That there may have been some mistalkes made by th Council, amidst the conflicting claims of different classe of flower growers, in arranging their schedules, is not hibitions has not been either the want of exhibitors or the quality of the shows-for though larger collections he quality of the shows-or though larger collections never anywhere nor at any time finer than in the pasi year--nor could there be said to be any want of speci mens. The reason of failure was not the deficiency of objects exhibited, nor the want of more or higher prize at the Chiswick shows, it was the want of visitors. And that want is to be accounted for by very obvious reasons. The rivalry of other societies possessing a more eligible locality, or other attractions for their exhibitions is the true cause of the failure of those at Chiswick. What has filled the gardens of the Botanic Society in Regent's Park, while those of Chiswick have been thinned? Obviously the convenience of the locality-a locality extremely agreeable in itself, and accessible to thousands who can assemble there without interfering with any other engagement of the day. Ladies and oungers of all degrees may choose their own hour, seo he show and the masic, during their afternoon drive. The professional man, the official, or the man of business from any quarter of the town, need not quit his chambers, his office, or his practice, earlier than usual, and may still enjoy the same treat on his way home. To go to Chiswick requires arrangements for the whole day, or a great part of the day; the expense of a carriage to those who have no carriage of their own ; to those who have a carriage the expense of servants and horses while waiting there. If the enjoyment of a country drive and a visit to a beautiful garden is desired on any other than a show day, Kew and Hampton Court and the Crystal Palace oow present attractions which Chiswick can never offer, make what you will of its garden.
True, the Crystal Palace is as distant as Chiswick. But the most resolute stickler for the shows at Chiswick will not pretend that the Horticultural Society can any more vie with the proprietors of the Crystal Palace in less addules for its shows than in any of the numberless additional altractions which sydenham presents, The question, in fact,
The question, in fact, resolves itself into a very
imple view :-The Horticultural Society flourished, and covered the costs of its garden in a great measure from the produce of its exhibitions, while it possessed a monopoly of the great flower shows. Flower shows have lost none of their attractions, and never will lose them as long as civilisation lasts. But the public demand now-a-days conveniences alike in their business and in their recreations. And since similar shows can be had in another and an agreeable situation, almost at their doors-and in a third situation, which, though at some distance, can be reached by a cheap railway that sets down the company at its door, and then lavishes enjoyments for the eye (and is not wanting in those which grosser senses demand), with a prodigality never before known, and not to be had at any cost else-
where-it is plain that the Horticultural Society's exhibitions can never compete with either of the other societies in attracting visitors, even if its schedules equalled the others in amount, and filled the pockets of the exhibitors instead of drawing upon them as the Society is now accused of doin,
It is useless in this utilitarian age to appeal to the prestige of the Horticultural Society, or to urge its
claims on the patrons and lovers of horticulture as the claims on the patrons and lovers of horticulture, as the originator of the great improvements in gardening in our times, and for many years-if not still-the chief promoter of these improvements, as the earliest if not chief contributor to those great accessions of trees and plants which have enriched the catalogues of horticulpublic will patronise that Society and those exhibitions which contribute most to its enjoyment at the least cost of time, convenience, and money. These requirements the locality of the Society's garden will not admit of its supplying to the extent which the locality or the accessupplying to the extent which the locality or the acces
sories of its more fortunate rivals enable them to do. sories of its more fortanate rivals enable them to do.
And as without the funds which the exhibitions formerly supplied, the garden at Chiswick cannot, according to the present constitution of the Society, be maintained, the problem which the reformers of the Society have to solve is, how to supply funds by other means if the garden is to be maintained, or to present some other reasible scheme for insuring the continuance and usefulMess of the Society without the garden. Another F.B.S., March
on frost splitting.-By Dr. Robert Caspary. Continued from \(p .133\) )
I now proceed to consider what are the real causes. And first we must distinguish between fresh frost clefts and old ones which have reopened, as the circumstances attending the two are somewhat different.
First, of the old overgrown frost clefts which broke open again. It struck me at the first glance at many being more contracted by than in a radial direction. Lest consider the frosi cleft of the Lime tree, No. 22, as it presented itself to me from the 3 d to the 26 th February, and as repre-
sented in the sectional diagram, fig. \(6, \mathrm{R}\) is the bark,
\(H\) the young wood, \(\boldsymbol{H}^{\prime}\) the old. The bark \(\mathbf{B}\) had in the I the young wood, H ' the old. The bark R had in the
preceding year been joined by the edge of over growth \(f b\) and \(g e\), the young wood by \(b a\) and \(c d\). On the asunder by a fresh cleft of an inch and a half. The sides of the old cleft \(a e\) and \(d e\), which had evidently often broke out, were full of dirt and dust, but without ice crystals, and already so much dece yed that the sides were no longer straight, but much hollowed out, as is shown by the lines \(a e\) and \(d^{e} e\). I could insert my rule 8 iuches deep into the fissure, the eye reached still farther; the tree was split up to the pith. Let us now represent to open again, about the 1st February; a trausverse section open again, about the 1st February; a transverse section
must then have been as in fig. 5. The bark \(R\) and the young wood \(H\) closed over the cavity at H , whilst the old wood " \({ }^{\prime}\) ' from a' to \(e\) was separated by a
radial fissure, the sides of which had become somewhat radial fissure, the sides of which had become somewhat
concave by decay. If we assume that frost clefte are caused by the expansion of the sap by congelation, or that the bursting proceeds solely from the difference or bulk of the inner still warm parts and the colder outer layers at the coming on of severe frost-an assumption I shall presently return to-we should expect that the inner wood, of greater relative bulk than the outer cavity in the lime tree in question. We should have expected on its again splitting open to find the fissure closed near the centre of the tree, and the sides lying close one against the ot'er, which, however, was not the case. If the alterations of volume which incontestably same in a radical and a peripherical direction, no rent same in a radical and a peripherical direction, no rent
of the border of ove:growth would have ensued. But does not a cleft of an inch and a half in breadth yawning to the very pith clearly show that the peripherical contraction (iudicated by the arrows fig. \(\bar{\delta}\) a and
was proportionally much greater than the radial ?
Ihave in vain sought through physical literature for by temperature changes in the volume of wood caused architecture give no information, and I do not believe that any experiments have as yet been made on this point, so important for the present inquiry. All that I could find are a few data on the expansion of wood by heat in a longitudinal direction, which are not applicable to my purpose. Kater ("Nicholl's Journal
London, 1822, v. M, p. 416) found the linear cociety of of the expansion of white Deal for every coefficient Fahr to be 0.0000022685 , and Struve ("Description Fahr. to be 0.0000022685 , and Struve (" Description
of the Great Refractor at the Observatory of Dorpat," 1825, p. 4), for the same wood gives 0.0000044 for a degree of Reaumur, that is
0.0000028444 for a degree of Falur., which is indeed but a very small change. But the alterations of volume by temperature in wood in a radial and peripherical direction are certainly as different from the above and from each other, as are the diversities in wood according to the three directions in respect of heat-conducting, elasticity, cobesion and permeability by fluids (see Tyndall on the Transmission of Heat through Organic Hagen informs me that in aquatic construct architect attention is paid to the contraction of wood by cold. I have heard the same thing from an intelligent official of the Prussian admiralty, a born Swede, who has had much experience in naval architecture. Both have assured me that the splitting of timber, that is of felled wood dried in the air, is unknown. Yet in the absence of all positive data on the relative contraction of wood in a peripherical and radial direction, it appears to me that this reopening of old frost clefis shows that the difference is considerable. It would appear that the decayed Wood which lines the clefts is particulariy subject to these changes, but that the same cause acts on sound any decayed wood on their sides.
But for frost clefts which burst open for the first time another cause optrates, which has less effect at least on the reopening of old fissures. A tree which bursts for the first time is either frozen through, as I have shown in the case of the thin stems and the 14-inch hick Chesnut 1 have ab the thickest trunks, it may not yet be quite frozen to the centre. The burstiog takes place at night by severe frost, not less than \(15^{\circ}\) Reaum. ( \(-11^{\circ}\) Fahr.) Hameaux has shown that the temperature of the concentric layers of wood by night increases from outside to inside. A very severe sudden frost that cools down considerably the outer layers must occasion an important difference in temperature between these and the inner ones, and at the same time a considerable difference in relative bulk. The inner layers, whether frozen or not, must considerably exceed the outer in relative bulk, and thus increase the strain upon them.

\section*{To be concluded in our next.)}

\section*{VEGETABLE PATHOLOGY.-No. CXI}
442. Lethargia* (Lelhargy). Whenever plants are removed from the ground, with a view to their transplautation, it is impossible, whatever care be taken, to effect the process without breaking off numbers of the finer fibres, on the integrity of which the vigoruus grow th of the plant immediately depends. In the case of trees, which

sible to avoid injury. This is often aggravated by the time which necessarily elapses before they are returne the firsil, when they have to contend not only agains lets which were still entire, from the want of moisture, from close packing. Such plants it is manifest mus make fresh roots before vegetation can take place in the time comes for the expansion of the buds, whell how scarcely any sinns of life, the buds remai dormant, and in extreme cases death naturally follows Life indeed was not for a long time altogether extinct, as was evident on the removal of a portion of the bark but it was so low, that there was not power enough to contend against difficulties.
443. Such a case may exist in trees planted in the autumn, where the injury has been great or where the plants have suffered from a long voyage; but even where great injury has taken place, if the tree be regetation wis pushed out, since contact with the roots is not frozen, and by spring there will be enough to produce short weal shoots, and after another season it will recover entirely from he change unless extraordinary drought has supervened A great deal of planting, however, is deferred till spring and seldom with good results. It often happens that weeks! of incessant drought succeed during which is impossible that any rootlets should be formed that the buds have nothing to force is imbibed growth except what nutrinuent is present in the stem, and that is not available because there is no moisture enough to make it soluble. Under such cir cumstances it frequently happens that at midsummer not a bud has started, and if the branches were no pruned summer may pass away wilhout any sign of life Even if a midsummer shoot is made, the powers of vegetation have in general been so much impaired that the reo, or it may live for years, never produces free canker healthy shoots, and the branches ultimately canker and it dies. Yt is possible indeed, even when a year has gone by without the expansion of the buds, that they may start in the next spring; but this is seldom the
case, and if so a few hot days in summer often concase, and if so a few hot days in summer often conummate the evil.
444. In autumn planting, trees seldom get into this lethargic state; if it be delayed till spring, plantations as seldom prosper, and under the latter circumstances if the summer should prove hot and the air dry, it will be garden the ground must be mulched and irigation ; in the must be placed round the trunk to shade the ground ; if the trees are large, the latter practice is good under any circumstances. The reason for spring planting often rests on the impatience of the proprietor, who cannot planter, but in no case is time gained, as most people know by dearly bought experience. It has hoeen people
ktated before that in trees that have been long packed irriga tion of the bark in a shady spot is often requisite, as also that it is wise in many cases in the first instance to adroinister water cautiously. (4/ 413.)
445. Grafts often show an indisposition to grow, from causes analogous to those which affect late planted trees It may be necessary sometimes to wet the clay by which they are protected from the outward air, or in cases of peculiar delicacy to put the graft in so low that it may be possible to heap the soil up for its protection. Where they have been kept too long before grafting, moisture previously applied to the bark may be of service. When buds are inserted in dry weather it is in like manner useful to moisten occasionally the worsted or matting by Which they are bound. Both grafts and buds, however, circumstances wake a time, at length under favourable ircumstances wake up from their lethargy and ultimately make strong and heaithy plants. Ré informs us that
grasting lethargic trees is often of use, but I have no grafting lethargic trees is often of use, but I have no
experience on the subject, nor can I find any further information.
446. Lethargy also may exist in bulbs and seeds, in the former generally from injury or disease in the part rom whence the leaves and roots are given off, in the latter from imperfect ripeness, \(\dagger\) age, or the want of proper conditions of moisture, air, and temperature In some foreign seeds the external coat is so hard that ture necessary to file it through in order to admit mois gardener embryo. It is the proper business of the conditions. \(\ddagger\) With respect to low, the water absorbed is not readily decomposed, and therefore must be applied very sparingly, otherwise the seed will soon decay. The application of warm wate before sowing has sometimes been found efficacious, or t somese seeds gerwinate rapidly though not quite ripe if at
onee committed to the soil, but if they are to be kept, they cannot be expected to retain their vegetative powers long unless properly

have been tried successfully, or water acidulated with nitric and sulphuric acid.
447. In certain tubers, as those of Orchids, vegetation may apparently be suspended for years in the absence of hight, as in those cases where such plants as Orchis hrcina, Ophrys apifera, \&c., disappear for years till the underwood is again cut down. If in these cases there is any growth, it is so suppressed that no external signs roots, in size withose of Dabliay, will grow for years, increasing patience will probably be at last rewarded by the formation of buds after the wounded surface has been entirely healed. Ré mentions a somewhat similar case as regards some tuberous night-blowing Pelargonium. The ivided roots, however, at length put forth shoots, which ease they had been too liberally administered,

\section*{Home Correspondence.}

Plane Trees.-The subject of Planes, as a small yer panter, is worthily one interesting to the ornamental planter, is worthily taken up by the Gardeners' Chronicle. gardens to account by planting in them authentic spec:mens of such really hardy trees and shrubs as are likely to interest and inform people of all classes. If the cominon so-called Platanus occidentalis is not the American species, what is it, and whence comes it ? dentical wis socal of the and other torrents as lue wint, fringing the Simois But there are other varieties gardens and gardeners' catalogues ; and thongh I have never made them out as distinct, there are certainly sort in the Conlinental gardens. In the Botanic Garden at Vienna was one that the late Prof. Jacquin thought to be the true orientalis, but as it was tender there and never grew beyond the size of a shrub, much reliance cannot be placed on its character. It has a smaller,
simpler leaf than our orientalis, cuneate in its general outline, deeply cut, but rarely more than trifid. This might not exhibit the true form of the foliage when developed by the vigorous growth of a large tree, but the plant doubtless exists still, and might be identified. Tritte wood of our common Platanus orientalis is soft somet, but very ornamental for joiners' work, being ancening between the Maple and Satinwood in appearscale when polished. The bark of this tree seems to concener Pless abundantly in dry weather than that of its ommon). This is Experinents with Charcoal
Imparting Heat by means of the Sus a medium for Imparting Heat by means of the Sun.-It is generally
understood that a black colour gets the warmest, and we have known of walls having been painted of that colour for the purpose of training fruit trees upon, but with nosatisfactory results. Probably one cause of the failure may have arisen from the walls not being sufficiently absorbent. Charcoal has this quality, but its chief value may be found to be under glass, or night coverings of some kind. Another thing which has not been taken advantage of, so far as I know, is the immense heating power " from solar influences which is given to a wall from being "battered," or slightly sloped. Taking hold of this, I have formed at by times some banks, at a angle of say 30 or 40 degrees, and have just got them planted with Peach trees, Figs, Vines, \&c. I mean to face those banks with. different materials for the purpose of experiment, and part of these hanks I have already sovered with charcoal. From the following figures it will be seen that we have got an agency at work of some power if we can properly apply it. I may remark here, that is in sun shine that the marked difference appears. The follow4 ith ) after a few hous of the thermometer to-day (Marcb 4th) after a few hours' sunshine :-

ported on. The subject has a wide appliation, and peems worthy of some artention. Gen. M'Ewen.

Cooking Seeds.-Your remarks on dead seerls must have in some degree opened the eyes of many who have but hitherto complained of the fly, the slug, and the Bull know the "strange ways" dhat have been practisel Bull know the "strange ways" hat have been practised unholy and adulterous alliance antil recently, but our intimacy has not only taken them to see our very strongholds, but presest and most vulnerable points, an the enemy has now gained so much upon us that we has a great affinity to Turnip seed, but we are not Russian enough to prefer the former to the latter to feed upon unless killed-literally dead-and then
we may cake it, but not otherwise. You imagine all who buy seeds can try their vitality or percentaye; that may be, but that would not detect mixed seeds, which are worse than dead. The fact is, all growers and seedsmen ought to state upon the face of their invoice that the seeds are pure, correct stock, and the year so state, for it will happen that last year's seeds are better than this, owing to the season. 1 understand many in the seed trade will only buy with some kind of warrant to certify this (for the most experienced eye cannot detect every kind or variety of seeds), and must possess the character of the seller. There are some, alf dead 1 ind and the party who may buy. I have also long conceived it possible that not only the preparatory measures used to kill, but the dry guano - pure or otherwise-helps to kill us, by imbibing directly
or indirectly the pernicious poisons made use of. We know and see by experience the effect
continued good living has upon our bodily frames, -blotehes, boils, \&c.; but at first we appear to fatten unless hereditary gout pinches us; in like manner do
all artificial manures, and although we hail all apparent improvements in the increase of our produce and our wealth, it is only temporary, The old system cattle, lime, suot, sawdust and ashes, with ammonia, \(\& \mathrm{c}\). are decidedly the best in the long run; and until we retum to our orivinal state our progress in this adulterAnother great ev 1 is the murderous onslaught on birds, which not only encourages slugs, \&ce, from the artifinial manure above named, but the flies, lice, and vermin songs all the day long. I trust that you will not let either subject fop thar we leave ont yose strange ways Johnson, a Seedsman, Bexley Heath.—Surely testing ceeds is a siuple phe Bermer an old farmer Tu:nip and Clover seeds in a pot filled with earth, which bad a saucer of water under it. This he placed by the side of his kitchen fire upon the oven top, an 1 a very short time sufficed to show whether the seeds would
vegetate or not. Nothing can be nore simple ur satis. factory than this, and ncthing more simple than to leave the nurseryman who sends you bard seeds, telling him the reason you do so. W. D. F.- A dislike "prices on application." I regret to fiud it followed by as me most respectable who you are, and I shall know how much cooking your seeds require." Why not state openly the prices? We can then guess Whetlier you are likely to cook or not. The case is

woed which a stream of water focky garden throuyh which a stream of water Hows, the total
length of which may perhaps cover 100 yards ; to kerp it clean a bed hay heen made for it of Portlanil cement to that in no place it comes in contact with earth. I varies from 4 to 6 feet in widnla, aud 3 to 12 inclies in
depth, but on acenunt of the water coming from a field pond at some distance, and in spite of a great length o pipe with several openins into gravel to fiter it, the would-be stream is aiways and most rapidly generating bick green slimy weeds, and alt down betweens rock into the garden, it becomes within a few yards filthy and slimy-looking. If it be cleaned out thoroughly it returus to its former state in the mast incredibly shor that I could put in it to keep it clean? The stream is so slow as to be almost imperceptible ; whatever is used must not be of a nsture to injure the Portland cement. 1 have tried sait in vain. An Amateur.

Crickets.-In the winter of \(185+-55 \mathrm{my}\) stove, honses, and hot pits were overrum by these pests. I hil.ed daring the night, but destroyed more by trapping them by means of wide-mouthed piekle bottles with a little treacle and water, or berr, or even train-oil as a bair,
the pickie bottles being suuk in the ground, or placed so that the crickets could get into them. This winter the nuisance has partly abated, but my gardener having some in his kitchen, I got a hedge-log to try the same
plan I have adopted with success in the souih of
England against cockroaches or black beetles. I do not think it did much good. I tried red wafers with no success, and I do not think much of slices of Cucumbers,
which are said by some to destroy crickets. T. B.P., Man-chester.-Roasted Apple and arsenic rubbed together and laid on the floor will tempt the crickets and kill them Lay it on a piece of thick paper or a thin tile. P.P.P.have we with comple hy Charles Penny, 4, Roseberry Cottages, Dalston X. Y. Z. - Chase's beetle poison killed huudreds, lots came to the funeral, they have since all disappeared. P. D.-By means of a half-crown box of Peuny crickets \(C\). We cannot confirm the statement respecting Chase's poison, which, although effectual with black beetles, we cannot persuade onr crickets to eat.]
Ferns.-As regards the temperature necessary for the growth of Ferns, I may mention that for my Fern house I only use heat thermometer down to \(29^{\circ}\) or \(30^{\circ}\) when I have omitted to light a fire or to keep it up sut ficiently. Under these circumstances I have found the following varieties uninjured by the winter, and also attain a state of great perfection in the summer viz. :
\begin{tabular}{|c|c|}
\hline teris tremula & Asplenium canariens \\
\hline , hastata and,macrophylla & furcatum \\
\hline " longifoliz & beilifo \\
\hline ", \({ }_{\text {crenata }}^{\text {vespertilionis }}\) & palmatum \\
\hline Adiantum pedatum & umbrosum (Allar \\
\hline , pubescens & dia anstralis) \\
\hline " assimile & " lucidum \\
\hline cuneatam & Cheilanthes vestita \\
\hline reniforme & profusa \\
\hline formosum & micromera \\
\hline hispidulum
affine & Lygodium palmatum \\
\hline ", Cunninghami & scandens \\
\hline Blechnum braziliense & Acrostichum alcicorne \\
\hline " australe & Nothochleare distans \\
\hline Polyśtichnan lanceola & lamuginosa \\
\hline Polystichnan coriaceum & Maranta \\
\hline  & Anemis fraxinifolia \\

It is evident that some Ferns, chiefly found in nearly tropical countries, will succeed under greenhouse culture here ; and I hope that several growers will, by making their experience known, help in determining which they are, for the convenience
Spring-tlowering Shrubs for Beds.--The suggestion of our correspondent, at p. 118, that Daphne Mezereum would form a desirable bed, or group, reminds me that He now possess a variety of ornamental springHowering shrubs which might furaish a successive out purposes. Is it not surprising that so little has been done in this way of garden decoration? Com(D. Mezereum), which, though essential as the first of is class to greet the opening spring with the rich incense of its grateful odour, as well as for the desirable contrast of white and parple in its variety, is neverthe very beautiful Siberian Rhododendron (R. dauricum atrovirens), which is now unfolding its gay violet rosy-tinted blossoms in many of our gardens. few plants of this very hardy, free-fowering, neathabited plant, amongst a clump of the firstform a fine feature in the distance, and in itself must be regarded as the gayest of our early blooming shrubs and perhaps the most valuable and universally adapted for picturesque effect, in the cool greenhouse or drawing room con-ervatory. Cnitorm with the above for a
separate group may be added the equally gay winter and early spring-tiowering Jasminum nudiflorum, furnishing an excellent contrast by its numerous clear bright yellow star-like blossoms, gleaming like early Primruses upon a green ground. When suitably arranged this valuable object would appear most lively when seen againct the darier tints of evergreens behind it. In rotation to these succeeds the neat green-twigged Forsythia (F. viridissima), which forms lively looking bushes literally loaded with clear yellow Jasmineat a distunce like golden Furze bushes-as hardy in growth and as free in flowering. As a pleasing contrast to this would be found the elegant Canadian Rhodora (R. Canadensis), yielding a profusion of small yet conspicuous rosy hilac blossoms. These again are foland Berberis Darwini, the former a Syringa in minia ture, with many racme of enow-wite the latter ornamented with numerons drooping spihes of yolden-yellow cup-shaped florets charmingly contrasted against its glosay darls green leaves. After these
comes the new Himalayan Rhododendron ciliatum, a neat dwarf species, unfolding comparatively large and
conspicuous white blossons, with roseate tint, which when seen en masse might readily be mistaken for a bed of Dog's tooth Violets. Among the well known lut little appreciated shrubs of highly ornamental choracter, blooming at a later period, and, like the foregoing, well adapted for portable pot-culture, are the double-flowering Peach, Jaden with thickly-set clusters of lovely, rich, rosy peach-coloured blossoms, resembling nothing so
much as miniature Pompone Roses; the Ribes atromuch as miniature Pompone Roses ; the Ribes atro-
sanguineum, an erect growing varjety, its long attenuate branches festooned with pendent races of richly shaded crimson flower-spikes; and last, but not least, are the brilliantly-flowered double and single blossonaed dwarf Almond, studded over with bright rosy-tinted bloom, and which would appear very effective as an outer circle in connection with the two previous kinds, William Wood, York.

Bees.-The study of the natural history of the honey. bee is surrounded by obstacles. To the difficalty of making experiments it must be ascribed that so little progress has taken place since the days of Huber in arriving at any certainty with regard to those points which were left by him in doubt Admitting at once that the eyes which he employed were occasionally mistaken, and that he sometimes allowed himself to be mind of Huber was eminently of an analyzing east, and many of his theories have been conised by sabsequent investigation. The instance referred to lately by a correspondent, (see p. 87) is one, the truth or fallacy of which I have often wished to see proved, bat have not had the opportunity of making the necessary experiments. Will your correspondent oblige me by saying if he has done so by placing the hive in the game condition as Huber did with his, removing the queen allowing the bees to supply their loss by raisiog an artificial queen in a forced royal cell, then removing her before the date of hatching, and marking those bees which emerge from the cells contiguous to the cradle of royalty. Such, if I remember right, was the proces employed by Huber, while his assistant, with won derful pereverance, watched these marked bees inces derful perseverance, watched for 30 hours ere he detected them depositing their eggs. It is evident that the experiment might frequently fail, without disproving the theory, as all depends on the chance of a portion of the nutriment destined for the queen having been dropped iato some of the ordinary cells. Yet when we reffect on the wonderful development which the larva of the worker undergoes, changing the instincts, form and functions of the industrious ingect into those of the fertile mother, a semi-metamorphosis can scarcely excite surprise, especially when we remember that the functions of these fertile workers are described to resemble those of true queens, whose organisation has been deteriorated, and also that a perfect queen, under certain circumstances, may produce a bee which is neither a perfect drone not a perfect worker. May I further inquire if it has beek ascertained with certainty that the bees ever remove an egg from a cell, except fur the purpose of eating it. G. N. New \(A\) merican Shrub.--A new and beautiful thowering shrub has been discovered in the state of North Carolina, Macon County, U. S. It is said to be s nameless and undescribed variety of Rhododendron, the flower of which is second only in magnificence to the Magnolia grandiflora. It grows to the height of 4 or 5 feet, and is easily transpianted and cultivated. It stated that no American flower exceeds this in beanty its colour is a bright crimson, approaching scarlet, and the panicles are composed of 20 or 30 flowers, fornaing leaves are evergreen, of a deep colour. The spot where leaves are evergreen, of a deep colour. The spot where the flower was found is on the top of a most inacossaw mountaing, A labowrer, Herbfordahere. [We bana, it nothing more.]
shepherdia argentea.-In 1843 there was noticed in Loudon's Gardeners' Magazise, page 43, a tree under this name which was said to produce excellent irn and to be grown extensively by Messrs Winship ah Brighton, near Boston, U. S. It also appears from the article in question that Messrs Osborne of Fulaam ordered some of the plants at that time. Now I should like to know how they have succoenied with them, and whether this Shepherdia is worth growing in this country as a fruit tree. J. Mitchell, jun.

Orchids wrongly named at Sules.-In August, 1854, my gardener attended a sale of Orchids belonging to Mr. Fairie, of Liverpool, at Stevens's, and one of the lots was marked " fine plant of Leelia purpurata. its rarity it produced great competition, and my gat dener purchased it for \(17 l .178\). I raised the plant wit great care until last autumn, when it flowered, and to my great disappointment it turned out to be a very poor variety of "Cattleya Crispa," worth about 20s. or lesu. If the sale had consisted of imported plants such a mistake might have occurred, but coming from a gen teman's colection, I think, under such circumstancein there should be some redress, which I have in vaig the plait of one of the London nurserymen. P.H.S. [Certainly Mr. Fairio ought to return the money, proceed to its recovery from him who deceived him.

Plavourtess Pive Apples.-I have ween wister fruit exactly in the condition of those described by "I. © from being watered with strong gasno water and ou an excess of mannre at the last shifting for plants intended o fruit in winter. D. D.
Ralbits.-Can any of your readers suggest to me
cheap and effective method of keeping out rabbits from burrowing under wire netting in a light sandy soll for so large an area as 400 yards. O. M. R., Norfolk.

Pitt Palace, Florence, It may interest your lady resders (who are fond of memorials of places visited by them) to know that I have just raised seeds found in March in the gardens of this palace under every Bay tree, and a few from a cone of one of the two Cypress
trees in the Campo Santo, Pisa. To naturalists these trees in the Campo Santo, Pisa. To naturalists these
are more natural souvenirs than bad flowers inlaid in slate, or worse alabaster figures, which are the usua substitutes. Somerset.

\section*{Worietieg.}

Limeean, Feb. 19.-R. Brown, Esq., V.P., in the chair. A. Hambrough, Esq., and the Kev. C. Popham Miles were elected Fellows. The following papers the Galls of Cynips Quercus-petioli," by Dr. Viner. After alluding to the vast mischief which has resulted from the great abundance of this insect during the past season, and mentioning that the galls had been used in Devonshire for ink-making, Dr. Viner explained the result of his inquiries as to whether the latter contain
a sufficient quantity of tannin to render them useful substitutes for the ordinary galls of commerce. By macerating 100 grains of Devonshire galls in ether and water a residue was obtained weighing 26.74 grains, and containing 17 grains, or about two thirds of tanic and gallic acids. 100 grains of the best Aleppo galls submitted to the same treatment yielded a residue of 58.50 grains, containing 56 grains of tannic and gallic acids. The Aleppo galls were very heavy specimens of the best kind, and had not been pertorated by th Cynips, whilst the Devonshire ones had all been per-
forated, and therefore contained a smaller proportion of tannin than would have been the case if they had been examined at an earlier period. The principal published analyses of commercial nutgalls which show a varying percentage of from 26 to 77 o tannin, indicate great difference of quality. Dr. Viner thinks these discrepancies are owing to accidental causes, such as the variable nature of the seasons, which it is well known greatly influence the quantity and intensity of vegetable secretions. As to the Devonshire specimens, which contained a less amount of tannin than had been expected, Dr. Viner is of opinion that if examined earlier in the season they would be found to contain a sufficient quantity to justify their collection for commercial purposes. If they were gathered at the proper season, before the Cynips had escaped, and when another good result would follow the valu state, prevented from increasing to what seems likely to be a mischievous extent, threatening the destruetion of the Osk plantations.-2."Deseription of a New species of Paussus, from Tropical Africt," by J. O. Westwood, Esq. - 3. The completion of a Memoir by G. Bentham, Esq., on "Loganiaceer," which was commenced at the descriptions and synonymy of the species which Mr Bentham refers to this order.

4 Lady's Second Journey Round the World. By Ida Pfeiffer. 2 vols. 8 vo. Longmans.
No one ean deny that Madame Pieiffer is an amusing and enthusiastic triveller. Those who read her forme volumes will remember with what vivacity, if not accuracy, she hit off India and its peculiarities, and they may now be glad to follow her in another small excur Bion from London to the Cape of Good Hope, Borneo Java, Sumatra, Celebes, Ceram, the Moluceas, Cali fornia, Panama, Pern, Ecuador, and home by the
United States, the whole performed in about four years.
Our horticultural friends will smile at the account ©The the authoress of the Chiswiek extaibitions:-
sertainly never have iy kind rainy weather would be desirable-and yet it was so. In fine weather all the gay world of London resorts to these flower-shows ; but the purpose of the meeting s rather to display their own finery tban to gee the lowers. Bands of musie play in various parts of the gardens; and the througing of the perpetually moving multitude makes a real examination of the supposed abjecta of the exhibition alnost impossible
"I had, however, on my visit the advantage of very
vourable weather-that is to say, it rained incessantly, favourable weather-that is to say, it rained incessantly,
and scarcely any eme came to disturb me in my admiraand scarcely any one canse to disturb me in my admira, tion of the glorio

The splendour of the collection, especially of the exotics, is almost indescribable. I reaily saw many specimens of these beautiful strangers that were fine country. The display of fruit was less remarkable, with the exception of the Pine-apples, which were of extraordinary size, and weighed ten of twelve pounds."
The information she collected respecting our own
England, where 4the winter often sets in at the end of
England, where "the winter often sets in at the end of
September and lasts till March," must we fear be taken
2s a specimen of the kind of accuracy which pervades
amusing. We must, however, always distinguish witneessed, and the information she received from others Her powers of walking are not the least remarkable part of this lady's accomplishments : for example, in Borneo she tells us that accompanied by a Chinese and a Dyak they set out on her second walking journey "at a
pace as if we were running for our lives, and continue pace as if we were running for our lives, and continued the whole way the same hot haste. I really believe we ran 20 miles without stopping." Two days after she had a "severe march of more than nine hours, throug walked or rather ran the whole day, 20 miles more. The country through which the race was run was nevertheless not particularly fav urable for pedestrianiom. Madame Pfeiffergives the following account of it:

Yesterday and to-day I had really some hardship to undergo. One-third of the way was through jungle Grass ; the other two-thirds up and down high hills covered with dense forests, and right through several marshes; and I was compelled to go barefont like the
natives of the country. Shoes would infallibly have natives of the country. Shoes would and high boots
stuck in the mud and been left behind ; and high would have become so heavy that I could not have walked in them. Another inconvenience was that I was sure to be, at least once a day, drenched through with the tropical rain, and had then to let my clothes be dried on me by the heat of the burning sun. The only thing scenery displayed in this mountainous region."
When a lady rans rounds the world at this pace she should not be expected to bestow time upon minutire Nevertheless she contrives to find time for everything She speaks with admiration of the good government of Rajah Brooke in Borneo, and gives much curious infor mation concerning the Dyaks and their love for suc fancy articles" as human heads. With the country itself she was charmed

The scenery of the country we were passing through The morasses had disappeared, and were succeeded by uxuriant rice-plantations, with smiling hills in the back round. Among the trees there were some glorious pecimens,-some with trunks 140 feet high,-other spreading out their mighty branches, and hanging their eaves down into the water, so as to form deliciously cool leafy bowers. Large hives of the wild bee wer often hanging on lofty slender stems with very few branches; but to reach hives of this kind and rob them their honey, the natives make a kind of ladder of famboo, which is fastened to the trunk of the tree every two feet, stands about

More and more beautiful views are continually presenting themselves. The hills are multiplying and came into sight cannot be less than 3000 feet high ame into sight cannot be less than 3000 feet high
The scenery reminds me of that of Brazii. Here, too are vast impenetrable primeval forests, with overwhe ming masses of luxuriant vegetation, and here, as wel as there, but little cleared land and but few inlaabite places. The chief difference is that Borneo is in tersected by a countless number of small streams or rivulets, whilst Brazil has scarcely any water but the vast floods of her mighty rivers. What might this island become were it peopled by industrious, peacelu, and truly civilised nations ! Unfortuately this is very far from being the case. The population is scanty, and more intent on war and mutual destruction than on an kind of productive labour; and for white settlers the climate is a great obstacle.
In Java Madame Pfeiffer of course visited th celebrated Botanical Garden of Buitenzorg, which she "c Bescribes
Beautiful parterres of flowers alternate with grove and lawns, and thickets, and bright clear water glitter through the fresh green leaves. The paths and road are kept in the most beautiful order, and cross eac other in every direction, while eiegant seats offer themselves for repose to the weary. Among the plants and trees there are some rare and valuable specimens Mr. Tressman, the superintendent of the garden, pointe out especially a plantation of Vanilla, a climbing plant introduced from America. With the Vanilla the climat semed to agree extremely well, and it hanging down loaded with large juicy pods." This reads ike a poet's description of Paradise.
When visiting Sumatra the famous Camphor tree were inspected. They must certainly be very peculia productions-for we are assured that the Camphor which is found in a concrete state under the bark, is
swept down with long brooms; " but this must be done swept down with long brooms; "but this must be done with the greatest care
the tree is destroyed.
the tree is destroyed.
After reading this, one cannot refrain from askin Whether the following account of the wild Alforas, race inh
upon:-
"'The"Alforas have, as I have said, like the Dyaks, a passion for collecting human heads, and esteem these valuables above every other booty that can be offered them. The most acceptable present that a lover can bring to his fair one is a fancy article of this kind ; and if he cannot get a whole one, abe will modestly content will frequantly form a compeny to or wix yong men will frequenty form a company to go on a head-hun and divide annong them any specimen they may procure.
The huts in which they keep these tropties are called

Baileo; and when one goes to decay and another is
built, it remains without a roof until a new head has been obtained to place in it. Then the roof is put \(0 D_{,}\) "Retarning home wi.h their prizes, they announce their good fortune, from afar, by a loud piercing whisle, produced with a shell ; and the women and children hasten out to see the conquering heroes come, greet them with all due exultation, and lead them in triumph to the Bailen. The heads are then given over to the boys and girls who have passed their 10th year, and they eagerly suck away every drop of blood that may yet be clinging to them-a proceeding which, in the opinion After thir parenta, tends to insnire them with vilour. the flesh, the tro? hies are slightly roasted, clea"ed if not cannilalt, and in these feasts, which last several days, they consume several wild hogs and deer."
Pleasant people these to be visited by a travelling gentlewoman ; our authoress however adds, that they are represented as "good and honest people, of very orals," notwithstanding the awkward habis xist among them, to which must be added the practice of killing their sick when not likely to recover.
Luckily Madame Pfeiffer did not succeed in making Weir personal acquaintance.
We have no space at present for further extracts. Those which we have given will show the vivacity of the anthoress and the intrepidity with which she exposed herself to risks from which the fair sex usually shrinks. Hereafter we may return to the amusing pages of the second volume, which chiefly relates to America, and especially the United States.

The Journal of the Froceedings of the Linnean Society No. I., is the herald of a new mode of publishing the body. The part just issued forms an 8 vo , of 96 closely printed pages, wish two plates, and only costs three sthllings. Four such parts are to appear annually, and will form a handsome volume. This is a great improvement upon the old and costly 4to. Transactions, whieh we hope and believe will no longer burthen the financess of the Seciety. We learn from a irelar leter from the Secretary that the Council have determined to forward the parts as soon as published, gratuitously (by post, to all Fellows of the society resident in the United Kingoom, whose addresses are known, and whote annual contributions are not in arrear. The "Journa" or the present year will be sold to the public at 120. or the four parts; or the Butanical and Zoological eetions may lo obtained separately for 8s. each. As the publication adds largely to the expenditure of the Sucitiv, the Cuuncil trust that the Feliows will assist in promoting its sale. All subseriptions prepaid for the year through a Fellow of the Society at the Society's House, 25 per cent

The part before us contains valuable communications by Messrs Ralf, Bell, Walker, Newman, and the late ewport on the Zoolozical side, while Botany is Meisner, and Mr. Kippist. The paper by the first of Meisaer, and Mr. Kippist. The paper by the first of
these gentlemen on the Botany of Madeira and Tenerifio will much interest even the most "general reader.
Things not generally known, is the title of a litule volume from the pen of Mr. Timbs ( 12 mo , pp. 247 ,
Bogue). It is a classifed serap-book or common place Bogue). It is a classifed serap-book or common place
book, in which the author gives an account of matters of which, as he enys, the world is not generally aware In his Natural History he has been wonderiully success ful. He says, for example, that Mr. Yarrell has proved the eel to be viviparous, because it has milt (printed mele) and roe like other fishes. That was certainly no known before. Pearls, he tells us, are formed by ignorant. Ranuuculus aquatilis and hederaceus are said to differ merely in this, that while the former plant remains in the water its leaves are al! finely cut and have their divisions hairy (!); but when the stems reach the surface, or if the seeds fall upon soil merely wet "the result is Ranunculus, hederaceus." This nobody bnew. Barley, Wheat, Oats, and Rye, are formed into Wheat; Baobab trees are 5000 years old Judas hanyed himself upon an Elder bush-or else Judas hanged himself upon an Elder bush-or else
Fig tree; a Bread frait treedying of old age is restored Fig tree; a Bread frait thee Nettle leaf seen through del of an extensive estato decorated with timber and shrubbery; finally the Potato dikease wae caused by an Aphis (no doubt the hune of tatur known-moat certainly Mr. Tiubs should confine himself to antiquities, which we hope he underatands better than Natural History.

\section*{Garden Memoranda.}

Mussas. Osborne's, Fulham.- \(A\) visit to this nursery of the show house are trained two Camellias, which are now beautitully in bluom. The varicties are Colville and imbricata, both of which flower at one time, and their blossoms being of different colours contrast ad mirably with one another. Camtlias managed in thi way make charming coverings fur wals, and where border for planting them in does not exist, boxes either of slate or wood answer the same purpose. If mad of slate or wood answer the same purpose. If made
han if wood is employed, but the latter if we'l seasone and properly put together has been found to last for The shelves in this house were gay with spring bulbs such as Hyacinths, Narcissi, Crocuses, and Tulips which are flowering here this year unuxually well. The Crocuses in this instance were planted in the pots before Hifted out of the open border in tufts a little before this season, just when they are coming intule before this make an equally good display, and require less atten make an equally good display, and require less atten
tion. Many varieties of Crocuses are grown her in beds out of doors, and as they arown here bloom and all labelled, and as these are now in differences and nomenclature may do well to inspect them. That delightful spring bulb, the Siberian Squill, is alsn now in blossom in the open border, as is Hikewise S. bifolia; but the former is the earliest, and
considerably the handsomest. In one of the stoves the Ageratum like Conoclinium ianthinum was in flower and well grown, as this was, in a decorative point of View, this is a truly valuable plant. Its colour, which bloom at the same time, renders it especially worthy of attention. Rogieria thyrsiflora was also in flower, and for the decoration of the stove at this ceason few plants are better adapted, for every shoot will produce flowers, and even pieces struck and placed erected here for the cultivation of Orchids and tender Ferns, to have collections of which has lately become so fashionable, and at one end of a stove we remarked miniature aquarium filled with the better kinds of Water
with Fp one of the greenhouses, which are now ga
With Epacrises, was an excellent specimen of Libocedrus
Donniana, a smail plant of which has survived the winter In addiurt, and quite unprotected in the open border In addation to aquills and Crocuses, Hepaticas, both White and purple, are as gay now in open beds as they Well can be, and that charming early Rhododendron dauricum atrovirens is still, and has been for the last three weeks, one mass of small parple blossoms. In therefore a collection of spring flowering shrubs this therefore must not be overiooked, and the same should is just now refence to Andromeda floribuada, which bell-shaped flowers. By means of such materials as these and others, of which every nursery afords examples, our gardens might, with no great difficulty, be rendered almost as gay in spring as at any other nothing can be much handsomer than Jasminum nudi florum, which blossoms profusely all through the early spring montlis.

\section*{Miscellaneous.}

English Oaks.- People who are accustomed to look on Oak trees as plants capable of arriving at an average size of some 40 or 50 feet of timber, as they generally
do in the nortl, and who have not had the advantage do in the nortl, and who have not had the advantage the south, can form no just estimate of what an Oal o first-rate dimensions really is. With reference to this, I may be allowed to state that in the New Forest, that forest there were, two years ago, when I inspected upwards of 200 cubic feet of timber. But the most valuable crop of Onk timber which I have ever seen there were 1200 Oak trees felled in order to supply timber for the navy. I happened to be called to napect this forest while these trees were lying newly cut, and the sight of so much fine timber was truly no
common one, as will be acceded to by every forester common one, as will be acceded to by every forester
when I stste that many of the stems of the trees When I stste that many of the stems of the trees square ; that I measured the stem of one particularly five tree, and found it to contain 400 cubic feet, and that the average size of the 1200 trees was somewhat more thin
100 feet. These trees were old and fully matured, should say they were above 200 years old. The size they attained must be acknowledged as first-rate, and is an evident proof that the soil and climate of the south of England are suited to grow the Oak to such dimen. sions; and from this fact it is to be inferred that they are also adapted to grow most other common hinds to dimensions equally as important, as may be proved From an examination of the many fine specimens of Vies throughout the parts of the country just adverted Jomes Brown in the North Britith A Arriculturist.
The true value of Weeds. - The weeds of hedge-banks and fences are innumerable : many wild flowers, not in our list, by growing in such situations are weeds.
Couch, Cleavers, Bindweed, and Bryony are among Couch, Cleavers, Bindweed, and Bryony are amony the most troublesome, especially when they occur in
young Quicks. To insure the growth of tie fence thees must be removed, and indeed siould never be suffered thanake head. This can be done with a small fork, the hedge. By this means we may not only remove the weeds, but the operation contributes to the fertility of -the soil, and thus the hedge more quickly overtops what but for this attention wiuld completely smother it. In this care, as in \({ }_{\text {ntm }}\) most others, it is safer \(u\) burn what we remove than to remove it to the dung-heap or to let it lie sbout. We knew a farmer who offered his
cottagers \(3 d\). the bushel for wed ashes - description of the manner in which a cottage family proceeded to make them may be useful and interesting,
ogether in a m heap, and covered with turi from the road-side; this, on being fired, burnt in a smothered manner, the children brought ail the weeds and refuse they could collect from time to time, and added it green (1) the rest, and by the occasional addition of turfs a continued smothered fire was kept up for weeks ; in one cottage-garden was as much as 50 bushels, and the uricess still going on. With these ashes the farmer lways did well in his Turnip crop ; so that not only was an exterminating warfare carried on with our nemies, but they were destined ultimately to be converted into food ; and we cannot better conclude this uetive Buckman in Journal of Royal A gricultural Society.

\section*{Calendar of Operations.}

\section*{PLANT DEPARTMENT}

Congervatory, \&c.-The operation of watering a this season should be conducted with care, more espe cialy in the case of recently potted plants, which must is not frostysed. Keep them close, and if rather moist atmosphere ; but until the orowh of plant shall have indicated that it has taken to the fresh soil apply water very sparingly at the root. Luculias in pots should be encouraged to make free growth in flower betore those planted in the conservatory border or it is desirable to prolong the blooming season of this charming shrub as much as possible. Stove.-Some o ve Orchids may probably require shading; at al use, but do without it as for the purpose is ready for listle care in removing plants as possible, and with a shady positions, it will not be necessary, at lemed to to night temperature of stoves may now be allowed, more especinlly if the weather thould prove bright, but this should be obtained not by the use of an extra quantity coal, but by shutting up early in the afternoon. Maintain a moist atmosphere, and give no quarter to insects of any kind.

FORCING DEPARTMENT
Pinert.-Give plants swelling their fruit as much iquid manure-water as the state of the soil will pormit, and afford them a thoroughly moist atmosphere day and night. Admit fresh air when by opening the ventilators on one side of the house only, nd by no means allow currents to blow through the house and rob the atmosphere of its moisture. See that a steady bottom heat of from \(80^{\circ}\) to \(90^{\circ}\) is mainlained, but do not exceed the latter. Let succession plants start slowly into growth, which will induce a comand surdy habit. Do not exceed \(60^{\circ}\) by night here, nd give a little air when the glass rises to \(75^{\circ}\); keep he atmosphere moist; also attend to the bottom heat, and see that the soil is not allowed to become too dry or get sodden, which is apt to be the case from syringing heavily, which however is a very bad practice. Thesyringe hould be used merely to dew the plants, and when the soil requires water a good soaking of clear weak manurewall should be given. Vinemes.-As the berries ith the early house lork over the bunches carefully, sufficiently thinned and ascertaing whether they have been which may require a second thinning, for it is great inustice to leave the berries to be cut out after they are stoned, which is by no means an uncommon practice EEACHES. - Keep the young shoots neatly and regularly and keep as to admit light and air freely to the foliage, apply sulphur immedit red spider at a distance; also apply sulphur immediatcly if mildew is perceived. Look succession houses too fast. Keep the atmosphere moist, succession houses too fast. Keep the atmospher
but avoid using the syringe on trees in blossom.

Flower garden and sirubberies
Bururbon, Tra, and other tender Koses may now be pruned, and the beds manured and lightly forked. Roses ont, however, dislike a rather firm soil, and care hould be taken not to mjure their ronts by forking or ging. The best manure for these is cloacine, which and an inch or two of fresh soil prevent any unpleasant sme!l that may arise from its use. Get walks edged, gravel rolled, \&e, and everything put in the neatest order. Also see that a sufficient quantity of plants for "bending" is in a fair way to be nnulals on a gantled in Muy. Sow seeds of tender annuals on a gentle hotbed where they can be freely exposed to air when up to keep them dwarf and stocky; they are intended to boom.
hardy freit and Kitcilen garden.
While favourable weather continues push forward all operations requiring attention here with the least pussible delay. If not already done, get nailing an aypearasce of neatness, and be prepared with covering for the protection of the blossoms. See to keeping up a succession of Peas and Beans; also plant out winter Lettuce on a rich warm piece other small sulad pro a succession of Radishes and Get Cauliflower plants raised un ler glass hardened off,
and pay every attention to those under hard-glasses, order to forward them as much as possille. Spinach, Early Horn Carrotz, and Stone Turnips should be som, at once on a warm rich border if not yet done; also Leeks, Iruassels Sprouts, Savoys, German Greens, Snow' Potatoes should bing Broccol, and the mail crop of

cottager's garden.
Fruit trees, if any, and small truit-bearing bushes, as Goseberries and Currants, should now be pruned ; this, not already done, must not be longer neglected whetly ground amongst bush frut manured and any ; but in doing so take care not to injure the roots. Pay all necessary attention to Early l'eas, and see that they are not injured by mice or birds. Where raising it on the windy side sufficiently to their stems, shelter for the plants. Plant Fairberd', Cle a kindo England for succession, and if a few of Fairbeard's Surprise are planted at the same time they will come in about a week earlier than the Champion.

\section*{The Mgritultural Gazette.}

\author{
SATURDAY, MARCH 8, 1856
}

Wg give elsewhere the paper anabridged which Mr. Hoskress read before the Society of Arts last Wednesday. The sabject is the History of Agriculture during the past 15 years. It is evidently written by the same pen to which we owe so many brilliant and useful contributions to agricultural literature. It opens with a reference to what may almost be called the ancient history of English agriculture-making use of the progress of land enclosure, of trade, and of population, during the early part of the present century, to indicate indirectly improvements of which we ought to have the history fully and directly in the statistical records of each succeeding year. The period during which the more detailed examination of the subject is conducted dates from 1840, when population had at length overtaken the resource of fresh enclosure -and when, as Mr. Hosiynss states, the deficiencies of acre No. 1 conld no longer be sapplied by a mere collateral resort to acre No. 2. It is then that the routine of the practice which has hitherto been sufficient must itself be altered, so that from the unalterable acreage the increasing demand for agricultural produce may be satisfied.

Mr. Hoskyns refers to four several agencies by which, in the absence of fresh lands waiting for enclosure, agriculturists and their customers have hitherto been benefited. These four "farmers' friends" are guano-Liebig, taken as repreventing the informa tion which we owe to scientific men-the Royal Agricultural Society of England, established at the commencement of the period under review-and improved draining. And the influence of these several "items of new resource, all opening to view for the first time, almost simultaneously, abont the year 1840"-forms the main topic of discussion.
It is with reference to the mechanical and chemical necessities of clays and sands respectively that this discussion is conducted, and the probabilities of the future as well as the history of the past are given under both of these divisions of the subject The whole concludes with an allusion to an agricuitural literature which has arisen within the period named, and to that confidence and respect for its teaching which it has at length achieved

The subject conld hardly have beea arranged so as more compendiously and instructively to exhibit those facts in agriculural history and practice to which our future progress will most probably be due. And our readers will we are sure agree with us, that it could not have been presented in a manner better calculated to win the regards of the intelligent though generally non-professional audience before whom Mr. Hoskyns read his lecture The paper furnishes indeed a capital instance of that singular power of agreeable illustration alladed to by H.R.H. Prince Albert, who presided on the occasion, as characteristic of its writer
The inference drawn from it by His Roysl High ness was that Science, Art, and Commerce were all contributory to the result presented by our agricultural progress in its present stage-and that on their contributions as well as on the information which full statistical inquiry would disclose, the thopes of our agricultaral future must depend. The appeal addressed to the audience, so far as it was agricultural, that each in his own sphere would facilitate this inquiry, coming as it does from one who has so good a claim to rank as a British farmer, will, we are sure, be influential.
At the close of the lecture Mr. Paine, of Farnham, stated what geologists have done for auriculture during the past few years: Mr. Lawfs related the progress of agricultural chemistry: Mr. Ransome re-
ferred to the adrances in agricultural mechanism: and Mr. Hunson, of Castleacre, ailuded to some of the more important steps in the progress of agricultural practice. We shall report these addresses fully next week. With one exception they were for the most part mere developments of points to which Mr. Hoskyns had previously alluded in his paper-and to that exception alone shall we refor at ment.
Mr. Ransome did not agree with all that had been advanced on the subject of agricultural mechanism and for the credit of machine makers he contended that the contrast hetween the exhibitions of Oxford and of Gloucester did not represent the relative positions of their art at those periods respectively But it is clear that Mr. Ransomp in asserting this, however truly, did not take notice of the object of the paper he was criticising ; it was not the progress of agricultural machine making but the progress of agriculture that was the point under discussion. 'The former might have reached perfection, while the latter might be miserably low. Agricultural mechanics might hoast a list of perfect agricultural machines, and if so, then if any of Mr. Hoskyns" "farmers' friends "should succeed in effecting their distribution and their general use, that agency would properly have the credit of the agricultural pro_ress which must ensue. We believe with Mr. Hoskyss that the English Agricultural Society have contributed largely to the agricultural progress that was being described, whether their patronage have induced the invention of any new machine or not. The invention of Crosskilis's clod-crusher mav have dated previously to the establishment of the Agricultural Society, yet the great services for which clay land farmers have to thank it are as properly referrible to the influence of that Society, as if the whole history of the implement were included within the lifetime of that third of Mr. Hoskyn's " farmers' friends." There is no point more prominently brought out by Mr. Hoskyns than the fact that agricultural progress has been, and still for long must be, mainly dependent on the publication of what is already known and practised by the few, as distinguished from what may be due to positive additions to existing power or existing knowledge, and the 2000 implements now annually collected at the exhibitions of the Agricultural Society may be fairly quoted, just as the ledger of every agricultural machinist in the country may be quoted, in proof of that enormous extension of agricultural power which the past ten years have witnessed in the distribution and employment of efficient agricultural machinery.
Perhaps no better illustration of the justice of this remark exists than is afforded by Mr. RasSOMR's own exception from his criticism: "All honour be to him," he exclaimed, "to whom we owe the successful application of machinery
to the art of land drainage!" We quote his words from memory, and may not guote them literally; but the impression he conveyed was that Mr. Fowler's drain plough was an exception to his general assertion that our existing agricultural machines date much earlier than Mr. Hoskyns had been supposed to state. But this is not an exception at all. It is 11 years since the engraving, which we here annex, was published in these

\section*{51 a}
columns-long before we heard of Mr. Fowler's name in comnection with this subject-and to Mr. Saul, of Garstang, not to Mr. Fowler, is due the origination of the idea of draining by an "ironstrang necklace of pipes" drawn underground behind a mole plough-an idea which the latter has since so energetically and cleverly developed. The conveyance of power, too, from a fixed station in a field to any part of that field for the purpose of dragging such a mole plough as is drawn above is no new thing. And yet we say with Mr. Ransome, "all honour be to Mr. Fowler," for we, more consintent than he, attribute the step in agricultural progress seen in the application of steam power to a draining machine, quite as much to the influences, be they the energy of individuals or the patronage of societies which extend already existing knowledge, as to the inventive genius to which existing knowledge may be due. It is plain that perfect models may exist either in example farms or in machines, which are useless as indices of agricultural progress until their example shall be generally followed and in operation ; and Mr. Hoskyns is right in describing the wonderful best illustration that exists of the advance in good farmirg during the period he referred to.

We only add that the paper was listened to with great interest by as large a number as the theatre of
the institution would hold, and that the Society of
and goodwill of farmers by this new instance of and good will of farmers

In common with our agricultural contemporaries we have received many letters on the ravages of a worm which in some localities has attacked
the young Wheat plant. Mr. WESTwood below all that the entomologist knows of its history and its habits that can be of any use to the farmer. As, however, considerable alarm has heen excited, it may be well to mention that the evidence which has reached us does not wholly confirm the original report from Riseholme on this subject. Those whose memory can retain the history of a dozen years together, know well that a season never passes in which reports of injuries in localities do not excite a general alarm at one time or another of the year in reference to one or other of the crops we cultivate. Present injury is observed-and the power of plants to recover is at the best but recollected: it more frequently is forgotten, and complaints arising in places take the form of a general lamentation, and an impression arises which subsequent events and an impression arises

A general remark of this kind, however true in a course of years, may of course fail of application to any particular instance. It is, we are aware moreover, sure to excite displeasure in the lucality that may be suffering, and we would not venture to have made it had we not received letters from that very locality which seem to show that the most has been already made of the injury complained of The following is a passage from one of them:-

In your remarks on the corn trade in your las week's paper, you allude to the bad appearance of the Wheat on the light lands in Lincolnshire, your remarks being founded upon a letter published in another paper from Mr. Marshald, of Riseholme, near Lincoln. I think this statenent is calculated to convey an erroneous impression of the appear ance of the Wheat on the light lands in this count at the present moment. Mr. Marshall's statement as to the great destruction of the Wheat plant o summer-eaten seeds is undoubtedly correct ; but I believe the general opinion is, that such destruction is to a much less extent this year than usual The appearance of the Wheat, in this district at least, is certainly good in comparison with other years, not excepting Mr. Marshall's, which I se nearly every week. There is an extra breadth of Wheat sown in this neighbourhood, a much greater portion than usual of the Turnip land that was bared up to Christmas being sown with Wheat.

The following is Mr. Westwood's report :-
We have received from a correspondent, Charles P. 'Tebbutt, Blunti-ham, near St. Ives, Huntingdonshire, a communication, dated the 4 th instant, relative to the extensive injury to which the young Wheat plants in that neighbourhood have been subjected during the last two or three weeks, from which the following are extracts :
"I I observe both in the Gardeners' Chronicle and the Mark I.aume
Express some complaint of the young Wheat plant in certan Express some complaint of the young Wheat plant in certain
localities. The cause of the loss of the plant is also stated not to he fully ascertained. I have a field of Wheat, the plant of of
which hus been rapidly failing during the last fortnight. Unon cavefnl examination I find a small maggot in the centre of the stem which cuts off the main shoot of the Wheat plant, and is, I think, clearly an immediate canse of the ev
"As this mater is one of great importanee, I have forwarded
you several specimens which will. Itrust clearly explain to yoursereral specimens which will. I trust, elearly explain my
meaning. The maggot has a white body near the head. Much of the plant has been quite destroyed in the field in question ; but I think if proceeding quare now slopped
suffient remains. I may mention that it is now somewhat difti-
s. sufficient remains. I may mention that it is now somewhat diffi-
citt to find the mangots than it was a week since, when alnovit
every cmit to tind the manguts than it was a week since, when almo
every sten scemed to contain them, I fancy they eat their way
out. In my instance thene magoots are confined to Wheat fatlow and greancrop. They are not new to me this year, I have
for several years found them and pointed them ont to friends as causing nuch of the injury ascribed to other causes; but l never
The specimens sent with the preceding communication consisted of various Wheat plants as well as several of the

small white maggots observed by our correspondent. And there is not the least doubt, both from an examination of these specimens as well as of others which have been submitted to me by the editur of the \(1 / a) k\) Lane Expmess, that the maggots are the true cause of the evil in questorwarded
been so crushed that the latter reached me in a dead state, eo that I shall be unable to follow their trans formations, and ascertain the precise species of fly which is the parent of these destructive larve. Ther is no question however, that they are the offopring of minute two-winged flies closely allied to the very inju rious Chlorps pumilionis and C. lineata, which also, in
the larva state, feed on the interior of the sta the larva state, feed on the interior of the stems of corn plants, but at a later period of its growth, so that the plant is at the time of its attacks in a condition to throw up an abundauce of side shoots, which sometimes even more than compensate the damage done by attacks of the fly. But in the cases now before us I fear that the plant is so much injured as not to be able to throw up any side shoots. On looking over Mr. Cartis admirable series of articles on in jucious insects in the Journal of the Royal Agricultural Society, there is one species of minute fly of which that author records the history, and which seems closely to agree in its mode of attack upon the Wheat plant With the insects now doing so much injury. This解 the Oscinis vastator (vol. 5 , pl. L. fig. \(31-34\) ), Whest pare which were obse attacking young in the early part of the following month. It is impossible without rearing the insect to determine whether sible without rearing the insect to determine whether
those now attacking the Wheat are specifically identical with those described by Mr. Curtis; the period of the with those desoribed by Mr. Curtis; the period of the
year when they were observed heing so different may year when they were observed heing so different may
possibly indicate a distinct species, although it may not be improbable that the June maggots were the offspring of a second brood of the Oscinis which had been produced from larvee which (like those now before us) had been hatched from eggs deposited in the past autumn and which had become winged flies in April or May, as will in all probability be the case with Whe larve which are now engaged in destroying the Wheat plants. I need searcely add that I shall be much obliged for specimens of the plants and insects clear upe, so that I may pursue their economy and species of fly. As the mexists as tot appar to me to be full grown the question immediately oecurs as to the steps most advisable to be taken to prevent their further rarages. Doubtless when they lave consumed one plant they crawl to the next and continue feeding till they have acquired their full size, when they will undergo their change to a pupa and shortly afterwards o the perfect fly, resembling in fact a miniature house fly. To resow the ground without taking any measures previously to cleanse it from these larve
would be I should conceive but waste of labour ; repeated ploughing and turning up the soil would certainly enable the rooks and other birds to destroy a grea number of the larver, but I would suggest where the injury is very extensive that the surface of the ground should be burnt.
It is proper to observe further that these small white grubs do not appear to be the only agents at work ai the present moment in the destruction of the youn Wheat plants. At the last meeting of the Entomological society on the 3.1 inst., a communication was received accomr. Botting, of Poynings, Hustperpoint, Sussex ompanied by specimens of insects which were stated that neiphtoing very great destruction in the Wheat in below the surface of the ground; the land where the insects were most numerous had been Clower and Rye grass last year, and it was stated that in some instance acres of the young Wheat plant were completely panied by a pill box contining letto inf accom panied by a pill box containing earth infested to very great extent by minute dirty coloured grube
with shining black heads, transversely wrinkled bodies and destitute of legs, which are at once recog nisable as the larvæ of some species of Tipula or daddy long legs, The specimens are scarcely more sequentlye (one-twelfth of an inch) long, and are cona a very young state, so that their ravage they belong to Tipula maculusa or a closely allied species.

Now these insects are more easily to be attacked than the Uscinis larvæ, because they do not bury themselve within the stem of the plant, but creep about at large on the earth feeding upon the fibres of roots or upon young fresh shoots as in the instance before us, and hence probsbly it is that owing to the ground not having been well cleared of the roots of the last year Clover crup, the parent fly has had the instinet to
food for her progeny, which she deposits in the earth liy a good superphosphate, thas state of things will reman management here recommended. The cream should be simply thrusting the sharp end of her body into little crevices in the ground, into each of which she drops an egg. Although lime-water is not sufficiently obnoxious to destroy these larve it might be advantageous to try watering the infested spo:s with brine, antrate of soda, or even strong liquid manure as a means of destroying
then. Their skins are, however, so tough that perhaps then. Their akins are, however, so tough that perhaps
the safest way would be repeated ploughing or burning the safest way would be repeater plou
the soil as suggested above. J. O. W.

In reference to the meeting this week of the London Farmers' Club we have space only to say that Mr. Jackson's paper, on the best form of agreement between landlord and tenant, illustrated in an effective and often amusing manner the evils of a tenancy at will as well as those which are inseparable from the lease. It advocated the establishby a long notice as the best style of bargain for the furtherance of good farming. It commented severely furtherance of good farming. It commented severely on the Delationship between landlord and togant animated discussion ensued, which we hope to give next week.

\section*{BONE-DUST AND SUPERPHOSPHATE.}

Allow me to direct attention in the columns of the Agricultural Gazelte to a mistake which I cannot pass Agricultural uazette to a mistaine Several of your correspondents have represeuted me as having fixed the value of bones at
\(5 l .128\). per ton, and that of superphosphate at \(6 l\). per \(5 l .128\). per ton, and that of superphosphate at 6l. per
ton. I do not know from what source they have derived their information, since nowhere have I published such ia statement. It strikes noe, however, that the error arisen from a superficial perusal of a paper of mine entitled, "On the comparative value of different artificial manures for raising a crop of Swedes," and
pablished in the last July Number of the "Journal of the Royal Agricultural Society of England." Amongst other manures employed in experimental trials upon Swedes, I used bone-dust and superphosphate of lime. The experiments were made in 1853. The bone-dust was purchased at that time at \(.5 l\). \(12 \%\). per ton, and the per ton.
per ton.
These prices you will observe are stated as plain matters of fact, and I cannot understand how any one can infer from such a statement that I meant to fix the price of bone-dust for all seasons at \(5 l .12 s\), and that that bones have risen very much in value, and that consequently a superphosphate like that which in 1853
was obtained at 61 . per ton, in 1856 would cost considerably more.
Whist speaking of the commercial value of super phosphate, I may observe that the question has fregood superphosphate? Now, if superphosphate were a manure which, like genuine Peruvian guano, or pure
bone-dust, or unmixed nitrate of soda, varies but little in composition, a definite answer could be given. But as the most heterogenous mixtures are sold under the common name of superphosphate and as manures, its composition must greatly vary even if it is prepared only from bones and oil of vitriol, and as these ingredients are used in different proportions, it is evident
that the above question is just as indefinite as any of the following:-"What ought I to give for a good horse, or a good watch, or a good house ?

Unless it is stated whether a carthorse or a good hunter is required, or whether a good silver or a gold watch, or a house with three or six rooms is wanted, objedt desired are stated, the adjective good becomes very vague in its meaning, and admits of all possible, it may be ensatisfactory answers. A similar case is presented to us in superphosphate, for this cor price, from 31. upwards to 12l. The commercial value of it depends chiefly on the amount of soluble phosphate and next on that of insoluble phosphate of lime con \({ }^{+}\)ained in it. Thus a sample containing 20 per cent. of solułle phosphate will be better than another sample
containing only 10 per cent. A third sample containing containing only per cent. A thirdsample containing with the preceding would be termed poor, but compared with a fourth sample, containing only 1 per
cent. of soluble phosphate, it would be a good sample. cent. of soluble phosphate, it would be a good sample
It must not be supposed that these examples are merrly imaginary and have nothing to do with what actually occurs in the manure market. Indeed the differences in the relative proportions of soluble phosphate in lound even greater than the differences here given hy way of example. And let it be observed that not only the cheap samples of superphosphate are often poor in soluble phosphate, but occasionally I have found on analysis
even the most expensive samples wretchedly poor in phen the most expensive samples wretchedly poor in samples of superphosphate are more frequently sold at diaproportionalely high prices, it is equally true that at the present time many expensive samples are sold in the manure-market which are not worth half the money
which is paid for them. As long as agriculturists will which is paid for them. As long as agriculturists will
be content with the declaration of the dealer to supply
usaltered; but a change must take place as soon as to insist on demanding from the dealer an analysis of his superphosphate. It would be uvjust to the manufacturer to insist on a perfect agreement between the results of the analyses as supplied by him and those superphosphate. Differences of two or three crased superphosphate. Differences of two or three or even
five per cent. in the amount of phosphates may occur five per cent. in the amount of phosphates may occur
in two samples taken from a large heap of superphosplate. But if the differences are much larger it is a proof the manufacturer does not carry on his business with that skill and business-like manner which enables several of our best makers, always to supply superphosphate of a composition, quite sufficiently uniform to afford a guarantee to the purcha

It is strange that men in the habit of buying and selling do not pay more attention to their own interest, and often are content to buy the cat in the bag. If this were not the case would it be possible for so many unprincipled individuals-ay, and even companies-to mann a lucrative trade in artincial "a good manure" is used is fraud with mischief. Applied to superphosphate the question "what must I pay for a good manure ?" properly speaking, has no sense. Before the atrount of goodness required is mentioned no definite answer can be given; and as the goodness of this manure depends principally on the amount of soluble or insoluble phos-
phate, the question is fairly put when it is asked: What am I to pay for a superphosphate containing 16 per cent. of soluble and 16 per cent. of insoluble phosphate Or the question may be reversed, and asked: What
amount of soluble or insoluble phosphate ought a sample of superphosphate to contain which is sold, for instance, at 7l. per ton?
At the present time I believe a sample containing which is rendered soluble by acid, can be obtained in the manure market at the rate of \(7 l\). to \(7 l .10 s\). per ton. Many samples lately analysed by me, and sold at that price, however, have shown me that only few were worth the money that was paid for them. Every buyer of superphosphate for which 7. to 7. 10s. is asked, therefore, will do well to obtain from the dealer a written
guarantee, stating that the bulk of the manure shall conguarantee, stating that the buik of the manure shall con-
tain about 33 per cent. of phosphate, one half of which is rendered soluble by acid. Unless this precaution is observed, he runs the risk of getting an inferior article, not worth, it may be, half the money which he has paid object to such a reasonable guarantee; but inasmuch as there are others who willingly comply with this just request, the purchaser of superphosphate has only to all fairness he is entitled to ask. Aug. Voelcher, Cirencester.

\section*{DIARY OF A DAIRY FARM} Marce.
The general operations of the dairy in the month of March must of course materially depend upon the time of the coming in of the cows, which, however, usually commences in this month. A great proportion of the milk is required the first fortnight as food for the calves, are, of course it must be continued till they are so'd to the butcher. The milk thas early in the season is not considered of importance as regards cheese making, as if new milk be used for that purpose, it causes fermentation, and this renders the cheese of very inferior quality, and often of very little value; therefore the appropriation of the milk to the purpose of butter making is much the most advantageous use to be made cheese that is made from the early milk, another objec tion to using it is the uncertainty of the quantity brought into the dairy after the calves have had their portion, which renders the supply too irregular for making cheese with advantage. On every account, therefore, it is considered most desirable to use the milk entirely for butter. Sometimes when the dairy is very early, persons are induced to begin cheas only for family purposes, when at least half the cream is taken from it, and even then it is very subject to heave. To prevent this many plans have been adopted one of simple character has however been tried with much success. After the rennet is putinto the miliz add a little of the sour whey which is going to be taken from
the dairy, abouta pint to 40 or \(j 0\) gallons will be sufficient The new milk after the cows have calved should not be hrought into the dairy to be set up for butter under three days; if not all taken by the calves it is useless excepting for the pigs; after the third day it may be set up to produce cream, and it has been found, that by skimming the milk every twelve hours the flavour of twenty-four hours, which is a plan many rersons adopt with the idea that they obtain a greater proportion of butter from one thick, than from two thin skimmings. If the milk should yield a trifle more in quantity, which is doubtful, the difference is not equal to the improved quality of the butter if the cream has not been allowed remain on the milk more than twelve hours; this experment has been the butter has proved decidedly better by the mode of
kept in tin vessels suited to the convenience of changing it, which should be done every day, and a flat piece of wond or slice kept in the tins used to contain the cream,
which the dairymaid should use whenever she has an which the dairymaid should use whenever she has an opportunity by stirring it frequently; this prevents a
skin from rising, which is a disadvantage to the butter. skin from rising, which is a disadvantage to the butter. butter is taken from the churned twice a week, when the scalded and afterwards left to lie in cold that has been be used to beat it with ; this will absorb) all the butter milk if wrung dry and the will absorb all the butterfour times: after this a quantity according three or fine salt should be added, and worked in with the hands, when it will be ready for making up into any form required, without the use of water. The process of washing it is by some pergons thought quite necessary for making good butter, and that the milk cannot be properly extracted from it without using a quantity of water, but if the experiment be tried after the mode of making above recommended, it will be found that no butter-milk whatever remains in it. It has been ascertained from many years' experience that butter made without the application of water retains its sweetness a longer time than when water is used, and it does not appear at all unreasonable that this should be the case, when we recollect that the washing of meat prevents its keeping as long as it would do if no water were applied to it. Some persons have an objection to salt, and there is a method of making butter without it by keeping the small pats or prints, as they are sometimes called, in strong salt and water after they are made; the butter is very delicate thus prepared, but is never ald in at market,

When calves are intended for weaning, which is usually done this month, or as early as convenient in the season, they should be selected from the best and oldest cows, experience proving to the farmer. that a heifer's first and second calf are not 80 strong and likely to thrive well as those from cows of tried constitution, \&c. It has been proved a better method to allow the caives a small quantity of best mike than a much larger month or six weeks. The proportion of 2 quarts morning, and the same quantity in the evening, will be as much as they will generally take well atter they are taken from the cow, before they drink well without sucking it with the fingers. Much patience and care is required by the attendant to induce them to do this, and great and letting them remain to be dion shows hanger stupidity in the holder of it. The stomach of a calf being very delicate, it is most easily affected by any change, and scouring soon foll a aggravated by the irritation and fear of losing its mother, which often retards the growth of young calves for several weeks, if it does not cost their lives: a natural habits and instincts beisg quite necessary in those having the charge of young animals, which of course need to be taught a process of even feeding when it is unnatural to them. When they can drink well one quart of best or new milk will be sufficient, added to which they should get half-a-pint of good ontmeal or the same quantity of Linseed has been found equally nourishing and sufficient to keep them in good growing coudition. Both the meal and seed may be prepared in the same take for each calf half a pint of oatmeal or Linseed, mix it in a little cold water, and then add suffiLinseed, mix it in a littie cold water, and for each calf cient quite quarts of liquid; keep it in a covered vessel till required to be given. The morning's meal should be prepared the night before, as it should stand for some
hours, and that given at night made in the morning, and if made in large quantities it retains some heat ; a little more boiling water may be added to give it the warmth of new milk, 1 quart of which sharts of this liquid to each calf.
The milking cows should now get the best food provided for them, with access to good water, the comfort of shelter, and everything teading to secure their good condition, surely tending to greater produce of milk. Konts and good hay can generally be supplied revery farm, an and butting rom the frod of the catule pres fing about a dessert spoonful of saitpetre, finely powdered, he milk, placing it in a tin vessel to stand in boiling water, and constantly stirring the cream while it is heating and until it cools again ; ahout half an hour is sufficient for the whole process. About a teaspoonful of common salt and half the quantity of saltpetre has proved also of use in preventing any disagreeable flavour in butter occasioned by the food of the cattle, being put into the proportion of 2 gallons of mill, when it is brought in warm from the cow and placed in pans or any vessel provided to receive it, to stand in till the cream is skimmed from it.

\section*{Home Correspondence.}

Guano with no Grano in it.-Some sime since friend of mine had a sample of guano sent him from Hull highly recommended as of first-rate quality. Hearing the price was 8 ., tobing my friend not to buy. Dried is an oven
ample of 100 grains lost ouly about 2 per cent. of ammonia was given off, nor was a glass rod dipped in muriaticacid in the least degree tarnished when held over it. Instead of losing above 50 per cent. by burning, turned a bright red. I mention this case because it is the first time guano without any guano in it has come ander my observation, and also because I believe it to be a new sulstitute sold for guano. I found, as might be expected, it contained a good deal of iron, a smail quantity of lime (I was not at the trouble of weighing), a good deal of clay, and a small percentage of the
finest sand I ever saw. Am I right in thinking this was the warp mud from the banks of the Humber dried and ground? This would account for the sand being in so exceedingly fine a state. My friend said it smelt
strongly when he first had it, the lime remaining in it; and the fact of its having been kept some weeks wou account for no ammonia remaining when tested by me. From some cause I could not get the name of the great lear of the law perhapsed it. Farmers have a escape loss do not like the trouble and riak of exposing a case of this kind, and even when taken in, generally make up their minds to take care next time and sa nothing about it. J. R. Pearson.
Steam Cultivation. - There are generally two sides to most subjects. It requires a mind quick-not of appre question at the same time with an equally strong eye he understands my circular method of caltivation, and is able to foresee what the consequence of its introduction, both arable and mechanical, would be. I shall quote all "Y. F. W.'s" objections, and comment upon them as they appear in his letter. 1st. He alludes to economy in liling, and points out that by this circular 4 acres untilled (which estimate is incorrect by half the amount stated.) 2d. He alluies to ventilation, and affirms that the land left untilled (if so left) would exercise no beneficial effect on the circular half acre crops. These are the agricultural points; and he then enters upon the mechanical principles involved in the
plan, and says, 3d. "C. B." seens to think the wellsnown mechanical law "C. B." seens to you in time you lose in power, does not apply to his case when he talks "Y. F. W." assumes the farmer must ever require as arge a series of tillaye contrivances as he now employs with gr hoe, and a cutting lnife, the whole of which he could carry in his great-coat pocket if he had but one "haft" harvest waggons, \&c. 6th. How the point d'appui to my machine is to be removed to a new base of operation ; how much time such transfer will take; and how the machine is to be moved out of one field int another-its weight, \&ce. Final!y, he does not know machinery more worthy than man. I will first premise for "Y. F. W.'s" information that steam-power is no more needed to my method than it is to a railroad. -The first point to which "Y.F. W." calls attention is the apparent waste of land, and insists upon the necessity of economising land. Now fur years past this cultural advancement; it is the economy of manure time, labour, and money, not of land which shonld most be studied in agriculture. No one has more forcibly illustrated than the farmer the story of the "boy and filberts;" or the straining at gnats in one The farmer, more frequently than camels at the other a substance he has not the power to embrace, and the result is weakness of hold. It has been demonstrated over and over again in the pages of the Agricultural 400 acres lost 50 acres to-morrow, that if a farmer of his manures his means, morrow, and did then bestow remaining 350, both himself and his country would be great gainers. It is true that by this circular method we by machinery, which might afterwards be cultivated by hand, or be applied to some purpose so as to conduce t the fertility of the cultivated acres. I believe there is no want of judgment in such a proposition. My plan
of tillage is so devised that if we do but establish the principle, it will compensate the farmer, through cartage, and by increased fertility in the cultivated areas, for any small loss of land he may suffer. The second point "C. B.' "Y. F. W." refers is ventilation: he remarks the aeration of the plants a acres in win conduce to circle." Now \(t\) is is not exactly the fact ; in the first place, I :ay these 2 acres need not be left untilled, utill if tell him this bonus of space, allowing a reasonable diswhole that it would Some years siuce, writen I made the thereased produce. of farming in the field my especial study, I desired to find out how Nature effected the ventilation of our crops rings and blighted sposs among growing from of fairy rings and blighted spo:s among growing crops, Natu, ' "Y. F. W." observes that the blunk spaces will no
affect the plants in the centre of the circles, they veiug
more than 80 feet distant. Now, I have travelled more than 80 feet distant. Now, I have travelled
round the globe, and under wany situations witnessed the operations of Nature on a large scale, never losing my interest in tillage and plant-production, and in the Guzette I can only offer the sum of a traveller' observation on Nature's method of aëration on the large and small scale: it may be thus stated, viz., that blank
or vacant spaces in our fields, although they be 80 feet or vacant spaces in our fields, although they be atmospheric current will ventilate those plants, howfar distant from certain trees and shrubs, will ventilate thern. "Y. F. W." says, "In my opinion the circula had better emplog mechanism is wrong; and "C. steam-machinery on the present square method." The first reason I have to offer for not blindly following in the wake of those who during the past 60 or 70 years have endeavoured to work field-machinery on the square method, is, that it has either signally failed, or led to no result. It is evident that in 1856 we stand in this position After years of hammering, by some of our "best hands," on the rusty old nail involved in the rectangular or square method of tillage, the various practices of the fields have not advance 1 a single degree in time, power with conomy, when placed in the balance and compared communication, navigation, \&c. Such being the result under the "rectangular" principle of mechanical operating in the field, why should I follow such fruitless exertions and want of success? The truth is, our present method of held operating has been perfected for years past, and to all intents and purposes "used up," quite incapable of advancement, a \(f \in w\) years ago. Now everybody sees that, in respect to the old turnpike-road method of travelling, even if the coaches had been made of gold, and the bones of the horses of "superphosphate" of lime, that business or practice never would have attained to the present "one mile in one minute ;" but ertain people having discernment turned aside from Itogethen track, and altered the method of operating be just the same with farming in the field. The past experience of others under the "square" method eading to no result is the rational consideration deter ring me from seeking to work tillage machinery after ucls a method. C. Burcham, London.
merits of British farming by Mons. .ony borne to the in his "Rural Econony of England, Scotland, and Irelaud," has been ably noticed in No. 209 of the Edinburgh Review just published. The article is composed in a kindred spirit with that of the work, and desirable thake its merits more widely known ; it is extensie that this treatise on our agriculture should be extensively rend, inasuuch as its laudatory tone is
strangely contrasted with the depreciatory strangely contrasted with the depreciatory terms geneis displayed by almost all indeed, a supercilious manner is displayed by almost all persons not farmers, who it least competent to judge and condemn them without mercy. It has been the fashion for several years to dwell complacently on the progress made by all classes in civilisation, in scieuce, in art, and in general information; but in no class has more real progress been made uano than among agriculturists. Whether it effected this transformation we cannot precisely say, or if the attention of men has been diverted from pursuing the phanum of protection to a close examination of
business ; or if a season of culamity has introduce economy, accounts, and better management; or if th clash and confusion of parties in the State has deprive once belonged to it, and has led to importance which one leases, liberal covenants, and a a settronger affection of the rights and claims of punctual tenants and good cultivation ; whether any or all of these influences com oined have wrought the change or not, at least it evident there is a change rapid, continuous, and powerful, as yet in the infancy of development onward march to maturity very fine fellow in it suggested by the iucreasing evideaces which surround us of the growing intelligence of farmers, as manifested every neadiness with which they avail themselves of produce, for tilling the land, for feeding stock, or for They have awakene as out of trial and likely to pay last aroused, their vigorous attempts at progress will not be less successiul than their compeers, or of less in the undrained unfolding the latent riches that abound waste, or the meagre sheep walk; rabbits, the sandy make way for Turnips ; fish and wild fuvl resivear dominion to Colested and Wheat ; Furze and Heathe are replaced by food for cattle and sustenance for man thowe who one while machines for every thing require "'cute" sure guide them ; master and man consult about questions that would puzzle a mathematician and that would hend botany in ist. If a farmer does not yet compre he is the best authorit: upon the habits and capabilities fathom all the theorics of comparative physiology he is
daptation for feedinerioriy of coustruction and dribute to the provision of our wants and the conply of our luxuries. Year by year the requisit bility to understand the higher processes of his brings added numbers and a higher standard of a cellence into the field, and we finally add that while this progress goes on, and this improvement is noturious i his tastes, his pursuite, and his conduct the British farmer, not withstanding that a considerable accession to his worldly means has been recently made, shows th ddity of his advance by employing more labour, by ding more implements, by reading more books and papers, and by taking a higher status in transacting loe , business than has been previously allotted him Thick and Thigh
" poor land"" that before -There is so much difference sowing Wheateither thick or thin, it should be thoroughly understood eathat an "poor" The term indicates want of dehminatio for the grow the the grown of a particular seed sown. One descrip and and yet throw off a fine crop of Wheat under judiciou Parsnips and fail in sending matexcellent crop o market. "Poor," therefore, when applied to land in connection with Wheat, must mean the alsence of proper nourishment to insure an average crop. Such prig common sense view of the matter, on what Pre does the farmer sow thickly on "poor land?" that is, on soil deficient in what is necessary to feed bot the latter fill occurs that hungry land becomes infested with the wirs worm and various grubs, in this case it may be requisite to sow thickly in order to compensate for the plant destroyed by the insects. The necessity of thas wasting seed arises, not from the advantage gained in failure in consequence per acre ; but to guard agains failure in consequence "o bad tillage. Where thin seeding is practised on "poor land," the drills being a may be much improved by frequent stirring to admit the food. In thick, which this kell kown to contain plant weeds, the favourites of poor land, be easily and effec tually eradicated. I have never advocated a grain to a square foot, as hinted at by your correspondent. I spring, of Wheat per acre-taking for pectent that draining and cleaning are rigidly enforced. If four grains of Wheat will flourish where there is only food or two, it is unlike anything else I know of in the vegetable kingdom, however I may have overlooked this my elight experieperty. It is certainly contrary to As the subject of thin seeding meets with but few converts may be considered futile to enlarge much upon till our ensuing growing crops on a lar, se scale prove to know that your correspondent, Mr. G. Simmons, in last week's Number, Murch ist, condescends so fairly on our thin seeding principles expressing only his doubts and fears shether principles, expressing only only one single plant of corn on each square foot of and. Without criticism and argument the subject sould remain too one-sided. Mr. S. admits that he of Wheat is about from \(1,280,000\) to 2560,000 whicb for an acre ; or from 8000 to 16,000 on a rod; or from oor. If he or any of yard; or from 29 to 58 on a square o plant atan early sar or due time of the year, ba his 3000 grains on a rod, or 264 on a yard, or 29 on a foot, which equals 2 bushels per acre; also another square rod with the quantities 250 on a square rod, or nine on a square yard, or one on a square foot, side by side, keep ing both clean and treating both crops in every other with alike, ears from each plant, whilst from the thick planted they would assuredly find themselves minus of the solitary number one perfect ear of 50 perfect grains rom each grain or plant. If he or they should, howproduce by such ate as to secure even this uniformity of nd ay such a proceeding, as a matter of course, f no less than 50 times 2 bushels per acre! which thick seeders never do or can attain. Hardy and Son, Seed Growers, dec., Maldon, Essex.
Agricultural Stutistics. - Those who oppose the collec tion of agricultural statistics may now be left alone
解 wight with the more intelligent portion of th agricultural community; but all must agree that gtatistic hould be exact, or they will mislead. There is certain margia of error in all human undertakings, corrects another. If, mather, and one error perhap corrects another. If, however, there is an error in the mitiated more or less, and this I think is the case with
ver the Scottish statistics as now published. In eigh counties there are no returns from occupants ander \(20 l\), while in the others returns are taken fron all under 102 ; a little cousideration will show that this musc bring utter confusion on the whole, when total come to be considered. It is said that these excepted counties are Highland, and the rest Lowland; but with
not the case. The wildest parts of the Highlands are
perhaps situated in Perth, and this, with Aberdeen, is ranked amongst the Lowland counties ; parts of Dumbarton and Stirling too are Highland. But why should a diff.rence be made? If it is said that the small tenants in the Highlands do not understand English and would find a difficulty in filling up the forms, the same may be said of many renting above \(20 l\), or even 100l. But no real difficulty would arise, all above 41. pay poor-rates, and should be included. There is (like that at p. 90) erroneous. There are no correct maps of the country, and the extent of parishes and estates is not knowa in many instances ; we are worse point out these things that the same blunders may not bo committed when English statistics are regularly collected, and that the present statistics may not be regarded as facts, as seems to be the case at p. 91
Wheat
lace in rego of 185s.- So much discussion has place in regard to the yield of the last year's Wheat may not be altogether unworthy of a place in your Journal. There can be no doubt that in this neighbour hood, and for many miles round it, the best Wheat lands ave yielded the least, and the worst and inferior soils the most ; and for this reason, that the heavy crops on the low lands were laid, and the moderate ones on the inferior soils stood up; but even with this advantage the produce is very much below what it ought to be I have been a tolerably good tiller of the soil, anxious to show an example to my worse informed and duller neighbours, and have followed the four-course systemTurnips, Oats sown with Clover, mown twice, and folWhed with Wheat-instead of the foolish plan of fallow, Wheat, Oats, and fallow again ad infinitum. This with the landlord, results in something like 16 bushels of Wheat on an average of seven years, whilst my produce is as under:-

\section*{1855, 32 bushels per acre, weight 65 lbs.
1153,24
1854,24
1850
1855,23}

Making an average of 27 bushels per acre, weighing ather more than 62 lbs. per bushel. The nature of the land is yellow clay resting on a strong blue clay full of large stomes at about 4 feet from the surface, which surface when I took it in hand might have 4 or 5 inches of tolerable soil on. By ploughing a little deeper every time I have now got rid of the yellow clay, and can turn up 10 or 12 inches of soil, off which I can get from 12 to 20 tons of Turnips per acre in a favourable season. This year, which was a most difficult one to produce any Tnrnips at all from such soil, I have from 2 to 15 tons of Swedes and 18 tons of white Norfolk The only extra manure I use is 2 tons of Stanhope ploughed down for Wheat, and 3 cwt. of home-mad superphosplate of lime per acre for the Turnip crop the cost of the lime is about 10 s . per ton, and that the cost of the lime is about 10 s . per ton, and that o
the acid and bones about 25 s . per acre-no great outla the acid and bones about \(25 s\), per acre-no great outiay
for fcur years' cropping. I use 16 single horse loads o for fcur years' cropping. I use 16 single horse loads of the ridge and all pulled off. Old Slope, Thirsk, Yorkshive

Alcohal from Mangel Wurzel.-In reference to the remarks in your journal of Saturday on distillation from Beetront, and that "alcohol can be made from Mangel Wurzel,' I wish to communicate a fact that has recently occurred on my farm, which may confirm the alcoholi property of Mangel Wurzel, while the latter may me and my farm-bailiff. Twice in the last 18 months Thave lost suddenly on one occasion six, on the second, about a fortnight ago, eight young porkers, from a seizure which had all the symptoms of water on the
brain or determination of blood to the head- gidbrain or determination of blood to the head-gid-
diness, blindness, slight convulsion, resulting after a few hours in death. The only appearance on opening the animal was a suffusion of lymph Onced periectly healthy On both occasions the food of the animals had been Mangel Wurzel boiled for several hours with some Barley-meal. The Mangels were cut in slices and boiled in a large iron cauldron, bat not given to the pigs till cold the next day Could some distillation have taken place in the proces and the animals have been affected by the alcohol Your remarks of Saturday seem rather to warrant such
a conclusion. The older pigs were not affected. Those that died lately were about four months old, and had been about a fortnight on this course of food. P.S.L.G.

\section*{Gorse.-I should recommend the drills for Gorse to be} 3 or 4 feet apart. Cut the whole crop at once, or you add much to the labour, and if the ground is too poor to grow an annual crop, cut half each year, but not in alternate rows. I cannot state what groand will be say half an acre of good ground would last a cow through the winter, if the Gorse is two seasons' growth. Gorse Will not grow to be of any use under trees. It likes a
free open situation. Any nurseryman will supply the seed. W. D. Fox.

Measles" in Pork.-I fear we must infer from the reply which you were so kind as to obtain to my inquiry (see page 108), that but scanty information subject. A single tape worm, as is well known, may
of which contains thousands of ore jonts or rings, each ova, like the spores of fung', may float in the air, and in that case find their way into the stomachs and circulation of pigs and other animals, whether grossly fed or

Bad food and impure water may, however, induc state of the system adapting it for the development of cellulosus, which then become the measle or cysticircu cellulosus, as this entoznon is technically designated that English pigs are not less subject to this affection than Irish. I may further mention that it is a gene rally received opinion among farmers in these part that sulphur, antimony, turpentine, \&c., have been resoried to for the extirpation of measles without the slightest beneficial result. E. Murphy, Qucen's Collcge, Cork.
Clinker Manure-In your notice of my clinker manure, in the report of the proceedings of the Royal Agricultural Society at a meeting held February 13 you speak of this substance as being obtained from th vitreous substances produced in the fluxing of iron and other ores, This is not the case: the "clinker" used
as the basis of my manure is the semifused ash of ordiary coal, and is quite unconnected with smeltin operations of any kind; it is, in fact, the mere inorganic matter of coals. In a short time the chemical analysi of this new manure wil be submitted to the agricultura public. L. A. Ritterbandt, M.D.

\section*{Wgdeespax, May 14,-Prof. Way's second lecture}

The Council then adjourned to their Weekly Meeting on the 12 th of March.

\section*{SOCIETY OF ARTS.}

At a very crowded meeting of this Society on Wednesday last, presided over by H.R.H. Prince Alb rt, the following paper, which we give entire, was read by Mr Hoskyns: "On the Progress of Englise Agricul
ture during the last Fifteen Years,
"Difficile est proprie communia dicere.
A very scute observer of the minor experiences of life has left behind him the remark that no subjects are so difficult to handle as those which are of everyday interest, and come under the definition of common property.
A very strong sensation of this truth came over my mind on being honoured by the request of the Council of this Society to undertake a paper on the recent progress of agriculture as one of its evening topics for discussion. There is no branch of our industry to which the remark I have quoted applies so forcibly; and if it were not that the most difficult tasks and the most discouraging results I have ever mot with have been from my own soil, I should never have had the courage to under!ake the task, nor that deep interest in the topic
which makes pleasure vault over difficulty, an enablesd ope to look discouragement in the face withou huching. In fact, if I am not sn much afraid of it as know I ought to be, it is because, with the everiasting
exception of my own farm, my agricultural experiences have not verified that stubbornness and tenacity which we usen to hear of, but, on the contrary, every idea or uggestion forced out by the reflections that accompany difficult practice have generally met with a freedom and openness to conviction which of itself has seemed to me to mark a sort of agricultural era, and has led me to watch with a wider interest its contemporary develope ment throughout the country
Yet in doing this, and looking back upon its past history, I cannot deny that the comparative universality I have alluded to, of the topic, has appeared in some legree to lay it open to the adage that "what is every ye of public interest from the landmarle of the ye of public interest from the landmarks of its progress by the very breadth over which its current definds whilst other industries and arts, ying in more defined channels, are more readily marked and mea sured, and every invention and improvement mapped down with a precision, not so easily accorded to the progress of a national industry, which, though repre senting a capital calculated, 20 years ago, at \(217,000,000\). has, for the reason suggested, reached our time with no history, no statistics, no representative in the law or the state, no board, no minister, no department, in faet, as Mrs. Gamp would say, "no nothing." So entirely annoted and unchronicled is its progress, by the state for the public, or by the public on its own account, that if were possible for me to recapitulate step by step all the forgotten facts of its history during the presen century alone, and lay them succinctly under the eye, I do not believe there is a single branch of art or industry of which the particulars would seem to form a more novel or eventful history, or more suggestive of surprise that they should have been allowed to drop astern, as it were, in the wake of time, and fade from view; and this, too, while presenting facts surely as instructive for reflection or foresight as could occupy the attention of the economist or the statesman.
Before attempting any reference to its more recent progress, it seems desirable to premise some statemen of the condition at which it had arrived at the opening of the period under review. To form a judgment of the yrowth one must know the original stature. For this purpose I must hasten over some ground familiar, probably, to many of my hearers
I need hardly point to the fact that this country, whose average imports are now nearly 10 million quarters annually, was, less than a century ago, doing a large trade as an exporter of corn to other countries; that later in the lust century than the year corresponding with this, a celebrated French economist (M. D'Augueille) quoted afterwards by Artiur Young, said that England could grow corn enough in one year to support herself for four. The 20 years elapsing between 1773 and 1793 were the turning point of our history in this respect, a sort of pivot period, when exports and imports nearly balanced each other, under almost nominal duties inward and outward. A slow but steady inclosure of and during that interval began to mark the consumption of a gradually increasing trade and population, of which however, we have no accurate means of computation or comparison till the opening of the present century. may just mention that throughout that unique period of 20 years the price of Wheat averaged with great steadiness about \(45 s\). per quarter in the money of that day when rents were from \(7 s\) to \(10 \%\). per acre, which afterwards rose to from \(30 s\) s to 40 s. Thus in the memory of men now living, the price of a bushel of Wheat was twothirds of the rent of an acre of land, not at a time of any severe pressure of war or scarcity, but under circumstances of comparative equability. It would be difficult to adduce a more striking evidence of the fall in the price of food as compared with the producing area, than the change that has since taken place

With the year 1793 this period terminated, and, with the wa, bega also a No account had been kept of the progress of inclosure
during the century ; but a Committee of the Honse of during the century; but a Committee of the House of Commons which sat in 1797
at about four million acres.

From the commencement of the present century, down to this time, we have a definite record of the progress of inelosure, of population, of corn imported, of prices, and, in some measure, of the rent of land and from these we shall be able to form some idea of the point to which our agriculture (using the term in its national or territorial sense) had arrived at the period which forms the starting point of our present inquiry.
Taking it in decennary periods, the account stands as follow: - From the increase of the population of Great Britain \(1,508,687\), and the quantity of Whest imported \(6,009,408\) quarters.
In the second decade, from 1810 to 1820 , the inclosure was
\(1,410,930\) acres, the forther addition to the population \(1,978,323\), 1,410,930 acres, the farther addi ion to the
Thus, during these first 20 vears, while apwards of three mil lion acres were brought nnder the plough, the population was in creasen about three-and-a-balf millions. The rent of land
advanced during the war to at least three times its forme advanned, measured athe least in a depreciated paper carrency. But
with the close of the war, in the middle of the second decade (1815), the ave age price of Wheat given by those 15 years,
84s. 9 d. q qurier, fell to an average of \(88 s\). Ad. for the last five

Thins, it will be observed, these 20 years present the phenome non of immense inclosure of land, noder the stimulant of the highest prices of food ever known, except in very early recorded
cases of famine, ia this country. It would seom to have required

 rents, though to nuthing like what they haid bern hefo e the war The best expression of this is seen in the strikingly reduced
inclosure of the next 10 years (from 1820 to 1530 ), which reached only 340,380 acres, little more than a fith of the previus rates During this third decennary period, the advance of the pitnral
tion by 2,161,495 was gradually bricging rumd the
Temedy to the farmer for those overdoses of inclosure which the War had prescribed; but the reduction of the average price of Wheat from its. 4d. to \(58 s .3\).l, accompanied by nu increase o
importation, shows an advanced acreable produce under a strong
home competition; the rent of land gradually rising to nearly its previous mark.
The nextdecennary period, from 1830 to 1840 , sho ms , in spite of the facilities afforded by the General Inclosure Act of 1835 ,
still reduced and almust triting addition to the cultivated soil amounting to only 236,077 arcess Jess than a sixth of these first
anmed. Still, thongh there were \(2,24,648\) more mouth to feed, and the importation, though iucreased, was not large, the average price again fell to 57 . the quarter, disclinsing a still fur
The summary of the whole four decades, then, from the begin addition of rather more than three-and-a-half million acres to the cultivated land, rgainss an increase of nearty six million to
the population of Great Britain; whilst the effect of the foreign supplies of Wheat did not amuuat to so much on the average as
It may be remembered that at the time when the question of the free admission of foreign corn was in agitation, it was a common prediction that it wonld have the effect of throwing land oucount of the immense inclosures during the first twenty years of this century, that had the measure taken place at the close of that period, there might have been some ground for clays, from the fact that the increased produce, shown by the figures I have given, was chiefly drawn from remarkable cotemporaneous improvement going on, lighter class or suits. But it is equally evident, from the ame figures, that from 1820 to 1840 not only was this prediction becoming every year less applicable, but, on
the contrary, we were beginning to present the opposite phenomenon of a population overtaking the resource of ther means for increasing the produce of the soil.
It is at this period in the history of a country that agriculture begins to assume the most interesting aspect for the purpnse of our present inquiry. It is qu te population has so risen as to cover that outlying margin which fresh inclosure brings under the plough, the mer routine of practice is not likety to offer much change, or to undergo much intrinsic improvement. As long as the deficiencies of acre No. 1 can be supplied by a mere collartral resort to acre No, 2, the same system Will do, the same old implements, the same waste of and in the fold, in the barn and in the cowshed, in the dairy and in the piggery, for the simple reason that the second inclosed acre is open to precisely the same pro ess as the first
But it las been and is the characteristic of our day to have witnessed in this country the comparative ex haustion of this resource. The plough can no longer strike a supplementary furrow in fresh ground; and
we have seen, during the fifteen years that have elapsed since 1840 , the first-fruits of that opening problem, how the old furrow was to be made the arena of an increased produce, when agriculture is thrown back upon its own examine those resources by the light of its principles.
No doubt this condition may have befallen other countries; perhaps in the Netherlands and in Tuscany, not to amme any other, something of the same phenomena in the exhaustion of territorial resource may have been possessing such characteristics as this in point of capital, inventive power, industry, and skill ; and there never perhaps has been a more remarkable exemplification of the provert - that 'all things are double, one agains another -than in the timely el-ments that seemed to spring up just when our husbandry had come to n
them, more than it was, so to speak, itself aware of.

I allude to four disfinct elements of new resourc opening to view for the first time, almost simultaneously about the year 1840 , and which, for reasons that wil presently ajpear, I will state in this order:-First, the cation in this country of the works of Liebig; thirdly the eatabli-hment of the Royal Agricultural Suciety of England; and fourthly, the introduction of an improved system of drainage.
comparative practical value of these four farmery friond on the comparative practical value of these four farmers' friends. No
dontht gaan is a ready friend, and a quick teacher. Bat who ia
there that does not remember the almost universal eron tha
guano brought to light, existing in men's minds as firmly roote
as a tirst principle, resp-cting the food of plants and the natur
of manures? Wio cunnot recal the shakes of the head with

I have vhat
showing what a happy collaterat commentary upon the introghowing what a happy collateral commentary upon the intro-
duction of guano were the translated works of such a writer
as Liehig. who, whatever his after-suffersd breach st certain points, when exposed to the formidable battery of
such experimentalists as Lawes and Gilbert, had yet probed into
nature's secrets and disclosed the theory of the action of manures, and led to that economy in the special application of them to
different crops, the effect of which has been to institute a new What womld our ancstors have said to the inanufucture of an
artiticial manure? Why, thirty years agn, the phrase would have
sounded about as rational as the idea of manufacturing a Wheat rick. Yet this is now a large trade ancillary to agriculture,
empp ying thonsind of hanfs, and proceeding upan cliemical
data the like an unknown tongue to the agricuiturist. The very adver-
tivements of such traders, puffing and exaggerated as they may oftea be, have hid the effect of engrafting into the language of
this new agricultural commerce, words and phrases which
incidentally aisert scientific facts, and involve a sort of rough incidentally assert scientific facts, and involve a sort of rough
introduction to the meaning and use of chemical terms for those Who would, probably, obtain it in no other way.
There is nothing more remarkable than the rapidity with
which the smallest morsel of practical truth, however scientific which the smallest morsel of practical truth, however scientific
in its nature, becomes snapped up and digested into the language
of commerce. The late Charles Buller nsed merrity to say that of commerce. The ate charles Buhler ased merrity in say that
the Times advertisements were the best light reading he knew
for amnsement and nstruction at short notice. I often think of
his remark when I see the practical doses of chemistry adminis-

certain landmarks laid down by accident, or by same of thnse
irresistibly ludicrons mistakes which the use of new terms brings
to pass, and stamps upon the memory, that one can measure the to pass, and stamps upon the memory, that one can messure the
change wronght in this particular. What a long-winded sentence
it used to take, far instarice, to paraphrase and explain the now it used to take, for instarice, to paraphrase and explain the now
well-known word ammonia, in order to rescue that alle-sential
chemical fron a certain personality uf attribute which its

farming world. But to return.}

The third element of progress I named was the establishment of that powerful engine of agricultural improvement, combining both the stationary and portable character, the Royal Agricultural Society.

The fourth element I named was Drainaze. To this shall have to return
I refer to these four prominent agencies, presenting tone of an exclucive citew, as cotemporaries, not in the causes co-operating with them have been many, much
loss with the ouject of stringing upon them arrative of facts. The use of the past does nit lie in its catalorues of annual occurrences, little better for our purpose than an almanack or an obituary. The review that gives back life and value to bygore evente consists iu theiv analysis; and, following that vein of thought, the causes I have named as dating their origin about the same period (1840), suggest to mind the two great heads into which agricultural improvement naturally mainly divides itself - viz., the Chemical and the Mechanical. And I confess that when I see the extent to which the use of 'chemical manures, so to call them, has been carried upon the light Turnip huswandry soils-upon those vast Norfork plains, for in stance, which the names of Hollham, and West-acro, and Castle-acre, bring to mind; where the large, and herchant is the largest landlord, 'I cannot help identithe heaviest rent his isions I have named, with the two classes so sop divish form almost separate of agricultural practice in this country, and whose history and experiences are so widely different-viz., the Light soils and the Clays.
It must be obvinus to any one who considers the nature of our
climate, that the treatment of the heavier and more tenacious
Snils presents by far the greater difficulty, and one that would be
the latest surmounted in the naturul progress of labour or inventhe latest surmounted in the natural progress of labour or inven-
tion. Rut the mechanical disadvantage presented by the clays is not the only one, nor the worst. Few men prefer a difficult tast
to an easy one. Few men, under a weeping sky, prufer a soit
which is for ever turn ng rain into a foe, to one upon where it is Which is for ever turn ng rain welcome one. Few men prefer a
not only a finien, but an ever whel

prise, is the course that indicates itself for the accomplishment this now widely cherished object. Cnuld the inauguration of such presence, which recall to mind the greatest union for the sacre witnessed?
I turn with anxious interest to such a machine as Fowler' Draining Plough, with its happy incidental adoption of the
lately-iovented wire-rope, and that most suggestive and satisfactory feature which it embodies in its stationary engine. It is remarks on steam culture, lately, delivered here, withnut recog-
nising in it the ontline of something which may relieve our clay soils as much from the pressure of heary hoofs and wheels on the pipas relieves their moistare from below, cutting through the subsoil like a cheese. It is upon the Steam-enyine in every formi, as it gradually wins its way from the fold into the field, an
from the one engine that smoked in onr trial-Fard at Bristol from the one engine that smoked in onr trial-yard at Bristol in
1842, to the fifty-seven that stood in row at Linenln, waiting to prove their speed and power by Mr. Amos's perfected Dynamthat mechanical progress of apriculture which our climate and
our clay demands, and our mines of coal and iron, with equal peciality, present the means
There is one striking feature which has marked the period we are looking back upon and has perhaps attracted the notice and interest of the non-sgricultura world more than any other, and will hereafter becume perhaps a distinguishing landmark of the time; I mean those numerous Example Farms, which, spreading gradually from one or two isolated inslances, and weathering a somewhat rude storm during the range ow prices reaching from 1847 to 1852, are now suff in every county of what can be accomplished by resolute enthusiasm in the adoption and carrying out all the improved resources which capital and general intelligence can bring to bear.
Inse the term general intelligence, as distingulshed from prac
tical farming knowledge, not as at all denving the latte tical farming knowledge, not as at all densing the latte effort, and always gradually attainable, but becanse I shall not think, misdescribe the object and idea of these really patriotic establishments, in speaking of them as the pioneers who, generally speaking, hare, explored untrodden paths, and who-
more prominent labours and results have been perhaps too mach mistaken by the public eye for a general movement of the main
line and body of our agriculture, to which they form
a sort of advanced company. If, however, foreigners express themselves in terms of admiring astonishment
at these examples of apphed capital and sk, ll, which
they are taken, from one to the other, fo visit, and they are taken, from one to the other, to visit, and
from which, as in the case of that careful investigator and fattering eulogist of British agriculture, M. Laverane. they 1 think they would be not less astonished could they Le mad
aware how large the bulk of farming is in this conntry which within that might be shown, if a balance were struck of the "creahlle would be surprising to those who judge of the whole contents a
the basket by the plump rosy apples that lie prominentlo the basket by the plump rosy apples that lie prominently at the
top. The fact is that the revolution which has been taking place in the agriculture of this country presents, like the planetary
motion from which the term is borrowed, a centrifugal as well as centripetal action; as the heavier capitalled portion, which has
come to regard the soil as a mere arena for invesment, has arge outer circle of those who vainly persist in thoking npen, a
farm as its own capital, are clinging on to holdings far beynal their means, and to a system which every invention and every
improvement, and every addition of capital to agriculturu renders more nutenable.
and sudden in ints operation and the struggle it presented of the condition of English iagriculture conld be given which
did not include the shadow upos the back result of an inflexihle law which no philathropic regr-
can avail to alter. It is true that capital canot be applied
protitably to atriculture beyond a certain limit, as Mr. Lawe has shown hy a simple table that submits it to the eye as
painly as an equaton, so far as the growth of cereans is con-
lerned: but the proof lies at a point so ligh, so far above the orned: but the proof lies at a point so ligh, so far akove th
ordinary scale of farming, that for the present question it is a though that limit dud not, exist. Every deseription of improve

Au almost exhausted hour-I fear a quite exhausted patience-warn me to a brief conclusion, while the hydra-headed suliject I have merely approached stares me in the face with its numerous and various topics, rising thicker and thicker to my view still untouched upon. Looking back over the space of my own, however limited, experience, and purposing sketch, I have encountered a history, which no effort a compression could reduce into the narrower space would glady prefer. One subject alone I cannot end without a parting word upon, and that shall be as short as those words can be which carry long thoughts When the cares and difficulties of an intractable soi first drew me from other studies to that of agriculture what was my dismay to find that books were looke upon as the very rocks and shoals ahead to be avoided not consulted, by the home mariner, the plougher of the land, who would escape shipwreck. Strange
paradox ! Yet of all the prejudices to be sur mounted this seemed surely the most difficul which would cut off every chart of information
beyond that which the solitary steerer already possessed, or saw axound him, in however wild patitude. It is still, indeed, true, as so discriminately pointed out by one whose toiling and valued pen has ceased among us-PHilip Puser-that books will not joined, are they a substitute for the apprenticeship of daily practice in any other pursuit. Yet, luckily-as no man better than the farmer knows-6 knowledge is no burthen,' and the boy who whistles at the plough, or the man who holds it, much more the master who directs it, walks none the heavier, observes none the eas acutely, draws truth from nature none the less easily, is none the less "in league with the very stones"o the field," though all "Morton's Cyclopredia," and Stephens' "Book of the Farm," were sublimated int his brain. It would be toiling over a siale furrow to argue the point again, but it is impossible for me to keen sense of gratitude to the bold and brilliant pen that have broken through a barrier threatening to immure husbanary within the solitude which is in truti its own greatest deprival, and in some degree inseparable from its steady and industrious pursuit, apart from the civilising thought and intercourse which the city mouse and light but who is there whose labour is not chered for personal intercourse, are yet struggling with the same task as himself? Whetber the acene lie among the now too classic fields of Pusey, in Berkinire, or midst the liqui-fertilised and startied acr bore the dry and barren name of Tiptree Heath, in EssexWhethe imbibe dranghts of chemistry from the fountain-head at Rothamsted, in Hertfordshire, or seek a too short oblivion or enjoyment of 'Present Prices' upon
the chalky downs of Dorset-or whether, invited by the active spirit of the times, deserting these hospitable homesteads, we start forth upon a roving commission, with the chiel amang ye taking noter, from the solent ap to John o Groat's -do we find that such fireside companions as these diminish our practicality, or invade our winter evenings less usefully and pleasantly than the Gaztte, or Express, or Messenger, or other weekly page which brings us tidings of the markets of the Brin, to which not more the trade than the mind of British Agriculture has been opened. f, at least, for change which "Practice, with Science" has wrought upon the aspects of farming during the 15 years past, the most striking, the most complete of all has been, where I suw most to despair of in the outset-in its Lirera TURE both practical and scientific (for even in its literature these two classes must co-exist). Did I meed token-a convincing attestation-that in the threefold character of farming, as an 'Art,' a "Manufacture, and a 'Commerce,' and, let me add, an Eulucation, its interest and progress are felt as among the highest oljects of the highest mind, in the spirit, if nor the words, f well-known epigraph, "Si indicium requiris circum brother-members and the Council of this here, before my Presiding presence of one who, amidst the absorbing
avocations of a life devoted to the promotion of the useful, the beautiful, and the good, has practically earned, and freshly dignified, a name associated of old
with the Throne and Royally of Eugland-the name of a British Farmer
After the remarhs of Messrs, Paine and Lawes Ransorae, and Hudson, which we will report next week, his Royal Highness the President said, "I feel I am only carrying out your wishes in proposing to you that we should return our best thanks to Mr. Hoskyns for the very valuable paper which he has read to us. He has given us a very accurate and succinct history of the progress of agricuiture, in that peculiarly agreeable and epigrammatic style which is familiar to every one who has read Clay Farm.' He has not only interested and amused us for the hour, but he has given us much to think on and if he has taught any one lesson of greater importance than another, it is that the future progress of agriculture will mainly depend upon the close and intimate union and the hearty co-operation of science, art, mannfactures, and commerce, and that the primary condition of a successful progress for the future will be the statistics. And here I hope I am not trespassing in asking you gentlemen, and every one of you, in his particular circle, to contribute his mite in obtaining particular circle, to contribute his mite in obtaining Government is now trying to collect. I merely repeat our thanks to Mr. Hoskyns for his interestiug paper."

\section*{Farmers' Clubs}

\section*{Tauyton: On Clay Suil Prufessor Voelcker,} the Agricultural College, of Cirencester, at the request of the Council of the Bath and West of England Agricultural Society, delivered a lecture on this subject, of
which we give the following abr:dgment from the which we give the following
columns of the Taunton Paper:-
"The subject of my present lecture has been selected because,
 mprovements; and thirdiy, Which illustrates in so many different ways the connection of
theoretica ichemistry with practical farming, The very formation
of clay soils is depending on cliemical action, for the chemical of clay soils is depending on clemical action, for the chemical
influence of the atmospheric oxygen and carbonic acid upan flay soils Clay soils are formed during the decoupositio granite and other rocks, which the geologist calls volcanic. In
ranite we find three minerals, quartz, mica, and felsvar. Felspar granite we find three minerals, quartz, mica, and felspar. Felspar
 and silicate of potash. Silicate of alumina is China insoluble. Silicate of potash is soluble. It is washed away and further decomposed into soluble siliea and carbonate of potash.
This explains why clay soils that are naturall deficient in sand or silex produce, notaithstandining, Wheat witli strong straw. All kinds of clay contain more or less soluble silica, and consist principally of silicate of alumina or a combiuation of silica with
alumina. Agricultural clays are produced principally from the alumina. Agricultural clays are produced principally froms the
decomposit on of granite, or felspathic vecks; the clay being becomes intermixed with other constinents, and these foreign constituents are the priveipal cause of the fercility we observe in cont agricultural clays. The foreign matters in agricultural
clays contalin potasho soda, lime, manganese, phosphoric acid, and Tow ot hers, which 1 will not mention at present. All these
furiche produce raised for food of man or beast, and as these constituents are always found in the aslies of plants we are
entitled to conclude that they are necessary for the existence and perfection of the plant; indeed, it may be laid down as
principal rule that those manuring constituents which form the oreign admixture in all agricululural clacss are absiotutely necesary, for the plants which we cultivate canuqut come to perfection
without them. But often they are contained in fuch a comblinat tion in the soil as to be compratively useless at the time, and
 decomposed materials, from which the clay is formed. These most fertilising constituents. By working the land, fresh quan itities of undecomposed granite are brought under the intluence
of the atmospliere, and the felspar contained in it is gradnall decomposed and furnishes soluble potash. This benefit is not
reaped by stirring a sandy soil. However much we mav stir a there is not potash present in any considerable quantity; butt in many clay soils the supply of potash, one of the mast useful fer-
trlising substances, is almost inexhaustible. All clay soils

 power of absorption is dependent in agreat extent on the
surface of the soil which is expesed to the, influpence of the atmo-
 pulverised, th. greater is the atsonbing surface, and the mire beneficial the ressutt: and this teaches ut at once the great ad
vantage of stirring clay seils when there is an opportunits. In wet scasisns I Im a ware you do harm to clav soils by working ake the advantage of the rnst fawnitable seathis for wrik in
them as much as posible, esperially bofore the settin frost, which in a p p
the ice which is form clay soils, and effects the chemical decounpsition of these 6 ,n-
stances, which furnish potash to the growing plant. Put clay
oils rom the atmosphero the property of absorbing fertilising gase
 you take liquid manure and pour it over a clay coil, Gun will bi: etaiaed by the clay soil. This is a very rem.rkable propert
thich explains nany facts with which all practical farm
 ashrd out by shavers of rain, and the mosit useful consti-
uents are lost. It is not 80 with clay soils, It is impossible
to wash out from them the most useful fertilising constituent
Let nu now inquire int the best means of improving clas soil
Draining not only takes awas the excess of water, but brin Draining not only takes awas the excess of water, but bring,
into the soil large quantities of a mospleric air, which. plyin it
influence on the constituents of clay soil, gradually renders the
 Bit brings likewise into the sol
rganic fertilizing constitnents

with a soil 1 estiog on cold sterile barren suboiil, you may run
 mature of the subsoil then must determine whether it is advan-
tageous at once to ploumth very deep, or more advantaneols
tradually to improve the condition of land by guing a little gradually to improve the conditin of land by g,ing a little
leeper and bruyging up the fubsoil every year or tro You have heard of Mr. Smith's sy tem of growing corn year arter
ear; Mr. Smith (I mean o' Lois-Weedon) grows corn year afte year, by leaving between the rows space sufficiently large for lim
to work between them, and by this means he succeeds in bringing to wark between them, and by this means he succeeds in bringin
the soil betwern the rows in a state of fertility which will ne
year year enable him to grow anothor crop of corn on the same field
hich the crop of the preeceing year had been crown. Mnstautly woiking the land in this way, Mr. Suith has s
ceeded in growing for a anceession of years abundant cropz. he carried out with very great advantage, but at the same tim
 plenty of undecomposed felspar, plenty of insoluble lime, penty those fertiliising constiturnts, which raturally are present in an
nsoluble state into a condition in which they can be assimilated
 Mr. Smith's plan with advantage and speak hiphly in it
farour, others term it an irrational and unapofitable ssstem.
Many clay soils I believe will eanale the farmer to Many' clay soils, I believer, will euable the farmer to grow corn
for a succession of jears, but this is to be satd, regarding Mr. Yor 2 .nnceession of years, but this is to be said, regarding M
Smith s systan, that yout have not alwass men mulficient at han to work the land, and therefore you cannot praotically carry o
that system. Nothing, I believe, improves clay soils so much the system of burning aud paring. Many of you lave heard really remard to clay soils, and the effects produced have be realy remarkaile. In birning, clay undergoes remarkabio
changes-potash becomes
shinluble, and all those fertilising con stituents are renuered soluble which plants require; or, to spea
in a somewhat sweeping way \(I\) would observe that burning pro in a somewhat sweeping way 1 would observe that burning pr
duces exactly those changes in clay soils which fallow produce and this, there can be no douht, is a very great advantag months. yous can at once realise the benefit of this process of iu proving clay snils, the ad vantages are apparent. Liming
another mode of improvenient. Many lay soils are deficient is
in substance; however, as clay soils differ much in composition,
must not be taken as a universal rule that all clar sois one proved byming Drop a w drops of apirits of saits on the sai and if it effervesces lime is not wanted: but if, on the contrary,
produces no efferveccence, it shows a deficiency of lime, and suc mprovemant of clar soiss is, the application of artifical manures If you have not home-made manure in sufficient quantities to enable you to give a fair dressing to all your fields, and have on
your farm light and heavy soils if you have sandy and cla sinl- it is decid
sandy soils, and fand stils, and to apply to heavy clay soils (provided it is in
fit tate of cultivation) a specific artificial manure: the consequence will appear at mece. Sandy soils contain, as a princip tively smatl quantities of other fertilising constituents, Now farm-Yard manure may be called \(a\) nniversal manure, containin all the elemen's of nutrtion which plants require, and conse
quently it produces in the soil naturally deficient in the quently it produces in the soil naturally deficient in these
elfements greater and more beneficial effects than in solls in ethith we hreave not this deficiency. For instance, ammonas in
wital mannue which mure for corn crops; nitrate of soda sinis -guano I muy hit to mention as one of the most useful fertilisers Now guano and nitrate of soda contain much nitrogen, which
exercises a specific action, highly beneficial to our Wheat crops The application of guano, however, in sandy soils, is not the
best. (iuano is not a perfect manure, because in sandy there is a deficiency of phosphoric acti, and this deficiency is no in guano. But by the application of guano to clay soils we can how a know corn crops. There is another instance, showin artificial manures. We find that in the cultivation of root crops
specific manures are reanired. A spocific specitic manares are required. A spacific manure for root crop
is superphosplate of Iime--benes in a seluble form. Super

}

THE DIRECTORS of the above COMPANY (many of whom are extensive Agriculturists) have great pleasture in acquainting their friends and the agricultural community, that they have now completed their extensive works and
Machinery for the manffacture of their Manures; and, having secured nearly the whole of the Blood produced by the butchera
of the metronolis of the metropolis, and a large stock of other neessary material. of the best quality, they are now io a prosition to the supply thers
Patent Manure of the highest quality; and, as most of the Directors and many of the Sharelolders are themselves Iarye concumers Patent Manure of the highest quality and, as most of the Directors and many of the Shareholders are themselves large concumers
of the Blood Manure, their fixed determination to supply nothing but sterling and genuine quality cannot fail to afford a
gramatee and proction to of the Blood Mare their fixed determination to sup
guarantee and protection to the farmer against imposition.
The great ralue of Blood Mnnore as h fertiliser may now be considered as a fully established fact. Ever since the first introduction
of this valuable fertiliser, the demand has been of a few experiments, it has been tried for the last four cousons by hundreds with slied. Its claims rest net in the assertion of few experiments, it has been tried for the last four seasons by hundreds with great success, and in the next it will be
tried by thousands. It affords, in fact, a conclusive answer to the question, "What has science done for A The Blood Maxure is composed of bones dissolved in Sulphuric Acid, to which is added a large quantity of pure Blood, specially prepared to suit various crops, and may either be applied by the drill or sown broadcast.

\section*{BLOOD MANURE FOR TURNIPS.}

The phosphates absolutely necessary for early development and rapidity of growth in the young stage of the plants are in a ordinary samples of Superphormhate of Lime, and, the Blood supplying nitrogen, the latter growth is alsn secured, hence the superiority of the Patent Manure. It may be used alone at the
rate of 4 cwt . per acre, or it farm- tard manure is will be sufficient, with an equal quantity of fine mould or ashes N.B. For this, as for all other root crops, an additional application of Blood Manure will much more than repay the additional
cost. Though 2 or 3 cwt . per acre will produce a crop superior cost. Though 2 or 3 cwt . per acre will produce a crop superior application of a much larger quantity will be found even more remunerative. The rent and charges must by paid equally,
whether the land yields 10,20 , or 30 tons an acre; so that an Whether the land gields 10,20 , or 30 tons an acre; so that an
addition of 8 or 10 tons of roots beyond the common crop costs nothing more than the price of the extra 2 or 3 cwt . of Blood
THE BLOOD MANURE FOR WHEAT, BARLEY, OATS, ETC.
Being rich in nitrogen and other necessary ingredients, it is
especially adapted for the Wheat and other Cora crops, and has Deen used with the greatest success in all parts of England. It is a very remarkable fact that the analysis of blood and the
grain of Wheat are nearly identical, as proved by the most grain of wheat are nearly identical, as proved by the most require, and when properly prepared, will become the essence of vegetable as well as of animal life. The highly fertilising properties of Blood have been commented upon by Professor Wroand others, and the success of the Blood Manure for Wheat and experience of numerous Agriculturists. Should Wheat mannured with dung in the ordinary way look unhealthy in the spring, it will be greatly benefited by top-dressing it with Blood Manure, at the rate of 2 to 3 cwt . per acre,-thus strengthening the straw, produce. For Barley and Oats, 3 to 4 cwt . per acre of the Blood proauce. For Barley and Oats, 3 to 4 cwt . per acre of the Blood
Manure may either be sown broadcast or drilled with the seed, if the former, to be well harrowed in.

\section*{BEANS AND PEAS.}

For Beans or Peas, 3 to 4 cwt . per acre may be used either broadcast and harrowed in, or a portion afterwards, betwoen the
drills at the time of horse-hoeing.

MANGEL WURZEL AND CARROTS.
cwt. to the acre with an equal weight of common salt should be sown broadcast over the field, and well harrowed in, the seed being drilled in the usual way' repeated horse-hoeing between the rows is of great importance for air and nutriment, and great
advantage will be obtained by occasionally sprinkling a little advantage will be obtained by occasionally sprinkling a little
Blood Manure between the rows previous to the hoeing.

\section*{POTATOES.}

Will be found to give most satisfactory results -it winp be most Will be found to give most satisfactory results-it will be most
successful if 11 sed to the extent of 4 cwt. per are, with half the the usual way. Should the farm-yard manure not he used, then 6 cwt . of IBlood Manure may be used alone, put into the bottom
of the drill, and the sets on the top aud earthed up.

\section*{\(F L A X\).}

This crop in olden time had the renown of being one of the most exhansting crops which could be put into the land, and this
by chemical analysis has been found to arise from the large oy chenical analssis has been found to arise from the large
quantity of nitrogen, phocphoric acid, magnesia, and the alkalies taken up by the Flax plant, which renders it a highly exhausting crop. The Blood Manure is carefully prepared, so as to meet considered an exhauster of the soil. In using Blood Manure for this crop, from 4 to 6 cwt . may be sown broadcast, and harrowed
in before the seed is drilled.

\section*{HOPS.}

It is well known to all Hop growers that Hops require more they cultivate : the constant withdrawing of the Holant which year, from the land necessitates the supply to the soil of a con siderable amount of both mineral and organic ingredients, and
the the Blood Manure has been particularly prepared, with the object of supplying the requirements of this important crop. It con-
tains all the constituents which the plant requires, both mineral and organic, and will be found as cheap and efficacious as any other manure now in use; from 10 to 12 cwt . per acre applied at two
different times well worked in between the allers, different times well worked in between the alleys, will be found a
most nseful application, or the manure may be put round most useful application, or the manure may be put round each
hill and covered up with the soil.

Testimonials from the most eminent Agriculturists who have used the Manure may be had from the local Agents. The following may be taken as a sample:-

Norfolk Farms, Windsor, February 20th, 1855. Gentlemen,-In answer to your inquiry respecting the results
Nitro-phosphate used on the Royal Farms, Windsor Great Park, I have great pleasure in stating, that after applying it to
a field of Swedes, which gained the cup at the Royal East Berks Agricultural Show, I have no hesitation in pronouncing it an excellent manure, and intend nsing it to a greater extent during the present season.

I am, gentlemen, your obedient servant.
Mr. Benjamin Goclton, Gedney Mareh ion Gbebner.保 along with the Wheat over 30 acres, and although the field is
the poorest land I have on my farm, the crop ranked amongst than by saying I shall use it mow how i can recommend it better Genti.Park Farm, Woburn, Bedfordshire, Jan, 1sth, 1854. Gentlemen, -In reply to your inquiry respecting the Nitro phosphate supplied to his Grace the Duke of Bedford in 1853, I beg to inform you I applied it all for swedes, and in every in-
stance was very successful, particularly so on a field of 30 acres where I put on 2 cwt . of it per acre, with a light dreasing of farm-yard manure, which has prodnced the finest crop of Swedes I ever grew. I with great confidence recommend this valuable manure to the notice of the agricultural community.-I am,
gentlemen, yours very truly,
G. W. BAKER.

\section*{\(\mathrm{E} \& \mathrm{Co}\), Seed Merchants, Plymouth.
Established 1786 .}
J. C. WHEELER PER SNOTON SON Offer
SEED POTATOES:PRINCE OF WALES.- This is the earlifest round white Potato excellent for fircing, and for a general crop cand be most highty
recommended. Per peck, \(2 s, 6\) d. ; per bushel, \(9 s\). "I was highly delighted with the Prince of Wales Potatoes I had from you last year; 1 consicer them more mealy and bette plavired in the samye soil and in every was alike."-Mrs. C Cssmanso,
Portfilids Hereford Portields, Hereford.
"Your Prince of Wales Potato I obtained when first sent ont,
and I beg to bear testimony to its good qualities. It is early and Y beg to bear testimony to its good qualities. It is ently
excellent, and very prolific. On a plot of ground last year I amin sure that I raised at the rate of nearly 400 bushels per imperis
 satisfaction in introducing this Potato into. general noticethey have sent it into nearly all parts of the Kinsdom, and every
where it is lighly spoken of. It is so early that it escapes the
 the strongest terms.
SLSTONE KIDNE
LSTONE KIDNEY.- This is perfectly distinct from any other Potato. It is an astonishing cropper, and the tabers are large size. It keeps well, and is good fiavoured, and
altogether an axcellentand proiftable variety. Per peck, 2 si . 6 d . per bushel, 98.
The Rev. R. O. Brourfecd, of Sprouston Manse, N. B., gives
the following report of the Alstone Kidneys which he had from ns.-"I had the Alstone Kidney planted in four rows of \(10 \frac{2}{2}\) yard ro prodice was three large heaped imperial bluthls of Potatoe
besides a few small refuse. Not knowing the Potato previousal I had it planted in rows 2 feet apart, which was too close and
made the crop less than it would have been, for the outside row \(10 \pm\) y yrd yiriled nearly \& heaped bushel. It is at the rate of FLUKE - 20 bushels per acre. The produce is unusualy larg. What of a Kidney, but perfectly distinct from any other. As second early Potato it is without doubt the best, and will in short time find its way into every garden. 2s. per peck.
ASHLEAF KIDNEY (true) an excellent sample. \(2 s\). 6 . per J. C. WHerler \& Sox, Nurserymen and Seed Growers
Gloucester.

J C. WHEELER and SON, Gloucester, bey to offer J the following FLOWER SEEDS, imported from one of the best Growerr in Germany, which 'they oan recomment
as beine of the very best quality, and which will be forwarded free by post at the following prices:

MEETINGS FOR THE ENSUING WEEK．

Is another column will be found a report of the proceedings at the meeting of the Horticultural Society last Tuesday．It will be seen that nothing has yet been determined as to the future action of the Society．Many reasons deter us from express－ ing at present any opinion upon the report of the Committee ；nor indeed would it be useful to do so， because the public can deal with mere matters of business，such as the discussion in Regent Street， without our assistance．We would only point out one thing，but that is important．The Council shrink，and we think most properly，from risking any further the financial position of the Society； were it not for that they would be as ready as the most eager Fellow to re－enter the field of Exhibition in the Garden．They doubtless think that in an association of English gentlemen the first consider－ ation is to preserve inviolate the honour of the Society，which would be compromised were they to consent to measures that should ultimately lead to an inability on the part of the Society to meet its engagements．In short，they are responsible for their acts，not only to the Fellows but to the world， and they feel that responsibility．On the other hand，gentlemen eager for the promotion of Horti－ culture and sincere friends of the Society，overlook， or under－estimate difficulties，and persuade them－ selves that no risk attends a farther prosecution of what the Council think dangerous．

The question at issue seems then to be in what
manner risk is to be removed or at least much his which led one of the Fellows who addressed the meeting on Tuesday to suggest the formation of guarantee fond. This is a practical view of a practical matter, and deserves consideration. any such plan could be devised the Council would then be somewhat relieved from a serious responsibility, which although not legal is moral, and therefore imposes the highest of all obligations; and we should hope that it will be found when the Society reassembles on the 31st of March, that this question has not been overlooked.

The other day, at the Society of Arts, Mr. Abchrr, in a very interesting account of some of the foreign commerce of Liverpool, mentioned that the use of Salbp has revived in an unexpected manner. Our readers, doubtless, know that the of such terrestrial Orchids as our Orchis mascula \&c., and that they once formed a pleasant beverage sold at the corners of streets in the early morning under the name of "hot saloop," just as Coffee is now sold. Mr. Archer tells us that he should have been much puzzled at the importation of Salep no only continuing, but increasing, had he not traced lot of the root to the manufactory of a chocolate maker, from which he presumes that it is occasionally employed in that preparation. At al events he is persuaded that Salep might be advan tageously employed in the manufacture of cocoa and chocolate. This conjecture seems to us to derive support from the nature of the aromatic principle which is present in well prepared Salep. One o the most costly ingredients in chocolate is Vanilla-the pod of a climbing Orchid-valued not only for its fragrance, but its stimulating qualities. The weak odour of Orchis roots appears to us to be identical with that of Vanilla, as indee is the fragrance of the whole race, however much it may be modified or disguised by the presence of other "essences." Possibly we have here the coni mencement of a mon Orchis grows wild abundantly ; possibly, also some of the S. African species, whose roots are so much larger than our own, may pay for collecting at the Cape of Good Hope and the adjacent colonies.

Another circumstance was mentioned by Mr Arcarr, to which we also take the opportunity of drawing attention. There is not a more dangerous poison than nux vomica, the seed of a tropical bush called Strychnos. It is used medicinally in very small quantities, but has no other legitimate appli-
cation. In the year 1838 duty was paid on 1017 lbs . cation. In the year 1838 duty was paid on 1017 lbs .
of the drug ; in 1839 on only 478 lbs ; in 1840 on 550 lbs . "Ten years since," Mr. Archer remarks
a ton of this article would have been a large annual import-it now exceeds sometimes a hundred tons. Its use in medicine will not account for this large increase, and our sanitary officers will do wel to make observations upon the symptoms which attend the dying ale-drinker, for notwithstanding the fine testimonials of the recipients of casks of pale and bitter ales, my firm conviction is, that the pure bitter of strychnine is a valuable auxiliary to the brewer. Great efforts were made a few years since to introduce the wood of Picrena excelsa, a large tree producing a wood as intensely bitter as quassia, and, indeed, this wood was supposed by the importers to be quassia, but they entered it as billet wood, in order to evade the duty. The trick was eyentually discovered, and this, together with the high rate of duty, prevented the brewers receiv ing their supply of bitter wood. They have, donbt less, found a substitute.
We recommend this statement to the attention of the Custom House authorities. We know not whether brewers, or rather publicans, are consumers of nux vomica; but it is certain that its emplovment is secret ; and it is not fitting in a country like this that vast quantities of so deadly a poison shoul be permitted to enter with impunity into consump tion for purposes which it is to he feared cannot but be destructive of human life. Prohibition, or prohi bitory duties, might stop the evil and remove the scandal.

We have received a letter from our kind correspondent, Sir W. C. Trevelyan, in which after microscopical examioation he subscribes entirely to the view we have put forth as to the absence of a
nuclens consisting of the dung of some animal in the curions ball-shaped Lichen which we lately figured (p. 84). It was stated that the Lichen was supposed to be a form of Parmelia ccesia, or some species of the group to which that species belongs sariety of Parmelia saxatilis, in which opinion Sir
W. C. Trevelyan now coincides. Sir W. .
Hooker has indeed shown us a specimen in which some of the lobes of the frond are very broad, and the surface corrugated, which certainly bear a strong resemblance to that species. The question can only be decided by the discovery of the fruit, which differs greatly in the two groups. Our correspondent believes that portions of the Parmelia are blown off the trees and carried from a considerable distance to the downs by west or south-west winds, to which the spot where the specimens were collected is most exposed, and there lodged amongst the short herbage. In this position they continue to grow, though liable to be rolled about continually by the wind, as he saw them on the loth of last October. There is no good reason
why they should not fructify, and we hope much why they should not fructify, and we hope much
that now attention has been turned to the subject we shall be able to procure fruiting specimens. In connection with the esculent Lichen of Pallas, Dr. Hooker has conceived a notion that it is not autonomous, but that it is a state of some wellknown species. This is of course at present but conjecture; but as good conjectures often lead to truth, the notion is worth recording. At present the curious arrangement of the gonidia, like spores in an ascus, and the occurrence of several allied species, one of which has a fruticose habit, militate arainst the notion, which may, nevertheless, eventually prove true. M.J.B.
\(W_{E}\) understand that the account of the Stanwick Nectarine Fund has been closed-and that his Grace the Duke of Northumberland has directed the proceeds, amounting to \(242 l .16 s\). , to be transferred to the Trustees of the Gardeners' Benevolent Institution. Mr. Stevens had previonsly paid over 12l. 7 s., and Mr. Rivers 12l. 6s., the amount of the sums they were severally entitled to for their commission on sales, so that this plant has yielded to the charity 267 l . 9 s .

The public will not fail to appreciate properly he kind feeling of the Noble Duke which first led his Grace to entertain the idea of making this valuable plant serve the cause of Charity
We have very great pleasure in announcing that o Mr. Veiteh, Exotic Nursery, Exeter, has been awarded in the 2d Class of the'grent Paris Exhibition a Silver Medal, for important services rendered to botany and horticulture, by the introduction of a great number of new and rare plants to our gardens, both from the old and new world. Although this took place in the autumn of last year, it is, we believe, only now officially announced in this country, in the "Jury A wards," No. i41, recently published for the United Kingdom. Mr. Vertch does not come under exhibitors, but "co-operators" in furthering the
cause of science. This is a high compliment very gracefully paid, and let us add most thoroughly deserved, as will be unanimously admitted by every over of plants who is acquainted with the great merits of Mr. Veitch.

GRASS AND CUCUMBER VIBRIOS
Dr. Hooker has kindly communicated to me a
curious production on some species of Grass from the curious production on some species of Grass from the
Arctic Regions, where it was gathered by Cas tain Pullen in 1850, and which for several reasons deserves notice in this Journal. The germen is converted into a brown hard flask-shaped body furnished with- a long white-tipped neck, like a Florence oil-bottle. The walls are hard and rather thick ; the cavity is destitute of anything like seed, the albumen of which is replaced by a ittle white cottony peliet, consisting of an infinity of little worns about \(\frac{1}{38}\) of an inch long and \(\frac{-1}{1300}\) in thich ness. In the midst of the mass are a few eggs with a oung worm perfectly formed within them, of much greater diameter yhan the worms themselves, which All this agrees perfectly with the Earcockle which occasionally occurs in Wheat, excent that the thickness of the Vibrios is slightly less, and the form which the diseased germen assumes is very different. The Vibrios did not revive on immersion in water, though the specimens have not been gathered quite so long as
some in which Professor Henslow intorms me that he has witnessed this wonderful phenomenon. Vibrios have on been found before in any except cereal Grasses and in nature they seem to be confined to Wheat Professor Henslow, however, observed "that Barley, Rye, and Oats may become infected by sowing them in the same hole with the grains of Wheat, which are filled with the Vibrio. The experiment howe I has with difficulty and only to a small extent.
Thave no information as to the exact spot where the Vibrio must was obtained, but it is quite clear chat the cold, as it is destined to be developed, after the long winter, in the young germinating Grasses-a remarkable Wheat
of dryness, that the slightest touch would reduce it to pow
The Vibrios are all as nearly as possible uniform in
size. The mothersworms must, therefore, have died, leaving behind them a mass of eggs, of which far the
greater part were already hatched when the specimen greater part were already hatclied when the specimen
was gathered. In the Wheat Vibrio the increase in size is enormons from the condition in which the wo in generally appar in the blackened grains. From dimen sions of the size of the eggs the increase must be as great in the Arctic Vibrio. I do not indeed imagine that the species is different. I have no details as to the comparativ differences of nppearance assumed by the germen of Rye, Barley, and Oats, when affected by the worm, but they are probably considerable, as in the analogous instance of Ergot. In size and form the Wheat Ergas is extremely different from that of Rye and Barley. have lately received from Mr. Bailey, of Nunehnm, specimen of a Cucumber plant affected by Vibrio similar to that which I had last year the opportunity o figuring in this Journal (1855, p. 220).
. but I have derived no fresh light upon the subject there are the same diche raparel cysts as beare, and as in the former instance dispersed, but sparingly, through the substance of the tuberous masses which the worms generate upon the root. The obtuse head in this case seems to indicale that the species is distinct from the Wheat Vibrio

It is almost impossible to guard completely againgt the attacks of such minute animals. The soil may be changed, and new modes of cultivation adopted, and yet the mote may be conveyed by the air to the young plant, notwithsfanding all our precautions. The bes hope is that like the Wheat Vibrio it may be extremely local. I have received the Wheat Vibrio from Surrey and Sussex, butafter the most diligent search I have neve been able myself to fiud a single specimen of Earcockle. The Cucumber Vibrio has occurred to other cultivators I believe, besides Mr. Bailey. The affection is so strange that it ought not to be confounded with the解 in common. The caution is, however, necessary, and he more so because mistakes in such matters stoltify remarks which would otherwise be useful.

\section*{\(\$ 100\)}

The figure represents the affected germens of the Grass and Wheat magnified, and highly magnified figures of the Grass Vibrio and eggs. The three proesees the tip of the Earcockle ot the Wheat seem to indicate that the germen is composed of three carpellar leaves. These processes are not, however, constan M. J. B.

\section*{gn frost splitting.-By Dr. Robrrt Caspart}

This inequality of relative bulk in the inner and outer layers has been given by Schübler, Pfeil, an formerly by myself as the sole cause of frost splitting Schübler says:* "When the outer layers of wood an bark are once frozen, which soon happens, there nothing more to cause these layers to increase in volume they will rather contract with increasing cold, as is the case with all solid bodies. These outer layers are thu no longer capable of containing the inner wood when in the act of freezing and thereby increasing in bulk, an they often split with great force." Schibler liera assumes, and I formerly followed him, that the trees are not yet frozen through when they, burst, which is, however certainly not the case in thin trees, and very question able for the thickest ones. Pfeil ("On Forest Use add Technology," part iv., 1845, p. 112) thus explains fros splitting: "Frost splitting takes place when suddenly a severe frost contracts the outer layers of wood, whits the inner ones are still distended by a higher tempera tare." This not very precise expression leaves one to conjecture that Pfeil also considered the interior of the tree as not yet frozen. But the contraction of the wood in a peripherical direction, which far surpasses the radial contraction, is not taken into account in the abore propositions. This cause, combined \(v^{r}\) ith the strain occa sioned by a sudden and considerable cooling doren and conscquent contraction of the outer 'aycrs, achilst the inner nes are sill woarmer and relatively more distonded (ma perhaps sometimes unfrozen), ettects a splitting of the as where there may be some ueak point in ats tissuc,
Duhamel and Buff in in the above quated worke, are of opinion that frost splitting is more frequent in we soils than elsewhere-"Les arbres qui sont dans les terroirs marécageux ont le tissu de leurs fibres ligueuse plus faible et plus rare, et leur sève est plus abonaia fai et plus aqueuse que dans les terroirs sees ; ce qui rai que l'effet de la raréfaction des liqueurs par la ñelee e plus sensible et d'autant plus en état de désunir les l ." The
- Quoted by Wiegmann, "Diseasees and Diseased Monstrocite of Plants", "1839, p. 140.
writings this is taken.
congelation of the sap, has been already refuted. But a distinguished gardener, Mr. J. Reinecke, is also of opinion that trees in a wet soil, which are otherwise quite healthy, are especially liable to frost splitting. He las sent me the following communication:-
"Observations on the splitting of fruit trees made during the continuous severe frosts of 1822-3 and 1829-30.
"During my engagement in the above years in the well-known nursery gardens of Kniestedt, in the Sudenberg suburb of Magdeburg, it happened that in the month of January, 1823, as also in December and January, \(1829-30\), whilst the frost was continuous
from \(18^{\circ}\) to \(24^{\circ}\) Reaumur ( \(-8^{\circ}\) to \(-22^{\circ}\) Fahr.), the from \(18^{\circ}\) to \(24^{\circ}\) Reaumur ( \(-8^{\circ}\) to \(-22^{\circ}\) Fahr.), the
young healthy fruit trees of 6 or 8 inches in thickness young healthy fruit trees of 6 or 8 inches in thickn
used to split open in the evenings and nights. observed it chiefly on young sappy Cherry trees, which were without a defect. The bursting took place on all sides; the consequence was that the Cherry trees suffered much the next year from the flow of gum, became sickly, and gradually died.
"I must remark also, that the garden was laid out in 1816 on very moist meadow land. Thll the year 1822 all the fruit trees grew with extraordinary vigour ; after that time some of the finest specimens began to sicken, Which has brought me to the conviction that we do very wrong when we plant orchards on a watery soil. split in severe winter, when the frost lasts at a degree "Berlin, Feb. 25, 1855". Jok Reineckr.
"Berlin, Feb. 25, 1855."
As to Mr. Reinecke's assumption that the trees in
question were quite sound, it may be a question whether question were quite sound, it may be a question whether was shown to me as having borse Chesnut tree, No. 29, the injury with which the frost cleft was connected showed itself to me at first sight. A linot, a stump, \& defect in the bark is easily overlooked, and is yet precisely the occasion of the frost split. Those Cherry trees gardener would certainly reckon as an injury, and yet may cause frost splitting, as in the Ash trees Nos. 31, however, a mere conjecture, and may have been bled is, in wet soils even perfectly, and is a question whether to frost splitin perfectly sound trees may not be liable to rrost splitting, for possibly, owing to rich moisture mouh toxiance, the tissue of trees may be weak injury. njury. This point is open for further investigation, but my observations are all againgt any more ready splitting of trees in wet than in dry situations. The trees on the Charlottenburg road which showed the most frost cleft are on the highest and driest part of it ; and in the lower parts of the Park, which are very wet and in the year in question were already under water in November, as for example, west of Frederick William III.'s monument, I observed no frost clefts.
The splitting of the stems of trees, of which I have been treating, has only been observed by me or by the frosts. Reum ("Vegetable Physiology," 1835, p. 172) is however of opinion that these clefts do not occur in winter only, but also in summer, on a diminution of heat, but only in steins whose pith is excentrical, whence they cannot be properly called frost clefts. Reum says that he has observed these splittings in summer to take place after hot days in cool nights, in the case of Weymouth Pines and Sumachs. As to the latter fact it seems to me that it should rather be attributed to unately I have never had pccasion myself to observe ayy trees split in summer. As to the supposition that it is only trees with excentric piths that are liable oplitting, this does not appear to me to be generally cutting any i have not indeed had any opportunity of ascartain the position of the pith; but their stems as to quite round, and showed no signs of their stems were The figure of the transye signs of excentric growth. hed a frost cleft transvere section of an Oak which hed a frost cleft given by Häring ("Distinctive Chap. 109) also shows the pith in growing in Germany," p. 109) also shows the pith in the centre.
small perennials (Perilla arguta, Tagetes bonariensis ete., Botan Zeit., 1854, No. 38), is distinguished from frost splitting by the following marks.

Exodic Annuals and Snall
1. The disruption of the tissue charp frost of the season at the commencement of winter, bre at no great cold ( \(-3^{\cup}\) Reaum. 2. The disruption of the tissue the eansed by the expansion of especially in the layers of camobium.
8. The disruption shows itself in perfectly ronnd plants and aterns if they (ore on half dead according to Leconte). Alther from the stem issues Which wes its origin to the sap Which was rising in the tissues

My viow
further confirmation causea of frost splitting require
all and the other very unsatisfactorily, and to which I would therefore invite attention. They are:1. Researches on the temperature of trees. determine its daily and annual periods in connection the air and of and annual periods of the temperature of during at least one year's observations evade threater, during at least one year's observations made three times
a day ( 6 A.M., 2 and 10 p.M.), and hourly during a few days in each montb, especially during the colder winter season.
2. Researches on the changes in the bult of wood, especially when fresh and sappy, in its three different dimensions at different degrees of temperature.
The following are the woodcuts alluded to in the

worder of over-growth
health may, except in very agoravated cases, ve restured by attention to this point. In Grape-houses there is no more fruitful system of mischief than inattention to the soil in which the roots are placed. As the leaves and branches are subjected to a high temperature, and therefore have an active interchange of fluids, and a considerable waste by perspiration and evaporation, except the temperature of the roots is conformable fresh fluid will not be supplied with sufficient speed and The branches will throw cannot go on very prosperously. The branches will throw out roots, the leaves become pale and warty, and the fruit will shant, ripen imperfectly, or exhibit symptoms of decay. Where the ground is well drained, provided the temperature should from the exfiently high, it can be raised by protection from the external air by mulching or the application of fermenting manure, but where it is no exit, such applications are almost useless.

45l. The cause, however, of languor or decrepitude may be the barrenness and dryness of the soil, separate or combired. This of course is not the case for the most part with the super ficial soil. No one would fix upon a dry barren sand as the site of an orchard or vineyard. In general the upper stratum is good, and the trees planted in it flourish well for a time. After a few years, however, healts gives way, various unfavourable symptoms appear, and gradually signs of discolution, increasing every ecason, In such evident to admit of mistaie. In such case it will generally be found that there is a bed of dry unprofitable trated, which the roots have penetrated, which yields neither nutriment nor moisture, and thetree is imperfectly nourished by the old roots which creep along the surface. It frequently happens moreover that this bed is terminated by an impenetrable crust of indurated gravel or conglomerate, so that the tree is precisely in the condition of a plant growing in a garden pot, which receives a little superficial moisture, while the soil below is completely parched and exhausted, and every gardener knows that such a condition cannot long be continued without injury. This case does not admit so readily of alleviation as the former. Irrigation where it can bo employed, and the application ficianure well mixed with the super On a stratum is the most available On a small scale something may be effected by digging out the sterile bark \(r\), whence the decay had penetrated into cleft \(f\), which crosses an injury in the permanently on land which is naturally F1a.4.-Ash (No. 31). The frost cleft \(f-f^{\prime \prime}\) fonliuws the cut made for bleeding cases the wisest plan is if possible to there is a second frost clett \(f^{\prime \prime}\). VEGETABLE PATHOLOGY.-No. CXII.
448. Languor (Decrepitude).-The dimease indicated under this name by Ré and Léveille * is a sort of decrepitude ar premature old age to which many trees are subject from various causes. It is not the natural decay of age which in trees arises principally from the decom position of the older tissues which gradually communi cates with and impairs the younger prowth, but a decrepid state under which, though the trunk is stil ound, the buds become few in number, small, and weak, producing meagre unhealthy shoots, the scanty blossoms do not set readily, and if fruit should set, it is nferior in size and general aspect, and devoid of flavour. The leaves, meanwhile, are pale, soon discolouring, and falling off many weeks before the ordinary time. Year by year these conditions become worse, the fruitfulness decreases, the branches are suffocated with Lichens, and at last death inevitably consummates the evil. This malady is not, however, confined to the orchard; it is well known in French vineyards under the name of goupissure, and is not uncommon in the avenues with which the roads on the conkinent are so often bordered 449. It is evident that euch a condition may arise from constitutional weakness, but outward causes also may produce it, such as the stagoant water of illdrained ground by depressing the proper temperature of the soil, and therefore not maintaining a due proportion between the atmospheric and subterranean heat, on which health so greatly depends, but much more commonly it arises, and especially the form just mentioned called goupissure, from sterile soil at a certain depth below the surface, accompanied frequently by a want of moisture.
450. The remedy in the first instance is easy enough. No person ahould think of planting fruit trees where he is not certain that there is a good drainage; but even where trees have suffered considerably from this cause,

Almanse du Bon Jardinier, 1852, p. 174.
up and put under the plough, for the
the expense of fencing. As regards fruit trees it may answer the cultivator's purpose to plant them even where the subsoil is bad, provided they last sufficiently long to make a profitable return for the space they occupy. When they begin to fail, or, as the phrase is, as soon as they strike into the Kale, the earlier in general they are removed the better. The question is,
however, one of pure calculation. M.J.B.

\section*{Home Correspondence}

Spinach and Turnip Failure.-I don't agree with your correspondent "Colo" in attributing the failure of autumn-sown Spinach crops to "over rich soil." The garden I have to cultivate certainly cannot be complained of on that score, for I will venture to say that the soil is naturally quite as poor as that of "Colo's" neighbour, and yet the Spinach I depended upon for a winter supply nearly all went off in' the manner escribed by "Quercus." The disease has also been general in this neighbourhood, whatever the quality of the soil. Is not a more probable cause to be found for it in the excessive wetness of the autumn? We had here the unusual quantity of \(8 \frac{1}{2}\) inches of rain between Sept. 29th and Nov. 4 th, which being followed by cold aights and one or two sharp frosts, so paralysed the young and tender plants that instead of growing they gradually dwindled away. In this part of the country we have also to deplore the loss of another antumn-sown crop-the Turnip, not oaly in gardens but in the fields. I always sow a good breadth of the Stone Turnip as soon as the second early Potatoes have been taken up, which sowing furnishes a very useful supply of small bulbs during the early spring months; but this season that crop was enirely destroyed by a species of aphis. In the spring and early part of summer our gardens were, with the exception of the Gooseberry caterpillar, remarkably free from.this and other injurious insects; remarkably free from. this and other injurious insects;
the aphides, however, were determined to pay us their

\section*{they "ame late in antumn. J. B. W. \\ Discoloured Rain.-On Saturday the 21 of February} Candlemas day, the morning having been previously P.M., the sky became suddenly overcast, when two flashes of lightning were succeeded by torrents of rain as dirty as the Irwell at Manchester, but without amell and the ditches and brooks were deeply and darkly dis coloured for hours afterwards. The rain-water tubs of some of the houses were emptied, as it was useless to thinli of washing with such a mixture. After 2 o'clock the storm moved off towards the north, up the valley of tha Ribble, and the evening was again warm and clear. How is the discolouration of the water to be accomnted for? Are any of your correspondents aware
of similar nccurrences? and is the fftect beneficial On these points I should like to have the npinion of your readers. Cliviger, March 10.
\(R\) hododendrons.-The great celebrity of these flowering evergreen shrubs, and the tempting descriptions given in our "Trade Catalogues" have induced me to pursorts. Having so done all my friends as they look at or see them at once say, "Oh they will never do any goodall money thrown away-they want a peculiar soilnothing but peat will do "" and with a variety of similar consolations I am daily rewarded for my hazardons outlay of about a ten pound note. Well now, will some kind friend say if my case is hopeless? The soil is rather a light loam. I have dug holes for them about two feet deep and two feet wide, which were filled with decayed turf and black bog soil, but I am willing to get peat or anything else if I can get them to flourish and Hlower. I buy guano, blood manure, \&c., for differen crops of "The London Manare Company," and on delight on "Irith Peat." Who will tell me if this is the food these splendid shrubs will luxuriate in? or if not where I can get it, and what to get? My neighbours are all laughing at me for my folly, so those who will help me will be friends in need, and friends indeed to A Farmer in a Fix. [Don't use Irish Peat. Your plants will do well enough if you have mixed your sand loam with the peat, provided the soil is not too dry.]

The Buffalo Berry (Shepherdice argentea).-Some 10 or 12 years ago I was much taken with Loudon's description of this "fruit bearing" tree, and accordingly of these were from the late Mr. J. A. Downing, then a nurscryman at Newburgh ; these, I remember, were all sent in pairs, it being, as is well known, disecious. planted out three pairs with the hope of obtaining fruit female trees when in bloom being quite apparent alihough from the flowers being very small they require close observation. These trees have blossomed every year most abundantly, but owing to their precocious habit of unfol ing their flowers the first mild days in February, and then being killed by the first frost, abtained a berry from them. Two yeare in placed a pair of young trees raised from layers in a large pot, be mingle l. This pot with its hopeful brair shor. be mingle 1 . This pot with its hopeful pair I placed in my orchard house ; they both blos=omed in February, liaj, and owing to the dry atmosphere did not suffer
from the frusts of March, so that last autumn I had the felicity of tasting real Buffalo berries in England. Let me ginte Loudon* and then guess my hopes. "Its frait, which is much relished in America, is about the size of the Red Currant, much richer to the taste, and forms one continuous cluster in every branch and twig."
My berries were in colour and shape like very small My berries were in colour and shape like very snal than the fourest Currants ever tasted; alas for my hopes! Still to a dusty-mouthed tired buffalo hunter with no red Currant bushes in view, they would probably seem a very crabby Apple eaten in the middle of a hard day' grous, shoting in hot weather in August will have Ribstur I'ippin flavour. T. R., Herts.-The Shepherdia argentea has been grown by us since 1843 , but it has never produced fruit. We consider it of no value as a fruithearing tree for this country, the summers being oon short in our latio. Asbmn di Sons, Fulham. Warming by Charcoal.-Mr. M'Ewen says charcoal has a great power for absorbing heat, and so it has, as all black coloured substances liave. And so far well, but it has an equally great power of radiation, so that it will prodace the greatest extremes of heat and cold unless the heat that it acquires by day be retained by some artificial means, such as Gulliver's philosopher was einployed about. This I think his own figures prove, or at least they do not disprove it. In the three experments in which he tried it there is only \(1^{\circ}\) in its favcur in the morning, while the dfference at noon is \(19^{\circ}\), and at night \(7^{\circ}\), so that it produces a more un This may perhaps account for the ill success that has at tended painting walls black. G.S.

Asparagus.- Having a garden on the south coast of Ireland running down to the sea with a warn aspect of which is nearly a pure sand, l have been ad an acr plant a nearly a pure sand, Have been advised to plant Asparagus as the n.o-t profitable crop, and would be greatly obliged for intormation from any

\footnotetext{

vecretable near the sea, as to whether it will grow and Live a fair produce in nearly a pure sand with only a tup dres-ing of guano. Also if heavy westerly hinds
and an occasiomal overflow of the highest tide woull be anil an oceasional overflow of the highest tide would be detrimental, and whether the sanl would require to otherwise be drained; also the best way and time to plant it. A Subscriber.
Therability of Lurch and other Posts.-Are there any seientific grounds for a remarik in the Builder that if Larch and other timber posts are inserted in the earth with the top part downwards they will be more durable
than if used in the contrary manner? J. Abell, Limerick [ We should require very strong evidence ketore crediting such a statement.]
Rabbit Fence (see p. 154). -Try burying a length of the wire netting well tarred under ground, or a tarred rick all round under the surface will have a consider able effect if your rabbits are not very determined Nom

Grafting.-The following example of fruits grafted on Jargonelle Pear was furnished to you by me in 1850 , and will be found in your volume for that year, p. 758 Inow repeat the diagram with such alteratious as have
Bon Chretien.
Ribston Pippin.
Common Hawthorn
(died last year).
taken place in it since that time. Grafted in 1840 ; all luxuriant, and bore fruit last year. F. Davies, Pcrshure March, 1856.

Pea-leaf Soup.-As many seem to doult the exce! ency of this soup, permit me to state that ever since it has been mentioned in your columns, we have had irequently, and it is pronounced by all Knight's Marrow Victoria Marrow, and Thurstane's Reliance, all of which answered well. They were grown with free access to light and air, and were well hardenen off before cooking. 'This gave them a deeper colour and more substance, which is what is required for Pea-lea soup in the middle of winter. The Pea leaves must however be put into the hands of an experienced cook to bring the soup to perfection. Green Mint is of cours required and other things to suit the palate, but this conk well knows. D. L. B., Linculn
Seed Sracing.-It would appear from the evidence collected by Mr. Hall Maxwell for Scolland, the Police of Ire'and, and the Poor-law Commissioners for Eng land, that the following is the probable quantity of land under four crops for which seeds easily adulterated are required, namely-
rim
The quantity and value of the seeds required for this acreage may be taken as follows :-

> Turnips, 8 lbs Mangel, 6 lbs. Carrots, 5 lbs.

authority tells us that 2 oz . of Cabbage seed is reqaired tor a roul uf ground ; this is 201 lh . weight per acre. 1 however presume that he meant mont, not rod, in which case half a pound or 31,888 seeds would be needed to produce 10,000 plauts. He also expressly says that '2 ounces of or nearly 18,000 seeds will only return 4000 o 5000 plants. I shall not pretend to say what amoun of waste there really is ex necessitate rei in these caren, but it certainly does appear to be very much beyond what can be accounted for unless we assume the seed to have received the assistance of some geatleman whose cleverness far outruns his honesty. Coclecr.
Sicd cooking. - We thank you for the excellen Sied cooking.-We thank you for the excellent articles on adulteration of seeds, the frequency of whid would appear from the simple fact that while \(\boldsymbol{A}\) is charging 18. for Mangel Wurzel, B charges \(9 d\).-and another house only 6d., and many other seeds in similar proportion, the last price being below the cost. \(R\).
Peach Houses.-Having erected several Peach houses (or glass lean-tu's against my garden walls without fire), tion as to their pricuty in getting any book or informa of the year. They are now becoming so general that I thou trentiee on the subject, or to give the necessary informs tion in your columins. A hint or two on the subjec would be conaidered a finvour. Thos. Broadwood, \(1 \%\) Cadogan Place.

\section*{かotittips.}

Horticultural, March 11.-A Special Genemal Meeting assembled to-day to receive a report from the Committee appointed Feb. 5 (see p. 87), "to investignte the whole of the accounts, and consider what is best to be done as to the contimuance of the Society. The Marquess of Sulisbury having taken the chair, Mr. Godson, the chair
following report :-
The Committee of Inquiry have met from time to time, and after a full and minute investigation of the accounts, have great pleasure in reporting that they have beem well and correcty omit, to acknowledge the readiness of those Officers to impu Before they proceed to the consideration of the next part of the business, your Committee think it necessary to state, that all the information which has reached them concurs to show that the Fellows are extremely anzious to preserve the Gardens; and the
strength of this feeling has been further proved by some of them
having been induced, by the mere rumour that the surrender of having been induced, by the mere rumour that the surrender of
them was intended, to withdraw their subscriptions. Indeed, it
almost amouns almost amounts to a forfeiture of the Charter, for the Society was
incorporated ex pressly, "for the improvement of Horticulture in all its branches, ornamental as well as useful; and it is obvion practice in the cultivation of fruits and flowers can be exhiblte frocimitation, and if there were no opportunity of testing the
value of any new horticultural theories by actual experiment value of any new horticultural theories by actual experiment;
in short, a Horticultural Society without a garden would be life crew of sailors without \& ship, or an army without weapons.propounded by the Conncil, enough of the Garden was to be retained for experimental pnrposes; but this is impossible. Th
Duke of Devonshire has signitied to the Committee, through his agent, that the Sociery must have all or none; his Grace wirm the remainder. More fragment for ourselves, and throw
in their entirety for its present purnones of these Gardeni in their entirety for its present purposes is an object
national importance; the Arboretum contains one of the mos
valuable and diversibied collections of

\section*{h}
the world; and
 of the property; for it is without an s comppore valuable feat and andere, and
its value is increasing every year, for it takes a great length time to bring a collection of this sort tit perfection. Many sort
of fruits that are rashly or ignorantly praised have to be tried the of fruits that are rashly or ignorantly praised have to be tried, thei
names have to be verified, for they are often incorrect, and thei merits have to be proved and described, if they possess sny; som are shy bearers, and are easily atlected by unfavourable seasons, and it is not thought fair to pronounce sentence upon them til
they have been tifed for several years, when they are rejected a they have been tilied for several years, when they are rejected as
worthless (and this has been the case with very many), theit places have been supplied by others, which have to undergo the some of the more recent introductions are set young, gnd hav not arrived at their full bearing, yet the Orchard contains almost every variety of tree which is likely to be asefal in this coentry
How sreat, then, is the advantage of this to the whole of the
British Istands, British Islands, both directly and indirectly: for not only the
Fellows of the Society have it in their power to obtain grafts of the most valuable sorts for their own orchards, without any fea of a mistake in the name, but those too, who, not being Fellown
of the Society, depend entirely for the supply of their Gardeng upon the reapectable nurserymen who are, bave the same asur upon the respectable nurserymen who are, bave the samed. The number of choice trees thus named, from which grafts may be obtained, is about 1600.
Since, then, it would not only be a disaster, but also a dimgrece, English Horticalture, if a Garden of this description wee sacrificed without some overwhelming necessity, we next proces calamity, for with the Gardens the Suciety itself must stand of for income of the Society may be much increased. At presenits
with a salary of jopt of each, both able are two head gardeners with a salary of 1001. each, both able and excellent men in
their own departments, but both independent of each otber, and
phaced under the general superintendence of Dr. Lindley. placed under the general superintendence of Dr. Lindley.
Of the scintific altinuents of the Vicesecretary it is impos-
sible to speate ton hithen sible to speak too highly, or of the advantige which the Society
has derived from his nowearied exertions to maintain itis has dertved from his nowearied exertions to maintain un
character: but we are of opinion that he has been treated unfairly by the Society in this,- -that its ofticers have laid apon
him the whole burden of the most ninute details in the Garden as well as in the correspondence, and have exacted more from
him than any one man could uegully perform: and this view of he case is confirmed by a resefution recontly proposed by th Council; namely, to institute a regular system of inquiry ino the king dom, hy means of special Commenters, wand othernise

There are two other alterations in the construction of the So ciety, which we deem essential to its future success: having
noticed that three at least, if not more, of the Members of Council aamed in the Charter were practical Horticulturists, we conside that one-thiri of the whoie number should consist of such persons, most likely to take a professional interest in tts proper manage ment, one being always included in the annual change directed
by the Charter. Provided always that, while in office, no Member the Council shall be alluwed to take advantage of the position, ion from the Council. The other alteration, which we recommend on the same grounds, will be much facilitated by the
adoption of thìs Rule. At present the Garden Committee ansists of five Mambers of the Society, besides three of it Horticulturists, and on the Council.
With respect to mode of increasing it is by diminishing expenditure; but your
Committee have looked minutely into the details, and are of opinion that
While they quite approve of a liberal distribution of Councl introduced by the Society, they d things for the benefit of a few Fellows, who might easily obtuin rules in this department would be very serviceable
deriyed from the sale of fruits might be increased.
Doubtless something might be gained by discontinuing a
prblications; but it woutd ill become a Horticultural S ciety to refuse to disseminate borticultural knowledge through the land who, beingonly occasionally resident in London, derive little othe The recent experience of the Exhibitions at Chiswick has filled the minds of timid people with misgivings, which, after all, may be
unfounded, and if, in future years, they are confined to two, one unfounded, and if, in future years, they are confined to tron, one
in June and one in July, and the tickets if not used in the Garden are understood to give admissinn to the Exhibition in Regent Street, there is reason to hope that they may a least b
selfesupporting, notwithatanding the expense which mus self-sapporting, notwithatanding the expense which mus
necessarily be incurred by a wise liberality in encouraging
exhibitors to encounter the risk, expense, and inconvenience o sending their plants for exhibition. The nntoward circumstances The last two years may be looked upon as an unhappy accident as the Society possesses in its Gariden for exhibitions of unsurpess-
arable excellence, why should the Society despair? The season cannot always be unpropitious; brightor days may yet be in
stoze for the Society. So long as the Society is solvent, some a reunion which contributes so much to the happine
of so many families; we venture, therefore, to exho
the Fellows not to be faint-hearted,

 unpaid, and it is most essential to ancerttin how tar we can rely
upon the assistance of the exisugy Fellows in carring out the
proposed experiments. it is highly decirable that a lotirr should
paid, calculated at so many years' purchase. The lover, however, was not inclined to dispute the price the lady mioht demand, but on apulying to her, and unfortuanswer that on no terms whatever would she emanci pate her slave. Every effort was used to slake th resolution, which appeared unaccountable : hut argu ment, entreaty, and money were alike unavailing, and the lady remained inexorable; giving in the end the clue to her obstinacy by observing that she would never see her serf tate precen her, as she would do if married to a colonel, while she was herself but the widow of a major. The match was nesessarily broken complete her misery, her mistress revoled her leave of absence and ordered her immediate'y to return to her native village; an order which the system of passport and police rendered it impossible to res'st or evade Arrived in the village, the unhappy girl accustomed to the habits and comforts of civilised life was clothed in the coarse garments of an ordinary peasant, and was moreover ordered forthwith to marry a rough-hearded moujit, or common country labourer. Revolting at this tyranny, and refusing to obey, she was flogged, and though she still resisted for awhile, a long continuance of cruel and degrading treatment conquered her in the end, and she was forced to submit to the miserable lot entailed upon her by the wretched jealousy of her re morseless mistress. The story of this barbarity was told me with an indignation as strong as could be felt among oureelves, but there was no redress for the sufferer. The mistress up to a certain point had the law on her side and where the hat not as had the pulsory marriage might overpowered right That such a case should be possible sufficiently condemns the whole system of serfdom."

Typical Forms and Special ends in Creation, by Drs MCosh and Dickie, (Edinhurgh, Constable, 8vo., pp. 539), is an ingenious well writen dissertation upon finsl causes-one of the best that has appeared since "Ray's
Wisdom of God in the Creation," now obs lete. Such a work requires a more critical examination than we can at present give it. We can therefore only recommend it to the attentive perusal of the careful reader. We shail take an early opportunity of adverting to some of the views advocated hy the learned authors, especially to that of Dr. M'Cosh, who finds a correspondence between trees and leaves in several respects, one of which is that a stalkless leaf indicates a trunk naturally branched from the ground, and a long stalked leaf the contrary. Dr. M'Cosh goes so far as to believe that this speculation is confirmed by the manner of growth of the Eugliah Oak tree, whose leaves have no stalks. That is surely going very far.

\section*{Garden Memoranda}

Mr. Glendinning's, Turnham Grein.- Perhaps the most interesting object at present in flower here is a new Camellia from China, discovered and sent home by Mr. Foriune. It is a carnation striped kind, very different however from any we have hitherto possessed ivasmuch as the stripes, rosy pink, are much more brilliant than in any variety we now have of this class, and the general outine and form of the foress and hat the most fastidious in such matters could desire. This therefore must be regarded as an acquisition of no mean importance. It may be mentioned that the plant which has flowered is half starved and nearly destitute of foliage ; therefore the blooms, handsome as they now are, may be expected to be much more so when produced by healthy specimens.
On a front shelf in the same range of houses in which we noticed the Camellia were a dozen of as fine Chinese Primulas as perhaps ever graced a greenhouse stage. They consisted of double varieties, white and pink, covered with flowers, each plant measuring about 15 inches in height, and as much in diameter. The effect produced by such a row of specimens may therefore easily be conceived. Though comparatively common, what have we so valuable for cor cratory decoration at this season of the year as this charte, it Primrose ; and for bouquets, we need not state, it will furnish an inexhaustible supply. It therefore well repays every attention that may be bestowed on it, and it may be induced to keep blooming for weeks together. These specimens were, we understand, raised rom cuttings struck in April last on a ittie botomeat they were kept growing and shifted on all 11 -inch pots, summer, till at last they were mod
dere in abundance The few introduced in the first instance by Mr Fortune made this plant dear and unobtainable, but now that it has been raised so plentifully from seed by Mr. Glendinning, its price has, become comparatively so moderate that we may soon expect to meet with it in everygarden in the country. What species of Cham ærops it is we believe is still uncertain; but it hardiness at Kew,t Bagshot, Osborne, and othe places where it has been planted out in said to have been
esiablished. Here, then, we at last possess the means of eslablished. Here, then, we at last possess the means our varying our landscapes with one of the most pecuiar forms of regetation of the tropies, and Pam bree pected to be a matter that will excite little surprise By the way, we may observe that in our advertising Horticultural society, planted in a low cold clay bank over shadowed by trees and exposed to the North, is now dead.

Another plant from which much is expected is Abied Kampferri. Of this Mr. Glendinning has some thousanais
 home in Wardian enses, in which they arrived safely, and aro all doing well. Thiss fine Conifer is said to have ben found in the central, northern, and enstern provinees of China, and is stated by Mr. Fortune to be
a very beautiful ree, and
no duwt perfeculy hard) a good aceount of it will be found in our volume for \(1854, p .235\), and a representation of its cone at \(p .455^{3}\) of the esmie volume, litte neels to tee said reepectiug it liere. The plants in their present state look exatily liko ao many young Lareles.
Of other Coniterous trees both rare and common Mr. Glendinning has asus a goos bolte rare end eommon
 lini-the famous Huon Piee, Finus paryyifiora, Bungeana and Paduffa, Picea, Nordmanaiana, grated perteetly, as the union of the top will the stock in this \begin{tabular}{l} 
Instance was so complete as to be sararely perceptible \\
\(I_{n}\) the same house were also \\
\hline
\end{tabular} In the eame house were also Thuy ppisis borealis, singular dwarf Juniper called echinitiormis, and other interesting plants. Out-of-doors we noticed an extremely bandsome l'icea Norlmannians, 3 feet in height, and as much through. This had been raised from seed.
Among new plants were the Primrose-lenved Campanula, the Green Dye plant of China,
novelties, of which little is at present lnown.
The geueral stock uuder glass is in excellent conHition, wore especially a span-roofed house full of plante, all in the best of healib, and many such as Westcutii and other winter kinds in blossom. In this house were also admirable specimens of Araucaria Bidwilli and Cunninghami, as well as of Cupressus funebris. The latter were near'y five feet in height.
In a lean-to house put up a year or two ago we is celebrated young vime plants, for when this nursery also by dung linings, and the young plants are started on a tan bed. Under such circumstances need it be rondered at that excellent results are obtained? On the back wall are permanent Vines of all the best sorts,
from which the eyes to be propagated are got, and therefrom which the eyes to be propagated are got, and there-
fore the sorts may be relied on as being true to their kinds.
Several acres of new ground have lately been added to this nursery chiefly for growing fruit trees on, a purpose for which, being a good we remarked some excellent pyramidal Pear trees, both on Quince and Pear stocks. On either side of a long staight walk lately made here have been planted all the excellent standard Portugal Laurels, of which there is here a capital stock. Small Urchard-house trees for the forthcoming season have been potted. Of last year's supply few have been left, which would seem to indicate that the demand for these dwarf trees is on the in crease. Orchard-houses are now being erected every where; we understand that they are even pushing thei way into the far north of Scotland.

\section*{Calendar of Operations. \\ (For the ennuing week.)}

\section*{plant pepartment.}

Coxsertatiory, \&c.-Now is the time to set about ascertsining whether or not there is a sufficient quantity of plants for the decoration of the conservatory during the summer and autumn. If this is attended to at once very much may yet be done towards making covered, for it is not yet too late to provide multitudes of showy plants for blooming early in autunn. Young plants of Allamandas, Clerodendrons, Torenias, \&c., and many other things if encouraged with a brisk bottomheat and other favourable circumstances will form nicesized specimens in a few months; and large masses of Satices, than which few plants are more useful, will, o'd Cassia corymbosa is a useful plant, and should not be overlooked where hetter things are scarce, as it grows rapidly and produces a long succession of bright yellow flowers. Those, also, who possess Impatiens Jerdonize should eneourage it by every possible means to make wood and propagate it as quich ly and freely as pos-
sible, for it is just the plant that is wanted for autumn decosible, for it is just the plant that is wanted for auturnn deco-
ration. Then there are quantities of useful things which ration. Then there are quantities of useful things which
may be raised from seeds, as Thunbergias, Ipomoeas, Cockscombs, Globe Amarauths, Balsams, Lobelias, \&c., and cuttings of Fuchsias made of young wood will root in Warm sand in little mure than a week, and may be grown into nice-qized specimens by July. The pretty ton delicate for the flower garden, will be found usefol for blooming under glass where sweet-scented flowers are in request, In fact, where the stock in band is delicient not a day should be lost in making every ros to be wanted, so as to be prepared anainst any accident or extra demand should such occur. Push on Camellias
chat have fairly started their buds with a warm moist been two much the practice to set the late ero amosphere and plenty of weak manure water. Also in May and even June, the consequence of which is that as they have sufficiently recruited their eneruies after circumstance (coupled with fermentation in and this flowering. By starting them into growth abont this ' pits; is at the bottom of much of that tenderness of con-
time and getting their wood ripened early they time and getting their wood ripened early they will he stitution that renders the plants a prey to disease. The in full blossom in November, at which season their cottager should sow a few hardy annual seeds directly, flowers retain their beauty much longer than after the sum becomes powerful in spring. Proceed as diligently as possible with the repotting of such of the hardthem every couse plants as require it so as to afford careful however before potting to have the ball in a nice moist state, and avoid giving large shifts to wealily Pineries Forcing department.
articulaly where bottom heat ials, as tan, \&c., and see thatuced by fermenting matetoo high, which it is exceedingly apt to do after fresh materials have been added, either during bright weather, or where there are pipes under the bed. Where much fire heat is used it requires some practice and attention to
be able to keep the soil in a proper state as regards moisture, but this must be effected state as regatds attention if success is to be insured any expense of thoroughly moist atmospho be, but do not Mashtain a stock too fast until we may be favoured with more sunshine, when if all is right at the roots there will be no danger of drawing the plants, as would be the case in the present state of the weather. Avoid allowing water to lodge in the hearts of plants showing fruit, syringe. Pot off or plant out suckers bloom with the obtained sufficiently strong, and attend to keeping up a regular zuccession of plants, which is the surest way of providing for a succession of fruit. Vineries.-Se are properly cleaned, the Vines painted with the usual composition of soft soap, sulphur, \&ce, and everything put into proper working order; also get the rods bent in time to induce the buds to push regularly. Attend to disbudding and stopping, dc., as may be necessary in the succession houses, and see that the inside border are kept properly moist, giving tepid manure-water may be necsary to effect this, and do not be afraid of giving too much of this to Vines in pots.
Sweep and clean lawns and give themberies,
with a heavy roller in order to malie the double rolling and solid. This is sometimes put off until dry weathe sets in, after which the roller makes comparatively little impression, whereas, if done now, the lawa will be greatiy consolidated and improved for the season. If any alterations or planting still remain unfinished every it done after this time will require much attention in watering, and this at the very busiest season of the year, especially if large plants are removed, and it is to commou a practice to put off such work to the last Look over beds planted with bulbs, and where necessary shir the suriace soil so as to keep it open and friable and also to give it a fresh appearance. If the stock in the most favourable position without loss time. See to the propagation of Dahlias and Holly hocks; the latter have of late years become so much Dahlia in the effect which they produce when planted skilfully, and therefore especial attention should be paid to having a good supply of them. Cuttings slipped off the old plants with a heel, planted in very sandy soil, and atiorded a gentle bottom heat, keeping the leaves as cool as possible, will be found to root perhaps
more freely at unis than at any other seasun Calceolurias hardened otf by removing them to a cold frame, and exposing them ireely to air preparatury to plauting them in turt pits to make room under glass e tender things.
hardy frut and kitchen garden.
Cauliflowers and Lettuces that have been wintered under glass may soon be planted out, selecting a sheitered deep rich piece of ground. It is a very good this uncertain season to throw up the ground in grood strong ridges running east and west, ground in good
stanting south side of the ridue. The west, planting on the from the north winds and fully exposed to the sun Peas, \&cc., that have been raised under glass, if properl ioured to the weather, should be planted out at once giving them the most favourable situation at command and it is a very good practice to shelter them for some time after planting out, by placing some branches of rows F , or any orher suitable evergreen along the dry days to break the wind, \&c. Take advantage of growing crops a the surface of the ground among appearance.

Follow up sowing the necessury crops, as in the kitehen garden portion of the Calendar, Carrots and Onions on trenched ground, the manure in the bottom sow a little Celery on a warm slope; throw small of slugs and of slugs, and cover up with a little litter. Celery seed roust be kept constantly damp, and the bed should be very rich. Grafting, if any, should be finished off hand. Potato planting should be proceeded with, both with plant out his Carnation layers, finisi, planting the Ranunculas, and attend to his flower beds if any generally.

\section*{SATURDAY, MARCH 15, 1856}

The following letter, descriptive of an uncultivated soil, has reached us from a correspondent:"I have a park of friable land of which the component parts, per analysis, are as follows:-
Silica \(\ldots\)....
Iron and aluminum
Carbonate of lime
Carbonate of magnesia
81.60
3.20

Carbonate of lime Moisture 8.71 6.40

\subsection*{100.22}

What would, in your opinion, he the best class of manures to begin applying to bring such land into cultivation? As large quantities of land somewhat similar in character exist, I think it would be a subject of much interest to landlords if the subject of soils was fully discussed; each proprietor conld apply the arguments to his own care, subject to
such particular alterations as the analysis of his own soil sugueste. 1."
The analysis is neither sufficiently full nor suffi ciently explicit. There are, we doubt not, other things present hesides those naned - quantities which, though mere traces in 100 grains, would in the quantity traversed by the roots of a single plant be large enough to exercise a very material influence on its growth.
If there be any vegetable covering at all at present, the soil contains the alkalies potash and sodait also probably contains some quantity, however small, of phosphoric acid ; vegetable matter exist in it to some extent ; and perhaps ammonia, if a sufficient weight had been examined, might have been detected. The quantity of these things which is present is precisely the point one wants to know
by which to guide an answer to the question put. It should be remembered that it does not need a thick or heavy covering of soil to make 1000 tons pe acre, and the very slight indications which the chemist here has neglected to observe may corre spond to such a dressing of bone-dust or of guano as not even Mr. Telfer or Mr. Mechi ever yet applied How much less, then, is such an analysis fitted to indicate the deficiencies which might lead one to advise the application of a few cwts. only of one manure or the other.

We may add here that we gather from the pub lished notice in the Journal of the English Agri cultural Society that such an analysis as the abov is made in their laboratory for \(1 l\). ; but the highe sum, \(3 l\)., charged for "a complete analysis," is for any purpose of information or of guidance

But the analysis quoted, as well as being imperfect, is not sufficiently explicit. It states that 81 per cent. are silica-but in what state is this silica It may be almost undistinguishable mechanically from clay-that is, it may be so finely divided that a very small percentage of alumina may give the soil the character of a clay, or it may be so coars grained that a much larger proportion of alumina wonld leave it still a sand; bat upon the lightness or atiffness of a soil might depend advice as to the condition in which bone-dust, farm-yard dung, and many other fertilisers should be applied. It states that 3.2 per cent. are iron and aluminum, but one does not know from this whether the soil may not be a ferruginous and barren sand; it may be full of poisonous iron salts, or it may almost be a fertile
loam. The entire absence of vegetable matter in the figures given strikes us as particularly noticeable for the quantity put down as moisture would lead us to suppose organic matter would be present in very considerable degree. It is plain, then, that the analysis given is not sufficient to enable an answer to the question.
Our answer, however, is less dependent now upon such information as is so imperfectly given above
than it would have been ten years aro. "Ten than it would have been ten years ago.
years ago," said Mr. Lawrs last week, thought that every description of soil would reguir special manures to suit them; it is no small addition to our stock of knowledge to have ascertained with certainty that when once we know the most suitable mannure for any particular crop, it will be applicable for all soils. The farmer who leaves the light soil o Norfolk to cultivate the heavy clay of Warwickshire requires no analysis of his soil to tell him that the same artificial manure which he used successfully to grow his Wheat on one soil will be equally appli the same rule would hold good in any part of the world where Wheat is cultivated."

A perfect analysis of a soil would indeed enable one to manure more economically-but, after all, the true economy in manuring is to apply it as of W
We suppose, then, that the soilinquestion is a com paratively infertile sand, and in that case we should 2 cwt . of Peruvian guano as a dressing, and plough it in in autumn, work it well in spring, and with 2 cwt . of Pervvian guano and 3 cwt . of saperphosphate, grow a crop of Turnips next summer and cake, and following that with Barley, seeds, \&c., in the usual rotation for light soils.
It in possible, however-and the presence of lime would almont indicate as much-that we are wrong in supposing the land so light and sterile; and may be possible by the addition of these "artificials, along with as nuch farm manure as can be spared, to
grow a crop of Turnips at once. That of course grow a crop of Turnips at once. That of co
will save a year in the process of improving it.
Referencer is made in another column to the prices of manures based upon the testimony of the
a report from them at the present date. The
following particulars are almost wholly from them. As, however, it is of the manure market generally that we have to report, we may add that superphosphate varies in price on conparing the lists of different manufacturers, and from \(6 l\). to \(7 l\). for honest superphosphate is a more accurate quotation. The manure market varies but very intle from week to
week in its quotations, and it is therefore needless to give a weekly report. If a rise or fall should happen we shall intimate the fact in time.
The imports of guano during the last week have been 7650 tons, the whole of which is readily taken from ship's side, the demand being extremely risk The stock of nitrate of soda is small and holders firm. Superphosphate of lime and all manures of value are in active demand.

A VERY striking instance of the spurious character of some of the oilcakes now in the market is given Britecent number of our contemporary, the \(\bar{N}\) orth British Agriculturist. High prices are of course a premium upon adulteration-just as low prices are apon that inferiority in quality produced by carelessness. A mixture of dust, earth, rabbish, is however very much less objectionable than one with the husks of other seeds, added quite as much or the additional bulk they give the cake as for their addition to the oil expressed. Such seeds, whether present unintentionally or added with a fraudulent intention, carry this farther effect, that they are often poisonous. And so Mustard seed is sometimes complained of, and in the instance now alluded to the seeds of some Polygonum, a weed common in the north of Germany. A liability so serious, to which both ignorance and fraud subject the purchaser of oilcakes, should make him very wary of entering at once upon their use as food They should be tried on a single head before the whole herd is fed, and their quality will then appear. In the case referred to by our contemporary, 90 cattle were affected by it. On the second day after feeding on the cake, Mr. M'Gregor o
Invergordon, who relates the case, says:-"In November last I was called by express, and when I arrived I found upwards of ' 90 head of cattle, including feeders and year-olds, attacked with the most violent purging that ever I witnessed. On making inquiry, I found the whole were getting oil cake, and that this was the second day they were getting this same cake. The year-olds did not get above a pound a day of it, and the feeders not more than 4 lbs. They were getting oilcake previous to this, but not of the same parcel. A few hours after I arrived two of the feeding cattle died, and having made a post mortem examination of one of them, found the most of the intestines inflamed, and coming to the conclusion that it was the cake given them that caused the violent parging and death, I sent the intestines of the other stot, and a sample of the cake given them, to Professor Dicr, to be analysed."
Dr. Kemp, to whom the cake was sent for exami nation, writes:-"I tested nearly all the contents of the stomach and intestines for the usual common poisons, but no trace of any could be detected. I
next ascertained that good oilcake should not contain the same number of these black seeds, if indeed, it should contain any. They are the seeds of a plant belonging to the natural order Polygo naceæ, some members of which possess acrid pro-
perties that would account for the symptoms witnessed by Mr. M'Grfgor during the life of the dead animal, and also of those similarly affected, but which recovered. The particular genus and species of the seeds found in the cake is, or at least almost certainly, the Polygonum lapathifolium, a seed tha I believe infests ill-cultivated soil in Belgium and the north of Germany, where the cake in question was probably purchased.'

\section*{THE POTATO CROP}

As the season for planting Potatoes is approaching, I thought I would give my experience of the way in which 1 have been most successfir in planting them, as well as the sort to be planted (which, by the way, has Wheat stuhble without any dung, dug up in the winter Wheat stuhble without any dung, dug up in the winte and allowed to lie till the beginning of April, when commenced planting them in the following manner
(the ground I should say is a very strong clay subsoil, (the ground I should say is a very strong elay subsoil,
but has been well drained 3 feet 6 inches deep):-we use but has been well drained 3 feet 6 inches deep) :-we use a toul called a Tubal, made in Devonshire, with which we make a drill as if for Peas, but about an inc deeper, the drills 2 feet apart, and then lay in the seto about 10 or 12 inches apart. After they are in draw in the drill on one side sufficient to cover the sets and leave the other side till the plant is up a fortnight ; the draw in the other side, and this will be as good as hoeing If, however, the ground is very foul, you must hoe again and heap them up if wanted. They will require nothing more done to them before they are ripe, save only the top dressing, which I sow broadcast abou this \(2 \frac{1}{2}\) of superphosphate of lime will answer the purpose. Now, I have planted several sorts in this way-Regents, Kidneys, Early Oxford, and others, all of which suc ceeded very well, but none like the Early Oxford ; they were ready to take up the latter end of July or beginThe ield was remarkably good, more than 130 sack The yield was remarkably good, more the and the mode in which we get them up is ae follow :- The Potatoes being planted near the surface, we have a tool like a dung fork, only turned down, wit Which a man can with ease get up 60 bushels a day, and being so near the surface there bas not been half bushel of diseased Potatoes to an acre. The 0xfor for all purposes. Richard Webb, Calcot Farm, Reading, March 6.

At page 164 you requested a few remarks respecting the Fluke Potato. There seem but two opinions respecting the quality of this Potato, and these seen cand. Vizo, firs rate, and "good for nouning. unequalled, while others condemn it as decidedly th anequalled, while others condemn it as decidody
worst Potato they ever grew. Now, when doctors diffe worst Potato they ever grew. Now, when woctors
who shall decide? By which party shall we be advised I offer the remarks respecting this Pota in cons quence of the divided opinion as to its merits. I hav on several occasions heard people exchaim, "Somebody must be wrong, for one highly recommends wail another condemns it." On several occasions I hav innessed different persons digging up their Flukes, and have frequently asked them their opinion, which ma be summed up as follows : "Well, master, I would wis "are they good?" The reply would be: "Ah, goo for the pigs! I will never plant another Fluke as as I live." Another perhaps would be more fav bilers ever saw in my are" the best croppers a thers woul rise the followis objections: \(s\) 'Too rane in the haulm; too much deformed " or, as your correspond ent observed-" not one-half came up that was planted. When the Fluke was so extensively advertised hat season, it was recommended in the following high terms "This fine variety is less liable to the disease than any th in of ecellent quality large, and very productive. How has it sustained the high character thus given o it? It is certainly very productive, large, and pro some unequalled in flavour. But has hus the disease more than any other variety! as say, as an eye-winess, in some distrile别 thers it has been less subject to it than many, elieve there are but few, if any, districts in whaide hat it merits the hith character given to it last season. For the benefit of those who may again grow the Fluk (to which, by the way, I trust all will give anothe trial), I beg to say it should be borne in mind that last very unfavourable one for the cultivatio of the Potato, more especially on high soil. The dry to lose their vitality in conse summer caused the tabets commenced to ripen theirequence of wich thing hal commenced to ripen their skins before attainiag a long full size, and when the senson changed we farmed long continuance of wet by which the newly- second lot, which accounts for 80 many deformed Flakes My opinion is that the Fluke, being naturally a coar rower, should be planted on poor soil; when planted rich manured land, the tubers become deformed, haulm exceedingly coarse, the Potntoes in consequamit ted ther warmth to the tubers nor sun and airnangly the haulm; the tabers do not intil 0 le in rengh of the haul merely gets set, and not properly matured such Potatoe cannot he expected thil lilas ball of flour, or eat Gavour like an riug peri, how bopa the bein of moderate strengt dies down in ufficient time to of moderate strength dies down in mien ity is ripen the tubers as they should be, while the quaily the first class. The fault thus lies not in the Potso ,ut in the soil and cultivation. The grower of these per no duubt selected his very best piece of land, and ore manured it in order to excel, by which means he overs-
shot the marly, for while poor ground will grow Fukes ef
the first qua, ity, over-manured land would only grow them
fit for pirs. ihere is as much difference in the constitu fit for pins. there is as much difference in the culture required in some varieties from others as the treatment required between a donkey and a race-horse. With respect to cutting the sets, I find
they will bear cutting as well as most Kidney Potatoes. There were planted here last season 12 bushels, the greater part being cut sets, and every oue was frozen as hard as a s one, and I believe not 30 sets failed in the !ateh : these were purchased of Mr. Holland, of
Middeton, Lancashire. I have no doubt, there being so many complaints respecting this Potato coming up so badly, that many of them were dried in a kiln and got roasted too much, as the Potatoes appear to be perfectly sound-the eyes only seem to be affected, as if dried completely up. I have seen perches of land with no doubt all parices have spoken of the Fluke as they have found it; be persuaded, and grow it again on poor sing its praises. Educard Bennett, Gr. to Sir Othey Makeman, Burt., Perdiswell Hull, Worcester, March 10
large scale" of Fluke Potatoes; but my mite of exlarge scale" of Fluke Potatoes; but my mite of ex-
perience may be useful as far as it goes. I planted last year about an acre of ground, half with cut sets, half with uncut, side by side, and treated as to manuring and all other circumstances exactly alike. The result was, that so few of the cut sets vegetated, that I plougbed up the ground and sowed it with Turnips. The uncut sets produced a moderate crop, which were the soundest Potatoes we had last year. I ought to mention that our ground is a wet, stiff soil, not well suited for Potatoes, of which we grow but a small quantity for home use. We had but a moderate crop with much disease last year. A Cheshire Subscribcr.

\section*{THE WHEAT GRUB.}

SINCE I wrote to you last week I have received several communications on the subject of the destruction of the young Wheat crop by insects. "R. F. W." from Southam has forwarded some Wheat plants infested by the larvee of the supposed Oscinis vastator, but having been pulled up without any earth left at the roots, and then sent by post in a letter, they are crushed and dried up, so that. I cannot hope to succeed in rearing any of the larva to the perfect state. A few plants with a purpose well. "R.F.W." says that for several years purpose well. "R. F. W." says that for several years the young Wheat than the wireworm, which may be easily accounted for, because the parent fly deposits its
eggs upon the young plant as soon as it appears above ground; whereas the wireworm, being at large in the ground, only by chance happens to come upon the young plants in burrowing through the ground. "IR.F. W."
further says that this maggot is fuund more or less in the Wheat after Clover and Rye-grass, which I cannot account for by any peculiarity in the insect's habits, for it is not to be supposed that the larvor feed on the stems of the young Clover, although they may do so on the which and March suffer from the wireworm in April. There is, however, no other natural connection between the two insects than that arising from both being fond of the young shoots of cereals. "R.F.W." lastly observes that the only check which he has found is the clod-crusher, and seems a reasonable mode of extirpation.
From other quarters I have received specimens of infested Wheat, which prove that several other kinds of insects are engaged in the work of destruction of the Wheat plant. In the neighbourhood of Brighton the Wheat grounds seem to be extensively infested with the young larve of the Tipulæ, of which I should be very glad of specimens, sent as above mentioned, in order to deternine the history and identify the species. In other parts of the country the little grub described by Mr. Markwicke in the Linnean transactions as same way as the wireworm, has reappeared, and In have now specimens alive and trust I shall be able to trace the species to the final state; Mr. Curtis considering it the species to the final state; Mr. Curtis considering it it to be a Rove beetle (one of the Staphylinida), as I find it to be identical with the larva figured in my Introduction to the Modern Classification of Insects, vol. i., fig. 16, No. 10 , and which I discovered more than 20 years ago gnawing the young Turnips in the early spring. I find also in the mould of infested plants specimens of a Snake millepede, and also of a very small and slender white worm, like a young Filaria. J. O. Westwood, Hammersmith, March 13 .

\section*{Home Correspondence.}

Meadow Land Farming.-Can it be ascertained with accuracy what is the produce of and expenditure upon meadow land of good iquality, say in Middlesex, where the supply of hay to the London market makes meadow land, producing hay, valuable? I think this is an interesting and useful subject of inquiry, and as one of your readers I shall teel obliged if you can assist in procuring information which can be relied on. I should be glad to learn the quantity of hay produced per acre, and let it be stated in cwts, 1 as to be understood by all persons-whether familiar with lowe or trussen, or other measures of quantity, which are local
terms. Let it also be stated whether one or two crops of
hay are taken in the season, and if two, the proportional
quantity and value of each. Let the kiod, quautity, and money value of the manure applied to the land be the manure and all other expenditure be charyenagainst the meadow, per acre, and let the money value of the hay be stated to its credit, and a balance struck. actual value of land managed in this manner, and the possibility of increased value beins given to meadow land by any other mode of treatment. It is to be hoped that accurate details can readily b... had. I do not doubt you will willingly lend your as-istance. The information
will be thankfully received. A Grass Farmer, March 10 . Chivas' Orange Jelly Tumip.-During the spring of 1855 your Paper was more than once speaking in praise of Chivas' Orange Jelly 'Turnip as being the most nutritious, and resisting the frost better even than the Swede. From the representations of your corre-
spondents I was induced to sow an acre of them, and most heartily do I regret it, as every Turnip was utterly destroyed by the first hard frost, worse even than the common white or red. I have been hoping to see that others have tried it, and what the result in their case has been. \(J . D . H\). . [In the last notice of this
Turnip we expressly referred to the very contradictory Turaip we expressly
reports given of it.]
Seeds.-I have been very much pleased by the perusal of your article in the Chronicle with respect to seeds,
and it has shown me the reason why it is recommended by some to sow so much seed per acre. In this part of Somerset (West) we never sow more than 1 lb . per acr whilst in a catalogue before me it is said that of Swedes 2 lbs or 3 lbs , is required for an acre; of Early Large Turnip 2 lbs to 3 lbs ; and of Stubble Turnip, 4 lbs . Whilst in my opinion \(\frac{1}{} \mathrm{lb}\). of new Turnip seed would be sufficient if we could manage to drill or sow it even wet my finger in my mouth and dip the top of it into the seed, count the number of seeds and proceed as you direct; by my plan you get good and bad if these be mixed together, and so have a better chance of ascertaining the percentage of good and bad seed. Thomas Cridland, Seed Groveer, dec
Central Farmers's Club.-The plan circulated by the committee for establishing this club in a house of its own with bed-rooms, \&c.o, does not, as bas been gkated, involve any deviation from its original constitution. The club was established in 1843 for the express purpose of affording opportunities of social intercourse to agri culturists visiting London. For want of sufficien funds it was located at the Xori Hotel, where a limited number of beds at a fixed price and the use of two rooms were secured for the use of the members. It was nut until the following year that the discussions on agricultural topics, by which the club has become best known, were commenced. At present the club has overgrown the accommodation of an hotel. There is comfort and economy of a club-house, would add interest to the discussions. S. S., one of the Committee of

Agricultural Drainage by the Military Authorities a Aldershot.-I believe no question can now be said to exist with landowners as regards the superiority of 4 -feet drains over 18 inches for the more pexfect drainage of sandy and gravelly soils; and it is also well known that under the advice of the most experienced draining engineers, and supported by the Parliamentary evidence taken before several committees on the subject of land draining, the Inclosure Commissioners, who have the passing the plans of the draining by means of the public loans of four millions and the advances of the several land drainage companies, do not consider any drains as perfect that are not of the depth of 4 feet. This being 30, what shall be said of the care of the public expendi ture when we find the public money is to be spent, or rather, my readers may say, to be wasted, upon plans that no landowner would allow tiles for, or that the Commissioners would admit to be of any use, and in volving an expenditure of at least double what would be thought necessary by any agricultural engineer to do the woris well ! I refer to the proposed plans and spec fications, as made public, for tencers for the drainage of the site of the Aldershot Camp, about 258 acres of sandy moorland, which are as follows: viz., with drains 18 inches deep and 12 feet apart, made of pipes of 3 inches inside diameter, with collars connecting the joints, and which under the specification and conditions will cost between \(20 l\) and 30l. an acre. As advisable to inform the military anthorities of the mistalse they were about to comrnit, and accordingly on the 23d February I wrote to the commanding royal engineer at Aldershot, informing him I was a draining engineer and a Government inspector of drainage, and had had large experience in draining in that lucality, and advising him that the proposed plans would be mperfect as regards laying the land dry and sound, and the expenditure wonld far exceed, by some thousands of pounds, what was necessary for that purpose, and referring him to the inclosure Commissioners for furthe information on the subject. On the 8th inst. I received a letter from Sir Frenerick Smith, inclosing me back my letter with a memorandum of his clers of the work, wherein he explains that the sand and gravel form the ower stratum only, and is not the chief consideration, and that the deep draining I had referred to as suceesscious plan would form no criterion as to the most judi-
him I had successfully drained the Kegent's Park for public use, a strong clay, with 4 -feet drains, at a coet of 10.. 15s. an acre, to show him that on the worst draining soils, and for other than mere agricultural parposes, 4 feet liad been chosen as not too deep, and an expenditure of 102. 15s. an acre was the are though necessary); and he winds up by saying that the nearer the pipes are to the surface after securing them with earth sufficiently to preserve them from accident, the hetter. To this communication I immediately replied, expressing my surprise at the confidence with which his clerk of the works had given an opinion on draining, and stating that I had for nine years been an agricultural drainer in large practice, as well as a Govern ment inspector of draining, and I[would undertake", to drain the land in question far more effectually, at hal the cost involved by the proposed plans, and enclosing him a little work called " Agricultural Drainage," drawing his attention to it and more particularly to Lord Lonsdale's evidence there given, as to the depth of drains with reference to road-mahing and laying the surface dry and hard, where he speahs of the failure of shallow drains to tale the water from the surface a the advantage of drains of 5 and 6 feet deep in laying the land dry and strengthening and hardening the surface. In doine this I expected I had done enough to bring about some inquiry, with a view to securing some attention to the subject; but no further notice has been taken of my communication, and I suppose the returi of my first letter should have told me to expect none The soil of the site of the camp iwill be known to most agriculturists as being composed of solarge a proportion of sand and gravel, with so hittie a mixture of clay as to be considered one of the most barren in the south of England. The surface for a few inches is sandy peat; underneath this there extends down for many feet 2 mixture of sand and gravel, which from having an im pervious bed underneath becomes full of water in winter By this description there are few of your readers con versant with draiming, who will not see that the soil in question is one of the easiest to drain, and most callin for very deep drains. Hewitt Davis, 3, Frederick's Place Old Jewry, March 12.

ROYAL AGRICULTURAL OF ENGLAND
Werely Counctl, March 12.-Mr. Miles, M.P. Vice-Preaident, in the Chair.
Churss.-At a weekly meeting of the Council, on the 24th of April, 1850, Messrs. Burgess and Key eub mitted their box churn to the inspection of the members, and exhibited its simple and peculiar action in the production of butter from cream. At this meteting on the 12th of March, Count Sparre favoured the Council with an opportunity of witnessing the performance of Major Stiernsvärd's Swedish centrifuyal churn, to which a medal of the first class had been awarded last year at the Paris Exhibition. These two churns were on the present occasion tried before the Council in juxta-position and under the same circumstances, the same mill and cream being in each case used

The Swedish charn was then tried, with the remaining cream, at less than its usual speed; but in consequence of its not being charged with the cxact quantity of cream required in its case, no result was obtained. In the the butter on being taken out of the churn was too suft to be weighed ; and on being put into cold water, it wat fo und too incoherent, without undergoing the regular process of "making," to be weighed.-The churn of Messrs. Burgess \& Key required little labour to be kept in action, and the butter was almost at once turned out in a fine marketable state. Coun Sparre thanked the Council for their kind attention in witnessing the performance of his countryman' churn, and regretted that its performance on that occasion, from circumstances for which he could not account, was not so satisfactory as it had been on formes trials.
Hanoverian Agriculture.-His Royal Highnear
Prince Albert communicated through the Hore Colonel

Phpps a present of two agricultural works to the
Society, from Dr. C. H. Meyer-Altenburg, of Ebstorf in the principality of Lüneburg, entitled respectively materieller, und national-ökonomischer Hinsicht," and "Die Einführbarkeit der Spaten-Cultur, in de grïssern landwirthschaftlicher Betrieb;" the latter work being the prize essay on spade cultivation of the Roya Hanoverian Agricultural Society at Celle. The Counci ordered their best thanks to his Royal Highness Prince
Albert, and to the author, for the favour of these resents
Value or Dairy Cows.-Mr. Horsfall stated at a former meeting of the Council that he valued his dairy cows on the average at \(25 l\). ; he has since communicated the following explanation of that estimation :-" My milch cows give, on the average, about 9 quarts each per
day; which, at the price stated, \(2 d\). per quart, gives \(25 l\) er year.
The Council stands adjourned over Passion week, to desday the 26th of March.

Society of AbTs: March 5-Agricultural Progress.
The following addresses were delivered at the close of Mr. The following addresseswere delivered at the close of Mr.
Hoskyns's paper : Mr. J. M. Paine, of Faruham, spoke on the geological resources of agriculture. He said :"I fear that it must be admitted that genlogy has not hitherto cone much for agriculture, und although its resources are still some grod things have been effected by its means, and more ably presented to us by Mr. Hoskyns, But geology without the Chemistry must toll IIs what to find, or when we bave found it what it is, while geology teaches us where to search for it. It avestigations, that the knowledge of the constituents of the true peological subsoils is of little value, inasmuch as the greater part of our cultivated fields is composed of superficial drifts, overlie. That this is usually the case is most true; and still is not likely we should obtain much advantage from a chemical dmit of general application. Geology, however, would here serve agticulture in another manner, by teaching the extent, depth, and direction of these diluvial drifts; remind my present hearers how this has been scarcely Kimilar benefit in draining some of mor scale I have derived But I consider that agriculture would ultimately reap many advantages, did it possess an analytical knowledge of the true
geological subsoils as they outcrop in various parts. From my own experience, I can confidently state, that the soil of one field sometimes liappens that examinationsof this nature lead to the manures, and will bear the expense of distant carriage. Such grounds for indulging in the sangruine hink, there are sufficient search would be rewarded both by pecuniary and scientific everal sources of of this opinion, I need only remind you developen, and many of which agriculture has wisely appropriphosphate of lime which Dr. Daubeny introduced to our notice me about as liappily chosen as the "coppery lishts" applied Cambridgeshire; the fossils and nodules of the upper and lower generally; the mineral paosphate from New Jersey; and, hillt and periaps the most important, \& very purse apatite recently
tmported from Norway by Mr. Lawes, from which super phosphate of a most superior quality is now manufactured lime. These discoveries are due to geology, and I think they
ought to stimulate us to undertake more comp jete invetige ought to stimulate us to undertake more comp, iete investigations; carefolly conducted chemico-geological examination of all the task, so far as relates to one well known geological division-I for my pains. The Royal Agricultural Society, I am persuaded would willingly assist gentlemen in kindred investigations, and vary valuable results would ensue. Might we not hope to
discover in our granitic districts rich veins of phosphate of lime discover in our granitic districts rich veins of phosphate of lime
like those I have just mentioned? For phosphoric acid is of
frequent occurrence in these rocks. it is frequent occurrence in these rocks; it is, I imagine, one of the
prmeval existencies of our globe, as it in fact censtitutes
a large proportion of that "dust of the' earth" a large proportion of that "dust of the' earth" out of which ma crops. It is well snown that the peculiar botany of ofific
district is chetly determined by its geology. So also does
indicate the deseription of agricultural
 bop, perennial plant requiring the richest suil. Until,
brought geology and chemistry to bear on some of my own filds,
they did not pay me 5s, per acre rent. I compared their soils,
both geologically and rhemicull pota geologically and rhemically, with Hop grounds worth 21
per acre, and found them alike in qeological position an
chemaical analysis. There now remained only one obstacle t
their being placed in a very different cotely impediment was water;-the land was deeply drained, and the fields became worth \(10 l\). per acre. My attention, as 1 stated junt
now, has been more specifically directed to the chalk formation, section of abont two miles, funnilitg from its examination. In every outcrop, from the lower green sand to the plast c clay. These of phosphate of lime, clay with a large per
thick beds of the soluble or gelatinons silica,
lime in every variety. Some of these

will not detain your Roynl IIighness and the meeting by ari further remarks, observing only in conclusion, that the carth far now wa-ted in the ordinary consumption of coals. and that many chemists would set their brains to work, and teach us how to
avail ourseives of these riches, it would indeed prove a great

Mr. J. B. Lawes, F.R.S., spoke on the chemistry of griculture. He said
The period which Mr. Hoskyns has selected as the starting read to us, although comprising so small a portion of time in the history of British agriculture, refers back to a period
sufficiently remote to include the whole history of the chemistry
of a of agriculture, so far as it relates to this country. Whatever that period, certainly neither attracted the artention nor before enced the practice of the agriculturists of Great Britain In is to an illastrious countryman of his Royal Highness, to Baron the attention of British farmene to of having effectively roused chemical science to advance the practice of their art. Although published, the foundation of this new science can liardly ye he said to be laid, or the first truths admitted without dispute.
When we consider the wide distinction which exists between the man of science and the practical farmer, and the very different
points of view from which they would regard this new science, it conld hardly be expected but that
serious disagreements should arise between them, serious disagreements should arise between them. The ques-
tion of procit and loss naturally enters largely into all the
views and considerations of the practical farmer tific man entirely disregards it practical farmer, while the scien vegetation by the employment of a few pounds of white crystal-
lised salts as would be produced by a cart-load of dung is to the man of science a phenomenon of great interest, irrespective of agricultural purposes would depend this salt to be used for having no connection with science. For want of practical know, edge the man of science, although correct in his principles, has want of scientific knowledge the agriculturist has expected from
wher the teachers of science rules to guide and improve his practice Which the science of the day was quite incapable of supplying. as visionary, theoretical, and unpractical, while the man of to it only to furnish himer with recipes to enable him to fill his pockets more rapidly. It has of late years been too mucla the custom to explain everything connected with the practice of venture to claim for agriculture the rank of an independen siology, and some other sciences, but still distinet from them alt Its truths can alnne be investigated and explained by experiments conducted in the field with all the aids and refinements culties, and yielding its frults but sparingly to those dithicultivate it with the greatest assiduity. Although not be eass, or even possible, to print out distinctly in what way
science has advanced the practice of a year, there is evidence of a very marked progress, if we compar
two periods suffeiently remote years ago, it was thonght that every
require special mannures to suit the when once knowledge to have ascertained with certainty that crop, it will be applicable for all soils. The farmer who leaves shire, requires no analysis of his soil to tell him that the same artificial manure which he used successfully to grow his Wheat further, and say that che same rule would hold good in any part of the world where Whext is cultivated. Ten years ago, nothing their chemical composition; at the present tims, there are many
in this room who would be willing to accept the chemical compo ition of any manure as the measure of its value. If time par-
noitted, I could point out to gon that more correct views are alo entertained on the suhject nf feeding animals; that we begin to economical a process for of crops is not a nec

 extibitions, many crudities, and many novelties. Most
of these have had their short hour of fame aut trial, and
eventually have disheppenred for ever. Amon:gst thes in

 These, with those me tioned as existing previously to the Oxford, meeting, may be
considered as maiuly comprising the class of staudard imple ments of the prest nt day. I lave not included in this list the
reaping machine, upon which much in ineluity and cost has bee expended to adapt it to the requireturnts of this conntry, by
several makers, because it has not as yet assumed the claracter of a standard implement; but I think another season will not the position to which agricultural mechanics had attained-both
prior to 1839 and since-I will endeavour to explain the cause owhich the present general use of the stanaard implements is
mainly attributable. 1st, to the improvements in all machinery and tools for working in wood and iron, producing a superio
style of workmanship at ordinary cost. 2d, to the facility of transit afforded by railways. 3d, to the necessity of econ-
omising all farming costs by means of every labour-saving omising all farming casts by means of every labour-saving
machine; and last, not least, to the opportunities afforded by the itinerant annual exhibitions of the Rogal Agricultural Society, mplements throughout the length aud breadth of the land This has enabled the makers of implements in every district
profit by the examples of the best implements of all othe the \(b\) st implements from thage obtained to the agricultural community, arisigg les ioption throughout the country of the bit implements of erery istrict, with a general improvement in the style and quality o
workmanship. Hitherto, I bave spoken of the instruments only ordinarily used by horse or hand power; but the introduction
of steam-power in its portable form has opelied up a wide field fo
he ingenuity and enterprise of the manufacturer; inasmuch by its aid, machines of a much more comprehensive characte, constructed; and in this direction the energy and the ability into agriciltural machine manafucturer has been largely calle
ind with most satisfactory results, especially in relation to the steam engrne itself, and to the threshing machive, ut the corn, the further stages of separation from offal and th production of a perfect sample, fit for market. Important
hwwever, as has been the application of steam power, whether to thery, greatly more important would it b honnur to the inventor of the steam tile draining marhine, who
by his persevering exertions has at last effected the first stage of this desirable object; but a rery much wider field remains yet to
 distance. There are many and varions views as to the best great for any one individual-too large fur individual enterprise. have no hesitation in saying, that if the object is to b national cost. The funds, I believe, are all that is wanting to bing about nome arrangeenent which will have a practical effect. place to enter upon the plan, but. This is not the time for the into the general fund for the accomplishment of such information

Mr. John Hudson, of Castle Acre, spoke on the practice of agriculture :I have been requested to speak a few words upon the
sibject of the progress of Practical Farming during the last
tifteen years. The scientific gentlemen who have preceded me this evening bave entered so fully into the subject, that they have
left me an almost barren field to work upom. 1 must, therefore
crave to the early part of the present century, when Thomas William
Coke, the late Earl of Leicester, adpted and recommended the
improved system of practical a, connty of Norfolk consisted of large tracls of wild heatha and rithbit warrens. Rye was extensively grown, but very little
Whent was prodiced there. Mr. Coke recommended the farmers at that time the drill superseded the broad-cast method of sowing
both corn and Turnips. Mr. ('oke spent large sums of money in building convenient farm premices for his tenants, and encourage
them to improve their farms by granting thrm 21 years' leases
with liberal coveruats, int of his life, to give hif improving tipant.s the leste tenant right
they could have-a renewal of thit heases fur yeans before the of the outlay of the tenants capitul. Lp to 1 lizl, he held annual
meetings at Holk ham, in the month of July, where he gathered around him all the scientific skill and practical experience lhe
could obtain at that time. I have therestell sir H. Dave, Sir
Jos. lianks, Dr. Raghy, and the ouly agricultural chomist of the "looming in the tupure," but it remained to the perion named on
the paper for discussion this evening, for the farther develop ment which chemical science hay brought to bear upon agricul-
ture. It is to Liebig, Lawes, Paine, Way, and others, that wa hard bone into food for the infant plant of our root crop. In my but now that our chemists have made these important dincoveriea,
the Royal Agricultural Society of England was formed, under the
auspices of his Grace the Duke of Richmond and the late Earl Spencer, Mr. Pusey, and Mr. Handley. That Society has offered prizes for improved implements, as well as improved
breeds of cattle, sheep, horses, \&c., and held out inducements for breeds of cattie, sheep, horses, ac., and held out inducements for
chemical science to aid practical farming. When I first put my
hand to the plough, it was a very primitive implement, and perhand to the plough, it was a very primitive implement, and per-
formed its work imperfectly. Ransome and Howard have inproved our ploughs; Garrett has improved couk's drill and in 1816, and Which I first used on my farm at Castle Acre in 1823. These improvei implements liave very minch tended to Ransome, Clayton, and Shuttleworth, Hornsby, Tuxford, and have greatly lessened the cost of production. The legislature of agriculture. Some 20 years since the siteration of the
Sols tithe-law tonk place, and labour was set free by the repeal ing could not have progressed as it has done. The people ing the cost of its production. The three great items in the farmer's expenditure are rent, labour, and the purchase of artifi-
cial manures. As the area of these islands cannot be extended We must not expect the first to be much decreased, and the
labourer is not too well paid. It appears to me that the best way to reduce the cost of acricultural production is to endeavour to obtain the manures at leys cost. We are fold that many of the
uninhabited islands in the Preific abound in fertilisine and could it be supplied at about half the present price, it ie enable the farmers of England to raise an abundant supply I trust the bread, corn, and meat, for the increasing population busy hive of industry, as in my mill not be considered drones in the to keep pace with the advancement of the manufacturing and commercia! community of these realms.

}

THE DIRECTORS of the rbove COMPANY (many of whom are extensive Agriculturists) have great pleasure Machinery for the manufacture of their Manicultaral and, having secured nearly the whote of the Blood produced by the butchers Patent Manure of and a large stock of other necessary materials of the best quality, they are now in a position to supply their of the Blood Manure, their fixed determination to supply nothing but sterling and genuine quality cannot fail to afford a guarantee and protection to the farmer against imposation.
The great value of Blood Manure as a fertiliser may now be considered as a fully established fact. Ever since the first introduction解 of a few experiments, it has been tried for the last four seasons oy hundreds with great success, and in the next it will be The Blod Mas arture? The Blood Manure is componed of bones dissolved in Sulphuric Acid, to which is added a large quantity of pure Blood, specialy
prepared to suit various crops, and may either be applied by the drill or sown broadcast.

BLOOD MANURE FOR TURNIPS.
and rapidity of growth in the young stage of the plants are in a larger proportion in a soluble form than in usially met witla in rdinary samples of Superphosphate of Lime, and, the Blood mpperiority of the Patent Manure. It may be used alone at the rate of 4 cwt . per acre, or it farm-yard mannre is used, 3 cwt . N.B. For this, as for all oqual quantity of ine mould or ashes. cation of Blood Manure will much more than repay the additiona cost. Though 2 or 3 cwt . per acre will produce a crop superio to that from a similar weight of Superphosphate of Lime, the
application of a much larger quantity will be fornd even more remnerative. The rent and charges must be paid equally whether the land yields 10,20 , or 30 tons an acre: 00 that an nothing more than the price of the extra 2 or 3 cwt . of Blood Manure applied.
THE BLOOD MANURE FOR WHEAT, BARLEY, OATS, ETC
Being rich in nitrogen and other necessary ingredients, it is been used with the greatest success in all parts of England is a very remarkable fact that the analysis of blood and the grain of Wheat are nearly identical, as proved by the most eminent chemists,-it'contains all the elements which plants
require, and when propery prepared, will become the require, and when properly prepared, will become the essence of
vegetable as well as of animal life. The highly fertlising properties of Blood have been commented upon by Professor Way other cereals, has been fully proved upon all soils by the practical
experience of numerous Agriculturists. Should Wheat manured with dung in the ordinary way look unhealthy in the spring it with dung in the ordinary way look unhealthy in the spring, it
will be greatly benefited by top-dressing it-with Rlood Manure, at the rate of 2 to 3 cwt . per acre, -thus strengthening the straw, making it less liable to lodge, and very much increasing the produce. For Barley and Oats, 3 to 4 cwt. per acre of the Blood
Manure may either be sown broadcast or drilled with the seed if the former, to be well harrowed in.

\section*{BEANS AND PEAS.}

For Beans or Peas, 3 to 4 cwt . per acre may be used either broadcast and harrowed in, or a portion afterwards, between the
drills at the time of horse-hoeing.

Norfolk Farme, Windsor, Febraary 20th, 1853. Gentlemen,-In answer to your inquiry respecting the results
of Nitro-phosphate used on the Royal Farms, Windsor Great Park, 1 have great pleasure in stating, that after applying it to Agricultural Show, which gained the cap at the Royal East Berks Agricultural Show, I have no hesitation in pronouncing it an
excellent manure, and intend using it to a greater extent during the present serson.

I am, gentilemen, your obedient servant,
Mr. Benja minn Goulton, Gedney Marsh, Long Sutton, Lincoln along with the Wheat over 30 aces ane

\section*{PRICE, DELIVERED AT ANY WHARF OR RAILWAY STATION IN LONDON \\ Corn and Grass Manure, £7 10s. per Ton. Turnip Manure, £6 10s. per Ton. \\ Flax and Hop Manure, \(£ 810 \mathrm{~s}\). per Ton. \\ \footnotetext{
 \\ 
} \\ -}

The Company beg to caution the pubtic against the attempts of spurious imitators, who, since the introduction of this Manure, hare professed to make one possessing similar qualities. As security, therefore, to the purchaser, every
bag is marked "ODAMS' PATENT BLOOD MANURE," and sold orly by the authorised \(\Delta\) gents of the Company

\section*{MANGEL WURZEL AND CARROTS.}

Btond Manure is an excellent fertiliser for these crops. Four sown broadeast over the field, snd well hartowed in, the seed the rows is of great importance for air and nutriment, and gieat divantage will be obtained by occasionally sprinkling little

\section*{POTATOES.}

The Blood Manure is specially prepared for this crop, and it uccessful if noed to most satisfactory results-it will be most sual quantity of farm-yard dung, and the whole earthed up in te usual way. Sbould the farm-yard manure not be used, then of the drill and Manure may be used alone, put into the bottom

FLAX.
This crop in olden time had the renown of being one of the most exhausting crops which could be put into the land, and this nantity of nitrogen, phosphoenc acid, magnesia, and the allalies cron up by the Flax plant, which renders it a highly exhausting crop. The Blood Manure is carefully prepared, so as to meet
the wants of this crop, and with its aid Flaz can no longer to considered an exhauster of the soil. In using Blood Manare for
this crop, from 4 to 6 cwt . may be sowu broailcast, in before the seed is drilled.

\section*{HOPS.}

It is well known to all Hop growers that Hops require mane manure for their proper development than any other plant whichyear, from the land necessitates the supply to the Hops, year by siderable amount of both mineral and organic ingredients, and the Blood Manire hass been particularly prepared, with the object of supplying the requirements of this important crop. It contains all the constituents which the plant requires, both mineral
and organic, and will be found as cheap and efficacious as any other manure now in use ; from 10 to 12 cwt per acre applied at two different times well worked in between the alleys, will be found a most usefnl application, or the manure may be put round each

\section*{Testimonials from the most eminent Agriculturists who have used the Manure
may be had from the local Agents. The following may be taken as a sample:- \\ Testimonials from the most eminent Agriculturists who have used the Manure

\section*{T. WHEELER POTATOE}
J. WHEELER AND SON offer the following PRINCE OF WALES. Thig is the enrliest roun whto Potato excellent for forcing, and for a general crop can be moot highly recommended. Per peck, 2s. 6ad; per bushel, 98 .
I was highly delighted with the Prince of Wales Potatoes 1 had from you last year; 1 considier them more mealy and ditter planted in the same soil nd in every Fas alike"- Mrs Cuxyriog Portfields, Hereford
"Your Prince of Wales Potato 'II obtained when first sent ont excellent and very prolife to its good quaiities. . . At year I am sure that I raised at the rate of nearly 400 bushels per imperial acro. C. Whernab satisfaction in introducing this Potato into general noticethey have rent it into nearily all parts of the Kingdom, and everyWhere it it highly spoken of. It is so cearly that it eacapes the disease more than almost any other variety. It is a large
cropper, and the flavour is exceillant, they cen the strongest terms.
ALSTONE KIDNEY. - This is perfectly distinct from any other Potato. It is an astonishing cropper, and the tabers are of lerge siza. It keeps wen, and in good favoured, and is per bushel, 98 .
The Rev. R. O. BrournizL, of Sprouston Mense, N. E., gives
the following report of the Alstone Kidneys which, he had from us.- "I had the Alstone Kidney plented in four rows of \(10 \frac{1}{4}\) yard in length, the running leugth of all being 42 yards, and the
prodice was three large heaped imperial bushels of Potates
 made the crop less than it would have been, for the outside row
10, yards yielded nearly a heaped bushel. It is at the rate of FLUKE.-This sort is now becoming well known. It is some
 short time find its way into every garden. 28. per peock. ASHLEAF KIDNEY (true) an exoclient sampl
peck, or 9s. per bushel, dellivered carriage free.
J. C. WHEzuze \& Sox, Nurserymen and Seed Growers.

\section*{NEW AND BEAUTIFUL PLANTS.}

THE ANNEXED LIST OF VALUABLE PLANTS has been selected from a large and rich collection of novelties; and the Advertisers having proved them to be desirable acquisitions, have therefore no hesitation in strongly and confidently recommending them. They will be severally announced, and seNr OUT FOR , THE first time during the prigent tear by

\section*{MESSRS. WILLIAM ROLLISSON \& SON.}

In snswer to numerous Subscribers that have kindly ordered our NEW PLANTS, we beg to say that Nos. \(1,2,3,5,6,7,8,9,10,11,12,13,16,17,18,19,20\), \(23, \& 24\), will be ready for delivery as soon as our New Catalogue (which is now in the press) is issued. We have adopted this course in consequence of our new Catalogue containing names, with prices and description, of upwards of 200 New Plants in species and varieties, which will enable those that have ordered some of our novelties to have any others forwarded in the same package that they may be pleased to select therefrom.
1. MEYENIA ERECTA. - This beautiful plant is a native o the scuth-west coast of Africa, and was first discovered by
in 1854 . 18 , in the Niger Expeaition, and ind diate house or stove: of shrulby habit. By plant cult vators it will be hailed as a great acquisitilon, beling of colour so much to be desired in plants grown for show
purposes, which is of a beautiful bluish purple, much superior to Thunbergia chrysops, or the well-known Mavrandia Barelayana, with a distinct yellow eye or throat. The biossoma are produced in the greatest profusio from the arils of the leave日, and shaped somewhat afte considerably larger, and about 2 inches in length. beauty of the plant, we deem on the merits and extreme the opinion of Sir \(W\). Hooker, who pronounced it to quote most beautiful plant of modern introduction. at the principal Horticultural Exhibitions, and receive ar the principal prizes, with the thighest encomiums that could be
passed upon it. 2 , each passed upon it. \(21 s\). each
2. AZALEA INDICA EMPRESS ELGENIA--An Indica in the of an excellent and compact habit, and blossomin in the most profuse manner: its colour is extremely ppotting on the upper petals; ;he flowers are large and exquisitely formed.
We have much pleasure in being able to offer this superi variety, and make no doubt that it will be an univeras merits, we may add that during the past season it has received the forlowing prizes:- First Class Certificate a
the Horticultural societr's Rooms, Regent Street; Silve Medal at the Royal Botanic Society's Gardens, Regent Park; First Class Certificate at the Horticaltural Society
3. AZALEA NNDICA IMPERATRICE JOSEPHINE. upper segments, free growth and excellent habit. 10. 6 apper
4. HOYA GRANDIFLORA.-This beautiful species was firs
 us by our collector Mr. John Henshall; the flowers ar equal in size to H . imperialis, but of a pure whit
foliage elliptic, and slighty lanaginous. 426 . each.
5. DENDROBIUM CXMBIDIOIDES. - This interesting pseudo-bulbous Orchid has been sent to us from Java: our
Collector fonnd it on one of the small hills adjoining the

Mountain Megamendung in the western district; the spikes. 5 guineas each. ENDROBIUA AMBOINENSIS. - This pretty dens
fowering species was introduced by our collector M John Henshall from the nortbern valleys of Amboina the flowers are of a bright rosy red colour, tipped with pal green, and produced in clusters ap the stem. 105s. each. peculiar free flowering variety will be a desirable addition
to our thoroughly hardy kinds: the habit if good, colour crimson scariet, and the flowers are richly spotsed on a the petals, after the style of an Alstreemeria. 158 , each. 8. RHODODENDRON INCOMPARABILE.-A useful, hardy and very late blooming kind, with no
9. RHODODENDRON STAMFORDIANCM.-This variet is an immense acquisition, possessing all the sterlin qualities which constitute a good Rhododendron, bein perfectly hardy, late, and a profuse bloomer, with unexcep
tionable growth; colour crimsonish purple, with intens black marking on the upper petals, which renders black marking on the upper petal
10. RHODODENDRON PAVONIUM. - A very conspicuou late, and free blooming hardy variety, of a deep blush
colour and rich dark blotch on the upper petals, colour and rich dark blotch.
to a Geranium. 15s. each
11. RHODODENDRON CLOWESIANCM A fre flowi thoroughly hardy kind; the blossoms are pure white, o exquisite shape, and the upper petals are strikingly marke with dark spots. 10s. 6 d. each.
12. RHODODENDRON MAGNIFLORUM.-A late blooming bardy variety, with remarkably fine foliage, immens truss, and most gigantic blossoms; colour lilac purple
shaded with red, intensely spotted with greenibh brown on the top petals. 21s. each.
13. DICTAMNUS ELEGANS.-A beautiful herbaceous plan with reddish crimson filowers, the apikes of blossom are
much larger than in the older varieties; altogether it is a much larger than in the older vari
4. GERANICM FULGENS Two charming tittle free 15. GERANICM MODESTCM \(\} \begin{aligned} & \text { full description will be here- } \\ & \text { after announced. } 10 s .6 d\end{aligned}\) 16. ABIES CRASSIFOLIA.-This very distinct and handsome species has been raised frons seed, befng perfectly hardy
it will be a great acquisition. Grafted plants, 31 s . 6d, each
17. AZALEA HARTNELLI-A new hardy variety that we can
trussea, the flowera individuelly are also large and well formed: the colours are pleasing, and distivet from other existing varleties; top petal yellow; all the other petals of spotted in a remarkable manner with brown at the base We offer this variety with confidence, having selected it from several hundred seedings, all of Which were pretty, entitle them to be named. 21 s . each.
18. ERICA PHYSODEG VIRESCENS.-This new and inte resting distinct species we have lately imported from the Cape of Good Hope: the plant is of pretty close habit; the
flowers somewhat resemble in shape the old and well known E. physodes, but are considerably longer, and are of a clear transparent green. 2 Lh . aach
19. ERICA AMABILIS.-A very distinct and pretty variety, of good habit, belonging to the "retorta" section: it is and flask-shaped ; colour white, shaded with rose. This variety will be very useful for autumnal exhibition pur-
poses, as it blossoms from July to October. 15s. each.
0. ERICA AFFINIS.-This is a nice variety, bling our well-known E. Carendishi, but for exhibition blossoms earlier than the last-named variety; the flowers are also a shade lighter, being more of a lemon colour; the habit is good, and the blossoms are produced in the most profuse manner. 10s. 62. each.
1. FAGRAEA MORIND AFFOLIA.-This splendid stove plant has been bent to us from the district of Indramaya, Henshall ; its Magnoliacemolike foliage makes it extremely ornamental, added to which it blossoms with fine long terminal spikes, from which the flowers are produced in clusters; they are trumpet-ahaped,
with a pure white mouth. 21s. each.
22. FAGREA PEREGRINA.-A very handwome free-growing stove plant, collected by Mr. John Henshall at Bantam, in the western division of Java; it has fine lanceolate foliage, and blo
flowers. 21s. each
23. RHODODENDRON RETU8UM.-A very distinct green "Panse species, discovered by Mr. Manic Menshail on the western part of Java, at an elevation of 10,000 feet above the level of the sea; the flowers are of a tnbular form, freely prodaced, and of a beautiful golden yellow colour.
See drawings in "The Florist," May No, 1805. 42\%. each
24. HUNTLEYA CERINA.-This is really a lovely orehid from st. Panl, of a delicate canary colonr, very showy,
and by far the handsomest apecies in this section. 210 s. each

The following is a List of New and Good Plants, selected from oar general stock of novelties, that were introduced by us and other horticulturists, and sent out for the first time during the past year: it contains the new plants imported from foreign growers that we have proved to be of sterling merit ; and we also include in this list a few new plants of especial merit that we have imported from foreign horticulturists during the present year.
25. GESNERIA MIELLEZI.-Thisplant will be found a most beanty when we say that it is more handsome than \(G\) Donkeleari ; the flowers in shape aro similiar to the Gloxinia, erecta, but produced after the manner of
26. BEGONIA SPLENDIDA.- This exquisite plant wa discovered in Java by our collector, Mr. John Hensha is an extremely beautiful plant, of ornamental foliage the stems and leaves of which
bright crimson hirsute down; altogethere it presents s strilizing an appearance that it is satone much to be desired
for its magnificent follage, for which we are now offering for its magnificent foliage, for which we are now offerin
WEINMANMIA TRICOSPERMA. - A greenhouse plan which is equal in beauty to that of a Fern; it is of zoo habit and easy cultivation. 10s. 6 d .
28. MANDIROLA ROEZLI.-An extremely handsome Gesneri aceons plant, producing fine spikes of lilac-coloure VAC
30. VACCINIUM ERYTHRINUM.-A most beantiful evergreen shrub, from the volcanic mountains in Java, sent to us by our collector, Mr. John Henshall, who found it growing about 10,000 feet above the level of the sea; the very dark green coloar, ovate and thickly set: the flowers are of a tine bright crimson, produced in bunches at the axils of the leaver. This magnificent species will prohably prove hardy, as V. Rolliseonof has done. 21e.
32. Azalea indica eulalie.-Thig distinet variety we can strongly recommend; the blossoms are large, of thicl waxy subatance, blush colour, intensely/
33. LOMATIA FERRLGINEA-This fine evergreen shrab was found in Chiloe and Patagonia, its beaulful Fern-like foliage; as a ine-leazed greenhonse
or conservatory plant it is perhaps without a rival. 103 s. \(6 d\),
34. TYDEAA ELEGANB,-A beautifal stove plant from New

35. BIGNONIA CHRYSOLELUCA.-A distinct Bpecies, and great addition to our stove creepers; the blossoms are yellow, tipped ilth white, exceedingly hurdsocme and
36. MANDIROLA LANATA.-A pretty Gesnerlaceous plant, of a delicate violet colour inside the mouth of the blos
soms, and shaded lilac outside; very fine blomer. 10 s. 6d
37. ERICA FMULA. - This is a very beatifal hybrid, in the Erica Massoni section, of a fine bright crimson colour, afte the style of Erica aristata, but very mach higher in
colour; allogether this is a very distinet varlety. \(15 s\).
38. ERICA EXIMIA SUPERBA.-This variety may really be said to be three thes as fine as the parent, Whose name
bears ; it is a very compact grower, and excellent in habit, with tubular blossoms of a fiery scarlet colour. This charming variety obtained the first seedling prize at the Royal Botanic (Ałardens, 1852. 21 s.
39. HABROTHAMNUS IZEPHIRINTA. -This is a ver distinct plant; it produces its red blossoms in corymb BIOTA MELDENSIS. - This distinct ermamental phant is raised from seed, and is reported to be a hybrid betwee the Red Cedar (Juniperus virginica) and the Chines Arbor-vitre (Thuja occidentalis); being quite hardy, and handsome free growing plant, we it. 50 s.
41. AMPHICOME EMODI.-A beautiful greenhouse plan from Northern India; flowers large, funnel-shap
orange tube, and pale rose-coloured limb. 218 .
42. GENETYLLIS HOOKERIANA (syn. G. fuchsioides)This is the extremely rare scarlet species, and the plant
alluded to in Dr. C. F. Meisner's paper "O ne of Chamelancieas," recently read before the Linnean Societ It has been introduced from West Australia, and succeed
13. RHOPALA ORGANENSIG tove plant, far exceeding in beauty exy o otber gorti in th fanily. 4iz.
44. ACBRIETIA MOOREANA. - A distinet and very fre
 Brazil: the blossoms ane - A first-rate stove climber from Brazil: the blossoms are of a bright golden colour, tippei the plant is of good habit, and the flowers freely produce
46. RHODODENDRON PELARGONLAFLORUM (T Houtte's), - Pink, shaded with yellow, benatifully spoittod a spi
47. BEGONIA SCAMANNI.- A very distinct species from
48. DAMMARA OBTUSA.-A most distinct and handsome sppecies from New Caledo
greenhouse Conifew. 6 ss.
49. CAETANEA CHRYNOPHYLLA the Golden Cheanut of Californis).- This extremely interesting, hardy, and maging as a great novelty; as an ornameutal plant, it will rank foremost among our evergreens; any deccription we
may give of this beautifui plant would but imperfectly convey a true representation of its character; the foliage is of a darly green on the upper surface of the leaves, and the under part of a beautiful golden colonr, which gives to the plant a most remarkable feature. 63
50. RHODODENDRON FERRUGINELM ALbUM.-This is precisely the same as the old R . ferruginenu, with the exception that it has blossoms of snowy whitenes; it is an IBES SUBVESTITL MI. -This new species has been fintroduced from Caliorily, its niowers are a \(^{2}\) and the foliage bighly ornamental. 10s. 6 a
52. SALISBURIA ADIANTIFOLIA INCISA.-This is a very
interesting plant, with pretty laciniated foiliage. 10 . 6 .
53. CALYPTRARIA HEMANTHA. - A beantiful plant from Panama, easily eultivated in an intermediate house ; the having on asch from 15 to 20 Howers, of a rich bright plum having on as
54. PTERIS ASPERICALLIS.-A stove Fern from the East Indies, and one of the most handsome of this pretty tribe;
an indispensable plant in wrery collection where Fecrus are grown. 138:
55. CROTON DISCOLOR - A truly magnificent ornamentai stove plant, darlk green on the upper surface of the leaf,
with bright red underneatb, which makes a striking con trast. 31s. \(6 d\).
56. DIDYMOCARPUS POLYANTHUS.-A very free flower ing, bandsome, and desirable plant; the leaves are fem blue colour, and produced in a penicle, which risea from the base of the leaf. 15 .
begonia opcliflora miniata. - This remarkable hytrid has been obtained by fertilising B. opuliflora with has the bright-coloured flowers of the last-named variety has the bright-coloured fowrers of the last-named variety,

\section*{F.} F. and A. SMTHH, BLORISTs, Dulwich, Surrey, beg
 scarlet flaked, crimson flaked, scarlet ispotted white; also a small Copy of Minute. National Florien
Copy of Minute. National Floricullural Society, July 26, 1855.
-Balsams:-20 plants from \(\mathbf{F}\). and A. Surtu, Dulwich,
 of plants (true Anunials, and therefore not considered Florists'
flowers), wish to express their unanimous opinion of the great flowers). .ish to express their unanimons opinion of the great
merte of the collection produced, whach for variety, habit, colour, size, doubleness, and general ex
hitherto come under their notice,"

Dr. LImDLEF, on inspection, said :"They are fully equal, and in in several particulars vastly,
superior to the best I have seen in Continental establishments," Extract from the Report of the Mreeting of the Nationat Floricul-
tural Society, in the Gardeners' Curonicle, August 4 4th, 855 , page 520. Several extremely well-grown plants of what are called
Camellia Balsams were furnished by Mr. Smith, of Dulwich, and very handanme things they must be admitted to he; among
them were blush, purple, and scarlet kinds, and scarlet motled

 was that they were scarcely sufficiently in bloom."

W ATERER AND GODFREY respectfully invite the Stoek of the following HARDY ORNAMENTAL TREES, \&inc. Aracarili imbricata, 2, 3, 4, 5, 6, 7 , and 8 feet high, in quantities, all atocky well grown plants; the larger sizes especially it
would be difficult to match Cedrus Deoddra, \(1,2,2,4\), and 5 feet, by the thonsand; do. \&
fine lot of larger, 6,7 , and 8 feet, do. some masnificent Trees 10 to 15 feet. These are all in a famous condition for Tran planting, having teen annually removed.
Cedars Red Virginian, 5 to 8 feet.
Cedars, variegated white, 2,3 , and 4 feet, one of the handsomest variegated plants we know. We have a large stock. It is ex-
tensively planted at Elvaston Castle. Cryptomeria japonica, fine plants, 4 to 7 feet.
Curreskus maeroarap or Lambertiann, \(8,4,6,7,7\), and 8 feet.
Nothing can be handsomer than some of the specimens of the Nothing can be h
fine hardy plant.
fune hardy plant. 6 to 8 feet.
Do. Irish, urpight, 3,4, , and 6 feet: do. larger, up to 8 and 10
feet. Our stock of the two last mentioned \(J\) Jnipers we believe feet. Our stock of the two last mentioned Junipers we believe
to be quite unequalled, the Irish especially; the larger sizes Do. recurva, \(3,4,5,5\), up to 8 feet.
 pleea nobilis, several hundreds of feet.
grown, and with pood lead. None are grafted. A few taller
specimens up to 6 feet.
Do. Nordmanniana, 8 Ihrge quantity of remarkably handsome
plants, \(12,2,3\), and 4 feet. Nothiyg
plants, 12,2, , a, and 4 feet. Nothing can excoed the vigour of Do. Pinsapo, magnifcent plants, 4 to 7 feet hith, In perfect health
Pinus insignis, \(1 \frac{1}{2}\) to 3 feet; , few good specimens up to 7 feet. ". Lambertiaua, from seed, 4, , , and 6 feet.

Montezaume, tine plante, 4 and 5 feet.
macrocarpa, 2 and 3 feet, from seed.
Weeping Larch, clean, stems good, heads 7 feet high.
The following 10 varieties forma a very singular rooup. They
are of dwarf habits; the well known Abies Clanbraziliana may be taken as the type of the whole. We beliere our collection to be quite unique, and, we may add, most interesting

All dwarf varieties

8 to 12 feet.
Do. Dovaston or Weeping, a great many fine plants, worked on
straight stemas, 7,8 , and 10 feet higb, with good heads.
Do adpremss, 2 and 3 , feet.
Do. dion
Dor

Do. do., a worked as standards on the common
Do. do., worked on Irish Yews, 6,7 , and 8 feet high 8 to 10 ft . high .
Do
 2f feet, and also worked as standards on the common and I Irish
Yew. We may suffy assert our stock of Golden Yews is
 Liave it, 1 the tris feet.
Thuje Weareana, five tushest, \(3,4,5,6\), and 8 feet. This is of the most rseful, and, at the same time, oruamental hardy
Do. A merican, for hedger, doubtless the very best, 4,5 , and 6 feet.
Do. anrea, or Golden Arbor-vites. This plant orion Nursery; it has anmor-as ite. This plant originated at tese beome a universal
favourite. Our stock of it enables us to offer a choice of many favourite. Our stock of it enables us to offer a choice of many
hundred fine specimens, from \(1 \frac{1}{2}\) to 3 and 4 feet high, and as mulch through-in fact, perfect globes.
Wellingtonia gigantea, qum of the finest plants in the country,
being near 1 f feet high, and as mut being near 1 feet high, and as much wide.
Hollies variegated, by the thousand, 2,3 , and 4 feet high. Sorae Hollies variegated, by the thousand,
splendid Plants, 10 to 15 feet bigh.
We may here remark with weference to the large specimens condition to transplant and travel any distance with perfect suffety. and in aolliciting a personal inspection of our stock, we believe in but jew establishments of its kind in this country. Whe Nursery may be reached in 40 minutes. by Train from the having \& Branch on to the North Western, enables us to send other oxtensive additions, -Knap Hill Nursery, Wokiogo Eurrey.

OIOSCOREA BATATAS), is now ready, and can be had Gratis on application. Wellington Nursery, St. John's Wood.

\section*{PAGEAND CO.'S \\ COMPOSITION FOR THE DESTRUCTION OF BLIGHT}

UPON THE

\section*{HOP, ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, VINES, STOVE AND GREENHOUSE PLANTS.}

\section*{Extra Strong, 4s. per Gallon, sufficient to make Four Gallons fit for use}

Ten Gallons and upwards, Carriage Free to London
A FTER FIVE YEARS' EXTENSIVE USE by the most eminent Gardeners in the Kingdom, the superiority of PAGE AND CO.'S BLIGHT COMPOSITION is unquestionable, requring only a trial to insure its general
or destroying every pest to which Plant and Fruit Growers are subject (without injuring the niost delicate fowers or foliage), add promoting a luxurrant growth.
The greatest indication of its valne is its adoption by the NURSERY TRADE as the most efficient and economical means they can employ, many of whose opinions will be found recorded in a Pamphlet of Testimonials, which may be obtained of the Agents;
but to publinh them as previously would take the whole advertising medium of the Gardenerr' Chronicle.

\author{
SATURDA Y, MARCH 22, 1856.
}

At the last meeting of the Horticultural Society in Regent Street, some remarkable illustrations of the timber of the common Oak ( \(Q\) pedunculata) and of the Durmast (Q. sessiliflora, were brought under consideration; the object of doing so being to show three things-that these Oaks may be distinguished by their timber as well as other marks, that Durmast timber is at least as good as that of the common Oak, and that the belief in its want of durability is not only unsupported by proof, but directly contrary to evidence
The large size of the medallary rays is well known to afford the means of distinguishing the timber; so that a practised eye can hardly fail to recognise the one or the other in cases where fair specimens can be examined. That small pieces of these Oaks may resemble each other is no proof that sections of mature wood cannot be distinguished. It is the large size of these processes which makes it so easy to rend the common Oak, while the Durmast refuses to submit to the operation. When genuine Durmast is contrasted with genuine common Oak, the distinctions are obvious; but in the opinion of all woodmen of experience there are varieties, or as some say hybrids, of each, which partake of an intermediate character in the foliage and acorns, and which may therefore be supposed to offer an intermediate condition of the wood. Of this we have an example now before us in a specimen from the county of Norfolk, which, because the acorns are on a very short stalk, has been supposed to be Durmast, although other circumstances show it to be merely a sessile-fruited variety of the common Oak, the only species we ever saw in the eastern counties.
An experiment as to the value of Darmagt was rinde some years since in Portsmouth Drekyard upon
timber taken out of the Vindictive, a ship into which some marked specimens had been parposely introduced in 1832. When tested as to strength it was found that while common Oak from the same ship broke on an average under a weight of 931 lbs., only bending \(4 \frac{1}{4}\) inches, the Darmast sustained on an average the weight of 1032 lbs ., and was deflected \(5{ }^{5}\) 岳 inches before breaking. This important experiment unfortunately stands alone, as far as we remember, but it seems to have convinced the dockyard anthorities that they were wrong in rejecting Durmast, as had been the case for a great many years, and it is now in great request in the Royal forests, at least in the New Forest. It is very much to be desired, as we said some months since, that further experiments on this subject should be made carefully in different parts of the country. If the Durmast is found everywhere, under equal circunstances, be tougher, or only as tough, as the common Oak, a very great fact will have been ascertained ; for it grows considerably faster than the common Oak, is far handzomer, and moreover will thrive on land too light for the common species.

All writers admit that it grows faster; in this we find no difference of opinion; our personal experience is the same, and a series of specimens produced in Regent Street on Tuesday, bore evidence to the same fact. Two "rounds" were sent from the New Forest, of the same size, and growing in the same place. They had been selected by Mr. Cumberbatch as fair objects of contrast, and had been growing near each other; the Durmast had acquired its size in 107 years, while the common Oak had required 132 years to gain the same girth. A second case was still more striking. While at Arniston Mr. Brown selected for comparison two trees on that estate, slabs of which were produced the Durmast had gained a diameter of 14 inches in 41 years, while the common Oak had done no more in 80 years.

Undoubtedly it is a common belief that fastgrown timber is less valuable than slow grown, and vice versd. It is, however, very far from being proved that this is true. Indeed, we gave some striking instances to the contrary several years since, and we shall endeavour to revert to the question in a week or two.
For the purpose of showing that the prevailing belief of the want of durability in Durmast is a mistake, a number of interesting ancient specimens, still in good preservation, were exhibited. The durability of the common Oak hardly requires proof; it was nevertheless illustrated by pieces of timber taken out of Windsor Castle when under repair, and by portions of an ancient canoe or coracle, which bottom of the "Slopes" of Windsor Castle by some workmen employed in digging a foundation for a bridge ; with it were found deer's horns, Hazel-nuts, \&c. The age of this relic although unascertaiuable must be very great, inasmuch as it was probably left where it was found at some period when the Thames, or a branch of it reached the foot of the Slopes, a time no doubt far more remote than when "Cowy Stakes driven into the bed of the Thames. These examples were furnished by Mr. Ingramy, H.M's gardener at Frogmore. Other specimens of common Oak were
taken from the venerable church of St. Cross at Winchester, furnished by the Rev. the Master ; from the foundation of the pier of Old Ouse Bridge at York, dating back to the 13th century ; and a piece of one of the piles of Old London Bridge from Mr. Merra
The specimens of ancient Durmast compared with these were as follows
1. Timber from Glasgow Cathedral, from the Hon. J. K. Howard, F.H.S. 2. Part of a beam from furnished by Capt. Corlinson, R.E (A. D. 1300), of 2 rafter in the church of St. Cross. 4. Pieces of the roof of Westminster Hall. 5. The end of a beam from Heslington Hall, a seat of the Yarburgs, built in the beginning of Elizabeth's at York, prior to being occupied by Caarles and James. 7. Part of the timber of the Hospitium of St. Mary's Abbey, York (about 1400 A.D.). 8. Part houses in Parliament Street, York, great numbers of these coffins were found. 9. Part of a huge boss from the centre of the roof of the choir of York Minster (end of the 14th century), saved from the fire in 1829. The five last had been contributed by Mr. Baines, of York.

It was impossible to say that the Durmast specimens were in any degree less durable than the others. The beam, indeed, from Heslington, and the half-burnt boss from York Minster, were in part as sound as when they were introduced into the buildings.
Nothing, therefore, can be clearer than that in
the cases now mentioned the Durmast yielded in no respect whatever to the common Oak in strength answered que.tion, viz., How far the quality of the Oak timber of either one species or the other is dependent upon soil or climate? It is certain that the Scotch foresters condemn the modern Durmast as they find it with them; it is equally certain that the woodmen of Dean Forest and the New Forest hold an opposite opinion. May we not suppose that Durmast, which is the common French species, requires a better climate than that of Scotland ?
Surely this is an inquiry that ought not to be allowed to sleep ; and which should engage the most serious attention of country gentlemen.

Under the head of "botanical geography" we propose to present to our readers comments upon some chapters in M. Alphonse De Candolile's "Geographie Botanique Raisonnée," which relate to meteorology and other subjects which have a direct bearing upon the every day operations of the gardener and agriculturist. From our notice of the work in question in September, 1855, (p. 615) it place readily be understood how high a value we place upon its contents, and we need therefore do
no more here than assure our readers that the subjects we shall select have never been so ably treated by any naturalist; and that whether for their value and interest, or for their importance in a practical and economical point of view, they deserve to be carefully studied and followed out by those who possess the means and ability for doing so. With regard to the instruments required, they are of the simplest and cheapest construction; for their observation no great amount of skill or expenditure of time is demanded ; and for working out the conclusions to be derived from them, none but the simplest rules of arithmetic are needed.

Hitherto the very facility of observation, the simplicity of the formulæ, and the cheapness of the instruments, have too often proved obstacles to the progress of meteorology, from having led to carelessness in the observations. The thermometers in common use are faulty to a proverb, and it is not too much to say that in nine cases out of ten no one attaches any confidence to the temperatures recorded by gardeners, though there is no reason whatever why these should not be as accurate as a record of Greenwich Observatory. The thermometer itself is so cheap that its goodness is seldom inquired into ; and it is moreover often imagined that the relation of the mercury to the scale is analogous to that of the magnetised end of the compass needle to its card, and that as all magnetised compass needles must always point to the magnetic north, so all columns of mercury must stand at the same height at the same time, if placed in reasonable proximity to one another. As little regard is paid to the reading off as to the selection of the instrument, and the fact that it often makes several degrees of difference in the result, whether the observer looks from above or from below to the point of the scale where the mercary stands, is very often disregarded. So, too, with regard to the position of the instrament, its exposure and height from the earth; provided it is out of the sunshine few care
where it is put. Paradoxical as it may seem, it is not the less true, that were the thermometer a costly instrument and one troublesome to consult, the science of meteorology would now be far advanced beyond its present stage, for few would have bought any but a good instrument, or failed to place it in a good position, to observe it accurately, and to work out the results conscientiously. Nine-tenths of the observations would then be available to science, whereas now the converse is the rule. Let any one who thinks these statements exaggerated, examine the records in our columns at the next accession of an unusual temperature, whether high or low, and ask how it is that places not a mile apart show differences of temperature of \(10^{\circ}\) and upwards at the same time, and this at times when the temperature is steadiest; and if he is still inclined to attribute this difference more to the influence of locality than to the causes we have named, let him read M. Dr Candolle's chapter upon the different temperatures of the air at heights of only a few feet above one another. Accurate instruments are now accessible
to all at a most moderate price (though not to be procured for the trifle that is generally expended upon a gardener's thermometer) ; and simple rules for placing and observing them have been drawn up by men of experience, and whose position in the country commands our confidence; and to these we would refer such of our readers as wish to have something better than a toy for an instrument, and deception for an observation.
On the Temperature of the Air at different Distances from the Ground.-Thermometers are usually hung 4 feet above the level of the earth, a height
which gives the temperature to which many bushes are exposed, bat which corresponds neither to that which the majority of herbs experience, nor to that of the foliage, flowers, and fruit of trees ; it is in short, that to which a very small proportion of the vegetable kingdom is exposed.

The formation of dew and hoar frost are familiar examples of the fact that the temperature of the surface of the soil is occasionally very mach lower than that of the air above it; but though the observations of Marcet of Geneva, and of James Forbas Edinburgh, have shown how the temperature varies at different elevations and under different circumstances, data are wanting from which any general laws may be deduced for calculating the ratio of diminution at different localities, seasons and hours, from the surface of the soil up to 300 feet above it ; at about which elevation the diminution due to the action of the soil itself is no longer appreciable

At Brussels M. Quetelet made a series of observations, which are detailed by M. De Candolle, on the effects resulting from hanging the thermometer at higher or lower levels, and the following are the degrees indicated :-

Mean temperature of the year.

\section*{Minimum temperature at 9 A.n.}

\section*{Winter
Spring
Summer}

These results are highly instructive. It has often been the subject of remark that the extreme temperature registered by the thermometer at the Horticultural Society's gardens at Chiswick (whoss accuracy is undoubted) are respectively higher and lower than those of neighbouring localities; and the importance of the appended notice, that the instrument is placed only 4 feet above the soil (the best elevation for many horticultural purposes) is oyerlooked; whereas, if duly considered, the difference should be no matter of surprise at all : some of the thermometers about London being hung at least
feet from the ground, and against the trunks of trees ; which, being warmed during the day, radiate heat during the night. In Brussels the thermometer at 10.8 feet elevation stands in summer \(5^{\circ} 6\) abore one placed on the surface of the soil, and in winter a trifle below it; and at extreme temperatures, when the observations differ most and are most commented upon, the upper thermometer in summer and autumn stands on the mean \(9^{\circ} \%\) above the lower, and in winter \(13^{\circ} 3\) below it.

Further, as it is not at all unusual to hang thermometers both outside windows of apper storeys, the differences between good observations that find their way into print may be expected to be even greater than the above ; and lastly, when it is added that an error of \(2^{\circ}\) is a common instrumental one, and that defective shading from radiation from surrounding bodies will engender errors of \(6^{\circ}\) or \(8^{8}\) more, it may readily be conceived that but for the fortunate circumstance that in the long run these errors in some degree compensate one another, the thermometer would run the risk of being banished from common use.
M. De Candolle says that, according to M. Marcet's observations at Geneva, the temperature ordinanly increases with the elevation above the ground and that this difference is greater in summer than in winter, but that nevertheless in particular cases of extreme cold the difference is enormons; as for instance on the 20th of January, 1838, when an elevated thermometer stood \(14^{-}\)above another 50 feet below it.
In continental countries the differences are greater than in islands, because of the clearness of theit skies, and their more variable temperature.

These observations prove that a tree, a bush, and a herb, growing side by side, are exposed to very different degrees of temperature; and we may add that it invalidates the means of comparison of a vast number of facts accumulated in England as to the effects of frost; for, putting aside the errors of instruments and observation, and the local disturbing causes that affect every place, it follows
that no available information is given by such facts as that at Brighton a temperature of \(18^{\circ}\) killed such and such a plant, whereas in London a temperature of \(10^{\circ}\) did not affect it; unless the height of the individuals be given, their elevation above the main level of the soil if planted on mounds, and that of the thermometer also.
M. Dr Candohle indeed observes that whereas the height of one and the same species is everywhere the same, whatever correction is to be applied to the observed temperature will probably not differ much in different countries; but from this opinion of the uniformity of the height of a species we altogether dissent, except it be greaty modified for there are many of our native of trees, that are on the average 3 feet higher over one large area than over another (of which the Oak, Furze, Broom, Juniper and Alder are conspicuous examples), and 3 feet may, as we have seen, be accompanied by a difference of cold which the temperature is already low.

Before dismissing this subject, we may so far digress as to observe, that happily for the practice of Horticnlture, the injurious effect of cold depends primarily upon the suddenness of its accession, and secondarily on the epoch of the plant's life and of the year at which it supervenes ; and that, except in extreme cases, the correction due to the elevation of the plant and of the thermometer is of subordinate importance; to which we may add the fact, that all species will under favourable circumstances endure unhurt a wide range of temperature above and below the mean which usually suits them best, The most conspicuous proof we can give of this is that in the Himalaya a large proportion of the species have on an average a range of 4000 feet in
elevation; this corresponds to a difference of mean temperature of \(13^{\circ}\). Take for example a tree growing from 9-13,000 feet, as the Himalayan Larch; it is exposed to mean annual temperatures of \(44^{\circ}\) at the lower and \(36^{\circ}\) at the upper limits of the range; and as the mean temperature of the hottest month at 9000 feet is about \(55^{\circ}\), and that of the winter at 13,000 feet is \(18^{\circ}\), this species is exposed to a range of \(37^{\circ}\) between these two extremes: further, the difference between the mean maximum of 9000 feet and the mean minimum of 13,000 feet is \(24^{\circ}\), to which difference of temperature two specimens of the same species may be exposed under ordinary circumstances on the same mountain. This is independent of the effects of exceptional temperatures, and of solar and terrestrial radiation, which would far more than double the amplitude. That this is not at all an exaggerated statement every one conversant with the statistics of mountain meteorology will admit ; and yet not
only has the Himalayan Larch proved most difficult to cultivate in England, but the scarlet Rhododendron, which has a vertical range of nearly 8000 feet (or almost double that of the Larch), is still more so in the open air.

We may conclude this subject with M. De Canpolle's own words, that it is no doubt vexatious to be so little able to appreciate the probable limits of the errors thas engendered, but that in the present state of the science it cannot be helped J. D. H.

\section*{NEW GARDEN FERNS.-No. VIII.}
19. Stenochleva tenuifolia, T. Moore. Lomaria tenvifolia, Desvaux, Berl. Mag. v. 326. Lomario botrpy tenulfolia, Fée Gen. Fil. 46. Sterochlena
scandrne, J. Sm. Bot. Mag. 1846, comp. 17; and of English, and probably all continental gardens.
Fronds dissimilar; sterile ovate pinnate; pinne linear-lanceo late, much accuminated, arguuely cartilagineo-serrate, the lower
stalked the upper sessile; fertile Dipinnate ; pinnæ stalked, glanduliferoun, and sporangiferous on the petiole; pinnules
linear ( 3.4 inches long) sessile and decurrent posteriorly; stipes

This Fern, which is known in gardens under the name of scandens, was received at Kew in 1841 from the Berlin garden, and was supposed to be the Acrostichum scandens of Linneus; but from specimens which have fruetified at Wentworth, and subsequently we believe at Kew, it proves to be a very different species, correctly placed however in Mr. Smith's genus Stenochlæna This group of Acrostichoid Ferns is a very natural one, marked by certain peculiarikies in the venation, and also by the production of a very obvious gland on the anterior base of the pinnæ, similar to those which occur on the phyllodia of sume species of Acacia; these glands occur near the base of the lamina in the sterile fronds, and on the petiole in the fertile ones, and are equally present in the original pinuate and the African bupinnate species, the latter differing however in having the pinnee continuous with the rachis, whilst in the former they are articulated. The peculiarity in the venation is this, that the parallel forked sud apparently free veius are in reality venules, that is secondary veins, spring ing from a series of veins which form very narrow costal
areoles, sometimes not seen without a careful examiintion, at other times very obvious. It is the pro-
of them represented in any of the figures we have seen except in a small woodcut in the "Gardeners"
Magazine of Botany" (iii., 130 ), which best distinguishes this from M. Fés allied genus Lomariopsis. The Lomariobotrys of Fée cannot be separated from Stenochlæna. The cultivated plant forms one of the most elegant of evergreen stove Ferns, its rhizome climbing extensively, and its numerous large, smooth, shining pendulous fronds having a strikingly beautiful appearance, when covering the wall of a damp Fern house, for which 4 is especially adapted. The sterile fronds are nearly a foot long, acuminate at the apex, somewhat obliquely wedge-shaped at \({ }^{-}\)the base, and furnished with harp, unequal, cartilaginous serratures on the margins The gland is produced on the anterior side of the

wedge-shaped base. The fertile fronds are bipinnate the pinne stalked and narrowly margined at the base and there often sporangiferous as well as glanduliferous; the pinnules alternate, distinct, linear, 2 to 4 inches long, sessile, and somewhat decurrent at the posterior base. The plant agrees with Presl's Stenochlæna Meyeranla, the Lomaris Meyeriana of Kunze, in its bipinnate ertile fronds, and continuous piunse, but in South African specimens of the latter before us the proportions and attachment of the fertile pinnules are 80 different that they cannot well be associated, and our plant seenuifolia of Desvaux, wilh which Kunze compares his L. Meyeriana, the former, he says, differing in its sessile and much longer fertile pinnules, the very points in which ours differ so remarkably from the South African specimens. Desvaux's plant is a native of Madagascar, and this furnishes another inference in favour of its identity with the garden plant, which will not with us survive the winter in a greenhouse, as it should do, if a native of Natal or the Cape of Good Hope. The more obvious points of difference pre-
sented by the garden plant are the more acuminared sented by the garden plant are the more and the more distinct arcuate veins, aud the two or three times longer fertile pinnules, which are not stalked but sessile and decurrent, and so long (often 4 inches) as to cross the rachis of two or three adjacent pinne, producing an
intermingled mass of linear segments. The accompany ing figure does not show the gland, which is present on the stalk of the fertile pinnr. T. M.

\section*{VEGETABLE PATHOLOGY.-No. CXIII}
452. Albefactio* (Blanching). - One of the mos important ayents in the growth of plants is undoubtedly ight. In its absence searcely any function is rightiy performed; perspiration is impeded, the tissues are weak, chlorophyll is not formed, and all the peculia secretions are either entirely suppressed or greatly diminished; and as light is a complex body, under peculiar circumstances, where it does not reach a plan in its normal condition, as when for instance it passe through coloured glass, its effect even when present wil not always be the same. It has been tound by experiment that the effect of the luminous calorific and
chemical rays are greatest when passing through a colourless medium, and that they do not pass through different coloured mediums in the same proportions. 453. All vegetables, however, do not require the same intensity of light. Seaweeds require frequently a very faint degree of light for their perfect development, and some fungi as Truffles grow in the complete abseuce of light, as is the case also in the artificial growth of Mushroomst But even amongst Phenogams the powers of endurance are very different, mainly because exhalation and absorption are principally excited by its pesence, and if the rootlets cannot absorb as fast as the moisture is abstracted from the leaves death must follow. Coloared glass, therefore in the shane of lights or bells has been recommended but it does not appear that any modification of light by such means is nearly that anco con exception perheps which should be made is in favour of those perhaps w F m ) which wall plants (as Ferns) which usually grow likt of trees, and therefore receive their light moained by passing through green leaver, anis perhaps is effected better by simply painting the glass with a thin coat of green than by any tinting in the glass itself.
454. Though light is necessary wherever green leaves are to be periected, and on their perfection the health of plants in great measure rests, roots in general where they depend upon matter already stored up in a plant, as in a bulb or tuber, are developed more rapidly in its absence, and hence the benefit of placing halbs which are to be grown in water in a dark room till sufficient roots are developed to supply moistare the pusling bud. Where, however, they rely upon the development, as in the absence of light the leavea cannot remain healthy. In such a case the bell glass, if coloured, might be expected to be injurious, it object being merely to insure the cutting against the injury of too dry an atmosphere. \(\ddagger\)
455. It sometimes happens accidentally that plants are completely shaded from the influence of light by being covered or obscured by some obstacle which wil not admit the passage of its rays. Such a state it is obvious, if continued for any length of time, must en in death. Where there is the slightest admission o light, however, it is quite curious how pla exactly a roots will travel after water. A Potato left in an obscure corner of a cellar has been known to send out shoots of many feet in length towards a crevice admitting light, and the same may be said of other plants under similar circumstances, and of all in som degree where light is not equally intense on all sides.
456. Plants grown in darkness are characterised by tissue and the absence of pecular secretions These are qualities which render blanching an importan process in horticultural practice. A Lettuce, for in stance, when grown ireely contains so large a quant for
of Lactucarium as to make it unpalateable and unfit for food, and the same principle applies in many other cases, as in Celery, Asparagus, Cardoons, \&c. Such varieties, then, are sought as by the natural conformation of the outer leaves protect some portion of the plant from the influence of light ; hence we have Cabbages, Broceoli, Cabbage-Lettuces, and a variety of other excellent culinary productions, and where nature modified by art is not sufficient, the same purpose is obtained by tying up the leaves themselves, throwing up earth against them, forcing the plants to vegetate in cellars or other places to which light has no access, or to pass through such a depth of soil that a long mild succulent shoot is produced, instead of one hard in texture and harsh in flavour.
57. Where plants have suffered from absence of light, provided they do not remain too long in darkness, and the shoots are not too thin and lanky, its admis sion soon restores heath. Pelargoniams, which have sprouted in a dark cellar, provided they are protected from a dry atmosphere soon acquire a green tint, and become perfectly bealthy; and the same plant may be subjected to a similar process some years in succession without permanent injury. M. J. B.

\section*{Home Correspondence.}

Construction of Hothouse Roofs.-At page 152 you mention a proposal by Mr. Jones of Birmingham to support hothouse roofa with trusses applied to the roof at certain intervals apart at this place a house 60 feet in length, 22 feet in width, 13 feet in height in the centre, and four feet six inches at the sides, supported with trusses, having no rafters or sliding sashes-bars the entire width of the house have only been used, the bars being very ligit, two and a quarter inches in depth, by one and a quarter in width, and 13 feet six inches in length. There is a longitudinal bar running the entire length of the house, half way up the roof on each side; the trusses occur at In the absence of light, however, fungi are not always per-
fected. Many spocies in mines, for instance, never attain their fected. Many spacies in mines, for instance, never attain their some years since from a cellar at Bristol by Mr. Thwaiten, resembling a Cauliflower wittout a vestige of hymenium. When placed under the influence to he Agaricus obtrestus. In this case, as: least,
the species proved tion
the dictun of Fries that the hymenium is the creature of light was perfeerly veritied.
\(\ddagger\) In seedlings the first root depends on the nutriment col +cted in the seed. Light is unfavaurable to germination how-
rer on ottuer accnunts. The translator of Lindley's " Theory of Horticulture," in his remarks on the germination of the Prony remain imprisoned in the shell of the cotyledons of the edons of the Acorn, Chesnut, Water Lly, \&c. See Lindl Theory of Hort, P.25, ed. 2.
every seven and a hait teet, and are conuected with the
longitudinal bar by a strutt 18 inches in length, all being firmly screwed together; the trusses are well adapted for climbing plants although we have not used them fur that purpose. The house is glazed with 15 oz . sheet
glass, the squares being three feet five inches in length. ad one foot fix inches in width. The trusses are of half inch round iron. This house was erected in September 1855 , the work all being done by workmen from the neighbouring village under plans devised and superintenided exclusively by ourselves. It is much
lighter than any house we have either seen or heard of, and it is said by all who have seen it to be a very elegant structure, and it is quite atcong enough. The bottonn ventiation is in the sides in the brickwork close to the ground, the top ventilation in the ridge in the shaq.e
of small rising lights, actin: very efficientiy, and when open there is a fine gentle breeze passing continually through the house. I have reason to believe this to be the first house that has been erected in this country on
this light, elegant, and eccnomical principle. Joln Paze this light, elegant, and eecnomical principle. John Page,
Gardener to Abrahain Dixom, Esquire, Birches Green, Erdington, nerrr Birmingham.
Mixing Secds.-As investigations are now taking place respectin.r the adulteration of articles of human food, I
amp gratified to find that through your exertions the am gratified to find that through your exertions the shameful system of adulterating horticultural and agriand profitably for some years past, will not be allowe to escape unnoticed. In this country we are almos entirely dependent for our supply of seeds on England, and it is therefore a matter of serious moment to us to find that this disreputable process of
some of your correspondents aptly term it, is so well will endeavour to showsively practised there. But 1 too astute and cunning a man to go to to expense and labour of purchasing and killing Rape seed to mix with Turnip, notwithstanding that the former may be had at sorts of Turnip seed can, in plentiful seasons, be bought instance, Swedish Turnip could be had at Mark Lane at much less than this, and accordingly at that time large quantities were purchased and have been kept in stock ever since, this species of stock being known by the
technical designation of 000 or trio, 4,5 , or 6 trio, according to its age, and is always at hand to mix with the neat seed in proportion to the vegetating faculties of the
latter article. The trio has then merely to be winnowed by machine, well shaken up, with the addition of a ance, and this precious article goes furth to the world as "genuine" "Turnip, Clover, \&c., as the case may be, Turnip yar aforled a good exnople or cho the original cost of the one half of it did not exceed 108. or 128 , and the other kinds of Turnip propurtionprice lists of the different London wholessle seed houses, under those that the quotations of this year, though we consider how large au ingredient the 4 , 5 , and 6 year-old trio forms in the composition of any parcel of seens quoted. Seedsmen may well chuckle at the grea uninitiacted in their accousteries displayed by the process ; and as for the proposal to appoint a man like Mr. Cuthin to rep.rt on the quality of seeds, it is, I fear, too impracticable to be entertained. In the present shate of things, the only remedy the purchaser hatd he have been duped with a spurious article, is
sho bring an action at law for the amount of loss sustained in connection with the subject There is another point to allude, and one which I should like to see determined. It is well known that a large quantity of gas it burned in all large seed stores, and as gas is proved to be detrimeutal to books and furniture, there is some reason to fear that it may also act prejudicially on the vital powers of seeds; at all events, it is a point worth
the attention of those interested in having rood seeds, and might be easily set at rest by any of our eminent chemists. Veritas, Dublin.

The Burometer in N. S. Wales. - In a recent (??) work on New South Wales, the aushor, Mr. Barron Field, observes, that in that country, where many things seem
to be the exact opposite to our experience on this side of the globe, "the barumeter rises before bad weather and falls betore good." Can any of your correspondents give any explanation of the cause of this? H.J.B.
Whut to do with Sand.-A correspoudent
Whut to do with Sand.-A correspondent wants to nnow what to do with an acre of sand in the south of
Ireland, near the coast. Why not set Liquorice? there is a ready sale for any quantity, as it is very useful in mixing with wines, beer, de., being innocunus. Guano on sand would be soon loot. Pinus Pinaster, if pro-
tected from rabbits, and planted thickly will pay well in pure sand in a moist climate ; in Perauzan pay well in wail) the sand rises some feet up the stem of the trees, and yet they are quite vigurous. Somerset.
Hothouses at Drayton Mranor.-
done me the unsolicited kindness of mentioning the improved mode of bothouse structure ing to you, of an way that I cannot resist the feeling to return you ing grateful thanks. On perusing the article in question I think most of your readers would consider that Mr. George Stephenson had something to do with the venti-
whole arrangement and construction of those houses was interfered with-and shackled-only by my own perfect. The late Sir Rubert Peel never knew of, or siw the ventilating drain-pipes until they were laid, and in operation, when they were pointed out and their to him, by the application of two thermometers, one in the descending pipe outside, and the other in the ascending one inside (the difference being full \(10^{\circ}\) ) The late Sir Robert adopted the mode of construc tion of the present hothouses at Drayton Manor from his having frequently seen (and I believe approved of)
the Frogmore houses during their erection. He the Frogmore houses during their erection. He placed Mr. Sydney Smirke, and that hands of his architect ultimately \(y\) mirk, and that gentleman was pleased of myself and the then gardener (Mr. Milne), a conf dence which I trust the result justified. I have not the Company that acting engineer to the Crystal Palace Cooke, C.E. J. Jones, Clerk of Works Ofice, iystal Palace, Sydenham.
Weedy Streams.-In the name of all that is natural tasteful, and picturesque, what can your "Amateur" correspondent be thinking of, when he cements the "to keep it clean"" and asks for am "through his garden "o keep it clean," and asks for a chemical compound winding rocky stream to some one who knows what to do with it, and go and buy a place near some wellfiltered water supply where he can lead through Portland cement banks as much cleau water as he likes, with no envious weeds to disturb its cleanness, or hide the "bed of cement" that keeps it from "contact with the earth." If he will not do this, let him try fish, snails, molluscs of all sorts, or waterfowl, to keep down
the growth of weeds, which form their natural pabulum rather than converthis winding rocky stream into a "dead Rabbit Fence.-A cheap aud effective method eeping rabbits from burrowing under wire netting an upright wooden frame, is as follows:-Take from 9 to 12 inches deep and fill the rut with broke brick-bats or rough gravel, then pour in thin hot lime grout till all the space is completely filled. I have been in the habit for these last 20 years of walling in find answers remarkably well. I way - a plan which I under-ground walls are very good for forming tanks for holding liquid manure in. William Henderson, Dunkeld. Transplanting Evergreens.-I shall feel obliged by Mr. Rogers informing me whether he considers the midale of April the suitable season for removing com Hollies in Ae mang reasons he has given for moving Hollies in April, instead of November, induce me whjections to transplanting any kind of evergreen in spring. Why take the risks of spring when you have ctober wilhout risks?]
Pea-leaf Soup.-From what has been stated in your columns we have been induced to try this. Our first tions. The second was however an improvement on the first so far as colour and flavour were concerned ; the only deficiency was substance, and that I am happy to say we successfully, obtained in the third attempt. At the
suggestion of a first-1ate cook, we boiled a small quantity of a blue variety of Pea (the Prussian blue), put them the Pes the tammy, mixed the two well together, and surpassed even by midsummer productions. A quantity expense (labour and space included) of be raised at the One quart of the strong growing varieties is enough for sowing, and half a pint of Prussian blue or any other to be used ; the less artificial it is the better. Pea Cheap Reordshire
Cheap Reading Room.-Why cannot your correspondents do as I propose doing, open their infant schools every evening from 6 to 9 , and on Sunday also between
services, and charge nothing? This "is the rub" with countrymen, who, whatever they be, farmers o labourers, have a morbid dislike to parting with hard cash. Somerset.
Experiments with Charcoal, Sloping Banks, dec.
Pernit me to infurm "G \(S\), object in directing attention to this subject was, as stated, to show "that we had an agent of some power at work if properly applied." I also said that it might be found most efficient under glass or coverings of some bind, and that it was in sunny weather that the effects few hours' sun in March-enough was elicited to justify repeated experime practical gond might result from repeated experiments. The figures in fact demonstrated the heating and radiating powers, and also showed their difference under covering; this having
been done I do not see the aim of such renaarks as the following: "And so far well, but it has an equally great power of radiation so that it will pro-
duce the greatest extremes of lieat and ald duce the greatest extremes of lieat and cold And again it produces a more unsteady temperature not well, if it pleases " G. S." better; but he must know what everybody else knows, that though a black coat is the warmest in summer and the coldest in winter, yet
the wearer even in the most "e cumtort and welfare o the wearer even in the most "extreme" occasions, and
by those too who need not be what "G. S." is plen to call "Gulliver's philosopher" I may here state that before the earth banks, \&c., can prove generally that fal for the purposes shadowed forth, experiments shoold extend over at least two years. A correspondent thus Writes-" My Strawberries and French Beans were all Well, but just as you will plant Strawberries and Frities. Beans as before, so do not give up the your hopes may be blasted once or twice, But lease where your plans fail, and rectify them for the future. It requires no foresight to see that it the be madness to plant fruit trees, unless in favourattending to and expansioneventives to retard the action of the app boughs, \&c., while such as Peach trees and Vines might be removed entirely until, say the middle of April, aad we are pretty certain that the summer and autumn heats, and the night dews, for which we have a great aflection, will more than make up for a late start. Again, by means of broad shutters made to fold back by day, or temporary copings as applied to walls on bracketa, or
even by calico, radiation night be stopped. Another way, which may be useful, but only applicable where early forcing is carried on, is this-and I can where from experience, both in Scotland and England, that to no better treatment can you subject early houses, when fully or their fruit (say in June) than to expose them have the earth banks then, in a variety of ways, migh have the use of the sashes. However these are only plasulions, and enlightened practice, adapting differen decide therent circumstances, must ultimatel ipened Vine remark that last autumn 1 thorough such banks, long after the sun had losi its Ther in the open garden and sheltered borde. here is nothing new in all this; it is as old as the hille and the Vine clad mountain sides in other lands ex emplify the principle. We have tried experiment winh coloured glass, why not coloured and hould Covered and also uncovered? Perhaps hould say that in some cases a temporary trellis, sary, and that the more sheltered the situation is the better. Geo. M•Euen

Sced Associations.-Much has been written in you Journal about the adulteration and mixing of seeds Adulteration of all kinds should be most strenuously pposed, but there las of late years been such a mani for cheap seeds that some houses in the trade have been tempted, in order to compete with others, to reduce the quality of their seeds. An association of seedsmen was mixing and scotland some years ago to prevent the mixing and adulteration of seeds, and every member was pledged to sell nothing but neat and genuine seeds. It would be a most excellent thing if at the present juncture an association of English seedsmen could be formed to carry out this most desirable object. I feel assured that such a step would be hailed with the greatest pleasure by all the respectable houses in the if you you would be doing the "State much service" The quanlity of Clover sold every year is immense, and with, is no description of seed so doctored and tampered to vary from 60 s. up to 908 . per cwt. for Red, and even to 11 s.s. for White Clover. A pound of the best will sometimes contain as many living seeds as 3 or 4 lbs of trade is so seves. that retailers cotition in the Clover than from \(\frac{1}{2} d\). to to \(1 d\). per lb. prufit. This would scarcely be believed by your corresporsuent "R.," who states that seedsmen who sell Manyet seed at \(6 d\). per lib. do so at less than cost price. He evidently knows little of that Mangel Wurzel seed retailed at \(6 d\) d per 1 b . will give a profit of more than 60 per cent. over the price paid to the growers. If seedsmen could get even one quarter of this profit on Clover they would be very conent. In conclusion I do sinetrely hone that much good may arise from the correspondence in your Joumal and I trust to hear the opinious of others respecting the formation of an association such as I have described. \(B\). Hints to Wocdmen from an A ncateur.- The best axe for any tree but large Oak or Elm (which are rarely cut Whith the axe) is an American, 3 lbs. head, with - ineh have a have had a and lus. axe with me, an have always found the small axe do more work, and
short handle in "sideling " ground is preferable. Thick shoes with very protruding hobnails, wilhout which in steep ground you cannot get a firm purchase; a flanne belt, as the small of the back is very tender, and much expused; a luose waistcoas with short flannel sleeves and short trousers, not lreeches, which hamper the streteh, and a loose flannel cap are best. Somersed. Larye Porlugal Luurel.-At Springwood Park, Rox burghshire, the seat of Sir George Duuglas, Bart, there was ately dug up what was two years ugo a magnificent Portagal Laurel, the dimensions of which were a follows:-circumference of trunk \(10 \frac{1}{6}\) feet, heigh 22 feet, extreme circumference 122 feet. I may mention tlat it would doubtless have covered a much greater surface had it not been that the extreme twigs had for years been annually cut off. It was billed by the frost in February, 1855, when the thermometer fell here to \(7^{\circ}\) below zero. G. W., Roxburghshire
TVasps,-I aend you a sketch of a weapon which I
have found most effective in killing the large wasps wire of \(\frac{1}{4}\)-inch mesh there is no resistance to the given the pattern to Mr. Whitehead, the agricultural given the pattern to Mr. Whitehead, the agricultural
implement maker at Preston, who will be glad to explemente orders. Nothing could wossibly answer the purpose better than it does, and therefore every garden should possess one. T. S. [The insirument in question s like the racket used by players at tennis, viz. a battle dore with wire substituted for parchment.

\section*{Buripties.}

Horticultural, March 18.-Rev. F. Beadon in the chasir. Many interesting plants were furnished on this
occasion. Among novelties was a hybrid Rhododendron from I. Anderson, Esq., of Edinburgh. It was stated to have been raised between R. davuricum and R. formosum, the former being the female parent. Its blooms ore of R. davuricum , and it was mentioned that specimen exhibited included, having stood brood, the in the open air near Edinburgh. It has, in short, anited the colour of the male parent with the hardy has been made to early flowering shrubs 1 Cerificn of Merit was awarded it. Mesgrs. Lee showed 'the Clivia-like plant called Imatophyllum miniatum, bearing upright flower-stalk; Oncidium maculatum, and four charming varieties of Camellia, The latter consisted of Jubilee, a carnation striped kind, a rosy-pink sort called colour, being violet purple, with a white stripe down the centre of each petal. From Messrs. Veitch came a fine pale flowered Rhododendron named picturatum superbum, a double red Chinese Almond loaded with
lossoms and extremely ornamental. This was reported to have been flowered in their Orchard-house, and for could possibly be handsomer cory at this season nothing tributed various specimen Epacrises, and the following Orchids, viz., Cypripedium villosum, Dendrobium Farmeri, and Trichopilia suavis, all in admirable condition both as regards health and bloom. Messrs. Henderson, flowered Phaius grandifolins, also Dendrobium Pie rardi, and some plants renaarkable for fine foliage among which was Pteris aspericaulis, which
one of the handsomest tender Ferns we possess.
From Mr. Charles Adams came what was called the "Berkshire Rake," an implement with handle and 18 inches ; and teeth former about 5 feet long, the latter 18 inches ; and teeth of iron, long and slightly bent for ward. It appeared to be an old pattern revived and no im provement on the iron rake. Of fruit there were bunche and fresh, from Mr. Bues covered with bloom, plump They received Honourable Mention, as well they might for no new Grapes could look more tempting than they did; not even a fruit stalk was in the slightes and the bunches looked as if they would keep good yet for weeks to come. Among plants from the Society's Garden the more remarkable were Echeveria retusa and rosea, two useful succulents; Conoclinium ianthi num, Lachenalia aurea, and Azslea obtusa. The latter Was a complete mass of small red flowers, which render
it one of the gayest greenhouse shrubs we have at this it one of the gayest greenhouse shrubs we have at this
season of the year. The Vice-Secretary offered some season of the year. The Vice-Secretary offered some
remarks on this occasion, "On the subject of British Oaks." It was unnecessary, he stated, to go into any poetical description of Oak. It is universally acknowledged to be one of the staple products of Engkinds of Oak. This has been disputed, and he agree as to what coustitutes any two persons would them. He would, however, direct attention to a sketch of the appearance they present in their most di hat is calle. There grows, he siated, in the New Forest botanists as Quercus sessilifors. Anoth is known to Oak, or Q. pedunculata, so cailed from the scorn Common produced on long footstalks. In the opinion of foresters It and It is generally supposed that the Durmast and Common Oak differ only in the acorns; but that is a misconcep-
tion of the difference between thern. It will be seen, aid, that the Durmast has broader and rounder leave with long yellow footstalks They are also more Moreover, if a young sprig of the Durmast is Oak pared with the other it will be found that there is a considerable difference between the two-the buds are larger and, as compared with the Common Oak, there is also a difference in the structure of the wood. It will medullary, he remarken, that what are called the small and thin in the other. A specimen of the wood of each was here exhibited, which plainly showed that Common in the Durmast were small whilst those in the Common Oak were large and much more easily distin-
guished. The wood of the latter was also stated to rend, Which the other refused to do. Of the relative value to which attention was directed, an account will be found

\section*{in aper.}

Linnean : March 4.-The President in the chair Drian specimens of about 130 species of East Austra-
liantected and presented by Dr. Müller, and collection of Aretic plants collected by Dr. Rae, ented by Sir Joln Richardson, were laid before the "oeting. The following papers were read :-1 on some Larve voided by Cliildren," by Mr. E. New-man.-2. Notice "on the oscurrence of Sepia birerialis Developement of the Ovule of Santalum album, with some remarks on the phenomena of impregnation in plants generally," by Prof. Henfrey. The observations detailed in this memoir were undertaken with the object of confirming Mr. Henfrey's views on this subject as detailed in the 21 st volume of the Society's Tran sactions, which views coincide generally with those of are in opposition to those of Schleiden and Schacht. Even among the disciples of Amici, however, a certain degree of discrepancy exists in regard to the origin of degree of discrepancy exists in regard to the origin of
the germinal vesicle, as to whether it exists before or is formed after fecundation. Hofmeister says before Tulasne says he never could find it anteys before fertilisation ; though, he adds, "t this delicate question no longer (1849) possesses all the interest which was accorded to it by MM. Mirbel and Brongniart, and more recently by Mr. Henfrey. It is true the existence of the embryonary vesicle at a period anterior to the arrival of the pollen-tube would, if placed beyond doubt, prove invincibly that this vesicle could not ow of the pollenists is no longer uncertain, the question seems worthy of attention, especially on account of the theoretical consequences involved"

Confidently as ulasne expressed himself as to the origin of the germinal this very point is most warmly contested by Schacht. Notwithstanding a tolerably positive opinion, derived from a number of cases in which the end of the pollen tube and the germinal vesicle were seen together, bu distinct, in one preparation, the objects are so delicate against, that Mr. Henfrey cannot but think the guard against, that Mr. Henfrey cannot but think the demon-embryo-sac must be considered the minal vesicle in the that can be brought forward in opposition to the views of Schleiden. As remarked by Tulasne, it has seculations as to the sourcance in reference to the being ; and it is no less important for the establishment of the relations of the processes of embryogeny in the various classes of plants, and of the analogy which these present to phenomena attending the reproduction o mimals. The details of Mr. Hen given with great exactness, and were illustrated by many
excellent sketehes. The memoir was chiefly occupied in describing the course of developement of the ocupule of one plant, in which the complete series of observations have been repeated many times. Other fragmentary corroborative researches being set aside, the facts de-
tailed, though not now brought forward for the firs time, were offered as supplementary, partly confirmaory, partly emendatory, of the memoirs on the same subject by the late Mr. Griffith. "I he investigation tself," Mr. Henfrey remarked, "had derived a melan choly interest from the materials having teen furnished by the late lamented Dr. Stocks." After describing many of his microscopic examinations. Mr. Henfrey continues I have directed my utmost efforts to the accurate ob servation of the ends of the embryo-sacs with the pollentubes adherent. They are tolerably easily extracted with needles under a low doublet. I have examined at least five-and-twenty, and have applied every means to make the structures clear. * * The end of the pollentube adheres so firmly to the end of the embryo-sac, that decided oninion is that Griffith fertilised ovule. My decided opinion is that Griffith was in error in stating
that the that it only applies itself firmly against it, iber the point where the line of division exists between the two coagula lying in the apex of the embryo-sac. But I ncline to believe that a phenomenon analogous to conjugation takes place. Moreover, very soon after the pollen-tube becomes adherent, the nucleus acquires a proper coat of cell-membrane, becomes a real cell, the germinal vesicle from which the suspensor is developed 1 think the contents of the pollen-tube, after it become adherent to the summit of the embryo-sac, pass into the latter, reach the nucleus, and determine its conversio into a cell. * * * The facts relating to the germi Thuret and Cohn, together with those bruught forward in this paper, tend to prove that the process of impreg nation in plants consists in the absolute admiature of th protoplasmic substance of two cells ("mule" and - fenale body which the female (or germinal) substance "protoplast," while the male (or spermatic) substance xiot in the form of a male (or spermatic) substance plants the spermatic fluid is conveyed directly into the embryo sac by the channel of the pollen-tube; a similar process appears to exist in the conjugation of the lower Algze ; in other cases the spermatic fluid is conveyed of the gans situated at a distance from the parent cell structures (spermatozoids) developed in the spermatic cells, bathed in and discharged with their contents, and
themselves composed of the nitrogenous protoplasmic matter of cell contents. A series of 36 clever micro eopic figures was given in illustration of the memoir.

\section*{Garden Memoranda}

Crybtal Palace, Sydenham.-Many have been of opinion that plants would not succeed in the interior of a mistake-a fact which we think will be this to be a mystake-a fact which we think will be obvious to present time; for alchough the plants generally have not present time; for alchough the plants generally have not
yet begun to grow, their condition after having passed yet begun to grow, their condition after having passed
through the ordeal of a moderately severe winter is in all respects as satisfactory as could possibly be desired The Palms in the warm end of the house have appa rently suffered little or nothing. Musas have alread begun to push, and the same onward movement is observable in other examples of tropical trees. Fiv or six of the large Date Palms imported from Egypt
have thrown ap leaves from their have thrown up leaves from their tops, and some of will live may made new roots. That some of them certainty. The scarlet flowered Inga pulcherrima appears to thrive admirably here, and so do Ficuses difterent kinds. Asiatic Crinums have been forms and long deep green leaves render peculia adapted for such plas Amell and others of the places. Among Ferns Cibotiums, delicate kinds look as if they were not quite at home Some of the pillars are becoming nicely covered with the Granadilla (Passiflora quadrangularis), so that in course of time this department may be expected to present a rich luxuriant vegetation. Round the edges of the beds has been p.anted a broad verge of the Common Toothed Lycopod, the lively green of which to the eye tired by looking at more gaudy objects has a pleasing and refreshing effect. The aquarium in this end of the building is being cleaned out, and the bottom fresbly cemented. The water has been drawn off and the soi? being removed. and other plants grew last year is made to cover the whole bottom of the tank, but this season Mr. Eyles intends to confine it in wooden boxes placed at certain distances apart in the water, and sufficiently large to accommodate the plants to be grown in on the former practice, and less soil will be thus required than when soread all over the bed
It is not however, alone in the warm en the "building that the plants look thriving, they appear in equally Many of the Camellias terate portion of the house. wany of the Camellias here are at present loaded
with flowers; the old Double White is the only variety that has to any extert dropped its buds, but even of it some plants promise a fair display of bloom. Some of the Egyptian Court but as may be expected they do not succeed equally with the same kinds in warmer situations. When it is stated that the temperature of this portion of the Palace has been down on several occasions nearly to freezing, \(t\) is rather a matter of surprise that they grow at all. Cycases seem mcre impatient of the cold; one or two planted out here lonk yellow and sickly. Although favnurable to growth, one of the two immense masses of Elephant's Foot which had been rlanted in front Elephant's Foot which had been rianted in front
of the Sheffield Court has died. It is however the smaller of the two. That which remains looks thoroughly established, and has pushed several healthy shoots. The different kinds of tender Araucarias with which the building is well furnished are in excellen order. The ncble A. excelsa presented by the Horticultural Society from the great conservatory a Chiswick is however dead. Though after bein replanted its stem and branches were enveloped in moss, which was kept damp to prevent exhaustion, it never the lall of earth which was shaken from it in travelling from Chiswick to Sydenham. The magnificent Orange trees which grace the nave and central portions of the Palace may be said to be as green and healthy as they possibly could be. True, some of them appear to have put on the "sear and yellow leaf;" but these are such as were out of health when they came. They had mostly been brought from France, and had been subjected to a rough passage. In conserfuence of their bad appearance Mr. Eyles has been led to retub some of them, and in doing so he found that their drainage
was most inefficient, so much so that he recommends al was most inefficient, so much so that he recommends al
who import Urange trees from the Continent to look to that matter the moment they arrive, bably have to pay for the omission by the death of their trees. Since the drainage has been repaired and fresh Azalea their condition has somewhat improved. rated planted out in the borders on slighty elematerial that would secire perfect drainage, are as full of flower buds as they can hold, and there is Holland plants have succeeded remarkably well. Blue Gum trees grow with wonderful rapidity, more especially the Eucalyptus globulus, which it will be remembered was killed out of doors near London during the severe winter befure last. The aquarium in the west end of the vailding has just been put in order for the summer. The vases and dry hasins round the sides of the water are
full of spring flowers, and are as gay as it is well
sible for them to he. Among the different objects of
decoration were Hyacinths, Tulins, Heatha, and Cine rarias, the whole being mixed with Epacris not in blonm, but placed there in order to set off the flowering plants to more advantage than they otherwise flowering plants to more advantage than they otherwise not in use have also been converted into floral vases, which, being full of Tulips and other early blooming plants, have an excellent effeet. Indeed, the condition of the indoor plants is most satisfactory. The aquatics, it will be remembered, were last year truly magnificent, and the display this season promises to be equally grand.
Ont of doors the grounds are now all but enmpleted, and the various basins and lakes are well supplied with water ; the fountains however do not play during the winter months. Numbers of beds in the terrace garden have been filled with Crocnses and other bulbs which are now in flower; but owing to the dulness of the weather they do not open well. Protections of Oak branches have been put round the different specimens of Araucaria imbricata which have been brought at considerahle expense from Elvaston. This Araucaria is well known to be hardy, but in antil the trees shall have become better established. The walks and grounds are in excellent order

\section*{FLORICULTURE}

Cimbrartas-- "P." (see p. 71) does not appear to recommend retaining any part of the old stools of these plants for potting. He prefers increasing them by offwith complete success. Last Augnst I prepared a quan tity of friable loam and one part leaf-mould. I shook sway the old compost previnus to potting off the old roots, which I put into \(4 \frac{1}{2}\) inch pots. I placed them in a cold frame where they had plenty of air, regularly shading them from the mid-day sun; they soon started into growth. About the middle of September I shifted them into 10 inch pots, using the same compost as before, and placed them as near the glass as possible. As soon as severe frosts set in they were removed to late Vinery. Before removal there was not a green fly on them, but it afterwards gradually made its appear-
ance and commenced its work of destruction. By means ance and commenced its work of destruction. By means
however of a little tobacco and Brown's fumigator my plants were snou restored to health and vigour. By following the above method I am confident that no cul tivator need despair, as "Y." justly terms it, of growing respectable specimens of Cinerarias. J. M.

\section*{Miscellaneous.}

Leaf of the Pigeon-Pca Tree.-The leaf of this tree (Cajanus indicuy) on its upper surface is covered with a fine down. When incinerated, it yields a large proportion of fixed matter, derived from the soil, consisting chiefly of the vegetable alkali, of phosphate of lime, of carbonate of lime, of magnesia, and silica. The silica is derived from the down. Under the microscope it exhibits the same form as the down, viz, that of spicules, in shape not unlike the poison-fang of the serpent, about \(\frac{1}{10}\) to of an inch in length, and in width at the bnse about zox is what remains after incineration- 1 infer to be silica, from its being infusible before the blow-pipe, and insoluble in the mineral acids. Were the soil in which the plant grows to be examined, probably after a few years, these spicule might be tound deprived of their vagetable organic portion, preserving their ferms, and they might be mistaken for the skeletons of infusoria The leaves examined were
from a plant growing in a volcanic soil, that of St. Kitts, where it is much used as a green dressing to the Cane fields, and is considered very fertilising. As its roots penetrate deeply, and the roots of the Cane spread near
the surface, it seems well adapted to counteract the exthe surface, it seems well adapted to counteract the ex-
hausting influence of the Cane. Dr. Davy in the Edin. New Philosophical Journal.

\section*{Calendar of Operations. \\ (For the ensuing week.)}

\section*{plant department}

Conspratitory, \&c.-Many of the structures which go under this name are very unfit places for Heaths, heing generally too lofty, and lept too warm; but such varieties as E. vernix coccinea, Westcotti, hiemalis, Lamberti rosea, Burnetti, Linnænides, \&ce, which bloom
in winter when the honse is grenerally kept cooler than at any other season are invalusble, flowering as they do, when well grown, most profusely. These varieties should be largely cultivated for the decoration of conservatories, and for supplying cut bloom. They should fo pruned back severely as soon as they have done
flowering, giving them a liberal shift when they start into growth, using rich strong peat, and if they are into growth, using rich strong peat, and if they are
well attended to during the growing season they will overcome any injury they may sustain through occuWying a somewhat unsuitable position while in bloom What with Azaleas, Camellins, Roses, Double Red Chinese Almonds, sce, and a sprinkling of New
Holland plants and forced bulbs, show houses should now be a blaze of flowers. Let every plant, however, be placed in the most suitable position, and aim at
displaying the colours to the greatest advantage, bearing in mind that no amount of foral display will compensate for bad arrangement, but will rather serve to make the aner more apparent. rour to replace the plants with others as soon as they shall have begun to get shabhy. Sprinkle the surface of the beds frequently, so as to assist in keeping the atmosphere moist, and also see that the under soil is rept in a uniformly moist condition. Watch for insects and attack them as soon as they are perceived, which is the ooly way of preventing them from doing mischief Srove, - Proceed with the repotting of such plants as require it, and give all necessary attention to those in active growth, using every means to induce rapid only way of effecting this is by securing a vigorous roo action, and leeping the plants near the glass. Specimens that were started early in the season will require rearrangement in the way of placing them in positions suitable to their state of growth. Ixoras, Cleroden drons, Allamandas, \&ce, that have become well rooted will be greatly benefited by a careful supply of manure water, but see that it is given in a tepid state and no over strong. Look sharply after mealy bug and thrips for if these are allowed to establish themselves at thi season, they will furnish

\section*{Forcing department}

Pingaies.- Where the Pines are grown in pots, it is by no means a bad practice to occasionally rearrange those in the fruiting pit, placing those showing by them selves, so as to be able to afford them a rather drier some danger of badly-formed fruit if the atmosphere is kept too moist, or the syringe used too freely while the plants are in flower. Those exp ceted to show shortly should also be kept as much together as circumstances will admit, so as to avoid having to disturb the arrangement for some time to come. Indeed, where a rezular rate quantity of plants, frequent rearrangements will be necessary ; for it is, perhaps, impossible to regulate the treatment so as to get every plant to fruit just at the deaired time? ?and hence it will be necessary to use every means to regulate the supply, such as removing many happen to show at once, which is frequently the can be done. Plants swelling the'r fruit can hardly be afforded too moist an atnosphere, and they must be carefully attended to with water at the root, giving clear liquid manure in a rather strong state, and some of to make the atmosphere resemble that of a dung pit Shut up early in the afternoons of bright days, letting the thermometer rise to \(85^{\circ}\) or \(90^{\circ}\), moistening the plants with the syringe, and sprinkling the passages so as to saturate the atmosphere with moisture, but avoid high night temperatures or a too free use of fire-heat. VINEwarming*the borders these must be turned occasionally, adding fresh dung as may be necessary to maintain a gentle warmth in the border, for it will not be safe to
nevlect this at present. Ventilate cautiously, on cold windy bright days admitting air on the sheltered side of the house only, and keep the inside borders moist by oceseional sprinklings, so as to counteract the dry iug effects of cold air and bright sunshine. If it is desirable to prevent the Vines in the late hous from starting for some time yet, they should be let
down as far from the glass as can be conveniently done, and the house shaded, unless the Vines can be taken out, which would allow of the house being used for other purposes, and there is little danger of the weather being such after this season as to injure the Vines. Houses starting should be kept thoroughly moist, syringiog the Vines moruing and evening, and the rods should be bent as may be necessary to induce the bud to push regularly. Peaches.- Where the fruit is fairl set, maintain a nice humid atmosphere, giving the trees a good washing with the syringe just before shutting up in the afternoon, so as to lseep them clear of red spider, and see that the soil about the roots is in a properly moist state. Attend to disbudding and tieing in the shoots, keeping them thin and regular. Here as else Where it will be a work requiring carefus attention, whil regulate the ventilation, but this must be attended to at any expense of time or trouble.
flower garden and shrubberies,
Look over all recently transplanted shrubs and trees for the purpose of ascertaining whether they are with the wind the tender roots are often broken off and the plants are consequently deprived of their only means of obaining nourishment. Mowing will soon require attuin; therefore have the turfswept, well rolled, an mate thoroughy firm without loss of time, and remembe got long it will require much time and labour to get the turf again into proper order. Also get the walks edged and otherwise put into proper repair. Attend carefully to the stock of bedding plants, and get rooted cuttings potted off as soon as they are fit, and encourage them with a gentle bottom-hoat and
careful management to make quick growth, for after this season there is no time to be lost with
planted out in a turf can be protected from frost or cold winds, but they must be prepared for this by previously inuring them to full exposure to sun and air, \&c., whenever the weather will permit. Their place under glass can be profitably occupied with recently potted off stuff with ordinary care they will do better planted out than atunted in smail pots.

HARDY FRUIT AND KITCHEN GARDEN Get in the main crop of Carrots the first fine day
when the ground is in good working order. Attend to keeping up a succession of Peas by planting every fort night a breadth proportionate to the demand. Soil up and stake those above ground and protect them from the ravages of mice and slugs, which are often very destructive at this season. Blanch Seakale in the open ground by placing inverted flower pots over the crowns and covering these with light soil or any material which will effectually exclude light. Priek out on a slight hot bed Caulifower Jants raised in heat The gent bottom-hest will preatly assist in pushing the gentle bottom-heat will greaty assist in pushing them along
with without their being weakly and drawn, as is the case
when they are grown under glass. Also prick out Celery when they are grown under glass. Also prick out Celery hand-glasses till it has become well establighed, and sow seed for the main crop. Attend to providing succession crops of Spinach, and keep the surface-soil regularly stirred among growing crops; also do not forget emal salad, as Radishes, \&c., and sow sweet herbs for transplanting.

\section*{The Ggricultural Gajette.}

SATURDAY, MARCH 22, 1856 .
It is curious to observe how knowledge which in ne age was considered only speculative or theoretical, and as such left entirely in the hands of daring adventurers on the confines of the territory of forbidden mysteries, becomes in a little while longe connected with the most practical concerns of our everyday life. If, for example, an agriculturist of 50 years back had been told that the science of geology could be made available in assisting him in his couclusions as to the value of land, could point out to him important facts which should guide him in relieving the soil of superfluous water, or direct him as to the position and depth helow the surface of a spring of well water, the smile of incredulity (if disbelief had manifested itself in so mild a form) would soon have given place to scorn at the presumption or imbecility of the scientific pretender.
But so much have matters become altered in the present day that there is little difficulty in gaining at least a respectful audience for the conclusions of the geologist in respect to any of the point just mentioned, and we therefore need offer no apology for a few remarks on the teachings of geolog apology respect to the agricultural value of land.
If for a moment we consider the aims of geology and agricalture, we shall see their intimate connection. The former has for its object the making us acquainted with the structure of the earth, and as a science in itself, is complete just in proportion as its science in itself, iscowplet npon knowledge of other conclusions are based nponends the best method
sciences-the latter comprehend of dealing with this same earth, so as to make it available to the bringing forth the greatest amount of produce.

Now the teachings of the geologist show us that the earth is made up of very different rocks, and that in one county one kind of rock or "formation" may prevail, whilst in another may be one of a totally different kind. In both these we may have the same climate, the same elevation, and but a slight variation in rain ane kind and quality of the andicultural productions of each. The question aunco, naturally arises, is this the result of caprice or of different management, or do the manners, cas-
oms，and generally prevailing farming peculiarities／gical and agricultural maps，in the main，mean the／been mentioned that the prices there
from the rocky foundation upon which they are laid the surrounding surface conditions merely modifying hem？
The inquiry will perhaps be best answered by bringing together the results of an examination of the prevailing crops on some of the more import－

This table，though confessedly only an approxi－ mation to the truth，yet points ont to us such them from their geological mpossible to disconnect and evidence at command it would not be difficult to show that each of the formations tabulated presents diversities in its different parts．Hence， though formed of widely different one formation， division of marls，and its lower parts，its upper breaking up into agricultural soil，present such a line of demarcation that the state of the crops no land itself will afford a most efficient means tracing the boundary lines of each．These differ－ ences are doubtless due to such causes as mechanical texture and chemical composition，which are not the mere accidents of particular spots but affect large districts，inasmuch as the area occupied by each geological formation was usually of large extent and Was throughout its whole deposited under the same circumstances of climate，materials and time．
Now，if we examine more fully the details of the table，the facts here insisted upon will only be brought before us in a clearer light．
In the matter of rent no one fact can be clearer than that this item，the touchstone as regards value， is very variable，for although in all districts will be bits of land bearing a fancy price affected by its for this not accommodation，yet each district depends for this not so much upon the surface as the sub－ stance．Of course patches here and there will be found to be made up of mixed materials deeply covering up the original formation，and indeed it has been stated that this is the rule；but here again， whenever this is the case，another difference will be distinguished by the accurate observer，so that the limesjof demarcation between local deposits upon formations，and the lines of the older deposits them－ selves，will at all times show themselves by the difference in the wild plants which elect to grow thereon，as also by the peculiarities of the culti－ vegetation．
Here，then，it is not too much to say that geolo－ rolhtive extents，bot rehuive velues of prodice．At best the are mere ppeculetions．
same thing；but for the latter，superficial deposits fully coloured，and this done，a well－executed map of any district or county might lead the student of nature to specolate upon the prevailing wild plants and the nature of the more civilised cultivated ones with as much certainty as the palmontologist or animal remains he may find ento nature of the rocks．
Let us now review the productions of formations as put down in our table．Fruit trees succeed on deep sandstone and the lias marls of the old and new red sandstone and the lias are particularly favourable to the growth of orchards；if，however，we trace the
lias lands to the scarps of the Cotswolds，we see that the moment they disappear orchards will not succeed ；the condition of fruit trees，and we may add of forest trees，shows at once the line separation between the lias and its superincumbent olite．Now，on following out the different beds of the oolite formation we pass over beds of clay，such as fullers＇earth clay，forest marble clay，Oxford clay；the moment each of these appears in a passage across the oolite rocks，those spots are marked by the reappearance of orchards to a greater or less oxtent，showing that this is due to the reappearance a the rocks of the proper mechanical conditions for their growth；but the differences in the manner produce they succeed，and the variations in the produce are so marked that we can only refer them to canses affecting individual rocks．
As regards grain，the different varieties of dif－ ferent districts，the amount of yield per acre，the variation in quality，though all confessedly affected latter element itself are yet these，with even the latter element itself，are matters dependant mainly upon the staple－that is，the rock we have to act
upon．But it would be idle to tending to show that if agriculture be limited to merely a matter of plant growing，it will be more less affected in its operations by the structure of the substratum of the soil to be cultivated，and hence
geology on this principle alone must be viewed－as is daily becoming－more and more as an eminently practical science．
The clothing of the earth with wild and cultivated plants，the kinds and condition of its animals，even business occutions and accommodation of man in his busickess，the materials of his dwellings，whether of brick，or stone，or wood，and the position of his
villages and towns－are all matters depend villages and towns－are all matters dependant upon important formation；and if we examine the now do in a future paper，we shall see that every person enuaged in a practical pursuit will be none the less ance for comprehending the truths of a science ance held to be entirely speculative，as was Gronoer

\section*{prices of manures．}

I beg to call your attention to the enclosed letter re ceived by me laet year from the secretary of the Ithink we may come to the After reading this letter ingredients found in superphosphate of lime can be supplied to us at a less cost per pound than is stated by Professor Way．If we add a fair percentage of the besides the tuents found in superphosphate of lime results ：－phosphates，we shall arrive at the following

fully 8l．per ton，aceording to Professor W 806
Thns it will be seen that the Manure Coy．
supply us with superphosphate of lime at lipy can ton less than Professor Way admits that it can be sup－ The following is Geo．Summers．
July 6， 1855 ，which materially affected to；its date dence now in the spring time of 1856\(]\) ：－

In the Gazette of last week a quotation from Professor Way＇s paper in the Journal of the Royal Agricultural different kinds of manures，with their respective values as shown by analysis．I think，however，it should have
wholesale cash prices for large quantities as imported and not the retail price delivered at the farmer＇s neared， station or wharf．It should be borne in mind thent merchants and manufacturers cannot be expected to embark a large amount of capital，attend markected to bad debts，and give credit merely for the pleasure of the thing．I therefore consider that the merchant＇s of the ought to have been added，or the retail prices profit ought to have been added，or the retail prices should have been given．Again，6l．10s．per ton is shown as the price of halfinch bones，whilst the Hull weekly price current for a long time past has given the price of cattle bones by the cargo before they are landed of erushed as \(7 l\) ．to \(7 l .5\) ．per ton．Phosphate of lime of is valued at \(\frac{3}{4} d\) ．per lb ，which I considuate of lime too calcined bones，yielding 70 per cent of phosph，for lime，are worth \(6 l\) ．per ton wholesale．of phosphate of ld ．per lb ．within a fraction．These Now this will be apparently trivial，are really of importance．S．

A STEAM－CULTURE REVERIE．－No．V．
found of the mechanical curiosities among which I dently rather lost myself was a diminutive bat evi－ acclivities， working， without a digging machine in a strong loamy soil，yet To 1o quench my ebullition of inquiries as to whether it my was derived from steam，air，gas，ether，\＆c my friend Digland handed me an old number of the Literary Gazette，＂（for August 20th，1840），contain ing an article on what was termed＂the New Agraxia System．
It seems that a Mr．Pinkus，cogitating the question of cultivang by steam，perceived the unavoidable waste engine iavolved in raaking an immensely heavy steam hence the aver arable ground band a thats and pulieys，in a direction at right anglea，to tillat the engine＇s slow progression．Yet for some tiliage operations，especially deep delving，it seems better to apply the power in direct connexion with the tool rather than to transmit it by horizontal traction in other words，spades or revolving diggers will be most advantageously worked by a locomotive power．How then obtain an exceedingly light ongine？＂s the Colosseum in the Regent＇s Park，＂writes the editor， we attended and witnessed the working of a model of certain machinery by which this is proposed to be attained．It consists of a stationary stan which commnnicates by pipes laid fow bengine， round，and branching in all the necesery did with the machinery for performing every agricultural labour－ploughing ha every kind of reaping，draining，levelling outing dowing，sowing， By these improved menting down wood，\＆c． many square milo mods distat felds，comprising are conneted with tear to or surrounding a station， pround pise leadi through the medium of the under－ the field in lan from the station and passing into there Thre shan be a mainkile in lengts of mains or pipe transga these the power of the stationary engine transmitted into the fields by an auxilary vacuu porter，which in any part of the fields can put in motion locomotive engine of light weight and withou boiler or furnace．to this locomotive engine actuated by atmospheric vacuum power，various implements of husbandry are from time to time appended，performing all the operations above enumerated．The power is transmitted ：to the engine by a hollono flexible tube working round a roller parallel to the axle，and which may be reversed at pleasure so as to operate back wards and forwards and in any direction．＂
Now Digland had not precisely copied this idea instead of laying down pipes all over bis estate to we distribute as you would water or gas，or indeed as tube，to connect is，he merely adopted the flexible tube，io condive with perceire in the could not fail to pelution of ma promised solution many difficulties involved in steam－culture， steame perplexing whether we attempt to propel steam－engine about an arable field or haul our tillin machinery by ropes and pulleys．However，I mus defer a full consideration of my friend＇s atmospheric sclueme by way of preserving the chronological order o my descriptions．I may here add，that Mr．Pinkus，in 1840 ，patented also a scheme for working implement by elctricity：wires taking the place of the main－pipes in the previous system．
Of the rather unfortunate tribe of rolling diggers os corkers intended to be drawn by horaes，I saw the earliest representatives ；the very firet，indeed，being a rotary grubber patented May 1st， 1821 ，by W．Thoma and Joseph Lobb．One was patented by Joseph Hall， July 6th，1842，consisting of a number of rotary delvers or discs on one axle，having a nades or cutters attached to their periphery．These cutters project radially ；but instead of being immoveably fixed project radiany；but allowing them a little play，so as to facilitate their entrance into the soil and delivery of the loosened earth jbehind，and the axis of the digger is placed ongitudinally，or nearly mo，instead of across the frame the carriage．
Another machine was a simple cylinder studded with spades（somewhat aftor the model of the＂bear＂or pade－machume with which the fen－men cleanse their July 7th， 1842 ，patented by Lady Ann Vavasour，

Liverpool meeting of the Royal Agricultural Society.
Of the performances of these implements it is hardly
necessary to speak : the latter clogged itself and became necessary to speak : the latter clogged itself and becam
useless in the most favourable soil ; and the former cut holes and creases in the land, raising a few lumps here and there, but neither inverting nor stirring in a worlmanlike manner.
Among my friend's collection of models on a small scale was one of a design patented April 2d, 1844
by William Stace and Phillip Vallance Borwick, Sussex.
This is for drawing ploughs or other implements by portable horizontal windmills. Ineed not devote a sheet of paper to the description of these mills; the fickle
though cheap motive-power of the winds having given place to that evolved at will out of fuel and cold water. But one or two details of the tackle or dragging apparatus (not included in the patentees' claims), deserve a Two mills ar
Two mills are employed, one erected in me corner of a field, and the other in the corner diagonally oppo-
site. A doubled endless rope is extended along one headland and one side of the field ; and by means guide-pulleys shifted on each headland, it can thus be made to range from end to end, and coincide with every rope. Instead of digging a fresh anchor-hole for each furrow, each pulley is hooked to a wooden beam, and attached by short chains to stakes driven into the ground. The plough of course traverses between the two anchored pulleys; and it is fastened to the rope by a pincer-shaped clip, which releases its hold when the
implement comes in sudden contact with any excessive resistance.
It will be seen that the above method of shifting the pulleys has been adopted, with slight modifications, by some very recent inventors. I. A.C.

\section*{ON MIDDLE CLASS EDUCATION}

\section*{Lord Ebrington has been kind enough to send us a memorandum
on this subject, read at the October meeting of the council of th
Bath and West of England Society for Bath and West of England Socier meeting of the the encouncil of the
agriculurement art, manufacture, and comraerce, which had been
prepared in relation to the proposed competition within the
districts of the Society which the offer of a prize was intended}

Having already repeatedly made public, both in writing and by word of mouth, my impression as to the exten and causes of the relative deficiency of the means of education for the middle classes in general and for the farmers in particular, I need not here go into the whole question again. Nor need I repeat how sincerely pace with the progress of other classes and other arts. now, I augur more favourably for some time to come of the professional than of the social prospects of the farmers. And for this reason. Though, on the one agriculture, hike all other arts, has latterly been making, acquaintance with the experience practice, and an acquaintance with the experience of a wide circle of will become gradually more and more indispensable to profitable farming; yet, on the other hand, the more I see of farming and farmers, the more sensible I become
of the very great amount of valuable practical knowof the very great amount of valuable practical know-
ledge they, for the most part, have of their particular ledge they, for the most part, have of their particular the strength of the really fuller knowledge they have derived on certain agricultural points from their wider flatter themselves they can give and trarels, sometimes lessons in their trade; yet the more I farmers general of the comparative pecuniary results of profensional and of amateur farming in general, the more highly I am whole branches the regular farmer's superiority in -of that business. This, however, mast important regret the more that, for want of some additional education, so many good farmers and sensible men should, to culture by the freer communication of their knowledge culture by the freer communication of their knowledge doing more justice to themselves in prevented from doing more justice to themsolves in the eyes of the community.
My object in offering the present prize is not merely to give young farmers an incentive to exertion, but also to endeavour to ascertain, with a viow to its amendment, cally available for that class in Devonshiresent pract general education, as distinguished from business traintained deficiency will long be allowed to cosy any ascercountry without some effort being made to supply it, more especially if the class affected be one so powertul and so capable of manfully overcoming difficulties as In the present instance this accurate knowledge is the more essential, because we have some reason to believe, the education of the classes both above and below the farmers than for them, but also that the present generation of farmers find, with regard to the education of
 and agnin at the North Molton and Castle Hill dinners last
their children, some disadvantages which their prewhen such local schools as existed were, for the most part, self-supporting. As it is to the masters of the surviving schools of this class that we shall be mainly indebted for the preparation of the candidates that may chiefly look for informatis to them also that we must investigation none can be more interested than these teachers. And I would put it to all able and earnest masters of middle class schools whether they have not experienced the want of some impartial and recognised standard in their too of ten unequal competition with unscrupulous pretenders to the honourable office and
title of preceptors. I would ask them to consider whether the institution of some public test of their pupile' proficiency would not, while encouraging those pupile to incressed exertions and longer stay at school, at the same time supply to their establishments an evidence of due qualification or certificate of excellence such as the examinations for University degrees and classes-and havg furnished to the schools of the higher great advantave furnished, I will venture to may, with those which, though some of them simply grammar schools by their foundation, have, thanks very much to these examinations, won a world-wide distiaction as the public schools of England.

The establishment of special examinations to test qualifications with a view to the selection of the right men for the right places, is becoming one of the ques-
tions of the day. Witness the examinations set on foot for the Indian service by the Indian recently set on foot for the Indian service by the Indian Governwar department; for lawyers by the inns of court the last, not least, those projected for our civil service by the late Government, But it is to be observed, that as yet the more general character of University education does not appaar by the results to have at all unfitted University men for distinguishing themselves in these more technical and special examinations; nor does the all de of academical distinctions appear to have been a newly-instituted contests. It has yet to be proved whether the establishment of something like a standard of middle class education, by means of some examina tions analogous to those of our Universities, would not prepare the way for, instead of obstructing, and be of more netead of obscured by, any subsequent triale believe this to be a desideraftrm much qualifications. I it can be supplied remains to be seen. The Society of Arts, by the examinations it has lately instituted, has made a vigorous effort to do so. As I stated in letter to Mr. Chester, the Society's compreheasive character, its more than centenary existence, its ties of affiliation with almost every town in England, and the Vice Presidents, work. We shall see by the result of this year's ex aminations whether the Society has hold enough upon has. I fear, large to succeed in its object. I hope it rural part of the population; and it is in them \(I\), as a country gentleman, must feel the deepest interest.
It was under these impressions that, before making trial of the Society of Arts, I was led to think of the in my letter to Mr. Chester. As this obviously how ever, could not be carried into effect without larger and more influential co-operation than I had any right to expect for any project of mine, I determined to take the step which the Council were so kind as to honour with a vote of approval when I mentioned it to them at Tiverton. Having said thus much to put the Council fully in possession of my view, and to secure those views, as far as may be, from misconception, I will proeed to the details of my scheme.

With regard to the candidates for the prize, my own idea is that they should be young men bond fide hire fir agriculture, the sons or relatives of Devondepending for their in frecholers or tenants), mainly culture. If occasion should arise for a more stringent definition in this respect, the 50l. franchise would perhaps the more fairly indicate the minimum for renting farmers, because it is with their educational qualifications for their position as Englishmen of the middle class, and for their duties as citizens of a free country that we are here concerned, rather than with their echaical or professional knowledge as persons engage in the business of farming. The standard adopted for tenant-farmers would furmish a sufticient basis for determining the limitations in the cases of freeholders or copyholders. It seems unnecessary to fix a maximum as the Committee would practically, I believe, find no difficulty in deciding whether or not any one offering himself as a candidate was or was not, from present position in society, or from past advantages of standard of the class I suek to benefit es to be an unfai competitor for the others to have to encounter
2. The object of limiting the age of candidates to fairly committed themselves to the pre their having al ture, and being so far removed from boyth of agricul tare, and belig so far sove jus boyhood as not and from competition those just arrived at manhood, and already eatering upon the basiness of life. But as
I have ambounced my intention of offering the same
prize for three years in succession, those who are yet
rather too young to come forward as candidates rather too young to come forward as candidates may look to doing so hereafter, and begin forthwith to prepare themselves accordingly.
3. I will refer

I will refer to my often cited letter to Mr. Chester for the reasons which lead me to require from the candidates certificates of competent scriptural knowledge grounds not religious only, with reference to a future world, but also purely secular, with reference to the world that now is, to society as at present constituted in England, to our English laws and English institutions. 4. With regard to the subjects of examination, they have this year been purposely limited to three, viz. the English Language, the History and Geography of the British Empire, and Praction! Mathematica-some ac quaintance with all of which is undeniably required by every Englishman of the middle class who can be con sidered educsted up to the standard of his position.
5 . With regard to the points chiefly to be aimed
5. With regard to the points chiefly to be aimed at in examining upon these subjects, I have conferred with the three gentlemen who have so kindly undertaken the happy to find a conducting the examinations, and I am happy to find a general concurrence between their views and mine.
a. The knowledge of the English language I seek to test and elicit relates not so much to correct grammar, though that of course is implied, as to some acquainof faithfully force and value of words, and the powe guage; that representing thoughat is meant in lan convey within a reasonable compass neither less than the sense intended to be conveyed. Mere granmar, the dry bones, so to speak, of the language, vital of itself perform this higher, and, as it were, vither function. Indeed if there must be a deficiency in than in expression. No one who better be in grammar
thas of a vocabulary sufficiently full and appropriate upon any given subject can without undue prolixity make writerf thoroughly understood about it; or speak or write effectively, even if he can himself think accurately, upon it, which, since words are thoughts, is in many cases far from easy. On the other hand the employment fine writing, while it is far more repugnant to good taste than the want of point and precision resulting from a defective vocabulary, for the same reason tends to convey impressions at least equally inaccurate. But every one must have heard and read much that was more or less incorrect in grammar, and yet perfectly intelligible and to the point, often very graphic and sometimes even eloquent. This classical scholars well know from oceasional examples in the best authors. Still, even were it otherwise, the practical character of the classes here in question requires that their education should deal with substance in preference to form
b. The History and Gengraphy of the British Empire may, I think, be well taken together, as they happen in the case of our particular country to be closely connected with each other. What I should especially seek here in the candidates would be a fair acquaintance with the outline of the History of the Empire, of its principal events, particularly of its wars and conquests, or dis coveries, and, in connexion with these, of the course of especially for men engaged in the business of raising food for the population, I should add a good general United Kingdom, and of those numerous colonies and dependencies which together make up the British Empire. The consideration of the History and Geography of that mighty empire in this point of view seems to me better calculated to kindle sentiments of pure and undivided patriotism in Englishmen, than would be the study, to an equal extent, of the history of the English people, of and political institutions ; because such a study neces and political institutions; because such a study neces-
sarily brings men into contact with party and controsarily brings men into contact with party and conaro over, the study without which a real knowledge of our history viewed in the latter aspect is not to be acquired must be far deeper and more systematic, and demand powers of philosophical reflection hardly to be attained without longer and severer mental training than it is offer my prize
. With regard to the third subject, viz. Practical Mathematics, what ought to be required would seem to be a thorough knowledge of theearlier rules of arithmetic and of the first principles of the mechanical poweri, of book keeping, and of measuration. I say of the principles, understanding of principles than a familiarity with those convenient formularies which, though invaluable in the daily business of life, cannot of themselves enable any man to deal with new and unexpected cases; and, if merely learnt by rote, give none of the valuable mental training furnished by the process of thoroughly master ing any subject.
In conclusion I will only add how anxious I am that the three examinerst should be relieved from all trouble about this matter not inherent in the nature of their desirable that a Committee should take off their hand any questions that may arise as to the admission of \(\dagger\) Sir Stafford Northeote, Bart., M.P.; the Rev. Chancellor martin; R. Dymond, Esq.. C.E., who most kindly unde
rersons propusing to present themselves an candidates,
dc. I would therefore venture to ask the Counii to to designate some Devonshire members of the Bath and West of England Society,* whose assistance I might solicit for this purpose with the high sanction of the Council.

\section*{Extract from the Minutes of the October Meeting of the Council of
the Bath and West of England Society for the Encouragement the Bath and West of England Society for the Ene}

\section*{Established 1777.}

After some remarks upon the above statement of his Lordship, it was proposed by Mr. T. D. Acland and secondel by Mr. A. H.D. mane for awarding the prize which he has offered to the sons
and relatives of farmern in Devonshire, and to assure him that Whatever tends to promote 80
matter of interest to them
That the Council urderstanding that his Lordsbip. Dymond propose to make the soclety reaponibible for the details of the proposed examinations, are bappy to learn that there is reann
to believe that some active members of thia Society are prepared co-operate with his Lordship in carryin
Both resolutions were carried nem. con.

\section*{THE POTATO CROP}

Having observed in your Notices to Correspondents in the Agricultural Gazette some remarks on the Fluke Four years ago I purchased one cwt. of Flukes; I was told at the time not to do more than uplit them, or they would not come up. Being anxious to set a certain eyes; they all came up with the exception of ten, the failure of those I attribute to the sprouts being rubbed autumn when taken up, they were arden. In-the auiuming 17 stone for every stone planted, or 136 stone of sound potatoes, and eight stone of diseased ones, making 144 stone in all. The ground on which they were planted is a very stiff clay soal, they were inwhich was very late-the quality was excellent. The following season having more seed wherewith to plant,
snd having picked out the middle sized ones for seed, snd having picked out the middle sized ones for seed,
they were planted whole on ground contiguous to where they were planted whole on grownd contiguous to where but when the crop was taken up it was quite inferior to the previous one, yielding not more than 12 stones per 3tone of seed, with a great deal more decayed ones from
lisease. From the same Potatoes this last season planted still more largely upon some new ground that had been trenched for a plantation. This was a light other half middle sized ones set whole. All came np well; at the time of taking up, those from cut stones per sinne of seed, or thus, cut sets 15 stone per garden from the same seed, and grown on the same ground on which they grew the previous year, were quite equal to those of the first year I had them, indeed the tubers were larger ; the quality is first rate, in none of these ceasons were the sets planted more than two
inches deep. I attribute the failure of the Fluke to over deep planting, and buying the seed just when it is wanted and baving them put in sacks, and nearly all the sprouts
rubbed off. The Fluke is nothing but a late Kidney; rubbed off. The Fluke is nothing but a late Kidney much by losing its first sprout. As to field planting, the above mode is as applicable as in the garden, having grown them there for my own use. My neighbour, a
large farmer, purchased some Fiukes the last season. He large farmer, purchased some Fiukes the last season. He had been told if he cut them they would not come up
he planted them whole and at 2 feet apart in the line I had 5 stone of cut sets in the same field. About dozen missed of mine, and my crop was quite equal th five times as much, os the seed was large in size. The Fluke when planted in the field should be covered as light as possible, or the ridges harrowed down immethis vicinity : one is excellent, the other worthless ; it is a large Potato, when cut into very yellow, and when boiled is always sweet as though it were frosted; this ariety has brought the gond one even into bad repute,
I see a correspondent in the agricultural part of you Paper writes to know if the Flake Potato may be
planted with cut sets. I have grown it in considerable planted with cut sets. I have grown it in considerable
quantities for the last three years, and I prefer whole small Potatoes, and at digging up time save them for ceed; but I cut some bushels of the medium sized ones longitudinally, and have very few blanks in the piece. I
consider the Flake Potato to require good garden consider the Flake Potato to require good garden
ground in preference to field culture. The crop here from the garden is immense-from the field hardly an average ; I have in the former dug 17 Potatoes, weighing 20 lbs ., in a row of 10 yards. G. Bond.
I hare grown Potatoes to a considerable amount for some years, and my experience has taught me that all
Kidneys are more liable to rot when cut than round ones. Last year I planted one cwt. of Flukes, a portion the cut ones perished, the others flourished. A neigh the cut ones perished, the others flourished. A neigh-
bour had a like case. Even a few cut onfs that were * The following members of the Council-Mr. Sillifant,
Coombe, Mr. Thomay Hussey, of Waybronke, Mr. Farrant, of
Growing, Mr. Fry, of Culmstock, and Mr. Widicombe,
Ugborough-mont kindly undertook to act as a Committee in Growing, Mr. Fry, of Culmstock, and Mr. Widdieombe,
Ugborotgh-most kindy undertook to act as Committee
compliance with thin request.
kept covered on a bare floor mildewed and became
useless. I plant very early for an ear! market and useless. I plant very early for an ear:y market an cutting them. The fact is whole sets are hardier against the action of manure, against rain frost and
vermin. If Kidneys are cut they should be so some vermin. If Kıdneys are cut they should be so some weeks before planting, that the cut part may form and daily before dressing those allotted for dinner cut of the crown; these crowns being dried would I think be sufficiently hardy to succeed in dry grouud when planted say in March, when the worst winter frosts and heavies rains have censed. But if we are driven to plant large whole Potytoes let ns give them more room in proportion, and (I have found) we shall have our reward in a greatly increased produce. \(P\). \(V, R\).
Last year on April 17 th 1 set 113 lbs. of Flukes, cut into 777 sets. I believe none of them would have failed had it not been for a lind of worm which destroyed nearly a third part of them. The others produced a
satisfactory crop. On the same day, but in a different part of the garden, I set 11 lbs of the same variety, cut into destroyed about a twelfth part. The remainder succeeded admirably. I did not weigh March 15 th 6 lbs. either case. I had previously set on March \(15 t h 6\) los.
of Dean's Seedling Potato (a seedling raised from the Fluke, and which it much resembles). I did not count the number of sets, but they were put in about 12 inches apart in eight rows 2 feet apart, the aggregate length of which was 170 feet. The produce was 93 lbs of very fine and excellent Potatoes, Four other persons in this neighbourhood procured Fluke Potatoes last spring. All of them cut them iuto ordinary sized sets, and a
satisfactory crop was the result. G. W. Manning, St. satisfactory crop was the result. \(G\).
Juliet Parsonage, Cornwall, March 17.

I am induced to state in consequence of the diversity of opinion expressed by your corresponcents what my experience of the Fluke is. Early last drained, pared, 3 acres of and and had received 10 cartloads of manure per acre with Flukes, all of them cut into sets. I was cautious not to take more than three or four from the largest Potato, and many were simply divided in half. My crop was magnificent. Taking the whole throughout, each set produced 45 well grown tubers. Many reached the high amount of from 60 to 76 tubers. This statement may seem almost incredible, lout I can verify it by friends who personally inspected my field. After this who can say that the Fluke is not, not only a good, but the A 1 Potato. The poor people round me have rightly judged of its merits, and if I had 200 bushels to sell I am certain that they would all be I am planting nearly 3 acres this year in the same fashion, being satisfied from experience that no harn can arise from dividing the Fluke Potato. C. F. Thruston, Talgarth Hall, Merionethshire

\section*{Home Correspondence. \\ Thick versus Thin Seeding -I sgree with "Falcon"} in his description of poor land, and was not aware but I had pointed out the common sense principle on which the farmer sows thickly on this description of soil. The greater number of plants found in the soil where thick seeding is practised produces a greater number of spongeolets than where there are fewer plants, and
these having each the power to absorb the pabulum of the plants a greater weinht of corn per acre results from thick seeding. With the greater number of plants is increased the facility for the collection of the consoluble food found in a barren soil could be placed in juxtaposition with the spongeolets or mouths, as can be effected in animal life, then would "Falcon's" theory be orrect. I would ask "Falcon," if he possessed two fields of Turnips on land of equal texture and richness, acre, and the other sown without manure, would he allow the former to be left 10 inches only asunder and the latter 20 inches? This, I believe, is what "Falcon" would call a common sense principle. No person rejoices more than myself to see any prejudice removed that ends to retard the advaacement of our profession, nor would any person enjoy more than myself the sight of a field of corn grown by the application of science to that perfection which we cannot yet attain to. Science is not yet sufficiently advanced-science may some day Messrg. Hardy \& Son would have us believe is now possible. The time may come when we may deposit \(4 \frac{1}{\text { pints }}\) of grain per acre and say with satisfaction we shall reap 84 bushels per acre in the coming harvest farmers who do not 100 often experience the loss resulting from the plants being too thin in the soil, and this in soils in a high state of cultivation. Chemistry must teach us more about manures before we can with profit 80 w 80 thinly, and the destruction of iusects mus them, before we sow as little as l bushel per acre on land that is naturally poor, or I think I may say on land that may be placed amongst the medium quality. On some land rich in the constituents
of Wheat I bushel per acre may be sown with of Wheat I bushel per acre may be sown with
advantage, provided that it is drilled in good season, but there sre few soils that do not even then require 6 pecks. I vary the quantity per acre according to the
earliness or lateness of the semson and the state of the
soil, 2 bustuls per acre being the medium quanity
drilled by me on my poor land. The Marigold Wheat contains 528,000 grains in 1 bushel, or \(1,056,000\) grains per acre. This will be about 24 grains per square our Wheat but not be lost sight of that we do not plant have not 24 plants per square foot, as Messrs. H. and Son would have us believe, but 17 plants per square foot, some grains not having germinated, others being destroyed by the attacks of birds and insects. I have rown Barley in my garden 8 inches asunder, and fourd it amply thick, which is a proof that overfed plants may this is gry thin with advantage to thate grower, bot seed so thin. Perhaps this Barley was sown where no corn ever grew before, and and on a natarally rich soil dug often and deep; in fact, such a soil as we do not often find cultivated in a manner that would not pay for the production of corn. Does this description of soil correspond with that on which Messrs. H. \& Son grew 84 bushels per acre from 44 pints, and 15 bushels only from 3 bushels per acre? If 80 , I am not 80 much surprised at the result, for it would be madness to seed so thickly on a soil containing a superabundance of the constituents necessary for a crop of Wheat. Twenty-one sacks of Wheat peracre! Is it possible! I have full confidence in Mesers.H. \& Son, but how was this result obtained? I presume that it was a few yards of transplanted Wheat, and that Messrs. H. \& Son's calculation was based on 3 calculation of the production of a plant from every seed, therefore their statement would require a little modification. Much praise is due to Messrs. Hardy \& Son for their perseverance in what they think will ultimately be of benefit to the community. Now that they cultivate Wheat by the acre their results will gain mor attention, and consequently they may gain more con verts, especially if they give us a balauce ehet showing greater profits than wo now obtain. Geo. Summers Houghton Farm, Elandford.
The Storm of \(F e b\). 6.-It will probably be in the re collection of your readers that in the night of February \(6-7\) th ult., a most destructive hurricane passed over the south-west of Scotland, and especially the city of Glasgow. In perusing the details which were given in the Times of Saturday, Feb. 9, I was struck with the fact that the nearer the different points of damage lay towards Ireland, at so much an earier hour of the night did they begin to suffer from the violence of the wind; whereas those which were situated further inland, or on the eastern coast of England, did not experience this visitation until a later hour, and towards the morning Conceiving, therefore, that this was a true progressive storm, and that its probable line of movement would be from west to east, across the north of Ireland and centre of Scotland, I made application to the Trinity Board for copies of the reports from the undermentioned light houses, an abstract of which I subjoin in Table \(I_{\text {., }}\) and if your readers will Glaw a has the city of Glas draw oth ther. through the city of Glasgow, and then draw others from it to the different stations in the following table, they will I think clearly perceive how regularly the barometers, there observed, fell and rose again, as the storm' centre travelled the course I have indicated. The genera direction of wind was from South and S.W., veering to West; the hours of its greatest force coincide very closely with those of the greatest depression of the barometer.

I think it probable that the logs of the outward bound American and West India steamers may carry back my data beyond the west of Ireland. F. P.B. Marting Oxford and Cambridge Club, March 18.

Covered Yards or Box Feeding. -Since I last addressed you on this subject, I removed 100 half-bred hoggets from an open boarded floor and placed them on atraw in a walled and covered shed with paved bottom. The space allowed is 10 superficial feet per head, including in this space the necessary feeding troughs. Of cours there is proper ventilation by openings in variou directions to carry away the impure corporeal exhald tions. Each sheep receives daily 10 lbs . of Mange, three quarters of a pound of Rape-cake, and some finely are in heat straw chaf. Their appetics ave coen now are in every way satisfactory. They have been now 8 weeks in this shed without any removal of manure,
and by an almost daily examination of the condition of and by an almost daily examination of the condition of
the manure I cm enabled to arrive at definite conclusions. If straw was too abundantly supplied the
manure became warm-too warm; by stopping the
supply it became cool. In fact the degree of wetness of the manure regulated its temperature ; when wet it wa cool, when moist it heated. Finely cut straw or short stuff absorbed moisture quickly, and had to be very sparingly sappl:ed. A light covering of straw once a day keeps but disturb it with a fork, and the odour is all-powerful. One pound and a half of straw per head per day for One pound and a half of straw per head per is sufficient foddering, and 9 to 121 bs . for a bullock. We must not forget that 13-14ths of the
manure is liquid. I was never before satisfied or confimanure is liquid. I was never before satisfied or confi-
dent as to feeding on straw bed, but now i see clearly dent as to feeding on straw becess depends upon the proper management of the manure. I read Mr. Lawrence's remarks with much satisfaction, and know that boxfeeding with him at Cirencester has been quite success
fal ; but there is much difference between the hard fal; but there is much difference befween the har spongy straw of the elevated Cotswold Hills. The ormer are more hard and reedy, and admit air readily, whilst the latter pack closely and exclude air. In the former case it is necessary to effect this exclusion by ample saturation. The late dry weather has caused the manure in many open farmyards in this neighbourhood to heat violently, and then "fire-fang." As my last communication on this important valuable by many practical farmers, I trust the presen may not be deemed inopportune. The quantity of straw where the nimals were fed entirely on roots, J.J.Mechi Tiptree, March 17
Nature v. Art, or Poultry v. Wild Birds.-There is a sad war going on from time to time, as it suits the con ven'ence of correspondents, about rooks, sparrows, and
moles, and such like so-called farmers' friends. Mr Wilkins, in your Number for February 2d, has treated us to the last essay on the subject; and as he calls on us to reason together, let us do so for a few minutes, for there is yet a "Greening" not so convinced by his argument as the happy issue of his interesting dialogue brought out. He asserts, what no denies, that all ought to let them remain as they are. But is not one of our first commands "to replenish the earth and subdue it ?" The reverend gentleman seems to be a great admirer of Nature in some things, but I do no hink he is so, so far as he himself supposes. Suppose we were to allow her to mana e hior own, what would the result be? All our life is a struggle against Nature, not to kill her, that we cannot do, but o subdue her; without her we could not get on at all but we must see if we cannot set her properly to mong crops we mast not say is Nature's tax, but art's imperfection. Let us then remove the evil even at the risk of having the cure as bad as the isease, and then see if art will not find a remedy micht put rooks and moles were destroyed rork, and which would at the same time be profitable What does any of these vermin do that our common barn-door fowls cannot and do not do? They can eat slugs, grubs, and insects of all kinds, and also corn, and the , iney and than that they are industrious. They will pick all of the surface, and even go down to a good depth. Well now that we have found them how are we to set them to work to do it properly? I think that we shall manage it by having our poultry houses built like gipsy vans, so that we can take the whole flock to where they are be taken in the morning when the ploughs co to work, and as their house is with them they will stop contentedly and work with pleasure, requiring little more food and converting a scourge to a profit. We know it is ssid that few will go where there is nothing to be got and so with them, yet see how incessantly they scour the one or two fields that adjoin their house; and if they get so much there, how much will they get if sen great numbers at little cost and with better health than they do, sometimes confined to one spot. And then, there would be no grub left for them. The work will be done at lees cost and by more tractable workers, and they might be made to answer as well in the garden (they could be confined by netting to the spot they are wanted in), so as not to injure any crop, and then we The farmer has, and I dare say always will have, lots of friends, but many of them are very selfish, and among such are Mr. W's protegees. Such a plan might perform a cure and solution for the game-laws, by gathering up all stray grains after harvest, so that nothing be lost nor left for these wild beasts. \(G\). \(S\).
sundries.-In the first place I recommend your inquirer "J. M." in the Number for March 8,1856, not to put any sulphate of soda to his cyder. It may be that he does not know that sulphate of soda is the common purgative salt called Glauber salt, the ase of
which is now almost superseded by Epsom salts. [It is not sulphate but sulphite, or rather hyposulphite of sods that is recommended.] Next as to Gorse-I think it extraordinary that a spineleas Furze bush, or at least a
bush with soft and harmless spines has not been dis bush with soft and harmless spines has not been dis covered among the millions of bushes growing almos tiplied by small cuttings, so as to be sold in rooted plants at a shilling or for less per hundred. In 1852, in
blossomed Furze more than a thousand cuttings, trimme and planted them very close together in sandy soil within a two-light frame to protect them from drying eca, all within five hours, and of them full a thousand anse rooted, and in the subsequent spring were pa at into rows a foot apart and nine inches asunder, and discover a spineless Furze bush, from which to propaate, and then so valuable a fodder plant for winter use will soon become plentiful. A reward should be offered for a living spineless Furze bush.-Lastly, in answer to the wish expressed in your notice to "X" as to seeds in a pound, I send you the weight of a pound of seed of each sort of a number of Grasses, and of some plant ascertained in the years 1838 to 1843 , during which period I was in the habit of ocessionally collecting seeds of Grasses, of other plants and of trees for the purpose of sending parcels or specimens to N. S. Wales, of mos scales so accurate that two seeds of Agrostis alba would alter their balance

Superphosphate of Lime-In your Paper of the 8 th of March there is a communication from Professo Voelcker of Cirencester upon the subject of supherphos phate of lime which contains some extrexcely usefu formation and some practical remarks founded upo sound sense and prudence, but it would be highly
desirable if he would go one step further in the desirable if he would go one step further in the chemical information which he aflus of superphosphate of lime sold varie extremely in consequence of the mode of preparing it and that he does not consider that it can be deemed good, (a relative term) unless it contains 33 per cent. of phosphate ' of lime one half of which has been rendered soluble by acid, and that such an article can be now furnished at from \(7 l\). to \(7 l .10\) s. per ton. The question which I should be anxious to have solved is, of what the remaining 67 per cent. is expected to consist whether of water contained in the acid, or of ashes, sand or other ingredients mixed with it by the manufac urer. Again supposing that no admixture has been made, that nothing but acid has been applied to the bones, and that the substance formed is in a tolerably dry state, what he then considers to be the proportion of phosphate of lime. I have been in the habit, since the time Mr. Pusey recommended the practice, of purchasing erushed bones and sulphuric acid separately and of mixing them in the simplest manner possible. Generally for the purpose of drying the mixture and convenience in nsing it, some ashes or sand have afterwards been added, but I should feel much obliged to Professor Voelcier io applies to the pure substance of I one and acid. I conceive not, but this point in his remarks is obscure. As far as I understand the chemical change which takes place, it is this: that bones consist entirely of phosphate of lime, that by adding sulphuric acid two substances are formed, one being ulphate of lime, the other a biphosphate of lime which easily soluble in water. These having performed this peration without any other admixture, what does he consider to be the proportions of the various ingre dients ? This appears to me to be the only true mode of estimating the real market value or cost of super-
phosphate of lime, and the value which is obtained in phosphate of lime, and the value which is obtained in ion and worthlessness of many artificial manures which Professor Voelcker has 80 often explained, and the doubtful value of what is sold as superphosphate of ime, it is surprising to me that more agriculturists do would obviate all chance of deception. Scotus. [Bone
rarely e
of lime.
Drainage and Irrigation.-A correspondent of yours ppearing desirous to have a confirmation of my statement that I had frequently caused deep drains in strong clays to discharge liquefied manure abrudantiy, I beg state that it has been no uncommon nccurrence. He may be more surprised when I tell him that the mavare was the solid as well as liquid, all mixed together with water. I have no doubt Professor Way was quite right in saying that clays will retain ammonis; but if our nitrogen has not become ammonia do we not lose it by filtration ? There is unmistakeable evidence given by the rich verdant colour of the vegetation which grows where the drainage flowed that we lose much valuable manure through our drains. A few years ago, during heavy rains, I saw the drains discharging rich streams of manure, and on examination found that it proceeded from a dung-heap 200 yards distant from me, which was on the surface of the soil; but through which, and hrough the soil the essence was carried by the falling rain. J. J. Mechi, Tiptree, March 17.
Soils.-I am extremely obliged by the notice you have taken of my communication in respect to soils. In reference to the completeness or incompleteness of the analysis I am not responsible. I forwarded the soil to Mr. Medlock, of Great Marlborcugh Street, and he charged me three guineas, the highest sum named by charged me three guineas, the highest
you in page 178. \(D\).

\section*{Farmers' Clubs.}

London, or Cbntral Farmers' Club: Farm Agree-ments.-At the late monthly meeting Mr. Jackson read a paper on this subject. His first inquiry wasAre verbal agreements, or, in other words, agricultural customs, best calculated to give a atimulus to agricultural improvement From the evidence given by witnesses before the Tenant-right Committee, it appears that a system of compensations for improvements has within the last 20 or 30 years grown up into a custom in parts of Lincolnshire ; and that this, combined with tenant right agreements, has in those districts almost magically changed the fens and rabbit-warren widderness into
fruifful fields. The following is from the evidence of fruitful fields. The following is from the evidence of
Major Francis Brown, landowner, occupier, and tenant farmer:
"Lincolnshire, in myy early period, was in a very bad state of cultivation indeed; in short, oue-third of the whole county was entirely uncultivaled; the four-field system wis gradually intro-
duced, and artifininl manures were introduced also; and then, duced, and artifina manures were introduced aha, and faen,
after a lapse of time, when tenauts had to quit thair farms,
valuers began to make allowances to them. It was a very valuers began to make allowances to them. It was a very
gradual thing in its early progresn; it was fought very stoutly It thus appears how improvement and security (the incitement to improvement) have gone band-in-hand, even without security of tenure; for there appear to have been few leases.-The description of farm agree. ment best calculated to give a stimulus to improve, is of course that which conveys to the occupier the ownership or freehold. This is the best inducement to improse, for there are no consents to ask or penalties to fear. Here is perfect fixity of tenure ; entire security for the possibility of this being the description of farm e posibily of this being the description of farm agricultural improvement : First, few farmers have the eapital wherewith to purchase land; and, secondly, only a small proportion of English freeholds ever come into the market for sale. If, however, perfect fixity of tenure and perfect security for investment form together the highest inducement to improve, does it not follow that the next highest inducement to improve is a long lease -99 years if you like. Formerly " long leases," and leases for one or more lives, were frequently given. Some of the latter even in my own neighbourhood are not run out ; but I never knew an instance in which they were renewed at rack rent. Many may, and in reference to holdings of from 500 to 1000 acres probably do, believe that leases for 21 years, with few restrictions and tenant-right clauses, are "best calculated to give a stimulus to agricultural improve, If we compare such leases with tenantright agreements, I think we shall find that their single advantage is fixity of This undoubtedly secures occupanon to the lessee both the pleasare and the profit of his improvements for the period; but it muet kept in mind that the profit in improvements is made more secure to the tenant by agreement, or even by tenant-right custom, where it has kept pace with improvement, as it has in some favoured spots-for example, in parts of Lincolnshire; because compensation is then calculated rom the date of improvement, while in the other case am aware it may be contended that certainty for a given time is better than uncertainty for double that time; as under the former the tenant can calculate up to a given date, whereas under the latter he cannot cal culate at of arne in mind "wat" the outlay-that has been conceded to agreements-but only for the pleasure and enjoymert ; and as these are brighter in anticipation than in retrospect, I do not see how we can refuse to concede, in reference to agreements and Lincolnshire customs, that on a bush so well birdlimed two birds are better than one. I have here an agreement of this Lind, for a farm of over 200 statute acres, dated 1817 ; and the compengation clause is in these words:- \({ }^{6}\) That, if the tenant shall be turned off the farm at any time, and shall not have
reaped the benefit of such permanent improvements as
he may have made thereon, he slaall be allowed for the same such sum or sums of money as two impartial persons shall fix upon, one to be chosen by the landord, and the other by the tenant; and in case they shall not agree, an umpire shall be chosen by them,
whose determination shall he final." As this is the whose determination shall he final., As this is the oldest farm agreement in which 1 have found a tenant-
right clause, it is gratify ing to perceive that it has stood the test of 39 yearg' experience. The tenant, feeling that the clause secured his improvements, so that the changed the farm from a bad to a good condition, and is continuing, up to the present time, to reap the harvest of his own sowing, having brought up his family in great respectability, and become independent in his circumstances. Many of the tenant-right agreements draw a proper distinction between acts o msbandry and permanent improvements, limiting in clause 9 of the Cheshire agreement; and the approved invoices put the matter beyond dispute annually the power, but depriving him of all pecuniary motive for cutcing short the tenure, be "the description agricultural improvements?" is the question I have now much pleasure in submitting to the agricultural world. However much we may differ on this question, I doub not we shall all agree that every farm agreement, however good, will fail in giving a stimulus to improvement
unless it obtain the entire suffrages of the tenan anless it obtain the entire suffrages of the tenant-
Mr. Sidney said : Many landlords still acted in some degree under the influence of the feeling that they were conierring a favour on their tenants by allowing them was trace of any general improvement in this reapect was be found about 25 years ago. He had been told by Mr. Hudson that if he let his farm "go out of heart" during the last four years of his term, it would still be for at that time it only produced 92 coombs of Wheat, whereas it was now producing, and had produced for 14 years in succession, upwards of 1300 coombs. This Hudson every year putting into the land about by Mr. Hok out every year putting into the land more than he amount of capital thus employed, with which the land ord could have nothing to do. The question on the card was, "The form of farm agreement best calculated to give a stimulus to agricultural improvement;" and was tenant to put as much of his flosting capital into the oil as put as much of his floating capital into the agreed as to these points: -That they must have a rotation of crops, use the best descriptions of farm implements, iay out very large sums in concentrated manures, and maintain a numerous stock upon the land. Was there one among them, then, whether Mr. Hudson of Castleacre, Mr. Thomas of Lidlington, or any other he soil Would go and put his 86 . or 10 . a power of the landlord, or the landlord's plastee, or even gamekeeper, if there happend to have been quarrel with that individual, to give him notice to quit leare him out at the end of 18 months of his tenancy, and tion? In considering this question they for compensatheir eye upon certain model landlords, but bear in mind that they were asked to sanction a form of agreement Which might be adopted under all or any circumstances between two different men. With regard to the broad and general principles on which all farm agreements
should be founded, in order to develope to the utmost the agricultural resources of the soil, the following ciramstances were essential :-
Hiss, roads, drains, fences, snitable and reaniined for farm stead toon of the farm
2pital sufficiey tenant should, in addition to experience, possess apedid, artifciaial manures, and labour required, by the thinery, stocreack, 3.thity of the farm.
temant to put the farm through at least one would enable the of crops, with security for return of unexhansted capital sunk in
4. That as minute restrictions hampered a good tenant, and lid not restrain a bad tenant, the restrictive clauses sloould be as
Mr. R. Baker, of
Mr. R. Baker, of Writtle, had always held the opinion that in making an agreement for letting lands, it was more advisable to secure the tenant in the money he invested by way of improvement as he went on, than to pay him an amount of compensation upon leaving. It was no remuneration merely to pay him for the im. provements which were unexhausted. That was only the last act of justice which could be done him in taking
the farm out of his liands, or letting it to another tenant \(t\) an increased rent - \(t\) must be obvious to every one who regarded the matter in the light of a commercial transaction, that, in taking a farm and looking to it to repay him his investment of skill and capital, to bring it ecurity able state, it was more neta ments, than repaying limself the outlay in improve when it would have to be paid by another the tenancy, of the present discussion should be, he thought, rather to convince the landlords as to what their real interests let their farms; and in all their arrangements they

\section*{mprovements} remain there, and not be withdrawn by the tenant at he end of his term. It had been very much the custom in his neighbourhood, where the farms were let for 14 years, for the tenant to go on farming exceedingly vell for the first seven or eight years, but after that mee he made it his business to exhaust the improveeft in antil, at the expiration of the term, the farm was took it. Now, he wished to worse sy, when he far restrictions being introduced into the clauses governing the latter portion of the lease, so that the tenant should the latter portion of the lease, so that the tenant should be paid compensation upon the principle laid down in the Cheshire agreement, or some principle analogous Mr. Sidney had stated the remained unexhausted. Mr. Sidney had stated that which the practical fhat until lately there had exactly correct, namely hat until lately there had been no permanent invest ment of the tenant's capital in the land. Now e maintained that 50 years ago the amount so invested was very little different from what it was at present. At that time marling, chalking, and draining were un derstood and applied to the land. He granted that the rilling of curnips was a recent practice, but he did now that it had much increased the production. The old system of growing Turnips was just as good as the prent, and every practical farmer would say that as hen, as with oilcake and Turning with Turnips alone increased the growth they had not improved the quality of Turnips, for every year they deteriorated. But the point they had to discuss to-night was," The form of arm agreement best calculated to give a stimulus to fricultaral improvement ;" and he held that the best orm of agreement would be that which would give the nant sufficient interest in the soil to induce him to in est his capital therein ; that would give him sufficient me to mak a retun upon so that at the expiration his term he should not feel compelled to withdraw his capital with the Enowledge that if he did not with raw it he would not be paid for it, but that compensa ion should be secured to him in proportion to the mount of capital he had invested over and above wha was invested under the ordinary modes of farming, and ver and above what he might have extracted and re urned to his own pocket. He (Mr. Baker) should say hat that would be best effected by a munning lense xtending from 10 to 15,20 , or 25 years, and termi nable by either party giving to the other five year notice in writing to that effect. But no tenure of land Everything should be reduced to writen azreent prevent a vast deal of trouble in the end wich would stamps on leases were reduced, there would be no diffioulty in effecting it on that account.
Mr. Mechi said, the combination of a fair and mode the valuation of improvements with a lease was, perhaps, and of desirable arrangement that could be made particular district, it had in effect the practice in a W. At the same time it would not interfere with the general right of individuals to make their own agreements Practically, at present there was nothing like harmony of action throughout the kingdom ; for whil in many parts of the country-in Lincolnshire, Norfolls, and Bedfordshire-liberal and enlightened arrange ments were carried out, in others the whole system wis 80 backward that they were really not in a condition to an themselves of the improvements of the age; and i mis timents districts the high notions and progis thing but satisfactory. He had often heard landlord complain of the difficulty of getting tenants with capital fault his answer to that was simply that it was their ow should offer them tain men of capital for tenants they them for whem compensat thenin the Mr The calun of the soil.
Mr. Thomas, Lidlington, Beds., maintained that i they wished to have aa honest, independent, persevering, wealthy, and intelligent tenantry, they would neve obtain them, in the long run, under the system recommended by Mr. Jackson ; that was, a yearly tenure determinable at the will of the landlord or a crusty on bilious agent, even though, on leaving, the tenant had an undoubted right to claim a money compensation the outlay he had made in the soil. There were highe and more generous feelings than those which originated the pounds, shillings, and pence, which ought to dictate not riangements between landlord and tenant. It was leat het that the latter should be in continual dread or what he be turned out, with a present in money, years of his tenancy. ment could be a mutual prietor and occupier ; and that could only be effected by the former giving such that could only be effecte best men to the land, and encourace them to lay ou their capital, with the prospect of its being returned them tenfold.
Mr. J. Pain, Felmersham, Beds., said that in travel ling through the kingdom he never bad occasion to ask was held under fixity of tenure or particular district he could always tell, without mar not. He though the sort; and the conclusion to which he came was that
ate of cultivation that with a lease they would have een in
On the motion of Mr. R. Baker, the following reso tion was passed unanimously :-
"That the form of farm agreement, or lease, best calcelated
to give a stimulus to agricultural improvement. is that which
gives security to the tenant during his occupation with pensation, for to the tenant during his occupation, with ted improvements at the expiration of
pe term.

Mid-Lothinx. - Cultivation of Red Olover. - The following is part of a paper by Mr. Walker, of Kilpunt, read at a recent meeting of this association :

The most important part of this subject is now reached-viz., how may Clover failure be partly or wholly remedied?
While it is difficult to get at a specific remedy, it is pos-
sible by remarking general and known characteristics of sible by remarking general and known characteristics of
Clover-growing lands, and by practical trials to acquire a
pretty good idea what applications may be necessary for the
several cakes. with which we are or may be connected.
In monorish soils, whether peat, clay, or bog, the application of
lime has been found most beneficial as a fertiliser, and although
on moorish soils of high altitude red Clover is lare, yet, of all nown mineral manures there is none that canses the land to
produce such an abundance of sweet herbage, and if broken uf produce such an abundanee of sweet herbage, and if broken up
so improve its capability for growing cereals, as well as root cropat
Sinch soils, however, are incapable of keeping succulent vegets-
tion alive during a severe winter; and are, therefore, especially

\section*{Farm Memoranda.}

Haddenham Manor Farm.-The aummer of last year (1853) the whole of the farm was very foul with couch and other weeds, much impoverished, and out of condition. The first process was thoroughly to clean and manure the land, and to drain it where required. The next was to get it into something like a rotation
rops as near as possible on the four-course system.
lst. The Swede crop. -The land having been well cleaned in the spring was drawn out into deep trenches, 26 inches apart from each other, which were filled with 15 loads of pig manure per acre, then covered in of Swede seed and 40 bushels of peat ashes per acre and upon some portion 3 cwt. of superphosphate per acre, over and above the manure and peat ashes. Th
the Swedes were in rough leaf they were hoed out at
intervals of 12 inches apart in the rows, and the land intervals of 12 inches apart in the rows, and the land
between the rows was well and repeatedly stirred with between the rows was well and repestedly stirred with
Smith's horse-hoe during the whole of the summer, until the Swedes were too large to admit of this opera-
tion. The Swedes are an excellent crop for the season, tion. The Swedes are an excellent crop for the season,
and are now being sliced with the turnip-cutter for the sheep and cattle, which, with artificial food, are thriving fast.
2d. The Barley crop-after the Swedes were fed off last winter by the sheep, having corn, oil-cake ( \(\frac{1}{2}\) pint of Beans and \(\frac{1}{2} \mathrm{lb}\). of cake daily, and clover-hay-was partly dibbled and partly drilled upon the land (being once ploughed and scarified), at the rate of about \(2 \frac{3}{3}\) was then well harrowed and crushed with Crosskill's was then welf harrowed and crushed with Crosskill's
roller. When the Barley was sufficiently high, it was roller. When the Barley was sufficiently high, it was
alternately horse-hoed and clod-crushed several times: the horse-hoe raising the mould so as to enable it to sborb the moisture and the nitrogen from the air, and by
this means increasing the bulk; the clod-crusher pressing and consolidating the land, so as to enable it to retain what it had absorbed, and by this means stiffen-
ing and glazing the straw so as to prevent it from falling. This process was adopted on all the Barley which was planted in February and March; and where it was adopted the Barley did not fall although it was a very full crop. Where this system was not entirely carried out, as was the case with the Barley was done by men in order to hoe instead of to harrow in the Clover seed which was sown upon one-half of the Barley land, the remaining half being left for winter Beans or Pulse (Beans and Peas).
3d. The Clover crop-being French Red Clover seed, was hoed in at the rate of 18 lbs . per acre on the Barley land, 20 bushels of soot and 20 bushels of ashes
being sown upon every acre in the month of March. being sown upon every acre in the month of March.
The first crop was mown for hay in June, the second crop partly mown and partly fed off by sheep. Where the second crop was mown the sheep were folded, and woollen rags were applied at the rate of 6 cwt . per acre. 4th. The Wheat crop was planted on the Clover lea, once ploughed, the weeds and Couch having been forked out by men and boys; the Uxbridge white Wheat, the separate portions in drills 10 inches apart ; the land was then trodden by the sheep and clod-crushed several times fin the autumn to consolidate it for the winter. 15 bushels of soot and 3 cwt . of salt per acre were sown upon it in the spring, the soot being intended to increase the bulk of straw, and the salt to stiffen, !glaze, and prevent it from falling, as well as to increase the weight of the grain. The 10 -inch rows fully allowed of Smith's
horse-hoe" being used in such a manner as to raise plenty of mould, and then the clod-crusher so consolidated the land and strengthened the roots of the Wheat, that the straw very much resembled a reed in respect of its stiffness; this process of alternate horse-
hoeing and clod-crushing was repeated several times hoeing and clod-crushing was repeated several times
during the spring, until the crop became the largest, during the spring, until the crop became the largest, and at the ssame time the most upright, which was
perhaps ever seen when the land had been previously in so bad a state.
The pigs daring the last winter were fattened upon Swedes, Barley, and Pulse, steamed by Stanley's apparatus. The cattle in the yards were some of them fed upon Swedes, hay, and oil-cake, some upon hay, and some of the very lean ones upon straw and cut Swedes. The horses work in pairs, and in Scotch carts, one horse in a cart; they are light in the leg, and yet full of horses, purchased with a blemish, which does not affect their worls, and yet prevents the price from being very Agricullural Society. Read in the Jowrnal of the English Agricultural Society.

\section*{Miscellaneous.}

The late Mr. John Haxton of Drumnod, Fifeshirem Mr. Haxton had been long conneeted with the literature of Agriculture. For some years he edited the Dublin
Farmers' Gazette-he had for many years been a valued Fonmers \({ }^{\prime}\) Gazette-he had for many years been a valued the artieles on the Practice of Agricultare in the Cyclopedia published by Messrs. Blackie of Glasgow. It is with unfeigned grief that we announce his death on年ighy last. His loas will be deeply felt in his own promoting the religious of one actively engaged in humbler neighbours ; it will be deplored by a large circle of sincere friends attached to him by the quie unassuming modesty of a character in which substantia were delightfully united. It will be felt throughout his rative country, as the removal of one of the most intelligent of the public men among its agriculturists for many years
Length of Leases. - I have been accustomed to think where no unusual outlay was required for improving a an owner to relinquish the power over his property, and for a tenant to have a fair course of crops; and in opinion. But in offering two no need to alter that autumn, believing that tenants of large means are not willing to remove and establish themselves in concerns demanding great capital withont the prospect of lengthened occupation, I offered them on leases of 15 or

21 years, as parties might propose. The result was, that of ten propoeala for one farm, which was eventualy let at a rent of \(2,000 \mathrm{l}\).-only three offered for both terms, and mark the difference of the offers. One for 15 years was 1630 l , but for 21 years 1760 L , viz. 130 l . more for the longer term, during the whole lease. Another for 15 years was \(1620 l\), but for 21 years \(1730 l\), being a difference of 1102 . per annum. Annther for 15 years was 14001 , and for 21 years \(1626 l_{\text {., making the great }}\) difference of \(226 l\). The other seven competitors offered only for a term of 21 years. Then, for another farm offered on the same conditions, and let for 1305l., of six parties, not one proposed for the shorter term. Having stated that the tendency of the times is for long leases, Ihe now venture on another assertion, and say tha the tendency is equally for large holdings. It used to be the argument against the policy of large farms, that there was less competition for them, in letting. I must again appeal to facts and practical demonstration. Of I had ten offers : for one of fistly let-for one of 20002 ., I had ten offers ; for one of \(1305 l\). , six ; forgone of 10500. ,
seven ; for one of 2581 six seven ; for one of \(258 l\). , six ; and for one of 1802. , two Hence, then, for a large farm of 20002. a-year were ten offers from highly respectable and eligible tenants, and for a small farm of 1801 , with good buildings and in good condition, only two. Mi. Grey at Hexham.
Sprouted Wheat good for Seed.-A correspondent of the Rural New Yorker, W. Garbut, Wheatland, New York, states that sprouted Wheat is about as good for Garbu that which is uninjured by wet weather. Mr sprouted says:- The excessive. Wet weather in harvest sprouted so much of the Wheat in this section, that
many of the farmers are very anxious to procure sound Wheat for seed. I can assure them that they need not be solicitous on that account, for Wheat that has been sprouted will germinate as freely a second time as it did the first, and with equal vigour. To test the fact, on the 17th of this month I tonk some of the worst sprouted Wheat that I had ; every kernel of it had grown, and it was so thoroughly dry that the sprouts all rubbed off. I put it into rich soil of suitable moisture. On the
fifth day much of it made its appearance, and now, fifth day much of it made its appearance, and now, on the eighth day, many of the spears are 3 inches long, and as strong and as vigorous as I ever saw young shoots of Wheat. Every kernel of it has grown. The Year-Book of Agricutture
A History of Low Land Drainage-Last year I drained a swamp in which were numerous springs; the natural drainage of the surrounding porous lands to a considerable extent had all found vent here, and formed a channel for escape, and in course of time had washed away the soil to the extent of about half an acre, and depth of two or three feet below the level of the surrounding land. In this case, we had to cut our outlet drain to the depth of about seven feet, and to lead all the springs into it, nearly filling a six-incls pipe,
which is constantly running and conveyed to the farmwhich is constantly running and conveyed to the farm-
honse. Had the water which breaks out here not found a vent, a bog would probably have been formed, and raised considerably above the adjoining surface this we frequently meet with, and when drained the land will sabside. I know meadow lands, which were drained some years ago, that have subsided and left the roots of Alder trees more than two feet above the present surface. Where fall can be obtained, I would but it case put my drains at less depth than three feet obtained without incurring too much expense, and in a case of this kind I drained a meadow last year at a shallower depth with good effect : this mendow was nearly of a dead level, and I could barely obtain three feet for an outfall into an open channel; consequently, had to obtain the fall in the drains by dimininishing the depth at the higher end to 30 inches. A large quantity of water is discharged, and with it a ferrugi-
nous matter commonly called "ear," whieh we find nous matter commonly called "car," Whieh we find
deposited in the open drain at the outlet This meadow is occasionaily flooded. This summer it was flooded to considerable depth, and when the flood subsided, the rush of water at the outlet of the drains was with great force, and was perceptible when the water in the open drain was several inchea above it This is an important consideration, as many.gentleman are of an opinion that an outlet should never be so low anderdrainthin the infuence of flood water, and to away. This is a great mistake, as the greatest improvement that I know of in draining has been on such lands. The temporary filling of the drains with water tends to loosen the ferruginous matter which adheres to them, and the rush when the flood subsides clears hem out. Wherever ferruginous matter exists in the water, it will be necessarry to flush out the drains occasionally. In meadows subject to floods this oper2tion will be performed by the floods to some extent,
but when water can be brought from a higher level and but when water can be brought from a higher level and
used at pleasure, it can be best performed. This has used at pleasure, it can be best performed. This has
been done with good effect on Sir Robert Peel's estate of been done with good effect on Sir Robert Peel's estate of
Drayton Manor by Mr. Josiah Parks, and I have recently adopted the same plan on Mr. Ashton's estate at Wervin. Besides flushing the drains, the plan has this further advantage: in a dry season, when the meadows become parched, water can be let into the drains, and, by stopping the outlet, will rise in the soil, through the cracks and fissures, to an height limited only by the bead of water, and effect what Mr. Parhs calls subirrigation, the great advantage of which must be sufficiently obvious to all practical farmers who know the ffect of a dry season on their hay crop. Where water cannot be brought from a higher level, the same effect
may be obtained to some extent by stopping the outlet at Withington, belonging to Wilbraham Egerton, Esq., which was drained by the Drainage Company. A great portion of this farm, "Withington Old Hall," was sand loam on sand substrata, and at two feet from the surface it was full of water, and in cutting our drains to the requisite depth of four to six or seven feet, we found it a tedious operation to keep our line of drain rue (which was necessary on account of the slight fall), and the sand out of the pipes. This we effected by a process too tedious for minute description here, and by putting a sluice at intervals along the main drain (which was a six-inch pipe), with a plug to stop it a fill all the pipes above the sluice, which, on being released, would effectually clear the pipes from any deposit. At first, being uncertain at what distance the rains would effectually draw in the sand land, I pu them at 24 yards apart, but soon found we might sately extend the distance, and we then put them at 48 yards apart. In wet weather, the flow of water was so great that the six-inch main was over-charged, and we put in a relief drain below every sluice, from the main into the brook, with which it was parallel at the distance of about a rood. We frequently find the upper part of a field a dry sand loam on a poroas substrata to some depth, resting on a strata that water will not readily penetrate, and the lower part of the field clay loam on clay or marl, marking a line where the wate from the upper portion finds vent at the surface ; in this case I cut a drain across the fall, above where the water shows itself, through the porous into the impervious strata, for a catch drain for the upper portion and then put parallel drains, in the direction of the fall, to the main drain at the bottom of the field. It happens sometimes that the impervions strata which throws up the water is merely a narrow seam or band, and the soil below is porous ; again in this case, a catch drain with a proper outlet will be sufficient: I have found it quite effectual. Mr. Palin, at Chester, Oct. 9, 1855.

Though 2 or 3 cwt. per acre will produce a crop superior 10 that from a similiar weight or superphosphate of pplication of a much larger quancres must be paid equalls whether the land yields 10,20 , or 30 tons an acre; so that an adation of 8 or 10 tons of roots beyond the common crop conts anure applied.
THE BLOOD MANURE FOR WHEAT, BARLEY, OATS, ETC.

\section*{Being rich in nitrogun and otaer necessary ingredients, it is} especially adapted for the weat and other Corn crops, and has is a very remarkable fact that the analysis of blood and the grain of Wheat are nearly identical, as proved by the most minent chemists,-it contains all the elements which plants require, and when properly prepared, will become the essence of
vegetable as well as of animal life. The highly fertilising properties of Blood have been commented upon by Professor Way and others, and the success of the Blood Manure for Wheat an oxperience of numerous Agriculturists. Should Wheat manured with dung in the ordinary way look unhealthy in the spring, it
will be greatly benefited by top-dressing it with Blood Manure, will be greatly benefited by top-dressing it with Blood Manure, at the rate of 2 to 3 cwt . per acre, - -thus strengthening the straw,
making it less liable to lodge, and very much increasing the produce. For Barley and Oats, 3 to 4 cwt. per acre of the Blood Manure may either be sown broadcast or drilled with the seed, if the former, to be well harrowed in.

BEANS AND PEAS.
For Beans or Peas, 3 to 4 cwt . per acre may be used either broadcast and harrowed in, or a po
drills at the time of horse-hoeing.

\section*{MANGEL WURZEL AND CARROTS.}

Blood Manure is an excellent fertiliser for these crops. Four sown broadcast over the field, and well harrowed in, the seed being drilled in the usual way; repeated horse-hoeing between the rows is of grest importance for air and nutriment, and great Blood Manure betwear the rows previous to the hoeing.

\section*{POTATOES.}

The Blood Manure is specially prepared for this crop, and it will be found to give most satisfactory results-it will be most usual quantity of farm-yard dung, and the whole earthed up in the usual way. Should the farm-Yard manure not be used, then cwt. of Blo Manure may be used alone, put in

\section*{FLAX}

This crop in olden time had the renown of being one of the most exhansting crops which could be put into the land, quantity of nitrogen, phosphoric acid, magnesia, and the alkalies taken up by the Flax plant, which renders it a highly exhsustiog
crop. The Blood Manure is carefully prepared, so as to meet the wants of this crop, and with its aid Flax can no longer be this crop, from 4 to 6 the bow broadcast, and harrowed in before the seed is drilled.

\section*{HOPS.}

It is well known to all Hop growers that Hops reqnire more mamure for their proper development than any other plant which year from the ; the constant withdrawing of the Hops, year by siderable amount of both mineral and organic ingredients, and the Blood Manure has been particularly prepared, with tbe object of supplying the requirements of this important crop. It coral
tains all the constituents which the plant requires, both mineral and organic, and will be found as cheap and efficacious as any other manure now in use, from 10 to 12 cwt . per acre applied at and
different times well worked in between the allers, will be found a most useful application, or the manure may be put round eact hill and covered up with the soil.

Testimonials from the most eminent Agriculturists who have used the Manure may be had from the local Agents. The following may be taken as a sample:-

\section*{Nonfolk Farms, Windsor, Februsry 20th, 1855.} f Nitro-phosplate used on the Royal Farms, Windsor Great Park, have great pleasure in stating, that after applying it to
field of \(S\) wedes, which gained the cup at the Royal East Berks Agricultural Show, I have no hesititation in pronouncing it an
excellent manure, and intend using it to a greater extent during excellent manure, a

I am, gentlemen, your obedient servant
Mr. Berjahim Gonurox, Gedney Marsh, Long Sutton, Lincolnalire. I I drilled your manure at the rate of 2t ewt. per acce
along with the Wheat over 30 acres, and although the feld in

PRICE, DELIVERED AT ANY WHARF OR RAILWAY STATION IN LONDON:
Corn and Grass Manure, £7 10s. per Ton.
Turnip Manure, £6 10s. per Ton.
Flax and Hop Manure, £8 10s. per Ton.
The Company beg to caution the public against the attempts of spurious imitators, who, since the introduction of this Manure, hare professed to make one possessing similar qualities. As secwrity, therefore, to the purchaser, every bag is warked "ODAMS' PATENT BLOOD MANURE," and sold only by the authorised Agents of the Company.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES• PLEASURE GROUNDS, LAWNS, BORDERS, BOWLING GREENS, ETC.

To cut from 9 inches wide, for a boy to work, \(\mathrm{C}_{\mathrm{p}}\) to \(\quad 30\) inches wide, for man and boy.

THE REGISTERED IMPROVEMENT renders unnecessary the gTeat care requisite in the handling of these machines on the old plan; all that is now required can be done br any usskilled Labourer, who has only to push the machine before him. The Registered adjostment insures a clean and perfectly level cut of any required height, and preveuts the knives from cutting fnto the soil, however uneven the ground may be.

ILLUSTRATED PRICE LISTS, with copies of Testimonials, will be forwarded, post free, on application to the manufactarer.

The above may also be procurea at the principal Agricultural Implement Depôts in London; and of all respectable Ironmongers and Seedsmen in the country.
B. SAMUELSON, Britannia Works, Banbury.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thas:-Screen the gravel of which the path is at present made from the lame which river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation
cannot grow through or apon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it to give a fall from the middle of the path towards the sides. The same preparation mares first-rate paving for BARNS, Where a clean, hard bottom is a desideratum other situation where a cqually well as in summer, Manufacturers of the Cement, J. B. \section*{The Garventrs Chromite．}

SATURDAY，MARCH 20， 1856.
IT seems that a new agent is provided for gar－ dening．The vitality of seeds we are assured is preserved，or when languid is roused into activity by Glycerine．At a late meeting of the Society of Arts，Mr．G．F．Wilson reported that he had re－ ceived from a very zealous and successful cultivator of tropical plants，a statement that glycerine has a remarkable action upon seeds．His friend wrote： ＂Some Castor－oil seeds were immersed in glycerine for 10 days；when planted，they germinated very quickly．I then put some of the Benee（？）seeds given me last year（some of which my gardener then sowed，but they never came up），into glycerine for 20 days，and I find they are sprouting beauti－ fully；some that were put in water have never appeared．The glycerine must have something to do with even restoring vitality，for I have tried one or two dried up Indian seeds，and they have succeeded also．＂Mr．Wilson added，that he should hardly have expected such favourable results；but when he remembered the extraordinary power of glycerine as a preservative of both animal and vegetable bodies，be thought it would be well worth while to try some experiments on the transport of seeds in glycerine．
It would be not a little cmrions to find that a substance the very existence of which is as yet hardly known to the world possesses the power of preserving seeds during long voyages，and that it
moreover should be obtained by the modern processes employed in candle making. Yet such would seem to be the case, for what is called glycerine is a colourless and sweet syrup produced in the manufacture of stearic acid, or as they are commonly called Price's patent, candles.
Should experiments prove that glycerine really possesses the property now ascribed to it, some attempt should be made to ascertain what there is in its composition that gives it the power. One might suppose that it owes its protecting action to the exclusion of air, or to the perfect dryness that it ensures, refusing as it does to allow moisture to pass, and moreover unable to give up its own water of combination at any ordinary temperature. We quite agree with Mr. Wilson in thinking that seeds bottled in glycerine should be at once sent to the colonies for the sake of testing the value of the upposed discovery.
But what can give it the property of stimulating as well as preserving vitality?

The Estimates for Civil Services for the present year now before as present some features of garden interest. In the (ireen Park 1454l. is required for filling up what is called the basin
opposite Devonshire House, and improving the adjacent ground. We had hoped that the Chelsea Water Company could have been compelled to pay this expense in consideration of the advantages they have so long been permitted to enjoy from a public nuisance. If the alteration is skilfully carried out this park will be so much improved in appearance as to console us for the loss of the heautiful bridge over the water in St. James's Park, which the Times would not permit Parliament to sanction. 500l. are devoted to enlarging the plantations in Victoria Park; it is to be hoped that some one will keep a vigilant eye upon the manner in which this money is expended. The New Museum at Kew is to cost, with fittings, \&c., \(5424 l\) a sum well laid out. A nursery for park plants is to be formed at Kew at a cost of 800 l ., an excellent measure much too long delayed. A couple of thousand pounds are devoted to the drainage of Richmond Park. May we ask how often this park has been drained (!) already? There is to be an iron fence round Kew and Richmond Greens, at a cost
of \(120 l\). ; Holyrood Palace is to have 34266 ., more of 1202. ; Holyrood Palace is to have 34266 , more
than two-thirds of which is required for forming a new road to Duddingstone.
The total cost of the Royal Botanic Garden, Kew, exclusive of the new museum, is 10,734\%. This part of the estimates is accompanied by an important report from Sir William Hoorer, from which we extract the following statements. The total number of visitors in 1855 was 318,818 ; their conduct is described as being the subject of great satisfaction. Indeed such aets of impropriety as are occasionally committed are plainly described as belonging more requently to the well-dressed than the lower classes.

The erection, during the year, of a new house for succulent plants, 200 feet long, 30 feet wide, and 15 feet high, has enabled us to display (and to sdvantage, for the first time) our noble collection of medicinal Aloes and Euphorbias, grotesque Cacti, and fibre-bearing Ayaves ; this is perfectly unique of its kind. Our new pits and frames will allow us to satisfy the general taste for flowers, by rendering the lawns and open borders more gay than they have hitherto been. The recently formed arboretum, or collection of hardy trees and shrabs, in the
pleasure-grounds, has received considerable accessions from temperate climes, which require nothing but time for their more full development to become ornamental as well as highly instructive to persons who are interested in forests and in ornamental planting."

The establishment of our present Museum of Economic Botany only dates from 1848. The building affords 6000 square feet of glazed cabinets for the deposit of those vegetable products that are either eminently curious or in anywise serviceable to mankind ; it is consequently of the highest essentance, if simply for instructional purposes, and essident to any person who reflects on the innumerable ways in which the vegetable kingdom ministers to the wants of the human race. The ship-builder, the carpenter, the cabinet-maker, the general merchant, the manufacturer, the weaver, the physician, the draggist, the dyer, the oil and colourman, \&cc. \&c., will here find systematically arranged the several objects in which they are interested, accompanied by their correct appellation, the countries whence they come, and the names of the plants from which they are procured. Till this collection and the correspondence which it entirely or chiefly unknown points, many had been or native country; and it is indabitable that every
ear more and more information will be elicited on points of no slight importance to a great mercantile conntry. So valuable and extensive a collection size and plan to that for the gardens, and one, with many illustrations, has consequently been published during the year just expired. The museum had already become even befure the close of 1854 inconveniently crowded by the accession of new contribntions, and a considerable amount of them had to be temporarily accommodated in the temples and in sheds. A vote for an additional museum wa therefore submitted to, and sanctioned by Parlia ment, and it has been happily so far carried out that at the moment of preparing this report the walls are erected, and the roof will in a few weeks be covered in. This convenient structure is destined to give furthe accommodation to the extent of 13,000 square fee of mural glazed cabinets. And it is in every respect fortunate that the structure is so far advanced, for an additional opportunity of acquiring valuable collections was atforded during last summer, when I was summoned by the French Imperial Commis sioner to take an active part in the jury of the second class at the Great Paris Exhibition. That class, mainly relating to vegetable products, offered
the very objects most requisite to enrich our collection. A grant of \(200 \%\). was accordingly obtained from the treasury, to be expended in procuring such articles as were most important for the Kew museum while the President of the Board of Trade liberall offered to expend an equal amount. Thus provided, and further assisted by the several officers of the then in Paris, and enriched by numerous donation from many exhibitors, 48 large cases were trans mitted to Kew. They contain vegetable products, many of them very rare and valuable, from Algeria, Australia, Austria, the East Indies, France, the Grand Duchy of Hesse, Jamaica, Mauritius, Norway Prussia, Sardinia, Sweden, Tuscany, the United States, Tasmania, Victoria, Wurtemburg, \&c. \&c. go far towards filling up the surplus space in the new museum

To say that this collection of vegetable products is unrivalled is saying little, and no more than might have been asserted while the museum was quite in its infancy, since nothing of the same in structive kind had ever been attempted. Ours is the gratification of having set the example, which is now being followed in several of our colonie (Jamaica, Demerara, Melbourne, \&c.). The East India Company is forming a similar musenm in
London, at Calcutta, and at Madras; another hás been attached to the Botanic Garden of Edinburgh and at the moment of drawing up this report observe the following paragraph in the Liverpoo Daily Post:-A museum of applied science is recently founded in connection with the Royal Institution of this town. It contains already above 600 specimens, many of great value, and as it has commenced with the vegetable substances, we
purpose to follow out the plan which has afforded purpose to follow out the plan which has afforded of the Royal Gardens of Kew.' A small but well arranged series of similar objects was formed towards the close of the Paris Exhibition by order of his Imperial Highness the Prince Napoleon; and we are likely to have a powerful but honourable rival
in the Museum of the Jardin des Plantes at Paris. There, indeed, an unexampled collection of woods and other products connected with physiology and pure botany has long been deposited, but with no approach to an economic museam till now, when donations and purchases at the close of the Great Paris Exhibition will lay the foundation of one on most extensive scale
With every word in these extracts we cordially都.

Deatr has this week claimed another victim from among the Nestors of Horticulture. Mr. Јонs Reeves, a name dear to all who are familiar with England and her gardens, has left us for a better world, after a long, useful, and honourable life of 82 years. Holding a high office in China under the E. I. Company at a time when that great association monopolised the Chinese trade, and when little was known of Chinese gardens beyond some grotesque caricatures upon paper and porcelain, Mr. Rerves
employed himself with indefatigable zeal in sending home all that he found most rare and beantiful among living plants. Thas employing his leisure through many years, he was either the immediate or indirect source from which were derived the Chinese Azaless, Camellias, Moutans, Chrysanthemums, Roses, and numberless other treasures which have been for so many years the glory of our col-
lections. Not a Company's for Europe without her decks being decorated
whith the litte portable greenhouses which preceded the present Wardian cases; and what was more, Mr. Resves succeeded in communicating to himself. Nor, indeed, could his exertions sending home new plants have been crowner with much success had not the goodwill of the officers been secured; for a voyage from Macao to London was not what it has now become. Doublin the Cape was so difficult an operation that the freight of living plants was continually damaged or thrown overboard in order to clear the decks. And in this way hundreds of plant cases were lost always however to be replaced by a zeal and perse verance which no disaster could diminish
Among the methods by which Mr. Rerves aceer ained what would be acceptable in England was the transmission of drawings, execated in
his own house, under his own superintendene, in order to secure himself against the dence tions practised by the native draughtsmen. Suct drawings first brought us acquainted with the Chinese Primrose, many of the finest Camellias and, above all, with the Glycine (Wistaria) sinensis a plant second only to the China Rose in import ance as an object of decoration. In this-way was
formed that collection of authentic drawing Chinese plants, by far the most extensive in Eirone which now forms part of the library of the Horticultural Society.
Nor were the exertions of our much lamented friend confined to the collection of living plants. I we look into private Herbaria, there we find mark of his industry and liberality; at the British Museam and in the Museum at Kew the name of Rrave occurs wherever Chinese productions are met with At last the kind good old gentleman has left us. One short week ago he was still to be seen examining the plants in the meeting room of the Hortical tural Society. Although now taken from us, he will long be present in the affectionate memories of those to whom he was more dear than words ca describe. The name of Reevesia thyrsoidea given by friend to a beautiful plant discovered by himself is the simple epitaph inscribed to his memory in the annals of science.

VEGETABLE PATHOLOGY.-No. CXIV.
458. b. Extrrexal ob Accidental, 2 (Organic.)-We have hitherto under this section (b) confined our attention arinch as possible to those aiseases which, thoog purely functional. We now come to a second series of maladies arising from palpable causes, which are indimaladies arising from palpable causes, which are indi-
cated not merely by a derangement of those function an which health depends, but by outward legions, about which no doubt can be entertained. These may be of various kinds, and may arise from various causes; they may be direct injuries, as from the foree of wind, light ning, or other atmospheric phenomena; from the depro dations of insects and other animals, or from what may be regarded as pure accident or wilful mischief ; aguin they may be due to the more insidious attacks of ex cernal or internal parasitic plants living at their xpense, and in consequence impeding their growth; or ago y, hey may be due to parasitic insects, arising irum way into it as soon as they are hatched. Formidable diseases may originate from any of these canses, and someimes two or more may be combined. It is not, how This, merely by exhaustion that injury is produced unfict mo exist in various degrees, and sometrues may as is frequently the case, ; but it is different whe as is frequently the case, the most important orgaui in consequence istication, are affected, and the no our intention to enter at any great length into the ravages of insects. We shall content ourselve with a few general remarks, first on the curion effects produced by insects on vegetable tissues, and then with a notice of some of the more important pests by which plants are affected as the Wheat Midge, the Pyralis of the Vine, the Vibrio, and plant lonse, without however attempting a description or enumera tion of the hosts of enemies by which they ars plagrounded, scarceiy one being exempt from its peedation respecting these will be found in works on Entomology, and our own Journal will afford in its notioes of insects a vast fund of such information. It will, on the contrary, be needful to enter at some length into the question of parasitic fungi, both on account of the very important part they bear in producing disease, the
ruinous effects of such diseases, and the neci sity thers i. ruinous effects of such diseases, and the necisituthivars,
for due appreciation of the subject by all cultiver for due appreciation of the subject by all cultiviom.
if they hope to contend successfully against them. The gardener must first be able to speal positively 48 to the nature of the attack. It will not do in such matters to act simply on conjecture; to fancy, for instance, , les a little natural pubescence on young leaves, or much lea some specks of carbonate of lime, or other chemical posit, are parasitic moulds, mistakes which are constand by made, and respecting whichwe are as often consahed by our correspondents; they must not again fancy fungi, no
must they think that every black speck apon their plants conceals an enemy in its bosom. If such is the case they apply remedies wholly unsuitable to the case before them A separate notice, therefore, will be tiven before them, important of these maladies, and in such a way, if poscultivators will cultivators will take the proper pains to come to a corsect conclusion. If they will still be satisfied with coming to a wrong conclusion greater chance of their coming to a wrong conclusion than of stumbling upon truth. It is now acknowledged by almost every competent authority that some of the greatest scourges of has been resisted by from parasites, though the notion has been resisted by every sort of argument; but this is not true of all, we shall still have some left for our remaining section, which is to treat of those diseases which arise from unknown or merely conjectural causes, and the trestment of such must of necessity be empi rieal. We may not indeed be able to combat with disease where its history is known, but we shall at leas have some prospect of succeeding if we can appl rational remedies. In following up the consideration organic disease arising from external cansideration of firat take those cases which come under the wead atmospheric or other material agency ; secondly thos arising from direct injury, as fractures, wound secon, those serious ruptures ; thirdly, the effects, wounds, and other serious ruptures; thirdly, the effects of parasites, whether the ravages of insects. Mcale of vegetation; and, lastly

\section*{SUN STROKES.}

I mire attentively read the articles by Dr. Caspary on Frost Splitting. My attention has long been directed plaee in spring, in the lower which more especially talies place in spring, in the lower part of the stems of fruit this splitting to spring frost prejudice which attributes has commenced. Trg frosts that occur after vegen ture of the air which sudden changes in the temperasap appear to be partly the cause of the evil ; but it is the sun's rays which cause the bursting of the bark and oceasion the splitting. The proof of this is that tha rents are always on the side next the sun, that which receives his rays between 11 A.M. and 2 P.M., and never on the east, north, or north-west sides.
Here is another still more positive proof: several is dwarf pyramids grafted on the Pear stock, trained were covered, in 1854 exposed to the action of the sun, were covered, in 1854 and 1855, to the height of 2 feet from the ground with a layer of straw, but only on the Splitting did to the sun's rays from \(114 . \mathrm{sm}\), to 2 p Splitting did not take place on the other sides of the troes, whilst about the middle of March, and somewhat bited fresh rente, at noon. From these facts on the side next the sun at noon. From these facts I draw the conclusion that having been confirmed by a a sun-stroke. The facts the grounds of several amateurs, I was induced to write the enclosed article which appeared in the "Echo de Bruxelles," and which may interest the readers of the Cuandeners' Chronicle. [We shall give this in a future Number.]
The soil of my fruit tree nursery is, for the most part, rather light and deep. A considerable number of and especially those which werer years from sun-stroke near the ground. Those that were trained ath branches and balf-standards escaped. The observation of this induced me to cut off the lower branches from all my vigorous specimen trees, and to train them ns half in autumn, and up to the after the fruit was gathered served any rent in to the present time I have not obhowever, that the he baric of these trees. I must say, been like that of lemperatare since Janary has no served splitting in the seedlings of the Apple, Pear Apricot, and Peach trained as standards or as half tandards.
What are the canses of these accidents? How can should be prevented? and what are the remedies tha the solution of to mitigate the consequences? For into some details which are the result requisite to enter tions made in different localities. Whane observasumed canses to which certain varietiet are the pretree, worked on the Pear atock, varieties of the Pear pyramids or Quenouilles, atock, and trained as dwarf pyring ? This question, are more especially exposed in trees because injuries is restricted to these sorts of seedling Pear trees, and never nes rarely occur on standard high, nor upon the stems of thesees grafted the Quince stock.
sems of those gratted on In general, sun-atrokes are more common on trees growing in a strong moist soil, than in one that is light fruit early, in the middle season, and late ; in ven their belonging to the different classes of form, as the Biesies Bon Chrétien, Bergamot, Doyenné, Corm, as the Bezi, vigorons ind icate and tender varieties, and in the most vigorous and hardy ; in young trees four or five years planted, and in those planted more recently.
the evil is thets established and admitted, the canse of tocks ous which partiy in the soil, in the condition of the tudes of elimate in Pear is worked, and in the vicissialso in the eondition of the young bark, which, baving been theltered all the summer by the leafy boughs of
resist the direet action of the solar rays in the month of March, when, owing to the absence of teaves it then without sufficient shelter.
In a strong moist soil, ss may be conceived, the roots, han in oetanion commences, draw sap more abundantly mence to vegetate before the graft can she stock comculate the sap throughout the stem and brand cirmust accumulate in the part stem and branches it juncticn of the stock and praft immediately above the I have seen stock and graft.
Apricot trees trained as devious years many Peach and also Vines, with than on any other their barks split on that much more soil, in the quality aspect. The causes, then, are in the cause the reflux of the stock, in sudden frosts which direct rays of the of the ascending sap; but it is the March which determine the months of February and it is from the observation of these of the bark; and thought proper to call this malady a facts that I hav Before the term frost-spliady a sun-stroke.
dmitted, it is necessary to prove that the be properly place in every part of the tree, as well as that exposed to the sun between the hours of 11 is as that exposed when his rays are most powerful. I have even observ., the progress of the splitting at these hours. The rents in their commencement, berceptible in the first day o as the thickness of a penny. The bart where as wide with a cloth reattach penay. The bark when covered this be neglected for several to the alburnum ; but i in that case it must several days the bark withers, and rom the alburnum be removed as far as it is detached and much trournum, and it then requires several years and much trouble to heal the wound.
iven the resulta that no English horticulturist has subject. Perhaps this article will induce Mr. Rivers to do so. De Jonghe, Brussels, March.

\section*{NEW GARDEN FERNS.-No. IX.}
20. Hymenolefis revoluta, Blume, Enum. Pl. Jave 201. Kunze, Schkhr. Supp. i. 101, t. 47, fig. 2. GYMnopteris revoluta, Moore and Houlston, Gen. and Sp. Cult. Ferns ined. Mralolepis revoluta, Kunze, Ind. Fil. Cult. 50.
A planiuscula, Kunze, Ind. Fil Cult. 50. Fronds lanceolate, scareely recurved at the margin, the fertile
appendage elongate, and attennated at the aper. Hymenolepis has been often reft apes
chere, but it seems to us to referred to the Acrostito the Pleurogrammmet the sori at first forming a each side of and close to sori at first forming a line on confluent over it. H. revoluta costa, though eventually
confluent over it. H. revoluta is a neat evergreen stove

Fern of remarkable appearance, its simple fronds be fructification. The fronds are spike, which bears the about a foot high, narrow lanceolate, smos, altogether half or nearly so being occupied by a linear , the uppe on the lower surface of which are borne the tpendage of densely compacted spore-cases, which soon coalesce over the costa, and form a maes covering the whole appendage; this part of the frond is gradually attenuated towards the apex. During the early stages of and partly entire edges of the appendage are revolute species the entire margin of the frond is trype of the lute ; but in this form, which only is knowa in gardena,
slight tendency to become recurved margin shows but bscure, baty to become recurved. The venation is the costa are seen to be more prominent emerge from having a tendency to becore prominent than the reat, called pinnate. There is a nearly allied plat, or what is the fertile appendage is a nearly allied plant, in which sides, and the veins is shorter and obtuse with paralle sides, and the veins are entirely hidden. In both the small short crowded lateral and articulated with the smail short creeping rhizome. The present, which appears to have been introduced from the continental ollowed ollowed Kunze in regarding it as a variety of Hym It seems but it has broader as well as plane frond It seems not improbable thas there may be the fronds. pecies as indicated by Presl (Epim. Bot. 159-60) and so the plant now under notice may be the Hym. cold the Acrostichum spicatum of Linneus, the others, Blume not tresi, being the Hym. ophioglossoides of Blume

\section*{Home Correspondence.}

The Plane Tree.-In the Royal Herbarium, Berlin, find the following specimens of this genus, viz.:-1. Pla Schiede ; P Moricand, from Mexico, collected by by Engelmann ; 3 P Patalis \(L\), from St. Louis, collected the gardens, fro. orientalis \(L\). var. hispanica, orientalis \(L\) rom Spain, collected by Ruiz; 4. P bagh, coll. var. liquidambarifolia Spach, from Kara acerifolia Aiton (Py szovitz; 5. P. orientalis \(L\). var 6. P. orientalis (P. acerifolia W.), from Spain, by Ruiz cultivated; and 7. P. orientalis \(L\)., from Italy and Greece (Patras by Link); from Jerusalem from Delessert ; and from Grusia under the incorrem from of P. acerifolia, given by Karl Koch. \(p_{1}\). Klotzrech Berline Rhododendrons Falconeri and Wighti.-It will doubt. less interest your readers to know that a will doubteach of these very fine plants is now in bloom in of each of these very fine plants is now in bloom in our
nursery. The flowers of Wighti are not equal to those nursery. The flowers of Wighti are not equal to those laya;" while those of Fhododendrons of Siksim HimaWhen first opened of Falconeri are very much superior. when first opened the blooms of Wighti were of a rery pale primrose, changing, however, in a day or two to pore white. They are of good shape, 3 inches across the mouth; and the petals have a very singular and beautiful appearance from being nearly transparent. Altogether the plant is a handsome one, and forms a decided acquisition. Falconeri is yet more than that ; its flowers are the most beautifully shaped of any known Rhododendron. Each is a perfect cup \(2 \downarrow\) inches across by about 2 inches deep, of a rich primrose colour, strongly daslied with crimson at the base. The shape of the individual blossoms, as well as that of the shape will leave nothing to be desired in those respects. The flowers both of Falconeri and Wishti are sweet-scented, the latter, however, much more so then the for Judging from the several species of the Sillim Rhodo thems which have now blossomed, and comparin them with the published representations, we think tha many varies of each will be found, some much supe rior, others far below what is expected. Standish and
Noble, Bagshot. Noble, Bagshot.
ransplanting Evergreens. - In reply to the inquiry addressed to me, I recommend him to remove Yews in that should no which I have recommended for Hollies for the folloriod reason. The young growth of the Yew commences much earlier than that of the Holly, and advances more slowly, and at the season stated he would find his Yews covered with young wood, which would suffer by removal, and would injure the tree. Evergreens vary very much in this respect, and almost every species has some constitutional peculiarity. It is very remarkable the Deodar, which I have never moved more successfully than in the spring, whilst the Cedar of
Lebanon (so nearly related to it that many persons Lebanon (so nearly related to it that many persons if moved at that season. I have moved from the same goot, and the sameason. I have moved from the same them, and the same soil, a dozen Deodars without one of them suffering in the least, whilst of 12 Cedars, five out of six died. John Rogers.
Ants.-I clear my hothouses of these by means of arsenic mixed with lump sugar, at the rate of abou 1 grain to 20 , laid on Orange peel, of which they will eat greedily. Wasps I have destroyed in the same way but it is dangerous to have this remedy lying about out of doors. Robert Cassillis, Gardener to the Rev. J. P. Jones, Elm Areen, near Cirencester.
Oak Timbcr.- With regard to the large Oaks of the Forest of Dean, I know that the shipbuilders of Chepstow, in Monmouthshire, and of Brokebear, in Gloucestershire, both on the river Wye and on the borders of the
forest, always considered the smaller Oaks of Hereford shire superior in quality to the giants of the forest ; and I believe there can be little donbt that the forest; and I believe there can be little donbt that an Oak grown
alone and in an exposed situation will be harder and alone and in an exposed situation will be harder and witness the white Osls of grown in a sheltered gronp, split so freely that they are nsed for of Canada, which are not more durable than our Ash. B. Minshull Thomas, Foxdown, Bideford. [But the white Oak of Canads, although an Oak, is not one of our Britiah

Soil for Rhododendrons.-"A Farmer in a Fix" page 174) need not put himself to any expense for peat.
clined to and, I have grown humdreds of Rhodolendrons, Azaleas, and Kalmias. When I first named to my foreman my intention to try to grow eughed at my phant there, he riunce in thus attempting to grow Rhododendrons without peat. Notwithstanding that, however, I made the attempt by planting out about 8000 kiuds, nearly 10 years ago, and they far exceeded my most sanguine expectations; since that time I have grown the quantity abuve stated, including upway they in some cases grow varielies 1 enuld presh and require extra removal, ireely, indead ton much so, ane is fine and bright in coluur. I have them from 6 inches to 6 feet high, and when in bloom they are a sight worth going miles to see. William Barratt, St. Jolen's Nursery, Wakefield.
Plane Tree Timber.-As much discussion has of late taken place respecting the Plane, I should like to know the experience of those who have tested its qualities as a timber tree; for it is but little known in the trade and consequently dealers are unwilling to buy it. timber it seems to resemble the yellow-coloured Beech more than the Sycamore, both in hardness, density and general appearance ; but I donbt much whether will ever become such a long-lived tree, for amonge some half dozen that I have cut of fair timber size 1 find only one sound, and the situation they wera its merits must be confined to its appearance. H.T.H

\section*{Eocieties}

Limmzan, March 18.-W. Yarrell, Esq., V.P., in the chair. H. Adams, Esq., was eleoted a Fellow, The influence of the sexual organ in modifying the external character in animals," by W. Yarrell, Esq. 2. The commencement of a memoir entitled "Remarks on the nature of the outer fleshy covering the development Clusiacere, Magnoliacee, de, and od the of the raphe in general usq. Mr. Miers, in a paper already published in the Society's Transactions, pro pounds an opinion different to that of some other botanists on the nature of these seed coverings, The external
fleshy envelope of the seed of Clusiee he regards as a proluct of extraneous placentary growth, subsequently to the development of the primine, and therefore \(a\) kind of arillus. In the tribe Tovomitere of the same family, the outer coating, similar in substance and colour, is unquestionably an aril, white in thecter of an enveloping pulp. If therefore in the two latter tribel, Mr. Miers as fair to cotude coat the analogous envelope in the Clusiex was of a similar nature. This inference had been confirmed by the detection of a distinct simple been conesth the inner pellicle of the aril, wholly free from the testa, which it perforated at the apex, and fecume lost in the clalaza of the iuner integument With such demonstraive proof as regards the Clusitre, comparison with similar facts observable in the Mag noliacese had been drawn, because, Mr. Miers added, that cuating be considered an aril in the oue faming, must be of the same nature on various nccasions, has Gray, on the other hand and on various nccasions, has
regarded the external fleshy coat of the seeds of Mag regarded the external fleshy coat of the seeds of Mag-
nolia as the testa, and the same view has been adopted nolia as the testa, and the same view has been adopted
by Drs. Hooker and Thomson in the recently published "Flora Indiea." In the present memoir Mr. Mier adduces at great length, and in much detail, what he regards as conclusive evidence in support of his own published view of the subject, replying to the objections of Dr. Gray, and adopting in support of his own argument Dr. Gray's figures of the structure of the ovales of detailed explanations of the structures in dispute, does not admit of compression within our limited space and is altogether of a technical nature.

Extosological, March 3.-W. W. Saunders, Eeq F.R.S., President, in the chair. Mr. Samuel Stevens exhibited a specimen of the beaudrul Epischnia diversalis taken by Mr. Myiton at Hurstperpoint, near Brighton, proving that the species, which had been rejected from the British lists, is really indigenous
this country; also a selection of Britisi moths from Mr Wailace's collectious recently received from Bornen Mr. Adam White made some observations on these species, pointing out their peculiarities, and recommending the more general study of exotic insects. Amongtt the species was a new species of the strange amall shrimp a ile A Crustacean taken out of well at Wandswortb, which Mr. Westwood identified as the Gammarus subterraneus of Leach, and as belonging to Schiodte's bind genus Niphargus. Another instance of the capture of this curious species near Bromley, Kent, was mentioned by Mr. Lubbock.
Mr. Saunders also exhibited a remarkable Longicorn Mr. Saunders also exhibited a remarkable Longicorn
beetle, of an elongated form, with incrassated hind thighs, from Northern Lodia. Mr. Stainton extibited a larva of a small Lepidopterous insect which had been vomited by a person who had previously undergone considerable suffering ; likewise leaves of Scoteln Fir mined
by the larvze of Ucnerostoma pinariella. Mr. Hudson by the larver of Ocnerostoma pinariella. Mr. Hudson
exhibited the larver and perfect beetles of the small stag beetle Dorcus para'ellipipedus, taken in Ash stumps,

Mr. Tapping gave an account of the discovery of the A. White identified as Cheyletus eruditus), which had A. White idenemed to the surface of a photoyraphic portrait, and had caused it to fog off. The Rev. Mr Hawkes exhibited a remarkable pale variety of the garden tiger moth, and Mr. Walker specimens found alive. Mr. Wollaston exhibited portions of his remarkable collection of Madeira insects formed during the past year, comprising a great number of novelties Mr. Lutbock made some ubservations in the legs of the genus Mysis. Mr. Westwood gave an accrop is at the present time sulijected in different parts of the country, owing to the attacks of different specie of insects: from Norfolk he had received specimen which had been destroyed by the larvæ of a smal dipterous insect, apparently Oscinis vastator, whilst he Society had received a communication from Mr Dunning, Hurstperpcint, in which the ground was warming with the young larvee of one of the Tipulide. Descriptions of new Longicorn beetles from Borne Dere read by Mr. Pascoe. Mr. White also read de seriptions of Mr. scriptions Mr. Westwood describel a yery fine new beetles. Mr. Mr Curtis com Morphideous butterfly from Borneo. Mr. Curtis municated a note from Mr. Maclean of the Brinstone butterfy proving that the early spring specimens have butterfly, proving that the early spring specime parturi hybernated. A uote by Mr. Newman of Dorthesia Characias was read, well as description by Mr. Baly of a new genus of Chrysomelidæ from tropical Africa.
Jersey Horticultural: March 1.-The Presiden in the chair. On this oceasion Col. Le Couteur read the following Memorandum on a Recently Observed Disease on Pear-Trees. "I was packing Beurré d'Aremberg, or Glou Morceau Pear, with an infinite number of brownish-looking excrescences al wer it. On a exactly shrivelled, butstarved in its growth, and had no exacly half the wize or swage of fine health fruit; ruit; also, that the parasceder the eye. The stem, being very mucth erear in all directions; some heads pointed one way, some another. At first I considered them to be fungi. I took the Pear to scientific member of our Board, who placed one of the supposed fungi under a powerful microscope ; but
could not then determine what it might be: there did could not then determine what it might be: chere did not appear to be life in it. I afterwards carefully lifte one of these excrescences from the Pear with a shar penknife, when I accidentally broke the under-akin of -on which I placed the creature under a powerfu microscopic power, when aible the naked eye. One of these eggs, on being exposed to the rays of the sun, in a short time burst, with signs of life, but I could not discover the contents, or see the embryo. It was viat fy lady-bird, elongated and flattened.
limpet adheres to a rock, it attaches itself to the bark of he tree, or to its fruit : and, how slow soever, evidently with power of locomotion and reproduction to a prodigious extent-in numbers sufficient to overspread and to damage the young shoots, eventually so as to The head is something like the snout of a pig, of a ransparent dirty yellow colour, which is attach to the body by a short neck of nearly the same colour, with two or three rings to it ; the back is
rounded, elongated, and brown, with a delicate fur or down over it, over its lower edges especially, on eithe side. When the creature is lifted with caution, the reposes, is seen to be a thin yellow shin, which protect the inside of the creature. On removing this fine skin I could discover no entrails with the glasses in my possession, but a number of transparent eggs wey ound in several spechers, being males. I commu nicated my discovery to Dr. Lindley, the Vice Secretary to the Horticultural Society of London, with a request the followin reply - SYour Pear is attacked by th the following reply:- Your Pear is and find the Mussel scale insect, wing. What you found under the skin are the young ones, each of which will soon have a litte of its own. All you can do is, to cut the trees as hard in as you can-when the leaves are off-to burn what ycu remove, and then paint the branches all over with a mixture of lime, soor, sulphur, and water-the old stem included. Should you care enough for your tree to painting it, to have the branches scrubbed with wate heated to \(160^{\circ}\) to \(180^{\circ}\) Fahrenheit. It is a horrid pest. I immediately examined all my Pear trees, and only Louise, which was overrun with it : the vegetation the tree seemed strangled and checked ; the crop had heen all but worthless, ill-grown and ill-flayoured. The vil wan bur our the the cut down the graft. A Beurré d'Aremberg, that was next to it the grait. A Beurré d'Aremberg, that was next to it, contact with the Marie Louise. All the branches on which I could discover the insect in numbers have been
cut off, and burned; wlere it is in few epots, the
branches have been painted, either with the mixtur recommended, or with paint wil, which I have found to fill up the pores of most insects, and so destroy thiem. I revent this pest, if possible, from devastating our well amed Island Pears.
The Rev. S. King then read the following communication on the same subject, by which it will be seen thal that gentleman differs from the views of Col. Le fungus, not an insect:-"In the autumn of last jear, Colonel Le Couteur brought me a Pear for examination, coverea with numerous small patches of parmaitic matter, of a kind which had never fallen under bis olservation before. One of these patches, about the twelfth of an inch in length, was placed upon a slip of glass, and suhjected to a low power of the microscope. Its shape was very much like that of a mussel shell, rounded at one extremity, and taperering away to a truncated point at the other, which point appeared formed of several folds, and lookin's much like the end of a cigar. It was of a light brown colour, beset with a hoary down, with ciliated edges, resembling a good deal the scale of a Beech leaf bud. The parasite adhered to the fruit like a limpet to the rock, the margin of ita shell conforming itself to the shape of the rind. regarded it as a fungus; but Colonel Le Couteur though it more likely to be an insect. There was, howevar, no vestige of legs or wings or antenne, or of any organ of either locomotion or sensation. The glass, with the specimen on it, was put into a drawer, and two months or more elapsed before I examined it again. I then found to my surprise, that the thing had burst appearing like an empty capsule, having scattered great number of white ova over the surface of the greal which of a fan and glass, to which they adhered, in the shape of a ran, and a distance fro being near the parasite atsel, bry with considerable force. They were rotato sbaped with surface-depressions, and not at all pointed the tho parent. This led me to look at a piece of the Peas rind, having several parasites on it, which I had pu way amougat other microscopical objects. I ova scattered like caseshot in all directions. A shor time ago I again examined the glass slip, and perceived that nearly every one of the ova was surfounded with or had proceeding from it, a cloudy stain, extending to a considerable distance. On submitting this to a higa magnifying power, the stain was resolved into milion of minute longitudinal cells or particles of tawny dush the ovum itself being reduced to an almost infinitely thin curled up membrane. In these particulars, observe a striet analogy with the growth and propagetion of funcoid plants; b

\section*{growth and proparation}

Specimens of the devastated branches of Peardree and of the insects (or fungi) under a microseope, were laid before the Board by Co. Le Couteur, and ware to subjects of much observation and \(\begin{aligned} & \text { Tines. If Mr. King will consult our volume for } 1843 \text {, }\end{aligned}\) Tincs. [If Mr. King will consult our volumeting yet to page 736 , he will discover that he

The Food of London: a Sketch of the Chief Varrotic Sources of Supply, Probable Quantities, 1 adulie Arrival, Processes of Manufacture, Smys)ctea Pood for
ration, and Machinery of Distribution, of the a Community of Two Millions and a hnfacturess George Doold, Author of "Brit
\&c. 8vo. Longmans; pp. 524.
The food of London! what a subject. Two million and a half of people to receive their daily bread by quiet system of self organisation; nine hundred how or by whom ; that is indeed a theme to
the powers of the shrewdest observer and the profoundest showing what a prodigious maw this London of our's
statistician. Nor is it a subject to be easily handled by possesses.
even the most able ; for although "there are rations for all and endless variety in those rations, yet is there no commissary-general to take care of sucli matters." There is no centre of information concerning such a subject must pick up evidence from among the countless fragments in which it lies concealed. Mr. Dodd appears to be just the person to handle such details; sidered skilfully. Such published information as existed he has used freely; and if he still leaves the subject nevertheless where he can have gleaned so much.
One chapter treats of the supply of food to London in past ages; in others are discussed the warehouse room, corn and bread, cattle and cattle markets, country meats and cured provisions, dairy produce and poultry,
Billingsgate and fish supplies, fruits and vegetables, Billingsgate and fish supplies, fruits and vegetables,
grocery and colonial produce, beverages, and finally grocery and colonial produce, beverages, and finally
the retail trade. Upon all these subjects the information carefully collected by the author is ample and extremely curious. The antiquarian chapter more especially will reward the most cursory reader; for he
will be surprised to learn how badly our great ances tors sometimes fared, how barbarous the food, when aldermen fed on porpoises, blackbirds, whelk pottage, and roasted mill, while poor men stayed the \(t\) appetites would seem to in Norfolk, about the year 1480 , malt sold for 13 d . a coomb (a measure of four bushels, not two as Mr. Dodd supposes), Wheat \(2 s\) or \(28.2 d\)., and Oats 18 .
our more especial concern. "Few of our market places," says Mr. Lodd, "link the present with the memory of the past so fully as the Convent Garden market-for
Convent Garden it was, before men clipped it and shortened it to Covent. The open area was once a
garden belonging to the monks of Westminster Abbey the ground is known to have been thus appropriate as far back as the year 1222 ; and there has probably never been a week, during a period of six centuries and a half, in which this plot of ground did not contain fruit, flowers, and vegetables-first as a garden, and then as a market. In the time of Queen Elizabeth, the (former) Convent Garden was a walled space, very much larger than the present market; extending from Drury Lane on the east to St. Martin's Lane on the west, and from open meadows on the north to Bedford House on the south. This house, the town-residence of the lordly constituting Southarmpton Street part of the ground now marked out comprised fields and gardens, with rows of mares, and a few buildings. The change of destination in this open space occurred at the time of the Reformation. At the period when the marginal portions of the old garden were thus covered with straight streets of new houses, the central area or square was enclosed by rails,
and had a sun-dial in the middle. The south side of the area alone, between the enclosure and the garden of Bedford House, was used as a market for fruit and vegetables. When Tavistock and York and Southampton Streets were built, at a somewhat later date, the enclosure ; this offended the aristocratic dwellers on the north side, who one by one left; their deserted mansions became occupied mostly as hotels; and to this feature in the locality hotels constitute a distinguishing feature in the locality. The market grew and grew in or comfort. Until within the last grow in cleanliness it was very. unsightly and ineommodious; the sheds ary it was very unsightly and incommodious; the sheds and wooden structures were in ruinous condition; the filth and disorder were terrible; and the reckless character of the market people was rendered still more reckless by the total neglect of all means of conducing to their
comfort and orderly management." We need not say. comiort and orderly management."

As to the consumption of fruit and vegetables in this and other London markets, there seems to be no possibility of arriving at anything like a probable estimate Rejecting Mr. Mayhew's calculations in the Morning Chronicle as excessive, our author gives a more reliable computation, apparently derived from a more authentic
"Mr. Braithwaite Poole, from the usages of his office as goods' manager on a great railway, is accustomed to estimate quantities by the ton weight, which sometimes renders it difficult to compare his estimates with those of other authorities. The following remarkable retur is given by him as representing the weight of the prin cipal kinds of vegetables sold at the London market in 1850 :-Potatoes, 138,000 tons; Cabbages, 80,000 Turnips, 43,600 ; Onions, 36,850 ; Broccoli, 31,950 Carrots, 8050 ; Turnip-tops, 4150 ; Peas, 3900 ; Cucum-
bers, 2240 ; Rhubarb, 2100 ; Lettuces, 2050 ; Beans, bers, 22000 ; Rhubarb, 2100 ; Lettuces, 2050 ; Beans,
2630 ; Celery, 800 ; Radishes, 750 ; Spanish Onions, 650 ; Vegetable Marrow, 300 ; Asparagus, 260 Herbs, 250.
"The same authority, adopting the same grouping into tons weight instead of measures of capacity, gives another return relating to fruit:-Apples, 17,150 tobs rants, 3900 ; Danusons, 1052 ; Cherries, 927 ; Strawberries, 700 ; Filberts, 230 ; Hazel Nuts, 226 ; Mulberries, 54 ; Raspberries, 1
admits, extremely uncertain. They however assist in

With one extract more we must close our notice of
The foreign fre-h-fruit trade has a clearly-marked character in Lon'on. It has its own locality, its own salesmen, its own buyers, its own porters. Around the lanes just named the warehouses are placed and the salesmen transact their businees. In more than one of them we may see the names of Keeling and Hunt written up on the fronts of warehouses which appea this firm granaries than mere fruit store-house trade. The wilderness of sweets about this neighbourhood is graphically sketehed by the writer just quoted 'The huge warehouses in Botolph and Iudding Lanes are the great fruit-emporiums of our metropolis. Thes floor upon floor, story upous story, may be seen piled and heaped, and blocked baskets, barrels, all bursting with their rich fruitiness. In cold, dark, stone cellars, in lofty ground floors, in topmost cockloft, not a foot of space is wasted its utmost function. Grapes, Chesnuts, Pine-apples Citrons, Hazel-nuts, Oranges, Lemons, all are there in overwhelming abundance, in waggon-loads, in heapedup piles, in towering pyramids. A busier and a noisier scenritory, in in another part of the great 'Orange fruit firms in Monument Yard is one of the larges the brokers who, almost daily during the season, hold auctions of the fruits they have on hand. In a long, not over cleanly room, lonking out upon the great stone Monument, are some desks, a solid table, and rows of benches, on which, in all sorts of attitudes, are to be seen all sorts of fruit buyers. When Pine Apples, Grapes, and French and Dutch soft fruit are on sale, Orange snd Lemon business the company comprise several west-end buyers, with a motley crew of nois greasy folk from the purlieus of Duke's Place, Coven Garden, and Spitalfields. Those men it is who, buying the fruit in lots of eight cases, retail them out at a good profit to costermongers and small shopkeepers. A load of fine early Oranges has just arrived at South ampton ; when immediately 'all is bustle at Monumen Yard; and in a few minutes circulars are conveyed by of the metropolis, informing them that by , we on the following, St Me ma mor the new St. Aichael crop will he on view in their warerooms,
trusting securely in the fact that the railway company will transmit the fruit in due time

This foreign fruit trade has become, indeed, a large one. No less than a million and a half of bushels of foreign Nuts, of various kinds, were brought to London in 1853, and a million and a half pounds of Grapes, goodly quantity of Pine Apples, Cherries, Apples, Pears, and other fruits.

Fruit and vegetables, the costly and the humble the British and the foreign-all are now experiencing Loneneft of rapid conveyance, 80 far as the supply o London is concerned. The Great Northern brings up and all the railways together now convey hundreds of thousands of tons of fruit and vegetables to London in a year. One of the curious results of our modern im provements is, that if Covent Garden has a plethora o good things on any one morning, she sends off a tele graphic message to Birmingham, or other large towns,
to ascertain the state of the supplies there; if there be to ascertain the state of the supplies there; if there be room for more, waggon loads of fruit are sent off by rail ; and thus prices become equalised and supplies
diffused. On one night several tons of Gherkins arrived at the King's Cross terminus. The South-Eastern Railway brought up to the Bricklayers Arms depôt, in the first half of 1855 , no less than 48,000 baskets and other packages of fruit and vegetables, weighing 1150 tons. But this is far below the amoun table products are in their prime; on three days in the months of July and August the arrivals amounted busy a than 10,000 packages each day. On one ver busy night, the goods' trains brought op 120 tons of Peas, and 40 tons of Filberts, grown in Kent, together a fair average of other vegetables and fruits. The Kent Road was in a turmoil all night,-nothing but laden waggons following in a stream almost continunus Of the wonders of the Hop-trade at the Bricklayers Arms depot, a future chapter will tell. It is obvious
that, when Covent Garden market receives such that, when Covent Garden market receives such tageous to avoid an excessive laxity of price by sendin portions into the country for sale; and the electric telegraph offers a peculiar aid here, by diffusing a knowledge of the state of the markets in any part of England."

\section*{Garden Memoranda.}

Messrs. Chandeer's, Vauxhall.-The fine collection
of Camellas for which this nursery has long been celebrated is now in full bloom, and we need not add they form a bank 160 feet in length and 8 or 10 feet in depth, some idea may be formed of the kind of enter ainment which so large a display may be expected to
apecimen Camellias which reach out in the border to the reat These are noble trees loaded with blossoms, which are also produced in great profusion by plants trained all ver the back wall. Among red varieties we remarke mannificent examples of Chandleri, Eximia and Elegans ; on the last were flowers of immense size and on most of them, as is frequently the case, the petals
werebeautifully notled with white. Amongemaller plants in pots were Rosea perfecta nova, a rather pretty kind with a bright rosy pink colour; Reine des Fleurs, a very ree flowering sort aven in a small state ; Mathottiana, Continental variety with bright red blossoms of very large size, some of them measuring quite six inches in diameter. Among other sorts were Teutonia, a pink ind, on which however the flowers sometimes come entirely white. Of Carnation-flowered varieties Alexina was remarkable for good shape and generally attractive character. Among whites the old double sort still holds the first place. Its only fault is its liability to drop its buds. In the plante here, however, this has no happened to any great extent this year ; at least enough have remained on to produce a fair crop of flowers.
gainst a have been growing out of doors here years ; they stand a north-west aspect for these last 20 a leaf being injured and fower well, furming whout succession to those under glass, from which they only differ in the size of their blossoms. The latter are much smaller on trees in the open air, and if the weather at flowering time hapens to be unfarourable their heauty soon gets farnished. A little protection to the flowers only would however remedy this; the
plants thenselves, after what has been stated, we need not say are perfectly hardy.
Stocks on which to inarch Camellias are planted out here in beds under glass, a method by which better pots. The produced than by growing them wholly in in pits under glass, and the stocks which are potted are brought and placed round them. Strong branches of the former are bent down and inarehed on the latter and in this way flowering plants are often obtained the first year.
In the show house were various Rhododendrons, among which one called fragrans was very sweet scented. Its flowers are white tinged with lilac. was meas were also very gay, and a dencions perfume ront shelves were interspersed with Ferns intermixed with plants of Lachenalia bicolor ; these formed as it were a sort of undergrowth for standard Azaleas, which rising up from among them and overtopping them looked like a foreat in minature, and had a pretty effect. Cupressus funebris and Cryptomeria japonien xcellent placed in vaser, we were informed, form remembering by those who have such places to decorate. They are reported to stand confinement well.

\section*{Miscellaneous}

Ten'a de Parayuay, or Faraguay Tea.-This is the wigs of a tree in Paraguay, vielding a pleasant and exhilarating infusion. The usual mode of preparing the infueion is in a small calabash, or matt, with a neek to it, which, cut off, leaves a small hole, the total contents being about the eighth part of a pint. To prepare a fall is to make an infusion, but it does not neceasarily article "dear bought and far fetched," is prized by ladies and well-to-do people. In the pampas of Buenos Ayres, the poor Gauchos invite the traveller to take a mate cimarron, i. e, an infusion of wild herbs, analoon Drake's yaren is appaks of the Symerons, or fugitive negroes. In the West Indies they call them Maroons. It is probably a corruption from ancient Moorish times, originaly Cis-Marrucco, or next to Morocco, as the French now call Spain "Africa bey II the Pyrenees." in some cases where yerva exista not, you are waked in which a bit of orange or lemon peel is steeped. But these are beggarly appliances, and the true thing is a mate do yerva-" "the herb," whieh is held to be a universal luxury, whether prepared in the simple calabash, or the silver cup, made in imitation thereof, for cup of the yerva infusion. Whether made in the mansion, the cottage, or the wilderness, the process is as follows :-The water is beiled in a cupper pot, higbellied below, and with a long neck and a man opening laugh, a pot such as 1 Cain. The Arabs to make, filled with yervo, after the bombilla has been placed in position. The bombilla is literally a "little pump," that is, a sucking rube, the perforated diaphragm in our teapot spouts. Some use sugar with the intusion, epicures burnt sugar, and put a water being poured on, the preparation is complete, and the imbiber, holding the maté in both hands in cold weather, sucks it dry, with care not to burn his tongue. A second water is poured on, and a second person auakm emptied and filled again, till sll the company is sup-

flant department
Conareryatory, \&c.-The oceasional bright sunshine and cold drying winds which have recently prevailed will soon, unless means are used to counteract their plants in this house, particularly if their blooming has been forwarded in a close moist atmosphere, and although it is yet too early to bring shading into general use it will be impossible without its assistance to premay now very soon expect Blindis can hardly be looked upon as anything better than necessary evils, for besides their being troublesome and expensive, it is very difficult to arrange them sho their disfiguring the louse. It is therefore worth while to have them so arranged as to be easly drawn up or let down, and to be as little conspicuous as possible there is a great tendency to employ them more than is absolutely necessary, and nothing can look more dismal than a house wrapped in canvas when there is no sun-
shine ; and besides the disagreesble appearance it is most injurious to any growing plants in the house, and also prevents those in bloom from attaining their proper colour. Whatever material is used for blinds it should be light and strong, for what is wanted is merely to the house. A nice light open-made canvas forms the best kind of ahading material. A close net is superior in some respects, but it is so objectionable in the case of lofty houses from its liability to get torn through moving it up and down that it is altogether unsuitable It may soon be necessary to admit air freely to keep possible allowing cold currents to blow over the plants.

FORCING DEPARTMENT
Pinkries.-Look over young growing stock, oceasionally examining 'and repotting such as is found to be in want of more pot room. The temperature may but this is a matter in which the state of the plant will be the best guide. Aim at securing strong dwar
h) ained, it is immaterial whether the night temperature sum very much will depen upon circum stances as to which will be proper. Plants that may be unhealthy and in an unkind state, if kept near the glass, will be benefitted by a considerably higher
temperature than would be suitable for others in a temperature than would be suitable for others in
free state of growth. These are circumstances however, which can be properiy judged of only by those in care of the plants, but they are easily understood by a little careful observation. Use every means free strong growth will result with otherwise ordinary care only. Vineries.-See that Vines starting into growth are tied up in their places hefore the shoots get so long as to be liable to be broken off in the to unfold; but use the syringe spaxingly after that is the case, and only on the afternoons of briuht ays. Where the buds do not promise to lreat regularly bend the Vines so as to place those that re backward in the most likely position to catch the sap, and this should be done directly any indications
of their breaking irregularly are observed. If any of the bunches in houses where the berries are stoned look as if they would be improved by a few more berries being cut out, let this be done at once, so as to allow those left plenty of room, and also to avoid having to
handle the fruit after it begins to colour. Give air as freely as the state of the weather will admit, using a little extra fire heat, and leaving a little air on at night so as to prevent the bloom being injured by damp settling on the berries, as is apt to be the case where the house is shat up. Figs.- Where the early crop is approaching maturity the borders should be well watered, so as to avoid the necessity of having to water the soil after the ruit begins to ripen, which is injurious to the flavour and is also apt to cause the fruit to burst prematurely, particularly if the trees have been rather dry at the root previously. So far as the present crop is concerned the trees can, perhaps, hardly be too dry at the root while the fruit is ripening, but where a second crop is expected care must be exercised to lieep the trees in health, and to prevent the foliage becoming a prey to heaith, and to prevent the foliage becoming a prey to expected to be good for much. Use the syringe expected to be good for much. Use the syringe
vigorously and maintain ir moist atmosphere as long as his can be done without risk of injuring the fruit. Also keep the young wood thin and regularly tied in, stopping before the fourth or fifth leaf, according to the strength of he shoots, \&cc. Melons.-Encourage those newly planted out with a moist warm atmosphere, so as to get them into full growth as quickly as possible ; but plants that are fairly established should be kept cooler, admitting ar on every favourable opportunity, in order to secure short-jointed fruitful wood. Keep the shoots thin and regular, pinching out any not wanted, but avoid stopping the main shoots until they reach the sides of the pit, when by pinching out the points the laterals will start into growth and show fruic abundantly; and by this time the plants will have gained sufficient strength to set and carry a fair crop. Do not exceed \(65^{\circ}\) at night, and admit air when the glass rises to \(75^{\circ}\), but do this very carefully on cold days. Endeavour to maintain a steady bottom-heat of about \(80^{\circ}\) or \(85^{\circ}\), and reep the soil in a healthy state as to moisture. See to
providing pleaty of young plants for succession crops roviding pleaty of young plants for succession cro

> FLOWER GARDEN AND SHRUBBERY

With bright sunshine and drying winds it may soon require the utmost care to save recently transplanted ill beens of large size ; and no mere surface watering vell as the bell should The ground about the roots as applying water and allowing the surface to become moderately firm stir it slightly with a blunt fork, which will prevent its cracking, and will also allow the free ction of the sun and air to warm the soil and encourage he production of active ronts. Surface dress with fine soil, and water newly laid turf whenever it is observed to be suffering from the effects of the dry cold weather. Take advantage of the present dry weather to stir the surface soil of shrubbery and herb borders, o prevent the growti- of weeds and give the whole a resh clean appearance. Do not neglect to put in plenty of Mignonette, and if not already done, hardy annuals should be sown without further loss of time, except in cases where they are not wanted to bloom before autumn.

HARDY FRUIT AND KITCHEN GARDEN
See that recently transplanted trees are not suffering for want of water ; this, however, will hardly be the case, except on dry porous soils, and in such cases the round should be mulched with decayed leaves to preserve it in a uniformly moist state. Attend carefully to the protection of the blossoms of all enient can be obtained Yew or Spruce branches will be of service, provided they are so fixed as not to be liable to be blown against the blossoms. Hemove the covering as frequently as may be convenient on fine days, so as to fully expose the trees to sun and air. Get supply of tobaces water in readiness to attack Phices immediately they make their appearance on Peach trees. Sow Broccoli on beds of liyht rich soil in Cauliffowers, Lettuces, \&c., in succession. Also attend Cauliftowers, Lettuces, \&c., in succession. Also attend to sowing small breadths of Turnips about once a fortnight, so as to secure having a regular supply in a fit state for use. Put in a small breadth of some early
onder, and plant a quantity in small pots to sheltered in a cold frame and planted out as soon as all danger frost is orer. Use the hoe liherally among danger of crops to destroy weeds, and keep the surface soil loose and friable.

\section*{Che \(\mathfrak{a g r i t u l t u r a l ~ G a z e t t e . ~}\)}

SATURDAY, MARCH 29, 1856.
IT may be well for the sake of any who intend to exhibit breeding stock, poultry, or implements, at the great National Agricultural meeting at Paris next May, to remind them that the 9th April is the last day on which declarations of such intention can be received. The French Government has appointed a committee in England for the purpose of making such arrangements as will induce English breeders to become exhibitors. Its office is 9, Pall Mall East, and the names upon it, Messis. Amos, Drnison, Brandrita Gibbs, Fisher Hobes, W. Miles, R. Milward, Professor Wirson, \&c., are evidence of its
capabili \(y\) and \(\in\) nergy. The French Government, in international gathering, have resolved to open separate classes for all other breeds of animals not enumerated in the original prospectus, and to give equally liberal premiums as to those classes already described-provided, however, that such breeds be represented by animals not less than four or five in nomber. We add that the various forms of declaration referred to in the prospectus of this gathering niay be obtained at 9, Pall Mall East or of Mr. Brandreth Gibrs, Half Moon Street Piccadilly.

The letter at page 138, on Agricultural Sta tistics, has undoubtedly been read with interest by many, both of those who anxiously look for the results of a general statistical inquiry and of those who deprecate any such "interference" in private and personal affairs. We confess we differ from our corre: pondent whether he argues for the English Agricultural Society or against the Highland Society. experiment and the Scottish success have presented all the contrast on which Mr. Hoskyws dwells, Along with the large percentage of returns asked for in the former case, but not obtained, there has been a large proportion of estimates at second-hand while in the latter case, from all that we can hear, there has been a kingular unanimity exhibited in the all but universal receipt of answers directly from the tenant farmers. Surely the word "cooking," in reference to these returns, which "S." had "almost written" should have never been referred to. If honest estimates, failing evidence at first hand, cannot fairly be obnoxious to such a charge as thatwhat shall be thought of its fairness in a case where simple addition seems to have been the only operation needed or performed in order to the attainment of the result ?
The great objection which " S ." has dwelt upon in connection with the Highland Society's returns is, however, founded on the absence of inquiry or of information as to the extent of moorland and of waste retained as such for sporting purposes by its owners. The reason given for this by Mr. Maxwelt in his evidence before the Lords' Committee on this subject was simply the impossibility of obtaining accurate information on the subject. Tenant farmers are not required to give the extent of their sheep
walks which they do not know, and in like manner landlords are not asked for the extent of land kept waste for deer. It might be interesting to know how much land is thus unoccupied, but the interest attaching to such information would depend upon its social rather than on its agricultural bearings Which alone are the proper object of the inquiry.
English Agricultural Society that we wish principally to comment. Its rules bind it to abstain from all questions having reference to measures pending or to be brought forward in either House of Parliament, and so "s." thinks that it is right in refusing plain that so strict an interpretation of these words will shut it ont from spheres of great usefulness, and is utterly inconsistent with the position such a society should occupy. The rule of the Highland Society is nominally the same, but practically very age Outfall Act brought in by Lord Lincouy some years aco was in its original form objectionable as regards Scotland: Mr. Hall Maxwell was sent to London, succeeded in disconnecting Scotland from the operations of that measure-drew a bill for Scotland-got it brought in and passed: and the influence of the Society has been felt most usefully through that-its interference, in spite of the letter of its charter, with a measure affecting the drainage
of the country. The progress of the Ordnance Survey of Scotland is another Government measure in which the Society has most properly taken great interest. And this energetic interference, advocacy or otherwise, in reference to measures and proceednsefnlly exerted, begets a habit of progress and activity which is of itself a guarantee of usefulness and evidence of life. Take the meeting the other day in Edinburgh as an illustration. The prospectus of the premiums offered by France at the forthcoming Paris Exhibition came before the distinct place in it-immediately Mr. Hall Maxwell was directed to prepare a memorial on the subject, and the president of the Society hinself places it in the hands of the Emperor-a supplementary programme of premiums is issued, special to the breeds of Scotland, and of the most liberal character-a public meeting is immediately called at which the Secretary of the Society explains the whole affair to the farmers present, and he is able
to say that there is every prospect of such a reprewill be highly creditable. He says:-
"The polled cattle of Angua and Aberdeen would be shown in great strength, and though there might be greater difficulty with Galloways, specimens of that race would not be wanting. The Duke of Sutherland, and various other Highland proprietors and farmers, had promised their quota of Highland cattle. Cheviots would be sent from Sutherland and from the south of cootland; black-faced sheep from Argyleshire, Perth shire, and he hoped also from the upper ward of the county of Lanark. The only other breed was Ayrshires, regard to which he looked principally for aasistance to those who were now present. He saw gentlemen enshire districts 11 fom for the purity Dumbar
 explanation which had been offered thent, atter the explanation which had been offered, that they would not be backward in taking such steps as would ensure a full exhibition of it, the more especially as he was
informed, on high authority, that it was precisely that class most likely to command high prices in the French market."

Now all this looks like activity, energy, and life -the habit of considering usefulness first and strict attention to order, rale, and etiquette as of subsidiary importance begets its proper and most useful fruit. On the other hand we have in England a society pursuing undoubtedly an important and a fruitful course of action, paying much stricter attention, however, than its northern sister to the letter of the rules by which its charter binds it declining to step beyond the limits of the path which they prescribe, and stationary therefore in the interest it excites, the influence it exerts, and the character of the work it does. Why have the large
meetings for agricultural discussion held latterly in London been at the bidding and arrangement of the Society of Arts, instead of under the auspices of the Royal Agricultural Society of England? Why is the committee in charge of English relations to the Paris Agricultural Show an independant body nominated by the French Government instead of the deputation, which it ought to be, from the national Agricultural Society, wielding all its influence and stinulating, as the Scottish Association does, the energies and activity of its members all over the country. The Society of Arts includes agriculture mong the subjects of its June examination, and has in other ways exerted itself in behalf of agricultural education. The Highland Society resolved at the meeting last Wednesday to apply for a supplementary charter, enabling it to act in behalf of agricultural education. Why do we never hear this subject of agricultural education mooted as the proper aim and object-direct as well as indirectof the Agricultural Society of England? Let our Society do as the Highland Society does; let it throw itself with as much epergy into every useful forward movement; be foremost in every place that agriculturists may occupy; care less about a literal adherence to precedent and rule ; depend less upon its charter and its funded property estimate as highly its opportunities as its income and use both actively and fully. There is no reason in the world, unless it be within itself, why its income be four-fold what it is at present.

Our readers have seen the protest which Mr. Hewitt Davis has recorded (p. 179) on the waste of abour and of money about to be allowed at Alder shot in the attempted drainage of the camp. The principle involved in the official specification of the work to be done does, if it be correct, entirely upset the theory and practice of land drainage as now anderstood, and may therefore well engage our attention. It seems that the drains are to be 12 feet apart and 18 inches deep, while the pipes employed are to be 3 inehes in diameter. We need not sa that such means of exit for the water are sufficient for carrying away the rain-fall of a year in less than a day-the pipes to be employed being absurdly large and the interval between the rows unneces sarily small.
Nor need we say that drains half a yard deep are not calculated to drain the land either as the site of houses or of rosds, or with the object of obtaining a firm and dry surface. They will not drain a foot deep of the land so well as if they were twice or hrice the depth propos-d-while the imperfectly drained 12 inches which may possibly be obtained may rest in spite of them upon a quagmire. Of course all drainage engineers agree with Mr. Davis in his protest. He superintended the drainage of Regents' Park-the object being to lay land dry for public enjoyment-and this was done by 4 foot
drains a perch and a half apart in stiff clay soil, with drains a perch and a half apart in stiff clay soil, with
pipes of \(1 \frac{1}{2}\) and 2 inches bore. The object at Alderhot is much the same, the difficulties incomparably less, and yet we have twice the number of the drains and four times their individual capacity
placed however wh
half their efficiency
The object, no doubt, is to lay the surface dry but that can only be attained by draining the snbstance of the soil below the depth from which the surface can be influenced, and any one who has seen on land or roads the effect of springs, or even of mere stagnant collections of rain-water in the soil knows that there must be at least 3 feet deep of dryness to ensure it on the surface.
In reference to roads, the best authority* declares that "it is the native soil which really supports the weight of traffic ; that while it is preserved in a dry state it will carry any weight without sinking, and that it does in fact carry the road and the carriages also; that this native soil mast first be made quite dry and a covering impenetrable to rain must be placed over it to preserve
it in that dry state." Drains 18 inches desp might serve as conduits for the water running off this "impervious surface," but they are unable to lay dry "the native soil ;" and unless that be done none of the results, whether for road-making, building, or mere surface dryness are attainable. We should like, moreover, to know how long they will resist the weight of field-pieces passing over them. It is plain that those who drew up the specifications referred to are ignorant of the art of draining land; there will be shamefui waste of public money if the plan is persevered in; and the only persons whose interests can be served by the proceeding will be those who after doing the work badly may have to pull it up and do it over again at the public expense.
Is there no one in the House of Commons to draw the attention of Government to this malter ?

Wr have to announce the sale, on Thursday next, of the Fawsley herd of pure-bred short-horn cattle, the property of Sir Charles Kinightley, baronet. heifers, and calves, and 27 bulls and bull calves. They will undoubtedly attract a large gathering of agriculturists, and command high prices.

\section*{THE PRICE OF MANURES.}

In your impression of Saturday last I observe two etters on the subject of the value of manures, one signed exception is taken to the data which in my papers in the last Journal of the Royal Agricultural Society I have furnished for the valuation of artificial manures, but curiously enough, in an opposite sense-the one asserting chat manures may be bought at less than the prices I have ventured to fix for their respective ingre dients; the other, that in quoting the wholesale cash prices and omitting the fair profits of the trade, I have sacrificed the dealer to my zeal for the consumer.

If the two classes here represented would agree to pair off respectively with their present advocates, could wish no better proof of the correctness of my fairly be attribur divergence between them migh such matters are naturally viewed through the medium of opposing interests, and my own figurs being the mean, might in that case be safely adopted as the truth. My answer to Mr. Summers is very simple. Mr. Summers quotes to you the price of superphosphate of lime as sold by a highly respectable firm, and taking the per-centage of soluble and insoluble phosphate of lime as guaranteed, he arrives at the conclusion that the ingredients therein are purchased at much lower rates than those which I have fixed for them. Now leaving out of the question the fact that Mr. Summers has filled in the sketch with details from his own fancy, for which (especially the proportija of ammonia), although they may be substantially correct, he finds, \(s o\) far as I can see, no warrant have letter he refers to ; and further, as you yoursel at different times, and very possibly under different conditions of the manure market ; setting aside, I sa these circumstances, Mr. Summers will not, I think, find in the paper referred to that I ever gave the priec at which superphosphate of given quality could bo supplied to the public; but that at which, average of makers of repute, it actually is so suppled Whether this is a good basis or not I must leave to others to judge, but to me it seemed the only one open to adoption. We may safely leave the ordinary the legitimate profits of the manure maker, and I fess that I should have been exceedingly suwilling to tamper with so very delicate a subject.

And this brings me to notice your other correspond ent's strictures, which for the reason just given I consider peculiarly unjust. "S." is evidently a ranantac turer of manures, and as such he upbraids me with giving the wholesale prices of different manures are The fallacy of this position is, I should think, too obvious to mislead of this position is, 1 tion, which 1 will immediately refer to, the cost of each ingredient of manures is calculated from the prices al ogredient of manures is calculated from the pricen
which the sulatances containing it are sold to the con-
sumer by the manure dealer. These prices in fact form sumer by the thanure dealer. These prices in fact by referring to the first of the tables which you did me
the honour to quote in your Journal of the 23 d of Feb., the honour to quote in your sournin of enate, the value of whose ingredients is in fact calculated from its average composition and price as ascertained by the best means at my disposal.
Does "S." mean to say that in taking the actual selling price of a manure, and calculating from that tioned to each ingredient, I have taken no accomnt of the manufacturee's profit? As well might he say that not paid for the expenses of its extraction from the Sugar-cane and its freight from the colonies.
The single exception to which I have referred is that of "insoluble phosphate of hme," and folly explain my that in my paper I difixed to that substance.
reauld in that case have found that I have done perhaps somewhat more than justice to it as an element of artificial ernure
In my estimates I have adopted \(\frac{3}{4} d\). per lb . as an average value for thosphate of lime in a manure. As
" ." justly says, its price in calcined bones is more nearly 1 d . per 1 lb . ; on the other hand, in coprolite and latter), phosphate of lime is bought at less than \(\frac{8}{4} d\). per lb . But will any one assert that the phosphate of bone, ash, or animal charcoal are worth 1 d. per 1 lb . as less can be said in favour of phosphate of lime derived from mineral sulistances, such as coprolite and apatite. Without decomposition by acids they are positively useless. If in anything I have erred it has been
in allowing too high a value for insoluble phosphate contained in manures, a conviction which I entertained even when writing my paper, as a carefal reader will
not fail to observe. With the sole exception of phosphate of lime from unburnt bones we have no altervacategory. There are no doubt degrees in its solubility and consequent efficacy, as derived from this or that source, but these are refinements into which
to price no one is at present prepared to enter.
bones the insoluble phosphate of lime the consumer at the price it costs the dealer, with a fair addition for his profit in reselling it, but nothing more. My own experience would lead me to believe that not one superphosphate in a hundred is so manufactured; but even if it were so, the value of insoluble phosphate of lime, as given by me, would be fully sufficient. The price quoted for halfinch bones was
furniehed to me in London at the commencement of Noveniber, when (as it will be seen by a foot note) the paper was written, although not published till late in January
prices I gave what in his case would seem to have been an fluctuations incidental to the markets.
My time is so much occupied that your correspondents and you yourself, sir, must acquit me of any want of respect it I dectine to discuss this question further the plaintiff having been answered by counsel for the defence is entitled to a reply, and there the matter rests If I have failed to satisfy or convince your correspondents in the matter y
But bertunity of saying so. I fear somewhat overlengthy communication, I would wish in all earnestness to say that in drawing up the tables referred to, I have felt a deep sense of the responsibility of the task-a task to which the wish of the agricultural community, rathe than my own inclination impelled me. Iolved, and how difficult it would prove to hold the balance impartially between the parties concerned. You may, therefore rest assured that I did not undertake this work in an indifferent or frivolous spirit. That I may have committed exrors of greater or less magnitude is more than probable, but if so, I believe I shall be one of the first fair right to ask in return that those who sit in judgment upon my conclusions should tale them as a whole, Way.

A STEAM-CULTURE REVERIE.-NO. VI.
So many steam-cultivators having been designed to operate with revolving diggers or toothed barrels, I was gratified when my friend Digla

In Pratt's invention of 1810, we have the first introduction of ploughs or cutters attached about a rotating patented a machine for drain-cutting and subsoiling, in which also a vertical spinde armed with cutters was employed to excavate a trench, while an endless elevating belt or a screw cleared out the loose earth behind it ;
and I may just say in passing that an endless belt or continuous railway with tooth-like projections was employed to propel the machine and keep it fed up to its work, and that the carriage-wheels were driven with a very slow motion by a tooth-wheel and serew. But the first horizonta cylinder armed with tines, blade, or tillers, and driven by gearing from a motive-

Pettitr, July 1846, under the name of a "serew phongh." It was affixed transversely hehind a frame mounted upon spur-uhewees or rollers; the gearing consisted an inter mediate spur-wheel, and a pinion on one end of the cylinder axle; and a rapid motion-in the same direction as the revolution of the carriage-wheels, and therefore assisting rather than retarding the onward progress cylinder, either by the carria;e being drawn forward by horses, or from a steam-engine placed upon it. Digland, having specially constructed a light locomotive
(pueumatic) engine for actuating quickly or slowly any otatory digger hung to its tail, tested this invention in an effectual manner. The tool as I saw it may be said to consist of a cylindrical shaft or barrel, upon which omething, in fact, half-way between the cutcer Budding's lawn-mower and a roller from the platform of Burgess \& Key's reaper. It seems really wonderful "Archimedean!" These screw-blades might be either in sections, or wrapped round the cylinder from end to same helical or screw form As might be anticipated, the blades, presenting a flat side instead of sharp edge o the ground, would not enter it at all, although the nventors had supposed they would turn over shor frongs or tines being tried, s scratching slovenly opera tion was accomplished, though with incessant stoppages n consequence of the teeth fouling themselves with The
The next invention in my historic series is a method of steam-ploughing, patented July \(23 \mathrm{~d}, 1846\), by John Tulloch Osborne, Esq, of Demerara, and which my ploughs of his own contrivance- to be noticed in a futur paper. As I found from the drawings submitted to me this invention was defective in detail, thoughits priacipal arrangements have been little improved upon by suc Heathcoat's and MacRre's in having two engines and two plough carriages instead of a single set of ploughs worked between an engine and pulley. The engines are placed upon temporary tramways from 100 to 200 yerds apart; and are made to travel (when required) at right angles to the direction of the ploughing by anchored a-head, and wound up by barrels on the chains anchored a-hea, and each engine engines. There are two drag ropes, and each ong out urries two drums, which that as each rope travels their respective ropes; so that as each rope travels first toward one engine and then to the other; the ploughs attached are worked to and fro, in npposice directions. Each plough-carriage, that is, a single plough mounted upon four wheels, lays down the slack rope in its rear ground, in line ready for the return bout. The ropes are about 5 feet apart, so that when each plough has which have been shifted forward 10 inches at a time, 5 feet onward along the tramways, in order to take resh ground. This removal is cleveriy manayed it is directed by the superintending workman on to an nclined plane, attached by hinges to the near side of the nd it is thus carried by the engine to the next breadth of land. Each plough, also, in the last furrow of each remove, lays down the slack rope by means of an outrigger, ready for the next furrow, which will be 5 feet ff. Two lengths of rail are employed for each engine, one being taken up behind and laid down in front, whilst the other is sustaining its weight. With a view of adapting the apparatus to the Demerara lowlands where the engines can be placed in boats or punts, the drums are made to slide on their axes (which are ver tical), in order to be raised or lowered to suit the relative levels of the ground and water.
With the improved portable steam-engines now in use, a better construction of drums and gearing, the trong and light iron wire-rope now manuectumodated to the mear mode of draught, there would seem to be othe fifficuly in following out a modification o Ond I may explain in another paper how this promises to be accomplished. And truly steam-husbandry is a matter of the firs importance. In 1840, the propounder of one schlion urged the advantage of aispensing and thus saving \(30,000,000\) l. annually. Mr. Osborne, again, introduced his invention to the notice of the Highland Society "at a moment when a scarcity of food was spreading dismay, and actual famine was abroad in many places, and argued that steam-powe must be greatly needed when horses consumed so much food, and yet laboured ouly 2400 hours out of the 441 hours of daylight in a year. And in a powerfuly writte loughing forms one of the principal texts. "In ploughing 100 acres" says the author, "men and horsts wal a linear distance of 1000 miles, wasting vital force and food which might have been so much better bestowed." And in dealing with the objection that animal power cannot be spared, as we have crops to carry, manure to lead out, \&c., he says, "S You need not totally disuse animal power; oxen, which eventwally become butcher meat, will be at hand; but I would ask this class of
wearving still obtains! If railreads have been of no utility loecause they did not entirely supersede common
roads, horses, and carriaces? If steam-vessels are of roads, horses, and carriages? If steam-vessels are of no use because sailinc-vessels still wing their way? If the electric telegra, is of no use because the post-
office is still in action? If the telescope is of no use because it does not supersede our eye-sight ?"

Many years have passed since energetic discussions of the subject appealed to public attention; yet we are again involved in times of scarcity without having an economical steam-cultivator employed in the field; and in epite of Talpa's burrowings under the foundations of olden prejudice, in spite of the trials of Lord Willoughby the Royal the Marquis of Tweeddale, and several others, its steam-plough prize to \(500 l\).-half what it would give for a substitute for guano. I. A.C

\section*{Home Correspondence}

Agricultural Statistica.-May I through your Journal draw attention to the bill brought into the House of Lords by the President of the Board of Trade for "The Collection of Agricultural Statistics. It is proposed that the Poor-law Board shall employ such persons as they think fit to distribute, collect, and receive the returns ; and to estimate the average rate of produce per tatute acre. Thus, the working of the measure will beentirely under the control of the Poor-law Board, and I venture to express a hope that they will not, as in the case of the experimental returns obtained by them in 1854, in any way confound it with the Board worthy and energetic local agent is required for every district, and no more; through whom honest superision and credible estimates of the average rate of produce claimed by the most suspicious contributor. Lord Stanley of Alderley, on introducing the subject into the House of Lords, made a quotation from Mr. Hoskyns' very clever article in the Journal of the Royal Agriculural Society in support of his argument in favour of the measure; I take the liberty of quoting from the same paper a paragraph which equally deserves the most extended publicity. After in a masterly manner disposing of the unfounded suspicions that were excited by the experimental returns in many minds, and of the false comparison between the producer and the retailer, represented by the farmer and the shopkeeper, a of the corn grown by the other, Mr. Hoskyns adds, page 585 :-
"But one is almost thankful in such a case for the candont that will put objection into a shape susceptible of reply; for it is
mere vexation to follow out the history of this experimental trial of one of the most useful measures that ever emanated from Government in the behoof of agricalture, as the tale is drearily
told in the remalning reports of the Por-law inspeotors em-
ployed for agricullural atatistics. But why Poor-law inspectors ployed for agricultural atatistics. But why Poor-law inspectors is the question that and fresh at every page. There are few
and recurrigg freah and
gentlemen of higher standing or more valuable capabilitieg
engaged in the public pervice than those who hold that title,
and devote thear legal and scienticic prowess to the carrying out
like faithtul knight-errants the decrees, partaking scantly in the like faithtul knight-errants the decrees, partaking scantly in the
pleasures, of that sempiternal Round-table which imafination
delights to picture, at Somerset House. But what pleasures, of that sempiternaset House. But what possible con-
delights to picture, at Somers
nection of thought was it that suggested the idea of turning their lances into reaping-hooks? By what 'discourse of reason' could the conclusion have been evolved thrt the fit and proper mediom
through \(\begin{aligned} & \text { hich to invoke the agrestial mind of England and } \\ & \text { Wales to the nature and benefits of agricultural statistics was } \\ & \text { body }\end{aligned}\) of gentlemen who either by education body of gentlemen, who either by education, habits, or official experience, were not in conscience bound
a Barley-rick?
"And still more does the question obtrude itself, why at the turn of every leaf of the Report one is compelled to knock one's
head against the ' Board of Guardians?' What has this reapectable but proverbially indurated body got to do with the mattiar? machinery ever hear the motto, "Divide et impera" " If not, we in the words nsed by no less an authority than Sir John Wal-
sham in his late evidence before the Lords' Committee:""Certain persons will always object to making returns. It is impossible to abalyse all the motives influencing a man's mind
in these matters. I have known myself - it has been within my own knowledge- that perhaps three fourths of a certain number of farmers would make the returns if left to themselves; but when
they get logether, say at market, with the other fourth, who will not they get logether, say at market, with the other fonrth, who win not
hear of making any return, the passive majority are surs to be therwise have given.'-p. 38 Our mildest experience,", Mr. Hoskyns adds, "joins in attest
ation of every word of this philosophy; but why stop at the market place? for if such may be zaid of the green what shall nder the free canopy of heaven, how much more in the loaded
tmosphere of that many-titled inner-chamber where, from timeto time, vestry-meeting, parish-ctub, or other proviacial nouk unanim
Now, with regard to those experimental returns, the public mind seems to have been divided between admiration of what was accomplished, and pity for the benighted individuals who, by the refusal of their coBut I am not aware that any one has ever ventured But I am not aware inaccuracy of those returns that were duly delivered, and that now wear such an orderly and unimpeachable aspect in the stately pages in which they are arrayed. Far be it from me thers-
fore to question their veracity ; ouly, as many persons fore to question their veracity; ouly, as many persons avowedly object to this inquiry, as being inquisitorial and unfair; as people do sometimes, in matters of equal moment make erroneous returns, as is evilenced ledgments in the Times of sumas sent to him by conscience-stricken taxpayers: so I think it will be
be mude uniunpeachable inlorination, that the return
should be made under the control of persions, in shount be made under the control of persons, in an
reapects qualifed to improve and amend misstaitement
and to estimate and to estimate the avernge rate of produce Acre. As Lord Stanley of Alddrley has entered upon the encounter which his predecessors have sluanned, we ma.
foirry hope that \(t\) o complete so useful secure to us reliable and unquuestionable returns. But the moment has arrived when all persons alive to importance of the measure should calmly reflect the mode in which it is proposed to carry it out. Chas P. Humbert, Watford, Berts

Wheat ritulity of sects, I had three small parcels of भesured they were talken out of nummiegyp, and I was very old, but whence from I know net.' I planted the whole very carefully, but not a grain grew. I I ladt then a packet tiven me of Whent which I was assured by the integrity and veracity me, and who is a man of real out of a mummy. The history of it was this-as it wen given to me. A nobleman was present at Cambridge at the unwinding of a mummy whe"cin some Wheat was gentleman's I obtained whose name I give you, with the gublication I obtained the Whent from also, but not for gardener pand home and himself saw his gardener plant it, when it grew and brought forth seed the norfection. It was that seed which was given to me by the nobleman's relative; and to protect it from Sparrows 1 planted it in a row by itself in a field of other Wheat. It all came up and ripened, and the produce ever before seen ; two of the lifferent from any I had one not. The whole three kinds ripened rather earlier than the Wheat among which it grew, and one of the sinds was very much praised by farmers who saw it I was however very unfortunate with it through it care. I had it reaped and tied up carefully, and hung and eat the whole. Where biras got toit through a hole think, the whole three samples wecause, Wheat. Now, I am serfectly were of superior kinds of man and his relative believed this whe that nobleout of a mummy ; but, could the Wheat to have come I could discover noue, though I tried an any deception having always been, though I tried all I could to do so of many years old sceptical on the growing of Whea But this thought has struck my mind, namely, if the Egyptians did put Wheat withind, namely, if the bandages, had they not a method of preserving thi vitaity of it unkuown to men of the present day? My wise as they certainly were possess such a method, or not have put the Wheat into the bandages of their Whmmies at all. Either, therefore, there has been no Wheat found in mummies at all under this supposition, been deceived and his relativ, and oup have method of preserving the vitality of Wheat altogeme unknown to men of modern times. Perhaps somegether scientific correspondents may be able to she of your further light on a subject wnich is certainly wome being inquired into and as for as certainly worthy of ascertained. I add the nam far as possible the truth of his relative, but I have, I observe, nobleman and that tion to make the names public. Geo. Willins, Wix Extraordinary
saying large eges, I-Having often heard of ducks one laid by a bird of the true Aylesbury bred weigh days ago, and find the circumference the ly breed a few 84 inches, and the other way 67 incheng way to be 4 年 oz. avoirdupois. Perhaps \(6 \frac{7}{3}\) inches, and weight will inform me if eggs of this some of your readers seems extrandinary. H. T. \(H\)., Waine comm

Aldershot Camp.-Mr. Hewitt Davis and Mr. Baile Denton have both recorded their protest against the system about to be pursued for the drainage of Alder the description of drain pipe to be used. It is an im pervious socket pipe suited admirably to the conveyance of water and very expensive, but most unsuited for of land within the last two years, and have used the common pipes made in most brick-yards, which are porous and not socketted. These pipes have proved

Twelve months aga, the weather was uncommonly cold nad damp, the soil was in a very unait state for the reeeption of year, however, the season has been mild and open, the seed condition, and the weather still continues as farourable as we
could desire. A large quantity of Spring Wheat has been sown could desire. A large quantity of Spring Wheat has been sown indeed so favourable has the season been, that, for once, the
farmers have had an opportunity of sowing Wheat to their hearts content. A good deal of April Wheat, which is now much use
as a substitute for barley, will yet be sown, and I venture to say that, when this is accomplished, alarger breadth of Whea
was never sown, in nue seasn, in this comntry. In the mont of February, and in the first of March, the autumn-sown Whea winds and frosty nights, which have meanwhile checked its pro gress, and have prevented premature advancement. The sor ing
of Oats las beers generally proceeded with, and on many farm
is concluded. Sandy (Oats, which have been largely sorn for many years in this neighbourlood, have within the last sown fo greatly deteriorated, and once again late Angus, which were
supplanted by Sandy, are sought after for seed; sud I doubs not, with the stimulating manures now at comnand, these late otato planting has been commenced, aud wisoly; for as thes them to the fields, where their early growth will do little harm
Our first Muir of Ord market for the season was heid last weel and a large number of sheep was exlibited. Prices were about cattle were disponed of to the butchers in the neighbourhood only a few grazing beasts were exhibited, and for these there
was no demand. Both Turnips and straw have run more quickly to their finish than us'al, linges are returning in fair condition to might reasonaluly expect, cattle may look out for shor
wations.
 Notices to Correspondents.
ment provides as follows:- In F. The bill now before Parliaseer of the poor is to send in to the Poor Law Board a ree over every occupier of land in the parish or district, with the nature to suech owners and sccupiers, Who will fill them whill be issued them on the 1st of June. The schedule contains columns ancriptions of crop, as well as thase of live the variou to the Board of Trade in order to poor Law Board, and thence ing to the respective counties to foir being arranged according to the respective counties. For the purpose of securing the parties engaged in this operatinn, by which any person
declining to fill up the schedule may be summoned before a justice of the peace; and the magistrate, on being satisfied that to inflict a peualty not to exceed 403 . It is left to the discrotion amount of the produce of each farm in such a way as they may deem most expedient. The government by this bill propose land he cecupied, and of the descriptions of crop which h information may be obtained either by testing the value of the crops, or by some other means.
the fertility of a farm being maintained by the appler about 5 cwt . of bought manure per acre to one quarter of it, and 40 loads of home manure per acre to another quarter of it
every year. We hope shortly to examine the case more fully.
Great Buoworth: \(J\), Cheshive. The description seems to us personally severe, and calculated to offend. We shall be happy you will favour us with a copy. The following are reports of actual practice in Cheshire, taken from the Journal of the Manchester Agricultural Society. The first is on a clay soil, manured with horse and cow dung; in 1852 was in Wheat, and in 1863 Oats, and sown down to Grass. In 1851 it was manured The same quantity of guano applied, and mownonce. The land tities and varieties of seeds were sown per sere: 31 lbs . of Red Ribgrask, 2 lbs. of Trefoil, 3 pecks of Peremaial \(2 \frac{1}{2} \mathrm{lbs}\), of 1 peck of Italian Ryegrass, \(\frac{1}{3}\) bushel of Meadow Fescue, \(\frac{3}{2}\) ditto Meadow Grass; all sown in April. The land is a strong ciay loam on a stiff clay subsoil, under first-rate maragement in every respect, and perfectly clean and free froma any bad
Grasses. A capital bottom of White Clover and other herby Grass, and the entire crop uniformly ther and other
(2). The soil is a good sandy loam of fair depth. resting clay, sand, and gravelly subsoil. The Iand had been previously Potatoes (manured with 20 tons of cow and horse dung peen acre), \(2 d\) Wheat, 3 d Barley, and sown with the following quartit, and Variety of seeds per acre, viz.: on the Barley crop in
April, 1 bushel Perennial Ryegrass, 6 lbs. hard Fescue, 6 lbs. rough and smooth-stalked Meadow-grass, 5 lbs. Ribgrass, and
12 lbs . Trefoil, and Red and White Clore. The field top dressed with \(2 \frac{1}{2} \mathrm{cwt}\) of guano per acre in the spring of both land is perfectly clean and free from bad herbage; the The above an average for the season, and a good mixture of Grasses, the botrom close and well up. The claimant is a good farmer in every department to which his practice extends. The farm is in a good climate. Inspected June 19th, 1855.
Lecerne And Clover: \(E\), They both like calcareous loamy a universal mannre, and both will prosper on it. We have grown Lucerne only in small parches-not more than halt an acre. It was sown in rows 16 inches apart, and a good dressing of stable manure spread broadcast and dug in between the Seed Corns : Charres D. It wili not be easy to ohtain Brown's
Barley, but Sandy Oats ale in common cultivation in Barley, but Sandy Oats are in common cultivation in Scotland, and you might apply either to Lawsons, seedsmen, of Edinturgh or perhaps a corn factor might obtain them for you; and Mr eddress. - The Red.straw Wlite Wheat is not more liable to sprout than other sorts-but it is somewhat liable to shed when

\section*{NEW PLANTS}

MESSRS. E. G. HENDERSON \& SON.
M Great Rritain and Ireland of the following; and they take this Royportunity of aral Gardens, Brassels, for the distribution throaghout auch ruperior and beantiful Plents, which they are sure will give satisfaction to every one, they being so totally distinct fromith all
other rarieties at present known in their different classes. ACHIMENES (LOCHERIA) MAGNIIRICA.
Coloured Plates of the nbove, and one of FCCHSIA EMPEROR NAPOLECALYX PULCHER.
application at \(6 d\) each, or if by post at \(8 d\). each, except when three or more are taken, when BANKs' NEW FUCHSIAS will be ment out next Mas, and the following vur Messrs. Allan, Stirling | Messrs Frewer, J.E.,Stowmrkt., Messrs. Moore, W., Derehall be able to supply Plants:-

Hendensos's favourite VERBENA for 1856 is without excep-
tion one of the finest, and will doubtleso, become one of the mest noted bedding Verbenas in every garden throughout Eng mand Wer its not profess to say it will surpass all others in form; bu The habit is robust and free, and does and of a rich dark scarlet duwn to fill up empty spaces, as is too often the case; but if left to
itself it is unequalled for its uniformity of growth. The whole itself it is unequalled for its uniformity of grow th. The whole
plant is alike covered with flowers on stout short footstalks, so hat it resists the rain perfectly, the side nhonts below eac the frist tlowers pass away; the fulliage is handsome and placen as a fexture that is often over-looked in this plant, as a Verbina
with small diminutive leaves never looks well, ner on the other hand is it pleasing to see large thin foliage, as is the case o Fariety, is loose and straggling. To be sent out after like tha May at \(2 s, 6 d\). each, \(24 s\). per dozen, and \(120 s\). per 100 .

In the course of May next, Plan
Henderson's favnurite PETCNIA for 1856 will be ready for delivery after the first week in May. This excellent variety, we conkent, will supersede every Petunia hi therto grown, either fording purposes or pot culture. Its superior qualities camnot be better described than in the words of the able and intelligent Gardener, Mr. John Smith, of Peel Ma:l, Lancashire, from whom they received it:-"I now send you the stock of Petunia No. 1. The flowers are moderate sized, with a fine bold outlines colour a rich bright scarlet, with clear white eye. It is a profuse thomer, and makes a most effective bed; indeed, it was the most which was filled with plant in the whole of our Flower Garden, lowering plants." In the showiest and most dazzling cinds of year's seedling," In consequence of the plant being a second year's seedling, the opportunity of proving its value as a bedding plant has beeu tried, and far exceeded our expectations.

\section*{SATURDAY, APRIL 5, 1856.}

Last Monday the Honticultural Society arrived a decision the importance of which can scarcely be over-estimated. The reports which we have pablished of the proceedings in Regent Street during the present spring have shown that the financial position of the Corporation has been engaging its serious attention ; and that two diametrically opposite views have been held of what should be its future aetion. On the one side it has been contended that the Garden at Chiswick can no longer be maintained, now that the funds provided during the last 25 years by the Garden Exhibitions have totally failed, and that the Society must be organised upon an entirely new basis. On the other, it has been urged that the exhibitions at will be be revived, the conse
Last Monday's meeting settled the question by resolving unanimonsly that the Garden must be
relinquished unless, before May 1, such a sum of
money shall have been subscribed as the Council may think adequate to secure its maintenance. By may think adequate to secure its maintenance. By parties in the Society will be fairly and speedily tested, by the only means that can be regarded as satisfactory : an appeal to the Fellows at large.

It is not necessary to show how great a loss horticulture will sustain should the relinquishment of Chiswick hecome inevitable, for it is not merely the place wherein the great modern revival of gardening has been effected, where rival methods of cultivation have been tested, and where the greatest gardeners in the world, by publicly exhibiting the result of their skill, have formed a correct standard by which all other cultivators have been measured throughout the country; but it is also the only public horticul-
tural establishment in the United Kingdoms. For tural establishment in the United Kingdoms. For
the great gardens of Kew, Edinburgh, Dublin, and the smaller ones in our provincial towns are all Botanical, while the so-called Botanic Garden in the Regent's Park is a pleasant public promenade, and nothing more. It is at Chiswick that gardening has been the one great object of attention; it is there that fruit trees have been tested ; that modes of cultivation have been the subject of inquiry, that the value of kitchen garden produce has been investigated, and that cultivation beyond this has been limited to what is beantiful and ornamental. Should Chiswick disappear there will be no such establichment take its place, unless the Horticultural Society locates itself elsewhere. This is undoubtedly a subject of very great national concern.

There is but one way of preventing what may really be called a calamity, and that is by furnishing the Council with funds wherewith the utility, as well as the existence of the Garden, may be preserved. Merely to do what would enable it to exist in a state of dilapidation, is to do nothing. It must be flourishing to be valuable. One may already see
in the general aspect of the Garden the effects of in the general aspect of the Garden the effects of
that constrained economy which failing funds have rendered indispensable. Another six months of such reduced expenditure would render it a thicket. Gardens are costly if they are maintained in a thoroughly effective state. Those who imagine that parsimony can be advantageously applied to such places, and that a niggard spirit will do what can only be done by numerous and expensive "munitions" of horticulture, only betray their ignorance of such subjects. One estimate which we den might be supported, under an "improved management," would excite our laughter if we did not know it to have proceeded from
good though much mistaken feeling. In that estimate it is calculated that 33 acres of ground, much of which is mown, with hothouses, greenhouses, conservatories, and endless lines of less continuous than in private establishmentsthat for all this a dozen labourers are enough, including a gatekeeper; that such a place can dispense with manure, loam, peat, sand, tools, and pots are necessary; that there shall not be one shilling spent in pens, ink, stationery, and petty expenses; and that the materials used in the repair of such a multitude of buildings may be taken at just six-and-twenty pounds a year. We readily admit that if allthis could be done, the management
which should bring it about world indeed be "improved." Such, however incredible it may seem, is one of the methods by means of which it is asserted that a great public Garden may be supported in efficiency
The Fellows of the Society have taken the right view of this matter. Country gentlemen have gardens of their own, and they are pretty good judges of the cost of such places. They therefore put aside all fallacious estimates; they decided that if the Garden is to be maintained it must be in a manner worthy of the great body to which it
belongs; that for this purpose money is indisbelongs; that for this purpose money is indis-
pensable ; and that if the Fellows do not subscribe the requisite amount the Garden must be relinquished; for they will be no parties to risks and speculations which may render the Corporation unable to meet its engagements.
The question has now become a public one, and by the public will it be decided. Should it unfortunately happen that Chiswick is to disappear, we venture to prophesy that its want will be quickly
felt, anless some unforeseen felt, unless some unforeseen opportunity should
arise of establishing it elsewhere.

We are among those who venture to regard the experiments in cultivation carried on at LoisWerdon, as forming an epoch in the history of tillage, from which grest improvements and im-
portant results must necessarily arise. The old
mantle of Tuul has fallen on no unworthy successor, but is now worn by one who has known no only how to restore it to freshness, but to fashion it into a form such as modern improvements render necessary. Had those experiments conveyed the same conviction to the Agricultural mind as they have
to our own, and had they been generally carried to our own, and had they been generally carried ont to their legitimate conclusion, they would have had no claim to a place in the Horticultural depart ment of the Gardeners' Chronicle. But they are still regarded with doubt, and have scarcely extended their influence beyond the Garden. We therefore, for the present, claim them as our own.
We do not believe that an experienced and intel ligent practical gardener can be found who will dissent from the conclusions at which the author of the celebrated Word in season has arrived. For gardeners well know the value of deep draining, crops plenty of room in which to grow. When a gardener is told that a larger crop can be had by working half the land within the compass of an acre than by filling it full of plants, he will only reply by assent, when he is told how the result is accomplaine. This is more clearly than ever explained in a little book,* which has just appeared,
and the curious reader will not fail to examine in their detail those Lois-Weedon operations to which we are here referring. What they are we do not attempt to describe, for if curtailed of their at length the anthor would be treated with injustice, even if our crowded columns could bear such an inroad. Suffice it to say that they result in the production per acre of 24 tons of Mangel, and more than 16 tons of Carrots. In like manner 33 tons of Drumhead Cabbages, weighing from 30 to 48 lbs . each, and 6 quarters of Red Lammas Wheat are borne per acre on the land in question.
And be it remembered that this land is about the stiffest, stickiest clay we ever had the misfortune to walk over in wet, weather. It shows, however,
that the heavy lands of England are among the richest in the world in the hands of those who are in a condition to work them well.
The results in question are obtained mainly by the use of a fork, not of a spade, nor of a plough The method of using it is this

For clean and accurate tillage, for bringing up definite quantities of a few inches of suboil, in
even layers, and placing them on the surface to be even layers, and placing them on the surface to be staple, the fork is the only implement at present on which I can depend; for the exposure of the subsoil is a matter of bit by bit. At an early stage of my farming, about 12 years ago, a chain or two o my land was ill dug with the spade by a heavy hand a spit of 8 or 10 inches of clay was brought up
and then mixed with the staple; and the error has taught me a lesson. The clods, covered with mould, and thus kept from the influence of the atmosphere have never been effectually weathered; with all my stiring I have been defied, and that stubborn piece has defeated me to this day. But the fork, judiciously handled, is able to effect what has hitherto been beyond the power of any other implement, and inch by inch with the shallow staple, to the required depth of mellow, friable moald. To the fork, then, I must still look for perfect tillage in this instance as well as some others. But there are occasions when the plough can be used with equal advantage and greater economy; and whenever they do arise I plough."
The true obstacle to the general introduction of the Lois-Weedon method of cultivation, an obstacle be it observed not felt in a garden, is getting the
land forked over quickly enough at the time when working the soil is required. Men cannot be always had, and machinery gives little aid ; but wait awhile, and relief upon this point is sure to come, It has never yet happened that when a want is felt, and an advantage pointed out, the ingenvity of man has failed to meet the want. To use the words of our experienced correspondent "B.," "I would seem that in all processes where machinery has to be invented, the first consideration should be that of the object to be attained; then, but not till then, the machine which will best produce the desired effect. The object of all digging machines is to diminish the tenacity of the soil, to expose new surfaces of it to the air, to bury weeds, to mix and
apply fertilising agents in the most efficacious manner, and that machine which best effects all or most of these purposes may, therefore, be considered as the most useful. The plough turns over the soil but does not break it up; the bigot, as it is called in France, turns over the ground, and when applied a second time breaks it up; both of these instru-
ments bury weeds, but are alike objectionable as
hardening the subsoil; the spade removes the ground, but requires a separate operation to break it up; the fork is free from most of thee objections; but like all the other tools used for digging, requires a separate operation to disintegrate heavy soils. For this purpose, however, clodcrushers, \&c.., are in frequent use, as in France the employment of women armed with beaters to break the clods. If the above requisites of a tiller of the and be just, invention should be directed-rot to the improvement of the plough or spade-but to the contrivance of a machine which, whilst it turas over the soil, breaks it up without hardening the soil beneath the instrument. Doubtless our mechanists of the present day are fully competent to the devising what might be termed a perfect tilling machine, capable of being worked by steam power. It seems only from limited knowledge of the requisites that it has not hitherto been accomplished.
In this opinion we think that everybody mast concur.

A correspondent or two beg for information as to the best way of caltivating and curing Tobicos. The same question has been so often pat to us on former occasions, that we gladly avail ourselves of s paper in a recent volume of the United States Patent Office Reports to lay before our readers the method practised in Florida. It is needless to add that those who may wish to try the experiment of Tobacco making in this country, within the limits permitted by law, must make due allowance for the differences between the climate of Florida and Great Britain. Those who have friends in ow colonies, India for instance, Borneo, the Cape, Australia, New Zealand, the West Indies, or even Canada, will we doubt not find the information given by Mr. Hernandez acceptable to their correspondents.
The growth of Tobacco of excellent quality is certainly not limited to the Havannah, where indead a great deal is of an inferior description, the fine cigars of that island being yielded, according to \(\mathrm{D}_{\mathrm{E}}\) la Sagra, by a very inconsiderable area. Tobaceo in no material degree less enjoyable than first-clas 1851 from Trinidad, Java, and some places in Bengal. That of Guatemala, as manufactured by young Spanish women (not blacks) in the employment of Don José Maria Samayoa, + although only beginning to be known in this country, is equal to genuine
Havannah of the first class, and will perhaps supersede it in public favour. Nor is there any reason why our own colonies should not also produce Tobaceo of excellent marketable quality, if not first-class. Where Cotton can be grown profitably there also is a field for Tobacco. Rich soil, high summertemperature, and thoroughly good manipulation are the essentials, and what the latter are the reader has now a better opportunity of knowing than he had while consulting the gardening books in which be asually seeks for information.

Even in this country, where a rod or two of ground are occupied by the plant, it will be found that attention is demanded to many details little thought of by gardeners, most especially in the drying and curing processes, concerning w
gives such nseful information.

VEGETABLE PATHOLOGY.-No. CXV. 159. Beontesis+ (Electric atroke).-The two populia causes assigned for the greater part of the diseases the which plants are subject are blight and lightning, the former of which is supposed to be conveyed by the wind, especially wher essterly, in the shape of a thin haze, while the latter is often as completely fabulous. In the one case as in the other, there is frequently \& great mirb take, and a neglect of true causes, which are plain enorgh, where the eyes are not completely blinded. It is reng rare for vegetation to be arreeted completely on the instant by a flash of lightning, though it is possible that sithout should be the case in trees as well as in animais with aso any siga of external injury. Trees, however, whichough struck by lightning will otten vegetate for years tranks the force has been sufficient not only to split the Where but to dive to the base of the strongest roots. Whant the bark is at once completely stripped with atten, the splitting of the trunk and drying up of its juices, a process of vegetation may be as effectually arrestod any feet in a \(i t\) were at once wifrully separare active the vegetation the in active vegetaill orsility would be tite vegetation the more speedy in all probability wourk has been
change. Cases however occur in which the bark change. Cases however occur in which the barion goos on thus separated by lightning, and yet vegetatiod in Garde-
without interruption. Such a case is reported without interruption. Such a case is reported in the new
ners' Chronicle, 1846, p. 597 , and is reproduced ners' Chronicle, 1846, p. 597, and is reproduced in Out of edition of the "Theory of Horticalture," p. 4 . ©uted multitudes of cases of death which have beea repres in as due to electric action, I have scarcely found Which there did not seem to be the eviden in smal quantities; ; and wo understand that this great houso gupplie them for private conmumption in boxes of so welt.
18s. pex box delivered in Engiand, exelusive of duty. 18s. per box delivered in England, exclusive of
some other cause. The vegetation of a slirub or a part
of it, for instance, which appeared healthy a day or two ago is arrested suddenly, the foliage withers, and from the ground or broken off and exposed to a burning from the a little examination shows that it was no sudden visitation; destruction had been travelling onwards with sure but certain steps; some grub had eaten through the tender succulent pith on which the vigour of the plant depended; the root had been gradually impaired by the mycelium of some fungus, the nark by which the foliage was supplied with nutriment was at length eaten through by canker, and 80 the mainspring of life was broken and the plant or a portion of it at once perished.
460. The effects of lightning when it is really the cause of injury are in general too palpable to admit of any doubt though it does not al ways act in the same way, nor with the same degree of actual lesion, supposing the force of the stroke to be equal. A multituae of as the comparative condition of the atmosphere, or the angle of incidence, or the part of the tree on which the stroke impinges. The albumen of the wood is more
strongly charged with moisture than the rest of the strongly charged with moisture than the rest of the of the stroke when it enters the tree follows naturally of the stroke when it enters the tree follows naturany
the course of the young wood, and in consequence the course of the young wood, and in consequence
shivers that more especially, at the same time throwing off the bark, by the sudden generation of steam, sometimes to a great distance from the trunk. The course
of the lightning is not, however, indicated by the of the lightning is not, however, indicated by the
line of fissure, which merely coincides with the line of least resistance. The more central parts meanwhile are fissured in consequence of the contraction of the concentric strata increasing in intensity towards the circumference exactly as in frost splits, the outer layers being progressively more filled with moisture and contraction of the annual rings themselves thus splitting at various points, causes also the separation of these rings from one another, and thus the tree is shivered into thin laths. Sometimes, however, there is less and the between the state of moisture of the rings, two principal fissures are formed without much detachment on the surface. Where the course of the longitudinal fibres of which the stem is composed is oblique, which is frequently the case as the stem splits more easily in that direction, the fissures in the trunk sometimes take a spiral course. When the trunk is hollow or filled with touchwood, the lightning may in addition to other mischief set the tree on fire, but this seems never to be
the case where vegetation is unimpaired, at least in our own climate.
461. It is not, however, probable that in every case the fissure is caused by contraction due to the liberation of moisture. A heat so intense as to generate steam of a trunk some two or three feet in thickness without mach external injury, as is sometimes the case, must passes, and yet fissured trunks may live for many years and the fissure be concealed by fresh layers of wood, insomuch that it may never be discovered till they are cut down. It is probable, therefore, that the effect
meay sometimes be produced by mere mechanical force alone, exactly in the same way as rocks and the firmest buildings are split, where there is no question about the sudden generation of steam, and this is possibly in
general the case where the fissures are unaccompanied general the case where the fissures are unaccompaniea intality may be arrested generally by the intense eloctric action.
462. Some kinds of trees are certainly more subject lightming upon all seems to be in proportion to the intensity of the fiash, and the ease with which the wood individnals frere it is desirable to protect particular a lightning conductor.* M. J. B.

\section*{CULTIVATION OF CUBA TOBACCO.}

The first thing to be considered in this, as in every ther culture, is the son, wich, Tobaceo, ought to be of a rich sandy loam, neither too meisture. The more level the better, and, if possible well protected by margins. The next should be the solection of a spot of ground to maske the necessary
beda. It would be preferable to make these on land newly cleared, or at all events where it has not been together with Tobacco would injure it materially, as the In preannot be removed without distarbing the plants properly, grub up all the small stumps, dig out the roots, and carekny remove them with the hands. This being one, maik feet broad, so as to enable the hand, at arm's length, to weed out the tender young plants with the fingers from both sides of the bed, and keep them perfectly clean.
The months of December and January are the most proper for sowing the sexd in Florida. Some persons
epenk of planting it as early as the month of November. spenk of planting it as early as the month of November

I am, however, of opivion that about the last of Decem-
ber is the best time to sow. Any sooner would expose the plants to suffer from the inclemency of the most severe part of our winter. Before the seed is sown, beds, to destroy insects and Grass seeds; then take an ounce of Tobacco seed and mix it with about a quart dry ashes, so as to separate the seed as much as possible, and sow it broadcast. After the seed has been thus sown, the surface of the bed ought to be raked over slightly, and trodden upon by the foot, carrying the whole weight of the body with it, in order that the water it. Should the nursery beds apparently become dry from blighting winds or other causes, watering will be absolutely necessary; for the ground ought to be kept in a moist state from the time the seed is sow until the young plants are large enough to remove.
The nurseries being made, proceed to PRRPARE The uand where the Tobaceo is to be set out. If the land is newly cleared, (and new land is probably more favourable to the production of this plant than it is to that of any other, both as respects quality and quantity, remove as many of the stumps and roots as possible, the surface perfectly loose; then level the surface, and in this state leave it until the nursery plants have acquired about one-half the growth necessary to admit of their being set out. Next, break up the ground a second time in the "same manner as the first, as in this way all the small fibres of roots and their rootlets will be more or less separated, and thus obviate much of that degree of sponginess so common to new land, and which is, in a great measure, the cause of its seldom producing well the first year, as the soil does not lay close enough to the roots of the plants growing in it, so that a shower of rain produces no other effect than that of removing the earth still more from them. Should the land be such as to admit of being worked with the plough, it ought certainly to be preferred to the common the plants are set out
The ground having been prepared and properly levelled off, and the plants sufficiently grown to be taken up, say of the size of good Cabbage plants, take mence TRA NSPLANTS This clondy weate with great care, and the plants put single at equal distances; that is are, ant the pleat north and south, and two and a hals or two and three-fourths feet enst and west They are placed thus close to each other to prevent the leaves from growing too large. The directions of the rows, hand. Where it has any inclination, the widest space should run across it, as the beds will have to be made so as to prevent the soil from being washed from the
roots by rain when bedded ; but where the land is roots by rain when bedded; but where the land is
rather level, the three-foot rows should be north and south, so as to give to the plants more effect of the sun by passing directly across the beds rather than obliquely over them. To set the plants out regularly, tase a
task line 105 feet in length, with a pointed stick, three feet long, attached to each end of it ; pieces of rags or soneething else through the line, at other ; place it north and sonth, (or as the land may require,) at full length, and then set a plant at every division, carefully keeping the bud of the plant above the surface of the ground. Then remove the line three fet from the first row, and so on until the planting completed. Care ought to be taken to prevent the this way, the plants can be easily set out, and a proper direction given to them both ways. In tasing the plants up from the nursery, the ground should first be loosened with a flat piece of wood or iron, about an inch broad, then carefally holding the leaves closed towards each other, between the fingers, draw them up and place them in a basket, or some other convenient thing, which can be planted during the day, water the nursery that the earth may again adhere to those remaining The evening is the best time for setting out the plants, but where a large field has to be cultivated it will be vell to plant both morning and in rainy or cloudy weather should be covered immediately, and the same hould be done with those planted the evening previous, hould the day open with a clear sunshine; the Palmetto leaf answers the purpose very well. There should be water convenient to the plants, so as to have them irrigated morning and evening, but more particularly in the evening, until they have taken root. It is hence generally necessary that wells should be sunk at con-
venient distances throughout the fields. The plants shoald also be closely ex amined when watered, so as to replace such as happen to die, that the ground may be properly occopied and all may ripen as nearly together as posesible.
From the time the plants are set out, the earth around them should occasionally be stirred both with hoe and the hand. At first, hoe flat, but as soon as the leaves assume a growing disposition, begin gradually to draw a slight bed towards the plants, which must be the ely examined, even while in the nursery, to destroy the stalks and gnaw the leaves when first set out. They resemble the grab worm, and are to be found cos from the eggs daposited ou the plazt by a butterfly,
and leed on the leaf, grow to a very large size, and look
very ugly, and are commonly called the "tobaceo worm." There is also a small worm which attacks the bud of the plant, and which is sure destruction to its future growth ; and some again, though less destructive, are to be seen within the two coats of the leaf, feeding as i were on its juices alone. The worming should be strictly attended to every morning and evening, until the plants are pretty well grown, after which every other day will be sufficient. The most proper persons for worming are either boys or girls from 10 to 14 years of age. They should be made to come to the inducements (such as giving a trifling reward to those who will bring the most worms) to worm it properly. Grown persons would find it rather too tedions to atoop to examine the under part of every leaf and seek the worm under ground ; nor would they be so much alive to the value of a spoonful of sugar, or other light reward. Besides where the former would make this search a matter of profit and pleasure, it would prove to the latter only a tedious and irksome occupation. Here I will observe, that it is for similar reasons that the culture of the Cuba Tobaceo plant more properly belongs to a white population; for there are few planta requiring more attention and tender treatment than it does. Indeed, it will present a sorry appearance, unless the eye of its legitimate proprietor is constantly watching over it.
When the plants have acquired from 12 to 14 good leaves, and are about knee high, it may be well to begin To TOP THEM by nipping off the bud with the aid of the finger and thumb nail,t taking care not to destroy the small leaves immediately near the bud; for if the land is good, and the season favourable, those very sud quite as soon as the lower ones, whereby two or four more leaves may be saved; thus obtaining from 16 to 18 leaves in the place of 12 or 14 , which is the general average. As the topping of the Tobacco plant is al essential in order to promote the growth, and to equaize the ripening of the leaves, I would observe that this operation should, at all events, commence the instan that the bud of the plant shows a disposition to go th seed, and be immediately followed by removing the suckers, which it will now put out at every leaf; indeed, the suckers should be removed from the plant as often as they appear. The robacco plant ought nover to the leaves texture, and gummy to the touch, at which time the end of the leaf, by being doubled, will break short, which it will not do to the same extent when green. It ought not to be cut in wet westher, when the leaves lose thei natural gummy substance, so necessary to be preserved About this period, the cultivator is apt to be rendered anxious by the fear of allowing the plants to remain in the field longer than necessary, unti ex on his guard, however, not to destroy the quality of his Tobacco by cutting it too soon. When the cutris is to commence, there should be procured a quantity of forked stakes, set upright, with a pole, or rider, sittin on each fork, ready to support the lobacco and seep from the ground. The plant is then cut obliquely even with the surface of the ground, and the person thus employed should strike the lower end of the stalk two or three times with the blunt side of his kife, 80 it cause as much of the sand or soil together, they are gently placed across the riders, or poles, prepared to receive them. In this state, they are allowed to remain the sun or open air, untir the ary wic, thereby hey wil hide in in ther bodies when fresh cut Thenly in cont , 1 on pole or rider as may, place as ianly carried, and take them into the may be convenienty drying house, where the Tobacco is strung our apo frames prepared for it, leaving a small speoly ameng the two plants, that air may circulate As the drying them, and promote their drying. As the drying advances, the stalks are brought closer to eachain to be housed.
In drying the Tobicco, all damp air should be excluded; nor should the drying of it be precipitated by the admission of high drying winds. This process is to be promoted in the most moderate manner, except in he rainy season, when the sooner the drying is efs the he better; for it is a plant easily afice commences. It is lisble to mildew in damp weather ; that is, when the leaf changes from its original colour to a pale yellow cast, and from this, by parts, to an even brown. When he middle stem is perfectly dry, it can be taken down, and the leaves stripped from the stalk and put is bulk oo sweat ; that is, to make Tobacco of its beter qulities this process, when a concentration of its better qaities by the weather, and cannot well be considered as being anything else than common dry leaves, partaking of the nature of Tobaceo, bat not actualiy Tobarco. The leaves are to be stripped from the stalks in damp or cloudy weather, when they are more easily handled, and the separation of the different qualities rendered also more easy. The good lenves are at this time kept by
Waahing the hands afier this in water is necessary, as the serld jaices of the
themse ves for "wrappers,
defectiv: ones for "fillings.
Whis the Tol acco is put in bulk, the stems of the leaves should all be kept in one direction, to facilitate the tyin of them in hanks; afterwards making the circunt..rence. To fuard arginst the leaves becoming overlosed, and to equalize the fermentation or sweatin;, after the first \(2 t\) hours, place the outs de leaves in the centre, and those in the centre to the leaves in the centre, and those in the centre to the
outside of the bulk. By doing this once or twice, and outsing care to cover the bulk either with sheets blankets, so as to exclude all air from it, and leaving in this state for about 40 days, it acquires an odour strong enough to produce sneezing and the other qualities of cured Tobaceo. The process of curing may then le considered as completed. Then take some o the most injured leaves, but of the best quality, and in propertion to the quantity of Tobaceo made, and place them in clear water; there let them remain until they rot, which they will do in about eight days ; next break open your buks, spread the Tobacco with the stems in one direction, and dampen them with this water in a gentle manner, in order that it may not soak through the leaf; for in this case the leaf would rot* Then tie them in hanks of from 25 to 30 leaves. This being done, spread the hanks in the Tobacco-house for about twelve hours to air, in order that the dampfor about twetve hours to air, in order that the dampness may be removed, and afterwards pack them in mannfacture them. The object of , until you wish to manafacture them. The object of dampening the Tobacer with this water is to give it elasticity, to promote its burning free, to increase its fragrance, give it an aromatic smell, and to keep it always soft. This is the great secret of curing Tobacco for cigars properly, and for which I am iudebted to the people of Cuba, who certainly understand the mode of curing this kind of Tobacco better than any other. It is to
them a source of great wealth, and may be made them a source of great wealth, and may be made
equa ly so to us. We cin have here three cuttings equaly so to us. We cin have here three cuttings from the original plan: ; the last cutting will be of rather weak quality, but which, nevertheless, will be agreeable to those who confine their smoking to weak Tobacco.
In "ratooning" the plant, only one sprout ought to be allowed to grow, and this from those most deeply rooted ; all other sprouts should be destroyed.
The houses necessary for the curing of Tobacco ought to be roomy, with a passage-way running through the and pierced on both sides with a suffithe other of doors and windows to make them perfectly airy.

In auldition to what I have said respecting airy of cultivating and treating the Tobacco-plant, I have further to state that the plant, once allowed to be pind tha in promoting the drying of the leaf, fire should not be resurted to, because the smoke would impart a fiavour In would injure that of the Tobacco itself.
In order to obtain vigorous plants, the seed ought to "reprocured from the original stalh, and not from the "ratoons," by allowing some of them to go"to seed for
that express purpose. In Cuba, the seed is most generally saved from the ratoon plants, but we should consider that its climate and soil are probably more favourable to the production of this plant than ours and, consequently, we ought to confide in the best seed Which can be liad from the origioal stallis. American

\section*{THE SUN:STHOKE IN PEAR TREES.}
[This is the article referred to hy M. de Jongle at p. 213.] the most dangerons is that which erises tree is liable, This is procluced on the lower part of a pyramid, or by the that thit afficction is occasioned the month of March bark of a young tree, being not yet hardened, struck directly by the solar rays, separates longitudinally inches inches. The bark cracks in the middle, and its edges curling up, it affords a refuge far insects, which take up their quarters there and contrihute by their biting to
increase the siz* of the wound, and to produce a canker increase the siz. of the wound, and to produce a canker
which most frequently causes the destruction of the tree The sun's rays striking this part struction of the tree expansion. It is also at that part where the sun-strok is alnost invariably observed, and seldom higher up among the branches. This ohservation involves the question of the influence of the stock upon the graft which will be the subject of consideration on anothe oceasim. Every amateur cultivating a certain number of Pear trees under the above circumstancas minh make out a somewhat long list of deaths which have taken place among his pyramids in consequence of san-stroke withulut perhaps having perceived the cause to which the luss nught to be attributed,
The incre the bark of a tree is exposed to the sun's rays the more it hardens, and the less it is liable to sun-stroke. The more its lower part is sheltered the more tender it is, and consequently liable to suffer in spring from the effects of the direct rays of the sun.
In order to prevent these bad consequences, it is important that the part of the stem immediately above the graft shonld be protected to the height of \(2 \frac{1}{2}\) feet with some slight eovering, such as a coarse cloth, straw rope or a covering of plaster, or clay. This protection

Fetruary and may be removed as soon as the tree is in full vegetation. If this precaution ber not taken, wounds in tho bark from sun-stroke must be healed by means of a plastor, consisting of a mixture of elay and con-dung with a piece of cloth, which shou'd \(r\) emain on till the end of the season. This is the only remedy which can be employed for the prevention of the fatal consequences resulting from sun-stroke. In the autumn, when the cloth and grafting clay are taken off, it will be ob-erve that a layer of bark, sufficient to preserve the tree from
destruction, has been formed over the allumpum. destruction, has been formed over the alhurnum. on the contrary, this remedy is neglected the rent of the
bark rarely heals of iteelf. The nust vigor,u* trees do bark rarely heals of iteelf. The nost vigor,us trees do not resist sun-strokes, and it is to this cause that the los of a great many fine yung dwarf pyramid and
Quenouille trees is to be atributed. (Echo de Bruxelles.

A Lesson on Horest Management and its Results. There may be," observes Dr. Lindley in the preface one of the editions of his "School Botany"
diference of opinion as to the advantage of spending much time upon the study of botany; but there is one
opinion only as to the importance of knowing the names of the plants of which man bas to mawing use, or which he is continually meeting witb. There is not at such present day a person of any intelligenee ignorant of youth should not have been that some portion of his nquiry. The Dorsetsline devoted to this kind on to considerable trouble and gentleman who put himself sack of Hornbeam seed from Florence to London, would have been saved the exertion had he known that the Hornbeam grew in abundance on his own estate; and is may be safely asserted that every one of that celebrated Court party which discovered a prodigy in the beautiful tree in Windsor Parl, would have been glad if their early education had spared them the mortification of learning from Lord M. that the tree in queation was aniy a Spanish Cheanut"" Now, if sach a lamentable
and and education would seem to warrant better puitio can harily wonder that those far below them shonld be equally deficient in a knowledge of "commo things." Yet so it is, and if such ignorance resulted in wothing more than occasionally placing thoe who are unfortunate enuu h to exhibit it in humiliating position it were hardly worth while to give he matter serious thought as a public question. But every every read+r of the passing events of the day know too well-are such as to render all of us interested in the dissemination of such lnowledge as shall preven heir oc.urrence. But it is not a deficiency in a know ledge of the external characters of plants that alone generally obtains; the simplest elements of vegetable physiology-the essentials of life and health-the primary causes of disease and death in plants are equally sealed books to the great majority of persane and more especially to those in whom such krowled would 1 e of the hiphest imporfance to themselves, indirectly to the community at large. I have ventured o make these observations by way o introducing an example of forest pruning, or rather I should say foreat mutilation, which has lately come under my observa ion. A geutleman whose antecedents I know nothing (but most certannly the management of plantation never formed part of his studies) became the possespo. an estate in a western county that shall be name ess. Like most persons with a recently acquired pro perty, he set about improving, or at least what he wa willing to believe to be improving, and of course the plantations came in for a share of his attention. To do however the former possessor justice, the woods were a a by means indiferent condition. Thinning we perhaps a little in arrear ; to remedy that was in realit all that was required. But our incipient landownem thought otherwise. It so happened that at the Mecha ics' Iustitution of the neighbouring town (of which by the bye the Squire, in virtue of his position, was a vico president), there was a lecture on vegetuble physiolag The lecturer having an eye to the direct application of his discourse-plantations abounding in the neighbores hood-dwelt at some length upon the impartance o ight to vegetation in general, and to trees in particular. voured to impress upon bis auditory that without an ample supply of that important element to planis they could never form the tissues and secretion pressary to robust health, that deprived of its influene they become puny and cieformed; that trees in over crowded plantations could not develop themselves, but became "drawn" and starved for lack of it; beside many other facts bearing upon the subject which nead not be alluded to here. Well this lecture, it meem opened a new field to our hero, and one in which he was determined to distinguish hiniself, and that he did mon ruthfully. The morning following the evening of the ecture saw him directing half a dozen men with axes, and bills, who were making sad havoc in the plas tion. Trees were cut down and the branches trimme ff others unmercifully, that one stood aghass at the destruction. Day after day the work went on, bare trulk carred and hacked by "pruning" met the eye onevery side. A beautiful wood that bordered the public road, and Birches, was chatline, and the drooping branches of the Birches, was the admiration of every one who gaw it gested by the unlucky lecturer "improvements wood is destroyed for ever; naked trunks ond an sighty gnags and scars remain-the waving branohen, e fowiag outline will never be found there again Why this mutilation? Why this destruction ! Let to ood timber light, and have I not cut off the branches to admis a much as possible to the trunks Truly is a litt knowledge sometimes a dangerous thing. G.W.L.
Growth of Conifers at Boconnoc in Cornwall:-

the winter of \(1854-5\), and the shoots of A. Brunonis New Kinds of Fnod.-By a paper real on some n the Animsl and Vegetable Products constituting the Foreign Commerce of Liverpoo, and by the discussion February, it appeared that many articles of foud, th:ugh much esteemed in foreign countries, could not find pur chasers in England, excepting for inferior purproses, such as provender for horses. Many of the-e vegetatle
substances could be imported and sold with a moderate profit at a cheap rate; it seems desirable to inquire how British prejudice against them could best be overcome Some Leguminosse, French Bean seed, fur example should, when cooked, have the first water in which sey are parboiled thrown away, as unpalatable if this pre caution be not taken ; but the greatest bar to the introduction of new kinds of diet is the high price at nhich retailers sell them. This, it would seem, might be emedied were some benevolent persons to supply new articles to some particular shop in Londun, for Garden Market, but on condition that the at Covent Garden Market, should not add to their prime wholesale cost any more than a reasonable profit. Sone un rejunce poor; such persons might be expected to purchas cheap kinds of food though new to them, and their example would go far towards the conviction o
their neighbourg that what is good, cheap, and their neighbours that what is good, cheap, and
nourishing abroad, should not be despised at home. Numerous instances might be adduced to show that new articles of diet are retailed at exorbitantly high prices, dried and pressed vegetables amon ist others, which, though obtained wholesale at a moderate rate, are re tailed at prices which renertion is applicable to fruits. Normandy Pippins, it is true, are retailed at price which at most seasons causes them to be cheaper than fresh Apples. These Pippins are examples that dried fruils are as good as fresh ones for puddings and for stewing, though in London much less costly than fresh Apples. These Normandy Pippins are a proo that shopkeepers are apt to raise their prices, no according to cost of the article, but for some asven-
titious reason, for when the Grape malady necessarily raised the price of Raisins, Normandy Pippins were thenceforth sold at \(1 d\). a pound dearer than befor This is not the only dried fruit susceptible of being sold at low prices, for dried Plams and Pears are equally abundant in France. The French plan is to spread the fruit on wicker trays, expose them to the sun, and when the oven is heated these trays are put into it after the bread is taken out, Miss Acton, in the new edition of her cookery book, gives ample instructions for the drying fruits on a small scale for domestic use
Cherries dried in her way are good for eating raw, and also soaked in tepid water, just enoughto cover then,
are excellent for winter pies and puddings. In the south of France the sun has pnwer sufficient to dry Figs, \&c. ; but in this climate artificial means of desic-
cation must be had recourse to. Probably in a large manafactory of dried fruits the passing a current of warm air over them would be found the most efficacious and the cheapest means, but time must be allowed for the interior mois
Pears in South Devon.-I have heard it stated that, favourable and mild as the south cosst of Devonsire mile or two inland is the finer kinds of Pears will not fruit there at all well, hut Apples bear most ahundantly. Would any of your correspondents living in that neigh-bourhood-Torquay, Teignmouth, or Plymouth-have the kindness to inform me if this is the case, and if so, whether it is attributable to the Apple blooming later, or to the greater prevalence of spring frosts in that locality having more effeet on the Pear bloom than the Apple?-Captain A. Wade. [The statement that the finer kinds of Pears will not fruit well a mile or two inland on the south cosat of Devon, while Apples bear most abundantly, appears to us to be rather paradoxical and not supported by any facts that have come to our knowledge. Perhaps some of our friends in that part of the county will enlighten us on this matter, if we are mistaken. We believe more attention is paid there to the culture of the Apple than to the Pear-but where the latter is grown, we think it will be found that it bears well, and that the fruit attains a degree of excellence unsurpassed by any produced in other parts of the kingdom. B.]

Horticultueal. Mareh 31.-Sir Philip de Malpas Grey Egerton, Bart., M.P., Vice-President, in the chair. This was a Special General Meeting for the purpose of receiving the reply of the Council to the report printed in extenso at p. 17 t, and for electing three new members of Council. The purport of the
reply, which is far too long for eatire insertion, will be reply, which is far too long for eutire ins
- After reealling to the reoollection of the meeting their pro meoting of the 11 th of March broke up, the Council inm mediately invited to a eonferenoe the Chairman and the two other members

These gentlemen were afterwards elected. The Earl Right Hon. Earl Grey, seconded by J. E. Denison, Esq M.P., moved as an amendment:-"That the Council be authorised to terminate the tenancy of the Garden at Chiswick as soon as the lease will permit, and that the property therein be sold." A long discussion ensued, which ended by Lord Grey's proposing to add to his
resolution the following words:-"Unless such a sum as the Council may require for maintaining the Garden as the Counci may require for maintaining the Garden
phall have been subscrived before May 1 ." This having shall have been subscrived before May li" This having
been carried unanimously, the proceedings terminated. We understand that the Council has since met for the purpose of giving effect to this resolution, and determined upon a circular letter to be sent forthwith to the Fellows of the Society.

\section*{20tices of 330\%.s.}

Audubom, the Naturalist in the New World (12mo, Longmans), is a little volume describing the adventures and discoveries of the great American natur ilist. It is in fact a brief sketch of his life, as illastrated by the aneedotes contained in his own works, or pablished by others. It is to be regretted that a more skiful hand has not been emptoyed in putting together such fragments; for although nothing can materially diminish the interest belonging to many of the stories, yet it might have been greatly enhanced by a person conversant with naturalists and their language. That sach is not the case in the present instance we collect from such inadvertencies as calling a bat a bird (p.35), and from the undoubting manner in which "Galt" and "de Thouville" are spoken of as well-known botanists. We would also suggest that a Tulip tree is not a Tulip ( \(p .41\) ), and that such words as verdercus, the cord of a bow, \&c., are scarcely English. Notwithstanding such blemishes as these and a constrained style, the little volume will, we doubt not, find many readers, for all admire adventures, and those of Audubon were sometimes striking enongh, as the following example shows. On one oeeasion when benighted he entered a small \(\log\) cabin occupied by an ofd woman and
a wounded Indian. The appearance of the former " might have dismayed any but the stoutest heart. A bout her tall, gaunt figure, her mi ierable attire was heedlesely gathered. The roughnee of her manner and the audacity of expression were also well suited to the large propertions and museular limbs of this Meg Merrilies of the woods.
"As he received no voluntary courtesy from his hostess, he was anxions to let her know of the hungex

Trupitiate her, drew forth a rich watch fromglins vest. inss ; for he was in-tantly infurmed of the existence of cakes, venism, and oti er dainties, from which to make au excellent repast. But, first, lie was compelled a rain (0) gratify her curiusity hy amether sight of the watch, whech she beheld in wonder. She received with ecstacy the gold chain, whicls Aulubon preeented to her; and hanging it with barbaric pride around her brawny neek, she expressed, at the sanie time, how happy the posses Audubon, more intent on satisfying his. appetite than securing his ornaments, paid hitle attention to her antics
signs however made by the Indian soon informed him that danger was near, and all the watchtulness of the raveller wa aroused :-
"After priming his gun, he returned to the hut, where, mahing a pallet of bear skins, and calling his dog to his side, in a few minutes he feigued a deep slumber, while awaiting the issue of the adventure. In hort hae, ano
 whisky, of which they drank freely,
creasing the ferocity of their gestures.

The mother then spoke in a low tone concerning The watch, and a conversation ensued which it was easy to interpret. Audubon then gently tapped his dog, and beheld with indescribaile relief the splendid eyes of the faithful animal sagaciously raised, as though aware of the impending danger, alternating towards his master and the trio in conversation. The looks of the young Indian, tno, reassured him.
"Yet it needed all his fortitude quietly to observe the menacing proceedings, for with surprise and horror he beheld the wretch, whose cupidity had been excited by lis possessions, take up a large carving knife, and prosoul erept grer him as he observed her sharpening still more and more the deadly instrument with which she whs about to talie advantage of his defenceless condition.

Approaching him cautiously, she appeared contemplating the readiest method of dispatch.
ic self-defence, be his last, was at hand, when suindenly the door opened, and two stout ravellers armed Wudubon instantly made his situation understood. The Indian instantly made his situation understood. The Indian danced for joy, and the culprits were now the captiveso
The return of a bright and rosy dawn brought their merited punishment, that which Regulators usually employ fur such delinquents. Their cabin was then fired, and its

This story would have charmed Mrs. Radoliffe.

Messrs. Jacirson's, Kingston.-The fruntage of this nursery has of late been considerably extended and improved A good show house at the entrance is now fong plants, among which were some which specimens of the sikkim Rododendron litatum, These had been lifted out of the open border in autumn, potted and wintered under glass. The Chinese Dielytra spectabilis, "potted up" from the open ground when well grown, the makes an exiremely showy plant at this year have bloomed abundantly, and in the centre of the house were numbers of well-flowered specimens of the better sorts of Rhododendrons, which, together with Azsleas and other spring flowering plants, made a fine display. Of Conifers, both in-doors and out, there is here an excellent collection. Among others under glass we remarked good sized plants of Wellingtonis gigantea, and of Jeffrey's Abies taxifolia or Pattoni from the Rocky Mountains; this last in is present state bears some resemblance to a Hemlock spruce. In the sibocedrus chilensis and Doniana, both handsome spec̣imens, Cephalotaxus Fortuni, and what was called Thuja elegans. These are stated to withstand ordinary winters in sheltered places withont injury. In the principal Orchid house a specimen of Dendrobium aggregatum was well furnished with charming bunches of bright yellow flowers, and along with it was a fine plant of Rucker's variety o: Dendsobium nobile, which is considered to be hanisomer than the species. There was also here a pretiy variety of Lycaste S inneri with a pure white lip, the pink colour in this inatance being wholly confined to the sepals and petals. In addition to Orehids this house contained a charming collection of Ferns, amung which we remarked Gymno gramma chrysophylla aurea, a variety the under sidea of whose fronds were of a brighter yelluw than thooe of the species; also G. pulchella and sulphurea, Cheihanthes farinosa, Pteris aspericaulis, a kind wid very handsmene are covered with long black hairs; Aspleof which are covered with long black hars; Asple Davallia falcinelia, and the singular-looking Aspidium Filix-mas monstrosum. At the entrance of this stove were two remarkable plants, one
X ylophylla latifolia, with a handsome top of leaf Xylophylla latifolia, with a handsome top of leaf-
like apvendages, on the edges of which the flowers like appendages, on the edges of which the flowers
are produced - the other Cordyline heliconiæfolia, with a noble bead of Musa-like leaves from among which issues a panicle of cream-coloured flowers. Both these
ot unmpusing in appearance. Un a side shelf was a
collection of the different sorts of variegated Orchids, and near them an example of the Madagasear Ouvirandra fenestralis. This was "growing in a small quantity of mould in the bottom of a glass pan with quantity of mould in the bottom of a glass pan with
some white pebbles placed over the soil to show off the skeleton leaves of this singular aquatic to more advantage. Thus situated, it seemed to be thriving, and although but a young plant was extremely interesting.
although but a young plant was extremely interesting.
Of Heaths and Epacrises there are here immense Of Heaths and Epacrises there are here immense appeared especially deserving of notice, inasmuch as it expands its flowers freely to the very points of the shoots, which few other varieties do. Its snow-white blossoms are also unusually abundant and showy. Among newer sorts of Heaths may be mentioned Erica glauca, which resembles elegans, but it is more upright
in habit. Of E. ventricosa coccines minor there were large quantities, that remarkably free-flowering variety always meeting with a ready sale.
In a cold frame were numbers of plants of the Pampas Grass, all seedlings, and many of them with leaves 2 feet in length. In the propagating house Eugenia Ugni, in the shape of young seedlings, was plentiful. A plant of it last year ripened fruit here, which was found to be peaty soil, and nearly every one of them vegetated. The old plant itself, we were informed, had been sold for a gentleman's orchard-house, for which, if it should not gurn out to be altogether hardy, it is well adapted. In this house were some beautifully-grown plants of the Double White and Red Chinese Primulas, and associated with them was a new scarlet Geranium with a white eye called Sir Colin Campbell, a striking kind which will doubtless prove an acquisition.
Among Azaleas we noticed a deep brilliant rosy salmon-coloured seedling, with flowers of great substance and good shape. It had also a handsome foliage, which set off the blossoms to good advantage. This will doubtless turn out to be a really good kind, and it is apparently new in colour. Among Sikkim khododendrons we observed a promising plant of Dalhousize it is said, often do not live long, and the same thing is reported of \(R\). javanicum. The Blue Tropæolum, we may add, is grown here abundantly. It is, we need scarcely say, a truly beautiful species, and deserving of more attention than it has hitherto received.

\section*{PLANT DEPARTMENT}

Conservatory, \&c.-All kinds of climbers should after this time be frequently examined, to prevent a
confused growth. Kennedyas, \&cc., if crowded should confused growth. Kennedyas, dce., if crowded should Thunbergias being subject to red spider should be well syringed to prevent that pest gaining ground. Where a large quantity of hardy shrubs is annually forced either to decorate the drawing-room or the conservatory, it is not desirable to pot a fresh stock each season, as a number of the deciduous things such as Roses, Lilacs, Thorns, Honeysuckles, \&e, may by proper treatment Select, therefore, the most suitable plants when removed from the housea, and give them some kind of temporary shelter to gradually harden their foliage; those cramped for pot room shift into a size larger pot plunge them in an open situation, in order that the wood may get ripe early. These plants, from having stock, of which a portion should each year be potted to stock, of which a portion should each year be potted to
replace such as become useless for further work. Cut replace such as become useless for further work. Cut
down and place in a cold frame the most choice kinds
of Cintrarias for suckers after they have done flowering display. As spring flowering plants for the stove and for catting, we know of none more useful than Begonias. Now will be a good time to commence with a stock for next season's display; as they go out of bloom allow next season's display; as they go out of bloom allow
them a short rest in a rather dry house, when they may be partially disrooted and repotted, pruning in any be partially disrooted and repotted, pruning in any
straggling shoots. Keep them close and syringe straggling shoots. Keep them close and syringe
frequently, when they will soon commence growing. Abundance of light and a tolerable share of pot room are necessary to insure fine plants. Above all keep
them a good distance apart, that the fine foliage of some them a good distance apart, that the fine foliage of some
of the species may have fall room to expand. As the of the species may have fall room to expand. As the
plants advance liquid manure may now and then be plants advance liquid manure may now and then be
given. Their period of blooming is from January to given. Their period of blooming is from Jan
May.

If not done previously the herbaceous ground should now be well cleaned and neatly raked over. Fill up vacancies either from the reserve garden or by sowing annuals in the intermediate spaces. Large plants some genera, as Phloxes, Asters, \&c., generally throw up too many flowering shoots; where such is the cas heads of bloom but increased strength to the remaining shoots to enable them to need less assistance from stakes Hollyhocks for late blooming may still be planted, as it is better where they are grown extensively to plant a These showy plants are admirably adapted for planting in long lines and parallel to straight walks, walls \&c., where they produce a grand effect. One o
the principal points in pleasure-ground scenery i the beauty of the turf, which should be kept at a times closely cut if perfection is aimed at, but more particularly at this season, when by frequent mowings, cutting the Grass as low as possible, the foundation of a sandy or rocky soils, the vadure must be maintained by occasional waterings with weak liquid manure.
forcing department.
Pineries.-In the present state of the weather it will be nearly impossible to maintain a properly moist state sufficient asphere without the aid of shading; for, the temperature, the atmosphere is speedily robbed of its moisture, and the foliage at once feels the change, and is easily injured by bright sunshine acting upon i Pines when it can be dispensed with, consistent with the Pell-being of the plants; but except in the case of tank well-being of the plants; but except in the case of tank
or dung pits, where a constant stream of moisture can be commanded, it is nearly impossible, in the present state of the weather, who the aid of shading, to maintain a sufficiently moist atmosphere, either for young growing stock or for plants swelling their froit. A very thin material should be used, however, and this oniy for few hours on the forenoons of bright days. Growing
stock and fruiters should be lightly syringed every five stock and fruiters should be lightly syringed every fins afternoon, shutting up the house early, but do not use the syringe too freely, as this is apt to render the soi about the collars of the plants too wet, and water, when allowed to lodge in the axils of the leaves, tends to dis figure and render the foliage weakly. See that the whole of the stock, whether in pots or planted out in the open bed, is kept in a healthy state as to moisture at the root, for any neglect in this respect at the present seaso the be most injurious, and may cause a large portion of Pines, the same attention and care should be exercised as in the case of more tender things, looking over the plants often, watering only such as are dry, and giving plants often, watering only such as are dry, and giving
these a liberal soaking. Vinerifs. Where the Vines are strong and vigorous, and a healthy root action can be secured there will not be so much to fear from the attacks of red spider, but in the case of old sickly Vines and badly conditioned borders, and these two generally go together, the most assiduous altention will be necesary to keep this pest from making its appearance. The almosphere should be kept moist, using fire-heat a sparingly as possibe, and if spider makes its appearance it must be eradicated at once either by washiog every affected leaf with a sponge, or by a liberal use of the syringe as long as this can safely be used, so as to avoid having to contend with this enemy when the Grapes are colouring. The pipes should also be coated with a mixture of sulphur and lime, renewing this oceasionally as it gets worn off. Stop laterals as they make their appearance, and keep the shoots thin and regular in order to expose the foliage as much as possible to the light. Ventilate very cautiously, opening the top sashes only on cold drying days, and shut ap early in the afternoon. Peaches. - Where the stouing process is falling there will be little or no danger of the fruit falling, therefore if the crops have not already been sufficiently thinned this should be done at once, and ir
nne fruit is an object thin liberally. Keep the trees moist at the root alter stoning while the fruit is swelling
met rapidly, and weak manure-water may be given with advantage to such as show any indications of weakness. Also secure a moist atmosphere by frequently sprinking ho floors, dc., and use the syringe freely on the forered spider.
hardy frut and kitchen garden
Seedling plants of Cauliffowers, Cabbage, \&ce, raised this present spring should be pricked off when large enough, to get atocky for final transplanting. As the
future growth of the Brasaica tribe depends much on
not being drawn when young, some attention shoula 'be paid to this point when they are in the seedling state, first neglect. As the time for sowing the principal first neglect. As the time for sowing the principal
crops of winter and Spring Broceolis and Greens is now at hand, select if possible an open piece of ground, rather poor than rich; let the seed be somn thinly, and when large enough to handle prick them out on a similar soil. To carry out the above directions among the numerous varieties inserted in the seedsmen's lists not more than three or four are necessary. A crop of the Globe Artichoke should now be planted for pro-
ducing a late supply of heads. We have in former Calendar give directions for preparing ground for these and our panent plants; on this the young side shoots taken from the old stools may be planted in lines 4 feet apart and 18 inches between the plants, or trenches may be dug 18 inches wide and the same in and the plants put out as above.

\author{
SATURDA Y, APRIL 5, 1856.
}

The sale at Fawsley, on Thursday, of Sir Charles Knightley's long established herd of Short-horns was, in spite of the wet weather, attended by three or four thousand people from all parts of the country. Mr. Strafford kept them standing patiently in the rain for five hours, during which he disposed of four dozen cows, heifers, and heifer calves, and 30 bulls and bull calves, at prices sufficiently significant of the esteem in which the breed is held, and of the genuine character of the herd which has been thus dispersed.
The animals were all in admirable condition, and the prices reached-generally uniform enough to show that unity of quality which by its long standing the herd had acquired-were in some few cases of the higher class by which the breed has been distinguished. The highest prices were generally given for those animals in which the Duchess blood existed. Thus the Duke of Cambridge by Grand Duke ( 10,284 ) sold for 330 guineas ; his sire was sold last year by Mr. Bolden for 1000 guineas. The next highest price was given for a young bull, Bosquet, which was bought by Mr. Sheparrd for 200 guineas. Several of the heifers exceeded 150 cuineas apiece, and the average-for cows and heifers nearly 81 guineas, for bulls and bull calves nearly 71 guineas, for the whole sale nearly 76 gaineas-is much higher than considering the comparative smallness of the highest prices is generally the case. This largeness of the aver.
age, nownhthstandug the few instances in which the highest prices were attained, is a satisfactory
proof of the general good quality of the animals. proof of the general good quality of the animals, will be completed next week:-
sale of the fawsley herd, Apall 3, 1856.

The sum obtained for 78 animals was 596.2 guineas, averacing nearly 76 uuineas each.
horns are shortly several additional sales of shorthorns are shortly to come off, and among them one advertised in our columns by Mr. Wetherell. We allade to that of Mr. Smythe ()wes, at Condover blood, as will be seen by referring to the catalogue. comes off on Tuesday, the l5th inst.
IT is a singular illustration of the inexactness of agricultural knowledge that the question how many Marjoribanks.
needs there are in the pound of our commonly culItvated field plants shonld still remain to be answered. It is plain that the answer will not
necessarily affect Iarm practice-for the quantity of seed which it is proper to sow per acre is matter to be determined by experience, not ly argument apart from trial; and yet surely it is most desirable to compare the number of the sreds we ordinarily sow with that of the plants we raise. If in ordinary practice \(1,200,000\) seeds of Wheat are sown on every 40,000 superficial feet, or what is more extraordinary 15 to 18 million seeds of Flax
are scattered on the same extent, about three to every are scattered on the same extent, about three to every
inch of land, it is surely well to let the farmer know it. He knows very well he does not raise so many plants as this-and struck, as he must be, by the enormous disproportion hetween the means he uses and the result he gets, he will inquire into its causes.
The Turnipseed employed per acre numbers from 600,000 to a million according to the kind and quantity adopted; this, if the rows are 2 feet apart, is two or three dozen seeds per fout of row, where a single plant alone is to be grown. No doubt nothing like so many generaly come up, but then there is a
great destruction by the hoe, which will explain much of the discrepancy in this case. What however becomes of the \(18.000,000\) seeds of Flax which are commonly-of the \(6,000,000\) seeds of Oats which are sometimes-sown per acre? There is no destruction by the hoe in either instance here. A single ear of Oats may contain 100 grains-a single plant will generally include half a dozen ears, but if \(6,000,000\) plants should yield as much as this implies, they would produce 100 loads of grain.
Instead of 600 seeds apiece they need yield but half a dozen each to produce an ordinary crop of Oats. It is plain that five-sixths of the seed or of the plants that they produce are killed in the cultivation of the crop. And the proportion is vastly greater than this in the case of other plants. What is the ordinary seeditg of the Clover crop? Eight lbs. of red Clover, four of white Clover, and four of Trefoil may be sown-that is at least \(6,000,000\) seeds per acre-a seed on every inch of land-but instead of 144 are there generally half a dozen plants on every square foot of the Clover field
There are ahout 25,000 seeds of Sainfoin in a pound of "rough" seen, as it is called, ant it weighs some 20 lbs . per bushel : 4 bushels is an ordinary seeding, and they contain \(2,000,000\) seeds, or 50 per square foot of land. This is the number too of seeds in an ordinary seeding of Vetches. It is manifest that in both these cases there is an enormous destruction either of young plants or seed; and these are the two great divisions under which the causes of this anomaly must be classed :Faults of seed and sowing, and faults of cultivation. To these two first-class agricultural suhjects we shall in future articles idirect the attention of our readers. Meanwhile we are enabled, by the assistance of Messrs. Rendle, of Plymouth, to lay before them the following answers to the questionhow many seeds to the pound?

The further consideration of this very important table we must postpone for a week.
We have to announce in reference to the examination in agriculture before the Society of Arts in
with Low's Agricaltare, Johnston's Agricultaral Chemistry, and Mr. Pueer's Paper on the Progrea of Agricaltural Knowledge, in No. 26 of the Royal Agricultural Society's Journal, together with such a seneral knowledge of farm practice and of the minagement of live stock as must to some extent at any rate have been acquired in the field. The examination will be conducted by written papera and orally. It is desirable that the most be mad of this opportunity in the interests of agricultare,
and what publicity our columns can give it is therefore gladly afforded. Mr. Mechi offers a prize of Ten Guineas to the candidate who shall pass the best examination in the principles of agricultore and obtain a first class certificate therein. TT examinations instituted are for candidates from ins'itutions associated with the Society of Arts, and any one willing to submit to them must therefore be introduced through one or other of these institutions. We hope that there may be many to compete for the certificates of proficiency that will be warded
In reference to the agricultural department it may he as well to remark that while Low, Jонnston, and Pusey are the authors named, the object of the examiners will be to ascertain the acquaintance of the candidates not so muc's with the writings specified as with the truths which they convey, which may be found elsewhere, and are in fact related in all systematic works on agriculture and agricultural chemistry.
We learn from a correspondent at Plymouth, that the demand for Italian Rye-grass has this seaso been enornous, and the wholesale price has boen nearly double of what it has been for many years past. Nutwithstanding this high price the sale has been immense, and a London agent writes, "I very much question if any foreign Italian Rye-grass is to be had in London." Oi' course he means in the he had in London.' Of course he means in the some still, though many of them, large as was the stock laid in, are already nearly cleared out, and will find great difficulty in executing orders.

DIARY OF A DAIRY FARM. April.
The process of cheesemaking commences very generully in the beginuing of April, although that which is made whilst the cows are eating hay is never of the firest quality. This is very manifest even in the ontward appearance, there being a deficiency of the blue coat, a sign of richuess which is observable when the cows an eating Grass, and the cheese is more inclined to heave during this month than later in the season. There is a plan adopted by very many persons to prevent this heaving, which if regularly practised through the summer would seem very likely to render the cheese onwholesome, and if not used with great discretion it might be very dangerous. This is the use of blue vitriol, dissolved in wa'r, a certain portion (of course a small one not exceering a piece the size of a nut for 50 gallons of milk) being put into the milk at the same time with the \(r \in\) nnet ; this has the effect of preventing fermentation but the use of it is frequently prejudicial, for if left to the judgment of the dairymaid, proper care is not the judgment of the dairymaid, proper care is no
always exercised, and when there has been too mach auways exercised, and when there has been too much
u-e it has leen known to show itzelf by turning the cheese blue when exposed to the air. In one instance it was known that a considerable quantity was entirely spoited, and the factor unable to do anything with it However it has heen a general custom to use it in dairies, and whiere is has been done with caution, it has proved remedy for the heaving of the cheese, which upon some land it is oftentimes very difficult to prevent.

The use of a small quantity of the sour whey and also a little saltpetre has sometimes proved very effectual without the risk of using vitriol. A tablespoonful of saltpetre to about 40 gallons of milk is place the sieve, and the mill passed through in straining, dissolves it, and mixes it effectually with the mill The practice of using annatto or cheese-colouring is not so generally adopted now as formerly, though in some districts it is still used, and the cheese preferred with it ; in others it is completely discarded ; it does not appear thatect the quality of the cheese excepting when used very largely, and then it has been found have the effect of drying it to a certain degree and thereby depriving the cheese of rieliness, therefor
under any circumstances a small quantity should be used, sufficient to make the milk one shade deeper in colour. In cheesemaking, as in most other things, people fancy their own way the right one, but it is very desirable to test the best method by trying severim experiments in the same dairy, by which a correct con clike may be obtained; there is certainly noble in m /st things, is dairy, where the variety of the seasons and constan changes in the weather have such a decided effeet that it is difficult to lay down regular rules for everything n:any circumstances, therefore, must be influenced by the experienced judgment of the dairymaid. Howera the plans here recommended have been practised maay
was in this dairy altogether abolished, and the cheese
was thought to be improved in quality thereby After the rennet is put into the miki it should always stand at least an hour without being disturbed, when it should be cat slowly with a knife having three blades, but only sufficiently small to allow of some of the whey being dipped from it ; after it has stnod a quarter of a hour it may be broken up very small, without the ris of importan; the quantity of wey buter shudl not of importance; the quantity of whey butter should not better ; the curd being broken very small the second time causes it to sirk into a solid mass, and the whey can then be more easily taken from it. It is of much importance to the quality of the cheese that the cur should be made as dry as possible, therefore it is gene rally put into vats and pluced in the press for half an hour to effect this, and when taken out and placed in the tub in large dairies a mill fur griuding the curd placed on the top of the tub has been found very efficacious, as a saving of much labour to
the dairymaid, the crumbling of the curb safficiently small being a very hard process for the hands, gilarly done as when for the hands, the mill. It only then requires to be pressed firmly into the vats. It has been proved that after the use of the mill the cheese retains the fat better than when all the process is performed with the hands Cheese has been found richer by the curd not being over it a!ter the wat is sufficiently full, fivat layin cloth over it, and the cheese to be turned over to allow of both sides receiving the hot water ; this makes it firm on the outside, and prevents its cracking.
It is well to commence cheesc-maling by using the thinnest vats; the cheeses in these are more like! to keep their proper shape thus early in the season; they
should nut be made thicker than eight or nine to the cwt. It is custon ary to set up a small porion of mi.k for butter to be skimmed once, and afternarls to be put into the cheese; the addition of a little cold milk is an advantage to it , and it has been proved that when the milk requires to be warmed to make it of the proper heat before adding the rennet, it is a much better plan to warm some of the milk when brought from the cow to a greater degree of heat than to warm that which has been standing 12 hours and the cream taken from it ; it has been observed that the cheese is much firmer by this plan, therefore it is well to adopt it. After the cheese has been in the press two hours it should have the wet cloth renoved, and replac-d ly and and if it be found that the curd is not properly closed a seeond may be used before it is salted. The salt
should be rubbed in at nigh: to the chetse made in the morning, and that made at ni, ht as soum as postilly convenient in the morning; three times is sufficent fur thin cheese, and four times for thick, the cluch to be left
of the last time of salting ; afterwards a small quantity of salt may lie used to prevent the cheese sticking to the vat during the time it is in the press, takirg care that in is turned every day; and though not necessary for thin thought au advantage if there is press rem to a, it is being longer before turned out on the shelves; when there it must be turned every day. Avoid puting it in a draught of air when tender, as this will invariably cause to crack
The dary should now be getting most of the new milk, the calves weaned last munth from the oldest cows being the best for this purpose. The milk they get, mixed wit! the oatmeal or Linse d before recommended, may be taken from the quantity set up for butter and once skimmed after standing 12 lours. Calves at five or six weeks old will grow fast and be in sufficiently good healthy condition, with half a pint ot Linseed or oatmeal prepared in thanner before described, and one quart or three pints of skimmed milk in adilition at every meal. The milk should be placed in a tin vessel in boil ng water to render to the age of the calves, and regulated nomewhat by the number kept, as their growth may be furced to some extent by higher feeding. Some good hay should be put to them twice a day, and some Swedes cut very thin, which they will soon take to eat readily if a bit is put into their mouths as snon as they have tak:n their milk, when they are disposed tos suck anything that comes in their way. The food as above described has proved by long experience to be quite sufficient for treated becoming fine heifers from this commencement at the end of three years, and iu many cases even at two years old. A sufficient number of these young coivs to supply the place of old cows turned from the dairy strick last autumn should now calve, and their young should run with thom for as much as a fortnight
and then be sold, exzent in cases of particular fivourites and then be sold, exzept in cases of particular fivourites heifers require some little time to becume quiet and accustomed to the milked, which they will more readily allow with their calves by their sides, and the frequent sacking of the calves durng the whole 24 hours makes the milking an easier operation afterwards. A run for a few hurr, in the day in a sunny field or orchard, with access to shelter, will do the wenning calves much good. ahould now have the best food provided, the dairy anould now have the best food provided, the dairy monst on every food feeding, and on ordinary farms by the end of the month some early Rye-grass could be pro-

Fided and be given to them in the yarde in addition to, the current casth-balance in the hands of the baukera their winter food, as a good preparation to their being wa

Seeds.- I have hitherto referred to Messrs. Lawson \& Son's treatise when I wanted to learn the number of seeds contained in l lb. avoirdupois. Let us compar "J.C. X.'s" table with that of Messrs. Lawson \&

"J. C. X." finds nearly trehle the number of seeds in Cynnsurus cristatus that Messrs. L. \& Son found, and more than double in Trifolium repens. The numbers vary greatly in other cases. Who then are we to
helieve, "J. C. X." or Messrs L. \& Son? Gco. Summers, IIoughion Farm, Blundford.
An error that may mislead. - In the "Scottish Agricul. tural Almanae" for 1855, page 11, is given report of experiments in fattemin! cattle, said to have bee have been awarded the Highland Society's prize of 241 ., 1852-3. In the results as there given, there seems miscasd as to the which if left uncorrected is fitted to mislead as to the feeding value of an acre of Turnips.
The error scems to run through the whole 21 lots experimented upon, but lot 5 may be tested being one of the simplest. The experimpnts extend nver 100 left as profit 21.11 s .11 l d. , being, says the report, at the rate of \(20 \% .14 \mathrm{~s} .09 \mathrm{~d}\). for the Turnips per acre of 30
tons. 150 lbs . of Turnips for 100 dars \(=15,000 \mathrm{lbs}\) the value of which is \(2 l .113\). \(11 \frac{1}{2} d\). Now \(15,000 \mathrm{lbs}\) 2l. 11s. 112 d. : : 30 tons: not 201. 14s. Opardo but referred to is the one publislied oy Mr. J. Loch har Morton, of Edinburgh.]
The Weather.-Although I have no faith in prognos tications about weather, and consider metenrology burren science in its present state, still I register facts and deal in suggestions, which help to keep alive the interest in the study; some law which may be applie may be discovered at last, but never will if we neglect to observe what takes place. With this general remark I request of such of your readers who study meteoro logy to let us know when the rain began in their locality on Sunday the 16 th March, and how they can accoun for the fact that the wind that day being due \(\mathbf{E}\). the rain commenced in the W., and progressively extended
to the E. The facts are these:-My brother was at Bath, W. of my residence 30 miles, and the raia bega at I P.M. ; here it commenced at 3 P.M. ; and at Her nitage, Berkshire, 30 miles E. of this place, it began at 5 P.M. ; making a nearly equable progress from W., to E. of about 15 miles per hour. I hope some of your readers may have happened to note exactly the time when it began to rain, that we may have the additiona facts to aid us in our inquiry for the cause. The only conclusion I can at present come to is, that the conditions producing rain operated in an exactly opposit direction to the wind, and progressed eastward quit [At West Moulsey, in Surrey, it began about 7 in the evening.]

royal agriculteral of england.
Monthly Council, April 2: Colonel Challonem
Trostee,
Fixances.-Mr. Raymond Barker, chairman of the Figance Committee, presented the report on the
accounts of the Society; from which it appeared that

Prize-Essays and Lidrary. - Mr. Dyke Acland, viecChairman of the Journal Committee, reported the arranmements made for adjuracating on the Essays sent Why the 1st of Murch last to compete for the prizes ffered by the suciety, and the furiter recommendetion of the Journal Committee in reference to the preparation of a compleie catalogue of the Socioty's itravy.
hemical Analysis.-Mr. Wren Hoelyns, Chairman of Chemical Committee, reported that a revision of the charges to be made by Prof. Way, Consulting Chemist to the Society, lor analyses placed in his hands by the Committee, who intended to report their recommendation of a new schedule of such charges to the Council at their next monthly meeting.-Mr. Fisher Hobbs expressed his intention of representing to the Committee on that occasion the great additional advantages the farmers of the country would derive from Prof. Way s scientific acquirements, if, consistently with ther arrangements, a condition could be introduced in the Society's re-engagement with him that he should in the course of each year make certain tours through the farming districts, aud acquire personally from the dife tical knowledge of the meane by which he might be able, not olly to improve his own aequaintance with the application of se:ence to agriculture, but to advanee their own intereste, and that of practical agriculture generally, by such more extended survey of the ordinary perations of farming.
Chelhsplrd Meeting.-Mr. Barnett, Vice-Chairmas of the Country Meeting Committee, reported their recommendations that a show-yard should at once be constructed of the same size as the one at Carlisle last year ; and that Mr. Manning, the Suciety's contractor of works, should prepare and suumit to the Committee the plan and estimate of a Pavilion capable of accommodating 1000 guests at dimner on the Thursday of the Cheimsford meetin's show-weel in the middle of Jaly next.
Certificate Entries. - Members were reminded that all entries of implements at the Chemsford heering (as far as regarded the space required and the the secretary by the lst May ; and all entries of livestuel by the lst June.
Mreitiobious Labourers. - Mr. Fisher Hobbs hoped hat some opportunity would be afforded at the Cheims ford Meeting to recornise in accordauce with one of the chartered objects of the Society, such services of meritorious agricultural labourers as might be brought under its notice by the several loeal associations of the county
Field-Dynamometrr, - Colonel Challoner having reported, as Chairman of the Implement Committee, Consulting effints in deving Do tractive force required to work field implements, the Cuuncil authorised the Committee to direct the conCruction of sucla an instrument for employment at the leeting , also to give final instruct Prizo-sheet for of the cond
Country Meeting op 1857.-Notice was given that at the next Monthly Council on the 7th May at noon, mernorials and deputations would be received in reference to the Society's Country Meating to be held in 1857 at some city or town in the d:strict comprised of the counties of Durset, Hants, Somerset, or Wilts.
Paris Show.-Mr. Brandreth Gilubs, as a member of the Committee appointed by the French Government for carrying out the arrangements in London for the Paris Show next month, expressed his williogness to
receive and forward any entrics the members of the Suciely micht wish to for that occasiun
English Jurors.-On the motion of Mr. Brandreth Gibbs, a special committee was appointed to carry out any application the French Government might make to the Council for the recommendotion of English Jurore fur the ensuing Paris Show.
Mr. Nesbit, Principal of the Agricultural and Chemical College at Kenniogton, presented a copy of the new edition of his work on Agricultural Chemistry, and the Nature and Properties of Guano. - Sinnor F. Lotterie, of Bergamo, presented a copy of his work on The Cultivation of the Mulberry Tree, and the ManaSuciety of Agriculiure at Brussels, the Royal Agrical tural Society of Bavarin, the Horscultural Society of Berlin, and the editor of the Moniteur des Comicas et des Cultivatewrs at Paris presented copies of their red
spective Transactions.-Mr. Eddisun, of Leeds, presented copy of the Leeds and York-hire Flax Society, with suggestions for prizes to be officed by the Royal Agricaltural Society of Enyland in that deparment.- Thase of the Council.
The Council adjnurned to Wednesday next, at twelve 'elock, when Professor Simonds would deliver before Diseases of Domesticated Animals.

Highland Society: March 26ith,-A special general neeting of this Society was held to make arrangemeots
plementary charter in conneetion with Agricultural Education. The first proceedings inelude of the Society, and the nomination of a deputation to the Paris Show. Mr. Maxwell then made the following statement with regard to the arrangements for the Show:-The directors have much pleasure in reporting that the invitation of the French Government will be
worthily responded to by the farmers of Scotland, and worthily responded to by the farmers of Scotland, and
that all the native breeds of this country will be well represented in the Show-yard at Paris. Indeed, the desire to support the meeting is such, that applications, in more than one instance, have been made by the Seld for exhibitors than is afforded by the programme. As it originally stood, ewes must have been lambed before lat November 1854. This necessarily exeluded gimmers, but on a representation the Minister has akered the period to lat May, 1855. There is a strong desire in Aberdeenshire to complete the polled breed by ing stock, an application has been forwarded on this peint also. The decision, however, has not yet been intimated. The implements are to be classed on Saturday the 24 th and Mondsy the 26 th. When on the subject of implememts, ho might mention that he had this day received a letter from M. Tisseraud, the French Commissioner in Britain, announcing an additional prize of 200 . and a gold medal for the best fixed steam engine
for farm purposes. The period for entering stock, \&c., for farm purposes. The period for entering stock, \&c., had been prolonged till Friday the 18th April, in consequence of is request he (the secretary) had made to that effect, with the view of having the day postponed to some important shows and sales at Caste-Douglas carried free to the different ports and back on the same terms when there has been no change of ownership. Implements to be carried at half price each way. Arrangements will not be neglected for so cleaning trucks, \&c., as to obriate all danger of infection-a precaulook to. The period for starting must be rulat by that when the stock should be must be regulated by that when the stock should be in Paris. Wednesday, yard, and the judges day fixed for receiving them in the yard, and the judges commence operations on the 29th some little time to recruit, and it is therefore proposed some little time to recruit, and it is therefore proposed
that they should all be delivered in Paris not later tlian Saturday the 24th, which would neeessitate their leaving London on the 22nd. Exhibitors will of course pay the travelling and other personal expenses incurred by themselves or their servants, both in England or in are advised to club togeth saving expenbe, them one respectable man, particularly as assistance will be found both in London and Paris. Stock, as has been already said, is carried free to London, where Mr Robert Morgan, 72, Camden Road Villas, London, the Society' agent, receives, honses, and ships it, exhibitors paying him only his outlay for food. The cost of the passage, it is hoped, will be met ly the Society's vote of fair rate to be levied on bhat ber In France, the carriage and lseep of atock are defrayed by Government. No arrangement has yet been matured in regard to the passage, but inquiry is now being made in London regarding the best port for landing a in France, the capabilities of the ordinary steamers, Thames to Boulogne or Dover, and steamer from the on this point will be forwarded by the secretary to each exhibitor. Arrangements have been made, not only to have accredited agents, who can speak English, at the place of debarkation, bat to lodge the Scotch servants together in the building of the Show, under the charge of similar persons responsible to Government for their conduct. Similar persons would be in attendance at the port selected for the debarkation of the Scotch stock. It must be distinctly understood that, while the Society employs an agent in London, makes arrangements for the voyage, and otherwise ondeavours to relieve exhibitors from expense and sificality, and that exhibitors will themeely any responloas or damage that may possibly oceor conseladed by that may possibly occur. Mr. Maxwell concladed by reading the following extract from a letter just received from M. Tisseraud:-" We have got at Paris, from the best sources of information, advice that important purchases of breeding-stock, for France and mumerous continental States of Paris America, and even, it appears, for Australia, Paris will thus be a very important European market, and the prices will be very bigh."
Agricultural Education.-The Secretary read the following petition, which had been prepared in reference to agricultural education:-
Unto the Queen's most Excellent Majestry, the petition of the Shaveth; -That your petitioners

The terms of a supplementary charter in conformity with this petition were also submitted to the meeting The proposed council consists of the President of the Highland Society and certain other officials, of seven f Priculture, Natural History, and Technology in the University of Edinburgh.
Professor Balfour stated that the subject of agricultural education had been brought before the Societ on several occasions previously, but circumstances
had occurred which prevented it from being fully carried out. In these days, when so much science wa brought to bear upon agriculture, they must all hav felt the importance of introducing a different system o education for agriculturists. It was very important that some curriculum should be laid down, in orde that young men might know how to proceed with their studies. The Society did not intend to establish college, or any institution of that kind, but simply take advantage of the means which they had at their command, to fix the curriculum which would be best suited for persons intending to be agriculturists, and having passed through this course, young men would be examined before a competent board appointed by the Society, and receive a certificate to the effect that they had gone through the course of study and passed the examination satisfactorily. He had taken a gree interest in this matter from the beginning, and he wa most willing to give any assistance that he could in th matter. He had also spoken to the Professors of
subjects connected with agriculture, in the University subjects connected with agriculture, in the University,
and they had all expressed their readiness to assist th ocicy had all expressed their readiness to assist the no difficulty in reference to that point Professo Balfour concluded by moving "that the meeting, bein of opinion that it is the duty of the Society to suppor any measure calculated to direct and stimulate agricultural education, cordially approves of the pro posed petition and draft supplementary charter, and authorises the directors to take all necessary steps for givin! effect to the object in view?
Mr. Wilson, Edington Mains, seconded the motion It had, he said, for a very long time appeared to him a singular fact, that nothing of the sort now proposed had been done in this country. In many quarter they heard surprise, and perhaps regret expressed that the important matter of agricultural statistic should not have received the sanction of that Societ and of the country at an earlier period. It appeared to him quite as remarkable that the very importan subject of the education of the rising generation of the farmers of Scotland should not have been deemed worthy of more notice than it had hitherto received now made, and he would even be disposed to see tho movement go a little farther than was at present con templated. This, however, he looked on as an exceed ingly judicions and appropriate beginning, and he trusted that it would work as well as it was expected to do. He had occasion to know that very many youn men-farmers sons-were sent to this city and else where to prosecute their education, who had suffere grievously from want of some judicious guidance as to the branches to which they should more immediatel turn their attention. The present proposal would he great advantage in supplying that want
The Chairman believed that what Mr. Wilson sai was quite true-that among farmers the want of
proper agricultural education was very greatly felt and the circumstance thet Mr. Wilson had seconded th proposal now made reminded him that both he and Mr Wilson belonged to a farmers club in Berwickshire whic some years ago felt so much the desirableness of of their funds anall is instruction, that they gave ou for the purpose of encouraging parish schoolmasters and others to open classes for giving instruction in agriculture. He recoliected also that some years ago Society from this subject had been presented to the parts of the kingdom, as in Ireland and in England there were great seminaries for the purpose of giving sleasedal agricultural education ; and he or pleased to see similar institutions in Scotiand. Thoug should be given to individuals who passed an examina tion in certain branches satisfactorily, he had no doub that ultimately this would lead to the eatablishment of seminaries in which the neceseary instruction could be
obtained. The Society and its directors had done
themselves gre
The motion was unamimously agreed to
The Society then resolved itself into a monthly meeting, when Mr. Wilson, of Edington Mains, read a paper on the cultivation of Mangel Wurzel.

\section*{Arbitus.}

Lois-Weedon Husbardry. J. Ridgway, Piceadilly.
Our advertising columns have for some time announced new work on Lois-Weedon Husbandry*. This little volume, hy the author of "A Word in Season to the Mangel'Wurzel and the Bean crop, of the Carrot crop, Mangel Wurzel and the Bean crop, of the Carrot crop,
the Swedish Turnip, the Drumbead Cabbage, the Italian the Swedish Turnip, the Drumbead Cabbage, the Italian
Rye-grass, the Lucerne, the Grass land, and, lastly, the Rye-grass, the Lucerne, the Grass land, and, lastly, the
Wheat crop. The prculisritiez of Lois Weedon has. Wheat crop. The prculisrities of Lois Weedon hus-
bandry are shown to be compatible with the ensy bandry are shown to be compatible with the ensy
management of all these crops ; for on each is brought to bear the principle of stirring the subsoil and the soil, thus rendering both absorbents of atmospheric stores of fertilising matter as auxiliary to an artificial application of the same.
It may be well to ask the author of this volume-who is undoubtedly the most intolligent as well as the most confident and energetic of the exponents of Tulls husbandry-What it is that he claims as original in bis system of tillage! To this question as already put Mr. Smith answers as follows:
claim the originality, such as it is, of going below the staple and bringing up to the surface the clay subsoil, while the Wheat is growing at its side. The accident of living in a happier age than Tull has enabled me to claim the originality of thus finding a supply of minera food which is practically inexhaustible, to feed the plant. In in its integrity, I find continual complaints of the loss of crops by the frost, from the exposure of the plant from the furrow slice taken from the sides of the rows before winter. I claim the originality of bringing up the subsoil without injuring the plant, but on the contrary of giving shelter to it by the ridges of each interval. I claim the originality, as compared with Tull, of narrowing the intervals while I increase my staple, and thus, assisted by my supply of mineral food, doubling my produce.

But, God help me! I am boasting a great deal. publishope and trust, however, that I havo never sure I shyld opinious presumptaously; and I ank quit not been put to me so directly by a writer eminent and influential in agricultural literature.

In a leading journal devoted to the interest of the farmer, a series of papers has lately been introduced by that writer on the subject of Tull's husbandry. They excellence, and have helped to call attention very forcibly to the worl of one who was the greatest genius in his way, and the most far-seeing cultivator of the soil, the country has ever produced. I fully agree with him that Tull anticipated draining and subsoiling ; and I believe that, had he lived till even the dawn of agricultural chemistry, uniting as he did great mechanical talent with accurate practice and ingenious theory, he would have left little to be done by us, his feeble descendant. As it is, I fear he had no prophetic view Whatever of those mineral elements of fertility-those arispensable phosphates and alkalies_those silicates and ulphates, of which wo are enabled to talk so glibly now. And I think it will be clearly seen, from the passages have quoted above, that Tull taught his followers, and made it a rule to himself, never to go below the staple, that if he had practised on my clay soil, which for the most part has a staple of only five inches, he would never have moved the subsoil ; instead of doing as I have done, bringing it by degrees to a friable depth of nearly 20 inches; for at the end of 12 years I have only gained that point; my practice being to bring up only two or three inches of this tenacious substance at a
for the last two or three years not even that."
The thing which will most strike ordinary readers of Tull, or rather readers of his ordinary reviewers, is the position Mr. Smith has claimed for him as the teacher not of the mineral but of the organic nutriment of plants.
"For it was on this very point of organic food for vegetation that the theory and practice of this great man wholly and solely turned. He believed that, by pulverising the staple of his broad intervals, eithe mechanically or by exposing the clods to the action of the atmosphere, the divided particles of the soil would become, in the annual fallow, so invested with vege table matter, which he called "earth,"-that matter
having first been exhaled into the air, and then brought having first been exhaled into the air, and then brought down by the rain and the dew, that it and it
would feed his crops year after year, ad infinitum.

Again, "that Tull depended wholly on vegetable matter to feed his crops, without any reference at all to mineral matter, is equally plain to my mind. For, no to enter too much into detail, which would be merely to repeat what I have said elsewhere, the following passayes by themselves prove it by the creareshee the soil can be supplied with vegetable matter to answer
what is carried off by these constant crops of Wheat, that the land be not consumed by them ?'-after answering, Mr. Bradley, he replies, 'The soil in this our case cannot be supplied in substance, but from the atmosphere. The earth which the rain brings down can do it alone if it fall in ereat quantity.' But, 'Dews must add very much to the land thus continusily tilled and hoed.' C. 11.
"And, to sum up, he adds,-'Could we as easily compute the quantity of earth in rain water as the quantity of water is computed, we might perhaps find it to answer the quantity of earth taken off from our hoed soil annually by the Wheat.' C. 11.

IIf, therefore, Tull thought that the rain provided an exact equivalent for the substances carried off by the Wheat, it is clear that, as he gave no account, so he took no account of any mineral substances at all.,
It was left for Mr . Smith to supplement the deficiencies of his predecessor, and by that diligent cultivation of the subsoil which Tull had previously applied only to the staple, to secure for his growing plants a permanent store of inorganic food from the storehouse of the former, at the same time that he storehouse of the former, at the same time that he
secured organic matter in abundance from the atmosecured organic matter in abundance
sphere by his cultivation of the latter. to disabuse those who have only heard, or but hastily read of Lois-Weedon, of the idea that it is merely an exceptional case, devoted to the growth of but a single crop. The principles there illustrated are here shown capable of application to every crop the farmer grows -they are shown to be everywhere in operation-and the methods of working in accordance with them, rather than in opposition to them, are pointed out in the case of all the crops we have named above.

\section*{Calendar of Operations.}

Berwicikembe Merbr Fara, March 31.- Seed time is now all butover, the rare exceptions being where a few Turnips yet remain on the grourd unconsumed. On reviewing the season we observe that it has been characterised she colitary shower on the 6th, and some symptoms of a snow storm immediately after. Ploughing being well forward, and the sand mellowed by the intense black frosts of January, the lea
afforded a plentiful cover of March dust for the Oat seed, and was afforded a plentiful cover of March dust for the Oat seed, and was
immediately rolled down in good order. Turnip land, where the crop was eaten on in wet weather, got very hard, and required twice ploughing to secure the necessar' tilth for Barley. Mach
April Wheat, however, has been sown in preference, which will cause a large deficiency of the former cereal in our coming crop.
Spring corg, though thus satisfactorily committed to the ground, has made no growth yet, and must await the advent of rain and warmer weather. Wheat after Turnips has stood the winter well;
but in the few instances where it was tried on lea ("seeds"), the but in the few instances where it was tried on lea ("seeds", the
most of the plants have been thrown out, and some have actually ploughed it up for a crop of Oats. It seems that our climate is about the beginning of the month set the Grass a springing, and promised well for the larnbing season, which commenced on the
7 th, but the cold winds soon nipped it up, though the absence of rain with the cold has favoured the lambs, in spite of a deficiency conaiderable mortality among the ewes, from inflammation con-
equent on difticult parturition. Ever since the New Year Turnips have commanded exorbitant rates. Large quantities rotted after the black frosts, and many were forced to sell their
stock much sooner than they expected. What roots do remain stock much sooner than they expected, Hoggs will do better now on the young Grass, bare as it is, with a daily feed of cake and Beans. The bigh and rising price of wool makes every one snxious to clip before selling if the weather
permit. Water-power threshing machines have been inoperative permit. Water-power threshing machines have been inoperative or thbeld from the markets, and most stackyards are Fell thinned
 can desire, and the seasonable rains that were ohliged the spend more labour to get the land to a proper tilth, but
now it works very free, and is again dry enough. The Wheat looks very forward and promising, and as wey will keep it back a little. There is a good than is agreeable. Many have their sheep on short allowance, and that at a very expensive rate; but fortunately the Clover plant looks well, and so does Rye and Vetches, and with milder weather all will of the flocks has been but indifferent lately The health of the flocks has becount of the cold northeast winds; many of the lambs have got stiff and cramped in their legs; and as there has been little sunshine their lying on the damp ground has increased the evil; but with brighter weather we have signs of returning
vigour. Wheat rolling is now nearly over, and preparing for vigour. Wheat rolling is now nearly over,
root crops will now be our work. G. S.

THE DIRECTORS of the above COMPANY (many of whom are extensive Agriculturists) have great plessure in acquainting their friends and the agrienitural community, that they have now completed their extensive Works and of the metropolis, and a large stock of other necessary materals of the best quality, they are now in a position to supply their Patent Manure of the highest quality; and, as most of the Directors and many of the Shareholders are themselves large consumers of the Blood Manure, their fized determination to supply nothing but sterling and genuine quality cannot fail to afford a guarantee and protection to the farmer against imposition.
The great value of Blood Manure as a fertiliser may now be considered as a fully established fact. Ever since the first introduction of this valuable fertiliser, the demand bas been greater than could be conveniently supplied. Its claims rest not in the assertion of a few experiments, it has been tried for the last four seasons by hundreds with great success, and in the next
tried by thousands. It affords, in fact, a conclusive answer to the quention, "What has meience done for Agriculture?"
The Blood Manure is composed of bones dissolved in Sulphuric Acid, to which is added a large quantity of pure Blood, specially pepard to suit various crops, and may either be applied by the drill or sown broadcast.

BLOOD MANURE FOR TURNIPS.
and raphosphates absolutely necessary for early dats iopment larger proportion in a soluble form than is usually met with in ordinary samples of Superphosphate of Lime, and, the Blood supplying nitrogen, the latter growth is also secured, hence the
superiority of the Patent Manure. It may be used alone at the rate of 4 cwt. per acre, or it farm-yard manure is used, 3 cwt .
will be sufficient, with an equal quantity of fine mould or ashes. will be sufficient, with an equal quantity of fine mould or ashes. N.B. For this, as fur will much more than repay the additional cost. Though 2 or 3 cwt . per acre will produce a crop superior
to that from a similar weight of Superphosphate of Lime, the application of a much larger quantity will be found even more remunerative. The rent and charges must be paid equally, addition of 8 or 10 tons of roots beyond the common crop costs
nothing more than the price of the extre 2 or 3 cwt . of Blood nothing more th

\section*{BARLEY, OATS, ETC.}

\section*{Being rich in nitragen and other necessary ingredients, it} been used with the greatest success in all parts of England. It grain of Wheat are nearly identtcal, as proved by the most eminent chemists,-it contains all the elements which plant require, and when properly prepared, Will become the essence
vegetable as well as of animal life. The highly fertilising properties of Blood have been commented upon by Professor Way and others, and the success of the Blood Manure for Wheat and experience of numerous Agriculturists. Should Wheat manured with dung in the ordinary way look unhealthy in the spring, it at the rate of 2 to 3 cwt . per acre,--thus strengtbening the straw, making it less liable to lodge, and very much increasing the
produce. For Barley and Oats, 3 to 4 cwt . per acre of the Blood produce. For Barley and Oats, 3 to 4 cwt . per acre of the Blood
Manure may either be sown broadcast or drilled with the seed, if the former, to be well harrowed in.

\section*{bEANS AND PEAS.}

For Beans or Pess, 3 to 4 cwt . per acre may be used either drills at the time of horse-hoeing.

Testimonials from the most eminent Agricultarists who have used the Manure may be had from the local Agents. The following may be taken as a sample:-

Norfolk Farms, Windsor, February 20th, 1855.
Gentlemen,-In answer to your inquiry respecting the results Park, I have great pleasure in stating, that after applying it to Agricultural show I have no hesitation in pronouncing it an excellent manure, and intend using it to a greater extent during the present season.
am, gentlemen, your obedient servant,
Mr. Bewink Goultor, Gedney Marsh Lont
 ahire-"I drilled your manure at the rate of \(2 \frac{1}{2}\) cwt. per acre

PRICE, DELIVERED AT ANY WHARF OR RAILWAY STATION IN LONDON: Corn and Grass Manure, \(£ 7\) 10s. per Ton.
Turnip Manure, £6 10s. per Ton.
Flax and Hop Manure, £8 10s. per Ton.
The Company beg to caution the public against the attempts of spurious imitators, who, since the introdsction of this Mamure, have professed, to make one possessing similar qualities. As security, therefore, to the purchaser, every
ag is wrarked "ODAMS" PATENT BLOOD MANURE," and sold only by the authorised Agents of the Compuny.

MANGEL WURZEL AND CARROTS.
Blond Manure is an excellent fertilser for these erops. Four
cwt to the ace with an equal w wight of common alt hould be the rows is of great importance for air and nutriment, and great divantage will be obtained by occasionally sprinkling a little
Blood Manure between the rows previous to the hoeing.

\section*{POTATOES.}

The Biood Manure is specially prepared for this crop, and it Will be found to give most satisfactory results- It will be mow usual quantity of farm-yard dang, and the wholo earth od up in the usual way. Should the farm-yard manure not be used, then 5 cm . of Blood Manure may be used alone, pat into the bottow of the drill, and the sets on the top and earthed up.

\section*{FLAX.}

This crop in olden time had the renown of being one of the nost exhansting crops which could be put into the land, and this by chemical analysis has been found to arise from the large
quantity of nitrogen, phosphoric acid, magnesia, and the alkalies
 the wants of this crop, ind with its ald Flax can no longer be considered an exhauster of the soil. In using Blood Manare for in before the seed is drilled.

\section*{HOPS.}

It is well known to all Hop growers that Hops require more manure for their proper development than any other plant whice
they cultivate ; the constant withdraving of the Hops, year by year, from the land necescitates the supply to the soil of a coniderable amount of both mineral and organic ingredients, and
the Blood Manure has been particularly prepared, with the object of supplying the requirements of this important crop. It contains all thi constituents which the plant requires, both mineral
and orgnic, sud will be found as cheap and efficacions as any and organic, and will be found as cheap and efficacions as any other manure now in use; from 10 to 12 cwt. per acre applied at two
different times well worked in between the alleys, will be found different times well worked in between the alleys, will be found a
most useful application, or the manure may be put ronnd each. most useful application, or the
hill and covered up with the soil. the best I have. I do not mow how I can recommend it better than by saying I shall vese it much more extensively this season." Gentlemen,-In reply to your inquiry respecting th, 1854. phosphate supplied to his Grace the Duke of Jjedford in 1853, I beg to inform you 1 applied it all for Swelles, and in every in-
stance was very successful, particularly so on a field of 30 acres, where 1 put on 2 cwt. of it per acre, with a light dressing of arm-yard manure, which has produced the finest crop of swedes
ever grew. I with great confidence recommend this valuable manare to the notice of the agricultural commumity.-I am, mentlemen, yours very traly,

\section*{N E W PLANTS.}

M ESSRS E. G. HENDERSON AND SON beg to give notice that they have just completed arrangements
 such sup-rior and beautiful Plants, which they are cire wi
other varietien at present known in their dufferent classes.
achimenes (Locheria) magnifica.
Coloured Plates of the GCPAEA EMINENS,
be had on application at 6abeach, or if by post at 8d, each, except when three or more are taken, when the postage will no

Henderbon's favourite VERBENA for 1956 is without exception one of the finest, and will donbtless beeome one of the most noted bedding Verbenas in every karden thr unghiout Eumphat. for its other good qualities it is anapproached by any. The
trueses of flowers are exceedingly large and of a rich darl scarlet. The habit is robust and freet, and does not require turt pearterid down to fill up empty spaces, as is con niten thes case: but if left to
itself it is unequalled for its unstiomity of growth. The whole plant is alike coverad with flowers on stont short footetalks, so
that it resists the rain perfeetly, the side shoots below each flower are always well set with buds ready to fill up the places an the frrst fowwers pass way; the filiage if handsome and plentiful, with smalid diminutive leaves never looks well, nor on the other
 Variety, is loose aud straggling. To be sent out after the 1st of
May at 2 t . \(6 d\). each, \(24 s\). per dozen, and 1208 . per 100.

Hexderson's favourite PETUNIA for 1856 will be ready fo distribution in May. This excellent variety, they are con fident, will siluervede every Petunia hitherto grown, either for bedding purposes or pot culture. Its superior qualities can not be better described than in the words of the able and intelli-
jent Girdener, Mr. John Smith, of Peel Mall, Lancashire, from whm they, M...John smint, of Peel han, Lancashire, No. 1. The fluwers are moderate sized, with a fine bold orthine colour a rich bright scariet, with clear white eye. It is a plofusa bloomer, and makes a most effective bed; indeed, it was the most conspicuons bedding plant in the whole of our Flower Garden which was filled with the showiest and most dazzling kinds of flowerin 弓 plants." In consequence of the plant being a second yurr's seeding, the opportunity of proving its value as a bedding plant has been tried, and far exceeded our expectations.

\section*{THE NEW SPRING CATALOGUE}

Will be ready for distribution the latter end of this month, and those parties not castomers of Messrg. E. G. Hesprasos \& Son, but desirous of obtaining this Catalngue, either for refurence or otherwise, can have a copy furwarded free on application. It will Geraniums, Fuchsias, Chrysanthemums, \&c. In addition to this information it will contain short and select lists, of the best Plants ted for the varions parposes connected with the Btove, Greenhonse, and Garden.
Collections of the followiog New Plants will be sent out in May. For deseription, price, deca, gee Naw Sprume Cataroauk. BANKS'S NEW FCCHBIAS.

\section*{The Garmeners Chromitle.}

\author{
SATURDAY, APRIL 19, 1866
}

The readers of the Gardeners' Chronicle will not have yet forgotten the interest which attached to the specimens of timber from Tasmania exhibited in Hyde Park in 1851. (See pp. 276 and 291 of our volume for that year.) It was difficult to over-estimate the colonial value of that description of produce, whether for the purposes of naval construction, ordinary building uses, or cabinet work. Most especially was the magnitude of the Buete Gum Tree (Eucalyptus globulus) a subject of universal wonder. We are, therefore, glad to have the opportanity of drawing attention once more to this marvellous example of negetable growth, as described in the very ably written account of the Tasmanian contributions to the late Paris Exhibition, of which a copy has just reached us from its
author, Mr. Milligan. It is true that Eucalyph are not trees for an English forest ; but we see no reason why they should not flourish in such climates as that of Killarney, as it is already known that they do on the once desolate island of Ascension We copy Mr. Milligan's descriptions verbatim.
With a plant exhibited by Captain Goldsmith, of Hobart Town, 70 feet long, 11 feet wide, and 3 inches thick, we have the following account:-
"This is perhaps the most valuable and important of the timber trees of Tasmania. Its principal habitat is in the south side of the island ; but it is also met with in the valley of the Apsley and at the Douglas River, on the East Coast, and it reappears apon Flinder's Island, in Bass's Straits: its stronghold, however, is D'Entrecasteaux's Channel, and along the south side of the island, whence it has been exported in varions shapes within the last three years to the value of about 800,000 . The Blue Gum attains, when at maturity, an average elevation and size greater probably than any other tree in the world; a plank forwarded to the London Exhibition of 1851, which, from the difficulty experienced in procuring a ship to carry it, arrived in England too late for exposition, measured 145 feet in length, and was 20 inches broad by 6 inches in thickness. A plank of the same width and thickness was cut 160 feet in length by Mr. James Boyd, Civil Commandant at Port Arthur, Van Diemen's Land, in order to be forwarded to the Paris Exhibition of 1855 , but it has been found impracticable to get it shipped by any vessel at this port (Hobart Town), and it does not therefore appear in this catalogue. This tree attains at its full growth a height of 250 to 350 feet, and a circumference varying from 30 to upwards of 100 feet, at 4 feet from the ground. In regular forest ground it rarely'gives off its principal limb under 100 feet, and there is not unfrequently a stem clear of any branch for 200 feet and upwards. The most important purpose for which this timber is adapted, and to which it is extensively applied, is that of ship-building. The Messrs. Degrares and Messrs. Watson of this place have built and fitted out vessels with it, of which several are now trading regularly to and from England. Its specific gravity is greater than that of Teak, British Oak, or even Saul ; and experiments instituted to ascertain its breaking weight, \&c., have estahlished the fact, that in strength and elasticity it is superior to all other timbers. For planking and stringers, and for keels of ships, the Blue Gum possesses a suitability beyond all other timbers, since it affords length and dimensions which it would be impossible to obtain from any other tree. The purposes to which the wood of the Blue Gum is applied are as numerousas the varieties of work which devolve on the shipwright, millwright, house carpenter, implement-maker, and engineer, for in all these departments of mechanical labour and skill it is found to be a material all bat indispensable, notwithstanding the great diversity of woods available in the colony. For instance, it is in constant use for treenails in shipbuilding, as gunwales for boats, for house building, for fitting up steam-engines and the heaviest machinery, in the construction of wheels, wheel-barrows, carts, \&c., \&c., and for piles on which to raise wharves; bridges of great span are built of it. That at Bridgewater, about Il miles from Hohart Town, of which a model was sent to the London Exhibition, and which is raised upon piles measuring 65 to 90 feet each in length, stands sures 96 feet from end to end, by a breadth affording a roadway of 24 feet, and is constructed entirely of this timber. This tree, like most of the Eucalypti, yields a red, highly astringent gum, which has been extensively used, and found to answer, as a 'kino,' and the leaves by distillation yield an essential oil having the properties of 'Cajeput oil.'
Another specimen, contributed by Mr. Jонn bbott, is described as follows:-
"This section, 3 feet in diameter, was cut out of the trank 194 feet from the root; the first branch being given off 208 feet from the root, and the total length of the tree being 318 feet. The following descriptions and quantities of timber are said to have been sold at the stump of this tree :-

\section*{£245 120}

Twelve months before this timber would have sold for double the amount, the price of all sorts of timber having run ap prodigiously, in consequence of the abondance of gold and the great demand for hard wood for house boilding, \&c. The net amount
yielded by this particnlar tree, at a time of very high prices, is, Lowever, no criterion as to its value in ordinary times, when its price would be regulated by the price of labour almost entirely."

One of the gentlemen who are preparing to occupy themselves with experiments on the comparative strength of different samples of OAK AND OTHER Trimber has suggested that it would be advantageous if we were to point out in what manner the timber should be cut for the purpose, in order to secure not only a correct but a comparable set of results. We quite agree with him. There is no doubt that the same timber cut and bent in one direction will possess a degree of strength beyond what it will have if cut and bent in another ; so that the weakest timber may appear the strongest if care is not taken to guard against this unsuspected source of error. The longbow exemplifies this. If two staves of Yew, taken from the same stick, and only divided by a sawcut, are curved in opposite directions, the one will snap with a 6 -inch pull, the other will bend for 2 or 3 feet. To this circumstance all experimenters on the strength of timber should most carefully advert. In whatever direction of the grain one piece of timber is cut, the other should be also cut in like manner.
Let the annexed figure represent a "round," or transverse section of a piece of Oak. The proper mode of cutting it, in order to secure the greatest resistance which it can offer to a strain, would be to follow the course of the medullary rays from \(a\) to \(c\) and \(b\) to \(d\). \(c d\), which would be wider than \(a b\), should be placed lowermost when the breaking weight is attached to its middle, and the lath \(a b c d\) placed between two uprights would be in exactly the same

position for resisting a strain as an ordinary long bow, when held in the hand: a representing the back and A the "belly" of the bow. But it is evident that if \(c d\) is uppermost instead of lowermost the lath would be in the same position as a how when drawn backwards; and it is also evident that if in any experiment respecting strength some laths have \(a b\) uppermost and others have \(c d\) appermost the results will be uncomparable and untrustworthy.
This explanation will doubtless be perfectly intelligible, and every one will at once see the truth of it. But timber may be cut in other ways not so obviously different, with the same fallacious result. Thus let us suppose that a \(\log\) is cut up into experimental quartering, the concentric circles in some spars being placed in one direction, in others in another, we have the very same sources of error For example, let four pieces of timber of equal magnitude be cut and placed as is represented in the four following diagrams; there is little doubt that

No. 3 will be able to bear a greater weight than the others without breaking; for it will be nearly in the position of \(\triangle B\) in the first diagram; on the other weakness, and No. 4 nearest in strength to No. 3 . These differences are to be more especially expected in such timber as Oak, Ash, Elm, Deal, \&cc., in which the structure is not at all homogeneous. In what are called Hardwoods, the structure of which is far more homogeneous, we coneive such differences would be found also to occur, although in a less degree.

Another possible source of error may consist in
one piece of timber being cut parallel with the fibre, and another obliquely across the fibre. Should this happen their relative strength, although taken from the same log, must be different, the obliquely cat being the weakest.
We are the more tempted to offer these remarks because we do not find it stated in Captain Fowrs's elaborate account* of his experiments on the woods examined last year in the Great Paris Exhibitions that this subject engaged his attention. If it did not the value of the results the gallant officer obtained is hardly equal to the labour and care bestowed on the experiments. We are the more apprehensive that the point was overlooked when we see that the breaking weights vary greatly in specimens of the very same tree. Thus in a Casuarina one piece broke with 3195 lbs., while another, under apparently equal circumstances, resisted the strain up to 4629 lbs ., and the same occurred in other cases. A difference equal to 1434 lbs. in the weight required to break two specimens of the very same timber one \(1 \frac{7}{7}\) inch, and the other \(1 \frac{5}{8}\) square, seems too remarkable to be explained except upon the hypothesis that the specimens were cut uncomparably.

In a Leader of last week we alluded to the resolution passed on the 31st ult. at the General Meeting of the Horticclettral Society, the words of which we think it well to repeat-" That the Council be authorised to terminate the tenancy of the Garden at Chiswick as soon as the lease will permit, and that the property therein be sold; unless such a sum as the Council may require for maintaining theidarden shall have been subscribed before May 1st." In consequence of this resolution the Council have met and have decided that a sum of 5000 l . is requisite to pay off the floating debt of the Society, and re-establish the Garden on a more secure foundation, and they accordingly yesterday issued a circular to the Fellows to that effect. The Council have themselves set the example of subscribing liberally, and if the other Fellows -and the public, for they are deeply interested in the result-only do their duty equally as well, there will be no necessity for the Gardens at Chiswick being closed, a proceeding which would deeply affect the interests of Horticulture in all parts of the kingdom.

\section*{New Plants.}
165. Double Rose-coloured Chinese Peach. When Mr. Fortune was in China for the Horticultural Society he obtained that beautiful spring shrub the double crimson Peach, of which a glorious specimen was exhibited by Mr. Veitch at the late meeting Regent Street. But the Chinese have several varietight of equal or greater beauty, one of which with brigh rose-coloured flowers has just flowered with Mr. Glen dinning. It has firm petals, rather deeper towards the edge than near the centre, and has moreover a perfectly double calyx; that is to say, one cup stands withi - Report of the Paris Cniversal Fxabibition, Part 1., p. \(402,8 v\) A Parliamentary paper just issued.
another as in a "hose in hose" Polyanthus. Although only two flowers have opened upon a weak plant, they
prove to be larger than in the double crimson, and leave prove to be laxger than in the double crimson, and lea
166. New Double Crimson Chinese Camellia.

Along with the preceding we saw a singularly handsome dark crimson Camellia, also sent home by Mr. Fortune. It is remariable for the regularity, roundness, and firmness of its outer petals, while the centre is a little open. It is in the way of the Myrtle-leaved, or perhaps of Beali, and when strong must become a very striking variety. At present the imported plant is weak, and the flower by no means what will be produced upon
vigorous young stock. Mr. Glendinning calls it Lindleyana.

\section*{A NEW EUROPEAN OAK.}

Dr. Andr.e describes in the Botanische Zeitung under the name of Quercus polycarpa, a Transylvanian Oak, which he supposes

This species was found at Hermannstadt by Dr. Schur and ourselves, and the description has been made and ourselves, and the description has been made
from the specimen in our possession. The leaves from the specimen in our possession. The leaves their upper surface, and are provided with slightly hairy talks, about one-third or one-fourth the length of the leaves. The expression "long-stalked "used by Schur seems scarcely applicable. The acorns, which we found tolerably ripe as early as the month of August, occur in clusters of from five to 10 on numerous short leafy shoots. The name given above is therefore very appro priate, unless indeed it should be found that the abund How far this Oak can be regarded as a new species mus be determined by future observation. In the shape of the leaves and their short rounded lobes the plan approaches, according to descriptions, \(Q\). iberica, \(M\) B. (Flor. taur.-cauc. ii. p. 402 and Ledebour, Flor to the cup longer and extended into seales point. The leaves are also like those of \(Q\) pennina, Lam., according to the descriptions of De Flor. Germ ex. Franc., ví, p. 352), and Reichenbach Flor. Germ, excurs, p. 177), but the numerous scorns are here collected into an interrupted spike on a long conglomerata Pers. (Rehb. Icon. germ., fig. 1310), Q. pubescens, Willd., Q. robur or lanuginosa, Rochl. (Plant ban. rarior, fig. 19), are distinguished by the form of the leaf, its much more sharp-cornered sinuses, and its pubescens. W, if of a he leaves and the leaf-stalks much more densely overed with hairs, which are themselves of a more yellowish grey colour. The hairiness of the other kinds is not described with sufficient exactness for the purpose of comparison. Notwithstanding the differences doubtedly most like Q. pubescens.
[We draw attention to the existence of this supposed ew species in the hope that it may induce some one acquainted with the Oaks of Eastern Europe to arestigate their differences and the quality of their respective timber. The late Mr. Tierney Clarke assured as that he never saw Oak timber of such excellence and dimensions as that which was brought from the Hungarian forests to be employed in the famous suspension

\section*{DISEASE IN APPLES}

Mr attention was attracted some three months ago by an enormous Apple resembling closely the Blenheim Pippin on the mantlepiece of a cottage. On examination there appeared to be something curious about the texture of the flesh as it loomed through the semi-transparent me, with on request, the fruit was readily accorded to being placed a few days in a dark eupboard till a fit moment offered isself for further investigation, it internally, which indicated approaching decay. The spots were perfectly circular and well defined, and Apple, the fres of regetation. On cutting through the Apple, the flesh was found to be discoloured in varions places frum the effects of incipient decomposition, which was not confined to the surface, but penetrated into the
centre of the fruit, by no means however extending to the centre of the fruit, by no means however extending to the
tissue intermediate between the patches. The appearance was in fact not altogether unlike that which occurs so frequently in Apples, when the flesh is speckled with russet spots, without being at all putrescent. In this case however the spots were larger and better defined. The divided portions were again placed aside to give more time for the development of the incipient vegetation which appeared on the spots, and in a few days some of them were studded with pearl-like specks bursting through the cuticle, and swelling above it in the form of speck in the very centre, but more frequently there was speck in the very centre, but more frequ
\(\boldsymbol{*}\) more or leas perfect xing of atellites.

On examination, each plant was found to consist of a branched inosculating mycelium giving rise to simple or forked subfastigiate irregular threads, each tip of which was surmounted by an oblong curved or irregular spore slightest trace of any investing membrave or peritho-
well-known Oidium on Pears, Plums, Grapes, and other fruit, that I was those blossoms which still remain on the tree is slow and half inclined to think that \(\mathbf{I}\) had before me some form or condition of that species. The specimen was therefor again put by ; but no further development took place A very curious circumstance, however, was observed tion, and no more were developed, though there cond promise of a further crop; but instead, the cuticle was raised into little shining transparent pustules, and tendril of minute spores precisely like those first oaserved was protruded through it. The vegetative part had been greatly diminished,
more than proportionally increased.
There was yet another matter of surprise. It wa impossible not to call to mind the little fungus figured upon Grapes in the Cardcner's' Chronicle, 1854 , p. 676 , and
the subjoined figure compared with the one there given would at first seem to indicate an identity. But the spores were more inclined to be curved, rather longer and not so variable in size, and the want of a periThe Grape fungas, according to received principles, was a Septoria, while this is a Glrosporium. At the same time these organisms are so different in different conditions, that I would not affirm that the two produc tions are essentially different, and the more especially fectly in external appearance and habit they are so per recording, and as it should seem entirely new. Whether the fungus has anything to do with causing the disease I am uncertain, but I am inclined to think that jit is not a mere aftergrowth from the evidence which is afforded y other species of Glæosporium which are developed n leaves while still in full vitality

The figure represents a portion of the skin of the Apple with decayed patches infested with the fungus of he natural size. The figure beneath presents the appearance of one of the little cushions penetrating the cuticle. The threads are represented on the left hand with the spores in situ, and beneath some of the spores Ilows :-Gloosporium fructigenum, n. s. pustulis concentricis biformibus; his stellatim apertis, sporis apicalibus ; illis poro apertis, sporis cirrhum gelatinosum

VEGETABLE PATHOLOGY.-No. CXVI.
463. Anemosist (Wind shake). -That organic mischie frequently caused by wind, is a fact familiar to ever no. Our woods and avenues, gardens and orchards suffer more or less during every heavy gale, and every gardener knows that a main part of his duty is to secure his trees and plants by proper stays from its destruc tive force, and more especially, as in grafts, where the union between the stock and graft is easily destroyed, or where a valuable bud may be prematurely separated. It is, moreover, a common report amongst woodmen that trees suffer from wind in the contraction of various fissures, and that in consequence the timber proves what they call shaky. I believe, however, that this is a mistake, and that such fissures are due either to frost or lightning.
464. Besides, however, the actual fractures or complete severance from the earth which is due to wind, organic mischief arises in a very different way. Within proper bounds, and when accompanied by a due propor tion of moisture, wind is beneficial to plants in promoting circulation and causing consequently the deposition of wood, as has been proved by the experiments of Mr . Knight. A too stringent confinement then of plants is not desirable, at least not greater than is sufficient to defend them from the violence of sudden gusts. But the effect of wind in general is to diminish the quantity of moisture, in proportion to its velocity, and east and south winds are peculiarly deficient in moisture, and the former often extremely cold. The consequence is, that in east winds the fibres of the wood which conduct the moisture are contracted, the flow of sap is diminished and vegetation checked. When the buds are just moving and the alburnum separating from the young bark, the woodman has no difficulty in stripping off the bark, which is scarcely possible when there is no flow of sap. But though the process may be easy to-day, 12 hour of north-east wind will cheek the flow to such an extent that the labourer is compelled to wait for a change Besides this, ss the air is charged with a less quantity of moisture, evsporation is increased while the supply of sap is diminished, and therefore a double mischie takes place, the evil at the same time being aggravate by depressed temperature. The consequence of which is that the peduncles of the blossoms fall off from their

This fungus is very different from the common Grape
\(\dagger\) From ansues, wiad.
ancertain. It is on this account that the aspect of and why the defer cultivated groands is so important, indispensable. It is extremely clumps of trees is often siderable skill in a garden fully exposed to the drill of a north-east wind to have any early vegetation, and it is because of its exposure to this wind that an eastern aspect is so unfavourable to wall fruit, quite as much as rom its receiving a smaller quantity of sun
as carefully as against frost, guard against wind quite as carefuly as against frost, and screens are no less requisite for the one purpose than the other, but wherever they are used, it is essential that they should be 80 firmly fixed as not to injure the young shoote by any agitation, and that they should not screen off the light to such an extent as to be injurious to proper
strength. Neither should the wind be so completely out as to prevent all motion, wind be so completely kept agent in the dispersion of pollen. To what an extent pollen is conveyed by wind may be conjectured from the frequent instances on record of yellow rain, the colour arising from the mixture of pollen. This phenomenon is often due to the pollen of Firs, but a case was submitted to me which occurred some years since in Wales in which the pollen of some Cupuliferous tree was concerned, I believe that of some (lak. Plants on the ground may be protected by little hedges of evergreens. In spots peculiarly exposed to sea breezes Bupleurum fruticosum is used effectually for this purpose, and I have seen delicate flowers brought to great perfection under such protection, which could not great perfection under such protection, which could not fordshire where Cucumbers are largely grown in the fields it is often the practice to grow a narrow row of Rye between each compartment for the same purpose, and in Hop-grounds the coarser growing Hops are often placed as a screen on the outside of the grounds while the hedges are encouraged to grow as high as possible. In this latter case, however, the object is not so much to screen from cold as from violence, as the Hop does not flower at a very early period. On the coast another object is effected by the screen, namely, to keep off in some measure the saline particles with which strong winds blowing from the ses are always charged, and for this purpose the sereen of course must be formed of something which is indifferent to their action, or to which salt is actually advantageous.
466. Another object is answered by such screens in some cases, namely, the arresting of the spores of parasites which might be injurious to vegetation. Expe but esplaw both in the Potato and disease, but especially in the latter, that plants are far less subject to attack where they are screened from pre protected because they are not likely to be so much protected because they are generally exposed to several quarters, but vineyards on a slope are exposed often to a single wind only. Dwarf Vines are far less subject to mildew than those on trellises. Even where winds are charged with noxious gases, screens are capable of affording some protection. M.J.B.

\section*{Home Correspondence:}

Cracking of Pears.-The following extract from the "Horticulturist" (American) is interesting, showing as it does the tendency of Pears to crack even in the sunny climate of America, and the mystery which seems to envelope the question. In some seasons, as is well known, Pears commence to crack when not larger than a Hazel nut, and continue to increase slowly in size, still retaining their cracked and deformed appearance, and never ripening or becoming fit for use. This species of cracking is very different from the bursting of Pears in autumn after a dry summer when the heavy autumnal rains fall. "A remark, if you please," says a writer in the "Horticulturist," "on the singular freak of my White Doyenné trees, producing fine splendid frait for years after planting, then for the space of nine or ten years uniformly cracking and producing only unsightly and worthless fruit ; then suddenly to resnme their former habit in the production of as fair and handsome fruit as you could wish to look upon or to eat, and this with out any apparent cause, or the least change in the soil. or anything being done to the tops. This to me is altogether an unaccountable mystery. I had attributed fair and good fruit to the last two or three unusually dry summers, but this being an unexampled wet one, and my fruit being now fally formed and grown without the blemish of a crack, I am just where I started-a Knownothing' on that subject. And I think the facts developed in my trees upset all the theories that have been started as to the cause. At all events they prove conclusively that it is not to the variety having run out by old age, or that the trees had absorbed from the soil all the particles necessary to their bealthy action and the perfection of their fruit. As I have observed in a former communication, my trees are scattered over my round, some in cultivated land and others in Grass ; the atter have never been disturbed about the root, the others have shared alike in the benefits of the other crops in the cultivation, aud yet all have acted preDorsetshive 'i. R., Herts.
Dorsetshire Climate.-For the last few years I have ound the Lacebark tree stand out very well, and grow prodigiously. Triteleia uniflora proves quite hardy and fowers well. Tasmanvia is flowering for the first sime out of doors, as are also Rhod. Zeylanicum, strie-
tum, arboreum scarlet, Gibsoni, Aponogeton, and

Gladiulus tristis, which cannot be too much praised ; Acacia Hugeli, which seems very hardy for an Acacia, for a month pant, which pass over and do no liarm, for : month patt, which pass
whi. I cannot aceount for. S.
ude Catuloyues.-I wish you would denounce, cal lira, the practice of \(m\) ny mureerymen printing their catalngues plants that they have not 4 nt, and
bulitve often never have hal. Sume names seem ficure as matter of cotirse, never to be catled for or sent wronis; some are gone clean out of mind, and to get a
true plant you must ask for it truc, and lucky if you get true plant you must ask for it true, and lucky if you get and place. \(S . F\). W.

Sun Dicls.-Will any of your correspondents be kind enough to inform me whe:her those old-fashioned but
mos: useful articles called sun-dials are still manufactured? I wrote lately to a most respectable house in London on the subject, but my inquiry seems to lave been regariled as a voice from the tomb-no reply whatever having been vouchsafert

Lois-Weedon Cultivation.-Your article on this subjeet has set my thoughts rambling back to the period when the Times commissioner in Ireland related such wonders about the immediate fertility of certain worthless land there, after it had been dug two spits deep, or as deep as practicable; the trench while open being broad enough to admit of the workman levelling the
bottom of the land, and thus facilitating the running off of the water. I think, too, it was recommended to put upon this level bottom such hollow litter as might be at hand. Land worth 28.6 d . per acre was in the next
year worth some 20 s , but I confess I am writing year worth some 208, but I confess I am writing however, for my application. I adopted the notion, and turned up in my kitchen garden a yellow clay (marly, kind, and easily disintegrated by frost) in every vacant bed, till in abuut two years I had the whole of it dug certainly in some parts I put hollow litter or sticks. beg you to unders!and that I buried the long cherished stapley completely, and it has not yet again seen dayJight (though I hope to live to bring it up some day member my labourer kaying, "Now, sir, you've spoilt your garden!" but 1 also well recollect the fine Ash-leaf Potatoes I found (embedded, I admit, like
fosills) in this clay the first year, and I lave never repented it, though in the wettest part of the around the repented it, though in the wettest part of the ir aund the to trouble you with this letter on account of the extrem caution which Mr. Smith says is necessary in bringing up the clay, and in order to suggest that where it is less
retentive than at Lois-Weedon, and where the staple is very shalluw, it may be good pulicy to deepen it at once
much more boldly. It is evident that Mr. S's land is much more boldly. It is evident that Mr. S.'s land is could be broaght up wilh accuracy an inch at a time on the points of the tines of a fork. I have since worked my ground with Parkes' forks three and four diguing, I may add that I have been a gratified reade of Mr. Smith's earliest pamphlet. G. W., A pril 9.

Red and White Larch Cones.-In your Journal for 1844 p .261 , is the following direction from the pen, (the martane not, of Mr. Billington:-"As soon as they" timber is desired, it would be advisable to mark with a dot or with a strip of paint all those with whitebl scomed Cones that they may be taken down at future thmber." I have searched diligently through all the subsequent volumes for any information from another but I can find none. I find, however, in "Brown's Forester," 2d edit., p. 216, "the white is the variety Which attains the greatest dimensions of timber, and is the sort most generally cultivated." "It is said that upon than one-third the cubic contents which the white Larel does; and this is alservable in every plantation where the two varieties are found growing together." Now, the " Larch with white-blossomed Cones" of "W. B.," the result of the experience of the one is exactly contrary to that of the other. Possibly the locality may Lareh plantations now coming up for thinning, and their extent is greater than I shonld care not to thin public daty in calling the attention of your readers to he question at issue; for if W. B. " be the man I suspect him to be, his authority on any question of
furestry is not to be lightly esteemed. Onnia explorate nelione retinete.
Pears in South Devon. - With regard to the statement of \(y\) onl correspondtat that on the south coast of
Devonshite the finer kinds of \(P_{t}\) ars will not fruit at all, Whist Apples bear abundantly, I have observed that the cause he has attributed is probably the correct one. The tuild wiaters forcing the blossom to expand before the cold niphts have ceased and the leaf is sufficiently avanced to protect the same, together with the well known moisture of the atmosphere in these parts fixing the fertilising paris of the flower are destroyed, and consequent filure, which might be prevented by a result. The earlier and more tender morts of Apples also often fail from the same reason; I have many
seasons seen a particular orchard in full blomm and yet been a su' ject of notice by me that orchards and veyetablen, as Broccoli, Cauliflower, \&c., are more liable to injury in an a pect of direct sunshine finfan in by the power of the sun. Devoniensis.

Pra-leaf Soup.-1 advised our cook to give this trial, and after showing her your correspondent's mocie
of making it, and giving her materials for the purpos. of making it, and giving her materials for the purpos
I am glad to say that she was successful the first time all who partook of the soup pronounced it equal to that made with green Peas in summer. Its colour was, how
ever, found to be improved by the addition of a few Lettuces. The proportions of the different articles user were-Half a pint of Peas, one quart of Pea leaves, two afforded soup for a company of six. The sort of Pea employed were Stubb's Dwarf Marrow, and for the leaves Taylor's Early Prolific, sown in December las out of doors. James Steuart, Gardener to H. K. Tomr son, Witchingham Hall, Norfoll.

Schizanthes pinnatus.-I have a noble plant of this, the dimensions of which are as follows:-Height 4 feet 6 inches ; diameter at \(t 力 p\) of pot, 5 feet 2 inches. It is at present complet-ly covered with flowers. As a
proof of prolon ed vitality in seeds, I may mention that the sced from which this plant and others were raised was gathered July 9th, 1849, and sown July 15, 1855 Cineraria seed gathered and sown as the above has also produced beautiful plants, which are now in flower

\section*{Foreign Correspondence}

GUatemala, February \(2 d, 1856\).- 1 arrived at th mouth of the river Dulce, in the Bay of Honduras, in the evening of the 17 th of December, aiter a fine got ashore on the bar of the river, and remained fas till 9 o'clock mext morning off the beautiful Carib village of Livingstone, so named in 1835 after the Minister for Foreign Affairs of the United States. There is now a population of Carib Indians here of some 600 or 700 whose occupations, except as fishermen, it is difficult to Mahogany in the various neighbouring works may be reek here, though absent nine months of the year
quietly in, and carried us with the assistancece came heavy sweeps ap that most beantiful of all tropical rivers, whose steep and perpendicular banks are covered with such a vegetation as only a visit to Kew or the Cry tal Palace can impart any idea of. Lofty Palms, rising in majesty with their plume-crowned tops out of an infinity of lovely evergreens, many coveredf with diversity of colourings, bat crowded into an interminable mass, and only slowing here and there a bare stem where the extraordinary growth had forced a clean and distinct trunk through the cover. What a field is here for one to hotanize, but it has its difficnlties. In the first place you must have a vessel at your entire digposal, and a subordinate crew who will bear with your folly, as they would term cutting busbes. What a sight across), present to the eye!-a wilderness of loveliness rank yet perfect, never yet intruded on by human foot and wherever a turn in the river has created a bank or you find the Buccatory hiccatee, a species of torto se, and the ug'y alligator snugly ensconced, and calling
attention from the dreamy to the real. Should your however, which is not unfrequent, by the force of the current in one of these creels get run into the bush, a topsail yard fouling one of the overhanging branches, shower of ants will be sent down on the deck, and woe betide all unfortunate beings on whom these gentry fall, particularly one not used to cope with them. A skin ce that of a patient in small-pox will in 10 minutes be aden with clothing, the thermometer never getting elow \(90^{\circ}\) of Fahr. We rot to the enirance of the Lagunita or Golfete about half-past 10 o'clock at aight, and lay all night with just sutticient wind to keep he vensel in her puaition. Next morning, the 19th, the sun nearly roasted us alive on this broad sheet of the breezer, perfectiy becal away we went, the vessel cutting her way through shoals of Pistia stratiotes, which is borne by the breeze through these inland gulfs. One very odd thing I observed here; though a considerable quantity of these Pistias are carried by the current nto the river, I never saw one carried out to sea. have often searched in this charming Golfete for Nympheaz or Victorias ! ! but never met with any. As we leave the Golfete, we enter another river with flat banks, the scrubby trees along its edge covered with Orchids, the principal and almost sole occupauts. The vola venustas, and Epidendmums of the a few Bramab Polycladian family, with immense of the Amphiglottian lisceuus order, some with brilline masses of the Brimehisceous order, some with brilliant crimson tops 2 or 3
feet long. As we emerge from the river, and immediately opposite the Castle of San Felipe, there are masses of Schomburgkia tibicinis, 14 feet ur perhaps more deep, and covering some 10 or 12 feet square,
whose flower stems dip in the water. An odd thingall these plants are inhabited by the red-fire ant; not a
single pseudo-buib can be found withont its base boin open and as full as it can hold of these insects, and no injury whatever seems to accrue to the plants, for out its 3 or 4 feet flower stem, covertd at the throwing hos-oms. The Epid. ticornutum is a species I have blos-oms. The Epid. Ficornutum
observed attacked in like manner.
From San Felipe to Yabal
From San Felipe to Ysabal nccupied us abnut 4 hours- 24 miles distance. 'Ihe breeze having moderate 9 much at sunset, we came to an anchor off Ysabal about politely sent a boat on board for me, the regulation being that no person can land before the vessel has en'ered at the custom honse. I slept on shore there f. re by courtesy.

20th. Occupied all day arranging my luggage and laying in provision for my journey; had very little time to saunter, though always much tempved, on the border of this immense and very besutiful lake, or gulf, as it is more properly termed. On its banks grow in great
uxuriance an infinity of fine Ferns and Lichens - f frmer trees of 20 feet high, with 5 or 6 inches diam the of stem and tops like Cocoanut trees. A few fine young of stem and tops inke Cocoanut trees. A few fine young selected again some of the finest and largest to have home (if I am spared so to do) another voyage. On the home (if I am spared so to do) another voyage. On the such as Oncidium luridum and roseum, Epidendrum alatum, Stamfordianum, and cochleatum, Epidenquantities of Trigonidium Egertonianum, which grow in tufts of some 3 feet square, and is really in such masses a rather imposing plant, for it has long slender leaves which after a certain height droop round a famous group of flowers, whoge stems continually main ain an erect position, and thus afford a fine show, and really the colouring is not so bad. I found a quantity of Coryanthes Gemini, of which you received specimens last year ; but though we have had men out for months hunting, no more of the Paphinias than the solitary specimens at Mr. Veitch's could I get. 'Tis no jok plant hang here; once the sum ge ab is next to impo ible to remain on the water aiding, it is noxt apos sible to remain nut of doors; and no plants of any wort vermin and snakes attends the huntsman. I mast confess to a spirit and love of the sport which surmonnt any difficulty, but at the same time I am also obliged to confess that here I am beaten, for I fancy this place the hottest on earth. I left here a plant of Cissus dis color which I brought out with me, and I feel sure in a ew years some traveller may be surprised to find this scrambling over every bush and tree within a mile of the eastern side of the town.
21st. About 9 o'clock a.m. started, and after 200 yards from the town, plunged into a primeval forest Where vegetation has iun wilu from time immemanal passionless that can enter such a wi derness and be some 40 times now, and yet I never do so without sense of intense veneration ; for I read in every leaf and every wonderful form-and here they are endless-sons tale of Divine truth. Who, indeed, can look upan Nature, such as a tropical forest presents here, and not be impressed at least with awe? But what has tended to render me the happy being I am in the midst of such solitude, I owe to my friend Bateman, who first called
my attention to what I might do for science, by telling my attention to what I might do for science, by telling
me to open my eyes only as I travelled, and to the me to open my eyes only as I travelled, and to the able guides; so that what I undertook at first as affording pleasure and amusement to others, has at last become the second nature of myself. I could no more now travel over any country without picking up appears new, than I could forget my food and rest and what pleasure, moleover, does it afford in dispelling the emmi of the tropics, which most of my countrymen complain of ; that at least never disturbs me. I never allow idleness to gain a footing, for have I not always at hand a pastime fertile with pleasure in such a country as this; for though engaged in businos as I am, we are isolated from the excitement of daily news-that treat only reaching us here monthly. Ant interval is one of weariness. But I am moralisisg
instead of getting over this, in days of yore almost iminstead of getting over this, in days of yore almost im-
passable, mountain of the Mico. The road (1) is at passable, mountain of the Mico. The road (1) is at
least now open to heaven, and the light and sum te vicible. Great improvement has taken place, it is now some 14 or 15 feet wide, and perhaps 5 yards of forest on each side are cut down; but the ups and downis are the same se ever, and it is wonderful to observe what a change in the vegetation is produced on each sida by the admitiance of air and ventilation. Lovely specimens of Begonias, with their hairy elephant-earol variegated leaves, some of enormous size trailed over by Ferns without number, a Campanulate flower now and then rising out from among them, while the edges of the forest are rank and dark with its giant trunce covered with twisting Arads, great withes connecting all in one web-like labyrinth? large Marants with their fanciful leaves luxuriating in he shade, and pou forth a shower of water as the breeze shakes
slender pendulous cradles, slender pendulous cradles.
For some 10 miles we have this deacription of scene, when, rising out of a valley called the Garrito, which seems to part the ridge of coast and interior, we ascend a dry stony bill covered with a perfectly distinet vegetation-not a single plant of what was innumerable sand mixed with talc and gravel. Here I found is a
luxuriant flower as it was when I passed in July last gonidia burst at the same time with the formation of apt to get green and discoloured, which the tiles the Bignoniad of which you have specimens at Chiswick; these apertures, Pringsheim conjectures, with great
quantities of Rondeletia anomala also in flower; probability, that they perform the same functions as the
Oaks and Laurels in very stunted forns, with here horn-like proceses in Vaucheria, but he has not

Oaks and Laurels in very stunted forms, with here miles of this and we cross another river or ravine (as it is sometimes dry), and get into a forest of Piuts splendid trees. Here all other vegetation except Gra-
minacees ceases; my atteution was arrested by a Lime or Lemon tree, every branch of which was literally covered by the my return I will bring some branches, Emerging from this forest and on its western edge stands the village of
Quirogua. Here I put up for the night, arriving just Quirogua, Here I put up for the night, arriving just one of my Cornish companions, a miner from Truro, By , a briag
By the break of day of the \(22 d\) I was again on my
mule. The first half hour of our journey was in obmule. The first half hour of our journey was in oblight in the tropics, so rapidly does the sun show itself after once passing the edge of the horizon! Shortly
after leaving Quirogua we enter a considerable strip of ater leaving Quirogua we enter a considerable strip of leaves or great fronds form arches that give the effect of aisles and naves of some glorious old gothic cathedral. The soil is very damp here, and though perfeetly natural this wonderfully beautiful grove has quite the appearance of having been planted. The nut or fruit of with the muleteers, whom you will always see breaking them up with hammers in their bivouacs or resting grove I found in a swamp Schultesia brachyptera, very grove I found in a swamp Schultesia brachyptera, very forms masses. We crossed the river Motagua at the Barbasco in a canoe, the river being too deep to ford with
safety, but not reaching beyond the mule's belly safety, but not reaching beyond the mule's belly. Just
beyond the Barbasco is a Diothonea growing on all the beyond the Barbasco is a Diothonea growing on all the
trees, which trees however are only Crescentias; it is a pretty crimson species and alive in Europe. Near the hacienda of Iguana I observed in a ravine near a small rivulet a very fine Pandanus-looking plant. Beyond Iguana I remarked in great luxuriance fine masses of
Schomburgkia tibicinis with lots of Epidendrum radiatum, and among them though very rarely; Lycaste cruenta. On the banks of a small rivulet about a league arrested by Lycoseris squarm Gualan my attention was was of the loveliest green with aright presenting one of the prettiest effects imaginsble. struck me that no plant could be introduced with more perfect contrast than the orange stars blazing in a shing green canopy. You will find seeds of the
female with rather larger flowers, but not such a fine foliage. I was particularly struck but with the grach a fine ness of a little Lespedeza (!) covering in a carpet-
like manner the sandy banks. This may prove a very oruamental plant, hanging like tracery over a suspended pot. I got into the town of Gualan about half.past 3
o'clock and put up fur the night, making up my mind to rest a day there. Remained quiet all Sunday, and on Monday, 24th December, started for Jacapa
On leaving Gualan we cross a small but very rapid river, one of the tributaries of the Motagua, and about
a league on I went to the tree from which I the fine specimen of the large orange-yellow Cassia (perhaps C. grandis). This I consider a real prize and a reference to the dried specimens will bear me out. It is very rare. I did not meet with a doz n trees, or rather shruls for it is not large, in all my in a valley near the river, I was particularly struck with the brillancy and depth of colours of the common Poinciana, which seems to grow everywhere; yet I never saw anything so graceful and beautiful as the
specimens before me. Such a flower is worth specimens before me. Sueh a flower is worth
cultivating, so I send :eeds (No. 8). Along the side of the river growing in loose sand were spec mens of a Tribalus ; I could find no ripe seeds. This plant
seems to be fond of a very dry soil, yet is, no doubt seems to be fond of a very dry soil, yet is, no doubt, Jacapa about \(10^{\circ}\) clock, and passed the night. \(G . U . S\).

\section*{Eucieties.}

Linnran, Axrit 1.-The President in the chair. J. A Brewer, Esqu.s and Dr. T. H. Tanner, were elected series of dried specimens of British Hieracia, in illus tration of his forthcoming work on these critical plants. The following papers were read:-1. "Note on the recent discoveries in relation to the microgonis of fresh-water Algoe" by the Rev. M. J. Berkeley. Prof. Braun has, it appears, discovered in different groups of the fresh water Alge, certain organs scarcely excerding stot of
an inch in length, and often not half that size, to which he has in length, and often not hame of microgonidia; they are clavate bodies, unicellular or divided by one or two septa, and occurs in little groups, or separately on or in the neighhourhood of the large spores. Pringsheim, who has thrown so much light on the physiology of the Algo, has observed in CEdogonium and Bulbocheete, that when the contents of the swollen joints in which the spores originate have been concentrated, a round lateral aperture in the former and one or more circular fissures in the latter entrance of minute bodies from without. As the micro-
witnessed the production of spermatozoids from them. Mr. Thwaites had noticed these bodies so long ago as them in some species of Elongonium and Bullowlrete communicated at that time to Mr. Berkeley, with a suggestion of their affinity with the above-named proup the question he has so succesefully begun, but as the season is just at hand for observing these bodies in perfection, Mr. Berkeley thought that eapecial notice might be drawn to the fact of their having been some years since observed in England, in order to direct the attention of ohler observers to the subject. 200 "Oome collections of Arctic Plants," yall in Sir E. Belcher's the collections made by Dr. Lyall in Sir E. Belcher's expedition; by Dr. Anderson and Herr Miertsching in Sir R. M'Clure's; and by Mr. party on an exploring expedition from Great Bear. La to the mouth of the Coppermine liver, and to the south shores of Victoria Land. These collections contained no novelty, but were considered of sufficient value for this special notice, as furnishing imporiant materials towards a knowledge of the geographical distribution of plants within the Polar circle. 3. "On the botany of the South Pacific Ucean," by Dr. Hooker. The materials from which this, sketch was drawn up consist of a small collection of plants made upon the island by Mr. M.Gillivray, late naturalist to H.M.S. Herald. The Kermadec Islands form a small group situated about 450 miles N.E. of New Zealand, and between that group and the Feejees. Raoul Island is che largest of this group. The most interesting circumstance connected with that vegetation is the identity of must of the flowering plants, and of all but one of the Ferns, that have been collected upon it, with those of New Zealand. The collection consists of 42 species, contained 17 species of dicotyand 22 species of Ferns and Lycopods

\section*{Garden Memoranda.}

Hillingdon Covrt, wear Uxbbideg, the srat built here, and gardens - new mansion has lately been worthy of its style and beauty. At one end of it is "bos garden," designed, we believe, by Mr. Nesfield. This when filled in different parts with flowering plants in summer, has doubtless a grand effect ; but even i winter a degree of variety has been given to it ly sur-
facing the walks with materials of different colours. facing the walks with materials of different coluurs,
These consist of white, red, and yellow gravel, and black coal ashes, which, when looked down upon from the windows of the mansion or viewed from the top
of the green sloping banks which surround this garden-for it is formed in what is called sunken pannel-have a varied and interesting appearance. A handsome dwarf wall, surmounted at certain distances apart by vases, separates this garden from the park, and at the end farthest from the house it is ornamented by a fountain and basio, the latter 30 feet in diameter. On the south froat of the mansion is the lawn, through which, parallel with the house, runs a noble terrace walk, margined with standard Roses, and right and left of this is dressed ground enriched with clumps of choice shrubs, specimen Deodars, and other Conifers. Romarkable among the with branches down to the very surface of furnished with branches down to the very surface of the closely shaven lawn, and having a main stem nearly 8 feet in
height. Associated with these, but standing out by height Associated with these, but standing out by
itseif, was a noble tuft of Pampas Grass, which grows and flowers here admirably every year. The points of its leaves get bleached and white, but beyond tlat it sustains no further injury from the winter. An inverted funnel-shaped wicker protection, open at top, has however been put over it when the weather has been at all severe. Opposite the garden entrance to this magnificent residence is a fountain and basin surrounded by flower beds, and in their immediate Rhododendruns, Heashs, clumps of the best kinds o flowering shrubs. We now come to the west end of the house, where in connection with it has been erected a pretty conservatory or glass-covered promenade, mor frontage and a fat roof on the has an upright glass Immediately inside the glass front is a slate shelf with Minton's with flowering plants, then a walk paved with Minton's tiles of various colours, and beyond Daphnes and in which fine specimens of Iudian Daphnes and other conservatory shrubs are planted
out, the whole being backed by a wall which will sonn be hid by Camellias and other plants trained against it on wires put there for that purpose. Occupying the bottom of a hollow some 12 feet below this conservatory is a herbaceous garden of elegant design, with a fountain and basin in its centre. This when viewed either ont of the conservatory or from the steep terraced baniss which surround it has a pleasing and excellent effect By the side of this delightful dell is a stove constructed on the same principle as the conservatory just alluded to. Its paths, however, are of Portland stone, which is not liked so well as Miaton's tiles, inasmuch as it is

No proper kitchen garden has as yet been formed but for forcing furposes there are plenty of glass walled off or otherwise separated from the ornamental ground. Here Pine Apples, Vines, Peaches, Figs, Cherries, Strawberries, Mełns, and Cucumbers, \&c, are grown extensively, in addition to which many span-
roofed pits and small houses are devoted to plant growing. The pits are all or very nearly so spanroofed, heated with 2 -inch hot-water pipes, and fitted ap inside with moveable wooden stages which can be lowered or raised aceording to the height and nature of the plants to be grown on them. The lights, which are hinged at top, lift up and down on both sides, and thus a plentiful ventilation is secured. Some of these pits were filled with bedding plants in boxes, which accommodate more plants in smaller room than could be done in pots ; in this way they also re quire less attention, and they transplant with equally good balls. It may be mentioned that bedding plants are all propa gated here in spring from a few store pita. As regards pits for Potatoes, that for the first crop is heated by hot only. From the earliest pit, which was started in Dtcember, the first dish of Potatoes was dug on the lst of this month. Of Figs we observed a pitful loaded with fruit. The kind which has been found to do best for a first crop is the Whice Nerii, which is not apt to shed its fruit; but Lees' Perpetual and the Brunswick are the Sorts most approved for general purposes. In the earliest Vinery there is at present a good crop just beginning
to colour. All the Vineries here are span-roofed, and in most of them the Yines are plaped span-roofed, and of the house alterusely; butaned erliest house which is smatler than the others and sunk, they are all on one side, the rods being led under the roof down to the bottom on the opposite side, and then turned back again. The later houses have a path up the middle o and and beds on either side, in which French Beans Frencher produce of that kind are grown. For the Peach Beans, however, pits are preferred. In the earlicst of them they have done stoning. In one or two of the houses we noticed examples in pots of the Stanwick Nectarine, whose fruit when ripe is delicious ; but it is at least 5 weeks later than the ordinary kinds, and thererere render it eatable it has to be removed to a use. It should, in fact, be grown in a house by itself, ase. It should, in fact, be grown in a house by itself, length, the trees are now in full bloom, as is also a Green Gage Plum. In this house a free circulation of air is constantly kept up, and the fruit does not ripen so early thus affurded, and it forms an excellent house for wintering Strawberries in, and other things which are all the better for a slight protection in severe house full of find of it is a lean-w ripening magnificent crop. The sorts consist of Keens' Seeding, Patrick's Seedling-a shony kind especially when in flower and much esteemed here, and Ingram's Prince of Wales. Melons and Cucumbers aro also largely cultivated, the latter being "in cut" all the year round. capital variety, which was found to resist the disease, while a pit full of tle Himalaya, although in all respecta similarly treated, was entirely destroyed.
Espaliers formed of iron uprights, through which are strained galvanised wire traiters, line the sides of the walks in a small fruit garden here. Concerning the galvanised wire, Mr. Constantine, the gardener, reported that it did no harm out of doors; but that indoors
Peaches cankered wherever the wood came in contact with it, while on Vines it had no ill effects.
It may be worthy of mentioning that the lawn is mown by one of Shanks' small machines, which is liked better than Budding's, inasmuch as it is more easily worked. The place we need scarcely say is in excellent staer, and in justice to Mr. Constantine it should be and that it has been wholly formed unde and skill. Of his success in fruit culture the prizes he has won at the ifferent metropolitan exhibitions are perhaps the best critarion.

\section*{FLORICULTURE.}

The Lawton Blackberry.-At a recent meeting of the New York Farmers' Club, Mr. Field said he had been experimenting with the common Bramble to see whether the improveronts effected in the Blackberry by Secore,
and carred into extensive operation by Lawton, we whether it could be traced to a peculiar variety of the Bramble. He took a plant from the wools, where it had grown in fine soil, and planted it in poor soil, and yet it produced berries as large as Lawton's, although only a small crop. Several berries measured 4 inches each in circumference. From his experiments he was convinced that there were distinct varieties of the others to produce the fine fruit now grown by Lawton, and that it is to the variety, rather than to either the soil or the cultivation, that the superiority is to be attributed. The Year-Book of Agriculture
Fubricution of Pastcboard.-A new species of manu facture has just been created in France-the fabrication of pasteboard from the pulp of Beetroot. This fabrica Foulain (Haute-Marne), and can be employed, it is said with advantage in ornaments, tea-trays, and other such articles. Daily Paper

\section*{Calendar of Operations}
(For the ensuing week.)

\section*{PLANT DEPARTMEXT}

Consetrvatont, \&c.-Proceed with the staking and tying out of plants which require such assistance, tive to growing plants with short-jointed wood a good deal in the way of stakes may be dispensed with, although some will be necessary to give the plant its desired shape ; on no account, however, use more than will effect that purpose. Turn each plant frequently round in order that it may not become one-sided. The
greatest care will be requisite to prevent soft-wooded greatest care will be requisite the prevent soft-woodid
stove plants from drawing ; as these will now be making stove plants from drawing ; as these will now be making
rapid progress, they should have a large share of light, slading only during the middle of the day. Some o those potted early may now require a second shite ; in the purpose for which the plant is grown. Tak every opportunity of keeping down insects by fumigation and the active use of the syringe, but in this take care to avoid injuring the young foliage of large-leaved plants,
The drainage of hard-wooded plants should be frequently The drainage of hard-wooded plants should be irequently bloom (as many of the New Holland plants) or approach ing that condition, and they will, as a matter of course require to be well surplied with water, more especiaily large specimens not shifted since last season ; if the drainage is imperfect therefore ill-health will inevitably be the consequence, and the most delicate plants wirst to winter flowering plants will now require potting off As it is not desirable that these should be grown to a large size keep them rather short of pot-room ; a hotwater pit will answer best for growing these and simila things. The plants can then be brought close up bushy with well ripened wood by the autumn, and may then be brought into bloom at pleasure.

\section*{FORCING DEPARTMENT}

Pinrriss-Plants swelling their fruit should be carefully attended to with water at the root; for, if the fruit and preventing its attaining, the size which it would under proper treatment. It is, however, easy to err in the opposite extreme, and considerablecare and practice are necessary to elaable one the properiy water not be intrusted to inexperienced hands, who would probably water every plant if the surface soil indicated dryness. Use weak tepid manure water for plants that are well rooted, whether fruiters or growing stock,
and keep the atmosplere thoroughly moist, giving air very sparingly on cold, dryin_, gleamy days. -Black Jamaicas and Montserats expected to supply ripe fruit at Christmas should sonn be ready for shifting into their fruiting pots, and care should be exerthis might lead to ther fruitiug prematurely. See to having the balls in a rather moist state at the time of atmosphere moist and rather close until the plants appear to have taken to the freah soil. The same attention will be necessary in regard to watering and bottom-heat, \&c., in the case of those growing in the open bed, for plants that are any size are apt to show \(\mathrm{V}_{\text {Ineries. }}\)-Directly the fruit in suecession houses is sufficiently advanced for thinning get this done, the aterals stopped, and the shoots regulated without loss of time, for allowing the berries to get so thick that the seissors can hardy be got amongst them renders thinning tedious, and also robs the Viues. Give inside borders a
liberal supply of manure water, using that from the stableyard tank where it can be obtained, and mixing with it asuficient quantity of warm water to render it about milk warm. In all cases, give every possille attention to the state of the roots, securing a little artificial warmeth cold and very unfavourable for the roots of Vines Where fermenting materials have been used on the border of the early house, the heat should not be easier to secure a heavy crop of well swelled frui than to perfectly colour and ripen even a moderat crop, and a healthy root action is perhaps more impor-
tant whle the fruit is colouring than at any other
period. Therefore let the fermenting materials be turned nccasionally, alding fresh as may be requisite to In cases where red spider threatens to be troublesome, in succession-houses, rendering syringing necessary rainwater should be provided for syriuging with, as it water containing lime is used, the berries are sure to be disfigured by an incrustation of lime. Figs.- To have
this fruit in perfection, the trees should be rather dry at the root and the atmosphere rather dry and warm during the ripening period; but respect to the second crop often prevents proper attention being given to the ripening of the first. If care, however, is used to have the borders in a healthy state as to moisture, and
rather inclining to dryness at the time the fruit begius to ripen, and save in the case of plants growing in pots or tubs, giving no more water at the root until the first crop is gathered, fruit of good quality will be obtained without risking the loss of the second crop. Plants in pots or tubs swelling a heavy crop will be benefited by an occasional watering with weak manure water.
flower garden and shirubberies.
Look well to recently transplanted trees and shrubs; do not allow anything to suffer for want of water at the root, but one good soaking after planting to settle the soil will be sufficient in most cases until we have more sunshine to warm and dry the ground. The soil thoud over-watering, as is sometimes done; a sprinkling overhead with the engine on the evening of drying days will be of more service to large evergreens than over-watering them at the root. See that all recently planted
things, whether large or small, are well secured against wind. The best way of effecting this in the case of large plants is to use three strong tarred cords for each specimen, fixing them to the plant by means of a collar made of strong metallic wire, and thickly wrapped round with canvas to prevent its injuring the bark, and then tying them to strong pieces
of Oak driven into the ground at proper distances from of Oak driven inte the ground at proper distances from the stem of the tree. This may be somewhat more expenwith on staning, especiany here stakes coly secured in this manner may be considered safe against wind, as the ropes will last for years, and until the roots get sufficient hold of the ground. For specimens in prominen situations metallic wires should be employed instead of cords, being neater in appearauce ; and although somewhat expensive in the first instance they will last a lifetime. Take advantage of the present state of the ground o stir and rake the surface soil of shrnbbery and herbaceous borders to prevent the growth of weeds and give a fresh neat appearance. Also plant out Waliftowers herbact plans geuerally. Delphinium Hendersoni is one of the fines plants we possess in this way, and should have a place
hardy fruit and kitchen garden.
The weather having become more genial to the opening bloom a portion of the protecting material might soon be removed from Peach, Nectarine, and Aprico trees, but this should be done gradually, in order that the bloom may not sufier from a too sudden exposure. Where canvas screens on rollers are employed of course they are roved up by day and let down at mion, of quite down, as little extra air will be more beneficial to the bloom than otherwise. We name this as we have more than once observed the blossoms of Peach and Apricot trees injured by too much covering where spray or netting is used, and which could not be conveniently remove daily. Figs should now have their wioter protection taken away, and have the necessary thinning out and tying
in. The bloom of the choicest kinds of Pears sliould have some protection should frost occur ; where the trees are against walls this is easily done, but with espalier and low standards the difticulty is greater; for the latter a slight frame shaped like an umbrella and covered with canvas might be fixed over each tree; of course the frame slould exceed in diameter that of the tree. For espaliers a width or two of canvas should be fixed on a frame over the line of trees. If the ahove are placed 2 feet above the trees they will protect them from a tolerably severe frost, provided it is not accompanied by wind. As soon as the principal kitchen crops are in the ground and the main quarters have got their supply of dung wheeled on to serve for the season as we formerly directed, proceed to make good any part of the edgings not in order, either (supposing they are Box) by taking the whole up and replanting or filling up blanks.

\section*{The Ggricultural Gazette. \\ SATURDA Y, APRIL 12, 1856.}

We learn from Mr. Brandreth Gibes that the French Government has extended the time for receiving declarations from those who intend to be exhibitors at Paris till the 23d of April, for the convenience of English exhibitors. They also offer additional prizes of \(20 l\). for the best fixed steam engine for farming purposes, \(10 l\). for the best portable threshing machine, and \(10 l\). for the best fixed threshing machine to be driven by steam. A new sub-category of prizes has been opened for shearling ewes lambed before the 1st of May, 1855. Intending exhibitors must send in their declarations
belore April 23
Pall Mall East,
A member of the Corps Législatif of France has asked :-" What is the average quantity of iron to include horne-rhnes, tires, chains, and all farm implements. As the incquiry has reference to au alteration of the French tariff in the interests of agriculture it is very desirable that some approxi-
mate datum thould be furnished in reply. Obviously mate datum should be furnished in reply. Obviously respect to this subject. Some soils are proverbially sharp, while others, adhesive and clayey, do but little to wate the ploughshare or the harrow tine There are, however, probably very few cases of
either sort of land where any kind of record either sort of land where any kin
singular illustration of attention to detail if an answer to so curious a question shall in any instance e obtained.
We put the question nevertheless, knowing that on some farms a contract with the blacksmith is in order and horses shod at so much per pair per in order and horses shod at so much per pair per
annum, payment for all new metal being in addition annum, payment for all new metal being in addition
to the price thus due. If any reader of this paragraph shall have a blacksmith's bill of this description by him, and will tell us its amount per annum, together with the extent and kind of soil he cultivates, we shall be very much obliged.

An interesting lecture on artificial manures wa given last Mondsy by Mr. Nespir, of Kennington before the London Farmers' Club. The rival theories of plant nutrition were described, and the "true" theory given in their place. This seemed to be, that all that plants contain threy need, and that the relative importance of their different in gredients depends pretty much upon the proportion which obtains between the quantity of each they need and the quantity of each supplied by nature. Ammonia and phosphoric acid are
special flemeuts of manures, as gypsum was once supposed to be; lut gypsum, so the lecturer stated, is not so considered now because enormous quantities are supplied in other ways,
as superphosphate, \&c., and the supply exceeding the demand no such extraordinary results are met with now as were formerly experienced from its application as manure. Whether ammonia or phosphoric acid ever shall become in like manner comparatively ineffective cannot be foreseen ; but the inference from Mr. Nesbir's statement was that all these things rank in importance simply according to the natural deficiency of each, and that the plant's demand for each is of the same kind, quality, or force, its exigency being in proportion merely to the deficiency the supply
This probably is in the main a true statement of the case, but it is very much calculated to
mislead if there be not added to it (1) that the natural supply of many things is abundant, and of others altogether insufficient for a crop large enough to pay a rent; (2) that the natural liability to waste others \(i t\) is of the most serious importance; and (3) that the appetite of the plant for some thinus may be satisfied by a substituted substance, while for
the want of others thele is the want of others there is no remedy whatever.
All these three considerations go to rnaenify the it imporsible that it in manures, and to render with gypsum in the class of manures liahle to lose their rank. Phosphoric acid, too, is so largely needed and so imperfectly supplied that its rank as a manure is with reference to the majority of soils a permanent one
The natural and artificial sources of supply both these substances were enumerated by Mr. Nescit. Guano, nitrates, blood, as affording
nitrogen; bones, phosphatic marls, coprolites, apatite, \&cc., as affurding phosphorus were referred to. On the subject of superphosphate some useful and some, as we think, questionable suggestions
were made. Mr. Nesbit production of an entirely soluble superphosphate. After the seed has brairded and the young plant is established it needs abandant food for months before it is matured. During this period the comparatively less solulde portion of a well-made superphosphate
comes into use; if it had been whuly would before that time have disappeared, and the plant, puffed out rapidly and unripened to an excesTurnips in Hampshire not long abo, and on crossing the line which separated dung and bones as the manure from superphosphate he found he had left sound roots for rotten ones, and this was the proof on which his argument was based. Now if
invofficent manure for Turnips we quite agree with it ; but if he desire to teach that the less soluble superphouphates in the market are equally valuable with others, we wholly disagree. Let farmers buy the manure containing the greatest quantity of soluble matter, they can dilute it with bones or dung or any hing else at home, and if they apply it to the soil Johnson very properly referred to this in the course of the evening as a complete answer to Mr. Nssbit's theory. His suggestion as to making
coprolites and other mineral phosphates the source of the soluble part of the manure, while bones should furnish the comparatively insoluble portion, is one that deserves the átention of all manure makers.
In addition to phosphoric acid and ammonia alkaline salts were specified; common salt was
alluded to as a "corrective of excessive fertility," and its use along with guano for cereal crops was recommended, as tending to strengthen straw and binder the falling of the crop.

Mr. Nesbit was followed by Mr. Baker, Writtle, who referred to the methods of applying artificial manures as being of the greatest importance. He had no doubt, and neither have we, that much of the guano and other ammoniacal manures applied on grain crops during the past dry month of March has been lost. The beat plan he believed to be that of applying these artificial manures before the seed, at any time during the preparation of the land, and ploughing it in. He had all his land for Mangel Wuizel ready for the seed. During the early frosts he had ploughed in 10 to 15 loads of dung-and he has since applied 4 cwt . of salt, 3 cwt . of guano, and 3 cwt . of blood manure per acre, and he will drill 1 or 2 cwt. of superphosphate with the seed. It is as easy to grow 35 or 40 tons of Mangels as 25 or 30 ." That is a crop you can " make ;" not so grain: Wheat you may manure excessively and lose your crop; there was, therefore, no egolistic vanity in saying that he grew the heaviest crops of Mangel Wurzel in his neighbourhood.

Mr. Mechi followed Mr. Baker, referring to deep cultivation as ensuring the economical storage of the manures applied and to the fact that in spite of it a waste of fertilising matter took place through the drains even on his stiff clays. To this subject Mr. Mechi has again referred in our columns of to-day Professor Wirson, of Edinburgh, had long since pointed out the fact, proving it by the analysis of drainage water, and to this Mr. Cuthbert Johnson referred in the remarks which he, following Mr Mechi, addressed to the meeting.
The discussion generally embraced very fully both the theory and the practice of manuring, and the full report of it in the Club Journal will form appeared

Before proceeding further with our remarks on the number of seeds sown per acre under ordinary may practice in the case of the several crops, we tained. Mr. Summers points out the discrepancy between Lawson and our correspondent
in the case of several Grass and Clover seeds, which
he specifies. In answer to him we have received the
"Owing to the remarks of Mr. Geo. Summers in the Gazette of the 5th inst., I confidently state that the table of the number of seeds in a pound, furnished by me and published on March 22d, was when recorded in 1838 to 1843 correct. I myself collected all the specimens carefully examined, and believe that each species or variety was botanically true, and not intermixed. The seeds were weighed when dry, after having been stripped from the rachis, or threshed and well cleaned from chaff and light rubbish, and from corolla when separable. It is not easy to clean perfectly the seeds of Holcus lanatus, Alopecurus pratensis, or any of the Poas Five ounces of Holcus lanatus seed as stripped from the rachis will produce only 2 ounces of seed as cleaned by me; 8 ounces of Festuca pratenis pro duced but 3 ounces of seed.
wish that Mr. Summers had procured thimbleful of the seed of Trifolium repens (whit Clover), had weighed a portion with a 10 -grain o half-scruple weight, counted the weighed portion and multiplied it by 700 , which would give the rumber of seeds in a pound, for if he had done so he would have been enabled to judge which of the tables, viz., that of 'J. C. X.' or that of Messrs Lawson \& Son, was most to be depeuded upon.
To this we add, that in the cases published by us last week one ounce, 100 grains, and in some few instances 10 grains, carefully weighed and counted were made the basis of the calculation. The seeds
were as supplied in the market, and the numbers
wiven as the result must in eier? case be taken a the maximum, it being often impossible in the case of Grasses to avoid counting aw reeds what may be merely husks or even dust. The seed as supplied in the market is of course often adulterated mus number of seeds actually sown per pound must not be taken from our correspondent's table as it might if the samples sown were botanically accurate, or frum our own, as it might if the samples sown were commercially honest. How largely this adulteration is carried on appears from a sample that has been sent to us by Messrs. Drimmond, of Stirling. They say :-

In Italian Rye-grass as well as other seeds there has been a good deal of 'manufacturing' going the other instance the enclosed sample sent us the other day as 'our own direct importation. Sprinkle a little of the seed upon a sheet of paper The Hair-grass is the small seed writ ' 18 in it and is a vile weed which is often to be found largely in common Rye-grass seed, and requires much labour to take it out. Seed cleaners generally burn it, but this year a demand sprung up for it, for what parpose you can guess. We may note that in genuine Hair-grass."

\section*{THE PRICE OF ARTIPICIAL MANURES.}

IF any excuse were required for addressing my portant subject referred to the present on the imparagraph of Professor Way's paptr, in which he says "I know full well how considerable are the interesto involved." In the same paper he adds, "that I may have conimitted errors of greater or less magnitude is more than probable, but if so I believe I shall Se one of the first to discover, and I hope to acknowlelge them." If he does this, I for one shall be per-
fectly satisfied, and it was for the pur fectly satisfied, and it was for the purpose of pointing Way min conceived to be erroleous, so that Professor I was induced to pen the fer of correeting them that I was induced to pen the few observations which I made I certainly did not upbraid him, and I have no idea of calling in question his motives, his mode of reasoning his general accuracy, or his scientific attainments; on all these points I entertain for him the highest respect,
Mr. Way says I am evidently a manufacturer. Well, grant that I belorg evidenty a manufacturer. Well, add force rather than otherpected the ground of my complaint, for no one can better judge the wholeale and retail value of manures than a manufacturer, and no one is so likely to suffer from an incorrect statement. Let us suppose a case: A consumer in the month of February asks the price of crushed bones, and he is informed 8 . per ton, or a relative price per quarter, his price including the use of sacks and the carrisge to ceives to railway station. Indignant at what he conProfessor Way's Table of Prices in the Agricultural Gaz:tte, and adopting the advice of the editor in the same article removes his custom from the unfortunate manufacturer, whio naturally \(f\) els somewhat sore at Voing made the vic'im of a mistake or mis-statement. aow, as this is a matter of fact which can readily be he "Hull Price Current" for enough to refer to February last, which he will find in the Eastern Counties Herald, and probably also in the Mark Lane Exprest, bearing in mind at the same time that it is the wholesule price per cargo for uncrushed bones that is here quoted, and not the retail price? Having done this will he have the goodness to state how much less than 76. per ton is the price quoted! Will he also refer to the public sales of bones in London during the same moners of cargoes during the same month at not less than 71. per ton. Having done this he will have a right to ask whether, when 6l. 10s. per ton was stated to be the price crushed bones, he was far wrong in saying that this must have been the wholesale and not the retail price,
or whether he imposed on his customer in charging \(8 l_{\text {. }}\) per whether he imposed on his customer in charging
including crushing, \&ce., use of sacks, and railway carriage.
Again, with regard to bone-ash, Professor Way acknowledges that \(6 l\). per ton is about the wholesale price of this article containing 70 per cent. of phosphate of lime, which will bring the phosphate of lime to very dearly la. per lib. ; bat he says that it is only of this value to dissolve, and not to apply to the land in its ordinary state. Now, surely if the phosphate of lime in ordinary half-inch bones will produce a great effect on the Turnip crop-and that it does produce a great effect we have had abundant proots-surely this same phosphate, when reduced to a fine powder by burning and crushing, will have at leasua can, of course, be added in another form. Again, althouga no doubt hare a much less affect yat when we are told and when we know that on certain soils containing 1 or 2 per cent. of phosphate of lime in a mineral stato neither bones nor superphosphate have any effect, this certainly militates stronyly against the assertion that puwdered mineral phosphate is perfectly use
Professor Way in his table gives ammonia in Peruvian
Professor Way in his table gives ammonia in Peruvian
for no reflecins prrson can say that the ready guano is not much more valuable thon in the cruche
state of half inch l,one, which requires fermentation state of half-math tone, which requires is is given up. and a contidrrable time betore its ammonia is given up.
This is no douhtowing to putting the phosphate ot lime too low. If he had valued the phosphate of lime in bones
at something like ld. per Ib., it would have brought
 To show that the phosphate of lime in bones is valued
too low, we may again refer to the table in which Professor Way calculates the phosphate of lime in coprolite as 10 s. 8 d . per ton more than that in bones, Now,
surely this cannot be correct. I am afraid I have occupied too much space, but the importance of the subject must be my excuse.
[We find that the Inuil "General Price Current," the price current of a conmission agent for wholesale buyers in bones, guano, \&c., of the same date, in 6l. \%s. 6d. weighed on delivery, buyers paying freipht; a ton at the docks. These prices are the lowest; the highest quotations are 2s. 6 d . more.]

\section*{Home Correspondence.}

The Royal Aysicultural Society and its Implement Prize Shetet.-The tfict of the establishment of the
Royal Agricultural Suciety on the manufacture of agricultural implements was admirably illu-trated by Mr. Hoskyns at the Society of Arts, by comparing it with
the wonders of Aladdin's lamp. Mr. Ransome whose imagination ordinarily requires but a spark to kindle it, appears to have been somewhat chilled by the solemnity of the occasion, or he would not have questioned the propriety of a comparison so apposite ; he would have lamp which evolie the genii, just as it is not the brillancy of the Suciety's judicial decisions, but the peryear to against Chandler, that has called out the "geniuses" who annually assemble under its tents. At least, if this view of the can abandoned, and a claim set up for the Society as having advanced the science of agricul-
tural mech nics rathre than as having diffused the knowledge of its achievements, I fear we must side with Mr. Ransome, fur searcely an instance can be named where the Royal Society so much as proposed a mechanical problem for the solution of the engineer,
whilst at least one will be familiar to most of your readers, for whish the cold shade of the Society's neglect did its worst, happily to no purpose, to destroy the age. How vicious is even its boasted system of trials by the dynamometer, regardless of other important elements, is well known to exhibitors and to the though the public will scarcely believe, what is however perfectly true, that the beautiful locomotive steamengines which annually contest the prizes of the
Society are unfit for use on the farm, and that, of the thousands of admirahle engines amnually manufactured for the use of the farm by the leading houses who compere, not one would have a chance of winning the Society's prize. That the same absurdity prevails amongst nimor implements will appear from one instance amongst
many. For years the prize for one of those usetul machines which assist the farmer in economising his fodder, was contested by a machinist in the north of England whose productions vie in cheapness, accuracy, and durability with those of the first mechanics of the district, and they are the first mechanics
England. His implements commanded a sale England. His implements commanded a sale of housands annually not only in England, but in every part which was carried off year by year by an industrious mechanic, without science, without capital and the appliances which it commands, but who still produce 1 before the judges a machine absorbing rather less power-though the power in eithercase was an practical importance-than that of his competitor ; but which, had it been put to a month's competitor; but which, had it been put to a month's
work in the state in which it was placed before the work in the state in which it was placed before the
judges, would have dropped to pieces at the end of that judges, would have dropped to pieces at the end of that to trial a handsome well-made machine, which performed its work with half the power of that of its rival, and tonk the prize. Orders for the prize machine poured in from all quarters; but they remain unfulfilled to this day, for the machine was constructed not to be sold, but to win. Should we travel out of the every farmer of capital and skill, and o!serve the Society's award on new implements, the reaping machine for instance, we thall find them less reliable Again the yuaided judgment of the practical man. Age Society's contradictory awards and comments, as regards this implement, been misled, the makers not leas than the users; the firm which has in the last instance obtained the Society's prize being perhaps furthest removed from the great requisites of simplicity furthest removed from the great requisites of simplicity
and duratility. Again, turning to the lowest class of and durability. Again, turning to the lowest class of
the Society's distinctions, what can be more absurd, for example, than to stamp with its verdict as the best charn for the farmer an implement tried with-four
it hive any infuence ar all, it can hat divert the ambi-
tim of agricultural engineers from the true oljects of then of arricultural engineers from the true oljects of existing, and the invention of new machines, to the aius of the jociey and of the jughler ; whilst it lowers the character of the Society, and serves no beter purpose thau to flatter the sell-impurtance of a few of its
members on the annual field days. Such were not the means that brought to the ir prestat perfection the rail way locomotive and the marine propeller, the power loom
and the spinning frame, the chronometer and the tele. scope, the galvanic battery and the electric cable. The master minds who have laboured in the advancemen of mechanical science in all these branches would senn to submit their inventions to the judgment of a few amateurs, or to dance attendance for days ou the estate en a countreer should cense to is time that the agricultural rewards as the Royal Agricultural Society can bestow Prizeman.
Conceruing which Mr: Brown made of March the rain tion, began foll It was prefaced with what in summer we would have called heat dro!'s. A heavy murky \(\leqslant \mathrm{ky}\) cast its gloom perceptible low down in the S.S.W. This gradually rose, bringing with its approach all the darkness of an impending thunderstorm, with for a short time some what of its sultriness. The wind was E.N.E., but there was evidently an upper current, bringing the rain upon us, and by one o'clock there was a somewhat gusty west wind blowing; towards dark it had drawn a poin or two to the north, the rain still falling heavily; sometime during the night, I cannot say what, the stars were brighty slining, and on Monday morning the wind was Appil 7 quarter again, and as cold as ever. \(R\)., Ushe (p. 235), I beg to say that the rain on the 16th March commenced here at from a quarter to halt-past 50 'elock, Iris, Her, ley-on-Thames.
anures through Soils.-The last thre days we have been irrigating a strong yellow plastic ciay held, which was some years since drained at inter 'Ihe soil is eet, with 1 -ineli pipes placed 5 feet deep Tha soil is a strong tile earth, far too tenacious fo making bricks. Our irrigation with pipe hose and j was composed of the solid and liquid droppings hullocks and other stock, together with the usual decomporition of the great tank and a proper addition of water. The quantity applied about 100 gallons per minute, falling hee a shower of rain ; total application per acre about 20,000 gat lons, or 1 ineh raintall. Every drain hie hita hasbeen rumning abundantly and discharging liquid manure, strong and highly coloured,
a:most invarially the case when we irrigate abun dantly. The same thing took place in another but cotturers field, drained 6 feet deep; of course the tainted whenever we irri gate, althoula spring find mile from the fields irrigated. Three questions arise out of these facts : 1st, will heavy land tarmers still coatinue to doubt whether water can filtrat through their soils? 2dy. Does not heavy rain wash through drained soils the essence or solutions of
ordinary farmyard manures that have been applied in the solid form? 3. When our town sewage is applied to agricultural purposes will not a large quantity of it find its way liy percolation to our brook and rivers? Practicully I can answer the two latter questions in the avoided, because it is quite clear that the people of this country nulst be fed, which can only tak place by abuadantapplicentions of manure. It is equally certain that strong eolutions of the 200,000 tons of bird's dung or guano which we annually import from Peru pass through our soils and mix with the water which is the beverage of millions of our poople. Limpid and transparent it may be, and yet it apparent much of the elenents of the cose essence of our corporeal substance. I thinl I mery essence of our corporeal substance. I think I men ordinary dung-heap on the surface of a strong clay field flowing abundantly through drains some hundreds of yards distant fromit. I feel, with many market gardeners, hat we must continue to see widh regret the essencen of our manures leave our ditches to fertise our river and seas. It may be interesting to consider whether since our extensive drainage and improved manuring he weeds in our rivers have not grown with greater vigour. That we must contioue to manure in spite of such losses is too obvious a proposition to be denied J. J. Mechi, Tiptree, April 1. N.B. My men and mysel are of opinion that our clay soils retain mach less rooisture than the more dry and open soils, their capila: y powers being inferior.
Produce of Four Alderney Conos-L Last year my dairy consisted of four Alderney cown. They were not all in profit until the besinning of July. The produce during the year was 712 lbs of 18 oz . of butter, and six small cheeses, weighing from 10 to 12 lbs . each. The pasture water it is the poor, bum in this locality to charn milk with the cream, by which means the butter keeps longer freeh than if cream alone is used. Considering the delicacy of constitution of the true Alderney breed,

Gresford, Denbighshire.

\section*{Sorieties.}
 Trustee, in the chair.
Simonds the Yep Domesticated Animals.- Professor Simonds, the Veterinary Inspector of the Society,
delivered before the Memiers the first part of his delivered before the Memi,ers the first part of his
lecture on the injuries arising to domesticated animals lecture on the injuries arising to domesticated animals
from parasitic insects infesting their skin. The Professor commenced his lecture by remarking, that however little apparent interest this subject presented to the scientifie physiologist, it was a most important one to the practical farmer and flock-muster. All dinesticated anmals were, to a greater or less extent, arivided by peculiar parasitical insects. These might be the external parts of the body, on which they pass through the whole period of their existence, as in the cases of acari producing scab, mange, \&ce. 2. Insects which pass their larral condition only on the skin, us a temporary nidus, from which they escape as most assuming their winged condition o. Insects, internal Simonds added, that veterinary science was still Simonds added, that veterinary science was still
very inferior to medical science in its nomenclature, very inferior to medical science in its nomenclature,
having in many instances very imperfect terms to express the peculiar forms of disease ; and it was still the habit to retain different names in the case of lower animals to diseases identical in their character; the mange and scab in the horse and sheep being analogous to the itch or scabies in the human subject. It would lead to greater simplicity and precision if the mange, term of "seabi" The were classed sheep led to grea losses among flock-masters, in consequence of the deterioration of the wool and general condition of the amimal. Its cause for many years was not known; and the merit of our present satisfactory information on the subject is due to a German physiologist, who clearly proved the wide distribution of acari or mites, in dirt or filth, sugar, cheese, flour, and almost every other form ulstable matter, but that there was a that male and female acarus of the hore and of the seep oossessed well.defined characters in the case of each of thee animals the forme being the cause of the mange, and the latter of the scab. The study of their natural history would, in Prof. Simonds's nopinion, be the best lue to the means of their destruction. These mites were endowed with the capability of travelling from one animal to another: and the scab-disease of sheep \({ }^{\text {nas }}\) chronic disease. Since 1848 Frof. Simunds had instituted numerous experiments for the purpose of ascertaining whether the mites belonging to one class of animals had the power of engendering the same disease on animals of another ; in other words, whether the mite which produced seab on sheep was capable of producing these \(h\) circumstance, but entirely failed to produce such results. It had however been alleged the had attended similar efforts. lie acari, ir the gary much in shape. Pediculi, or lice, existod in grent ticular part of the animal's body to which they were adapted. He then referred to the period which elapsed between the deposition of the acari on the sinin of sheep affective evelopment of the scab-disease, as lie liability attached the purchasiction. First a slight rednese came on the skin, albuminous flaid was exuded which matted the adjoining wool. In a few days, definite pain was felt by the animal, which violently attempted to eratch itself by rubbing the part against any resisting object. The irritation extended to 10 or 12 inches. The disease advanced with rapid progress. Acari had ravelled over other parts of the body. In 16 days, 50 or 60 eggs of the acarus were found at the base of the wool. Large thickened crusts of a white appearance were formed. The health of the animal and its skin became generally affected. Large scales or scabs enued, which on being raised, a great number of acari culd be detected Inflammation had ensued on the kin. The itch in the buman subject arose from the same cause; the acarus burrowed beneath the scale of the epidermis, or outer skin. This affection was known to be more communicable when the person was warm in bed than under other circumstances, the acari then coming out and exteading their operations. The itchmite insinuated itself within the shin, while the mites of the horse and the sheep made their attacks upon the kin. He described in detail the peculiarities in the adaptations of these creatures for the accomplishment of their particular purposes; their suctorial dises for extracting the juices of the glin, their hooklets for holding themselves loy the wool or hair so as not to be shaken off while continuing their operations, and the rumpet-bhapen appendages which enabled them to hold hemselves securely by valves to flat surfaces; the clative size of the male and female mites, the female being the larger insect and adapted for propagation,
while the male was smaller and adapted for sucking the

Professor Simonds remarked that arsenical applications were more potent, but they required great care.
The best mode was that of sprinkling a solution of arsenic, again and again, over the diseased parts. The preferable form of such solution was that of arseniate He recommended two ounces of common arsenic, and two ounces of carbonate of potash to lue boiled together in a quart of water until they were dissolved, when farther quantity of water was to be added to make up vegetatle solution. To this gallon of solution, a gallon of gallon of boiling water over four ounces of Foxglove leaves, and allowing the infuaion to remain till cold, when it was poured off. These two gallons of liquid remedies for scab. Half a pint of the most poten few days, was to be sprinkled (from a bottle, through a quill in the cork) on the skin at the back and sides of
sufficient to cure the most inveterate cases of scab in sheep. Many of the advertised remedies consisted of preparations of mercury or arsenic with similas
vegetable infusions,-Professor Simonds then proceeded to state that parasitical insects travelled to other animals ; and although they did not produce the identical disease on them they peculiarly produced on the par-
ticular animal to which they naturally belonged, they ticular animal to which they naturally belonged, they of local irritation of an annoying character on the skin. He cited as an instance of this kind the effects of insects infesting common domes ic poultry on the horse. Poultry, it was known, swarmed with insects of various kinds, especially with lice and mites, and those creatures had a great tendency to travel from the poultry to other animals. Horses often appeared to have the mangly the inflammation occasioned by poultry ticks reaching them from the contiguity of the hen-roost to the stable; often from the roost being over the stable, in which case the dirt and insects from the birds fell through the flooring upon the horses. Inflammations f this kind were easily cured by means of oil impregnated with sulphur.-Prof. Simonds concluded his lecture by referring to the third class of parasitical insects, which passed only one period of their existence in the skin of animals, namely, the period of their larva or grub state, berore they assumed their winged form in stances of a result in such cases. These were small tumours, about the size of a Hazel-nut, on the skin of the farmer's best-doing stock, and contained each a large maggot, grub, or bot, the larve state of the gad or deposited their eggs not only on the backs of cattle, but in the nostrils of sheep, and on the hair and skin the horso and passing into the stomach and afterwards through the intestines as bots. The cattle gad-fly deposited on the skin of the animal its exceedingly minute egg, which being hatched by the lieat passed beneath the scarf-skin and lay secure, feeding on the unctuous secretions of that integument. fterwards burrowed into the skin, and insinuated tself below it. A small puncture, like that made by the prick of a pin, might be detected; the fly itself having no power to puncture the skin. In this situation the
grub passed through the winter. In March diffused grub passed through the winter. In March diffused gave pain on pressure, the burrowing of the insect having induced inflammation. The grub lay in its nidus, or nest, within the true skin till the approach of summer, when its white colour became dark, and it made its way ut of is retreat. On the ground it soon assumed the chrysalis state, escaped from its shell as a gad-fy, laid its eggs, and died : the eggs again produced grubs, and the same transformations succeeded. It was the same with the bots of the horse. When they lost at maturity their power of attaching themselves to the stomach, they slipped their holdings, and passed out of the stomach through the intestines to the and became flies, -The egg of the sheep gad-fly was deposited about the middle or latter part of summer The sheep were seen herded together with their heads down, and violently stamping with their feet. The fly at length deposited its egg in their nostrils, and the hatched grub penetrated through the immediate cavities its getting to the brain. In the case of horned sheep it would get to the extremity of the horny cavity. In
these situations the grubs found a natural secretion rom the lining membranes, on which they subsisted heep, such as vertigo, gio, giddy, turnsick, goggles, \& agibligo, gig, giday, turnsick, goggles, \(\alpha\) c, rubs reaching that organ, had a totally different origin, namely, arising from the formation of little sacs or bladders containing hydatids. He ex and explained the mechanical impossibility of such penetration of gad-fy maggots through the nostrils into eing the particular camonds alluded to the dog-fea as ese her wase fruitrul soure of disenot action and mange on the skin of the dog, where it generated and passed through all its gradations of existnce. The Professor, iu conclusion of this first portion his lecture, explained by coloured drawings highly ects whose annoyances to the domestic stock of farmers he had described. and submitomestion of he members, by means of his powerful microscope, the actual specimens from which those magnified drawings had been executed.
Sir John Johnstone, Bart., :M.P., moved a vote of anks to Prof. Simonds. The facts and reasonings he \(f\) far before the meeting were novel to the generaity e produs and highly interesting. They could not fall opportunity would be given during the present season or the concluding part of the lecture,-Mr. Mainwaring Paine, in seconding the motion, \(r \in\) marked that the inormation they had received was very useful.-Colonel Challoner, as chairman, put the motion to the meet ing, which was carried unanimousiy. He had heard which science was rendered so perfectly intelliyible which science was rendered so perfectly intelliyible
to farmers. He felt how mich more he now knew to farmers. He felt how mich more he now knew
of the cause of the parasitical complaints among
animals. As a lover himself of dogs, and having taken great pains with a particular variety of breed of pointers, he had experienced the great advantages ta.b pplication of a valuable old remedy heir skin, and the application of a valuable old remedy he had constantl They were dressed with it regularly every spring and They were dressed with it regularly every spring, and having occasionally left a single dog out by way of dog the greatest possible difference "from the others. He had fully proved the effect, he now knew the reason. These fleas it appear never leave the dog, and can only be kept awsy in the first instance by a constantly recur ing detergence. Such information as the Professor had given would be highly useful to masters jof hounds He himself offered Prof. Simonds his own personal thanks for his lecture.-On the motion of Mr. Fisher Hobbs the thanks of the meeting were voted to Colonel Challoner for his kindness in presiding on that occasion On the motion of Mr. Lawrence it was decided that be recommended to the next Monthly Council that Parasites Affecting Domesticated Animals," should be Parasites Affecting Domesticated Animals," should be
delivered before the members at 12 o'clock on Wednes day, the 25 th of June next
The Council then adjourned to their Weekly Meeting on Wednesday the 16 th of April.

\section*{Calendar of Operations.}

Forfarshire Glens, March 31- - With us the past has been a
model winter, a general temperature low enugh to enable vege-
table life to enjoy its usual period of repose, but at no time model winter, a general temperature low enough to enable vege-
table life to enjoy its usual period of repose, but at no time has
there been so much severity as to prove dangerous, or even diss
agreeable to the animal creation. An incipient vegetation which
appeared about the end of February has been completely kept in
check by the dry cold weather previling thr agreeable to the animal creation. An incipient vegetation which
appeared about the end of February has been completely kep in
clieck by the dry cold weather prevailing througloont March.
The soil was never in better working state, clean,
friable by the bare frots friable by the bare frosts of winter. Oat seeding commenced early in March, and is now generally concluded. The early
varieties now under cultivation, combined with the hope of high
prices continuing, bave induced a number of Glo prices continuing, have induced a number of Glen farmers to try
their luck in both autumn and spring Wheat this season, some
on farms where Wheat has not been grown for the last 40 years, \(=\mathrm{mavavavav}\) wawawazaviz
 state of the Prospect of remuneration. Inquiries regarding the
"more than half rotten;" notwithbut onding general answer, viz.,
"he Potatoes continue abundant and almost unsaleable, and a a great part are likely
ultimately to be disposed of as food for cattle; the crop of last season seems everywhere to have been both extensive and
abundant. Turnips, between rotting from the effects of frost abundant. Turnips, between rotting from the effects of frost
and injury from the raids of wild animals, now afford a greatly
reduced amount of sound feeding per acre, and cattle are likely to reduced amount of sound feeding per acre, and cattle are likely to
be put on a still more stinted allowance ere their place is sup-
plied by Grass. The rigid economy that has heen exercised in
the straw barn during the winter is still tound necessary, and
generally nothing that is available as fodder will be lett over, generally nothing that is avaitable as fodder will be left over,
As a consequence of the scarcity of rations cattle markets have
been been glutted with immature animals all winter, and a general
complaint prevails of not paying, and so far that is true. The
farmer who rears and feeds his own stock is paid and well paid,
but the deuler who
 Turnips to the feeder, as, at the utmost, Fd.; 1 ton of Turnips is
therefore worth 7 s. 9 gh., and an acre producing 20 tons worth
7l. 15s., which, taking beef at the extreme price, leaves him
nothing at all to cover expenses and pay for trouble. The average price of Turnips let to dealer's during the past season
has been from 99 . to \(12 s\), per ton, a price which does not afford the
least probability of remuneration. Feeders of sheep are in the
same tix, and from the same caise, viz, too expensive food. The
high price erealised by growers of Turnips, the loss incurred by
the dealers, and the disappointment experienced in the Potato wivewawaw wix waw wawayaw When left at liberty they are soon fond to have arranged them the highest ground, and the nextoldest the next highest. In a
extensive grazing where a complete stock is kept up, by mid
summer they will be foun in four divisions: highest up, the
three order the two-year-olds, below these the one-year-olds, and lowes
of all the lambs, ket by themselves. Where the differentages
meet they mix 10 some extent, but the distinction is very clearl kept up. In the extreme higher range three-year-olds a alone will
be found, and in the extreme of the lowest of the three voluntary midions, one-year-olds alone will e e found, and the certre of the
middle zone will be occupied chiefly, if not exclusively, by two-
year-olds. Besides this general arrangement, each of the larger dequent the same locality, and unless disturbed seldum leave it
during the season, and when driven oft take the firs opportunity
of returning. Private friendships seem alin to exist, two or of returning. Private friendships seenl alin to exist, two and
three will often keep each other company for a whole season, and
sometimes for a whole lifetime, and when accidentally separated sometimes for a whole lifetime, and when accidentally separatei
show evident signs of distress until they are afain united. Distinctions of rank are evidently kept up in the wonlly community,
and in some cases are very obvious , except during the tuping
season, rams will keep company only with rams, and when any まvew wawaze mbumamixim 25 hor some months until they know their boundaries and have thel
habits formed. If that in carefully sttended to they seldom in after life seek to lesve the ground. Sheep purchased after the
first year never settle upon a new uninclosed pasture; they alway and will, if allowed, return from any possible distance. S

VALUABLE IMPROVEMENTS IN MOWING MACHINES.
BYROYAL
LETTERS PATENT.
Under the Patronage of Her Majesty Queen Victoria, and His Majesty the Emperor of the French.

\section*{ALEXANDER SHANKS AND SON, arbroath, forfarshire.-Patentees.}
A. SHANKS AND SON, while soliciting the attention of the Nobility, Gentry, and Gardeners to their at the same time respectfull around flower beds, f\&c., and which has now undergone a trial amply sufficient to enable the Patentees with all confidence to offer it as the cheapest as well as the most efficient and complete machine extant. The improvements effected by the Patentees enable close to the edge of flower-beds; has great facilities for quick turning, cutting and rolling at the same time; the length of the cut can be effectually regulated in a few seconds by merely turning a screw, and being simple as well as complete in its construction the machine can be easily worked and managed by a common labourer. The machines are fitted with due regard to strength and durability, and consequently not at all liable to get ont of order. The work is executed with great rapidity, and in a manner vastly the furf. The Rolling and Mowing Machine is now in common nse at all the Royal Gardens. Windsor, Katiy improve and beautify and Oshorne. A. SHANKS \& SoN have much pleasure in submitting the following from the numerous unsolicited testimoniais received by them in favour of their New Hand Machine:
"Gentlemen, -We must inform you that your Hand Machines give extreme satisfaction; indeed, they are preferred to all others.
From R. K. Goode, Esq., of Heather Hall, Ashby-de-lo-Zouch. be done with the scythe, and at half the expense."

From James James, Esqu, of Samiston, near Jedburgh. "Gentlemen,-I am happy to say that I am much pleased Work. It is, I find, a very great saving of labour, and far sur-
passes the scythe in the manner that it leaves the Grass affer passes the
wig.

Hendergon's favourite PETLNIA for 1856 will be ready fo distribution in May. This excellent variety, they are con fident, will supersede every letunia hitherto grown, either for beldiner purposes or pot culture. Its superior qualities can at be better described than in the words of the able and intelli gent (rardencr, Mr. John Smith, of Peel Hall, Lancashire, from Whom they received it:- I I now send yort the stock of Petuni colour a rich bright scarlet, with clear white eye. It is a profine colour a rich bright scarlet, with clear white eye. it is a promos conspichous bedding plant in the whole of our Flower Gardon, which was filled with the showiest and most dazzlins kinds of flowering plants." In consequence of the plant being a secum rear's seedling, the opportunity of proving its value as a bedding plant has been tried, and far exceeded our expectations.

\author{
1METMEGS POR THE ENSUING WCEI
}

Dors any one remember a hardy herbaceous plant, of no mean beanty, once called Chrysanthemum coccinewm, and afterwards Pyrethrum carneum? -a bright green tafted thing, with rose-coloured flower heads as large as a halfcrown, and leaves not unlike Chamomile, for which reason it is called on the continent Camomille rouge. Some will doubtless call it to mind; while others can find it figured in the 1080th plate of the Botanical Magazine, or
of those pretty ornaments of gardens which the "beddin Verbenas and Pelargoniums and other tion. In the gardens of Belgium and Germany it is still preserved and thus may be readily recovered as we doubt not it will be after we shall have said something of its curious history
It appears that eastern like western nations are tormented by Fleas-the former rather more than the latter, if travellers are to be credited-saving slways the Pyrenean shepherds who are so happy as to sleep in a sheepskin sack, and who appreciate better than any others the meaning of a bag of fleas. Now there are certain plants which possess, we dare hardly say deserve, the reputation of being what an ingenious French writer calls pulicifuges, by which he means repellent of fleas. One of our common road-side plants is called Fleabane (Inula Pulicaria), which same, says Donosns, an old Flemish herbalist, " laid, strowed, or burned in any place driveth away all venomous beasts and killeth gnats and flees."
We are also assured by a certain Prof. Cantraine that the common Oxeye Daisy (Chrysanthemunn Leucanthemum), which whitens the meadows of slovenly farmers in early autumn, is used in Bosnis
and Dalmatia, mixed with the litter of their domestic animals, as a specific against such unpleasant visitors. In fact, the Professor was surprised to find so few fleas considering the dirty habits of the people. Prof. Morren confirmed the fact of the Oxeye Daisy being pulicifugous by his own personal experience at Lięge.
- Hence it may be inferred that fleas haves prejudice against Pulicaria and Leucanthemum, which they manifest by declining to associate with those plants,
Bat it seems that Caucasian, Persian, and But it seems that Caucasian, Persian, and
Koordiwh fleas have a still worse enemy in the beautiful red Pyrethrum to which we referred in the beginning of the present article. M. Ducbartre has brought this to our recollection by announcing in the last number of the Flore des Serres that Persian flea powder, prepared from its flower heads, "not only causes the death of all sorts of disagreeable or injurious insects, but when distilled yields a spirit, of which a small quantity mixed with water may be used with the greatest success in the open air or in greenhouses against greenfly, house flies, \&c., without doing the least injury to plants." We know not whether this is the Poudre mismaque* advertised in the Paris newspapers as effectual for such parposes. What is certain is that a powder of Pyrethrum is very largely use
the nations of Western Asia.
Concerning this powder some curions details are given by Mr. Henry Galeotri in the Journal d' Horticulture de Belgique. He assures us that since its energetic properties have been discovered it is
largely cultivated in various circles and governlargely cultivated in various circles and govern-
ments of Southern Russia. It begins to flower there in Jane and lasts for more than a month. In dry weather the flower heads are hand-plucked, and a good collector will obtain from 30 to 80 lbs of the wild flowers daily. They should be dried in the shade, care being taken to stir them frequently;
this operation takes three or four days. Mr. Galeotri adds that 1000 lbs . weight of fresh flowers are required to produce a single pound of dried ones ; which is evidently some misprint ; for he adds that in Transcaucasia above 40,000 kilos of the powder are manufactured annually for consumption in Russia, which, if the loss by drying were such as he repre-
sents, would require 80 millions of pounds weight sents, would re
of fresh flowers.

Five-and-thirty tons of this flea powder are manufactured annually for Russian use in Transcaucasia alone. Such we are assured by Baron Fölmersahm a Russian noble, \(\dagger\) from whom M. Galeotti seems to have obtained his information, is the fact; and we recommend it to the attention of statisticians, who may possibly be able to calculate the number of bushels of fleas which 35 tons of flea powder will kill. This gentleman adds that more than 20 Fillages in the district of Alexandropol are occuphed with the cultivation of the Red Camomile, whose powder he assures his readers will preserve them from fleas, will kill flies, gnats, and lice, and destroy the maggots which breed in the wounds of domestic animals. When winged creatures are to be dealt with the powder is to be mixed with any substance which they like, such as sugar when house flies are to be killed. M. Fölsersahm is also of opinion that if further experience should demon-
strate the efficacy of the Pyrethrum against other sorts of insects, it would be easy for everybody who has a garden to grow enough of it to kill all the

insects which ravage his crops. We answer for it that if it would only repel the Gooseberry caterpillar gardeners would be satisfied.

The discovery of this drug is said to be quite modern. "An Armenian merchant called Sumbirorr, while travelling in southern Asia, remarked that the inhabitants employed some kind of powder to protect themselves from the stings of insects. Having discovered that the Red Pyrethrum yielded this powder he, on his return to his own country, communicated the secret to his son and taught him how to know the plant. The son, having fallen into bad circumstances, set to work to manufacture
'pulicifugal' powder, and made much money by t; his selling price in 11.18 having been 25 roubles (about \(4 l_{\text {. sterling) the pood, or } 2 s \text {. a pound." }}\)
There is no doubt that the Russian flea powder is the same as that Piré-ot \({ }^{\text {i }}\), of which samples have been sent from Erzroum to the museam at Kew, by our invaluable correspondent Henry H. Calvert, Esq., with the following memorandum :-

Piré-oti (which means Flea-wort) is exported from Koordistan to various parts of Turkey, for the destruction of fleas, which it certainly accomplishes most effectually. It suffices to strew some of the powder inside a bed or over a sofa or carpet to kill or drive the intruders away. The English and French officers made an excellent use of this drug in the Turkish barracks! I have not yet been able to ascertain the plant from which it is obtained; I thought it was a Pulicaria from the similarity of smell of the dried pulverised leaf, but a native tells me that such is not the case, and he described to me a plant with a white flower, yellow disk, and divided leaf, which leads me to think the Pire-oti is
Matricaria or Anthemis. I believe the two samples of Piré-oti are more or less adulterated, for not find better qualities for
We think ourselves able to say with certainty that the Piré-oti is the ground half ripe flower heads of Pyrethrum carneum, for in one of Mr. Calvert's samples there still remained some unground fruit, which we are unable to distinguish from that plant. At all events it seems that the plant spoken of by Messrs. Fölkersahm and Galrotti is that species, if the figures in the Flore des Serres (ix. .t. 917) represent it. As for \(\boldsymbol{P}\). roserem, we have never seen in cultivation; for the plant so called in the Botanical Register, t. 1024, is certainly \(P\). carneum as \(\mathrm{De}_{\mathrm{C}}\) Candolur pointed oat. It is to the latter that those who wish to try experiments with flea powder must have recourse : and we promise them that if it do not kill fleas it will at least prove a very gay ornament of their flower garden.
Ir is evident that the directors of the Crystal Palace intend to occupy themselves seriously with Horticultural exhibitions. The immense quantity of covered space at their disposal gives them facilities unknown elsewhere, and of those facilities they are determined to avail themselves.
We have now before us the plan of the ensuing Horticultural Campaign. There is to be a meeting, lasting for one day only, in May; another is to last
for two snccessive days in June; and a third, extended over three successive days, is announced for September. At these three meetings prizes of the aggregate value of more than \(2350 l\). are offered, and the amount may be increased. Of this large sum about 1650 l . is applied to flowers, 600 l . to fruit and 105\%, to what are called "Amateurs" and Cottagers' classes " in September.
In general the rules are framed apon those of the Horticultural Society, and being the result of long experience, may be expected to work well ; but considering the means at the disposal of the Crystal Palace Company they might be, and probably will
be, improved. Moreover to be effectual they must be strictly enforced.
One thing in particular strikes us as being unskilfully explained. Each exhibitor is furnished with a form in which he is to state in writing, five clear days before the exhibition, "the average diameter of objects to be exhibited." Now among those
objects are cat flowers, Potatoes, Onions, Pine objects are cut flowers, Potatoes, Onions, Pine
Apples and other fruits, and collections of produce. Suples and other fruits, and collections of produce. diameter of Cherries, Plums, Carrots, Dahlias, and Asters. We cannotsuppose that any such information is needed; and we are quite sure it will never be furnished. Something else is evidently intended, and that something should be clearly pointed out, or the managers of the exhibitions will find themselves involved in endless misunderstandings.
There is now en private view, at 14, Newman Street, the bark of a portion of the trunk of \(W_{\text {ellingtonia, stripped off the wood at } 20 \text { feet from }}\) the surface. The specimen is 20 feet in diameter inside the bark, and gives an idea of this stupendous tree, such as no drawing or description can convey.

\section*{New Plants.}
 Picked by Mr. Gordon out of some Epidendrupe Botteri. It by the Horticultural Society from \(\mathrm{Mr}_{5}\) great triangular herbaceous stipules, deep green digitate leaves with oblique sinuously incised oval ahining leaflets, pale beneath and thinly covered there with long rufous hairs which spread over the stalkleta nith collect in a dull purple collar at the apex of the petiole thence straggling sparingly down the petiole petiole, The flowers are bright rose colour, in a close dichotomous hairy panicle. The petals are two to enct flower, male or female, firm and orbicular. The wing of the fruit are nearly semicircular, one being abone twice as large as the other two. This is a pretty addi-
tion to the genus, its firm dark green shining giving variety to the somewhat monotonous folinge of the race.

\section*{168. Thunbergia laurifolia.}

\section*{leté dentatis hasíntrinervits, foribus geminis padunento obsomete dentatis hasi trinervilis, floribus geminis pedunculo como obliquis acutis fauce duplo brevioribus, calyce trunceta intefauci infundibulari}

This is a noble twining stove plant, for our knowledge f which we are indebted to Meser8. James Veitch \& Son. With larger and finer fiowers than Tr. grandifrom 4 fociates smooth, frm, rather shining leaves, rom 4 to inches long. The corolla, which is ultrainches in diameter, although the mans before nearly 2 inches in diameter, although the plant before us is lar from being in vigorous health. It is perfectly distinct leaves. grandiflora in the form and surface of the and its flowers sre considerably fiver. Its native country is uncertain.

ON THE INFLUENCE OF THE STOCK UPON THE GRAFT
The raiser of a new and remarlable variety of the Pear increases it, in the first place, to a limited extent in order to study its nature and productions before he proceeds to propagate it on an extensive scale. But in doing this, as in the case of every other fruit tree, there are certain principles which must be followed to insure success and the future good condition of the variety propagated. One of these principles forms the subject of the present article. It is founded on facts, and supported by observations which every amateur might nucser himself, sither on his own trees of in tho on a considerable, from a weries of observations and the stock has an influence both upon the growth and productions of the graft may be arrived at. To establish the truth of this beyond donbt, several specimens of the same variety grafted upon different kinds of stocks must be grown in different soils and aspecta. Not only does this influence manifest itself in the vigour and hardiness of the tree, but also in the quality of the ruit and the time of its ripening.
rom 25 thorg quarter whare rom 25 to 50 stocks of different kinds are budded with the same variety, it will be seen that after two years growth in the same place some of the stocks will be more vigorous than others of a different origin planted in the same line. Afterwards, when these stocks are ransplanted into other quartery for training, it will be seen that the stocks which grew beat in the beginning continue to take the lead of those of a more delicate constitution, or one having no similarity to that of the graft.
Can we judge of the vigour and hardiness of a new variety propagated on the last-mentioned kind of stocks? When the trees reared on them are transplanted with the view of producing fruit, we find that the latter has neither the form nor the flavour of that borne by vigorous trees of the same variety. In judging from the growth and produce of a tree worked on in regard to the real merits of a new variety. When we examine the rame varieties, worked on the wild Pear stock, on the same species of Pear in a wild states, or on free stocke from seed of a good variety, planted in soil of very different quality-for instance, in a shallow humus soil, with a gravelly subsoil, or in a marly claywe eatablish the same facts as in a light deep soil, or in an alluvial soil enriched with rotten dung, namely, that stocks of a delicate constitution and of a different nature or temperament from that of the graft never produce trees so healthy and well-grown as those reared on may be.
In contradiction to this opinion, it has been asserted that the stock is only a medinm of communication between the earth and the scion, and that the latter, if vignrous, will always predominate over the stock, and impress its characters upon it. This opinion, expressed in too absolute a manner, can only be admitted on the condition that all stocks possess the same amount of vigour and the requisite degree of similarity, and that all the grafts or buds employed shall be exacty alike. That a vigorous variety accommodates itself better to any stock than one does that is delicate or that
is introduced from countries warmer than our own, may be admitted without neserve.
Ia order to make this more intelligible we will give
an example, In my nursery there are two Pear
trees of the variety Alexandrine Hélie (named after trees of the variety Alexandrine Helie (named after
Mdlle. Helie, of Paris, a daughter of one of the corre spondents of the late Van Mons). The variety came spondents orthe late
first into bearing in 1844 , two years after the decease of first into bearing in 1844 , two years after the decease of
Van Mons, and was named as above by his son. We raay add, that ty its wood and the flavour of the fruit it raay add, that by its wood and the flavour of the fruit were planted under the most favourable conditions as negards soil. One of them is of a delicate constitution the other is vigorous. The former yields a small, eracked, and gritty fruit; the latter fine fruit of the
Passe Colmar form, but more round, of an exquisite flavour, ripening in the end of autumn or in winter Thinking they were two different varieties, and being determined to settle that point, I cut off the stem of the delicate tree, and cleft-grafted it, at the height of 6 feet on a stock raised from seed of the Poire d'Amande double. On this the graft soon became as vigorous as the other tree of the same variety. In the fourth year mens of the variety. This result lesds to another con clusion, that a vigorous seedling variety, after having grown for some years on stock which exercises an unfavourable influence upon it, does not, in consequence, lose its essential properties; and that these will be reproduced as soon as the tree is placed under circumtances favourable to their development. The above results are also confirmatory of the influence of the tock upon the graft.

We will adduce another example. Two strong pyramids of the variety Nouveau Poiteau, which forms part and remarkably vigorous branchesand ahoots; and it has produced for four years fine fruit, especially on the apper part. These fruits are fit for use at the end of November, and are of excellent quality. The other pyramid has the branches less upright, and the wood nstead of being of a deep green colour is yellowish brown, the fruits are not so well formed, their quality a the two trees grow in the same kind of soil, the fruit is gathered at the same period, and the rees are both under the same system of management rees are both under the same aystem of management. Joes not this difference arise from the difference of the tocks on which the trees are worked? We are inclined a believe so; for the person from whom the trees were
ontaized employed the same kind of scions from shoots ontained employed the same kind of scions from shoots
on the upper part of the tree, worked on the Pear stock. A: third proof is confirmatory of the iufluence of A ithird proof is confirmatory of the influence of
the stock upon the gratt as regards the period of the stock upon the gratt as regards the period of
tipening. Williams's Bon Chrétien, a well-hnown Pear bears fruit upon the free stock, and also on the Quince which ripen generally in the end of September, or beginning of October. One of my standard trees, planted in the same soil as two pyramids, ylelded fruit of which the successive ripening did not take place til the end of November, and continuing till the end of Decamber. The stock originated from a seed of the Catillac Pear, on which at half-standard height was budded a good winter Pear, and on the stem thus cormed was grafted five years ago the Williams's Bon Chrétien. This difference in the time of the ripening of the fruit, kept in the same fruit room, is it not owing to the influence of the stock? We forgot to mention that the quality of the fruit left nothing to be desired, and that it was even superior in aromatic flavour to the best of the fruit grown on a tree worked on a strong Quince stock.
These facts clearly show that it would be difficult no o acknowledge the influence of the stock upon the raft, and that the latter can only produce fruits of an meliorated character in proportion as it is favourably afluenced by the stock. It is from the analogy of the tock and graft that healthy vigour results; and unless that analogy is sufficiently close, it is impossible, in our climate, to obtain from a tree, cultivated on the Pear stoek, either as a dwarf, half, or tall standard, fruits in all their beauty, and possessing all the essential qualities of the variety. De Jonghe, Brussels.

VEGETABLE PATHOLOGY.-No. CXVII 467. Heliosis* (Sun-burn, sun-spot, dec.).-Under the action the sun has in promoting or destroying the fune tions of plants, but it is no less powerful in producing organic mischief. One instance was mentioned in an earlier part of this series under the article Gumming The sun's rays are sometimes so powerful on the portion of the trunk submitted to their direct or reflected action that the bark bursts, t and the exposure of the wood soon induces further evil. M. De Jonghe has very lately drawn attention to this circumstance, and has shown moreover that fissures in the trunks are sometimes due 0 the same cause, which are often attributed to irost The circumstance has perhaps not attracted the atten tion which is requisite in this country. In extremely
- From rdeopes I am exposed to the sun. Food may be illustrated by the following passage in Sir James
Rond's "Antarctic Voyage," vol. i., p. 225 :-"We have often in Ronds "Antarctic Voyage," vol. i., p. 225 :. "We have often in renta and fissures of many miles extent; especially on the fresh-
pater lakes of those regions, where the ice being perfecty trans-
parents better means of observing the effects produced: a all of thirty or forty degrees of the thenmometer immediately of the crackection, ond attended with frequint in places several inches by the contriction t the exper
not weather, or when there is a very sudden change, it which are peculiarly exposed to injury.
468. Organic mischief frequently takes place, however, in a very different way. In large conservatories, where it is almost impossible to shade effectually from a burning sum, except by painting or the use of rough or ground glass, the rays of light are often so concentrated by the unequal substance of the glass through which they ass, as to induce injury to tender tissues
When the leaves are young that they seem especially susceptible of injury. The destruction of the tissue is 0 complete that no chlorophyll is ever formed in it, and an unsightly blotch appears upon the plants, till the leaves ultimately fall. A close inspection of the course of these blemishes shows plainly that in most cases the injury took place in an early stage of growth. The affection does not seem to depend altogether upon the peculiar kind of glass which may be used, though from the mass of evideace which was adduced in this Journal in 1848, \(\ddagger\) in spite of some conflicting facts, it is pretty ertain from its peculiar mode of manufacture tha heet glass is more apt to produce burning than crown glass. The more perfect the manufacture, and the more uniform the substance of the glass, the less probability there is of injury. In small establishmenta shading is the most evident remedy, but this cannot be earried to excess with safety. The surest remedy appears to be a thorough ventilation. Where this has been secured, from the testimony of Six J. Paxton and Mr. Rivers, no evil has been experienced from the use sheet glass.
469. Similar spots occur frequently upon the tender eaves of plants where water has rested, it is supposed rom the convex drop of water acting as a lens. It is however very doubtful whether this is a true explanation of the case. It is much more probable that some chemical action takes place betw
470. The spots however in this latter case are not always entirely exempt from chlorophyll, but the chlorophyll is oxidized or partially decomposed, so that a pale spot appears surrounded by a variously-coloured ring. Sometimes the centre of the spot is occupied by a few erithecia, filled with spores. The fungus, however, seems ather to be the consequence than the cause. Such spots may possibly be due to the concentrated rays of the sun, ut it is quite as likely that they may arise from chemical ction, or cold. The resemblance of the effects of heat and cold did not escape the notice of Virgil, who conseuently describes cold as burning; \(\$\) or, in other words, erforming the effect of heat. The effect is to destroy itality in one or two cells, in consequence of which the neighbouring tissues are more or less affected, as the surace of a smooth sheet of water into which a pebble has fallen. Certain it is that drops of water freezing on the urface of leaves give rise to such spots, sometimes probably by the action of cold, sometimes by their acting as lenses, at a time when vitality is comparaively low. In some cases, as that of a Cherry the
leaves of which were figured in this Journal, 1849 , . 595 , the whole subjacent spot is destroyed, and the pury does not extend further ; but at length the dead ore separates as the leaves grow, and periorations M.J. B.

\section*{NEW GARDEN FERNS.-No. X.}
21. Grammitis Hewardif, Moore, in Index Filicum, ined. Gymnogramb oracile, Heward, Mag. Nat. Hist. 1838, 457. Leptogramma gracile, J. Smith, Hook. Journ. Bot., iv., 52.
ronds lanceolate pubescent, pinnato-pinnatifid; pinne oblong rudimentary; segments linear bluntizh and sometimes crenate rut the apex, dilated and confluent below, with an open sinus;
sori oblon simple the olog simple, obiquely paraliel, uniserial rizeach
We have adopted the view of Presl, which appears to us the most correct, as to the generic position of those compound Ferns which bear sori such as those

of the present species, that is to say simple oblong naked som. They are very commonly referred to Gymnogramma, or to its offshoot Leptogramms, the genus
irammitis being restricted to a set of small mostly
\(\ddagger\) See especinlly Pp. \(639,605,004\); and the communicationa of
g - penetrsbile frigus adurat.-Virg. Georg. 1, v. 93
simple ironded Ferns, having sori however resembling those of the present plant. This has no doubt arisen from too high a value having been attacbed to the aspect of the plants. Mere external resemblances however, appear to us to be very fallacious tests of generic affinity; and as there is between the sn-called Gymnogrammas now alluded to, an absolute identity in fructification with Grammitis even as limited ; and as more over the latter genus, as originally proposed by Swartz, had something of the comprehensive characte here claimed for it, we have no hesitation in referring to it all that section of Gymnogramma to name of Leptogramma has been applied. Gymno gramma itself, separated by Desvaux from Grammitis, although perhaps sufficiently defined by the character of forked sori, is not, ng was long ago remarked by Sir W. Hooker and Dr. Greville, too distinct from the latter genus, for in many species the simple sori are as numerous or more so than the forked ones. The present subject is a graceful evergreen stove Fern, with an erect caudex, beaxing terminal adherent pale green fronds of about 2 feet in length, lance-shaped, tapering very much below, the lowest pinnse being merely rudimentary; they are also considerably tapered and elongated at the apex. The pinnee are sessile, oblong-lanceolate, attenuate or acaminate at the spex, pinnatifid almost to the rachis, the seamenta falcate The i The fes , the fronds are ferte throughout, the sor formin simple oblong lines of spore cases on the simple veibs, and ranged in an obliquely parallel series on each side the midvein. It is a native of Jamaica, and was introduced ro our gardens about five years since. It was
first noticed and described by Mr. R. Heward, whose name we have taken the opportunity to associat with it \(T . M_{\text {. }}\)

\section*{Home Correspondence.}

The Horticultural Society. - I have anxionsly attended to all that has been published in your Journal reqarding the question of relinquishing the garden of the Horticultural Society. Being a foreigner and no Fellow of the Society, I am perfectly aware that I am as little entitled to meddle with English affairs as the poet in Shakespeare's Julius Cæsar with the grudge of the generals, and that I may perhaps risk a simila treat ment Nevertheless, the lively interest I take in everything concerning 'Horticulture and the thorongl conviction that there are no two institutions in Europe conviction, that there are no two inold be in Lurope, the discontinuance of which would be in a highe degree deplorable for all friends of gardening than the London Horticultural Society in its full and unabated efficiency, and the Qardeners' Chronicle, a journal containing more real practical knowledge than all con tinental garden journals together, are too strong in me, not to give them way and make me bold to offer \(100 t\).
on the same terms as will be fixed for other subscribers on the same terms as will be fixed for other subscribers
of funds to be collected for the conservation of the of funds to be collected for the conservation of the
Chiswick Horticultural Gardens. Sir, I know very well that lo0l. is a trifling sum in England. But I am no man of large pecuniary means, and think a good wil does not fail to find a good place. Directions for payment will be given upon notice. Hein. Behrens, Traveminde, near Lübeck, A pril 9, 1856.
Thuja dolubrata and Cupressus japonica.-In looking over Thunberg's Travels in Japan in 1775-6," which, by the way, is the most interesting acconnt we have yet Fad of the interior of that country, he states that neas his road to thassing over the Fakonie mountaing journey thence ""one of the handsomest and largest trees I saw here was the superb and incomparable Thuja dolabrat which was planted everywhere by the road dolab I Wer this as themest of the Firch trees on accunt of its its Frila, its lo trunk, and its leaves, which are constandy green on the upper and of asiver-white hue on the name of this Conifer in some foreign have seen the name of this Conifer in some foreig. catalogue, but do not recollect ever having seen in English collections. Has it been introduced it [We believe Messars. James Veitch \& Co. possess ini. of his "Travels," "Cedars (Caya, page 164, vol. in. of his reat plent hereabs (Cupressus japonica) grow in great plenty as in most of the provinces; but nowhere perhaps can they be found finer or in greater numbers. These are, indeed, the straightest and tallest of all the Fir-leaved trees. Their trunks run up as straight as a candle, and the wood lasts long without being subject to decay. It is not only made use of for the construction of bridges, ships, boats, and other sorts of wood-work to be kept under water; but of it is made also joiners' wort of all kinds and dimensions, which, when Has this fine tree been introduced into England [Yes; it is Cryptomeria japonica.] In the next page, after describing the Thuja, he says:-J"The very cold, I found here several geners of trees and very cold, I found here several are otherwise inhabitants in Europe, although for the most part they were a new species. Thus I found here two or three kinds of Oak, som Vaccinia, a few Viburna, and trees of the Maple kind, together with a wild sort of Japanese Pear (Pyres
japonica)." We may therefore, I think, hope that Chujadolabrata and Cupressus japonica will flourimh with us. T. R., Herts.
Thermometers.- Persons aequainted with Rutherford's
 mometer is constructed on the same principle, which is
one ihat every gardener ought to understand, We may therefore give the explanation of it which we find ina statitment accompanying a specimen of Negretti and pari of the tube "is filled with perfectly pure spirits wine, in which floats freely a black glass index. A slight ele ration of the thermometer, bulb uppermoset, will where it will remain, puless to the surface of the liquid decrease of temperature the alcohol recedes, taking with alcohol alone ascends in the tubes leaving the end of the index furthest from the bulb indicating the lowest temperature that has taken place during the absence of the perature that has taken place during the absence of the considered a Rutherford's, which we have frequently recommended as the most convenient registering ther mometer for horticultural purposes. It may be of course attached to a scale of wood, metal,
or other material. The peculiarity of the instruor other material. The peculiarity of the instrustrong zinc, apparently cast ; and instead of the divisions and numbers indicating the degrees being marked by indented lines they are raised, the intervals being cut out of the solid metal. The divisions are not of course so fine as in delicate instruments where the utmont precision is required; but they are nevertheless exset enough for all ordinary purposes of Horticulture. They are easily seen, and not liable to penfectly well with one of Newman's first-rate thermometers, and the price is only \(3 s .6 d\). Considering the durable nature of the new instrument in question i must therefore be comsidered cheap, and well sdapted for horticultural purposes. We may be permitted to
point out that the recess for the bulb should not be too point out that the recess for the bulb shpuld not be to contact with the balb.f
Lacebark Trree.- Your correspondent "S." (p. 245), bark tree "stand out in the open border in Dorsetshire and grow prodigiously." The Lace-bank tree, par excellence, and the only one, as far as I lnow, generally lintearia, Lam.) of Jamaica, and there not a mountain plant. We can hardly conceive it to be that, and we shall be thankful if he will give the tree its scientific name, as he has done with the other tender trees which he has found to bear a Doxvetshire climate in the open nir. W.J. \(\boldsymbol{H}\).

Muat Cavendiahi. We generally grow at this place fruit ; dhers are Musas, sare of which are now in size. But in the same batch, and of consse in the same temperature (as they are all in two houses), I have one plant which is greatly superior to all the rest of Cavendishi, although it has received exactly the same And I may at regands pot-room, avil, and water, \&ce. And I may remark that some fruited last summer of the same age as the one to which I now allude, and also thet none of my plants are grown in bottom-heat, i.e., they are not plunged in any heating material. Notwithstanding its superiority and being an older plant than the others, I cannot however perceive any signs of its offering to show fruit, and therefore should it continue growing throughout this season, I am of opinion that it will make magnificent specimen. All that I can say pras is that it is growing most luxuriantly, and that I have seen elsewhere. The following are the exact dimensions of this plant, viz, circumference of stem, 6 inches from the bail, 2 ft .4 in . \(;\) circumference at top of stem, 1 ft .11 in .; height of stem, 5 ft . length of altogether, 10 ft. Are these dimensions unusually large ! John Roberts, Gardenicr to Sir J. Radoliffe, Bavto, The Crystal Palace May Shown-I April 16.
the Crystal Palace Company began to think that when the Crystal Palace Company began to interest itself in the noble science of Horticulture, we should have had all the inmates of our gardens represented in a fair and impartial manner, but I am sorry to eay that one class at least has been onitted, namely, that of regetables. I am- quite sure that giving liberal prizes for vegetables would not only bring a great many more exhibitors together at these meetings, but would in a groat measure sorve to counteract that sameness which is acknow. ledyed to exist in the Horticultural and Bo'anic Societies' trees in Permit me also to add that if growing fruit order of the day, why exclude vegetables? What of well-s rown greater acquisition than halfaloz pots Cucumbers, and a hout of other things. This would be giving what I may tetm middle-class gardeners a chance [Prizes are offered for mege fortunate brethren. \(A_{0} A_{0}\) [Prizes are offered for vegetables in September.] comid probalily obtain a sun-dial from (Dee p. p. 246) Zambra, Hatton Garden, nuless he preferred trying the diploidoseope made by Dent, of 61, Strand, which is mare correct" simple as a sun-din, while it is infinitely gainess. \(\boldsymbol{H}\). \(F\)
Protecting Pruit Treaz-If any of your readors have into blosoom, they will fiad dry hay the best of all pro-
meter registered \(18^{\prime \prime}\) or \(14^{\circ}\) of frost; but I saved my crop of Apricots by throwing a light covering of dry atfered to r-main on the trees night and day withou any injury. T. R., Herts.
Rublits.-Being much troubled with these pes's, which have burrows in a high bank full of tree roote whilst a depth which precludes the possibility of digging, used, I have thought that in a case of this sort some preparation containing arsenic might be employed to ill them; and I am sure if such were to be sold, many would gladly buy it. I throw this out as a suggestion to some of your chemical readers. J. R. Pearson.
Larch Comes (aec p.246). The question raised rewhite and red cones, is answered in this district on the oolite in favour of the red, as seen in the measure ments annexed. I apprehend it will be very difficult Although the trees comparative value of the timber. Although the trees measured give the paim to the red cones, I do not trust much to this, knowing how limited my inquiry has been ; but the fact of the great difference in growth in trees of exactly the same species faveurs the idea of atrong individuality, and induces me to recommend any person thinning Larch to cut out the weaker trees and let the lords of the forest have dominion, without any reference to red or white conis plan than by attempting any scheme that has notbeen worlad out. We cannot grow superior timber of the Fir kind in England, they all grow too fast; even Larch timber-the best-does not equal the foreign Spruce, our worst-principally because the first will grow 1 inch in circumference annually, whilst the latter will not average 3 of an inch, and other thinges the aume ; ne sirength of timber depends on the number of ite anual ringe:-

\section*{Foreign Correspondence.}

GUATEMALA, F article (seo.p. 246) by stating what I found at Jacapa.
On Dec. 25 th, Christras Day, I started about 8 . Fine cloudy morning, and I was glad of it, for the day's ourney was over arid plains, through a forest of Mimosas, Pereskias, and the Organos Cactus. This Epidendrum asperum, which has evidently not spared a single plant, for bardly is there one without this Epiphyte in possession of one of its branches. No field whatever to-day to make any collection. The only last year under the name of Jarge Orange Magnolia It is a fine thing. The tree was abut 12 feet higholia Wpeading; the flawers solitary-not a leaf on the tree. beached Jicaro at 40 'cloek.
moonlight. I did this to accomp morning, wrilian the Callejon of Guaystatoya, a dangerous pass through are obliged to have an escort of troops on account of its vicinity to impassable mountains infested by robbers, who occasionally sally out on stray travellers. I reached this pass about 7 o'clock and found my friends lia meceded me, so alone I entered, and abont \(90^{3}\) clock command assured mo all was quiet and no danger, so loitered for hours as a fine harvest was to be got here.
About 100 yards in the first ravine I found About 100 yards in the first ravine I found a Bejuco, frome species of Paullinia, hanging in gracetul clusters got a most lovely Bignonia called here by the natives Siñac. Presently occurred in great luxuriance and exquisite fragrance Cassalpinia exostems This is Poinciana. clusters was Dipteracanthns Henjei, while the banks of the steep mountain sides shone with white clusters of the very beantiful Corollate Euphorbia of which I hope to send seeds next month when ripe, as I have found it near here; but Mr. Veitch has a living plant I
gave in August last. The Tara Mimosa, sweetly veented, is here also as well as a Tecoma, distinct from velutina; curions Broom-like plant belonging to Asclepiads, very abundant; also a curious tree with bunches of pendulous seeds hanging in clusters like Iponce, with a large, very large, white flower which Callejon is more temperate and may climate in thi about \(68^{\circ}\) more temperate and may be estimated a \(0^{\circ}\) Fahr. was more near the standard.
Brealifasted in Guastayton, and proceeded afterwards hroughout this journey now in a colder much struck patches on the mountain sido here white as mow, there brilliant pink erimson prodnced by overpowering quas: itiee in full blossom of No. 2 and No. 5. Desceuding the Allammadarched but senrehed in vain for seede of from me in Augunt.

Next day I lett Florda, Dec. 27, and though I passe notice was a Hibiecus near phiceniceus. I sent sead of this by last pust in a letter to Mr. Veiteh and Lady thing than this of its kind. You may judge by the driod specimens, which yet retain some of their pristine colour (it is certainly a very handsome thing.) My atten I found it, however, very scarce with few ripe seed. and I have never seen it out of the spot I found it in viz. Sonorate. From this the whole vegetation is littie different, only I found a quantity of Oncidium cebollot with Hexopia crurigera, and here and there a stray Oncidium roseum; the class of trees Nlimosas, or Bras woods. I slept at the village of San Joné, swinging my
hammock as I had done siuce leaving Ysabal, in the corridors of the rancio. Here, however, I felt the cold much, being now nearly on a level with Guateme Leaving San Jobé on the 28 th early in the morning eached Guatemala to a 10 o'clock breakfast, and fong, all well. From San José to Guatemala there are to be round Lycaste croenta, Odontogloasum maculaten Oncidium leucochilum, Brassavola glauca, Epidendram radiatum, aromaticum, selligerum, Skinneri ; Dinema; Brassias Wrayse and verrucosa, Sobratia ma crantha, Notylia bicolor, Comparettia falcata-all thew plants occur on the Oalse, the predominant tree, of which some five species can be counted. I found the Corollate Euphorbia up to within three leagues of this city, and I hope to get seeds for next packet. This lat day's jouxney is through a highly exposed country, and from the circumstance of much ventilation, and, at the same time, sufficient shade, is most abundantly the habitat of Ouchidacese, at all events as to quantity though quality, I must confess, belongs to wamer climes. Eive thousand to eight thousand feet above the level of the sea is sure, at least in this latitude, \(14 \mathrm{~N}_{4}\) bo be the seat of many fine spenies and genera
Nothing particular occurred hern worth mentioning and muc 10 o'clock, and which increased and increased in heaviness with an opaque and most unnatural coloar. About half-past 2 o'clock, however, all conjectures wen set at rest by a shower of fine dust, which was moen painful to the eyes, causing a sneezing like the commence ment of a cold. I went out to a neighbouring mourt from which we could get a view to ascertain where this phenomenon arose; but all was perfect olscurity to the north-western side, proving that from the volcano. De
Fuego, near the Antigua, the cloud took it origin. The made collections of the dust, which lay on the morning of the 10 th full one-eighth of an inch deep in the streets. I went on the 10 ch 10 the Antigua, nine leagues from and deeper and more ponderous as I approagh deopar and deeper and more ponderous as I approached ; is the Antigua I found it a quarter of an inch deep. Mounted a horse and rode out to Duenas, a village Within four miles of the crater's mouth as the arow flies; here I found the scoriæ larger. I send samples of what fell in Guatemala 40 and 50 miles distank, and also of what fell about five miles distant, and I shall order some to be sent of what fell in Xsabal, at least who witnessed the first eruption from the coast deacribe it as most magnificent; a pillar of ashes rose in a perpendicular form for some 500 feet above the pealz, gradually assuming the form of a canopy, and extending till it seemed to have attained an insupportable density, whan into a cloud, covering a to the north and spread ont into a cloud, covering a distance the extent of which
is not at present ascertained. The important thing is not at present ascertained. The important thing hor us to learn here now is what effect such material samples as will enable you to get it analysed, and we wit with much anxiety the result, 38 we observe the mountain is determined to persevere. Immere volumee, happily only of smoke, came from the pinnade, and every moment we may have a repetition. this will, we fear, have a very bad effect on our Cochneal plantations, all now covered with the young insect, the seeding having commenced generally about the 5th, and even yet the plants are covered with the dust The insect however seems to have only atteched itself the side which was protected. A notice of the ricle pray give, and your ideas of its effect on the so You may take into consideration that this fell as th of January, and we shall not have any rais tilt the \(22 d\) or \(23 d\) of May, is \(a_{0}\) in the Antigas and immediat eighbourhood of the voleanoes. Here, fortanately, washed our house tops at least bus the and wo heavy that it liez in colid masest where year a specimen of thm rare Oreophosis Derbyantis which is in the British Museum now; and Mr. Car penter there has two drawings of this volcanofrom the borth, the other from the western side. gave them to the museum as an illustration of the has ever yet been found upon. The peak from which this new eruption took place is the southern one, from which a gentle curl of smoke always arose. Now it Mr. Thos. Wyld, who resides withings were made miles of the volcano, a brother of Mr. W
ton Chambers, Regent Street,
mueh changed in form. It is

Linnean Society, April 15.-The President in the chair. F. Currey, Esq, M.A., was elected a Fellow. Mr. Westwood exhibited and made some remarks on a species of Coccus from Natal, producing wax, and on the
wax obtained from it. The following papers were read: wax obtaned from it. The from Mring papers were read: to G. Bentham, Esq.," giving some accouns of the neighbourhood of Tarapota, in Pern, and of its vegeta-
tion. 2. "Note on Obolaria virginica," by Dr. Asa tion. 2. "Note on Obolaria virginica," by Dr. Asa plant was figured and described, Dr. Gray suggested that it should be referred to the Gentianacere, notwith-
standing a peculiarity in its placentation. It now appears that it ought to be referred there on account of its placentation. Mr. H. J. Clark has noticed that in noost of the Gentians of the United States, the orules oscupy the whole or nearly the whole parieties of the ovary, sometimes in nearly definite rows, but more commonly indefinitely crowded over every part except Bartonia (of Muhlenberg), in the ovary of B. tenella there occur four re-entering angles, which render the cell cruciform, and in this the resemblance to Obolaria is striking. The only anomaly of Obolaria as a true Gentianaceous plant is the imbrication instead of the convolute æstivation of the corolla, but this character is found to be not allogether constant \(\in\) ven in orders where it is considered important, as is evidenced in some species of Mimulus, especially M. ringens and M. moschatus, which almost as frequently present the restivation of the Rhinanthider as that of the Antirrhinidere. 3. A memoir "On several instances of the anomalous development of the raphe in seeds, and the probable causes of such deviations from the usual course of structure, especialy in reference to Stemonurus (Urandra of Thwaites), with some prefatory remarks on that genus," by J. Miers, E

Commentarics on the Productive Resources of Russia.
By M. L. de Tegoborski. In 3 vols, 8 Fo. Yol pp. 483. Longmans.
Of this work the first volume, relating to the internal sourees of wealth in Russia, appeared about a year ago,
and was then noticed at some length in our columus. and was then noticed at some length in our columus.
(See Gardenerg volume now before us the author gives an account of the manufactures and commerce of the Russian empire. It is from works of this description rather than from the loose notes of travellers that anything like a just notion of the internal state of a great country is to be acquired; and dull as statistical tables no doubt are, recourse must be had to them by all who require infurmation of a more solid description than can be obtained from the sweeping conclusions and partial statements in. which popular
ou foreign countries so frequently abound. To all empire with which we are now happily at peace wast further instalment of M. Tegoborski's work will be most welcome. The advocates of protection, if any snch there be, will see the na ural effects of that policy in a country Where almost every interest is protected, and where as a consequence almost every ciass suffers in order that
some other may carry on a lingering trade. Speaking some other may carry on a lingering trade. Speaking English rivalry, the author shows that for 12 or 15 years Russia cottons were selling for at least 60 per
cent., and in many cases 100 per cent. and more, dearer cent., and in many cases 100 per cent. and more, dearer
than similar articles of English manufacture ; for the whole series of 27 jears, from \(1824-50\), the average difference in price was 50 per cent., and the sacrifice nearly 17 millions of roubles per annum. This is not all;'; the manufacturers who have been kept on their legg by the prohibitory system, and have been thus sheltered had no sufficient reason to cxert themselves, and theyo are wholly unable to produce many articles which the popalation would willingly enough consume if they had advocate for free trade; but even in his opinion the advocate for free trade; but even in his opinion the time has arrived when a little more competition from
abromd has become requixite, were it only to stimulate the activity and intelligence of the home manufacturers, and to give them that confidenee in their own atrength and to give them that confidenee in their own strength
which they will never aequire by continuing to lean
upon the cruth of upon the crutch of Cuntom-house grohibition.

Iron affords another striking example of the effect o the mistaken benevolence of protectionist goveraments
In order to keep alive a few ironworks in the eastern and northern extremities of European Russia the importation
of iron is prohibited.
The consequel cannot be better described than in the words of th cannot be better described than in the words of the
author. "We find in the rural buildings of our western author. "We find in the rural buildings of our western
provinces wooden nails taking the place of iron nails provinces wooden nails taking the place of iron nails;
and even amongst easy, if not wealthy proprietors, we and even amongst easy, if not wealthy proprietors, we
find locks and bolts at park gates and garden doors, and sometimes at barn doors too, replaced by wooden latches, and hinges by Osier-rings, by which the doors who use the metal article wrumble the richer brethren Throughout a grent part of the empire farm horses are without shoes, and farm carts without tire; axles are of wood, spades of wond covered with a thin coating of iron, and in many districts the ploughshare itself is of wood with an iron point. Implements of that description were to be seen at the St. Petersburg show of agricultural products in 1850. The partisans of the prohititory system allege that in many provinces the shoeing of the horses and the use of irou in the peasants' carts would, from the quality of the soil, be totally
useless, in fact, rather hurful than ntherwise; but we useless, in fact, rather hurtiul than ntherwise ; but we
think such assertions as these scarcely require a serious refutation."

Tea, which is largely consumed in Russia, is another carefully protected article. The Tea trade between Russia and China is carried on exclusively overland via Kiakhta, and is in the hands of a very limited number of merchants. The frontier town of Kiakhts is situate in the midst of a vast desert at the extremity more than 7000 English miles before it reaches Moscurs which may be considered the centre of its distribution Importation by sea is prohibited in order that the overland trade may be supported, and whilst Tea of a fair quality sells in Loudon for 80 or 90 kopecks the lb., Tea of the same quality costs in Russia 2 or \(2 \frac{1}{2}\) roubles, not withatanding the fact that the duties levied in England and Russia are, or at least were till lately, pretty nearly the same. This enormous difference of price of course leads to smuggling on a most extensive sale, and in spite of the vigilance of the police little else than smuggled Canton Tea is drunk in Poland and the western proviuces of Russia. It used to be thought that the Caravan Tea was of a different and very superior quality to the Canton, and that to this circumstance its higher price was referrible. It appeare, however, that the two sorts come from the same plants and the same plantations, and the differences in quality are referrible to the periods at which the leaves are gathered. The author quences at considerable length the probable conse quences of removing the prohibition on Canton Tea work itself. He will find in the Appendix a very full and interesting account of the trade between Kussia

England appears to be the great customer for Russian produce. From the author's estimates it would seem
that nearly two-thirds of the whole exports find their way into this country. Our space, however, compels us to refrain from making any further extracts. This second volume appears to be in every way equal to the
first. The third and concluding volume will be devoted to the means of interoal communication and the financia resources of the empire.

\section*{Garden Memoranda.}

Honticulfural Soctety's Garder, Chiswick. The young and tender foliage and newly developed blossoms now every where observable out of doors, more especially in the ornamental department of this garden, indicate plainly that spring has at last fairly set in, and at the same time warn us that notwithatanding the cold three to make rapid progress. This therefore is just the time when gardeners who wish to keep their places in good order must beatir themselves to have things neat and trim, and when a little extra labour in keeping Grase ground is best walks, and otherwise beautifying dress ground is assistance may be observed here and there in the gardens now under notice, bont not to a grenter extent than a month's work of sufficient hands might easily rectify. Indeed, considering the reduced state of the labour in all departments here for so many monthrs in succession, it is somewhat surprising to find that so little has been meglected, and that every-
thing looks so thriving and well as it does. servative wall has already received its annual pruning and nailing, and mowing of the Grass in the arboretum now in progress.
In-doors the plants generally are in excellent condition, and masy of them are in foll flower. Ia the curvilinesar stove was one of the best specimens of Rhynchospermum jasminaides we ever remember to with snow-white blossoms, whose frasrace scented the whole house. In another stove was the singular Columnea Schiedeana, with brown spotted flowers, together with Tecoma undulata, an East lidian species, with clusters of bright yellow blossoms net unlike those of an flowers that are produced for several weels is avceest
sion, Thyrsacanthus Schomburgki, which is one of the many varieties of Begonia, among which one of the gayes was Ingrami, a cross-bred raised by Mr. Ingram, of Frogmore. In the greenhouses among Azsieas and gay flowering plants of that description we observed one or
two striking examples of Lachenalia surea, with spikes two striking examples of Lachenalia aures, with spikes
of deep yellow or rather orange coloured flowers, of deep yellow or rather orange coloured flowers, stems as these were, are extremely showy; associated with these were Deutzia gracilis, a mass of snow-white blossoms ; Mr. Fortune's double red and white Chinese Peaches, the benaty of which is not yet sufficiently known; the new large variety of Mignonette, which is quite as sweet ocented as the common kind ; and Tropree omple de Gand, whith with a good sticcession In planis may be had in flower from Uctuber till May. lang conservatory auter the Camellias, ave been aud are still in \(\mu\) reat beauty, perhaps the most striking plants were examples of Salvia geanerifora, which is to the conservatory or greenhouse at this season what the scarlet Geranium is to the parterre in summer, viz. the gayest of the gay. In proper time the cutcings should be put in now, and after they have grown into plants large enough to put out of doors they should be furned out of heir pots and planted where they can stand all the summer, and whem danger from frost is to be apprehended in autumn they should be taken up, potted, placed in a close frame for: a fow days, and when they come into flower infroduced to the conservatory, where they will last in beauty for several weeks at a time. This plant, therefore, is a real acquisitiou wherever it is desirable to have a fine cisplay of thowers at this time of year. The larLe Brugmansias and Tea Roses in the bed of this house will also soon be in full blossom. The beauty of the latter will doubtless be increased by giving them, as has lately been done, some fresh soil enriched with manure, by which they have apparently been improved in vigour, and they are covered with flower-buds. While speaking of Roess we must not omit to notice the Rose-house, in which the plants have thriven most satisfactorily ; they bid fair to be tven finer if possible this season than they were last The young wood which they have pushed is strong and disease. The beds have been forked up and the house altogether made neat and orderly.
In the propagating house, among new plants yet to be proved, ot which there is at present a good many here (clsiefly supplied by Mr. Skinner), we remarked an example of the Magarar Water Yam (Ouviradedra fenestralis). This was growing in loam in a pas of wattr, which is changed once or twice a day by pouring fresh water over it from a rosed watering-pot thus causing the stale water to flow over the sides of the pan, and at the same time giving the skeleton lace-like eaves of this singular plant a good washing. Under hise treatment it appears to be thriving and increaving size
The orchard-house is the next point to which attension may be deservedly directed. This is at present fill of nicely grown trees in pote, mast of them in flower, out some of them with fruit already set. Nuthing could possibly be more interesting or afford greater pleasure o inspect than this house as it appears at present Along the sides of the paths 40 sorts of Strawberries in pots have been placed for trial, and up the rafterd Vines have been trained, mostly new binds also placed there with the view of proving their value. The Peach trees in the glass walls, it may be mentioned, have
biossomed freely, as have also those in Messra Rivers' biossomed freely, as have also those in Messrs Rivers and Kers plotected trellis, and in both places, if an
goes on well, full crops may be expected. Peaches oa the open wall in the orchard department may now be said to have fairly set a full crop. On some parts of this wall they have been, and are still, proteeted with Harrison's netting, of which a high charaeter and a woudcut representation were given in our volume for been purpose for which they are applied perfectly. Owing, dowever, to the budsuot having been previousy excited by mild weather, and the trees having received but this year while they were in blossom, fruit basset well boards. On standard and espalier trees of all kinde there is also this season every appearance of good crops. The espalier trees, maiden plants put in 5 years ago on nowly trenclied grund, have sinco that fime cade part 5 teet in height and 12 feet in length, and promise oproduce good crops. What fruit they bore last year was finer than that from walis. The stakes which support the espaliers are inch syuare yellow Deal, and it may be worth mentioning that the tops of these after hey have rotted off at bottom remain sound and make good talies. They are cut ioto the required lengahs and oplit down diagonally, the name being writton ne new face which is thus formed, With abels of this kind most of the fruit trees in the belta nd eler.
It may be useful to add that among Lettuces the hardy Hammerswith and Brown Cos have again proved hemeelves to be excellent winter sorts; but we alao Morine." This is of a much paler green than the Hammersmith, and is reported to be a valuable varinty

Calendar of Operations.

\section*{(For the ensuing week.)}
plant department.
Conservatory, \&e.-Heat and moisture may now be more liberally supplied to tropical plants. As the
season advances these should be gradually increased but in all cases avoid a high night temperature ; for those plants which are growing most actively \(60^{\circ}\) are suf. ficient at this season. The necessary night temperature must be principally obtained by closing early and so reare required they must not be so strong as to render it necessary to admit currents of cold air for the purpose of keeping the thermometer down. Cold air must, indeed, be used with greater caution now than when the of cold cure in a dormant state, for the admission growth frequently gives it a check, and so injures the tender foliage as to spoil the future appearance of the plant, a cold carrent of this deseription is very is necessary in all plant structures attention to Achimenes, Gloxiniss, and other pummer and autumn flowering plants, according to the directions given in former Calendars. The latest succession of Achimenes to flower late in the autumn should now be placed in heat. Some of those in former successions
may be potted for hanging vases, for which and cupreata are particularly well adapted. Prefer pans or broad shallow pots for their general cultivation, and as they require an abundant supply of moisture as possible are in flower, let the drainage be as efficient without stagnating the soil. Let that useful summer and autumn flowering plant the Fuchsia have its due share of attention by repotting them as they require it in rich compost, and occasionally watering them with liquid manure. Much, however, of their beauty depends on the shape of the plant. Nearly all the varieties o bushes fuchia have a natural tendency to form pyramida into this very a be allowsed to appropriate furm ; only one shoot should perfectly upright and ; this one should be trained periectly upright and the side shoots regulated by atopping any exuberant ones which are outstripping
their neighbours. Violets are everybody's flower, and are therefore well worth a litt'e attention to produce them in first-rate excellence. A frame of light rich compost, consisting of loam and leaf-mould, should be
prepared under the shade of a north wall for their
summer quarters, as in such a situation they may be
hin ravages of the red spider, from the
ans of which they will certainly sufier if exposed to
ahe seorching sun during the hot months. In this frame 4 inches asunder, and kept close till they have begun to farm new roots. The best varieties are the Neapolitan and the Tree Violet.

\section*{Forcing department}

Pineriss. - Whire the houses are glazed with larbe sized equares, and the plants are close up to the glass, a thin shade will be of great service on bright days ; but
only a thin material should be used, for the object in only a thin material should be used, for the object in
ahading should be to break the force of the sun's rays, shading should be to break the force of the sun's rays, not talarken but shut up early in the afternoon, sprinkling the growing stock lightly with the syringe and well loading the atmosphere with moisture by spriukling every a vailable surface. See that plants growing in the open bed
ing properly moist at the root, giving a thorough soakwatering is of no use here. Fruit beginning to surface colour should be afforded ss dry an atmosphere as circumstances will admit. Eudeavour to keep newly-potted stock as much together as possible, in order to be able until the roots strike into the fresh moil. Queens, iatended to furnish the aatamn supply of fruit, should by this time be well established in their fraiting pots ; and ponible attention, for it is easier to retard thase than to induce growing plants to show fruit. Vinkrems Where it is desirable to retard the breaking of the Vines Where it is desirable to retard the breaking of the Vines caenot be removed nor the Vines possible, and the glass sir, they should be let down as far from the glass poasible. We, shading the roof, and giving all the are is any decided advantage in retarding Vines by artificial means after this season. We would almost invariably allow the buds to start at the bidding of the weather tak this time, merely giving all the air possible, an ing thencens to the fruit leeping until next March, prefer furnish a very late a cropply. Weakly or overcropped furnimh a very hate sapply. Weakly or overcropped
Vines ooght to be very carefully examined for red spider, which may be expected to make its appearance spider, which may be expected to make its appearance
on these, particularly if the weal her continues bright, and means should be used to thoroughly eradicate it the woll wash it is perceived. Probsected leaf with a the beat method is to wril wath everyaffected leaf with a sponge, for it is useless oaly serves to keep it in cheek, and when the fruit bagins to colour, and syringing, must be laid aside, it will incrense with fearfal rapidity. Keep the atmoeppere moist, sprinkling the floors, sce., frequently on supplied with water.

Flower carden and gerubberx.
Lose no time in potting off bedding plants, or prickthey are sufficiently rooted, and seedlingy as soon as they will bear handling. As the potted-off plants becotne established they should be hardened off by gradually inuring them to the open air. The hardier inde may be set upon a bed of coal ashes or plunged hoops and thats open air, and protected at night by plunged in old tan, ashes, or some other light pots are much of the labour of watering will be saved, many deaths avoided, and the plants will altogether be in a better state when planting-out season arrives. Patches of some of the more showy of the hardy annuals should now be sown in vacant places which usually exist in the he baceous beds, and in the edges of clumps and borders in the shrubbery. Among the many kinds excellentiy adapted for this purpose we may mention the pins, Sunflowers Poppies of various colours, Lupins, Sunflowers, African and French Marigolds, Goodetias, Erysimum, Clarkia, Gilia, Collinsia, Si lene, Escholtzia, Nemophila, Nolana, \&c., not for
getting the old fsshioned favourite Mignonette. sufficient quantity of cuttings and seedlingg of half hard climbers should now be potted for planting out in May with sucl plants as Cobzaa, Maurandyas, Lophosper mums, Calampelis, Loasia, Tropeoum canariense, \&c. many bare places on the walls and trellises raay be covered and made ornamental which would otherwise be unsightly blemishes on the general appearance of the place.
hardy fruit and kitchen garden
Continue to thin very gradually coverings of Spruce Commence the disbudding of Peaches and Nectarine by removing a portion of the superfluous shoots now and in a week or 10 days go over them, and regula e tage should be taken of a fime morning to sadvanrees with the engine, for the purpose of removing decayed blossoms and destroying the greenfly. The superfluous shoois of Apricots should also be removed, and the remaining shoots carefully examined in search of the green caterpillar, which not only injutes them, but also eats holes in the young fruit, and thereby causes them to gum and grow deformed, or fall off before they are stoned. Wherever these pests are observed, let them be destroyed by gently pressing the leaves ad finger they are lodged between the thumb with clear water from the engine. After the fruit i set more is to be feared from the ravages of the caterpillar than from either frosts or storms. As regards vegetables continue to make periodical sowings of Spinach once a fortnight, and Peas, Beans, and Turnips once in three weeka, successional sowings of all Salads tion paid to pre wing tegularity and proper attention paid oo preservig them from the ravages of birds and pasees, as a deficient supply of these little necesOnions nexcusable after his month. If the crops or Onions, Leeks, Parsnips, Beets, Salsafy, Scorzonera, and Skirret are not yet sown, no time should be lost, and the latest period for sowing the main crop of Beans may now be made in early of tall Kidney early sowing of this useful vegetable not unfrequently gets cut off by late spring frosts, but when this happens the ground should be left undisturbed, as shoots will be produced from beneath the surface which will furnish a crop nearly as soon as the leaders would if they had remained uninjured. The sooner stakes are put to rows of Peas after they are sown the better, as at this season of the year they afford a slight above ground. The remainder of autumn-sown Coy appear and Cauliflowers should now be transplanted on the first favourable opportunity.

Che agricultural (6ajette.
SATURDAY, APRIL 19, 1856.
The Committee appointed in England by the French Government for carrying out the objects of the forthcoming Agricultural Exhibition in Paris, having applied to the various railway companies Stock and Implements to and from the Show, the following companies have most handsomely accorded facilities as follows:-
The Great Northern, London and North-IVestern, Great Western, Eastern Connties, and the companies in alliance with them, to carry live stock free to and from the Show. Implements to pay full fare to the Show, bat free on return.
The return being subject to a proviso that the stock and implements continue the bond fide property
of the exhibitur. These are the same privilemen that have anmurtly been granted to our own Ruyal
Agicultural Society of Fingland at its country metins.
The South Eastern Railway Cumpany has aloo handsumely gianted free transit for live stock both wavs. Half-1ate for implements. Under the same coviditions as to ou nership.

The committee have rectived informstion from-the Mayor of Calais that this port possesses every con-
venience for the disembarkation of animals, \(\& c\). The committee are now obtaining information as to the best mode of shipment, \&c.

The letter on Agricultural Statistics which we publish in another column requires that we should give our readers some additional information on the proceedings of the Highland Suciety, both in reference to statistics of Scotland, and in relation to the subject of agricultural education. On their effort: towards the due representation of Scotland at the forthcoming Paris Exhibition there nieeds no word of praise from us. Whether " S ." be right in speaking of that meeting as something " in the bazaar line" or not, it is in its most useful aspect a great international gathering of great significauce at the present time-and of great influence, all who saw the Exhibition last year will say, not only upon future times, but especially on the experience of agriculturists during them on both sides of the British Channel. The Highland Society appeared to be exhibiting their energetic character in this as in other ways, and we believe that we were night in referring to this as illustrating by contrast the comparative want of energy of the national Society of
England. "S." says that the contrast was the ther way last year, and we are perfectly willing that whatever credit may be due for the appoint ment of a body to represent them at the Paris Show should be given to the English Agricultural Society; but in explanation of the absence of Scottish representatives on that occasion, must be stated that no prizes were offered to Scottish breeds of stock. A place for Scottish breeds was this year claimed by the Highland Society, and on the concession of this claim, though at the eleventh hoar, all that influence which the Society possesses was put forth-with what effect, though bnt two months' notice could be had, will no doubt be seen.
We must now refer to our correspondent's strictures on the proceedings of the Hiyhland Society as regards the agricultural statistics of Scotland.

We cannot admit the correctness of the inference to which his statement leads. He would have us to suppose that the difficulties in Scotland were in reality much like those experienced in England; but had either been overcome by Mr. Hall Maxwele's management, or concealed by him in his report. This is giving him more credit for the success achieved than we believe he would claim, and less for candour than he merits. Our correspondent seems to have forgotten the following passage in the report by Mr. Maxwell :-"I do not mean to affirm that information was always voluntarily tendered, or that there have not been instances where it was refused; an entire absence of opposition was not to be looked for in connection with such a measure, but its extent has been singularly and satisfactorily minute. There were no exact means last year for determining this point, or for ascertaining how many returns of refusals. I have now, however, obtained reports as to this from every district, which enable me to state that in 13 counties, though there may have been instances of neylect and oversight, there was not one of ahsolute refusal or opposition, while in the other 19 counties there were about 60 cases of that character." Now, we are able to affirm that this number includes all the cases of tabulations by obliging neighbours alluded to by "S." He is therefore scarcely justified in stating that while "we know of every shortcoming in Hampshire, we where 60 cases of refusal are actually reported. Mr. Hall Maxwell had the ordinary good taste not to dray forward the name of Mr. Campbell or any other defaulter ; but at the same time he directly reported that the opposition did "comprise the names of landlords whose influence might have been looked for in an opposite direction, but whose example has been fortunately disregarded by their tenants."
One sentence more on the question of agricultural education. A supplementary charter to enable the Highland Society to act in this was applied for in 1849, and a report on their proceedings in that matter was read before the meeting of the Society in that year. The late Lord Anvocate rejected the petition
of the Society in that matter, as " \(S\)." says, "for
 kept out of sis thint has never heen answered.
Now we have in) wirh whatever to keep this repor how we have in) whith whatever to keep this report its "reasons" may exent what influence properly helongs to them. The foiluwing is the

"Anter carefully consisidering the cireumstanke, wif this petition.
along with the exthing charters of the Highland Society, and the

"Londor, 2th Mar, 18 ts.: "
The fact is that although " S. ." hints that this report was kept out of sight and never answered, plainly tolid the public that the Anvocate never had considered the question with them; that there had been no such meetings as he alluded to; that on one occasion only had he seen a deputation, and then refused to convider or discuss the point; that neither then nor in his report had he assigned grounds, and al as conclusive : and their resolution on that suhject then, is being acted on now.
We contend that the three points which we discussed, and which "S." again refers to-thei condact in the collection of the agricultural statistics of Scotland - their energetic effort towards an efficient representation of Scotland at the Paris show-and their con'emplated movement in agricultural education-are all evidence of the life, wistlom, and power of the Highland and Agricultural Society of Scotland. They were referred to at first, only incidentally, in order tha all the force of a contrast might be brought to bea upon the conduct of the English Agicultural Society in these several particulars. There are probably few English farmers who are not ready
admit with us the useful course of conduct by admit with us the useful course of conduct by which our national Agricultural Society has been distinguished ; all we contend for is, that those who guide its proceedings err if they think that by continuing year after year in the same unvarying course, however good originally, they will either fulfill the purposes of a national Agricultural Society or obtain for themselves that support and influence in England which their sister association is rapidly acquiringin the north.
\(W_{E}\) have seen a thermometer invented and manufactured by Messis. Negretti and Zambra, which appears very successfully to unite the qualities cheapness and efficiency. minimum thermometer p
the lowest temperature
chief peculiarity consists in usual way. The frame on which the scale is cast in relief. A minimum thermometer is often useful to the farmer, and an instrument so effici-nt as the one named and costing so little as three shillings and sixpence, deserves to be thas brought under his notice.
Fxception was taken lately by a correspondent to the paragraph upon the demand this spring for Italian Rye-grass seed, which was described at page supply. We were told-"Whoever your informant is he is quite incorrect, although it may be his own opply of foreign seed is limited. No man has any ight to pretend to have such information, which could only be obtained by correspondence with the chief holders, and this has not been the case in this instance.'

The publication of an inaccurate statement in so prominent a place as this is of course exceedingly mischievous, and though placing confidence ir ou original correspondent on this subject, we immediately made inquiry into the accuracy of his inormation. He had himself failed in his attempts to us of sufficient importance to justify our notice of it. We learn, however, that in Scotland the supply of foreign Italian Rye-grass has been fully equal to experience; the trade has been long an illcreasing one, and preparation was therefore made for the still larger demand of the present year. The largest importers of it tell us that though the supply is short in comparizen
that none is to be had.
The war has had a direct influence in causing a
scarcity-a fact which is not werally known. Early
in last season the Cimean commisariat despatched their agents to Lombardy (whence the greater portion of our stocks are obtained) and purchased the rowinc crops. This was done to a very considerable extent. The crops were immediatrly cut, and sent to the Crimea as compres-ed hay for the use of he army. This soon became known to contractors, and the price of seed rose accordingly. The smaller dealers felt unwilling to purchase, being of opinion that the high price would limit the demand, and that hey would run the risk of having their stocks unsold. They refrained from purchasing, and were content to be dependent on the large wholesale dealers for a supply when the season came round. This has now arrived, and the market is in a somewhat excited state from the eagerness to purchase by small dealers for the supply of their customers.

This appears to be the true state of the case-and our advice to purchasers now would be to delay their seed time till after harvest. The new crop will have ripened, and seed from Lombardy of the curren year will have arrived before October, when Italian Rye-grass seed may be sown with perfect safety and suiccess.

\section*{AGRICULTURAL STATISTICS}

A Letrer bearing the same signature as shall be appended to this, which appeared in your Number of comment at p. 218 of your Paper. I have no reason to be dissatisfied with your remarks on the ground of want of courtesy, though you have arrived at and expresned conclusions different from mine. Perhaps you will allow me to resume the subject, and to carry it on somewhat further than eithe
Hoskyns, has yet followed it.
My point of view will not be obscured by the fog of prejudice against agricultural statistics, for I have already stated myself to be an advocate for them; or by the mist of special predilection either for that national society (the Scuttish), which has assumed that one (the Engliah) which has considered such a task as beyond is sphere of authority and usefulness, for 1 am member of coth societies; neither willit be rofession) pealousy of outsille interference, for while I am a tenant
 tarme have been el herelyto clear my way to the positions which I desire to establich. These my way
1 st . That agricultural statistics are a national, not solely, or even chiefly, an agricultural necessity ; hence 2d. That they should be collected through a national agency.
a greatest of all manufactures is the manufacture of a nation's fiod." With this dictum of Montesquien few of your readers will be disposed to quarrel. Wer its present extent record of the one will be the best exposition of the other.) Foreign imports and exports, their amounts, the items of which they are composed, the countries to which they go, from which they are received-all these ted as a matter of daily business by Government officers, are tabuated and puling a monthly, summed up yearly. The shipping arriving ats deparing from, and regise and thns the progress 0 recorded and tabulated; and thas the progras traced declension of any branch of our comme "ce can bublished under governmental authority. Do importers of sugar or cotton, exporters of iron or haberdashery, complain of "interference in their private affairs" because thich not import or export without giving ic a wel after passing through the hands of the local custom officials, will be incorporated with tables that circuiam not only from Cornwall to Caithness, but literally China to Peru." Because one column of these tables tells us that 100 million yards of cotton have been exponted, have we thence any knowlerge how many yards the house of Messrs. Twist and Spun have manizfactured? -when we learn from another that ture millions" worth of "apparel" has been sent abraced does this tell us how many slop articles are from Moses and Sons emporium? In like million did a table tell me that had 300,000 sheep, would thi quarters of Wheat, and howing how many quarters were be any guide to my knowing how man sheep were harvested by Farmer Smith - - iow the least. Why, then, should English farmers and some self-styled "friends" consider the demanding fr of a manifest ( 50 to speak) of the lading of Whest Barley, Potatoes, she p, cattle, \&ce., which their land carrying to maturity and to a market, as unwarno and inquisitorial ? No one w shes to know, and no owe hould know save the officials in the metropolitan omes hould kuch of either individual farmers produce the nation desires to know, and is entisled and dotes mined to know, how much the aggr
of the country the subject from another point of view, But, to view the subjoct import, export, and shippiag

April 19, 1856.\(]\)
THE AGRICULTURAL GAZETTE.
as a mater appertainin- to each trade in its own par-
ticular branch ? Were shipowners to tabulate shipping, West India merchants sugar and rum, cotton brokers cotton? Were there no compulion upon no authorised officer to whom these particulars should be communicated? There are chambers of commercezealons, act : to employ them to collect and tabulate the import, export, and shipping returns would be fully as feasible and as much in accordance with the purposes for which they were organised, as it would be to employ a society originated and chartered for the advancement lection of its statistics. Yet this task has been, as I think unwisely, undertuken by the it appears to be mutter of regret to Mr. Hoskyns and
yourself that the English Society, sticking not merely to the letter but also to the spirit of its charter, con sidered that it neither could nor should concern isse
with a similar task in England. The Irish Society is uadisturbed, because the constabulary do (in a way) collect the statistics of the Green Isle
In times past farmers have never been asked to furnish any statistical information; those holding "land and beeves" were as unnoticed in the tables of ou ver on the national well-being. Commerce was wise however in this respect than statecraft, for the ence direct or indirect over the money market of the whole world. Now, all of a sudden, an outcry is rased because farmers Smith and Brown do not reach per altum to the conclusion which our public men have been centuries in arriving at; because they do not do at somebody's (they do not well know who's) asking, what their commercial brethren are bound to do of customs or excise, that is, disclose as much of their individual doings as will enable the State to make a summation of all the similar duings of the community, Which is the alone purport of statistical inquiry
The nation has a right to this information, for \(t\) will be useful-it cannot well be called inmation, fo eeing how long it has been done without-to the states men who direct the nation's affairs.
These are the grounds on which I rest my advocacy of agricultural statistics ; and it is as a national inquiry, to be conducted by a regulariy constituted departmen of State, that I shall consider it in a future communicathe system, however promptly or correctly it wer worked, could be of direction to agricultarists in their sales. I showed that Mr. Hoskyns' estimate of the loss sustained by "needy sellers" who came early into the market in 1846, might well be "written off" by the gain the same class have made from selling promptly in
1855 ; yet this supposed loss in 1846 is made, even in the speech of the P'resident of the Board of Trade (I should have preferred writing of the Board of Agriculargument to show that farmers would profit in a pecuniary sense by the proposed collection. If they profit, necessarily the remainder of the community
would, to the same extent, lose! I have considered the would, to the same extent, lose! clave considered the portance; and it is as such alone that it is deserving of support. How I would have is worked I shall hereatter discuss in your columns: in the meantime I shall succintly reply to your stristurea on my previous letter.

Itherein broached s supposition- wherewith you are not quite satisfied-that in the Scottish returns here ased. I something of the malion in those places wheroin Scottich forers do congregate without hering jokes as to how little difficulties and obstinacies and joke Hall Maxwell. Now by conxing a recusant ; again by tiring him out with duplicate, triplicate, or quadruphate of the unfilled-up schedules; or if that failed getting an obliging neighbour to tabulate for him, Al his was very good maragement-it has succeededand as Taileyrand said, "nothing succeeds like success :" I believe the totals tabulated are as close as practicnble to the reality. But this judicious management has been veiled rather than thrust into notice. In the English partial inquiry the case has been very differentiy handled ; e. g.-Mr. Hoekyns has named to the world Shropsinire yeoman who tore his solhedule and sent it back endursed-" Such questions!" There is nothing in the Scottish report to show how a west country magnate named Campbell of Monzie-a landowner and sheep farmer of no small reputo-not only refused to fill up a chedule, but came to "the countercheck quarrelsome," and a litte further, in a correspondence with the High and Socity's secretary which I enclore Englishmen, it is notorions, parade the short-comings of their
 people; Scotsmea are more can and quiet; hence we know of every short-cuming in Hampshire,
When adverting to the educational projeet of the Highlend Society, which finds much favour in your eyens, you were must likely unaware that it is but the reproduction of a scheme which had been brought forward several years ago, when an application for a supplementary charter, such as is now pending, was vaferred to the late Lord Rutherford, then Lord whale history illunarates how an energetic body of men, determined upon a neefal counse of action, proceed when
hindered by the letter of their clarter of incor-
poration.] He, it is well known, was not a mere professional brethren but even of the reforning states men of the By him the application was rej-cte kept out of sisht, but has

Again you point out in your ediorial comment how the Scottish Society is to show, or cause to be shown, at the Paris gathering of this year, which I believe should be considered as somewhat in the bazaar line; while you overlook the fact that at the grand exposition of last year English agriculture was fully represented by Suciety a ppeared by no representatives either at Paris or at Carlisle. I shall conclude for the present by saying that while there may be fussiness without p Apress,

\section*{BOYDELL'S TRAC'ION ENGINE} On Wednesday and Friday the 2 d and 4 th inst. the Messrs. Boydell \& Glasier, of the Camden Workz, exhibited their traction engine at various perfornances the former day at the Camden Works, and by advertisement on the latter at Willesden, Midulesex. Both courses of experiments have given general satisfaction, the propositions of ploughing and carting on level hand having been fairly solved. To the truth of this we hope Mr. Mechi, of Tiptree Hall, who was present on both ccasions, will bear his invaluable testimony, and a ed ings of the day. The engine experimented with is one of those ordered by Lord Panmure some time ago for He Crimea, where the endless railway is now in success ful operation on the wheels of gun-carriages; Genera Codrington bearing favourable testimony in his des patches to the importance of the invention, as enabing him to transport heavy siege guns, whe enine is greatly
been done by any other means. The eng been done by any other means. The engine is greatly as will be seen from the following description.
The engine has two cylinders, each \(6 \frac{1}{2}\) inches in diameter, and works with a stroke of 10 inches. Th crank shaft has two cranks, with a fly wheel on one end and a small ten-leaved pinion on the other, which slides out and in of gearing by means of clutchwork. On the carriage wheel, 6 feet in diameter, is a 96 -toothed wheel 5 feet in diameter, into which the above pinion work when on the quick speed. On another shaft working in two slide-boxes are an intermediate 20 -toothed wheel, into which the pinion works when on the slow motion, and a small ten-leaved pinion, which then gears in the 6 -tnothed wheel. This shaft and wheels are lifted out is required for threshing or other purposes, or ehanging rom the one speed to the other. All admired
licity and importance of these improvements.
At it so 2 miles from \(3 \frac{1}{2}\) to \(4 \frac{1}{2}\) miles. It weighs 9 tons, including 2 tons of coal and water. With 60 lbs . of steam per square 360 lbs are lost by extra velocity of the pistons, reducing the force exerted on the crank shaft to 2040 lbs .
Calling this force the motor force, and the force applied o haul carts, ploughs, \&cc., the traction force, we have the former, 2040 lbs . as above, for the quick speed, and 4080 lbs . for the slow speed as applied to the top of the 96 -toothed wheel on the carriage wheel. Of these forces 850 lbs are consumed in friction and propelling the engine forward on level ground accurding to experiments made to ascertain this, so that the forces applied to produce movement are for the quick speed 190 lbs ., acting on a leverage of 5 feet 6 inches from fulcrum or endless rail ; and for the slow
Doubtless theoretical conclusions conld be drawn from Doubless theore to the traction force of the engine the above dation the divided state of opinion on this topic, we shall allow the following experiments to speak for hemselves, hoping by means of a dingram to return to this disputed branch of the subject at some future period.
The Wednesday experiments at the Camden Works were as follows:-
1. Two trenches were dug in the groand, one for ench wheel 1. Two trenches were dug in the giogna, onfient to allow the
about 18 inches in depth, and ingth sumfient
endess railway to rest in the bottom, for the purpose of doing amay with any momentum acquired in descending into the troneh.
 bottom, and then propelled ise foup an 3 . Thiis experiment
the escent being thuu about 1 foit
repaatedly performed, much to the satisfaction of spectuors. Is object is to show what inclination the engine will ascend
tithout exerting any traction force, so as to be able to exer
s. without exerting any traction force, so as to be able to exert
double the force down hill, or in hat haling ap hill gunsor waggons
doun onch time.

The engine nart hanled over soft ground 7 tons of bricks in
 carting on a comparatively level farm.
3 The thind
.
 pleased every time it was made.
4. The last experiment twas
ade. ew inches more than the width of the carriage wheels, turning within a narrow space the wagron, dea, proving the command the
Berrow turna with engineers had over the engine, and
case spoke greatly to their praise.
\begin{tabular}{l} 
Such were the first day's experiments. Results in \\
\hline
\end{tabular} very case were so satisfaciory as an important step has been made towards successful tean cuiture and cartage.
The field experiments at Willesden, Middlesex, on Friday, the thin inst., were not so succeessfully performed as those at Camden Town, owing to the heavy rain which fell during the preceding night, and the want of he necessary precaution to meet such an exigency. The field, for exanup.e, set apart for experimenting in was so wet that it could not be entered, while Samuelson'
digger and Ransome's double plough provided as implements could not advantageously be worked. But although these circumstances were against the experi ments in one sense, they were in their favour in another as they exemplified the action of the endless-railway on a very tenacious clay soil, too wet for horses entering, and the traction force of the engine in such a case.
 or the near made.
The conclusions to be drawn from these experiments are in favour of the application of the endless railway to , more to one wheel only reduces the amount of traction force dis posable for agricultural or other purposes. That engines may be constructed capable of performing all the cartage of a farm and ploughing by direct traction on armparatively level land; that the endless railway does les* harm to the land than horses' feet, and that frames of one-way ploughs must be made 80 as to avoid out castiogs. Whether cirect traction, or inarect by meat of fixed or travelling windlasses, are to make the bed and cheapest worse a probability is that when steam culture and cartage are fairly established, both direct and indirect traction will be required on every farm, waggon and cart wheels of every kind ued for slow motion on land being furnished with endless rail. A general error appears to be to place too much confidence in individual projects, without taking into consideration the vast variety of circumstances. This the beoner the agricultural mind is disabid and appreciate the different links in the chain of pro-gress-the endless railway being obviously one. W. \(\boldsymbol{B}\).

per
 interior of the hnuses of Paris．In phe new eultivation
dressings with liquified farm－yard manures has been deeme a maximum application．Yet to such an application a dres
ing of guano has been superaded，as I complain，whilst liquitin． farmyard manure way in the tanks and might be made further available．I rely upon the evidence of market gardeners as to
an experience of many years for the fertilising power of farmy manures upon the same crops year atler year，and the market
gardeners to whom have shown the reesults obtained or the
Hew liquified manure farms，exceeding，at they have already new liquified manure farmas，exceeding，as they have already
done，all other agricultural production，deeni that production as nowise extraordianary，nor will it be found to be so in relation
to the grean crops growin by market gardeners and I rely upon
the evidenco of the evidence of horticulturitho of practical experience and much
superior production in qually as well as quantity，in asserting
the expediency of far nuore frequent applications of tiquified

 of growth to avoid carrying the vegetation too far into stalk at
lear．
are with horticultural exper ence shoms that when the leat and the plant is out of bloom and the should then be well fed to make the corn plump and heavs，
If the soils are light and the weather dry，the food may be conveyed in the liquid twice a week．It may be conveyed
the roots of the stauding crop by a bose with lateral apertures，
ex explained atp． 165 of the Minutes of information on the applica－
tion of the reeuse of houses and towns to agricultural production
亚 What I wisk then to irmpress is that it it more economical to
have the manure on the land then in the tank； have the manure on the land than in the tank；that all delay
of the application until decomposition has commenced is waste－
ful nad dangerouns；that until the whole of the farm－yard manure is thus used up，any artificial manures are superthuous，and that
they do not yet know how far it w，ll go．The information I have received warrants mee in saying that the best of the
Itquified manure farms may by this course far exceed their present crops．
as to the expenses of the process，Mr．Chadwick stated that Mr Walker had intormed him that he estimated the establishment pipes，and labour of diatribution the new works，steam－engine that was for pipes over double the areat that wourd in future bee be
used；and Mr．Chadwick said that accordiny to the best
 ing 10 dressings during the season．The expense
each additiona dressing of 20 tons of liquine entane
watering with simple water）by steam－power，was stated at abo 1s．under ordinary circumstances．Where gravitation wa from 7s．to \(10 s\) ．per acre under ordinary circumgtances．However principle on beavy as well as light lands by steam as well as b gravictation，which would aford fupther data．It had been stated
as almost invariably this manure was still applied as a dressing，bu fion of plain water，that is to say it was liquified on the ground instead of in the tank，and this was only another and commonly
The discuasion on this subject we must unaroidably postpone till next week
Firench Pines．－Mr．Baskerville Glegg，having found that the Pine seeds he presented to the Council on a former occasion had grown exceedingly well on his解 ing statement respecting the foreign cultivation of that ＂The \(P\)
ima has long been extensively cultirated o ing on the sand hills on the sea coast，as it st one of the few of
the tribe unaffected by the sea breezes．The mode of culture consists in breaking up the surface and sowing about 20 ibs．of
seed to the statute acre．It vegetates quickly and well，and th plants come up very thick，and are thus drawn up very straight． them out．The first use made of them is of support the Vines，
there used as fences for the railwas and put to different purpose ＇till they reach 14 years＇growth；by thit time they parpose a This is done by a strip of the bark being taken off about the width
of the hand and 7 feet high exudes from the wound and is scraped oif as it torms；the fol－
lowing yyar another strip Owing year another strip of the bary is removed，and so on every removed by this time the scre is healed and they begin was tirs again．It is considered that each tree pays abont 5 sous，or 2 th a year；aud this land，whech 20 years a ayo niight have been pur－

The late Rev．William Rham，in his Paper on the agriculture of the Netherlands，published in the second volume of the Society＇s Journal（page 61），gave a drawing and description of the implement referred to y Mrep－Dra
Deep－Draining．－An interesting discussion took place，which we regret that our limits will not allow us to give，on the question of the depth and frequency of drams on ditferent soils．Mr．Beale Browne hoped a lecture would be given before the Society on this sub－ ject．He had found 4 feet the most useful depth．The minimum of depth in any case was considered by the ineeting to be from \(3 \frac{1}{2}\) to 4 feet，and the maximum 5 while very deep drains（as of 10 feet）had been found injurious．Mr．scott，during his extensive experience， had never known Mr．Parkes＇s principles fail if only deperly applied；he had found 4 feet the standath closest eoil．Mr．Slaney had used 4 feet deep and 36 eet apart，with great advantage．
Miscrllaneous Communications．－Count Sparre and Messrs．Burgess and Key transmitted the result of trials （privately made）of their respectin Mise stead，having special reference to the feeding of cattle．
The Council adjourned to the 23d of April at 12 clock，when Prof．Way would deliver a leciure＂On the Progress of Chemical Science，both at Home and Abroad，in reference to Agriculture．＂

\section*{Arbictos．}

On Agricultural Chemistry and the Nature and Fro－ perties of Perurian Guano．By J．C．Nesbit，F．G．S．， F．C．S．，\＆e．Fourth edition．Longman \＆Co
These lectures have been delivered in many parts of the country before farners＇clubs and agricultura meetings．Mr．Nesbit has the power，as he proved last Monday，of commending and explaining his subject to agriculturists in a remarkable degree．And having mixed much with farmers，he is better able than many agricultural chemists to give a practical turn to his suggestions．The book he has now published contains four of his lectures，together with an essay on Peruvia Guano，from which we shall next week mal
We may mention as an illustration of the way in which Mr．Nesbit＇s labours as a lecturer are appreciated by English agriculturists，that，on the conclusion of the discussion at the Central Farmers＇Club on Monday evening last，several gentiemen expressed their desiro to offer to Mr．Nesbit some testimonial of the apprecio－ cion with which they regarded the valuable services be had in this way rendered to agriculture．A subskley Manor，Sussex，the chairman for the year，has con－ sented to act as treasurer to the fund，and Mr．H．Corbet as honorary mecretary．

\section*{Calendar of Operation＊．}

Chssiris，April 9．－The weather for the last eight weeks has been mosst favourable for all field operations，consequenty of cereals is completed，or nearly so on many farms，and Potato state．Wheats generally are looking well，although，as is alway the case at this searon of the year，there are complaints about injury from wireworm，grub，\＆c．．Italian Rye－grass is，very feather is favourable，will be ready to cut for soiliug in a fort weather or three weeks．This is \＆valusble Grass either somu alone for eariy cutting or mixed with Clover and other seeds for pasture；it is a Grass that all cattle are food of，and there is aothing that we have met with that will afford so early and of
pasture for owes and lambs．We luve sean instances of a

 the more advanced stage, withering of the leves, we foand the
roots perfectly healthy and vigorous, but the crown had b brown roots perrectig healhy and vigoroup, but ine crown and sito the
 and also some of the suspected depredators, with \(\mathcal{A}\) few smail
round subseances resembling eggs, found in the tentre of the

 damaged has ocacasioned by the prevalence of foods in the seaious consideration of both landlord and tenant in a dairy winter supply of food from the meadows. Ewes and lanibs appear to be doing well, and farmers are looking forward to earliel
pastures than they have had for the last few years, as nothing pastures than be more favourable to the growth of Grass than the present weather. Milking cowe have been fetching high prices, butt fat and store cattle are condiderably lower than at this time las year, whilst store pigs are as dear as wo ev

An Erbor
Notices to Correspondents.
Edinburgh, writes to us as follows:-"In the Agricultural Edinburgh, Writes to \(u s\) as follows:-"In the Agricultural
Fazette of April 5 th, 1 observe a communication from a corve spondent in Forfarshive referring to an error in the Scottish Agricnltarist's Almanack for 1855. At the 11th page of that
little book a summary is given of a number of experiment little book a sumranary is given of a number of experiment
on the fattening of cattle as coudtucted by Mr. Micullocb, of on the fatteuing of cattle as coudncted by . Thrnip crop as
Auchness. The returns per acre for the Turn
therein stated were taken from a tahle published along with therein stated were taken from a tahle published along with
Mr. M'Culloch's prize essay (see Hightand Society's Transe tions for July 1853, p. 73), and assuming that the figures of such them. As pointed out by your correspondent they are certainly them. As pointed out by your correspondent they are cercainty time I prepared the summary, which it is right to say was submitted to Mr. M"Culloch before being publiked in the
Almanack." Cheshire:
Creshire : W \(B\), Cheshire, wants to know if it is customary for landlord. Many such customs which existed ave gradually dying out.
Experge of Iron on Farms: \(G\) W, Bushey, says, "When I
lived in East Lothian about the year 1850 it was the practice with some farmers to contract with the blacksmith for repairs at the rate of 50 s . a pair of horses per annum. This included the repairs to all gear with the exception of carts, which I think were extra; the farms which particularly came under my notice were strong land with a good proportion of rock. I Bubwhen my blacksmith's bill averaged 5l. a pair per anuum, exclusive of new implements, the soil partly clay and part sand. I can possibly account for the apparent difference in expense if desirable." We should be glad to hear further on this blacksmith in the course of the year.
Irise Moss: J Maguire. Will any one who has used this in pig feeding state what quantities are given per day, and what pro portion of Barley-mealis used win
Lime, SALt, Ayd Ashes: \(J \quad B \quad H\). Your own experience is the
best answer to your question. We should howerer be know how your opinion has been arrived at. It is possible that in a calcareous soil near the shore, lime and salt may be useful, because the mixture generates a caustic alkali, which might quicken and dissolve matters now lying inert in such a soil; but for hurrying Turnips through the season or datiger from ammoniacal superphosphate.
Rennet: Ihderton bays :-"Your correspondent, Feb. 2, 1856, give an excellent recipe for making rennet, headed 'Duary of from him the weight of vells for every 2 gallons? for be say vary greatly in size, for the other day I got three weighin 3 oz. each, and yesterday one weighing \(18 \frac{1}{2} \mathrm{oz}\), all last year's curing. Your correspondent does not state whether the renne should be excluded from the air by tightly covering the ja this the writer of "Diary of a Dairy Farm" informs oar corre spondent that Irish vells vary in weight from 5 to 8 ounce each, therefore in making a quantity of rennet it has neve beea found necessary in his dairy to weigh each vell; taking
one with the other the number of 6 to every 2 gallons has been found a sufficient rule. The Irish vells are always prepare better than the English, and are of a more regular size, but the English are oftentimes saved, and used from motives of economy; these vary ruore in size in consequence of calves being sold st sold in England at a week old as inferior meat to the butcher, and sometimes kept many weeks and fattened whereby the vells would of course be greatly increased in size aells, git. In a small dairy might be well to weigh to vells, as also in a small dairy where it is more difficult to account be used. If there be not an earthen top to the vessel used to hold the rennet, one made of wood to fit the tap has been found to answer as well; it is not necassar the air so entirely as to use any other covering.
Society of Abts Examinations for Candidatrs from IngtiThe fillowing are the rules:-The examinations will commence at 10 A.M. on Tuesday the 10th of June, 1856, at the society's House in the Adelphi. Candidates who propose to offer themselves for examination must give written notice of their
tion to the secretary before the Sist of May, 1856. Each can didate must state the institution to which he belongs, his age, his employment, and by whom employed, and the subjects in Which he desires to be examined. All candidates will be sperling. The examiners define good writiug as a bold hand in which all the letters are distinctly and completely formed. ery candidate will be expected to come prepared in two subjects (not subdivisions of subjects) at least. The examiners in be prepared to recognise knowledge however obtained. The examination will be conducted by written papers and by oral examination. The examiners will award certificates of three classes. First class certificates will be awarded only to a high
degree of excellence. The examiners in agriculture will Mr. James Cuird and Mr. J. C. Morton. The examination will management of live stock as must to some extent, at any rate have been obtained in the field. The text-books by which it will be guided are, Low's Elementary Agziculture (Longmans), Johnston's Agricultural Chemistry (Blackwood), Mr. Pusey's Papers on the Progress of Agricultural Knowledge, in
Enratux: In "A Prizeman's" paper on the Implement Show of the English Agrieultural Soctety, p. 251 , at columa a, line seven from the bottom, for "firm" read "form."

I YNCH'S STAR OF THE WEST CUCUMBER. Lusolicited, Which fully bears out the character given to is by the raise Extract of letter received frome a scientific Horticulturis: "Last year I obtained some seed of Lynck's Star of the West Cuoumber from you, which turned out everycellent flawowr, and in all the general qualities for a 1 rst rate Oucumber. As a first rate bearer \(\bar{F}\) may mestion that in one plant I counted PiPTP-FIGHT PRUTT (after rubbing off eight where they came double), before any of then were more than 6 tncher long, and the plins Packets show fruit at the first joint on ewery side alowind
 FOREIGN SEED URDERS.-Ply mouch is admirOrders. The Subscribers have during the past season forwarded Seeds to Ajgtralia, New Zealamd, Unitid States, Oayada, India, Malta, France, autstria, Portegal, Ioniay Island,
Madeiba, Gambia, Cbina, Cape of Goon Hope, Prnce, Edwakds
 they have supplied some Rubsian Ofyicrrs (lately quartered in Plymouth), to talse to their native country.
The following letter has just been recelved from a Warseryman in Austratid, and is mportant in showing that by careful and proper packing, Seeds will trave
the Tropics too, without injury.
"The case of Seeds you sent me arrived in excellent condition, and they are all growing well, and, from ever", appearance, I should have supposed that they had only travelled a short distance instead of so Many thousands of miles. This \(I\) consider is owing to their leing well
ripened and dried, and cankruly ane PRopral PaCKed. I have to tender my beat thamlas to you for your attention in doing so, for generally seeds that are sent dus to this Colony are destroyed oving to their getling damp on the passage."
Our plan of pacing succeeds admirably, and ani the retters
from our Foreign Correapondents tell the same tale. All Totefo Orders will be attended to with promptness and eare. Williais E. Rexdets \& Co., Foreigh and Export sobd MerCLOWER large Colh EEDS.- We have selected out of an leauliful and showy warieties, each sort distivic in colont, and culculated to produce a fine eject when planted ow in groups or beds in the Flower Garden. The Gamare Stocks, Asters, Larkspurs, and Wallfowers especially are most superb. The Collection will be sent free by pout any address, price \(5 s\).
The following unsolicited testimonials will give some slight "I beg to inferm you that the German Stocks and Asters you sent me last year met my entire satisfaction, for I had m most - Mr. John Eyre, of Long Buckby. "The Wallflower seed you sent me is much finer than eval inches
before; they are grand in the extreme- spikes of flowers 12 ind "The lierman Stocks and Asters have given general satisot colour and compactness Edesbaston, Birmingham.
"The German Stocks came to to your recommendation; they gave me great satisfaction, and many fien
gardens asked me where I had the seed from
Oardener to T. B. Le Beker, Fuq., of Fardoidke Court.
 were really good."-Mr. Chapman, Gardemer, The Heath, Cardl. Wheleler de Son, Seed Growers, Gloucester.

T TYLOR and SON'S REGISTERED GARBEN - SYRINGE.-Small size, for Amateur use, 21s. bash. Large size, for fardeners use, 25s. each Extra for Telescope Tube as showu in engraving for watering water can be deposited in the pot without wetting the leaves, 10 . By a simple arrangement this Syringe is rendered mon effective than any portable Conservatory or Garden Pump eve offered to the public. It is equally adapted for water in a given time as any other Syringe now in use. The arrangement consists in attaching a small floxible suction fub to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means
Syringe is always charged, and the pull-up stroke of the pistnil Syringe is always charged, and the pul-ed, no work to do, the rendered perfectiy easy, it having, indeed, no whis made self supplying, a great saving of labour is effected; and the necessit of stopping to fill the syringe at every discharge being dons a way with, the direction of the water can be mainen, as it is me
length of time. It is perfectly cleanly in in its action, length of time. It is perfectly cleanly in in its action,
possible for any water to get on the nutside of the harrel, whic is a well-known inconvenience attendant on the use of evely other Syringe. Its construction is perfectly simple, and camnoll out of order: the ground in ball vaives and fittings used To be had all other patent Syringes being en Sirely sum in town or country. J. Tylor \& Sons, Manufacturers of Horticultural Apparaus, Warwick Lane, Newgate Street, London. N.B. These prices delivery in the country. \author{
SEASON 1856.
}

\section*{PROGRAMME.}

THE DIRECTORS OF THE CRYSTAL PALACE COMPANY have the honour to announce the following arrangements for the coming Season, commencing on the 1st of May :-
I.-FETE IN CELEBRATION OF THE RETURN OF PEACE
This is intended to be held early in May, and will be on \& scale
great magritude and interest. The details will be fally anof great magnitude and interest. The

\section*{II.-FLOWER SHOWS.}
1. On Satarday the 24 th of May, a Grand Hortcultaral and Floricultural Fete. 2. A Second Grand Flower Show, on Wednesiay the 25 th and Thursday the \(28 t h\) of June.
3. A Fruit and Flower sho
3. A Fruit and Flower Show, including, special Prizees for
Amateurs, on Wednesday, Thurday, and Friday, the 10 th, 11 thi and 12th of September.
III.-GRAND WATER WORKS.

The arranvements for playing the whole of the Grand System
of Water Works being now finally completed, \& Ftee will be held as early in the Summer a a the state of the weather wil permit, at which a display will be made of the while of the
magnificent series of Upper and Lower Fountaing, Cascades, and Watarfills. Of thle Fete due notice will be given.
IV.-ALTERATIONS AND ADDITIONS TO THE PALACE NOW IN PROGRESS.
1. Pioturg Gallisky.- Steps have been taken for the forma-
tion of a Picture Gallery, for the extribition and sale of the works of artists of the modern Schools of England and the Coritinen This Gallery will be situated in the North Wing, hithert occupied by the Raw Produce Department, and wall be open to the
Public eariy in May. The Raw Produce Department itself has been transferred to the Second Gallery on the Garden side of the
Great Transept, a position at once more accessible to the public. Great Transept, a position at once more accessible to the public.
and more convenieat to the Department than that bitherto and mor
2. Naval Meamen. - The Directors have also set on foot the formation of a Naval Museum of All Nations, the object of which is to Mlustrate the progress of Naval Architecture, both in Sailin
and Steam Ships, from the earliest times; the Collection bein so maintained as to represent the actual state of the science as it progresses. The proposels of the Directors have met with the
most favourable consideration in all quarters, and they are ablit most favourable consideration in all quarters, and they are abl
confidently to announce that the Naval Museum will be very confidently to announce that the Naval Museum will be ver
shortly opened. The Museum will occupy the Galleries on the Garden side of the North Transept, and in connection with it will be a Department where Inventions and Manufactures of ail rinds connected with Ships will be ahown.
3. Esameernve Modilis.-In proximity to the Naval Museam there will be also a Collection of Models of Engineering an Architectural W orks, Bridges, Docks, , iaducts, churches, and other struotures, which, although of great interest in themselves
and forming an important branch of Art-manufacture, have, like the models of Ships, been hitherto inaccessible to the public.
4. Coumt of Invemitions.-A Department is alno in formation for the exhibition of Patent Inventions, in which explanations motion where necessary.
5. Cerame Court.-In one of the Industrial Courts, on the
Garden side of the Palace, the Directors intend shortly onening Garden side of the Palace, the Directors intend Bhorty opening tery, from the earliest specinems of antiquity down to the latest
works of the Imprial Manufactory of Sivres, the manufactures of Dresderu and Berlin, and those of Minton, Copeland, Riduway, and others of the English manufacturers. Extetisive prumiss
of assistance have heen promptly given to the Directors by th owners of valuable collections of Pottery and Porceltin. as well
as by manufacturers, and they have every hope that this Court may be opened early in the summer.
6. Exhibitors' Department. - The Directors are happy to announce generally, that, owing to the arran \(\quad\) ements lately mad
for the admission, at a nooinal rent, of articles intended for Ex hibition, almost the whole of the available space is now allotted Whereby the completeness and interest
of the Palace will be much incressed.
7. Colonial Deparmiment.-It gives the Directors great satis faction to be able to announce, that they have made arrange and New Prinswick for the nccupation of space ill the Puluce with exhibitions of the products of those important countries,
under stipulations which ensure the maintenunce of the Colunder stipulations which ensure the maintennnce of the Col-
lections as actual representations of the state of the commerce lections as actual representntions of the state of the
and manufactures of the Colonies from time to time.
8. Enlabgemest of Refrebhmest Rooms.-By an alteration now in progress in the mode of approach to the Palace from the
Railway, alarge additional space will be obtained for Dining Railway, a large additional space will be obtained for Dining
rooms, while the entrance through the Refreshment-rooms hitherto found 80 objectionable - will be entirely avoided Addittonal facilities have also been provided for the Refresb
ment of Third Class Visitors.
9. Machinery in Motion.-The completion of the Water Towers has enabled the Directors to make the final arrangement machinea and tools of the Machinery Department. The Machinery will therefore for the future, be in action at such times as will he
announced in the detailed advertisements. The machinnry nuw in the department comprises a complete set of machinery for spiuning frr the manupacture of Cotton goving, by Walker \& Herekine, and Harrison \& Co.; Lathes, Shaping Machines, Selt-rctiny Plantury
Drilling, and other machinerv, by Whitworth, Muir, Harrison He Mornay Sons; Centrifugal Sugar and Drying Machines, hy Manlove
\& Alliott; Bteam Engines, by Gondfellow, Dnan, Hatterslev \& Co., and others; Marine Engines, with Screw Propeller, by Tod
and M'Gregor; and a grat Fariety of other machines.
 beautitul and exte
shortly announced.
11. Agricultural Machirese.- The Department of Agri.
cultural Machinery and Implements is now in a very complete state. Exachules will be found there of all the machines of the chief manufacturers, and purchases can be made at the same prices as at the warehouses of the makers. The stock is con-
tinually receiving additions, and every means is taken to make it a perfect representation of the state of one of the mont fapporlant branches of modern industry
12. Fancy Faibs. - The Directors are prepared to afford
Accommodation to Benevolent Institutions for bolding Fancy Accommodation to Benevolent Institutions for bolding Fancy
Fairs in the Palace during the season. Arrangements have been alremdy made by the Managers of the Queen Adelaide Naval already made by the sanagers of the Queeu Ade aide Na,

\section*{MESSRS. E. G. HENDERSON \& SON}

W ILL shorly send out their NEW CATALOGUE for the present Season, and beg to inform parties who

 of 500 Stove, 700 Greenhouse, and 1000 Miscellaneous Plante, will render it an interesting guide, pqually suitable for reference or cultivation, discard'n's those that have been found not to answer the expectations of their cultivatnrs, and retaining only such varieties as they can confidently recommend.

\section*{DAHLIA (Dwarf Bedding).}

CRYSIng Dahlia are such that henceforth no garden with but half a dozen flower beds will be complete without it. It fills up
that void so long felt by many, viz., the having a bed compost of large bold flowers, billiant in colour, proftrse bloomers, and it will, therefore, be easily imagined how smaller and more diminutive flowers are lost beside it, added to which, it is one of the easiest plants to preserve througbout the winter, aud can be propagat dill spring by dividing the roots in the same way as an Crystal Palace last season must have been struck with the noble effect the Dahlia there made when pegged down, bat this variety from its dwartness of grow th will not require such care; and those Who have had the pleasure of viewing the noted
gardens of Ted worth House last summer, will be able to appre-
cendent there, Mr
"In colnur thet beantiful dwarf Dahtia is equal to the most glowing scarlet Geranium. The flowers are of a mediam nize, very double and foll to the centre, of very compact habit, its growth averaging one and a half feet, and having fine dark leaves which
contrast admirably with the brilliant colour of the flower. commences flowering early in July throwing op large quantities of flowers together, and remains one perfect sheet of bloom until cut off by the autumn frosts. As a bedding plant it will stand pre-emiuent, and will he found unequalled ror the decoratioun the flower garden during the autimnal months; another and not shine have any effect on its brilliancy.

Plants can be had in May, Be. each.

\section*{Wellington Nursery, St. John's Wood, London.}

SATURDAY, APRIL 26, 1856.
Thert has been before us for some weeksan account of a new gardening material, called Boemead Charcoar. This substance appears to act in the same way as peat charcoal, destroying offensive odours absorbing gaseous matters, and then detaining them till they require to be given up to a crop. The value of Irish Peat Charcoal for such parposes is we suppose universally admitted; but its extravagant price prohibits its emplovment where cost is considered. Last Christmas this material could not be had for less than 90 s. per ton delivered in London, or 50 s . per ton free on board in Dublin, exclusive of sacks, for which \(1 s .9 d\). each was charged. Upon such terms it would be a mere waste of money to use it as a manure.
The substance to which we would now direct attention has heen favourably mentioned in the Journal of Gas-lighting by a correspondent of that paper, igning himself "John Malam," of Holmpton Lodge, and also hy Mr. Hodgson Jones, the civil engineer connected with the Chartered Gas Company's works, Westminster, where we understand it may he obtained at a price not exceeding 1l. a ton. Some of our readers doubtless remember a curions trial at Edinburgh concerning what was then called Torbane coal, half a dozen scientific witnesses on one side asserting that the substance onder lixigation was
coal, and as many ocher scientific wittesses on the
other side asserting that it was not coail. It was a strange business, and did not reduund to the hon.uur of science, for simple-minded people had an opiniou that before the parties went to loggerheads it would have been desirable to define what the word coal really signifies. We forget how the trial ended, nor does it matter. If science was unable to throw light upon the nature of the mineral, the mineral itself is likely to throw no little light upon science; for it now appears that this Torbave mineral, otherwise termed Bouhead coal, is becoming extensively used for gas making.
Mr. Joses informs us that the gas supplied to Buckinghan Palace and the Houses of Parliament is made from this coal, which yields upwards of 14,000 cubic feet perton, with a higher illuminating power than that of any coal gas. It is the residue left in the retorts after the eas is drawn off which
bears the name of Boghead Charcoal.

Dr. Fyfe's analysis is :-
Volatile matter 6 Charcoal
\[
\begin{aligned}
& . . \quad . . \\
& \text { Carbon } \overbrace{9.25=30}^{\text {consisting of }}=3 \text { per cent. } \\
& \text { Ashes } \frac{21.75=30}{31}=-101
\end{aligned}
\]

The ashes consist of 71 per cent. of silica; 21 per cent. remaining consisted of lime, magnesia, alumina, and a minute quantity of iron in union with sulphur. The charcoal has the peculiar property of bleaching vegetable colouring matter; ly filtration Port wine may be so bleached.
In the number of the Journal of Gas-lighting for March 18, Mr. Malam recommends the use of Boghead Charcoal saturated with the ammoniacal liquor or gas water of gas-works as a top-dressing for cereal crops and Grass land, and for Turnips and Mangel Wurzel, by putting it into the rows at the rate of 3 tons an acre. But he does not appear to
have actually tried this mannre on such crops; his opinion of its atility is merely founded upon the following experiments. He found that "Boghead Charcoal, slightly impregnated with the ammoniacal water of gas-works, and mixed with the soil used for greenhouse plants, promotes the healthy and vigorous growth of the latter. Its effects," he says, on Cineraria plants are surprising-several of them measuring nearly 2 feet 10 inches in height: their stems and brauches being stiff and strong, like those of a shrub, and their foliage very large, of a deep green colour. His Hyacinths and Tulips, in the greenhouse, also look remarkably heallhy. His Cinerarias last year were often covered with green fly, and it was necessary frequently to smoke the house with Tobacco or paper, in order to destroy them; this year, however, on only two plants have a few been discovered. Some coal tar which last spring he poured on the surface of his Vine border, and with a fork, caused not only the health and good produce in his Vines, but appeared to have a wonder fal effect in freeing them from the attacks of the red spider. A Peach tree, growing in the same house on the wall, which had sewerage manure given to it, was covered on its leaves, \&c., with red spider, and destroyed by them ; whilst on the leaves
f the Vines there was not a red spider to be found.
From the above facts he is led to infer that carbonaceous manures conduce to the sound healthy growth of certain plants, which are consequently less liable to the attacks of insects and fungi ; and as Boghead Charcoal is a "carbonaceous manure" he concludes it will act in a similar way-a mode of reasoning with which we are not called upon to deal. It is, however, hardly to be doubted that whatever merit mav be possessed by the dear and unattainable Peat Charcoal must be equally possessed by this Boghead Charcoal, a mere refuse material as we have shown. Our own personal experience tells us that no better garden manure need be employed for ordinary purposes than what is formed in the following manner:-Into a dry clay ditch stationed near the house, Grass sweepings and mowings, leaves, spoiled vegetables, weeds, and refuse of all kinds are daily thrown. To these is added also daily the fluid refuse of the chambermaid, which the leaves, \&c., detain. In order to keep down the offensive
odour of the mixture peat charcoal is scattered over it as often as is necessary, and with so good an effect that although the ditch is within a few yards of the drawing-room windows, no unpleasant smell is ever experienced. All this rubhish accumulates until one-half the ditch is full, when it is turned over and cast into the other half; the space thus cleared is gradually refilled as before. By the time the latter is full the first half is well rotted down and ready to be cast out and mixed with woodashes, cinder siftings, and burnt clay. The whole
neechanical texture, and quite as strong as is generally requived. If a ranker (more azotised) manure is wanted, it can be easily formed ou: of the same materials by saturating them with gas water. The only difficulty in this operation is the exorbitant price of peat charcoal. That the cheap Boghear Charcoal will answer the same purpose, we canno doubt, and we trust it will be made the immedia'e sulject of tial by gardenets who live near the works in which the Torbane mineral is used.

We read in the Flore des Serves that Mr. Tittleвасн. of the Royal Botanic Garden, Berlin, has been successful in his attempts at cultivating the hitherto uncultivable parasites called Broosi-Rapes or Orobanches. It appears that he sows the seeds of the annual species at the same time as those of the mlants on which they grow, or soon alter. Thus U. ramosa is sown with Hemp, and O. Picridis with Picris, and so on. As to the perennial species they are sown in autumn, soon after becoming ripe, on the stout roots of the plants they infest. Mr. grow without a plant to feed on, but the seedlings do not arrive at maturity. As to Lathroea squamaria and clandestina they do very well without any artificial support.

We learn from a correspondent in Canada that the American Scientific Association meets at Alhany the third week in August, and proposes to send invitations to 20 or 30 of the leading savants of Europe. They will ask these gentlemen to become their guests, and to accept free passages to America and back. It is also understood that the Grand Trunk Railway of Canada will pass these fisitors over their line free. The "American Scientific Association" is organised like our "Association for the Advancement of Science," and will rise in time for the m-mbers to proceed, if they Hea-e, successively to the Lower Canada Exhibition, of New York ditto, 30 ch Sept. : all on the river St. Lawrence, and easy of access.

The Canada Exhibition will he a good one, and out of it they hope to obtain a Horticultural Garden and a Floral Hall or small Crystal Palace.

169. ECHEVERIA NUDA.
E. foliis in caulem strictum nitum sparsis obovatis apiculatis This addition to the pretty genus Echeveria has been received by the Horticultural Society from Mexico, where in was found on Orizaba by M. Boter. Mas a leaves, and terminated by a leafless spike of flowers, 8 or 9 inches long. They appear to have been crimson, but the dried specimens from which alone they are at present known have only their remains eurrounding the
fruit. The present species is most like E. coccinea fruit. The present species is most like E. coccinea,
which has narrower leaves, and long bracts giving the Which has narrower leaves, and long bracts giving the
170. Notylia albida, Flotzsch. Rchb. f. Xenia, p. 48. A graceful little thing, deliciously scented, and beautifully formed, although its fiowers are no bigger thau Peppercorns, and the whole inflorescence the size of an unlike those of Rodriguezic secunda, its natural comanlike those of hodiguezia secunda, ratere droops a graceful dense raceme of whitish flowers perfumed like a Lily of the Valley. Their back sepal is oblong, convex, pale apricot coloured, very firm and convex, and being in all cases turned to the outside
of the inflorescence the flowers are not unlike littie of the iuflorescence the flowers are not unlike little
fairy shells. The rest of the blossom is transparen fairy shells. The rest of the blossom is transparen white except one little pale apricot spot at the base of each petal. It has appeared rom among the rejecta the other day in the Garden of the Horticultural Society We should scarcely have recognised it as being the plant intended by Dr. Klutzsch had not Professor Reichenbach, jun., obligingly furnished us with a couple of authentic dried flowers of that species. The fresh flower enables us to correct two points in our learned friend's definition. 1, the lower double sepal is by no means bifid, but only emarginate in a very slight degree,
and 2 , the lip is not angular on each side near the and 2, the lip is not angular on each side near the
middle, but is trowel-shaped, with a short unguis like that of N . aromatica.

VEGETABLE PATHOLOGY.-No. CXVIII.
471. Phillilesia* (Leaf-curl, Blister).-Leaves are liable to wind round and curl up from various canses. In some cases the affection is inherent to the peculiar species or variety, as in Salix annularis; in some it is
constitutional, as in the Potato curl ; sometimes it arises simply from the puncture of insects, as in leaves deformed by, the attacks of Acari or Aphides; sometimes it is due to parasitic fungi, as in a very curious affection of Peach leaves arising from the attack of an Ascosporium; sometimes againit accompanies the peculiar hypertrophy of the hairs which is known under the . A name adopted from Ke , derived apparently from funday leaf, and sex.sซou to wind.
name of Erintum; and fina,ly it may arise trum pur-
ticular conditions of temperature, as in a disease which icular conditions of temperature, as in a disease which
is common on Peach leaves, resembling very closely last-mentioned in external aspect, but without any true of fungi,
4i2. The affection which I have now more especiaily in view is this latter of the Peach tree, which is sometimes so prevalent that it is scarcely possible to find a siling'e leaf which is not deformed. I was unable, however, last year to obtain speciziens for examination, and I have been by no means more fortunate during the present season. Currant and Apricot leaves are subject to a similar affection, but iu general not to so great an extent. It has been said that it arises from the rritation produced by Aphides, and the exhaustion of the tissues which compose the lower stratum of the leaf. The under surface, it is supposed, contracts in consequence of this exhaustion while the upper
increases, and consequently the leaf curls inwards. Though however I have been unable to procure specimens of the Peach blister, I have cbtained leaves already nursing a host of Aphides and Acari, but with litule or no thickening of the substance, though there are here and there little bullate swellings, and sometimes complete exhaustion of the cells. It is not indeed to be denied that the presence of aphides will sometimes cause a great alteration of texture. Thave now before me Pear leaves attacked by a large black aphis, which are so altered in appearance that no one could tell to what tree they belong without previous acquaintance with the fact. The leaves are bright red, or red shaded with green, folded back and swollen so as to look like little boats, while the substance is thickened, brittle, and juicy, with a considerable lustre.t The affection in this case is evidently due to the aphis, for there are no insects on any leaves except those which are thus trausformed
473. In the true Peach blister the leaves are in a similar manner altered both in form and substance. The parenchyme of the upper portion of the leaf is greatly increased, and extremely brittle, with a semitransparent aspect, but with a far less developbuilate of chlorophyll than is usual, while the to in the preceding paragraph are of an extremely dark green. It bas been observed frequently that this affection takes place upon sudden depressions of temperature, whether accompanied or not by wet or by strong wind. It is not confined to spring, but may occur in summer or even in autumn. then nce produced the leaves may nurse vast quantities of aphides from their superior succulence; or they may
be attacked by white mildew, but the aphides and fungi sre not therefore to be considered as the efficinnt cause. The malady in severe cases is not confined to the leaves, but the young wood is equally deformed, and when once the evil is set up it is apt to relurn in the succeeding season. The affected twigs should therefore be care-
fully pruned, which is the only remedial measure which seems practicable.
474. Though it is pretty certain that the malady is due to the cause just named, it is not easy to understand why a sudden check should cause an hypertropby of the upper surface of the leaf. In the Apricot the effect is somewhat different : the leaf as in the Peach becomes succulent, and blistered, but the under surface becomes convex, and at the same time the cuticle separates from the parenchyme so as to present little white specks coated with a delicate film. In the Apricot the affection is for the most part comparatively slight, bot Ihave seen instances in which it prevailed to such an xte it that no wood was ripened, and the proper tore was not recovered for three or fuur years. M. J. B.
varieties of american grapes.
How many kinds of Grapes are native to the United States, says Putnam's Magazine, it is impossible to say; Dr. Rafinesque catalogues forty species and one hundred varieties in a little hand-book of ines, pubervations during wich he offers "as the result on miles of travel. Since this was published, much new territory has been added to our great Republic, in some portions of which native Grapes in great variety and profusion are found. Travellers in Texas and California, especiaily, agree ss o the wonderful profusion of Vines noticed in both these States. Upon the Pacific, wine is already manufactured, not in abundance, but still with resals so is an factory, that it will be but ew ears one farmer there raising ninety thousand pounds of Grapes annually; of premiums given for the best wach. of bunches weighing from one to eleven pounds than Their Grapes also are represented to be larger and ours-" large as Plums," and superior in co the skins flavour. The berries, too, are very tender, and two and a half feet from the ground, and the large indolent masses of fruit rest upon the lap of the common mother.
The Grapes of California are called "Catawba," by some "Sweetwater." The berries are vbloug, egg.
 rolled in. An aphis takes possession of ins to thicken; the
face. The substance immediately begis superior development of the uper surface along and the two
side of the midrib soon causes it to project between the folded involute margins so as to conceal the insect between the folds on
lamina. The process is then continued till the border unfores either side, so as to form a little pod or boat which compother protectsurable conditicn of the atmosphere.
shaped, of a light reddish brown colour; in flavour
delicious; they are destitute of pulp, and so tender as delicious; they are destinte of pulp, and so tender as Grapes of any value, they are claimed to be of "foreign origin." History is thus falsified, and our Vines robbed of their birthright. Major Adlum discovered a fitie Grape in the gardens of Mr. Johnson, near Fredericktown, M. Scholl, of Clarisburg. He says, "A German priest,
who saw Mrs. Scholl's Vine in full bearing and when ripe, pronounced it the true Tokay, and says he saw the same kind growing in Tokay, in Hungary !" The Schuylkill Museadel was christened "The Cape "Grape,
as Mr. Longworth says, "to give it reputation "" and to as Mr. Longworth says, "to give it reputation ;" and to
this day, many believe it to be a native of Africa, although its wild hrethren are found in plenty all over Pennsylvania. The Isabella, formerly called the Las peyre Grape, is a native of North Carolina.
To return, however, to the Grapes of California,
There are no vineyards in the immediate vicinity There are no vineyards in the immediate vicinity
of San Francisco, but Vines are caltivated in the valleys, especially to the stuthward of the State; and a strong red wine, resembling claret, is drank by the country people from their own Grapes. At Los Angelos the Catawha in fivour
The "Mustang" and the El Paso are the peculinr Grapes of Texas. The former, which is scarcely ac-
credited as a wiue Grape, is known only at present as a wild Vine, indigenous to the soil which produces i'. The El Paso has, however, been successfully cultivated. The following, from De Bow's "Industrial Resources of the South and West," gives us some account of the is said to produce the best wine in the world:-

The settlement of El Paso extends fom the Falls of the Rio Grande on the north to the Presidio on the
south, a distance of 22 miles, and is one continuous south, a distance of 22 miles, and is one continuous
orchard and garden, embracing within its area an industrious and peaceable populaion ot at least 8000 . This spacious valley is about midway between Santa Fé and
Chihuahua, and is isolated from the other Mexican settlements by the mountains which rise on the east and west, and close into the river on the north and south. The breadth of the valley is about 10 miles. The most important production of this district is Grapes, from which are annually manufactured not less than 200,000
gallons of perhaps the best and richest wine in the world. This wine is worth two dollars per gallon, and constitutes the principal source of revenue to the counclusters and preserved for use during the winter. In this state they are considered superior to the best Raising that are imported from Europe.
The great Mustang Grape of Texas is also said to be a wine Grape of superior quality. It grows in the greatest profusion, without cultivation, in every part of Texas, and uphn all varieties of suil. The wine pro-
duced from it is said to resemble port. Not alone in California and Texas, hut thruaghout the entire Souih, do native Grapes flourish in wonderful luxuriance. The sea islands that fringe the coasts from Norfolk to the
FJorida reefs are embroilered with wild Vines, laden with clusters, as well as the margins of rivers that intersect the mainland. Florida abounds in this delicious fruit ; in Alabama, Grape culture is already exciting
much attention, and the native Grapes produce not only wines of most excellent quality, but also a very great variety of wines. Their cultivation is very easy, and the to the "Alabama Planter," says : "A vineyard at maturity, say the fourth year, would be gond for from 500 to 750 gallons; the seventh, for 1000 gallons; the
Scuppernong much more, to the acre. Among other properties posses-ed by our native Grape, the quantity of viucus matter they possess is most remarkable. A bushel of bunches, as pulled from the Vine, will give 3 gallons of wine, and after undergoing a second opera-
tion, abnut l gallun more of a lighter but most agreeable tion, about I gallinn more of a lighter but most agreeable
wine. It would take a third pressure to produce the wine. It would take a third pressure 10 produce the
meagre drink with which, in part, they feed the peasantry in France who tend the vintage."
The woods of Louisiana, Mississippi, and Arkansas abound in varieties of wild Vines that yield masses of fruitage, renowned as Raccoon, Bear, Bull, Chicken, and Fox Grapes. As yet, we bave had no specimens of
wines of these celebraved brands. Ons of these wild Vines has been successfully cultivated already, under the name of "Bland's Madeira," and doubtless there are many species which, hy the skill of the Vine-dresser, may be made to yield an agreeable variety of wines; in act, our chief dependence must be upon our indigenas ring training. It is well to observe that a Grape may produce a superior wine in one district, and yet be of may disappoint the cultivator in Arkankas, that is no may disappoint the cultivator in Arkankas, that is in reason why it should be rejected
In Georgia, the luscious Muscadines gathered in the wild state produce a wine of considerable merit; as yet no attempt bas lieen made to give them a formal training, except here and there upon a small scale. This is also the case in South Carolina.
North Carolina is the natal noil of the Catawbs, the Herbemont, and the Scuppernong; the first two of these unquestionably owe their reputation to the skill of the cultivators of Ohio and New York, and have only a limited growth in their native State; but Scupperuong
north, to the s.uthern counties on the Cape Frar River,
and extend inland almost to the thot of the Blue Ridue Mountains; while so varions are the qualities of wine produced, that eome kinde command 3 or 4 dollars \(t^{e}\) gallon, and some kinds can be purchased ior 5 ar
dollars a barrel! There are two species of this Grape -the best having a white, silvery slin, with a rech metallic lustre, while the inferior kind bears a sniall, pernong bears from one to four berries on a humeh, and would, in times of war. if lead be scarce, be as valuable, white when ful'y ripe, as the Fox Grape, for bullets. The is a better Grape than the black. But the shin is thick, and the pulp hard ; it will never be valuable as a wine Grape, unless to give to other must aroma and flavour." If for no other purpose thon this-vamely, to mix with the must of less flavoured Grapes, to give charactex
to the wine when made-this Scuppernong will prove t to the wine when made-this Scupperuong will prove t
he most valuable to this country. The "Iraminer" of the Rheingau, a smali-berried Grape, abounding in sac clarum, and full of aroma and strength, is so used to mix with the "Riesling," the favourite Grape of the Rhine, in the production of the first-class German w'ne
And that the cenerality of European wines owe thei excelience to the judicious mixture of various growth and vintages is so well known as scarcely to need re peating here.
But the value of the Scuppernong as a wine Grape has lina. Of all the samples we have tasted, not one was the pure and original fermented juice of the Grape, but in every case more or less sop, histicated with sugar 0 honey, and not unfrequently with whisky or brandy. I
is usual to add 3 lbs . of suyar to 1 gallon of the nust, and then a little distilled spirit of some kind is poured into every barrel of wine "to mai:e it keep." Subjected
to this treatment, the fluid degenerates anto a sort ot vincus grog, and its pecnliar character as a wive is
almost entirely lost. Still, in spite of this, it has an almost entirely lost. Still, in spit
aroma which is somewhat grateful.

That species of the Muscaline called the Scup pernong is a very sweet Grape, but sweet Grapes ar
often wanting in saceharine matter. For a familiar instance, take the Catawba and Isabella Grapes. To the taste the latter is hy far the sweetest fruit ; nevertheless, in making a sparkling wine, the Isabella needs a liberal allowance of sugar, while the Catawba wine requires makes a very accurate distinction betweell the "swe principle" and that which constitutes the "sugar" in fruit. The latter, the saccharine principle, is the element which by the process of fermentation is iransmuted into alcohol or spirit of wine, a certain per centnge of whell is derived directly from the sugur of the Grape. Now, the difference between the sweet element and the sac who illustrates the subject by comparing molasses with refined sugar, the first being much the sweetest of the two to the taste, and yet not comparable to the latter in
its proportion of pure saccharum. And if we may venture upon a theory, we should say "that the reason why sweet Grapes make a wine less sweet than those not so
dulcet to the taste, lies in this: that in the sweet Grape the whole quantity of saccharum is absorbed in the pro duction of alcohol, while in those more abounding in sugar a portion only is transmuted into alcohol; the and sweetening the wine, less or more, as may be."
Now the Scuppernong Grape produces a wine naturally hard and dry, with little to recommend it but its peculiar aroma and flavour, and in consequence the must is artificially sweetened to make it a markelable or saleis practisedity. So long as this method of trearment u:ed can rank with any wines of Europe, except with the spurious productions of Cette, Lisbon, and Marseilles. The difficulty lies in this: our Vine growers are afraid of \(a\) hard, dry wine, because popular taste so far (efpe cially in the rural districts) has been corrupted by the sweetened, sophisticated, ponrest class of imported wines, the sweet malagas and pure-juice ports that are current
in every country town. Pure wholesome wines never are, and never should be, sweet; a glass of syrup is no refreshment for a labourer, and as a daily beverage for anybody, actually repulsive; and as we are looking forward to the period when our wine shall be used as the common drink for all classes of people, we shouid difine now and here that by "w:nes" we mean the pure, fermented juice of the Grape, without the admixture o any thing else uhatsoever
That the Scuppernong is a hard, dry wine, when made without sugar, is doub:less true; but the question is, mellow character win this very wine assume whe is as harsh, austere, and repulsive for th first few years as a blue-nosed Presbyterian elder fresh from the sinod, nor is it drinkatle until age has corrected the acerbity f its temper? but what then? Then it becomes one price superior, in some instances, to any conown wine, price superior, in some instances, the any hilown wine,
with the exception of Imperial Tokay. The real merits with the exception of Mperial Carolina, then, still need
of the native nine of North Cal of the native nine of and
development ; age and proper treatment must in time produce something; for the Scuppernong is unt destitute of delicate aroma-an important quality, indeed. The mode of culture is peculiar ; the Vines (lay ers, not cutings) are planted 100 feet apart; the main branches have space to run 50 feet each way, at right angles from
the centre, before meeting. Each Vine may be repreented thus, + , the laterals interlacing over head and forming a canopy. The branches are never pruned, as
it 1 s said "s the vine would bleed to death." Like the Vines in Lombardy, these are high trained, (haut tige, the lowest branches being 8 feet ahove, and parallel with, he grould. The yield is most abundant, a single Vine often bearing thousands of luuches; the berries small and but few to the bunch. Instances have been cited of single Vines yielding ennugh Grapes to make several barrels of wine, and covering \(2 \frac{1}{1}\) acres of ground.
W'e have seen specimens of native Vines of Virginis of excellent quality. The Catawba there is an abundant rarer, an them it essentially different frim, eem to be peculiarly adapted for the purpose, and the account in the production of Vines. To Virginia we are indebted for many species already popular, among which 's Seedine" " "W and "Cunningham." Here, too, the Bland Grape grows hundantly, under the name of the Virginia Muscadel Grapes are cultivated, some of extraordinary productive ness. One Vine raised by Mr. Willis (near Baltimore) in 1832, yielded 25,000 bunches; and in the following , Mess. C. M. Bromwell and R. Monkland certify "that they counted upon it 54,490 bunches, omitting 3000 more.
That part of the United Slates between the 38 th and 44 th parallels of latitude, so tar, is entitled to the supreMissouri begin culture. Already the wines of hio and Champagne wines here, even at the same prices. Teraces rise above terraces on the hillsides of the Ohio River, and the red bluffs begin to disappear beneath masses of Vive foliage and purple clusters of fruit. In and of last century, an association was formed for the purpose of cultivating the
Grape for wine, and vineyards were established at Spring Mill, under the superintendence of Mr. Peter Legoux. This was a failure : foreign Vizes were tried and abundoued, and finally the wild Grape called Schuylkill Musceadel met with temporary suecess.
In New Jersey the Vine lias been cultivated for many yeurs, especially in the neighbourluod of Burlington.
The soil of some parts of this State is peculiarly adapted or thi of some and we msy hope lieneafter for better wines than those she now furnishes under a variety of foreign brands. Still further west, we find that Indiana, Illinois, and Michigan are improving the hint fiven by Ohio; in fact, Indiana must be recognised as one of the pioneers ; for, in the beginning of this cenmade in the United States was from the Cape or SchuylFill Grape of Vevay, Switzerland county, Indiana.
Missuari alrealy ventures to contest the palm with Ohio. In 185., the viseyards at Hermann embraced ome many other vineyards in the interior of thisthriving State. At the Crystal l'alace Exhibition in New York, six prizes were awarded to Vine-growers of Missouri for samples of superior native wines, buth Isabella and Catawha, still and sparking. The last Grape is ihe In St. Louis, the native wines are rapidly supplanting the foreinn, especially the sparkling kinds; at the hote's there, the majority of wiues on the tables are of home production.
The two principal wine Grapes of Ohio are the Catawhin and the Isabella; the first, however, in the proportion of 20 to 1. Buth are natives of North CaroGrape, in the year 1802, by Colonel Murray and others, in Buncombe county, North Carolina. There it reposed for upwards of 20 years without attracting attention, and so would have remained prolably until now, had not its merits been discovered by Major John Adlum, of hijig Adlum Surveyur-General of Pennsylvannia, was a great cultivator of tlie Grape, and devoted the last years of his ife to the with native Vines he found this one in the garden of a German at Georgetown, and after a fair trial vinced of its value as a wine Grape, that he sent some of the slips to Mr. Longworth, with a lefter, saying, "I have done my country a greater service by introducing this Grape to public notice than 1 would have done if had paid the national debt. \({ }^{3}\) Adlum paid the debt of
wature soun after, but the slips fell into good hands. For nearly 30 years, with patient perseverance, these Grapes were nurtured by Mr. Longwortb, until the hour has arrived when the prophecy of Major Adlum seems certain of fultilment. Thirty years of patient labour ; 3o years of unfaltering faith; 30 years of mans hife, hoary age a long while, my good friend, to look forward toa lons way io lonk back. In the 30 years to come we may have occasion to thank these pioneers-we may may greater results than either of them dreamed of. The Isabella Grape was first introdaced to notice by Mr. George Gibbs, of Brooklyn, Long Island. The slips were brouyht from North Carolina by Mrs. Gibbs, his wife, and the Vine, in compliment to her, was named the "Isabella." Originally, it was called the "Laspeyre Grape," Mr. Bernard Laspeyre, who resided neas Wilmington, North Carolina, having the pareut Viue
from whence these slips were derived. By him it was supposed to be a foreign Grape; but all scientific Writers on Vines in this country assert that the species in a wild state is quite common, and is unquestionably an indyenous production of the United States. Of these two Grapes the best wines are made in Uhio. We may also nention that the "Herbemont," another variefy of favour differeat from the other two.
In comparing the American wines with those of Europe, we must bear in mind that they are distinct in flavour from any or all of them. Sparkling Catawba is not Champague, nor can Isabella be cumpared with ay other wiues known in the world. I- is a peculiarity of these wines that no spurious compound can be made to imitate them, and in purity and delicacy there is no nown wine to equal them
The most expensive wine in Earope, the "Tokay," contains the least anount of alcohol, 9,85 per cent.; but "St "Still Catawbs" ahows a per centage of 950 only, being, in fact, the lowest per centage of spixit to be found in any wine in the world.
One more fact in passing. By the Patent Office Report for the year 1853, it is s:ated that the value o American wines exceeds that of the Tobacco crup:-
" Tobscoo

But not alone for the production of wine are Grapes valuable. The seeds of Grapes are eaten by birds; and in Parme oil, similar to Olive oil, is made from hitable either for cooking or burning in launps. The cuttings of the Vines are always saleable to propagate new viseof the Vines are always saleable to propagate new the yards; the leaves can be used to feed cal is, made from the carbon of the charred stalks of old Vines. And from the carbon of the charred stalks of old vines. And from the lees of wine we get cream of tartar, whic! an Whathy
should be without. And then the Raisins! Whether should be without. Ans the enormous crop of ehildren raised annually in our States, or from some other unknown reason, we import more Raisins than all the rest of the world put together ! So much for the Vine as a source of nationa
prosperity. Year-Book of Agriculture.

\section*{Home Correspondence.}

Oecidental Plane.- Although I head this notice (as a similar one upon a former occasion*) "Oceidental Plane,"
yet now as then my object is to elicit information yet now as then my object is to elicit information
respecting not only that, but also another and more hardy kind but very similar, often known as Platanus acerifulia, yet confounded with and generally called in nurseries, the Occidental Plane. It was scarcely to be expected that in the wiater season the subject should attract much attention; nevertheless it has been dis cussed hy several intelligent contribaicatons, which wil al, ather I trust, tend to pave the way to a more corree knowleige of these trees. Mr. G. D. Vallance, gardener at Furleigh Castle, Bechington, Sumerset, informs me thar a very fine tree, which used to be calied the Virginian Plane, was growing a few years aro in the Court paren Court, Peubrokeshire. If there is good authority for the name, it ought to be the true rlatanus occiden:alis,
and we should be glad to hear about it in the leafing and flowering season, and to receive or dried. Dr, Liudley finds in his herbarium a specimen quite agreeing with the Plane tree which has given rise to this appeal to the Garileners' Cheronicle, from
Cashmere. This might give rise to the impression that it is of Asiatic origin, though I carnot at all subscribe to the opinion of Aiton, Mr. Loudon, and others, who rank it as a variety of P . orientalis, from which i differs tuto coel, -hahit, ramification, foliage, constitutino, sce. I may observe that my own specimens of anil that is aclinowledsed to be culciva:ed. Yout correspundent "T. R., Herts," (Grurdeners' Chronicle, 1856. Feb. 9, p. 35 c) proves himself to be fam inar with our P. aceritolia, and he considers it quite distinct both from the well-known Orienta and Ocendental Plane, and he will, it is to be hoped, favour your readers with further remarks and distinguishing characters in the summer.
"C. W. Strickland" (Gardeners' Chrowicle, Feb. 16, 1856, p. 102 a) "has a strony impression that the great trees In the phain of Buyukdere, on the Busphorus, have lesves like those grown about London, and not the deeply cut ones of the Oriental Plane." This is answered by Mr.
Bentham in the following number of the G\&, deners Bentham in the following numuer of the Gre arners rees of Buybldere, as well as those that I observed in the neiphbourhood of Constantinople, all evidently planted, belong to the common easterin form of the Oriental, with leaves much deeper cut than either the tender Plane that we suppose to be the true occidentalis or the one commonly known in England and France nuder the name of acerifolia." The Viscount Downe frardeners the above statement of Mr. Bentham, and goes on to compare the cultivation of Platanus occidentalis on to compare the cultivation of Platanus oceidentalis
with that of P. orientalis in Nurth Yorkshire, saying that "Platanus occidentalis is the quecker grower of the two." Does he not mean P. acerifolia? "J. B. Whiting, Deepdene Gardens," (Gurdeners' Chvonicle,
March 1, 18.56 , p. 134 t , tellis of some very fiue March 1, 18.56 , p. 134 b), tellis of some very fue
Plane trees at Chart Park, Derpdene (apparently those referred to by Loudon as necidentalis), which he has

See Gardenere' Ohronicie for Feb. 2, 1856, P. 69 c
always understood to be P. orientalis, and which agree
with the descriptijns of P. orientalis given in Loudon's "Arboretum Britannicum"" He given in Loudon's "Arboretum Britannicum." He adds that he has never seen a large tree of true nccidentalis (the
occidentalis. Does he mean tender kind), or what we are now considering acerifolia "Dr. Klotzsch" has favoured us (Gardeners' Chronicle, March 29,1856, p. 213 c ) with a catalogue of the species of Platanus in the Royal Herbarium, Berlin, where the 5th kind stands as ". P' orientalis L., var. acerifolia, Aitou \(\dagger\) (P. acerifulia, Willd.) from Spain, by Ruiz." But may this not be a cultivated specimen from the Botanic Garden of Madrid? Nowhere, as far as I can find, is any Platanus recorded as a native of Spain. Yet not only is there another var. of P. orientalis called hispanica (the third Plane in Dr. Klotzselh's list) here said to be from Spain, gathered by Kuiz; but P. acerifolia itself (though said by Aiton to be a native of the Levant) is called, in the 2 d ed. of Hort. Kew., Spanish Plane Tree. Indeed the more we endeavour to disPlaver the origin of this tree ( P . acerifolia), the \(\underline{e}\) reater seems the amount of evidence in favour of its being a native of the Old World; even Tournefort (in whom the native of the old World; even name originated-supposing ours to be identical with his) calls it "Platanus orientalis Aceris folio." The huthor of the botanical notes to Hunter's edition of Evelyn's Sylva (probably. Ph. Mille-r), 2 ( ed. part ii. P. \(54-55\), has two species of Plane (P. orientalis
and P. occidentalis), and "two vars, the one the and P. occidentalis), and "two vars, the one the
Spanish Plane tree the other the Maple-leaved Plane ;" but makes no allusion to their native country, nor doe he say of which species they are to be considered varieties. There is an editorial remark in the Gardeners' Chronicle following C. W. Strickland's queries, common park Plane (R. acerifolia) was a Greels plant. But this was merely an obiter dictum." A nother country I now find claims the honour of P. acerifolis, as there indigenous, viz., Italy. Tenore, in his Flora Neapolitana, v. 5, p. 265 , included three species:-P. orieutalis,
plant from Asia ; P. acerifolia + W. "Native place ; plaint fron Asia ; \(\mathrm{P}^{\text {. acerifolia }}+\mathrm{W}\). "Native place ;
it grows solitary in the woods of Abruzzo. I have seen it growing abundantly along the road of the Acqua Santa, near Ascoli. The tree is of lofty stature and ready grow th ;" and "Platanus cuneata, W." (said by Willdenow to be na ive of the Levant.) "Native place; this is the common tree with us, and grows along the banks of rivers in Calabria. A tree of low stature and slow growth."
My herbarium specimens of this show that P. orienIy herbarium specimens of this show that P. orien-
alis is very liable to vary with cuneate leaves; and alis is very liable to vary with cuneate leaves; and indeed it is this form of leaf which is figured or true
orientalis in Watson's Dendrologis Britannica, Tab. 01. Tenore's remarks on the above three trees are as ollows: "When they are seen together, and have been cultivated for several years, they are recognisable without any difficulty. We have them in the same part of the gardens, and they preserve uualterably their \(P\) cuneats I felter. The one last planted be a tree whether it might not be referrible to one or other of the first two species; but \(I\) was soon convinced of the contrary. It remained of much lower stature, and all its parts, the leaves especially, continued to be smaller. This latter characteristic has satisfied me that the tree which came from the royal garden of Caserta, under the name of P. hispanica, and which we had kept for 20 years in our arboretum side by side with P. aceri-
\(\mathrm{f}_{0}\) ia and \(P\). orientalis, ought to be referred to \(P\). uneata. Taken together with the stature of the tree and with its dimensions. the characters of the foliage erve to discriminate it from the two before-mentioned species, the leaves being cut like those of Platanus rientalis, and thereby entirely dissinilar from those of P. acerifolia, especially by having their three lobes combined in a conical form, so that by this peculiarity slone hey are abundantly distinguishable from Platanus orien voods of Abruzzo may be considered wild, which is very doubtful, I should fear that the abundant ones growing along the road of the Aequa Santa cannot possibly be so. I think however we have arrived at the conclusion that P . acerifolia, though nearest in ontanical characters to P. occidentalis, is nevertheless quite distinet, readily distinguished by those who have paid attention to it, and not introduced from any part of the New World : that its actual locality is not yet ascer
tained, and that we want a clearly defined specific character derived from flowers and fruit as well as the foliage, and taken from the living plant ; and further we want to know if there are any old trees of true P . occidentalis in the country. Our own rich herbarium of native species of Platanus contains P. orientalis, L. (and the only one of the Old World), P. occidentalis, and the fertile heals of flowers being solitary), \(P\) mexicana, Moricaud (perhaps ton near P. occidentalis), and P. racemosus of Nuttall (P. californica, Benth.) W. J. Booker.

Remarkable Plunts now in flower at Enville.-There is now in bloom here a plant of Medinilla magnifica of the following dimensions :--Height 5 feet, dianueter 6 feet, number of bunches of blossom, 97 . The plant, which has
been here upwards of two years, is in all respects a been here upwards of two years, is in all respects a

fruit.
magnificent object, and perfectly unique in appearance. There is also now in flower at this place a fune specimen of apitrobium Pierardi var. latifutiuin. The number length, and few less than 3 feet, each well furnished with fluwers. We have likewise a fine plant of Rhodo with fluwers. and 3 feet through ; this is, I should think, one of the most beautiful plants of the sort. The flowers are most beautiful plants of the sort. The flowers are top. I have had this Rhododendron in my possestion five years, and would recommend every one to grow it who cares anything about early spring flowering plants. S. Eaton, April 23.

Sundials.-These are made as cheaply of stone where stone exists as of that nasty cement. Any circular plan is cheap, as it can be turued on a lathe. They can be

bought very cheap and good at the Box station of the Great Western Railway. A common baluster of stout proportions, with a square base and something square above to receive the dial, will cost a very few pounds. I send you a tracing, which will enable you to judge of it from general appearance. Samerset.
Cherries Preserved by Burial.-On Monday last I employed a man to excavate a portion of an old Strawerry bed, in order for 3 or 4 feet cound, black, fleshy, He found several Cherries, plump, retaining How long they may have lain there I know not How long they may have lain there I know not. Certainly the ground has not been disturbed in occupa years, the period during which I have been in occupa-
tion. I intend trying whether they yet retain the cion. I intend trying whether they yet retain yon power of germination, and beg to enclose two which you
may perhaps think it worth while to submit to a similar test. They appear to belong to the variety termed carvons. C. A.Johns, Callipers, Her/s. [The specimen sent us quite answered to the above description.]

\section*{Sarieties.}

Horticultural, April 22.-Sir Philip de Malpaa Grey Egertou, Bart., M.P., in the chair. Several remarkably interesting plants were exhibited on tbiz an exasion. Fureroust ly in flower, of the new Sikkim an example, beauti'ully in flower, of lie new species, Rhododendron campylocarpum, a she shy, and being pale yellow ore somewhat unusual in coluur. In this pale yellow are somewhat unusual greenhouse and was instance, the plant was from a greenhouse asse it was nentioned, however, that the same species had blos nentioned, however, air at Lord Burlington's place at Holkar, in Lancashire. It may, theretore, turn out to be sufficiently hardy for out-door decoration. Messars Standish and Nuble, from whom this plant came, als sent Gaultheria furens, a hardy evergreen from unlike having much resemblance to an Andromeds; but undit. that genus was stated to bear a fleshy ornamenta Mrars. Of Sikkim, Bhotan, and other Rhododeudrons, Mess E. G. Henderson furnished an interesting collecioum consisting of Hookeri, Nuttalli, Boothi, leptocarpumd Javanicum, of which there are two varieties, which Edgeworthi. It is rep in this country, has flowers has not yet blossomed even \(R\). Dalhousixe itself. Its foliage is also large and handsome. Sut be hardy, therefore, as it is said to be, it cat not fail to be a valuable acquisition. his has lately
R. Hookeri is also a Bhotan epecies ; this
flowered with Mr. Fairie, of Liverpool. Its foliage is less striking than that of the last-named kind ; but its blossoms though small are showy, owing to the great brilliancy of their colour, which is purplish crim son. R. Boothi has not flowered yet The creamcoloured blossoms of R. Edgeworthi, we need scarcely
say, are remarkable for their fragrance. As regards the plant itself, it was stated never to attain a large size even in Sikkim. The same firm also contributed two hybrid Azaleas, and one or two other plants. From Messrs. Veitch \& Son, of Exeter and Chelsea, came the
charming R. jasminiflorum, a tender kind with long charming R. jasminiflorum, a tender kind with long tubular blossoms, a form of flower which it was mentioned that Rhododendrons take more or less as they
the approach the eastward specimens of a Fuchsia sent from Guatemala by Mr. Skinner ; it belonged to that class of this genue type; likewise Dodecatheon integrifolium, a new kind somewhat like D. Meadia, but different in foliage Primula mollis, a new sort, the pink flowers of which are produced in successive tiers or whorls all up the stem Lee communicated various variegated Geraniums; the Ribes called Beatoni, a hybrid from R. aureum crossed with R. sanguiaeum ; some cross-bred Rhododendrons Azalea Versehaffelti, and a magnificent sweet-scente Begonia called splendida. Mr. Mielliez, a nurseryman at Lille, eontributed Azalea Madame Mielliez,
white with purple stripes in it, and anothe white with purple stripes in it, and another of the Chiswick Nursery, sent a well-flowered specimen of Gesnera Doneklaari, a handsome hybrid
nearly related to G. diseolor. From Mr. Turner, o Slough, came a colleetion of extremely well grown and beautifully flowered Cinerarias consisting of some o
the best sorts in cultivation; one named Brilliant (Lidthe best sorts in cultivation; one named Brilliant (Lidgard, a cear white wind, having all the good qualities which a Cineraria could well be expected to possess. these useful flowew together with a stand of Pansies cut from plants in pots. From Messrs. Henderson, of Pine-apple Place, came extremely well-grown examples of Dillwynia pungens, Borvnia pinnata and macrophylla Tetratheca ericifolia, a handsome lilac-flowered apecies Aotus intermedia, and an Eriostemon. The Rev. F Beadon, of Norih Stoneham, Hants, furnished a boxiu on a south-east wall
Of fruit Mr. Drummond, gr. to S. L. Stephens, Esq sent Keens' Seedling Strawberries and Black Hamburgh Grapes, of which some account will be fcund in
another column. Mr. Jones, gr. to Lady Charlote Schreiber, furnished a Prickly Cayenne Pine Apple weighing 4 lbs .9 oz ; and a tray of Beurré Rance Pears came from Mr. Ingram, gr. to the Duke
of Rutland at Belvoir Castle. The latter were large and fine, and had not the slightest symptoms of shrivelling about them. The Garden of the Society contributed various plants; among them were the sweet-scented Rhynchospermum jasminoides from Hong p. 263 ; Nemesia versicolor, a perennial from the Cape of Good Hope, with blue flawers about the size of Lobelia ramosa, and produced in sufficient abundance to render the plant worthy of trial in beds out of doors for this purpose it was stated that it would require with it were Calceolaria violacea, a kind with helmet shaped flowers, which although not showy at a distance when closely inspected are found to be very pretty and Begonia ingrami, acuminata, and coccinea. The first of these is a cross-bred between the other two, and
is certainly one of the handsomest Begonias which our gardens at present possess. It was raised by Mr. Ingram of Frogmore, who has been very successful in producing new and beautiful hybrids among this class of plants.
Rigby Wace, Esq, exhibited an example of a double Rigby Wace, Esq, exhibited an example of a double
iron espalier, with iron feet to go into the ground, \(i\). e. two espaliers about a foot or so apart fastened together by crossbars, while on the top was a pent-house roof o galvanised sheet iron, which projected far enough, it was thought, over the sides to prevent nocturnal radiaby Mr. Wace to be list, more perfect shelter to th tree on the north side than is obtained by the single espalier; 2d, having a succession of frait for a larger period than from one tree with one aspect; 3d, comcoping ; 4th, earlier production of truit by having the coping made of glass, giving the advantage of an orchard-house with dar less expense and trouble ; and
then and durability. Whether or not, how 5th, economy and drability. Whether or not, howremains to be ascertained by experiment.
In connection with the qualities of British Oak, of which so many illustrations were produced at th last meeting, Dr. Lindley exhibited two specimeus of the timber used in the construction of the ancient litil wooden church of Greensted, near Ongar in Essex. Having been eent by Mr. Beckford of Estier, who had received them from the Rev. Philip Ray, the reetor of Greensted, their authenticity was indispatable. One of these pieces which had formed part of the log walls was the timber of Q pedunculata, ard was much worm enten; the other piece, Q. sessiliflora, was pexfectly sonnd, Dr. Lindley expressed a desire to know of Ongar.

\section*{F20tires of Boohs.}

The Entomologiste' Weekly Register is a penny periodical devoted to communicating immediate intelligenee among the colleetors of insects. Let us hope it will meet with sufficient support, Shield's Practical Hints respecting Moths and Butterflies (Van Voorst, 3s.), conveys in the form of a monthly calendar invaluable information as to the times and places where the young Lepidopterist must seek for lis game, and what to do with afterwards. Of far creater pretensions and wider cope is The World of Insects by Mr. Douglas, the earned Secretary of the Entomological Society (Van Voorst, 3s. 6d.); a readable and instructive volume concerning the insects of the House, the Garden, the Orchard, the Fields, Hedges, and Lanes, Fences, Commons, Downs, Woods, Waters, Seashore, and Mountains.
This arrangement of matter is novel, and we think advantageous, especially to those who stady entomology s an amusement rather than a science, and who rea books with the same end in view. The following extract will illustrate the author's mode of treating his abject :-

The garden being an artificial assemblage of certain plants within a restricted space, there to be cultivated that all the insects attached thereto have thus the conditions favourable to their increase proportionably multiplited and cared for. Some insects accordingly abound in gardens, not only in those attached to mansions in the country, but in those small parallelograms ttached to modest suburban residences, which are ranieally, or by courtesy, termed gardens, bat the number of specees found is not very great. Many arden fowers, however, are attractive to insects born ad bred beyond the boundary wall, and draw them rom the surrounding woods or fields: so far a garden is an advantage to a collector, for some of the visitors are rare and not otherwise to be obtained, or at least
not without great trouble. I allude more particularly not without great
to the Sphingidæ.

\section*{The sweet lips of the flowers and harm}
hovering over them, Petuniss especially, in some years in great abundance. I suspect that if gardens near the south coast were attentively watched on summer evenings the number of our native species of Sphingidæ, at
present very small, minht be increased, and some of present very small, might be increased, and some of the rarer species of
they are at present.
"Did you ever see a Sphinx fly? There is nothing To compare its motion to, except a flash of lightring. While you are looking at a flower in the twilight, between you and it glides a motion, a moving haziness, which is before you and yet conveys to your eye no definite image. Before you have half thought what it ean e, you see the flower again distinctly, and rub your ibly an unsteadiness of vision caused by the irritation of that gnat that was buzzing about your head; when, o! the flower just beyond seems to shiver,-you move to see what is there, but there is a move before you, and a dim shadow flits away like a thought. Can be it anything real? Stand still awhe: and now, in the in-
creasing gloom, as you bend over the Petunias, holding creasing gloom, as you bend over the Petunias, holding
your breath, you see a darkness visible drop down before your breath, you see a darkness y , but its presence is better made known by the you, bat its presence cased by the rapid vibration of wings. Stir not, or this aerial body will hoat away. Now you see it deigns not to alight or touch the margin of the chalice, but, poising itself in arr, stretches out its long tubnlar congue and quaffs the nectar at the bottom. Now or never, if you wish to catch it. Strike with your ringnet rapidly below the flower, raising your hand and turning your wrist at the same moment. There you loy lory, its eyes like stars brought down light. But if you wish to see the other beanties of your captive tomorrow, you must kill it: first stop its fluttering by a pinch on the under side of the thorax, and then a dose du cons acid on the poith acedo whit hors in the net. As might have been expected the scales on the winga of all Lepidoptera being ensily rabbed off, but it is as good a specimen as is usually got in this way: perfect ones are rarely obtained, except by rearing them from the caterpillar, and such rare species as this are seldom found in their early states.
The Flower Garden by E. S. Delamer (Routledge), is a companion to the "Kitchen Garden," formerly woticed in our columns (1855, p. 679). Like its prede-
cessor it is a really ueeful guide, and its low price ( 1 s. cessor it is a really usetul guide, and its low price (1s.)
will doubtless secure it a large circulation. It is evident that the author, whoever he may be in disguise, is no only well acquainted with common gardening and common garden oljeects, but knows how to communicate his information. These books would make good prizes or cottage gardeners.

\section*{Garden Memoranda}

\section*{Tu Gnove Pien Mir} Stephens, Esq- -This place has been greatly improved within the last few years. Immediately in connection with the house a new flower garden hass been formed frow designs turnished by Nesfield. It is in sunken pnnels, and eontains some pretty tracery worla in Box, the effect of which is heightened in summer by the
skilfal introduction of flowering plants, both in beds
the lawn in connection with them are some handsome specimens of Thuja aurea, Irish Yews, upright Cypresses and Rhododendrons. Around the bases of many of these slrubs has been planted wild Thymes, which is a favourite here for such purposes, and which The flower garden is to have a very pretty appearance. The flower garden is cut off from the lawn by an ornain front of the house is a small lake with an is'and in it, which in addition to its being an interesting feature in the landscape strves as a breeding place for waterfowl At one end of the house is a littie Rosery, the beds in which are covered over with iron trellises, upon which the plants are kept constantly tied down, and in this way they always present a dwarf and neat appearance. At the other end of the mansiou is a conservatory, the centre of which is filled with Orange trees in tubs, with flowering plants in pors set all round them. A border which passes round the house is also kept continually gay with plants in lloom. In front are twiners and plauts of neat growth, and on the back walls these are to be intermixed with Camellias, for which roum is to be made by cutting away the branches from the stems of the climbers. Thus the latter will occupy the upper portion of the wall and the that for the last two months standard and other Roses, in the culture of which Mr. Drummond has been most successful, have furwed a principal feature in the decoration of this house, and we need not say have been greatly admired by all who have seen them. Their treatment is as follows :- When they have done flowering they are pruned, the soil is shaken from their roots, and the plants are placed in \&maller pots, moving them into larger ones as they increase in gron th. In short, they are annually treated exactly as Geraniums usually are. Young plants for fresh stoch are propagated from eyes, like Ines, and are grawn on
and flowered in small pots. In this way a large amount of gaiety is kept up all through the spring months. The roof of this conservatory is glazed with Hartley's patent rough plate glass.
In the kitchen garden there has been put up within the last three years a handsome new range of glass room, with sheds, Mushroom. house, young men' of that room, tool house, and other convor. The glass henin, all of the very beal halves by corridor in the middle, on eiher side of which are Vineries, Peach-houses, and forcing pits, and each division has its own potting shed, with doors out of the back wall of the houses into them, so that plants can be carried from the one to the other without loss of time or exposing them to the open air. These housea were put up, we believe, by Shakespear, of Birmingham They re all made of ron and copper, and are heated and ventilated exactly on the same plan as those in the Royal gardens at Frogmore. In the earlient Vinery the Grapes are just beginding to colour ; but in a forcing pit new Grapts have been ripe here since about he
beginning of this month. They are grown in pots, and this is the second crop that has been cut from the same plants in 24 monthes. As soon as the first crop was ripe in May last the Vines were shaken out of their pots, the soil carefully washed from their roots, and they were then repotted in the same sized pots. They were placed against a wall during the summer to harden their wood, and were placed in the forcing pit last November. Here they have produced a fair crup of not very large but extremely well coloured fruit, which is covered with a beautiful bloum. The two forcing pits in this range of houses being extremely useful contrivances, are worthy of particular notice. They are both for forcing Ruses, Kalmias, Azaleas, Rhododendrons, and other shrub for the decorat on of the couservatory. The other is used for winter Cucumbers, Vines, and Figs in pots, and French Beans are grown under the Vines. The Cucumbrrs are placed at the warmest end, the Vines in the middle, and the fiys in the coldest part. By this arrangement all these fruits are successiully cultivated under one roof, and it was from Vines grown in this pit that the fine fruit exhibited by Mr. Drummond pits Tueslay was cut Along the back wall of these pits, as well as that of the other houses, are very convenient hinged shelves supported on moveable brackets, which being taken away allow the shelves to fall down when they are not wanted. These in winter and spring are found very useful. Strawberries are grown in al these houses in abundance, and among them some fine fruit of Keens' Seedling is now ripe. They are brought on at first slowly on moveable stages, with which in the lionsestion as they are wanted. After they are ripe they are again removed to a cool house in which a circulation of air is always kept up to give ther flavour. In this way fruit of excellent quality is theen favour. In the different Peach-houses the trees, although young, produce heavy crops. That in the earliest huse is just stoning. Nigs are forced here in pota. They are placed shoots have made three leaves their points are pinched, and the shoots are fruit instead of woud, and thus a crop is obtained from the present season's grow \(h\) h. A second supply of fruit is also got from the same plants in one season by the same practice. Fresel Beans are cultivated here.
largely. They are sown in boxes and then planted out
in beds- with which some of the housesare fur-nished-in rows 18 inches apart. For later crops of them dung frames are employ ed. Potatoes are managed nearly in the same way. We also observed a frame open ground and planted here they come in a little before those out of doors.

\section*{Miscellaneous.}

Potato Manure.-The experiments made by me last year with four barrels of gas-tar, as a manure for Potatoes, on about an acre of arable land, were most beneficial in counteracing the disease-only one Potat in two thousand, when taken up, being discased. The tar was poured in a thin stream, out of a large watering. inches of soil, on which the sets were planted. The strength of the tar, however, was too great for the first young shoots, a great many of them being killed by it and it became evident to me that the tar ought to have been put on the surface of the land, and dug or ploughe in betore winter. The produce of Pulaoes in my yards, was at the rate of about 1800 pechs per acre, and was those row near a manare heap, and some that were growing amougst some Artichokes and laspberry trees. It is now foar years since I atandoned the Potato farm-yard manure for the cullivation of the Potato ; and the manures used by me on the above occasion were wood ashes, gas-tar, lime, and sand from the sea-shore containing protoxide of iron. Some very diseased sets, from St. John's, in America, which were sent to see if was clever enough to het lhem to grow, \&c., produced a very large crop, perfectly free from germinate more freely than sonod sets, and produce crops free from discase. The dusting of the haulm and leaves with quick lime three or four times during their growth, I find to be most advaitageous in preventing he blight. A row of Potatoes to which sewerage manure Was freely given had very large haulms, five feet iu length; but the tubers were few and smani, the best of disagreeable taste and odour. Potato sets dipped in tar, with the exception of the eyes, produce good crois but the use of tar for Cabluages, unless thorotighly decomposed in the soil, is destructive to them. Cabhages contuin much gluten in thent, and therefore grow luxuriously when fed on prutrescent manures whilst the healthy Potato, whose cells are well filied with starch, grows well in aritiseptic carbonaceous
manures. It must be evident, therefore, that what is one plant's food is ancther plaut's poison. John Malam in Journal of Gas-lighting.

Catavissa Raspberty. - The Catawissa Raspberry, Bay the American Horticulturist, originated in the graveyard of a little Quaker meeting-bouse in the village of is of medium size, inferior to many of the new popular varieties, but is sufficiently large for all economical pur puese Its coluer is dark red purple when ripe, and of a very high flavour. It bears most abundantly after the young wood, on which it produces its best fruit trains a height of 4 or 5 feet; usually begins to ripe early in August, and even sooner. The fruit is pro duced on branches continually pushing out from all parts, successively appearing in various stages of growth,
from the blossom to perfect maturity; and often there may be counted more than 50 berries on a branch. the fruit of each branch successively ripens, the late ones gradually diminish in size but there is no suspension of blooming or fruiting before the plant is checked by frost. If protected in-doors, it undoubtedly would produce during the winter months. One great advantage of this over other varieties of the Raspberry is, that if the stocks should be mecidentally broken or cut off, or should be killed by winter frost, it is all the better for the crop. Another advantage is, that from the small space of a few yards well cultivated, a daily dessert for a staall family would te at hand for from three to four mon.hs of the year Ycar-Book of Agriculture.

\section*{Calendar of Operations \\ (For the ensuing weel.)}

PLANT DEPARTMENT
Consmbatory, \&c.-Among winter blooming plants We have few that are so attractive and so useful as
Gesnera oblongata and Euthorbia jacquiniflora, both heing profuse bloomers and remaining long in beauty These shonld be extensively grown wherever winter flowers are valued; and if at the expense of negiecting
some of our more recently introduced subjects, they should be afforded every necessay accommodation and atiention at the present season, in order to secure good specimens for next winter. Also attend to affording Correas sufficient pot room and a growing stempeseason, and get the wood well ripened early in autumn, which is the secret of having them finely in especially the double varieties, is also deserving of every atcution, and should not be neglected at the present season. Pot off seedlings of the fringed varieties, and encourage them with a moist genial atmosphere, shading
them slighty on bright days. Unless there is a good
the flowers should be picked off the old plants as soo as they show symptoms of weakness, shaking the ex hausted soil from the roots and repotting in linht fibry pest, weil intermixed with sand, keeping the plants well dituation. This will obviate the difficulty which many
sing and growers experience in the management and propagation of these showy winter flowers, for if the plants have not been too much exhausted by blooming, young roots will be freely emitted from every branch, and when this is the case the plants should be broken up and repotted separately, affording them a rather warm and thoroughly moist atmosphere until they have become well established, when with ordinary care they will grow and form fine specimens before winter Fuchsias intended for large specimens will require to be shaded from bright sunshine, and will be greatly benefitted by a liberal supply of manure-water ; and when free growth is expected from these after this season, the atmosphere can hardly be sept too moist. Young specimens of greenhouse hard-wooded plants should be hept as moist and warm as can be done without inducing weakly growth. See that these are properly supplied with water at the root, and do not allow them to sustain any check from want of pot room. Stove.-Attend to training the hoots of twiners as they advance in growth, aud dem attention these to get entangled before giving the other plants, and afford free growing subjects plenty of pot room. Achimenes and Gloxinias, filling their pots with roots, will enjoy an occasional watering with weak manure water. Persevere in keeping down insects, which if allowed will progress with great rapidity. Very little fire heat will now be sufficient if the practice of shutting up early in the afternoon is adopted. Proceed with repotting Orehids as th \(y\) may require it. Do not use the syringe too freely among those starting into growth, but keep the atmosphere thoroughly moist allowed to suffer for the want of water, for when the soil in baskets is once allowed to yet thoroughly dry the water is apt to run off. When this is found to be the case the baskets should be immersed in tepid water until the soil gets thoroughly soaked.

\section*{forcing department}

Pineries.-Where there is not sufficient means of maintaining a thoroughly moist night temperature the morning but where plenty of evaporation can be obtained from tanlis or evaporating pans the syringe should be used over the foliage only in the afternoon, and then but lightly. Heavy syringing tevds to render the soil about the collar of the plant too wet, and makes ailo the leaves enntantly fuil water is not favourable to compact sturdy growth. See that none of the young stock is alluwed to suffer for want of pot room or to get too dry at the root, for a short time's neglect at this season may end in a grea many of the plants fruiting prematurely. Maintain a brish bothan-heat, as near as can be managed, bu on no account exceed this, aud keep the atmosphere a warin as the plants will bear without growing weakly Successions, if all right at the root and near the glass, may shely be kept at from 65 to 0 at night and \(5^{\circ}\) to \(85^{\circ}\) with sun-lieat, and plauts swelling their ruit, is afforded a thoroughly moist atmosphere, will enjoy night temperature of \(70^{\circ}\). Give these plenty of manure water at the root. Vineries.-As soon as the fruit is ripe in the early house discontinue the use of fire-hen as iar as the state of the weather will admit, and keep he atmosphere cool in order to prevent the increase of spider and preserve the foliage in a bealthy state as long as possible. Where the borders have been covered with fermenting materials this should not be removed in the present state of the weather where the fruit is colouring, but where the fruit is ripe the border shoul be uncovered so as to expose it to the sun and mir and prevent the growth of laterals, \&c. See that Vines in pots and boxes are well supplied with manure-water at the root. Give timely atteutiou to the work of disbudding, stopping, and tying in the shoots in succession houses, and endeavour to get the fruit thinned directly the berries are sufficiently large. Peaches. There will be little trouble from insects where the trees are in a healthy vigorous state; but the excessively dry state of the atmosphere and cold nights, rendering fire-heat still neceseary, is a very favourable state of trings for red spider, and any weakly or overcropped borders are properly supplied with water, keeping the atmospinere moist, and that every means are used to keep the trees in vigour, and if spider makes its arpearance give the trees repeated washings with the engine until the enemy is thoroughly eradicated. Thin the crop severely directly the fruit is stoned, and avoid leaving more than the trees can bring to perfection which would only result in small, flavourless fruit, a continual war with iusects, and greatly injure the trees for next season. Keep the young wood thin and neatly tied in, 80 as to expose all parts of the trees equally to light, \&c. Give nir freely to houses where the frait house too freely

FLOWER GARDEN AND SHRLBBERIES
It is still dangerous to ribk even the hardier kinds of bedding plants from under the protection of glass. All that cau be safely done until the nigha have become
warmer, in the way of hardening the stock preparatory to its being planted out, is to give as much air as
circumstances will admit without injuring the pion and to place Calceolarias and the injuring the plants, the stronger verbenas in turf pits, where they can be securely protected at nighte and elieitered from drying winds. Such things when removed to cold pits should be planted out in fine very Eandy soil, which will lisave, trouble in watering, and be much better for the plunts than keeping them confined in small pots. Tender anuals that have been raised in heat slould be pricked ont in light soil under hand-glasses, in order to get them strung before planting out time. If not already done and do not forget plenty of Mignonette and Stocks the fragrauce of which will always render them favourites. Look over the stock of plants at present in fluwer and mark the most admired for propagation at the proper season.
isbud P YREIT AND KITCHEN GARDEN
ill admit each rees, sc., as soon as the young shoots ower then two or three times, so as to prevent going sudden check to the flow of sap, and affurd the fruit the protection of the leaves, \&ce., as long as it can be done without injury. Look sharply after green fly, and apply tubacco-water the moment it is perceived; on light sandy soils, however, it may be kept in check by frequent washings with the engine. But whaterer method is preferred see that it is applied before the pests get established.

making, as before stated, a grand total of 349 head of stock.

In addition to this Messrs. Lawsow are to furnish assortment of all the vegetable agricultural productions of Scotland. The entries of implements are comparatively small.

There can be no more important practical questions connected with land than those which have reference to water supply and the rights to which it ives rise, and yet the whole round of applied science cannot offer a subject for consideration in which its resources are more useful in aiding our practical conclusions. Water has been popularly described as of two kinds:-rain water, which falls directly from the clouds, and spring water-such as gushes out from what are termed springs, or well water such as is obtained by well sinking to a greater or less depth into the earth. Our present object will be to point out-

\section*{The origin of spring water.}

The geological facts which influence its supply; and 3. To deduce from these some practical conclusions as affecting land.
1. In the "Oxford Encyclopædia," published in 1828, we meet with the following theory of springs:\({ }^{6}\) There is a great abyss of waters occupying the central regions of our globe; and all the phenomena of springs owe their origin to the vapours, rains, and issues of this great abyss, into which they are all returned." And further :-"A perpetual circulation and equality are kept up by a vast subterraneous fire, the springs never failing; and the sea, by reason of its communication with
This, though so vaguely expressed, favours the absurdity that springs have some mysterious sonree in the centre of the earth, and would lead to the inference, which indeed is commonly believed, that
spring water is one kind of this fluid derived from
unknown depths, whilst rain-water is a kind totally unknown depths, whilst rain-water is a kind totally
different, having its origin in the clouds. At present, however, we have no difficulty in coming to the conclusion that all spring water is derived from rain, and the chemical differences in the former and the latter are due to the salts and gases which rain dissolves in sinking through the various geological strata
Springs therefore may differ in volume according as the season be one of great rain or of drought; many springs indeed which afford a good volume of water in the former become nearly or quite dried up according to the continuance of dry weather. Springs may vary much in depth, those at slight depths being considered as surface springs, whilst those at several feet or yards are distinguished as deep springs. Springs, too, must be considered as occasional when the drainage area for their support is but small, and permanent when this area receives a rainfall sufficient to cause a constant and equable flow.

In order to understand the geology of water supply it will be necessary just to glance at the asual constituents of the earth's crust; these we shall find to consist of clays, shales, marls, sands, sandstones, lime, limestones.
Masses composed of these materials in a greater or less state of induration will be found interstratified over different parts of the globe, giving rise to alternations of pervious and impervious beds; and the simple theory of springs is that the porous beds form the collecting gronnds for spring water from rain-water, whilst the impervious ones are the basins in which it is collected, and that, there fore, natural springs arise from the running over of the water at the edge of this basin wherever it is exposed, and well-sinking is simply the operation of boring through the porous strata to the water contained in the impervious basin. Now, let a illustrate this by an actual example taken from a district in which determination about the depth of these so-called springs is often a matter of great importance, namely the Cotteswolds; here we have in the oolitic series of heds many alternations
of porous and impervious strata, without a due knowledge of which the operation of well-sinking is rendered uncertain in the extreme, whule it becomes a matter of the greatest certainty when this knowledge gaides it. To illustrate this the

Now, here the alternations are so accurately defined that supposing we wished to commence a well through any porous bed to an impervious one, the depth will usually he equal to the thickness of the former, which we shall have to penetrate; and so elearly is this the case over a large area, that the depths and distances of the wells will give ns a very exact engineering section of the surface of the country, a fact which may be illustrated by the circumstance of the country as to water supply and wells in the neighhourhood of Cirencester.

Now, it follows that in a district on the great oolite formation houses will asually be situated as near the fullers' earth stratum as possikle, which is the case for miles abuut Cirencester, except in the ca-e of large establishments, such as the Royal Agricultural College, Earl Bathurst's farm buildings, and Mr. Dewes' homestead, in which cases it has been worth while to obtain water at any expense, and consequently the buildings have not been placed in re-

In other parts of the Cot
other parts of the Cotteswold district, where
different beds come to the surface, the same process of calculation usually serves the case, of course the amount of the supply being dependent upon the area of porous beds which can act as the collecting round; if, for example, a porous bed just caps a hill, the impervious stratum beneath it may afford a limited supply of water, but if a large one be re-
quired the imperrious beds at the broader base will afford a more ample, constant, and equable supply than the more shallow examples. It is therefore no wonder that surface springs, in the case limited receiving grounds, should be exhausted a period of dry weather, whilst in the cases deeper wells and a wider area for collecting, we may look for a supply of greater extent and more permanent in its character. A section of such
country as we are supposing will show how easy it is to arrive at conclusions in some cases with respec o the depth we shall have to sink for water When arrived at by a geological examination the conclusion depends apon fixed principles. The fact, of course, without the principle may be equally well known to the practical well-sinker; but if
the continuity of beds be interfered with by local reaks or faults in the strata, science would be per fectly prepared to grappie with the difficulty, while practice in the mere manual labour of well-sinking would be entirely at fault. Take for illustration the following example from the North Cotteswolds.
A new farm-house was built on the top of a in, and when nearly completed a well was comThe for the water supply of the new buildings. The spot lay on the side of a fault, which led to its being much higher geologically, and, therefore, much further from the impervious bed below it
than the land close by on which the well-sinker had than the land close by on which the well-sinker had
acquired his experience. Before commencing the operation of well-sinking it so happened that the following conversation took place:-

Geologist. How deep do you expect to go for water ?
Well Sinker. A matter of 15 feet.
Geoloyist. Let me assure you that at the spot you 150 feet.

Well Sinker. I have sunk wells all my lifetime, and sure I ought to know best.
Geologist. You take it very coolly now, but let me tell you you will be blasting like a miner long before you get water there.
At this point the geologist made his exit, resolving quietly to await the termination of the conflict of practice and science. A fortnight after, however, on going to watch the result, the first thing he hears while yet a long way off is an explosion proving that his anticipations had been all fulfilled.

How often is it the case that nothing less energetic than hard work and gunpowder will satisfy the practical man when a little quiet reasoning and an examination of principles would settle the matter, after all, more practically when practice is founded on a knowledge of not a few but of all the facts.

The new house stood just within the line of a fanlt, and the well-sinking was carried on to a depth of about 100 feet and then given up in despair; this fault, however, the practical man was not aware of, and his conclusions, though drawn up on correct principles as regarded the other side of the fanlted ground, were as mach at fanlt as the stratification.
Many other examples of this kind might be here given, but this will at present suffice as an illustration that a science once thought so theoretical is yet capable of guiding us in a truly practical because scientific manner in questions that by some have been dealt with as quite beyond the bounds of science, a fact which will be further considered in a future article on the geology of water rights.

We are just now engaged in sowing Mangel Wurzel. To this end we have had the last year's Wheat stubble ploughed before winter, harrowed, and hand-picked-pioughed, harrowed, rolled, harrowed, and again hand-picked. It has then been ribbed with the plough into ridgelets 26 inches wide, and between them 20 cart-loads, about 12 tons, per acre of farm-yard dung have been applied, Over this several cwts. per acre of guano, blood manure, wool manure, and "Anglican guano" have been spread broadcast in separate plots to
determine their relative value for the crop. The ridgelets have then heen covered and rolled-the dung heing thus in the centre of each, the "artificial " fertilisers being distributed throughout the substance of each-and the moisture being retained in each as well as a drying east wind woll let it be The women are now setting the seed: they have it in their aprons, and each stands on the left side of the drill, down which they go. Having a handful of seed in the left hand, and a stick 18 inches long in the right, they make a rut about 1 inch
deep and 3 inches long along the dri!l with one end of the stick, put three or four seeds into it, cover it with the stick, and put the right foot upon it. The length of the stick applied from the middle of the foot indicates where the next rat is to be made, and so the work proceeds. They do not plant more than an quarter of an acre a day apiece, being unaccustomed to the work: old hands would put in double this quantity. The roller follows, and we whit for rain before the plants can appear.

The point, however, to which we wish especially to call attention is this. We have purchased 7 lbg . of seed per acre for the extent we intend to grow Thi that is what we find the women are using This seems to be the usual quantity sown, and while looking on, as the operation is performed, we find ourselves instinctively cautioning those at work not to spare the seed rather than not to waste it But how many seeds are they putting in? We want two plants in every yard of drill. There are 6700 yards of such an ridgelet in an acre and twice that number of plants we hope to grow upon it. Now, according to the table published at page 234 every pound of seed contains more than 20,000 seed-vessels, each of which contains two seeds. The quantity we sow should produce 230,000 plants if every seed were living-enough for 20 acres instead of one. This is what the practical man reconmends to sow and, as we think, wisely. It is easier, and considering the difference between a sown or transplanted root it is cheaper to destroy a dozen plants than to transplant one.
The plants will come up in bunches, and we expect some time in June to send a number of children into the fields, who, laying the left hand to hold the best plant of each bunch, will, with the right, sweep away at one stroke all the rest. This is done at a cost of 3 s . or 4 s . an acre. But as we hope to grow at least 30 tons of roots an acre-as they must therefore average 5 lbs . each-as the difference between a sown and transplanted plant is at least 50 per cent. in favour of the former, id
10 per cent. of blanks should have to be so filled, there would be a loss of nearly 2 tons per acre in the crop. And this, though not entirely, is of course to a great extent guarded against by "wasting" 6 lbs. of seed per acre in the sowing. This "waste " then is jastifigble in the case of root crops, where plants are thinned by hand or hoe after the seed has brairded. For grain crops and for Grase crops the comparison between the seed we sow and the plants matured is much more startling, and must be referred to on another occasion.

Home farm management.-No. I
Is treating of this important subjeet it is well to consider what the great lessons are which well managed home farms ought to teach. Unfortunately there exists a very general impression that a farm cul tivated by its proprietor cannot and should not be expected to prove remunerative. Home farms generally are rather looked upon as class hobbies than anything else, and must necessarily, it is thought, prove costly to those who are resolved to ride them. It is certainly too true that heavy losses are often incurred by those who farm their own land, but in nine cases out of ten these are merely the results of misroanagement, either in the injudicious interference of the principal or the incompetency of the manager. To indicate clearly the main object that ought to be attained in good home farming the following proposition may be stated: -1 , A home farm should set aut example to tenant farmers in everything which can be regarded as really in the van of agricultural progress; and prinwhile managed on the newest and most approved prin eiples a home farm can rever serve its hig.
an exemplar unless it is known to pay well.
Without adopting formally this divieion of the sabject I purpose in the sequel to state the sort of managemen which will be most likely to yietd good proits, mind, the effects that are sare to be produced in the farmige practices of whole districts from high culture and largo returns being conjoined in example farms.

When a proprietor takes a farm into his own band be is often either completely at a loss to know the best course to adopt in its management, or entirely dependen on his overseer or grieve. If the latter is in posessio of the qualifications necessary for his responsible position matters may move on satisfactorily, but otherwise it will soon be hinted in the neighbou hood that proir does not seem to be a desideratum at the home farmery. In order that a fair start may be made on sound principles, proprietors not themselves possessed of sufficient practical and theoretical knowledge will do woll obtain the best possible advice in laying down wax plan of operations, and by all means keep heary crop and good retarns in view, as the main condition success. Being satisfied that this or that general plaa of the campaign is the one which with English perseverance is sure to give a complete victory over the savagism of the soil, the next point to determine is the oullay necessary on permanent improvements. In all cases where landlord farms his own land it is requisite that two ledger accounte should be opened, one as the proprietor
and the other as the tenant. Unless these are kept to the greatest possible advantage the various sections perfectly distinct there will be endless confusion and must be so arranged with regard to each other that unsatisfactory profits. All the outlay on permanent improvements, such as drainage, erection of farm buildinge, laying down irrigating pipes, and forming buildinge, laying down irrgating pipes, and forming exterior or subdivision roads and fences should be debited to the la
The stock and implements of course come under a different head, being part of the floating capital required different head, being part of the floating capital required
in the management of the land. While the stock should, in the management of the land. While the stock slould, outlay on implements as requiring to carry a good interest rather than to be repaid in full by protits. This however, is anticipating a distinct department of the subject, and I proceed, therefore, to treat shortly of th mode in which the permanent outlay should be made. first improvement, and being a permanent oue it should certainly be performed with the greatest possible efficiency. The drains ought to be deep enough to give suthicient dry soil for the roots of cultivated plants to ramify in and not farther apart than will secure the extraction laterally of all water half-way between the drains which will have a tendency to staguate. Whether the soil is of a clayey or a light porous nature a depth of 4 feet ought to be the minimum, while the distance asunder in the former case may range from 20 to 30 asunder in the former case may range from 20 to 30 feet, and in the latter from 30 to 45 feet. great danger of erring on the side of cheapness in conducting drainage operations, but it should always be remembered, as a general rule, that a permanent agri-
cultural imprevement well done is cheaply done. It is cultural imprevement well done is cheaply done. It is not by saving a few lines of drains that profits are to be
secured in the management of a home farm, and of all the land in any given district, surely that in the occupation of its owner should at least be thoroughly drained. While avoiding unnecessary expense in the use of pipe tiles of larger calibre than is really indis-
pensable, it is judicious no doubt to see that pipeage only of sufficient size is employed.
Where there is little water, such as at the upper ends of the drains, there is no advantage gained in using 2 -inch pipes while 1 -inch ones may suffice. Neither can there be any use for collars if care is taken to make the subsoil collar the pipes. I have often thought that collars have slipped into use mainly through inadvertency on the part of improvers. "Oh", say they, "the collar keeps out mud." Strange, surely, say they, "the collar seeps out mud. Strange, surely, of the pipe and the interior of the collar is as large as the space between the ends of the pipes themselves. "But it keeps the ends of every two pipes opposite each other," continue the collarers. Then I understand the argument-collars are to make up for badly cut drains. Let the workmen be taught and compelled to keep the bottom of the drain only the width of the pipes to be used, and natural collars will in this way be secured.
If the subsoil is hard and must be picked, little bits of If the subsoil is hard and must be picked, little bits of
stone or clay will pack the pipes to a nicety, and with properly krpt levels cullars may well be dispensed with. All the efficiency of drainage will in many cases depend on the qualifications possessed by the overseer of the work, and the attention he gives to his duties. This and a thousand other things indicates the necessity there is for having a thoroughly qualified manager in able model of good management ; but this will be more fully referred to in another place.

In covering the pipes there is perhaps nothing equal to a paring of clay taken off both sides of the drain, and folded neatly over so as to form a filtering roof. If the drains are cut lengthwise in the directiou of the proved principles in respect of outfalls, depth, distance proved principles in respect of outfalls, depth, distance
apart, and levels, all that is necessary thereafter is the laying down in a plan-book the position of every drain and outlet. By this means a drain which happens to give way is easily found out and repaired, an advantage which is greatly to be desired in all cases, but an indis pensable requirement in the cate of a mudel farm.
2. The next permanent outlay requiring to be noticed relates to farm buildings. The house erections on a
home farm should always be substantial and of suitable home farm should always be substantial and of suitable
size to admit of the daily operations being profitably conducted, but there is no sense in their being extravagantly expensive or monstrously large. In many in. stances proprietors consider that the only way they can make sure of getting a steading to harmonise in costliness and appearance with their position in society, is to employ some eminent architect to furnish a design; the gentleman so employed is, in all probability, totally unacquainted with practical agriculture and the requirements of the erection he is called upon to plan; he doe his best, however, and what is lost in want of adaptation he makes up for in bulk and exterior appearance. If his employer is pleased with the general character of the homestead it is all plain zailing with the professional relish. It may be good for landlords to have a very pretty steading to look at, and it is still better for pro fessional men to have the privilege of outwardly embel lishing what, in respect of practical usetulness, is but a very naked suit of buildings, but these are not the sort of erections which are wanted when a home farm is to be managed on profitable principles. A farm steading is, or should be, a manufactory of beef, milk, and other marketable commodities, either directly by the dressing of raw produce, or indirectly by its consumption and
both time and labour will be economised. The straw barn should be of easy access from the cattle stalls, and these again situated in such a position that cooked food if thought advisable may be supplied from the cooking apartment both with ease and dispatch. Provision should be made for the corn ricks being moved bodily from the farm-yard to the front of the threshing loft. If properly designed the engie and connected machioery of power will be entailed in executing the largest possible amount of mechanical labour. With gnod planning there can be no doabt that an engine may be made to perform an enormous amount of bye-work in the daily operations of a large steading. It may be made to drag in roots from convenient stores,-mince the different kinds of food for use-haul out the manure to the dung-pit-work the liquid manure force-pumps, and many other things which need not be mentioned. If it engine constantly for minor operations, a small one might be provided for these particular purposes. To have everything going on in a large suit of offices like clockwork necessarily implies considerable outlay on requi site fitments, and may suggest the idea of extravagance and unprofitable investment. But before arriving at a final conclusion on these points, it is well to think a moment of what has already been done in commercial manufactories in the very same direction-that of quickening and cheapening production. It will be long dimini the cotton-spimer or the machinist think of rounding their producing machinery simply on the tion in a farmstead is totally different from that of most manufacturing concerns, and cannot be so extensively acted on by machine appliances ; but unquestionably an acted on by machine appliances ; but unquestionably an machinery for manual labour.

There can be no doubt that farm steadings entirely roofed in on the ridge and valley principle are far pre ferable to those scattered in detached divisions round an open yard. One great aim in planning the former should be to give abundance of fresh air to the interior the supply being regulated by dampers acting on the ventiducts. For want of due attention to this matter many covered steadings are nothing else than monster nuisances, particularly in summer, when stench and clouds of flies render the cattle-houses an abomination. While avoiding everything like extra vagance in the construction of such home farmsteads as are intended to serve a profitable purpose, no outlay should be spared if it can be shown that a fair interes will be realised upon it. If it is found, for example that boxes are better than stalls for feeding stock, an estimate should be formed of the money difference, so as to ascertain if it is sufficient to affurd a fair interest on the extra expense. In the construction of stables having a feeding passage in front of the stalle, there is necessarily a rather larger outlay than without this convenience ; but when it is considered that in feeding the animals-not to speak of improved ventilation-there is an immense saving of labour effected, the judicious proprietor will not hesitate to authorise the additional expenditure. J. Lockhart Morton, Edinburgh.
AGRICULTURAL STATISTICS OF EUROPE. (By Mr. H. Reader Lack, Board of Trade.)
THE importance of agricultural statistics, which is every day becoming more apparent in this country, has not only long been ackuowledged on the Continent, but the perception of their value has ed moreover to practical resuits. In most of the distribution of the soil, of the extent of returns of the distribution of the soil, of the extent of lavd under various crops, and the produce thereor, as published by their respective Governments, and translapublished by their respective Governments, and the ret of the Parliament by the Board of Trade. It is from these Parliament by the Board of Trade. It is frum these culutural conditions of several European countries have been prepared.
Amongst the countries possessing agricultural statistics we find the vast empire of Russia itself, and surely after such an example as this no excuses as to the difficulty of obtaining like statistics for our o small island can for one single moment be admitted. Without any further remarks upon British agricultural statistics, however, we will proceed to enumerate the facts relating to those countries embraced in the first division of our inquiry :-
Division I.-Russia, Prtisita, S
Russia.-In the year 1840 the in the several Governments of the Russian empire (exclusive of Poland and Finland), was as follows:-

\section*{Arable
Meadow \\  \\  \\ Laké, rivers, roads, \& \&}

Total
1,688,905,251
From these figures it appears that more than half of he area of the empire consisted of waste lands, and nearly one-fourth of woods and forests, so that there remained rather less than one-fifth for land under culti-
ation or tillage. These results in a great messure bespeak the condition of the empire, yet notwithstanding the large proportion of land uncultivated in Kussia, the amount stated as arable alone in the year 1849
exceeded he area of the United Kingdom by \(152,447,516\) acres, or more than double its extent-thus the arable land in the Russian empire in that year was more than three times the extent of the United Kingdom. What might such an empire become under a liberal Government and a free and industrious people?
Russia is chiefly an agricultural country, its principal exports being natural productions in a raw or half manufactured state. The grain crops are very large; those in the year 1849 amounted to

\section*{Puthor kinds}

The manufacture of Beetroot sugar, although not on o large a scale as in some other European nations, is carried on to a considerable extent in Russis, the great production being in the government of Kieef, in which department in the year 1848 there were no less han 42,160 acres under the cultivation of Beet, affordong employment in its reduction into sugar to 72 manu actories. The total production of the empire, includiag Poland, in the same year (1848) was 29:1,238 cwts. of augar. The total number of manufactories was 337, and the quantity of Beet consumed \(8,744,400 \mathrm{cwtb}\), or more than 30 cwts. of Beet to make 1 of sugar. The returns of live stock for the year 1849 were-
Horses
Horned
\(17,456,503\)
\(21,28,440\)
Sheep, ordinary
\(21,2: 28.240\)
\(28,187,948\)
8wine
Goats

It will be noticed that the number of horses and cattle are very large.
Prussia-In the year 1852 the distribution of the soil in the kingdom of Prussia was:-
\begin{tabular}{|c|c|c|c|c|c|}
\hline & & & & \multicolumn{2}{|l|}{\multirow[t]{2}{*}{English Acres.}} \\
\hline Under tillage & & & .. & & \\
\hline Meadows ... & ... & ... & ... & ... & 5,266,449 \\
\hline Permanert pastures & ... & ... & ... & ... & 5,419,192 \\
\hline Forests ... & & & ... & ... & 13,614,56 \\
\hline \multirow[t]{2}{*}{Gardens, Vineyards} & nd & ards & ... & ... & 892,079 \\
\hline & ... & ... & & ... & 13,529,614 \\
\hline Total & & & & .. & 68,816,538 \\
\hline
\end{tabular}

Of the total area of the kingdom it will be seen therefore, by the above figures, that in the year 1852 between one-third and one-fuurth was either occupied by forests or remained in an uncultivated state. The 1852 over that under tillage in 1849 was \(1,195,110\) English acres. The following are the quantities of each of the prin-
cipal kinds of grain produced in the Prussian kingdom in cipal kinds of gra
the year 1851:-

The area of land under Vine cultivation in the year 1850 was 38,926 acres, and the quantity of wine produced \(6,242,799\) imperial gallons.

The farms in Prussia appear to be mostly what would be termed "small holdings" in this country, upwards of 50 per cent. of the total number being holdings of under 3 acres each; and 28 per cent. holdings varying is dize from 3 to 19 acres each. The number of large holings, 2 per cent. of the whole. The following table gives the number of farms, classed according to size:-

The number of Beetroot sugar manufactories in the ringdom and its dependencies in the year ended September 31.1853 , was 206, and the quantity of Beet con sumed \(18,741,677 \mathrm{cwts}\).

The number of each kind of live stock in the kingdom in the year 1849 was-

(T̈O be continued.)
PROGRESS OF RRITISH AGRICULTURE SINCE 1851.
[The following is extracted from the report by Mr. Denison,
M. \({ }^{\text {P }}\), to the Board of Trade or the Faris Exhibition.]
P., to the Board of rade or the Faris Exhibition.

To the second, and not the least interesting question"What progress has been made since 1851 !" a reply may confideutly be given that progress has been made
on every side. In machinery, in scientific acquirements, on every side. In machinery, in scientific acquirements, question, the productive powers of these kingdoms have been more largely increased within the last four years than within an equal space of time at any former period.
In machine making, though some interesting novelties have appeared, the characteristic feature has beea the constant improvement, tending to perfection, of our use through the body of the farming community, a fact signiticant of the superior intelligence which is now brought to bear on farming affairs, promising a sure
First on the progression
First on the list in point of interest, first in its re-
No furmer who has ever steam machinery.
No furmer who has ever had a steam engine on his
farm will ever again be without one; no farmer who has ever threshed his corn with steam power could bear again to see his horges toiling in the wearisome circle,
now jerking onwards when the whip sounds, now brought almost to a stand-still when the machine is clogged by a careless feed-r. The regular stroke of the untiring steam engine gives excellence to the work, keeps everyhody in his place, and introduces among men, even the most careless, something of its own exactness and precision.
18.51, was thought a remariable thing that in the year a firm not known to the \& Shuttleworth, of Lincoln, ago, should have constructed and sold in one year 140 portable steam engines. Since 1851, the annual pro gress has been as follows:-
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline \multirow[t]{2}{*}{1 S 52} & \multicolumn{3}{|l|}{Engines.} & & gre & h \\
\hline & sold & 243 & & ... & ... & 1349 \\
\hline 15.53 & & 2933 & & ... & ... & 1723 \\
\hline 1851 & & 3 f & & ... & \(\cdots\) & 2297 \\
\hline 1856 & " & 491 & & -.. & .. & 3832 \\
\hline & & 1890 & & & & 8701 \\
\hline
\end{tabular}

Besides the constant increase in numbers, it will be seen there is a constant increase also in the power of the machines. In the year 185 , each engine averagen
scarcely the power of five horses. In the year 1855 they average nearly seven.
It is computed that 90 per cent. of these engines are used for agricultural purposes in England; the remain ing 10 per cent. are sent abroad, or are used for pur poses not connected with agriculture. We have there fore in the last four years, deducting 10 per cent. from the whole number of 3.01 , a power equal to 7831 horses added to the force of the farmer from one firm alone. Messrs. Clayton \& Shuttleworth direct their attention by steam power tion to one class of objects is of itself an indication of progress, and conducive to perfection.
The increased power afforded by steam has induced to improvements in all machinery moved by steam, in nome more than in threahing machines. The corn now is commonly delivered from the stack upon the machine, and delivered from the machine into sacks ready for market; a great econony of time and of money. For these and similar processes, the use of steam power is to the great help and furtherance of every operation to which it can be applied.

Our leading machine makers all concur in attributing marked results to the Exhibition of 1851.
Mesurs. Garrett have foreign orders arising from connections formed at the Exhibition still coming in. One customer iu Hungary has had not less than 8000 l. worth of machinery, chiefly drills and threshing machines. Drills have been improved by a new steerage patented in 1854.
Chambers' patent manure distributor is a new instrument, the invention of a practical Norfolk farmer. acre, delivering it with great regularity, and is excellent acre, delivering it with great regularity

Drills for liquid manure are still undergoing improve ment. If found useful in this country, how much noore raluable are they likely to prove in the dry and sunurnt plains of Soulhern Europe
Messrs. Hornsby consider the improvements in thresh ing machines to be equal to a new creation of the implement. Their business has increased threefold ince 1851.
Messrs. Howard find the demand for improved inple ments to come now mainly from the tenant farmers, and large proprietors. The husiness of all the leading machine makers has doubled since 1851.
Messrs. Ransome concur as to the improvement in threshing machines, and as to increased demand for machinery. Much has been done, but much rearains to be done still.
Messrs. Smith and Ashby date the wide diffusion of goodimplements from the Exhibition of 185 l . The sources of trade, in France, Algeria, and Germany, and has led to the appointment of an agency in Bertin for the introduction of improved machines into Germany, the instance of a spirited merchant of that city.
Me:srs. Bentall have found the demand for improved machinery increase largely since 1851.
Such has been the uniform tenor of the replies from all the leading machine-makers from whom communications have been received, There is a host of local makers, equally alive to the importance of improvement, and adding largely in their respective spheres to the stock of good implements.
Agricultural Chemistry.-In speaking of the progress of agricultural chemistry, the nanse of Mr. Lawes must be placed by English farmers in the first place of honour. Waront entering on the high controversy between Baron Liebig and Mr. Lawes, lately revived with inreased anmation, the English farmers have wisely ments in the care and accuracy of based on experiments in the care and accuracy of which full reliance may be placed. and the results of which are open to the
view of all. They have learnt view of all. They have learnt that the approved artififertility which, when mere stimulants, but asents of fertility which, when properly applied, may be depended upon with certainty to produce s crop. The principies on which the growth of corn depends are better under-
stood. The repetition of corn crops on the same soil can no longer be considered as necessarily faulty in
principle, and to be unconditionally condemned. It is rather a question of expediency, to be decided ly the The manure and of produc
These leasons the English farmers have learnt from Mr. Lawes. They have accepted them with hecoming
grati:ude. They are practising them with increasing confidence, day by day, to their great and proved dvantage.
Mr. Way, to whom also the farming world is under the greatest obligations, has snatched a few moments ollowing slietch of the general progress of agricultural chemistry.
This department of applied science is now attracting to itself the attention of able chemists in all countries; and the contributions to knowledge resulting from the various investigations have, during the last few years, been very considerable. To attempt anything lihe an account of these results in this place is obviously out of the question, and we content ourselves with litile more than an enumeration of the principal and most interesting investigations.
In this country, Mr. Lawes has continued his experiments on the laws concerned in the feeding and fattening of animals, taking for the objects of trial pigs and sheep. The number of animals exprrimented upon, the intelitigence and care brought to bear upon every detail of the experiments, and the very considerable expenditure Which has evidently accompanied them, place these investigations far in advance of any of a similar kind that have been undertaken elsewhere. Although the results are of a practical character, the experiments of Mr. Lawes must not be classed with the very numernus rials on the feeding of animals that are to be found dispersed through agricultural publications, and which are mercly practical, being undertaken without reference ty general principles. The results of Mr. Lawes' inquiries are too numerous to be stated here, hut they seem to point out that a just balance of the different constituents of fond is of more importance in the feeding and fattening of cattle than a predominance of any one; that beither the albuminous or farinacenus elements of from ave an exclusive value for the purposes to which they are applied; and that the classes o! vegetable which ar peculiar in containing a high proportion of nitiogenous matter are not necessarily, from that circumstance, th. 8 most adapted in practice to produce that part of the animal body (muscle) which most resembles them iu composition. According to Mr. Lawes, therefore, the valuation of foods in relation to their contents in nitrugen is attended with much fallacy.
Amongst other papers, Dr. Voeluker, of Cirencester College, has published an account of experiments made with a view of ascertaining the canse of the fertulity produced by bornt clay when used as manure. He has arrived at the opinion that the effectiare partly mechanical, but principally due to the hberation of potash from silicates of that aliali existing in the soil, but only slowly available until released by torrefaction,

Mr. Wry has published twis further papers on the important subject of the absorption of manure by soils, in continuat:on of his first research on this sulject which was published in 1850 . Mr. Way attributes the power possessed by soils to remove various alkalin bodies (as potash, ammonia, \&c.) from solution in water to the existence of a class of double silicates of alumina and another base, which is generally lime or suds. Mr Way has succeeded, for the first time, in producing this class of salts; and he argues, from the effects observed in soils, that these latter contain the silicates in question in small quantity, and hence their power to preserke soluble manures from loss by rain and drainage. His second paper on this subject refers to the action of lime on soils; and he endeavours to show, from the large quantity of ammonia existing in almost all soils, which, according to his experiments, very far exceds the dose of this alkali usually applied in manure, that lime acts much in the same way as ammoniacal manures them selves, by furnishing indirectly a supply of nitrogen to p'ants. The effects of over-liming are accounted for in Mr. Way
Mr. Way has also given an acccunt of his examina tion of certain beds lying immediately below the chall formation, which contain large quantities of what is known to chemists as "solulle silica." This form of silica has not hitherto been met with naturally, except in the case of some strata in the Department des Ardennes, in France, which were examined four or five years agn by M. Sauvage. From their peculiar nature they are supposed to be available with advantage for many purposes in the arts, and as a source of soluble silica for agricultural use.
The subject in the chemistry of agriculture, which has lately, however, attracted the greatest share of attention, both in this country and abroad, is that of the source from which plants derive their pitrogen. It has been satisfactorily proved that plants growing in the ordinary satisfactorily proved that plants growing in the ord than they can obtain from the soil in which their roots are ulaced; and it is obvious that in some way or other this placed; and it is obvious that in some way or other accumulation is derived from the atmosphere. Now, the air surrounding the globe is composed of a mixture of nitrogen and oxygen gases in the proportion of about four parts of the former to one part of the latter; it also contains small quantities of other gases, such a carbonic acid, nitric acid, and ammonia. The question at issue is, as to whether plants can, under any circum stances, make use of the great bulk of the nitrogen of the air in building up their tissnes, or whether they derive the observed excess from the ummonia and nitric
acid in the air. This question, the interest of which, both in a purely scientific and agricultural point of View, can hardly be overrated, has enlisted the energies
of chemists on both sides, and has given rise to some of chemists on both sides, and has given rise to some
admirable researches. It has also involved the exadmirable researches. It has also involved the exascertain how much ammonia and nitric acid are usually contained in the one, and brought down by the other. The principals in this discussion in France are MM. Boussingault and Ville ; both of these chemists have made extended series of experiments on plants grown in glass cases; their conclusions are, however, diametrically opposite : M. Boussingault contending that plants cannot make use of the atmospheric nitronis in the air for their supply in excess over that fur \(n\) ished by the soil; M. Ville maintaining that in the absence of both of these, an increase of nitrogen in plants still takes place. A Commission of the French Academy of Sciences, recently appointed to look into this matter, leans rather in its report to the side of M. Ville, but the question is still far from being get at rest.
M. Barral has determined the quantity of ammonia and nitric acid brought down by rain in Paris. M Boussingault has repeated these experiments as regards ammonia in Alsace, and finds the quantity very much smaller than in the rain of the city, a circumstance
which we should be prepared to expect. M. Boussingault has also examined, with the same object, the water of fogs and dew, and of rivers and streams. M. Ville has carefully determined the ammonia existing in the air both in the interior and suburbs of Paris.
Mr. Lawes and Dr. Gilbert have published the results of an inquiry into the quantity of ammonia and nitric acid in rain falling at Rothamsted, in Hertfordshire. acid are at present so imperfect, that Messrs. Lawes \& Gilbert have not thought it well to publish their results as to this substance, but they are led to believe that in quantity it exceeds that of ammonia in rain. Besides the names we have mentioned in connection with these researches, other continental and English chemists might be referred to, if circumstances admitted of grester amplification. It is, however, obvious, that
in this hurried sketch we have omitted all notice of many investigations on this and other subjects of agricultural chemistry which might well claim attention in a more extended review.
Finally, we must not omit to mention that the trade in artificial manures, which is rapidily rising into such national importance, especially in England, is receiving the most important aid at the hands of chemical science. Not only are the various waste substances of mauufactures and of daily life worked up into available form, but the manures produced by chemical means, more especially the superphosphate of lime, are daily improving in character, mainly through the suggestions of chemists who have specially devoted themselves to this been discovered, and new supplies of substances useful to the farmer have in several places been obtained.

It is, therefore, not without reason that we congratu late ourselves on the progress which has within the last five years been made by that departme
which is based upon chemical science.

THE KEYTHORPE DRAINING.
Lord Berners with great kindness has opened his house to a large party of agriculturists during the Easter week fur the purpose of giving them the opportunity of inspecting bis draining and farming, and as system of draining, at the same time thas he has invited system of draining, at the same time that he has invited
the pablic to benefit by his example, he will I trust be pleased to see his practice freely commented on. His lordship conmences draining by sioking test-holes 5 or 6 ft . deep over the field; he then proceeds to cut a
drain diagonally across the fall and through the wettest ground, and, as he finds this drain effectual in laying the adjoining holes dry, he proceeds to cut his next drain, and is thus governed in taking each succeeding drain throughout the field; and with respect to depth his lordship has certainly adopted a right principle, for he endeavours to sink each drain to the bottom of the watery strata, frequently going through several feet of clay or apparently dry soil to reach it, and none of the deep, and som \(=\) of the cuttings were as much as 10 or 12 feet deep. His lordship's plans of draining will be seen to differ from what may be said to be the general practice of
follows, viz.

1 , in not taking his drains directly ap the fall and in not keeping them in one uniform directicn.
drains not adopting any uniform width between his drains.
3, in not limiting the depth of his drains to so
little as 4 feet.
To account for these variations from the usual practice much has been written and said of certain pecu liarities of the soil of Keythorpe, which has been generally described as strong, with a subsoil of retentive clay lying in banks several feet from the surface, and presenting with great regularity natural ridges and
furrows between the soil and subsoil which it has been the object to intersect by the drains; but this descrip tion of the soil and subsoil I cannot say agrees with m observations. The various strats appeared to me to
take the usual line, namely, across the hill
the soil is much mixed, and is what upon the clays
in the south of England would be generally called a loam or good Barley soil, adapted for the alternate rowth of ruots and grain, and when drained readily ploughed with a pair of horses at all seasons. At the of east wind, and everywhere the surface of the drained and undrained land, with some exceptions as to the latter, was dry, and therefore did not admit of an opinion being formed as to the perfection of the drains
in laying the land uniformly dry. His lordship still continues to lay up his arable land in narrow lands, so as to keep the horses at drill and harrow in the furrows, an admirable practice on wet land, but a loss of labour on such a soil, supposing the land to have been laid per-
fectly dry. The subsoil comprises sand, gravel, boulder fectly dry. The subsoil comprises sand, gravel, boulder stones, and clay, occasionally stratitied, but more clay layers of boulder stones with veins or fissures of sand or gravel ; and so various and uncertain is the subsoil that, whilst in many places water in winter is found been sunk many feet deep close by are without any symptoms of water, and the subsoil in places is so open that water would rapidly soak away if brought to it From this description of the Jand it will be seen in places o call for only partial drainage, and might be often through the watery banks, and of this his lordship han wished to freely avail himself, but wherever the surface of the land has presented an uniform call for drains, there the frequency of the deep drains applied has brought the cost of the draining to as much as a judicious uniform draining of 4 feet
but \(I\) cannot think with equal success.

A stranger coming to lay out drains on this descrip fion of land, unless he has had great experience on similar soils and has sufficient confidence to incur the risl of occasional failures (for with such wide interval there must be uncertainty), would, to insure uniform drainage, be likely to place his drains somewhat closer than he might think possibly necessary or even would apply to land of his own, where he would have the oppor tunity of amending, without exposing his reputation to be questioned for such little failures as must be incidental to such experimental draining. The advantage of test holes in a soil so varying and uncertain as Keythorpe is doubtless of advantage to one who has the opportanity of watching the draining and of proceeding the present day when so much draining is being left to inexperienced direction it may offer some guide, although I cannot say that I discovered it had in prac-
tice been of the use one would have expected; and tice been of the use one would have expected; and indeed Mr. Trimmer admits that when one drain does
not succeed he puts in another, and sometimes a third, not succeed he puts in another, and sometimes a third, so that in fact the success of this draining is admitted to be attended with much uncertainty, and to call for amendment.

With respect to his lordship's principle as to depth this is unquestionably to be recommended, and the more so that there are still many afraid to exceed 30 inches drains. With respect to his directions of the drains taking them across the fall, here I am quite at issue, and I could see no grounds in his lordship's practice for any departure from the principle now so universally admitted of giving the greatest fall to the drains, and although I know his lordship's object is to unite the different porous pots between the clay banks, I was at a loss to discover any guiding rule in the lines taken, for the drains ran irregularly and in several directions, and none other wa apparent to me than to secure a fall; and I felt convinced in many instances, that had his lordship commenced with an upright cutting he would have better crossed the various freely and in greater quantity, and a more uniform drainage would have been gained at less cost.
His lordship's labours as an agricultural improver are far from being limited to draining; the same enter prising spirit is exemplified in his farming, building, the laying out of his grounds, and all that appertains to a country life ; and I am at a loss to convey the admiration and respect that I felt in witnessing his earnes desire to benefit others by his example in the field, and the kindness which so freely opened his house to me and many others from a distance. Hewitt Davis, 3, Frederick' Place, Old Jewry, A pril 8, 1856.
P.S.-Lord Berners, with reference to my speaking of his land as a Barley soil, and suited to the alternate growth of roots and corn, says:-" I could not have paid his management of his strong retentive land a greater comDeep and autumnal cultivation, after the water is taken out, completely changes the character of the soil." The change in this respect is indeed marvellous, and I have little doubt that good draining will in a few years do much to restore the
they formerly held.

\section*{We have also received the following}

It is perbaps not generally known that a great meeting of gentlemen interested in land draining took place at Keythorpe Hall during the Easter week. An unavoidable engagement prevented me from availing myself of the invitation with which Lord Berners kindly mation of what passed on the occasion, I have been looking with interest for some public account of it.

Among those present were gentlemen who represen all the parties into which the land draining world is divided. There was M. De la Trehonnais, the cele brited Anglo-French agricuiturist, who is a warm advocate of the system, and has most ably explained it principles, efficiency, and economy to the agriculturists
of France; and in France, if not in England, economy is a question of paramount importance. There were present, also, Mr. Bailey Denton and Mr. Hewet Davis, so well known for their uncompromising hostility to the Keythorpe system. Both these gentlemen pro They have judgment on it, before they saw its results. They have at length been eyewitnesses of them, and have now an opportunity, either of confirming their preconceived opinions or of candidly confessing their errors with the best grace they can.
There were also present a number of gentlemen well the neutral party. For their iderable pars. For their opinions look with con whatever they be it is ane them they should be publicly expressed, and that if the economy and efficiency of the system are mere fallacies these falleine matlacies, hese fallacs bosped
It is to the opponents of the system, however, that I and call prinaily, and thus publicly, address myself, ystem, a public declaration of their opinions The uestions, there they have seen ir adress to them and to which I request categorical replies, are the following:-
1. Is the Keythorpe estate efficiently drained, or is not
2. Is the arable land well drained, or is the system, I have heard it insinuated, only adapted to pasture 3. Are the geological conditions-the soil, subsoil, and ubstrata-such as I have described in my pamphle . Keythorpe system ; and, if not, wat are they ? Have the furrows, which I have so often pointed out, and on which the efficacy of the Keythorpe system so greatly d
mere myth

\section*{mere myth}
5. These gentlemen must have drained many thouands of acres. Are they willing to select from all they rained aned any farm of 400 acres, as efticiently urnished the most ample details, and drained at as cheap a rate ?
Lastly, are they willing to leave the decision of the question to a jury impartially selected? J. Trimmer.

THE BEST METHOD OF APPLYING GUANO. [The following is the extract from Mr. Nesbit's
It requires but a short consideration of this subject to perceive, that before any useful practical rules can be obtained for the application of guano, we must carefully compare the properties of the soil with those of th manure to be applied. Reference must also be made to the different conditions of the atmosphere at different easons, particularly as respects moisture, dew or rain The nature of the crop will also mattrially influence the quantity of guano to be used, and the time of its application.
Practical men have long been aware of the great difference existing in soils as regards their retentive power for manure. On certain lands, the result of the application of s given quantity of farm-yard dung may be seen for a number of years. On others, the effect the same quantity ceases to be visible in a very much clays, and in general the heavier descriptions of land lays, and in general the heariseriple chalks, and other lighter qualities, not inaptly termed by the farmer 'ther lighter
These varieties of soil differ both in chemical com position and mechanical properties. The beavier in general contain more alumina and oxide of iron than the lighter ones. They are also less porous, even when drained ; their particles are finer, and their absorptive power is greater. The want of great porosity prevencs the too rapid action of the aimosphere on the manures they may contain, and their absorptive power eusbles them to retain, to a considerable extent, the liquid and volatile elements of the manure, and at the same time to obtain a certain quantity at the expense of the atmosphere.

The case is, however, different with gravels, sands, and the lighter soils; upon which, in consequence of their greater porosity,
When manure is applied to them it is rapidly decom posed, and unless there be a growing crop ready to absorb the fertilising particles as they become soluble, hey will be washed away; or, if they become volatile, will, to some extent, be absorbed by the atmosphere These soils, therefore, require different treatment. We may apply to heavier lands a strong dressing of manure at once, and little loss wil ensue, for some time at least, from any other source than the action of the growing crops. On the lighter soils, we must use, even of farm yard dung, a leas amount at a time, but it must be
applied more frequently. We thus see that light lands applied more frequently. We thus see that light lands
have the advantage of more rapidly decomposing the dung, and consequently of preparing it more quickly for the use of the plant. For this reason, among others, light soils are preferred by the market gardeners, who, by their repeated manurings and repeated croppings,

The difference of soils is not the only consideration is exceedingly different
In Irelass, in Scotland, and in the Western district of Englan'l, from Cornwall to Cnmberland, the quantity of rain which fal's in the year is probiably rearly double that which descends in Suffolk, Norfolk, and on the Fiast coast generally. The air also is constantly more humid and for this reason those parts of our Isles are well adapted for the growth of root and green crops, and are quently, at any time of the year, be there used in larger quantities, without the same danger of burning the crop which would occur in our Eastern counties. In thes latter districts, the guano should never be applied as a top-dressing in dry weather, but during a wet or Where Why
Where Wheat is grown in humid climates, it is liable to lodge before harvest, and therefore guano, if assed, should be applied with caution to this crop. Two or 3 cwt . per acre, mixed with 4 cwt of salt, is quite pring.
From these and various other ascertained facts, we may deduce the following general rules for regulating the application of gusno:-
general roles por usinfo avaso.
1. That guano is best applied in damp or showery weather.
2. That guano should not generally be put on Grass land in That guano should not generial
the opring later than April.
That when guano is applied to arable land, if shonld
immediately be mixed with the soil, either by harrowing
or otherwise or otherwise.
than usual amoun is sown very early in the autumn, a less
 might become too luxuriant, and be injured by subsehat guano, and artificial manures in general, shontd be put on the land only in quantities sufficient for the par-
ticular crop intended to be grown, and not with the in-
tention of assisting the succeeding one. Each crop tention of assisting the succe
least from five to six times its weight of ashes, wharcoat, salt, or tibe soil.
> ith the aed

The preceding rules, if duly attended to, will pre vent the recurrence of most of those vexatious losses of time and capital, which many, oven of our best farmers, the properties of concentrated manures.

\section*{Home Correspondence}

On Town Drainage, its Application to Agrioultureaspecially so to one who, residing in a large and rapidly increasing suburban town, has had constant opportunities of observing the progress of a system of drainage carried on during the last six years. The following remarks are therefore offered with some degree of improvements in Paris which have rendered the wate of the once foul river Seine a pattern of purity. We are told that the greater portion of the refuse water of houses from culinary and other operations is passed by channels from the various houses led across court yards and foot pavements; whereas the fecal refuse and much of the slops, as those of bedrooms, \&c. are mercial speculation of the mater. It is not to describe prceesses - sufficiently disgustiot our object so describe processes-sufficiently disgusting in the pelves-whereby the dry manure called poudrette produced, but it is evident that the Paris system is posing of the sewage of London and its neighbourhood. The pollution of rivers is viewed as the chief opprobrium of our drainage system. Rivers are doubtless the natural channels of conveyance, yet from the condition to which the Thames water is reduced by the sewage matters flowing into it from the London drains, the course of the tider, and the constant disturbance maintained by the paddles of steamers, there can be no doubt beadopted. As to the applicability of seware ere 1on ture, we may safely refer to the vast prolificity of grass lands about Edinburgh caused by irrigating them with atterpt to separate the solid and liquid constituents. At Croydon, on the contrary, attempts have for year been made to collect and deodorise the solid matters, Suffering the nater to flow into the channel of the Wandle. Thus great offence has been given, and much animosity created, which still continues to rankle.
The deodorisation of the solidg by means of peat charcoal or shaje of some kind admits of no doubt; but when that has been effected the question recurs, what have we done? Professors Anderson and War, both seware passes awiots have proved that the ammonia of The writer hinself has filtrated foul and fetid manure through peat charcoal, till the filr rate passed clear as ammonia that had existed in the sewage. Common earih in a garden pot is also seen to act in a similar separation of the elentents has been produced when a separation of the elements has been produced, experience
has shown that the deodorised heap accumulates : that has shown that the deodorised heap accumulates: that
it cannot be sold at a price low enough to induce it cannot be sold at a price low enough to induce
purchasers; hence, that the delusive idea of a profit to
fore, we infer that if drainage is ever to be emploved as a fertiliser, it must be dis ributed over the surfacewhether of grass or arable land-neat and entire as it fows from the drains. Thus then the mode of its
application resolves itself into a purely mechanical operation. In bringing the foregoing suygestion to a n: thus we read in the "Transactions of the Highland Society," p. 199. January, 1856 :-"Numerous attempts have been made to bring the valuatle constituents of
sewage water into an available condition, and the methods proposed have been extremely varied." It has been repestedly shown "that ammonia, the most
valuable constituent of a manure, cannot be precipitated y any process whatever, except such as are altogether precluded by their expense." Dr. Anderson then adduces two analyses as illustrations of what may be effected hy experiments sufficiently large to test the value of the process. The following table gives the
result of the first of these as being the better of the two

"A very trivial examination suffices to show that these substances are of trifling value ; the 2 of phos phoric acid and 1.13 of ammonia, when calculated of guano, proves the solids to be worth only about \(16 s\). per ton, yet these and similar substances are gravely declared to be equal in value to guano." Not to "I have seen no reason to alter the opinion expressed in a previous number, that if sewage is to be employed all, it must be used in toto as liquid manure." J. T. days last week to the examination of the operation of this machine as a locomotive and tractive power, and have come to the conclusion that it is "a great success." This guccess is owing to the endless and wide which gives a fulcrum for the lever, and a bearing sufficiently wide to carry a great weight on soft ground without imbedding in the soil. Hence the avoidance of friction and clogging; we might illustrate this by sportsman on the mud oozes, whose feet would sink in and thus render his power unavailable, but by attaching nished to a bearing condition. Thus, in the case Mr. Boydell's machine, although it weighed nine tons, ts impress was scarcely perceptible where a horse's oot left a deep indentation. This is a most important desideratum, seeing that weight in a traction engine is indispensable. We can form some idea of the value o agricultument when we reflect that a common portable ons, requires two horses to draw it on the common threshing machine more are required to draw the Camden Town to. Mr. Boydell's engine walked from Camden Cown to Acton, taking in tow its four-whee waggon, with coals, and four heavy iron ploughs, and water enough for four hours' work. When on the sof Turnip field (after a night's rain) it drew after it
ploughs, scarifer, \&c., with perfect ease, and then ploughs, scariffer, \&e., with perfect ease, and then walked home again to Camden Town. It can ascend an stairs, our stairs being one in two. It wan back, advance, or stop instantaneously, the pinion bein shifted from the coss of the driving wheel, and the power thus suddenly released is carried off by a separate fly-wheel, which may be used for driving threshing machines, mill-stones, or other purposes. In act, instead of a farmer sending for and sending back -horse power engine and threshing machine, requiring anywhere-draw the corn to market, bring home manure, and do the cultivation and work of the farm Mr. Boydell having expended nearly for its development Mr. Boydell having expended nearly \(10,000 l\). in accomplishing his object. A full description of it is given in
the Mark Lane Express of the 7 th inst. It may briefly be described as a horizontal engine mounted on wheels, with a man to bteer in front and the engineer behind The two cylinders were \(6 \frac{1}{2}\) by 10 , worked at 60 lbs . per power. 20 lbs. of steam was required to keep th machine moving, the other 40 lbs . for traction. Mesars. Boydell and Glazier's works are at Camden Works, Camden Road. The machine can turn as easily as a common waggon, and does not mind a deep furrow or a buffer epring at eturdently require a sort of railway which attach it to its load. J. J. Mechi, Tiptree Hall, Kelvedon, Essex, 10th April, 1856.
umstance and condition that question so much in handling than it generally meets with. The extrennes are almost always uri ed by the allvocates of beth sides with much (bbivion of the chjections that may be and are put forth. It seems to me so very evident 38 to require hut little d:scussion, to show that thin seeding incapable of throwing up a strung plant ; and that in contrary condition thick sowing is pot advisab'e.
imple, notwithstanding the analogy whioh has ery some few others to a different conclusion. On a firs view no doubt it would appear that where a searcily of food exists, the number of consumers should be lessene proportion that a rich, well tilled, and strong grour bounding in fond in a fit state to be taken up by plants, would bring to perfection a number of whants pro il-tilled to the abundance of food ; while the thin 1 -tilled, poor soil, in which there were lack of food, hould be limited to a low number of mouths; but from the moment of their formation the orgaus of plants eady for emsetves in proportion to the food they find fod mion. pher stro vigour of growth that enables their routs to push far and wide into the soil, and their leaves to absorb a amount of aerial fond, while much sunlight is requisite o enable them to deposit carbon. for both from abo and below, to preserve a healthful state, all their elements must be taken up in the proper digestible proportions ; the excess of any one element is in fact a poison calling for a wasteful action, an injurinus energy heir pases and rootse fants cultivated for tand at distances proportional to the rant io lhem il for their seeds. It were hold good in those we cultivate for thir seeds. It wore wiso in is tegulate the treatment of our cereal crops by that of our root ones. The future growth of plants dependssiso much on the food har hey find wimn rach of heir eanly ruhment, hat, in poor soils starved from their first germination, heir roots, poor, weak, and diminutive, have neither the strength nor the disposition to travel far for their food widely dispersed around them ; their leaves consequently mall, with their air orifices of proportional minuteness can only give to the plants very little serial food although it may probably be found in just proportion to hose matters their roots take up. These plants d no then \(r\) quire a wide space for they could mate no n. t, and as their produce of seed is in propotion to \(t\) eir ize, to realise a tolerable produce we mut sow the ed in such quantities as will place the plants so neare a other that their number may make up for their we \(k\) ness, and that the whole food of the soil and the may find mouths to consume it. There is anothe motive for thick sowing in such soils, as plants are found to tiller less in them. And with respect to will will keep them down. I have no doubt that in suct poor soils a superior crop may be obtained by what may call a thick and thin sowing, that is, by sowing thic nows at such intervals as will admit of working the保 In this case the vigour of their development drills; this would s well adare a consequent larger growth of the plants with a greater return of fruit. J. M. \(G\).
isease of Pigs. \(m\) to give an acenunt in our journal of a disease that has made its appearance my pig-styes, in the hope that some of your corre and cure of it. When the gige get as to the cause and cure of 10 . When the pigs get to be about thre months old they, as the inness attacks them, leave of ood and stand for an houe together with their head pressed hard the corner of the stye; the moment they are moved from that position the whole body, head, and legsare in continual convuisive motion; they canno walk when the fit (I may call it) is on, though they erk themselves along backwards to the corner, where they thrust their heads, and the twitchings cease. The hand placed with a gentle pressure anywhere on the spine, which is very hot, also stops the twitching or inchuntary motion of the limbs. They generally die within 24 or 36 hours after being taken ill, though have three alive now that have been suffering for enerally precriba fy formber generaly prescribed by farmers in this neighbocrhoditle strong dose of cast with asmaco made a post-morfem examination of one, haf the ing to find the bladder of watery matter in sometimes seen in sheep; but the brain was quite sometimes seen in sheep; but the brain was eemed, as far I co bid healthy and sound. F. \(D\) The symptoms resemble those of eplepsy and might caused by indigestion brought on by improper fecung? or the disease might be hereditary and constifutioual. In the latter case the symptoms would be directly pro duced by derangement of the brain and spinal curd o should not in any case have expecteds thereby produced would have been more gradual and noderate in heir character, the movement of the body circular, the general health less impaired. Water in the ventricies or fulness of the vegele or ather morbid appearances If cerebellim, mredulla oblongata, or the spinalicord, reason to believe mach more probal hereditary prevention must be sought for by changing the blood; if, on the other hand, injudicious feeding has produced the mimptoms, the removal of the cause, and a dose of ing from suggested. With regard ntrom the tal, warm baths, stimulating the spine, a nternaly oily and saline purgatives with s.C.S Steam-engine Furnaces.-Referring to my last paper
own answers admirally under the new arrangement,
the whole spaiae, 30 incles in depth by 28 inclies in width, being filled wiht brilliant pale yellow flame : smoke is seldons seen at the chimney top, and then only
for a few seconds. I thnk I mentioned that the waste steam is introduced into the chimney just above the flue, the pipe pointing upwards, as in a locomotive, the
hoarse pulsatiou falling on the ear at many hundred yards' distance in quiet weather. The intensity of heat produced by suel a mass of flame at a temperature of
3000 , had the effect of causing a thin layer of "s slaz" to encrust the furnace bars almost inmovably, and thus impede the drausht. I effectually remedied this by retaining its form, and thu \(\div\) admitting air, prevents this formation of sla, so that we have mothing now to desire or amend. By using a vertical plunger to our engine pump, about 3 -inch diameter and 2\(\}\)-inch stroke, worked from the eccentric, we have never once been troubled
as to a supply of water. Formerly, with a ravid moveas to a supply of water. Formerly, with a rapid move-
ment and long thin horizontal plunger, there was always rouble, owing, I believe, to a slight vibration which listurbed the packing and admitted air. J. J. Mechi, Tiptrce, April 21.

\section*{Eocictice.}

ROYAL AGRICLLTCRAL OF ENGLAND.
The following discussion, which we were unavoidably compelled to postpone, took place after the paper read
by Mr. Chadwick last week, :Mr. Shadwick last week, Mr : Mr. Slaney thought that Mr. Chadwick would confer prepare from the various returns in his possession, or to be obtained by him, a succinct tabular statement o facts in reference to the application of liquid manure, so that economic farmers who wished to employ it might
at once be enabled to deduce in pounds, shillings, and penc. the advantages they were likely to derive from its a option : adding to such statement practical inforthe \(s\) quisite engines, horse-powers, hose, jets, and other app \(u\) atus necessary for carrying out the operations. He also referred to the advantages to be taken of declivities in the distribution of liquid manure ; and to the location of homesteads on such elevations that the sanitary conditions of the family, as well as the agricultural advantages to the farm, might equally the details Mr. Slaney thought desirable, at least as far as his own operations were concerned. He had inspected Mr. Walker's arrangemeats, which he understood could now, from the experience he had gained, be made much more economically than they had originally been. His crops were looking most luxuriant.-
Mr. Raymond Barker alluded to the impediment that would arise to the continuous laying on of
liquid manure from the frost in winter.-Mr. Scott liquid manure from the frost in winter.-Mr. Scott
considered it ruinous to irrigate meadows during the continuance of frost. Arable land ploughed up in time of snow gave no crop the following year.-Mr. Sidney considered the natural system of gravitation in liquid manuring to be infinitely superior to artificial distribution. The most successful instances of irrigation quirement occurred of a constant stream of water rapidly passing over the land. Mr. Robert Smith, at Exmoor, had a stream from the top of the hills, which passing through his farm, where in time of heavy rain of irrigating 80 acres in the course of half an hour. Steam-power, Mr. Sidney thought, should only be employed in the absence of natural privileges. He felt compelled, from his own experience, to enter his strong protest against Mr. Chadwick's system, which, although aided by every advantage of publicity since 1842, had not, in Mr. Sidney's opinion, made much way available for green crops, and that it was only to such that it was applied in Italy. The farmers of this country had shown so great a willingness to to them, that he was quite sure they would also have adopted Mr. Chadwick's plan had it been ther interest to do so. They had evinced on all occasions a readiness to pay a reasonable interest on the permanent improvements made by their landlords.10 per cent interest on the bones spplied by their landlords to their land. - Mr. Chadwick appealed to the facts he had adduced, showing the alvantages farmers had derived from the employmen of liquid manure. Yields of one-quarter more had been Mr. Mechi grew 46 bushels on Tiptree Heath, others Mr. Mechi grew 46 bushels on Tiptree Heath, others
60 , and others again 80 . Mr. Scott was well acquainted 60 , and others again 80 .- Mr. Scott was well aly hat his
with Mr. Telfer, who had told him repeatedly that own operations constituted an experiment, which he had not yet asserted was remunerative, or was ever likely
to pay an ordiusry farmer. The climate of Italy to pay an ordiuary farmer. The climate of Italy
and the natural advantages of Edinburgh were not fair examples to cite. Sir William Cubitt had reported that we had not yet made the slightest approach to the solution of the great problem of town-sewerage.-Mr. Chadwick remarked that Mr. Telfer had stated that 25 acres of his farm would maintain a steam-engive.-Mr. Siduey had not found a single instance in which liquid manuring was advantagenus to corn crops. In Italy it was never and to Italian Rye-grass, at the right time, immediately
ter cutting, to furnish supplias of ereen tood fur their
dairies. Chemistry had slown the valuable matter contained in cancentraten manures, in guano and other substances yieling ammonia. In Cheshire, cesspoo matter, even before its dilutinn, fetched only one-hal the price of horse-dung - Mr. Chadwick cited the
au'hority of Count Gasparin as to the value of liquid manure ; and referred to the growth of cereals in Peru by means of irvivation.
Mr. Slaney, in moving a vote of thanks to Mr. Chad wick, remarked, as the result of his experience in public life, that good humnur, dogged perseverance, and calm
ness in the discussion of every great question woul invarially and eventually suc⿻eed when its advocate was in the right, and would as-uredly fail, as it ought to do, when he was in the wrons. Guano undoubtedly
was a connpact and manageable manure. He quite was a connpact and manageable manure. He quite
agreed in the opinion expressed that tenant farmers ought not to he callen upon to lay down expensive
apparatus for the culivation of the land. - Mr. Scott seconded the motion, remarkin; that Mr. Chadwick however led away perhaps on some poin's by an excuthe best stored mind statistically of any man livin in referevee to the application of liquid manure.

Weekly Council. April 23,-Mr. Raymand Barker, during the past week for election into the Society at the ensuing monthly Council, were read
Arachide-nut Cake.-Mr. Spooner favoured the Council with the following reply to inquiries made of " in repiv to vour coumpunication renpton, March 31, 1856.

 other feeding cakes, such as Nut-cake, Poppy-cake, and Cotton-
cake, more particularly when such cakes are rich in their nitro-
genous elements. Poppy-cake is much relished by cattle as well genous elements. Poppy-cake is much relished by cattle as we
as sheep, and appears to be very suitable for working oxen.
is rather dearer than Nut cake.
W.C. Spoover."

Mr. Gadesden was surprised to hear that the Poppy seed cake was priced so high, as he obtained his ow supplies at the rate of \(8 l\). per ton.
BaRN-Floors. - Mr. Greaves, "of Matlock-Bath Derbyshire, favoured the Council with the following information respecting barn-flonrs, in reference to an inquiry made by Colonel Chapman, "whether any cheaper and equally durable material had been met with, as a substitute for barn-floors, than the old-
fashioned Oak-fiorine, for which an estimate had been fashioned Nak-finorine, for which an estimate had been "In reference to ynur inquiries relative to the laying of barn
finors, I stronaly recommend asphalte in preference to won for many reasons, a few of which may be mentinned, as (1) th sweet state from the dry ness in which it is kept. I get the
asphalte in hbock: and having ret up an old boiler near the
plece, I mix gravel with it while hot and plece, I mix gravel with it while hot, and run out he mixture on
the surface required to the thickness of about 2 inches.
In a few

Mr, Devas remarked that there was great economv in this !flooring, its cost being only 7l. for an area which laid down with Oak, would be \(40 l\). It would not only bear weight, as stated by Mr. Greaves, but was well application of the flail in the operation of threshing.-Mr. Raymond Barker feared the ohjection to its use as threshing floor might be the dust he understood it ncea
sioned.-Mr. Devas had not sioned. - Mr. Devas had not heard of that ohjection. H.R.H. Prince Albert had adopted it as the material for the flooring of his sheds and piggeries; and it had heen found to answer those purposes extremely well.-Mr Aldam, M.P., inquired respecting the particular kind of asphalte employed.-Mr. Devas stated that he believed it had been supplied by Mr. Prentice, of Stowmarket who intended to exhibit specimens of asphalte at the Chelmsford Meeting in July next.

Communications were read from Mr. Brown, late of Arriston, on the subject of shut drains to exclude the entrance of fibrous matter in the neighbourhond of plantations ; and from M. Bortier, of Bruges, on the subject of the limestone of Nieuport containing a small proportion of phosphate of lime, and which he thought might possibly be worth importing into England.

Prof. Way (on account of temporary indisposition) was unable to attend for the purpose of delivering hi at Home and Abroad, in reference to Agriculture." Its Wednesd was accordingly postponed till the following Wedneaday, April 30, at 12 o'clock

\section*{Farmers' Clubs.}

London: April 7.-Artificial Manwres. We add the following from some of the addresses given after the ecture reported last week:
Mr. Bradshaw (of Knole, Guildford), stated the results of an application which he made in 1854, on 18 damaged guano, at 93.6 d . a cwt., which cont 1 l 8 s . 6 d . The hand was undrainen, very wet, and altogether int the guano-manured land he grew 40 bushels of Oats an
acre. Whilst upon the unmanured land he grew but 20 and thrushing himself, he was satisfied the carting of mistake in the matter. The fact was, he got 20 bushela of Oata extra, and three of Crosskill's harvest carts, in addition, of straw. That extra quality of straw he addition, of straw. That extra quality of straw he
valued at 11 . and the 20 bushels of Oats at 31 . 15 s o, or valued at 11 , and the 20 bushels of Oats at 31 . 15 so, or the 17. 3s. bd. fur guann, a clear profit was left him of \(3 l .6 s .6 d\). He had followed Mr. Nesbit's plan of
manuring for Mangel. In November, 1854 , he ploughed once ten inches deep. In the spring, three week before sowing the Mangel, he applied three cwt. of puano broadcast, and next scarified the land and drilled in two cwt. of superphosphate. Then, previous to nitrate of sods and three cwt of salt, and the result was that he grew 30 tons of clean root, not including tops, of Lung Red Mangel, withuat the application of simsle load of farn-yard manure. By the same method he rlso grew 25 tons of Orange Glohe, and 30 tons of Long Reil. The succeeding crop was Wheat. And the regard to Swede Turnips, he had applied thre With superphosphate, with about eight or 10 loads of farmyard manure, and grew 20 tons to the acre last year. In 18.54 he tried several experiments with Swedes, and they were not upon a small scale, for he tried them on patches of land three and four acres in extent. On two patches of land three and four acres in extent. On two
occasions he made use of bones on a field of 14 acres. On one purtion of the field he used three quarters of halfinch bones, and four hushels of bones dissolved in sulphuric acid. On another portion of the field, about four acres, he sowed two quarters of half-inch bones,
four bushels of bones dissolved in acid, and two cwt of four bushels of bones dissolved in acid, and two cwt. of guano per acre broadcast. The results were, that
whilst there was little difference in the size of the Swedes, those grown with guano were more porousthat was to say, spongy - and not of so good quality as those which were grown without.
Mr. J. A. Williays (of Boydon, Wilts): When Mr. e intended had once applied guano broadcast and hed made up his mind that it should be the last time he would ever do so, for he believed he lost three-fourths of the effects of it. The application was made on a dry day, and the greater portion was carried off by the winds to his neighbours farms, for aught he knew, miles off. And were applied on the broadcast system. The question had been asked to-night, "What was manure ?" He agreed with Dr. Ellis that it was, in fact, the food of the plant ; and if they applied manure to the soil which was not suitable for it, they would in effect as much
throw it away as if they gave hay to a pig, or the animal fond upon which mankind subsisted to a horse. With regard to what Mr. Mechi had stated respecting
his drainage, he gave that gentleman credit for experinice, nerived from experimental farming; but thought that, atter ohserving the effects of his drainage, and the practical means by which he irrigated his land, he would do still further service to agriculture if he anaysed the coloured water which ran off through the drains, and ascertained whether that water had not, in truth, left its valuable properties behind. Upon very strong greater importance than superphosphate of lime. Wherever he had tried the latter on a light soil, he invariably found there was nothing equal to it ; but on strung clays he grew better Turnips o here he used ground half-inch bones alone, than where he had put super-
Mr. W. Bennett (Cambridge) should be glad to be enlightened as to which artificial manures were the most likely to produce premature decay in the noat use of these manures that roots-Turnins for instancewere more liable to decay where artificial manares were u-ed than where they were not: that, he hesitsed not to state, was the result of his own experience. It had leeen his practice for many years to manure partly with farmyard dung, and partly with such artifieials as he thought best adapted to the particular erop. But this year, finding the farmyard manure holding out better than e expected, he applied it to eight acres of Swedish hat his Turnips stood a vast deal better there, and with less rot among them, than where the artificial manure had been used. He recollected that, some few ears ago, prizes were offered for the best crops of Turnips in Bedfordshire, by the County Society, both at Leighton Buzzard and Luton, and being put upon his metle," he dressed heavily for Turnips, and used Rype-cake in addition to farmayard manure. One of the must splecdid crops of Swedes he ever saw was the result; butseveral of the roots had begun to exhibit signs of decay as early as the first week in November,
and he was disqualified by the judges on the ground that the Turnips were not all sound. He should be lad, therefore, if Mr. Nesbit would give them some dea as to which artificial manure was hikely to cause decay at an earlier period than another. With regard 0 What Mr. Mechı had stated respecting his liquid maure being carried through the drains 300 yards off as black as treacle, the statement was very staggering. Of course, be did not deny that it was true; but he was lave extracted pretty nearly all that was valuable in the manure, provided there was anything valuable in
itin the first place. Colour was a most mistaken test of value. As to irrigations of this description, he would rather his friend Mr. Mechi should have recourse to them than himself, for he had derived so little benefit from irrication by liquid manures in the long run, that he belived he might put in his eye and see none the worse for italy the good it had ever effected. He woul inst heaps, prefer using his liquid manure, mixed in co
Mr. OweN Wallis (of Overstone) said that Mr. Bennett's remedy would lead him to suppose that decay in the Turnip arose in some degree from the use of artificial manures, and as on his farm hars in considerable quantities for several years past, and his Turnips had suffered much from rot this year, he had himself entertained a similar notion. Having made iaquiries amongst his neighbours, however, he diss covered many instances in which rot had been equally prevalent on land where no artificial manures had been applied within any man's recollection. It occurred to him that it was highly probable that decay in Turnips might be something like decay in the Clover plant that it might be occasioned by the exhaustio its proper quslity in the soil that was necessary th its would \(t\) ren their attention to that point, he believed they would render greater service than ever to the causo of improvem 1 bute his 5l. or Ineorery for this evil. discovery of a remedy for this evil.
Mr. Nesbit alluded to the question of soluble phns phates, and said that there had been a tendency amongs professional chemists, Professors Anderson, Way, and others, to recommend the manure makers to make all phosphates soluble. He could not say, however, that he would advise anything of the sort at present. He believed if they had not a sufficient amount of insoluble phosphates for the latter growth of the Turnip, there was a chance of its growing too rapidly at the beginning, and being checked and stunted afterwards, and so rendered liable to disease; and he had observed that where there was too large an amount of soluble phosphates, the Turnips had shown a tendency to early decay. As to the running away of manure through the drains of which Mr. Mechi had spoken, they must be a ware that a loss soil : only where the land was undrained it went off the surface, and the loss was much greater than where the land was drained. With reference to the various kinds of soils, a more scientific nomenclature of soils was wanted ; but as a general rule he should say that supergaano suited light land better than heavy, and guano suited heavy land better than light. Mr. Nesbit said there were something like 20 different substances which the manure makers had to select from, in making their superphosphate. They might, therefore, have a superphosphate almost of any colour. For instance, if it were if of animal charcoal, black ; and if of the two, grey. Salt was certainly useful for strengthening the straw in all cereal crops, and would be found advantageous in almost every district, applied with any dressing that was given to the crops. It would enable them to stand a mach larger dressing of ammoniacal and nitrogenous substances than if it were not used; though it was not so beneficial where land was well drained.

\section*{Che Gardeners' Chronitle.}

\author{
SATURDAY, MAY 3, 1856.
}

The Ving disease still lingers among us, and continues to destroy the crops of the inexperienced. Hardly a week passes but something is heard of its apearance, and of the alarn it creates in the minds of those who know not how to arrest its further progress. It is, however, as certain as anything in natural history that its irresistible enemy is sulphur, dasted copiously upon the parts affected as soon as it appears, the precantion being previous!y taken to syringe the Vines. For gardens this is so ready and simple a plan that others are superfluous. We therefore by no means agrec with the author of recent pamphlet apon the subject that "empirical nostrums can have ru place in a case of this kind case calls foz the application of any remedy which answers the purpose, whether we can account for its mode of action or not. Sulphor is such a remedy, and it would be folly to refase to employ it merely because we do not know why it kills our enemy.
While we say this we are by no means insensible to the necessity of searching diligently for the cause of the disease. We fully admit that it is of great
importance to learn if possible why the Vine has become of late years a prey to a malady till now unknown, for doubtless it is better to prevent illness than to cure it. We therefore willingly listen to Mr. Dow's account of what he supposes to be the origin of the matter in the vineyards of Portugal.

This gentleman, who appears to be an Oporto merchant, is of opinion that it is bad management which has brought the constitution of the Vine into a state which predisposes the plant to receive morbific influences which it was formerly able to resist.* After stating that out of 26,000 pipes of wine of the last vintage not more than 4000 are exportable, the evil evidently becoming aggravated in each succeeding year, he observes that:-

There are several circumstances which lead to the opinion that the proximate cause of this socalled disease is to be found in some abnormal condition of the atmosphere, in conjunction with a diminished power of resistance, from other causes, in the Vine itself.,

In support of the opinion that the fungus was derived from the atmosphere, and that the weakly or unhealthy condition of the Vines was the cause of their being attacked, he produces the following evidence :

In the year 1854, on the appearance of the fungus on my Grapes (Muscatel and others), I at once cleared off every particle of it with a clean soft-haired painter's brush (pinzel), before it had time to fasten its root on the skin, on the juices of which it feeds and prevents its expansion, not only in this way, but by superinducing a state of cold several degrees below that of the surrounding atmosphere, kept up and increased in the sun's rays by the force of constant evaporation from its own cold, damp, white surface. It was quite visible that with this incubus it was impossible for the Grape to increase to its natural size, though sometimes it appeared struggle very hard, and occasionally succeeded. was, however, perfectly successful in ripening all
my Grapes, by care and watching to clear off the fungus immediately and watching to clear off the occasions it generally again showed itself. I ripened even the delicate Muscatel which, in the five previous years, had been a total failure from other causes. Of this fact I invited many of my friends to become witnesses at the time, and which, if now dormant in their memories, I have no doubt they will at once recal. It is well known that scarcely a Grape was produced elsewhere in the city. felt therefore warranted in concluding that those Vines were not in a state of disease, but that the fungus emanated from the atmosphere. To still further test their state of health, I took several cuttings from the infected branches and planted them out in the spring of the present year. They have nearly all taken root, grown well, and shown no sign whatever of fungas on their leaves, for frait of course they have none. It has also been observed that, on Vines infected with the disease, bunches of Grapes and branches of the Vine, wellsheltered especially from above, have escaped, while all the rest of the Grapes on the same Vine have been destroyed. Singularly enough, bunches of Grapes growing near the earth, and even resting on it, have not been touched by the fungus, while the rest of the Vine standing higher in the air has suffered severely. Many Vines in the Alto Douro have escaped altogether, though surrounded on all sides by infected Vines, probably through possessing constitutionally a greater power of resistance to the atmospheric fungus. There are also other wine districts in the direction of Almeids, which have not been hitherto visited by the fungus, whose production has been regular, and even in this present year, abundant.
"It has never been the practice," he adds, "to apply manure of any kind to the Vines of the Alto Douro, and I believe, with just reason, as the manures usually talked of are too gross and heavy, and are quite incompatible with the great delicacy of pure Douro wine. The amount of produce carried off at the end of every vintage is not greater thas can be supplied, in ordinary years, by the disintegration of the soil effected by the operations of the farmer in hoeing and breaking it up, so as to expose it to the constant action of the weather and atmosphere. Ta assist these operations, rain is most essential duringthe winter to act as a solvent in reducing the natural wourishment derived from the soil to a state in which the spongeolets of the reots will easily absorb it in tro spring; and if I can show that this important condition was wanting 1850-51 successive winters-1848-49, 1849-50 1850-5l-and that a large proportion of the farmors, wines for some years previously to 1851 , did not, or could not, afford the expense of the labour necesa rmedy, by a 23 yearsi resident in Portugal. Saunders \&
OUey. A pamphlet of 16 pagev.
sary to effectually prune their Vines, renew their are sach as evince much knowledge of the stocks, and properly disintegrate the soil to effect constitution of plants; they are those of a practical the necessary exposare to the action of the weather, 'man; and cannot fail to produce an important effeet without which produce must decrease, I think these upon the vineyards where Mr. Dow's advice is facts, with the excessive overproduction of the three listened to. Had he recommended the heavy lands years, 1846-47, and 48, will go far to account for a to be thoroughly drained 4 or 5 feet deep, still considerable degree of weakness that had been observed in the Vines generally before the fungus made its appearance in 1853."

In 1851 the rain came down in October and lasted with little intermission till May 1852, of which year the spring was cold, wet, and late. In May vegetation became rank and luxuriant; the Vines produced branches of twice or thrice their usual length, and formed leaves of enormous size these Vines were little pruned, and so the evil kept increasing:-

In its altered condition after this inundation," adds Mr. Dow, "the Vine was well prepared in
the following year to become an easy prey to the Oidium Tuckeri, which, unlike other fungi, excep mildew which it resembles is not so ceremonion as to wait till its victim is dead and decaying before making its attack, but appears, on the contrary, to fasten on its living juices with a pertinacity so great that the weakened resistance of the Vines generally has not been able to shake it off. In cold and damp localities, where vegetation was most rank, it appears to have revelled in excess.

The average annual production of the Douro district throughout the century, as published, has been about 70,000 pipes until the years 1846-47, and 48 , when it rose to the extraordinary average quantity of 106,000 pipes, that of 1848 , the last of the series, being 111,000 pipes. This extreme over production could not but be an additional cause of future weakness. The three following years brought no rain of any consequence. For three successive months in the depth of each winter we had dry Wells that had never been known to be dry gave no water. The electrical state of the air must have been abnormal, for I do not recollect one thunderstorm during the whole of those three years. The vintages became comparatively short in quantity, the bunches of Grapes much smaller in size than usual, from the want of sufficient food."
What Mr. Dow considers to be the remedy for the present state of things is thus stated:-

To strengthen the Vine, then, I should conclude must be the primary object of treatment, to enable it to present a greater power of resistance to the attack of the fungus, and this can only be done by a judicious system of pruning according to the actual sum of force in each Vine; the general mode of pruning having had quantity rather than strength for its object, necessarily produced weakness; the 8oil ought not only to be cleared of Grass and weeds, but they and the prunings should as early as possible be burned, and the ashes scattered ove the vineyard, for the roots of the fungus must in certain localities be in the soil, which ought to be broken up with hammers and pickaxes to change its surface-an operation much neglected by all-to and to dissolve its elements. Every year, in the end of June and beginning of July, all defective and ill-formed Grapes and bunches should be removed and buried around the Vines, one foot in depth along with all the superfluous shoots or branches broken into small pieces, which only weaken while
on the Vine; but when buried in this green state, at that time, are decomposed in less than thirty days, and return again into the Vine to immediately increase its force, and if annually practised, to maintain its vigour, as trees are maintained in a forest for centuries by the annual decomposition of their own leaves. In other wine countries this practice is adopted with the very reasonable view of restoring back to the soil some part of its produce instead of carrying off the whole, as has been the uniform practice here for time immemorial. The Argol (Sarro), an element of the soil and of the wine, and bitrate of potash, if judiciously and sparingly spread among the Vines, and mixed with the soil in small pieces (not pounded), would also be of great service in recovering them from their present prostrate condition; but the chief reliance must be in a due disintegration of the soil to change its surface, and reduce its clements to a state in which they can be asily assimilated.

Were these vjews immediately adopted, and diligently carried out every year, I can scarcely trenath be pre vine will speedily recover its flourish as formerly; but should unfortunately notking be done, as there is too much reason to fear, from the very diminished means of the great body of he farmers to carry out any effective system, I am afraid the future results will be still more disastrons." It mast be owned that these recommendations
better results might be expected. We have ourselves seen how greatly the Potato disease, a perfectly analogous malady, has given way before the influence of good cultivation, and it is hardly to be doubted that similar happy consequences may be expected in the case of the Vine.
Our own gardeners will do well to study carefolly what Mr. Dow suggests, for there can be no doubt that what he recommends for a vineyard is equally true of a Vinery. They may also learn that er. perienced men in the countries where the Vine is most at home do not recommend dead horses, dead pigs, and all sorts of garbage to be introduced into the soil. On the contrary, he writes as if he had been a pupil of our skilful friend at Lois Weedon.

A very remarkable trade catalogue is now before us, containing a greater number of hardy novelties than we have before seen recorded in any one nursery list. We allude to a priced enumeration of the Japanese plants actually cultivated in the nursery of Siebold \& Co., of Leyden. As is well known, the Dutch monopolise the intercourse of Europeans with Japan, the country most in climate like our British isles, but resplendent with a vegetation infinitely richer and more varied than our own. Camellia, Cephalotaxus, Cryptomeria, Aucuba, Chimonanthus,' Clematis, and Pyras japonica sufficiently indicate how beautiful and hardy is the Flora of Japan, to say nothing of Weigela, Forsythia, and the whole race of Moutans. Availing themselves of their commercial privileges the Datch have sedulously occupied themselves with the acquisition of everything most worthy of introduction to Europe, and the result is already a total number of 3 or 400 species and varieties offered for sale by the firm above mentioned. Of so curious an assemblage we are sure that a brief account will be interesting to all lovers of gardens. We shall however confine our remarks to what are represented to be hardy races.

In the first rank stand Conifers, among which we find four species of Cephalotaxus, Juniperus japonica and procumbens, Pinus densiffora and "the true" P. Massoniana, Podocarpus Coraiana, Retibrata mentioned the other day by our correspondent "R." ( \(\mathbf{p} .26 \mathrm{i}\) ). The last however has no price attached.
Among forest trees are mentioned two Sycamores, Acer japonicum and polymorphum, the stock of which is held by Van Houtre, and UImus Kejaki, which we are assured furnishes the most valuable timber known in Japan.
Fruit trees comprehend a very early Apricot called Armeniaca Mume, whose early rose-coloured flowers are extremely ornamental, while the fruit, wing to the firmness of the flesh, is particularly well adapted for preserving. There is also a plant allied to Pyrus japonica, named Choenomeles umbilicata, thus described: "The fruit of this variety is perfumed like Violets, and in the hands of the conectioner surpasses in flavour all the fruit in our gardens." Mention moreover is made of a Japanese variety of Peach.
Small flowering trees and shrubs form a considerable part of the catalogue. The following appear to be the most remarkable:- Acacia Nemu; a weeping Apricot named Armeniaca pendula, whose branches are described as falling almost perpendicularly; a new variety or two of Aucuba japonica; Catalpa Kampferi; a Judas tree, Cercis chinensis: Corylopsis spicata, a small bush resembling the Hazel; Weiqela hortensis; Indigofera Iwafusi; variety of Külreuteria japonica; a new Privet; Toringo, floribunda, and Rinzo, three dwarf Apples, boringo, floribunda, flowerers well adapted for forcing; Rundant flowerers well adapted for Osbeckii, "on whose leaves galls are formed Rhus Osbeckii, "on whose leaves galls are
of better quality than those of Aleppo;" rum Ibota, the true wax Privet, on which the wax insect (Asiraca cerifera) naturally feeds; two Roses called Iwara and Camellia; Spircea mupestrys. Tamarix chinensis: and a great many sorts of Tree Pæony.
Climbing shrubs include Tecoma Thunbergii, the true Bignonia grandiflora of Thunberg; some new Wistarias ; Aristolochia Kempferi, and Ampelopsis heterophylla.

Finally, there is a considerable number of herbaceous plants, among which are included several new kinds of Funkia and Lilium, a Burdock called Lappa edulis, the roots of which are eaten like Scorzonera; a couple of Irises; Polygonatan japonicum, whose roots are a substitute for Aspa-
ragus; a Polygonum called Sieboldi, recommended as a green crop for cattle food, as an excellent bee plant, \&c. \&c. ; and the Chinese Yam, which M. Siebond calls Dioscorea opposita, and to the hardiness of which he fully testifies. He also offers seeds of the Soja japonica, the real plant from which the sauce called Soy is prepared.
We doubt not that all these things will soon be in our own nurseries for sale; some indeed are already announced as having been acquired by " Mr. Henderson" and "Mr. E. G. Henderson."

Tur Entomological Society of France has just elected Mr. John Curtis, our veteran English entomologist, an honorary member of their learned body. Considering that this Society admits but six honorary members, among whom stand such men as Humboldt, LÉon Defour, and the Marquis Spinola, and that the late Mr. Kirby and Mr. Curtis are the only Englishmen on whom the honour has been conferred, the recent election must be considered a very graceful as well as important recognition of solid merit. It give us the more pleasure to record it, coming as it does when blindness is about to render all future labour on the part of Mr. Curtis impossible ; and when therefore it is most especially consolatory to find that the devotion of a life to science is appreciated by those best able to measure its value.

\section*{New Plants.}
 tunbe calyceas dimindio provioribus, stigmate capitato quadrilobo.
Very nearly allied to the alcoost forgoten \(F\), albo rescens, from which it differs in its pyramidal inflorescence, much smsller flowers, and small obovate or ovate-lanceolate leaves. The flowers are wine-red and in mass pretty. It was exhibited by Messrs. Veiteh at the last meeting of the Horticultural Society. Mr. Skinner sent home the seeds from Guatemala. It appears to be the "Fuchsia sp, arborescens flore purpureo bacea nigra; Cuesta grande de Jalacing
temp. Dec. \(28^{\prime \prime}\) of Deppe's Mexican collections.

VEGETABLE PATHOLOGY.-No. CXIX,
475. Cladodystrophia* (Stag's head).-This word adopted from Ré, though not very harmonious to English ears, expresses exactly the main feature of the disease under consideration, known by the French under the name of Couronnement or Décurtation. \(\dagger\) All trees may be subject to the affection, but it is the Oak which more especially suffers from it, and in which it is most conspicuous. It is a malady which is popularly recognised, insomuch that a wood in my own neighbourhood, in which almost every Oak of any age is stag-headed, is known by the name of Hornstock, in allusion, as it is
said, to the condition of the trees. Whether the etymology is correct or not, the interpretation at the shows the prevalence of the disease. The Oal though extremely long-lived, like other timber trees after a certain number of years attains its full maturity and perfection, beyond whieh, though it may live for centuries, decay of grenter or less importance commences, increasing year by year till the
timber is perfectly useless for the purposes of art. It has always been a question, what is the age at has always been a question, what, is the age at
which the Oak must be cut down, so as to have the timber in full perfection, and beyond which it is not wise in an economical point of view to let it stand. The question perhaps does not admit of a very ready answer, but it is certain that when the terminal branches show the least sign of decay, the ree will make no more profitable growth, and should at ance be felled. On estates linble to impeachment of Waste, this is a safe rule, and one which within my own
knowledge has been strictly carried out; and I have learnt from a person of the soundest judgment and most extensive experience in such matters, that if a tree ander such circumstances is left till the course comes round again, which is usually one of fourteen years, material injury is always found to have taken place, in that period. Where the eye is practised, and the rule properly carried out, it is probable that the timber will be cut down almost at the proper moment, In such cases the decay of the terminal branches is due to the energies of the plant beginning to give way, insomuch that nutriment is not conveyed to them whe quence the buds are not properly developed, the terminal ehoots themselves perish, and decay at last attacks the branch from which they spring. + . This may be the case there the soil itself is congenial, and other circumstances are favourable to growth. The disease how ever which is more especially under consideration is not that of trees which have arrived at perfection and are beginning to fail, but of those which have not attained \(t\) third of their proper dimensions when decay sets in.
 are also Leveliied to accidental loss of the leading shoot, and to ollarding.
main branches which have no well defned leader, where the from them, it is the thips of these shoots which at length fail as
being at boing at A greater vertical distance from the sofl, snd therefore
heving a greater height from which to derive their nutriment.

The circumstances under which this occurs are totally different from those which have been just mentioned.
It is well known that the Oak will not flourish except It is well known that the Oak will not flourish except the soil is suitable. Oaks of enormous size occur in very
different soil, hut it is necessary that it should be rich different soil, hut it is necessary that it should be rich and strong, with proper depth, and that there should be a fitting subsoil. It should in the first place be calcareous; but if this condition is secured, it is of no great consequence whether it is a deep loam or clay, for noble trees soil itself is thin, the Osk will flourish provided the tap root can strike into some vein of marl or other congenial matter. Where however the soil is thin and poor, and at the same time the subsoil is unsuitable or impenetrable, the trees can never attain good dimensions, but after a ew years will show inevitable signs of decay in the leading shoot. It is perfectly useless to leave them after course is to destroy such woods altogether and
wiser coll convert the soil to some more profitable culture. The vil is not in general due to bad management but is nherent in the soil itself.
476. Before leaving the subject it may not be out of place to recommend a matter for investigation to those
landholders who may chance to have'woods in which the trees are naturally stagheaded. It is believed that certain roots have an especial relation to certain parts of the rree, and that any injury to such roots must affeet that part of the tree which corresponds with them. It is probable that the notion is well founded, and if so, sup-
posing the tap-root to become unsound or diseased, corresponding injury might be expected in the leading shoot. It would be worth while, therefore, where woods are much affected by this malady, to examine the condition of the tap-roots, which can only be done at some expense of time and labour by large proprietors.§ The roots of Oaks are not in general subject to decay like those of many other trees, but even they cannot conformed, it is most likely in the natural course of things formed, it is most hikely in the natural course of teangs
to give way first, and if so the destruction of the leading to give way first, and in so the destruct
shoot will probably follow. M.J.B.

NEW GARDEN FERNS.-No. XI.
22. Goniopteris gracilis, Moore and Houlston, Gen. and Sp. of Cult. Ferns, ined.
Fronds narrow-elongato-lanceolate, erect, pinnate below, pinna-
tifid and proliferous above; the lower pinne scarcely tifd and proliferous above; the lower pinne scarcely, stalked,
distant, deflexed, obliquely subbastate, i.e. obtusely oblong-
 crenate, the central o oess oblong-obtuse falcate, adanate,
scarcely sublastate, , lightly crenato-lobate near the base otherwise entire, the upper ones shorter, confluent; rachis and
the nerves benaeth pubbecent with minnute forkedd hairs ; sori
uni- or bi-serial, the spore-cases intern uni- or biseserial, the spore-cases intermixed with prominent
forked hairs ; barren fronds shorter spreading with mor erowded pinnex; fronds terminal, adherent.
This plant resembles and is undoubtedly allied elosely to Goniopteris reptans, but it presents several marked dispances. It is a larger and stouter plant with less disparity in the character of the barren and fertile ferous towards the point. The upper pinne moreover are almost always confluent and crowded, instead of

distinct and distant as they constantly are in G. reptans; and the pabescence of the rachis is of a different character, the hairs being short, instead of long and spreading; besides this the texture of the plant is spreading; besides this the texture of the plant is
stouter, G. reptans being considerably more lax and 2 Where trees are felled by the ase without the assistance of
ne ssw the tap-root is sometimes drawn to s considerable depth When the tree falls, and where the trunk proves unsound it will
often be found covered with white mucedinous threads. Nomeron observitions therefore may sometimes be made without much
trouble and with no expenst.
slender as well as more prostrate in habit. G. gracilis grows from a foot to a foot and a half long, having deep green fronds shining on the upper surface, the taller fronds abundantly fertile, and both these and the barren cnes bearing proliferous buds from the rachis. The barren fronds, about half the length of the fertile ones, much resemble small fronds of G. asplenioides, and are not all like those of G. reptans. It is an elegant small evergreen hothouse Fern, a native of Jamaica, and has been introduced within a few years to the Botanic Gardens of kew and Giasnevin. The species occupies an intermediate position between G. reptans and G. asplenioides. T. M.

\section*{ECONOMY OF WASPS' NESTS.}
[From a description by the Rev. Professor Henslow, of specimens in the Museum at Ipswich. The article, though rather long, and relating to objects which our readers cannot see, is nevertheless too graphic to be dvantageously curtailed.]
An illustration, in several portions-presently to be deseribed, is placed in case No. 72 in the gallery. I may first remark that three species of wasp are common in the neighbourhood of Hitcham: viz, Vespa crabro (Hornet), Vespa rufa (Anchor-faced Waep), and Vespa vulgaris (Common Wasp). The first generally selects or forms cavities in the trunks of rotten trees, or else chooses the open space beneath the roofs of cottages as chamber for its nest ; though instances occur of its building in holes underground. The other two almost always build underground, though occasionally in some convenient situation above ground. I am not certain that either Vespa Holsatica or Vespa Britannica are found in Suffolls. They both suspend their nests from the branches of trees and bushes. My observations having been made upon the three first-named, these remarks will refer to them, and more especially to the nests of the Anchor-faced and Common wasps.
No. 1. A cavity or nest-chamber in stiff clay soil, in which a small nest of the Anchor-faced wasp was suspended. This cavity has been preserved in two sepa-
rate pieces, one with the base and the other with the rate pieces, one with the base and the other with the
roof, by enclosing the soil in plaster of Paris, and otherroof, by enclosing the soil in plaster of Paris, and work
wise securing it from falling to pieces. It is the work of the wasps; whenever they leave the nest in search of resh materials for enlarging it, or for food for the young, they carry out, embraced by their legs, a small pellet of earth, which they drop a short diatance from the entrance hole ; and thus the cavity is continually enlarged, the progress of the coiony requiring the constant enlargement of the nest itself. Our stiff clay-drift being full of chalk and flint pebbles, the wasps are perpetually obstructed by these whilst they are enlarging their nest-chamber. By undermining them, and removing the surrounding earth, these pebbles subside to the bottom of the chamber, and there form a rude sort of pavement, immediately below the nest. This is shown on the left hand, in the bottom portions of the chamber. It often happens that a stone is too large to be readiy andermined and allowed to subside to the bottom, up to it and around it. The stone in such cases is advisedly surrounded by and embedded in the materials of the nest, and at length fairly built into it. As the of nest increases the stone is prevented, by props below nest increases the stone is prevented, by propi below
and suspended above, from crushing the fragile materials in which it rests, and is ultimately to be found far within the nest, among the comb.
The roof or vault of the nest-chamber is on the right hand, and so tilted that the whole of the interior and the entrance hole at the top may be exposed as well as a portion of the surface of the soil, with the Grass on it, thus showing the depth at which the nest was suspended. The bases of some of the short columns by which this was effected may be seen adhering to the roof. The diameter of the nest being always somewhat less than that of the chamber in which it is suspended, a free passage is thus left all round the nest
traverse it in every direction.
No. 2. A small nest of the Anchor-faced wasp, taken from the cavity just described. The very soft materials of which it is composed have apparently been procured from herbaceous stems, and not from either solid or rotten wood; though I believe it is generally considered this wasp and the hornet build their nests of the latter. I have often observed some of the layers of the shelllike patches on the surface of these nests when fresh captured, quite green and pulplike; such materiala captured, quite green and pulplike, britle when dry, as would naturaily be
we here see them.

No. 3. A small nest of the Common wasp, which was suspended in a chamber not more than 12 feet from the last, and at about the same depth below the surface. As both were captured early in the season (21st August, 1854), they were still conveniently small for the purpoee for which they are required; but they contained neither drones nor young queens, both of which only appear later in the year. This nest (like those of
Holeatica and \(V\). Britannica) is constructed from firm woody fibre, which the wasps may often be observed collecting from posis and window-sills, The wood fibre is completely masticated and mixed with a somewhat giutinous secretion, and thus forms a pulpy material ine papier mache, which these native paper-makers put to a purpose it would be hopeless laminse of different tints are united in shell-like patches on the surface of the outer wall of these nests, and each of these patches becomes a segment of a sphere resting
upon otitro velow, whit a cavily interveming. 'The
whole work is thus made very light, and at the same time is strongly bound together.
No. 4. Another amalier neas of the Common wasp is rather irregularly built, owing to the numerous obstruc-
tions from large pebbles in the soil. This has been divided vertically into two equal portions, to show the horizontal arrangement of the layers of comb with the cells open below and ranged in single layers. In beecells placed back to back. The material of which the cells are composed is the same detcription of papien maché as that which forms the outcide case. The topmost layer is suepended from the ease itself, and each of the others from the one abole the cells. The several penders of the same material as the cells. The several and there where they are sometimes partially attached to it for support. A ready communication is thus kep ap with the different layera, as the wasps have secured
a continuons pasgage over the whole of the inside as well as over the outside of the nest-case. The entrance hole through : the nest-case is generally somewhere about midway between the top and boitom-an (E) marks its position in each of the three nests here preserved. The cells are hexagonal, like those of the honey-bee, but are not destined to contain honey or
any kind of food. They are construeted for the sole purpose of receiving each one egg frome the queen purpose of the whole colony.
No.5. A small nest prepared by a queen wasp. This beginning, of what is afterwards converted by the is often popularly regarded as the work of the so-called solitary wasp, whioh in wact it buo completed the sense intended. The soure was a queen, deatined to become gant little structure was a queen, the fruitful mother of whole swarm. Having secreted themselves during the winter in ome crevice, the young queens come forth in spring, seek out con vemient spors for laying the founilation of their colonies, and then set to work, each by herself, to build a nest This little nest differs from the form which it afterwards assumes when greatiy enlarged oy the nentera. It con point, and enclosing one amall horizontal tier of abou half-a dozen to a dozen cells. The outermost of the two conts is intle more than a hemisphere, and does no is oval. The latter has rather a large opening below which serves as an entrance hole. Ihe quaen deposits on egg in each cell; and these eggs soon produce maggots, or caterpillars. These caterpillars suspend hemselves win the vertical cells. Those first close to are fed by the queen. The nectar secreted by the lands, on the under-side and near the base, laure coming forth in eariy spring. If the weather prove fro coming forth in eariy spring. If the weather prove propitiour, the queens succeell in bringing a few caterpillar cocnolr within its cell, closing the mouth of this spins a delicathin cell, closing the mouth of this with a chrysalis state. In a few days the young wasps emerge from their chryea'is state, gnaw their way through the silken cover, and after taking a lithle refreshment from their queen mother, are prepared to ease her of all fur her labour about the nest. This they speedily enlarge whilst she continues to lay an egg in each of the new vournble seasone, wasp nests often attain lay as many as 20,000 eggs! The wasps which proceed from those laid early in the season are called neuters which are, ws in the hive bee, imperfectly developed emales. The males or drones have no sting, and are produced later. Their caterpillars occupy some of the those which contained the neuters. The lowest, or las from these the queens, or fully larger cells, and from these the queens, or fully developed females, in a large nest. As each of these might (the following year) become the mother of 20,000 wasps, and as 500 imes 20,000 are 10 millions, it is clear the world might soon be filled with wasps, if the possible rate of increase ay but entomologists) a rather disagreeable wasp reason, seems to depend, in a great measure, on the oung queens having struggled successfully through the difficulties of their early position, whilst preparing their nests, and feeding the caterpillars first hatched. If the earing this firat unpropitious they do not succeed in helpless and soon perish. This accounts for the great nother. Though the number of woung oneens may beands seen in spring,gh thousands of young queens may be of egs, it does not nepoparily follow that we shall have 2 plague of wasps in autamn. On capturing a nest the queen mother may readily be distinguighed from hez chidaren suhjects by her larger size. Late in the season, when the young queens have come fistinguishable by her tattered whog and by other syraptoms of old age, whilst her hardsome daughers are as yet fresh and fair.
No. 6. A small nest of Vespa Holsatics, captured daring last summer by W. Calvert, Esq., at East Bergholt. I have been informed by C. Bree, Eaq., of Stowmarket, that he has met with nests of this wasp in that neighbourhood abo. As before stated, I hwve not
found it at Hitcham. The material of which this het Vespa vulgaris, but the mode of construction is dyfterent Inslead of the shell-like patches of which the outer case is composed in the nest of the common wasp, we have here series of thin cases ountinued all round, on over-lapping the other, the innermost leaving a snall
entrance bole at the bottom. The present specimen is entrance bole at the bottom. The
attached to a branch of Hawthorn.

No. 7. Nest of Vespa crabro, the "Hornet, in a carit of an old Pollard Elm. Thisspecimen issuspended betweel iron wods, and may be moved to show the lower parts The material resembles that emplof this large wa rufa, and is very tender. Tho those of moderate sion nests of V Wuin so many cell V. rufa. When built in the hollow of a tree, or among Thatch, the hornets dispense partly or entirely with an outer case round the tiers of cells. In the present specimen the well-formed lowe prtions of the case may be seen, in which there Iways an extensive opening at bottom. It is also disinct in the openings in the tree expose the nent to view. When a nest is suspended in iree space, as beneath the thatched roof of a cottage, the case is then completed all round the cells. By waiting till the close of the eeason before capturing a hornel nest, we shall find it well stocked with young queen and drones, but with very few neuters remaining. By pouring a little alcohol over two fine nests brought home on the same day, and placed on my atudy table, I dis charged between 100 and 200 queens and drones from hem, but there were scarcely half a dozen neuters. They came out in rather quick succession, and nearly all fiew directly to the windows, where they were captured with pair of forceps. By keeping the nest between himself and the light, the operator is in very little or no danger of being siung by the queens; but it is as well to be rich a in find in case a vicious neuter, de armed wing to turn to light should be disposed to attact sining to turn to may be out-manœuvered by the operator standiug may be out-manouvered by the operator stand and briskly aritating a hoop net at the end of a stick. They ty at the object in motion, and are readily canght. By acting on this knowledge, a Hornet's nest may be secured without danger in broad
daylight. First capture as many neuters as possible, as hey fly out or return, during three or four hours; then et one person begin to suw the tree, whilst another continues on the watch. If a hornet or two should be disposed to attack the sawyer, the sentinel must shake his hoop-net at them, gradually retneating at the same clumsy indeed if to turn upon him, and he must be assistance of our village carpenter, and sometimes with the aid of one or two others, I secured seven hornets' nests in this village during one summer. Three of these were in the hollows of trees, which we cut down ; a remarkably fine one (now in the Kew Museum) was obtained by sawing through the thatch and main rafter of a cottage roof, also taking away with it a portion of the wattles and stucco of the gable. There were not many active neuters about: the queens, however, uttered loud indications of their displeasure, but were too dignified to come out. We bore it of carefully, in an inverted possible to transport it in safety to a distance, provided be not entrusted to the tender mercies of railway I secured its satety; but shortly alterwards, on sending another beautiful specimen, firmly secured (as I surposed) in a hollow truak of a tree, it arrived at kew a mass of powder ! illuded asing on my study table on the same day, and from which I discharged the hornets by means of alcohol. J. S. Henslovo

\section*{Home Correspondence.}
how those great gardeners would act, in reference to see how those great gardeners would act, in reference this Society, who have derived immense benefits from in the shape of prizes, before I could offor my fmal mite towards the \(5060 l\). required for its support, and which I hope will soon reach 10,0002 . and at once set the Society upon a firm basis. Can any one forget those Chiswick Shows where people from the whole breadth of the United Kingdom and Ireland were assemb'ed within the gardens: can we forget the endle:s equipages covering many miles of road and occupying many acres of ground round Turnham Green; and what ness the enormous tarn-out for bat to witknown world, as well as the finest fruits that earth and the skill of man could produce? Can ir, then for a moment be supposed that this country will allow, this great national society to sink for the want of the small sum asked for? Surely it may look to the great aristocracy, the wealthy merchants, the rich
amateurs, for support. All of them are deeply indebted o the Society. What were their gardene 30 years ago compared with what they are now? has not the Horticultural Society of London done much towards their recent improvements in conclusion I beg to say that my truat that many others in small way as I am will do the same. To allow this Society to fall will be diggrace to the whole hortieultural people of this country ;it would very much lower ns in the estimation of even the mallest foreign lower ns in the estimation of even the

\section*{Fich and all of them have
James Cuthill, Camberwell.}

Toy.-I lately met with a remarkable looking Iry plant, growing in is about six feet in height and absa as much in diameter, and growing without any attech ment to other substan rees; the leaves are not lobed like the common but are ovate or obovate. Such a hardy evergreen miulit be uful in exposed situations. Is this plant the Hedera arborescens of Loudon's "Hortus Britannicus!" P. Mackenzie. [Yes.]

The Groce gardens, Rochamptos.-You will I am sure xcuse my calling attention to an omission in your notice f these gardens at p. 283 of \()\) our last Saturday's number. The furcing-houses were, as you have stated, erected by me, but at the request of S. Lyne iStephens, Esq. the heating was done by Messrs. Bailey, of Holborn, in justice to whom, and not liking to take the credit of other persons' work, I have been induced to tronble you with this statement. Wm. Shakeopear, 55, Liond Street, Birmingham

Cutting down Old Ihorn Hedges.-Some time ago a hint was given in the agricultural portion of your Paper to the effect that old Thora hedges when cut over with a hedgebill or hatchet made better shoots than those that were sawn over. I lately saw a hedge that was some years ago cut over abrut 2 feet from the ground; the plants before they were cut would be about 20 feet high, part of them were cut both ways, and at present the one part is as good as the other, as far as the strength of the shoots is concerned \(P M\)
Seeds.-Acting on the advice of your correspondent to ascertain whether the seeds I have had this season had undergone the cooking process or not, I counted a amall packet of Comish Broccoli containing 670 seeds, of which 647 have produced plants. This, in my opinion, is a fair sample of what seeds should be. They were purchesed of Mr. H. Watkinson, Market Place, Manchester. J. S., Gardewer to W. Harter, Esq., Hope Hall, Pendleton.
Large Beet Root.-I had last week a root of Beet which weighed, when cleaned and ready for dressing, 9 lbs . I have had them often 5 and 6 lbs , but never so large as this. The seed I obtained from Meesrs. Bass \& Brown, of Sudbury (Mitchell's dark blood red Beet and Cattell's also), and in justice to Messrs. Bass I should say that all Turnips, Beet, \&c., are excellent, and do well in our Northamptonshire soil. I have tried them well myself, and have given them also to farmers in the village, who
have praised them highly. W. A. Buclland, the Ficarage, Ravensthorpe, Northampion.

Ayres' Perpetual and Wild's I pswich Standard Cuow-bers.-As my duties here will soon terminate, I thits it well to report on the two kinds of Cucumbers sent me to test, viz, Ayres' Perpetual and Wild's Ipswich Standard, black spines. I have tried one plant of each in a pot in a Pine pit, under exactly similar conditions, and Ayres' is both a better grower and a better bearer than Wild's. We have cut five brace good fruit from the former and one brace imperfect from the lattor. In frames they are just coming into bearing and the sume characters were perceptible. In flavour, however, prest with which I am not satisfied is, that time may yet prove that the Ipswich Standard is an excellent summer Cucumber. But for general usefulness I unhesitatingly give the preference to \(A\) y
Arundel Castle, \(A\) pril 24 .
Breeding Fancy Canaries to content for prizes the various canary exhibitions in the metropoli requires some skill in the selection of the breeding followed it is to be regretted that the general metho canary is breeding the commoner varieties to be the means of rendering that bonefit which othes wise it minht be expected to produce; and althoug wise are able anveally to import man thousands, and the shops to sell them at even a loves price the rule laid down for breeding canaries, is simply to mateh birds of opposite quaties. Can this be a rational rail for the purposes of improving and developing the breod of canaries! It is evident from the many varioke and the varying qualities which these birds have brolen into, that there is a planticity in their nature which, if matched and judieionsly persisted in by breediog for series of seasons to a specific end, might result in and novel varieties and qualities as great in contrastas. find to exist between the Belgian and the smain varietice of the common canary. As the canary has been domet ticated are there not other species of hrds which migu be bred indoors, and eventually breal into severn varieties from like cultivation, and new properties an capabilities impressed upon their progeny? in broe onl mules from the canary nind birds of novel colont for the purposes of producing birds of novel colotion the breeder has to contend against the unplasticity of the wild parent and the more plastic nature the canary, as the general result of these pairing are young taking very much more atter the wher the than the canary. Most animals when bred under the varying artificial sheltering feeding care and protection of man for a considerable series of years, ohngerm colour and other qualities, showing that the vory and pand nature of the wild individuals is infles with which
pair the canary for the purpose of breeding mules were,
domesticated like the canary, its power of impressing its nature, \&c., upon its hybrid issue would be diminished and more upon a par with the canary, and therefore the mule from such a union would doubtless be a more equal mixture of the qualities, dispositions, \& c., of the
two than it is between a domesticated canary and a wild goldfinch, limuet, siskin, greeufinch, \&c. The greenfinch is said to pair with the canary readily, but that the progeny is too much like the greenfinch to nake them
favourites or profitable to rear for sale. It is also said favourites or profitable to rear for sale. It is also said and this bird is very docile and yielding, accommodates itself to confinement with great facility, it would be a very suitable bird to experiment with and try to breed indoors. It is known to have considerable caracity to
learn the song of others, \(\& \mathrm{c}\)., and so might be taught to learn the song of others, \&ce, and so might be taught to
sing a new ditty, which very probably, if its offepring was also instructed the same for a series of years, would become its permanent song. W. W.
oslpit was set on fire for tho shale from shale; it has been bre for purpe of reducing the burnt out yet. There is an old wild Cherry tree grow ing near the edge of the shale; about one half of the tre is in leaf and in blossom, while the other parts are little more than bursting their buds. P.M., Stirling, Apil27. which is communicated to the branches and buds.]

\section*{sucietiog.}

Horticultural.-Anniversary, May 1.-Col. Chal loner in the Chair: A statement was read recapitulating the proceedings of the Society during the past the Council reported what has been done to onve effect to the resolution that the Garden be relinquished unless funds sufficient for its support be provided by subscription, as already advertised. On the 3 d of April the Council reassembled, and after a careful review of the conclusion that a smaller sum than 5000 . woula be insufficient to enable the experiment of letter was shortly afterwards sent by post to every Fellow, representing the objects of the Society and announcing the names of donors to the amount of 580t. Since that time a further list of subscriptions has been sent to every newspaper (563) in the United Kiug dom, with a request that the editors would be good
enough to draw the attention of their readers to the enough to draw the attention of their readers to the
position of the Society; a request which the Council have reason to believe has been most readily complied with. The lists of suhscriptions have been advertised gratuitously by the Athenceum, the Literany Gizette, and
the Gardeners' Chronicle, to the propvietors of which the Council desire thus publicly to express their thanks. second and further list of subscriptions has b-en forwarded to all Fellows. Finaily, many hundreds of circulars and lists of subscriptions have been sent through the post to wealthy inhabitants of the metropolis not being Fellows, duced the sum required, Some Fellows had not pro attempt being made to preserve the Garden, others have answered by sending in their resignations; but from the greater number no reply has been received, so tha the subscription list, when closed, amounted to no more than 2773.10 s , contributed by 181 persons, of whom 15 Heinrich Behrens, a German among the latter is Mr . Heinrich Behrens, a German gentieman, residing near
Lubeck, wholly unconnected with the Society, who has most liberally off-red to contribute the large sum of 1001, towards the proposed fund. The Council however considered that the result of this appeal is so far satisfactory, that it seems reasonable to defer closing the subscription for the present, not doubting that the
spirit which has been already displayed, will gltimately spirit which has been already displayed, will altimately proceed to say that "It does not necessarily. Thlloy that the Society is to have no Garden, and that its horticultural operations are to terminate, even if the Garden at Chiswick is relinquished. It will be in the recollection of the Fellows, that in the scheme proposed organising thell, on the 24th of December, for regarden should still be mainconed for the purpose of raising such seeds as may not arrive in sufficient quantity for distribution, for restoring the health of imported plants, and for experimental puri Oses. Thi also formed part of the plan laid before the Society on which have betn lately made to the Council is one from Sir John Lubbock, Bart., an old Life Member, who remarke, in a letter dated April 11, that the obvious course for the Society is to move the Garden to the grounds of the Crystal Palace, there being no doubt Garden arrangement might ensily be made by which the Garden would be there preserved in a better locality to
the advantage of both Societies. Within the last two the advantage of both Societies. Within the last two
days the Cunncil have received a communication from the Direetors themselves of the Crystal Palace, conveyed through Sir Juseph Paxton, suggesting the expethency of an arrangement being made between them and interest, by which a portion of the grounds in the Cryatal Paiace Park may be occupied by a Garden for the that the Council are sot at prosent in a position to do
state of the finances of the Society will be seen from the I chief groups collon to be tolerably illustrative of the Balancer that the debt of the Society is Meting. It is there shown t the last anniversary increase of only 567 l .6 s . But on the other hand there is a diminution in the available assets of the Corporation to the amount of 15441 . 19*, chiefly caused by the zale of property : namely, of Stove plants, which produced 56.9 .4 s .6 d. ; of the H-rbaria, for which the unexpectedy large sum of 2531 . 15s. was obtained : and of the old stock of Transactions, \&c., which realised \(282 \% .198 .9\)., or nearly 833 . beyond the sum at which sey were valued. In ec.nsequence of the unsetted
state of the affairs of the Society it had been found impossible to make any ayrangements for Exhibitions uring the present year; but should the appeal to the public prove successful, the Council hope they may look orward to the revival of the Exhibitions with all their

A discussion ensued, during which conflicting opinions were expressed as to the expediency of maintaining the Garden even if the proposed 5000l. were raised. It was generally admitted that the money could only be re garded as a means of trying the experiment of placing he society upon a broader basis, and by that means o ncreasing the number of Fellows enough to provide the requisite income. Eventually the following resolutions were carried: -1 . The meeting receives and confirms the report of the Council, and fully approves of that part of the report in which it is determined to extend the \(5000 l\). proposed to be raised for the purpose of maintaining the Garden. 2. The meeting ptands adjourned o Tuesday, June 24. 3. The curdial thanks of the Horticultural Society are returned to Mr. Heinrich Behrens, of Lubeck, for the very handsome offer he has made of contributing 100l. towards the experiment The Chuirg he Garden.
The Chairman announced that the following Fellows, Lee, Mesors. Siyismond Rucker, Conrad Loddiges, John Le, and II. G. Bohn had been elect:d into the Council and , rom of his Grace the Duke of NorthumberRobert Hhlip de Malpas Grey Egerton, Bart., M. on, President; William Wilson Saunders, Esq., Treasurer Dr. Royle, Secretary ; and Messrs. Stevens and Leach, Auditors for the ensuing year.

Botanic Garden, Cambridge: Exiracts from the Report of the Syndicate.-Trinity Coliege Lodge,
March 5, 1856. -The Botanic Garden Syndicate, in naking their First Annual Report to the Senate, think desirable to give a more detailed account of the character and state of the Garden than will be nectssary in future years. In the formation of the new , it was intenced to make selecee the first confor botanical studies, and to render the Garden an agreeable acquisition to the University, the designers consulted ornamental appearance, whenever it did not interfere with the main object. Owing chiefly to the been gradually carried out with cousiderable, though not entire, success. The funds applicable to the support of the Garden being small, its ohjects are necessarily limited ; effur.s, however, have been made to render it complete in particular departments. The formation of a collection of hardy plants was
thus preferred to one consisting of numerous tender hus preferred to one consisting of numerous tender species, which would have required the erection of extensive and costly plant-houees for their preservation.
The hardy plants may be divided unscientifically, but The hardy plants may be divided unscientifically, but conveniensly for the culivator, into trees, shrubs and herbs, and such a division was adopted by the designers of the Garden. The trees form a belt surrounding the whole of the ground, to which they will ultimately be a considerable protection. They are arranyed as far as possible on a scientific plan, so that allied genera and species are near to each other. Amongst them will be tound nearly all the trees that will stand our climate, and it is believed that, when grown up, they will form one of the most perfect arboreta in the lingdom. The hardy shrubs will be found in a series of beds crossing the Garden at the upper end of the central walk. They were planted in accordance with their affinities, but it is now found that some of them will not succeed in that part of the ground, and, therefore, the plan must be partially disarranged by their removal to a portion of the unoccupied land near the proposed pond. The inroduction of a few trees into the place now appropriated o shrubs would add considerably to the beauty of the rection to the upper part of the Garden from prevalent winds, and part of the Garden from the prevalent winds, and would not interfere with the The herbaceous plants are arranged in beds pn the right of the great walk. Each bed contains a single natural order, or a division of one. This is a very perfect and valuable collection, and it is much used by he members of the University who study scientific Botany. The mode in which the plants are arranged has been found to be well suited for this purpose. has already been stated, no attempt is made to keep an extensive collection of tender plants, for that would require very much larger plant-houses than the University can afford to erect or maintain. The housee Mr. Stration, are capable of containing a suffieiently
regions of the earth; and such, to a great extent, is the collection which is now successfully cultivated in them. It includes a considerable number of fine specimens of the older inhabitants of greenhouses, now specimens of the older inhabitants of greenhouses, now
rarely to be seen, and also many very intereating species which, from possessing slight claims to besuty, have fallen out of cullivation The chaims to beauty to re fallen out of cultivation. She syndicate are glad and thas the novel plan upon which they anes successful has been found to be wery which they are arranged has been found to be very conveniest. Owing to an sary to the in the chimney of the furnaces, it is neces sary to have it rebuilt upon a different plan, and the Syndicate have given directiuns for the work to be done. There is reason to believe that when the new chimney is erected, there will be a much smaller consumption of coal, sad consequently a considerable reduction in one of the largest items of annual expenditure. In the Report of the Syndicate, dated Feb. 23, it was stated that two small houses were wanted for the propagation of plants, and for operations that could not well, if at all, be carried on in the existing plant-houses. When these are built, they will add considerably to the efficiency of the Garden, and remove much that is unsightly from the greenhonses. According to the rules and orders at present in force the Garden is open daily (Sundays excepted) to all graduates of the Unireraity ; to all undergraduate giving their name and college, if required ; and to all respectaly dres college, ir required, and to all their name and address. Servants with children, children by themselves, and persons accompanied by dogs are excluled. The plant-houses may be visited from one till four. No fees are allowed to be received by any of the attendants. The accounts for the year ending ov. 3,1655 , have been examined and audited by the yndicate. The following is a summary:-

The above sum of 4192.11 s .7 d . Was allowed to the Vice-Chancellor of last year by Grace of the Senate, Feb. 6, 1856. The Syndicate have been informed by the Curator that an annual saving of about \(40 l\). would be effectad if a horse, cart, horse-roller, and mowing machine were procured for the use of the Garden, and they have accordingly given directions for making the requisite purchases. The following is a summary of the years euding Nov. 3,1855 :-

Entomological, April 7.-The President in the chair. The President announced that the subject of the prize essay for the present year is the Natural History and Economy of a small Moth (Gelechia terrella) extremely abundant in pasture grounds, with a view to determine whether it be injuriou to agricultarists or It was also announced that a new part of the Transactions, completing the current volume, was ready for delivery to the members. Mr. Augustus Shepherd exhibited a specimen of Ennomos Alniaria (ound in species only two individuals had hitherto beenber last. this country), taken near Margate in September lhe mode fint mode of fight of the genus syn Lepiapterous with their wings partially erect. The genus had been regarded by its founder, Mr. Doubleday, as Heteregarded by its founder, Mr. Ditsed antennæ, but Mr. rocerous, notwithstanding the connecting link between the Stinper butterflies and the Castniæ. Mr. Westwood the Skipper butterflies and the Castnix. Mtical figures, of gave an account, illustrated with analytical figures, of which bave the head greatly dilated and flattened at the sides bave the head greatly diated a, belonged to the ramily Ero, a native of Guinea, Celonge in Ceylon is of doubtful affinity. Mr. Westwood aleo communicated an account received by him from Dr. Lee, F.R.S. of the development of vast quantities of a species of mite n a small cabinet of curiosition belonging to a lady at Lyme Regis. They first appeared in connection with. a Palm leat fly-flapper from Egypt, and thence spread over several of the adjoining rooms, proving extremely difficult to be destroyed, and consequently becoming a
great nusance. 'The fumes of sulphur lad destroyed The employnent of chloride of lime, solution of corrosive sublimate, Chamomile, and other substances were suggested by several of the members. A note from distinctions in the geuus Agra, belonging to the family Carabidse and sub-family Brachinidxe. In addition to the donations of books from the Royal, Linnean and other societies, \&c., a collection or minute insects from Ceylon was presented by Mr. Thwaites.

\section*{}

The British Hieracia, by James Backhouse, junr. (York, Simpson, 8vo.), is a monograph of our wild
Hawkweeds, by a hawk-eyed botanist. Everybody who Hawkweeds, by a hawk-eyed botanist. Everybody who
has studied the Flora of this country knows that Hieracium is a worthy cumpanion of Rosa, Irubus, and Salix, not at all less perplexed and intricate, and therefore the subject of endless differences of apinion. Not to us
belongs the task of settling them. Mr. Bacliouse admits 33 species, to say nothing of nine others which he does not think are really British. The former are placed in nine groups, and each is carefully described, As far as a hasty glance enables us to judge, the work is done well and conscientiously. The marks of practical field-knowledge are visible at every step. We only wish such a useless word as "phyllary" to express an involucral scale had been dispensed with. Were Mr. Back house as much inconvenienced as general Botanists are terms, he would, we are very sure, be no party to their adoption.

\section*{Garden Memoranda.}

Mr. Gaines' Nursery, Battersea.-The show house here (a span roofed one) is now extremely gay house here (a span roofed one) is now extremely gay
with Azaleas, Rhododendrons and other early flowering with Azaleas, Rhododendrons and other early flowering
plants. Conspicuous among the Azaleas were Nonepuch, a large rosy flowered kind with a brilliant fiery centre; Magnifica, a purple sort with fine foliage "Illustrious," a variety in the way of Perryana, and Mont Blanc, an extremely good white. Among the Rhododendrons the greatest novelty by far was Incomparable, a seedling of Mr. Gaines' with handsome peach coloured flowers edged with white after the manner of
Azalea Exquisite. This will prove a decided acquisition. Azalea Exquisite. This will prove a decided acquisition. Among yellows Gaines' Aureum is at present finely in flower; it forms a fine contrast with the more ordinary noticed some pretty kinds. Amaranthina was especially remarhable on account of its handsome were also showy. A house 54 feet in length and dilecta, pletely filled with Rhododendrons, all of them magnificent specimens. Among them were Victoria Regina, a light kind, which wrs reported to have had quite 100 trusses of bloom on it; Princess Royal, also a light 5 coloured variety with coneshaped trusses of flowers 5 inches high, and as much through at the base; Prin-
cess Alice, spotted pink; Prince of Wales and floricess Alice, spotted pink; Prince of Wales and flori-
bundum, red. The finest specimen was, however, magbundum, red. The finest specimen was, however, mag-
nificum, a light kind with 140 trusses of bloom on it This was quite a little tree. The above are all hybrids of the handsomest description. In another house we also noticed a desirable red sort, with compact heads of
flowers, all the petals of which were prettily spotted with minute black spots. This was named Eximum.
Among Cinerarias were some promising kinds, all seedlings sown last June, and we also observed some pretty varieties of Mimulus. Acacia armata is largely grown here for market, as is also Cytisus racemosus, of heh we remarked pitfulls of pretty plants, beautifuly from cuttings about two years ago. Pelargoniums are extensively cultivated here, several large houses being entirely filled with them. That containing the best pecimens of them is 80 feet long, and the stage on which the plants are set is 10 feet deep. A grand display of these flowers may therefore soon be expected.
Already several of the early kind are in blossom. Of these the more remarkable were Gauntlet, album multiflorum, Gage, magnificum, and Gaines' White, the last a beautiful variety pure white, with a small spot in the upper petals. We also noticed some of the new French sorts, which forming as they do large trusses of promise to be acquisitions for early forcing.
Tulips in open bed will soon be very gay; their Howers are uninjured, but the late spring frosts have hurt their foliage a little. Double Stocks in flower are being put under cradles covered with mats, to make plants are now being hardened off with all posible expedition.

\section*{Miscellaneous.}

Sale of Orchids.-A small collection of these made in the province of Verosua, New Grenada, was sold the mass, fetched \(2 l .28\); smaller lots, 10 s to 12 4s, Odon toglossum Warczewiczi, two fine specimens, \(2 l\).; Tri chopilia coccinea, one fine specimen, \(2 l\). 4s.; Ly caste Lawrenceana, (?) several plants, \(1 l .4 s\). ; Cattleya, species union of 4000 feet, at the base of the Vol
cano of Chriqui, two fine heaithy plants, \(4 l\). 4s.;

biens, 2l. 1 s . : Epidendrum maculatum of Reichenbach (what is this?) ?! ; Cycnocnes sp., fragrant, \(1 l\). ; ditto, with flowers said to be pale purple, \(2 l\). ; Cypripedium caudatum roseum, \(1 l .48 . ;\) Cyrtochilum sp., \(1 l .48 . ;\) all 177 , fetched from \(10 s\). to \(1 l\). per lot. A few lots of Stangeria paradoxa realised from \(1 l\). to \(1 l .48\). each.

\section*{Calendar of Operations. \\ (For the ensuing week.)}

PLANT DEPARTMENT.
Conservatory, \&c.-Azaleas, as they go out of bloom, should have their seed vessels picked off, and those that require more pot room should be shifted at once. Some recommend mixing a portion of loam in soil intended for these; but strong rich fibry peat, with plenty of silver saud, forms the best compost for them. After potting every plant should be neatly staked and tied before taking it out of the potting shed, for besides this being luetter doue at once it will not occupy half the time it would doi deferred until the plants have made their growth. These beautiful plants are exceedingly subject to thrips, and
unless a sharp war is carried on with these pests immediately they make their appearance it will be difficult to subdue them. To avoid the nuisance of having to smuke houses or pits, bave a light frame of a convenient size
coveredwith oiled calico in which tosmoke the plants. This may be placed over the infested plants in any of the houses or on a bed of coal-ashes out of doors and filled with tobacco smoke by means of a fumigator and allowed to remain for a few hours. If the calico is properly put upon the frame every insect to which tobacco smoke is inimical will be destruyed, for not a breath of the smoke can escape. We ind this simple cheap contobacco serves when the smoke cannot escape, and it is a great comfort to be able to smoke plants without being obnged to inhale the disagreeable fumes. Go over the constrvatory frequently to regulate growth and to see that the borders are kept moist, giving a thorough not reach the roots, aud although useful in keeping the atmosphere moist will not sexve to maintain the plants in vigour after this season

\section*{FORCING DEPARTMENT,}

Pineries.-In cases where a regular supply of fruit sary to examine the stock of planis, frequenily marking those considered the most likly frequing, so as to be able to keep them rather dry at the root for a month or so, which will, in most instances, have the desired effect of checking growth and throwing the plants into fruit The only effectual method, however, of securing a supply of fruit at any particular time is foresight in the management of the stock, taking care to get the growth well matured in sufficient time to allow of affording the plants a short period of comparative rest, which is the only certain means of inducing them to fruit at any desired season. With plenty of convenience this is easily enough season. With plenty of convenience this is easily enough by far the mostpdifficult part of the culture of the Pine. And in cases where a regular eupply of fruit has to be furnished from limited accommudation, it is saler to grow the plants in pots, so as to secure perfect command over the roots, and also be able to move the plants to a cooler pit or otherwise, as may be necessary. Black
Jamaicas and Cayenues are the best varieties for winter fruiting, and the stock of these should receive every atteution at this season so as to induce them to make free growth, and a portion of them should be shifted into their fruiting pots as soon as possible. Use every means to afford growing stock a moist atmosphere, which in the present state of the weather is a work that requires much attention, but must be done if the plants are to bo kept in first-rate condition. Give air freely, but avoid draughts of cold drying air, and use shading to assist in keeping down the tenperature without being under the necessity of admitting cold drying air too freely innries.-In cases where Muscats are grown in the same house with Hamburghs, and other free setting varieties the temperature must be kept sufficiently high during bloom, and until the berries are farrly set to suit the Muscats; for a crop of these cannot be de-
pended upon from the most healthy Vines, unless they can be afforded a brisk temperature while in bloom and setting their fruit. It will be better, however, to risk having the Muscat bunches somewhat thin than to injure other varieties by maintaining a night temperature of \(75^{\circ}\), which is the practice of sume good growers; \(68^{\circ}\) or \(70^{\circ}\) will be found quite sufficient. Liet the borders prepared for plauting out young Vines, and it these are started into growth befure planting do not keep them too warm, or it will be difficult to prevent their sustaining a check after planting out.

FLOWER GARDEN AND SHRCBBERIES.
Now that we have showery and somewhat milder weather, these will afford ample employment for all the strength which in most cases can be concentrated upon hem. Hardy anduals must be sown at once, covering them lighty with fine soil. Stuchs, Peutstemuns, Antirrhinums, Hollybocks, Sce, that have been properly harened off should be planted where they are to bloom, as also any remaining stock of bienniais and peremnials. The planting of tender Roses should not be longer delayed, and uiose previously planted must be examined, replacing those that appear to be much injured by
the weather. "Get bedding plants hardened off as the pits and frames place them covered at night in case of necessity, and also take can that they are not injured .. by too sudden exposure to bright sunshine.

\section*{HARDY FRUIT AND KITCHEN GARDEN}

Recently transplanted trees, \&c., must be carefully attended to with water. Take advantage of the present state of the ground to get manure wheeled upon quarters supply being prepared for the Celery crop; for without plenty of old rich manure large crifp Celery can hardly be obtained. Directly the weather becomes more favourable get the spring-raised Cauliflowers and Lettuce planted out, if not yet done, selecting for them a sheltered situation and light rich soil. A few braaches of evergreens stuck amongst such things after planting, so as to screen them from the sun, is a great roots get hold of the ground.
sTATE OP THE WEATHER AT CHISWICK, NEAR LONDON,

\section*{Notices to Correspondents.}

To our Correspondents.-By an unlucky accident three or fou notes containing inquiries have been lost. Will our corres
pondents accept our apology and repeat their questions? ThNUA1.8: Furioso. We hardly understand your question, leaves of a book, and drying them; or by plunging them in
spirit, or glycerine and water. But your inquiry probably
points in some other direction.

Renovating Mixture for Old Pastures, perib. 248. to 0010
All orders and inquiries will receive prompt attention. Carriage
The Agritultutal Gajette.

Tes great international Cattle Show at Paris will be the most extraordinary of its kind that has yet been witnessed. We hear that already upwasds of

1200 head of cattle, 1000 sheep, and \(200 \mathrm{p}-\mathrm{ns}\) of \(t\) ttement of an experience. The farm consints of piss have heen entered, besides more than 440 pens land, Ireland, Belgium, Holland, Denmark, Holland, Ireland, Auesgum, stein, Sixuny, Austria, Germany, Switzerland, Italy and France have pronised contributions. Scotland as we said last week, shows 1 T2 head of cattle and 177 sheep. England, not so vigorousty canvassed, or requiring a more vigorous canvass, has entered 94 head of cattle and 170 sheep, beside 35 pigs, 290 entries of farm implements, 39 of produce, and 199 of poultry. Of Iteland we have not received the actual numbers to be sent; but it is said to have contributed more than its proportion.

The exhibition will be held in the Palais de l'Industrie: and a horticultural fête will take place at the same time in the same place.

The few attempts that have been made to determine the number of seeds of our common crops actually sown per acre in our ordinary farm practice have not issued in any very unitorm results. seeing that the seeds of the same plant vary exceedingly in weight and size, and that simples such as those prepared by our correspon-
dent " J. C. X.," botanically exact, have been compared with samples professing merely to be commercially honest. It is plain that the fiyures obtained by an examination of the latter only are proper to be used as agricultural data: and that even these will not agree among themselves, must appear to any one considering the enormous discrepancies of weight and quality, which different samples, all of them, it may be, genuine, present. Thus, for instance, Common Rye-grass (Lolium perenne) varies from 10 lbs , to 30 lbs . per bushel :seeds of a common size, it is plain that 1 lb . of the lightest wili contain three times as many seeds as I 1 l . of the heavies \({ }^{2}\); and so of all the other sceds enumerated. Mr. Summers, who points out how "J. C. X." and Mr. Lawson differ, must accept these differences not as errors chargeable on one or other of the authorities he quotes, but as actual results properly obtained from the examination of different samples. Our own results, given in
the sanie number of the Agricultural Gazette with those of Messrs. Lawson and of "J. C. X." (see pages 234 and 235), are another illustration of the same discrepancy. Thus. Lolium perenne is put down as yielding 199,680, 192,000, and 344,000 seeds per lb. ; Trifolium pratense as \(322,560,192,0 n 0\), and 249,600 per lb.; Trifolium repens as 821,760 344,000 , and 686,400 per lb . ; Phleum pratense as \(948,4100,888,010\), and \(1,178,400\) per lb. ; and Festuca ovina as \(1,113,600,768,000\), and 548,000 per and exhibiting quite as distinct a character as eitier of the others, on a comparison.
The following table, therefore, must be taken with the understinding that its figures, however widely they show the quantity of seed used per acre in English agricultural practice to vary, yet do not give the limits of this variation wide enoughapparently equal weights may yet, owing to sowing numbers differing 50 per cent. and more from one another
The fullowing table relates to those crops in ordinary cultivation which are not thinned during their growth:-
\begin{tabular}{|c|}
\hline Wheat \\
\hline Barleg ... \\
\hline Vats \({ }^{\text {Vetese }}\). \\
\hline Beans (horse) \\
\hline Peas \\
\hline Flax ... \\
\hline Lucerne \\
\hline \\
\hline Clover \\
\hline
\end{tabular}

It is to the last column that the attention of the obtain 300 or 400 plants of Flax or 100 to 170 plants of Clover on every square font we sow ?

The question was asked some weeks ago in these columns:-What is the annual waste of iron per acre in the cultivation of land? It is probably unanswered without any serious loss to our readers Nevertheless, we are, very mach obliged to Mr. Howard, of the Britannia Iron Works, Bedford, who has kindly examined the accounts of a farm in Bedfordshire with which he is acquainted, and has giren as the result of his inquiries the following
one of white, and one of yellow. the mixture is 2 lbs of red,
\(3: 30\) acres of arable land and 120 acres of mealow or permanent Grass. The following is the list of the implements employed upon it :-

\begin{tabular}{|c|c|}

\end{tabular}

The estimated weight of iron in these implements is 20 tons, and to it there may be added at least 4 tons for iron work in farm buildinse, gates, \&e. The estimated annual consumption of iron in order to keep these implements good is about \(6 \frac{1}{2} \mathrm{cwit}\)., or rather more, per annum of wrought iron, and 7 cwt . of cast them on an average uses 32 shoes per annum, weighing about 2 lbs. each of them; one-eighth or so are lost, and the average weight of the
old shoes worked up is about \(\frac{3}{4}\) b. each. From these data it is calculated that nearly \(5 \frac{1}{2}\) c
wrought iron are annually used yearly in horse shoes alone. And this makes the total consumption of wrought iron 12 cwt ., and of cast iron 7 cwt . per annum. We are not informed as to the quality of the soil-the number of horses would lead one to
suppose it heavy-but from their being spoken of as 'pairs,' and from the use of double furrow ploughs we suppose it to be light, and the latter is more probably the case.
On this farm in Bedfordshire, then, it appears that on 450 acres there is a consumption of rather more than 4 lbs of iron per acre per annum. And
this must be taken by our French correspondent as the only answer to his inquiry we have been able to obtain-the only one indeed we have ever seen attempted. He must remember however that the relative proportions of arable and parture on this farm are not those which obtain over the country generally, and that the stock of iron imple-
ments upon this farm very far exceeds the quanments upon this farm very far exceeds the quan-
tity generally in use. On both these grounds we have little doubt that in this experience there is nearly double the consumption of iron which generally obtains per acre; and, therefore, that this, over the country generally, ought to be assumed rather as being between 2 and 3 lbs . per acre yearly than as between 4 and 5 .

HOME FARM MANAGEMENT.-No. II.
Or the outlay on permanent improvements connected with a home farm the irrigating appliances of modern times form no inconsiderable part. With many excellent
farmers, the vital question "will it pay?" is still in respect to irrigation thought to be unanswered. Lookng at the heavy expenditure of from \(4 l\). to \(5 l\). an acre, which is necessary to bring the process into operation, a superficial examiner of the subject will naturally leap at the conclusion that it is certain to prove unremunerative. A careful profit and loss calculation on the other hand will generally demonstrate the fact that under judicious management it is sure to prove successful even in a money point of view. One great error committed in some well-known cases has been that of Seeds laying down more pipeage than could be kept in constant operation. In this way a very heavy interest has been ocurred, and a comparatively small return obtained on the gross expen-
diture. There is so much liquid manure requ red for a small breadth of irrigated land that an excess should always be at command rather than that there should be the slightest risk of the liquid manuring practices of our day is that of employing urine alone. Every one acquainted with the chemical composition of anal excreta is aware that peither urine nor freces contains separately all the elements of nutrition required by pinnts, but if used together they do supply these manure in a liquid form can be employed with advantage, is to bave both solid and liquid exuvie present in solution. Not to anticipate the discussion of ceed topartment of my sulice the outlay on irrigation as constituting an important part of the landlord's proportion of it would be too on improvements. With a let farm it would be too much to expect the liquid manuring system to be adopted, unless the proprietor were agreeing to bear the major part of the expense, and in farming his own land the latter would therefore require to place the coat of all irrigating fitments at the debit
lay no doubt a more liberal interest should be allowed than would suffice on drainag夬 expenditure, but taking everything into consideration \(6 \frac{1}{b}\) to 7 per cent. would be enough. While it is advisable by all means to limit as far as practicable the cost of irrigating appliances, real efficiency and its certain concomitants should suggest the danger of unwise stintedness. Whether it be in the tanks, the engine, the force-pumps or the subterraneons pipage, true economy will always point to substautiality as a sound test to go by
Nothing can be more annoying to a keen agricultarist farming his own land than an interruption every is just what may be expected if there is a want of power in the engine, a defectiveness in the tank construction, or a general weakness in any of the other fittinge connected with the irrigating machinery. How greatly do some of the older fashioned and more prejudiced farmers rejoice when a little mishap impedes the success of a new species of farm practice, which, as if by intuition, they have long ago condemned without a trial. In 100 many cases irrigation and other progressive systems, with the principles of which men who were thought to be enthusiasts have endeavoured to stir the cerebral faculties of the farmer, have experienced greater obstruction by some defect or practical inadequacy in the means adopted to bring them into operation than rom any other cause. If a home farm, therefore, is to become a great school or a repertory of experience for the guidance of tenant farmers, all the new procenses which may be introduced, whether relating to irrigation or otherwise, should only be so under such circumstances ais give the greatest probability that the ond in view will be Extravagance in the constrnction lew will be giti. luxtas praction necessary fittings, or exppive carrying into certainly be avoided with as sedulous a care as the extreme which might be dictated by parsimony

The next landlord's improvement which calls for a passing notice is that of roud construction. A farm relut as one more fovourably circumstanced in this respect, and if good roadways add to the rental, the increase when sufficient to yield five or six per cent. on the expenditure, should give complete satisfaction. Every one knows that with a large addition to the produce of a farm in consequence of the adoption of the highest systems of farming, the wear and tear of its roads mustalso be greatly increased. Hence it is well or a proprietor in taking a home farm into his own hands to put all the necessary roads into substantial and thorough repair, and from year to year they should be kept in the highest possible state of jefficiency. While the outlay requisite in forming the roads ought cer tainly to be charged against pernanent improvements, such repairs as may be made from time to time belong to the tenancy account. In some cases it will be a matter worthy of consideration whether tram roand, of even railways might not be preferable to ordinary maca damised roads. It may seem an absurd idea, but 1 confess I have a strong conviction that ere thirty years it will be no uncommon thing to see the produce of a farm brought from its outskirts to the vicinity of the homestead by means of a railway, the working plant of which will either be fixed or locomotive as may be desired. How handily might the farm-yard manure be run out to distant fields in this way! It could not perhaps be laid down at the very spot at which it was required, but if brought to within 200 or 300 yards of it a most important end would be served. For a farm of 400 to 500 acres with the steading near its centre, two main lines crossing each other at right angles, and a branches would be sufficient. Here, however, let the purse-stirring question be put-"Will this railway I ameme leave a dividend?: Why should it not? Bu I am again anticipating a future section, and must pass on. Of the profitableness of cheap tram-roads ther can be no doubt, and in many cases it will be found advisable to make them the substitutes of metalled roadways.

The only remaining improvement, the cost of whic should be plact d to the landlord's account, is that of is the Whether live or dead fences are ene tenan being bound to perform necessary repairs. On some estates the live hedges are kept in order at the mutas expes of the landlord and tenent the woing performel by af of hedgers bept for the purpose. This is no doubt the fairest way of rating the pose. This is no doubt for the tenancy account of a home farm. Let the hedgersion, say be debited to the proprietor, and a fair proportion, sad about a half thereof, including cost of paling, carric to the tenant's lenger ; on the same principle the gates should all be put in good working order, half the ex pense of repairs being debited to the tenancy outlay With stone dykes, or other dead fences, the case is very similar. The landord derives the greatest-becauso the most enduring-advantage "from the erection of permanent fences ; but the tenant has also an intercel in the matter, and should contribute a share of the expense towards maintaining them in first-class order. As it is not my object in this department of the subect to enter more fully into the question of permanent mprovements I shall conclude this letter by referring o the superior position in which proprietors farming heir own land are enerally placed in comparison to that of many tenant farmers dependent on their own means and exertions for success. The greatest drawback which a tenant can experience
cient capital, and notwithtanding the present high
prices of produce there are still many farmexs who are far from being in a favourable position as to money matters. True, the personal attention which a tenatit
farmer is enabled to give to the daily operations of his farmer is enabled to give to the daily operations of his capital ; but with gond management money commanded ought to throw a liberal balance on the credit side his ledger. So far as necessary funds are concerned then, amateurs cultivating their home farms have far greater chancts of success than lessees can be expected to have. The former are not compelled to send their produce to market merely to obtain cash to serve a particular end, nor do they need to delay the purchasing of portable mauures till the spring demand raises them rates in favour of home farms as against let farms, but the latter have also their advantages, though in many cases these are not sufficient to counterl alance their disadvantages. The shoal rocks on which the profits in the agricultural chart by two words, "extravagance" and "incompetency." It the proprietor is ignorant of practical farming and will yet ketp the helm of affairs n his own hand, or think himself justified in duncing minuet with every builder of agricultural castles in that case that he himself should pay the piper. By his extravagance, unguided by sound practical judgment, he extravagance, unguided by sound practioal judgment, he profit on expended capital were the management more udicious. That incapacity is exhibited in numerous instances by persons in charge of the practical opera-
tions in home farming cannot for a moment be doubted, tions in home farming cannot for a moment be doubted, and to incompetency of the manager as much perbaps as extravagance of the employer are many of the cient capital, a ski led and prudent responsible sttward and a proper selection of farm servants, whose intel lectual and moral culture will be cared for, there can be no sound reason for supposing that the profits of a those of any similar occupancy farmed by a tenant. In my next letter I purpose to enter on the tenanc department of my subject. J. Lockhart Morton.

\section*{PROGRESS OF BRITISH AGRICULTURE.}

\section*{Denison.]}

Field Practice.-The greatest improvements in cultivation and management have taken place in the strong lands. Draining is the foundation of all these improvements. Draining, now better understood and generally character of whole districts, turuing unmanageable and unprofitable soils into easy-working and productive land.
It would be interesting to ascertain the extent of land drained each year; but no sufficient data exist for a
reliable estimate. Draining operations are carried on by means of the public loan, the capital of private comOf the public loan of \(4,000,000 \mathrm{l}\).,
works in each of the last three years have bums issued for 1852
1853
1854

\section*{}

What proportion do the lands drained by the public loan bear to the lands drained by private capital? If area of the country, the lands drained by the public loan would not be more than one-fourth of those drained by private capital. In such case, the total sum expended in drainins for the last three years would amount to \(5,257,6152\)., and allowing \(5 l\). for the expense of an acre the extent of land drained would exceed \(1,000,000\) acres. This sum, or whatever sum may have been expended in draining, will have been capital supplied mainly by the proprietors of land. A sum equal to the above in amount has been expended, mainly by the tenant farmers of the three kingdoms, in the purchase of a single article of manure ; and this is not a vague estimate but an ascertained certainty.
The sale of Peruvian guano by Messry. Gibbs for the last three yearn have been-

1852

177,000 \\
\hline 150,000
\end{tabular}
Allowing 127. per ton for cost and carriage, the sum expended amounts to \(5,160,000 \mathrm{l}\)
To this must be added the large outlay on Linseed eake, on bones, rags, on minerals containing fertilising principles, on lime, plaster, \&c. With these combined efforts on the part of the owners and occupiers of the soil, there can be no danger in asserting that the produc*
tive powers of these islands have largely increased, and are continually gaining new force.
I have said that the most marked improvement has taken place on the strong lands. Draining and antumn cultivation, materially assisted by good implements, have Turnips to this courier of strong land to add Swede Turnips to this course of cropping. The importance of root, which is beginning only to marieties, created the value of the light lands, is now performing a serviee
lands, for feeding sheep, but for feeding catle The superior. The land will bear the whole crop to be carted off to feed cattle in 3 ards. Cattle supply mature, manure gives corn. It is difficult to estimate the addition, in meat and in grain, which this alternating process will surely afford
It nay be thought by some that too much stress has been laid on the value of improved implements. Way be worth while to examine the point more closely. What saving might be effected on a farm of 200 acres of arable land (the rental, say, 25 s , per acre, drained and laid into fields of a suitable size, by the use of good implements ? All land is ploughed at leas wice a year. The difference in labour between ploughing drained or undrained land is very great.

\section*{It would be an estimste nuch below
18 per acre for each plougling.

the new system, with an \\ . Would be sown with better results}

There would be a saving, therefore, of 1 bushel per acre on the 50 acres sown with Wheat, which, at 78. whole ares, 1s. 9d.
On area, 18. 9d
On 50 acres of Barley there would likewise be a saving of 1 bushel of seed per acre, which,
bushel, would give a saving per acre of 1 s.
buahel, would give a saving per acre of ls.
Next comes the preparation of the grain for market. There are to be threshed the produce of 50 acres of Wheat, at a yield of 4 quarters only per acre, 200
quarters; of Barley, 50 acres, at a yield of 5 quarters per acre, 250 quarters. The cost of threshing Wheat by the flail, and dressing, is \(4 s\). per quarter ; by an improved steam machine, \(\mathrm{J}_{\mathrm{s}} .6 \mathrm{~d}\). Saving on 200 quarters of Wheat, \(25 l\)., or per acre, 2 s .6 d . The cost of threshmachine, \(2 s\). Saving on 250 quarters, \(12 l\). 10 s ., or per acre, 1 s . \(3 d\).
Total saving by the use of drill and threshing achine, \(8 s .6 d\). per acre, or one-third of the rent, 25 s. Besides the economy and direct gain to the farmer, the saving of 1 bushel per acre of the grain employed in reproduction is an important aid to the consumer, and when multiplied over the total area of land still cultivated under the old system would form no insignificant addition to the annual resources of the The
The rapid spread of useful information and of approved practice must be laid to the account, in no
small degree, of the journal and of the meetings of the small degree, of the journal and of the meetings of the
Royal English Agricultural Society. The meetings of Society, held in each year in different districts, enforce precept by example, and communicate every variety of aseful intormation in the most attractive form.
Such are some of the proofs of the onward march of agriculture, and of the progress which it has made since the Exhibition, and, in many points, by virtue of the on the threshold, and much remains to be done. W ask of science to penetrate yet deeper into the secrets of Nature's laws. We ask of mechanical art to bring o our aid in the field the mighty agency of steam.
We call upon the farmers to continue and increase their efforts, so alone will they he able to keep pace With the demands made upon them by a population tain the place in the front rank which they now honourably hold.

\section*{Home Correspondence.}

Alderney Cows.-Having seen a statement from "E. C., Gresford, Denbighshire," in your Paper, of four
Alderneys giving 712 lbs . ( 18 oz. to the pound \()\) of butter Alderneys giving 712 lbs . ( 18 oz . to the pound) of butter
during the year, besides a small quantity of milk, cheese, and cream for family uses, I would wish to state the true Guernsey (or Alderney) cow is only to be oltained pure in this island. Those seen in England are mostly brought from Jersey, and sell rather cheaper. The pure Guernsey cows are infinitely [!] larger, taller, and of Instances darker colour than those from ox bey fattened to 15 cwt ., but the heaviest in Jersey has not exceeded 11 cwt. It is an invariable practice throughout Guernsey to tether the cattle, staking them by the horns to the earth, by means of an iron or wooden peg attached to a halter about 12 feet in length; this is shited about four times in a day, allowing a fresh range of 4 or 5 teet. They are months; the milk is churned with the cream. The butter is in great request by the country people as an article of food, and is pretty palatable ; cheese is never made. The general quantity that a Guernsey cow will In summer many instances occur in 365 lbs . of butter. n summer many instances occur in which cows give as much as 15 lbs . of butter in a week. So convinced are the people of the eminence of their cows, that every
foreign breed is rigoronsly excluded, oxen only being foreign breed is rigoronsly excluded, oxen only being would not even allow a Jersey cow to come on his land, though this distinction is not known in England. As a guide to the English purchaser, it may be observed, that a thoroughiured Guernsey cow is required to exhibit on its person 20 marks before the Agricultural Society of the island pronounce it perfect. These marks are the following :-The pedigree of the father being proved to be good, and yielding yellow
butter, the distinctive marks of which property being round tinge at the root of the cail, and full ndder- eyes, count for \(\overline{7}\) points; general appearance, colour cream, count for \(\overline{7}\) points; general appearance, colour cream, short, count for 3 prints ; handsome head, ditto horns, slightly curved inwards, bright and prominent eye, 4 ; deep barrel-slaped body, the flanks well rounded, 3 , handsome legs, not knocking each other when walking, I; the hind quarters flat and right-angled, back straight and level, 2. Criterion of perfection, 20 marks. J. Charlion, Gaidener to P. de Jersey, Esq., Queen's Ruad,
Filtration of Manures through Soild-Mr. Mechi writes, at p. 251, "The quantity of liquid manure applied was about 100 gallone per minute. * * Total application per acre about 20,000 gallons, or 1 inch rainfall." May not the rapid rate of that application be the cause of the liquid manure passing through Mr. Mechi's drains "strong and highly coloured." One inch rain-fall in six hours is a very heavy rain, and what we do not frequently get. According to Mr. Mechi'a quantities he pours on the soil 1 -inch fall in three hours and a half. I would suggest that Mr. Mechi mours trial of an application of liquid manure at the rate of 1 -inch fall in nine lours, whill will be an ordiary havy hill when then cases of an application upon very dry ground, he will not find hi "application upon very dry ground, he will not find his "spring-water tainted at a mile distant from the field irrigated," or the water running coloured through the drains. Seeing "the solution from an ordinary dung heap on the surface of a strong elay field flowing though drains several hundred yards from it," I think is no argument that such is the case from dang spread on a field. Soils in a very dry condition are much slower in absorbing water, especially clays, than when they are only in a moderately dry state, consequently their powers of filtration are shown. The state of the soil should govern the rate of the application of liquid manures if a perhold in solution is desired. Very dry clay canno the quantity of liquid manure Mr. Mechi tells us he found on his field in about three hours and a half time With such a pressure the interstices of the clays would convey the water directly and rapidly to the drainshence the failure in filtration. Henry Bundy, Dynevor Castle. [It is desirable that there should be a careful re-examination of Mr. Mechi's extraordinary experience. We should be inclined to attribute some the waste to a flow over the surface of the land.]
The Keythorpe Draining.-I have read a paper on the Keythorpe draining in your Number of the 26 th inst., signed " J. Trimmer," in which that gentleman ex presses his confidence in what he terms the "Keythorpe system," and challenges any disciple of the perpen-
dicu'ar and parallel princinle to produce a farm of 400 dicular and parallel principle to produce a farm of 400 acres as efficiently and cheaply drained as that at Keythorpe. Unfortunately I have not had an opportunity of seeing that farm, nor am I strictly speaking in a situation to take up the gauntlet so boldly thrown down hy Mr. Trimmer, inasmuch as my farm contain but 310 acres, of which 170 only are under the plough. Should Mr. Trimmer however, be willing to extend his limit from 400 to 340 acres, I am prepared to accept his challenge and "leave the decision of the question to a jury impartially selected." Having now disposed of the draining question, I will venture a step farther, and challenge Mr. Trimmer or any other person in the United Kingdom for 100 guineas to produce a farm of 170 or any greater number of acres, carrying a Whent crop of equal luxuriance and comparative extent with mine, taking into account the quantity and quality of corn produced in 1855; the aforesaid draining jury to decide this question also, either now or just before or Surrey and Sussex, but as I found no competitor, I am in hopes by making the invitation more general I shal meet with better success this year. J. C. Sherrard Kinnerslcy Manor, Reigate.
Agricultural Statistics. - The following letter, which has been sent to us for publication, was lately addressed by Colonel Clinton to the Secretaries of the Royal Agricultural Societies of England and of Scotland :-
I have the honour to state to you that I object to the propocal retnrms. Wbat is sauce fur of Enose is sance for gander, according to a vulgar but sharp trutb-telling saying. May not the question
be asked, if the country has a right to force farmers to answer such questions, whether the councry may not-claiming a similar constituted authority-call upon bankers to give upon oath perio-
dical returns of the 'Fields of capital they lay dowa? --o the
crops' of interest of that capital which they reckon reaping? May not the conntry lay claim to a right of demanding similar returns from all merchants and sbopkeepers, from Colonel.

On Ladders.-Among all the prizes offered and given for so many and varions articles and productions, I do not recollect ever to have seen a prize "for the beat ladder," yet for the general convenience of the comof its kind; in fact it should be strong and light. As I bave succeeded in making a good ladder, perhaps some of your readers would wish to hear some of the particulars. Being in want of a couple of laduers for stack building, \&c., we procured two good Norway spars, and having divi ed one of them 1 was advised to place the convex sides inwards for the convenience of any one Who might have to sit on it ; so we made a very good other spar was divided it pretty heavy one. When the two ladders of it instead of one, and accordingly wo had
one side divided again, each quadrant presenting its
