment as to temperature as that of ordinary green. house plants. Like the Japan Lily tribe it is a deciduous herbaceous plant. Let us take, for example, a young plant in a 6 or 7 -inch pot, the leaves will now be ripening; keep it without water in any dry cool place well drained, using for soil turfy loam enriched with leaf-mould or rotten dung, or what is better, water it Give little water until growth has commenced, then a Jittle two or three times a week, increasing this quautity as the season advances and the leaves increase in size give it all the natural heat and light at command continue this treatment for one month after the leaves have attained their full size, then gradually withhold water, but if possible increase the heat and light. This may be done by moving the plant from the house or pit and placing it under a south wall until the leaves
begin to turn yellow, when it may be removed to its winter quarters, which may be a cellar, shed, or under the stage of a greenhouse; any of these places will do equally well. In February shift it into a $16-\mathrm{inch}$ pot, treating it as above, and your correspondent ${ }^{68} \mathrm{H} . \mathrm{H}_{\text {. }}{ }^{\text {" }}$ have been in 1855 . Three here were more than 10 feet high; one had 12, one 13, and one 14 perfect flowers on it. It will also bear a high temperature ; this I had proof of with the firat plant we had, which opened its
first flower in April, 1853 . In short the treatment of first flower in April, 1853, In short the treatment of soil well draiced, and abundance of water while grow ing (supplying none when quite at rest), a light warm position in a greenhouse or cold pit near the glass while growing, and any dry cool place

Tacsonia mollissima, it is stated in Notices to Correspondents, requires more heat than a conserva tory without a closed roof affords to grow and bloom it in perfection. Exactly the contrary is my experience in the matter. A plant here (than which nothing can
be more beautiful) bas been in bloom during the last six months, and the flowers produced in early summer and late in autumn were in every respect very markedly superior to those that bloomed during the extreme heat of the season, when they were badly coloured and did not expand freely. Being also a plant of most vigorous growth, it has found its way through every possible opening of the sashes or ventilators into the open air so that it covers the roof both outside and iu with foliage and flowers; and finding that it has withstood the cold without injury to either, although they have had covering of snow, I am confirmed in the opinion that much heat is not only unnecessary but injurious to it, and that it will be found to thrive on a wall or even
(where tolerably sheltered) a verandah. As a hint to (where inclined to try this, I would advise them to grow it in a pot with holes in the bottom, and to plange it in good soil at the proper season, precisely as Rivers be removed to some shelter during the severity of winter, and render success certain. J. M., Folkestone. [What was meant was that it required more bottom heat than the ground of an ordinary conservatory can supply.]
Timbiber Found in Peat.-Seeing allusion made (in page 743 ) to Peat Moss and timber found in it I think it may be interesting to state that I have closely observed and find the fact to be, as stated $t$ me by a very intelligent resident engineer of an Irish railway, that timber found in the bogs of Ireland has never been prostrated by storms or felled by the hand of man. The rot is always found as it grew, and the tree separated from it by having rotted off. And I need not say that if blown down the tree would generally be attached to its root, or if cut down it would show some mark of the axe. The same gentleman who stated the circumstance gave me the following
(to me) interesting statement of the way in which he accounta for the above fact. "I never could account for it," he said, "until one day, happening to travel along the banks of Lough Neagh, I saw a plantation through which was a watercourse, which, having been choked by leaves, \&c., had overflowed its banks and formed a small lake under the trees, and as far as it extended the trees were dead. It struck me that in the same manner the forests of Ireland were first killed, and sfterwards the trees, like any other postg, rotted off between wind and water, showing evident marks of decay at the base, although sound in the general length of the stems." My own observation entirely bears out everything as stated above, I. T.

Cut Plowers.- I find many flowers cease to be orma mental when cut, owing to drooping immediately on being pat into water. Can any correspondent suggest a remedy I have a large plant of Luculia gratissima coming into abundant bloom, specimens of which will be desirable in the drawing-room. Their be wuty was how ever so short-lived last winter when gathered, since they drooped and withered almost immediately, that I shall hesitate to have them cut unless I can find the means of preserving their freshnese. The Mandevilla, Beaumontia, and Brugmansia, with many others, fade in like manner. A Devonian.
Siberian Cono Parsnip.-It may perhaps be interesting to some of your readers to see recorded the dimensions
of one er two very large specimens of this Paxsip
growing (not far from the Northumbrian moors) in the garden at Longwitton Hall, the residence of Mrs Spencer Trevelyan. The specimens in question were in a situation sheltered from the cold north winds. On measuring one of the plants the dimensions were as follow :-height, 12 feet 6 inches; circumference of the
stem at the base, $12 \frac{1}{2}$ inches; at 4 feet from the base, stem at the base, 10 inches. I do not know whether larger specimens
10 at 4 feet from the base, have been seen. I should be glad to be informed whether the plant might not be fcund useful as food for cattle. They appear to be exceedingly fond of th leaves and stalks. Ortolano.

Swans. - In reply to "Citizen's" further inquiry respecting swans, permit me to say that they will swim 18 inches headway; I think that the culvert should no be less than $2 \frac{1}{2}$ feet wide, with 2 feet headway

Veronicc Andersoni.-Last spring I obtained a plant this in a pot, and afterwards planted it out in the in height, but it grew so rapidly and luxuriantly during the summer that it is now upwards of 4 feet high, and
very bushy. All the time it blossomed most splendidly, ary bushy. All the time it blossomed most splendidly, and the foliage as green and fresh looking as it was during the warm weather, notwithstanding our havio sharp frost. Will you oblige me by mentioning whether or not you think I might allow it to stand where it is during the winter, surrounded with matting, as also a vigorously but has not flowered? If these can be thns rotected, they will, no doubt, attain an immense size in the course of a few years, and become beautiful object planted on a
greatly doubt.]
Washing Machines.-I have just been to see Mr Moore's new washing machine, and as an old house keeper I venture for the benefit of some of you country correspondents to state that in my opinion it is a decided improvement on all previous inventions of the kind. As far as the saving of time, trouble, and soap oes, nothing can be more economical than its principles works up and down by means of a lever or wheel (which can be managed by any good-sized boy or girl), and submerges the linen into a bath of hot suds, in which are floating 200 wooden balls, which by their constant gentle friction clean the linen in a few minutes, withou bives a chance of doing it any injury. There are three which of $3 ., 6 l$., and $10 \%$. each (and if lined with zinc, extra). The smallest size is not suited for large bed lined, but is serviceable for all ordinary washing in a mall family; but the larger ones of course answer very purpose, and would I am sure be duly appreciated all country housekeepers. An Old Lady
Rogers' Conical Boilers, and fixing Iron Pipes by means of Portland Cement.-I wish to heat an orchar house and was much interested by "Sigma's" statemen relative to these matters. I shall be obliged if he will state fuel other than Welsh coal and cinders will answer Lynch White's boiler; would gas cinders do alone? or Scotch coal alone? "Sigma" mentions that Rogers" large boiler may be left for 24 hours without any attention. But I would infer that Mr. White's could only be left for 12 hours; is this owing to its conWill "'Sigma" explain what he means when he says be has a boiler "on a large scale" that only heats 150 feet of 4 -inch pipe and yet is deserving of commendation? Surely this is going back instead of forward; I can bear testimony to the efficiency of cement oints, having made them of Roman cement, which stands as well and sets quicker than Portland. Mr. Kay, of Finchley, had used Portland cement successully three years ago. Will "Sigmas give the items where he makes the heating of a large house only come to $11 l .2 \%$ ? I fear this may mislead those unacquainted with such matters. A Vinery, say 30 feet long by 4 feet wide, cannot be heated so as to have Grapes the lat of June at less than 201 hort of this does not deserve the name of heating; the mere exclusion of frost is sometimes set down as heating. "Sigma" is on the right track, but I fear he is uide, anlees he explains mone explicitly what he means by beating a large house. A Constant Reader
Colouring of Grapes.-In the year 1847 I built three Vineries, two for Black Hamburgh and one for Muscats; the borders were made under the direction of a most experienced gardener, and the Vines were planted 4 feet eep with thorough drainage. When the Vines began to bear fruit, the crop was abundant, but the Hamburghs
were badly coloured and frequently shanked; the Muscats also were affected in the same way. I was ecommended in the year 1854 to take up the Vines from one of the Black Hamburgh houses and to replant them only 3 feet deep. The effect of this was successful in producing a crop beautifully coloured, whilst the other house remained as before, but the extraordinary part of the story is this-that in the present season the Grapes n the house which were transplanted are almost olourless, whilst in the old house where the Vines were planted deep they are abundant in quantity and perfect in colour. If you can explain these circumstances and
suggest a remedy you would much oblige one of your suggest a remedy you would much oblige one of your
earliest suberibern $\mathcal{F} . \boldsymbol{H} .8$. [Has it not been owing

## the unusually low below the surface ?]

Catsup.-You say, "We do not nind this word in the edition of Johnson before us, nor is it in Richardson." In my Johnson, folio (seventh edition, 1785,) I find it thus :-"Catsup, a kind of Indian pickle, imitated by pickled Mushrooms." "And for our home-bred British heer, Botargo, Catsup, and cavier."-Swift. M. J. P. Iris reticulata.-In the Journal of the Horticultural Society for the year 1848, it is mentioned that the scea if this is exactly that of Violets; I have a particular wish to grow some in my room for the spring, but cannot find out where the bulbs are to be obtained, nor the probable price of them. Will you be kind enough to tell me, and if it is too late to plant them, and when thoy are likely to blossom? Some years ago I read in the Gardeners' Chronicle of the Copper Filbert, and although I have repeatedly tried to get news of it, all has been in vain; it would be a very nice thing to introduce into the country, but I can get no tidings of it. $F . N$., Shrewsury. [The Copper or Purple-leaved Filbert may be had of any good nurseryman. As to I. reticulata weane unable to say where it now is.]
How to Keep Peas from Birds and Mice,-A litte rosin powdered and dusted over Peas, \&cc., when sown effectually protects them from the depredations of birds, mice, and other vermin. A.
Large Citrons. - Some time since Lord Emlyn orown you the weight and dimensions of a Lemon growned the and in noticing it in your Paper you than a Lemon; and you then the size of sha more respecing it I now by desire of Lord Emlyn forward you with this one of 12 Citrons gathered yesterday from one tree, treated exactly as the Lemon was treated, and the tree is of the same age. Sub was treated, and the tree is of the same age, sub
joined is a statement of their respective weights when gathered :-

## John Hill, Golden Grove, Caermarthenshire. [It is a fine

 specimen.Laburnum. -I have 's tree at present full of flower in my garden. This tree blossomed at the usual period last spring, afterwards became totally blighted with the dry weather we had, vegetated again when the rain came on, and now it is a perfect mass of green and yellow. Being sheltered by a thick hedge from the piercing north and east winds, it has not yet suffered in the least from the late cold, although last night the therWhitland.

Petunia impevialis.-I observed a few weeks ago an article from a correspondent, stating that he could not get this Petunia to flower in the open border. Precisely the same thing occurred with me. Like him, purchased two plants which, although they displayed most luxuriant foliage, did not produce a single blossom upon being planted out. Finding such to be the case, I removed every shoot from one of the plant as well as some of the earth around its roots, which replaced with a mixture of bog mould and silver gand and placed a hand-glass over it, with a brick placed underneath in order to admit air, watering it two or three times a week with weak liquid manure, and not allowing more than three or four stems to remain upo the plant. These shoots soon became full of perfec flower buds, but I pinched off the greater number of them as they appeared, letting only a few of them come
maturity. In this way the blossoms becam perfectly developed, but, I confess, I could not discove in them the fragrance of the "Oleander, nor dingle Petunias. A Subscriber, Whitland.

## Eotittic\%.

Linnean: Nor. 4.-Professor Bell, President, in the chair.-A. Beardsley, Esq., was elected a Fellow. The following resolution of the Council was unanimously adopted by the meeting: "That on this, the first occasion of its meeting since the death of late Treasurer, W. Yarrell, Esq., the Council is desirous of entering on it minutes an expressien of the high seose which it entertains of the personal qualities of that gentleman, of his extensive zoological attainments, and of the services rendered by him to the Society during a long period of Fellowship, and espe cially during the eight years of his Treasurerehip; as also of its deep regret at the loss of a colleague so amiable and eatimable, and so warmly attached to the interests of the Society." Subsequently Dr. Boott ws elected Treasurer, and Dr. Baird a member of Comecil, and W. W. Saunders, Esq., was nominated one of thell Vice Presidents, in the room of the late Mr. Yarrell Mr. Ward exhibited from his garden a branch of tree introduced by Mr. Fortune, and apparently species of Fraxinus, on which it is stated the It had which produces the Chinese insect-wax feeds. It with been growing at Clapham for the last 12 months The out protection, and appeared perfectly hardy. The following papers were read:-1. "On Sphaerobolo Stellatus, papers were the Rev. H. Higgins The paper con sisted of memoranda of a microscopical examonen
the sporangia of this fungus, taken from speimen

Which were obtaned in september last from the stun Some of the living fungi attached to a portion of the wood were removed and placed under a glass shade, where it was found that the sporangia were discharged with such force as to adhere to the sides of the shade, flattening themselves against the glass. The proprobably from the compression of the globular sporangium by the very strong and elastic tissue constituting the inner peridium, which is glossy and imbricated, and has a somewhat constricted mouth. The discharge may be illustrated by the manner in which a marble or a Bean may be propelled by being squeezed between the finger and thumb. 2. "Description of the Kobo-tree, a new genus of Leguminosee, collected by Dr W. T. Daniell in Sierra Leone," by J. J. Bennett, Esq. secrotary. This new genus, which Mr. Bennett names Guibourtia, in honour of the learned pharmacologist Whose elaborate investigations have thrown so much light on the origin and history of substances used in and is nearly related to Hymense and Copaifersties, species, which was named G. copallifora, produces a gum resin, of which it was stated that considerable quantities Entomogenous Spherize", by the Rev. M. J. Berkeley M.A. The entomogenous Sphæriæe seem to predominate in warm or equabie chmates, eight of the known species of Cordyceps being found to occur in temperate climstes, descending occasionally to warmer regions, and seven being peculiar to tropical or subtropical climates. The species, from South Carolina, all of which appear to grow on larve. The species described were also illustrated by figures. In the course of a discussion
which followed the reading of the paper, Mr. Westwood pointed out from $\$ 0$ me recent observations the probability that in these cases the larver are attacked by the fungi while they are in a living state, and suggested that inquiries should be instituted in order to ascertain whether or not this is really the case.

## Rotits of Books.

Dr. Asa Gray's Botany of the Northern United States, (Putman \& Co. New York; Trübner, London), confessedly the most able and important work that has litherto appeared on North American plants, has swelled from a sturdy duodecimo of 710 pages to a portly 8 vo . of 740 pages with 14 plates, representing the genera of Cryptogamic plants. It now describes for the first time all the country as far south as what includes Virginia and Kentucky, and westward to the Missisipp river. "This southern boundary" to use the words of the author, "coincides better than any other geographical line with the natural division between the cooler temperate and the warm-temperate vegetation of the United States; very few characteristically Southern plants occurring north of it, and those only on the low coast of Virginia, in the Dismal Swamp, \&c. Our estern limit, also, while it includes a considerabl prairie vegetation, excludes nearly all the plants peculiar the great Western woodless plains, which approac boundary, being that of the United States, varies through about five degrees of latitude, and nearly mon Con 80 that nearly all the plants of Canada East on this side of the St. Lawrence, as well as of the deep peninsula of Canada West, will be found described in this volume." Within this area occur 794 genera and 2351 species of flowering plants alone, a number which we have no doubt that some of our writer
distinctions, would easily treble.
The technical nature of the work precludes extracts we aball therefore only add that not only does its publication afford astisfactory evidence of the healthy sate of North American science, but that it places ita learned author higher than ever in the eatimation of men of science, while the paper, typography, drawings
and ongravings do credit to the New York publishers.

Tytier's Elements of Modern History (Black \& Co. ; $12 m 0$, pp. 275) has been issued as a school book, the
narrative being carried up to the end of the late war It is needless to say that this is one of the best compendiums in any language, and therefore peculiarly well adapted to teaching.

Of Bostock \& Riley's Translation of Pliny's Natura Eistory a fifth volume has appesred (Bohn). Wie rolumes (see Gard. Chrom. for the present year, p. 87), $s 0$ far as the translation goes; but we have nothing to say in praise of the manner in which the press ba andrachne (over and over again), thryselinum for thysselinum, \&c., are discreditable.

Mannder's Treasury of Geography adds another to those remarkable workg for which the public has to thank the enterprise of Messrs. Longmans. In a 12 mo columas of 924 pages of the smallest print in double anthor of the Hughes, who is the editl that is most im portant in its relation to the Geography of the world. information. When we add that the volume is] illus-
executed steel engravinge, we shall have described a work the sterling value of which cannot be over-estimated. The price (only 10 s.) is another feature of $n 0$ small moment to purchasers.

Glenny's Garden Almanac for 1857 (Cox, King Street, Covent Garden) contains a good Trade Directory, Calendar of Operations for every month in the year, and some clever articles on other subjects. Among the latter is a very sharp attack on the proceedings of the National Floricultural Society. Several pages are
devoted to lists of select florists' flowers, fruits, and vegetables, all of which, as far as they go, will doubtless be found useful

## Garden Memoranda

Royal Botanic GARDEN, KEW,-Since we last visited this establishment some important improvements have been made in it. The old museum having become much too small to hold the many interesting subjects which are being continually contributed to it, additiona which has been erected for their accommodation at the upper end of the lake which lies in front of the great Palm stove. This is a plain substantial brick building, about 112 feet in length, 36 feet in width, and three stories higl. Each story has 11 windows in the side, and between each window is to be placed a handsome mahogany case 8 feet high, 9 feet in length, and about 3 feet in width. These cases are right angle to the wall. By two windows and at ment a greatly increased amount of accommoda tion will be secured, and, as there will be a window between each pair of cases, the objects they contain will be placed in a very favourable light for critical examination. The building is to be warmed by means of open staircases and walls, wherever there is room, will be ornamented with drawings and paintings something in the manner in which the present museum is now decorated. When this new building, therefore, shall have been completed, which it very soon will be, and stored with the many important materials with which the interesting features of this noble national establishment

Another object of much interest connected with this great garden is its new succulent house. This is spanroofed 200 feet in length, 26 feet in width, and 13 feet in height ; the roof is tied together by means of circular ron girders, and is otherwise without support, except the walls at the sides. is glazed with glass of a green tint, which is how ever, not very uniform, some of the panes being much more faintly coloured than others. Along the sides are berds in which creepers are planted to run up the roof, and for forming shelves for the accommodation of the smaller kinds of succulents in pots. These beds are supported ou brick arches above the hot-water pipes A red tile-paved pathway with stone kerb runs all round the house, in the centre of which are arranged the taller plants, such as Euphorbias, Opuntias, Cereuses, Aloes, American and others, Yuccas, Dracenas, Crinums, Litteas, one of which (striata) has lately flowered and has been figured in the Botanical Magazine ; Fourcroyas, different species of the handsome genus Dasy lirion, Dianeliss, and other smaller growing Grass-lik plants. These genera and others which the house contains are all as much as possible grouped together by themselves, so that the differences they present, and those of the species of which they are composed, may be readily perceived. Some of the Fourcroyas, Agaves and Opuntias are immensely large. $\Lambda$ few of the latter ere a little shaken in removal from their old house to their present quarters, but have now nearly re thered preir former health, The plants in this rere in pote and tubs some of which are set on brick rein pote and tubs, some of which are set on brick and regniar appearance. A specimen of the "Old Man and regular appearance. A specimen of the "1d Man cactus," Pilocereus senilis, measures quite 12 feet in which time it has grown only about 18 inches. Another which time it has grown only about 18 inches. Another near the base, from which it Lept rotting apwards. This was however arrested by cutting the decayed part completely off; the plant was then laid on its side for a shor time to dry, when a portion of the cut part being in contact with some leaf-mould soon struck root into it, and now it is poited and doing well though of course shorter by a foot or more than it would otherwise have been Among Sansevieras, somewhat recently introduced, was that from which in Angola an excellent cordage is manufactured. It has upright terete leaves of consider able size. At one end of this house were arranged the different varieties of Epiphyllum truncatum and such other Cacti as grow on trees after the manner of Orchids, and in another place we noticed in a glass case a plant of Opuntia coccinellifera covered with the gardens for these last 40 years and more; it has, however, sometimes been pearly lost from those nace quainted with it clearing it off the
As regards the general collection of plants under ghass it appeare to be in a better state than ever we號 The Orchids have improved considerably, nearly all
having been repotted and othervise put in a condition the fuccessful culture growth. One great drawback to the euccessful culture of plants of this kind here, as indeed it must be in all gardens to whose houses the public has access, is the continual opening of doors in Winter by which cold air is admitted, and for this there is no remedy except shutting up the house during the coldest months. In summer the evil is but little felt. Pitcher plants are also in a better state than formerly, and the extensive and valuable collections of Ferns which this establishment contains, and which Mr. Smith fresher than especial care of, also appear healthier and fresher than when we last inspected them. Some of the hardier New Zealand, Madeira, and Mexican kinds that were planted out on a bank in a house with a north aspect have been lifted and potted and replaced in the same house. This change in their condition has set them off to much better advantage, and their names are more conspicuous and accessible than they were before. Two newly imported plants of South Arrican Alsophila capensis have lately been placed in this house; they have pushed some new leaves, among which their singular Trichomanes-like appenages are already apparent.
The Victoria Regia has not thriven well here. The however, Nelumbiums, and even Eurysle ferox succeed as well as could possibly be desired. The Ouvirandra fenestrali or Water Yam from Madagascar has also made lare and fine leaves, which from their singular appearanco are great favourites with the public. This is prown are great fand in cenerslly found at other places which than it fortunate enough to possess it whin fll bee fortuate enog. to poss hill The Palus in the large sowe house have made much rogress in growth of we last saw them. different inds Cois ifferent kinds of Cocos have already reached the to increas in In order to rive more head rately some of the tallest it has been found necessary some of the tallest it has been found necessary
sink the beds or boxes in which they grow mach below th may mention floor of the building as possible. We entrance has been moved Banyan tree at the wess be too cold and dry for it, its underground roots having nearly all rotted away. That being the cas the tree had to be taken up, the decayed portion removed, and the top placed in a shallow box in a warm house, where it has struck root freely and is now begin ing to push fresil leaves. The whole of the specimen in this vast house are in progress of rearrangement so that it may become a collection of groups illustratin genera or orders. In the case of Areca Palms and Cycads this has been a ready accomplished, and nothin can be more beautiful than the effect thos produced.
The magnificent specimens of tender Conifers in tub have been placed as usual for the winter in the Old Orangery. The Norfolk Island Pines moro especially are now become truly noble treen, which in a year or two it will be impossible to get into this house. Indeed, now it is so over-crowded that more ample
The houses generally, it may be mentioned are excellent order. In one of the coolest of them the handsome Lapageria rosea has been beautifully in handsome Lapageria rosea has been beautifuly in
flower. It was growing in a wide shallow pan, in which it is found to succeed perfectly. When the prope is it will rank among the finest of all greenhouse climbers. A plant of this Lapageria has been blossomin most beautifully in the nursery of Messrs. Veitch in the greateat profusion. In that establishment we are informed it is planted out in the border of we are informed it is planted out in the border of with plenty of a laod turfy loam and peat, leaf mould with plenty of good turfy loam and peat, leaf mould and sand, all well mixed together. A particular point in its management is stated to be that it likes plenty of water while in a growing state; in order therefore to permit of this being given, the soil in which it grows must be thoroughly drained. In short efficient drainge, plenty of water, a loose porous soil, and a cool house are all that 19 necessary to ensure this fine plan rowing and flowering abundantly as it should do. It may also be mentioned that the blooms will keep fresh and beautiful for a long time after being cut, even in a warm sitting-room, and thus is added one of the most beautiful of climbers to the list of plants adapted to cutting for the bouquets now so generally employed in internal decoration.

The continuation of Mr. Kemp's description of Biddulph Grange is unavoidably deferred to next week Two more notiees will complete it

## Miscellaneous.

The Yew.-Zuccarini constitutes a distinct species (Taxus Wallichiana) for the Himalayan Yew; but though the leaves aro more curved, and the berries smaller than in our European tree, the difference is so trifing, that, with our knowledge of such a marked variety as the Irish Yew generally reproducing the common form, a new species seems uncalled for. Dr. Hooth (Jouraals, iu. 25) holds that the Himalayan, the belong to Taxus buccata; he tells ns s(i. 186) that the
of the Brathmans in Nepal. The timber found by
Layard in the palaces of Nineveh, and pronounced by hayard to be Cedar, is in reality Yew. - The preparation of a hind of tea from the Yew tree is, I think, peculiar to the H mataya, and it is remarkable that so dangerous plant should have been selpeted. Col. Markham (Shooting in the Himalaya, p. 115) thus describes its use in Kashmir: "There is a capital substitute for tea,
in the iuner bark of the Yew tree, dried and prepared in the iuner bark of the Yew tree, dried and prepared
like tea. The colour is perfect ; but I never could find much taste in the infusion, although one of my friends his reason that, in Kuhéwar Tamus baccatc is for Sangelú $=$ Sang tea, perhaps connected with the name of the ruountain Suny-lo in Kiangnan, "famous in China as being the place where the green tea shrub was first discovered, and where green tea was first manufac tured." -Of the popular idea of the great age attained by this tree, I met with a curious illustration is 1815 , when an Irish gardener repeated the following as being an ancient composition taught him by old people. Three years being the age assigned to the unit, the total comes to 2187 : -

Abridged from a pupor by Col. Madden in the Annals of
The Gunyang
The Gunyang; a new Australian fruit.- The Guuyang bush is a kind of Solcunum or Nightshade, and has much the appearance of $S_{0}$. aviculure ( S . laciniatum Ait.), to which species it is indeed in habit so closely allied that superficial observers, seeing these plants growing promiscuously, will hardly become aware of their distinction.-It differs from $S$. aviculare in its
green lut not dark purplish twigs, its sessile, decurrent, somewhat scabrous, and less shining leaves, whilst those of S. aviculare are distinctly petiolate, and consequently not decurrent along the twigs; in its more tender corollas, which are very slightly, but not to the
middle, five-cleft, and hardly ever outside whitish, its thinner styles and filaments, the latter not shorter than the anthers, its more acute teeth of the calyx, its almost spherical, transparently green berries with large seeds: the berries of $S$. avicu' arc are, on the contrary, at all times exactly egr-shaped, of an orange colour, and with seeds but half as large as in $S$. vescum. The natives of an account of their disagreeable taste.-The Gunyang has been found, as far as I know, only yet in Gipps' Land, where it occurs on sand-ridges around Lake Wellington; on the coast towards the mouth of the
Snowy river; on grassy hills at the Tambo, the Snowy river; on grassy hills at the Tambo, the Nicholson's River, and Clifton's Morass; on the rich
shady banks of the Latrobe River, and near the Buchan River. The occurrence of the plant in such varied localities proves how easily it may be cultivsted in any
soil. It flowers during the spring, and ripens its fruits sowards the end of the summer. The berries only lose their unpleasant acridity after they have dropped in full maturity from the hranches, and then their taste resembles in some degree the so-called Cape Gooseberry
(Physalis Peruviana), to which they are also similar in size. Abridged from a paper by Dr. $F$. Mueller in Hooker's Journal of Botany

## Calendar of Operations. <br> (For the ensuing week.)

## plant department.

Conservatory, \&c.-Chrysanthemums in most insances will be the chief feature of attraction here at present, and where these are largely grown, which they should be wherever there is a demand for flowers at
this season, they make a fine display, and are worth every necessary attention to preserve them in beauty as long as possible. They are very impatient of a close rather warm atmosphere, and if the house coatains should, as far as is practicable, be placed in the coolest part where air can be given freely on every favourable opportunity; for except they can be rather freely exposed to air their fuliage soon gets attacked and dis figured by mildew, especially if the plants are bushy
aud well grown. See also that they are kept well aud well grown. See also that they are kept well necessary either to prevent the temperature from falling too low or to dry the atmsphere. Endeavour to have everything neat and clean, and set off the piants in bloom to as much advantage as possible. If such things as Geraniums, Cinerarias, and Calceolarias must be wintered in the sume house with Heaths and other hard-wooded plauts, they should be kept as much as closer temperature than hard-wooded plants; but where circumstances admit of it these should occupy a house or pit by themselves. Cinerarias and Geraniums
intended for late flowering will do very well in a enld pit unil severe weather sets in; but those where fire for flowering early should be placed at once where fire heat can be used at will so as to be able
they will at least be safe from heavy rains. Where Amerien and other shrubs are used for forcing these should be taken up and potted without delay, placing them in a cold pit until they are wanted for forcing or weather by straw mats, shutters, or other covering.

Pineries.-The plants expected to show fruit early next year will be greatly benefited by being kept in a subjecting them to a warm moist temperature. The atmosphere should be kept dry, also allowing the soil ahout the roots to become as dry as can be done with safety; do not, however, subject the plants to a very low temperature, but keep this at from $60^{\circ}$ to $65^{\circ}$ by means of fire heat, for although the plants will bear a con-
siderably lower temperature without any apparent injury, those not subjected to any unnecessary extremes will produce the finest fruit ; and a short period of comparatively dry treatment will ripen the growth, and just as effectually induce a tendency to show fruit as checking the energies of the plant by an unnaturally law temperature, and without any of the ill $e$ ffects of the watter method. No dependence can be placed on this season, therefore see to plants in pits weather at this season, therefore see to plants in pits
with insufficient means of heating being well protected by means of covering at night, and maintain the command of a rather high temperature by frequently renewing the linings, \&c., so as to be prepared for
any sudden decrease of the external temperature avoid anything approaching excess of atmospheric moisture among young stock, whether in pits heated by linings, or in better arranged structures, which only tends to promote a too free rate of growth for the amount of light, and weakly blanched foliage is the result Vineries, - Where forcing is commenced, attend to previous directions as to leeping the atmosphere moist as there will be some difficulty in getting Vines to breal freely at this season except this is attended to. I circumstances allow of having a bed of fermenting
manure inside the house, this will be found the best means of keeping the atmosphere regularly moist, but i this cannot be used the house must be sprinkled with the syringe frequently, and the evaporating troughs kep full. Also see that the roots are afforded a steady gentle warmth until the buds are fairly swelled; keep the day, letting it rise to $70^{\circ}$ on the forenoons of sumn days. Get succession houses cleaned, the Vines pruned, painted and put into order for work, and see that the heating apparatus is in perfect order, for if this or anything else about the house requires any repairs this should be done while the house is not in use.
flower garden and shrubberies.
If the beds are not yet filled with their occupants for the winter lose no time in getting them furnished with them, as frost may now soon be expected. Where the land is not too wet alterations of grounds and planting should be carried on with dispatch; but on no accoun attempt planting when the soil is in a state of puddle the drier soil is when placed round the roots of newly planted trees (provided they are judiciously watered in) the sooner they will emit fresh roots. Mulching is, however, requisite to keep out frost, and earlier in the season to prevent evaporation. As tree leaves are always in request either as a fermenting material or for leaf soil, they should at this season be carefully collected if they are required only as a manure they may be stowed generally the case, they are in demand as a cheap mode generaly the case, they are in demand as a cheap mode
of furnishing bottom-heat to Pines as well as for forcing different kinds of vegetables, some pains should be taken to seep them dry; for this purpose they should be stacked up in some back place, or behind the garten walls where access can be had to them at all times; and after allowing time for them to settle put on a coat of thatch to effectually secure them from rains. By these means they will be found in a state fit for use for a twelvemonth to come.
hardy fruit and kitchen garden.
Any planting of young trees, or removing of others which may yet remain to be done, should be proceeded with as expeditiously as possible, for the sooner this kind of work is finished for the season the less trouble will be required in watering next spring and summer Pruning and nailing should now be proceeded with every fine day, even although it should delay some of the other work, which can be done with more comfor in bad weather than nailing; it is most important to get the latter done while the weather is mild. Nailing is a cold enough job for even a warm winter day; but to turn men out to it in very cold or wet weather, and expect them to do a fair day's work indicates bad management. Look over fruit stores frequently to see that all is keeping well, and remove any fruit that may show symptoms of decay, so as to prevent the mischief from spreading. A good stock of Lettuzes fit for use should be put into cold frames or turf pits where they can be protected from frost by neans of straw mats or some other efficient covering also take care to secure a good supply of Endive for winter use. Caulifiowers coming in mast be frequently examined ; those not wanted for use should be taken up and stored till wanted; for these cannot be safely trusted to the weather after this season. Take advantage of frosty mornings to get manure wheeled on quarters where it will be wanter, and get al

## relog of the Theek.

An extraordinary meeting of the French Cabinet was held on Monday at St. Cloud under the presidency of the Emperor, and three Cabinet Counciis have been held this week in London by Her Majesty' Ministers. The first result of this renewed activity on the part of the two Governments is said to have been the re-establishment of an entire accord on the Russian question, and on the other topics of foreign interest which have latterly occupied their attention. It is said that the Emperor Napoleon is convinced that the due execution of the Treaty of Paris is as necessary for the honour of France as it is for the future tranquillity of Europe, and that he has expressed his concurrence in the determination of the British Government to insist on the literal fulfilment of the Treaty, and to reject the pretexts for delay and evasion by which Russia is endeavouring to divert attention from the real questions at issue. It is understood that there will be no new meeting of the Congress of Paris, but that the British fleet will remain in the Black Sea, and the Austrian troops will occupy the Principalities until the affairs of Bolgrad and the Isle of Serpents are satisfactorily settled. With regard to Naples, it appears that King Frbdinand is still indisposed to make concessions, and that the allied Governments have
this week sent then pas-purts to Prince Cariar and the Marquis Antosisi, the Neapulitan Ambassadors in London and Paris, with an intimation that their $y$ reseuce at the allied Courts is no longer advisable.
By the overland mail from India we learn that the expedition for the Prosian Gulf was to leave Bombay about the end of October. Herat has fallen from famine, but an Affighan force is said to have recaptured it. Dost $\mathrm{M}_{\text {ahommed }}$ is without supplies, and his troops at hamlahor are in a state of matiny.

## 320ne J2ctus.

The Court, - The Queen, Prince Albert, and the Royai family contune at Wiatsor Castle. On Thursday week after inspecting the tropps at Aldershot, the Queen had a duner party ut the Paviion, which included in addition to the hoynl visiturs Leut.-General knolys,
Major-General Sir J . Searlett, Major-General Lord Major-General Sir J. Scurlett, Major-General Lord
W. Paulet, and Mujor-General the Hon. A. Spencer. W. Paulet, and Mujor-General the Hon. A. Spencer
After dimuer her Majesty, with the Koyal party, lionoured the amateur theatricals performed by the officers in camp with ther presence. On Friday morning the Queen drove round the camp with the Duchess of Brabant, and Pruce Althert rode on horseliack with the Duke. Her Majesty left the Pavilion at 3 p.ar, and returned to Windsor Cinst e. On Saturday morning the Duke and Duchens of Bral ant visited the Duchens of Cambridge and the Duchesw of Gloucester. Prince Frede rick William of Pruss a arrived at the Castle on a visit to the Queen. On Sunday morning the Queen, Prince Albert, the Prince of Wales, the Princess Royal, rrusio attended Divine service in the private chapel of the Castle; the Dean of Windsor officiated. The Duke and Duchess of Brabant went to the Roman Catholic Chapel at Claremont. On Monday morning the Duke and Duchess of Brabant left the Castle on their return to Brussels. The usual pa in Monday morning in hunour of the birthday of the Prince of Wales, who attaned his 15 h year on Sunday, was countermanded in consequence of the serious illiness of the Prince of Leiningen, hall-brother to her Majesty. All invitatous to the Castle were also cancelle.1, and the thearrical performances which also cancelle., and the thearical performances which
were anoounced to take place at the Castle on Thursday were postponed. The Earl Granville, Mahomed Pasha were postponed. The Earl Granvile, Mahomed Pasha, and M. Musurus, the Turkish Ambassador, had Queen, with the Princesses Helena and Louisa and Pueen, with the Princesses Arthur, walked in the Castle Gardens. The Duchess of Kent visited her Maje-ty. Princess Alice rool a carriage drive. On Weduesday morning the Queen, with the Princess Royal, walked in the grounds adjacent to the Castle. Prince Albert came to town and presided at a meeting of the Council of the Duchy of Cornwall. Prince Frederick William of Prussia accompanied his Royal Highness to town an'! paid visita to the Duchess of Gloucester, the Duke of Cambridge and the Countess Bernstorff, wife of the Trussian Minister. The Prince of Wules went out shooting, and in the evening his Royal Highness went to Eton Col ${ }^{\text {g }}$ and attended a lecturematieal school, Uu Thursda morning the Queen and Prince Albert, accompanied by the Princess Royal and Prince Frederick William of Prussia, walked in the Home Park. The Duchess of Kent visited her Majesty. The Prince of Wales rode on horseback. Lord de Tabley has succeeded Lord Sackville West has snceceded the Hon. Colonel Hood as the groom in waiting on her Majesty.
Prince Alpred arrived at Bonn on Friday from Bruesels, and passed the night at the Hotel de l'Etoile d'On On Saturday his Royal Highness coatinued his journey on Coblentz, where he arrived Prince dined at the Giant fore, and pro ceeded to the Palace, where the Po Prussia had arrived to receive him. On Sunday morn ing his Royal Highness accompanied the Princess
of Prussia to the Church of England service in the of Prussia to the Church of England service in the
chapel of the palace. The Royal party ajterward chapel of the palac
drove to Stolzentels.
drove to Stoizenferis. Freserick Wileiam of Prussia landed a Dover on Saturday, and proceeded to Windsor Castle where he stull remains on a visit to the Queen.
Nibw Peerage.-The Queen has created Lord Talbot de Malahide a Peer of the United Kingdom, by the same title which he bears in the peerage of Ireland.
The Cabinet.-The firat Cabinet Council of the season was held on Tuesday at the officia! residence o the First Lord of the Treasury in Downing Street. An the Ministers were present. Cabinet Councils were also held on Wednesday and Thursday.
Dishisgal of the Neafolitan Aubasgadors.- Priace Carini and the Marquis Antonini, the Neapolitan Ministers in London and Paris, have received an intima ion that their presence is felt by the Enylish and French Cabinets to be no longer advisable, and that entury Motryents.-On Th
Parliamenar Movsmeds.-On Thursday Parlia Tresday the 16 ch December. The significant words
"then to meet for the desp
included in the commission.
The Judiciar Besch.-Sir Alexander Coelkburn has aceepted the Chief Justiceship of the Common Pleas, and Sir Richard Bethell will succeed him as AttorneyGeneral.
Rumoured Resignation of the Bishof of Rochester. -It is said that the Bishop of Rochester contemplates the resiguation of the see, in consequence of ill health. The German Legion.- The Sultana and Culloden freight ships left Spithead on Monday with 1200 men
and officers of the British German Legion for the Cape.

Pubic Pensions. - Lord Palmerston has recommended her Majesty to confer a pension of $100 l$. a year of Physic in Edinburgh University; a pension of $100 l$ a year on Mr. Philip James Bailey, the author of horn, the mother of Lieut. Waghorn.
Pardon for Political Ofrences.-The Queen has signified her pleasure that a full and free pardon be granted under the Great Seal to all persons suffering under the consequences of conviction for political offences,
What had hitherto been done merely remitted the punishment inflicted in each case, but a pardon under the Great Seal restores the individuals to all their civil rights.

## frorcign.

Francl.-The Emperor and Empress arrived in Paris on Sunday afternoon from Compiègne, and immediately proceeded to St. Cloud. An extraordinary Cabinet Council was held on Monday at that palace, the emperor presiding. now pending, both of foreiga and domestic questions now pending, both of Coreiga and that explanations took place which will render the contemplated
changes in the Ministry unnecessary for the present. changes in the Ministry unnecessary for the present.
M. de Persigny left Paris on the previous day for London. During bis stay in Paris he left nothing undone to remove whatever misunderstanding had occurred between the two Governments, and to restore ther state. A note from Lord Clarendon is stated to have been the final cause of re-establishing an entire accord between France and Enylaud on the Russian affair- - General Kisseleff, the new Kussian Amabsador, presented his letters credence Wednesday the Emperor having come to Paris on purpose to receive him. The following is the reply made by the Emperor to
oceasion :" Monsieur le Comte, -As soon as the Treaty of Pence was
signed it beceme my constant care, without wankening my
ancient alliances, to modify by kind acts all that which the ancient alliances, to modify by kind acts all that which th
turict execution of certain conditions might make severe.
fearnt with pleasure that my Amhassador at St. Peterbit animated by these sontiments, had succeeded in winning thi

## you here, y own personal knows how

$t 00$ often leaves behind, to think only of the ad
sincare peace by entertaining friendly relations."
The state of the domestic affairs of France is said oe nuch gravity, and more than one influential and plain-spoken member of the Cabinet is said to have last few days, and added that unless certin within the which they suggested were adopted no one could say what the consequences might be. In consideration o this state of affairs his Majesty has absndoned his in-
tention of visiting Fontainebleau, and the Emperor and Empress have piaced at the disposal of the Prefect of Police a sum of 100,000 f. for the purpose of opening the conomical kitchens which were of such great assistance to the poorer classes last winter. - The Paris journals turing Palmerston's speeches in the manufac the general feeling foreign affars will be attended with beneficial results throughout the continent, as showing tha tion not to give way. The continued occupation Blacl So give way. The continued occupation of the animated discussion in the Paris papers. The Repub lican Siècle warmly cefends the English alliance, and manfully supports the policy of maintaining the occupa tion of the Black Sea. It shows that this occupatio has been purposely misinterpreted by the partisans perfectly justified in and contends that England is perfectly justified in keeping a squadron in the Black threatened by the present attitude of Russia, inasmuch as each of the three Powers who signed the treaty of April 15 engaged "jointly and severally" guarantee the integrity of the Turkish territory each of "the Powers" binding themselves therefor individually as weli as in concert with the other two. The Débats, Union, and Assemblée Nationale reply to this argument at considerable length. The latter urges that the word " solidairement" (which the treaty maker use uf) does not bear the interpretation "jointly and severally," but merely signifies "jointly," and that parties bound "solidairement" cannot act independently
of one another. The Cnion sneers at the Republican argan for its sympathies towards England; and the argan for its sympathies towards England; and the Art. 1 of the treaty states that the contracting Powers
guaranteed "jointly and severally" the integrity o
Turkey, Art. 2 enacts that the Powers shall concert with the Porte on the measures to be adopted, and also on the employment of their military and naval forces.
Now this condition, it says, has not been accomplished, and cannot be under present circumstances, since concord does not exist among the three contracting Powers on the manner of examining the question.- Letters from hadame Rachel, dated Cairo, the by he and express a confident hope of further amelioration.

Spain. - The Ministerial paper España declaims against the Anglo-French alliance, and proclaims the advantages of an alliance between Spain and the
Northern Powers, in order to counterbalance the supremacy" of France and England. A Circular relative to the press prohibits discussion in relation to
religious subjects, and to matters personal to foreign overeigns, and also the diffiusion of Socialist doc rines, as contrary to propriety and morality. bishops are authorised to take the necessary steps fill up vacant cures. The Infanta Dona Josefa, who is married to M. Guell y Rente, has parchased a smal ouse on the sea-shore wear St. Sebastian. Her who is a prey to profound melancholy, intends to reside who is a prey to pro.
there in retirement.
The Cape de Verdes.-The South-American Com pany's steam-ship Imperador has brought intelligence that the island of St. Vincent, one of the Cape de Verde group, has suffered terriblylfrom cholera. Out of a population of 1200,800 had died, principally males, square for want of means to inter them. The Imperador was coaled by women.
Madeira, -Letters from Madeira state that there are ymptoms of improvement in the vines, and it is hoped that it may continue, so that the supplies of wine may be kept up. The failure of the vine crops has had he effect of turning the native industry of Madeir into other profitable channels. The sugar-cane ha satisfactory results. Attention has also been paid to he cultivation of corn and to the production of coch neal, both of which branches of industry are likely to regetables of all sorts, especially the potato, and the now seem to be in a comfortable state. The cholera has departed, and the opportune and liberal donation of bedding, clothing, money, and other articles which have been sent out by the people and Government Great Britain for the relief of the survivors have called orth the most hearty expressions of gratitude
the Bastic. The Guf of Fioland was covered with ce on Monday as far as Tolbeacon, in consequence o which about 120 ships were unable to get away, an nust remain for the winter if a thaw does not speediy
take place. Everything indicated an early and sever take pla
winter.
Lapland.-The Stockholm papers state that the in telligence from Lapland is very deplorable. The aever cold which prevailed during the month of August destroyed nearly all the erops, which is an almost irremediable misfortune there, as there are no means of communication. The Laplanders are in gr
Russis.-It is reported that Prince Napoleon, who i now at Stuttgard, is endeavouring to obtain the hand of the young Princess of Leuchtenberg, the niece of the Emperor of Russia ; and that a marriage is not im probable between the King of Sardinis and the Grand Duchess Maria, widow of the Duke of Leuchenberg. - Letters from St. Yetersburg state that M. de pied in that capital in preparing the bases of a treaty of commerce between France and Russia, by which French commerce will obtain important advantages for the eatry of its productions into the Rassian territory. His Excellency is said to have sold his state carriage and the rich collection of pictures, which he took with him to Russia, to great advantage in St. Petersburg, where he as the reputation of being " un heureux speculateur"
Belgium - The session of the Belgian Legislative Chambers was opened on Tuesday by the following speech from the King :-

Havover.-A telegraphic despatch announces that the Hanoverian Chambers have been dissolved by Royal ew elections are to take place, and the new Chambers are to meet on the loth of February next
Frankfort.-The Germanic Diet in its sitting of the 6th inst. adopted the conclusions of the special com mittee appoiuted to make an immediate report on the Neufchâtel question. Those conclusions are to the ffect that the Diet adheres to the protocol of London of the 24th May, 1852, recognising the rights of Prussia over the Principality of Neufchatel ; and that it request the German Governments having diplomatic agen accredited to the Swiss Confederation to support, in the name of the Germanic Diet, the release of the Royalis prisoners, at the same time iotimating to the Swis Goverament that the Diet will uphold the steps that may be taken for that purpose by the Government Prussia. These resolutions are to be immediatel communicated offeially to the Swies Government the German representatives accredited to Berne
Switzerland.-A telegraphic despatch from Berne dated on Wednesday, announces that General Dufour intrusted by the Federal Council with a mission to th Emperor Napoleon, left on the previous night for Paris
Prussia. -The Supreme Court on Tuesday rejected the appeal of Teschen, the police agent, against a sentence of the court below, which condemned him to eight vear detention on the charge of stealing official despatches

Bayaria. - The Bavarian Government has issued notice to its officials not to permit the disbanded sol diers of the British German or Swiss Legion to ente the territory, and to arrest all Bavarian subjects who may have enlisted in it.
Saxony.-The marriage of the Archduke Charles Louis, second brother of the Emperor Francis Joseph with his cousin, Princess Margaret of Saxony, too place at Dresden on the 4 th inst. The Archduke is his 24th, the bride in her 17th year. The festiva according to the customary etiquette of German Courts, ast four days. The marriage of the Horediar Grand Duke of Tuscany with Princess Anna of Saxony will be celebrated on the 24th. These alliances ar some compensation to the King and Queen of Saxon for the "misalliance" !just contracted between thei econd daughter, the Duchess of Genoa, and Captain Rapallo, who, according to general report, has nothing to recom wend him intellectually, and still possible persomally.
Aubtria. - The Emperor and Empress will leave Vienna next week for Italy. The Concordat is producin an unlooked-for result. Vast numbers of persons Moravis and Bohemia are embracing the Protestan faith. One of the richest manufacturers in Austris with large landed property also in Hungary, has joine the Guralical Contession with 300 of the men en the Evas parts of the plopir empire the Latheran Catholics recently been an much frequen the usual Protestan that there has

ITALY - The Emperor of Austria is about to isgue a mperial decree restoring the Central Congregations of Lombardy and the Venetian States. The Cungregations are to assemble very speedily, with definite and extended confirmed in their seats. It is related in Ultramontan confirmed a Rome on the 8th of December, the annivensary of the
day on which the doctrine of the Immaculate Concep-
tion was deelared to be one oi the dogmas of the Roman tion was declared
Catholic Church. The British and French steam frigates stationed at Naples have left on a visit to Messina and Palermo, but they will probably revisi
Naples. The Risorgimento of that the subscription of 10,000 muskets, originating with that Mazzinian party, is a complete failure. the Mazzinian party, is a complete failure
the 3 d inst. Lord Stratford de Redeliffe had invested the Sultan with the Order of the Garter, the ceremonia being conducted with great pomp. The Sultan sent two masters of ceremony and several Court carriages in carried by the different members of the Embassy and the heralds, were placed, the Ambassador and Garte King-at-Arms occupying the principal carriage. Lord
Lyons, Sir Henry Bulwer, and several others who been invited, followed in the remaining carriages as far as there was room ; the rest, who were mainly officers, rode on horseback. The Ambassador made an address, which was translated by the Minister of Foreign The ing then the statutes of the order were read promise being made between the etiquette which corbias to touch the person of the Sultan and the must be the investiture, by which the new member therefore handed to the Sultan wilh the exception of the riband with the St. Sors, whassado which he touched the Sultan's to take great interest in the herald ar Sultan seemed to take great interest in the heralds, or rather in their costumes, which he examined with attention after the and Sir Henry Bulwer the decoration of the Medjidie and has also presented to the former a sabre ornamented with brilliants, in testimony of his satisfaction. The Cressy ship of the line had arrived and joined his lordthup's squadron.
Circassia.-Accounts from Circassia to the 23 d ult, state that Sefer Pacha was encamped at Sasdjok with 25,000 men. The forts and blockhouses were still in the possession of the mountaineers. An English steamer had taken the Naib back to Circassia.
Black Sea.-The Huasians have made another atem,t to land at Serpent's Island. They sent a for the sere to land provisions, water, and clothing lighthouse. Captain Vansittart, of her Majesty's thip Magicienne, the superior officer in command of the station, went on board, and informed the Russian commander that he could not allow him to land, but that he was ready to take off in his boat the provisions and clothing, though not the materials for the lighthouse, as the latter has been in a perfeot state since the 15 th of the present month, displaying a splendid revolving light lo be ble mole , and improvements him on shore, and allow him to communicate with his countrymen. While the conversation was carried ha boat pushed off from the Russian steamer towards the boat pushed off from the Russian steamer towards the
island, but was prevented from landing, and the Russian steamer departed re infecta, after having given over the provisions and clothing.
India. - The overiand mail arrived at Trieate on Tuesday, with Bombay news to Oct. 17. The expedition for the Persian Gulf was to leave Bombay in the end of October, and reinforcements of men and supplies were to be furnished by the Imaum of Muscat. - The directors of the Great Indian Peninsular Railway have issued an advertisement for tenders for a line from Wassma to Nagpore, a distance of 487 miles. - The native troops a Peshawur were suffering from fever
Prersia.-A detachment from the Persian army before Herat had captured the Affgban city of Furrath, sending of governor a captive to Teheran. The Delhi Gazette The governor and his family have been but fa death The Persian army has been reinforced to the number of 100,000 men. Dost Mahommed is without supplies, and his troops in Kandahar are in a state of mutiny sians were subsequently expelled from Herat by an Afghan army.

## fotetropolis and its Yitinity.

Lord Mayor's Day.-The mayoralty of Alderman Finnis was inaugurated on Monday with the usual ceremonies. Both by land and water the route was
longer than is usual on such occasions. It is the practice for the procession to pass through the ward of Thich the new Lord Mayor is alderman; and as Tower Ward, over which the present chief magistrate the has to traverse when the Lord Mayor is alderman of more westerly ward. The procession from Guildhall Then came the music of drums and fites, the boy belonging to the Royal Marine Society with banners the City Marshal's man, and three trumpeters. Banners and arms of the City Companies 'were next borne along, with the Royal standard and union jack. A grand military band followed, and almost immediately after wards came the allegorical devices of Mr. Sheriff Mechi, which seemed to excite more interest than any other portion of the procession, even more than the Lord Mayor and an ele diaction engin purposes, drawn by six horses (Boydell's pstent) prize reaping machine in a car decorated with agricultural produce from Tiptree Hall Farm, drawn by four horses (Burgess \& Key's patent) ; and a steam plough drawn by two horses (Fowler's patent). Throughout the whole of the route these devices were the great topic of attraction. The next and concluding part of the procession consisted of the civic magnates in their Aldermen, the late Lord Mayor, the band Sherifs and Guards, the new Lord Mayor in his state carriage drawn by six horses, followed by the usual guard of honour The procession, after moving out of Guildhall Yard, passed through Gresham Street and Princess Street, up Postern Row, and thence by Tower Hill into the Lord Mayor's ward. The procession then moved along Eastcheap to London Bridge, and thence by water to Westminster, where the Lord Mayor was presented to the Chief Baron of Exchequer and the
other judges. The procession then returned to Blackother judges. The procession then returned to Black-
frians Bridge, where it was joined by the Lady Mas friars Bridge, where it was joined by the Lady May oress, who whs in waiting in her State cartiage. The return Ludgate Hill, through St. Paul's Churehyard and Cheapide, to King Street.
The Dinner is Guildesll.-The grand banquet given by the Lord Mayor and Sheriff in honour of return of the to offce, took place on Monday after by about 1200 persons. Among the compsny were the Duke of Cambridge, the Lord Chancellor, the Marquis of Salisbury, the Earl of Harrowby, Lord Palmerston, Lord Panmure, the Chancellor of the Exchequer, the Pernvian, Haytian, and Mexican Ministers, Lord Williams, M.P., Sir B. Hall, M.P., the Lord Chief

Baron, Major-General Sir G. Pollock, Sir F. Thesiger, Oliveira, M.P., Mr. Justice Erle, Mr. Baron Martin Mr. Justice Crowder, Mr. Baron Bramwell, Mr. Justice Watson, Mr. Justice Williams, Mr. Justice Willes, Mr. Wilson, M.P., Serjeant Shee, M.P., \&c. After the usul routine toasts, the Lord Mayor proposed the health of the Duke of Cambridge as Commander-in-Chief. In acknowledging the compliment his Royal Highness
 have in some respects done me great honour by naming
me alone; but I am desirous, on helalf of the army, which
I now have the honour to represent, to express in their
name my sense of the distingulsher attentinn which
they have received efince their return from the seat of war.
Nothing could name my sense of the distingulshen attention which
they have received aince their return from the satit of war.
Nothing could be more gratifying to the feelings of the army
than the cordial welcome they have fxperienced from the whole than tine cordial weleome they have experienced from the whole
community since their return from the Criniea. That geod feeliug bas been nowhere more cordielly disphayed than in inis great metropolila, and we are deoply indebted to my excellent triend
the late Lord Mayor for the ability with which he presided over the banquet given to the Guards. ©n behalf of the armyy I beg
to thank my friend the late Lord Mayor and the citizens of London for the very bandsome compliment they then pald to our
troops. I am sure, also, that the army roust be equally gratified by the cordial welcomes which have been accorded to them in the
sister capitals of Dublin and Edinburg sister crpitals of Dublin and Edinburgh. The best reward of a
soldier is the kindly approval of his fellow-cnuntrymen. The people of England have exhibited that kindly feeling sowardh nrmy, I beg to toll you that they are gratoful for the compli-
The Lord Mayor, in proposing "t the health of ber Majesty's Ministers," said, they were honoured by the presence of a member of the Cabinet who had rennation at a period of its greatest need. That noble lord had carried the country safely through a sanguinary war, and he would now such measures as would in had lame of peace. They had seen that the noble lord ing distriy employed himself in visiting the manufactux ing districts, and wherever he presented himself to the people his tsients and nequirements must be highly appreciated. Lord Pa

## "Your Royal Highness, my Lord Mayor, ladien and gentlemen, for myself and for my colleagues, I beg you to accept our mos sincere thanks for the honour you for myself and for my colleagues, I beg yout to accept our most sincere thanks for the honour you have done us by the reception younave given to the toast that has jntut been drunk.

 you have given to the toast that hay jnut been drunk. I canassure you that the goodwill-1 trust I may say the approbation
-of our fellow-countrymen must always be the gris.
con couragement and reward of those who are charged with the
conduet of public affairs. The different classes in this conntry
are all deeply occupied with their are an deeply occupied with their own avocatima, and it is not
often that they have the oppertunity of meetiog at such festiv
boards as that around boards as that around which we are assembled ; and on that
account, ppeaking for my colleagnes, 1 may $88 y$ that we peculiarly prize the opportunity afforded us
magaificent hall the splendid hospitality of here cementing aequaintancespips-I trust I am not gaving
too much if I call them friendships-which may not only conduce a useful tendency to facilitate the intercourse which must have comraercial men in various transactions connected with the basiness of the country. You, my Lord Mayor, have anverted to the
events of the late war, and to the peace which has followed. At the finvst army and the present year this country possessed the gaged in defending the honour and the rights of England. The
pirit of the people was roused to as high a pitch as was eve sirit of the people was roused to as high a pitch as was ever
witnessed in this country. There was every prospect that, if the war at sll events to those which had crowned the armies of the allies peace which would satisfy our just demands, and which wonld secure the future peace and indepeudence of Europe, we thought
it our duty to sheathe the sword, and, in conjunction with our allies, to put an end to the hostilities which were at the time in
pranress. We were convinced that the people of Enyland would
illingly forego the prospects Wilingly forego the prospects of future military and naval gollory
when they wer satiofied that the objects of the war had been
subutantially accomplisted. sub,tantially accomplished. It now remains that the conditions
of the peace shil be faithfully executed and honouratly ob-
serven, and then I trust that the peace of Entrope
will be place upon a secure and permanent foundation.
The Lord Mayor has adverted to a visit which served, and then I trust that the peace of Europe
Will be place upon a secure and permanent foundation.
The Lord Mayor has adverted to a visit which I
have just made to the manufacturing districts of this country. It is indeed most gratifying to those who are charged with the
conduct of publie eafair to witaess every where the industry, the enterprise, I will say the genius, of the people of this , land
-to see, upon what secure foundations the prosperity of The empire rests, and to angur from, the glorinis present the
future increasing progress of the wealth, the power, and the
prosperity of our commoa country, I can only express my prosperity of our eommoa country. I can only express my
fervent wish that this great city, which is, I may say, the centre
of the commercial wealth and enterprise of the world, which regulates the commercial affairs of almost every country on the
face of the earth, may continue for the foture to flonrish has done in the past; that it mayy continue to be the heart--for
mo it may be termed-of this great country, and that it may only contribute to the wealth and prosperity of England, but
that it may tend to promote the blessings of peace and civilisa tion in every country of the habitable globe.
The toast of the "House of Commons" was acknowledged by the Chancellor of the Exchequer, who made the following remarks on the charge of ineffeiency which has recently been brought against the House : "The time had arrived when very different opinions were
entertained with regard to the House if Commons from those entertained with regard to the House of Commons frora those
which had prevailed some year ago. Persons Who had pasmed
the middte period of life eould remember the time when fears

Address to the Late Lord Mayor. - The following address was presented to Alderman Salomons on his principal bankers and merchants of the City, including the governor, deputy-governor, and directors of the of the Enst India Company:-

 consisting of Sir Culling Eardley, Bart., Captain gentlemen, had an interview with Sir B. Hall on Friday for the purpose of protesting againgt th drainage scheme of the Metropolitan ind and hard near Erith,
and the northern outiall on the shore mmedialy opposite
The deputation stated that the proposed southern outfal was within a mile of the metropolitan limit, and that a large amount of valuable property at Erith, which is yeriously damaged by the scheme, that the crews of the shipping moored off Erith would also suffer, and the around, extending back to the metropolis itself. They therefore urged Sir Benjamin Hall to reject the proposed therefore cootect the inhabitants of the metropolitan plan, and prise from this great mischief. On Tuesday enstern sutntion from Gravesend, consisting of Mr. Masters Smith, M.P., the Mayor, town clerk, and other gentlemen, had an interview with Sir B. Hall on the same men, had an Wednesday, at the meeting of the Board of subject. On Wednesday, at the miring Hall aunoancing his rejection of the plan proposed by the Board, on the ground that, as regards the outiall near Erith, the plan is at variance with the intentions of the Legislature and contrary to the spirit of the statute. Sir B. Hall, however, offers to confer with the Board upon the subject of any amended plans which they may have to propose, and to cubmit to the Government any claims which they may prefer to a contribution of public money for the purpose of carrying out a system of drainage on a more extensive plan than they feel justined in und

Turkish Missions.-A special public meeting of the Turkish Missions Aid Society, the object of which is to raise funds in aid of existing evangelical missions in the Turkish empire, was held a few days since in Exeter Hall. The Hon. Arthur Kinnaird, M.P., took the chair and stated that the immediate and special purpose of the meeting was to take leave of the Rev. Dr. Haulin, for 20 years a missionary to the Armenians, on his return to Constantinple. He read a letter from General sir F. Williams, in which he expressed his regret that he could not personally state to the meeting his experience of 16 years in the various localities of the efforts of the American missionaries, adding that he hoped ere long to testify in that hall to all the advantages gained to Christianity, as well as to humanity, by the unceasing and judicious exertions of the American missionaries both in Turkey and Persia, who had proved themselves so zealous in the work, and so worthy of the sympathy Hamlin then proceeded to address the meeting:-
He observed that the subject of clristian missions to Turkey wefone of rast importance, and he man attended the effiorts of the American missuon. There were certain general topics con-
nected with the cause that conmanded their attention as of prime nected with the cause that commanded their atention as of prime
imporiance, one of Which wat the instrumentality of the press
in the missionary work. Eithateen years ago, when he first visited in the misnionary work. Eighteen years ago, when he first visited
Constantinople, the in fuence of the press as a religious agency
was almost ueutralist d by the anathemas of the patriarchs, Constantinople, the it finence of the press as a religious agency
Was almost ueutralist by the anathemas of the patriarchs, which
were then mightier than Imperial edict, and the anathemas of
the Greek, Armenian, and Catholic patriarchs were all launched

The sale of books wnough now a legat recognised calling thian press. the empire, so that colporteurs malght go through the length and

attended its efforts, he conclided he makino an appeal to the
Colonel Sir Henry Rawlinson moved a resolution wel eoming Dr. Hamin, and expressing the high admira tion entertained by Christians of all denomination throughout England of his honourable, lengthened, and successful work as a Christian missionary to the Arme-co-labourers :-
Having resided in the conntry many years he could fully American miscionaries, and the great 10 . resulted from them. He fully agreed that it was utterly impos-
sible to evangelise the Turks through a direct mission, it being sible to evangelise the Turks through a direct mission, it being
death by the law of Turkey for any Turk to profess himself a Christian. He also spoke of the unfairness with which Protestant who totally ignored their results, and accused them of being mere dilettanti missionaries, whereas the Catholics were fixed
missionaries. He denied entirely that the Protestant misionmissionaries. He denied entirely that the Protestant mission-
arips were, as had heen siated by French Catholic writers, mere aripa were, as had heen siated by French Cathonc ancer numan
tourists and gentlemen. He knew no greater instance of human progress than that of the Nestorian Christians in Kurdistan.
In 1855 he visited them, and they were in the most barbarous on rertions of four or five earnest men, they had churcien
sehools, an excellent press, and were even able to carry on
literary and polemical controversies printed in Syriac. In
reference to the political question of Protestantism in Turkey eference to the political questinn of Protestantism in Turke
he rejoiced that in this instance politics and religion wen
hand in hand. There could be no donbt that the Easten their vitality. The two religions with which those sect Roman Catholic forms of Christianity. Now, it must never bo forgotten that the spread of the Greek religiou was equivale
on the spread of Russian influence, and the spread of Catholicism was identical with the spresd of French infuence would raise up a power which would act as a counterpoise t Russian and French influence. The British Government wa
always very loth to mix itself up with religious questions, an would be especially reluctant with respect to Turkey. B with respect to Turkey, it had the greatest interest in preventin the ambitious projects, of other Powers, and thus far would b naturally aruious to support the cause of Protestantism in tha
country. He conld not shut his eyes to the fact that the M a hometan religinn was fast dying out, and in another century h
believed the bulk of the inhabitants would consist of the thre believed the bulk of the nhabitants wom; and he did say that
denominations of Christians he had named;
the future relations of European Powers with Turkey would, it appeared to him, particularly as regarded England, depend
very greatly upon which class of Christians was predominant in very greatly upon w
the Turkish empire.
Dr. Blackwood seconded the resolution, which was carried unanimously. The Hon, and Rev. Baptist Noel then moved a resolution recognising the devoted exertions of the American missionaries, and expressive of the sympathy of the Christian population of England in Bagnall, and carried unanimously

The Turner Collection.-The following 20 pictures by Turner were exhibited on Monday for the first time at Marlborough House, and excited great interest :459, Moonlight; a Study at Milbank (1797); 466, View in
Wales (about 1800): 468, View on Clapham Common (about
1802): 476 , Shinwrect (1805); 483 , Greenwich Hospital (1s09); 1802); 476, Shipwreck (1805); 483, Greenwich Hospital (atroy)
485, Ahingdon. Berkshire (about 1810); 489, Cottage Destryes by an Avalanche (about 1812); 496, Bligh Sand, near Sheernes ginian Elupire (1817), one of his imitations of Claude ; ${ }^{* 505 \text {, The }}$
Bay of Baiz (1823); 511 , View of Orvieto (1830); 516 , Childe Harold's Pilgrimage-Italy (1832); 518, Apollo and Daphne 522, The "Fighting Temeraire" tugged to her last Berth (1839)
523, Agrippine Landing with the Ashes of Germanieus (1809)
527 , 523, Agrippine Landing With Sigh (1840); 531, The Burial o
Wille Bridge of Sigha
Wilkie (1842); 535. The "Sun of Venice" going to sea (1843)

The Members for Southwark and their Conwark was held on Tupsday to hear from their members, Mr. A. Pellatt and Sir C. Napier, an account of their conduct in Parlianient during the past session. Mr. Pellatt in his speech said he had had the satisfaction of passing three bills-one on the law of crossed checks, one for regulating the registration of marriages, and one for abolishing the exemptions in the Smoke Bill. The events of the session showed that the Irish Church was shaking to its foundation, and that the day was not far distant when it would cease to exist ; and there could be no doubt that the principle of voluntaryism in religion and education was every day gaining a greater hold on the public mind. Sir Charles Napier in hi speech gave an account of his votes on the most impor-
tant questions of the session, and then proceeded to make the following remal lis on the campaigns in the Baltic and the Crimea:-

## As to the war in the Baltic, it had not been well conducted twas known a year befure the first campaipn that we wese going to war, and he had in vain urged the Admiralty to pre- are, to commissinn ships, and to diacipline men, but it was no until February, 1854, that they began to get ready. Here the Ministers were to blame. For the disasters in the Crimea they were not to blame, but they were to blame for not having rade better naval preparatious. Still they wer: only following the policy of econons which had been insisted on by Parliament for  had adopted Thiers's policr, an army might with ease have been thrown on our shores. We were in the same unpro- ected state when the Tahiti affair occurred. He would no tected state when the Tahiti affair occurred. He would no been settled, ${ }^{28}$ far as on come had told there a plain, in the House of Commons. He hat straightforward story, every word of it true, though it could not be expected that he, who was unvied to debating, could make head successfully against Sir James Graham-a mostunscrupulous man-not to use a harsh word- Who comld make biack whea, he white black, at his pleasure. Since the conclnsinn of peace he right or wrong in not attacking it. He found the fortifications stronger even, he confessed, than he liad helieved them to be

The Murder in Parliment Street.-Mr. Cope,

## November 15, 1856.7

THE GARDENERS' CHRONICLE NEWSPAPER.
the victim of the ticket-of-leave convict, Marley, after lingering in a state of great suffering for nearly three
weeks, died on Sunday afternoon from the effects of the injuries he received on the night of the 20th alt. The fatal termination was not anticipated until within a few hours of his death, when inflammation of the brain
set in, and the unfortunate man gradually sunb coroner's inquest was held on Wednesday, when the jury returned a verdict of Wilful Murder against the magistrate for trial on the capital charge.
Supposed Murder and Robbrry at Erith.-The body of a young man called George Carter, the son of found on Saturday morning in Park Spring Copse with 16 punctured wounds in the chest and ribs, five of Friday he had $70 l$, or $80 l$. in his possession, and he is supposed to have been murdered and robbed, as there were only three halfpence in his pockets. The inquest has been adjourned for further evidence

Great fire in St. Martin's Lane.-On Sunday morning the premises of Messrs. Almond, army and navy tailors, in Swan Yard, St. Martin's Lane, consist-
ing of nine flats stored with valuable property, were ing of nine flats stored with valuable property, were
deatroyed by fire. The flames spread to the adjoining houses, several of which were destroyed or damaged including those of Mr. Goodwin, livery stable keeper,
Messrs. Whittingham \& Co., coach-lace makers, Mr. Davis, coach builder, the Parthenium Club Rooms, and others.
Fire at the South Metropolitan District Schools-On Thursday morning a fire took place at which was in the Elizabethan style, was three stories high, extending between 500 and 600 feet, with wings on either side nearly 100 feet in depth. A great portion of the building has been destroyed, with the furniture and stores, including nine of the largest dormitories, the needle room, workshops, and about seven of the offcers
rooms. There were upwards of 900 children in the schools, but they were all saved from injury, and have schools, but they were all
been sent to their homes.
The Farringdon Streer Extension,-The macadamising of the new street leading from Farringdon Street to Coppice Row, Clerkenwell, has commenced under the direction of $h$ having been hitherto postponed in order that the new having been hitherto postponed in order tiat the new
ground might become solidified. When it is completed, the portion of the new street out of the City will b handed over the Holborn district and the parish of Clerkenwell. The Metropolitan Railway Company have taken the ground on the east side of the new street extending from Peter Street to the back of the Sessions House, at a rent of 78000 . per annum, with the option of buying the freehold at 30 years' purchase, the railway company intending the ground as thesite for theirstation.
Wood Pavement.-Application having been made wond paving firm, asking permission to lay down gratuitously a new specimen of wood pavement, stated thoroughfare, the members of the Board were almos unanimous in declaring that wood pavement had failed completely wherev
The Iron Pavement in Leadenhall Street.-The cast-iron pavement, constructed after an American patent, and laid down some months since in Leadenhall Street, having exhibited a want of tenacity and endurance, has recently been taken up, preparatory to being relaid. The bottom upon which the paving
rested was found to be insufficient, and has been replaced by a bed of concrete, in order still further to test the experiment.
he New Street in Southwark.-At a meeting of the Metropolitan Board of Works on Friday, it was resolved, on the recommendation of the Committee of
Works, to adopt for the proposed new street a line Works, to adopt for the proposed new street a line cross Street, at its intersection with Castle Street, and terminating in Blackfriars Road, opposite Stamford Street. A division took place on the question whether the point of junction with High Street should be near Pa Lion street or York Sireet. The junction wid the Committee on the score of economy; the junction with York Street by a curved line was moved as an amendment, with the view of bringing the new street a near as possible to the railway stations at London junction, deducting the Government grant, wes estimated at $187,711 l$.; the total cost of the line with the curved junction was estimated at $230,671 \mathrm{l}$. On a division the amendment was carried by 27 to 8 . The the plan Munday to the Chief Commissioner of Works, tho hae rince intimes his approval of it
The Public Healy - The Registrar-General's weekly return states that the total deaths in London, which in the prevous week were 969 , rose to 1006 in the week that ended Saturday, November 8. The average number in the 10 corresponding weeks of the
years 1846.55 was 1032 , which raised in proportion to years 1846-55 was 1032, which raised in proportion to
increase of population will become 1135 , showing a difference of 129 in favour of the return of hast week The births of 820 boys and 791 yirls-in all 161 children-were registered in London during the week;
in the 10 corresponding weeks of the years $1846-55$ the average number was 1514 .

## 

Birkentead.-A little more than nine years ago the Rev. Joseph Baylee, D.D., Incumbent of Holy Trinity school win town, established a thenlogical traiung ministry of the Established Church. The idea had been orced upon his mind by the fact that while there were 300,000 souls in the adjoining town of Liverpool, there rants 100 clergymen to attend to their spiritual wants. It struck him that there was a manifest want of for the work than was presented by the existing univer-ities-a means which, with a laborious course of theological instruction, should include the practice of making the students practically acquainted with the pastor's duties by district visiting in Birkenhead and egulations, as a means of inducing confidence in preach he One of the earliest to recognise the movement wha the present Archbishop of Canterbury, then the bishop of the diocess, who intimated to Dr. Baylee his willing ness to ordain any of the pupils of the college after they Dr. Baylee soon found numerous friends to aid him in the work; and the result has been the erection of a larg building in the decorated ludor style of architecture The land was purchased from the Birkenhead Com missioners for $9325 l$, and the building has already had 2,000 l. or 14,000 l. expended upon it. When complet will form a quadrangle; at present only the principal façade and west wing are constructed. The College was opened on the 4th inst. with a public dinner, $\{$ at which the Marquis of Westminster presided. There Lord Alfred Churchill, the Marquis of Blandford, Lor and Lady Rayleigh, Mr. Brown, M.P., Mr. Horsfall, M.P., Mr. Greene, M.P., the Right Rev. Bishop Spencer the Rev. Dr. Baylee, Principal of the College, the Archdeacons of Chester and Liverpool, the Rector 'f Liver pool, the Recorder of Liverpool, \&c. After dinne everal speeches were made, and an address was pre sented Dr. Baylee on benalf of the stadents, accompanied by the gill oith handsote pier-glass and the Rev. H. Linton, Lecturer in Divinity at the College and to the Rev. H. G. Vernon, Chaplain to the College. Bungar.-Some remarks have been made upon some alleged Puseyite proceedings in the recently established penitentiary for fallen women at Shipmeadow, near
this town. It is reported that a "sisterhood" has been established of the young ladies, who devote themseives the unfortunate objects of the institution, and several of its influential supporters have withdrawn their patronage from it. 4 meeting is to be held shortly to onsider the subject.
Chatham. - On Friday the Duke of Cambridge re riewed the whole of the troopsbelonging to the differen branches of the service stationed at Chatham garrison, with the view of brigading them and testing their efficiency and ability to act logether
Cheadle. -The solicitors to Earl Talbot have iesued circular to the tenantry of the Shrewsbury estates, giving them notice not to pay their rents (some of which are now receivable) to the devisees of the late Earl of to or right of interference with the estates," and calling on them to pay their rents to the earl. The prounds upon which Earl Talbot rests his claim to the Shrewsbury estates are thus set forth in the circular:-"By the 2 d section of the act 6 th of George I. (1720), it is enacted that the estates in question shall ' be and remain to the use and behoof of all and every person and persons being issue male of the body of John, firs art of shrewsbury, to whory the siter hono decease Gilbert, Earl of Shrewsbury, George Talbot, and John Talbot (therein named), without issue male of heir respective bodies, by virtue of the said letters patent come severally and suceessively one after another as they and every of them shall succeed to and in herit the said earldom, and of the several and respeclive heirs male of the body and bodies of and snd very such person and persons issuing, to attend and to and descend with the same.' By the 8th section of the ame act the estates are made inalienable, but with proviso enabing Protestants, conforming wortai ceremonies, to alienate. This proviso has, 6 thever th Victoria, chap. 28 (1843), passed upon the petition of the then Earl of Slirewsbury, a Roman Catholic and the estates have become, in consequence, inalienable male of the bodies of Gilbert, Earl of Shrewsbury George Talbot and Jobn Talbot, named in the act 6th George I., has failed : and Earl Talbot, as issue male of the first Earl of Shrewsbury, is now entited to he estates. In April last the lato estates, to become absolute owner of them, and to possess limself of an absolute power of disposition over ome , Mun Scott and Mr. Serjean Bellasia," The circular states that Earl Talbot is about to take immediate steps to establish in due course his right to the earldom of Shrewsbury and to the estates, and adds that the coneideration of his right to the
earldum is necessarily deferred till the meeting of

Parliament. His lordship's enlicitors also offer to the tenants the indemnityl of Earl Talbot and his eldest son, Discount Ingestre, against any other clammant.
Darlington,-On Weinesday week Mr. Lawrence Heyworth, M.P. for Derby, presided by invitation over teetotal meeting in the Central Hall in this town. rom 600 and 700 per-nns were present. Tea com-half-past 10. The chairman made a speech of considerable length, in which he dwelt upon the magnitude of the evils produced by drunkenness, and praised water could be no better beverage, he said, into water with lif and substane. Every vegetable and fruit wa nourished by imbibing earhar fromic ase mixed nourided by hoing cal 1 was read and seeches were delivered by other persong. was read, $A$, Dorkno.- A yoted for coroner's jury and also by the magistrates, on the harge of having wilfully murdered her new-born child The accused was a domestic servant in the service of Mr. Abel ; and, according to her own confeasion made to the superintendent of the county constabulary, as soon as the child was born, she became alarmed lest her mistress should hear the cry, and immediately struck its head against a chair, and then cut its throat with a penknife. Subsequently she placed the body in her box, where it remained for two days, and she them buried it in a spot where the remains were subsequently discovered. The penknife with which the deed wa committed was found in her box; and the medical estimony clearly proved that death had been caused by the wound in the throat. At the inquest some of the dinesses urged that the mother was sutfering from a mind at the time she committed the act ; ba the coroner informed the jury that they must
Durfam. - Bishop Maltby has munificently presented his extensive library of books to the Durham University. They are to be kept separate, at the
Exetsr. -The collision between the Poor-law Board and the St Thomas guardians has not yet terminated A special meting of the guardians was held on Friday, A spec a resolution was unanimously carried to the effect thea a mol aw Board that they have mo other object in view than保 pronce the interests of the poor in the union and the rope, proper the welly number of paupers relieved and as regards the weelly $u$ ier papers rel and he weekly smount of out-dioor relitr during the period relieving officers, as compared with the corresponding period of last year, when the duties were discharged by our officers, leads to the conclusion that while there ha been a decrease in numbers and in amount, there is no round for apprehension that either "he interests of the poor or the proper administration of relife have been neglected ; and that the conclusion is strengthened by the absence of any complaintagainst the relieving officers or neglect of duty or inatention to the requiresents of the poor; that the guardians express their regret that the Poor-law Board should have declined to consent to he proposed division of the union into three districts for general relief, or to sanction a trial of the proposition, or by either of these means the present anpleasan relations between the guardians and the Poor-law Board would have been obviated and the retirement of the late chairman prevented; but, inasmuch as the guardians have had an experience of 15 weeks with, as they believe avourable results both as regards the 'interests of the poor and the proper administration of relief, they will of March jection to take spoinsment of the fourth officer, f in the meantime further experience shoulc have shown that either'the interests of the poor or the proper ad ministration of relief' have been prejudicially affected." - Earl Fortescue, the Lord-Lieutenant of Devon, presided at the recent annual meeting of the Devon and Exeter Auxiliary of the British and Foreign Bible Society, ${ }_{4}$ Ind heard the following remarks on Italian freedom:-

Liseds.-On Saturday Henry Harrison, the Leeds
wizard, was brought up in custody from the borough gaol, and examined before the magistrates on two charges on the 14 th of May, having married Sarah Ann Rrown well, his first wife, Jane Brayshay, being then alive and, seeondly, with having married Maria Steel on the 14th of October, 1850, at St. John's Church, Wakefield The excitement was by no means so great as on the previous examination of the prisoner on the charges preferred against him by Eliza Croft, but the court was well filled, and the gallery was thronged by women. The bvidence disclosed a career of extraordinary profligacy, the magistrates accordingly committed him for trial on oth charges.
Liverpool.-On Friday Lord and Lady Palmerston, this port. On arriving they weywood, paid a visit to Mayor and corporation and the leading merchants of the town, by whom they were conducted to the Town Hall Addresses were then presented by the Town Counci and the commercial bodies, to which his lordship re sponded at considerable length. He subsequently presented himself at the Exchange balcony, and was loudly eheered by the merchants assembled, whom he warmly
thanked for the reception given to him. His lordship afterwards proceeded on 'Change, where he was ceived with the greatest enthusiasm. He entered the news-room, and there delivered a few words of than for the cordial greeting they had accorded to him. His lordship had subsequently a sail on the river in steamer, which afforded him an opportunity of seeing the extent of the docks and the nature of some of the improvements on the Cheshire shore. He afterward Home. His Abert Dock warehouses and the Sailors Home. His lordship and Lady Palmerston returoed to Manchester by the afternoon train. The following is an extract from the speech delivered by his lordship in the Town Hall :
"It is most satisfactory to Government to have found, during the continuance
engaged, that a sense of thar justice of the cause, that a sense o the necessity for the exertions which we called upon the country
to make, overpowered, in the minds of the commercial com-
munity of this country, all eonsiderations of private incerest nal munity of this country, all eonsiderations of private interest, and Which reflected sueh honnur upon the country at large. I ma

|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Manchester.-Lord Palmerston's visit to this city has been followed by that of M. Kossuth, who arrived of citizens. He was loudy cheered by a arge concourse Woodlands, Cheetham Hill, at whose house he is sojourn during his stay in the neighbourhood.
Tuesday evening there was an immense gathering at the Free Trade Hall to hear an address from M. Kossuth on the affairs of Italy. Mr. R. N. Phillips, high sheriff patriot in exile fided, and introduced M. Kossuth as patriot in exile for the cause of liberty, and as such the
friend of every true Briton." M. Kossuth then ceeded to address the meeting at great length, beginnin by reminding them that on that day five yers he had paid his first visit to Manchester, and that he was an exile still. The following is an abstract of his address:-

th trample out the nationality of Italy of the country, Italy
would not die. Whar, he asked, was the mysterious souree of that
imperishable life? It was, that when even a comomuity arrived
existence, it would never rest until it tnok its sfand as an
independmat member of the family of nations, and became the mistress of its own dpatiny. When he read the many blue books
published on the affairs of Italy, he was surpriced at the narrow
view which the British Government were taking of them. No matter what mipht be earid to the contrary, he was ready to con-
tend that the Italian movement was essentially a national movement, and that none of the nostrums preseribed by foreign
Governments fur her amelioration were worthy of a moment's
consideration. The Italian population amounted to 24 , They oecupied the finest country in the world. They had the
most glorious recullections ot any people in Europe; snd was it to be viewed, in the languaye of Prince Mettermche; as merely
'geographical denmination? Hatred of foreign domini
was the prevailing sentiment in Italy. She wanted
become a nation, and it was vain and idle to scome a nation, and it was vain and idle to pre-
scribe refms for her. He attributed the present anomat
lous position of Italy in great part to the Papal Govern-
ment- the worst of all human institutions. There were three.
desering rescriptions of goverminents, which, be they good or bad, were
reognised among civilised States. Those were liereditary
govenal election; but the Papal Government haverninent by
national to to
any of these titles- th ruled by the sole ageney of that which was in great part a foreign priesthood. A constitutional Pope could people would tolerate in the 19h century. Having denounced
the Governnents of Spain, Germany, and France, as inconsistent
 successful popular rising would arhieve these great resultEnglishmen whather thre was a fair prospect of success, a
otherwise the Fuglish people would never sanction, by word deed, a mere wanton effusion of blond. He believed there was a
fair prospect of success. The whole story of the Italian striggle had been designedly falsified and misrepresented. The Italian
movement of 1848 did not oue its impulse to the French Revolu tion, for it was in full career when, on the 24th Fehruary in that
Year, King Louis Philippe made room for \& republic. At that
time laty had nothing to expect from France. The absurd theories of Lamartine, who came into power after the downtall of
the Orleanists, were blown to the winds; and when France long, who would not say that the prospect of Italian liberty was
not fairer than in 1818 ? The riew taken by Lamartine was in ston himself had gone the Britith Cabinet, as Lord Palmer-
sidered the integrity of the Austrian kingdom that he con
tor thecessary for the peace of Europe. The noble lord liad also contirmed
and strengttened this declaration when he told Metterrich
that no change could be made in the teritorial arrangemen of the Italian peninsula without the eonsent of all the
Powers who had subsicribed the treaty of Vieuna. He was thoroughly persuaded that whenever haly or Hungary chnse to
rise, no British Aliniter, no matter how popnlar he might be,
would dare to resist the bur-t of British sympary which would despotiam. He then dwelt at cousiderable length on what he
termed the perfidy of the houne of Hapsburg; and having ex-
plained in detail the circumstances which led him personally to revolt against Austria, expressed his convietion that Austria
could never retain her Lombardian provinces without an im mense standing army, and that the h, provincus without in inevitably come
when her own regiments wnuld tear up the black and yellow flag
as the Italian batalions had already done and follow the as the Italian battalions had already dnne, and follow the
tricolour. The condnct of King Carlo Alberto in the Lombar
dian struggle bad dian struggle bad been regulateci, not by a desire for Italian
liberty, but by the hope of preventing the establinhment of $a$
republic in his own neighburhod. IIe concluded amid loud cheers by declaring that all he had stated was based upon
historical facts, and by expressing his corviction that a European crisis was at hand, which a, discoaiviction Hungarian and

Oxford.-The Oxford Free Library and Reading
proved eminently successful. The number of books in
the library on Sept. 30 was 3983 ; number of books re the library on Sept. 30 was 3983 ; number of books re
ceived towards establishing a lending library, $189^{\circ}$ number of specifications received, about 12,500 average number of daily visitors, 407 ; average numher
of daily book readers, 74 ; average number of Sund evening visitors, 66 ; total number of books read during the last month, 2208 , of which 1226 were novels and tales, 421 poetry, drama, and miscellanenus literature, 256 history, biography, travels, \&c., 305 theology,

Pembroke.-There is at
Pembroke Dockyard, which is in progent great activity in Pembroke Dockyard, which is in progress of being improved by giving greater length to the dry dock by as by adding several feet to its length inland. This extension has become necessary from the great addinow about to be laid down as a frigate is to be 300 feet long, which is considerably more than the line-of-battle ship Puke of Wellington.

Plymouth. - The Court appointed by the Admiralty to make inquiry into the charges preferred by Mr. riscott, the storekeeper of the Royal William Yard against Captain Nias, superintendent of the yard, having Captain Nias is to be superseded; and Mr. Triscott himself has not escaped withcut an admonition.

Portsmouth,-Some serious disturbances have taken place in this town and Gosport in consequence of the German Legion, stationed proceedings of the British miles from Gosport. Quarre Browndown camp, five occurred last week almost daily and nightly, ending with the use of the knife. On Friday night the fatigue party of the Legion, who were placed on board the Sultana and Culloden for conveyance to the Cape, endeavoured to force their way out of the dockyard, and a violent struggle ensued between them and the police. It was found necessary for the preservation of order and the security of the dockyard to double the military guard allowed out of the dockyard, and thus could boast of having carried their point in the midst of a garrison numbering upwards of 4000 men of different branches of the service. During the whole night their proceedings were of the most riotous character. The windows of private houses were wantonly broken at Gosport, Portsea the state of matters was even worse. A quarrel ensued between some of the men of the Legion who were drinking at a beer house and a scuffle and fight was the result. Knives were used, and finally one man of the Legion was so severely stabbed that he died almost instantly. The embarkation of 1200 men of the Legion was fixed for Monday, but the pruceedings of Saturday evening were of so riotous a character as to render it a matter of the greatest danger to allow the men to remain on shore another night. The authoriBrowndown marched them into the dockyard from Browndown on Sunday afternoon, and the moment they were embarked the ships were towed out to Spithead, from which they sailed on Monday for the Cape. The arms of the Legion were taken from them before they Eubielded, and when they get to the Cape the patent the married men are to go out together in the sailingship Stamboul.
Sheffield. - A movement has been commenced among some of the working men of Sheffield to erect a monument in the town to the memory of their countrymen who fell in the Crimea. They have comnunicated with Miss Nightingale, through her relative, Miss Shore, of Meersbrook Hall, requesting her to lay the foundation stone. Miss Nightingale has declined thas invitation, but has sent a cheque of 20l. towards the object, conisting of subscriptions of fother, and her uncle and aunt, Mr. and Mrs. Samue Smith, accompanied by the following letter:-

Lea Hurst, Matlock, Oct. 23, 1856.
"My dear Lydia,-The purpose mentioned to me in your letter
has my deepest symparhy. It would have been mast congenial brave men, to take a part in it. I shall be with the men of Shef Weld in spirit whenever they expcute their proposed plan. It is
with real pain that I feel compelled to decline the privilege
Wich they offer to me, of laying the first stone. But I believe I shall best hononr the cause of those brave dead by abstaining been ny greatest impediment in the work I have been engaged
in for their sakes, impeding it by arousing in some minds care
for worldly distinctions. I will ask you to give this letter to Mr. Orerend, and I should be glad that Mr. Overend should make
known to those who had expressed a desire that I should lay the first stone my reasons and my sorrow for not doing so and should say also that I feel an especial regret in declining this at
Sheffield, from old and dear family recullections connected with he place. I must apologise or so late an answer, as I have only

## "Miss Shore, Meersbrook."

- At a public meeting held recently in this fown, it was determined to prosecute the scheme for the erection of a monument to the late James Montgomery; and to commence a subscription for carrying out the design
of Mr. Bell, already submitted to the public.

Stroud. - The Koman Catholics have recently been making eonsiderable progress in this borough. A large monastery, inhabited by some 30 monks, and a handsome chapel, which is crowded every Sunday, has been erected at Woodchester, about three miles out of the town, and a large church is in course of erection in the town. Various lectures have at times been delivered against Romaniam. Some Ftoman Catholic gentlomen
having complaned of some of the observations made in letters to the Stroud Journal, a theological correspondence ensued, and the result was that Mat-
thew Bridges, Esq., a Roman Catholic gentleman of thew Bridges, Esq., a Roman Catholic gentleman of
the neighbourhood, gave a challenge to Protestants to discuss the question with him. A number of gentle men formed themselves into a committee to arrange the matter ; Dr. Baylee, the Principal of the Theologica College, Birkenhead, was engaged as the champion of Protestantism ; and three daya were fixed for the discussion, which took place on the 28 th , 29 th , and 30 th ult. Admission was by ticket at $6 d$. each, the holders being bound to exhibit no manifestations of feeling during the proceedings. The discussion commenced on the first two days at $120^{\prime}$ 'clock, and on the third day at 11, lasting four hours, each disputant being allowed one hour's speech and two half hour speeches. Mr. George Edwards presided Mr. Bridges argued that Protestantism was indebted to the Catholic Church for the Scriptures, thatethe Church settled the canon, and they took it in connection with tradition. Dr. Baylee pointed out that the Fathers wer all at issue in their opinions as to various books, and that it required no council to settle what was and what was not Scripture, as the holy writ found a response in the
heart of man. The subject was treated with great heart of man. The subject was treated with great
reverence. The proceedings throughout were conducted in the most orderly manner and gentlemanly spirit The two disputants several times gave expressions to each other to their respective houses. The audiences were large and highly respectable.
Wrexham. - The inquest on the 13 mon who lost their lives in the inundation of the Bryn Mally Colliery on the 30th September, after several adjouruments, terminated on Wednesday in a verdict of Accidental Death, the jury at the same time expressing their opinion that the mine ought to be surveyed and the drivings laid down on the plans more frequentiy than had hitherto been the case.
York. - The late Earl of Scarborough having cut off the entail of his estates, and having tiree natural sons and a daughter, it was not known until after his death how his property was devised. It has now transpired, however, that his lordship has constituted his cousin and successor to the title, Richard George Lumiey, Esq., of Tickhill Castle, his heir, and that the new Eari will have the estate at Sandbeck, the Lumley property in Lincolnshire, and the family castle and estates in Durham. The present (ninth) Earl of Scarborough is the only son of Mr. Frederick Lumley, by Charlotte, danghter of the Right Rev. George de la Poer Beresford, Bishop of Kilmore. He was married in 1846 Frederica Mary Adeliza, second daughter Mr. Andrew Robert Drummond, by whom he has several children. His lordship is an ardent admirer of the aports of the field.

The Education Question.-A commotion has been created among the Irish national and Roman Catholic journals by the views upon education in its highest branches propounded by Dr. Lyons before Dr. New-
man and the Catholic University on the opening of the man and the Catholic University on the opening of the
second session of the Medical School. Dr. Lyons, second session of the Medical School. Dr. Lyons,
whose name is familiar to the profession at harge, not less by his eminenee as a practitioner than by his recent scientific visit to the Crimea at the instance of the Government, shows that while one Scotchman in every
5000 of the population is a graduate of some Uuiversity, Ireland only one man in every 20,000 has received similar proof of superior education. Dr. Lyons proves by figures that Ireland is the most ignorant of all the civilised nations ; and further, that she cannot plead poverty as her excuse.

The pipperary bane. - There are 19 petitions aiready filed in the Encumbered Estates Court (on behalf for the sale of estates foeds sold by the late John Sadleir), be transfers of mortages. Some of those instruents, be transfers of mortgages. Some of hiose instruments, thus a new source of litigation will be opened in a cour which has, up to this time, enjoyed the peculiar reputa Which has, up to this time, enjoyed the peculaar reputaof legislation. Meanwhile, the preliminary arrangements for a compromise between the shareholders an the creditors of the Tipperary Bank are in progress; but serious difficulties have yet to be encountered, and it is said that nothing practical can be accomplished in the way of arrangement without a apecial act of Parliament took place off Cape Clear, which resulted in the total loss of the schooner Mary Macklin, of Cork. The achooner, which was on its way to Canirciveen with cargo of Indian corn, was run down by the Mangerton steamer, of Limerick, which picked off the crew and landed them at Queenstown. The Mangerton is the Zealand packet, off Folkestone, a few months ago.

## Erotlano.

The Scottish Bishops and the Bibhop of Jere sazzu. The Edinburgh Advertiser states that at a
Synod of the Scottish Bishops, held leet month; it was Synod of the Scottish Bishops, held laet month, it was unanimously agreed to send an address to the Archbishop of Canterbury, representing that "a bishop who is neperstood to be of the province of Canterbury, and
who is commonly called the bishop of the United
ecently officiated in several parts of the country in chapels which are not subject to Episcopal jurisdiction and this in more than one instance, notwithstanding the most solemn remonstrances previously addressed to him by the respective diucesans." The bishops appeal to his grace whether such acts ought to be allowed to pass without some expression of censure on the part of his ecclesiastical superior. The address at the same time complains of the misrepresentations which the Scot tish Bishops are "continually exposed" from adherents "as there is no doctrine held by the Church of England which we have not subscribed, so there is no error repudiated by the Church of Eugland which we do not also repudiate, both in our own names individually, and in the name of the Church whose rights and privileges it is our daty to uphold." In reply to the address the Archbishop of Canterbury states that the bishop referred to
is not under his jurisdiction, and that it was not comis not under his jurisdiction, aud that it
petent for him to entertain the complaint.

## Baitivans

Gigantic Frauds on the Great Northern.-The Great Northern Company has been defrauded of an immense amount of woney by the dishonesty of Mr. Leopold Redpath, one of its principal officers, who abscondediast week leaving defalcations amounting to $150,000 \mathrm{l}$, or 180,000 . These defalcations were caused by a series of frands which throw those of Robson on the Crystal Palace Company completely into the shade,
Mr. Leopold Redpath, of 27 , Chester Terrace, Regent's Mr. Leopold Redpath, of 27, Chester Terrace, Regent's Park, was the registrar of slares and transferrer of
stock in the Great Northern Railway Company, and in that capacity had a command over the whole of the company's shares. Athough his salary was not more than 300. a-year, he lived in a loxurious style in a fashionable house, had his stall at the opera, was habitué of the theatres, a governor of Christ's Hospital, a leading manager of the St. Ann's Society, and a tions. occupations afforded, he averted all suspicion, and was thus enabled to perpetrate a series of enormous frauds by adding an " 0 " to every 100l. of stock which he had to issue, thus making the amount 1000 l. in the company's books. This operation extended to stock of trang 300 . and 500 c ., so that out of every 1006 . stock Red perred he gained 900\%. Associated with Mr. Leopo Kedpath in the same office, and acting "ith him as man bore a high character for honesty and ability, but mixed wip he mixed up with the frauds perpetrated by Redpath he was given into castody, ana has undergone a private examination by the phy well Police Court. The case was made out with sul ficient strength to induce the magistrate to remand him, and he is now in the House of Detention. It seems to be the general impression that he was the dupe of a On leaving London Mr. Redpath fled to Yaris, but find ing that Mr. Williams, the Company's Inspector of Police, was on his track, he returned to London and was apprehended yesterday morning at the house of a
friend, No. 4, Ulator Place, Now Rowd He wass examined yesterday at Clerkenwell Police Court, and was remanded for a week. The prisoner, who seemed very self-possessed, was conveyed in the usual way to the House of Detention.

Thr Miragr at Sea.-A singular optical illasion is mentioned in a letter from Aden, dated Sept $15:-$ " Yesterday, a little after noon, the signal was made a 'steamer to the eastward,' and was kept flying the whole afternoon. Towards evening the signalman reported that the steamer was gradually receding, and supposed that she had either broken down or run out of coal. On this the political resident ordered the Hon. Company's steamer Queen to get up her steam and go to her assistance. The Queen accordingly left about 9 o'elock and met the Oriental at 3 o'elock this morning steaming along all right. At the time the sreamer was signalled she was 150 miles from Aden, and we can only account for this very singular phenomenon by some optical illusion, such as the mirage.

## MARK LANE-MOMDAY, Nov. 10.

The weather since Monday has heen to
The weather since Monday has been tolerably fine but cold,
with strong northerly winds, to-day N.W. Considerable dullness has this week prevaited throughont the grain markets of the sale at 1s. to 2s. per quarter decline, excepting hard and such qualities as are adapted for export to France, Portugal, or Spain, means to supply them, and the intelligence of Cronstadt being closed by ice with a large number of vessels frozen in there,
imparts confidence to holders bere, and makes the majority imparts confidence to holders here, and makes the majority
indifferent sellers excepting at very full prices. Business in Barley, Beans, and Oats has also been languid, with a lowering value. Prices of Peas were generally well supported. With the
exception of some few purchases of Flour for export, the trade han been very quiet, and in some instances lower rates were have been large, of all other grain and Flour moderate. This English Wheat was in request at fully ; Monday's ratess, all other harels there is very little doing. Barley is a very slow sale at
harely Monda's prices. The value of Beans aud Peas is unatitered. The large proportion of the supply of Oats is taken to
gramary, and the trade is firm at Monday's prices. The Flour
trade is quiet, and the few sales made were at a reduction of
about las. per barrel apoa the rates current a fortnight since.

Offices，Bingley Hall, Birmingham．

## © $\mathfrak{C l}$ agricultural Gazette．

SATURDAY，NOVEMBER 15， 1856.
The French Government evidently places a very high value upon English agricultural experience as an incentive and example to the agriculturists of France．A more liberal set of arrangements in order to secure for Frenchmen an exhibition of our results as manufacturers of meat could hardly have been devised than is published with reference to the show of fat stock next spring at Poissy．
British Stock are admitted to this exhibition in order to show French farmers the capacity for feeding，and the value of the produce derived from the breeding stock shown in the Great International Exhibition of Breeding Animals held in Paris in the month of June．
Poissy being a station distant about ten miles from Paris，on the railway from Le Havre to Paris， British exhibitors are advised that one of the best ways of conveying cattle to the show is to send them by the steamers from London or from any other seaport to Le Havre．From Le Havre to Poissy the journey is direct，and a very short one． The cost of the transport by the French railways wili be paid back to exhibitors on their arrival at Poissy by the French Administration．The exhi－ bitors or their servants will have for that parpose to keep carefully their railway receipts，and to pre－ sent it to the Commissary of the show．
The show takes place on the 6th， 7 th， 8 th ，and 9th of April next year．The following is the list of prizes offered to English exhibitors：－602．，48l．， of prizes offered $40 l$ ，are offered for the best ox under 3 years old of the short－horn，Devon，Hereford，and polled breeds respectively； $48 \%$ ．， $40 \%$ ．，and $36 l$ ．are offered
for the best ox over 3 years old of these several
breeds, and also for the beat Highland ox puder breeds, and also for the beat Highland ox under
4 years old ; $36 l ., 32 l$, and $24 l$. are offered as prizes for the best ox of any age of the Kerry breed, and for the best ox under 3 years old of any cross-breed 321., 28l., and 24l. are offered for the best Highland ox over 4 years old, and for the best cross-bred ox over 3 years old; 40l., $32 l$., and $28 l$. are offered for the best pen of 5 fat yearling wethers of the Leicester, long-woolled, and Soathdown breeds respectively and $241 ., 20 \%$, and $16 \%$. are offered for the best pen of 5 fat wethers under 3 shear of the Cheviot breed, under 4 shear of the black-faced breed, and shearling sheep of any cross-breed.
In addition to the money premiums, gold medals will be given with first prizes, silver medals with second prizes, and bronze medals with the others, As extra prizes, a silver cup worth $100 \%$. will be given for the best fat ox of British breed, and a cup
of $48 l$. value will be given for the best pen of sheep. The sheep must be shorn, except a small lock left behind the left shoulder.
Declarations of entry must be made on or before the 15th March, 1857. The certificates must contain the name and address of exhibitor, with the kind, class, breed, and age of the animal. The age of all animals mast be calculated up to the 15 th March, 1857.

The certificates mast be sent to the Minister of Agriculture and Commerce, 78 Bis, Rue de Varennes, Paris, so as to reach the Ministry on or before the 15th March, 1857.

All animals intended to be exhibited at the show can arrive at the yard during the day of Saturday, the 4th April, and they must be at their place on Monday, th April, before 70 clock in the morning.
None can be admitted after that hour. The French Government will pay transport within their own frontier, and will provide for the keep of stock during the exhibition.

Application should be made for certificates to the Minister of Agriculture, Paris.
THE storing of root crops and getting in of Wheat are operations engaging the chief attention of the farmer during the current month. A period is no will be nearly uniform, but as yet a wide provincial dixersity exists not unworthy of notice. The opening up of the country by railroads, enabling farmers to judge from observation, and the disnaturally follows, point to the ultimate adoption of a more general rule. At the same time a diversity of soil and climate must always give to this branch of farm practice more or less of a provincial character.
When Turnips are followed by winter Wheat the former must of course be removed from the field, but when they are to be followed by spring corn it
is a not uncommen practice to throw 80 many drills together and cover them in the field. In this case the number of drills to each row will depend apon the weight of the crop, and other circumevery four or six drills, a man will keep three or four toppers going, carrying from 12 to 24 drills on each side, thus making from 28 to 52 drills in each row, the four middle ones being left as a
foundation. Thus a company of 12 hands finishes a row, leaving it ready for covering, nine pulling (four on each side and one in the middle), two carrying (one on each side), and the twelfth trim-
ming ap the row or line. If the land is wet the ming ap the row or line. If the land is wet the
roets are stored on the surface; but if dry two plough farrows may be cast out, one to each side, and the roots thrown into the hollow. When this practice is followed the four middle drills have to be pulled prior to opening the furrows. The covering
is done partly by the plough and partly by the spade. By this plap a large breadth of Mangels or Swedes may soon be stored. It is liable, however, to several objections, such as liability to sustain injury either in wet or frosty weather, and injury to the land in carting during winter.

The better plan is to store near the homestead, or where that is impracticable from distance, to
make the bins in the field where the Turnips are grown or in the one adjoining near a road, so that they can be removed at pleasure afterwards. At Wheat, there being seldom time for the removal of heavy crops, such as Turnips, to a distance. From the bins in the field the roots are taken to the
homestead as required, 14 days or a month's consomption being removed at one time. This supply is stored either in barns or bins adjoining the cattleyards, from whence they are taken by the cattlegrown near the homestead, the whole may be carted grown near the homestead, the whole may be carted
directly from the field and stored in these barns or
bins, thus saving the storing in the field; but on
large farms this cannot be done, twice carting being unavoidable, as a month's or six weeks' supply is all that can conveniently be contained at home without interfering with the duties of the cattleman to the injury of their charge.
It is, however, in the mode of storing, or in the practice exists. For the sale of illustration the storing of Swedes may be taken. We have seen this crop extensively grown in England, Ireland, and Scotland, identically the same practice of storing being followed in each place. There were no doubt some differences in detail, but not more betwe

The practice followed was to make the hins on This surface, a cart-load to every yard in length. This is not only a convenient size for every purpose
at the storing, but it also serves afterwards as a ready measure for carting home and consumption. When made larger they are liable to heat, and when less more expensive to cover. The work itself is simple: a man superintends the emptying of the carts, placing a plank on each side to regulate
width and prevent the roots from rolling sideways. When the roots are neatly trimmed up, they are covered with straw and allowed to lie thus for 14 days or a month, according to the quality of the with earth, leaving a narrow strip along the top uncovered, in which state they remain until the arrival of frosty weather, when they are topped out.
The rationale of this practice is as simple as the practice itself. When Turnips of any kind are pulled and immediately carted to the bin, they are unfit for being covered close up with earth This arises from the fact that they are living plants, and that the mere topping and imperfect state of circulation is kept up, gases being given off from the surface of bulbs, and moisture absorbed by any rootlets remaining, and even by the
bottom of the bulb itself when the roots are taken bottom of the bulb itself when the roots are taken
off. This active state must be destroyed and life placed in a dormant condition, and upon the successful effecting of this depends the entire success of storing Turnips. Now the covering of straw allows all gases evolved to escape into the atmosphere;
the roots soon dry and scale over, becoming then incapable of absorbing either moisture or gases, at least so freely. The covering of earth with a way of escape for gases at the top completes the process. At first hoar-frost will not lie on this opening, proving that gasesare yet being given off. Eventually, however, it lies, proving that gases now cease to be evolved; and then the bin may be earthed up. On the contrary, were it covered wholly with earth at once the gases would then be confined and absorbed by the bulbs setting them into fermentation, when the result would soon be a rotten mass. Such being the condition of roots when newly stored, we need hardly advert to the impropriety of storing unhealthy ones, or those having sustained injury from frost, as a few bad examples would soon injure the whole. Unhealthy bulbs are easily known by their tops or tails, and when either are unsound they should be thrown aside.
Other modes of making bins are practised, such as digging a pit or trench the breadth of the cart, or placing stuffed hurdles or hoarding on each side, but hey are liable to two very serious objections-first, being too expensive-and, second, the depth of roots being too great, they are thus liable to sustain injury from heating. Hurdles and hoarding may be judiciously used at the homestead for a month's consumption or so, but in the field they are beyond that economy which farmers mpst ever study to observe.

## DRYING OF GRAIN.

There has rarely been a season of harrest in Scotand more calculated than the present to excite the of the consumer of grain, and it has been difficult to look at the crops of Wheat and Barley, dreached by the rains in the last days of September and in the commencement of October, and in the best parts of Scotland, without asking the question, whether no
means can be found to prevent the food of man being means can be found to prevent the food of man being
destroyed to such an extent, and the just hopes of the best farmers disappointed? The quality of all grain crops must necessarily depend primarily on the season rarely hane by which they have been ripened ; but it deficient, if the moment the crops have ripened they could be secured against the subsequent risks of the beason. After the period of ripening has come, it may be asked, to what araount of deterioration is the crop
liable ! It is to be feared that in Scotland, at least ia the present year, that amount is very serious. It may be assumed that the quarter of Wheat in perfect
condition is worth, at the present time, at least 70 . condition is worth, at the present time, at least 70 s.
have lately had, may be taken at any sum varying
from ls. to 20s. quarter ; indeed, if the Wheat has irom 1s. to 20s. \& quarter; indeed, if the Wheat has
sprouted in the field, it is lost as the material of bread, and is saleable only at a low rate for other purposes. The question is, whether at a cost which it reasonable to incur, the Wheat crop can be saved from the risks of the season, and its quality preserved at that standard of excellence to which the season may a sumatured it. It is similar to a case of insurancedegree, but the insurance certain to cover the its whatever it may be. My belief is, that such a system whatever it may be. My belief is, that such a system
is attainable, and, if it be, it ought to have a fair trial. It seems to me that it might consist in the following scheme of operations:-

 Total cost per serse,
falls to dedie ceitting
But from this sum falls to be deducted the entting
down of the erop in the ordinary way, say total
extra expenae for one acts proluving sime quarterp 160 010 This sum is to be placed against the possible deterioration in the quality and consequent money value o grain exposed to all the vicissitudes of weather. Is it reasonable to cover a risk and secure a certainty at
this cost? In the case of Scotland in the present year that answer no doubt must be, that over a wide extent the actual loss incurred far exceeds the cost of the remedy proposed.
It may be stated that an excellent and powerfud heating apparatus may be erected for about 40l. The cost of separating the corn from the straw is taken a 3s. per acre (assuming five quarters of grain), the I have a strong persuasion that the whole operation would be practically accomplished for less rather than more money than has been estimated, and the larger the seale, the smaller mast be the cost of the drying process -at all events, something between 4 d . and $6 d$. per bushel.
Another consideration arises from the successful adoption of this scheme ; the present system of threshing out the Wheat crop would no longer be applicable, the process of threshing would be applied to the ears alone, the straw would no longer pass through the threshing machine, and consqu a much power machine it. Inamula power to work it. Inasmuch as power and labour are
the equivalents of expense, so the discontinuanee of powerful machinery and labour implies an important economy in this respect. There would be saved a costly machine, and a costly power of steam or horses, that of water being more rare. The manual labour would be much less, from the less bulky nature of the material to be dealt w th ; a very light machine would chaff. Here, therefore, would be an important saving to set against the assumed extre expense of $38.2 d$. per quarter, or $5 d$ per bushel.
The result or object to be gained seeme to be, to place the Wheat crop, after it has ripened, in circumstances of certainty and security, independent of
all weather, and to secure its quality and sample at the highest standard to which the season may have matured it. There would be no waiting for dry weather to commence the cutting down of the cropor nould be a matter of indifference whed the comor of not during harvest, except as regarded tarers wonld be introduced into the operations of harvest, it would no longer be necessary to have the most able bodied at high wages, the labour would be comparatively 1 and could be performed by the weaker and although, no doubt, the principle of contract would be introduced with advantage, and good wages mighred,

It is to be observed that the process of drying by currents of pure and dry and heated sir can have no injurious effect on the taste and delicacy of the fiour. It is not a process similar to drying in a kiln by which the taste of grain is affected-the processes
In conclusion, I may remark that the agricultumal world is at present in pursuit of the important objeet of reaping by a machine as a substitute for the sickle and the scythe, and it seems nearly to be attained. Whas
with the end and oiject of the present statement. would be readily effected as the crop was laid on the ground by the action of the reaping machine-its position would give every facility for the operation. The liberate a greater number of persons for the various parts of a new system of harvest operations. The facilitate the success of the drying system, which I am desirous to bring under consideration. A Landlord in the North British Agriculturist.

MR. CHADWICK
PROGRESS AND COMPARATIVE POSITION OF AGRI-
CULTURE IN ENGLAND AND ON THE CONTINENT.
IN England the deficiencies of our labouring agricaitural poppr-
ation and of our agriculture are vast. In inlustration of the lation and of our agricilture are vast. In illustration of the
milserable economy of labour, I may mention that I hare shomi
that in common instances agricultural labourers have to walk to
 paid labour finds it phy him to provide an orouibus to collect his
flabourers and bring thitm to their field of wwork and convey them
to and from different parts of it. In some manufactories, machinery Worked by stean is provided to lift and mower the workmen with
their tools and material from the lower to the mper torir their descent, as well as in mines, not to waster strength o
for
time in din time in ascending and descending. From the intiluence of the
lam of setclement, and the neglect toprovide sufficient dellings
two families are frequently put into two families are frequently put into cottages of a bad construc
tion for one, and many agricultural labourers are driven into the
worst parts of the suburbs of towns The nse of meat as an article of diet is in insufficient. Whilst their physical condition in extensively depressed, their education and moral and intellee-
tual culture is neglected mare than 60 per cent. of them can tual culture is neglected , more than 60 per cent. of them can
neither read nor write, and in general the rest can only do so in
differently.
The meana of removing and preventing excesses of moistur
 a century has elapsed in doing that smatl proportion ver
rudely,
allhough it was eariy proved that the peneficiel effect
 to be too wet to bear sheep properly. The subsoil of the greate
portion of the suburban cultivated land around Manchester in
diggran bered fields display the low state of agriculture there, and yet Know that in that same county properly directed improvement
have been hatended with a return of 7 p per cent. of the capita have been attended with a return of ${ }^{4}$ per cent. of the capital of fon or dangerons bog. The ind
jected to febrile attacks when the wind prevails from the contiguous Kent and Eassex marbhes, and their health is lowered by
tho foge arising from the wat of drainage of the low-lying
district and of the suburban site. The arterial drainate of the distriet and of the suburban site. The arterial drainaye of the
country is allowed to be obstructed by extenilve illegal eneroacb ments, and by the want of manas of equitanhe compensatio amount of the evil to be made a means of scalidaloul
as 2 condition of its abatement. The works of arteria ing art, yet, as I have shown, the ground to be gained by pip drains, would papy for the expense of the work.
Whilst the removal by general drainage of all the surplu moisture which in evaporation lowers temperature would im
mensely advance provuction, it is proved from the obserration
of the effecta of particular purtions done, that in all probability the complete drainage works would raise the generall temperatur
A farmer being aiked whether he had noted sny difference in

## OIL-CAKES

Linserd.caik is manufactured in England, in America rance, Holland, Germany, Russia, Belgium, Italy, and other continental countries, and imported into England under names denoting the country in which they have been manufactured. English cake is generally preerre market. However, much depends upon the fancy market. However, much depends upon the fancy of
the purchaser : thus, whilst in most localities English cake is preferred to American, I am told the latter fetches a higher price in Exeter market than English.
This circumstance led me to ascertain whether there was any real difference in the composition of two samples or America of 1l. per ton for the American cake. Without men of lioning the details of my examination, I will briefly
 hat the differences in their composition were so trifling be identical. Neither in their chemical composition nor in their physical properties, could any marked difference be detected $\begin{aligned} \\ \text { hich might account for the higher }\end{aligned}$ En , . are mion Enligh or ccount for the higher estimation .. wich Engish o American calses are held. The suparior value of home made and also of most American cale, 1 believe depeads not so much on their chemical composition, as upon the condition in which the cake is found in the marlet Good home-made cake, and most American cakes, are always dry and free from mouldiness and rancid smell they have an agreeable flavour and mild sweet taste, and or these reasons are more highly appreciated than other foreign cakes, which generally possess a more or less rancid smell and taste, and appear often mouldy or amp. Moreover, on the continent the extraction of the oil from the Linseed is frequently aided by a degree of heat which impairs the flavour, and consequently deteriorates the value, of the cake. On the whole, greater care is bestowed on the manufacture of English ries. Bea hat of cakes imported from only in imited extent, and always finds a ready sale; no time is therefore allowed for the oil still remaining in the cake to become rancid. Foreign cakes, on the contrary, in assing through different hands before they reach theif final destination, often attain a considerable age, which mpairs the flavour and deterior in damp places. Like 11 organic substances, oil-cake is subject to changes, which do not improve its qualities. The fresher it if, the better it is adapted for feeding purposes. Foreign Linseed-cakes, with the exception of American cakes, and this no doubt is another reason why home-made eake is more highty prized by the practical feeder.
Mustard-cake.-Mustard-cake isimported into Eagland from the continent, and extensively used in the Hop districts of Kent as an excellent mazue. This is tho only safe use to which it can be applied. But as it is much cheaper than Linseed or Rape-cake, and resembles intimately Rape-cake, it is now and then mixed with this calie by unscrupulous dealers; and instancees are Rape-cake
When Mustard-cake or Rape-cake, containing mach Mustard-seed, is made with cold water into a thick pabte, and this paste is kept for about six hours, it acgire Mus taste and strong irritating smell pecunar to by the volatio preinl of Mustard, which is produced under the influence of cold water from myronic acid and myron, two inodorous and tastelene constituents of Mustard seed. Myronic acid is peculiar to Mustard; myron resembles in its chemical charac gradually changes myronic acid in the presence of cold or moly of Mustard. At the temperature of boiling water myron becomes coagulated, and in this state is incapable of changing myronic acid into essential oil of Mustard. Mustard cake in a dry state has neither a pungent smell nor taste. It resembles, indeed, intits cale is kept, however, for some time in the mouth, it tastes bitter, acrid, and becomes more and more pungent the longer it is kept between the teeth. On grinding, moreover, it gives a bright yellow powder, alogecher By these chappearance end especially by the pungent smell which Mustard-cake develops when mixed with cold water, Mustard-cake is readily distinguished from Rape-cake. Neither Mustard, nor Rape-cake confeeding much Mustard-seed, should ever be uil of Mustar which is gradually cenerated in the stomacb of the beat for upo such cakes, acts as an irritating poison, hich may cause serious injury, and even death Not long ago case of poisoning with Mustardeake was brought under my notice. A gentleman residing at Bibury, a village eight miles from Cirencester, Gloucestershire, lost three valuable beasts, which had been supplied with a small quantity of oil-cake, ${ }^{2}$ The day before the cake was given to them they ware perfectly well; and after haviog eaten some cake, they became suddenly so ill that two died before the
veterinary surgeon could'administer an efficient remedy The examination showed that the cake which caused this mischitf was either altogether a Mustard-cake or contained a very large proportion of Mustard-seed. There remained thus no doubt that the beasts died from the effects of the pungent oil of sustard. As the formation of the essential oil of Mustara is prevented by boiling water, and Rape-cake often contains Mustardeffect $u$ degree which cannot but exercise an injuriona to mix all Rape-cake with boiling water before it is given to cattle. By this simple means any injury which Rape-cake containing Mustard-seed would promay, when not submited to the action of boiling water, state of perfect ebullition, it will fail to accomplish this
desirable end. In conclusion of these reminks on oulfollowing easy tests: - 1 . Examine a bit of the calie a to its taste and smell ; observe that it is fresh, and free from any mouldiness. 2. Examine another piece with a common pocket lens. This examination will show as the form of Linseed and Rape-seed are widely different. Much more difficult is it to dist nguish by the lens about I oz. of the calke, broken into small tumbler about 1 oz. of the calke, broken into small
pieces, with 6 oz. of cold water. Good Linseed-cake will form, under these circumstances, a stiff, agreeablytasting jelly, withont separating any water. Rape-cak will become much less gelatinous, and separate a
yellowish or brown, rather bitter-tasting liquid. yellowish or brown, rather bitter-tasting liquid
Mustard-cake likewise will become little gelatinous, and separatea brown liquid, which possesses the characteristic taste and smell of essential oil of Mustard. Rape-cake, fraudulently or naturally mixed with Mustard seed, under these circumstances wil exhibit a similar behavour to taste and smell when compared with pure Mustard-cake will afford means of estimating approximately the amount of Mustard which the cake contains. From Dr Foelcker's Paper on the Chemistry of Food in the Bath Voelcker's Paper on the Chemistry of Food

## Home Correspondense.

Leaf Feeding,-I thank Mr. J. M. Goodiff for his explanatory note on this important subject. I entered on this interesting affair more than 40 years ago, and
therefore the story is an old one, though not stale. therefore the story is an old one, though not stale.
Every spring brings fresh barm, which starts the crust of the earth into its annual fermentation. summer, by its hot and cold, wet and dry, storm and tempest, maintains this ferment, or digestion, which produces food for the roots of plants. Every nutumn, duces the supply of prepared food in proportion to the demand. And every winter destroys fermentation by congelation or freezing, and prevents the food from becoming stale. Every possible means should be re-
sorted to in the early spring to increase the fermentation of the earth, when our plants are young and require heat and food nicely prepared. This is done by disintegration, letting one particle of earth lie as lightly as
we can manage it on the other, because this state of the we can manage it on the other, because this state of the a.great degree, and the fermentation proceeds satisfacmornings. Every means should be resorted to in the summer to prevent a too rapid fermentation from going on, lest the moisture (let us say nothing about com pounds) of the soil be sent off in steam or by radiation; this is effected by similar means; the hoo, properly solong as there is any bare ground round each plant,
whatever the crop may be. The surface thas reWhatever the crop may be. The surface thas re-
duced to powder prevents the sun's rays from baking it as it were, and keeps it cool; this,
with the amount of moisture condensed in the soil, regulates fermentation, and the plants grow and kind of calture of the surface which keeps the heat in the earth during our cold nights in the spring, when our days are short and heat deficient, prevents it from burning in the summer, when our pays are long and which are distant from the manure heaps, this surfacecalture can searcely be carried too far, but in rich lands the time to stop it is when the master thinks that he has prepared food enough to bring his crops (distance of his plants and other items considered) to perfection. My
former remarks had no reference to the mere de. atruetion of weeds, though generally speaking the hoe would seldom be set a-going were it not for the purpose of removing those obstructives. Yet there
cannot be a doubt but it was this obligation which first turght man to pry a little further into the utility of hoting, and of stirring the surface in a regular manner. I quite agree with Mr. Goodiff that plants are thirsty Ereaypt and all hot climates is proof sufficient. In our own country we never have too mueh rain for plants generally to thrive well when the temperature is high; plenty of sunshine produces healthy Grass when the land is moist; the stock feed and fatten upon ir ; but the stock eat it but do not fatten, and ere long become divensed. I may be excused, I trust, for digressing to say that the day will come when dry food sunless periods, when the Grasses have become dropsical, as a preventive of disease. Young animals which have been carefully reared, and being "high bred " in
a fattening point of view, are cut off in great numbers a fattening point of view, are cut off in great numbers
by disease under a variety of names; the cause, no doubt, is to be found in the unwholesome state of the Grases and exposure to that condition of the atmosphere which creates extra succulence in the Grasses,
while animals less artficially reared, and having a pasture perhaps in a less artificial state, where they can stave of wholesome bushes or fences when the sof yexrn after something more solid, entirely escape dis the of any title. Mr. Goodiff remarks that "it is by organic partions of this food are carried up, as salt is

The better the culture the less this evolvement, if any absorbent. As to the roots of plants going deep into the earth and "not finding food in a fit state for their nourishment," I doubt it very much, as I think it quite as probable that they send their roots deeper into the
earth in search of food less organic than what they find nearer the surface amongst our applications called manure, by which they carry on their economy in manner that prevents plethora-plethora once established in annual plants they seldom recover. Ben Giles.

Sotch Don Potatoes.-In the Gazette of Oct. 25 some very good remarks on the Potato culture are made by Mr. Dixon, of Dorward's Hall, Witham, Essex.
Having seen his Potato crop last summer I took the Having seen his Potato crop last summer I took the
greater pleasure in perusing his statementa, and am persuaded he is right in planting whole Potatoes instead of cut sets. On deeply wrought land there is nothing like giving Potatoes as well as other plants, abundance of room. Mr. D. seems to grow better crops of the Scotch Dons than of any other sort. This Potato is all but extinct in Scotland now, it was so liable that almost every farmer ceased to plant it. With Mr. Dixon, however, it seems to do remarkably well. The Don grows a heavy crop of excellent quality, and it certainly would be a great pity were it going
wholly out of cultivation, particularly in Scot/aná. A Scotchman
How Wages are regulated.-"A Tenant Farmer" in the Gazette of the 4th October, denied very emphatically the justice of a remark by the individual who writes under the signature of Martin Doyle, that " in England the price of labour is regulated by the price of bread." As I think that this denial was unjustly and moost ancourteously given to the writer in question, who is accused of "great ignorance of England in the presen day England the wages of day labourers depend upon the markets. If the markets are high and the loaf at 20 d for instance, the generality of employers raise the wages one or more shillings per week, and after the prices are
fairly down then they lower them. At present the fairly down then they lower them. At present the average amount is 98 . per week, but atithough the
markets are going down and labour is rather in excess of the demand, the wages will remain at what is judged the minimum point, with due consideration for the Berks, Nov. 10

## Borieties.

Wharfedale: Award of Turnip Prizes. -The annual premiums offered by this Society, of Silve the best and second best crops of Swede Turnips, were awarded on Wednesday last. There were 10 entries in both classes. The judges were Mr. Thomas Horner East Morton, near Bingley ; and Mr. Henry Tennan Peacock, Haddockstones, near Ripley; and the follow ing is the result of their decisions. Gentlemen's Class 1st, Thomas Horsfall, Esq., Burley Hall ; 2d, W. R. C Stansfield, Esq., Esholt Hall ; highly commended, Edward Akroyd, Esq., Denton Park. Farmers Class Renton, Leathley - highly commended, Mr. John Renton, Leathley. The crops of Turnips in both classes were all commended for cleanliness. The judges gave it as their opinion that although Potatoes had been grown on every alternate ridge in Mr. Hors fall's field, that gentleman had still, from the in creased size of his Turnips, a greater weight of
Turnips on the whole acreage than any other of the competitors in the gentlemen's class. In the evening the judges, a portion of the committee, White Horse Hotel, Otley. An interesting discussion on agricultural topics ensued, in the course of which Mr. Horsfall gave it as his opinion that the cultivation of Turnips and Potatoes on alternate ridges was advantageous to both crops, inssmuch as the foliage of the Totarnip, and on the latter having expanded its of the Turnip, and on the latter having expanded its leaves
to the full those of the Potato had considerably dwindled to the full those of the Potato had considerabiy dwindled
the effect was to afford to each crop the advantage of freer access to the influence of the atmosphere when most required. The produce of his Potatoes up to the acre, reckoning only the ground occupied by Potatoes The Potatoes taken up since the wet season had been partially affected with rot, and on this aecount had not yielded equally well. For many years he (Mr. H) had applied his manure (the liquid and solid excrement of his cattie, which is withoutadmixture of straw) quite fresh, and without previous fermentation; he preferred doing this on his stiong land in autumn, but in case of his applying it in spring near to seed time he had found it advantageons to strew guano amongst the fresh excrement at the rate of 2 to $2 \frac{1}{2} \mathrm{cwt}$ per acre. The effeet of decayed latter, was well known. In order sound, affecting the satisfy himself of this, he (Mr. H.) had filled two large garden pots with fresh excrement, in one of which be mixed a small quantity of guano; the effect was soon perceptible by a change of colour and by the appear ance of gaseous bubbles on the surface, accompanied
admoxture of guano did not exhibit the same appear-
ances. The advantage of accelerating the decomposiances. Tha advantage of accelerating the decomposi-
tion of manure for Turnips would be acknowledged. tion of manure for Turnips would be acknowledged.
The experiment was tried twice in his Vinery at a Mr. Horsfall's crop measured in girth 2 feet 4 inches to 2 feet 6 inches.

## 3xruictus.

Rcport to the Committee of the Royal Society for the Promotion and Irprovement of the Growth of lax in De Cock-Kenifeck, Belgian instructor to the Society. August, 1856. Belfast.
We extract from this little tract, published at the Belfast Mercury Office, passages on Schenck's system of superiority of this more rapid warm-water process of steeping and preparing straw for scutching over the oldfashioned plan of retting in pools, or by exposure on the Grass to rain and dew. The report refers to a series of retteries visited by the author. We shall give
but one of them as a specimen in detail, along with the general remarks suggested by a review of all.

From the reports given it appears that in a wellconducted rettery, a ton of scutched fibre, ready for market, can be produced at an average cost, for represent a fair allowance per ton, and that 81 more for interest of capital invested-making in all, 16l. per ton. "This calculation" says the writer" "is fully borne out in a report made by M. Kindt, Inspector under the Belgian Government, to the Minister of the Interior, in May, 1855, on the rettery of Bouvignes, Province of Namur, established by M. de St. Hubert, under the parronage of Government. He therein calculates the working expenses, wear and tear, and interest of capital at $15 l$. per ton of fibre produced. The Bouvignes rettery, which I did nat visit, is not in that portion of Belgium where the management of Flax is 80 wel understood. It is situated in the Walloon country, where the farmers are much behind the Flemish in agricultural skill. Although the soil is capable of producing a very good Flax plant, the culture is carelessly managed, and in place of steeping, the very inferior process of dew-retting is resorted to. M. Kind reports the result of an experiment in which 800 kilogrammes (about 16 cwt .) of Flax straw was divide into two equal portions ; one-half dew-retted for 30 days produced $17 \frac{1}{8}$ per cent. of fibre from the retted and dried straw, and was valued at 296. per ton, the total expense being estimated at $16 l$. . per ton ; the other hailf, steeped at Bouvignes, on Schencr's system, in four days, yielded $18 t$ per cent of fibre, valued at 462 per ton. But although this showed a very grea bslance in favour of Schenck's system, it was by no means what it has siuce become, under the vary able direction of M. Auguste Serive, of the Lille rettery before mentioned.
"I was desirous of obtaining the opinions of the proprietors of all the retteries I have referred to on Schenck's steeping process. The following is a summary of their views :-1. That the principle of Schenck' system of retting rests on a sound basis. 2. That, as far as possible, all the processes should imitate thos practised in the ordinary open air steeping. 3. That the wet rolling is a decided improvement, but should be used with great caution. 4. That to meet the demand for Flax fibre, it is desirable to take its management out of inexperienced hands and to place it in those who can carry on with regularity and skill in retteries. 5. That o obtain satisfactory results there is much want of a self-acting scutching machine, giving both quantity of work and yield of fibre, and aso or a good tow cleaning machine. 6. That only the worst portion of stra should be steeped in midwinter, or that the steeping should even be totally suspended at that period possible. 7. That task or piece work, instead of pay ment of labour by time, shoulofitably worked in al localities where average good Flax straw can be procured ca a less cost than 67 per ton

Your secretary having considered it of importance that I should closely examine one of the Irish retteries in order to compare it with those on the continent, and having selected that of Messrs. Pownall and Co., near Enniscorthy, for that purpose, I have now to submit

This rettery, which was capable of working 40 ton of straw weekly, was established by an enterprising English company, in a new Flax growing district in the connty of Wexford. It has in a short space of time attained great efficiency of organisation. While seedng, straw is."sorted into different qualities. There are anks out of doors for economising the water for steep ateepvats, for irrigation. Mean temperature of stecply 78 degrees (Fahrenheit), with a small continaal through of cold water. The steeped straw wet-roled thes, and several pairs of rollers with a high presenre, in the
copiously washed by a flood of water. Drying in copiously washed by a flood on wire, very ingeniously disposed to secure rapid dessication, and provide against injury from weather. Some of $\mathrm{M}^{\prime}$ Bride's scukning machines (of his first patent) are employed, This rettery aly under the immediate manage inenious details, as wel for the saving of labour as for the quick handling of the
straw when steeped. From the large difference in the yield of cultivation to ensure a more equal quality of the material.

Price of unseeded straw, per ton, $4 l .10$ s.
Yield of seed 5 bushely
Loss by seeding, 18 per cent.
Cost of seeding, per bushel, 1 s
Cost, per ton, of seeded straw, 32.5
Working expenses, per ton, of scutched fibre, 87.15
Loss of weight in steeping, 25 to 33 per cent
Yield of fibre from unsteeped straw, 15 to 25 per cent
"I now come to a comparison of the different retteries I have referred to, in the principal items. They are as follow: -

Rettery.

1. Dordt, Hol-
2. Dankerque,

France ...
3. Lille, France

5 Wilum, Irelanत

In none of these returas is any account taken of able shows, in the first place, wide difference in the first cost of the straw, and is not borne out by the difference of quality in the fibre. There is also a great difference in the working expenses. Though the yield of fibre is variable, it appears that the three best continental retteries give nearly the same per centage.
${ }^{6}$ The fibre produced from wet rolled straw has been objected to by spinners from its weakness. The question ariges as how this is to be remedied. The following recommendations appear to me worthy of trial :-1. The steep straw only to be rolled when well drained. 2. No shower of water to fall on the straw, which I think washes fibre off, but rather an immersion in water, by a continual supply from a reservoir, through which the straw should pass, on an endless web, from one set of rollers to another. 3. A trial of both cold and hot water, at 70 degrees (Fahrenheit), to ascertain which will act best. 4. Not to oversteep the straw, and much attention to the handling of it after rolling.
"Up to this time, much diversity of opinion subsists as to the advantage of wet rolling. By much rolling, and a copious washing, the gum is of course removed, and the full quality of the fibre developed; whereas, when the gum remains, there is a marked difference in the ppearance of quality in the fibre proded reme traw. It remains an openquesios the haekle, for o not actually part of o mechanical acton washing could iopart a quality llo hay ollers may carry too far a divion of the frore whin heavily pressed upon. As for the total removal of the gummy substance by washing, I cannot see its absolute necessity, when the straw is exposed to the atmosphere, ollowing the same course of treatment by which the best fibre is produced, in the ordinary processes. From the good results I observed in every rettery where the vats receive a constant supply of fresh water, at nearly steeping temperature, I think all retteries should be provided with a similar supply. If no mesns of obtaining it existe, such as are found in Dunkerque and Lille retteries, a spare reservoir might be constructed, where the water would be heated to the requisite temperature, and regularly kept up to it, which would eave much fuel for the vats."

SATURDAY, NOVEMBER 22, 1856.

The Court of Chancery has lately pronounced a most righteous judgment in a matter deeply concerning the interests of country gentlemen and cultivators of the soil. It has punished with all the severity it could command a case of great oppression : effectually throwing down the strong man grievous than the nuisances with which we are assailed in all directions by people who seek to make money at the expense of their neighbours. One man sets up a wharf, brings to it all that is most stinking and loathsome, stifles everybody near him, and justifies himself upon the plea that mannre making is a public benefit. Another builds a tall chimney, manufactures alkali, kills the trees within half a dozen miles of it, and drives from their houses families who have lived there for generations ; the justification is that alkali is a most importantarticle in this great nanufacturing country. A third establishes gas works in the midst of fertile fields, covers the neighbourhood with soot, ruins the poor man's crops, and converts his district from a garden into a dirty desert; the defence is that gas illumination is a public necessity. Let us hope that the case of Broadbent v. the Imperial Gas Company will teach great people that might has not yet overcome risht, and little people that the law of England wiil protect them.
The case in question was this:- The plaintifi, a market gardener at Fulham, sought, and, after a long struggle, succerded m ohtaining an injunction restraining the defentants from making gas in a certain retort house newly erected by them. Mr. Broadbent carried on the business of market gardener and florist at Sinl's. End, Fulham, and after he had commenced so doing, the Gas Company erected their works. Until recently their retort houses were too far off to do much inju:y, but latterly the Company found it necessary to erect new retort-houses, which were built much closer to the plaintiff's groonds than before. He brought an action against the Company for damage caused by the gases and soot evolved from the new buildings. The action ended in a reference to arbitration, and after a long investigation the arbitrator made his award in the plaintiff's favour. The nuisance however continued unabated, and therefore
an application for an injuuction to restrain the Gas Company from carrying on their works was made to the Court of Chancery. Th case was heard before the Vice-Chancelior Woon, and as already stater the injunction was granted, the effect of which is that the Company must either discontinue their profitable ba-iness, or must make ample amends to Mr. Broadbent for the injury done to his property, so that, when it becomes their own, they may do with it as they like.

The history of this case affords a good example of the way in which powerful companies with money at their command set at nought the rights of private individuals, and for the sake of increaling their own dividends ruin without scruple anyholy. Amongst other reasons arged on behalf of the Company in opposition to the plaintiff's application, it was said that the pablic would be most seriously inconvenienced if the making of gas in the new houses was prevented by the court. A similar argument is, we believe, always urged in cases of this description. It has a specious appearance, but a little reflection will show its atter worthlessness.

In what sense was it necessary for the Company to erect additional works? Obviously only to enable them to supply an increasing demand for gas; and where was the necessity of their doing this? Simply because if they did not some other company would, and thus a good business would be kept more or less stationary, and an opportunity of increasing profits would be allowed to pass by. Such is the argument put into its true light. We acknowledge that cases do occur where for the sake of some great public benefit private rights must be interfered with, and that it may be justifiable to compel a man to part with his own whether he likes it or not apon being duly compensated. But we protest altogether against the conduct of those who for their own pecuniary gain, but under the specious pretence of rendering great services to the public, attempt to violate the rights of others. There is a good old maxim that "no one shall take advantage of his own wrong," and it is not possible to apply this too rigorously where the power, irresponsibility and money of a body of men associated for purposes of gain are used with the view of increasing their own wealth at the expense and even ruin of their less powerful neighbours.
Another feature in this important case which demands comment, is the natare of the evidence adduced by the defendants for the purpose of disproving damage to the plaintiff. Mr. Broadbent complained and he and his witnesses proved that his fruit trees were destroyed or rendered unproductive, his hedges blackened and decayed ; the branches of his trees were covered with soot, his annual crops were injured, and his trade seriously affected by the impossibility of bringing what few vegetables he could raise early into a state fit for sale. His scientific witnesses, one of whom was Prof. Way, proved that the leaves of his vegetables were covered with white spots, and those of his trees were shrivelled up; that the branches were so loaded with soot that it could scarcely be cleaned off, that their breathing pores were choked up, and their very tissue disorganised.
The Company, in answer to this, attempted to make out that the damage was caused by the coldness of the season, a neighbouring brickfield, the drainage from a heap of "Blue Billy" (the workman's name for gas-lime), an inundation, east winds; and, as if all these were not enough, the exhalations from a neighbouring dungheap! The defendants admitted that after drawing their retorts the hot coke contained sulphur, that when water was thrown on the coke fumes of sulphurous acid escaped from the retort houses, and that such escape in small quantities could not be prevented. But notwithstanding this and the facts deposed to by the plaintiff and his witnesses, persons were found to sapport the preposterous theory that the injuries complained of might have been caused by hydrosulphate of ammonia derived from a common manure heap. If this ahsurdity had proceeded t unworthy of notice; but such was not the case. On the contrary it was supported hy gentlemen of known scientific attainments. We unf rtunately are too well aware of the little value attached by -ither the bench or the bar to scientific evidence. We know that scientific witnessus are reyarded as partisans ; and that their evidence is scarcely thought more trustworthy than that given by horse dealers or seamen in disputes about a horse warranty or the running down of a ship. This impression so unfavourable to men of science has of late been rather strengthened than otherwise. It cannot for a moment be disputed that it is no part of the business of any witness to make out a cave. The daty of a scientific witness is especially plain however difficolt it may be to perform. All he has to do is to observe carefully, to infer cautiously, and to state
his conclusions boldly, whether they tell for or against the party calling him. If this became general, scientific evidence would be estimated at
its proper value, and would not, as is unfortunately the cave at present, be regarded with distrust and suspiciou even when given by men whose impartiality is as unimpeachable as their talent.

## New Plants.

187. Ciamactparis thurifera, Endl. Clen. Conif., 62, chas Cupressus thurifera. Humboldt, Bonpl, and There is commonly found in gardens throughout Europe a Mexican Coniferous tree called Cupressus thurifera, under the supposition that it is the plant so
called by Humboldt. The late Prof. Endlicher however pointed out the mistake, showing that the garden plant is a true Cypress, while that of Humboldt is a
Chamrecyparis, and therefore he called the latter Chamcecyparis thurifera, giving the name of Cupressus Benthami to the wrong-named garden plant. Lindleyi for the same thing. No two plants can be more different than Cupressus Benthami and Chamrcyparis thuvifera - the first a true Cypress with numerous Chamæecyparis with only two or one, and those not Bed
But nobody seems of late years to have met with this Chamæeyparis in Mexico; even in the vast Her-
barium of Kew it is not to be found. A few cones of a Cypress-like plant with roundish wingless seeds having however been received by the Horticultural Society, and raised in the Chiswick Gardens, further inquiry has led to the discovery that this Orizaba plant is in all probability the long lost Chamæecyparis thurifera. Mr. Botteri sent them home without one word of information, that lie forund it in a cultivated state. Being a true Channecyparis, and only one from Mexico being known to butanists, the inference that we liave at last the true plant of Humboldt seems inevitable. In that great philosopher's work, above quoted, it is said to be a very tall resinous tree with spreading branches,
whose timber is used for building purposes. The young seedlings in the Garden of the Horticuitural Society are very glaucous, with almost the aspect of a Thuja. How far they may be able to bear this climate remains to be ascertained.
188. Thujopsis borealis of Gardens.

What is this beautiful and quite hardy Conifer Received origially from Messrs. Booth, of Hamburgh and sent into the trade by Mr. Pontey, of Plymouth, it bears a name for which nobody chooses to be responsible It has also borne the name of Th. Tehugatskoy accordfrom the neighbourhood of "Lake Tschoudskoe", place we are unable to find in any map accessible to us But it may also be surmised that this word Tchugatskoy is only an erroneous reading of Tschukotsk, the name of a Cape on the western shore of the sea of Kamtehatka, to which circumstance the name borealis might very well point. Should that be so, the question arises whether this Thujopsis borealis may not be the Chamcewest coast of America, about Nootha Sound and Obser vatory Inlet in the island of Sitcha, a place frequented officers of all our' expeditions have been seen by the and it is much to be regretted that they did not procure seeds. The Russian botanist Bongard calls Cupressus putkiensis Thuja excelsa, which renders it the more probable that Thuja borealis is the very same plant. The difficulty is that Cupressus nutkiiensis has 4 angled shonts, while those of Thujopsis borcalis are flat. Is that the difference between youth and age?

## NEW GARDEN FERNS.-No. XV.

27. Stenosbmia aurita, Presl; not of Hooker. Acros
Blume
Pronds ternate, puberulous on the veins, the firriile contracted
 nes elnyated, broadly lancpolate, and pinnatifid; the segments paleaceous. This is one of those Ferns in which the hinder or ower side of the divisions of the frond are more developed than the auterior or upper side, producing considerable obliquity of outline in the parts. It is a very group, having separate sterile and fertile fronds contructed on the same plan, but the former broad and leafy in the parts, while the lntter have the narrow space which horders the rib or rachis, closely covered on the lower surface with spore-cases. It grows from 1 to 2 feet high, with very long stipes, which are scaly below, and terminated by the pentangular fronds. The sterile ronds are 6 or 3 inches long, and nearly as much in breadth in the leafy parts, ternate, i.e., divided into three branches, which are sessile. The upper branch is ovate, somewhat cuneate at the base, deeply and equally pinnatifil, the segments oblong, acute, entire, repand or pinnatifully lobed below, the upper ones
becoming bluntish and confluent. The two opposite lateral branches are also pinnatifid with segmente cimilar to those of the upper branch, but diminishing in
much enlarged on the posterior side, so that they are very oblique in outline; Blume describes them as dimidiato-cordate. The basal posterior lobe is considerway to its midrib into oblong bluntish secondary lobes ; the apex of one of these, representing the peculiar netted venation, is shown in the accompanying
figure, which also shows one side of the base of a fertile frond. The fronds are viviparous in the axils of the branches. The fertile fronds are very much smaller and on longer stipes; their divisions ard barrow linear, appeariug as if reduced to mere skeletons, and the lateral branches again are oblique in consius side Two or three olants with similar venation, but different in the structure

of their fronds and in the nature of their fructification, vere associated with this species by Mr. Smith in his enumeration of the Philippine Island Ferns collected by Mr. Cuming. One of these figured by Sir W Hooker as Stenosemia, we conceive to be the plant figures in the Tentamen. It is an interesting sto orn Introduced rom the Dutch ga

PRACTICAL LESSONS IN BOTANY FOR - BEGINNERS OF ALL CLASSES.-No. XII.

Flower-Buds. - The abundant formation of buds in the axils of leaves is only partially applied to the developement of branches with leaves. Many leaf-buds perish, others lie dormant (often for years) until pecular circumstances (as the decay or pruming of the Certain buds, from the earliest stage in which their several parts can be distinguished, instead of presenting the more usual condition of closely packed nascent leaves, assume the character, and develop as an aggregation, of "floral organs." Such buds are termed
"flower-buds." The influence (whatever it be) which impressed this condition on some buds, seems also to be more or less felt by the earlier buds which produced the branches on are formed. In the Bean we observe this to be the case. A bud on the main stem (s) has developed into a short The leaves which in the usual developement of a leaf-bud would have appeared upon this branch, formed), and their position at the nodes is only faintly indicated by slight swellings. The axils of these arrested leaves would lie immediately above these spots, and here it is the flower buds are formed. These develop into flowers with 5 sepals (cohering), 5 petals, 10 stamens (cohering), and one carpel. One or two of the lowermost buds produce a very short stalk to the flower. As the artist, in improving on my own sketch, has introduced the base of a petiole ( $p$ ) with a stipule (st), the latter completely hides what I had intended to show. I must, therefore, leave the existence of such a short flowerstalk to the imagination, and content myself with indicating the position $(p)$ which such an one would have decupied below the uppermost flower if it had been developed there. The modified branch from which all "peduncle" " $p$ ) ; and every produced is called a "peduncle" (P) ; and every little branch or stalk supporting a flower is called its "pedicel" (as at $p$ " if oue had been developed there!
N.B. Oftentimes the branches produced from buds ormed on a peduncle do not immediately support ig takes which support the flowers are developed from the true flower-buds. In numerous cases the flower-buds do
on the peduncle. In many, also, only a single sessile formed from a terminal flower-bud at the summit of the peduncle (see Ex. 2, Wood Anemone)

Vernation and Estivation.-The manner in which young leaves are packed in a leaf-bud is termed theis "vernation" (vernatio, a renovation); and the disposi-
tion of the floral organs in a flower-bud is called their "estivation" (from astiva, summer quarters).
Bracts.-Leaves developed on peduncles and their branches assume forms and characters more or less called "bracts." They are generally small, and are cale-like. No bracts are formed on the Bean, the leaves on the peduncle having been arrested, as we explained.
N.B. In the figure to Ex. 1, white Lily, we see many cale-like bracts on the peduncle. In Ex. 2, wood Anemone, there are three large bracts, closely resembling ordinary leaves, seated in a whorl round the peduncle In Example 4, bulbous Crowfoot, no distinct bracts are ormed, unless the uppermost leaf on one of the peduncles should be so regarded. In Ex. 5, wild-cherry f the pedicels are bracts. In Ex. 7, Willow, the flowers are too crowded to show the small scale-like bract at the base of the little pedicel on which each is eated; but it is readily observable in a specimen. In scales which in the figure surround the unexpanded head of flowers are bracts. Many plants of the same order (Composites) have also one or more bracts at the base of every flower. These bracts arise from the receptacle, and (owing to very close packing) become mensbranous scales, bristles, or hairs.
Inflorescence.-This term is applied in the aggregate to all the flowers that are seated on the same peduncle, o its branches collectively. In many cases it will necessaxily be restricted to single flowers.
N. B. In the few woodcuts introduced in Nos, $V$ and VI. the term Inflorescence will be applicable to single flowers in Examples 2 and 3. It includes more than one flower in Examples 1, 5, 7, 8. The term is, in fact, of rather arbitrary application, though there is seldom any difficulty in determining whether it is to be applied to a single flower or to comprehend two or more. Where the flowers stand apart, or where each stem or branch supporting only one flower bears fully formed leaves, the inflorescence is restricted to such one flowes.
But if a main stem or branch supporting several flowers But if a main stem or branch supporting several flowers then it assumes the character of a peduncle, and all the flowers directly or indirectly supported by it constitute the inflorescence

Without here defining or explaining the several terms which designate different kinds of inflorescence, we may advantageously allude to the relation in which five principal kinds stand towards each other. Any elementary work will define the terms employed. Suppose the flower-buds on a "spike" were to form nearly equal pedicels to its flowers, we should have it transformed into a "raceme." If the pedicels in a raceme were 50 lengthened relatively that the flowers stood nearly on the same level, $a$ "corymb" would be the result. If the internodesbetween the pedicels of a corymb were arrested, but the length of the pedicels still so regulated as to keep the flowers at about the same level, an "umbel would be formed. If the pedicels of an umbel were arrested, so that its flowers became sessile, whilat the summit of the peduncle was sufficiently expanded (into號 " heneral receptacle) to allow If the expanded summit (general receptacle) of the peduncle supporting a head were elongated, the obliterated internodes being aso restored, we should return to a "spike." These forms of inflorescence, therefore, depend upo
developements of the peduncle and pedicels.

To be continued.)

## THE CROP OF FRUIT IN 1856

Ir has seemed strange during this autumn to travel through the fruit-growing counties and see all the trees bare of fruit, looking, as compared with last autumn, most desolate. Devonshire, Gloucestershire, W orcestershire, Herefordshire, and Kent, counties generaly so productive in orchard produce, have failed in common with the counties not so highly favoured by climate and soil. I hear also from a friend who has travelled through the fruit-growing districts of Germany and France that the failure there has been the same. In America (the United States) the main crop of fruit
an entire failure. The canse of this seems worth inquiring into. In my own orchard I imputed the frilure not to frost, for there was no frost sufficiently sharp to injure the germs of Pears and Plums whe remained green and fresh till they dropped off (the latter even commenced to mulch), but to the successiod of moist cold winds from the north-east, which seen its to glue the pollen to the anthers, and thus prevonhere proper action; but would this state with such a variation of exist over so large as sace, and alluded to? Allow me to surface and chmat of your meteorological readers will cuss in rour columns this most interesting subjec

When M. de Jonghe visited England in the frost of the 25 th April, he then triumphantly told us that he had plenty of fruit, and that if we obey his instructions with regard to thinning and pruning out

November 22, 18 ă 6.
THE GARDENERS' CHRONICLE.
wres they wulu always resist the humical eftects of our
In short that climate had nothing to do with it, climate. In short that climate had nothing to do with it, frees managed as English trees were never could give any fruit worth a dump. ere sound and good; but 1 as to thinning and pruning in asserting that culture could avert the effects of $7^{\circ}$ or $8^{\circ}$ of frost in the blossoms of fruit trees. It was
gmusig to see in 1855 our unpruned abused English Pear trees give a direct contradiction to all that M. de Jonghe had advanced in the autumn of 1854 , for withou any hesitation, and not waiting to be educated, they gave us the most abundant crop of the finest Pears have erer seen. They have sthast, for I know some culti-self-will the seass thinned their trees of fruit and carefally educated them, hoping to have a crop in 1856 ; but, alas, the produce ; thus telling us in tolerably plain give that cortain matters are beyond our contro
Some cultivators have recently put forth the idea that Apple trees if never suffered to overbear will never fail give a crop. There are some varieties which give the are the that their usual rest This is rood practice, but has totally failed this season; fact it is now apparent that in open air fruit culture he effects of some adverse seasons cannol be avoided noms and excellence of the Sturmer Pippin Apple. ness and excelience of the sturmer a pavourite in Covent Garden Market as a late dessert fruit. For sew years I had fine crops, and congratulated myself on my good fortune. My last good crop was in 18 , same
1852 the blossom was all deatroyed by frost ; the same in 1853 ; the same in 1854, by the severe 25 ; and the trees were also much injured by it they had a blighted appearance all the summer. thinned the trees with much care the following blossoms were pale and weakly; they all dropped of rithout setting their fruit; but the following summer (1855) the trees were in fine health; they were pruned in the autumn, and I anticipated from the long rest they had had that I should be favoured with an abunsant crop in 1856. The trees last spring bloomed magnificently; the blossoms were vigorous, the weather emed (as droper 100 to 500 pples from twes ushels. I could not dscover .ialts bere all perfect jaured, for petals, stamens, and pisis were all perfect, and the weather was so fine that the pollen seemed to perform its office. It appeared to me just one of those aysteries so often very properiy broug bero the eye of the gardener, to bring him up as it were, and enetrate into all that Nature pleases to do. I have there re now come to the conclusion that good culture should ways be practised, but that it is idle talking for any culvator, be he Flemish or Einglish, to assert that he can control his crop of fruit on trees in the open air by any peculiar culture. The most favourable circuman and cold dry winds from north to south.east. Three or four degrees of dry frost at night are of no ill consequence ; this is the climate of the great fruit growing districts of the east of Asia, and also of those pasts o Germany where in most seasons such enormous crops Plams are grown. Our moist Atlantic and Eceland Ireland, and Scotland are most inimical to the blossom $f$ fruit trees, and I fully believe that to ensure regular rops of Pears and Pluns our fruit gardens must be covered with glass, and the orchard-house system much nlarged, for espaliers, and pyramids, and bushes may eeldom or never to fail to give good crops. I know of one ciever cultivator who has planted a house with Plums as pyramids; these bear so abundantly ever year as to do away with the necessity of root pruning, ress large quantity of fruit went the trees makin wood vigorous and unmanageable. T. R., Herts.

## Home Correspondence.

Conical Boilers.-As the author (in England at least) mards boilers which 1 have employed now give a atisfactory answer to the inquiries of some of your correspondents. The fuel suitable for conical boilers is either housecinders, gas, or oven coke, or Welsh coal ; that is to say anthracite or non-bituminous stonealt, which are raluable in the order in which house cindeded them; though for certain purposes houseany of the other kinds of fuel. The most powerful of tion of is anthracite mixed with coke in the proporto about the size of hen's eggs. This I employ only in heat Ordinerily I burn anthracite only. Fuel equal Ordinarily I burn analathe ancite, is valuable equal quality, say oven coke and anthracite, is the ratio of its weight-that is to say, 1 lb of fuel will do a certain quantity of work whatever its bulk be. Now, coke is lighter than anthracite, and a greater for balk the weight of oren-coke is to anthracite about furnace is 15 inches diameter will hold about 60 lbs of anthracite or 36 of coke. It is evident, therefore, that a charge of anthracite will do more work than a charge very inferior to oven-coke ; cinders are not quite equal to good oven-coke but superior to ordinary gas-coke. that a 15 -inch furnace of the construction which I employ will heat thoroughly 150 ft . of 4 -inch pipe, and burns from 60 to 75 lbs , of fuel per 24 hours when doing bo and working at as high a temperature as I find vecessary for an Orchid-house. In severe weather perhaps something over 75 lbs . is burnt, but on an average of six winter
months 75 lbs , will cover the daily consumption. This quantity is put in in two, or at most three charges, that is to say two charges of 12 hours each in moderate, and three charges of eight hours each on an average in cold weather. The object of the more frequent charges is that the furnace is not kept quite so full in severe as in ordinary weather in order to allow more draught. With respect to duration of fire it will remain a-light unatlast 12 hours in the latter case would be small and oncertain ; and if the fire be allowed to get very low, it either becomes extremely fierce or goes ont, so that to ensure a regular fire it is best to feed it every 12 hours employed ; it will keep a-light longest with house cinders ; it will give most heat for the longest time with anthracite ; it will burn out quickest, giving the same time much heat, with coke. After 20 years' ex perience I can safely say that there is no boiler which s so easily managed, or which will give so much and uch uniform heat, with the same quantity of fuel. Nor is there any boiler which requires so little attendance In conclusion errould guard your readers against a giving them too high chimneys, and consequently too much draught, which makes them almost unmanageable Where they are attached to a high chimney, the bottom of the chimney should be left open, so as to admit draught of cool air to pass upit. In this way I use a boiler attached to a chimney 40 feet high which warm my dwelling-house. The proper height of chimney for a conical boiler does not exceed 6 to 8 feet, and ther should always be a soot-door or means of admitting air at the bottom of the chimney, which will regulate th ire better than any damper. J. Rogers.-_Sigma (see p. 742 ) states that to heat a large house with Rogers'
Conical Boiler would only cost 111 l . 2 s . He means, I magine, the expense of boiler and pipes, together with that of fixing them, Another correepondent (see p. 758 ) says a house 30 feet long by 14 wide cannot be heate under 20l. Does he mean the expense of fue difficult for any one to say what it would cost for fuel heat a house, so much depending on whether the latte lofiy or low. A low house is best adapted for early forcing and consumes least fuel. Again the expense of fuel varies; in one locality you may buy coal for 103 pinters also make a difference of several pounds in the expense of fuel for heating purposes. In 1855 I forced with a conical boiler, the fuel for which cost 211.10 s. Finding that the boiler just mentioned consumed a great quantity of fuel, I had it removed and replaced with one of Taylor's tubular ones. With this boiler th uel this season for the ahove named house only co 22. 10s. The Grapes in 1855 and this year were fit ut the second week in June. Having given various shaped boilers a fair trial for several years, 1 can wid confidence recommend 'Taylor's as being bnth efficien and economical. A. C., "Oombermere Abbey, Cheshire.Sigma begs to inform "N. B." that he has had no expe rience as regards burning gas cinders or Scoteh coni Rogers' boilers. Probably w. Lhis kind of fuel. The boile lluded "one who has used a Vinery 110 feet by 15 feet, and this one may be left for 24 hours without any attention. Mr. Lynch White's boiler at 50s., and capable of heating 150 feet of 4 -inch pipe, requires attention every 12 hours merely because it is smaller. "A Constant Reader" will find the best cement for joining iron pipes to be a mixture of Portland and Roman cement, the former to strengthen, the latter to set quickly if required. Sigma only recommended an economical plan for heating an orchard house, so as to exclude frost during the and wood. If "A Constant Reader" has not already a little work written by Mr. Rivers and styled "The Orchard House," he bad better get one for heating an and he will then know what is required for state that a orchard house. Sigma begs again to state that a large orchard house 60 feet by 20 feet can be heated
sufficiently to exclude frost and advance the ripening of the fruit and wood for 111.2 s , the boiler costing 50 s . and the 4 -inch pipe and fittings 81. 12s., whe gardener fixing the apparatus, as in his case. With regard to Sigma's "statements being insely to misead the with these matters to be a safe guide," perhaps this had better be left to a more competent judge than "A Constant Reader" appears to be. Sigma.

Lilium giganterm.-1t has often occurred to me that the besucy of this plant might be greatly enhanced ii we could introduce more colour into its flowers, say scarlet or crimson. If that could be done without
ond foundation for aneral charactan, What species do you think would be the best to use for obtaining thie result ? I have a very strong lulb, th best we have ever had, which will flower next year, and Somerl purpose trying the experifferent in manner of growth from the others, that we fear it will be imposeible to cross it The best way perhaps would be to try it with tigrinum, superbum, lancifolium, and chalcedonicum.]

Fater Pipes. - I observe an inquiry from Merseman" concerning iron waterpipes, and have been troubled in the same way; and I believe the discoloration arises from carbonic acid gas in the water which has an affinity to the iron, and the best emedy I conceive, after much inquiry, to be the use of Paris patent glass enamelled wrought iron pipes made by the Birmingham Patent Iron Tube Company, Smethwick, near Birmingham. These tulues are itrified or covered inside and out helieve will angwer glass, al have eryy oly somples but am shout using them. C. Willcoxson, Tonbridge Wells.-The best remedy to prevent the oxide or rust in pipes for the conveyance of water for washing or house pur poses, is before laying them down to thoroughly clean and then limewash the inside. I manufacture these perfectly. Lonch $W^{\text {Hehita }}$
Cloth of Gold Ruse, dec.-You have had many inter esting communications about the Cloth of Gold Rose and I shall be glad to add my experience to that of your other correspcndents. 1 have a plant on its own root, put out from a pot in 1848 against a soun dan, think it wrew as many incles, but in 185 L it threw out two shoots from the collar, each of which made about 12 feet of wood. These are now the main stems; one measures at the point of separation, nine and three quarter inches in girth, the other seven. It reached the top of the house about 28 feet two or three year go makes shoots annually of eight or 10 feet in length The border is narrow, of very poor soil, bu he pi is roulary mulched and watered with liquic It is its extreme bere. is this reapect that itieve sets peoplo
 gann ill with precisely the beauty woure bear year I can never count same culture year by year, 1 can cover . there blooms. In have been less than 200 , or 250 could not with equal growth of wood there were This year, with equal growloms come chiefly from perhaps 20. A frad the young wood of the prevous yert, in tho , hoots thorouchly, is essential to a free bloom. I have observed that nearly every year two or thre strong eyes start from about the collar of the plant which invariably, when about a yard long, cease grow and throw large trusses of bloom, but the individua flowers are not nearly so fine as those which come singly. The plant has no pruning except cutting out owing no doubt to a want of a more liberal treatment I have another plant budded on Sir Walter Scott (Noi sette) which makes strong growth, but is too young to determine anything as to its blooming propensities. Now I want to gay another word about Roses. How are we unfortunate amateurs, who cannot always go and see or ourselves, to be guided in our choice of new ones That extract from the "Florist" in your 45th numbe is to the point. A catalogue one year extols a ne Rose, and gives such epithets as "perfect, superb, and so on while in the following year it puts the same Rose aside as an ordinary flower, or worse. from and be is more lost than from The fing thers and Wood Here is Mr Wood's description of Williome new evergeen climbing rose:-"This is a seedling from Ayrshire Splendens, fertilised with yellow Thea its rapid growth and elegant habit is precisely like the Ayrshire Splendes, while its alossy folisge and long lemo Spleadens, wartak of the character of the yellow Thea its fowers are creamy white, deliciously sweet scented, and are borne in long racemes of 12 20 on a single shoot, being produced from every axil. Now is that not enough to make your mouk water for such a Rose? I had nearly bought a plant in conse quence, but happened to have no room for it. Well now for Mr. Rivers:-"Williams' evergreen climbing Rose has proved quite worthless." Is not this a amateurs fom deciding? The old Roses are the best yet. I do not believe there are six better than Coupe Reine, Baronne Prevos, prince indeed, but La Reine beats all when it opens properly ; it is uncertain, that is its fault. If you want six more, the following are first-rate, here-General Jacqueminot (hy. China), Louis Bonaparte (hy. perp.), Triomphe de Paris (hy. perp.), William Griffiths (hy perp.). These are 12 old Roses not beaten yet, in my maison. A. Rese Bromley.

Swans. - Several inquiries have been made as to the widh of diter necessary for swans to travel from one pond to another; and also whether they would pass up a tunnel. Is any ditch or tannel necessary? Swan

Wim reauly huu tutir way irum pond to pond if not more
than a quarter or half a mile distant-indeed they are than a quarter cr half a mile distant-indeed they are
often troublesome from this preat disposition to ramble often troublesome from this great disposition to ramble
from one pond to another. If your inquirer will drive from one pond to another. If your inquirer will drive
them once from one pond to the other they are wislied to frequent, they will visit it quite as often afterwards by land as they would do by a ditch if there were one. While on this subject I will mention a curious fact which occurred a few years' since near Plymouth.
pair of swans frequenting a pond died. The owner not being able to get another swan, had a wooden one made painted white and moored in the pond. The survivor neighbourhood. A visitor doubted the fact of the its one frequenting that part of the pond on this account, of the pond 0 ive one. By thisy, when it was at once followed by the live one. By this contrivance the swan was always kept in the part of the pond which was visible from the windows. I imagine a similar effect might occur with a pair of swans if a wooden one was
Lee's Prolific Fig.-I have a specimen of this about 5 feet high with several stems grown in a tub 14 inches equare, and from 18 to 20 inches in depth. The plant is from four to five years old, and has been standing in soil in which it grows is black earth supplied occasionally with pure cowdung. Last year and this it bore three distinct crops. Between July and the present time I have gathered 20 and 30 Figs in succession. Two days ago two more Figs were gathered ripe; and at this time one more is ripening for a week lience,
There is also on the tree abundance of fruit for the oming ason. I should add that the fruit was well Gavoured and juicy. C. George Thornton. Marder, Now, 15 Couve Tronchuda.-This is recommended by respect able seeusmen as furnishing a good substitute for Se kale in the ribs oi the hesves, but it hearts lite Cabbage, so how can it be so nsed? Have you any ax perience of its good qualities? Inquirer. [It is the bes Cabbage known, but must be consumed before frost comes. It does not heart, or very little. You seem to have grown the wrong sort.]
Peturia Imperialis.-Having bloomed this Petania successfully in the open border, I am satisfied in stating that I have found it to answer in every particular the character given it loy Mr. Turner when he sent it out to the public. I have found it to succeed best in poor form erhaphat find of soil he prew his plants is J. Milner, Lotties Hall, Bedean, Yorkshire.

Canadian Mountain Ash.- What a pity it is that this is not more cultivated as an ornamental tree. It is a splendid tree when in berry. The only ones I ever saw were six sent me, as "the true Service" from Stamford Wey are admired by all who see them. W. D. F.
Wellingtonia gigartea - Subjoined are the dimensions of the growth of one of my plants for this season only. One summer's growth :-Length, 2 feet 2 inches; width of branches at base, 2 feet 9 inches. Nineteen branches on the shoot which form a cone. Girth of shoot at base $\frac{7}{\frac{9}{2}}$ inches. My largest plant at the base is $6 \frac{1}{3}$ inches. They have been planted out two summers. William
arro, Elvaston Castle

Hints on Seed Sowing.-All flat seeds should be sown sideways, for if laid flat on the soil they are apt to rot ; and if this misfortune does not befal them they never germinate so readily as those placed sideways This accounts for so many failures amongst Gourds,
The A merican Washing Machine
ersonal observation, I feel confident that the American Washing Machines rre very useful. I should say that the medium sized one would be found the most usefu in a small family, the small machine being too small. In large families the large one is of course the best F. Staffordshire.

Vegetable 1rvitability.-Dr. Lindley in his Vegetable Kingdom has described some curions Australian Orchider, in which the labellum when touched by an form formed column, thus imprisoning the insect. Doss the editor know the use of this movement? Does the stigmatic surface lie within the kon, and is pollen thus carried into it I ask from having for mome years attended to many years ago told me that in Catasetum (I think) the polien massts are ejected with such force that they had sonaetimes struck his face. I cannot remember whether irritation was necessary to cause the movement; if it be necessary, would not the pollen masses be apt to trike any insect causing the irritation most body? Can the editor tell me how .is. the stamens or pistil, Kölreuter's or pistil, T think it cannot be doubted from Kolreuter's observations on the Berberry, and Ch . Morren's on the Goldfussia, the insects play an important part in their fertilisation. C. D. [The phenomena by Mr. Drummond of what he saw the account given colony. As the stigma lies within the box in Calecna nigrita, and in face of the hammer-shaped labellum the blower instances, it is highly probable that when it is sprung, will bave the effect of disturbing the powdery polien and knocking some of it upon the stiolent $s$ surface. As to Catasetum we believe the anther bed, to arise from \& sudden contraction of
we strong cartiayinous gland and caudicle. As far an
we have remarked a disturbance of some kind is we have remarked a disturbance of some kind is
necessary to produce the contraction, the effect of which is occasionaily to make the pollen masses jump several feet.]
Epidendrum myrianthum.-An Orchid bought under this name has just flowered in the collection of W. H. t is of Langton, Esq., at Newton St. Loe, near Bak. habit. I would be glad to know whether it has flowered before in this country. Another Orchid purchased the same time as the former, and called Gongora cymbiformis, flowered in the same collection last June. The spikes were 2 feet long. $A$ Subscriber, Harke Beauchamp imperfectly elsewhere. When properly grown it is a very fine thing, with a panicle of flowers a foot long and almost as wide.]
Treddle Spade

Subjoined is a sketch of my treddle raising trees, so powerful as a lever, and most convenient for root pruning find the roots that are cut cut cleanly, I more quickly. It is curious to see in oue often finds. My men, a large body, 70 or 80 , of "cute" labourers, will not use a garden spade; they call them for The blade of the treddle spade is il inches long, eight inches wide at top and six inches at bottom. From top of haft to blade is two feet three inches; entire length three feet two inches. About four inches of lower part are of steel, so as always to be sharp. Thos Hear
Heavy Grapes.-My gardener has this year produced me a bunch of Black
Hamburgh Grapes weighing 3 lbs 9 oz The Vine is pruned upon Crawshay's plan. Can you name any heavier cases? The hough not like this bunch. X., Norfolk. [Much heavier bunches have been produced. Mr. James, our bunches weighing respectively 48 l lbs , and $3 \frac{1}{2} \mathrm{lbs}$., thus averaging 4 lbs 3 oz . each in the same year Mr. W. Hurray, of Polmaise produced a bunch weighing 5 lbs . In 1847 Mr . Hutchison, gardener to A. L. Gower, Esq., of Castle Malgu yn ent to London a bunch weigling 5 lbs , and the yea nd 3 lbs others weighing $5 \mathrm{lbs},{ }^{2} 4 \mathrm{lbs} .2 \mathrm{oz}, 3 \frac{1}{2} \mathrm{lbs}$, and 31 lbs .9 oz ; or on average 4 lbs . 3 oz In Novem-
ber 1851 Mr . Forbes grew in the gardens at Woburn a bunch weighing $5 \frac{1}{4} \mathrm{lbs}$., the heaviest yet recarded of the Black Hamburgh variety. Bunches weighing 4 lbs . have also been produced in the gardens of the late Grey.
Preserving Cut Flowers.-Has "A Devonian" ever tried glycerine added to water for preserving cut flowers? In the "Journal of the Society of Arts" some time ago the proportions were given. I think they were hree parts water to one of glycerine. I generally use ancy that camphor to keep the water sweet, and ancy that it has some effect in preserving the flowers.
Beucleric's Patent.-I would be glad to be informed how to apply Dr. Boucherie's process to the preservin of Hop poles. A Worcester Subscriber. [Information on

Way Company, 26, Great George Street, Westooinster.]

## Eorictieg.

Brimese Pomological, Nov. 6.-Mr. Hogg in the hair. Four new members were elected. Mr. Spencer or Bowood, Caine, Wilts, read a communication on the arcount of the fruits best adapted for that locality. Some remarks were also made by Mr. Varden Seaford Grange, near Pershore, on the effects of the frost last spring upon fruit trees growing at different altitudes and subject to various degrees of exposure Beautiful bunches of the Bowood Muscat Grape were exhibited by Mr. Spencer. A full account of this new and excellent variety will be found in our "Home Correspondence" of last week. Mr. Melville, gr, at Dalmeny Park, near Edinburgh, showed examples of a Seedliny Grape, a cross between the Black Damascus and Black Prince. It was considered to be no improvement on existing varieties. Mr. Turner, gr.
to J. Hill, Esq., Streatham, produced a handsome bunch of Barbarossa Grapes, weighing ened in a greenhecimens of Black Hamburgh Mr. Spencer. They we without firetieal came from cellent in flavour. Mr. Tillyard also sent a boxful of this Grape large and well coloured. A bunch of the curious Lady's Finger Grape, or Cornichon Blane, was exhibited by Mr. Hogan, Loekwood Gardena, near hudderatield. Champion Grapes were also furnished by Messms. Lee, of Hammersmith. Mr. Tillyard sent two Black Jamaica and one Ripley Queen Pine Apple weighing about 4 lbs e each. Some seedling Pears and Apples were exhibited, none of which were however considered worthy of cultivation. Specimens of Por tugal and other Quinces were ahown by H. B. Ker, Esq.
and a collection of Oranges grown against an open wall Mn Glamorganshire were sent hy Mr. Challis, gr.
Margam Park, in that county. They were good-lc. fruit and quite ripe. Morello Cherries were shown Mr. Tillyard, and specimens of a late American variety It is a freestone sort, and was considered valuable for its lateness.

Rotal of Van Diemen's Land: Extracte-Feb.8,1854. A paper was read by Mr. Swainson on the cultiration of English Grasses, and the formation of artificial pastures, in which a comparison of the productiveness, as regards dairy produce and the feeding of live stock upon the native and artificial pastures, is made, greatly in favour of the latter. Mr. Swainson says that, having observed in the Illawarra District of New. South Wales an indiwhich continued green and succulent throughout the hottest and driest summer months, he secured so much of the seed as has enabled him to make up about 60 packets (laid on the table) for distribution, and that any nember or other person who will give the necessary care and attention to its culture may have a packet for experimenting with or for further dissemination over he colony, the bare, dry, arid, withered aspect of which he does not hesitate to say, would by the introduction of this Grass be changed to a luxuriant and lively green. Mr. Swainson has named it provisionally "Red Timothy Grass." The English Grasses which Mr. Swainson considers best adapted for cultivation in the climate anc soil of Tasmania are

## Phlewn pratense-Timothy Grass, or cat's tail Alopecurus pratensis Fox-tail. Festuca elatior - Tall meadow Gras Festrea arundinatal Festuca arundinacea-Reed ditto. Dactylis glomerata-Cock's foot Gras Holeus mollis-Wooll Boft $G$ rass Anthoxanthum ©ornum-Sweet vernal Gra Poa pratensis-Smooth meado Gras Pos pratensio-Smooth meadow Gra Agrostio stolonifera-Fiorin Grass. 11. Holcus averaceru-Tall Oat Grass.

Mr. Swainson mentions that white Clover grows so luxuriantly, and the risk of loss from cattle "blown" by
it in moist weather in New Zealand is so great, that he carefully avoids its introduction (!) upon his estates there. Rib Grass (Plantago lanceolata) he considers also so inferior in point of value for cattle food as

A pril 19, 1854.-A letter was read from the Rev. D. Galer transmitting a small bible, one of a consignment curiously mutilated by insects, though soldered up fuparently with the usual care in tin and enclosed in a deal case-a board from which, half eaten away on the inside, accompanied the book. Mr. Galer states that We case of books was sent out from England by the William Woolley, and that the cargo was sent ashore at the Mauritius while the vessel underwent repair, from which it would appear probable that the species of Termites, commonly known as the white ant, had ther gained a footing in the wood, and afterwards, had found admission to the books, disclosing, however, on the box being opened here, no trace of itself save by its ravages. The Secretary reported the despatch of five cases of plants, indigenous to these colonies,
May 10,1854 . Read 18 , May 10, 1854.-Read the following note, dated ?nd Earl of Clarendon having with great difficulty procured from Morocco perfectly fresh aeeds of the Argan tree (Argania sideraxylon), and placed a quantity of them at to send them especially duty to distribute them, and where the climate is suited to their growth and vigour The husks are greedily eaten by cattle; the nuts yield a valuable oil, and the wood is hard, and useful for many domestic purposes." A quantity of seeds have been left at the Museum for distribntion, and persons desirous of cultivating them, and disposed to furnish a report of their success or otherwise, may obtain a portion on application.
June 14, 1854. - The following donation was. announced:-Transactions of the Royal Hawaiian Agricultural Society, vol. i. Part IV.
July 12, 1854.-Read a note from Mr. Francis Cotton, of Kelvedon, Swanport, drawing attention to the unusual character of the season, as evidenced by the fact that in the first week of this month the Raspberry plants in his garden were covered with blossom and ruit in different stages of growth up to ripeness in several instances; that many of his Roses were ther in full blossom, and that the Sweet Briar hedges presented quite a gay appearance; Mr. Cotton observing nothing of the kind has occurred before in our experi ace, which extends over 25 years in this hemisphere. Sir W. Denison added that in Dr. Hampton's garden the Pear trees had not only blossomed secondere, but produced a crop of well-formed frait several ruit trees, Rose trees, \&c.
August 9,1854 . - The attention of the meeting was alled to a bunch of Raspberries in various stages of advancement, from blossom to perfectly ripened fruit, sent to the meeting by Sir Henry Atkinson, from whose garden at the upper end of Macquarie Street they were aken. A note from Mr. H. Hull on the extreme mildness of the present winter, as exemplified by the ripening of these and other fruits, was read on a paramunication from Mr. H. Hull was also read on a para
the 9th century, wherein he states that certain trees in
the Island Sombrero, in the East Indies, have large worms attached under-ground in place of roots, \&ce, and which Mr. Hull supposes to indicate the knowledge in that early period of some species of Spheria, or plantVillage, Van Diemen's Land.

## Rotices of 2sookr.

De Candolle's Prodromus, vol. 14, part I. In this new volume are contained Polygonaceæ by Bentham
and Meisner, Proteaceer by Meisner, Myristicaceæ, and Peneacere by Alph. de Candolle, from which last the learned author following Sonder, separates Geissolomacera, although the so-called order consists of only a single species; a measure which is, we think, open to
much objection. Upon such hasty examination of the pages as we have been ahle to give the volume, we should say that the varions authors have done their very diffi-
cult work, with care, skill, and judgment. Most especially is it worthy of praise tbat Prof. Meisner has refused to listen to the arguments of species makers, even in the great and difficult genus Polygonum, which he restricts within 215 species, althongh he might easily have vamped up 500 . $P$. chinense alone absorbs 13 85 species arc enumerated, and of Proteacere $102 \overline{\text { s }}$, of which 53 belong to Dryandra, 58 to Banksia, 115 to Hakea, and 176 to Grevillea

Botanists may well be proud of a work like this which, we trust, will now be completed in the course o a few more years. It would be a great gain if, before
the termination of the work, the first 2 or 3 vols. could the termination of the work, the
be re-edited, or rather rewritten.

Bohn's Standard Library has been extended by the welcome addition of the Critical Essays contributed to
the Eclectic Reviero by the late John Foster. Edited by J. E. Ryland, M.A. One volume has appeared and others are to follow. The editor has managed skilfully 2 rather unmanageable mass of materials, and by converting what were originally reviews into essays has rendered the volume better suited to the general reader. participates in the strong antipapal feelings of Foster will gladly welcome a book so entirely after their own hearts.

Bohn's Edition of Pliny's Natural History.-The publisher ha
forwarded us the following letter from the transilator of this
Work:- "The editor of the Gardeners' Chronict has evidently bee
sleeping the sleep of Rip Yan Winkie over his Pliny of Iate Sleephing the sleep of Rip Van Winkie over his Pliny of Iate.

Die familie der Bromeliaceen, by J. G. Beer (Vienna, Tendler), is an arraugement of the Bromeliaceons order by the same learned gentleman who revised that
of Orchids (see our vol. for 1854, p. 679). Being written wholly in German, the merits of the work will be little appreciated in this country, but we dare say that in German gardens it will find admirerso it is to technical descriptions are uninformed whether the long technical descriptions are original or not; froms the
Preface we understand them to be copied, but the Preface we understand them to be copied, but the that fossil plants should find a place in a book dealing with plants of the present day, Fee p. 149, Echinostachy cylindrica. The last pages of the volume are occupied claims the parentage of a large number by affixing his name to theirs.

## Garden Memoranda.

Biddulph Grange, the resioence of Jamps Bate rax, Esq.-(Continued from p. 727 ).-Emergiug from the tunnel which divides the Pinetum from the Rhodo dendron ground, we encounter at once an obscure path on the right, which is so enshrouded by shruls that it
might easily be overlooked, and which leads into a wild might easily be overlooked, and which leads into a wild rocky little glen to be noticed presently. Pursuing the on low irre however, we pasi intervening patches an glades of Grass, and a lake-like piece of water on the right, which is very varied in its outline, and has large island, chiefly clothed with shrubs, in the centre. The whole of this region is principally devoted to Rhododendrons and other "American" plants, which form the most luxuriant groups. Kalmias, Andromedas, Gaultherias, Menziesias, Rhododendron ferrugineum and hirsutum, Epigea repens, and many other beantifu plants of this tribe, are clustered about in sufficient masses to produce breadth of effect, and to give a true dea of the habit and character of each kind ; while the larger-growing Rhododendrons form the staple of the plantations. Cotoneaster affinis grows in this part to considerable size ; and, in ordinary seasons, produces freedom. The Kilmarnock Weeping Willow occurs several times on the island, and is a plant of strikin appearance, from the unusual size of ins leaves, but it extremely peudent halit presents a degree of rigidity and formality which is not altogether pleasing. The the island, where there is a group of it, by the peculia dark green of its autumn foliag
Un that side of the water nearest the house there is a collection of Berberries in one of the clumps. Ber orls deleis is very strong and fine; and several piouou object when in bloom. B. Darwinii, also, which is an extremely neat and elegant little shrub, has severa square yards of a border allotted to it.
Keeping to the line of the walk, as it proceeds towards the house, we find ourselves separated from the high road by only a nar ow bank of evergreens, but these are on dense and massive that the road is completely excluded. Common Hollies form the principal part of siderably heightened occasionally by broad masses of old Ivy scrambling over them, and ( $n$ October, when the Ivy scrambling over them, and n october, when the
place was seen) beautifully clotued with flower. This vy is an evidence of the extreme care with which the were transplanted, as it was growing upon them in the hedge-rows from which they were taken.
The steep bank between the high road and the pleasure grounds has its surface covered in parts, by way of relief, with masses of Irish Ivy; and to litt this ittle off the ground, display it to better advantage, and produce some amount of diversity, old roots and stumps of trees are now and then employed, by chnging to which it assumes a greater variety of picturesque shapes. With a judicious disregard of petty criticism, Mr. Bateman has, in some instances, inserted the stems of old trees in the ground, and left all the larger roots spreading ou urface Ans becomes the top, at or treet fokm hat ridioul firt they are, when clothed with Ivy what ridiculous at first, iney are, exhibit the triilin character of the Ivy so favourably, that their temporary bareness and peculiarity may be freely submitted to. The Yarsley-leaved Bramtle is anuther plant which scrambling wildy over other clumps of roots on the bank, prod
An effect which is at least curious is obtained by attaching a canopy of thatch-a thatched roof in factto an old tree on the lawn by the side of this walk The thatch is immediately overhung by the branche and foliage of the tree, and affords a convenient sheltering place from either rain or sun, as there is a seat round the trunk of the tree.
The Khodedendron ground, and the walk by which it is traversed, terminate at the house, beneath the library window. The snace devoted to this charming tribe is very considerable, an 1 , the coliection unusually rich. When

May or the loginning of June, the po a most gorgeous appearance; for one peculiarity of the collection is that the bulk of the planta are of the rarer and better sorts, the common hybrids of $\mathbb{R}$. ponticum being introduced quite sparingly as compared with the others.
But the Rhododendron department does not end with the walk just described. It is continued, and embraces a distinct section of the clase, in a little romantic rocky bollow called "the Glen," which is entered from the main walk ty the almost imperceptible side path near the tunnel previously referred to Indeed, there is : rouriety in the indistinctness of this minor path, for it eads, by a broken track, and sometimes over stepping tones across a small stream, throagh the secluded little dell now to be noticed, and in the recesses of which, by he bed of streamlet, various aquatic an wald planta fic il ho hile ko of the rocks piled around its sides afford the happiess

${ }^{6}$ The above are all planted against perpendicular masses of rock facing the north, and most of them in damp and dark situatious, screened from every wind uch bein. the conditions in which Dr. Hooker (in ho Himalayan Journals) describes these plants as mos uxuriant in their native habitats. Such an a uent has the further advantage in this climate of retard ing their growth in the spring, for all are of ax ature, and therefore liable to be injured by A marked improvement has, how hose species that have stoo hese having, to a considerable exibi themselves to circumstances, and exhion less dispositheir first winter. $\mathbf{K}$, eximium may be taken as a case their first winter. K. eximium may be taken as a cas in point. Of two speciaens of the same size, ne was urned out in the summer of ing, the other in 185. The former was seriously injured by a late frost has year; but this seasom did not commence its growth until atter the occurrence of a severe frost, which damage the one that had ween planted last. The plant turned out in 185.4 has made magnificent leaves this year

Besides the species already enumerated, all of which occupy sheitered situations, there are other Siskin Rhodudendrons, such as R. glaucum, R. setosua, found at a much ureater elevation, are planted here on higher and more exposed ledges of roch, where the seem to thrive in company with $R$. hirsutum, R. ferm gineum, \&c. R. lepidotum, R. setosum, and K. giaucum have already flowered $K_{\text {a }}$ anthoposon makes itsel perceptible a distance by diffnging that extremely pungent and disagreeable odour which in the extensive pung cor with the species in the higher regions of the Himalayas, eavse (aceoring to Dr. Hooker) such the Hi viou ieselar plant Dhodothamnas Ramehaticus, rare and singular plan, Rhodorna occupies a dars frevice hes thed dendron californicum, introduced by Messrs. Veitch dendron calitself perfectly hardy, and promises to be a has proved itself

Amung the innumerable hybrids raised of late year (and of which there are specimens here of neary all th best varieties), Khododendron Paxtoni stands conspi cuous in its singulary large and wavy leaves, which give the plant a very handsome appearane
There is a high degree of naturalness, and therefore of artistic excellence, about the treatment of this inte resting little glen. It has sufficient depth and narrowness to rencer it perfectly secluded, and to impart a certain mount of that dampness and shade whth should belon to it. The outliues of the rocks are so very irregular that it is impossible to see more than a portin of trom an one point. A running stream of clear water issues from the rocks on one side, and taking a very sinuous course among the stones, passes out through a more open and sedgy channel, this being the cannecting stream between the upper pool in the Chinese garden and the larger lake betore mentioned. The paths through the hollow, and others which euable the visitors to examine the various plants up the banks, are so inartificially contrived and conducted that we step frum stone to stone (all of them being tolerably flat, however) without any conspicuous tiack obtruding itself, and yet without room fordoubt as to our pursuing the right route. One or these
country; and, what is a still grearer merit than any yet recounted, the numberless stones are all piled together on their natural bed, and there is nothing whatever to
be seen of the usual rock-builder's trick of standing stones be seen of the usual rock-builder's trick of standing stones
on their edges or their ends for the sake of giving prominence to any point, or producing a greater ruggednes of surface.
By the margins of the zocky streamlet through the glen, a nice collection of half-aquatic and marsh plants is arranged, and some moist spots are specislly provided for the many pleasing bog plants of Ireland and Wales Here are various kinds of Reeds, Sedzes, the Chinese Zealand Flax, Bambusa Hetalie-a hardy and pretty Zealand Flax, Bambusa Metalie-a hardy and pretty Bamboo, the double-flowered Sagittaria, the Water
Dock, the charming little bog-loving Pinguiculas, and a reat number of other interesting plants, including some of the bolder forms of Fern, for which the shade and moisture are particularly suitable. In truth, here as else Where throughout the place, the greatest possible pecaliarity of condition is introduced, not merely for the sake of additional variety (though that has been one elemen of consideration), but to furnish a congenial abode fo plants to which such circomstances are naturally inci dent. E. K

## Miscellaneous.

Respiration of Nelumbium.-On watching a little pool of water, on the Lotus leaf thin films of air will be seen leisurely to arise-at first barely swelling above the some tenacity. The water flowing over them, by the reflecting light from its under surface, shows the area over which the air is eronnating, the form it is assuming as it grows in volume, when increasing in depth from the crest down till it becomes detached in the shape o bubblef, disengage themselves, and rising to the surface From 15 to 30 seconds is usually occupied in this, and th bubbles rise promiscuously, commonly at intervals of 2 or 3 inches from each other over the whole surface of
the leaf. I have endeavoured to ascertain whether there be any particular circumstances or specific time when respiration goes on with greater or less activity but have been unable to arrive at auy trustworthy conclusion on the subject :-it seemed more active about wo hours after sunrise-least so in the evening. have not managed to collect the air respired from the urface of the leaf, but have obtained rom the leaf-staiks freshly cut across. From this rushes out for days on end in a continuous succession bubbles, which obviously come from the larger ai vessels, and are in volume proportioned to the size of
the apertures from which they emanate. These air vessels, as already observed, have no direct visible com munication with the water or atmosphere anywhere they are cut across half a dozen of times at least by Xet the vast volume of air discharged by them nust either have been extricated directly from the water, or be the produce of the respiration which I have supposed possible through the lower portion of the leat. The tinues healthy and strong, while some one or more of the air vessels have become eaten through by the little water snails (Paludince), which browse on them with such avidity. In this case it continues rising for hours in a continuous rush of bubbles. These proceed from the Lurger vessels alone, all of which on reaching the leaf pass on to a complex air chamber in its upper surface, themselves in all directions through the leaf. These doubtess afford those air bubbles, to be seen in such abundance when the leaf is itself submerged under or covered with water. Just within the outer coating of the leaf stalk are systems of vessels, around the inner circuit the stalk filled with mill, and each provided with a apiral. As the lower side of the leaf is neared, a
portion of these expand themselves into air tubes, and a this fashion enter the ribs of the leaf-a portion of them enter, but do not alter or expand, apparently feeding the leaf with milk. This is to be met with in abundance wherever it is cul, especiay so ducts or channelo, affording a triangular section, as represented in the diagram. They contain air only, of what description I am not aware. However often the main ribs branch off, the doutle channel is maintained both in the principal and secondary, and in both are, from time to time, cut across by partitions or septa, the nature and mechanism of which I have not ye ascertained. These air chambers are like the large
tubes, the stalk, inclined here and there with papillo, presenting to the unitiated eye the appearance of hairs Unfortunately I have neither had time enough nor a lase of sufficient power at my disposal to come to any of the anatomy of the leaf. I offer the following with the greatest hesitation, and as pure conjectures, the facts ascertained being comparatively few-many of It is beyond doubt that all the larger tubes in the roo and stalks are air vessels only, and conduce mainly, if not exclusively, to the functions of flontage or respira-
tion. A single stem of one- third of an inch in diameter, tion. A single stem of one-third of an inch in diameter,
containing air veesels of a sectional area of not more
containing air veasels of a sectional area of not more
than one-fourth of this, or say-two-tenth of an inch
square, even where the leaf is cut off, and the natural
experiment to discharge 33 cubic inches of air hourlythe velocity with which the column advances must be a the rate of 20 feet an hour. This, considering the mass of the plant, is equal to the entire aerial circulation of
many of our warm blooded animals : and the Lotus many of our warm blooded animais: and the Lotus the oxygen in circulation to obtain which takes place under the ordinary economy of respiration. This much is fact: what follows is question or conjecture. The air thus projected upwards to all appearance circulates in the upper surface of the leaf, and is in whole or in part thrown off. What is the function of the 38 large acteasels in the pricipal ris, ac., coith the wh ressels? Do they send air forward also; and if so whence is it derived? The lacteals, which expand at heir base, to all appearance contain no free gaseous matte Whatever-are they respirants drawing vital air eithe from the water on which they float; or re-conveying the he large tubes through the upper surface, and thu oxygenising the lacteals which feed the plant? The hypothesis seems not without plausibility : it is hazarded to challenge an inquiry of very great interest, which want of leisure permits me not to parsue. The whole plant seems as remarkable for the beauty and richness its internal structure as it is for that of its external hue and form. Dr. Buist's Notes on the Lotus.

## Calendar of Operations.

(For the ensuing week.)
PLANT DEPARTMENT
Conservatort, \&c.-The stock of plants to bloom at Christmas, consisting partly of stove plants grown fos the purpose, and partly of forced shrubs and bulbs, atter, which should be undergoing a slight amount of forcing to get them into bloom by that time. Chinese Azaleas and Oranges may be assisted by a little extra heat, being carefui, however, to apply it gradually
the same time, if a forcing house is at command a portion of the stock of Roser, Lilacs, Syringas, Deutzias, and other hardy shrubs from the reserve pit may be placed in the cool end of it, or in a light situation in an early Vinery or Peach house; if they can be afforded slight bottom-heat all the better. A few of the more easily forced American plants, including some of the they will greatly enhance the display in January. Brin orward Hyacinths and Early Tulips in a gentle bottom heat. Double Roman Narcissus, Crocuses, Neapolitan Violets, Mignonette, and Cyclamens, bloom early without much lorcing, and answer best placed on shelves at the insure them from damp.

## Forcing department

Pineries.-Plants in bloom will require very careful management to prevent their being injured by damp, and the atmosphere must be kept dry, with a rather brisk temperature, admitting a little fresh air on every favourable opportunity; if means exist of admitting air over the pipes, so that it may get warmed before coming in contact with the plants, a little should be admitted constantly. Plants in bloom should also be near the glass, and where they will catch every ray of sunshine. It is nearly impossible to get fruit to swell anything like properly at this season ; therefore unless a succession of ripe fruit is indispensable, and cannot be secured except by driving plants that bloomed ate in autumn, these had better be kept rather quiet until the sun gains a little more power. Where an attempt must be made at present to get fruit to swell, a moist warm temperature of about $70^{\circ}$ at night and $75^{\circ}$ by day must be maintained, allowing it to rise to $30^{\circ}$, with the assistance of sunshine, and the bottom-heat must be kept regular at about $85^{\circ}$, taking care to keep the soil in a healthy state as to moisture. Bat it is dificult to get the fruit to make much progress at present, and a little time lost now will be easily overtaken in spring when the plants will edjoy a high moist temperature, and the froit will increase more in weight in one month then than in two at present Yiveries.-As soon as the early house is closed for forcing, be careful to secure a thoroughly moist state of the atmosphere by frequently sprinkling the floors and every available surface, but as observed previously, a regular moist state of the atmosphere is most effectu ally secured by means of a slight bed of fermenting materials in the house, which will also afford a little warmath, and the moisture from this is much more congenial to vegetation than anything that can be effected by the most careful use of the syringe or evaporating pans. The most essential point however in successful early forcing is securing a healthy and vigorous root ction, and unless this is provided, the best and most careful management of the atmosphere will be of bu little importance.
flower garden and shrubberies.
The beds being now, filled with spring flowering plants, a regular cleaning up of Grass and gravel walks should take place in order that the whole may have a neat appearance through, the winter; if the walks are much soiled a surfacing of fresh gravel should be apread orer the principal ones in connection with the hower garden, which will keep up a degree of freshnes at a season when good keeping and neatnest are the only
equivalents for floral beauty that can now be offered.

The stock of cuttungs and newly potted plants will plan is to raise the sashes up at the back and front, and plan is to raise the sashes up at the back and front, and may change suddenly, be prepared with plenty of coveriog material for use when wanted.

HARDY ERUIT AND KITCHEN GARDEN
A good stock of roots should always be kept at hand Jerusalem Artichokes, Horse-radish, Beet, Scorzonera, and Salsafy should be thus kept in readiness for use If the vegetable shed is, is it onght to be several feet below the ground level, and have a close fitting door, the above named vegetables may be merely laid in heaps. If, however, they are likely to shrivel, store in layers of clean sand. - Let all remaining Cabbage plants still in the seed beds be pricked out forthwith. If time wil permit Rhubarb, Seakale, and Horse-radish may be planted now instead of in spring. In all these cases be sure to trench deeply, and loosen the bottom of the ground on the subsoling principle. Some early frame Radishes may be sown in a week or so. Some plant Kidney Potatoes now on raised beds. In such cases soil them 6 inches deep and sow early Radishes on the surface. The straw covering necessary protects both crops. If not already done let Figs be protected imme dately with straw coverings. Let all superfluous nails be drawn from wall trees, and proceed on every favourable opportunity with pruning and nailing, except perhaps in the case of south walls which had better remain till the end of January, as the buds are apt to become unseasonably excited.
